During this reporting period, the City provided a Water Quality booth at all three large scale City events. City personnel staffed both booths to answer any questions and to provide stormwater and pollution prevention educational materials. These materials included brochures on pool cleaning and draining, pet waste, oil recycling, healthy garden tips, Green Wrench guides, What's Cooking guides, and household hazardous waste disposal information. Between the three events, approximately 5000 residents, business owners, and visitors were exposed to the City's stormwater and pollution prevention program. The City again mailed educational material to one hundred percent of the restaurants within the City boundaries. The information contained a calendar of free workshops provided in collaboration with SDG&E (San Diego Gas and Electric).

The City continues to investigate the implementation of a FOG (Fats, Oils, and Grease) program in conjunction with the issuance of the new Wastewater Discharge Requirements order. City personnel received grease trap and inceptor inspection training at the end of the previous reporting period and hope in future reporting periods to begin grease trap and inceptor inspections at local facilities. The needs assessment for the sanitation district showed a need for a FOG program and the City is working to develop a program that will serve the needs of the sanitation district and water quality.

4.3.1.3 Compliance and Enforcement

The City intends to utilize routine inspections (including licensing and permitting as appropriate) as its primary means of compliance verification for stationary commercial sources. Inspection programs are currently in place for all high priority commercial facilities, and are described in further detail in section 4.4.1. The City utilizes DMax to conduct its facility inspections for commercial and industrial facilities. The City, in this reporting period, focused its inspections on eating/drinking establishments, automotive repair facilities, and repeat offenders from previous reporting periods. The City observed an improvement in compliance at the repeat offender sites. Many are making noticeable strides in compliance efforts and basic good housekeeping practices have improved in all facilities inspected. The City feels the improvements are due to increased, repeated education and better trained City personnel, who observe potential non-compliance early. The City had no commercial sites requiring violation notification during this reporting period.

4.3.2 Outreach to Commercial Businesses in FY 2006-07

The goal of the City's commercial outreach program is to promote effective BMP implementation by making commercial business operators aware of their regulatory obligations and by providing them useful information on how to comply. To this end, a variety of methods were utilized during this reporting period, including mass mail-outs, informational brochures and hand-outs, and direct interaction with employees during inspections and permit processing.

4.3.2.1 Automotive Industry

During this reporting period, the City increased its outreach efforts to include the automotive industry within its boundaries. The City is aware that not only is this sector engaged in activities with a high potential to discharge pollutants, it is also large and highly visible to the community. The City met its goal of providing outreach at community events, like the Spring Festival, and Winter Bonfire. Section 4.3.1.2 provides the types of materials distributed at these events and the number of potential recipients. The materials included information on oil recycling, free oil funnels containing oil recycling site information, and Green Wrench guides in English and Spanish. The City also sponsored a Green Business workshop for automotive facilities within its boundaries and within the San Diego Bay Watershed. The workshop contained information on BMP implementation and water quality issues. Each participant received an educational video, a hydro-mop and bucket, and the EPA automotive BMP packet.

Partnerships

The County-chaired Green Business Group continues to make progress in developing a self-assessment program for small automotive businesses. The goal of the program is to recognize businesses that are in compliance with environmental regulations and that take extra steps to go beyond compliance in the areas of pollution prevention, energy, and water conservation, and solid waste reduction and recycling. The program is aligned with statewide green business standards and has already approached several businesses in San Diego County. To promote the use of "green" business practices, a public flyer was developed along with self-assessment checklists that are distributed by workgroup stakeholders during business inspections, trade association meetings, and at various community events. BMP information is included in the checklists and in the supporting materials provided to the businesses. These materials are all included as Attachment C and are available on the Workgroups website at www.projectcleanwater.org/html/wg_green_bus.html.

4.3.2.2 Eating and Drinking Establishments

The City has continued its outreach to this sector of its commercial community. The City is working to annually increase its activity specific outreach to an additional commercial or industrial sector. Automotive facilities and eating/drinking establishments are the two commercial sources that have received individual outreach materials. The City is aware that not only is this sector engaged in activities with a high potential to discharge pollutants, it is also large and highly visible to the community. The listing below shows the areas in which the City plans to increase its outreach efforts to eating and drinking establishments during the next two fiscal years.

- Basic Housekeeping workshop utilizing the *What's Cooking Guide*
- Mailer describing safe and effective grease disposal methods and dry-cleaning methods for spills (currently working with a consultant to evaluate the most effective way to implement a FOG program)
- Workshops on how to maintain health codes and improve water quality

Some activities that the City is currently engaged in will continue. A listing of these activities is below.

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Continued use of the *What's Cooking Guide*
- Outreach at public events such as the Winter Bonfire and Spring Festival

The City mailed educational material to one hundred percent of the restaurants within the City boundaries. The information contained a calendar of free

workshops provided in collaboration with SDG&E (San Diego Gas and Electric). Several of the workshop topics focused on energy efficiency, fewer waste products and green business practices. The Outreach Workgroup collaborated with SDG&E to ensure that stormwater and pollution prevention are recurring themes in the majority of the presentations.

The City is also investigating the implementation of a FOG (Fats, Oils, and Grease) program in conjunction with the issuance of the new Wastewater Discharge Requirements order. City personnel received grease trap and inceptor inspection training at the end of the previous reporting period and hope in future reporting periods to begin grease trap and inceptor inspections at local facilities. After receiving the results of the needs assessment, the City is working to establish a FOG program that will serve both the sanitation district and water quality.

What's Cooking Guide

The Copermittee Outreach Workgroup, chaired by County staff, developed *What's Cooking*, a stormwater BMP guide targeting eating and drinking establishments. The guide is designed for use by local businesses as both a source of activity-specific BMP information and as an employee-training tool. It presents a set of standard BMP requirements that are found in most jurisdictional ordinances, contains contact information for each jurisdiction in San Diego County, and includes supplemental pages to aid operators in documenting employee training.

The City will continue to utilize the *What's Cooking Guide* and will use it as the basis for future workshops for eating and drinking establishments.

Partnerships

The Green Business Technical Workgroup continues to make substantial progress in developing a self-assessment program for commercial businesses, including an element focusing on the food service industry. Supporting materials are included as Attachment C and are available on the Workgroup's website at www.projectcleanwater.org/html/wg_green_bus.html.

The City plans to utilize the Green Business Program more effectively during the next reporting period. The City hopes to collaborate with other jurisdictions in its watershed and region to offer programming to local businesses. This will allow the City and other jurisdictions to provide a consistent message through out the region. A consistent message will make it easier for citizens and City staff to enforce water quality and pollution prevention measures. Based on the attendance at the previous reporting period's workshops, the Green Business Program and its collaboration agencies are exploring other outreach options and

possible incentive programs for attendance at workshops. The City will continue to participate in the program and it's efforts.

The Green Business group is also working with other state agencies to create state wide standards for acquiring a Green Business certification. The City feels that by working closely with this group, that it will benefit from a uniform message and that its businesses will see the value in promoting green practices. Water quality and pollution prevention are high priority items for the certification process. Businesses with a Green Business certification should decrease the number of potential polluters within the City. The City is hoping to be able to offer incentives for the Green Businesses in the future and looks forward to continued collaboration and growth in this partnership.

4.4 Compliance and Enforcement

While educating business owners and operators is an important first step toward achieving compliance, the City also conducts programs to verify that stormwater BMPs are being implemented "on the ground." This includes both routine inspections of commercial facilities by DMax and response to complaints received via the Stormwater Hotline. When City staff observes a stormwater violation, appropriate actions are taken to ensure that businesses are returned to compliance with all BMP requirements and discharge prohibitions.

4.4.1 Inspection of Commercial Facilities

During this reporting period, DMax inspected 54 high priority commercial facilities on behalf of the City. As stated in section 4.3.1.3 above, the City focused on eating and drinking establishments, automotive facilities, and facilities with non-compliance comments from past inspections. Inspectors' primary function is to assess compliance with minimum BMP requirements, which are specific to the types of facilities and activities designated as high priority by the Permit. Each inspection is conducted in the presence of a facility operator who has the authority and responsibility to ensure the implementation of corrective actions should they be required. For more inspection data see Attachment B1.

4.4.2 Complaint Investigations Involving Commercial Sources

The City received no recorded commercial oriented complaints during this reporting period.

4.4.3 Enforcement of Violations at Commercial Businesses

The primary objective of the City's commercial enforcement program is to return violators to compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary, but generally include Verbal Warnings, Notices of Violation, and potentially fines.

The City began a trial code enforcement program for water quality during FY 2004-05. This program has continued to grow and will include a part time staff member with a water quality compliance focus during the next reporting period. The city can now issue escalating fines for water quality violators and will be able to conduct in-house inspections and community support. See Attachment B-4 for the flowchart detailing the code enforcement process. The City understands the need for immediate response on water quality compliance issues. However, this is the City's first water quality code enforcement program and it must be used with discretion. The City must also ensure that the municipal code contains the necessary ordinances to provide validation for code enforcement efforts.

4.4.4 Reporting of Non-Compliant Sites

The City's JURMP outlines standard operating procedures for reporting non-compliant facilities and sites to the RWQCB. The City did not have occasion to report any instances of significant non-compliance over the course of this reporting period.

4.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Commercial Component in FY 2006-07.

4.5.1 Narrative Assessment

In FY 2006-07, the City continued the improvements discussed in the previous annual report. DMax continues to inspect, on an annual basis, the majority of high priority commercial facilities. This year the City focused on automotive facilities, eating and drinking establishments, and repeat non-compliance facilities. DMax also provided the City with an updated facility inventory. The continued inspections of City facilities are beginning to show results. A change in behavior is evident in the increased number of BMPs found on site, the decrease in non-compliance issues, and the increased knowledge of the facility operator and/or manager. The City is continuing to set a precedent in its commercial community. Through the inspection program, facilities receive an annual reminder of water quality and pollution prevention in addition to any material provided by City staff or workshops attended. The inspections also set the stage for improved code enforcement measures and tracking data during future reporting cycles.

Although the City considers its existing commercial program to be both Permit-compliant and of a high quality, staff realizes the need for improved tracking to assist in obtaining load reduction data. The City believes that with the implementation of the proper BMPs in all businesses, load reduction numbers can be assessed. City staff also worked cooperatively with the Copermittees on several issues related to commercial activities. The first, the development of a

comprehensive framework for reviewing and possibly revising existing programs (*A Framework for the Implementation of Best Management Practice [BMP] Programs at Commercial and Industrial Sites*), will provide guidance to City staff in future years as we continue to implement and refine our efforts. The second, the continued development and distribution of targeted BMP guides for the restaurants and automotive businesses (*What's Cooking and The Green Wrench* G*uide*), will promote regional consistency and serve as an important source of activity-based BMP guidance for two important industries.

No specific management practices or BMPs relating to commercial facilities or activities were identified as being ineffective during this reporting period.

4.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activitiy-Based Targets

Target 1
Increased outreach at community events
100% complete

Target 2
Increased outreach to eating and drinking establishments
85% complete (more detailed outreach is still desired)

Target 3
Update the JURMP commercial listing through DMax
100% complete

Target 4
Increase outreach to automotive facilities
85% complete (more detailed outreach is still desired)

Target 5
Improve education through business license renewals and new business licenses 40% complete (still working on informational mailer to include in renewal notice, in-person staff interaction has increased when applicants renew at City Hall)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Commercial Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

A continued new aspect of the 2006 Industrial and Commercial Inspection Program involved each inspected facility being assigned a rating to reflect the level of BMP implementation noted at the site, and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge. The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs, and were assigned based on how many of the following questions were answered correctly:

- What is storm water?
- What is the difference between the storm drain system and the sanitary sewer system?
- Where does storm water flow to?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good housekeeping or best management practices are?
- Do you know what NPDES is or means?

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention measures and the NPDES Storm Water Program were rated "Level 5". Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a "Level 4" rating. "Level 3" rating indicated an individual who answered three questions correctly, "Level 2" indicated one or two correctly answered questions, and a "Level 1" rating indicated that the individual was not able to answer any of the questions correctly.

At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- "Level 5": All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- "Level 4": BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business' activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- "Level 3": BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- "Level 2": Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open and oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- "Level 1": A violation of one or more of the City's Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs, and/or significant littering) was noted. BMP implementation was poor.

The table below provides a breakdown of information from the 2006 Industrial Inpsection Program stating the average and median ratings for BMP and knowledge assessements, as well as rating frequencies:

Table 4.2 Program Scores for FY 2006-07

	Knowledge Assessment *	BMP Assessment
Average Rating	2.6	3.5
Median Rating	3	3
# of "Level 5" Ratings	6	25
# of "Level 4" Ratings	28	34
# of "Level 3" Ratings	30	49
# of "Level 2" Ratings	22	12
# of "Level 1" Ratings	33	4

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

Table 4.3 Program Scores for FY 2005-06

	Knowledge Assessment *	BMP Assessment
Average Rating	2.39	3.33
Median Rating	2	3
# of "Level 5" Ratings	0	14
# of "Level 4" Ratings	9	26
# of "Level 3" Ratings	34	30
# of "Level 2" Ratings	26	11
# of "Level 1" Ratings	18	7

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

As indicated by the assessment ratings breakdown, the overall knowledge and BMP implementation ratings were not particularly high. Knowledge assessment scores in particular were quite low. Sixteen percent of inspected facilities had BMP assessment scores of "5", indicated that no corrective action recommendations were necessary. This being the first year that this rating system was used, there is no prior standard with which to compare these ratings. It is anticipated that subsequent year's assessment ratings will increase as businesses receive more educational materials and become more familiar with the City's storm water program and what is expected of the businesses.
The DMax inspections have shown a need for improved outreach with commercial sources and facilities. Even though none of the facilities had "gross" violations, many lacked basic housekeeping BMPs, such as spill kits or open dumpster lids. The last time the commercial facilities were inspected was in 2002 presenting the City with a gap in data collecting. The City plans to continue yearly inspections from this point forward, creating a more in-depth data supply.

Level 4 Outcomes: Load Reduction Estimation

Because of the diversity of facility types and operations in the City's commercial source inventory, no attempt has been made this year to estimate reductions in pollutant loading that might be expected as a result of city efforts in FY 2004-05. In the future, the City will continually seek to develop valid methods for estimating load reductions from commercial facilities. To this end, a continued inspection presence will help to improve our understanding of potential reductions.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

4.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. However the Report of Waste Discharge (ROWD) contained an initial spatial analysis of commercial facilities within watershed boundaries. This information can be found in the ROWD document presented to the RWQCB.

Section 5.0 Residential Component

The City implements a variety of programs to prevent and respond to discharges from residential areas. All of these programs are predicated on the assumption that knowledge and awareness are crucial to affecting and sustaining responsible behavior. Where possible, programs and activities are tailored to reflect the unique characteristics of the many areas of Lemon Grove.

5.1 Priority Residential Sources

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment D-1 contains a demographics chart for the population of Lemon Grove. As Attachment D-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

5.2 BMP Requirements

The JURMP document lays out minimum Best Management Practice (BMP) requirements corresponding to all identified categories of high priority residential sources.

5.2.1 Minimum BMP Requirements

As described in JURMP section 5.3, the City establishes basic BMPs for all manner of residential activity. Below is a list of the activities covered in JURMP section 5.3:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home and Garden Care
- Disposal of Household Hazardous Waste
- Disposal of Pet Waste
- Disposal of Green Waste

JURMP section 5.1 emphasizes the importance of pollution prevention, making it the basis for the BMPs described in each of the above listed activities.

5.2.2 Pollution Prevention Methods

The City encourages its residents to use pollution prevention BMPs through a variety of educational programs and activities. The core function of the City's

pollution prevention efforts is to promote the use of these practices by City residents, local businesses, and municipal employees. Pollution prevention concepts are also incorporated into virtually all of the City's literature on water quality.

Providing residents with useful sources of BMP and pollution prevention information is a major focus of the City's stormwater programs, but is emphasized in other regulatory programs as well.

5.3 BMP Implementation

The City takes a multi-faceted approach to ensuring that its residents implement required and recommended BMPs. Education remains the preferred approach, but environmentally responsible behavior can also be facilitated in other ways. For example, the City operates a Stormwater Hotline, making it easy for residents who see a potential water quality problem to communicate with City staff. We also provide and support a wide variety of recycling and hazardous waste disposal opportunities in conjunction with EDCO, the local waste disposal facility. The City also encourages public participation in clean-up events, anti-litter campaigns, and other community events. Each element of this approach is described further as follows:

- Outreach to Residents
- Outreach to Schools
- Reporting and Information Resources
- Recycling and Waste Collection Services
- Measurement of Awareness and Behavior

5.3.1 Outreach to Residents

The City implements an outreach program targeting the general residential public. Outreach typically includes a combination of regionally and locally focused activities, but this year staff focused on outreach in the schools.

The City did participate in several joint effort outreach activities with other Copermittees.

5.3.1.1 Lemon Grove Clean-up (April 28-29, 2007)

The City held one collection day through EDCO and their facilities. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 28-29. See Attachment D-4 for a detailed break down of the HHW collected throughout the City. The City participated in several East County events targeted towards the collection and

proper disposal of e-waste (electronic waste). However the City does not have quantity information for these events.

5.3.1.3 Chollas Creek Clean-up Event

The City participated in "I Love a Clean San Diego's Creek to Bay Clean-up" event on April 28, 2006. The City had nineteen volunteers arrive to clean the Chollas Creek tributary at the Federal Blvd and McArthur intersection. This is common illegal dumping site and has been cleaned in past events. The volunteers removed 464 pounds of debris from the site and 464 pounds of recyclable material. See Attachment D-2 for a copy of the full report.

5.3.1.4 Printed Outreach

The City utilized three distinct forms of printed outreach during FY 2006-07. The first was distributed at the Winter Bonfire on December 1, 2006 and consisted of brochures on pet waste disposal, pool water disposal, oil recycling, general stormwater information, household hazardous waste (HHW) hotline information, promotional items containing oil recycling and HHW information and household BMP brochures. The second event took place on May 18, 2006, during the Spring Festival. City staff provided healthy gardening tip booklets, HHW information, E-Waste disposal information, oil recycling funnels with drop off locations printed on the sides (English and Spanish), pet waste brochures, pool water disposal brochures, general stormwater brochures, and the City Newsletter, which contained an article on proper fertilization and watering methods. The third event took place on October 14, 2006 during the Fire Department Open House event. Informational brochures on water quality, the stormwater program and household hazardous waster were available for visitors. Stormwater personnel were on hand to answer any questions and provide further information. See Attachment D-3 for examples of the brochures available at these events.

5.3.2 Outreach to Schools

School outreach remains a key component of the City's education strategy; however, the City chose to focus its outreach efforts in the commercial and land development areas of the program during this reporting cycle. Due to limited staff and fiscal difficulties, it is important that the City perform as efficiently and effectively as possible. This often requires the City to focus its efforts in a specific area, therefore no school programs were presented during this reporting period. The intent of school programs is to stimulate long-term behavioral change by alerting students to the importance of clean water and environmental responsibility.

The City plans in future reporting cycles to increase its educational outreach. The City firmly believes that long-term behavioral changes are possible,

especially with repetition like yearly presentations. The list below details a few of the areas the City would like to explore:

- Individual presentations to science classes
- Large school presentations in conjunction with other school programming like during pollution prevention week
- Encouraging student involvement in volunteer cleanup efforts
- Creating student specific cleanup events
- Encouraging involvement in larger environmental programs and opportunities like Arbor Day and Jiminy Cricket's Environmentality Challenge
- Improved internet links for students through the City website
- Create a listing of community service projects that are water quality specific for scout troops, school groups or other volunteer groups
- Material distribution at community events targeted at school aged children

The City believes that by increasing its community/school outreach, the general population will become better acquainted with water quality issues. Eventually the City will be able to tie awareness to effectiveness and then to load reductions. The City believes BMPs are the key link and that with increased awareness more residents will implement household BMPs on a daily basis. In theory, as long as the correct BMPs are in-place to the maximum extent practicable (MEP), pollutants of concern should no longer be entering the waterways. The City can then measure the amount of prevented pollution.

5.3.3 Reporting and Information Resources

The primary goal of the City's residential program is to ensure that the public has access to useful information about urban runoff and can easily report their complaints to City staff. The City has established a Stormwater Hotline and several public information brochures for these purposes.

5.3.3.1 Stormwater Hotline (619-825-3810)

The City continued to operate its Stormwater Hotline during this reporting period. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to the stormwater staff for resolution and/or information. The hotline referred approximately four calls during FY 2006-07. The number is not exact because some calls are attributed to the hotline, even if they are received through other channels. Most of the complaints are resident to resident issues and can be handled through verbal channels. On occasion, the City delivers a written notification to a group of residents about a persistent problem. The calls were either unfounded or dealt with on a small scale with no code enforcement involvement. The most common type of call received involves

neighborly disputes on private property, therefore it is quite common that the City offers advice but no direct action is taken.

5.3.4 Recycling and Waste Collection Services

5.3.4.1 Used Oil Collection

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.8 million gallons of used lubricating oil (ULO) recycled during 2003, which was 10 percent above the 83.1 million gallons collected in 2002. The ULO recycling rate for 2003 was 61 percent, which is a 24 percent increase when compared to ULO recycled in 2002."[1] Below are two charts that demonstrate this trend in increased recycling.

Table 5.1 Oil Collected by Public Collection Programs (in millions of gallons)

Table 5.2 Oil Collected by Public Collection Programs (in millions of gallons)

	94/95	95/96	96/97	97/98	98/99	99/00	00/01	01/02*	02/03*
Curbside	0.9	0.9	0.8	0.9	0.7	0.6	0.5	0.9	.9
Form 303	0.6	0.7	1.0	0.8	0.9	1.1	0.9	1.0	1.0
Certified Centers	5.6	8.7	10.2	11.3	13.2	15.2	16.3	18.5	19.9
Total Oil	7.1	10.3	12.0	13.0	14.8	16.9	17.7	20.4	

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

[1] www.ciwmb.ca.gov/UsedOil/Facts.htm

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the three collection sites and the number for curb-side pick-up. See Attachment D-3 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment A-4 for copies of the Newsletter.

The three collection sites are:

- Auto Zone 7582 Broadway (oil only)
- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection. Table 5.3 shows how much oil each site collected during 2007.

Table 5.3 - Oil Collection in Gallons per Site

Site	Gallons Collected in 2005	Gallons Collected in 2006	Gallons Collected in 2007
EDCO	1,690	2,710	2,830
Auto Zone	13,000*	13,300*	13, 000*
Kragen Auto Parts	8,800*	8,000*	8, 100*
Total	23,490 gallons	24,010 gallons	23,900
Increased Collection		**520 gallons**	**-110 gallons**

*These numbers include in-house used oil, not just used oil from the public. They do not separate the two collections.

5.3.4.2 Solid Waste Recycling and Household Hazardous Waste Collection

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. Due to reporting errors, the calculations were not complete for this reporting period. During the next reporting period the City will supply our percentage of recycled material for this reporting period.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only one demolition site qualified and completed the program during this reporting period. Honda is building a new facility in the City and performed demolition activities to

clear the site for development in December 2006. Honda estimated a 500 ton demolition load and recycled eighty-four percent of that load.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in four collection events for solid waste disposal. Two of the events were in cooperation with a Household Hazardous Waste grant through CIWMB and focused on the collection of e-waste. The other two are an annual Lemon Grove Clean-Up event further discussed above in Section 5.3.1.1.

The City's participation in the Household Hazardous Waste (HHW) grant facilitates the proper management and disposal of toxic materials and household hazardous wastes for residents of the City. The program was created to protect landfills, receiving waters, and the environment. The focus of the clean-up and collection events is to enable residents to safely dispose of their hazardous materials and bulky discards. See Attachment D-3 for examples of educational material provided to residents.

HHW Collected

During this reporting period; 19,175 pounds of waste were collected from 188 stops in the Lemon Grove area. This amount is cumulative for all door-to-door services collected through the HHW grant program. Each stop averaged 102 pounds of waste. See Attachment D-4 for a detailed break-down of individual source collections.

In future reporting periods, the City hopes to be able to present a trend analysis of HHW and solid waste collection. Currently the data is tracked by CIWMB and EDCO. If more information is required, either of these organizations is happy to supply further data.

5.3.5 Measurement of Awareness and Behavior

The Permit requires the City to assess how effective its educational efforts are in changing the knowledge and behavior of targeted audiences. This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2006-07.

5.3.5.1 Future Assessment Measures

During the current reporting period, the City utilized observation as the main form of awareness and behavior measurement. However in the future the City plans to incorporate the following measurement tools for the residential component:

- Surveys for school presentations
- Questionnaires for public outreach such as Lemon Grove community programs and the Winter Bonfire events
- Documented observations by City staff
- Year to year tracking of complaints and resolutions

5.4 Compliance and Enforcement

City investigation and follow-up on all complaints of a residential nature during this reporting period are described below.

5.4.1 Complaints Received

The City receives resident complaints on a regular basis both through the hotline and through the regular phone system. The majority of the calls can be handled through verbal interaction, the rest are investigated by City staff. Staff investigated several residential complaints during this reporting period; however the majority were unfounded or untraceable upstream. One incident however is detailed above in Section 5.3.3.1.

The challenge with residential complaints lies in the inability at times to confront the source of the pollutant. Often times the complaints are received after the illicit deed has been committed and the individual placing the complaint has limited knowledge of the source.

5.4.2 Investigation and Enforcement

The City had one residential event that required code enforcement involvement. These events are detailed above in section 5.3.3.1. The complaint was received through the hotline, therefore the details are presented in that section.

5.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2006-07.

5.5.1 Narrative Assessment

The City made a number of important improvements to its residential activities programs in FY 2006-07. This year, the City's outreach efforts to residents and

schools demonstrated a clear intention to expose a larger segment of the Lemon Grove population. The City is clearly thinking of long-term results with the increase in school programs. By presenting material at community events, such as the Spring Festival, the Winter Bonfire and the Fire Department Open House, the City can reach a large, diverse sector of the community. By increasing door-to-door communications, the City brought water quality into the home-life of Lemon Grove's residents.

The City provided a variety of waste collection and disposal services to its residents. Through education to increase awareness, and by making these services convenient, attendance at collection facilities and events rose considerably from previous years. This increased participation not only speaks to the quality of these programs, but is encouraging as an indicator of increased support for environmental programs in general.

Recognizing the need for increased measurability, the City plans to increase its evaluation efforts in respect to resident and student awareness. Section 5.3.5.1 details the areas in which the City plans to grow and further develop in coming years. The City believes feedback is a vital part of refining and possibly redirecting future efforts.

No specific management practices or BMPs relating to residential activities were identified as being ineffective during this reporting period.

5.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activitiy-Based Targets

Target 1
Target outreach based on hotline calls
100% complete

Target 2
Continuted presence and outreach at community events
100% complete

Target 3
Larger variety of educational material available
75% complete

Target 4
Improved tracking of hotline calls
65% complete (a database was created near the end of the reporting period)

Target 5
Increase the information available on the City website
75% complete (a new and improved City website is being created and will contain more water quality information and links)

Target 6
Use of door hangers by DPW to notify residents of a potential issue
40% complete DPW staff now has the door hangers but data has not been collected on their effectiveness and no hotline calls were received based on distributed hangers

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Residential Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

As with knowledge and awareness above, the City recognizes a need for such measures in the Residential Sector. Section 5.3.5.1 describes the ways in which the City wishes to develop assessment instruments for knowledge, behavioral change and BMP implementation.

Response to residential complaints is perhaps the only currently utilized method that involves direct observation of residential behavior. The City anticipates that an increase in complaints demonstrates an increase in awareness of urban runoff issues and available reporting resources. Another indication of behavioral change is the participation of the public in activities that prevent waste from entering the City's MS4. In particular, increases in oil recycling totals and household hazardous waste collection (Section 5.3.3) indicate the engagement of residents in environmentally protective behaviors. The City will continue to

monitor these measures and to search for additional ways to assess changes in behavior among residents.

Level 4 Outcomes: Load Reduction Estimation

Current methods are not yet sophisticated enough to accurately gauge pollutant-loading reductions resulting from implementation of the City's residential program. This is simply due to the variety and scale of polluting behaviors associated with the residential population. However, certain existing data are helpful in making some initial estimates. As reported in Section 5.3.3, City recycling and waste collection programs diverted 23,900 gallons of used oil and 19,175 pounds of household hazardous waste from landfills and the storm drain system during this reporting period. Because only a small percentage of either of these waste streams would actually be illegally disposed, adjustment factors were applied to each to estimate load reductions. Both factors were selected in consultation with staff from each of these respective programs; neither is based on data of any sort. Both figures represent the experience and best professional judgment of staff. Load reduction estimates are shown in Table 5.5.

Table 5.5 - Summary of Residential Load Reduction Calculations

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Used Oil Recycling	23,900 gallons	10%	2,390 gallons
Household Hazardous Waste Collection	19,175 pounds	1%	191 pounds

Because of the diversity of residential activity types in the City, no further attempt has been made this year to estimate reductions in pollutant loading that might be expected as a result of implementing the City's regulatory oversight program in FY 2006-07. In the future, The City will continue to seek to develop valid methods for estimating load reductions from residential sources.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

5.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period.

Section 6.0 Land-Use Planning Component

This section describes actions taken by the City during FY 2006-07 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

6.1 Assessment of Planning Process

During the current reporting period, City staff developed mechanisms in the planning process to provide improved water quality and watershed protection for new developments. The City is working to effectively integrate these principles and practices into the entire planning process. An important objective of the improvements is to develop land use goals and policies that will maintain a built environment compatible with, and sensitive to, the City's natural setting, while retaining the unique local character.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment E-1 shows the form that is presented to each applicant regardless of project size. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

6.2 Mapping Impervious Cover

Water quality data is the most definitive measure of determining the quality of our watersheds. However, because extensive data sets are not always readily available for the City's watershed, mapping impervious surface coverage can provide an important predictive tool to complement empirical methods. National research over the last decade has shown a significant correlation between impervious surface coverage and water quality. Development generally results in

an increase in both pollutant sources and impervious surfaces. In the Permit, it states, "Numerous studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving water quality. Significant declines in the biological integrity and physical habitat of streams and/or receiving waters have been found to occur with as little as a 10% conversion from natural to impervious surfaces. (Developments of medium density single family homes range between twenty-five and sixty percent impervious)."[1] The increase in pollutant sources, (i.e. parking lots, buildings, rooftops, and streets) contributes to increased pollutant loads in stormwater runoff, while corresponding increases in impervious surfaces limit the land's natural ability to filter these pollutants. As a result, developed areas typically experience higher runoff volumes and lower runoff quality. The challenge presented to the Copermittees is the mandate to reduce harmful runoff (a product of development), while complying with the State mandate of increasing housing stock and creating affordable development projects.

Mapping impervious surface coverage helps land use professionals better predict watershed health and guide growth patterns to minimize the impacts of development on water quality. The City lacks the sophisticated equipment necessary to create a complete and accurate impervious surface map. However the City has made a good faith effort to determine on average how much impervious surface is present within its boundaries.

To determine the impervious surface of the commercial and industrial portion of the City, a survey of parking spaces was taken. To determine impervious surface amounts for the residential sector of the City, the City averaged each residence as having 2 parking spaces. Table 6.1 shows the results of this study and Attachment E-2 presents a partial breakdown of the parking survey taken. The full document is rather lengthy, but is available upon request.

Table 6.1 - Results of Parking Space Study

Source	Total Number of Spaces	Acres covered by Impervious Surface
Churches	1,510	5.62
Apartments	2,367	8.80
Schools	741	2.76
Commercial and Industrial	9,604	3.36
Residential[2]	17,444	64.87
Totals*	**31,666**	**117.77**

***** Totals are based on the average sized parking space, which is 18'x9' with a=162'

[1] California Regional Water Quality Control Board, San Diego Region. Order No. 2001-01; NPDES No. CAS0108758, p.2. retrieved from www.swrcb.ca.gov on May 30, 2004.
[2] Based on 8,722 housing units. Information from *2030 Cities/County Forecast*, available through www.sandag.org .

In the process of conducting the study, the City discovered some inconsistencies with parcel numbers and addresses. These inconsistencies are slowly being rectified based on need and time available.

The City hopes in future reporting years to utilize the study information in estimating load reductions.

6.3 Land Use Professionals Resources

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

6.4 Development Project Approval Process

As required by Permit Section F, the City has modified its discretionary land use permitting process to incorporate specific water quality requirements. The basic process is laid out in the City's General Plan, Chapter 17.28 *Procedure and Administration*. The Plan, itself, does not delineate for water quality; however the City includes water quality personnel in all development proposals.

The developer must submit all required documents at the beginning of the process. The project Stormwater Maintenance Plan (SWMP), Stormwater Pollution Prevention Plan (SWPPP) and/or Standard Urban Stormwater Mitigation Plan (SUSMP); plus the Hydrology Study are all due with the Site Plans for checking and approval from the on-set of the approval process. As stated in Section 6.1 above, this is to ensure a complete presentation for project approval by the Planning Commission.

The City has updated its checklists for developers to include water quality related lists. See Attachment E-3 for the final version of those lists. The City has received positive verbal feedback from the applicants who have utilized the new

checklists. The City also refers many applicants to the Lemon Grove SUSMP on our City website for further information about water quality guidelines. The Lemon Grove SUSMP can be found at the following web address:

- http://www.ci.lemon-grove.ca.us/clg/cityhall/Default.asp

During the current reporting period, the City reviewed eight potential SUSMP development projects with in the City limits. The following chart shows the development projects under review during this reporting period.

Table 6.1 SUSMP Projects Under Review FY 2006-07

File Number	Project Name	Applicant	Description
TM 0047/PDP 04-02	Center Hilltop Condos	Kevin Leon	Small multi-family housing unit
TPM 0042/0049	Citrus Heights*	Carter Reese	78 single family home development
TPM 0180	Citron Court Condos	Community Collective	12 condo units
TM 0057/PDP 07-005	Mallard Village Condos	Thomas Fitzmaurice	9 senior living condo units
TPM 0177	6505 MacArthur Dr.	Terrence Taylor	3 lot single family subdivision
TM 0052/PDP 06-05	Mc Manus Subdivision	Randall McManus	9 lot single family subdivision
TPM 0174	7872 Mt Vernon St.	Kai Adler	3 lot single family subdivision
TPM 0178	8040 Lincoln St	Steve and Pat Worley	3 lot single family subdivision, one house existing

*Project on hold due to desire to sell.

The City requires all major projects, determined to be significant contributors to post-construction pollutant loading, to file a SWMP. The document ensures that effective BMPs will be put in place to foster long-term water quality improvements. The requirements for a significant contributor are listed below:

- Residential development of 100 units or more.
- Residential development of 10 to 99 units.
- Commercial development greater than 100,000 square feet.
- Automotive repair shops.
- Restaurants.
- Hillside development greater than 5,000 square feet.

- Projects discharging to receiving waters within Environmentally Sensitive Areas
- Parking Lots greater than 5,000 square feet or with greater than 15 parking spaces and potentially exposed to urban runoff.
- Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater.

A *Preliminary Grading Plan* and the *Preliminary Hydrology/Drainage Study* are the technical basis for the SWMP; however, changes and refinements to the SWMP may be required as technical review of the application and completion of CEQA documentation continues. The complete SWMP must provide at least the following:

- A project description;
- An identification of water quality pollutants of concern and a proposed treatment volume base on the applicable design storm, site plans and adjacent land use, and soil characteristics;
- An identification of mitigation measures, including structural treatment BMPs, to protect water quality and prevent increases in downstream erosion to the maximum extent practicable;
- Agreements, easements, and licenses relating to proposed BMP construction, location, maintenance, or changes in drainage character;
- An identification of the beneficial uses of impacted receiving water bodies, including groundwater; and
- An identification of Section 303(d) impaired water bodies potentially impacted by the project.

The associated *Preliminary Grading Plan* and *Preliminary Hydrology/Drainage Study* must be prepared by a registered civil engineer with experience in fluvial geomorphology (drainage patterns). The *Preliminary Hydrology/Drainage Study* is, at a minimum, required to: 1) Characterize pre- and post-construction hydrology, both on-site and downstream, 2) Identify potential off-site discharges of stormwater and any increased potential for downstream erosion, and 3) Identify structural BMPs sufficient to address stormwater issues in compliance with the permit. To assist applicants through the permit application process, City staff has created a checklist for the development of Grading Plans, see Attachment E-5. The City uses the County's *Hydrology/Drainage Guide*, which can be found at www.sdcounty.ca.gov/dpw/watersheds/land_dev/drainage.html.

6.5 Environmental Review Process

JURMP 6.3 summarizes the revisions made to the City's environmental review process for new development and redevelopment projects to incorporate Permit requirements. The process outlined there continues to accurately reflect the

City's environmental review efforts. Attachment E-6 provides the checklist from CEQA that the City utilizes for its environmental review process.

6.6 New Development and Redevelopment Outreach

During this reporting period, the City used a variety of means to educate its customers about the potential impacts of development and redevelopment on water quality. These included direct staff interaction with the public and the development and distribution of informational checklists.

6.6.1 Interaction with City Staff

The City predominately utilizes staff time and the pre-application process to provide water quality information to developers and residents. Attachment E-1 provides the form required of all building and grading permits regardless of project size. Large development projects are rare in Lemon Grove. The City is approximately 3 miles square and is predominately existing residential development. To ensure that even the small projects are aware of water quality measures, the City requires a signed BMP checklist to be included with any permit application. The City has also created three checklists for any SUSMP redevelopment or new development project. These checklists are used by both City personnel to review SUSMP projects and by developers to ensure complete submittals. The checklists are included in Attachment E-3. The City uses the checklists and counter visits to provide as much education as possible to anyone interested in developing or building in the city limits of Lemon Grove. Face to face time with staff is the most effective way to reach the largest number of permit applicants because they must apply in person with their plans.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator also plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but makes approval faster once the formal submittal is made. The Planning Commission knows that all issues have been dealt with prior to their approval hearing and that City staff has ensured a minimal environmental impact.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable educational resource for both the City and the developers.

City staff meets with all new applicants in some way and eleven open permit applications equal at least eleven consultations within the current reporting period.

6.6.2 Informational Checklists

As discussed above and as seen in Attachments E-3, E-5, and E-6; the City provides all applicants with a variety of checklists pertaining to application requirements. These checklists represent a small portion of the application checklists available for applicants. City staff is always available for further clarification and the Lemon Grove SUSMP is available at the site listed in Section 6.4 above.

6.7 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Land Use Planning Component in FY 2006-07.

6.7.1 Narrative Assessment

Although new development projects approved during the reporting period included adequate BMPs to address stormwater discharges, the City recognized that project level planning tools were largely under-utilized as many projects relied mainly on structural treatment controls, which can be expensive, maintenance-intensive, and less effective than site-design controls. Staff recognizes that it is easier to preserve a project site's natural hydrology through site design, than to artificially control it through detention or retention. As the City increases its outreach efforts, it foresees an increase in awareness of water quality knowledge in developers and the public. By providing developers with as much information at the beginning of the application process, the City hopes to encourage creative designs that improve water quality while maintaining the environmental integrity of Lemon Grove.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven

to be ineffective. The City therefore does not currently recommend any changes to this program component.

6.7.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

Target 1
Improve checklists for project submittals for staff use
100%

Target 2
Create a database to track project reviews
75% complete (a database was created, but it needs to be re-vamped to accommodate multiple reviews of the same project in an efficient manner) This project is on hold due to implementation of a GIS system that would allow for integrated tracking.

Target 3
Create a working map of Waters of the State for use by City staff and developers
30% complete (data collection is slow due to limited staff numbers)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 4 Outcomes: Load Reduction Estimation

The primary goal of BMP implementation is to reduce the loading of pollutants to stormwater discharges. An important emphasis of annual program assessment is the estimation of loading reductions resulting from various program activities. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. Quantifying load reductions represents an important endpoint for City assessments. Table 6.2 below demonstrates the direction the City is moving towards for future reporting periods. In future reports, the Table below will provide an initial estimate of the effectiveness of the SWMP process and its ability to reduce the pollutant loadings of selected constituents of concern.

Table 6.2 - Sample Table to Show Pollutant Loading Reduction Estimations

Constiuents of Concern	Loading Factor (lbs/ac/yr)[3]	Total Acreage	BMP Effectiveness Adjustment	Prevented Pollution
Total Copper				
Total Nitrates				
Total Cadmium				
Total Arsenic				
Total Suspended Solids				

SAMPLE

These estimates will provide a starting point for characterizing the benefits of implementing this program element, but are subject to a number of qualifications. First, load estimates assume that all projects are low-density, single-family residential developments. Second, project proponents have discretion in the selection of specific BMPs to meet the Maximum Extent Practicable (MEP) standard required of them. As such, individual projects employ a combination of BMPs, each with varying levels of effectiveness. The percentage adjustment is an estimate of the overall effectiveness of the measures based upon best professional judgment.

This project is being re-vamped due to new collaborations at the watershed level. It is the City's understanding that the new permit increases the emphasis on

[3] Source: Minton, Gary. *Stormwater Treatment – Biological, Chemical, and Engineering Principles.* 2002

watershed collaboration and evaluation of up-stream contributors. However the concept is similar, but focused on the type of business (initially automotive facilities), its likely pollutants and the relationship of those pollutants to certain BMP effectiveness. The members of the San Diego Bay Watershed group have already looked at their inspection requirements and are drafting improvements in the BMP compliance and efficiency areas. The City feels it is important to tackle the issue of load reduction on a regional basis to ensure the highest level of effectiveness. The City believes that a more regional and/or watershed approach will result in better, longer lasting water quality improvements.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

6.7.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. See Attachment E-7 for a City zoning map.

Section 7.0 Construction Component

The City implements a variety of programs to prevent and respond to discharges from construction sources. All of these programs are predicated on the assumption that knowledge and awareness is key to effecting and sustaining responsible behavior, but that an active oversight and enforcement presence is also necessary for long-term success. This section describes actions taken by the City to regulate construction sources during the FY 2006-07. It includes the following general types of activity:

- Requiring BMP implementation through ordinance and permit (7.2);
- Encouraging BMP implementation through outreach (7.3); and
- Verifying compliance through inspection and enforcement (7.4).

7.1 Priority Construction Sources

The City maintains a construction permit database. The City currently lists 75 open construction permits. However, because sites are continually opening and closing, that number is not definitive at all times. The number also includes all private and public construction sites. The majority of the current construction permits are for low or medium priority projects.

The City completed eleven minor infrastructure improvement projects during FY 2006-07:

- El Prado
- La Corta
- Primera
- Ramon
- Plata
- Corte del Sur
- Patero
- Alberdi
- Buena Vista
- New Jersey
- Lemon Grove Avenue

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

The City continues to have only one high priority construction source at:

- St. John of the Cross Church and Preschool – this project is a multi-phase project but overall it qualifies. (This project was not active during this reporting period, but received approval for the final phase.)

The Honda site that participated in the demolition ordinance did not perform construction after during this reporting period. To assist in processing the demolition ordinance the City processed the demolition permit separate from the building permits. The building permits were under review during this reporting period.

7.2 BMP Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment E-5 gives a breakdown of the City's grading permit requirements.

7.2.1 BMP Requirements for Permitted Construction Sites

Prior to the adoption of this Permit, the City required implementation of sediment and erosion control BMPs. These controls continue today. During FY 2006-07, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);
- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

7.2.1.2 BMP Requirements for Major Grading Permit Sites

Major grading permit applicants are required to submit a Storm Water Pollution Prevention Plan (SWPPP) Addendum to the Grading and/or Building Permit Application. The standards for SWPPP are closely related to those required for developers in the pre-approval process. The biggest difference is the focus during construction, not post-construction.

7.2.2 BMP Requirements for Public Construction Sites

All City-managed Capital Improvement Projects (CIPs), regardless of size, include contract specifications requiring the implementation of BMPs in compliance with the General Construction Permit even prior to this reporting period. Specific BMPs that are implemented on public construction projects were identified in JURMP 7.6 and match those required for private projects. These have not been updated.

7.2.3 Pollution Prevention Requirements

The City continues to encourage and, where appropriate, require the use of pollution prevention practices by construction site owners, developers, contractors, and other responsible parties. Specifically, pollution prevention practices are encouraged in all BMP implementation material. The City requires specific pollution prevention plans from any activity that disturbs more than five acres. These sites must also seek coverage under the General Construction Permit. The City believes that with proper and complete BMP implementation, pollution prevention is a natural consequence.

7.3 BMP Implementation

The City ensures that BMPs are implemented to the standards described in Section 7.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

7.3.1 Construction and Grading Approval Process

The Preliminary Grading Plan enables the City to better evaluate stormwater and drainage impacts on permitted sites The SWMP documents how dischargers will implement BMPs.

Although CIP projects do not require City Permits, their approval process is much the same as for private sites. These projects follow a process to ensure that BMPs are addressed at all phases. Starting at the project planning phase, projects are required to submit a SWMP. The SWMP refines the project by setting source controls, site design, and treatment control requirements. Once all the elements and concerns have been addressed at the planning level, the project moves into the design phase. During design, construction and post-construction BMPs are introduced into the plans. The plans are then circulated to the Water Quality Program Coordinator for review. At a minimum, this review is conducted when the project design is 30, 70, and 100 percent complete. These checks ensure that BMPs are adequately addressed in the plans and adjoining specifications are included.

7.3.2 Compliance Verification

Actual implementation of on-site and off-site BMPs is verified during site inspections. Inspections conducted during this reporting period are discussed in Section 7.4.1 below.

7.3.3 Construction and Development Industry Outreach

The City places a high priority on educating project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. It is difficult to send mailers or brochures to construction sites because individual job foreman rarely have an office. The City is looking into the possibility of offering training to job site personnel to further increase its educational outreach for construction sites. On the checklist required with each project seen in Attachment E-1, education and training are required BMPs. The City is exploring the possibility of making it a required BMP. Political ramifications must be further researched. Through its Annual Report, the City will keep Regional abreast of its efforts in this area. Until that time, the following educational efforts are currently in place.

Customers are offered a number of educational resources as they progress through the permit application and approval process, including interaction with field and counter staff (Building Inspectors, Planning Personnel and City Inspectors) and distribution of informational checklists and document examples.

7.3.3.1 Interaction with City Staff

City staff (including building inspectors and counter staff) regularly interacts with permit applicants and other members of the public. Personal interaction provides an important opportunity to increase the level of stormwater awareness among City customers. A particularly important interaction takes places at the very beginning of the project. Each applicant seeking a building permit of any kind receives a checklist of required BMPs. This form is being revised for the next reporting period to improve clarity and to streamline the process. From the very beginning, applicants are forced to think of water quality issues. The form is a required part of the application. More information on the initial process is available in Section 6.6.

7.4 Compliance and Enforcement

Compliance and enforcement is an integral part of the City's efforts to address BMPs at the construction phase. Inspections are conducted on a daily basis throughout the City on various projects.

7.4.1 Inspection of Construction Sites

JURMP Section 7.7 provided a description of the City's construction site inspection process. The stormwater component of these inspections is intended to ensure that contractors, property owners, and developers implement an effective combination of BMPs to meet minimum water quality protection requirements. Inspection staff utilizes checklists to assist them in verifying appropriate BMP implementation at each site inspected, and shares with the owner/developer to increase awareness of stormwater requirements and assist them in complying. See Attachment F-1 for a copy of one such checklist. The City conducted 39 scheduled inspections of nine active constructions sites. The City also conducted an average of 3 informal inspections of these sites and potential sites weekly throughout the reporting period, providing approximately 144 inspections total during the reporting period. It should be cautioned that while average numbers of inspections are illustrative as a gross measure of program activity, they can also be misleading. As already mentioned, individual sites open and close throughout the reporting period, and significant differences also exist between these sites and their inspection records.

The City has also instituted the use of a construction inspection database to track construction site visits pertaining to water quality and pollution prevention issues. Attachment F-2 contains a print-out of the visits made to all active construction projects during the 2006-07 reporting period. City staff also performs a number of informal inspections by attending joint meetings on site with other staff members or visual inspections while out investigating complaints. City staff believes that a visible presence is an excellent deterrent to non-compliance. If the workers know the site is being observed on a regular basis, they are less likely to let BMP up-keep deteriorate.

The City has just begun to use the new tracking process for construction site inspections. The City records each inspection in a tracking database. The City, due to its small size, currently inspects all construction sites regardless of priority or size. The database also allows the City to track the number of building inspections performed at each site and ensures that each site is visited a minimum of three times. The City is currently with a representative to merge water quality data with the building permit program. This would create a centralized data source for all the businesses and building permits in the City. The building inspector's visits are tracked in a previously existing database managed by the Planning and Development Department. The City Inspector uses the new database for tracking inspections as well as a BMP checklist that each owner/developer signs and commits to uphold, see Attachment E-1. During all building inspections, water quality concerns are taken into consideration. If the inspector discovers a problem, the Water Quality Coordinator is called upon to make a separate inspection. At the completion of each project, the City requires a final inspection requiring signatures by any involved parties including building, engineering, sanitation, water quality, and

planning/development. Without the signatures, the project is not recorded and not deemed complete until all requirements are met. The City requires a water quality signature on all SUSMP projects. The City also requires all building and grading permits to comply with minimum BMPs through the use of a checklist and property owner signed confirmation of said BMPs.

The St. John's site that is listed as a high priority site continued as non-active during this reporting period; the Catholic Church was under investigation and all assets were frozen including construction expenditures. If the site had been active during this period, the frequency of inspections would comply with the Permit requirement found in Section F.2.g. It states that high priority sites will be inspected weekly during the rainy season, unless the Copermittee can justify to Regional that the site meets the listed exemption criteria.

7.4.2 Enforcement of Construction Sites

City inspectors enforce stormwater requirements according to protocols outlined in JURMP Section 7.8. The City's enforcement program is designed to educate the community, promote compliance with applicable laws and regulations, return violators to compliance in a timely manner, and penalize violators as appropriate.

The City utilizes written warnings, notices of violation, administrative citations, and stop-work orders to enforce applicable stormwater requirements on its construction projects. The City's code enforcement program was in place on a trial basis and has transitioned to permanent policy. The trial period allowed the City Council to see examples of the most common code enforcement violations and for the City to flush out any kinks with the policy. Attachment B-3 contains a copy of the flowchart for stormwater code enforcement efforts.

The policy allows the code enforcement process to be utilized making it easier to deal with any issues discovered while dry weather-testing or site inspecting. With the new code enforcement process in place, the City can deal with any stormwater violations in a more expedited manner than the previous system, which did not allow fines or recuperative costs to the violator. The City also hopes to hire a part-time code enforcement officer with a water quality focus during the next reporting period.

In severe cases of non-compliance, or in the event of significant discharges, it may be appropriate to deny or revoke a permit. As a final resort, the City may use civil and/or criminal court actions under the State Porter Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

7.4.3 Reporting of Non-Compliant Sites

The JURMP outlines standard operating procedures for reporting non-compliant sites to the Regional Water Quality Control Board. The City did not have occasion to report any non-compliant sites over the course of this reporting period.

7.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Construction Component in FY 2006-07.

7.5.1 Narrative Assessment

In FY 2006-07, the City continued to move its Construction Component forward in a number of important ways. Not only has the intensity of inspections grown, but an additional year of implementation has also allowed City staff and the regulated community to grow more accustomed to assimilating new stormwater regulations into their standard operating procedures. As familiarity and experience increase, the City expects compliance and oversight to improve commensurately.

The City hopes in future reporting periods to increase its outreach in this component. The City plans to host developer and contractor specific workshops dealing with water quality issues and compliance in future reporting periods.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven to be ineffective. The City therefore does not currently recommend any changes to this program component.

7.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

Target 1
Increase construction site inspections
100% complete

Target 2
Track construction site inspections
95% complete (the database continues to be in transition due to the potential for a centralized tracking source for a number of City programs)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 4 Outcomes: Load Reduction Estimation

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

7.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

Section 8.0 IC/ID Component

This section describes activities conducted during the FY 2006-07 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment. What follows is a summarized list of where each IC/ID program component is discussed in this Annual Report:

- Dry Weather Monitoring (Section 8.1)
- Spill Prevention and Response (Section 8.2)
- Public Reporting of IC/IDs, Complaint Investigations, and Enforcement (Sections 3.4, 4.4, 5.4, 8.3, 8.4)
- Used Oil and Toxic Materials Disposal (Section 5.3.3)
- Limiting Infiltration from the Sanitary Sewer to the MS4 (Sections 8.5 and 2.1.4)

8.1 Dry Weather Monitoring Program

This section provides and overview of the results of the City's 2006 Dry Weather Analytical and Field Screening Monitoring Program (Dry Weather Program), which is implemented by DMax. This section will provide a complete copy of DMax's findings and report.

8.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 153 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls four were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 4.4 and follow-up and enforcement for residential complaints is dealt with in Section 5.4.

8.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

8.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 5.3.

8.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 2.1.

8.6 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its IC/ID Component for FY 2006-07.

8.6.1 Narrative Assessment

In FY 2006-07, the City continued its Dry Weather Program through a contract with DMax Engineering. The City saw significant improvements in its site testing. This year's sampling was further increased the City's knowledge and awareness of its watershed and waterbodies. This is reflected in the specific recommendations contained in D-Max's report and findings.

The City also continues to attend the Regional Dry Weather Monitoring Workgroup to assist in watershed improvements together with other copermittees.

8.6.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

The City did not track activity targets during this reporting period. However, the City will remedy this problem during future reporting cycles. The City believes the program was dealt with effectively, but activity-based targets were not tracked.

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 4 Outcomes: Load Reduction Estimation

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in

the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

8.6.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

Section 9.0 Education Component

This section provides a brief overview of the City's educational efforts during FY 2006-07. Since education is such an integral part of the all JURMP components, outreach to specific audiences is discussed in greater detail alongside program descriptions in the Land Use, Industrial, Commercial, Residential, and Construction Sections. This integrative organization allows the reader to better understand the context in which education is conducted.

9.1 Overview of Education

City outreach efforts continued to be guided by the three objectives set out in JURMP Section 9.1: 1) configuration and purpose of municipal separate storm sewer systems and how pollutants can be released to them, 2) how urban runoff impacts local receiving waters [mainly Chollas Creek] and surrounding habitats, and 3) BMP solutions that are available for treating or controlling the various pollutants of concern. Specific tools and methods are adapted as appropriate to best convey meaningful information to the target audience. Methods emphasized during this reporting period include:

- Presentations and Workshops
- Direct Mailings
- Community Events
- Educational Material Distribution
- Hotline Resources
- Interaction with Staff

The City participated in four outreach events during FY 2006-07. (See Attachment G for a table detailing each of the events) An accounting of formal events, however, does not adequately convey the significant amount of outreach that takes place during permit processing, inspections, on websites, and via other means. For a discussion on each of these alternative forms of outreach, see sections 3.0 through 7.0 and all corresponding attachments. What follows are overviews and selected highlights from the City's major educational components.

9.1.1 Outreach to Residents

The City implements an extensive outreach program targeting school children and other members of the general public. As the program continues to evolve, the content of the City's outreach will increasingly focus on those pollutants and activities identified by water quality analysis and other program data to be high priorities. Data from the City's Dry Weather Program (See Section 8) have been used to identify combinations of areas and pollutants that may warrant increased or more focused outreach. We hope to expand on this type of program feedback as data sets become larger and program components increasingly integrated in future years. The City conducted four residential outreach events during this

reporting period, as well as four public participation events. Section 5.3 details these events more extensively. School outreach is another major component of the City's education program. The intent is to stimulate long-term behavioral change by exposing students at a young age to the importance of clean water and environmental responsibility. Similar to how recycling behavior has been significantly modified by targeting school aged children. City staff strives to ensure that classroom presentations are memorable and interactive by incorporating hands-on activities such as watershed models. The previous year's Whale Tale grant was a one year program only, but the City hopes to develop it's own elementary education program during future reporting periods.

9.1.2 Outreach to Commercial and Industrial Businesses

The goal of the City's commercial and industrial outreach program is to promote effective BMP implementation by making business operators aware of their regulatory obligations and by providing them with useful information about how to comply. To this end, a variety of methods were utilized during this reporting period (i.e., direct mailings, outreach events, personal communications, educational materials).

Every industrial business and all the high priority commercial businesses on the City's inventory received facility-specific BMP guidance during inspections this reporting period.

It is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation.

Each reporting period, the City plans to increase outreach and improve communications with a new sector of the business and industrial community. Due to limited staff and fiscal limitations, the City must target and focus its program from year to year. However, no program will decrease once the outreach to a specific sector has been achieved. A consistent and constant message is instrumental in creating changes in behavior and increases in knowledge. Each year the City hopes to initiate a new focus area of increased outreach to provide in its annual report.

9.1.3 Outreach to the Construction Industry

The City places a high priority on education project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. Customers are offered a number of educational resources, the key one being regular interaction with knowledgeable City staff.

During this reporting period, the City increased its outreach to the developers and construction sites within the City. The City increased the number of inspections, both informal and formal. Water Quality personnel review all development plans that are presented to the City. The City requires all permit applicants to complete a construction BMP plan. Water Quality personnel also require a notation on all plans to verify the use of BMPs for the duration of the project. The City continues to use and further develop the information available to contractor and developers. Several checklists are available as well as other educational materials on BMPs, both pre- and post-construction. The City is working on making its stormwater information educational and easier to use for the construction and development sector. The City continues to believe that the increase in inspections confirms the importance and commitment to an effective water quality and pollution prevention program.

Section 10.0 Public Participation

During FY 2006-07 the City continued to actively encourage stakeholder participation in the development and implementation of its Jurisdictional Runoff Management Program (JURMP) through various venues:

- Informational Resources
- Community Outreach Efforts
- Stormwater Copermittee Meetings

In addition to the activities described further below, the City continued to rely heavily on the interaction of staff with members of the public during their regular duties. As described below, the interaction of these staff with the public through various means (i.e., permitting, inspections, presentations, etc.) continued to provide an additional avenue for obtaining direct feedback from the City's customers.

10.1 Public Participation Venues

A key element of an effective public participation strategy is providing the public with easily accessible resources for obtaining water quality information and reporting complaints.

10.1.1 Hotlines

The City continued to operate its Stormwater Hotline at (619) 825-3810. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls received are promptly referred to the correct City staff. Complaint responses are handled in a timely manner. The focus is to gain compliance from the erring source, so a speedy response time is crucial. During this reporting period, the hotline received four calls pertaining specifically to water quality issues and approximately 153 pertaining to sewer issues. These numbers do not represent the number of calls that come through the main phone line and are water quality in nature. The City is working to create a tracking system for these calls.

Table 10.1 – Comparison of Calls

Total Number of Calls	Number of Calls pertaining to Water Quality	Number of Calls with City Action
153	4	0

10.1.2 Chollas Creek Clean-up Event

The City participated in I Love a Clean San Diego's Creek to Bay Clean-up event on April 28, 2007. The City had nineteen volunteers arrive to clean the intersection of Federal Blvd and McArthur. This location is a tributary of Chollas Creek and a common illegal dumping site. The volunteers removed 464 pounds of debris from the site and 428 pounds of recyclable materials. See Attachment D-2 for a copy of the full report for the entire event.

10.2 Stormwater Copermittees

10.2.1 Copermittee Meetings

The City continued to participate in a variety of Copermittee Meetings sponsored mostly by the County. Below is a listing of the Workgroups that the City actively participates in:

- BMP Effectiveness and Assessment Workgroup
- Permit Re-Issuance Workgroup
- San Diego Regional Management Committee
- Dry Weather Monitoring Workgroup
- Regional Monitoring Workgroup
- Report of Waste Discharge Workgroup
- Outreach Workgroup
- Green Business Program Meetings
- Watershed Workgroup (through Port of San Diego)

Each of these meetings occurs once a month on various days or bi-monthly in the case of the Management Committee. The yearly activities calendar of the former Water Quality Coordinator was lost when the computer was re-formatted for a new user, so dates are un-available for attendance records. However, each meeting was accompanied by a sign-in sheet supplied by the sponsor, typically the County. The County would have records of the City's participation in the above listed groups.

10.2.2 Collaborative Efforts with Copermittees

This section will highlight two particular collaborations that will be highly beneficial to Lemon Grove and the region.

Chollas Creek Water Quality Protection and Habitat Enhancement Project

The Chollas Creek Water Quality Protection and Habitat Enhancement Project (Chollas Creek MOU) is an agreement between the City of San Diego and the members of the Chollas Creek watershed. The City of San Diego applied for the Chollas Creek Grant to create a more comprehensive education plan for areas in

the Chollas Creek watershed. The Grant included regional educational materials and programs. The Grant provided for Chollas Creek clean-ups and restoration to native habitat in and around the stream-beds. The City benefited from the programs and educational material when they joined as a Grant partner. San Diego provided the in-kind money; they are asking the partners to provide in-kind services only. The in-kind services will be equal to roughly $10,000; no actual money is exchanged. The City assisted in educational material development, local programming for businesses and schools, and offered assistance at San Diego meetings pertaining to the grant. The Chollas Creek MOU went into effect in 2005. The City feels this collaboration is beneficial to the City of San Diego, to Lemon Grove, and the residents in both cities. Although this grant is complete, the City continues its education efforts in reference to Chollas Creek.

County of San Diego Green Business Program

The City increased its involvement with this program by offering an automotive workshop during this reporting period. The City looks forward to continuing these efforts and further improving its outreach to the local and regional business communities. This partnership has provided the City with valuable insight into local, state and federal regulations pertaining to pollution prevention and hazardous materials. In turn, the City has provided the program with an increased awareness of water quality programs and regulations.

Section 11.0 Effectiveness Assessment

11.1 Introduction

This section provides an overview of the methods used in this report to assess the implementation and effectiveness of the City's JURMP for the period of July 1, 2006 through June 30, 2007. As with the programs themselves, the City's approaches to effectiveness assessment have evolved considerably during this period. An important aspect of these new and augmented programs is ensuring their measurability and their nexus to changes in discharge and receiving water quality. In particular, Permit sections F.7 and I.1.a.F.7 require that the City identify and report on measures to assess the effectiveness of JURMP implementation and identify strategies for assessing long-term program effectiveness.

The City is taking important steps toward the development of new and improved methods for conducting assessments, and in putting those methods into practice in this report. This section provides an overview of the approach that the City has taken to conduct its effectiveness assessment this year. However, the actual assessments are contained throughout the remainder of this report within their respective program components. Specifically, the following sections contain effectiveness assessment elements, each following a common organization described further in Section 11.2 below:

- 2.0 Municipal Component
- 3.0 Industrial Component
- 4.0 Commercial Component
- 5.0 Residential Component
- 6.0 Land Use Planning Component
- 7.0 Construction Component
- 8.0 Illicit Discharges Detection and Elimination Component

The scope and content of these assessments varies widely for each program element. However, in all cases, the City has included sections corresponding to each of the major effectiveness assessments elements described below.

11.2 Assessment Approach

The City and other Copermittees have in past years described a number of basic measures that can be relatively easily tracked and quantified. The City's objective is to go beyond those efforts by more closely scrutinizing existing measures with an eye toward a more complete understanding of their meaning and value to the effectiveness assessment process. From this, the City has also endeavored to identify where new or revised measures might be needed. Our starting point was the collaborative development of the document, *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management*

Programs, submitted to the RWQCB on October 16, 2003. This document represents the Copermittees' current thinking on how effectiveness assessment can best be approached now and in the future. More importantly, it procedes an important starting point for the evolution of more detailed and sophisticated strategies by the City and other Copermittees. The remainder of this section draws heavily on the content of that framework.

The City's approach to effectiveness assessment as reflected throughout this JURMP Annual Report, is organized according to three primary elements, each described below:

- Narrative Assessment
- Assessment of Specific Measures
- Spatial and Geographic Analysis

11.2.1 Narrative Assessment

In previous comments on the City's JURMP, RWQCB staff has indicated a desire for a more detailed discussion of successes, strengths and weaknesses, and outstanding program features. The narrative assessment addresses this concern by qualitatively describing major programmatic achievements from throughout the year. Other more specific and quantifiable measures are addressed in the remaining portions of the assessment.

Permit Section I.1.g also requires that the City identify in its JURMP Annual Report any management measures proven to be ineffective in reducing urban runoff pollutants and flow. Each narrative assessment section also includes the identification of any such measures identified in the reporting period.

11.2.2 Assessment of Specific Measures

This section provides a short overview of several of the key concepts and organizing principles of *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*. That document should be read in its entirety for a more complete understanding of the City's long-term effectiveness assessment strategy. Due to the length of the document, the City has not included it in this report. However, a copy is available on request.

Essential to increasing measurability is the establishment of clear and meaningful measures that can be tracked over this and future reporting periods. To establish such measures, it is crucial that the desired or targeted outcomes of any particular program activity be clearly identified and understood. Attachment I illustrates six basic levels or categories of outcome that can be employed for any of these six levels. The City's assessment intends to follow this basic model. Ultimately, the objective of the effectiveness assessment process is to identify measures at the highest level of the hierarchy possible. In doing so, knowledge

gaps between program activity and water quality outcomes can best be addressed. It is important to note, though, that a single measure will rarely provide a complete picture of any program area. Multiple measures will therefore usually be utilized for many program activities.

11.2.2.1 Compliance with Activity-Based Permit Requirements (Level 1)

This level consists of activities that are prescribed by or established under the Permit (updating source inventories, training staff, conducting inspections, etc.). A fundamental feature of Permit-derived programs is the explicit establishment of specific activities that are assumed, but not proven, to be beneficial to water quality. While many of the assumptions underlying the establishment of required activities may be correct, there are currently few means of quantifying or establishing causal relationships that will make many of them more measurable. The City's long-term goal is to explore these assumptions in more depth; this year's report focuses on clearly defining the intended outcomes of these activities and identifying specific measures by which them can be accurately assessed.

11.2.2.2 Changes in Knowledge/Awareness (Level 2)

The most immediate and basic outcome of many urban runoff program activities is a change in the knowledge, awareness, or attitudes of target audiences (learning that storm drains and sanitary sewers are separate systems, that everyday activities contribute to water pollution, etc.). Such changes are most often targeted through outreach or training programs. Not an end in themselves, these changes presumably form the basis of behavioral change, or BMP implementation.

11.2.2.3 Behavioral Change/BMP Implementation (Level 3)

Building on increases in knowledge, the City's primary objective is to affect significant and lasting changes in the behavior of municipal employees, residents, and business representatives. Behavioral outcomes are usually expressed in terms of BMP implementation since this is the overriding objective of the City's programs. Since this is the level at which actions are actually taken, estimating or quantifying BMP implementation is a necessary component of a successful effectiveness assessment strategy. It is also necessary as a precursor to establishing load reductions. Several elements of this year's report include a discussion of BMP implementation.

11.2.2.4 Load Reductions (Level 4)

The primary goal of BMP implementation is to reduce the loading pollutants to stormwater discharges. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. The primary purpose

of conducting a load reduction estimation exercise is to better understand the benefit of conducting high priority activities (i.e., to characterize the expected reduction in loading of contaminants to the MS4).

The City regards the estimation of load reductions as the key to its assessment process. By working to establish Level 4 outcomes for lower level activities, we hope to increasingly improve our understanding of the relationship of these activities to water quality improvement. Because these efforts are both difficult and speculative, and often require data and information not readily available, this year's assessment includes load reduction estimates in only a couple of areas. In future years, our understanding of the many assumptions that must be made to address existing uncertainties, and variables that affect any given measure, will improve as we document and study them. Our goal this year was simply to develop and test some basic approaches.

11.2.2.5 Changes in Discharge Quality (Level 5)

In many respects, changes in discharge quality are the most direct expression of successful program implementation. Measurable improving the quality of discharges both into and from the City's MS4s will therefore be an important targeted outcome. Establishing relationships between discharge quality and specific program components, however, is beyond the scope of this year's assessment.

11.2.2.6 Changes in Receiving Water Quality (Level 6)

The ultimate objective of the City's programs is the protection and improvement of water bodies receiving discharges from its MS4. Both discharge quality (level 5) and receiving water quality are addressed through the City's Dry Weather Program (Section 8) and the Copermittees' Receiving Water Monitoring Program (submitted under separate cover). Establishing relationships between receiving water quality and specific program components, however, is beyond the scope of this year's assessment.

11.2.3 Spatial and Geographic Analysis

Several sections of this year's report contain analyses of program data aimed at better understanding their spatial variability and its relevance to program implementation. The approaches utilized are simple and straightforward. Data is examined regionally, by watershed, and by community to identify potentially significant trends. For instance, clustering of a particular business type may warrant outreach efforts that are specifically focused in a watershed. The City hopes to develop more sophisticated methods of spatial and geographic analyses in the future. At the same time, it is important that our understanding of the potential uses of program data evolve concurrently. Any type of meaningful

analysis is limited by the amounts and quality of data that are available to support it.

During this reporting period, the City finished a preliminary needs assessment for the implementation of a city-wide GIS program. The needs assessment encouraged the City to update its existing base data and layers using modern technolory. The City hopes to have the initial phases up and running by FY 2007-08. The City sees GIS as a powerful compliance and collaboration tool that will make tracking and reporting more efficient and accurate. The full implementation of the GIS program is dependant on budgetary constraints in future reporting periods.

Section 12.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

12.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 12.1.

Table 12.1 – 2006/2007 Fiscal Analysis Summary

Stormwater Cost Analysis
All costs covered in the General Fund.

ACTIVITY	CURRENT YEARLY BUDGET	CURRENT BUDGET LOCATION
STORM DRAINAGE CLEANING AND MAINTENANCE		
Public Street and Parking Lot Sweeping		Streets
Streets	$30,000	
Parking Lots	$2,000	
Public Street and Parking Lot Sweeping Total	$32,000	
Litter Removal		
Litter Removal	$13,000	
Litter Removal Total	$13,000	
Storm Drainage Cleaning		
Inlets		
Inspection and Cleaning	$19,820	
Fossil filter replacements	$1,400	
Inlets Subtotal	$21,220	
Basins and Channels		
Inspection and Cleaning (Note 1)	$38,829	
Basins and Channels Subtotal	$38,829	
Video Inspections		
Video Inspections (Note 1)	$50,000	
Video Inspection Subtotal	$50,000	
Storm Drainage Cleaning and Maintenance Total	**$155,049**	
STORM EVENT ACTIVITIES		
Sandbag stock piling and placement	$4,000	
Patrols	$3,089	
Storm Event Total	**$7,089**	
ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM		Engineering

		Services
Dry Weather Testing	$20,000	
Enforcement	$5,000	
Administration/Supervision	$1,000	
Stormwater HotlineComplaints	$2,000	
Illicit/Illegal Enforcement Program Total	**$28,000**	
STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)		
Construction Related SWPPP	$2,000	
Plan Review (including SUSMP's)	$15,000	
Inspection	$3,000	
Construction Related SWPPP Subtotal	$20,000	
Municipal Facility SWPPP		
SWPP Implementation, Inspection, and Maintenance of Municipal Facilities	$18,798	Streets
Municipal Facility SWPPP Subtotal	$18,798	
All SWPPP Activities Total	**$38,798**	
BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION		
Inspection of Industrial and Commercial Facilities	$50,000	
Inspection of Municipal Facilities	$1,000	
BMP Total	**$51,000**	
MISCELLANEOUS ACTIVITIES		Engineering Services
Annual Reporting (JURMP)	$5,000	
Administration (General)	$74,004	
NPDES Permit Fee	$7,500	
Public Education/Outreach	$5,000	
Miscellaneous Activities Total	**$77,504**	
PROGRAM TOTALS	**$371,440**	

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2006-07 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

12.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.

Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

Section 13.0 Conclusions and Recommendations

The City's sixth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2001-01, "Permit") represents a full year of water quality activity and programming in the City of Lemon Grove. We are confident that the report demonstrates our success in building a program that meets and often exceeds Permit requirements. At this same time, the annual reporting process offers an important opportunity to critically assess program implementation, and to identify areas in need of modification or improvement.

The programs described in this report to be significantly expanded and improved over previous years, as is evidenced by the numerous accomplishments described. City staff once again responded positively to the implementation challenges presented by the Permit; thanks to a sustained team effort, we continued to improve and augment our programs.

Moving forward, it is important to keep in mind that meaningful measurement is a necessary part of a successful program strategy. This year's report reflects more monitoring, more data, more assessment, and more deliberation on the part of City staff than ever. This speaks well of the City's program, but it is only a start, the stormwater puzzle will take many years to solve. The increased focus on measurability that is manifested in this report must remain a focus. In particular, the new and innovative approaches to effectiveness assessment that the City helped to pioneer must continue to actively evolve. The framework set out in the document *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* provides a great deal of useful direction, but success is not guaranteed. Staff will need to develop and embrace the detailed measures and measurement tools necessary to track and evaluate long-term success. Similarly, we will also need to continue looking for ways to improve and best utilize our monitoring programs so that they continue providing timely and useful information.

As in previous years, the City continued to demonstrate strong collaboration with other Copermittees throughout the reporting period. This is reflected in the quality and vision of the Copermittees' many collaboratively conducted activities. Such collaboration has become a hallmark of the Copermittees' programs and must continue to be. Future success will require no less collaboration.

This year's report is characterized by a higher integration of elements than in the past. Although the City's programs are implemented over numerous departments, the coordination and communications between those efforts has been commendable. Our experience over the past year has also shown htat we have many new challenges ahead of us. Many of the City's stormwater programs and activities are still in their infancy. Unlike many other regulatory programs, the way forward is neither easy nor straightforward. Meeting the challenges ahead of us will require continued diligence and good humor.

Executive Summary

The City's seventh Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In FY 2007-08, the City continues its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2007-08. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2007-08, the City continues to make significant steps toward the implementation of a City-wide GIS program, including a City-wide needs assessment performed by a contractor. The newly implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

Section 1.0 Introduction

Lemon Grove's seventh annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2007 through June 30, 2008). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City believes in an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City hopes that in future reporting periods, some of these challenges can be met with cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City continued its outreach material to developers and contractors and increased the participation of water quality staff in preliminary development meetings. Water Quality staff has began active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a city-wide GIS program. The City is currently working on an implementation RFP for GIS services for the Engineering and Public Works Departments. These early efforts include base data entry and updating the existing layers with current technology. However, all implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with sever economic challenges both on a local and state level.

At the jurisdictional level, the city has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. During this reporting period, it was

discovered that the City's existing tracking system for building permits and code enforcement, HdL, might be a viable option for water quality personnel. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- Continue outreach to restaurant community
- Continue outreach to automotive facilities
- A new in-house water quality inspector and code enforcement officer
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 4.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2007-08. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

Section 2.0 Municipal Component

This section describes actions taken by the City during the FY 2007-08 reporting period to prevent polluted runoff from its municipal facilities.

2.1 Municipal Facility Activities

The City of Lemon Grove owns and operates a wide variety of fixed facilities and an extensive system of roads, municipal separate storm sewers (MS4s), and sanitary sewers.

City personnel implements site-specific Best Management Practices (BMPs) to prevent and reduce pollutants in facility runoff. Since BMPs are tailored to the unique activities conducted at each City facility, the remainder of this section is organized according to facility type. For each facility type, information is presented as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Facility Inspections

2.1.1 Priority Sources

Nearly 65.5 miles of roads, streets, and highways are maintained by the City. The City is not responsible for maintaining roadways that are managed by other agencies or jurisdictions, or are privately owned. All City-maintained roads are routinely inspected annually, and more frequently upon request. Needed repairs are noted and performed as appropriate to ensure safety and riding quality for the traveling public. Roadway maintenance typically involves concrete and asphalt repair, drain inlet cleaning, litter removal, and street sweeping. Other BMPs, as listed in JURMP 2.4, are implemented as required.

2.1.1.1 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for the City-maintained road system. BMPs applicable to roads, streets, and highways have been reviewed, and remain unchanged. Below is a brief listing of some of those BMPs:

- Vegetation Control
- Proper Material Storage and Coverage
- Concrete Maintenance Methods for Wash-outs
- Designated Vehicle Maintenance Area
- Vehicle Washing Area
- Employee Training

2.1.1.2 BMP Implementation

Details regarding specific road maintenance activities conducted during this reporting period are provided below. It should be noted that other road maintenance BMPs not described here were identified in JURMP 2.4 and are implemented as necessary.

Street and Facility Sweeping

The Department of Public Works (DPW) Streets Division insures that City-maintained roads and facilities are swept at the following frequencies and locations:

- Curbed Streets (Broadway, Buena Vista Ave., Massachusetts Ave., and School Lane) – weekly
- All Other Curbed Streets – biweekly
- Non-Curbed Streets – monthly
- Center Islands and Medians – monthly
- Parking Lots and Alleys (Broadway Business Lot and Lester Ave. Alley) – weekly
- All Other Parking Lots and Alleys – monthly

The City considers sweeping to be an extremely effective BMP in that it prevents accumulated material from entering the stormdrain conveyance system. To quantify its sweeping activity, DPW Streets Division crews record the length of streets swept and the amount of debris collected on a month-by-month basis. The City swept approximately 80 miles during FY 2007-08 and collected 169.75 tons of debris. The City swept approximately 80 miles during FY 2006-07 and collected 169.75 tons of debris. These figures include the regular sweeping of roads, specialty or requested road sweeps and corporate yards.

The City swept 100% of public maintained curbs and gutters both reporting periods. The City is responsible for 65.5 miles of roadway in Lemon Grove. The extra mileage swept is due to parking lots and special request sweeping on private streets. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

The City is now contracting street sweeping services with Day and Night Sweeping. Their contract followed the guidelines from the previous contractor for this reporting period. Sweeping frequencies are scheduled to increase over the next few reporting periods to double the current contract amount. This increase however is based on the current level and quality of the contractor's performance. If the contractor does not meet quality standards - based on citizen complaints and visual inspections - a new bid process will take place to replace them.

2.1.1.3 Road Inspections

All City roads are inspected annually or more frequently upon request, and needed repairs noted and preformed as appropriate to ensure safety and riding quality for the traveling public. During this reporting period, all City roads were inspected prior to and during the rainy season. Based on these results, maintenance crews evaluated potential stormwater impacts and identified the need for cleaning, maintenance, and future upgrades. Conveyance system and road right-of-way cleaning conducted as a result of these inspections is described in section 2.1.2.3 below, and street sweeping in section 2.1.1.2 above.

2.1.2 Municipal Separate Storm Sewer System (MS4)

The City maintains the publicly owned portions of the MS4 within its boundaries. The City's MS4 inventory consists of culverts, channels, ditches, pipes and related flood control structures.

2.1.2.1 Priority Sources

All City roads, streets, and highways are designated as high priority municipal sources. The Public Works Yard is also designated as high priority because of pollutant potential. See Table 2.1 which details the City's priority municipal sources.

Table 2.1 – High Priority Municipal Facilities

Facility	Address	Basis for Designation	Receiving Water
Roads, streets, highways, and parking facilities	Throughout City	Specified in Order 2007-01	Chollas Creek and Sweetwater River
Flood management projects and flood control devices	Throughout City	Specified in Order 2007-01	Chollas Creek and Sweetwater River
Public Works Yard	2873 Skyline Dr.	Specified in Order 2007-01 and has potential to discharge pollutants of concern.	Chollas Creek

2.1.2.2 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for City-maintained MS4 facilities. BMPs applicable to the City-maintained MS4 have been reviewed, and remain unchanged.

2.1.2.3 BMP Implementation

Further detail about specific MS4 maintenance activities conducted during this reporting period is provided below. Other BMPs identified in JURMP 2.4, but not described here, are implemented as required.

Conveyance System Cleaning

During this reporting period, City staff inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Only six conveyances and 60 catch basins were found to be in need of cleaning, and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,830 pounds from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those six conveyances, providing approximately another 1,800 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.

In the past few reporting periods, the DPW has noticed a slight decrease in the trash quantities found in and around conveyances. DPW attributes this to a more effective street sweeping program and the implementation of Trident Curb Screens in several high trash areas of the City. During FY 2007-08, the City also installed five Green Visions Solutions curb screens in high sediment areas. The screens were installed towards the end of the reporting period on a trial basis and the City is awaiting the rainy season to access their effectiveness in regards to sediment capture.

Attachment A-1 contains the initial mapping of the City's major drainage pipes.

Storm Drain Stenciling

The City began implementing a new drain label program. Instead of painting stencils, the City began using drain labels that are more permanent and longer lasting by using thermoplastic labels. They are heat set onto the concrete any place around the drain and will last a minimum of 10 years. They are also fade, graffiti and tamper resistant. As of the end of the 2004-05 reporting period, the City had placed labels on approximately 30 drains on Broadway, a main through-way for the City and commuters. The City then placed an additional 30 labels on various inlets throughout the City with a focus on major streets first, during 2005-06. The City maintained this program in 2007-08, by installing an additional 30 labels on drains throughout the City, covering major streets first; bringing the current total for labeled drains on primary streets to approximately 90. Soon the City will begin placing them on non-primary City maintained residential streets. The City plans to purchase approximately 30 each fiscal year until all the drains on public maintained streets are labeled. In the meantime, the City continues to

let “I Love a Clean San Diego” stencil drains that are un-marked or have worn-out stencils.
The City continues to require developers to mark any new drains in connection with development or redevelopment. The City encourages them to use concrete wet stamps or thermoplastic labels for longevity on private streets and requires either if the street will be maintained by the City. See Attachment A-2 for a picture of the thermoplastic labels and the concrete wet stamp.

During FY 2007-08, the City installed five test Green Vision Partner’s Curb Screens in various high sediment locations. The City wished to test their durability and usefulness in conjunction with the new street sweeping program. Insufficient data is available at this time to begin judging their effectiveness, but informal visual inspections show a decrease of trash in the catch basins and the trash is curb side making it easier for the street sweeper to pick up.

In the pervious reporting period, six Trident Curb Screens were located in various test sites throughout the City. These screens have so far proved durable and effective at preventing trash from entering the covered conveyances. DPW has noticed a considerable decrease in the need for cleaning at these locations. It is difficult to access the specific amount removed prior to entering a particular conveyance as the street sweeping contractor provides gross tons collected. However, informal visual inspections by the DPW crews verify that less trash is entering those conveyances protected by the Trident Curb Screens. As fiscal funds allow, the City will be installing more of these screens on primary roads and in high foot traffic locations, such as near schools and fast food restaurants.

2.1.2.4 MS4 Inspections

The Streets Division conducts annual field investigations in order to inspect the City-maintained MS4 to identify the need for cleaning, maintenance, potential illicit connections and illegal discharges (IC/IDs), and to assess the structural integrity of facilities. As reported above, the City inspected forty-three road segments, sixteen conveyance facilities, and 190 catch basins during this reporting period.

2.1.3 Sanitary Sewer System

The Sanitation District manages and maintains a collection system of 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa’s sewer systems. San Diego and La Mesa share sewer space with Lemon Grove. La Mesa utilizes 728.60 EDU of Lemon Grove’s sewer space; San Diego uses 986.20 EDU.

2.1.3.1 Priority Sources

The City operates no high priority waste water facilities within its boundaries.

]2.1.3.2 BMP Requirements

JURMP 2.5 details minimum BMP requirements for all sanitary sewer system lines. BMPs applicable to sanitary sewer system facilities have been reviewed, and remain unchanged.

2.1.3.3 BMP Implementation

Control of Sanitary Sewer Overflow Events

DPW staff responds to sanitary sewer overflows (SSOs) according to protocol established in RWQCB Order 96-04, the current Waste Discharge Requirements and Water Quality Order 2006-0003. During FY 2007-08, the City had 5 Category 2 private SSOs. None of the discharge reached the MS4 or receiving waters. The new Discharge requirements require the City to tract all reported spills even if the they are from private, which the City does not track or maintain.

Limiting Infiltration from the Sanitary Sewer System to the MS4

As a proactive means of preventing or limiting infiltration from the sanitary sewer system to the MS4, the City conducts aggressive inspection and maintenance programs for both systems. City personnel are instructed to investigate locations exhibiting sewer-related discharge or odor during MS4 inspections (further discussed in section 2.1.2.3 above). No instances of infiltration were noted during this reporting period. Sanitary sewer system inspections are also conducted on scheduled intervals to ensure the functionality and structural integrity of the system. These are described further below. The camera/video truck was purchased and utilized during this reporting period.

2.1.3.4 Inspections

Sanitary Sewer System Inspections

The City regularly inspects its sanitary sewer system to ensure functionality and structural integrity. Towards the end of reporting period 2004-05, the City began cleaning and inspecting public sewer lines in-house. During this reporting period, all public sewer lines were cleaned and maintained in-house.

Table 2.2
Sanitary Sewer Services in Feet

	Total FY 2005-06	Total FY 2006-07	Total FY 2007-08
Cleaned	**298,043**	**331,369**	**52,493**
Root Cut	**18,370**	**20,927**	**36,039**

2.1.4 Corporate Yards and Fleet Maintenance Facilities

The City's municipal facilities inventory includes one facility classified as a corporate yard and fleet maintenance facility. These facilities are classified as high priority, due to the potential pollutants stored on-site.

2.1.4.1 Priority Sources

Fleet Maintenance Facility

DPW operates one fleet maintenance facility that provides maintenance, repair and fueling to forty-five vehicles from all City departments. The maintenance is co-located with the DPW headquarters and is listed as the Public Works Yard on the inventory. The facility is considered a high priority threat to water quality due to the presence of hazardous materials, automotive fluids, and fuels on-site.

2.1.4.2 BMP Requirements

JURMP 2.4 defines all minimum BMP requirements at the DPW-maintained corporate yard. BMPs applicable to DPW-maintained corporate yards have been reviewed, and remain unchanged.

2.1.4.3 BMP Implementation

Fleet personnel always implement BMPs under the guidance of the facility's Fleet Manager. In addition to a periodic schedule of ground maintenance and housekeeping, the facility maintains an inventory of spill kits, absorbent, fiber rolls, and storm drain maintenance equipment. BMPs are also implemented to address particular activities of concern: vehicle and equipment repair, hazardous waste storage, vehicle washing, re-fueling, etc.

As in previous reporting periods, BMP implementation at the corporate yard and fleet maintenance facilities was verified and evaluated during routine facility inspections. Where inspectors noted a lack of BMPs or ineffective results, employees were required to implement corrective actions immediately.

2.1.4.4 Inspections

Fleet Maintenance Facilities

Though Fleet Managers are responsible for applying and maintaining BMPs on a daily basis, the Water Quality Coordinator conducted an annual inspection to verify implementation during this reporting period. The only notable infractions were an open dumpster at City Hall and a degraded straw wattle at the Public Works Yard. City staff has noticed a marked improvement in the maintenance of good housekeeping BMPs at City facilities. Water Quality staff believes this is

due in part to frequent informal inspections and increased staff training, as well as the formal annual inspection.

2.1.5 Parks and Recreation Facilities

2.1.5.1 Priority Sources

The Department of Recreation Services (DRS) manages stormwater discharges from seven park sites. Included among these are local and regional parks, park buildings (including the community center), historical sites and open spaces. In the inventory submitted with the City's JURMP, all parks are considered medium priority. See Table 2.2 for a detailed description of park areas.

Table 2.2 – Other High Priority Municipal Facilities*

Facility	Address	Basis for Designation	Receiving Water
Berry Street Park	7101 Mt. Vernon St.	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek
Fireman's Park	School Lane and Central	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek
Kunkel Park	8171 Lemon Grove Way	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Sweetwater River
Monterey Heights Park	Canton and Glencoe	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek
Lemon Grove Park	Washington and Alton	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek

2.1.5.2 BMP Requirements

JURMP 2.4.2 defines all minimum BMP requirements for City parks and recreation facilites.

2.1.5.3 BMP Implementation

Because parks vary widely in both size and function, it is difficult to generalize about BMP implementation. All park personnel are instructed to implement BMPs at all times. In addition to a periodic schedule of ground maintenance and housekeeping, most facilities maintain an inventory of spill kits, absorbent, and miscellaneous storm drain maintenance equipment. BMPs are also implemented

to address particular activities of concern: material and waste storage, fueling, septic tank maintenance, etc. A complete list of facility-specific BMPs can be found in JURMP 2.4.2.

DRS has also endeavored to make the implementation of pollution prevention BMPs a priority at park facilities. Unless otherwise noted, these practices were implemented at all facilities in the DRS inventory. They include:

- The storage of used construction materials outside for future projects is being eliminated. The site that contained materials during the last reporting period is now empty of City materials. The City has plans to fence and lock the site to prevent the illegal dumping of large waste items like furniture. The fencing should be accomplished within the next two reporting periods.
- The prohibition on washing City vehicles and equipment on-site has continued to be enforced. All washing occurs off-site at appropriate locations. The majority of vehicle repair and maintenance is performed by Bob-Brown Automotive on University Ave. By having vehicle maintenance performed off-site, the City drastically decreases the number of pollutants stored at the Corporate Yard. The City is continuing to look into the possibility of in-sourcing oil-changes to allow for the use of re-refined oil. The City is currently searching for a closed loop system that would supply the oil and then take the used oil back for further recycling. The City has not been able to locate a closed loop system. The City has postponed the implementation of re-refined oil in City vehicles until the warranty on the new fire engine expires. If the City uses re-refined oil in the new engine it will nullify the repair and maintenance warranty. The inclusion of the fire vehicles is integral to the implementation of a re-refined oil program. Without the inclusion of the fire vehicles, the City would not be able to purchase the oil in the quantities sufficient to encounter fiscal savings. The City plans to renew its efforts to establish re-refined oil after the warranty expiration in reporting period 2009-10. Maintenance on the fire engines is preformed off-site through Grossmont High School District.
- The City uses pesticides and insecticides on a very minimal basis, only when a problem is persistent and can be dealt with no other way.
- All City parks maintain recycling facilities.
- The use of drought resistant plants is encouraged. See Section 2.2.2 for further information on the plants used in the City.
- The City installed 1 additional doggie bag dispenser at the Lemon Grove Civic Center and maintained a distribution of approximately 650 bags at the existing 4 locations in City parks.

2.1.5.4 Inspections

The City's Water Quality Coordinator conducts annual stormwater inspections to verify appropriate BMP implementation at all of its parks, regardless of priority classification. All observed deficiencies were noted and scheduled for correction. Many of the deficiencies noted during FY 2007-08 involved trash and debris. All deficiencies were promptly addressed. DPW Grounds crews inspect parks on a weekly basis for the removal trash and debris and for graffiti abatement. A repeat inspection after a clean-up day, showed a significant decrease in the visible trash and debris. The park parking lots are swept twice monthly to assist in removing trash and sediment on the impervious surface areas. See Attachment A-3 a copy of the facility inspection report.

2.1.6 Other Municipal Facilities

The City operates and maintains several additional facilities not captured by the categories outlined above. These include office buildings, a sheriff station, and a fire station. The Fire Department re-joined the City in July of 2004. All repairs, maintenance, and equipment storage is performed in a covered and completely enclosed garage/bay area with locked doors. All hazardous materials are stored in locked self-contained areas inside the bay area and labeled appropriately. Nothing hazardous is stored outside or un-locked.

2.1.6.1 Priority Sources

Offices

The City maintains four business offices and two public safety offices including the new fire station, which previously housed the Department of Public Works and Recreation Services. No new offices have been added during this reporting period, see list below. The Sheriff Station is connected to City Hall, therefore they are categorized together under City Hall, which is listed as a medium priority threat, as most activities are conducted in enclosed areas.

- City Hall and Sheriff's Department – 3232 Main St.
- Fire Department – 7853 Central Ave.
- City Hall Annex (Department of Recreation Services) – 3225 Olive St.
- Community Center – 3146 School Lane
- Department of Public Works – 2873 Skyline Dr.

Vacant Land and Excess Right-of-Way

The City owns one vacant property at:

- 6949 Central Ave.

This site will be considered medium priority due to the minimal on-site activity and lack of impervious surface.

2.1.6.2 BMP Requirements

All BMP requirements for the facilities discussed in 2.1.6.1 above are covered in JURMP 2.4. These BMPs have been reviewed and remain unchanged.

2.1.6.3 BMP Implementation

BMP implementation at facilities classified as miscellaneous is overseen as applicable by DPW, DRS, or facility personnel. Procedural requirements and staff training protocol are specific to each department, but in all cases are sufficient to ensure stormwater compliance at these facilities.

2.1.6.4 Inspections

Each facility identified in 2.1.6.1 was inspected at least once during FY 2007-08 to verify compliance with minimum BMP requirements. The main infraction was an open dumpster lid at City Hall, which has since been corrected and is checked by staff on a regular basis. The drip irrigation system installed in the landscaping at the front of City Hall during the previous reporting period has cut down significantly on run-off from the site. See Attachment A-3 for a copy of the facility inspection report.

2.2 Management of Pesticides, Herbicides, and Fertilizers

The City of Lemon Grove's Grounds staff uses only herbicides and algecides. The City's pest control contractor is Knott's Pest Control. Knott's Pest Control meets all BMPs for pesticide application found in JURMP 2.4.

2.2.1 BMP Implementation

The following BMPs, described further in JURMP Appendix 2.2.1, were implemented by DPW for the application of herbicides, algecides, and occasionally pesticides; although as mentioned above Knott's Pest Control handles the majority of the City's pest control needs.

- Safer Alternative Products
- Good Housekeeping Practices and Material Storage
- Vehicle and Equipment Washing and Cleaning
- Illegal Dumping Control
- Pollution Prevention

2.2.2 Use of Drought Resistant Vegetation

Grounds division of Public Works attempts to use drought resistant plants throughout the City's landscaping. Common variations of these plants used throughout the City are lavender, sage, oleanders, natal plum, rosemary, and pyracantha. The use of drought resistant vegetation allows for drip irrigation, which greatly decreases the amount of water used and limits the amount of potential runoff from sprinkler systems. A drip irrigation system also allows soils to absorb nutrients from fertilizers and compost preventing them from washing into the drains with irrigation water, a common residential pollutant problem that will be further discussed in Section 5.0.

2.2.3 Schedules for Irrigation and Chemical Applications

Weather conditions are always considered prior to outdoor pesticide applications. Depending on the formulation and characteristics of the pesticide to be applied, an application may be postponed or allowed to proceed prior to, or during, a rain event. This is because the Grounds division applies pre-emergent herbicides as part of its vegetation management program. Pre-emergent herbicides benefit from a gentle rain that soaks the pesticide into the soil where germinating seeds are killed; getting these types of herbicide to the root zone also controls existing young vegetation. The application of contact herbicides, on the other hand, is not permitted if precipitation is likely. These materials tend to wash off plant surfaces and contribute to water quality degradation.

2.2.4 Collection and Disposal of Pesticides

When available the City purchases herbicides in recyclable bulk containers. By reducing the volume and variety of herbicides, the department is able to maintain a minimal inventory of pest related chemicals.

As a general rule, emptied pesticide containers are triple rinsed and the rinse water is put in with the application solution. Containers are then disposed of in accordance with local regulations.

2.3 Employee Training

The City is committed to increasing the awareness of its employees regarding urban runoff issues, and effecting positive behavioral changes to protect water quality. To this end, two types of stormwater and water quality education are provided to employees.

- Basic Awareness Education; and
- Focused Employee Training

2.3.1 Basic Awareness Education

The goals of this element are to promote responsible behavior at home and work, and to encourage employees to act as the City's "eyes and ears." As described in section 2.4 of the City's JURMP, the City's goal is to provide some level of basic awareness education to all employees annually.

2.3.1.1 City Newsletter

The City has continued the Environmental Page in its biannual Newsletter. Each issue contains oil recycling sites and household hazardous waste information. The Fall 2007 edition contained an article on Fats, Oils and Greases, proper disposal of prescription medications, and on rainy season homeowner BMPs for limiting pollution in the storm sewer system. The edition also featured the standard used oil information and e-waste guide. The Spring 2008 edition featured information on the Creek to Bay Clean-Up event, BMPs applicable to home improvement projects, the City's reusable shopping bag giveaway, a brief recycling survey, information on household hazardous waste, free shade trees, and used oil recycling.

The Newsletter, which is produced by City staff, is distributed to the residents and businesses of Lemon Grove, as well as City employees. Because of the public and internal distributions, City staff is kept abreast of the current issues and knows what information is being given to the public. See Attachment A-4 for copies of the Newsletter articles discussed in this section.

2.3.1.2 Informal Staff Training

Water Quality staff continues the informal educational e-mail program. At least twice a month, staff sends a City-wide e-mail with new water quality information. The e-mails contain anything that has to do with water quality and pollution prevention. New sites such as www.bewaterwise.com or new articles from the BC's California Water News (a Brown and Caldwell daily e-mail newsletter) are shared with all City staff members. Water Quality staff has discovered that this method, although informal, provides a positive transfer of new information, up coming events, and technological advances in the water quality field. Water quality remains a primary focus for all staff through these small constant reminders and updates. It also provides staff an opportunity for internal dialogue without trying to schedule large scale meetings or trainings. The e-mails have been received favorably and will continue in future reporting periods.

Water Quality staff participated in weekly inter-departmental meetings with City planning, code enforcement, engineering and fire personnel. Current development projects, code updates, enforcement concerns, and construction site details are discussed. The meetings have provided water quality staff with the opportunity to regularly update the former mentioned department staff on

concerns and changes in the water quality program. The constant re-enforcement ensures that water quality remains an issue of primary concern for the development sector of City staff.

2.3.2 Focused Employee Training

2.3.2.1 Bi-Annual Public Works Staff Training

Each fall and spring, water quality staff participates in one of the public works safety trainings. Staff provided updates on new concerns and regulations, as well as obtaining the concerns of the public works staff. This year's training focused on the developing new permit and the changes it would bring for DPW staff. Water quality staff continues to provide DPW staff with informational brochures on used oil recycling and pet waste to utilize in educating the public further on these common infractions. The regular exchanging of information has been beneficial to all staff members involved. Water quality staff believes the continued involvement has increased public awareness as well due to the readily available information and more knowledgeable public works staff. Both staffs look forward to continuing the exchange of ideas and information.

2.4 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Municipal Component in FY 2007-08. It consists of three primary elements: 1) a narrative assessment, 2) a discussion of the City's success in meeting specific quantifiable targets, and 3) a discussion of issues related to the spatial and geographic variability of program data.

2.4.1 Narrative Assessment

The City made a number of important improvements to its municipal activities programs in FY 2007-08. In spite of the large number of individual activities and programs comprising the City's Municipal Component, continued progress and improvement was made in all areas. In particular, another year of experience in implementing BMPs at City facilities has translated to a more complete integration of stormwater mandates into standard operating procedures. City crews also continued to pound the pavement throughout the community, collecting greater amounts of debris from our streets and MS4 than they ever have before. City crews are also better educated on the water quality program and can provide more information to residents themselves. They are also more knowledge about illegal practices and many issues have been dealt without code enforcement involvement.

The City is continuing to gather GIS information. The City purchased new aerial photographs of the city limits, as well as Lidar graphs. The City is currently investigating survey equipment and GIS programs. The City currently has

ArcView 3.2 with minimal mapping and levels. The City is investigating upgrades versus new systems. The City plans to have a functioning GIS system in place within the next five to eight years depending on budgetary constraints. The City has evaluated several different options for its GIS system and has performed an initial needs assessment. A needs assessment for GIS implementation was performed during this reporting period. The initial stages of implementation will involve base data and updates for the existing layers based on current technology.

Staff training continues to develop and change based on staff's needs and new incoming information. The City focused this reporting period on SUSMP specific training because of the audit and a need to improve the SUSMP review process. Staff also discovered that employees were more favorable towards specialized trainings due to the repeated generic trainings of the past two reporting periods. Water Quality staff plans to rotate specialized and generic trainings every few years. This will allow the limited Water Quality staff to provide optimal trainings regardless of the topic. The rotation also allows City staff a chance to receive more in-depth training in a field that directly relates to their daily tasks.

2.4.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

The City is beginning to track activity targets and establish long-term goals for the water quality program. Below is a listing of the targets for this reporting period:

Target 1
Provide More Targeted Staff Training
100% complete

Target 2
Improve and provide permanent labels for local stormdrains

50% complete (on-going process)

Target 3
Improve catch basin inventory
75% complete (on-going process)

Target 4
Obtain educational decals for the DPW tailgates (fiscal constraints temporarily delayed the purchase of the decals, should be in place during the next reporting period)
50% complete

Target 6
Increase information available through the Newsletter
85% complete (more education is always needed)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not track specific measures related to changes in knowledge or awareness. However during this reporting period, City staff showed an increased awareness of water quality issues by requesting specific, focused trainings. In discussions with water quality staff, they expressed a desire to learn more about specific segments of the water quality program like SUSMP requirements and processes.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measure related to behavioral changes as part of its Municipal Component in FY 2006-07. The need for the identification and assessment of such measures is being considered for the next reporting period. The City is currently working on connecting BMP implementation to load reductions and program effectiveness. The City feels that despite the lack of official tracking, progress is being made and behaviors are changing. Staff's efforts to maintain the closed dumpster lid are evidence of the change in behavior, as well as the installation of the drip irrigation at City Hall. All City trucks are now equipped with sand bags and gravel bags to contain any emergency run-off problems, until other assistance arrives. The bags are also available to the residents in case of drainage problems.

Level 4 Outcomes: Load Reduction Estimation

As stated above the City of Lemon Grove is working on a connection between BMP implementation and Levels 4 – 6. Some program data can be used to make fairly straightforward estimates. The Municipal Component lends itself to this process easily as the City is already required to keep extensive records of daily activities. The process is also facilitated by centralized data collection.

However, the process is in its infancy with a more complete picture projected for future reporting periods. As reported in Section 2.1.2, the City's street sweeping and MS4 maintenance activities resulted in the diversion or removal of a combined 3,360 pounds of debris from the MS4 this year. Unlike other waste streams likely to be only partially introduced or conveyed to the MS4, the entire amount of these totals is assumed to be a load reduction.

Table 2.4 - of Load Reduction Calculations for Municipal Activities

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Street Sweeping	169.75 tons	None	169.75 tons
MS4 Cleaning	3,360 pounds (1.815 tons)	None	3,360 pounds (1.815) tons
			Total 171.565 tons

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between municipal sources and water quality outcomes. The City will continue to explore these relationships. The City is attempting to connect BMP implementation to load reductions and eventually receiving water quality. The theory is that with the proper BMPs in place, a certain percentage of load reduction is expected, load reductions equal lower pollutant levels which lead to improved water quality.

2.4.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any municipal program data during this reporting period.

Section 3.0 Industrial – Commercial Component

This section describes actions taken by the City during FY 2007-08 to minimize discharges from industrial and commercial facilities and their impact on receiving water quality and other environmental resources. The City continues to implement a number of complementary and inter-related program activities, including the following:

- Maintaining a watershed-based inventory of industrial sources
- Requiring BMP implementation through ordinance and permit
- Encouraging BMP implementation through notification and outreach
- Monitoring compliance through inspection and enforcement

3.1 Priority Industrial-Commercial Sources

For its FY 2007-08 JURMP Annual Report, the City identified nine high priority industrial sites in its borders. Since a single repository of facility data does not exist, the City relies on other data sources as well as field reconnaissance, to modify its inventory. The City uses the annual industrial/commercial inspections to verify BMP and good housekeeping standards in its business sector. During this reporting period the City brought its water quality inspections in-house with a new part time code enforcement/water quality inspector position. The City will be transitioning data and revamping the program over the next few reporting periods. This is not as difficult a process as it first appears, because the City does not experience large quantities of new development, the facility list remains fairly stable from year to year. The City updated its city-wide business and development database through information gathered in last year's and this year's reporting periods. This reporting period was spent training staff and learning to utilize the new system. No statistics are available from the updated system due to the short time in use.

As required under Permit section D.2.b, the City maintains and annually updates a city-wide inventory of high priority commercial sources as a basis for its outreach and regulatory programs. This inventory currently includes 139 individual sources. Table 3.1 summarizes the commercial inventory by business type and indicates the sources of information used to compile data for each type.

Table 3.1 - Summary of High Priority Commercial Sources

Commercial Activity	Number of Facilities in Lemon Grove
Automobile Dealers/Rentals	18
Automobile Supply Stores	9
Automobile Repair/Paint	9
Automobile System and Tire Repair	56
Automobile Cleaning/Washing	3
Gas Stations	7
Eating/Drinking Establishments	60

Landscaping, includes lawn care	9
Nurseries and Greenhouses	1
Pest Control	3
Equipment Repair/Maintenance/Cleaning	3
Metalwork	6
Masonry	4
Parking Lots and Storage	3
Carpet/Building Cleaning	21
Pool and Fountain Cleaning	3
Total	**215**

As Table 3.1 suggests, the City has yet to locate a single, centralized source of commercial facility information. Several of the facilities with commercial SIC codes are high priority industrial due to their proximity to Chollas Creek, a 303d listed water. This explains the discrepancy between the above number and the commercial inventory number. While the City remains hopeful that improved sources of facility data and information can be identified, in the meantime it must continue to rely on existing data sources such as permit databases, the Yellow Pages and field reconnaissance.

3.1.1 Additions to the Industrial Inventory

There were no facilities that were recommended for addition to the City's high priority category during this reporting period.

3.1.2 Deletions from the Industrial Inventory

The City discovered no facilities during FY 2007-08 to be deleted from the inventory.

3.1.3 Updated Industrial Inventory

The City's updated industrial inventory currently consists of 27 facilities. This number includes all industrial facilities within the City. Table 3.2 provides a summary of the types of sources contained within the facility inventory.

Table 3.2 - Summary of High Priority Industrial Sources

Industrial Activity	Number of Facilities in Lemon Grove	Revised High Priority Category Facilities
Waste Disposal and Recycling	1	
Equipment/Transportation	3	2
Metalwork	2	3
Building Supplies and Woodworking	3	2

Industrial Paper		1
Contractor, Special Trade		1
Specialty Hardware, Drapery		1
Total	**9**	**10**
	Total Facilities	**19**

3.2 BMP Requirements

3.2.1 BMP Requirements for Industrial Dischargers

The City's SUSMP and JURMP documents lay out a set of minimum BMPs required of industrial and commercial businesses in the City. A detailed discussion of these requirements was provided in JURMP section 3.4.1 and section 4.3.1, respectively. The City's tiered approach to establishing BMP requirements addresses all regulated industrial activities; broad standards apply to all types of industrial activity, and progressively tougher standards are imposed on high priority activities to reflect their greater risk to water quality. The JURMP also provides specific BMPs based on business type as well as the general ones previously discussed (waste disposal, metal work, etc.).

3.2.2 Pollution Prevention Requirements for Industrial Dischargers

In recognition of the important role that pollution plays in the long-term success of the City's industrial and commercial program, the City views pollution prevention as part of BMP implementation. The JURMP in Section 3.1 and 4.1 discusses the City's pollution prevention goals with respect to industrial facilities. The City feels that if BMPs are implemented, that pollution prevention is obtained to the maximum extent practicable (MEP). The section further discusses the importance of education and outreach for further pollution prevention.

3.3 BMP Implementation

3.3.1 City Strategy for Ensuring BMP Implementation

The City and other Copermittees submitted the document *A Framework for the Implementation of Best Management Practice (BMP) Programs at Commercial and Industrial Sites* to the RWQCB on October 16, 2003. As noted for commercial sources, the City's strategy for ensuring BMP implementation at industrial facilities builds on this framework, as well as activities it is already conducting.

The City previously contracted with D-Max for their inspection needs. However, during this reporting period, the City brought the inspections in-house. The new staff member is working from the questionnaires and forms created by D-Max to maintain consistency in data. Attachment B-1 contains the forms used by D-Max

and now City staff to evaluate the facilities. A list of the inspected facilities can be found in Attachment B-2. The new inspector is also a code enforcement officer. The City hopes the combined position will strengthen the inspection program and close any compliance gaps. However, budget constraints limit the growth of these fields, with the position remaining a split position until such time as the budget can handle two full time positions. Even so, the new split position allows for easier, timely follow-up on facility violations, as well as creating a consequences-for-violations policy. A new code enforcement process for water quality violations is currently being implemented by the City for use with non-compliant construction sites and illegal discharges. The City has expanded the process and municipal code to include non-compliant industrial and commercial facilities, except with reference to monitoring and testing. Due to budget constraints and staff's limitations, the monitoring and testing element will be added later as the budget allows. The water quality code enforcement language is now contained in the recently passed municipal code updates in response to new Permit due dates.

The City created a stormwater fee for businesses and residents. The City has explored different billing criteria based on the experiences of other cities. The City explored solid waste services as a possible billing mechanisim. The fee was standard for residential but differentiated based on facility/business dumpster size and frequency of pick-up. The fee allowed the City to recoup some of its water quality expenditures, but would also increase public awareness and participation. People and facilities are more likely to implement BMPs if a regular reminder of their importance is provided.

During late FY 2004-05, the City developed a fee based on trash removal services. The City believed a correlation existed between the amount of trash a site produced and the site's potential for pollution contribution. However the constraints of Proposition 218 made the fee vulnerable, therefore the City decided to re-vamp the fee structure to prevent any complications. The fee is no longer based on trash services for commercial facilities, but is attached to existing City fees for licenses and permits. A flat fee remains in effect for residents based on solid waste fees. The combined commercial and residential fees only cover one third of the cost of the City's stormwater program. The percentage is expected to lower with increased costs incurred by the issuance of the new MS4 permit, however they do not compensate for increased requirements and new programs. The already strained General Fund will continue to bear the brunt of the program's cost. With the vote failure in Encinitas, a coastal city, the inland cities have little hope of passing a stormwater fee without Proposition 218 exemption.

3.3.1.1 BMP Selection and Application

As discussed in the framework document, the goal of the Copermittee program is to assist businesses in selecting appropriate combinations of BMPs that address their unique circumstances, activities, and discharge potential. While the City has existing BMP requirements in its JURMP document, BMP selection and application is an ongoing and iterative process that reflects a constantly evolving state of knowledge. As such, review and assessment of available options are standard elements of the City's program planning process.

A need exists to ensure regional consistency between Copermittee efforts. For instance, regional collaboration is beneficial in disseminating regionally consistent information to businesses, and for sharing information about practices that are working and those that are not. The Copermittees' BMP Workgroup provides a forum for exploring these and other key issues. The City will continue to participate in this venue, and in doing so will seek to provide an understandable and regionally consistent message to the businesses it regulates. The City also participates in a San Diego Bay Watershed workgroup that explores topics pertinent to the entire watershed. These topics include BMP implementation and strategies for ensuring effectiveness. Effective education is key to ensuring BMP implementation. The City participates in both the County's Green Business meetings and the Copermittee's Outreach and Education Workgroup. The groups collaborate and share ideas and solutions. The City feels its participation in these venues is valuable in developing an effective and well-rounded program. Collaboration also ensures consistent messages to area businesses. The businesses know what to expect if they re-locate to another area of the County. Where applicable, the City will advocate the use of the January 2003 Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA). These handbooks provide detailed and up-to-date information on BMPs for both commercial and industrial activities.

3.3.1.2 Outreach and Notification

Although compliance inspections are the cornerstone of the City's industrial facilities regulatory program, education is key to ensuring effective implementation by facility operators. The City is working to improve its outreach to the industrial and commercial facilities within the city-limits. Due to the City's decision to bring the inspections in-house, the results of the inspections were not received until after the end of the reporting period, therefore any improvements and follow-up are representative of the previous year's inspections.

Several types of outreach and notification activities can be effective in ensuring that business operators have been adequately informed of their compliance obligations and provided useful information on how to meet them. As shown

below, the City attempts to utilize each of the following types of outreach to varying degrees as part of its outreach and notification process:

- Printed Materials
- Direct Mailings (including e-mail)
- Workshops and seminars
- Websites and hotlines
- Direct contact
- Industry associations

The degree to which any of these tools are used will vary by specific program area, as well as the interest level of regulated parties. For instance, workshops and seminars will generally be made available upon request, but the City may specifically target certain sectors it considers to be in need of extra attention. Outreach will also play a proportionally larger role in the City's approach to businesses not subject to an active inspection process. Community groups and community outreach events can also play a useful role in reaching some types of commercial businesses. The City intends to increase its emphasis in this area on a continual basis. Three public events that lend themselves to information distribution are the Fire Department Open House held in October, the Winter Bonfire held in December, and the Spring Festival held in April or May.

The City is also working to improve its notification system. Staff is working to expand its database to contain all previous and present violators. The database will contain the number of violations, the type of violations, contact information, and notification information. The database will allow the City to track repeat offenders and establish a better code enforcement policy. By tracking violation type, the City can better target its outreach efforts, making them more effective educational tools.

The City is currently working to alter the emphasis of its outreach. The current focus is on "don'ts"; the City is attempting to turn that around and make the focus "what to do." The City believes that many violations continue because businesses and developers are not aware of alternative methods. If the focus of the outreach becomes "what can be done", people have an alternative behavior, not just a change in knowledge. As stated above, for industrial facilities and construction, CASQA has very comprehensive BMP handbooks, which provide a variety of treatment methods based on activities and pollutants. Informing facilities of resources is a very simple example of positive outreach that provides people with behavior alternatives. Repetition is also key in an effective outreach program. The more often facilities are notified, the harder it is to claim ignorance. The City continues to investigate the implementation of a FOG (Fats, Oils, and Grease) program in conjunction with the issuance of the new Wastewater Discharge Requirements order. City personnel received grease trap and inceptor inspection training at the end of the previous reporting period and hope in future reporting periods to begin grease trap and inceptor inspections at local

facilities. The needs assessment for the sanitation district showed a need for a FOG program and the City is working to develop a program that will serve the needs of the sanitation district and water quality.

3.3.1.3 Compliance and Enforcement

The City continues to use routine inspections as its primary means of compliance certification for industrial facilities. All industrial and high priority commercial facilities in Lemon Grove are now being performed by new in-house staff. The staff turn-over and development of new internal systems will be a slow process, but the City hopes to have a database, based on the one previously utilized and created by D-Max, up and running by the next reporting cycle. All required inspections were performed this year for both commercial and industrial facilities. Frequently found concerns were lack of good housekeeping training below the management level and poor spill control programs. The City has already begun follow-up investigations. The new staff person also functions as a code enforcement officer, so if continued violations are observed, the process for dealing with those violations is more streamlined and time efficient.

The City sent no code enforcement letters based on inspections during this reporting period to local industrial and commercial facilities. No complaints or investigations were needed at local facilities. The City is working on responding to the suggestions based on the inspection results for any follow-up visits. The final report was not received until after the end of the reporting period, but the City is working to schedule second inspections at several facilities and sending educational information to several others. The educational materials explain the NONA/NEC possibilities and what is required of each facility. Attachment B-3 contains a copy of the education packet now available for distribution.

3.3.2 Outreach to Industrial and Commercial Businesses in FY 2007-08

The City provided outreach to the industrial and commercial sector through several avenues in FY 2007-08. Specific activities are described below.

3.3.2.1 Outreach Events Targeting Industrial and Commercial Audiences

During this reporting period the City did not perform any outreach events that targeted Industrial audiences directly. However, through the inspection process, all industrial facilities are reached in some manner with water quality information. Each facility receives a copy of their inspection complete with recommendations for improvements. In future years the City plans to up-grade its industrial outreach. The following is a list of the activities the City wishes to implement in future reporting periods:

- Workshops on water sampling (a number of facilities are in violation on this aspect)

- A general information sheet about compliance with the General Industrial Permit and the Permit affecting the local jurisdiction
- Workshops on dry-cleaning methods for spills and general good house-keeping practices

Some activities that the City is currently engaged in will continue. A listing of these activities is below.

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Outreach at public events such as the Winter Bonfire and Spring Festival

The City continues to increase and develop its outreach to the automotive facilities and food and beverage facilities. Some of the tactics used during inspections include:

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Continued use of the *What's Cooking Guide*
- Outreach at public events such as the Fire Station open house and the Winter Bonfire

The City also hopes that by bringing their inspections in-house, more detailed outreach will obtainable and pursueable. Simply having a staff person perform the inspections increases the level and quality of outreach. Violations can be dealt with in a speedy, consistent manner.

Partnerships

The County-chaired Green Business Group continues to make progress in developing a self-assessment program for small automotive businesses. The goal of the program is to recognize businesses that are in compliance with environmental regulations and that take extra steps to go beyond compliance in the areas of pollution prevention, energy, and water conservation, and solid waste reduction and recycling. The program is aligned with statewide green business standards and has already approached several businesses in San Diego County. To promote the use of "green" business practices, a public flyer was developed along with self-assessment checklists that are distributed by workgroup stakeholders during business inspections, trade association meetings, and at various community events. BMP information is included in the checklists and in the supporting materials provided to the businesses. These materials are all included as Attachment C and are available on the Workgroups website at www.projectcleanwater.org/html/wg_green_bus.html.

3.3.2.2 BMP and Pollution Prevention Resources

Providing business representatives with useful sources of BMP information is a major focus of the City's stormwater program, and is emphasized in other regulatory programs as well. In this respect, particular stress is placed on pollution prevention practices.

The City's Pollution Prevention Program continued to promote pollution prevention practices among local businesses and the public during this reporting period. Stormwater and urban runoff messages are incorporated into all pollution prevention literature and program content. Through this program, the City continues to pursue partnerships, which provide important opportunities to integrate industrial stormwater program elements into existing programs, materials and avenues of distribution.

3.3.2.3 Outreach During the Inspection Process

Personal communication through the inspection process is perhaps the most effective means of imparting useful BMP information to industrial operators. As described below, DMax conducted twenty-four industrial facility inspections during this reporting period. During these inspections, DMax provided detailed compliance information for facility operators. Direct communication through the inspection process, augmented by various other outreach tools, will continue to be the City's primary means of outreach to industrial businesses.

3.4 Compliance and Enforcement

In addition to educating business owners and operators, the City now provides in-house inspection services to conduct routine inspections and respond to business-related complaints to verify and enforce compliance with stormwater requirements. In all instances, enforcement is pursued as necessary to return violators to compliance.

3.4.1 Inspection of Industrial Facilities

The City inspected all twenty-seven industrial facilities during this reporting period. One hundred percent of the City's industrial facilities were inspected including low and medium level facilities.

Each industrial inspection consists of observable behavior and asked questions. The first portion of the inspection details facility and site information. The general information includes all required codes and classification information.

The inspection also includes a section detailing the BMPs in use, both observed and discussed. The final portion details recommended improvements and possible City action. The majority of compliance actions that were recommended

dealt with the up-graded high priority facilities and the need for them to file NOIs or NONA/NECs and create monitoring programs. The facilities will be re-inspected and the necessary paperwork followed-up with during the next reporting cycle. The City has already contacted several of the facilities and is working with them to ensure they are in compliance with the Permit.

During this reporting period, the City inspected 54 high priority commercial facilities. As stated in section 4.3.1.3 above, the City focused on eating and drinking establishments, automotive facilities, and facilities with non-compliance comments from past inspections. Inspectors' primary function is to assess compliance with minimum BMP requirements, which are specific to the types of facilities and activities designated as high priority by the Permit. Each inspection is conducted in the presence of a facility operator who has the authority and responsibility to ensure the implementation of corrective actions should they be required. For more inspection data see Attachment B1.

3.4.2 Complaint Investigations Involving Industrial Facilities

To the knowledge of City staff, no complaints were filed against Lemon Grove industrial facilities during FY 2007-08.

3.4.3 Enforcement of Violations at Industrial Facilities

During FY 2007-08, all enforcement activities consisted of detailed notification by letter and a new code enforcement policy. See Attachment B-4 for the flow chart demonstrating the new policy. The City sent BMP housekeeping information to all the industrial facilities listed in the previous reporting period as having improper or poor BMP implementation. The City is currently working to ensure the upkeep of BMPs at its industrial facilities. The City's primary focus during the next reporting cycle will be collaborating with the industrial facilities to ensure complete compliance with water quality standards and pollution prevention efforts.

3.4.4 Reporting of Non-Compliant Sites

The City did not have a situation requiring it to report any non-compliant sites to the RWQCB over the course of this reporting period.

3.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Industrial Component in FY 2007-08.

3.5.1 Narrative Assessment

In FY 2007-08, the City continued a revamping of its notification system. An initial step in this re-designing was the contracting of DMax in 2002 to perform annual inspections of all industrial and commercial facilities in Lemon Grove. However, the staff position has lacked consistency on a year to year basis and keeping a yearly account of facilities in violation has been difficult. The City has a record of all notices, but no database to assist in analyzing the information. During this reporting period, the City began to establish a data base to chronicle notifications as well as hiring in-house staff to perform facility inspections. A database will facilitate later effectiveness assessments by allowing the City to analyze past violations by type and frequency. If a decrease in violations or in BMP violations is evident, then levels of effectiveness are easier to assess. The new staff person is a split position being a part time code enforcement officer and a part time water quality inspector. The City hopes the combination will stream line any compliance issues and limit repeat violations. A continual record of violations will also enable the City to focus its education and outreach to fit the specific needs of the industrial community in Lemon Grove.

The City implemented a new database for tracking industrial and commercial facilities within the City's boundaries. The City is still inputting past data to bring the system up to date to allow for tracking and figuring out how to maintain consistency with the data gathered by D-Max. Each facility will have a file that contains past inspection data and compliance issues. DMax and the City have focused on updating the current business facility list to ensure accurate database information. This was how the ten new facilities were located and re-evaluated for correct prioritization during FY 2006-07.

The City believes its current program is in compliance but can be further developed to make it an outstanding and effective program. The City is aware that the need to assess effectiveness is of high importance. Therefore, the City worked cooperatively with other Copermittees to develop a comprehensive framework for reviewing and possibly revising existing programs (*A Framework for the Implementation of Best Management Practice [BMP] Programs at Commercial and Industrial Sites*, submitted to the RWQCB on October 16, 2003). It is through the use of this framework that the City hopes to improve and further develop its existing program. The City is moving towards a more BMP based program. The City believes that BMPs are the backbone of an effective program. Through proper implementation, BMPs present an excellent measuring medium. Once the BMP is in place, the prevented pollutant load can be assessed.

In 2004, the Stormwater program came under new management. The City combined its Public Works Department and its Engineering Department. In August 2004, the City hired a new Water Quality Program Analyst. The yearly turn-over in the stormwater position has made it difficult for the program to develop and grow. However, the City is working on making certain elements

standard, so that a basis is present from which growth can occur regardless of who is running the program. Combining the above mentioned departments facilitates the collection of stormwater data. Public Works personnel are the front-line, so to speak for City stormwater maintenance. By having them in the same department as the Stormwater manager, it will be easier to assess and improve collection methods and data.

No specific management practices or BMPs relating to industrial facilities or activities were identified as being ineffective during this reporting period.

3.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

Target 1
Begin database for tracking non-compliant facilities
50% complete (the database needs more back data entries to be accurate)

Target 2
Update JURMP industrial and commercial list through the new inspection process
85% complete

Target 3
Provide educational material to those facilities eligible for NONA or NEC
100% complete

Target 4
Create annual activity specific informational mailer
30% complete

Target 5
Increased outreach at community events

100% complete

Target 6
Increased outreach to eating and drinking establishments
85% complete (more detailed outreach is still desired)

Target 7
Increase outreach to automotive facilities
85% complete (more detailed outreach is still desired)

Target 8
Improve education through business license renewals and new business licenses
40% complete (still working on informational mailer to include in renewal notice, in-person staff interaction has increased when applicants renew at City Hall)

Level 2 Outcomes: Changes in Knowledge / Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Commercial Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change / BMP Implementation

A new aspect of the 2005 Industrial and Commercial Inspection Program involved each inspected facility being assigned a rating to reflect the level of BMP implementation noted at the site, and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge. The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs, and were assigned based on how many of the following questions were answered correctly:

- What is storm water?
- What is the difference between the storm drain system and the sanitary sewer system?
- Where does storm water flow to?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good housekeeping or best management practices are?
- Do you know what NPDES is or means?

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention

measures and the NPDES Storm Water Program were rated “Level 5”. Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a “Level 4” rating. “Level 3” rating indicated an individual who answered three questions correctly, “Level 2” indicated one or two correctly answered questions, and a “Level 1” rating indicated that the individual was not able to answer any of the questions correctly.

At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- “Level 5”: All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- “Level 4”: BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business’ activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- “Level 3”: BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- “Level 2”: Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open and oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- “Level 1”: A violation of one or more of the City’s Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs, and/or significant littering) was noted. BMP implementation was poor.

The table below provides a breakdown of information from the 2005 Industrial Inpsection Program stating the average and median ratings for BMP and knowledge assessements, as well as rating frequencies:

Table 3.2 Program Scores for FY 2006-07 & 2007-08**

	Knowledge Assessment *	BMP Assessment
Average Rating	2.6	3.5
Median Rating	3	3
# of "Level 5" Ratings	6	25
# of "Level 4" Ratings	28	34
# of "Level 3" Ratings	30	49
# of "Level 2" Ratings	22	12
# of "Level 1" Ratings	33	4

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

Table 3.3 Program Scores for FY 2005-06

	Knowledge Assessment *	BMP Assessment
Average Rating	2.39	3.33
Median Rating	2	3
# of "Level 5" Ratings	0	14
# of "Level 4" Ratings	9	26
# of "Level 3" Ratings	34	30
# of "Level 2" Ratings	26	11
# of "Level 1" Ratings	18	7

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

As indicated by the assessment ratings breakdown, the overall knowledge and BMP implementation ratings were not particularly high. Knowledge assessment scores in particular were quite low. Sixteen percent of inspected facilities had BMP assessment scores of "5", indicated that no corrective action recommendations were necessary. This being the first year that this rating system was used, there is no prior standard with which to compare these ratings. It is anticipated that subsequent year's assessment ratings will increase as businesses receive more educational materials and become more familiar with the City's storm water program and what is expected of the businesses.

Level 4 Outcomes: Load Reduction Estimation

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 5 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

3.5.3 Spatial and Geographic Analysis

The stormwater runoff in the City of Lemon Grove drains to two waterways that eventually end in the San Diego Bay; Chollas Creek and Sweetwater River. See Attachment B-5 for drainage zones.

Section 4.0 Residential Component

The City implements a variety of programs to prevent and respond to discharges from residential areas. All of these programs are predicated on the assumption that knowledge and awareness are crucial to affecting and sustaining responsible behavior. Whenever possible, programs and activities are tailored to reflect the unique characteristics of the many areas of Lemon Grove and the diversity of its residents.

4.1 Priority Residential Sources

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment C-1 contains a demographics chart for the population of Lemon Grove. As Attachment C-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

4.2 BMP Requirements

The JURMP document lays out minimum Best Management Practice (BMP) requirements corresponding to all identified categories of high priority residential sources.

4.2.1 Minimum BMP Requirements

As described in JURMP section 5.3, the City establishes basic BMPs for all manner of residential activity. Below is a list of the activities covered in JURMP section 5.3:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home and Garden Care
- Disposal of Household Hazardous Waste
- Disposal of Pet Waste
- Disposal of Green Waste

JURMP section 5.1 emphasizes the importance of pollution prevention, making it the basis for the BMPs described in each of the above listed activities.

4.2.2 Pollution Prevention Methods

The City encourages its residents to use pollution prevention BMPs through a variety of educational programs and activities. The core function of the City's pollution prevention efforts is to promote the use of these practices by City residents, local businesses, and municipal employees. Pollution prevention concepts are also incorporated into virtually all of the City's literature on water quality.

Providing residents with useful sources of BMP and pollution prevention information is a major focus of the City's stormwater programs, but is emphasized in other regulatory programs as well.

4.3 BMP Implementation

The City takes a multi-faceted approach to ensuring that its residents implement required and recommended BMPs. Education remains the preferred approach, but environmentally responsible behavior can also be facilitated in other ways. For example, the City operates a Stormwater Hotline, making it easy for residents who see a potential water quality problem to communicate with City staff. We also provide and support a wide variety of recycling and hazardous waste disposal opportunities in conjunction with EDCO, the local waste disposal facility. The City also encourages public participation in clean-up events, anti-litter campaigns, and other community events. Each element of this approach is described further as follows:

- Outreach to Residents
- Outreach to Schools
- Reporting and Information Resources
- Recycling and Waste Collection Services
- Measurement of Awareness and Behavior

4.3.1 Outreach to Residents

The City implements an outreach program targeting the general residential public. Outreach typically includes a combination of regionally and locally focused activities, but this year staff focused on outreach in the schools.

The City did participate in several joint effort outreach activities with other Copermittees.

4.3.1.1 Lemon Grove Clean-up (April 26-27, 2008)

The City held one collection day through EDCO and their facilities. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The

event during this reporting period took place on April 26-27. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2007-08, as per the HHW program, are not due to the State regulating agency until October 1, 2008; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2008.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2007-08, the City held four e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2008.

4.3.1.3 Chollas Creek Clean-up Event

The City participated in "I Love a Clean San Diego's Creek to Bay Clean-up" event on April 26, 2008. The City chose a new event site this year, a vacant lot adjacent to Palm Middle School in the Swetwater Watershed. Due to the high temperatures experienced that day, only four volunteers participated plus two City staff. The volunteers removed 132 pounds of debris from the site and 87 pounds of recyclable material. See Attachment C-2 for a copy of the full regional report.

4.3.1.4 Printed Outreach

The City utilized three distinct forms of printed outreach during FY 2007-08. The first event was held at the Fire Station Open House and Pancake breakfast on October 13, 2007. The City provided a manned booth that contained HHW information, Creek to Bay Clean-up information, information for service project clean-up events, and the standard stormwater brochures pertaining to pools, over-irrigation, used oil and pet waste. The second event involved distribution of similar brochures and information at the Winter Bonfire on December 7, 2007 and included promotional give-aways pertaining to clean water and HHW. Due to public safety issues, the City is no longer sponsoring a City event in the Spring. Stormwater personnel were on hand at all events to answer any questions and provide further information. Water Quality staff also participated in the Regional outreach event at the San Diego County Fair on June 15 and June 29, 2008. Lemon Grove specific materials were available on those dates. See Attachment C-3 for examples of the brochures available at these events.

4.3.2 Outreach to Schools

School outreach remains a key component of the City's education strategy; however, the City chose to focus its outreach efforts in the commercial and land development areas of the program during this reporting cycle. Due to limited staff and fiscal difficulties, it is important that the City perform as efficiently and effectively as possible. This often requires the City to focus its efforts in a specific area, therefore no school programs were presented during this reporting period. The intent of school programs is to stimulate long-term behavioral change by alerting students to the importance of clean water and environmental responsibility.

The City plans in future reporting cycles to increase its educational outreach. The City firmly believes that long-term behavioral changes are possible, especially with repetition like yearly presentations. The list below details a few of the areas the City would like to explore:

- Individual presentations to science classes
- Large school presentations in conjunction with other school programming like during pollution prevention week
- Encouraging student involvement in volunteer cleanup efforts
- Creating student specific cleanup events
- Encouraging involvement in larger environmental programs and opportunities like Arbor Day and Jiminy Cricket's Environmentality Challenge
- Improved internet links for students through the City website
- Create a listing of community service projects that are water quality specific for scout troops, school groups or other volunteer groups
- Material distribution at community events targeted at school aged children

The City believes that by increasing its community/school outreach, the general population will become better acquainted with water quality issues. Eventually the City will be able to tie awareness to effectiveness and then to load reductions. The City believes BMPs are the key link and that with increased awareness more residents will implement household BMPs on a daily basis. In theory, as long as the correct BMPs are in-place to the maximum extent practicable (MEP), pollutants of concern should no longer be entering the waterways. The City can then measure the amount of prevented pollution.

4.3.3 Reporting and Information Resources

The primary goal of the City's residential program is to ensure that the public has access to useful information about urban runoff and can easily report their complaints to City staff. The City has established a Stormwater Hotline and several public information brochures for these purposes.

4.3.3.1 Stormwater Hotline (619-825-3827)

The City continued to operate its Stormwater Hotline during this reporting period. The Hotline number is now a direct line to Water Quality Staff. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to the stormwater staff for resolution and/or information. The hotline referred approximately six calls during FY 2007-08. Occasionally the Hotline receives complaints that are not related to water quality and those are forwarded to the applicable departments. Most of the complaints are resident to resident issues and can be handled through verbal channels. On occasion, the City delivers a written notification to a group of residents about a persistent problem. The calls were either unfounded or dealt with on a small scale with no code enforcement involvement. The most common type of call received involves neighborly disputes on private property, therefore it is quite common that the City offers advice but no direct action is taken.

4.3.4 Recycling and Waste Collection Services

4.3.4.1 Used Oil Collection

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

Table 4.1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005 (Calendar Years)

Table 4.2 Annual Oil Sales and Used Oil Recycling Rates (in millions of gallons)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005
Lubricating Oil Sales	141.2	140.8	136.2	137.5	142.1	150.0	154.3	163.6	168.0	150.2	150.5	153.5
Industrial Oil Sales	78.0	117.3	140.9	141.7	152.4	176.4	155.7	149.1	147.1	135.8	144.6	123.1
Total Oil Sales*	219.2	258.1	277.1	279.5	294.5	326.4	310.0	312.7	315.1	286.0	295.0	276.6
Lubricating Oil Recycled**	59.9	54.6	56.8	60.9	73.6	76.9	80.0	81.9	83.1	83.7	87.0	91.3
Industrial Oil Recycled**	16.7	19.5	20.8	19.3	11.6	10.4	7.9	15.5	17.5	32.4	32.5	31.4
Total Oil Recycled	76.6	74.1	77.6	80.2	85.2	87.3	87.9	97.4	100.6	116.1	119.4	122.7

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

Table 4.3 Oil Collected by Public Collection Programs (in millions of gallons)

Table 4.4 Oil Collected by Public Collection Programs (in millions of gallons)

	94/95	95/96	96/97	97/98	98/99	99/00	00/01	01/02*	02/03*	03/04	04/05
Curbside	0.9	0.9	0.8	0.9	0.7	0.6	0.5	0.9	.9	1.0	1.0
Form 303	0.6	0.7	1.0	0.8	0.9	1.1	0.9	1.0	1.0	1.0	1.0
Certified Centers	5.6	8.7	10.2	11.3	13.2	15.2	16.3	18.5	19.9	20.6	19.9
Total Oil	7.1	10.3	12.0	13.0	14.8	16.9	17.7	20.4	21.8	22.6	21.9

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the three collection sites and the number for curb-side pick-up. See Attachment C-3 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment A-4 for copies of the Newsletter.

The three collection sites are:

- Auto Zone 7582 Broadway (oil only)
- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

4.3.4.2 Solid Waste Recycling and Household Hazardous Waste Collection

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. Due to reporting errors, the calculations were not complete for this reporting period. During the next reporting period the City will supply our percentage of recycled material for this reporting period.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only one demolition site qualified and completed the program during this reporting period. Citron Court is a new mixed use redevelopment project located at 7385 Broadway that began construction during this reporting period. According to their reports, their demolition site generated 108.2 tons of recyclable materials.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in six collection events for solid waste disposal. Four of the events were in cooperation with a Household Hazardous Waste grant through CIWMB and focused on the collection of e-waste. The other two are an annual Lemon Grove Clean-Up event further discussed above in Section 4.3.1.1.

The City's participation in the Household Hazardous Waste (HHW) grant facilitates the proper management and disposal of toxic materials and household hazardous wastes for residents of the City. The program was created to protect landfills, receiving waters, and the environment. The focus of the clean-up and collection events is to enable residents to safely dispose of their hazardous

materials and bulky discards. See Attachment C-3 for examples of educational material provided to residents.

HHW Collected

See section 4.3.1.1 above for information pertaining to the City's HHW program.

4.3.5 Measurement of Awareness and Behavior

The Permit requires the City to assess how effective its educational efforts are in changing the knowledge and behavior of targeted audiences. This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2007-08.

4.3.5.1 Future Assessment Measures

During the current reporting period, the City utilized observation as the main form of awareness and behavior measurement. However in the future the City plans to incorporate the following measurement tools for the residential component:

- Surveys for school presentations
- Questionnaires for public outreach such as Lemon Grove community programs and the Winter Bonfire events
- Documented observations by City staff
- Year to year tracking of complaints and resolutions

4.4 Compliance and Enforcement

City investigation and follow-up on all complaints of a residential nature during this reporting period are described below.

4.4.1 Complaints Received

The City receives resident complaints on a regular basis both through the hotline and through the regular phone system. The majority of the calls can be handled through verbal interaction, the rest are investigated by City staff. Staff investigated several residential complaints during this reporting period; however the majority were unfounded or untraceable upstream. One incident however is detailed above in Section 4.3.3.1.

The challenge with residential complaints lies in the inability at times to confront the source of the pollutant. Often times the complaints are received after the illicit deed has been committed and the individual placing the complaint has limited knowledge of the source.

4.4.2 Investigation and Enforcement

The City had one residential event that required code enforcement involvement. These events are detailed above in section 4.3.3.1. The complaint was received through the hotline, therefore the details are presented in that section.

4.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2007-08.

4.5.1 Narrative Assessment

The City made a number of important improvements to its residential activities programs in FY 2007-08. This year, the City's outreach efforts to residents and schools demonstrated a clear intention to expose a larger segment of the Lemon Grove population. The City is clearly thinking of long-term results with the increase in school programs. By presenting material at community events, such as the Spring Festival, the Winter Bonfire and the Fire Department Open House, the City can reach a large, diverse sector of the community. By increasing door-to-door communications, the City brought water quality into the home-life of Lemon Grove's residents.

The City provided a variety of waste collection and disposal services to its residents. Through education to increase awareness, and by making these services convenient, attendance at collection facilities and events rose considerably from previous years. This increased participation not only speaks to the quality of these programs, but is encouraging as an indicator of increased support for environmental programs in general.

Recognizing the need for increased measurability, the City plans to increase its evaluation efforts in respect to resident and student awareness. Section 5.3.5.1 details the areas in which the City plans to grow and further develop in coming years. The City believes feedback is a vital part of refining and possibly redirecting future efforts.

No specific management practices or BMPs relating to residential activities were identified as being ineffective during this reporting period.

4.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness

- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activitiy-Based Targets

Target 1
Target outreach based on hotline calls
100% complete

Target 2
Continued presence and outreach at community events
100% complete

Target 3
Larger variety of educational material available
75% complete

Target 4
Improved tracking of hotline calls
65% complete (a database was created near the end of the reporting period)

Target 5
Increase the information available on the City website
75% complete (a new and improved City website is being created and will contain more water quality information and links)

Target 6
Use of door hangers by DPW to notify residents of a potential issue
40% complete DPW staff now has the door hangers but data has not been collected on their effectiveness and no hotline calls were received based on distributed hangers

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Residential Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

As with knowledge and awareness above, the City recognizes a need for such measures in the Residential Sector. Section 5.3.5.1 describes the ways in which the City wishes to develop assessment instruments for knowledge, behavioral change and BMP implementation.

Response to residential complaints is perhaps the only currently utilized method that involves direct observation of residential behavior. The City anticipates that an increase in complaints demonstrates an increase in awareness of urban runoff issues and available reporting resources. Another indication of behavioral change is the participation of the public in activities that prevent waste from entering the City's MS4. In particular, increases in oil recycling totals and household hazardous waste collection (Section 5.3.3) indicate the engagement of residents in environmentally protective behaviors. The City will continue to monitor these measures and to search for additional ways to assess changes in behavior among residents.

Level 4 Outcomes: Load Reduction Estimation

Current methods are not yet sophisticated enough to accurately gauge pollutant-loading reductions resulting from implementation of the City's residential program. This is simply due to the variety and scale of polluting behaviors associated with the residential population. However, certain existing data are helpful in making some initial estimates. As reported in Section 4.3.3, City recycling and waste collection programs diverted 25,600 gallons of used oil and as yet unobtained number of pounds of household hazardous waste from landfills and the storm drain system during this reporting period; as well as the 108.2 tons of recyclable demolition debris from the Citron Court site. Because only a small percentage of either of these waste streams would actually be illegally disposed, adjustment factors were applied to each to estimate load reductions. Both factors were selected in consultation with staff from each of these respective programs; neither is based on data of any sort. Both figures represent the experience and best professional judgment of staff. Load reduction estimates are shown in Table 4.5.

Table 4.5 - Summary of Residential Load Reduction Calculations

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Used Oil Recycling	25,600 gallons	10%	2,560 gallons
C&D Ordinance Recycling	17,852 pounds	1%	179 pounds

Because of the diversity of residential activity types in the City, no further attempt has been made this year to estimate reductions in pollutant loading that might be expected as a result of implementing the City's regulatory oversight program in

FY 2007-08. In the future, The City will continue to seek to develop valid methods for estimating load reductions from residential sources.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

4.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period.

Section 5.0 Land-Use Planning Component

This section describes actions taken by the City during FY 2007-08 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

5.1 Assessment of Planning Process

During the current reporting period, City staff developed mechanisms in the planning process to provide improved water quality and watershed protection for new developments. The City is working to effectively integrate these principles and practices into the entire planning process. An important objective of the improvements is to develop land use goals and policies that will maintain a built environment compatible with, and sensitive to, the City's natural setting, while retaining the unique local character.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment D-1 shows the form that is presented to each applicant regardless of project size. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

5.2 Mapping Impervious Cover

Water quality data is the most definitive measure of determining the quality of our watersheds. However, because extensive data sets are not always readily available for the City's watershed, mapping impervious surface coverage can provide an important predictive tool to complement empirical methods. National research over the last decade has shown a significant correlation between impervious surface coverage and water quality. Development generally results in

an increase in both pollutant sources and impervious surfaces. In the Permit, it states, "Numerous studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving water quality. Significant declines in the biological integrity and physical habitat of streams and/or receiving waters have been found to occur with as little as a 10% conversion from natural to impervious surfaces. (Developments of medium density single family homes range between twenty-five and sixty percent impervious)."[1] The increase in pollutant sources, (i.e. parking lots, buildings, rooftops, and streets) contributes to increased pollutant loads in stormwater runoff, while corresponding increases in impervious surfaces limit the land's natural ability to filter these pollutants. As a result, developed areas typically experience higher runoff volumes and lower runoff quality. The challenge presented to the Copermittees in the mandate is to reduce harmful runoff (a product of development), while complying with the State mandate of increasing housing stock and creating affordable development projects.

Mapping impervious surface coverage helps land use professionals better predict watershed health and guide growth patterns to minimize the impacts of development on water quality. The City lacks the sophisticated equipment necessary to create a complete and accurate impervious surface map. However the City has made a good faith effort to determine on average how much impervious surface is present within its boundaries.

To determine the impervious surface of the commercial and industrial portion of the City, a survey of parking spaces was taken. To determine impervious surface amounts for the residential sector of the City, the City averaged each residence as having two parking spaces. Table 5.1 shows the results of this study and Attachment D-2 presents a partial breakdown of the parking survey taken. The full document is rather lengthy, but is available upon request.

Table 5.1 - Results of Parking Space Study

Source	Total Number of Spaces	Acres covered by Impervious Surface
Churches	1,510	5.62
Apartments	2,367	8.80
Schools	741	2.76
Commercial and Industrial	9,604	3.36
Residential[2]	17,444	64.87
Totals*	**31,666**	**117.77**

***** Totals are based on the average sized parking space, which is 18'x9' with a=162'

[1] California Regional Water Quality Control Board, San Diego Region. Order No. 2001-01; NPDES No. CAS0108758, p.2. retrieved from www.swrcb.ca.gov on May 30, 2004.
[2] Based on 8,722 housing units. Information from *2030 Cities/County Forecast*, available through www.sandag.org .

In the process of conducting the study, the City discovered some inconsistencies with parcel numbers and addresses. These inconsistencies are slowly being rectified based on need and time available.

The City hopes in future reporting years to utilize the study information in estimating load reductions.

5.3 Land Use Professionals Resources

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

5.4 Development Project Approval Process

As required by Permit Section F, the City has modified its discretionary land use permitting process to incorporate specific water quality requirements. The basic process is laid out in the City's General Plan, Chapter 17.28 *Procedure and Administration*. The Plan, itself, does not delineate for water quality; however the City includes water quality personnel in all development proposals.

The developer must submit all required documents at the beginning of the process. The project Stormwater Maintenance Plan (SWMP), Stormwater Pollution Prevention Plan (SWPPP) and/or Standard Urban Stormwater Mitigation Plan (SUSMP); plus the Hydrology Study are all due with the Site Plans for checking and approval from the on-set of the approval process. As stated in Section 6.1 above, this is to ensure a complete presentation for project approval by the Planning Commission.

The City has updated its checklists for developers to include water quality related lists. See Attachment D-3 for the final version of those lists. The City has received positive verbal feedback from the applicants who have utilized the new

checklists. The City also refers many applicants to the Lemon Grove SUSMP on our City website for further information about water quality guidelines. The Lemon Grove SUSMP can be found at the following web address:

- http://www.ci.lemon-grove.ca.us/clg/cityhall/Default.asp

During the current reporting period, the City reviewed eight potential SUSMP development projects with in the City limits. The following chart shows the development projects under review during this reporting period.

Table 5.2 SUSMP Projects Under Review FY 2007-08

File Number	Project Name	Applicant	Description
TM 0047/PDP 04-02	Center Hilltop Condos	Kevin Leon	Small multi-family housing unit
TPM 0042/0049	Citrus Heights*	Carter Reese	78 single family home development
TPM 0180	Citron Court Condos	Community Collective	12 condo units
TM047/PDP04-002/VA06-001	8137 Casio Ct.	Kevin Leon	12 condo units
PDP06-008	8247 Broadway**	Troy Richardson	Used auto sales
Engineering Review	6670 & 6700 Federal Blvd	EDCO Waste and Recycling	Public Improvements and SUSMP update
TPM 0174	7872 Mt Vernon St.	Kai Adler	3 lot single family subdivision

*Project on hold due to desire to sell. **This project is in Code Enforcement for illegal usage as per their conditional use permit.

The City requires all major projects, determined to be significant contributors to post-construction pollutant loading, to file a SWMP. The document ensures that effective BMPs will be put in place to foster long-term water quality improvements. The requirements for a significant contributor are listed below:

- Residential development of 100 units or more.
- Residential development of 10 to 99 units.
- Commercial development greater than 100,000 square feet.
- Automotive repair shops.
- Restaurants.
- Hillside development greater than 5,000 square feet.

- Projects discharging to receiving waters within Environmentally Sensitive Areas
- Parking Lots greater than 5,000 square feet or with greater than 15 parking spaces and potentially exposed to urban runoff.
- Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater.

A *Preliminary Grading Plan* and the *Preliminary Hydrology/Drainage Study* are the technical basis for the SWMP; however, changes and refinements to the SWMP may be required as technical review of the application and completion of CEQA documentation continues. The complete SWMP must provide at least the following:

- A project description;
- An identification of water quality pollutants of concern and a proposed treatment volume base on the applicable design storm, site plans and adjacent land use, and soil characteristics;
- An identification of mitigation measures, including structural treatment BMPs, to protect water quality and prevent increases in downstream erosion to the maximum extent practicable;
- Agreements, easements, and licenses relating to proposed BMP construction, location, maintenance, or changes in drainage character;
- An identification of the beneficial uses of impacted receiving water bodies, including groundwater; and
- An identification of Section 303(d) impaired water bodies potentially impacted by the project.

The associated *Preliminary Grading Plan* and *Preliminary Hydrology/Drainage Study* must be prepared by a registered civil engineer with experience in fluvial geomorphology (drainage patterns). The *Preliminary Hydrology/Drainage Study* is, at a minimum, required to: 1) Characterize pre- and post-construction hydrology, both on-site and downstream, 2) Identify potential off-site discharges of stormwater and any increased potential for downstream erosion, and 3) Identify structural BMPs sufficient to address stormwater issues in compliance with the permit. To assist applicants through the permit application process, City staff has created a checklist for the development of Grading Plans, see Attachment D-5. The City uses the County's *Hydrology/Drainage Guide*, which can be found at www.sdcounty.ca.gov/dpw/watersheds/land_dev/drainage.html.

5.5 Environmental Review Process

JURMP 5.3 summarizes the revisions made to the City's environmental review process for new development and redevelopment projects to incorporate Permit requirements. The process outlined there continues to accurately reflect the

City's environmental review efforts. Attachment D-6 provides the checklist from CEQA that the City utilizes for its environmental review process.

5.6 New Development and Redevelopment Outreach

During this reporting period, the City used a variety of means to educate its customers about the potential impacts of development and redevelopment on water quality. These included direct staff interaction with the public and the development and distribution of informational checklists.

5.6.1 Interaction with City Staff

The City predominately utilizes staff time and the pre-application process to provide water quality information to developers and residents. Attachment D-1 provides the form required of all building and grading permits regardless of project size. Large development projects are rare in Lemon Grove. The City is approximately three miles square and is predominately existing residential development. To ensure that even the small projects are aware of water quality measures, the City requires a signed BMP checklist to be included with any permit application. The City has also created three checklists for any SUSMP redevelopment or new development project. These checklists are used by both City personnel to review SUSMP projects and by developers to ensure complete submittals. The checklists are included in Attachment D-3. The City uses the checklists and counter visits to provide as much education as possible to anyone interested in developing or building in the city limits of Lemon Grove. Face to face time with staff is the most effective way to reach the largest number of permit applicants because they must apply in person with their plans.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator also plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but makes approval faster once the formal submittal is made. The Planning Commission knows that all issues have been dealt with prior to their approval hearing and that City staff has ensured a minimal environmental impact.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable educational resource for both the City and the developers.

City staff meets with all new applicants in some way and eleven open permit applications equal at least eleven consultations within the current reporting period.

5.6.2 Informational Checklists

As discussed above and as seen in Attachments D-3, D-5, and D-6; the City provides all applicants with a variety of checklists pertaining to application requirements. These checklists represent a small portion of the application checklists available for applicants. City staff is always available for further clarification and the Lemon Grove SUSMP is available at the site listed in Section 5.4 above.

5.7 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Land Use Planning Component in FY 2007-08.

5.7.1 Narrative Assessment

Although new development projects approved during the reporting period included adequate BMPs to address stormwater discharges, the City recognized that project level planning tools were largely under-utilized as many projects relied mainly on structural treatment controls, which can be expensive, maintenance-intensive, and less effective than site-design controls. Staff recognizes that it is easier to preserve a project site's natural hydrology through site design, than to artificially control it through detention or retention. As the City increases its outreach efforts, it foresees an increase in awareness of water quality knowledge in developers and the public. By providing developers with as much information at the beginning of the application process, the City hopes to encourage creative designs that improve water quality while maintaining the environmental integrity of Lemon Grove.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven to be ineffective. The City therefore does not currently recommend any changes to this program component.

5.7.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

Target 1
Improve checklists for project submittals for staff use
100%

Target 2
Create a database to track project reviews
75% complete (a database was created, but it needs to be re-vamped to accommodate multiple reviews of the same project in an efficient manner) This project is on hold due to implementation of a GIS system that would allow for integrated tracking.

Target 3
Create a working map of Waters of the State for use by City staff and developers
30% complete (data collection is slow due to limited staff numbers and budget constraints)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 4 Outcomes: Load Reduction Estimation

The primary goal of BMP implementation is to reduce the loading of pollutants to stormwater discharges. An important emphasis of annual program assessment is the estimation of loading reductions resulting from various program activities. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. Quantifying load reductions represents an important endpoint for City assessments. Table 6.2 below demonstrates the direction the City is moving towards for future reporting periods. In future reports, the Table below will provide an initial estimate of the effectiveness of the SWMP process and its ability to reduce the pollutant loadings of selected constituents of concern.

Table 5.3 - Sample Table to Show Pollutant Loading Reduction Estimations

Constiuents of Concern	Loading Factor (lbs/ac/yr)[3]	Total Acreage	BMP Effectiveness Adjustment	Prevented Pollution
Total Copper				
Total Nitrates				
Total Cadmium				
Total Arsenic				
Total Suspended Solids				

SAMPLE

These estimates will provide a starting point for characterizing the benefits of implementing this program element, but are subject to a number of qualifications. First, load estimates assume that all projects are low-density, single-family residential developments. Second, project proponents have discretion in the selection of specific BMPs to meet the Maximum Extent Practicable (MEP) standard required of them. As such, individual projects employ a combination of BMPs, each with varying levels of effectiveness. The percentage adjustment is an estimate of the overall effectiveness of the measures based upon best professional judgment.

[3] Source: Minton, Gary. *Stormwater Treatment – Biological, Chemical, and Engineering Principles.* 2002

This project is being re-vamped due to new collaborations at the watershed level. It is the City's understanding that the new permit increases the emphasis on watershed collaboration and evaluation of up-stream contributors. However the concept is similar, but focused on the type of business (initially automotive facilities), its likely pollutants and the relationship of those pollutants to certain BMP effectiveness. The members of the San Diego Bay Watershed group have already looked at their inspection requirements and are drafting improvements in the BMP compliance and efficiency areas. The City feels it is important to tackle the issue of load reduction on a regional basis to ensure the highest level of effectiveness. The City believes that a more regional and/or watershed approach will result in better, longer lasting water quality improvements.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

5.7.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. See Attachment D-7 for a City zoning map.

Section 6.0 Construction Component

The City implements a variety of programs to prevent and respond to discharges from construction sources. All of these programs are predicated on the assumption that knowledge and awareness is key to effecting and sustaining responsible behavior, but that an active oversight and enforcement presence is also necessary for long-term success. This section describes actions taken by the City to regulate construction sources during the FY 2007-08. It includes the following general types of activity:

- Requiring BMP implementation through ordinance and permit (6.2);
- Encouraging BMP implementation through outreach (6.3); and
- Verifying compliance through inspection and enforcement (6.4).

6.1 Priority Construction Sources

The City maintains a construction permit database. The City currently lists 180 open construction permits. However, because sites are continually opening and closing, that number is not definitive at all times. The number also includes all private and public construction sites. The majority of the current construction permits are for low or medium priority projects.

The City completed 8 minor infrastructure improvement projects during FY 2007-08. Many of them were continuations of partial resurfacing projects from the previous reporting period:

- El Prado
- La Corta
- Primera
- Ramon
- Alberdi
- Buena Vista
- New Jersey
- Lemon Grove Avenue

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

The City had only one high priority construction source at:

- 3615 Lemon Grove Avenue

This was the Honda site mentioned the 2006-07 report that had completed demolition. During reporting period 2007-08, building permits were approved and construction completed on this site. The site became operational toward the end of the reporting and final inspection by water quality personnel was performed. All permanent BMPs were in place as designed and functioning properly. The site was inspected on a weekly basis at a minimum to maintain proper BMP placement and functionality during the construction phase. The following reporting period will be the first year with fully operational permanent BMPs and required maintenance verification.

St. John of the Cross finally completed the last of their phases during this reporting period as well. However, they are currently experiencing some difficulties with Helix water district over the placement of a tree. Renovations maybe required during subsequent reporting periods.

6.2 BMP Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment E-5 gives a breakdown of the City's grading permit requirements.

6.2.1 BMP Requirements for Permitted Construction Sites

Prior to the adoption of this Permit, the City required implementation of sediment and erosion control BMPs. These controls continue today. During FY 2006-07, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);
- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

6.2.1.2 BMP Requirements for Major Grading Permit Sites

Major grading permit applicants are required to submit a Storm Water Pollution Prevention Plan (SWPPP) Addendum to the Grading and/or Building Permit Application. The standards for SWPPP are closely related to those required for developers in the pre-approval process. The biggest difference is the focus during construction, not post-construction.

6.2.2 BMP Requirements for Public Construction Sites

All City-managed Capital Improvement Projects (CIPs), regardless of size, include contract specifications requiring the implementation of BMPs in compliance with the General Construction Permit even prior to this reporting period. Specific BMPs that are implemented on public construction projects were identified in JURMP 7.6 and match those required for private projects. These have not been updated.

6.2.3 Pollution Prevention Requirements

The City continues to encourage and, where appropriate, require the use of pollution prevention practices by construction site owners, developers, contractors, and other responsible parties. Specifically, pollution prevention practices are encouraged in all BMP implementation material. The City requires specific pollution prevention plans from any activity that disturbs more than five acres. These sites must also seek coverage under the General Construction Permit. The City believes that with proper and complete BMP implementation, pollution prevention is a natural consequence.

6.3 BMP Implementation

The City ensures that BMPs are implemented to the standards described in Section 6.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

6.3.1 Construction and Grading Approval Process

The Preliminary Grading Plan enables the City to better evaluate stormwater and drainage impacts on permitted sites The SWMP documents how dischargers will implement BMPs.

Although CIP projects do not require City Permits, their approval process is much the same as for private sites. These projects follow a process to ensure that BMPs are addressed at all phases. Starting at the project planning phase, projects are required to submit a SWMP. The SWMP refines the project by setting source controls, site design, and treatment control requirements. Once all

the elements and concerns have been addressed at the planning level, the project moves into the design phase. During design, construction and post-construction BMPs are introduced into the plans. The plans are then circulated to the Water Quality Program Coordinator for review. At a minimum, this review is conducted when the project design is 30, 70, and 100 percent complete. These checks ensure that BMPs are adequately addressed in the plans and adjoining specifications are included.

6.3.2 Compliance Verification

Actual implementation of on-site and off-site BMPs is verified during site inspections. Inspections conducted during this reporting period are discussed in Section 7.4.1 below.

6.3.3 Construction and Development Industry Outreach

The City places a high priority on educating project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. It is difficult to send mailers or brochures to construction sites because individual job foreman rarely have an office. The City is looking into the possibility of offering training to job site personnel to further increase its educational outreach for construction sites. On the checklist required with each project seen in Attachment D-1, education and training are required BMPs. The City is exploring the possibility of making it a required BMP. Political ramifications must be further researched. Through its Annual Report, the City will keep Regional abreast of its efforts in this area. Until that time, the following educational efforts are currently in place.

Customers are offered a number of educational resources as they progress through the permit application and approval process, including interaction with field and counter staff (Building Inspectors, Planning Personnel and City Inspectors) and distribution of informational checklists and document examples.

6.3.3.1 Interaction with City Staff

City staff (including building inspectors and counter staff) regularly interacts with permit applicants and other members of the public. Personal interaction provides an important opportunity to increase the level of stormwater awareness among City customers. A particularly important interaction takes places at the very beginning of the project. Each applicant seeking a building permit of any kind receives a checklist of required BMPs. This form is being revised for the next reporting period to improve clarity and to streamline the process. From the very beginning, applicants are forced to think of water quality issues. The form is a required part of the application. More information on the initial process is available in Section 5.6.

6.4 Compliance and Enforcement

Compliance and enforcement is an integral part of the City's efforts to address BMPs at the construction phase. Inspections are conducted on a daily basis throughout the City on various projects.

6.4.1 Inspection of Construction Sites

JURMP Section 7.7 provided a description of the City's construction site inspection process. The stormwater component of these inspections is intended to ensure that contractors, property owners, and developers implement an effective combination of BMPs to meet minimum water quality protection requirements. Inspection staff utilizes checklists to assist them in verifying appropriate BMP implementation at each site inspected, and shares with the owner/developer to increase awareness of stormwater requirements and assist them in complying. See Attachment E-1 for a copy of one such checklist. The City conducted 35 scheduled inspections of six active constructions sites. The City also conducted an average of 3 informal inspections of these sites and potential sites weekly throughout the reporting period, providing approximately 156 inspections total during the reporting period. It should be cautioned that while average numbers of inspections are illustrative as a gross measure of program activity, they can also be misleading. As already mentioned, individual sites open and close throughout the reporting period, and significant differences also exist between these sites and their inspection records.

The City has also instituted the use of a construction inspection database to track construction site visits pertaining to water quality and pollution prevention issues. Attachment E-2 contains a print-out of the visits made to all active construction projects during the 2007-08 reporting period. City staff also performs a number of informal inspections by attending joint meetings on site with other staff members or visual inspections while out investigating complaints. City staff believes that a visible presence is an excellent deterrent to non-compliance. If the workers know the site is being observed on a regular basis, they are less likely to let BMP up-keep deteriorate.

The City has just begun to use the new tracking process for construction site inspections. The City records each inspection in a tracking database. The City, due to its small size, currently inspects all construction sites regardless of priority or size. The database also allows the City to track the number of building inspections performed at each site and ensures that each site is visited a minimum of three times. The City is currently with a representative to merge water quality data with the building permit program. This would create a centralized data source for all the businesses and building permits in the City. The building inspector's visits are tracked in a previously existing database

managed by the Planning and Development Department. The City Inspector uses the new database for tracking inspections as well as a BMP checklist that each owner/developer signs and commits to uphold, see Attachment D-1. During all building inspections, water quality concerns are taken into consideration. If the inspector discovers a problem, the Water Quality Coordinator is called upon to make a separate inspection. At the completion of each project, the City requires a final inspection requiring signatures by any involved parties including building, engineering, sanitation, water quality, and planning/development. Without the signatures, the project is not recorded and not deemed complete until all requirements are met. The City requires a water quality signature on all SUSMP projects. The City also requires all building and grading permits to comply with minimum BMPs through the use of a checklist and property owner signed confirmation of said BMPs.

As stated above the City had one active high priority construction site during this reporting period at 3615 Lemon Grove Avenue, the DCH Honda site. This site was inspected according to the weekly inspection requirement even after the rainy season ended.

6.4.2 Enforcement of Construction Sites

City inspectors enforce stormwater requirements according to protocols outlined in JURMP Section 7.8. The City's enforcement program is designed to educate the community, promote compliance with applicable laws and regulations, return violators to compliance in a timely manner, and penalize violators as appropriate.

The City utilizes written warnings, notices of violation, administrative citations, and stop-work orders to enforce applicable stormwater requirements on its construction projects. The City's code enforcement program was in place on a trial basis and has transitioned to permanent policy. The trial period allowed the City Council to see examples of the most common code enforcement violations and for the City to flush out any kinks with the policy. Attachment B-3 contains a copy of the flowchart for stormwater code enforcement efforts.

The policy allows the code enforcement process to be utilized making it easier to deal with any issues discovered while dry weather-testing or site inspecting. With the new code enforcement process in place, the City can deal with any stormwater violations in a more expedited manner than the previous system, which did not allow fines or recuperative costs to the violator. The City also hopes to hire a part-time code enforcement officer with a water quality focus during the next reporting period.

In severe cases of non-compliance, or in the event of significant discharges, it may be appropriate to deny or revoke a permit. As a final resort, the City may use civil and/or criminal court actions under the State Porter Cologne Water

Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

6.4.3 Reporting of Non-Compliant Sites

The JURMP outlines standard operating procedures for reporting non-compliant sites to the Regional Water Quality Control Board. The City did not have occasion to report any non-compliant sites over the course of this reporting period.

6.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Construction Component in FY 2007-08.

6.5.1 Narrative Assessment

In FY 2007-08, the City continued to move its Construction Component forward in a number of important ways. Not only has the intensity of inspections grown, but an additional year of implementation has also allowed City staff and the regulated community to grow more accustomed to assimilating new stormwater regulations into their standard operating procedures. As familiarity and experience increase, the City expects compliance and oversight to improve commensurately.

The City hopes in future reporting periods to increase its outreach in this component. The City plans to host developer and contractor specific workshops dealing with water quality issues and compliance in future reporting periods.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven to be ineffective. The City therefore does not currently recommend any changes to this program component.

6.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

Target 1
Increase construction site inspections
100% complete

Target 2
Track construction site inspections
95% complete (the database continues to be in transition due to the potential for a centralized tracking source for a number of City programs)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 4 Outcomes: Load Reduction Estimation

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between

commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

6.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

Page Left Intentionally Blank

Section 8.0 Education Component

This section provides a brief overview of the City's educational efforts during FY 2007-08. Since education is such an integral part of the all JURMP components, outreach to specific audiences is discussed in greater detail alongside program descriptions in the Land Use, Industrial, Commercial, Residential, and Construction Sections. This integrative organization allows the reader to better understand the context in which education is conducted.

8.1 Overview of Education

City outreach efforts continued to be guided by the three objectives set out in JURMP Section 9.1: 1) configuration and purpose of municipal separate storm sewer systems and how pollutants can be released to them, 2) how urban runoff impacts local receiving waters [mainly Chollas Creek] and surrounding habitats, and 3) BMP solutions that are available for treating or controlling the various pollutants of concern. Specific tools and methods are adapted as appropriate to best convey meaningful information to the target audience. Methods emphasized during this reporting period include:

- Presentations and Workshops
- Direct Mailings
- Community Events
- Educational Material Distribution
- Hotline Resources
- Interaction with Staff

The City participated in four outreach events during FY 2007-08. (See Attachment G for a table detailing each of the events) An accounting of formal events, however, does not adequately convey the significant amount of outreach that takes place during permit processing, inspections, on websites, and via other means. For a discussion on each of these alternative forms of outreach, see sections 3.0 through 7.0 and all corresponding attachments. What follows are overviews and selected highlights from the City's major educational components.

8.1.1 Outreach to Residents

The City implements an extensive outreach program targeting school children and other members of the general public. As the program continues to evolve, the content of the City's outreach will increasingly focus on those pollutants and activities identified by water quality analysis and other program data to be high priorities. Data from the City's Dry Weather Program (See Section 7 due on December 15, 2008) have been used to identify combinations of areas and pollutants that may warrant increased or more focused outreach. We hope to expand on this type of program feedback as data sets become larger and program components increasingly integrated in future years. The City conducted

four residential outreach events during this reporting period, as well as four public participation events. Section 4.3 details these events more extensively. School outreach is another major component of the City's education program. The intent is to stimulate long-term behavioral change by exposing students at a young age to the importance of clean water and environmental responsibility. Similar to how recycling behavior has been significantly modified by targeting school aged children. City staff strives to ensure that classroom presentations are memorable and interactive by incorporating hands-on activities such as watershed models. The previous year's Whale Tale grant was a one year program only, but the City hopes to develop its own elementary education program during future reporting periods.

8.1.2 Outreach to Commercial and Industrial Businesses

The goal of the City's commercial and industrial outreach program is to promote effective BMP implementation by making business operators aware of their regulatory obligations and by providing them with useful information about how to comply. To this end, a variety of methods were utilized during this reporting period (i.e., direct mailings, outreach events, personal communications, educational materials).

Every industrial business and all the high priority commercial businesses on the City's inventory received facility-specific BMP guidance during inspections this reporting period.

It is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation.

Each reporting period, the City plans to increase outreach and improve communications with a new sector of the business and industrial community. Due to limited staff and fiscal limitations, the City must target and focus its program from year to year. However, no program will decrease once the outreach to a specific sector has been achieved. A consistent and constant message is instrumental in creating changes in behavior and increases in knowledge. Each year the City hopes to initiate a new focus area of increased outreach to provide in its annual report.

8.1.3 Outreach to the Construction Industry

The City places a high priority on education project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. Customers are offered a number of

educational resources, the key one being regular interaction with knowledgeable City staff.

During this reporting period, the City increased its outreach to the developers and construction sites within the City. The City increased the number of inspections, both informal and formal. Water Quality personnel review all development plans that are presented to the City. The City requires all permit applicants to complete a construction BMP plan. Water Quality personnel also require a notation on all plans to verify the use of BMPs for the duration of the project. The City continues to use and further develop the information available to contractor and developers. Several checklists are available as well as other educational materials on BMPs, both pre- and post-construction. The City is working on making its stormwater information educational and easier to use for the construction and development sector. The City continues to believe that the increase in inspections confirms the importance and commitment to an effective water quality and pollution prevention program.

Section 9.0 Public Participation

During FY 2007-08 the City continued to actively encourage stakeholder participation in the development and implementation of its Jurisdictional Runoff Management Program (JURMP) through various venues:

- Informational Resources
- Community Outreach Efforts
- Stormwater Copermittee Meetings

In addition to the activities described further below, the City continued to rely heavily on the interaction of staff with members of the public during their regular duties. As described below, the interaction of these staff with the public through various means (i.e., permitting, inspections, presentations, etc.) continued to provide an additional avenue for obtaining direct feedback from the City's customers.

9.1 Public Participation Venues

A key element of an effective public participation strategy is providing the public with easily accessible resources for obtaining water quality information and reporting complaints.

9.1.1 Hotlines

The City continued to operate its Stormwater Hotline at (619) 825-3827. This is a new hotline number for the City. The number is a direct line to water quality staff. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls received are promptly referred to the correct City staff. Complaint responses are handled in a timely manner. The focus is to gain compliance from the erring source, so a speedy response time is crucial. During this reporting period, the hotline received six calls pertaining specifically to water quality issues. Two of those numbers were in reference to construction sites that were not maintaining their sediment BMPs over the weekend. Both instances were rectified without formal code enforcement involvement. These numbers do not represent the number of calls that come through the main phone line and are water quality in nature. The City is working to create a tracking system for these calls.

Table 9.1 – Comparison of Calls

Number of Calls pertaining to Water Quality	Number of Calls with City Action
6	2

9.1.2 Chollas Creek Clean-up Event

The City participated in I Love a Clean San Diego's Creek to Bay Clean-up event on April 26, 2008. Due to the high temperatures that day, the City had four volunteers and two staff members arrive to clean the vacant field adjacent to Palm Middle School on Camino De Las Palmas. This location is in the Sweetwater watershed and was a new clean-up location for the City. The volunteers removed 464 pounds of debris from the site and 428 pounds of recyclable materials. See Attachment C-2 for a copy of the full report for the entire event.

9.2 Stormwater Copermittees

9.2.1 Copermittee Meetings

The City continued to participate in a variety of Copermittee Meetings sponsored mostly by the County. Below is a listing of the Workgroups that the City actively participates in:

- BMP Effectiveness and Assessment Workgroup
- Permit Re-Issuance Workgroup
- San Diego Regional Management Committee
- Dry Weather Monitoring Workgroup
- Regional Monitoring Workgroup
- Report of Waste Discharge Workgroup
- Outreach Workgroup
- Green Business Program Meetings
- Watershed Workgroup (through Port of San Diego)

Each of these meetings occurs once a month on various days or bi-monthly in the case of the Management Committee. The yearly activities calendar of the former Water Quality Coordinator was lost when the computer was re-formatted for a new user, so dates are un-available for attendance records. However, each meeting was accompanied by a sign-in sheet supplied by the sponsor, typically the County. The County would have records of the City's participation in the above listed groups.

9.2.2 Collaborative Efforts with Copermittees

This section will highlight two particular collaborations that will be highly beneficial to Lemon Grove and the region.

Chollas Creek Water Quality Protection and Habitat Enhancement Project

The Chollas Creek Water Quality Protection and Habitat Enhancement Project (Chollas Creek MOU) is an agreement between the City of San Diego and the members of the Chollas Creek watershed. The City of San Diego applied for the Chollas Creek Grant to create a more comprehensive education plan for areas in the Chollas Creek watershed. The Grant included regional educational materials and programs. The Grant provided for Chollas Creek clean-ups and restoration to native habitat in and around the stream-beds. The City benefited from the programs and educational material when they joined as a Grant partner. San Diego provided the in-kind money; they are asking the partners to provide in-kind services only. The in-kind services will be equal to roughly $10,000; no actual money is exchanged. The City assisted in educational material development, local programming for businesses and schools, and offered assistance at San Diego meetings pertaining to the grant. The Chollas Creek MOU went into effect in 2005. The City feels this collaboration is beneficial to the City of San Diego, to Lemon Grove, and the residents in both cities. Although this grant is complete, the City continues its education efforts in reference to Chollas Creek.

County of San Diego Green Business Program

The City increased its involvement with this program by offering an automotive workshop during this reporting period. The City looks forward to continuing these efforts and further improving its outreach to the local and regional business communities. This partnership has provided the City with valuable insight into local, state and federal regulations pertaining to pollution prevention and hazardous materials. In turn, the City has provided the program with an increased awareness of water quality programs and regulations.

Section 10.0 Effectiveness Assessment

10.1 Introduction

This section provides an overview of the methods used in this report to assess the implementation and effectiveness of the City's JURMP for the period of July 1, 2007 through June 30, 2008. As with the programs themselves, the City's approaches to effectiveness assessment have evolved considerably during this period. An important aspect of these new and augmented programs is ensuring their measurability and their nexus to changes in discharge and receiving water quality. In particular, Permit sections F.7 and I.1.a.F.7 require that the City identify and report on measures to assess the effectiveness of JURMP implementation and identify strategies for assessing long-term program effectiveness.

The City is taking important steps toward the development of new and improved methods for conducting assessments, and in putting those methods into practice in this report. This section provides an overview of the approach that the City has taken to conduct its effectiveness assessment this year. However, the actual assessments are contained throughout the remainder of this report within their respective program components. Specifically, the following sections contain effectiveness assessment elements, each following a common organization described further in Section 11.2 below:

- 2.0 Municipal Component
- 3.0 Industrial Component
- 4.0 Commercial Component
- 5.0 Residential Component
- 6.0 Land Use Planning Component
- 7.0 Construction Component
- 8.0 Illicit Discharges Detection and Elimination Component

The scope and content of these assessments varies widely for each program element. However, in all cases, the City has included sections corresponding to each of the major effectiveness assessments elements described below.

10.2 Assessment Approach

The City and other Copermittees have in past years described a number of basic measures that can be relatively easily tracked and quantified. The City's objective is to go beyond those efforts by more closely scrutinizing existing measures with an eye toward a more complete understanding of their meaning and value to the effectiveness assessment process. From this, the City has also endeavored to identify where new or revised measures might be needed. Our starting point was the collaborative development of the document, *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management*

Programs, submitted to the RWQCB on October 16, 2003. This document represents the Copermittees' current thinking on how effectiveness assessment can best be approached now and in the future. More importantly, it procedes an important starting point for the evolution of more detailed and sophisticated strategies by the City and other Copermittees. The remainder of this section draws heavily on the content of that framework.

The City's approach to effectiveness assessment as reflected throughout this JURMP Annual Report, is organized according to three primary elements, each described below:

- Narrative Assessment
- Assessment of Specific Measures
- Spatial and Geographic Analysis

10.2.1 Narrative Assessment

In previous comments on the City's JURMP, RWQCB staff has indicated a desire for a more detailed discussion of successes, strengths and weaknesses, and outstanding program features. The narrative assessment addresses this concern by qualitatively describing major programmatic achievements from throughout the year. Other more specific and quantifiable measures are addressed in the remaining portions of the assessment.

Permit Section I.1.g also requires that the City identify in its JURMP Annual Report any management measures proven to be ineffective in reducing urban runoff pollutants and flow. Each narrative assessment section also includes the identification of any such measures identified in the reporting period.

10.2.2 Assessment of Specific Measures

This section provides a short overview of several of the key concepts and organizing principles of *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*. That document should be read in its entirety for a more complete understanding of the City's long-term effectiveness assessment strategy. Due to the length of the document, the City has not included it in this report. However, a copy is available on request.

Essential to increasing measurability is the establishment of clear and meaningful measures that can be tracked over this and future reporting periods. To establish such measures, it is crucial that the desired or targeted outcomes of any particular program activity be clearly identified and understood. Attachment I illustrates six basic levels or categories of outcome that can be employed for any of these six levels. The City's assessment intends to follow this basic model. Ultimately, the objective of the effectiveness assessment process is to identify measures at the highest level of the hierarchy possible. In doing so, knowledge

gaps between program activity and water quality outcomes can best be addressed. It is important to note, though, that a single measure will rarely provide a complete picture of any program area. Multiple measures will therefore usually be utilized for many program activities.

10.2.2.1 Compliance with Activity-Based Permit Requirements (Level 1)

This level consists of activities that are prescribed by or established under the Permit (updating source inventories, training staff, conducting inspections, etc.). A fundamental feature of Permit-derived programs is the explicit establishment of specific activities that are assumed, but not proven, to be beneficial to water quality. While many of the assumptions underlying the establishment of required activities may be correct, there are currently few means of quantifying or establishing causal relationships that will make many of them more measurable. The City's long-term goal is to explore these assumptions in more depth; this year's report focuses on clearly defining the intended outcomes of these activities and identifying specific measures by which them can be accurately assessed.

10.2.2.2 Changes in Knowledge/Awareness (Level 2)

The most immediate and basic outcome of many urban runoff program activities is a change in the knowledge, awareness, or attitudes of target audiences (learning that storm drains and sanitary sewers are separate systems, that everyday activities contribute to water pollution, etc.). Such changes are most often targeted through outreach or training programs. Not an end in themselves, these changes presumably form the basis of behavioral change, or BMP implementation.

10.2.2.3 Behavioral Change/BMP Implementation (Level 3)

Building on increases in knowledge, the City's primary objective is to affect significant and lasting changes in the behavior of municipal employees, residents, and business representatives. Behavioral outcomes are usually expressed in terms of BMP implementation since this is the overriding objective of the City's programs. Since this is the level at which actions are actually taken, estimating or quantifying BMP implementation is a necessary component of a successful effectiveness assessment strategy. It is also necessary as a precursor to establishing load reductions. Several elements of this year's report include a discussion of BMP implementation.

10.2.2.4 Load Reductions (Level 4)

The primary goal of BMP implementation is to reduce the loading pollutants to stormwater discharges. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. The primary purpose

of conducting a load reduction estimation exercise is to better understand the benefit of conducting high priority activities (i.e., to characterize the expected reduction in loading of contaminants to the MS4).

The City regards the estimation of load reductions as the key to its assessment process. By working to establish Level 4 outcomes for lower level activities, we hope to increasingly improve our understanding of the relationship of these activities to water quality improvement. Because these efforts are both difficult and speculative, and often require data and information not readily available, this year's assessment includes load reduction estimates in only a couple of areas. In future years, our understanding of the many assumptions that must be made to address existing uncertainties, and variables that affect any given measure, will improve as we document and study them. Our goal this year was simply to develop and test some basic approaches.

10.2.2.5 Changes in Discharge Quality (Level 5)

In many respects, changes in discharge quality are the most direct expression of successful program implementation. Measurable improving the quality of discharges both into and from the City's MS4s will therefore be an important targeted outcome. Establishing relationships between discharge quality and specific program components, however, is beyond the scope of this year's assessment.

10.2.2.6 Changes in Receiving Water Quality (Level 6)

The ultimate objective of the City's programs is the protection and improvement of water bodies receiving discharges from its MS4. Both discharge quality (level 5) and receiving water quality are addressed through the City's Dry Weather Program (Section 8) and the Copermittees' Receiving Water Monitoring Program (submitted under separate cover). Establishing relationships between receiving water quality and specific program components, however, is beyond the scope of this year's assessment.

10.2.3 Spatial and Geographic Analysis

Several sections of this year's report contain analyses of program data aimed at better understanding their spatial variability and its relevance to program implementation. The approaches utilized are simple and straightforward. Data is examined regionally, by watershed, and by community to identify potentially significant trends. For instance, clustering of a particular business type may warrant outreach efforts that are specifically focused in a watershed. The City hopes to develop more sophisticated methods of spatial and geographic analyses in the future. At the same time, it is important that our understanding of the potential uses of program data evolve concurrently. Any type of meaningful

analysis is limited by the amounts and quality of data that are available to support it.

During this reporting period, the City finished a preliminary needs assessment for the implementation of a city-wide GIS program. The needs assessment encouraged the City to update its existing base data and layers using modern technology. The City hoped to have the initial phase up and running by FY 2007-08. However, due to budget constraints, the City was forced to put the initial phases on hold until the next reporting period. The City sees GIS as a powerful compliance and collaboration tool that will make tracking and reporting more efficient and accurate. The full implementation of the GIS program is dependant on budgetary constraints in future reporting periods.

Section 11.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

11.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 12.1.

Table 11.1 – 2007/2008 Fiscal Analysis Summary

Stormwater Cost Analysis
All costs covered in the General Fund.

ACTIVITY	CURRENT YEARLY BUDGET	CURRENT BUDGET LOCATION
STORM DRAINAGE CLEANING AND MAINTENANCE		
Public Street and Parking Lot Sweeping		Streets
Streets	$30,000	
Parking Lots	$2,000	
Public Street and Parking Lot Sweeping Total	$32,000	
Litter Removal		
Litter Removal	$13,000	
Litter Removal Total	$13,000	
Storm Drainage Cleaning		
Inlets		
Inspection and Cleaning	$19,820	
Fossil filter replacements	$1,400	
Inlets Subtotal	$21,220	
Basins and Channels		
Inspection and Cleaning (Note 1)	$38,829	
Basins and Channels Subtotal	$38,829	
Video Inspections		
Video Inspections (Note 1)	$50,000	
Video Inspection Subtotal	$50,000	
Storm Drainage Cleaning and Maintenance Total	**$155,049**	
STORM EVENT ACTIVITIES		
Sandbag stock piling and placement	$4,000	
Patrols	$3,089	
Storm Event Total	**$7,089**	
ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM		Engineering

		Services
Dry Weather Testing	$20,000	
Enforcement	$5,000	
Administration/Supervision	$1,000	
Stormwater HotlineComplaints	$2,000	
Illicit/Illegal Enforcement Program Total	**$28,000**	
STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)		
Construction Related SWPPP	$2,000	
Plan Review (including SUSMP's)	$15,000	
Inspection	$3,000	
Construction Related SWPPP Subtotal	$20,000	
Municipal Facility SWPPP		
SWPP Implementation, Inspection, and Maintenance of Municipal Facilities	$18,798	Streets
Municipal Facility SWPPP Subtotal	$18,798	
All SWPPP Activities Total	**$38,798**	
BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION		
Inspection of Industrial and Commercial Facilities	$50,000	
Inspection of Municipal Facilities	$1,000	
BMP Total	**$51,000**	
MISCELLANEOUS ACTIVITIES		Engineering Services
Annual Reporting (JURMP)	$5,000	
Administration (General)	$74,004	
NPDES Permit Fee	$7,500	
Public Education/Outreach	$5,000	
Miscellaneous Activities Total	**$77,504**	
PROGRAM TOTALS	**$371,440**	

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2006-07 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

11.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.

Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

The City's seventh Annual Report overall and the first submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents a full year of water quality activity and programming in the City of Lemon Grove. We are confident that the report demonstrates our success in building a program that meets and often exceeds Permit requirements. At this same time, the annual reporting process offers an important opportunity to critically assess program implementation, and to identify areas in need of modification or improvement.

The programs described in this report to be significantly expanded and improved over previous years, as is evidenced by the numerous accomplishments described. City staff once again responded positively to the implementation challenges presented by the Permit; thanks to a sustained team effort, we continued to improve and augment our programs.

Moving forward, it is important to keep in mind that meaningful measurement is a necessary part of a successful program strategy. This year's report reflects more monitoring, more data, more assessment, and more deliberation on the part of City staff than ever. This speaks well of the City's program, but it is only a start, the stormwater puzzle will take many years to solve. The increased focus on measurability that is manifested in this report must remain a focus. In particular, the new and innovative approaches to effectiveness assessment that the City helped to pioneer must continue to actively evolve. The framework set out in the document *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* provides a great deal of useful direction, but success is not guaranteed. Staff will need to develop and embrace the detailed measures and measurement tools necessary to track and evaluate long-term success. Similarly, we will also need to continue looking for ways to improve and best utilize our monitoring programs so that they continue providing timely and useful information.

As in previous years, the City continued to demonstrate strong collaboration with other Copermittees throughout the reporting period. This is reflected in the quality and vision of the Copermittees' many collaboratively conducted activities. Such collaboration has become a hallmark of the Copermittees' programs and must continue to be. Future success will require no less collaboration.

This year's report is characterized by a higher integration of elements than in the past. Although the City's programs are implemented over numerous departments, the coordination and communications between those efforts has been commendable. Our experience over the past year has also shown that we have many new challenges ahead of us. Many of the City's stormwater programs and activities are still in their infancy. Unlike many other regulatory programs, the way forward is neither easy nor straightforward. The City has also

dealt with severe budget constraints during this reporting period and does not expect them to mitigate during the next reporting period. The issues being confronted on the national and state levels have drastically affected our local communities and budgets. These factors continue to make meeting the demands of this program fiscally challenging. Meeting these challenges and the challenges ahead of us will require continued diligence and good humor.

Certification Statement

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2007-08 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment. What follows is a summarized list of where each IC/ID program component is discussed in this Annual Report:

- Dry Weather Monitoring (Section 7.1)
- Spill Prevention and Response (Section 7.2)
- Public Reporting of IC/IDs, Complaint Investigations, and Enforcement (Sections 3.4, 4.4, 7.3, 7.4)
- Used Oil and Toxic Materials Disposal (Section 4.3.4)
- Limiting Infiltration from the Sanitary Sewer to the MS4 (Sections 7.5 and 2.1.4)

7.1 Dry Weather Monitoring Program

This section provides and overview of the results of the City's 2007 Dry Weather Analytical and Field Screening Monitoring Program (Dry Weather Program), which is implemented by DMax. This section will provide a complete copy of DMax's findings and report.

7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 123 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls five were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 3.4 and follow-up and enforcement for residential complaints is dealt with in Section 4.4.

7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 5.3.

7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 2.1.

7.6 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its IC/ID Component for FY 200-08.

7.6.1 Narrative Assessment

In FY 200-08, the City continued its Dry Weather Program through a contract with DMax Engineering. The City saw significant improvements in its site testing. This year's sampling was further increased the City's knowledge and awareness of its watershed and waterbodies. This is reflected in the specific recommendations contained in D-Max's report and findings found attached to this section.

The City also continues to attend the Regional Dry Weather Monitoring Workgroup to assist in watershed improvements together with other copermittees.

7.6.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

The City did not track activity targets during this reporting period. However, the City will remedy this problem during future reporting cycles. The City believes the program was dealt with effectively, but activity-based targets were not tracked.

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 4 Outcomes: Load Reduction Estimation

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in

the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

7.6.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

City of Lemon Grove
Dry Weather Field Screening and Analytical Monitoring Program

Re: 2008 Dry Weather Field Screening and Analytical Monitoring Program
City of Lemon Grove, California

Dear Ms. Long:

Per your request D-MAX Engineering, Inc. (D-MAX) has completed the 2008 Dry Weather Field Screening and Analytical Monitoring Program. This report presents the results of the monitoring program conducted in the City of Lemon Grove during the 2008 dry weather season. The contents include field screening data and analytical laboratory test results, trash assessment, analyses of the collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations conducted to identify the sources of pollutants detected during the field screening program and our recommendations for additional actions.

It has been our pleasure working with the City of Lemon Grove on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering, Inc.

Arsalan Dadkhah, Ph.D., P.E.

1 INTRODUCTION

1.1 Regulatory Requirements

In accordance with San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit), each of the Copermittees, including the City of Lemon Grove, is required to annually perform dry weather field screening of discharges into its storm drain system. This procedure is comprised of recording field observations, estimating observed flow rates, and conducting field testing at selected locations along the storm drain conveyance system during the dry weather season, May 1 through September 30. The Municipal Permit also necessitates that Copermittees conduct laboratory analyses for at least 25 percent of the visited sites with flowing or ponded water. If a sampling location is dry, meaning there is no flowing or ponded water, an alternate sampling station should be visited. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. A more detailed trash assessment component has also been required. The Dry Weather Monitoring Program is an integral part of the City of Lemon Grove's Urban Runoff Monitoring Program.

1.2 Program Overview

The primary purpose of the Dry Weather Monitoring Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. The Dry Weather Monitoring Program consists of the following three components.

- Field screening observations
- Field analytical testing
- Laboratory analytical testing

Information collected from the dry weather monitoring is used to characterize dry weather discharges to the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations were conducted as necessary to detect and eliminate the sources of these pollutants. The results from the 2008 Dry Weather Monitoring Program conducted by D-MAX Engineering, Inc., (D-MAX) are presented herein.

1.3 Hydrologic Setting

The City of Lemon Grove (City), located in the southeastern portion of San Diego County, is situated within the Pueblo San Diego Hydrologic Unit (HU 908) and Sweetwater River Hydrologic Unit (HU 909). These two Hydrologic Units, along with the Otay River Hydrologic Unit, form the San Diego Bay Watershed and ultimately drain into San Diego Bay. Most of the City of Lemon Grove is located within the San Diego Mesa Hydrologic Area (HA 908.2) of the Pueblo HU, while the remainder of the City is in the Lower Sweetwater HA (909.1).

The City of Lemon Grove drains to San Diego Bay. Three of the four main drainage basins in the City drain to the San Diego Mesa HA, primarily via Chollas Creek. The approximately 1.7 square mile **Lemon Grove Avenue drainage basin** and the 0.3 square mile **Madera Street drainage basin** are both located in the southeast portion of the City; the **Federal**

Boulevard/Broadway drainage basin is 1.9 square miles and is located in the northern portion of the City. The fourth drainage basin, known as the **Broadway/Sweetwater drainage basin**, is approximately 0.4 square miles. It constitutes the northeast region of the City and drains to the Sweetwater River, eventually terminating in San Diego Bay.

Based primarily on wet weather data from mass loading stations (MLS), ambient bay and lagoon monitoring, bioassessments, and 303(d) listings in Chollas Creek and/or the Sweetwater River, the high priority water quality issues for the San Diego Bay Watershed as a whole have been identified in the 2008 San Diego Bay Watershed Urban Runoff Management Plan (WURMP) as bacteria, gross pollutants, metals, oil and grease, pesticides, sediment, and trash. It should be noted that the Sweetwater River is not on the 303(d) list, unlike Chollas Creek, which is 303(d) listed for bacterial indicators, copper, diazinon, lead, and zinc.

1.4 Previous Work

The numbers of historical dry weather monitoring sites since 2002 are presented in Table 1-2. Historical dry weather monitoring data is included in Appendix A.

TABLE 1-1
SUMMARY OF HISTORICAL DRY WEATHER SITES

Year	Number of Field Screening Sites [1]	Number of Flowing Sites	Number of Ponded Sites	Number of Dry Sites	Number of Lab Analysis Sites [2]
1998	11	9	2	0	---
1999	13	11	2	2	---
2000	10	9	1	4	---
2001	12	12	0	3	---
2002	15	14	1	3	4
2003	15	15	0	2	4
2004	15	14	1	4	4
2005	15	15	0	4	4
2006	15	13	2	4	4
2007	15	14	1	3	4

Notes:
[1] Number of Sites Screened = Number Flowing + Number Ponded. Field screening cannot be conducted at sites found to be dry. Dry sites are replaced by either a flowing or ponded site.
[2] Laboratory analyses commenced in 2002 as required by RWQCB Order 2001-001.

1.5 Report Outline

Section 1, Introduction, includes regulatory background, a program overview, a discussion of the City of Lemon Grove's hydrologic setting, a summary of previous work, and the report outline.

Section 2, Sampling Locations, describes the field screening sampling locations and site selection criteria.

Section 3, Field and Laboratory Analytical Methods, includes field screening and laboratory analytical procedures, quality assurance protocols, and follow-up action levels.

Section 4, Field Screening Results, presents qualitative observations of the sampling locations and results of the field screening analyses.

Section 5, Trash Assessment, discusses the procedure and results of the trash assessment.

Section 6, Laboratory Analytical Results, presents results of the laboratory analyses.

Section 7, Data Analysis, provides an analysis of field and laboratory data collected in 2008, as well as a comparison with the results of previous years.

Section 8, Follow-Up Investigations, details the results of follow-up investigations undertaken to isolate the sources of pollutants detected during the field screening program.

Section 9, Summary and Recommendations, provides a summary of the program results and recommendations for follow-up actions.

Appendix A Historical Dry Weather Monitoring Data

Appendix B Photographs of Sampling Locations

Appendix C Laboratory Analytical Reports

Appendix D Field Data Sheets

2 SAMPLING LOCATIONS

The City of Lemon Grove has 15 designated primary monitoring stations. If no flowing or ponded water is observed at primary monitoring stations, alternate field screening sites are visited. Four of the 15 primary sites are also designated as sites for laboratory analysis.

During the 2008 Dry Weather Monitoring Program, primary sites 4 and 13 were observed to be dry, so alternate sites 19 and 20 were selected as locations for monitoring.

Table 2-1 provides the location, conveyance configuration, land uses, hydrological subarea, and GPS coordinates of the sampling locations that were visited. Photographs of sampling locations are included as Appendix B. A map of sampling locations is included as Figure A at the end of this report. A map of the watersheds in and around the City of Lemon Grove, broken down into HSAs, is included as Figure B.

TABLE 2-1
2008 DRY WEATHER MONITORING STATIONS

Site I.D	Location	Conveyance	Primary Land Use	Secondary Land Use	Hydrologic Subarea	Latitude	Longitude
Site 1	100 feet southeast of the Sweetwater Road and Broadway intersection	Outlet	Residential	Commercial	909.12	32.74512	-117.01826
Site 2	Behind the building at 6420A Federal Boulevard	Natural Creek	Industrial	Residential	908.22	32.73127	-117.06124
Site 3	Next to 6691 Federal Boulevard	Natural Creek	Commercial	Residential	908.22	32.73569	-117.05477
Site 4	Between 7102 and 7106 Westview Place, west end of street, before driveway	Catch Basin	Residential	Commercial	908.22	32.74118	-117.04557
Site 5	6883 College Avenue, behind Discount Tire	Outlet	Commercial	Residential	908.22	32.74035	-117.04941
Site 6	Buena Vista and Lemon Avenue., in Home Depot parking lot, in front of nursery	Manhole	Commercial	Industrial	908.22	32.74360	-117.03484
Site 7	Corner of Primera Street and Madera Street	Catch Basin	Residential	Commercial	908.22	32.72054	-117.04865
Site 8	Lemon Grove Avenue, 100 feet south of Massachusetts Avenue Trolley Station	Outlet	Residential	Commercial	908.22	32.72255	-117.04050
Site 9	Main Street, under trolley tracks, between Davidson Street and Mt. Vernon Street	Outlet	Commercial	Residential	908.22	32.73259	-119.03365
Site 10	Across from 2220 and 2196 Main Street, under trolley tracks	Earthen Channel	Residential	Commercial	908.22	32.72869	-117.03591
Site 11	100 feet west of the Broadway and Massachusetts Avenue intersection in front of McDonald's, on divider	Manhole	Commercial	None	908.22	32.74255	-117.04378
Site 12	North side of Lemon Grove Way, between residential address 8156 and the Grove Condominiums	Catch Basin	Residential	Open	909.12	32.74559	-117.02408
Site 13	Northeast corner of the Palm Street and Lemon Grove Avenue intersection	Manhole	Residential	Commercial	908.22	32.73486	-117.03152

TABLE 2-1
2008 DRY WEATHER MONITORING STATIONS (CONTINUED)

Site I.D	Location	Conveyance	Primary Land Use	Secondary Land Use	Hydrologic Subarea	Latitude	Longitude
Site 15	6636 Federal Boulevard, in front of Thompson Building Materials	Earthen Channel	Industrial	Commercial	908.22	32.73566	-117.05503
Site 16	Citronella Street and Palm Street intersection, east of Arco station	Outlet	Residential	None	908.22	32.73524	-117.03071
Site 19*	In a small cul-de-sac on west side of Skyline Drive, south of Lincoln Street	Manhole	Commercial	Residential	908.22	32.73726	-117.02695
Site 20*	Intersection of Alberdi Drive and San Altos Place, 100 ft and north on dirt Road	Earthen Channel	Residential	Commercial	908.22	32.71822	-117.04422

Note: * Alternate sites 19 and 20 replaced dry primary sites 4 and 13.

3 FIELD AND LABORATORY ANALYTICAL METHODS

3.1 Field Screening Procedures and Methods

Field screening techniques consist of flow measurement, quantitative field analyses of selected water quality parameters, and qualitative field observations. Information relating to weather conditions, the amount of time since last rainfall, and the type of storm water conveyance are recorded. Specific observations and results of the field water quality analyses are documented on field data sheets, which are included in Appendix D. The data sheets also serve as a record of the field visit and are completed for every site visit regardless of whether or not samples were collected.

For 2008, field data sheets were updated to include three categories of visits. Previously they included check boxes for either routine field screening or follow-up visits. This year there are check boxes for routine field screening, confirmation, and IC/ID follow-up visits. A confirmation visit is a revisit of the original site, whereas an IC/ID follow-up is an upstream investigation. For the purposes of this report, confirmation and IC/ID follow-up visits are both referred to as "follow-up" visits.

Field screening and analyses were conducted according to the following procedures and methods.

Qualitative Observations

Irrespective of flow, qualitative field observations are made during each site visit. These observations provide a general site assessment and describe factors like water odor, clarity, the presence of floatables, visible deposits or stains, vegetation and biological organisms. Evidence of present or past illicit connections and illegal discharges to the storm drain system may also be ascertained through careful field observations. Each field screening location is photographed to provide additional information and documentation of site conditions. Photographs are included in Appendix B.

Flow Measurement

Flow measurements can be utilized to estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may indicate an illegal discharge upstream. Various field methods are used in formulas to estimate the flow rate. These include measuring the velocity, depth and width of the flowing water; recording the amount of time required to fill a bottle of known volume with sample water; or, if measuring flow within a cylindrical pipe, measuring the pipe diameter as well as the depth and velocity of the flow. Low levels of flow may also be assessed visually.

Field Water Quality Analyses

At each site with ponded or flowing water, grab samples were collected and analyzed in the field for the following constituents:

- Specific conductance
- Temperature
- pH
- Turbidity
- Surfactants (MBAS)*
- Nitrate-Nitrogen (Nitrate-N)
- Ammonia-Nitrogen (Ammonia-N)
- Orthophosphate-Phosphorus (Orthophosphate-P)

* Surfactants may also be referred to as detergents

The methods that were used to perform the above field analyses along with each method's detection limit, range and accuracy, are listed in Table 3-1.

3.2 Laboratory Analytical Methods

Consistent with the Municipal Permit's requirements, samples were collected for laboratory analyses at eight sites, representing over 25 percent of all sites where ponded or flowing water was observed. These samples were submitted to EnviroMatrix Analytical, Inc., a California Department of Health Services-certified laboratory, for analysis of the following constituents:

- Oil and Grease
- Total Hardness
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- Diazinon
- Chlorpyrifos
- Total Coliform Bacteria
- Fecal Coliform Bacteria
- *Enterococcus* Bacteria

The methods used to perform each laboratory analysis along with method detection limits and holding times are listed in Table 3-2.

TABLE 3-1
FIELD ANALYTICAL METHODS

Parameter	Method	Reporting Limit	Range	Accuracy
Specific Conductance	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.01 mS/cm	0 – 20 mS/cm	± 2% of functional sensitivity[1]
Temperature	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.1℃	0.0℃ – 60.0℃	± 0.5℃
pH	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.01	0.00 – 14.00	± 0.01 pH
Turbidity	Hanna Instruments HI 93703-11 Portable Turbidity Meter***	0.01 NTU	0.01 – 50.00 NTU and 50 – 1000 NTU	± 0.5 NTU or 5% of reading (whichever is greater)
Surfactants	CHEMetrics CHEMets Kit (K-9400) Methylene Blue Active Substances	0.13 mg/L	0.0 mg/L – 3.0 mg/L*	± 0.13 & ± 0.5 mg/L[2]
Nitrate-N	CHEMetrics V-2000 Multi-Analyte LED Photometer – Nitrate 3 Vacu-vials® (K-6933) Cadmium reduction[3]***	2.26 mg/L**	2.26 mg/L –13.6 mg/L**	± 30%
Ammonia-N	CHEMetrics V-2000 Multi-Analyte LED Photometer – Ammonia 3 Vacu-vials® (K-1403) Salicylate***	0.10 mg/L**	0.10 mg/L – 3.00 mg/L**	Varies with measured concetration[4,5]
Ortho-phosphate-P	CHEMetrics V-2000 Multi-Analyte LED Photometer – Phosphate 2 Vacu-vials® (K-8513) Stannous chloride chemistry[6]***	0.25 mg/L**	0.25 mg/L – 2.61 mg/L**	Varies with measured concetration[4,5]

Notes:

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20%. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L NO_3. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the NO_3 molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14 g/mol) to NO_3 (62 g/mol). The detection limit for nitrate is 10.0 mg/L; however, the detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30% at PDL, ±20% for 25% of full range, ±10% for 75% of full range, ±10% for 120% of full range. "Full range" is equal to the upper limit of the test kit's range.

[6] This method determines the concentration of orthophosphate in mg/L PO_4. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the PO_4 molecule. Oxygen is 67.4% of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31 g/mol) to PO_4 (95 g/mol). The detection limit for orthophosphate is 0.75 mg/L; however, the detection limit for orthophosphate-P is lowered due to the conversion.

*Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

** Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

***Reporting limit, range, and accuracy information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com. Additional information regarding CHEMetrics accuracy was obtained from the manufacturer via email.

TABLE 3-2
LABORATORY ANALYTICAL METHODS

Analyte	Analytical Method	Method Detection Limit	Maximum Holding Time [1]
Oil and Grease	EPA 1664	5 mg/L	28 days
Total Hardness	EPA 200.7	10 mg/L	14 days
Dissolved Cadmium	EPA 6020	0.00100 mg/L	24 hours
Dissolved Copper	EPA 6020	0.00100 mg/L	24 hours
Dissolved Lead	EPA 6020	0.00100 mg/L	24 hours
Dissolved Zinc	EPA 6020	0.00500 mg/L	24 hours
Diazinon	EPA 8141A	0.05 µg/L	7 days
Chlorpyrifos	EPA 8141A	0.05 µg/L	7 days
Total Coliforms	SM 9221	[2] 20 – 1,600,000 MPN/100 mL	6 hours
Fecal Coliforms	SM 9221	[2] 20 – 160,000 MPN/100 mL	6 hours
Enterococci	SM 9230	[2] 20 – 160,000 MPN/100 mL	6 hours
Total Coliforms	SM 9223 (IDEXX Colilert) [4]	10 – 2,400,000 MPN/100 mL	6 hours
Escherichia coli (*E. coli*) [3]	SM 9223 (IDEXX Colilert) [4]	10 – 2,400,000 MPN/100 mL	6 hours
Enterococci	IDEXX Enterolert [4]	10 – 240,000 MPN/100 mL	6 hours

Notes:

µg/L = micrograms per liter

MPN/100 mL = most probable number (of colony-forming units) per 100 milliliters

[1] Maximum Holding Time values listed here apply to samples collected and preserved in accordance with the quality assurance and quality control procedures listed in Section 3.3.2.

[2] For D-MAX's Dry Weather Monitoring Program, EnviroMatrix Analytical, Inc. (EMA) performs standard dilutions for total coliforms to quantify from 20-1,600,000 most probable number per 100 milliliters (MPN/100 mL). For fecal coliforms and *Enterococci*, EMA performs standard dilutions to quantify from 20-160,000 MPN/100 mL. During the analysis and interpretation of the results, the number of tubes used to quantify the sample must fit the MPN index table from Standard Method 9221. The dilution set used will determine the detection limit. A standard dilution analysis is set up with 15 tubes at different concentrations. The reporting limit will always be adjusted depending on the dilution factor used for quantifying the actual results based on the MPN table. If the result for the analysis was less than 16,000 MPN/100 mL, the reporting limit will always be 20, and the dilution factor will be 10. As the dilution factor goes up, the reporting limit listed in the results from EMA will also go up based on the calculation made with EMA's data system. However, the lowest quantifiable number or reporting limit would still be 20 based on how the standard tubes for the sample is set up.

[3] Number of fecal coliforms is derived from number of *E. coli* through the following formula:
Fecal Coliforms = *E. coli* / 0.85. The converted fecal coliform count, not the number of *E. coli*, is reported in this report's data tables.

[4] IDEXX Colilert and Enterolert tests are performed by EnviroMatrix Analytical. This test is used during upstream investigations only.

3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project includes the United States Environmental Protection Agency (EPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

3.3.1 Field Sampling and Analysis QA/QC

The pH meters are calibrated periodically with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube is kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter is calibrated and periodically checked for accuracy using standard solutions. The conductivity meter is checked periodically with standard solutions and calibrated as necessary.

Field sample collection containers are first rinsed with distilled water and then with the sample water before sample collection. Upon completion of sampling at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water and dried.

The accuracy of field analytical techniques is assessed at the beginning of each sampling week by analyzing solutions of known concentrations for ammonia-nitrogen, surfactants, nitrate, and orthophosphate. The results of the assessment are shown in Table 3-3.

TABLE 3-3
FIELD ANALYSIS QA/QC RESULTS

Date	Analyte	Known Concentration (mg/L)	Acceptable Range* (mg/L)	Field Test Kit Results (mg/L)
9/16/08	Ammonia-Nitrogen	1.0	0.8 – 1.2	0.802
9/16/08	Surfactants	1.0	0.75 – 1.25	1.0
9/16/08	Nitrate *	44.3	31.0 – 57.6	55.93
9/16/08	Orthophosphate *	1.0	0.75 – 1.25	0.904

Notes:

* Acceptable range is calculated based on the error associated with the methods as listed in Table 3-1.

** Nitrate and orthophosphate are converted to nitrate-nitrogen and orthophosphate-phosphorus, respectively, when conducting standard field screening. This is accomplished by multiplying the results by 0.226 for nitrate and 0.326 for orthophosphate. To simplify the calibration process, the unconverted numbers are used when calibrating the instruments.

3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis are collected concurrently with field samples and utilized the same sampling procedures. Pre-sterilized sample bottles are obtained from the laboratory and thus do not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples are kept in a cooler on ice until picked up by the lab. Strict chain of custody procedures are followed, and samples are delivered and analyzed within the appropriate holding times, as listed in Table 3-2. Completed chain-of-custody forms are included in Appendix C.

3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation is necessary, numeric action levels and best professional judgment are used to interpret the field screening results. If visual and/or analytical evidence of gross contamination are present at a site (e.g., substantial petroleum sheen, extremely high ammonia concentration, evidence of a sewage release, etc.), then an immediate source identification investigation is initiated. For sites that exceed numeric action levels but are not perceived as an immediate threat to water quality, a re-sampling is conducted within one day. An upstream pollutant source investigation is conducted thereafter if elevated concentrations persist and no sources can be identified in the immediate vicinity of the monitoring station. If elevated levels of pollutants are detected by the laboratory analyses, a comprehensive follow-up pollutant source investigation is conducted within two days of receiving the analytical reports from the lab. The results of these investigations are included in Section 8 of this report. Recommendations based on these investigations are included in Section 9.

The following three methods are employed to determine whether immediate or comprehensive follow-up investigations are necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment. All three approaches are described in detail below and presented in Table 3-4.

Numeric Action Levels

Numeric action levels are used as the primary approach for interpreting pH, orthophosphate-P, nitrate-N, ammonia-N, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (see Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels, which are based on county-wide sampling data and have been used by all Copermittees since the 2003 dry weather season. If pH, orthophosphate-P, nitrate-N, ammonia-N, or surfactants are observed above the numeric action level, a follow-up investigation is conducted within one day to investigate the source unless best professional judgment indicates otherwise. If oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, or *Enterococcus* laboratory analytical results exceed numeric action levels, then source investigations are conducted within two business days of receiving the test results from the lab.

California Toxics Rule

The CTR criterion maximum concentration (CMC) is used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in EPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total

hardness of the sampled water, with the action levels increasing as hardness increases. More information on the CTR is available at http://www.epa.gov/region09/water/ctr.

Best Professional Judgment

Best professional judgment is used as the primary approach for interpreting turbidity, water temperature, and conductivity and as a secondary approach for interpreting the results of all other field and laboratory analyses. Under best professional judgment, the need for a follow-up investigation is left to the discretion of the field crew. Best professional judgment may indicate that results which either exceed certain action levels or statistical outliers may be the result of natural or background factors.

TABLE 3-4
ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

Field Screening Analytes	Action Levels[1]	Source/ Notes
pH	<6.5 or >9.0	Basin Plan, w/ allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia.
Orthophosphate-P (mg/L)	2.0	EPA Multi-sector General Permit
Nitrate-N (mg/L)	10.0	Basin Plan, and drinking water standards
Ammonia-N (mg/L)	1.0	Based on Workgroup experience. May also consider unionized ammonia fraction.
Surfactants (MBAS) (mg/L)	1.0	Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences.
Turbidity (NTU)	Best Professional Judgment	WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity), and unusual odors.
Temperature (°C)	Best Professional Judgment	Base judgment on season, air temperature, channel type, shading, etc.
Conductivity (mS/cm)	Best Professional Judgment	Values > 5 mS/cm may indicate IC/ID however; EC may be highly elevated in some regions due to high-TDS groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values < 0.75 mS/cm may indicate excessive potable water discharge or flushing.
Laboratory Analytes	**Action Levels**	**Source/ Notes**
Oil and Grease (mg/L)	15	EPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation.
Diazinon (µg/L)	0.5	Response to diazinon and chlorpyrifos levels above 0.5 µg/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs.
Chlorpyrifos (µg/L)	0.5	
Dissolved Cadmium (µg/L)	California Toxics Rule	Use California Toxics Rule Table, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd – 14 ppb; Cu – 38 ppb; Pb – 209 ppb; and Zn – 297 ppb.
Dissolved Copper (µg/L)	California Toxics Rule	
Dissolved Lead (µg/L)	California Toxics Rule	
Dissolved Zinc (µg/L)	California Toxics Rule	
Total Coliform (MPN/ 100 mL)	50,000	Bacteria levels in many storm drains are likely to exceed public health guidance criteria. Use confidence interval test and best professional judgment to identify conveyances for source ID.
Fecal Coliform (MPN/ 100 mL)	20,000	
Enterococcus (MPN/ 100 mL)	10,000	

Notes

[1]The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry Weather Monitoring Program data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.

°C	degrees Celsius
mS/cm	milliSiemens per centimeter
mg/L	milligram per liter
IC/ID	illegal connection/illicit discharge
MBAS	methylene blue active substances
MPN/100 mL	most probable number per 100 milliliters
NTU	nephelometric turbidity unit
ppb	parts per billion
EPA	United States Environment Protection Agency
WQO	Water Quality Objectives

4 FIELD SCREENING RESULTS

The 2008 Dry Weather Monitoring Program took place from September 17th to October 3rd of 2008. Field screening was conducted at the 15 sites where ponded or flowing water was observed. Primary sampling station sites 4 and 13 were dry, and replaced with alternate sites 19 and 20. A confirmation visit was also performed at one site where a field constituent was found to exceed its action level. Field data sheets for each site visit are included in Appendix D.

4.1 Qualitative Observations

Qualitative observations, which are a routine part of the Dry Weather Monitoring Program, are summarized below and presented in Table 4-1:

Light Conditions
Light conditions were sunny during all site visits.

Odor
Water samples from the majority of sites were odorless. One sample had a slight chemical odor.

Color
Water samples taken from most of the sites were colorless, with the exception of two yellow water samples.

Clarity
Aside from negligible amounts of suspended particles, nearly all sites had clear water samples. One site had cloudy water.

Floatable Materials
Two sites had some bubbles and three sites had a sheen on the water surface. Eight of the screened sites had trash in contact with the water. Section 5 of this report includes the results of full trash assessment conducted at each site.

Deposits
Sediment and fine particulates were observed at most sites. No stains or oily deposits were observed.

Vegetation
Each of the sites supported vegetation in accordance with soil availability and sunlight exposure. For example, while manholes lacking soil and sunlight had no vegetation, natural creeks had normal vegetative growth.

Biology
The presence of aquatic flora and fauna can indicate healthy water conditions. Algal growth is an indicator of persistent water flow. Many of the sampling locations were home to insects, snails, fish, and/or crayfish.

TABLE 4-1
FIELD OBSERVATIONS

Site No.	Date	Time	Light Conditions	Odor	Color	Clarity	Floatables	Deposits	Vegetation	Biology
Site 1	9/17/08	11:20	Sunny	None	None	Clear	Trash	Sediment/gravel, fine particulates	Normal	Insects, algae, fish, snails
Site 2	9/17/08	10:00	Sunny	Chemical	None	Clear	Bubbles/foam	Sediment/gravel, fine particulates	Normal	Insects, algae, fish, snails, crayfish
Site 3	9/18/08	15:25	Sunny	None	None	Clear	Trash	Sediment/gravel, fine particulates	Normal	Insects, algae, fish, crayfish
Site 4	9/18/08	9:05	Sunny	ns	ns	ns	ns	Sediment/gravel, fine particulates	Limited	None
Site 5	9/19/08	11:00	Sunny	None	None	Clear	None	Sediment/gravel, fine particulates	Normal	Insects, algae
Site 6	9/18/08	9:30	Sunny	None	None	Clear	None	Sediment/gravel, fine particulates	None	Insects
Site 7	9/18/08	12:05	Sunny	None	None	Clear	None	Sediment/gravel, fine particulates	Limited	Insects
Site 8	9/17/08	13:20	Sunny	None	Yellow	Clear	Trash	Sediment/gravel, fine particulates	Normal	Algae, fish

4.2 Field Analytical Results

Field analyses are conducted at all sites with flowing or ponded water. The measured constituents are described below.

Flow rates are the measurements of the volume of fluid passing through a given surface per unit time. Flow rate measurements are needed to calculate the load or particular amount of a pollutant discharged.

Water temperature is needed to assess the significance of other parameters, such as pH and conductivity. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. In the field, water temperature is measured immediately upon sample collection at each site with ponded or flowing water.

The **pH** is an expression of acidity or alkalinity of a water sample. The pH of an aquatic system will drive a variety of chemical reactions, including the availability of nutrients or the solubility of chemical substances, particularly heavy metals.

Turbidity describes the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation, thus reducing photosynthetic capacity, but excessive suspended particles can also absorb heat and increase water temperatures.

Specific Conductance (Conductivity) values indicate the total concentration of ions in an aquatic system and the ability of the water to conduct electricity. This parameter can be used to assess the mineral content of water and potentially help indicate the presence of dissolved pollutants.

Surfactant concentrations in water samples often reflect illegal discharge from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms.

Ammonia-Nitrogen (ammonia-N) is an indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment; however, in higher quantities it can become toxic to fish and other organisms.

Nitrate-Nitrogen (nitrate-N) is a common sign of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, which can deplete oxygen from the water during decomposition and eventually suffocate other aquatic life. During the field analysis, nitrate is measured in milligrams per liter (mg/L) NO_3 and converted into mg/L nitrate-N using a conversion factor of 0.226. This process is explained in Note 3 of Table 3-1.

Orthophosphate-Phosphorus (orthophosphate-P) is also an indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate-N, orthophosphate-P pollution can cause nutrient enrichment (eutrophication), stimulate algal growth, and thus deplete oxygen in the water to levels that are dangerous for aquatic life. Even low levels of orthophosphate-P can cause significant algal growth, as it is commonly the limiting nutrient in plant growth. During the field analysis, orthophosphate is measured in mg/L PO_4 and converted into mg/L orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 6 of Table 3-1.

A statistical summary of the routine field analytical results is presented in Table 4-2. Table 4-3 shows the results of all field analyses conducted at the sampled sites. Graphs of the

various parameters and appropriate action levels for follow-up investigations are included at the end of this section.

5 TRASH ASSESSMENT

5.1 Regulatory Requirements

Section II.B.3.C.(7) of the Municipal Permit's Receiving Waters and Urban Runoff Monitoring and Reporting Program requires Copermittees to assess the presence of trash in receiving waters and urban runoff at each dry weather field screening site. This trash assessment program is designed to provide information on the spatial extent and relative amount of trash present, as well at the nature and origin of the trash at the site.

5.2 Procedure and Definitions

The San Diego Copermittee Dry Weather Monitoring Workgroup developed a two-page Trash Assessment Form to document the amount and extent of trash and the threat to human and aquatic health. The first page is completed at every site. The second page, which includes information about the types, prevalence, potential routes, and sources of trash, is also completed at sites where a larger amount of trash is observed.

A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form includes five categories to describe the amount and extent of trash. The definitions are primarily qualitative, although numbers of trash pieces are also included in each category as a rough guideline. The five categories are listed below.

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.
- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is assessed at each site using the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* – Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and

other materials that have the potential for entanglement. Oil and other visible chemicals or chemical containers fall in this category.

In the event that a site is noted as potentially posing a threat to human or aquatic health, additional descriptive comments are recorded in the "Comments" section of the Trash Assessment Form.

If a site is labeled as submarginal or poor, it is then assessed for types of trash present (e.g., automotive, biohazard, food waste), which are ranked based on the prevalence and potential threat to water quality of the items. Lastly, the potential mechanism through which trash reached the site (e.g., dumping, littering, upstream sources) and the potential source of the trash (e.g., construction, commercial, transient) are identified.

5.3 Trash Assessment Results

Table 5-1 and Graph 5-1 summarize the trash assessment results for 17 sites, including two dry sites. Figure 5-1 provides a map of the sites and their corresponding trash assessment.

TABLE 5-1
TRASH ASSESSMENT RESULTS

Optimal (1site)	**Suboptimal** (5 sites)	**Marginal** (9 sites)	**Submarginal** (2 sites)	**Poor** (0 sites)
2	1 6 7 11 12	3 5 8 9 10 13 16 19 20	4 15	

GRAPH 5-1
TRASH ASSESSMENT SUMMARY

Six sites sampled in the City of Lemon Grove received either an "optimal" or "suboptimal" trash rating. Nine sites were considered "marginal," and two sites were rated "submarginal." None of the sites were considered to have "poor" trash levels. Conditions at one site were noted as posing a potential threat to aquatic health due to the presence of an aerosol paint can.

5.3.1 Threat to Aquatic Health

Site 8 is located at an outlet 100 feet south of the Massachusetts Avenue trolley station, next to Lemon Grove Avenue. The site was assessed as marginal due to various bottles, cans, and a folding chair observed during field screening. The presence of an aerosol paint may also be a threat to aquatic health.

5.3.2 Submarginal Sites

TABLE 5-2
BREAKDOWN OF SUBMARGINAL SITES

Site	Types of Trash	Ranking	Potential Route 1	Potential Route 2	Potential Source 1	Potential Source 2
4	Food Packaging	1	Littering	---	Household	---
	Household	2	Littering	---	Household	---
	Cigarette Butts	3	Littering	---	Household	---
15	Food Packaging	1	Littering	---	Commercial	Industrial
	Business Related	2	Littering	---	Commercial	Industrial
	Cigarette Butts	3	Littering	---	Commercial	Industrial

Site 4 is a catch basin between 7102 and 7106 Westview Place, in a primarily residential area. The site was dry, however a "submarginal" level of trash was noted. Observed litter items at Site 4 included styrofoam and plastic food packaging, balls and toys, toiletry items, and cigarette butts. It appears that most of the trash could have originated in the residential area from littering, improper trash disposal, or, in the case of toys, accidental loss.

Site 15 is an earthen channel in front of Thompson Building Materials at 6636 Federal Boulevard. The site was rated "submarginal" due to the quantity of trash items noted. Observed litter items at Site 15 included many types of food packaging, business related packaging (e.g., styrofoam peanuts, cardboard, plastic twine), paper waste (e.g., mail, receipts, coupons), a large amount of shredded paper, and cigarette butts. The site is also very near a garbage handling facility.

6 LABORATORY ANALYTICAL RESULTS

6.1 Summary

Laboratory analyses were conducted at four sites, representing over 25 percent of the 15 primary sites. The laboratory constituents measured are defined below.

Oil and grease analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities.

Total hardness measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Hardness itself is not considered a pollutant, but is measured to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions.

Diazinon and **chlorpyrifos** are organophosphate pesticides that can be harmful to aquatic organisms if transported in urban runoff. Diazinon and chlorpyrifos are highly toxic to birds, mammals, and insects. They are also highly toxic to freshwater fish and invertebrates following acute exposure.

Metal contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms.

The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness, with toxicity decreasing as hardness increases. Therefore, each dissolved metal has a CMC for a specific total hardness. The laboratory samples are analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Table 6-1 shows the sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

TABLE 6-1
CTR – CMC FOR DISSOLVED METALS

Site	Total Hardness (mg/L)	CMC (mg/L)	Concentration (mg/L)
Dissolved Copper			
Site 1	680	0.0818	0.00469
Site 2	1,210	0.1408	0.00299

Site 2	1,210	0.969	0.0117
Site 8	502	0.460	0.00827
Site 10	972	0.805	0.109
Dissolved Lead			
Site 10	972	0.679	0.0169

Notes:
Dissolved cadmium and lead were not detected at any sampled sites.
For equations and constants used in CTR calculations, see http://www.epa.gov/ost/standards/ctr/toxic.pdf

Coliform bacteria are relatively harmless to humans and are present in mammalian digestive tracts and are naturally found in most surface waters and soils. Testing water samples for total coliform bacteria is a standard practice in public health since a high level of total coliform bacteria often may indicate the presence of other more harmful, pathogenic organisms, sometimes of fecal origin. Total coliform is measured in lieu of these pathogens since the various pathogens are generally present in much smaller quantities and are difficult to detect.

Fecal coliform, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastro-intestinal tracts of humans and animals and are commonly used as indicators of water contamination by fecal matter. A host of human diseases, particularly those of the gastro-intestinal tract, are spread through water contaminated with fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material was human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain.

A summary of the laboratory analytical results is presented in Table 6-2. Table 6-3 presents the laboratory results from all samples. Laboratory reports are included in Appendix C.

TABLE 6-2

nd = not detected
na = not analyzed
CTR = California Toxics Rule; CTR action levels for metals are calculated based upon on the total hardness value of the water sample.
* Total hardness is not considered a pollutant (see section 3.4 for details), and thus has no established action level for the purposes of dry weather monitoring.

7 DATA ANALYSIS

This first part of this section provides an overall evaluation of test results obtained from the 2008 Dry Weather Monitoring Program. The second portion of this section describes historical trends for various constituent exceedances.

7.1 2008 Results

This year, three sites had action level exceedances. Site 1 had high levels of all three bacteria indicator tests; Site 10 had a total coliforms exceedance; and nitrate–nitrogen was measured above the action level at Site 19. Table 7-1 displays the 2008 action level exceedances.

TABLE 7-1
2008 EXCEEDANCES AT A GLANCE

Site No.	Nitrate-N	Total Coliforms	Fecal Coliforms	*Enterococci*
1		✓	✓	✓
10		✓		
19	✓			

Note: Table reflects exceedances occurring during routine visits only, not confirmation or follow-up visits.

7.2 Previous Results

Historical results of exceedances are presented in Table 7-2, Graph 7-1, and Graph 7-2. Table 7-2 shows the percentage of sampled sites that have had exceedances each year of the Dry Weather Monitoring Program. Graph 7-1 illustrates the percentage of exceedances for field constituents, and Graph 7-2 presents the percentage exceedances by year for laboratory analyses.

Beginning in 2002, no exceedances were measured in temperature, oil and grease, cadmium, copper, lead, zinc, or chlorpyrifos. Thus, these constituents have not been included in the following table or graphs. Orthophosphate-phosphorus, turbidity, and pH were detected above the action level only in 2002. A diazinon exceedance was noted in 2003 only. There have been nitrate-nitrogen exceedances since 2002, and total coliforms have routinely measured above the action level since 2003.

TABLE 7-2
PERCENT OF SITES WITH EXCEEDANCES BY YEAR

Year	Field Screening								Laboratory Analyses				
	Number of Field Screening Sites	pH	Turbidity	Conductivity *	Surfactants	Ammonia-N	Nitrate-N	Orthophosphate-P	**Number of Laboratory Sampling Sites**	Diazinon	Total Coliforms	Fecal Coliforms	*Enterococci*

2007	15	0	0	0	0	0	20	0	4	0	25	0	0
2008	15	0	0	0	0	0	7	0	4	0	50	25	25

Notes:
Results based on complete routine visits only. Confirmation visits, follow-up visits and dry sites not included.

* By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgment in order to account for sites in which salt water and groundwater increase conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

PERCENT OF SITES WITH LABORATORY ANALYSIS EXCEEDANCES BY YEAR

8 FOLLOW-UP INVESTIGATIONS

One of the main purposes of the Dry Weather Monitoring Program is to identify IC/IDs. Both field screening and laboratory analytical results are compared to regionally developed action levels (Table 3-4). When a parameter is measured at or above its action level, it is possible that an IC/ID is present. To further investigate potential IC/IDs, additional investigation is initiated whenever action levels are exceeded. Procedures for such investigations are described below.

8.1 Investigation Procedures

When Dry Weather Monitoring Program results exceed action levels, the City either conducts an investigation to identify the source of the discharge or provides rationale for why the discharge does not pose a threat to water quality and does not need further investigation. An immediate source identification investigation is initiated if visual and/or analytical evidence of gross contamination is present at a site during a routine investigation. Examples of gross contamination include substantial petroleum sheens, constituent concentrations well above action levels, abnormal colors or odors not attributable to natural site conditions, or evidence of a sewage release; such conditions would typically be considered a threat to human health or the environment. Immediate source identification investigations are also often conducted when surfactants exceedances are noted. Past experience has shown that an immediate investigation is much more likely to identify the source of the exceedance for this particular constituent. This is because such exceedances are often related to washing activities, which are typically intermittent in nature.

When further investigation is needed but an immediate upstream investigation is not necessary, the City initially confirms the results by resampling within two business days of being informed of the exceedance. For field screening, this is within two business days of the initial test. The overall time frame for laboratory analytical results depends on the time that results are received from the lab, but investigations will be conducted within two days of receiving the data, where applicable. These investigations are labeled as “confirmation” visits in this report, and they are used to guide further upstream investigations where necessary.

When confirmation sampling confirms continued exceedance of action levels, then the City conducts further investigation to identify the source of the exceedance. This type of investigation is referred to as “follow-up” in this report. Additional investigation is not conducted when exceedances are not noted during the confirmation visit or when the exceedance is known not to be the result of IC/IDs, as without a high constituent level to track upstream, the investigation is unlikely to identify any sources. As noted earlier, when gross contamination is observed during a routine visit, an immediate upstream source investigation is initiated. Prior to beginning an upstream source investigation, field staff review previous dry weather monitoring reports and consult MS4 maps to plan the investigation.

Dry weather flows are generally traced from the site in an upstream direction along the conveyance system. Photos, narrative descriptions of relevant visual observations made, and GPS coordinates are recorded to aid in documentation and in potential enforcement procedures. Water samples are collected at upstream confluences for analyses of the constituent(s) being tracked. All samples are documented through the completion of field data sheets, which are provided in Appendix D. If the samples are being submitted for laboratory analysis, they are delivered within the appropriate holding time, and all appropriate

chain-of-custody procedures are followed. Sampling and analysis methods are typically the same as those used for the routine portion of the Dry Weather Monitoring Program, with the exception of bacteria analyses. During confirmation and follow-up sampling IDEXX Colilert and Enterolert methods are used instead of the multiple tube fermentation (MTF) methods used for routine visits. The IDEXX methods provide faster turn-around time than the MTF methods: results can be provided within 24 hours instead of several days. Shorter turn-around time allows investigators to conduct further follow-up testing sooner where necessary. The IDEXX methods are also less expensive than MTF methods, which allows field investigators to take samples from a larger number of locations.

If the results of the upstream investigation indicate that an IC/ID may be present, appropriate City personnel will be notified. Where appropriate and feasible, field staff may also contact the party responsible for the discharge directly regarding the IC/IDs and potential BMPs.

8.2 Investigated Sites

During the 2008 Dry Weather Monitoring Program additional investigations to investigate potential IC/IDs were completed at three sites. One site had a nitrate-nitrogen exceedance, and two sites had exceedances for bacteria. A brief description of each site, the field and/or laboratory analytical results, photographs of selected upstream locations, and the results of upstream investigations are included below. Table 9-2 in Section 9 of this report provides a summary of the investigation results.

Site 1

Site 1 is located at a 76" corrugated metal pipe (CMP) outfall, 100 feet southeast of the Sweetwater Road and Broadway intersection. During the initial visit to the site the water at the site was nearly ponded, with a small flow of less than 1 gpm. Laboratory analysis of the water sample resulted in levels of total coliform, fecal coliform, and *Enterococcus* bacteria above each of their respective action levels. Upon receiving the laboratory results a confirmation visit and upstream investigation were conducted.

Photo 8-1: Litter, sediment, and a sandbag in manhole at upstream location 1-1.

During the confirmation visit the sample had a high count of total coliforms, but fecal coliforms and Enterococci were below their action levels. The condition of the site appeared similar to the initial visit, when a small flow of water was observed downstream of a pooled area. The flow was traced upstream to a manhole at the eastern corner of Broadway and Lemon Grove Way, in front of a Valero gas station (upstream location 1-1). A similarly small flow was observed in the manhole, where litter and a sandbag were also noted. The sample at upstream location 1-1 had high counts of all three indicator bacteria (see Table 8-1). Of the two pipes upstream of this manhole, the southwestern pipe was dry upstream, and no sample was taken. However a significant amount of litter was observed in the manhole located

Photo 8-2: Litter and sediment in manhole near 8165 Broadway, southwest of upstream location 1-1.

in front of 8165 Broadway. The northwestern pipe into upstream location 1-1 comes from primary Site 12 on Lemon Grove Way (upstream location 1-2). The sample taken from upstream location 1-2 had relatively low levels of bacteria and did not appear likely to be a source of downstream exceedances.

From the evidence available it seemed likely that conditions in the manhole at upstream location 1-1 or transient input from the dry line southwest of upstream location 1-1 could be the cause of bacterial growth. Both upstream location 1-1 and the manhole near 8165 Broadway had a significant amount of litter and sediment in the cleanouts. Much of the trash observed was consistent with litter that may be generated by customers of convenience stores, such as the adjacent Valero, or fast food restaurants. In 2006 strong evidence of wildlife activity (i.e., feces, a carcass) was found in the storm water conveyance. While this evidence was not observed in 2008, significant amounts of food packaging litter would provide a reasonable incentive for scavenging animal activity in the storm water conveyances along Broadway upstream of Site 1, a potential source of fecal indicator bacteria. A summary of the upstream investigation at Site 1 for bacteria is presented in the following map and table.

FIGURE 8-1
SITE 1 UPSTREAM INVESTIGATION MAP

Base Data Sources: USGS, SanGIS, SANDAG, City of Lemon Grove

TABLE 8-1
SITE 1 UPSTREAM INVESTIGATION

ID	Location	Flow (gpm)	Total Coliform (MPN/100mL)	Fecal Coliform (MPN/100mL)	*Enterococcus* (MPN/100mL)
1 (routine)	100 ft southeast of the Sweetwater Way and Broadway intersection	1	170,000	90,000	90,000
1 (confirm)	100 ft southeast of the Sweetwater Way and Broadway intersection	1	68,700	5,118	4,352
1-1	Manhole in sidewalk at northwest corner of Broadway and Lemon Grove Way	1	345,000	141,176	61,310
1-2	Dry Weather Site 12, Lemon Grove Way, across from 8156	1	13,000	462	341

* Fecal coliform values were obtained from *E. coli* values by dividing by a factor of 0.85.

Site 10

Site 10 is located in an earthen channel across from 2220 and 2196 Main Street, by the trolley tracks, and is between Site 9 (upstream) and Site 8 (downstream). The sample taken during the initial visit had a total coliform count of 130,000 MPN/100mL, above the action level of 50,000 MPN/100mL. Upon receiving these laboratory results a confirmation visit and upstream investigation were conducted.

Photo 8-3: Litter and decaying organic matter in dense vegetation upstream of Site 10 at Site 16.

The sample from the confirmation visit also had a high level of total coliforms, 61,300 MPN/100mL. Site 9 (upstream location 10-1) is separated from Site 10 by a stretch of densely-vegetated earthen channel and had an even higher total coliform count, as well as some litter and a shopping cart. The flow was then traced upstream to a catch basin at the corner of Cypress Avenue and Lemon Grove Avenue (upstream location 10-2). This location had a similarly high level of total coliforms. Further upstream along the same line, Site 13 was dry. Visual observations in the upstream areas noted dense vegetation and trash in the upstream conveyance at primary Site 16. The *E. coli* bacteria counts at the upstream locations 10-1 and 10-2 indicated fecal coliforms were below the action level and fecal contamination was unlikely. Therefore, trash and decaying organic matter are the most likely sources of total coliforms at Site 10. Notably, the levels of bacteria appear to decrease as the flow moves downstream to the site. Additionally, runoff appeared to pond at Site 10 and not reach the downstream Site 8, which had a total coliform bacteria count that was below the action level.

A summary of the upstream investigation at Site 10 is presented in the map and table located below.

FIGURE 8-2

* Fecal coliform values were obtained from *E. coli* values by dividing by a factor of 0.85.
** Visual observations only recorded at these locations during the upstream investigation.

Site 19

Site 19 is located in a manhole at a small cul-de-sac on the west side of Skyline Drive, south of Lincoln Street. This site has a history of nitrate-nitrogen exceedances, and again this year the nitrate-nitrogen concentration was above the action level during the initial site visit at 10.58 mg/L. However, a confirmation visit found that the nitrate-nitrogen concentration had dropped below the action level to 8.33 mg/L on the following day. A brief look in upstream conveyances revealed that they were dry and that flow likely still arose from groundwater ingress into the storm water conveyance, similar to observations in previous years.

9.0 SUMMARY AND RECOMMENDATIONS

9.1 Summary of Field Screening and Laboratory Analysis Data

9.1.1 Summary of Field Screening and Laboratory Analysis Data

Fifteen monitoring locations were selected and visited for the 2008 Dry Weather Monitoring Program. Two alternate sites were visited and sampled to replace the two primary sites that were dry. Table 9-1 provides a summary of action level exceedances.

TABLE 9-1
SUMMARY OF ACTION LEVEL EXCEEDANCES

Field Screening (15 Samples)			
Analyte	**Number of Exceedances**	**Percentage of Sampled Sites with Exceedance**	**Site(s) Exceeding Action Level**
Nitrate-Nitrogen	1	7 %	19
Laboratory Analyses (4 Samples)			
Analyte	**Number of Exceedances**	**Percentage of Analyzed Sites with Exceedance**	**Site(s) Exceeding Action Level**
Total Coliforms	2	50 %	1, 10
Fecal Coliforms	1	25 %	1
Enterococci	1	25 %	1

Note: Data is from the initial site visits only.

A formal trash assessment was performed for the first time in 2008 in accordance with the Municipal Permit. Seventeen sites, including dry sites, were assessed, and six of the sites were scored as optimal or suboptimal, having little or no trash. Nine sites had marginal levels of trash, and two were considered submarginal. An aerosol paint can observed at Site 8 was also considered to be a potential threat to aquatic health.

9.1.2 Summary of Follow-Up Investigation Data

Table 9-2 presents the conclusions based on the results of confirmation visits and upstream investigations conducted at three sites for the 2008 Dry Weather Monitoring Program.

TABLE 9-2
SUMMARY OF FOLLOW-UP INVESTIGATIONS

Site	Follow-Up Investigation Target Constituents		Results/Probable Source
	Field	Laboratory	
1		Total Coliforms, Fecal Coliforms, Enterococci	Only total coliforms remained above the action level during the confirmation visit. Significant amounts of trash observed in two upstream catch basins is the likely source of bacteria. Previous investigations have also found evidence of wildlife activity in the area, which could also be a source.
10		Total Coliforms	Trash and dead organic matter were observed upstream where water flowed slowly through dense vegetation. Since fecal coliforms were low, trash and organic matter are the likely source of bacteria.
19	Nitrate-Nitrogen		Nitrate-nitrogen was below the action level during the confirmation visit. History of elevated nitrate-nitrogen levels at this site has been attributed to upstream groundwater ingress in the past.

9.2 Recommendations

Based on the results of the 2008 Dry Weather Monitoring Program, the following actions are recommended for consideration.

9.2.1 Maintenance

- Clean out trash in the storm water conveyance upstream of Site 1, particularly focusing on the manhole at the east corner of Broadway and Lemon Grove Way and the manhole in front of 8165 Broadway.
- Prioritize removal of trash from sites 3, 4, 5, 8, 9, 10, 13, 15, 16, 19, and 20, which were scored as submarginal or marginal by the trash assessment during routine site visits. In particular, remove the aerosol can from Site 8, which may be a threat to aquatic health. Add these sites to the City's existing clean up schedule as appropriate
    - The above list of sites includes the sites upstream of Site 10. Trash and organic debris accumulation at these locations were thought to be a likely source of total coliform bacteria at Site 10.
- Of the remaining sites with a suboptimal trash score prioritize removal of trash from Site 1, where the trash was also in contact with the water. Other suboptimal sites should also be cleaned up and added to the City's existing clean up schedule as appropriate, including sites 6, 7, 11, and 12.

Laboratory Analytical Reports

EnviroMatrix Analytical, Inc.

26 September 2008

D-Max Engineering
Attn: Arsalan Dadkhah
7220 Trade Street, Suite 119
San Diego, California 92121

EMA Log #: 0809390

Project Name: Lemon Grove Dry Weather
Project Desc./#:200842W-1

Enclosed are the results of analyses for samples received by the laboratory on 09/17/08 14:52. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that this data is in compliance both technically and for completeness.

Dan Verdon
Laboratory Director

CA ELAP Certification #: 2564

4340 Viewridge Avenue, Suite A - San Diego, California 92123 - (858) 560-7717 - Fax (858) 560-7763

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.

Dan Verdon
Laboratory Director

Calscience Environmental Laboratories, Inc.

Subject: **Calscience Work Order No.: 08-09-1742**
Client Reference: 0809390

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/18/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Glossary of Terms and Qualifiers

Work Order Number: 08-09-1742

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

COMMENTS: _____

Trash Assessment Form

SITE ID: 1 **DATE:** 9/17/08

LOCATION: 100 ft SE of the Sweetwater Road and Broadway intersection **TIME:** 11:20

OBSERVER: CG, CM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 15 x 10

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 2 **DATE:** 9/17/08

LOCATION: Behind the building at 6420A Federal Blvd **TIME:** 10:00

OBSERVER: CG, CM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 30 x 10

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☐ MS4 ☒ RECEIVING WATER ☐ BOTH	
☒ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 5 x 5

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 11 **DATE:** 9/18/08

LOCATION: 100 ft west of Broadway and Massachusetts Ave. intersection in front of McDonalds, on divider **TIME:** 10:25

OBSERVER: CG, CM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 8 x 8

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 19 **DATE:** 9/18/08

LOCATION: In a small cul-de-sac on westside of Skyline Dr., south of Lincoln St. **TIME:** 11:10

OBSERVER: CG, LM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L X W (FT): 5 x 5

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☒ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). COMMENTS: Trash at site included food packaging and household items such as a chair, pillow, and other fabric. High conductivity in the sample water appeared to interfere with the ammonia test kit, making the ampule cloudy, but not producing significant color change that would indicate the presence of ammonia. Field screening result is based on visual color evaluation.

City of Lemon Grove

Jurisdictional Urban Runoff Management Plan Annual Report

FY 2008 – 2009
September 2009 Report

The City of

LEMON GROVE

BEST CLIMATE ON EARTH

Incorporated in 1977

Executive Summary

The City's seventh Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In 2008, the City updated its JURMP and Municipal Codes to reflect the requirements of the new Permit, Order 2007-01. The Model SUSMP was completed by the Copermittees and submitted for Regional Board approval during this reporting period and will be added to the City's Municipal Code in the next reporting period. In FY 2008-09, the City continued its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have

helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2008-09. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2008-09, the City continues to make significant steps toward the implementation of a City-wide GIS program, including the beginning of service contract to install GIS layers for the sanitary sewer system. Other departments and layers will be added as the budget allows. Currently the budget does not allow for other layers, but the City hopes this will change in future reporting periods, although perhaps not until the next permit cycle. The implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

Section 1.0 Introduction

Lemon Grove's eighth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit"), represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2008 through June 30, 2009). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City strongly supports the concept of an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City also feels a stronger regional program could help alleviate the cost burden the current program forces on the City. The end result would be a maximization of severely scarce funds and funding. The City is currently experiencing, as are many others, serious financial hardship due primarily to the economy and the State raids on local funds to support its own programs. The loss of revenue in the past year has forced the City to redistribute General Funds to maintain even basic service levels, such as pothole repair. The City feels the current program meets regulatory requirements, but is leery of program expansion without a secure revenue source. The unfunded mandate aspect of this program continues to stress the City's already stretched thin General Fund. The City encourages the Regional Board to take a stronger leadership role in facilitating more cooperation with State agencies in obtaining long-term funding for this program. The City hopes that in future reporting periods, some of these challenges can be met with more cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City's construction and BMP databases continue to evolve as more information is gathered and tracked. Water Quality staff continues active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City believes in a comprehensive and collaborative approach for environmental concerns and solutions. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a

city-wide GIS program. The City is currently working on implementing initial GIS programs and layers through the Sanitation District. These initial layers will include the mapping of our sewer mains and City maintained laterals, as well as the tracking of maintenance activities. All further implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with sever economic challenges both on a local and state level.

At the jurisdictional level, the city has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- A new in-house water quality inspector and code enforcement officer
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming
- A burgeoning sustainability program of which stormwater is a key element

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 5.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to

public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2008-09. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

Section 2.0 Development Planning Component

This section describes actions taken by the City during FY 2008-09 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

2.1 Land Use Planning

The City's land use planning process facilitates the reduction of development project discharges of pollutants from the MS4 to the MEP, the prevention of development project discharges to the MS4 from causing or contributing to a violation of water quality standards, and of increases in runoff discharge rates and durations from development projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. The water quality staff works closely with engineering staff in these efforts, presenting a united, collaborative process to developers.

The City's land-use planning process consists of development and implementation of the following documents:

- General Plan
- Jurisdictional Urban Runoff Management Plan
- SUSMP
- Municipal Code, which includes the City's Development Code, Grading and Excavation standards, and all Stormwater regulations

The utilization and regular update of each of these documents enables the City to successfully conform to the requirements of section D.1 of the Municipal Permit. The following sections will describe the City's land use planning process and the four planning documents in more detail.

The City of Lemon Grove was incorporated in 1977 from the County of San Diego. The City's General Plan was adopted in 1996 and is currently undergoing an in-depth review and amendment process. The City's JURMP, Stormwater Ordinance and SUSMP were originally developed and adopted under Order 2001-01 in 2002-2003. These documents have been reviewed and updated under the new Order 2007-01.

2.1.1 Source Characterization

The City addresses eleven major land use categories in its General Plan:

- Low density residential
- Low/medium density residential
- Medium density residential
- Medium/high density residential
- Mixed use
- Retail commercial
- General Business
- Industrial
- Parks and recreation
- Transportation
- Special treatment area (STA)

The General Plan also recognizes eleven zoning categories:

- Residential low
- Residential low/medium
- Residential medium
- Residential medium/high
- Residential professional
- Central commercial
- General commercial
- Limited commercial
- Heavy commercial
- Light Industrial
- Special treatment area (STA)

Each of these land-use and zoning categories is associated with different combinations of pollutants and activities that have the potential to negatively affect the surrounding environment. A detailed discussion of the potential threats to water quality associated with existing residential, commercial, industrial, and municipal land uses can be found in their specific sections of this report.

Through the implementation of the land use planning policies, procedures, and requirements established in the General Plan, JURMP, Municipal Code, Grading Ordinance and SUSMP, the City aims to reduce the potential for pollutant discharges from all planned development and redevelopment land use sources.

2.1.2 Best Management Practice Requirements

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment D-1 shows the form that is presented to each applicant regardless of project size.

This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue by developers. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity. Through a series of updates and reviews, the City is working to include low impact development concepts through-out the applicant review process and in its codes and regulations, specifically the General Plan.

2.1.3 Program Implementation

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

2.1.3.1 General Plan/Municipal Code/SUSMP

As a component of the 2008 JURMP update (conducted during FY 2007-08), an assessment of the City's General Plan and Municipal Code were conducted to determine the City's consistency with the watershed protection policies and principles found in the Permit. The analysis found that the City's General Plan goals and policies are consistent with the Permit and that no amendments to General Plan were required as a direct result of the JURMP update. The

General Plan discourages the use of large amounts of connected impervious surfaces, requires a landscape minimum, works to protect environmental sensitive areas, and prohibits development near or in a known watercourse. However, the City's General Plan is currently undergoing a comprehensive review process with plans for amendments occurring over subsequent reporting cycles. The City plans to ensure that each area covered in the General Plan contains environmental and sustainable options and concepts. Low Impact Development ideas will be presented and encouraged throughout the document. The City's General Plan is meant to cross reference and openly comply with the City's Municipal Code and all other pertinent development documents.

The City's General Plan serves as the blueprint for the long-range, orderly, physical development of the City. The Development Code section of the Municipal Code contains all zoning and land use requirements and stipulations. These two documents together are designed to protect the City's environmental, social, cultural, and economic resources as the City develops and redevelops.

The Municipal Code did undergo a lengthy review and amendment process due to the issuance of Order 2007-01. Section 8.48 Stormwater Management and Discharge Control was broadened and made more comprehensive. A BMP specific section was added, Section 8.48.060-110. Section 8.48.140 contains regulations for all land development and redevelopment projects and Section 8.48.150 contains BMP maintenance requirements. All of these additional sections, strengthen the City's water quality program by providing a legal basis for implementation and enforcement. During the review process, the City decided to also include the SUSMP as a Municipal Code section, Section 8.52 now contains the City's SUSMP document. This section will be further updated during the next reporting period with the approval of the new County-wide SUSMP document. During this reporting period, the City collaborated with the Copermittees to create the final draft SUSMP, which was then turned over to the Regional Board for review and approval.

2.1.3.2 JURMP

In compliance with Order 2007-01, the City's JURMP document underwent a major update during FY 2007-08. This update process was continued after receiving comments from the Regional Board in early 2009. The JURMP document serves as the City's foundational storm water program management tool, capturing the developed process, procedure, and implementation strategies for described elements. The purpose of this document is to present an integrated approach to reducing the discharge of pollutants from the MS4 to the MEP, and to protect and improve the quality of water bodies in Lemon Grove.

2.2 Environmental Review Process

As part of the 2008 JURMP update, the City evaluated its environmental review process and confirmed that the current process accurately evaluates water quality, cumulative impacts, and identifies appropriate measures to avoid, minimize and mitigate those impacts for all development projects.

The California Environmental Quality Act (CEQA) requires environmental review of discretionary applications for development projects. Environmental initial studies are conducted to determine whether the project may have a significant impact on the environment. This review process evaluates a project's potential for significant impacts on water quality.

The environmental review process ensures that a project's impact on water quality is addressed early in the planning process. If a project is determined to have a significant environmental effect, mitigation measures are required under CEQA to avoid or reduce the effect to below a level of significance. The mitigation measures will normally take the form of adopted permanent Best Management Practices to be incorporated into project plans prior to discretionary approval.

2.3 Development Project Approval and Verification Process

As discussed previously, the City has an established multi-departmental review process for all new development and redevelopment projects. By using all of the above mentioned regulations, the City aims to mitigate the negative impacts of urban runoff from development projects to the MEP. Each proposed discretionary and ministerial project is subject to the City's development approval process. The following sections describe this process in detail.

2.3.1 Source Characterization

As discussed above, development projects have the potential to discharge different types and amounts of pollutants based on the project's size and intended land use. Pollutants such as trash and debris are anticipated from all developments, regardless of land use; however, pollutants like bacteria and viruses are more likely to originate from restaurants and residential developments, whereas grease and oil are more likely contributed by parking lots and automotive repair shops. Since the potential for a site to discharge pollutants is unique to each development, the City's design requirements for development projects vary according to size, project characteristics, and anticipated land use.

The City's SUSMP, which was updated and added to the Municipal Code during FY 2007-08, describes specific categories for priority projects and indicates common pollutants associated with each category. A priority project must

identify the potential pollutants anticipated from its development and implement design concepts and other BMPs to address these pollutants.

In the City, all development projects, including building and ministerial permits are required to implement minimum BMPs. These BMPs include construction BMPs and good housekeeping practices. Discretionary projects, however, generally pose a greater potential threat to water quality and are subject to an additional set of BMPs and more intense scrutiny.

2.3.2 Best Management Practice Requirements

The City's minimum BMP requirements for all discretionary development projects are summarized here and are included in the City's SUSMP. All discretionary development projects are required to explore and implement where applicable the following principles:

- Source control BMPs that reduce stormwater pollutants of concern in urban runoff, including but not limited to storm drain stenciling and signage, properly designated and covered material and trash storage areas, and the use of efficient irrigation systems.
- LID BMPs that provide retention, slow runoff, minimize impervious footprint, direct runoff into landscaping, and promote water conservation.
- Grading and construction activities must implement all requirements outlined in the City's JURMP and Municipal Code.
- Submittal of proof of on-going long term maintenance for all structural post-construction BMPs.

SUSMP priority projects must submit a water quality document, which includes identification of potential pollutants from the project, proposed LID, source control and treatment control BMPs, and an attached maintenance agreement. The document must also include how the project will manage increases in runoff discharge rates and durations associated with the project. It is the City's policy to prevent permitted projects from increasing the runoff coefficient that eventually enters the City's MS4. Both the water quality document and hydrology report must provide retention and detention details for any runoff increase due to the development or redevelopment of a site.

2.3.2.1 Hydromodification Management Plan and Interim Hydromodification Criteria

To reduce the negative impacts to beneficial uses and stream habitats that are attributed to increased runoff rates and in compliance with Order 2007-01, the City is currently collaborating with the other Copermittees to adopt a detailed Hydromodification Management Plan (HMP).

The final draft HMP will be submitted to the Regional Board during the next reporting cycle. However in FY 2007-08, the City established interim hydromodification criteria that will be in effect until the final HMP is approved by the Regional Board and adopted by the City. The City requires all priority projects disturbing 50 or more acres to comply with the interim hydromodification criteria, except those sites that are considered exempt as per Section D.1.(g)(6) of the Permit. These interim requirements are consistent with the regionally adopted interim hydromodification standards. The City of Lemon Grove is a small developed community and does not anticipate any projects during the following reporting period that will meet these criteria. The City also connects almost exclusively to concrete channelized streams at its borders and does not anticipate frequent projects subject to future hydromodification requirements.

The City does not issue permits to development projects until all minimum BMP requirements are met. Any changes made to the development project's proposed stormwater BMPs during project construct must be reviewed and reapproved by City staff before being implemented.

2.3.3 Program Implementation

As required by the Permit, the City has implemented a program to ensure that development and redevelopment projects comply with post-construction BMP requirements, including Low Impact Development (LID), source control, and treatment control BMPs. The Permit further requires the City ensure proper installation of treatment control BMPs and their maintenance into perpeturity through such procedures as BMP verification, maintenance agreements, and annual inspections.

The following sections provide an overview of the City's SUSMP implementation practices and tracking during FY 2007-08.

2.3.3.1 Model and Local SUSMP updates

As a part of the 2008 JURMP update process, the City updated its current SUSMP document to meet the interim requirements outlined in the Permit. The City's update followed the recommended language developed by the regional SUSMP update group. All required interim SUSMP updates were incorporated into the Municipal Code. In compliance with the interim SUSMP update standards established in Order 2007-01, the following tasks were performed during the review and interim update of the SUSMP:

- Priority project categories were updated
- The document was reviewed to ensure no obsolete or ineffective BMPs were retained
- LID requirements and additional source control requirements were added to meet or exceed Permit requirements

- LID BMPs that can be used as treatment control BMPs were added to appropriate tables and discussions of treatment control options were updated accordingly
- Pollution removal efficiencies of treatment control BMPs were reviewed and updated where necessary

In addition to the changes discussed above, a comprehensive model SUSMP update was completed by a regional workgroup during FY 2007-08. The comprehensive model SUSMP update includes the following as required by the Permit:

- Inclusion of LID, source control, and treatment control BMPs that meet or exceed the minimum requirements of the Permit
- Establishment of siting, design, and maintenance criteria for each LID and treatment control BMP listed in the model SUSMP
- Addition of criteria to help determine conditions where implementation of each LID BMP included in the model SUSMP is applicable and feasible
- Addition of a requirement for priority projects with low traffic areas and appropriate soil conditions to use permeable surfaces
- Addition of any necessary restrictions for infiltration BMPs from priority projects that generate high levels of pollutants

Once the model SUSMP is accepted by the Regional Board as described in Section D.1.d(8)(b) of the Permit, the City will update its local SUSMP within one year to include requirements at least as stringent as those in the newly adopted model SUSMP. Additionally, the City's local SUSMP will include a review process to verify all proposed BMPs for priority projects meet the criteria designated in the updated local SUSMP.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's local SUSMP. The HMP was developed by a consultant and regional workgroup during this reporting period and the draft HMP was submitted to the Regional Board for approval.

2.3.3.2 Development Project Approval Process

The following includes a summary of the City's current development review process.

Discretionary Projects

Projects requiring a discretionary review are subject to an in-depth review by City staff. During the first submittal or pre-meeting, it is determined if the project is a SUSMP priority project and if a water quality document will be required. The project is reviewed by engineering, planning, sanitation, building, and water quality staff; through all permit phases. After review at the City, the project is

reviewed by the City's Planning Commission and conditions of approval are set for the project and approved by the City Council. These conditions require the applicant to uphold all proposed water quality measures and any changes are subject to review and approval by City staff and potentially the Planning Commission and City Council depending on the significance of the changes.

The City of Lemon Grove requires applicants to complete their water quality documents at the time of discretionary review and approval. During this process, the applicants and their engineers are guided by City staff to provide adequate post-construction BMP facilities and to document those facilities on the site plans and documents being submitted. This process results in better designed, more comprehensive, post-construction BMPs since the facilities are included in the project design even in the earliest phases of the project. Each applicant who prepares a water quality report for a priority project is provided a self checklist to assist in their report preparation. This checklist provides the applicant with an outline and details pertaining to the requirements of the SUSMP and the Permit for BMP implementation and sizing.

All hydrology reports and treatment control BMP sizing are done during this phase and are upheld through the remainder of the grading and building phase through the conditions of approval. The same City staff that performs the discretionary review also performs the grading and building permit reviews. This also maintains consistency throughout the review process and ensures the conditions of approval are upheld. City staff provides constant feedback and assistance to the applicant and their engineers through out this process and all additional permit processes. The City continues to discourage the use of mechanical treatment systems. Natural systems are easier and more cost effective to maintain in the long term, as well as encouraging landscaping and additional green space with little if any additional irrigation. All proposed BMPs must meet the standards set forth in the City's SUSMP document, which upholds the requirements put forth in the Permit. If the submittal is inadequate in any regard, approval is withheld and re-submittal is required.

Ministerial Projects

Grading, improvement plans and building permits are all ministerial permits, which means they only require the approval of City staff, not the Planning Commission or the City Council. However, if the project is not completed to staff's approval, no permits are issued and no actual work can be done on the project site. These projects are reviewed by all the same departments and staff as the discretionary projects. Lemon Grove is a small city and has a small staff, which allows the full spectrum of departments to be intimately knowledgeable about the projects being reviewed and any concerns pertaining to the project. If it is discovered that a ministerial project meets priority project conditions as per the SUSMP, all the requirements discussed above are applicable. No permits

are issued by City staff until the project satisfactorily meets all of City staff's requirements, particularly water quality requirements.

All ministerial projects, except water heater installations and electrical wiring, are reviewed by water quality staff. Even if the project does not meet priority project standards, water quality staff reviews the project for LID concepts, proper drainage design, proper erosion control, and smart irrigation.

Post-Construction BMP Maintenance Agreements

All priority projects under review for permits must execute a stormwater maintenance agreement guaranteeing the maintenance and/or replacement of permanent BMPs as necessary into perpetuity. The maintenance agreement is recorded against and runs with the property. This ensures that all future owners maintain the permanent BMPs to the original standards and any changes require the approval of City staff.

Capital Improvement Projects

The City's Capital Improvement Projects (CIP) are subject to the same post-construction BMP requirements as private development. Because many projects are redevelopment, linear or repair projects, often only construction BMPs are necessary. However, SUSMP qualifying projects must also install post-construction BMPs. Priority CIP projects are designed to incorporate the City's SUSMP requirements and LID, source control, and treatment control BMPs will be implemented. The city takes responsibility for long-term maintenance and regular inspection of any installed permanent BMPs. Section 4 of this document provides a description of the City's MS4 maintenance and inspection program.

2.3.3.3 SUSMP Project Approval

During the planning process, the City reviewed eleven SUSMP projects during this reporting period. A list of those projects can be found in Appendix D4. All applicable SUSMP BMP requirements specified in the City's local SUSMP were applied to each of these projects. Under no circumstances was any priority project permitted to implement treatment control BMPs with low pollutant removal efficiency ratings. In addition, all of the development projects approved in FY 2008-09 were less than fifty acres in size; therefore none of the projects were required to meet Interim Hydromodification Standards. All treatment control BMPs met the treatment control BMP sizing requirements outlined in the City's local SUSMP; therefore, the City did not initiate a waiver mitigation program and did not issue any waivers of infeasibility during FY 2008-09. Depending on the date in which the project was reviewed and approved, conditional SUSMP requirements may vary as a result of the migration to the new Permit requirements and the required adoption of the new local SUSMP.

2.3.3.4 SUSMP Project and Treatment Control BMP Tracking

Over the past fiscal year, water quality staff worked to implement a watershed-based SUSMP tracking system. In the future, this tracking system will be transitioned to a GIS based system. However, it is currently only a tracking database. Since the City is predominately in the Chollas Creek watershed with only a small portion in the Sweetwater watershed, it is not difficult to track projects by watershed. The database tracks the following information:

- Type of treatment control BMP
- Location of the BMP
- Watershed within which the BMP is located
- Date of construction of the BMP
- Responsible BMP maintenance party information
- Owner information if different from maintainer
- Receipt of annual maintenance verification
- Inspection findings
- Corrective actions if necessary

The City is continually working to refine the database as more permanent BMPs are implemented and tracked. The City currently has less than 10 tracked BMPs, although several more are still in the proposal and review stage as evidenced by the priority project list. Due to the small number of permanent BMPs in the City, staff inspects all of them regardless of JURMP priority level. They are inspected formally on an annual basis, but frequently informally inspected when staff is in the vicinity. If, in the future, the number becomes significantly larger, the City will begin to utilize the priority rating to determine inspection frequency.

2.3.3.5 BMP Installation Verification Process

The City has always verified the proper installation of all permanent BMPs and LID components, which are similar to the site design elements of the previous Permit. The City continues this practice under the new Permit. Each project requires closing signatures from staff once construction is completed. This involves an on-site staff visit to verify the project was constructed per the plans and appropriate documents including any water quality reports, hydrology reports, and soil findings. If corrections are needed, staff does not provide a signature and can withhold that signature for as long as it is needed to gain compliance. Without compliance, the site cannot be used for its final purpose. If compliance is not reached within a reasonable amount of time, Code Enforcement proceedings are begun. Each project under goes frequent staff inspections during the construction as detailed in Chapter 3 of this report to ensure that any underground elements are being built according to the approved plans and provide regular staff feedback and assistance. All in the hopes of a properly designed site at signature request time. The final signature process involves the same departments that reviewed the project from its initial stages,

typically this includes planning, engineering, sanitation, and building. This means that the staff providing the final implementation inspection is the same staff that reviewed and approved the project, meaning they are very knowledgeable of the project and its requirements. The City's interdepartmental cooperation is instrumental in making this process effective and efficient. Problems are viewed and solved jointly and comprehensively.

2.3.3.6 Annual Treatment Control BMP Operation and Maintenance Verification and Inspection

As required by the new Permit, all treatment control BMPs installed at development projects must be inspected annually and maintained in perpetuity by the responsible party. As part of the JURMP update, the City established a Treatment Control BMP tracking program. Because implementation of the City's JURMP did not begin until January 2008, this reporting period is the first year the tracking system has been used. Annual inspections took place by City staff during this reporting period of all permanent BMPs that have been in operation for at least one full year and rainy season. Again, due to the small size of the City and the currently small number of permanent BMPs, the City was able to inspect all of the BMPs meeting the one full year of operation criteria. As stated before, should that number increase drastically, the City will then begin to use the priority ratings established in the JURMP. A listing of the BMPs inspected during this reporting period can be found in Appendix D5. The City currently does not have any permanent BMPs that meet the new requirement of annual owner/operator verification letters. This information will however, be tracked in the same database that tracks BMP location and inspection results. The City has mailed a notification letter to all those owners/operators that will be required to provide annual BMP verification letters to the City. These letters must be submitted prior to the start of each year's rainy season.

In the first year of implementation, the City anticipates a significant amount of information gathering and validation. Through initial contacts with responsible parties, the City will refine its inventories as well as methodologies to effectively assure proper maintenance and management of permanent BMPs.

2.3.3.7 Enforcement Measures for Development Sites

Since the City's Treatment Control BMP Operation and Maintenance Verification and Inspection Programs did not commence until FY 2007-08 and prior to that the City had a very small inventory of operational treatment BMPs, no enforcement action was required. Verifications and inspections will be completed as required prior to the rainy season of each reporting period and any subsequent enforcement action will be tracked and reported in the next annual report.

The City will use a variety of escalating enforcement methods to implement storm water requirements for all development projects within the City's jurisdiction. This process is standard for any code violation does not threaten the public's health or immediate safety. Most issues are handled informally with a verbal warning and follow up inspection. These are not always tracked, as this is considered the informal part of the compliance process. The City believes it is important to provide the owner/operator a chance to correct a violation prior to beginning a retribution process. However, if a verbal warning is insufficient, formal proceedings begin with a written notification sent certified mail to verify receipt and detailing the time of the next inspection. The City is flexible on the compliance time frame depending on the severity of the work required for compliance. If a swale needs to be mowed, the City would allow seven days for compliance. However, if a private channel needs concrete work, the City is apt to allow 30 days for compliance as this requires significantly more labor, equipment and cost. Subsequent inspections verify compliance and if continued non-compliance is found; notices of violation, monetary fines, property liens, withheld permits, and small claims court are all viable follow-up actions based on length and severity of non-compliance. A detailed description of the Code Enforcement process is available in the City's JURMP document or through the City's Municipal Code which can be found on-line at www.ci.lemon-grove.ca.us.

2.3.3.8 Notable Activities

Several notable activities were conducted as part of the Development Planning Component during FY 2007-08 and FY 2008-09. Notable activities included:

- Comprehensive review and update of the City's JURMP
- Comprehensive review and update of the City's Municipal Code
- Comprehensive review and update of the regional Model SUSMP
- Development and Implementation of the BMP Verification and Inspection tracking database
- Comprehensive review and revamp of the annual report based on Regional Board feedback
- Continued education of project developers
- Revision of checklists provided to developers to reflect new standards and language

The City will continue to develop and amend its water quality development processes to meet new requirements and demands based on water quality results and improvements in technology. Future annual reports will detail these changes as they take place.

Section 3.0 Construction Component

The purpose of the City's construction component is to maintain an updated inventory of all construction projects, identify pollutant sources from construction projects, educate the construction community, implement construction site BMPs, inspect construction sites, provide proper enforcement of violations, and implement all of the requirements of the Permit as outlined in Section D.2.

3.1 Source Characterization

3.1.1 Site Inventory

Within the defined reporting period of this report, the City has compiled, maintained, and updated a watershed based inventory of all construction sites within its jurisdiction. The construction inventory for FY 2008-09 included a total of eight operating construction sites, mostly private driveways and private sewer laterals. Only two of the projects were SUSMP priority projects and they are discussed below. The City formally inspected all of these sites on a monthly basis and informally almost weekly. All of the sites during this reporting period were within the City's main watershed, Chollas Creek.

The City completed 4 minor infrastructure improvement projects during FY 2008-09. The City has been forced to drastically decrease its street resurfacing due to current budgetary constraints.

- Northbound Lemon Grove Ave.
- Lincoln St.
- Grove Pl.
- Golden
- Sewer Main pipe replacement on Lemon Grove Ave.

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

According to the above definition, the City had no high priority construction sites during this reporting period. However, the City had two construction sites that it monitored very closely during this reporting period.

- EDCO Federal Blvd widening, which required a 401 Permit for the affected drainage area
- Citron Court, a politically charged redevelopment project located off Broadway

The City performed weekly inspections at both of these locations, during both the dry and wet seasons, to ensure the proper placement of BMPs and general site upkeep.

3.1.2 Ordinance Updates

As required by Section d.2.a of the Permit, applicable City documents and ordinances were updated in March 2008 to establish adequate legal authority to enforce applicable storm water requirements. As part of the comprehensive JURMP update completed in March 2008, the City also updated Municipal Code 8.48 Stormwater Management and Discharge Control and 18.08 Excavation and Grading. The following construction specific provisions have been made to these two sections:

- Best Management Practice requirements and general requirements applicable to all dischargers (8.48.060)
- Additional requirements for land disturbance activity (8.48.130)
- Minimum BMPs for land disturbance activity (18.08.140)
- BMP maintenance (18.08.180)
- Stormwater runoff (18.08.450)
- General Construction permit requirements (18.08.900)

3.2 Best Management Practice Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment E-5 gives a breakdown of the City's grading permit requirements.

3.2.1 BMP Requirements for Permitted Construction Sites

Through the JURMP update process completed in March 2008, the City reviewed and updated a set of minimum BMps that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to implement general site management BMPs and erosion control BMPs to reduce, retain, and manage pollutant discharges to the MEP. During FY 2008-09, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);
- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection

- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

3.2.2 Seasonal Site Management Requirements

Construction sites are required to implement minimum construction BMPs to prevent pollution discharges to the MEP regardless of the season. However, the City also maintains requirements for erosion and sediment control BMPs that are additional for the wet season (October 1st – April 30th). These requirements include:

- If necessary, upgraded perimeter protection for pending storms
- Erosion prevention BMPs must be installed, maintained, repaired, improved or replaced to the MEP and as is safe
- Amount of exposed soil shall not exceed seventeen acres, exceptions must be approved by the City Engineer
- Any incomplete disturbed area not being actively graded must be fully protected if left inactive for 10 or more days

Prior to the beginning of the wet season, the City sends a letter to the owners of all active construction sites explaining the wet weather BMP requirements and reminding them of the standard minimum requirements.

3.3 Program Implementation

The City ensures that BMPs are implemented to the standards described in Section 3.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

3.3.1 Construction and Grading Approval Process

The City has an established and thorough interdepartmental review and approval process for local construction and grading permits. When a construction project comes to the City for approval, it is required to obtain a building permit, a grading permit, or both. A grading permit is required prior to any activity where the total volume of material disturbed, stored, disposed, or used as fill exceeds 50 cubic yards. All other projects require a building permit. Both permits require that plans be submitted and approved by the City. The City's grading ordinance requires that all projects, whether subject to a grading plan or not, are required to minimize site runoff, erosion, and sedimentation. In addition, all projects requiring a grading permit are required to prepare an erosion and sediment

control plan. All permits that go through the City's review and approval process are tracked within a City wide data management system called HdL.

The grading permit outlines the regulatory (Federal, State, and City) conditions for new construction. The grading permit requires that grading plans be prepared, reviewed, approved, and signed by the City Engineer. As part of this approval process, the City's water quality staff also reviews the grading plans to ensure compliance with applicable construction specific regulations.

The grading plan approval process consists of a series of plan checks, revisions, and final approvals. Plans are checked by planning, engineering, water quality, and sanitation. Engineering staff reviews the plans for overall compliance with the grading ordinance. Planning checks to verify the plans are consistent with any previously approved discretionary plans and to verify landscaping, if applicable. Sanitation checks for the location of any sewer laterals and ensures that all tie-ins are legal and properly located. Water quality staff checks the plans for specific compliance with the stormwater section of the Municipal Code, the Permit, the local SUSMP, and any other applicable State or Federal regulations. If the site falls under the jurisdiction of the State's General Construction Permit, staff follows up with the developer to ensure that a SWPPP is properly prepared and submitted. In addition, the SWPPP is reviewed and approved as part of the normal approval process and must be complete before the grading permit is issued to the applicant. The City also requires proof that a Notice of Intent (NOI) has been submitted for sites that are subject to the General Construction Permit.

Prior to issuing building and grading permits, staff verifies that the proposed construction project plans to implement all applicable required BMPs to reduce pollutant discharges to the MEP.

3.3.2 BMP Implementation

Water quality staff spends a significant amount of time coordinating storm water management and BMP implementation at construction sites with the help of the Engineering Department and the City Inspector.

Staff constantly monitors weather patterns and storms in the Pacific through the National Weather Service. Weather reports and forecasts are emailed to all applicable inspectors to inform them of the possibility of incoming rain. This e-mail reminds them to verify BMP compliance at all active construction sites. If the forecast exceeds 40% over the coming five day period, letters are sent to site owners and inspectors check for any additional, applicable BMPs at each of the active sites and any inactive sites with exposed soil. The upkeep of these BMPs is monitored daily while the rain lasts.

Staff approved only two projects with SWPPPs during this reporting period:

- EDCO Federal Blvd widening
- Citron Court Condos

Other project reviews completed by staff as part of the permitting process are addressed in more detail in Section 2.0, Development Planning.

Through the review and plan check process, staff may require additional or alternative BMPs to be implemented on individual projects. This allows the stormwater program to ensure that the proper sediment control, erosion control, and materials management BMPs are shown on the plans and are to be implemented on-site. Any changes to on-site construction BMPs require the approval of the City Inspector and are tracked as red line changes on the construction site drawings.

3.3.3 Construction Sites Requiring Advanced Treatment

There were no sites in FY 2008-09 that required advanced treatment. For the majority of the construction sites with the City's jurisdiction, the minimum required BMPs, if correctly installed and maintained, adequately control sediment discharges from the site. If it is determined that a project site possesses characteristics that could result in standard construction BMPs being ineffective in the treatment of sediment, resulting in an exceptional Threat to Water Quality (TTWQ), advanced treatment will be required. Standard criteria for determining projects that pose an exceptional TTWQ and a description of advanced treatment methods are included in the City's Municipal Code and in the new local Model SUSMP.

3.3.4 Inspections and BMP Verification

The City has an established inspection program to evaluate compliance with stormwater regulations at all construction sites within the City's jurisdiction. The City Inspector is responsible for inspections at all construction sites in the City. Stormwater issues, such as compliance with the grading and stormwater ordinances, are a main focus, especially during the rainy season. It is quite common for water quality staff to also assist in regular inspections and for building inspectors to notify City staff if a violation is observed or if compliance is questionable.

Due to the small number of active sites in the City during any given reporting period, the City inspects all active construction sites regardless of priority and extra attention is paid to any site with a higher threat to water quality during the rainy season. All sites are formally inspected monthly at a minimum and often receive informal inspections on an almost weekly basis.

The City Inspector tracks all inspection notes in a tracking database for future reference and enforcement actions if applicable. This database is updated after each inspection performed, so on a monthly basis at a minimum.

3.3.5 Compliance and Enforcement Actions

3.3.5.1 General Compliance

The City is responsible for enforcement of local ordinances and applicable local permits at all construction sites in its jurisdiction. Enforcement for construction projects is administered by the City Inspector and other applicable City staff, such as Code Enforcement.

The City typically employs a tiered, escalating enforcement system which includes verbal warnings and education, written warnings, and administrative citations. However, the City reserves the right to determine the most appropriate enforcement course for a given situation, as dictated by the specifics of each case. For example, a stricter initial enforcement measure may by applied where significant noncompliance is noted or when a potential rain event increases the potential for the violation to have a negative impact on water quality.

Verbal warnings and education will typically be the initial enforcement methods employed, assuming that a) the site or individual does not have a history of non-compliance with storm water regulations, and b) there has not been an observed illegal discharge to the MS4. The inspector will educate the violator on what actions need to be taken to prevent a violation from occurring or to correct the violation and document the violation and verbal warning in the inspection file. A time frame will be given for an identified violation to b corrected and a follow-up inspection date will be scheduled, which will also be documented.

A written warning is typically issued to violators that are already aware of the City's stormwater regulations or to those who have not corrected their actions after being given a verbal warning. Written warnings can be given using a variety of methods, including the issuance of a Notice of Violation (NOV) or Stop Work Notice. The NOV will provide a description of the violation to be corrected, the time frame for correction, and a follow-up inspection date. All Stop Work Notices issued by the City for construction sites are reported to the RWQCB per the reporting requirements of the Permit.

Civil penalties for violations of the Municipal Code are established in Section 1.24 of the Municipal Code. Determined violations of the stormwater regulations may be subject to administrative citations and associated administrative fines. Administrative citations and fines are used in addition to other legal remedies as described in the paragraphs above.

All inspection personnel have the authority to take immediate enforcement actions when necessary. This facilitates timely correction of inadequate BMP implementation, reducing the risk of pollutants discharging from the site. City inspectors conduct follow-up inspections to determine if corrective actions have been taken to comply with City ordinances and minimum BMP requirements. The time frame for a violator to correct a documented violation is determined on a case-by-case basis at the discretion of the inspector and the severity of the violation.

3.3.5.2 Reporting and Non-Compliance

During the FY 2008-09, approximately 35 known complaints were received through the City's hotline and other phone lines. The majority of the calls were related to the work occurring on the Citron Court project. The surrounding neighbors had unfavorable attitudes towards the project as a whole and frequently called hoping to cause trouble for the site. All calls were investigated the day of the call; the majority of the complaints were unwarranted. Any violations that were discovered were corrected within 24 working hours of verbal notification to the site manager. The site was inspected by the Regional Board during this reporting period and only minimal corrections were required and all were completed within 24 hours of notification.

Section 4.0 Municipal Component

The municipal component of the City's stormwater program includes proper management of facilities owned and operated by the City of Lemon Grove to eliminate or reduce the amount of pollutants that enter the storm drain system. The City maintains streets, sewers, the storm drain system, and municipally owned facilities which includes six public parks, a fire station, a municipal yard, four office type buildings, a senior center, a public parking lot, one recreation center with a gymnasium, and one vacant lot. The updated municipal facilities index and inspection results are in Attachment C. The City also conducts high threat to water quality activities, as defined in the Permit, such as street and sidewalk repair, painting, graffiti abatement, equipment maintenance, and minor vehicle maintenance. The City, however, also performs a number of activities that are beneficial to water quality, such as street sweeping, inspections of municipal facilities, educational efforts geared toward municipal personnel, annual MS4 inspection and cleaning, and regular upkeep of the sanitary sewer to prevent overflows and illegal connections.

4.1 Roads, Streets, Highways, and Parking Facilities

Roads, streets, highways, and parking facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control pollutants such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities.

4.1.1 Source Characterization

The City maintains 65.5 miles of roadway in Lemon Grove and one public parking lot. This number includes main arterials, curbed residential, and non-curbed residential streets. The City also maintains center islands and medians on these streets and in all parking lots including those attached to municipal buildings. The City does not maintain any highways.

4.1.2 Best Management Practice Requirements

Both pollution prevention methods and BMPs are implemented for roads, streets, highways, and parking facilities throughout the City. The City utilizes both the City's JURMP and the CASQA Municipal Handbook to choose applicable BMPs to implement for roads, streets, and parking facilities within the City. Street sweeping is the main BMP that is implemented for these sources. Treatment control BMPs are used for all road sections which are subject to SUSMP requirements, described in more detail in Section 2.0.

4.1.3 Program Implementation

This section describes the steps that were taken in FY 2008-09 to require and verify the implementation of designated BMPs for all City maintained roads, streets, and parking areas and related activites as outlined in the Permit Section D.3.a(5)(a-c).

The City currently implements an aggressive sweeping schedule for its roads, streets, and parking facilities. Long before Order 2007-01 was approved, the City was sweeping to its standards.

The frequency of street sweeping is as follows:

- Major arterial curbed streets – weekly
- All other curbed streets – biweekly
- Non-curbed streets – monthly
- Center islands and medians – monthly
- Major parking lots and alleys – weekly
- All other parking lots and alleys – monthly

During FY 2008-09, the maintained it's street sweeping mileage from the previous reporting period, approximately 80 miles and 175 tons of debris were collected. These figures include the regular sweeping of roads and parking lots, as well as specialty or requested road sweeps and the municipal yard. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

4.2 Fixed Facilities

The City owns and operates a variety of fixed facilities that have been grouped in this section because these facilities received formal inspections as part of the stormwater program. Therefore, the program implementation for these facilities is generally the same. Municipal fixed facilities include the following:

- Parks and Recreation Facilities
- Public Works Facilities
- Fire Stations
- Other Fixed Facilities

4.2.1 Source Characterization

The City inspects all municipal facilities on an annual basis. This includes the following list of facilities:

- All six public parks (Kunkel, Berry Street, Lemon Grove, City Center, Fireman's, and Monterey Heights)

- Fire Station
- Recreation Center
- The Community Center
- City Hall/Sheriff's Station
- Senior Center
- City Hall Annex
- Trolley Depot

The City's JURMP does rank each of these facilities based on their threat to water quality, however due to the City's small size it is possible to inspect each facility on an annual basis.

Parks and Recreation Facilities
The City operates six public parks:

- Berry Street Park – 7101 Mt. Vernon St., Chollas Creek watershed
- City Center Park – 7715 Church St., Chollas Creek watershed
- Fireman's Park – School Ln and Central Ave, Chollas Creek watershed
- Kunkel Park – 8171 lemon Grove Way, Sweetwater River watershed
- Monterey Heights Park – Canton and Glencoe, Chollas Creek watershed
- Lemon Grove Park – Washington and Alton, Chollas Creek watershed

All landscape maintenance activities are performed through the City's Grounds Division. In previous reporting periods, a portion of the parks were maintained through a private contractor. However, due to current budget constraints, those services were cut and taken over in-house. The Grounds division is trained and certified to handle pesticides, herbicides and fertilizers properly. They perform all landscaping and irrigation maintenance, as well as all trash and debris removal for all six parks.

Public Works Facility

The City owns and operates one public works yard. The only equipment maintained on site is the landscaping equipment used by the Ground's Division. This frequently includes mowers, the Gator (a small all terrain vehicle), chain saws, and other small devices. The City maintains a small fleet of large vehicles including several pick-up trucks, a dump truck, a paver, a video camera truck, and a vactor truck. All large vehicle service is performed off site under a private contract at a non-City facility. The public works yard does not contain a gas filling station and all materials are stored under covered areas, in doors, or surrounded by BMPs like straw wattle and gravel bags.

Fire Stations

Fire fighting is an essential element of municipal activities conducted in the City. The City has one fire station at 7853 Central Ave. The fire station is home to

three engines and one ambulance response vehicle. All servicing on these vehicles is done off site under contract at a non-City owned facility. Very minimal equipment maintenance is performed on site. It includes the cleaning and maintaining of the hoses and chainsaws.

Other Fixed Facilities

Other fixed facilities include the City's office and administrative facilities.

- City Hall/Sheriff's Station – 3232 and 3240 Main St.
- City Hall Annex – 3225 Olive St.
- Community Center – 3146 School Lane
- Recreation Center – 3131 Main St.
- Senior Center – 8235 Mt. Vernon St.

Despite theses facilities being low threats to water quality, all are inspected annually. Inspection results are in Appendix C.

4.2.2 Best Management Practices

4.2.2.1 Updated BMPs

In FY 2007-08, the City established minimum BMPs for various municipal activities at all fixed municipal facilities. The BMPs are outlined in the City's 2008 JURMP and the City's Municipal Code. The City also references the CASQA Municipal Handbook when choosing appropriate BMPs for various fixed facility types. More detailed information about BMP implementation at specific facility types is included in the following sub-sections. The City implements additional BMPs as deemed necessary, and implements equivalent BMPs when it is determined that a specific BMP is not feasible at a particular site. In addition to implementing BMPs, the City utilizes pollution prevention measures to reduce or eliminate the amount of pollutants generated from City-owned fixed facilities.

Parks and Recreation Facilities

In FY 2008-09, the City implemented a variety of BMPs to reduce or eliminate the amount of pollutants entering the MS4 from municipal parks and recreation facilities and other open landscaped areas, such as medians and traffic islands. The City is maintaining general waste management BMPs and encouraging facility users to recycle, properly dispose of trash, and pick up dog waste by providing conveniently located receptacles at parks and in common dog walk areas. Doggie bag dispensers are available at the 3 largest, most frequently used parks (Berry Street, Lemon Grove, and Kunkel) and at City Center Park. These are frequently vandalized, but the City works hard to keep them full and operational. They are checked weekly and maintained as needed.

Due to their widespread outdoor use, pesticides, herbicides, and fertilizers can be common pollutants discharged to MS4s. Transport of these pollutants is often a result of the following: a) runoff from improper irrigation after application, b) application of chemicals during or prior to storm events, c) use of chemicals that do not properly absorb into soil or plants, and d) overspray from chemical applications that may eventually enter the MS4. The City maintains the following procedures and BMPs pertaining to integrated pest management:

- Educating and training staff and contractors on all BMPs
- Requiring any contracted party to adhere to all City codes and procedures pertaining to proper use of pesticides, herbicides and fertilizers
- Implementing a process for identifying pests and/or problems by site
- Selecting less toxic treatments
- Proper training and licensing of all personnel who handle pesticides, herbicides, and fertilizers
- Use integrated pest management techniques whenever possible
- Record keeping for application dates, times, locations, and quantities.
- Pesticides, herbicides and fertilizers are applied per manufacturers directions and only as needed.
- Compost, mulch, and soil amendments are used whenever possible.
- All federal, state and local regulations are followed
- Pesticides, herbicides and fertilizers are not applied prior to a predicted rain event
- Native and drought tolerant plants are used whenever possible
- Small weeding is done by hand
- Diseased or infected plants are removed completely, if proper treatment is ineffective
- Irrigation systems are remotely controlled and weather and flow sensitive to prevent over watering due to rain or a broken line

Public Works Facility

Public works staff implements appropriate BMPs for all activities that take place at the Public Works yard. This facility uses good housekeeping BMPs most frequently, including but not limited to spill kits, sweeping, dry clean up methods for any oil spills, and proper cleaning of painting equipment. Minimal small equipment maintenance is performed on site, limiting potential pollutants from vehicle maintenance and repair. All of the large vehicles are maintained off site. The site has a SWPPP which includes a site description, a description of potential sources of pollutants, a summary of existing BMPs, a description of BMPs to be implemented, and a monitoring and record keeping plan. The SWPPPs is kept at the facility and the facility is inspected annually by water quality staff and monthly on an informal basis. All Public Works employees receive monthly informal training as detailed in Section 8 of this report.

Fire Stations

The City implements pollution prevention measures and BMPs to reduce or eliminate the amount of pollutants generated by fire fighting activities in the City. The City's fire station uses source control BMPs to minimize and control discharges related to washing activities. All fire fighting training activities which include aqueous film forming foam are conducted at a fire station outside of the City. All the engines and emergency vehicles are maintained off site. Only small equipment such as chainsaws are cleaned and maintained on site, always using best housekeeping practices to prevent pollutant generation. The Fire Marshal receives regular water quality updates at a weekly joint meeting with water quality, planning and engineering. Water quality staff has worked jointly with the fire department on several occasions when dealing weed abatement, commercial inspections, or illegal dumps. These occasions have provided excellent informal opportunities for education, which have been passed on to other fire personnel. It is common for fire personnel to call water quality personnel from the field with potential water quality concerns. They are an invaluable set of eyes in the community on a daily basis for potential water quality concerns.

Other Fixed Facilities

The City implements pollution prevention methods and BMPs to reduce or eliminate the amount of pollutants generated by the management of public buildings, other fixed facilities, and surrounding areas. The City implements BMPs to control erosion and sediment, during landscaping maintenance, and for waste management as per the Municipal Code and the CASQA Municipal Handbook.

The City employs a number of pollution prevention practices at City Hall. These practices have been expanded in recent years to include:

- The use of recycled paper for all copiers and printers
- Programmable thermostats to control heating and cooling systems
- Implementing a furlough work schedule, so main City buildings are closed very Friday
- Installing timers on exterior lighting
- Supplying each employee with a personal recycling container
- Providing large recycling containers near all dumpsters and access doors
- Lids on all dumpsters
- A battery collection site accessible by employees only
- Allowing City employees to participate in all local e-waste events

4.2.2.2 Additional Controls for Municipal Areas and Activities

If the City identifies any potential sources of other pollutants of concern for which water bodies in the City are 303(d) listed that could be a result of activities at

fixed municipal facilities, additional controls will be required to be implemented where applicable. The City will implement additional controls for municipal areas and activities adjacent to or tributary to ESAs when determined to be necessary. Presently, there are no municipal fixed facilities that have been determined to need additional BMPs due to 303(d) listings. The City's primary watershed, Chollas Creek, is 303(d) listed for several pollutants, including heavy metals and Diazinon. The City's current BMPs are preventing these pollutants and many others to the MEP. Any changes would be detailed in the applicable future annual report.

4.2.3 Program Implementation

The City implements the municipal program using a variety of different processes, including maintenance, training and education, inspections, and enforcement actions if necessary. Program implementation also includes the continuous assessment of municipal programs to ensure that they are designed and executed in a manner that is most effective to reducing, and potentially eliminating, the threat of pollution from fixed municipal facilities.

4.2.3.1 Maintenance

In FY 2008-09, the City continued to conduct regular maintenance activities at fixed facilities, which included landscape maintenance, building maintenance, parking lot,and sidewalk repair, when necessary. Sweeping of the parking facilities associated with the municipal facility is conducted at these facilities during regular street sweeping hours.

City personnel are trained and required to implement the proper BMPs when at municipal facilities and when engaging in specific activities at those facilities. City personnel are also trained to dispose of any waste properly and to report illegal discharges/illicit connections, as they may come across them during normal work activities.

4.2.3.2 Training and Education

Municipal personnel are trained on implementing appropriate BMPs and preventing non-storm water discharges. In FY 2008-09, water quality staff provided regular training and updates to the following municipal departments: Public Works, Engineering, Planning, and Fire. A detailed description of the municipal education program can be found in Section 8 of this report.

4.2.3.3 Municipal Inspections

Water quality staff performs annual inspections at all of the City facilities. As part of the FY 2008-09 program, staff conducted 14 inspections, one at each facility. The results of these inspections can be found in Appendix C. Any required

corrective actions have been taken. No enforcement actions were required at any of the municipal facilities during this reporting period.

4.3 MS4

The primary function of municipal separate storm sewer systems are to collect and transport surface runoff to receiving waters during storms in order to prevent flooding. The entire MS4 system is considered a high priority due to its tendency to collect and convey pollutants to receiving waters. The City's MS4 consists of streets, curbs, gutters, catch basins, inlets, pipes, natural channels, natural and piped creeks, and culverts. The City also maintains a number of treatment control BMPs such as filter inserts and curb inlet protection, which are included in the regular maintenance of the MS4. In order to reduce the transportation of pollutants into receiving water bodies, the City regularly maintains its MS4 to ensure that it remains both fully functional and free of pollutants to the MEP.

4.3.1 Source Characterization

The City maintains a variety of MS4 facilities which includes 190 catch basins and inlets, approximately 75 miles of piping, and approximately 2.5 miles of open channel. The City plans to put all of these facilities in GIS during future reporting periods. However, due to budget constraints, these plans are currently on hold.

4.3.2 Best Management Practice Requirements

4.3.2.1 Updated BMP Requirements

In FY 2007-08, the City prepared a JURMP update which directs staff to utilize the CASQA Municipal Handbook in addition to the Municipal code to choose applicable BMPs for municipal areas and activities, including MS4 maintenance. All of these BMPs are designed to prevent waste and pollutants from entering the MS4 system as well as ensuring that waste which is collected during maintenance for the City's MS4 does not re-enter the system.

The 2007 Permit requires that retrofitting flood management facilities be evaluated to determine the feasibility of providing additional pollutant removal from urban runoff and should only be conducted where determined to be effective. The City does not own or operate any flood management projects or flood control devices that may be retrofitted.

4.3.2.2 Additional Controls For Municipal Areas/Activities

The City will implement additional controls for MS4 facilities adjacent to or tributary to ESAs when determined necessary.

4.3.3 Program Implementation

The City's MS4 management program includes responding to complaints, detecting and ceasing IC/IDs; inspecting and maintaining MS4s by cleaning, removing sediment, debris, and excessive vegetation, by repairing and/or replacing damaged or failing MS4 structures; and by providing signage on storm drain inlets. The City trains and requires field staff to implement BMPs, inspect equipment and follow an action plan for regular maintenance, emergency maintenance, and/or discharge control. The City utilizes a vactor truck during MS4 maintenance to collect both dry and liquid debris from catch basins and inlets. Applicable BMPs are used during routine and emergency maintenance.

All maintenance activities during this reporting period were in compliance with the current Permit. All maintenance BMPs were updated in FY 2007-08 to correspond with any new Permit requirements.

4.3.3.1 Maintenance

A summary of the City's MS4 operation and maintenance activities that occurred throughout the fiscal year is included below:

- Within this reporting period, the City inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Only seven conveyances and 68 catch basins were found to be in need of cleaning and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,860 pounds of trash and debris from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those seven conveyances, providing approximately another 1,500 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.
- The City continues to install Trident Curb screens and has added Streamhawks to several curb inlets as well. Both of these devices prevent trash, debris, and sediment from entering the MS4 by keeping the debris in the curb line and easily accessible to the street sweepers. The City attributes the decreases in trash quantities found in and around conveyances to these devices and the more efficient use of the street sweepers.

4.4 Sanitary Sewer System

Spills and/or leaks caused by a malfunction or failure of a component of the City's sanitary sewer system have the potential to introduce a significant volume of untreated sewage into receiving water bodies. Untreated sewage can contain high concentrations of bacteria, viruses, and parasites, all of which have the

potential to negatively impact the environment and pose a significant threat to human health. Untreated sewage also has the potential to contain a variety of hazardous chemicals, which also pose threats to environmental and human health. The City conducts routine inspections and maintenance of the sanitary sewer system to ensure that the system is functioning properly. Routine inspections and maintenance of the sanitary sewer system reduces the potential for an overflow and helps prevent and eliminate infiltration of seepage to the MS4. The City also responds to sanitary sewer overflows to reduce or eliminate the amount of untreated sewage that reaches nearby portals to the MS4 and aids in cleaning up and disposing of overflow residue.

4.4.1 Source Characterization

The City maintains 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space and San Diego uses 986.20 EDU.

4.4.2 Best Management Practice Requirements

4.4.2.1 Updated BMP Requirements

The City has created and maintains basic BMPs in the JURMP and the Municipal Code. The City also utilizes the CASQA Municipal Handbook as a reference guide for BMP implementation, including the maintenance of the sanitary sewer system.

Similar to the MS4 maintenance program, the City trains field staff on implementing BMPs, equipment inspection, and the action plan that is followed for regular maintenance and emergency maintenance and/or discharge control. Structural BMPs are used during routine and emergency maintenance, where applicable.

4.4.2.1 Additional Controls for Municipal Areas and Activites

The City implements additional controls for sanitary sewer facilities adjacent to or tributary to ESAs, if applicable and when determined to be necessary. The City has a regular sanitary sewer maintenance program the minimizes sanitary sewer overflows (SSO) and is described briefly below and in more detail in the City's Sanitary Sewer Management Plan (SSMP) in accordance with Order 2006-03.

4.4.3 Program Implementation

The City's sanitary sewer management program includes responding to overflows and spills as necessary, identifying spills and leaks, containing and controlling spilled materials, repairing damaged and leaking sewer lines,

remediation of existing lines as necessary, and proper disposal of hazardous waste.

4.4.3.1 Maintenance

The City maintains a routine maintenance schedule for the sanitary sewer system. In FY 2008-09, the City cleaned and maintained the following portions of the sewer system. Hotspots are inspected three times annually and easements are inspected twice annually.

Table 4.1
Sanitary Sewer Services in Feet

	Total FY 2005-06	Total FY 2006-07	Total FY 2007-08	Total FY 2008-09
Cleaned	**298,043**	**331,369**	**52,493**	**646,943**
Root Cut	**18,370**	**20,927**	**36,039**	**596,943**

Within those numbers is the following information:

- 24,901 feet of hotspot line was cleaned and root cut
- 153,066 feet of easement line was cleaned and root cut
- 234,438 feet of right of way line was cleaned
- 184,438 feet of right of way was root cut
- 50,000 feet of right of way was row jetted for clearing

All SSO information was reported electronically to the Regional Board through the SSMP program. However, the City had no mainline overflows during this reporting period. The appropriate City staff are trained in detecting, reporting, and responding to all SSOs.

4.5 Mobile Municipal Activities

The City conducts a number of activities, which are not confined to any specific locations. Due to the nature of these mobile activities, temporary structural and source control BMPs are implemented as necessary.

4.5.1 Source Characterization

The City conducts a number of activities that are not designated to a specific location. Such activities include, but are not limited to, the following:

- Power washing for graffiti removal
- Street and sidewalk repair and maintenance (striping, repainting, and pothole repair)
- Landscape maintenance

4.5.2 Best Management Practice Requirements

4.5.2.1 Updated BMP requirements

The City implements good housekeeping and general pollution prevention measures during municipal maintenance activities, including the mobile activities described above. During the City's JURMP update, minimum BMPs were established for all municipal activities. The City also references the CASQA handbook and the Municipal Code to ensure the use of all applicable BMPs for any given activity.

4.5.2.2 Additional Controls for Municipal Areas and Activities

The City implements additional controls for municipal mobile activities adjacent to or tributary to ESAs when determined necessary. Presently, City related mobile activities have not been determined a high threat to water quality. Public Works and Grounds division staff are vigilant about the use of proper BMPs when doing any mobile activity. Pollutant generation is limited to the MEP through temporary BMPs such as gravel bags and straw wattles or good housekeeping practices such as dry spill cleaning, wet vacuums, and sweeping. During this reporting period, the current BMPs were evaluated and determined to be sufficient and to the MEP.

4.5.3 Program Implementation

In FY 2008-09, City staff were sufficiently educated in the proper BMPs to utilized during mobile activities. These BMPs include proper containment, control, and capture of any discharge generated by a mobile activity and possibly carrying pollutants.

4.6 Special Events

The City hosts a very limited number of special events each year. The current line-up consists of the Winter Bonfire, the Fire Station Open House, and Concerts in the Park. Special events have the potential to generate significant trash and litter caused by the patrons and activities of the special event. The City utilizes many of the controls listed in Permit Section D.3(2)(f). These BMPs are described in more detail below and are implemented during and/or after special events, when and where applicable.

4.6.1 Source Characterization

The City hosts a few special events each year that have the potential to produce trash and debris pollutants.

4.6.2 Best Management Practice Requirements

4.6.2.1 Updated BMP Requirements

In FY 2008-09, the City implemented many of the controls specific to special events listed in Section D.3(2)(f) of the Permit. The City has chosen the following BMPs as most effective and efficient for City needs.

Anyone outside of the City seeking a Special Events Permit, must ensure the following BMPs are maintained:

- Proper management of trash and litter, including temporary trash receptacles
- Post clean up activities, such as catch basin cleaning and general litter pick-up, when necessary
- Post event street sweeping, when necessary
- Other BMPs when considered necessary by City staff

The City will consider implementing additional BMPs depending on the site location, site conditions, and/or type of special event.

4.6.2.2 Additional Controls for Municipal Areas and Activities

The City will implement additional controls for municipal special events adjacent to or tributary to ESAs when determined to be necessary.

4.6.2.3 Program Implementation

In FY 2008-09, there were the following City sponsored special events:

- Movie Night in the Park
- 6 Concerts in the Park
- Winter Bonfire
- Fire Station Open House

At a minimum, these events were required to provide extra trash and recycling containers, proper disposal of grease if food preparation was involved, and proper secondary containment for port-a-potties.

During the events, City staff was on hand to ensure that the event remained free of illegal discharges and/or illicit connections to the MS4. City staff were available for the duration of the event and afterwards for immediate trash removal and to notify the appropriate staff if a problem was observed.

Section 5.0 Industrial – Commercial Component

Activities associated with industrial and commercial businesses can contribute pollutants to the City's MS4. The City has implemented a program that aims to reduce and prevent industrial and commercial pollution discharges from the MS4 to the MEP, to protect local receiving water bodies, and to comply with the Permit.

Commercial facilities within the City include a wide range of oriented businesses from restaurants to nurseries. There is one main commercial area within the City, along Broadway and down Lemon Grove Ave. This area contains many different commercial businesses ranging from restaurants to automotive outlets. The City's industrial area runs along Federal Blvd adjacent to SR 94.

Throughout FY 2008-09, City staff has worked diligently to fulfill the requirements of Order 2007-01. The City worked to ensure our current inspection program met the requirements of the current Permit and made any adjustments necessary. Due to the City's small size, staff is able to inspect a larger than needed majority of its commercial facilities and all of its industrial facilities. The City also continues to participate in the development of a regional mobile business program. The following section will demonstrate the City's successful implementation of the requirements of the Permit (Section D.3.b) during FY 2008-09.

5.1 Industrial-Commercial Sites/Sources Element

Each stationary industrial and commercial facility has the potential to discharge pollutants into the MS4 and consequently degrade local water quality. Often, the most cost effective and simple solution to reducing pollution is to implement pollution prevention techniques at the source. The City emphasizes the use of pollution prevention methods as a primary mechanism for reducing commercial discharges of pollutants into the City's MS4. Further, the City requires minimum site and activity specific BMPs to be implemented, and inspections and enforcement procedures will be conducted where necessary, to comply with the Permit.

For the rest of Section 5.1, "commercial facilities" will be used to refer to stationary commercial facilities that are not mobile. The mobile commercial sites/sources component is described in Section 5.2.

5.1.1 Source Characterization

A watershed-based inventory of the industrial and commercial sites/sources within the City was compiled as part of the 2008 JURMP update. As required by the Permit, the inventory includes the following information for each site/source: facility name, address, possible pollutants, if the site drains to a 303(d) listed

waterbody, and a brief description including SIC codes which best reflect the principal products or services provide by each facility. This list can be found in the 2008 JURMP. Because mobile commercial businesses do not have a fixed address at which they operated, they are tracked within a separate, non-spatial database.

The commercial inventory is continually updated as facilities go out of business and new facilities open. This process is performed primarily through the business license data base. Staff also collaborates with the Fire Marshal to verify existing and new facilities and to combine inspections. In addition, the City identifies businesses that are not on the facility inventory when complaints are filed about businesses that are not registered or licensed with the City. When this occurs, these facilities are added to the inventory and the proper City staff are notified to ensure the business is brought into compliance with City licensing requirements. During annual facility inspections, City staff has the opportunity to identify new or closed businesses and update the inventory with these findings.

In FY 2008-09, the City continued its focus on high priority commercial businesses by inspecting all restaurants, manufacturers, and automotive repair facilities with in the City. This totaled 34 facilities for this reporting period, the list of which is located in Attachment K 2. Table 5-1 contains a summary of the commercial facilities found in the City. The summary includes home businesses like carpet cleaners and household cleaning services, which the City finds to be difficult to inspect due to their transitory nature and small size (typically one person operations). The City deals with these operations more from a residential perspective than a commercial perspective and requires the standard minimum residential BMPs of these services. The City also inspects parking lots in conjunction with their respective buildings and does count them separately in the site total.

Table 5-1 - Summary of High Priority Commercial Sources

Commercial Activity	Number of Facilities in Lemon Grove
Automobile Dealers/Rentals	18
Automobile Supply Stores	9
Automobile Repair/Paint	9
Automobile System and Tire Repair	56
Automobile Cleaning/Washing	3
Gas Stations	7
Eating/Drinking Establishments	60
Landscaping, includes lawn care	9
Nurseries and Greenhouses	1
Pest Control	3
Equipment Repair/Maintenance/Cleaning	3
Metalwork	6
Masonry	4
Parking Lots and Storage	3
Carpet/Building Cleaning	21

Pool and Fountain Cleaning	3
Total	**215**

The City has 19 industrial facilities, most of which are high priority due to their proximately to Chollas Creek, a 303(d) listed waterbody. The City inspects all of these facilities on an annual basis. This number includes the three facilities which fall under the Statewide Industrial Permit as well. Table 5-2 contains a summary of these facilities.

Table 5-2 - Summary of High Priority Industrial Sources

Industrial Activity	Number of Facilities in Lemon Grove	Revised High Priority Category Facilities
Waste Disposal and Recycling	1	
Equipment/Transportation	3	2
Metalwork	2	3
Building Supplies and Woodworking	3	2
Industrial Paper		1
Contractor, Special Trade		1
Specialty Hardware, Drapery		1
Total	**9**	**10**
	Total Facilities	**19**

As part of the 2008 JURMP update and development of the interim SUSMP, the City collaborated with Copermittees to identify the pollutant loading potentials of industrial and commercial sources. Table 5-3 in Attachment K2 lists the pollutants that may be generated by each category of business. The pollutants that many be generated by each individual business can be determined by matching the category of business noted for each of the businesses in the commercial inventory in the JURMP.

All industrial and commercial facilities that meet at least one of the following criteria are included in the inventory:

Industrial Facilities

- Industrial Facilities, as defined at 40 CFR S. 122.26 (b)(14)
- Facilities subject to the statewide General Industrial Permit or other individual NPDES permit
- Operating and closed landfills
- Facilities subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)
- Hazardous waste treatment, disposal, storage, and recovery facilities

Commercial Facilities

- Automobile repair, maintenance, fueling, or cleaning
- Airplane repair, maintenance, fueling, or cleaning
- Boat repair, maintenance, fueling, or cleaning
- Equipment repair, maintenance, fueling, or cleaning
- Automobile and other vehicle body repair or painting
- Mobile automobile or other vehicle washing*
- Automobile (or other vehicle) parking lots and storage facilities
- Retail or wholesale fueling
- Pest control services
- Eating and drinking establishments, including food markets
- Mobile carpet, drape, or furniture cleaning*
- Cement mixing and cutting*
- Masonry*
- Painting and Coating*
- Botanical or zoological gardens and exhibits
- Landscaping*
- Nurseries and green houses
- Golf courses, parks, and other recreational areas/facilities
- Cemetaries
- Pool and fountain cleaning*
- Marinas
- Portable sanitary services
- Building material retailers and storage
- Animal facilities
- Power washing services*

*All mobile commercial businesses are discussed in Section 5.2.

Both Industrial and Commercial Facilities

- All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired waterbody segment, where the site/source generates pollutants for which the waterbody is impaired
- All other commercial or industrial sites/sources within or directly adjacent to (i.e. within 200 feet of) or discharging directly to coastal lagoons or other receiving waters within an Environmentally Sensitive Area (ESA)
- All other commercial or industrial sites/sources that the City determines may contribute a significant pollutant load to the MS4.

5.1.2 Best Management Practice Requirements

5.1.2.1 Updated BMP Requirements

During the 2008 JURMP update, the City established a set of minimum BMPs for all industrial and commercial sties and incorporated these into the City's Municipal Code Sections 8.48.080 and 8.48.090. The list of minimum BMPs includes both structural and non-structural BMPs and is itemized specific to pollutant-generating activity. The City's set of minimum BMPs for industrial and commercial sites/sources also includes pollution prevention methods, where appropriate. A complete list of the City's minimum BMPs for industrial and commercial facilities can be found in the City's JURMP and Municipal Code. The Municipal Code can be accessed through the City's website: www.ci.lemon-grove.ca.us.

Industrial Facility Specific BMPs

Industries subject to the General Industrial Permit are required to prepare a SWPPP and implement the BMPs prescribed therein. At a minimum, the SWPPP should include sections which describe the significant materials present on site, areas and activities that are potential sources of pollutants, and BMPs to address the identified pollutants' sources onsite. In addition, because of the small scale of the City's industrial program, the City is able to require site-specific BMPs at its industrial sites. These BMPs are based on a review of the site's SWPPP and site inspections, where needed.

5.1.2.2 Additional Controls

The City requires the implementation of additional controls for industrial and commercial sties and sources that are 1)tributary to CWA Section 303(d) impaired water body segments or 2) directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

The City prescribed additional controls during inspections of commercial and industrial facilities, as needed, depending on the proximity of the facility to the waterbody and the observed potential of the site to be a significant source of pollutants that may threaten the downstream waterbody as necessary and appropriate.

5.1.3 Program Implementation

This section describes the steps employed by the City to require and verify the implementation of designated BMPs for stationary industrial and commercial sources. During FY 2008-09, the City updated its program as needed, provided education and outreach through inspection actions, inspected inventoried businesses to evaluate compliance with established minimum BMP requirements

and the local stormwater ordinance, and took enforcement action as necessary to bring violators into compliance.

5.1.3.1 Inventory Prioritization

Since the new Permit no longer requires industrial and commercial facilities to be prioritized as high, medium, or low; the City prioritized industrial and commercial businesses as either high priority or non-priority.

When evaluating threat to water quality, the City considered the following attributes of each industrial and commercial business to determine priority or non-priority status:

- Type of activity (SIC code)
- Materials used at the facility
- Wastes generated
- Pollutant discharge potential
- Non-stormwater discharges
- Size of facility
- Proximity to receiving water bodies
- Sensitivity of receiving water bodies
- If the facility is subject to the General Industrial Permit or an individual NPDES permit
- Filing of a No Exposure Certification/Notice of Non-Applicability
- Facility design
- Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff
- Compliance history
- Any other relevant factors

Although not specifically required by the Permit, the City will continue to classify industrial facilities that have obtained coverage under the General Industrial Permit as high priority. The City uses the following additional spatial attributes to prioritize industrial and commercial facilities:

- Proximity to a 303(d) listed waterbody
- Pollutant potential of the facility type
- Stormwater violation history

If a facility was identified as having a potential threat based on two or more of these criteria, the facility was determined to be a high priority commercial facility. In addition, if during the City's commercial inspection process or based on institutional knowledge, it is determined that additional sites that would otherwise have a lower priority should be classified as high priority industrial or commercial facilities based on the Permit criteria, they were noted as such in the inventory and inspected as required.

The City's commercial inventory was updated and prioritized during the 2008 JURMP update and will be prioritized at least once per year prior to conducting annual inspections.

5.1.3.2 Inspection Frequency

FY 2008-09 commercial facility inspection priorities were established in consideration of inspection frequencies and prioritization standards outlined in the Permit. As part of the JURMP update, a new process to determine high priority facilities was formulized and put into effect during the previous reporting period. To determine which industrial and commercial sties were inspected in FY 2008-09, the following steps were taken:

- Confirm that the current industrial and commercial inventories are up-to-date.
- Prioritize each facility based on the prioritization process described in Section 5.1.3.1 of this document
- Review the list of facilities that were inspected the previous year
- Determine the facilities that will be inspected in the current year based on each site's prioritization and inspection history and other relevant factors, such as TMDLs and 303(d) listings.

In compliance with Permit standards, the inspected over 50 percent of all stationary industrial and commercial facilities inventoried as high threat to water quality and over 20 percent of all stationary inventoried sites. Mobile businesses are not included when determining the inspection requirements based on percentages of the inventory. The City tracked completed inspections throughout the reporting period to ensure that the minimum inspection frequencies required by the Permit were met.

During the 2008 JURMP update, the City identified the businesses that would be inspected as part of the 2008-09 reporting period. The City's facility summaries can be found in Tables 5-1 and 5-2 of this section. The list of high treat to water quality stationary commercial facilities can be found in Attachment K2. The City inspected all of these facilities and all of the industrial facilities in Table 5-2 during FY 2008-09.

5.1.3.3 Routine Facility Inspections

The City routinely inspects its commercial and industrial facilities. Inspections are intended to:

- Provide facilities with information regarding the City's stormwater program
- Provide guidance in complying with stormwater regulations
- Validate and manage the inventory

During FY 2008-09, the City conducted 19 industrial and 34 commercial inspections for compliance with ordinances, permits, and policies. All inspections included, as applicable:

- Review of BMP implementation plans, if the site uses or is required to use such a plan
- Review of facility monitoring data, if the site monitors its runoff
- Check for coverage under the General Industrial Permit (NOI or WDID), if applicable
- Assessment of compliance with Copermittee ordinances and permits related to urban runoff
- Assessment of BMP implementation, maintenance, and effectiveness
- Visual observations for non-stormwater discharges, potential illicit connections, and potential discharge of pollutants to stormwater runoff
- Education and training on stormwater pollution prevention, as conditions warrant

Based on the results of each site evaluation, City staff completed an inspection form, which can be found in Attachment K1.

Staff generally works with site contacts to provide examples of BMP solutions that could be implemented. Effective, low-cost solutions were sought whenever possible, although in some cases more expensive BMPs were needed to reduce pollutant discharges to the MEP. Each business was also evaluated for staff training procedures and the stormwater quality awareness of the contact person; educational information was provided as appropriate. Whenever possible, the findings of the inspection and related corrective actions were discussed with the responsible party while the inspector is at the site. The responsible party is always provided a copy of the inspection findings after the inspection. For any sites found not in compliance, corrective actions are written on the inspection form along with any follow-up actions or inspections, as needed.

Inspection Tracking

Complaint and inspection documentation is filed in a tracking database and is kept up to date on a regular basis.

Third Party Inspections

All commercial inspections conducted in FY 2008-09 were completed by City staff. The City has one full-time Code Enforcement officer with a stormwater focus, who is dedicated to conducting routine commercial, industrial, and residential inspections and follow up for routine inspections as well as complaint calls. A third party was not employed to conduct inspections during this fiscal year. Therefore, verification of third party inspection effectiveness was not necessary.

City staff responsible for conducting stormwater compliance inspections and enforcement of industrial and commercial facilities are training regularly on inspection and enforcement procedures, BMP implementation, and assessment of monitoring data. Water quality staff actively collaborates with inspection staff throughout the region to share methodologies and approaches that may be beneficial region wide.

Inspection Follow-up and Enforcement

Staff conducted follow-up inspections at all facilities that were directed to implement corrective actions. Follow-up investigations are conducted to ensure that the required BMPs were implemented and confirm full compliance of the facility. The City only had one non-compliant industrial facility. The facility was storing materials uncovered, outside. The corrective actions were given to the facility contact and all corrections were made by the follow up inspection. Twelve restaurants were found in non-compliance on the initial inspections, all corrective actions were minor and completed by the follow-up inspections. The restaurants continue to display confusion over the water quality inspections versus health code inspections and fire code inspections. For this reason, staff has worked diligently to provide on site education and to coordinate inspections with the City's Fire Marshal. It is not possible to coordinate inspections with the health inspectors as that is a County program with its own staff and own time lines for inspection requirements.

5.1.3.4 Notification

The City will notify each inventoried industrial and commercial business of the City's updated BMP requirements that are applicable to the site/source. During FY 2007-08, the City provided a formal letter notifying the facilities of any changes and that a new Permit had been issued. During FY 2008-09, the City did not feel a second formal notification was required and dealt with education during the actual inspection.

5.1.3.5 Complaint investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the City's hotline, e-mail, other phone line, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or clean up activities by the City or responsible party.

As required by the Permit and depending on the severity of the violation, the City enforces its stormwater ordinances for all commercial and industrial facilities as

necessary to maintain compliance with the Permit. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for staff to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the City's Code Enforcement database.

During FY 2008-09, the City had two commercial related complaints and no industrial related complaints. The two commercial complaints were the hosing of parking lots. The behavior was stopped immediately upon investigation and both dischargers were educated on the proper dry methods for cleaning impervious surfaces.

Reporting of Non-Filers

The City did not identify any industrial sites that may require coverage under the General Industrial Permit, but which, to the City's knowledge did not file NOIs.

5.2 Mobile Sources

Illegal discharges tend to be the major area of concern with mobile businesses. Mobile businesses can be difficult to inventory because they may not be based in the City and do not typically have a permanent address. Additionally, new mobile businesses are started, and previously existing mobile businesses go out of business on a regular basis. For the reasons listed, and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

5.2.1 Source Characterization of Mobile Sources

The mobile businesses known to operate within the City's jurisdiction are listed on an inventory found in Attachment K2. This inventory was prepared as part of the 2008 JURMP update. The following business types are addressed by the mobile sources element of the City's industrial and commercial program:

- Mobile automobile and other vehicle washing
- Mobile carpet, drape, or furniture cleaning
- Mobile construction trades such as: cement mixing or cutting, masonry, painting and coating
- Landscaping
- Pool and fountain cleaning
- Power washing services

In addition to the types of businesses listed above, any other mobile businesses that the City determines to have a significant threat to water quality will be added

to the inventory. Because not all mobile businesses have obtained business licenses in the City or have a base of operations outside the City, staff is continually refining and updating the mobile inventory. In addition, the City is participating in the creation of a regional mobile businesses list.

5.2.2 Best Management Practice Requirements

5.2.2.1 Updated BMP Requirements for Mobile Sources

All BMPs required for station sources, described in Section 5.1.2.1 of this document and listed in detail in the City's JURMP, are also required of mobile businesse, where applicable. The most important BMPs for most mobile businesses are typically those that address non-stormwater discharge control and spill prevention, control, and clean-up.

5.2.3 Program Implementation

5.2.3.1 Education/Outreach and Notification of Mobile Sources

The City will provide information and outreach regarding stormwater quality to mobile business owners and operators. Businesses will be given educational materials outlining pollution prevention methods and other related BMPs if businesses are found to be in violation of the City's stormwater ordinance or the Permit. City staff will also give recommendations to businesses, where applicable.

Because the mobile business program is a new element of the industrial and commercial program; it is anticipated that some mobile businesses are not aware of stormwater requirements and that education will be a significant portion of the program. The education is described in more detail in Section 8 of this report. It is worthy to note, that even before the issuance of the new Permit, City staff reviewed and gave verbal stormwater education to any mobile or automotive business license applicant.

The City will continue to coordinate and collaborate with the regional Education and Outreach Workgroup to notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

5.2.3.2 Inter-Jurisdictional Cooperation

During this and the previous reporting periods, the City has participated with other Copermittees in a Mobile Business subcommittee to develop the Regional Mobile Business Outreach and Education Strategy. Because mobile businesses inherently provide services at offsite locations crossing jurisdictional lines, the

Copermittees have chose to collaborate on a regional mobile business strategy, which addresses the following elements:

- Inventory Development and Maintenance
- Establishment of Minimum BMP Requirements
- Outreach and Education including notifications

A consultant may be hired at some point to assist with this process. Compliance and enforcement responsibilities for mobile businesses will continue to reside with individual jurisdictions, and are therefore not addressed as shared regional tasks under this strategy.

5.2.3.3 Inspections

The inspections for mobile businesses generally follow the same procedure described in Section 5.1.3.3 of this report. The main focus of most mobile business inspections is on discharge control BMPs. After thorough investigation, enforcement, and follow-up as needed, none of the mobile businesses investigated warranted a formal inspection. Notably, as part of standard response actions, staff works directly with mobile business owners and employees to ensure that their business practices meet the City's minimum BMP standards.

5.2.3.4 Complaint Investigations, Violations, Enforcement, Follow-up, and Compliance

Complaint response, follow-up investigation, and compliance of mobile commercial businesses are handled in the same fashion as stationary commercial facilities. For a general description of the City's complaint response procedures, refer to Section 5.1.3.5 of this report.

In FY 2008-09, City staff investigated six complaints based on mobile business activities. Investigation of mobile business activities can be difficult based on the transient nature of their operations and their habit of operating primarily on weekends. The City has limited Code Enforcement abilities during non-working hours, but has managed to educated several mobile businesses by actual staff observation of activities. All calls were investigated and followed up with to the best of staff's ability to obtain contact information for the mobile business operator. All contacted operators were provided BMP requirement education and told if complaints persisted, administrative fines would be processed. To the City's knowledge, all have complied with the BMP requirements.

Section 6.0 Residential Component

Approximately 80 percent of the City's 3.7 square mile area is designated as residential on the land-use map. Residential land use comprises a large area of the City and residential activities can have a considerable effect on water quality of receiving waters. The City's residential component of the stormwater program aims to reduce pollutant runoff from residential areas and activities to the MEP.

The overall goal of the program is to minimize the impact of discharges from residential areas on receiving waters in Lemon Grove and, where possible, to enhance the quality of these resources. The following sections will describe the program activities conducted during FY 2008-09 that contributed to the successful implementation of the City's Residential Component.

6.1 Source Characterization

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment L-1 contains a demographics chart for the population of Lemon Grove. As Attachment L-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

This section identifies the high threat to water quality residential areas and activities that were focused on during FY 2008-09. The high threat to water quality areas and activities within the City were identified during the 2008 JURMP update process and are described in detail in the JURMP. The following section will briefly summarize this process.

6.1.1 High Threat to Water Quality Activities

In consideration of the minimum required high threat to water quality residential activities listed in Section D.3.c(1) of Order 2007-01, the following residential activities were identified as residential activities that hold the greatest threat potential to local receiving water quality:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home Improvement, Garden Care Activities, and Product Use
- Disposal of Trash, Pet Waste, Green Waste, and Household Hazardous Waste

6.1.2 High Threat to Water Quality Areas

Section D.3.c(1) of Order 2007-01, requires that Copermittees identify all high threat to water quality residential areas. During the 2008 JURMP update, the City identified high threat to water quality residential areas using the following criteria:

- Any residential areas tributary to a CWS section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within environmentally sensitive areas (as defined in Attachment C of the Permit)

The City has one section 303(d) impaired water body within or directly adjacent to its boundaries. The 303(d) impaired water body within the City is Chollas Creek and is the main watershed for the City. Based on the definition in Attachment C of the Permit, the City does not have any coastal lagoons or environmentally sensitive areas within its boundaries. By collaborating with other copermittees, the City has identified the following pollutants as pollutants of concern for residential areas:

- Bacteria
- Nutrients
- Sediment
- Pesticides
- Trash

In consideration of identified 303(d) listed water body and the primary pollutants of concern, City staff has identified the locations of high threat to water quality residential areas as follows:

- All houses within 500 ft of Chollas Creek, USGS blueline
- All houses within 500 ft of any major Chollas Creek drainage channels

This primary affects houses along Main St, San Miguel, and Bakersfield at Ensenada.

6.1.3 Evaluation of Oversight of Residential Areas and Activities

The City is planning to conduct a formal evaluation of the methods used for oversight of residential areas and activities during the permit cycle of Order 2007-01. The evaluation will coincide with the City's effectiveness assessment for the Residential Component. Since the methods used for residential oversight were recently updated within this last fiscal year, City staff determined that it would be

most appropriate and most accurate to evaluate the success of these methods in following reporting periods.

6.2 Best Management Practice Requirements

This section describes the updates made to the City's minimum BMPs that were implemented during FY 2008-09. The minimum BMPs for residential high threat to water quality activities were established in the City's 2002 JURMP. As part of the 2008 updated, the minimum BMPs were reviewed and updated as necessary.

6.2.1 Pollution Prevention

Pollution prevention is the act of reducing or eliminating waste at the source by modifying production processes, promoting the use of non-toxic or less-toxic substances, implementing conservation techniques, and re-using materials rather than putting them into the waste stream. Pollution prevention methods have been integrated into the minimum BMPs established for high threat to water quality areas and activities.

6.2.2 List of Minimum BMPs

As part of the City's JURMP update, the City designated the following minimum BMPs for high threat to water quality residential activities and areas. The minimum BMPs are primarily nonstructural and area targeted at activities specified in Section 6.2 as having a high threat to water quality. Pollution prevention methods were incorporated into this set of BMPs, where appropriate.

Automobile Repair and Maintenance

Pollution Prevention: a) employ routine preventative maintenance practices, b) reduce vehicle use whenever possible (carpool, use public transportation, bike or walk for short trips, alter driving habits), c) make timely vehicle repairs
Leaks and Spills: prevent leaks and spills from entering the stormdrain by using or doing: drip pans, plastic sheeting, or other containment devices, work indoors or under shelter and never in the rain, immediately clean spills, use dry cleaning methods, establish clean up standards, and require that tools and parts be cleaned in a contained area
Materials and Waste Management: properly manage and dispose of automotive wastes and materials by: draining fluids from automobiles, disposing of wastes and fluids properly and lawfully, store materials, parts and tools indoors or under cover, use secure and watertight containers when storing materials and wastes

Automobile Washing

Management/Reduction of Wash Water: a) whenever possible, use commercial self-serve or full-serve car washes that properly dispose of or recycle the water, b) when washing at a residence be sure to: wash over a porous surface such as grass or dirt when possible, use dry cleaning methods, turn off the water when not in use or use a controllable spray nozzle, encourage the use of a neighborhood wash area where contaminants can be easily manged
Materials and Waste Management: a) properly dispose of soapy water or bucket water to a sanitary sewer or landscaped area, b) use dry methods to degrease or clean especially dirty areas such as tires

Automobile Parking

a) use routine preventative maintenance practices and make timely vehicle repairs to prevent fluid leaks
b) design and construct parking areas to minimize stormwater impacts; covered garages should be plumbed to the sanitary sewer

Home and Garden Care Activities and Product Use

Garden and Yard Care
Pollution Prevention: a) use safe substitutes and alternative gardening methods such as IPM techniques, native and drought tolerant plants, use compost or vermiculture for green waste recycling, follow manufacturers instructions for the application of any chemicals, identify pests before treatment, b) read all labels on products, c)implement water conservation, d) consider xeroscape gardens, e) repair and maintain irrigation system to prevent over watering, f) recycle green waste, g) plant or mulch hillsides and slopes to prevent erosion
Leaks and Spills: a) immediately clean any chemical spills, fertilizers, or soil, b) return spilt items to container for future use or proper disposal
Materials and Waste Management: a) store lawn care products in closed labeled containers indoors or covered areas, b) refrain from using chemicals on windy or rainy days, c) cover stockpiles of soil, compose, or fertilizer, d) dispose of chemicals through the HHW program, e) utilize dry sweeping methods for clean up
Restrictions on Activities: a) do not hose off paved surfaces to the street or gutter, b) do not put hazardous waste in the trash, landfill or stormdrain

Home Care and Maintenance
Pollution Prevention: a) utilize smart purchasing practices that reduce waste, b) use less toxic or non-toxic substitutes for cleaning, c) read and follow product labels, d) recycle used or unwanted products, e) use water based paints when possible, f) recycle unwanted appliances and equipment
Leaks and Spills: a) clean up spills immediately, b) properly dispose of waste from clean up materials

Materials and Waste Management: a) store HHW materials in closed labeled containers and in covered areas, b) recycle latex paint through local programs, c) dispose of hazardous products though the HHW program, d) dispose of trash in the proper receptacles with lids
Restrictions: do not dispose of wash waters (carpet cleaning, mop water, paint wash-up, etc.) to the street, gutter or storm drain

Disposal of Pet Waste

Pollution Prevention: spay or neuter pets to reduce feral populations
Waste Management/Disposal: a) clean up after pets when walking them in public places, b) clean up yards or other commonly used areas, c) properly dispose of the waste in the trash or toilet
Pet Management (Dogs and Cats): do not allow pets to run free in residential neighborhoods, whenever possible

6.3 Program Implementation

This section describes the steps that were taken in FY 2008-09 to require and verify the implementation of designated BMPs for residential areas and activities.

6.3.1 Outreach and Training

The City has an education program that is consistent with the Permit and the jurisdictional program. A significant element of this program consists of educating residents about ways in which they can minimize their impact on local waterways and the environment in general. Education of the citizens in Lemon Grove contributes to the implementation of the residential component of the stormwater program. Outreach messages that are relayed to the public include, but are not limited to:

- Impacts of urban runoff on receiving waters
- Distinction between the MS4 and the sanitary sewer
- Pollution prevention and safe alternatives
- HHW collection and recycling
- BMP implementation and maintenance
- Pet and animal waste disposal
- Equipment and vehicle maintenance and repair
- Spill response, containment and recovery
- Water conservation

During FY 2008-09, City staff conveyed these messages to the public through a variety of mechanisms, including:

- City's Website
- Production and distribution of brochures and promotional items

- Public participation in community events
- Response to residential complaints
- One on one conversations
- Public participation events such as clean-ups

Implementation of these mechanisms by the City helps to make the public aware of the types of activities that have the potential to impact water quality and the BMPs that can be implemented to reduce this impact. Awareness is the first step in the process towards behavioral change. A detailed description of the educational activities implemented by the City can be found in Section 8.

6.3.2 Used Oil, E-Waste, and HHW Collection Services

The City facilitates the proper management and disposal of used oil, toxic chemicals, and other household hazardous wastes (HHW) through various mechanisms. The City participates in door to door home collection, a permanent recycling facility is located in the City, and collection events for all HHW and e-waste. In addition, the City encourages weekly curbside garbage, recycling, and yard waste pick-up services through a franchise with EDCO. The various components of the solid waste and hazardous waste collection services provided by or for the City are described in detail below.

HHW Collection Program

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. This information is lengthy and is available upon request.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only one demolition site qualified and completed the program during this reporting period. Citron Court is a new mixed use redevelopment project located at 7385 Broadway that began construction during this reporting period. According to their reports, their demolition site generated 108.2 tons of recyclable materials.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in eight collection events for solid waste disposal. All of the events were in cooperation with a Household Hazardous Waste grant through CIWMB. .

The City held one collection day through EDCO and their facilities at the same time as the curb side clean up day. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 25-26. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2007-08, as per the HHW program, are not due to the State regulating agency until October 1, 2008; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2009.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2008-09, the City held eleven e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2009.

Used Oil Recycling Program

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

Table 6-1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005 (Calendar Years)

Table 6-2 Annual Oil Sales and Used Oil Recycling Rates (in millions of gallons)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005
Lubricating Oil Sales	141.2	140.8	136.2	137.5	142.1	150.0	154.3	163.6	168.0	150.2	150.5	153.5
Industrial Oil Sales	78.0	117.3	140.9	141.7	152.4	176.4	155.7	149.1	147.1	135.8	144.6	123.1
Total Oil Sales*	219.2	258.1	277.1	279.5	294.5	326.4	310.0	312.7	315.1	286.0	295.0	276.6
Lubricating Oil Recycled**	59.9	54.6	56.8	60.9	73.6	76.9	80.0	81.9	83.1	83.7	87.0	91.3
Industrial Oil Recycled**	16.7	19.5	20.8	19.3	11.6	10.4	7.9	15.5	17.5	32.4	32.5	31.4
Total Oil Recycled	76.6	74.1	77.6	80.2	85.2	87.3	87.9	97.4	100.6	116.1	119.4	122.7

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

Table 6-3 Oil Collected by Public Collection Programs (in millions of gallons)

Table 6-4 Oil Collected by Public Collection Programs (in millions of gallons)

	94/95	95/96	96/97	97/98	98/99	99/00	00/01	01/02*	02/03*	03/04	04/05
Curbside	0.9	0.9	0.8	0.9	0.7	0.6	0.5	0.9	.9	1.0	1.0
Form 303	0.6	0.7	1.0	0.8	0.9	1.1	0.9	1.0	1.0	1.0	1.0
Certified Centers	5.6	8.7	10.2	11.3	13.2	15.2	16.3	18.5	19.9	20.6	19.9
Total Oil	7.1	10.3	12.0	13.0	14.8	16.9	17.7	20.4	21.8	22.6	21.9

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the two collection sites and the number for curb-side pick-up. See Attachment L-2 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment L-4 for copies of the Newsletter.

The two collection sites are:

- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

6.3.3 Complaint Investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the stormwater hotline or other form of communication such as e-mail, a County hotline referral, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or cleanup activities by the City or responsible party.

The City enforces its stormwater ordinance for all residential areas and activities as necessary to maintain compliance with the Permit and ensure water quality. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for the City to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the Code Enforcement data base.
In FY 2008-09, the City received 89 Residential IC/ID complaint calls. Thirty five of those calls were construction related and are discussed in Section 3. Eight of them were related to illegal dumping in the street or gutter. All were abated within 24 hours of notification to the City and all known dischargers were educated on proper disposal methods. No citations or fines were leveed for residential complaints during this reporting period. The remaining calls were either unfounded or not related to stormwater and were delivered to the appropriate department.

6.3.4 Regional Residential Education Program

The City collaborated with other jurisdictions in the Education and Residential Sources Workgroup to develop the Regional Residential Education Plan. The Plan contains recommended strategies for the development and implementation of the Regional Residential Education Program. Implementing an enhanced regional program to target residential sources of stormwater pollution encourages the development of consistent messages throughout the region and enables Copermittees to better leverage resources and utilize economies of scale.

This reporting period's collaboration on a regional level was promotion of residential stormwater BMPs at the San Diego County Fair. The Copermittees combined funds to pay for a fair booth, material distribution, signage and advertisements at several locations on the fairgrounds for the duration of the fair. Booth staffers promoted the Think Blue message and presented stormwater educational materials to all fair attendees.

Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2008-09 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment.

7.1 Dry Weather Monitoring Program

This portion of the report will be submitted on December 15 as required in the Permit.

7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 104 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls eight were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 5 and follow-up and enforcement for residential complaints is dealt with in Section 6.

7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 6 of this report.

7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 4 of this report.

Section 8.0 Education Component

8.1 Overview of Education

The City's outreach program includes an education and public participation component. The education component is focused on disseminating educational information to increase public knowledge of stormwater issues, while the public participation component, discussed in Section 9, provides opportunities for the public to become involved in the process of reducing pollutants of concern in stormwater and urban runoff. The education component is primarily implemented by the City's water quality staff.

The Permit establishes the following five target communities which must be addressed by the education program:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

The overall goal of the education element is to provide an education program that will:

- Measurably increase the knowledge of the target audience regarding MS4s, impacts to urban runoff on receiving waters, and potential BMP solutions appropriate for the target audience and their activities.
- Measurably change the behavior of the target audience and thereby reduce pollutant releases to MS4s and the environment.

The City performed a wide variety of storm water education activities during FY 2008-09. Education and outreach was performed on three levels – Jurisdictional, Watershed, and Regional. Budgetary constraints are currently severely limiting the City's outreach abilities to in-house staff and resources only. However, the City has always worked hard to openly communicate with its community and staff has always been available for face to face meetings both at City facilities and while out in the community. The community also has easy access to all City staff by phone or e-mail. The City feels that this informal accessibility works in our favor and actually provides our residents with more meaningful, in depth education than multitudes of printed material.

8.2 Municipal Staff Training

Public Works. Water quality staff participates in monthly meetings with all of the public work division and weekly meetings with the public works supervisors. At these regular meetings, water quality staff provides updates on current policies

and areas of concern. Due to the regularity of interaction between water quality staff and public works staff, no separate annual training is currently being provided. Any questions or comments can be dealt with more effectively at the regular meetings and changes to regulations or activities can be instituted quickly and efficiently. Water quality staff is also integrally involved in ensuring that public works staff receives and maintains all required certifications, such as Confined Space certification, Hazwoper certification, Cal OSHA updates, pesticide application qualification, and other risk management trainings applicable to their daily jobs and their stormwater activities. Towards the end of this reporting period, the City began exploring a newly available training tracking program, which in future reporting periods will make it even easier to verify staff trainings.

New Employees. Water quality staff is working with the City's HR department to establish a new employee interactive training power point presentation, which will include basic stormwater information and an evaluation test at the end. This video will be shown to all new employees regardless of department and their end test results will be tracked. The City is participating in the Regional Municipal Workgroup, which is working on developing a series of employee educational videos that would be available to all Copermittees. These videos would include new employee, management and task specific trainings. With the City's new training tracking system, it will be easy to track employee trainings and track pre and post-test results to evaluate a change in knowledge.

Engineering and Planning Departments. Water quality staff meets weekly with these two departments to discuss development review projects, new policies, streamlining of existing policies and to participate in consistent interdepartmental education. The City finds these regularly scheduled meetings a much more efficient and effective way of updating and educating staff on water quality concerns, regulations and improvements. They are the foundation for the City's new sustainability mindset and have been vital initiating the overhaul of the City's General Plan. It allows the City to present an ideologically unified front to its residents, developers, contractors, and business owners.

8.3 Educational Outreach

This section describes education efforts conducted for each target community during FY 2008-09.

8.3.1 Underserved Target Audiences and Mobile Businesses

Underserved Target Audiences. For those segments of Lemon Grove community that do not speak English as their first language, the City provides many of its brochures and handouts in both English and Spanish. The City also employs bilingual staff to assist our residents, answer questions, and translate information. The current water quality brochures available in dual languages are

IPM pest tip cards, recycling and HHW information. The City also has available the Green Wrench BMP guide for automotive repair shops and the Green Cooking BMP guide for restaurants in Spanish. The City also works with the County's Green Business group which provides BMP information in Spanish and in English. Despite these efforts, the City realizes this continues to be an underserved audience and by collaborating with the other Copermittees hopes to continue to develop new ways to provide them with water quality data and information.

Mobile Businesses. During FY 2008-09, the continued to participate and provide information to the Regional Mobile Business Subcommittee for the development of the Regional Mobile Business Outreach and Education Strategy. Mobile businesses inherently provide services across jurisdictional lines; therefore the Copermittees chose to collaborate on a regional mobile business outreach and education strategy, which addresses the following elements:

- Inventory development and maintenance
- Establishment of minimum BMP requirements
- Outreach and education

The City's water quality staff, for several reporting periods, has reviewed any business license that pertains to a mobile business and required them to provide applicable BMP information on the business license application. Until the new Permit, however, these businesses were not an independent category in the business license directory. They were filed by business type, such as automotive or food service. During this reporting period, the City created the mobile business category and has begun transferring the known mobile businesses into the correct category. One of the challenges faced by Code Enforcement, in conjunction with mobile businesses, is their tendency to conduct business during off hours. City staff is very limited in their ability to work off hours and since the economic downfall, all overtime is prohibited unless emergency related. The City hopes that a Regional database of mobile businesses will help to track and regulate their activities and improve education opportunities.

8.3.2 New Development and Construction Communities

The City uses the following strategies to provide education and outreach to its development and construction communities:

- BMP training request as part of the permit application process
- Meetings with project developers, owners, on-site contractors and site supervisors
- SUSMP checklists as part of the development review process
- Signed BMP checklist for all ministerial permit applications (training request sheet is attached to this checklist)

- Informal meetings with developers and contractors due to questions, comments, concerns, etc. Generally occurs during the review process or normal site inspection process
- All changes to construction site BMPs are required to be submitted to City staff for approval

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

8.3.3 Commercial/Industrial Owners and Operators

The following is a summary of the education and outreach provided to commercial and industrial owners and operators during FY 2008-09.

- Annual inspections of all industrial facilities, restaurants and automotive facilities in the City by our in-house Code Enforcement staff. During these inspections, individual one-on-one education was presented to each facility manager/owner. Information presented included general storm water quality information and BMP requirements.
- The City also has Green Wrench and What's Cooking guides available for interested parties.
- Mailings to facilities about applicable local workshops and education opportunities, such as those offered by SDG&E and the San Diego Energy Commission.

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party. However, it is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation. They perceive stormwater inspections as part of this over-bearance and are often reluctant to make changes without the involvement of Code Enforcement proceedings.

8.3.4 Residential Community and General Public

The following is a summary of venues and media outlets utilized within the defined reporting period of this report to provide education and training to various residential and public audiences:

- City Newsletter containing an environmental section with water quality and environmental tips (such as how to properly care for your lawn, list of

basic household BMPs, or home improvement – BMPs your contractor should know) and information about HHW and recycling

- Various brochures available at City Hall: Used oil recycling, car washing, pet waste disposal, etc
- Maintenance of the stormwater hotline (619) 825-3827, which monitored by water quality staff
- Water quality staffed informational Booths at the following events: Fire Station Open House and Winter Bonfire.
- Participation and staffing at the Regional Education Outreach booth at the San Diego County Fair
- Participation and collaboration in watershed-based efforts such as Creek to Bay Clean-up and watershed based school presentations

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

The City is constantly striving to improve its outreach and education opportunities within the limited means of the current budget. Much of the current education is done by City staff in an informal manner with the public and business communities. Having a small City staff, means a consistent message is provided because staff is easily kept up to date on the current regulations and policies. This program will continue to evolve as necessary and as funds allow.

9.1 Public Participation

Public participation is one of the components of the City's outreach program. The goal of the education component, discussed in Section 8, is geared towards disseminating educational material to increase public knowledge of storm water issues. The goal of the public participation component is to provide opportunities for the public to become involved in the process of education and reducing pollutants in stormwater and urban runoff.

Public participation activities provide opportunities for the public to interact and become involved with water pollution issues. When the public has the opportunity to become involved there are several positive outcomes. First, those involved become more knowledgeable about stormwater issues. Second, they become educators and stewards for the stormwater program. Finally, they provide important feedback to the stormwater program regarding the concerns of the public and issues that may be overlooked. Ultimately, public participation help makes the education process more effective.

9.2 Public Participation Approach

The City's approach for the outreach program is to develop an understanding among its residents and businesses of some fundamental storm water concepts. These include:

- The difference between the sanitary sewer and the storm drain system (sanitary waste gets treated, but discharges into the storm drain system flow directly to our waterways and beaches untreated)
- The economic value of our beaches and inland waterways and the importance of protecting them.
- An understanding of illegal discharges, i.e. sidewalk and street wash water runoff, vehicle fluid (antifreeze and oil), landscape debris, sediment, etc.
- How to report a stormwater violation (stormwater hotline or website).
- The fact that we all live in a watershed and that the watershed is integral to wildlife, public health, and to the water quality of the rivers, streams, and oceans.
- Reducing pollutants of concern.
- Responsibility of citizens to participate in the cleaning and maintaining of the community (i.e. creeks and parks) and not to be part of the pollution problem (littering, illegal dumping, improper disposal of household chemicals).

Some of the tools that are used by the City to implement the public participation activities are:

- public outreach events
- public reporting methods
- pet waste dispensers
- Household Hazardous Waste Collection and Used Oil Recycling
- public opinion surveys
- copermittee collaborations

9.3 Program Implementation

This section describes the specific public participation tools used during the FY 2008-09 reporting period.

9.3.1 Public Outreach Events

The City participated in several outreach events during FY 2008-08:

- Coastal Clean up Day - April 25, 2009, 12 volunteers, Federal Blvd/San Miguel drainage channel, graffiti abatement on adjacent k-rail
- Youth Group Community Service Project – April 7-8, 2009, 35 volunteers, Lemon Grove Park clean up and mural re-painting
- Church Community Service Project – October 12, 2008, 40 volunteers, median clean up and re-landscaping with drought tolerant plants

9.3.2 Public Reporting Methods

The City has a local hotline that connects the caller directly to the City's water quality staff. The number is (619) 825-3827. A public works person is available for after-hours emergencies, who will contact the best staff person to handle the emergency. There are also two regional stormwater hotline numbers promoted within San Diego County: a toll-free Regional Storm Water Hotline, 1-888-846-0800 and the Think Blue Hotline, 1-888-844-6525 (1-888-THINK BLUE). Both of these hotlines are staffed by the County of San Diego Monday through Friday, 8:00am - 5:00pm. In addition to personal service at these hotlines during regular business hours, the hotlines provide a voice mail message for 24-hour public access.

The City's stormwater hotline has been heavily advertised since the programs inception. In FY 2008-09, the hotline received eight stormwater related calls, typically pertaining to the illegal discharge of fluids in the gutter over the weekend or a business hosing off their parking lot. All calls are investigated by Code Enforcement and are usually handled with a verbal warning and education about household BMPs. None of the calls during this reporting period requied formal Code Enforcement proceedings. The hotline is advertised in the newsletters and

on the City's website, in brochures, on give-aways, and at City events like the Winter Bonfire and the Fire Station Open House.

The City's website also provides water quality information and event updates: www.ci.lemon-grove.ca.us.

9.3.3 Pet Waste Dispensers

Residents are encouraged to protect our creeks, lagoons, and ocean by cleaning up after their pets. To make this easier; pet waste dispensers can be found at all the City parks and in the vacinity of City Hall, all areas where people frequently walk their dogs. Trash cans are also readily available in all of these areas. Both the trash cans and bag dispensers are maintained by the City's Grounds division.

9.3.4 Household Hazardous Waste Collection and Used Oil Recycling

The City co-sponsors several HHW and e-waste events over the course of the reporting period. During these events, residents can drop off any HHW or e-waste free of charge. The City collaborates with the Cities of Chula Vista and La Mesa for HHW events and data collection. The City participated in eight HHW events and eleven e-waste events. The City has two used oil collection points in the City:

- EDCO Recycling Center 6670 Federal Blvd
- Kragen Auto Parts 6925 Federal Blvd

9.3.5 Copermittee Collaborations

The City continues its collaboration and encouragement of the County's Green Business program for restaurants and automotive repair shops. This effort continues to develop and explore a State wide collaboration and standards. The City will continue to promote these programs to the applicable commercial facilities where-ever possible.

Section 10.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

10.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 11.1.

Table 10.1 – 2008/2009 Fiscal Analysis Summary

Stormwater Cost Analysis
All costs covered in the General Fund.

ACTIVITY	CURRENT YEARLY BUDGET	CURRENT BUDGET LOCATION
STORM DRAINAGE CLEANING AND MAINTENANCE		
Public Street and Parking Lot Sweeping		Streets
Streets	$30,000	
Parking Lots	$2,000	
Public Street and Parking Lot Sweeping Total	$32,000	
Litter Removal		
Litter Removal	$13,000	
Litter Removal Total	$13,000	
Storm Drainage Cleaning		
Inlets		
Inspection and Cleaning	$19,820	
Fossil filter replacements	$1,400	
Inlets Subtotal	$21,220	
Basins and Channels		
Inspection and Cleaning (Note 1)	$38,829	
Basins and Channels Subtotal	$38,829	
Video Inspections		
Video Inspections (Note 1)	$50,000	

Video Inspection Subtotal	$50,000	
Storm Drainage Cleaning and Maintenance Total	**$155,049**	
STORM EVENT ACTIVITIES		
Sandbag stock piling and placement	$4,000	
Patrols	$3,089	
Storm Event Total	**$7,089**	
ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM		Engineering Services
Dry Weather Testing	$20,000	
Enforcement	$5,000	
Administration/Supervision	$1,000	
Stormwater HotlineComplaints	$2,000	
Illicit/Illegal Enforcement Program Total	**$28,000**	
STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)		
Construction Related SWPPP	$2,000	
Plan Review (including SUSMP's)	$15,000	
Inspection	$3,000	
Construction Related SWPPP Subtotal	$20,000	
Municipal Facility SWPPP		
SWPP Implementation, Inspection, and Maintenance of Municipal Facilities	$18,798	Streets

BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION		
Inspection of Industrial and Commercial Facilities	$50,000	
Inspection of Municipal Facilities	$1,000	
BMP Total	**$51,000**	
MISCELLANEOUS ACTIVITIES		Engineering Services
Annual Reporting (JURMP)	$5,000	
Administration (General)	$74,004	
NPDES Permit Fee	$7,500	
Public Education/Outreach	$5,000	
Miscellaneous Activities Total	**$77,504**	
PROGRAM TOTALS	**$371,440**	

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2006-07 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance

activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

10.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.
Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

11.1 Introduction

The City began applying baseline program effectiveness assessment methodologies soon after they were developed by the San Diego region stormwater Copermittees during the last permit cycle as described in the document titled "A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs" dated October 16, 2003. The City has also actively participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008 and as an ongoing process. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs, so the City prepared its own effectiveness assessment approach and measures modeled after conventional strategies and the existing levels of effectiveness assessment as detailed in the October 2003 document.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is anticipated that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will undertake the issue of standardized assessment metrics and procedures in the near future. The City is committed to engaging in the process of developing such regional standards and incorporating resulting work products into its own local program effectiveness assessment system. It is in consideration of the evolving and ongoing regional standardization process that the City has endeavored upon fine tuning its local effectiveness assessment approach as presented in the subsequent paragraphs and tables. Further, it is recognized that these methodologies and strategies must be adaptable as regionally developed procedures are solidified in the future.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The core structure of the City's stormwater program is composed of three primary drivers:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The programmatic process typically proceeds from planning to implementation to assessment, although in practice all three maybe in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program elements developed during the planning step are implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments

are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

As part of the JURMP update process, the City has identified a variety of significant activities uniques to each program element and metrics (numeric and/or narrative) to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics are provided in SEction 13 of the City's revised 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step towards the more difficult level of improvements to water quality in receiving waters. The levels are listed below.

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

11.2 Effectiveness Assessment Results

The new Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment - assessment that combines both monitoring data and programmatic data - are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome Level Assessments

Level 1

A requirements checklist, which includes a directory of permit compliance elements and where each is described within the JURMP annual report, can be found in Appendix G.

Level 2 and 3

Tables 11-3 at the end of this section include discussions of Level 2 and Level 3 outcomes for activities identified as significant by the City within each program component. Note that only Level 1 assessment applies to fiscal analysis, so a table for fiscal analysis is not included.

Level 4

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load reduction estimation methods have not yet been or cannot be developed.

Level 5

On September 10, 2008, the Regional Board adopted Addendum 2 to Order 2007-01, effectively extending the annual due date of the illicit Discharge Detection and Elimination reporting requirements to December 15. It is anticipated, consistent with previous Dry Weather Monitoring reports prepared by the City that baseline trend analysis will be provided for a number of constituents evaluated through the Dry Weather Monitoring Program. This information is further spatially correlated with sub-basins or drainage areas within the City, and evaluated against land-use areas and potential source areas.

Level 6

It has been determined, through ongoing development and discourse over long-term effectiveness assessment methodologies that relationships between programmatic activities and changes in receiving water quality are difficult to establish on an annual basis or a jurisdictional scale. As such, the City will point to future regionally coordinated efforts including Report of Waste Discharge (ROWD) and Long Term Effectiveness Assessment (LTEA) development to more holistically evaluate changes in receiving water quality. It is anticipated that such efforts will be further refined and supported by ongoing data gathering efforts both locally and regionally.

11.2.2 Overall Component Assessments

Development Planning

The City's review process for development projects is effectively requiring higher removal efficiency treatment control BMPs. Further, two new significant program elements were in production and in early stages of implementation within the defined reporting period of this report; both new programs are demonstrating positive trends. BMP installation verification and BMP operation and maintenance verification efforts, while not wholly implemented at the time of report production, have resulted in the establishment of programs that will support long term effectiveness assessment measures for development planning.

Construction

The City's review and approval process for construction related plans and documents is effectively verifying proposed construction specific BMPs. BMP implementation and maintenance is being effectively managed through construction site inspection activities, and validated through associated assessment measures. It is anticipated that in response to increased inspection frequencies and refined data gathering practices that this trend will continue.

Municipal

The defined reporting period of this report is marked by significant expansion of municipal operations and maintenance activities to meet the standards established in Order 2007-01. Enhanced stormwater conveyance, drainage facility, channel maintenance and inspection and street sweeping activities, were developed and implemented, equating to the removal of salient volumes of debris. Effective operations and maintenance activities are demonstrated in the Table 11-1 below, and it is anticipated that this continued level of service as well as enhancements in data gathering methods will support the efficacy of municipal activities.

Table 11-1

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Street Sweeping	169.75 tons	None	169.75 tons
MS4 Cleaning	3,360 pounds (1.815 tons)	None	3,360 pounds (1.815) tons
			Total 171.565 tons

Industrial and Commercial

Stormwater activities and actions related to industrial and commercial entities have exhibited positive trends within the defined reporting period. The City has identified inspection activities coupled with complaint response and enforcement as the significant activities by which to evaluate program effectiveness. During the defined reporting period, the City has been able to evaluate effectiveness on a number of levels (See Table 11-2) through the gathering of critical statistics, including a knowledge and BMP assessment scoring system. Data gathered and evaluated during the defined reporting period indicate that identified significant program activities targeting industrial and commercial sources have been effective.

Table 11-2 Program Scores for 2008-09**

	Knowledge Assessment *	BMP Assessment
Average Rating	2.6	3.5
Median Rating	3	3

# of “Level 5” Ratings	6	25
# of “Level 4” Ratings	28	34
# of “Level 3” Ratings	30	49
# of “Level 2” Ratings	22	12
# of “Level 1” Ratings	33	4

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

Table 11-2 cont. Program Scores for FY 2005-06
(This was the first year the analysis was done and is provided for comparision)

	Knowledge Assessment *	BMP Assessment
Average Rating	2.39	3.33
Median Rating	2	3
# of “Level 5” Ratings	0	14
# of “Level 4” Ratings	9	26
# of “Level 3” Ratings	34	30
# of “Level 2” Ratings	26	11
# of “Level 1” Ratings	18	7

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

Residential

Residential BMP implementation has been identified as the significant activity by which effectiveness has been assessed. Residential complaint response and enforcement constitute the core of residential BMP implementation assurance actions. Based upon an evaluation of data associated with these elements, including the number of incidents responded to and the ultimate resolution of these events, the City has demonstrated a notably effective program and level of service to the community of Lemon Grove.

Table 11-3

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Used Oil Recycling	25,600 gallons	10%	2,560 gallons
C&D Ordinance Recycling	17,852 pounds	1%	179 pounds

Education

Education effectiveness is assessed for a variety of program elements. In terms of education opportunities provided to the various community sectors and City

staff and contractors, identified as the significant metric by which to evaluate education activities, the City has achieved a high level of success.

Public Participation

The City provides a variety of venues and outlets in support of public participation. The City has identified a number of measures to evaluate the effective implementation of this program element. As with education, public participation translates across a number of program areas; however the assessment measure are focused on success of the venues ad outlets supported by the City. From the measures identified and quantified, community partnerships, event attendance, hotline calls, and volumes of debris and hazardous materials collected through public participation, the City has established exceptional trends.

11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 have been made since the submittal of this document.

LEMON GROVE

BEST CLIMATE ON EARTH

Incorporated in 1977

Executive Summary

The City's eighth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In 2008, the City updated its JURMP and Municipal Codes to reflect the requirements of the new Permit, Order 2007-01. The Model SUSMP was completed by the Copermittees and submitted for Regional Board approval during this reporting period and will be added to the City's Municipal Code in the next reporting period. In FY 2009-10, the City continued its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have

helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2009-10. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2009-10, the City continues to make significant steps toward the implementation of a City-wide GIS program, including the beginning of service contract to install GIS layers for the sanitary sewer system. Other departments and layers will be added as the budget allows. Currently the budget does not allow for other layers, but the City hopes this will change in future reporting periods, although perhaps not until the next permit cycle. The implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

Section 1.0 Introduction

Lemon Grove's ninth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit"), represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2009 through June 30, 2010). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City strongly supports the concept of an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City also feels a stronger regional program could help alleviate the cost burden the current program forces on the City. The end result would be a maximization of severely scarce funds and funding. The City is currently experiencing, as are many others, serious financial hardship due primarily to the economy and the State raids on local funds to support its own programs. The loss of revenue in the past year has forced the City to redistribute General Funds to maintain even basic service levels, such as pothole repair. The City feels the current program meets regulatory requirements, but is leery of program expansion without a secure revenue source. The unfunded mandate aspect of this program continues to stress the City's already stretched thin General Fund. The City encourages the Regional Board to take a stronger leadership role in facilitating more cooperation with State agencies in obtaining long-term funding for this program. The City hopes that in future reporting periods, some of these challenges can be met with more cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City's construction and BMP databases continue to evolve as more information is gathered and tracked. Water Quality staff continues active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City believes in a comprehensive and collaborative approach for environmental concerns and solutions. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a

city-wide GIS program. The City is currently working on implementing initial GIS programs and layers through the Sanitation District. These initial layers will include the mapping of our sewer mains and City maintained laterals, as well as the tracking of maintenance activities. All further implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with sever economic challenges both on a local and state level.

At the jurisdictional level, the city has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- A new in-house water quality inspector and code enforcement officer
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming
- A burgeoning sustainability program of which stormwater is a key element

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 5.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to

public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2009-10. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

Section 2.0 Development Planning Component

This section describes actions taken by the City during FY 2009-10 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

2.1 Land Use Planning

The City's land use planning process facilitates the reduction of development project discharges of pollutants from the MS4 to the MEP, the prevention of development project discharges to the MS4 from causing or contributing to a violation of water quality standards, and of increases in runoff discharge rates and durations from development projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. The water quality staff works closely with engineering staff in these efforts, presenting a united, collaborative process to developers.

The City's land-use planning process consists of development and implementation of the following documents:

- General Plan
- Jurisdictional Urban Runoff Management Plan
- SUSMP
- Municipal Code, which includes the City's Development Code, Grading and Excavation standards, and all Stormwater regulations

The utilization and regular update of each of these documents enables the City to successfully conform to the requirements of section D.1 of the Municipal Permit. The following sections will describe the City's land use planning process and the four planning documents in more detail.

The City of Lemon Grove was incorporated in 1977 from the County of San Diego. The City's General Plan was adopted in 1996 and is currently undergoing an in-depth review and amendment process. The City's JURMP, Stormwater Ordinance and SUSMP were originally developed and adopted under Order 2001-01 in 2002-2003. These documents have been reviewed and updated under the new Order 2007-01.

2.1.1 Source Characterization

The City addresses eleven major land use categories in its General Plan:

- Low density residential
- Low/medium density residential
- Medium density residential
- Medium/high density residential
- Mixed use
- Retail commercial
- General Business
- Industrial
- Parks and recreation
- Transportation
- Special treatment area (STA)

The General Plan also recognizes eleven zoning categories:

- Residential low
- Residential low/medium
- Residential medium
- Residential medium/high
- Residential professional
- Central commercial
- General commercial
- Limited commercial
- Heavy commercial
- Light Industrial
- Special treatment area (STA)

Each of these land-use and zoning categories is associated with different combinations of pollutants and activities that have the potential to negatively affect the surrounding environment. A detailed discussion of the potential threats to water quality associated with existing residential, commercial, industrial, and municipal land uses can be found in their specific sections of this report.

Through the implementation of the land use planning policies, procedures, and requirements established in the General Plan, JURMP, Municipal Code, Grading Ordinance and SUSMP, the City aims to reduce the potential for pollutant discharges from all planned development and redevelopment land use sources.

2.1.2 Best Management Practice Requirements

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment H-1 shows the form that is presented to each applicant regardless of project size.

This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue by developers. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity. Through a series of updates and reviews, the City is working to include low impact development concepts through-out the applicant review process and in its codes and regulations, specifically the General Plan.

2.1.3 Program Implementation

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

2.1.3.1 General Plan/Municipal Code/SUSMP

As a component of the 2008 JURMP update (conducted during FY 2007-08), an assessment of the City's General Plan and Municipal Code were conducted to determine the City's consistency with the watershed protection policies and principles found in the Permit. The analysis found that the City's General Plan goals and policies are consistent with the Permit and that no amendments to General Plan were required as a direct result of the JURMP update. The

General Plan discourages the use of large amounts of connected impervious surfaces, requires a landscape minimum, works to protect environmental sensitive areas, and prohibits development near or in a known watercourse. However, the City's General Plan is currently undergoing a comprehensive review process with plans for amendments occurring over subsequent reporting cycles. The City plans to ensure that each area covered in the General Plan contains environmental and sustainable options and concepts. Low Impact Development ideas will be presented and encouraged throughout the document. The City's General Plan is meant to cross reference and openly comply with the City's Municipal Code and all other pertinent development documents.

The City's General Plan serves as the blueprint for the long-range, orderly, physical development of the City. The Development Code section of the Municipal Code contains all zoning and land use requirements and stipulations. These two documents together are designed to protect the City's environmental, social, cultural, and economic resources as the City develops and redevelops.

The Municipal Code did undergo a lengthy review and amendment process due to the issuance of Order 2007-01. Section 8.48 Stormwater Management and Discharge Control was broadened and made more comprehensive. A BMP specific section was added, Section 8.48.060-110. Section 8.48.140 contains regulations for all land development and redevelopment projects and Section 8.48.150 contains BMP maintenance requirements. All of these additional sections, strengthen the City's water quality program by providing a legal basis for implementation and enforcement. During the review process, the City decided to also include the SUSMP as a Municipal Code section, Section 8.52 now contains the City's SUSMP document. This section will be further updated during the next reporting period with the approval of the new County-wide SUSMP document. During this reporting period, the City collaborated with the Copermittees to create the final draft SUSMP, which was then turned over to the Regional Board for review and approval.

2.1.3.2 JURMP

In compliance with Order 2007-01, the City's JURMP document underwent a major update during FY 2007-08. This update process was continued after receiving comments from the Regional Board in early 2009. The JURMP document serves as the City's foundational storm water program management tool, capturing the developed process, procedure, and implementation strategies for described elements. The purpose of this document is to present an integrated approach to reducing the discharge of pollutants from the MS4 to the MEP, and to protect and improve the quality of water bodies in Lemon Grove.

2.2 Environmental Review Process

As part of the 2008 JURMP update, the City evaluated its environmental review process and confirmed that the current process accurately evaluates water quality, cumulative impacts, and identifies appropriate measures to avoid, minimize and mitigate those impacts for all development projects.

The California Environmental Quality Act (CEQA) requires environmental review of discretionary applications for development projects. Environmental initial studies are conducted to determine whether the project may have a significant impact on the environment. This review process evaluates a project's potential for significant impacts on water quality.

The environmental review process ensures that a project's impact on water quality is addressed early in the planning process. If a project is determined to have a significant environmental effect, mitigation measures are required under CEQA to avoid or reduce the effect to below a level of significance. The mitigation measures will normally take the form of adopted permanent Best Management Practices to be incorporated into project plans prior to discretionary approval.

2.3 Development Project Approval and Verification Process

As discussed previously, the City has an established multi-departmental review process for all new development and redevelopment projects. By using all of the above mentioned regulations, the City aims to mitigate the negative impacts of urban runoff from development projects to the MEP. Each proposed discretionary and ministerial project is subject to the City's development approval process. The following sections describe this process in detail.

2.3.1 Source Characterization

As discussed above, development projects have the potential to discharge different types and amounts of pollutants based on the project's size and intended land use. Pollutants such as trash and debris are anticipated from all developments, regardless of land use; however, pollutants like bacteria and viruses are more likely to originate from restaurants and residential developments, whereas grease and oil are more likely contributed by parking lots and automotive repair shops. Since the potential for a site to discharge pollutants is unique to each development, the City's design requirements for development projects vary according to size, project characteristics, and anticipated land use.

The City's SUSMP, which was updated and added to the Municipal Code during FY 2007-08, describes specific categories for priority projects and indicates common pollutants associated with each category. A priority project must

identify the potential pollutants anticipated from its development and implement design concepts and other BMPs to address these pollutants.

In the City, all development projects, including building and ministerial permits are required to implement minimum BMPs. These BMPs include construction BMPs and good housekeeping practices. Discretionary projects, however, generally pose a greater potential threat to water quality and are subject to an additional set of BMPs and more intense scrutiny.

2.3.2 Best Management Practice Requirements

The City's minimum BMP requirements for all discretionary development projects are summarized here and are included in the City's SUSMP. All discretionary development projects are required to explore and implement where applicable the following principles:

- Source control BMPs that reduce stormwater pollutants of concern in urban runoff, including but not limited to storm drain stenciling and signage, properly designated and covered material and trash storage areas, and the use of efficient irrigation systems.
- LID BMPs that provide retention, slow runoff, minimize impervious footprint, direct runoff into landscaping, and promote water conservation.
- Grading and construction activities must implement all requirements outlined in the City's JURMP and Municipal Code.
- Submittal of proof of on-going long term maintenance for all structural post-construction BMPs.

SUSMP priority projects must submit a water quality document, which includes identification of potential pollutants from the project, proposed LID, source control and treatment control BMPs, and an attached maintenance agreement. The document must also include how the project will manage increases in runoff discharge rates and durations associated with the project. It is the City's policy to prevent permitted projects from increasing the runoff coefficient that eventually enters the City's MS4. Both the water quality document and hydrology report must provide retention and detention details for any runoff increase due to the development or redevelopment of a site.

2.3.2.1 Hydromodification Management Plan and Interim Hydromodification Criteria

To reduce the negative impacts to beneficial uses and stream habitats that are attributed to increased runoff rates and in compliance with Order 2007-01, the City is currently collaborating with the other Copermittees to adopt a detailed Hydromodification Management Plan (HMP).

The final draft HMP was submitted to the Regional Board at the end of this reporting cycle and will be approved and integrated into the City's program during the next reporting cycle. However in FY 2007-08, the City established interim hydromodification criteria that will be in effect until the final HMP is approved by the Regional Board and adopted by the City. The City requires all priority projects disturbing 50 or more acres to comply with the interim hydromodification criteria, except those sites that are considered exempt as per Section D.1.(g)(6) of the Permit. These interim requirements are consistent with the regionally adopted interim hydromodification standards. The City of Lemon Grove is a small developed community and does not anticipate any projects during the following reporting period that will meet these criteria. The City also connects almost exclusively to concrete channelized streams at its borders and does not anticipate frequent projects subject to future hydromodification requirements.

The City does not issue permits to development projects until all minimum BMP requirements are met. Any changes made to the development project's proposed stormwater BMPs during project construct must be reviewed and reapproved by City staff before being implemented.

2.3.3 Program Implementation

As required by the Permit, the City has implemented a program to ensure that development and redevelopment projects comply with post-construction BMP requirements, including Low Impact Development (LID), source control, and treatment control BMPs. The Permit further requires the City ensure proper installation of treatment control BMPs and their maintenance into perpeturity through such procedures as BMP verification, maintenance agreements, and annual inspections.

The following sections provide an overview of the City's SUSMP implementation practices and tracking during FY 2009-010.

2.3.3.1 Model and Local SUSMP updates

As a part of the 2008 JURMP update process, the City updated its current SUSMP document to meet the interim requirements outlined in the Permit. The City's update followed the recommended language developed by the regional SUSMP update group. All required interim SUSMP updates were incorporated into the Municipal Code. In compliance with the interim SUSMP update standards established in Order 2007-01, the following tasks were performed during the review and interim update of the SUSMP:

- Priority project categories were updated
- The document was reviewed to ensure no obsolete or ineffective BMPs were retained

- LID requirements and additional source control requirements were added to meet or exceed Permit requirements
- LID BMPs that can be used as treatment control BMPs were added to appropriate tables and discussions of treatment control options were updated accordingly
- Pollution removal efficiencies of treatment control BMPs were reviewed and updated where necessary

In addition to the changes discussed above, a comprehensive model SUSMP update was completed by a regional workgroup during FY 2007-08. The comprehensive model SUSMP update includes the following as required by the Permit:

- Inclusion of LID, source control, and treatment control BMPs that meet or exceed the minimum requirements of the Permit
- Establishment of siting, design, and maintenance criteria for each LID and treatment control BMP listed in the model SUSMP
- Addition of criteria to help determine conditions where implementation of each LID BMP included in the model SUSMP is applicable and feasible
- Addition of a requirement for priority projects with low traffic areas and appropriate soil conditions to use permeable surfaces
- Addition of any necessary restrictions for infiltration BMPs from priority projects that generate high levels of pollutants

The City adopted the new Model SUSMP during this reporting period. The SUSMP includes a review process to verify all proposed BMPs for priority projects meet the criteria designated in the updated local SUSMP.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's local SUSMP during the next reporting period. The HMP was developed by a consultant and regional workgroup during this reporting period and the draft HMP was submitted to the Regional Board for approval.

2.3.3.2 Development Project Approval Process

The following includes a summary of the City's current development review process.

Discretionary Projects

Projects requiring a discretionary review are subject to an in-depth review by City staff. During the first submittal or pre-meeting, it is determined if the project is a SUSMP priority project and if a water quality document will be required. The project is reviewed by engineering, planning, sanitation, building, and water quality staff; through all permit phases. After review at the City, the project is reviewed by the City's Planning Commission and conditions of approval are set

for the project and approved by the City Council. These conditions require the applicant to uphold all proposed water quality measures and any changes are subject to review and approval by City staff and potentially the Planning Commission and City Council depending on the significance of the changes.

The City of Lemon Grove requires applicants to complete their water quality documents at the time of discretionary review and approval. During this process, the applicants and their engineers are guided by City staff to provide adequate post-construction BMP facilities and to document those facilities on the site plans and documents being submitted. This process results in better designed, more comprehensive, post-construction BMPs since the facilities are included in the project design even in the earliest phases of the project. Each applicant who prepares a water quality report for a priority project is provided a self checklist to assist in their report preparation. This checklist provides the applicant with an outline and details pertaining to the requirements of the SUSMP and the Permit for BMP implementation and sizing.

All hydrology reports and treatment control BMP sizing are done during this phase and are upheld through the remainder of the grading and building phase through the conditions of approval. The same City staff that performs the discretionary review also performs the grading and building permit reviews. This also maintains consistency throughout the review process and ensures the conditions of approval are upheld. City staff provides constant feedback and assistance to the applicant and their engineers through out this process and all additional permit processes. The City continues to discourage the use of mechanical treatment systems. Natural systems are easier and more cost effective to maintain in the long term, as well as encouraging landscaping and additional green space with little if any additional irrigation. All proposed BMPs must meet the standards set forth in the City's SUSMP document, which upholds the requirements put forth in the Permit. If the submittal is inadequate in any regard, approval is withheld and re-submittal is required.

Ministerial Projects

Grading, improvement plans and building permits are all ministerial permits, which means they only require the approval of City staff, not the Planning Commission or the City Council. However, if the project is not completed to staff's approval, no permits are issued and no actual work can be done on the project site. These projects are reviewed by all the same departments and staff as the discretionary projects. Lemon Grove is a small city and has a small staff, which allows the full spectrum of departments to be intimately knowledgeable about the projects being reviewed and any concerns pertaining to the project. If it is discovered that a ministerial project meets priority project conditions as per the SUSMP, all the requirements discussed above are applicable. No permits are issued by City staff until the project satisfactorily meets all of City staff's requirements, particularly water quality requirements.

All ministerial projects, except water heater installations and electrical wiring, are reviewed by water quality staff. Even if the project does not meet priority project standards, water quality staff reviews the project for LID concepts, proper drainage design, proper erosion control, and smart irrigation.

Post-Construction BMP Maintenance Agreements

All priority projects under review for permits must execute a stormwater maintenance agreement guaranteeing the maintenance and/or replacement of permanent BMPs as necessary into perpetuity. The maintenance agreement is recorded against and runs with the property. This ensures that all future owners maintain the permanent BMPs to the original standards and any changes require the approval of City staff.

Capital Improvement Projects

The City's Capital Improvement Projects (CIP) are subject to the same post-construction BMP requirements as private development. Because many projects are redevelopment, linear or repair projects, often only construction BMPs are necessary. However, SUSMP qualifying projects must also install post-construction BMPs. Priority CIP projects are designed to incorporate the City's SUSMP requirements and LID, source control, and treatment control BMPs will be implemented. The city takes responsibility for long-term maintenance and regular inspection of any installed permanent BMPs. Section 4 of this document provides a description of the City's MS4 maintenance and inspection program.

2.3.3.3 SUSMP Project Approval

During the planning process, the City reviewed eleven SUSMP projects during this reporting period. A list of those projects can be found in Appendix H4. All applicable SUSMP BMP requirements specified in the City's local SUSMP were applied to each of these projects. Under no circumstances was any priority project permitted to implement treatment control BMPs with low pollutant removal efficiency ratings. In addition, all of the development projects approved in FY 2008-09 were less than fifty acres in size; therefore none of the projects were required to meet Interim Hydromodification Standards. All treatment control BMPs met the treatment control BMP sizing requirements outlined in the City's local SUSMP; therefore, the City did not initiate a waiver mitigation program and did not issue any waivers of infeasibility during FY 2009-10. Depending on the date in which the project was reviewed and approved, conditional SUSMP requirements may vary as a result of the migration to the new Permit requirements and the required adoption of the new local SUSMP.

2.3.3.4 SUSMP Project and Treatment Control BMP Tracking

Over the past fiscal year, water quality staff worked to implement a watershed-based SUSMP tracking system. In the future, this tracking system will be transitioned to a GIS based system. However, it is currently only a tracking database. Since the City is predominately in the Chollas Creek watershed with only a small portion in the Sweetwater watershed, it is not difficult to track projects by watershed. The database tracks the following information:

- Type of treatment control BMP
- Location of the BMP
- Watershed within which the BMP is located
- Date of construction of the BMP
- Responsible BMP maintenance party information
- Owner information if different from maintainer
- Receipt of annual maintenance verification
- Inspection findings
- Corrective actions if necessary

The City is continually working to refine the database as more permanent BMPs are implemented and tracked. The City currently has less than 10 tracked BMPs, although several more are still in the proposal and review stage as evidenced by the priority project list. Due to the small number of permanent BMPs in the City, staff inspects all of them regardless of JURMP priority level. They are inspected formally on an annual basis, but frequently informally inspected when staff is in the vicinity. If, in the future, the number becomes significantly larger, the City will begin to utilize the priority rating to determine inspection frequency.

2.3.3.5 BMP Installation Verification Process

The City has always verified the proper installation of all permanent BMPs and LID components, which are similar to the site design elements of the previous Permit. The City continues this practice under the new Permit. Each project requires closing signatures from staff once construction is completed. This involves an on-site staff visit to verify the project was constructed per the plans and appropriate documents including any water quality reports, hydrology reports, and soil findings. If corrections are needed, staff does not provide a signature and can withhold that signature for as long as it is needed to gain compliance. Without compliance, the site cannot be used for its final purpose. If compliance is not reached within a reasonable amount of time, Code Enforcement proceedings are begun. Each project under goes frequent staff inspections during the construction as detailed in Chapter 3 of this report to ensure that any underground elements are being built according to the approved plans and provide regular staff feedback and assistance. All in the hopes of a properly designed site at signature request time. The final signature process involves the same departments that reviewed the project from its initial stages,

typically this includes planning, engineering, sanitation, and building. This means that the staff providing the final implementation inspection is the same staff that reviewed and approved the project, meaning they are very knowledgeable of the project and its requirements. The City's interdepartmental cooperation is instrumental in making this process effective and efficient. Problems are viewed and solved jointly and comprehensively.

2.3.3.6 Annual Treatment Control BMP Operation and Maintenance Verification and Inspection

As required by the new Permit, all treatment control BMPs installed at development projects must be inspected annually and maintained in perpetuity by the responsible party. As part of the JURMP update, the City established a Treatment Control BMP tracking program. Because implementation of the City's JURMP did not begin until January 2008, this reporting period is the second year the tracking system has been used. Annual inspections took place by City staff during this reporting period of all permanent BMPs that have been in operation for at least one full year and rainy season. Again, due to the small size of the City and the currently small number of permanent BMPs, the City was able to inspect all of the BMPs meeting the one full year of operation criteria. As stated before, should that number increase drastically, the City will then begin to use the priority ratings established in the JURMP. A listing of the BMPs inspected during this reporting period can be found in Appendix H5. The City is currently working to implement the annual verification letter requirement. As this is a new and additional requirement for businesses, there have been some initial delays in receipt of these letters and receipt of incomplete information. However, the City is working with the businesses to obtain all the required information in a more timely manner. The City is working to integrate the letter process into its annual commercial and industrial inspection program to solve the previously mentioned difficulties. This information is tracked in the same database that tracks BMP location and inspection results. The City has mailed a notification letter to all those owners/operators that will be required to provide annual BMP verification letters to the City. These letters must be submitted prior to the start of each year's rainy season.

In the first year of implementation, the City anticipates a significant amount of information gathering and validation. Through initial contacts with responsible parties, the City will refine its inventories as well as methodologies to effectively assure proper maintenance and management of permanent BMPs.

2.3.3.7 Enforcement Measures for Development Sites

Since the City's Treatment Control BMP Operation and Maintenance Verification and Inspection Programs did not commence until FY 2007-08 and prior to that the City had a very small inventory of operational treatment BMPs, no enforcement action was required. Verifications and inspections will be completed

as required prior to the rainy season of each reporting period and any subsequent enforcement action will be tracked and reported in the next annual report.

The City will use a variety of escalating enforcement methods to implement storm water requirements for all development projects within the City's jurisdiction. This process is standard for any code violation does not threaten the public's health or immediate safety. Most issues are handled informally with a verbal warning and follow up inspection. These are not always tracked, as this is considered the informal part of the compliance process. The City believes it is important to provide the owner/operator a chance to correct a violation prior to beginning a retribution process. However, if a verbal warning is insufficient, formal proceedings begin with a written notification sent certified mail to verify receipt and detailing the time of the next inspection. The City is flexible on the compliance time frame depending on the severity of the work required for compliance. If a swale needs to be mowed, the City would allow seven days for compliance. However, if a private channel needs concrete work, the City is apt to allow 30 days for compliance as this requires significantly more labor, equipment and cost. Subsequent inspections verify compliance and if continued non-compliance is found; notices of violation, monetary fines, property liens, withheld permits, and small claims court are all viable follow-up actions based on length and severity of non-compliance. A detailed description of the Code Enforcement process is available in the City's JURMP document or through the City's Municipal Code which can be found on-line at www.ci.lemon-grove.ca.us.

2.3.3.8 Notable Activities

Several notable activities were conducted as part of the Development Planning Component during the last several reporting periods. Notable activities included:

- Comprehensive review and update of the City's JURMP
- Comprehensive review and update of the City's Municipal Code
- Comprehensive review, update, and adoption of the regional Model SUSMP
- Development and Implementation of the BMP Verification and Inspection tracking database
- Comprehensive review and revamp of the annual report based on Regional Board feedback
- Continued education of project developers
- Revision of checklists provided to developers to reflect new standards and language

The City will continue to develop and amend its water quality development processes to meet new requirements and demands based on water quality results and improvements in technology. Future annual reports will detail these changes as they take place.

Section 3.0 Construction Component

The purpose of the City's construction component is to maintain an updated inventory of all construction projects, identify pollutant sources from construction projects, educate the construction community, implement construction site BMPs, inspect construction sites, provide proper enforcement of violations, and implement all of the requirements of the Permit as outlined in Section D.2.

3.1 Source Characterization

3.1.1 Site Inventory

Within the defined reporting period of this report, the City has compiled, maintained, and updated a watershed based inventory of all construction sites within its jurisdiction. The construction inventory for FY 2009-10 included a total of eight operating construction sites, mostly private driveways and private sewer laterals. Only two of the projects were SUSMP priority projects and they are discussed below. The City formally inspected all of these sites on a monthly basis and informally almost weekly. All of the sites during this reporting period were within the City's main watershed, Chollas Creek.

The City completed 12 minor infrastructure improvement projects during FY 2009-10. All of the projects were minor street resurfacing or pavement rehavilitation. The City has been forced to drastically decrease its street resurfacing due to current budgetary constraints.

- Hardy Drive
- Siegle Court
- Blossom Hill Drive and Court
- Craig Court
- El Verde Court
- Olive Street
- San Altos Place
- Loma Drive
- Circle Drive
- Roosevelt Street
- Edgerton Street
- Lemon Grove Ave, N
- Mount Vernon Street

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

According to the above definition, the City had no high priority construction sites during this reporting period. However, the City had one construction site that it monitored very closely during this reporting period.

- The rehabilitation project at the City's Recreation Center, which was not a priority project and had a decrease in impervious surface area.

The City performed weekly inspections this location, during both the dry and wet seasons, to ensure the proper placement of BMPs and general site upkeep.

3.1.2 Ordinance Updates

As required by Section d.2.a of the Permit, applicable City documents and ordinances were updated in March 2008 to establish adequate legal authority to enforce applicable storm water requirements. As part of the comprehensive JURMP update completed in March 2008, the City also updated Municipal Code 8.48 Stormwater Management and Discharge Control and 18.08 Excavation and Grading. The following construction specific provisions have been made to these two sections:

- Best Management Practice requirements and general requirements applicable to all dischargers (8.48.060)
- Additional requirements for land disturbance activity (8.48.130)
- Minimum BMPs for land disturbance activity (18.08.140)
- BMP maintenance (18.08.180)
- Stormwater runoff (18.08.450)
- General Construction permit requirements (18.08.900)

3.2 Best Management Practice Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment I-5 gives a breakdown of the City's grading permit requirements.

3.2.1 BMP Requirements for Permitted Construction Sites

Through the JURMP update process completed in March 2008, the City reviewed and updated a set of minimum BMps that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to implement general site management BMPs and erosion control BMPs to reduce, retain, and manage pollutant discharges to the MEP. During FY 2009-10, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);

- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

3.2.2 Seasonal Site Management Requirements

Construction sites are required to implement minimum construction BMPs to prevent pollution discharges to the MEP regardless of the season. However, the City also maintains requirements for erosion and sediment control BMPs that are additional for the wet season (October 1st – April 30th). These requirements include:

- If necessary, upgraded perimeter protection for pending storms
- Erosion prevention BMPs must be installed, maintained, repaired, improved or replaced to the MEP and as is safe
- Amount of exposed soil shall not exceed seventeen acres, exceptions must be approved by the City Engineer
- Any incomplete disturbed area not being actively graded must be fully protected if left inactive for 10 or more days

Prior to the beginning of the wet season, the City sends a letter to the owners of all active construction sites explaining the wet weather BMP requirements and reminding them of the standard minimum requirements.

3.3 Program Implementation

The City ensures that BMPs are implemented to the standards described in Section 3.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

3.3.1 Construction and Grading Approval Process

The City has an established and thorough interdepartmental review and approval process for local construction and grading permits. When a construction project comes to the City for approval, it is required to obtain a building permit, a grading permit, or both. A grading permit is required prior to any activity where the total volume of material disturbed, stored, disposed, or used as fill exceeds 50 cubic yards. All other projects require a building permit. Both permits require that plans be submitted and approved by the City. The City's grading ordinance

requires that all projects, whether subject to a grading plan or not, are required to minimize site runoff, erosion, and sedimentation. In addition, all projects requiring a grading permit are required to prepare an erosion and sediment control plan. All permits that go through the City's review and approval process are tracked within a City wide data management system called HdL.

The grading permit outlines the regulatory (Federal, State, and City) conditions for new construction. The grading permit requires that grading plans be prepared, reviewed, approved, and signed by the City Engineer. As part of this approval process, the City's water quality staff also reviews the grading plans to ensure compliance with applicable construction specific regulations.

The grading plan approval process consists of a series of plan checks, revisions, and final approvals. Plans are checked by planning, engineering, water quality, and sanitation. Engineering staff reviews the plans for overall compliance with the grading ordinance. Planning checks to verify the plans are consistent with any previously approved discretionary plans and to verify landscaping, if applicable. Sanitation checks for the location of any sewer laterals and ensures that all tie-ins are legal and properly located. Water quality staff checks the plans for specific compliance with the stormwater section of the Municipal Code, the Permit, the local SUSMP, and any other applicable State or Federal regulations. If the site falls under the jurisdiction of the State's General Construction Permit, staff follows up with the developer to ensure that a SWPPP is properly prepared and submitted. In addition, the SWPPP is reviewed and approved as part of the normal approval process and must be complete before the grading permit is issued to the applicant. The City also requires proof that a Notice of Intent (NOI) has been submitted for sites that are subject to the General Construction Permit.

Prior to issuing building and grading permits, staff verifies that the proposed construction project plans to implement all applicable required BMPs to reduce pollutant discharges to the MEP.

3.3.2 BMP Implementation

Water quality staff spends a significant amount of time coordinating storm water management and BMP implementation at construction sites with the help of the Engineering Department and the City Inspector.

Staff constantly monitors weather patterns and storms in the Pacific through the National Weather Service. Weather reports and forecasts are emailed to all applicable inspectors to inform them of the possibility of incoming rain. This e-mail reminds them to verify BMP compliance at all active construction sites. If the forecast exceeds 40% over the coming five day period, letters are sent to site owners and inspectors check for any additional, applicable BMPs at each of the active sites and any inactive sites with exposed soil. The upkeep of these BMPs is monitored daily while the rain lasts.

Staff approved only no projects with SWPPPs during this reporting period:

Other project reviews completed by staff as part of the permitting process are addressed in more detail in Section 2.0, Development Planning.

Through the review and plan check process, staff may require additional or alternative BMPs to be implemented on individual projects. This allows the stormwater program to ensure that the proper sediment control, erosion control, and materials management BMPs are shown on the plans and are to be implemented on-site. Any changes to on-site construction BMPs require the approval of the City Inspector and are tracked as red line changes on the construction site drawings.

3.3.3 Construction Sites Requiring Advanced Treatment

There were no sites in FY 2009-10 that required advanced treatment. For the majority of the construction sites with the City's jurisdiction, the minimum required BMPs, if correctly installed and maintained, adequately control sediment discharges from the site. If it is determined that a project site possesses characteristics that could result in standard construction BMPs being ineffective in the treatment of sediment, resulting in an exceptional Threat to Water Quality (TTWQ), advanced treatment will be required. Standard criteria for determining projects that pose an exceptional TTWQ and a description of advanced treatment methods are included in the City's Municipal Code and in the new local Model SUSMP.

3.3.4 Inspections and BMP Verification

The City has an established inspection program to evaluate compliance with stormwater regulations at all construction sites within the City's jurisdiction. The City Inspector is responsible for inspections at all construction sites in the City. Stormwater issues, such as compliance with the grading and stormwater ordinances, are a main focus, especially during the rainy season. It is quite common for water quality staff to also assist in regular inspections and for building inspectors to notify City staff if a violation is observed or if compliance is questionable.

Due to the small number of active sites in the City during any given reporting period, the City inspects all active construction sites regardless of priority and extra attention is paid to any site with a higher threat to water quality during the rainy season. All sites are formally inspected monthly at a minimum and often receive informal inspections on an almost weekly basis.

The City Inspector tracks all inspection notes in a tracking database for future reference and enforcement actions if applicable. This database is updated after each inspection performed, so on a monthly basis at a minimum.

3.3.5 Compliance and Enforcement Actions

3.3.5.1 General Compliance

The City is responsible for enforcement of local ordinances and applicable local permits at all construction sites in its jurisdiction. Enforcement for construction projects is administered by the City Inspector and other applicable City staff, such as Code Enforcement.

The City typically employs a tiered, escalating enforcement system which includes verbal warnings and education, written warnings, and administrative citations. However, the City reserves the right to determine the most appropriate enforcement course for a given situation, as dictated by the specifics of each case. For example, a stricter initial enforcement measure may by applied where significant noncompliance is noted or when a potential rain event increases the potential for the violation to have a negative impact on water quality.

Verbal warnings and education will typically be the initial enforcement methods employed, assuming that a) the site or individual does not have a history of non-compliance with storm water regulations, and b) there has not been an observed illegal discharge to the MS4. The inspector will educate the violator on what actions need to be taken to prevent a violation from occurring or to correct the violation and document the violation and verbal warning in the inspection file. A time frame will be given for an identified violation to b corrected and a follow-up inspection date will be scheduled, which will also be documented.

A written warning is typically issued to violators that are already aware of the City's stormwater regulations or to those who have not corrected their actions after being given a verbal warning. Written warnings can be given using a variety of methods, including the issuance of a Notice of Violation (NOV) or Stop Work Notice. The NOV will provide a description of the violation to be corrected, the time frame for correction, and a follow-up inspection date. All Stop Work Notices issued by the City for construction sites are reported to the RWQCB per the reporting requirements of the Permit.

Civil penalties for violations of the Municipal Code are established in Section 1.24 of the Municipal Code. Determined violations of the stormwater regulations may be subject to administrative citations and associated administrative fines.

Administrative citations and fines are used in addition to other legal remedies as described in the paragraphs above.

All inspection personnel have the authority to take immediate enforcement actions when necessary. This facilitates timely correction of inadequate BMP implementation, reducing the risk of pollutants discharging from the site. City inspectors conduct follow-up inspections to determine if corrective actions have been taken to comply with City ordinances and minimum BMP requirements. The time frame for a violator to correct a documented violation is determined on a case-by-case basis at the discretion of the inspector and the severity of the violation.

3.3.5.2 Reporting and Non-Compliance

During the FY 2009-10, approximately six known complaints were received through the City's hotline and other phone lines pertaining to construction sites. All calls were investigated the day of the call; the majority of the complaints were unwarranted and not related to stormwater. Any violations that were discovered were corrected within 24 working hours of verbal notification to the site manager. The site was inspected by the Regional Board during this reporting period and only minimal corrections were required and all were completed within 24 hours of notification.

The municipal component of the City's stormwater program includes proper management of facilities owned and operated by the City of Lemon Grove to eliminate or reduce the amount of pollutants that enter the storm drain system. The City maintains streets, sewers, the storm drain system, and municipally owned facilities which includes six public parks, a fire station, a municipal yard, four office type buildings, a senior center, a public parking lot, one recreation center with a gymnasium, and one vacant lot. The updated municipal facilities index and inspection results are in Attachment J. The City also conducts high threat to water quality activities, as defined in the Permit, such as street and sidewalk repair, painting, graffiti abatement, equipment maintenance, and minor vehicle maintenance. The City, however, also performs a number of activities that are beneficial to water quality, such as street sweeping, inspections of municipal facilities, educational efforts geared toward municipal personnel, annual MS4 inspection and cleaning, and regular upkeep of the sanitary sewer to prevent overflows and illegal connections.

4.1 Roads, Streets, Highways, and Parking Facilities

Roads, streets, highways, and parking facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control pollutants such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities.

4.1.1 Source Characterization

The City maintains 65.5 miles of roadway in Lemon Grove and one public parking lot. This number includes main arterials, curbed residential, and non-curbed residential streets. The City also maintains center islands and medians on these streets and in all parking lots including those attached to municipal buildings. The City does not maintain any highways.

4.1.2 Best Management Practice Requirements

Both pollution prevention methods and BMPs are implemented for roads, streets, highways, and parking facilities throughout the City. The City utilizes both the City's JURMP and the CASQA Municipal Handbook to choose applicable BMPs to implement for roads, streets, and parking facilities within the City. Street sweeping is the main BMP that is implemented for these sources. Treatment control BMPs are used for all road sections which are subject to SUSMP requirements, described in more detail in Section 2.0.

4.1.3 Program Implementation

This section describes the steps that were taken in FY 2009-10 to require and verify the implementation of designated BMPs for all City maintained roads, streets, and parking areas and related activites as outlined in the Permit Section D.3.a(5)(a-c).

The City currently implements an aggressive sweeping schedule for its roads, streets, and parking facilities. Long before Order 2007-01 was approved, the City was sweeping to its standards.

The frequency of street sweeping is as follows:

- Major arterial curbed streets – weekly
- All other curbed streets – biweekly
- Non-curbed streets – monthly
- Center islands and medians – monthly
- Major parking lots and alleys – weekly
- All other parking lots and alleys – monthly

During FY 2009-10, the City maintained its street sweeping mileage from the previous reporting period, approximately 80 miles and 175 tons of debris were collected. These figures include the regular sweeping of roads and parking lots, as well as specialty or requested road sweeps and the municipal yard. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

4.2 Fixed Facilities

The City owns and operates a variety of fixed facilities that have been grouped in this section because these facilities received formal inspections as part of the stormwater program. Therefore, the program implementation for these facilities is generally the same. Municipal fixed facilities include the following:

- Parks and Recreation Facilities
- Public Works Facilities
- Fire Stations
- Other Fixed Facilities

4.2.1 Source Characterization

The City inspects all municipal facilities on an annual basis. This includes the following list of facilities:

- All six public parks (Kunkel, Berry Street, Lemon Grove, City Center, Fireman's, and Monterey Heights)

- Fire Station
- Recreation Center
- The Community Center
- City Hall/Sheriff's Station
- Senior Center
- City Hall Annex
- Trolley Depot

The City's JURMP does rank each of these facilities based on their threat to water quality, however due to the City's small size it is possible to inspect each facility on an annual basis.

Parks and Recreation Facilities

The City operates six public parks:

- Berry Street Park – 7101 Mt. Vernon St., Chollas Creek watershed
- City Center Park – 7715 Church St., Chollas Creek watershed
- Fireman's Park – School Ln and Central Ave, Chollas Creek watershed
- Kunkel Park – 8171 lemon Grove Way, Sweetwater River watershed
- Monterey Heights Park – Canton and Glencoe, Chollas Creek watershed
- Lemon Grove Park – Washington and Alton, Chollas Creek watershed

All landscape maintenance activities are performed through the City's Grounds Division. In previous reporting periods, a portion of the parks were maintained through a private contractor. However, due to current budget constraints, those services were cut and taken over in-house. The Grounds division is trained and certified to handle pesticides, herbicides and fertilizers properly. They perform all landscaping and irrigation maintenance, as well as all trash and debris removal for all six parks.

Public Works Facility

The City owns and operates one public works yard. The only equipment maintained on site is the landscaping equipment used by the Ground's Division. This frequently includes mowers, the Gator (a small all terrain vehicle), chain saws, and other small devices. The City maintains a small fleet of large vehicles including several pick-up trucks, a dump truck, a paver, a video camera truck, and a vactor truck. All large vehicle service is performed off site under a private contract at a non-City facility. The public works yard does not contain a gas filling station and all materials are stored under covered areas, in doors, or surrounded by BMPs like straw wattle and gravel bags.

Fire Stations

Fire fighting is an essential element of municipal activities conducted in the City. The City has one fire station at 7853 Central Ave. The fire station is home to three engines and one ambulance response vehicle. All servicing on these vehicles is done off site under contract at a non-City owned facility. Very minimal equipment maintenance is performed on site. It includes the cleaning and maintaining of the hoses and chainsaws.

Other Fixed Facilities

Other fixed facilities include the City's office and administrative facilities.

- City Hall/Sheriff's Station – 3232 and 3240 Main St.
- City Hall Annex – 3225 Olive St.
- Community Center – 3146 School Lane
- Recreation Center – 3131 Main St.
- Senior Center – 8235 Mt. Vernon St.

Despite theses facilities being low threats to water quality, all are inspected annually. Inspection results are in Appendix C.

4.2.2 Best Management Practices

4.2.2.1 Updated BMPs

In FY 2007-08, the City established minimum BMPs for various municipal activities at all fixed municipal facilities. The BMPs are outlined in the City's 2008 JURMP and the City's Municipal Code. The City also references the CASQA Municipal Handbook when choosing appropriate BMPs for various fixed facility types. More detailed information about BMP implementation at specific facility types is included in the following sub-sections. The City implements additional BMPs as deemed necessary, and implements equivalent BMPs when it is determined that a specific BMP is not feasible at a particular site. In addition to implementing BMPs, the City utilizes pollution prevention measures to reduce or eliminate the amount of pollutants generated from City-owned fixed facilities.

Parks and Recreation Facilities

In FY 2009-10, the City implemented a variety of BMPs to reduce or eliminate the amount of pollutants entering the MS4 from municipal parks and recreation facilities and other open landscaped areas, such as medians and traffic islands. The City is maintaining general waste management BMPs and encouraging facility users to recycle, properly dispose of trash, and pick up dog waste by providing conveniently located receptacles at parks and in common dog walk areas. Doggie bag dispensers are available at the 3 largest, most frequently

used parks (Berry Street, Lemon Grove, and Kunkel) and at City Center Park. These are frequently vandalized, but the City works hard to keep them full and operational. They are checked weekly and maintained as needed.

Due to their widespread outdoor use, pesticides, herbicides, and fertilizers can be common pollutants discharged to MS4s. Transport of these pollutants is often a result of the following: a) runoff from improper irrigation after application, b) application of chemicals during or prior to storm events, c) use of chemicals that do not properly absorb into soil or plants, and d) overspray from chemical applications that may eventually enter the MS4. The City maintains the following procedures and BMPs pertaining to integrated pest management:

- Educating and training staff and contractors on all BMPs
- Requiring any contracted party to adhere to all City codes and procedures pertaining to proper use of pesticides, herbicides and fertilizers
- Implementing a process for identifying pests and/or problems by site
- Selecting less toxic treatments
- Proper training and licensing of all personnel who handle pesticides, herbicides, and fertilizers
- Use integrated pest management techniques whenever possible
- Record keeping for application dates, times, locations, and quantities.
- Pesticides, herbicides and fertilizers are applied per manufacturers directions and only as needed.
- Compost, mulch, and soil amendments are used whenever possible.
- All federal, state and local regulations are followed
- Pesticides, herbicides and fertilizers are not applied prior to a predicted rain event
- Native and drought tolerant plants are used whenever possible
- Small weeding is done by hand
- Diseased or infected plants are removed completely, if proper treatment is ineffective
- Irrigation systems are remotely controlled and weather and flow sensitive to prevent over watering due to rain or a broken line

Public Works Facility

Public works staff implements appropriate BMPs for all activities that take place at the Public Works yard. This facility uses good housekeeping BMPs most frequently, including but not limited to spill kits, sweeping, dry clean up methods for any oil spills, and proper cleaning of painting equipment. Minimal small equipment maintenance is performed on site, limiting potential pollutants from vehicle maintenance and repair. All of the large vehicles are maintained off site. The site has a SWPPP which includes a site description, a description of potential sources of pollutants, a summary of existing BMPs, a description of BMPs to be implemented, and a monitoring and record keeping plan. The

SWPPPs is kept at the facility and the facility is inspected annually by water quality staff and monthly on an informal basis. All Public Works employees receive monthly informal training as detailed in Section 8 of this report.

Fire Stations

The City implements pollution prevention measures and BMPs to reduce or eliminate the amount of pollutants generated by fire fighting activities in the City. The City's fire station uses source control BMPs to minimize and control discharges related to washing activities. All fire fighting training activities which include aqueous film forming foam are conducted at a fire station outside of the City. All the engines and emergency vehicles are maintained off site. Only small equipment such as chainsaws are cleaned and maintained on site, always using best housekeeping practices to prevent pollutant generation. The Fire Marshal receives regular water quality updates at a weekly joint meeting with water quality, planning and engineering. Water quality staff has worked jointly with the fire department on several occasions when dealing weed abatement, commercial inspections, or illegal dumps. These occasions have provided excellent informal opportunities for education, which have been passed on to other fire personnel. It is common for fire personnel to call water quality personnel from the field with potential water quality concerns. They are an invaluable set of eyes in the community on a daily basis for potential water quality concerns.

Other Fixed Facilities

The City implements pollution prevention methods and BMPs to reduce or eliminate the amount of pollutants generated by the management of public buildings, other fixed facilities, and surrounding areas. The City implements BMPs to control erosion and sediment, during landscaping maintenance, and for waste management as per the Municipal Code and the CASQA Municipal Handbook.

The City employs a number of pollution prevention practices at City Hall. These practices have been expanded in recent years to include:

- The use of recycled paper for all copiers and printers
- Programmable thermostats to control heating and cooling systems
- Implementing a furlough work schedule, so main City buildings are closed very Friday
- Installing timers on exterior lighting
- Supplying each employee with a personal recycling container
- Providing large recycling containers near all dumpsters and access doors
- Lids on all dumpsters
- A battery collection site accessible by employees only
- Allowing City employees to participate in all local e-waste events

4.2.2.2 Additional Controls for Municipal Areas and Activities

If the City identifies any potential sources of other pollutants of concern for which water bodies in the City are 303(d) listed that could be a result of activities at fixed municipal facilities, additional controls will be required to be implemented where applicable. The City will implement additional controls for municipal areas and activities adjacent to or tributary to ESAs when determined to be necessary. Presently, there are no municipal fixed facilities that have been determined to need additional BMPs due to 303(d) listings. The City's primary watershed, Chollas Creek, is 303(d) listed for several pollutants, including heavy metals and Diazinon. The City's current BMPs are preventing these pollutants and many others to the MEP. Any changes would be detailed in the applicable future annual report.

4.2.3 Program Implementation

The City implements the municipal program using a variety of different processes, including maintenance, training and education, inspections, and enforcement actions if necessary. Program implementation also includes the continuous assessment of municipal programs to ensure that they are designed and executed in a manner that is most effective to reducing, and potentially eliminating, the threat of pollution from fixed municipal facilities.

4.2.3.1 Maintenance

In FY 2009-10, the City continued to conduct regular maintenance activities at fixed facilities, which included landscape maintenance, building maintenance, parking lot,and sidewalk repair, when necessary. Sweeping of the parking facilities associated with the municipal facility is conducted at these facilities during regular street sweeping hours.

City personnel are trained and required to implement the proper BMPs when at municipal facilities and when engaging in specific activities at those facilities. City personnel are also trained to dispose of any waste properly and to report illegal discharges/illicit connections, as they may come across them during normal work activities.

4.2.3.2 Training and Education

Municipal personnel are trained on implementing appropriate BMPs and preventing non-storm water discharges. In FY 2008-09, water quality staff provided regular training and updates to the following municipal departments: Public Works, Engineering, Planning, and Fire. A detailed description of the municipal education program can be found in Section 8 of this report.

4.2.3.3 Municipal Inspections

Water quality staff performs annual inspections at all of the City facilities. As part of the FY 2009-10 program, staff conducted 14 inspections, one at each facility. The results of these inspections can be found in Appendix J. Any required corrective actions have been taken. No enforcement actions were required at any of the municipal facilities during this reporting period.

4.3 MS4

The primary function of municipal separate storm sewer systems are to collect and transport surface runoff to receiving waters during storms in order to prevent flooding. The entire MS4 system is considered a high priority due to its tendency to collect and convey pollutants to receiving waters. The City's MS4 consists of streets, curbs, gutters, catch basins, inlets, pipes, natural channels, natural and piped creeks, and culverts. The City also maintains a number of treatment control BMPs such as filter inserts and curb inlet protection, which are included in the regular maintenance of the MS4. In order to reduce the transportation of pollutants into receiving water bodies, the City regularly maintains its MS4 to ensure that it remains both fully functional and free of pollutants to the MEP.

4.3.1 Source Characterization

The City maintains a variety of MS4 facilities which includes 190 catch basins and inlets, approximately 75 miles of piping, and approximately 2.5 miles of open channel. The City plans to put all of these facilities in GIS during future reporting periods. However, due to budget constraints, these plans are currently on hold.

4.3.2 Best Management Practice Requirements

4.3.2.1 Updated BMP Requirements

In FY 2007-08, the City prepared a JURMP update which directs staff to utilize the CASQA Municipal Handbook in addition to the Municipal code to choose applicable BMPs for municipal areas and activities, including MS4 maintenance. All of these BMPs are designed to prevent waste and pollutants from entering the MS4 system as well as ensuring that waste which is collected during maintenance for the City's MS4 does not re-enter the system.

The 2007 Permit requires that retrofitting flood management facilities be evaluated to determine the feasibility of providing additional pollutant removal from urban runoff and should only be conducted where determined to be effective. The City does not own or operate any flood management projects or flood control devices that may be retrofitted.

4.3.2.2 Additional Controls For Municipal Areas/Activities

The City will implement additional controls for MS4 facilities adjacent to or tributary to ESAs when determined necessary.

4.3.3 Program Implementation

The City's MS4 management program includes responding to complaints, detecting and ceasing IC/IDs; inspecting and maintaining MS4s by cleaning, removing sediment, debris, and excessive vegetation, by repairing and/or replacing damaged or failing MS4 structures; and by providing signage on storm drain inlets. The City trains and requires field staff to implement BMPs, inspect equipment and follow an action plan for regular maintenance, emergency maintenance, and/or discharge control. The City utilizes a vactor truck during MS4 maintenance to collect both dry and liquid debris from catch basins and inlets. Applicable BMPs are used during routine and emergency maintenance.

All maintenance activities during this reporting period were in compliance with the current Permit. All maintenance BMPs were updated in FY 2007-08 to correspond with any new Permit requirements.

4.3.3.1 Maintenance

A summary of the City's MS4 operation and maintenance activities that occurred throughout the fiscal year is included below:

- Within this reporting period, the City inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. The same numbers as the previous reporting cycle. Only seven conveyances and 68 catch basins were found to be in need of cleaning and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,860 pounds of trash and debris from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those seven conveyances, providing approximately another 1,500 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.
- The City continues to install Trident Curb screens and has added Streamhawks to several curb inlets as well. Both of these devices prevent trash, debris, and sediment from entering the MS4 by keeping the debris in the curb line and easily accessible to the street sweepers. The City attributes the decreases in trash quantities found in and around conveyances to these devices and the more efficient use of the street sweepers.

4.4 Sanitary Sewer System

Spills and/or leaks caused by a malfunction or failure of a component of the City's sanitary sewer system have the potential to introduce a significant volume of untreated sewage into receiving water bodies. Untreated sewage can contain high concentrations of bacteria, viruses, and parasites, all of which have the potential to negatively impact the environment and pose a significant threat to human health. Untreated sewage also has the potential to contain a variety of hazardous chemicals, which also pose threats to environmental and human health. The City conducts routine inspections and maintenance of the sanitary sewer system to ensure that the system is functioning properly. Routine inspections and maintenance of the sanitary sewer system reduces the potential for an overflow and helps prevent and eliminate infiltration of seepage to the MS4. The City also responds to sanitary sewer overflows to reduce or eliminate the amount of untreated sewage that reaches nearby portals to the MS4 and aids in cleaning up and disposing of overflow residue.

4.4.1 Source Characterization

The City maintains 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space and San Diego uses 986.20 EDU.

4.4.2 Best Management Practice Requirements

4.4.2.1 Updated BMP Requirements

The City has created and maintains basic BMPs in the JURMP and the Municipal Code. The City also utilizes the CASQA Municipal Handbook as a reference guide for BMP implementation, including the maintenance of the sanitary sewer system.

Similar to the MS4 maintenance program, the City trains field staff on implementing BMPs, equipment inspection, and the action plan that is followed for regular maintenance and emergency maintenance and/or discharge control. Structural BMPs are used during routine and emergency maintenance, where applicable.

4.4.2.1 Additional Controls for Municipal Areas and Activites

The City implements additional controls for sanitary sewer facilities adjacent to or tributary to ESAs, if applicable and when determined to be necessary. The City has a regular sanitary sewer maintenance program the minimizes sanitary sewer overflows (SSO) and is described briefly below and in more detail in the City's Sanitary Sewer Management Plan (SSMP) in accordance with Order 2006-03.

4.4.3 Program Implementation

The City's sanitary sewer management program includes responding to overflows and spills as necessary, identifying spills and leaks, containing and controlling spilled materials, repairing damaged and leaking sewer lines, remediation of existing lines as necessary, and proper disposal of hazardous waste.

4.4.3.1 Maintenance

The City maintains a routine maintenance schedule for the sanitary sewer system. In FY 2009-10, the City cleaned and maintained the following portions of the sewer system. Hotspots are inspected three times annually and easements are inspected twice annually.

Table 4.1
Sanitary Sewer Services in Feet

	Total FY 2005-06	Total FY 2006-07	Total FY 2007-08	Total FY 2008-09	Total FY 2009-10
Cleaned	**298,043**	**331,369**	**52,493**	**646,943**	**359,174**
Root Cut	**18,370**	**20,927**	**36,039**	**596,943**	**329,174**

Within those numbers is the following information:

- 26,919 feet of hotspot line was cleaned and root cut
- 124,265 feet of easement line was cleaned and root cut
- 207,990 feet of right of way line was cleaned and root cut

All SSO information was reported electronically to the Regional Board through the SSMP program. However, the City had no mainline overflows during this reporting period. The appropriate City staff are trained in detecting, reporting, and responding to all SSOs.

4.5 Mobile Municipal Activities

The City conducts a number of activities, which are not confined to any specific locations. Due to the nature of these mobile activities, temporary structural and source control BMPs are implemented as necessary.

4.5.1 Source Characterization

The City conducts a number of activities that are not designated to a specific location. Such activities include, but are not limited to, the following:

- Power washing for graffiti removal
- Street and sidewalk repair and maintenance (striping, repainting, and pothole repair)
- Landscape maintenance

4.5.2 Best Management Practice Requirements

4.5.2.1 Updated BMP requirements

The City implements good housekeeping and general pollution prevention measures during municipal maintenance activities, including the mobile activities described above. During the City's JURMP update, minimum BMPs were established for all municipal activities. The City also references the CASQA handbook and the Municipal Code to ensure the use of all applicable BMPs for any given activity.

4.5.2.2 Additional Controls for Municipal Areas and Activities

The City implements additional controls for municipal mobile activities adjacent to or tributary to ESAs when determined necessary. Presently, City related mobile activities have not been determined a high threat to water quality. Public Works and Grounds division staff are vigilant about the use of proper BMPs when doing any mobile activity. Pollutant generation is limited to the MEP through temporary BMPs such as gravel bags and straw wattles or good housekeeping practices such as dry spill cleaning, wet vacuums, and sweeping. During this reporting period, the current BMPs were evaluated and determined to be sufficient and to the MEP.

4.5.3 Program Implementation

In FY 2009-10, City staff were sufficiently educated in the proper BMPs to utilized during mobile activities. These BMPs include proper containment, control, and capture of any discharge generated by a mobile activity and possibly carrying pollutants.

4.6 Special Events

The City hosts a very limited number of special events each year and even fewer under the current economic climate. The current line-up consists of the Winter Bonfire, the Fire Station Open House, and Concerts in the Park. Special events have the potential to generate significant trash and litter caused by the patrons

and activities of the special event. The City utilizes many of the controls listed in Permit Section D.3(2)(f). These BMPs are described in more detail below and are implemented during and/or after special events, when and where applicable.

4.6.1 Source Characterization

The City hosts a few special events each year that have the potential to produce trash and debris pollutants.

4.6.2 Best Management Practice Requirements

4.6.2.1 Updated BMP Requirements

In FY 2009-10, the City implemented many of the controls specific to special events listed in Section D.3(2)(f) of the Permit. The City has chosen the following BMPs as most effective and efficient for City needs.

Anyone outside of the City seeking a Special Events Permit, must ensure the following BMPs are maintained:

- Proper management of trash and litter, including temporary trash receptacles
- Post clean up activities, such as catch basin cleaning and general litter pick-up, when necessary
- Post event street sweeping, when necessary
- Other BMPs when considered necessary by City staff

The City will consider implementing additional BMPs depending on the site location, site conditions, and/or type of special event.

4.6.2.2 Additional Controls for Municipal Areas and Activities

The City will implement additional controls for municipal special events adjacent to or tributary to ESAs when determined to be necessary.

4.6.2.3 Program Implementation

In FY 2009-10, there were the following City sponsored special events:

- Movie Night in the Park
- 6 Concerts in the Park
- Winter Bonfire
- Fire Station Open House

At a minimum, these events were required to provide extra trash and recycling containers, proper disposal of grease if food preparation was involved, and proper secondary containment for port-a-potties.

During the events, City staff was on hand to ensure that the event remained free of illegal discharges and/or illicit connections to the MS4. City staff were available for the duration of the event and afterwards for immediate trash removal and to notify the appropriate staff if a problem was observed.

Section 5.0 Industrial – Commercial Component

Activities associated with industrial and commercial businesses can contribute pollutants to the City's MS4. The City has implemented a program that aims to reduce and prevent industrial and commercial pollution discharges from the MS4 to the MEP, to protect local receiving water bodies, and to comply with the Permit.

Commercial facilities within the City include a wide range of oriented businesses from restaurants to nurseries. There is one main commercial area within the City, along Broadway and down Lemon Grove Ave. This area contains many different commercial businesses ranging from restaurants to automotive outlets. The City's industrial area runs along Federal Blvd adjacent to SR 94.

Throughout FY 2009-10, City staff has worked diligently to fulfill the requirements of Order 2007-01. The City worked to ensure our current inspection program met the requirements of the current Permit and made any adjustments necessary. Due to the City's small size, staff is able to inspect a larger than needed majority of its commercial facilities and all of its industrial facilities. The City also continues to participate in the development of a regional mobile business program. The following section will demonstrate the City's successful implementation of the requirements of the Permit (Section D.3.b) during FY 2009-10.

5.1 Industrial-Commercial Sites/Sources Element

Each stationary industrial and commercial facility has the potential to discharge pollutants into the MS4 and consequently degrade local water quality. Often, the most cost effective and simple solution to reducing pollution is to implement pollution prevention techniques at the source. The City emphasizes the use of pollution prevention methods as a primary mechanism for reducing commercial discharges of pollutants into the City's MS4. Further, the City requires minimum site and activity specific BMPs to be implemented, and inspections and enforcement procedures will be conducted where necessary, to comply with the Permit.

For the rest of Section 5.1, "commercial facilities" will be used to refer to stationary commercial facilities that are not mobile. The mobile commercial sites/sources component is described in Section 5.2.

5.1.1 Source Characterization

A watershed-based inventory of the industrial and commercial sites/sources within the City was compiled as part of the 2008 JURMP update. As required by the Permit, the inventory includes the following information for each site/source: facility name, address, possible pollutants, if the site drains to a 303(d) listed

waterbody, and a brief description including SIC codes which best reflect the principal products or services provide by each facility. This list can be found in the 2008 JURMP. Because mobile commercial businesses do not have a fixed address at which they operated, they are tracked within a separate, non-spatial database.

The commercial inventory is continually updated as facilities go out of business and new facilities open. This process is performed primarily through the business license data base. Staff also collaborates with the Fire Marshal to verify existing and new facilities and to combine inspections. In addition, the City identifies businesses that are not on the facility inventory when complaints are filed about businesses that are not registered or licensed with the City. When this occurs, these facilities are added to the inventory and the proper City staff are notified to ensure the business is brought into compliance with City licensing requirements. During annual facility inspections, City staff has the opportunity to identify new or closed businesses and update the inventory with these findings.

In FY 2009-10, the City continued its focus on high priority commercial businesses by inspecting all restaurants, manufacturers, and automotive repair facilities with in the City. This totaled 34 facilities for this reporting period, the list of which is located in Attachment K 2. Table 5-1 contains a summary of the commercial facilities found in the City. The summary includes home businesses like carpet cleaners and household cleaning services, which the City finds to be difficult to inspect due to their transitory nature and small size (typically one person operations). The City deals with these operations more from a residential perspective than a commercial perspective and requires the standard minimum residential BMPs of these services. The City also inspects parking lots in conjunction with their respective buildings and does count them separately in the site total.

Table 5-1 - Summary of High Priority Commercial Sources

Commercial Activity	Number of Facilities in Lemon Grove
Automobile Dealers/Rentals	18
Automobile Supply Stores	9
Automobile Repair/Paint	9
Automobile System and Tire Repair	56
Automobile Cleaning/Washing	3
Gas Stations	7
Eating/Drinking Establishments	60
Landscaping, includes lawn care	9
Nurseries and Greenhouses	1
Pest Control	3
Equipment Repair/Maintenance/Cleaning	3
Metalwork	6
Masonry	4
Parking Lots and Storage	3
Carpet/Building Cleaning	21

Pool and Fountain Cleaning	3
Total	**215**

The City has 19 industrial facilities, most of which are high priority due to their proximately to Chollas Creek, a 303(d) listed waterbody. The City inspects all of these facilities on an annual basis. This number includes the three facilities which fall under the Statewide Industrial Permit as well. Table 5-2 contains a summary of these facilities.

Table 5-2 - Summary of High Priority Industrial Sources

Industrial Activity	Number of Facilities in Lemon Grove	Revised High Priority Category Facilities
Waste Disposal and Recycling	1	
Equipment/Transportation	3	2
Metalwork	2	3
Building Supplies and Woodworking	3	2
Industrial Paper		1
Contractor, Special Trade		1
Specialty Hardware, Drapery		1
Total	**9**	**10**
	Total Facilities	**19**

As part of the 2008 JURMP update and development of the interim SUSMP, the City collaborated with Copermittees to identify the pollutant loading potentials of industrial and commercial sources. Table 5-3 in Attachment K2 lists the pollutants that may be generated by each category of business. The pollutants that many be generated by each individual business can be determined by matching the category of business noted for each of the businesses in the commercial inventory in the JURMP.

All industrial and commercial facilities that meet at least one of the following criteria are included in the inventory:

Industrial Facilities

- Industrial Facilities, as defined at 40 CFR S. 122.26 (b)(14)
- Facilities subject to the statewide General Industrial Permit or other individual NPDES permit
- Operating and closed landfills
- Facilities subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)
- Hazardous waste treatment, disposal, storage, and recovery facilities

Commercial Facilities

- Automobile repair, maintenance, fueling, or cleaning
- Airplane repair, maintenance, fueling, or cleaning
- Boat repair, maintenance, fueling, or cleaning
- Equipment repair, maintenance, fueling, or cleaning
- Automobile and other vehicle body repair or painting
- Mobile automobile or other vehicle washing*
- Automobile (or other vehicle) parking lots and storage facilities
- Retail or wholesale fueling
- Pest control services
- Eating and drinking establishments, including food markets
- Mobile carpet, drape, or furniture cleaning*
- Cement mixing and cutting*
- Masonry*
- Painting and Coating*
- Botanical or zoological gardens and exhibits
- Landscaping*
- Nurseries and green houses
- Golf courses, parks, and other recreational areas/facilities
- Cemetaries
- Pool and fountain cleaning*
- Marinas
- Portable sanitary services
- Building material retailers and storage
- Animal facilities
- Power washing services*

*All mobile commercial businesses are discussed in Section 5.2.

Both Industrial and Commercial Facilities

- All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired waterbody segment, where the site/source generates pollutants for which the waterbody is impaired
- All other commercial or industrial sites/sources within or directly adjacent to (i.e. within 200 feet of) or discharging directly to coastal lagoons or other receiving waters within an Environmentally Sensitive Area (ESA)
- All other commercial or industrial sites/sources that the City determines may contribute a significant pollutant load to the MS4.

5.1.2 Best Management Practice Requirements

5.1.2.1 Updated BMP Requirements

During the 2008 JURMP update, the City established a set of minimum BMPs for all industrial and commercial sties and incorporated these into the City's Municipal Code Sections 8.48.080 and 8.48.090. The list of minimum BMPs includes both structural and non-structural BMPs and is itemized specific to pollutant-generating activity. The City's set of minimum BMPs for industrial and commercial sites/sources also includes pollution prevention methods, where appropriate. A complete list of the City's minimum BMPs for industrial and commercial facilities can be found in the City's JURMP and Municipal Code. The Municipal Code can be accessed through the City's website: www.ci.lemon-grove.ca.us.

Industrial Facility Specific BMPs

Industries subject to the General Industrial Permit are required to prepare a SWPPP and implement the BMPs prescribed therein. At a minimum, the SWPPP should include sections which describe the significant materials present on site, areas and activities that are potential sources of pollutants, and BMPs to address the identified pollutants' sources onsite. In addition, because of the small scale of the City's industrial program, the City is able to require site-specific BMPs at its industrial sites. These BMPs are based on a review of the site's SWPPP and site inspections, where needed.

5.1.2.2 Additional Controls

The City requires the implementation of additional controls for industrial and commercial sties and sources that are 1)tributary to CWA Section 303(d) impaired water body segments or 2) directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

The City prescribed additional controls during inspections of commercial and industrial facilities, as needed, depending on the proximity of the facility to the waterbody and the observed potential of the site to be a significant source of pollutants that may threaten the downstream waterbody as necessary and appropriate.

5.1.3 Program Implementation

This section describes the steps employed by the City to require and verify the implementation of designated BMPs for stationary industrial and commercial sources. During FY 2009-10, the City updated its program as needed, provided education and outreach through inspection actions, inspected inventoried businesses to evaluate compliance with established minimum BMP requirements

and the local stormwater ordinance, and took enforcement action as necessary to bring violators into compliance.

5.1.3.1 Inventory Prioritization

Since the new Permit no longer requires industrial and commercial facilities to be prioritized as high, medium, or low; the City prioritized industrial and commercial businesses as either high priority or non-priority.

When evaluating threat to water quality, the City considered the following attributes of each industrial and commercial business to determine priority or non-priority status:

- Type of activity (SIC code)
- Materials used at the facility
- Wastes generated
- Pollutant discharge potential
- Non-stormwater discharges
- Size of facility
- Proximity to receiving water bodies
- Sensitivity of receiving water bodies
- If the facility is subject to the General Industrial Permit or an individual NPDES permit
- Filing of a No Exposure Certification/Notice of Non-Applicability
- Facility design
- Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff
- Compliance history
- Any other relevant factors

Although not specifically required by the Permit, the City will continue to classify industrial facilities that have obtained coverage under the General Industrial Permit as high priority. The City uses the following additional spatial attributes to prioritize industrial and commercial facilities:

- Proximity to a 303(d) listed waterbody
- Pollutant potential of the facility type
- Stormwater violation history

If a facility was identified as having a potential threat based on two or more of these criteria, the facility was determined to be a high priority commercial facility. In addition, if during the City's commercial inspection process or based on institutional knowledge, it is determined that additional sites that would otherwise have a lower priority should be classified as high priority industrial or commercial facilities based on the Permit criteria, they were noted as such in the inventory and inspected as required.

The City's commercial inventory was updated and prioritized during the 2008 JURMP update and will be prioritized at least once per year prior to conducting annual inspections.

5.1.3.2 Inspection Frequency

FY 2009-10 commercial facility inspection priorities were established in consideration of inspection frequencies and prioritization standards outlined in the Permit. As part of the JURMP update, a new process to determine high priority facilities was formulized and put into effect during the previous reporting period. To determine which industrial and commercial sties were inspected in FY 2009-10, the following steps were taken:

- Confirm that the current industrial and commercial inventories are up-to-date.
- Prioritize each facility based on the prioritization process described in Section 5.1.3.1 of this document
- Review the list of facilities that were inspected the previous year
- Determine the facilities that will be inspected in the current year based on each site's prioritization and inspection history and other relevant factors, such as TMDLs and 303(d) listings.

In compliance with Permit standards, the inspected over 50 percent of all stationary industrial and commercial facilities inventoried as high threat to water quality and over 20 percent of all stationary inventoried sites. Mobile businesses are not included when determining the inspection requirements based on percentages of the inventory. The City tracked completed inspections throughout the reporting period to ensure that the minimum inspection frequencies required by the Permit were met.

During the 2008 JURMP update, the City identified the businesses that would be inspected as part of the 2009-10 reporting period. The City's facility summaries can be found in Tables 5-1 and 5-2 of this section. The list of high treat to water quality stationary commercial facilities can be found in Attachment K2. The City inspected all of these facilities and all of the industrial facilities in Table 5-2 during FY 2009-10.

5.1.3.3 Routine Facility Inspections

The City routinely inspects its commercial and industrial facilities. Inspections are intended to:

- Provide facilities with information regarding the City's stormwater program
- Provide guidance in complying with stormwater regulations
- Validate and manage the inventory

During FY 2009-10, the City conducted 19 industrial and 34 commercial inspections for compliance with ordinances, permits, and policies. All inspections included, as applicable:

- Review of BMP implementation plans, if the site uses or is required to use such a plan
- Review of facility monitoring data, if the site monitors its runoff
- Check for coverage under the General Industrial Permit (NOI or WDID), if applicable
- Assessment of compliance with Copermittee ordinances and permits related to urban runoff
- Assessment of BMP implementation, maintenance, and effectiveness
- Visual observations for non-stormwater discharges, potential illicit connections, and potential discharge of pollutants to stormwater runoff
- Education and training on stormwater pollution prevention, as conditions warrant

Based on the results of each site evaluation, City staff completed an inspection form, which can be found in Attachment K1.

Staff generally works with site contacts to provide examples of BMP solutions that could be implemented. Effective, low-cost solutions were sought whenever possible, although in some cases more expensive BMPs were needed to reduce pollutant discharges to the MEP. Each business was also evaluated for staff training procedures and the stormwater quality awareness of the contact person; educational information was provided as appropriate. Whenever possible, the findings of the inspection and related corrective actions were discussed with the responsible party while the inspector is at the site. The responsible party is always provided a copy of the inspection findings after the inspection. For any sites found not in compliance, corrective actions are written on the inspection form along with any follow-up actions or inspections, as needed.

Inspection Tracking

Complaint and inspection documentation is filed in a tracking database and is kept up to date on a regular basis.

Third Party Inspections

All commercial inspections conducted in FY 2009-10 were completed by City staff. The City has one full-time Code Enforcement officer with a stormwater focus, who is dedicated to conducting routine commercial, industrial, and residential inspections and follow up for routine inspections as well as complaint calls. A third party was not employed to conduct inspections during this fiscal year. Therefore, verification of third party inspection effectiveness was not necessary.

City staff responsible for conducting stormwater compliance inspections and enforcement of industrial and commercial facilities are training regularly on inspection and enforcement procedures, BMP implementation, and assessment of monitoring data. Water quality staff actively collaborates with inspection staff throughout the region to share methodologies and approaches that may be beneficial region wide.

Inspection Follow-up and Enforcement

Staff conducted follow-up inspections at all facilities that were directed to implement corrective actions. Follow-up investigations are conducted to ensure that the required BMPs were implemented and confirm full compliance of the facility. The City only had one non-compliant industrial facility. The facility was storing materials uncovered, outside. The corrective actions were given to the facility contact and all corrections were made by the follow up inspection. Twelve restaurants were found in non-compliance on the initial inspections, all corrective actions were minor and completed by the follow-up inspections. The restaurants continue to display confusion over the water quality inspections versus health code inspections and fire code inspections. For this reason, staff has worked diligently to provide on site education and to coordinate inspections with the City's Fire Marshal. It is not possible to coordinate inspections with the health inspectors as that is a County program with its own staff and own time lines for inspection requirements.

5.1.3.4 Notification

The City will notify each inventoried industrial and commercial business of the City's updated BMP requirements that are applicable to the site/source. During FY 2007-08, the City provided a formal letter notifying the facilities of any changes and that a new Permit had been issued. During FY 2008-09, the City did not feel a second formal notification was required and dealt with education during the actual inspection.

5.1.3.5 Complaint investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the City's hotline, e-mail, other phone line, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or clean up activities by the City or responsible party.

As required by the Permit and depending on the severity of the violation, the City enforces its stormwater ordinances for all commercial and industrial facilities as

necessary to maintain compliance with the Permit. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for staff to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the City's Code Enforcement database.

During FY 2009-10, the City had four commercial related complaints and no industrial related complaints. The two commercial complaints were the hosing of parking lots. The behavior was stopped immediately upon investigation and both dischargers were educated on the proper dry methods for cleaning impervious surfaces.

Reporting of Non-Filers

The City did not identify any industrial sites that may require coverage under the General Industrial Permit, but which, to the City's knowledge did not file NOIs.

5.2 Mobile Sources

Illegal discharges tend to be the major area of concern with mobile businesses. Mobile businesses can be difficult to inventory because they may not be based in the City and do not typically have a permanent address. Additionally, new mobile businesses are started, and previously existing mobile businesses go out of business on a regular basis. For the reasons listed, and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

5.2.1 Source Characterization of Mobile Sources

The mobile businesses known to operate within the City's jurisdiction are listed on an inventory found in Attachment K2. This inventory was prepared as part of the 2008 JURMP update. The following business types are addressed by the mobile sources element of the City's industrial and commercial program:

- Mobile automobile and other vehicle washing
- Mobile carpet, drape, or furniture cleaning
- Mobile construction trades such as: cement mixing or cutting, masonry, painting and coating
- Landscaping
- Pool and fountain cleaning
- Power washing services

In addition to the types of businesses listed above, any other mobile businesses that the City determines to have a significant threat to water quality will be added

to the inventory. Because not all mobile businesses have obtained business licenses in the City or have a base of operations outside the City, staff is continually refining and updating the mobile inventory. In addition, the City is participating in the creation of a regional mobile businesses list.

5.2.2 Best Management Practice Requirements

5.2.2.1 Updated BMP Requirements for Mobile Sources

All BMPs required for station sources, described in Section 5.1.2.1 of this document and listed in detail in the City's JURMP, are also required of mobile businesse, where applicable. The most important BMPs for most mobile businesses are typically those that address non-stormwater discharge control and spill prevention, control, and clean-up.

5.2.3 Program Implementation

5.2.3.1 Education/Outreach and Notification of Mobile Sources

The City will provide information and outreach regarding stormwater quality to mobile business owners and operators. Businesses will be given educational materials outlining pollution prevention methods and other related BMPs if businesses are found to be in violation of the City's stormwater ordinance or the Permit. City staff will also give recommendations to businesses, where applicable.

Because the mobile business program is a new element of the industrial and commercial program; it is anticipated that some mobile businesses are not aware of stormwater requirements and that education will be a significant portion of the program. The education is described in more detail in Section 8 of this report. It is worthy to note, that even before the issuance of the new Permit, City staff reviewed and gave verbal stormwater education to any mobile or automotive business license applicant.

The City will continue to coordinate and collaborate with the regional Education and Outreach Workgroup to notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

5.2.3.2 Inter-Jurisdictional Cooperation

During this and the previous reporting periods, the City has participated with other Copermittees in a Mobile Business subcommittee to develop the Regional Mobile Business Outreach and Education Strategy. Because mobile businesses inherently provide services at offsite locations crossing jurisdictional lines, the

Copermittees have chose to collaborate on a regional mobile business strategy, which addresses the following elements:

- Inventory Development and Maintenance
- Establishment of Minimum BMP Requirements
- Outreach and Education including notifications

A consultant may be hired at some point to assist with this process. Compliance and enforcement responsibilities for mobile businesses will continue to reside with individual jurisdictions, and are therefore not addressed as shared regional tasks under this strategy.

5.2.3.3 Inspections

The inspections for mobile businesses generally follow the same procedure described in Section 5.1.3.3 of this report. The main focus of most mobile business inspections is on discharge control BMPs. After thorough investigation, enforcement, and follow-up as needed, none of the mobile businesses investigated warranted a formal inspection. Notably, as part of standard response actions, staff works directly with mobile business owners and employees to ensure that their business practices meet the City's minimum BMP standards.

5.2.3.4 Complaint Investigations, Violations, Enforcement, Follow-up, and Compliance

Complaint response, follow-up investigation, and compliance of mobile commercial businesses are handled in the same fashion as stationary commercial facilities. For a general description of the City's complaint response procedures, refer to Section 5.1.3.5 of this report.

In FY 2009-10, City staff investigated six complaints based on mobile business activities. Investigation of mobile business activities can be difficult based on the transient nature of their operations and their habit of operating primarily on weekends. The City has limited Code Enforcement abilities during non-working hours, but has managed to educated several mobile businesses by actual staff observation of activities. All calls were investigated and followed up with to the best of staff's ability to obtain contact information for the mobile business operator. All contacted operators were provided BMP requirement education and told if complaints persisted, administrative fines would be processed. To the City's knowledge, all have complied with the BMP requirements.

Section 6.0 Residential Component

Approximately 80 percent of the City's 3.7 square mile area is designated as residential on the land-use map. Residential land use comprises a large area of the City and residential activities can have a considerable effect on water quality of receiving waters. The City's residential component of the stormwater program aims to reduce pollutant runoff from residential areas and activities to the MEP.

The overall goal of the program is to minimize the impact of discharges from residential areas on receiving waters in Lemon Grove and, where possible, to enhance the quality of these resources. The following sections will describe the program activities conducted during FY 2009-10 that contributed to the successful implementation of the City's Residential Component.

6.1 Source Characterization

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment L-1 contains a demographics chart for the population of Lemon Grove. As Attachment L-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

This section identifies the high threat to water quality residential areas and activities that were focused on during FY 2009-10. The high threat to water quality areas and activities within the City were identified during the 2008 JURMP update process and are described in detail in the JURMP. The following section will briefly summarize this process.

6.1.1 High Threat to Water Quality Activities

In consideration of the minimum required high threat to water quality residential activities listed in Section D.3.c(1) of Order 2007-01, the following residential activities were identified as residential activities that hold the greatest threat potential to local receiving water quality:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home Improvement, Garden Care Activities, and Product Use
- Disposal of Trash, Pet Waste, Green Waste, and Household Hazardous Waste

6.1.2 High Threat to Water Quality Areas

Section D.3.c(1) of Order 2007-01, requires that Copermittees identify all high threat to water quality residential areas. During the 2008 JURMP update, the City identified high threat to water quality residential areas using the following criteria:

- Any residential areas tributary to a CWS section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within environmentally sensitive areas (as defined in Attachment C of the Permit)

The City has one section 303(d) impaired water body within or directly adjacent to its boundaries. The 303(d) impaired water body within the City is Chollas Creek and is the main watershed for the City. Based on the definition in Attachment C of the Permit, the City does not have any coastal lagoons or environmentally sensitive areas within its boundaries. By collaborating with other copermittees, the City has identified the following pollutants as pollutants of concern for residential areas:

- Bacteria
- Nutrients
- Sediment
- Pesticides
- Trash

In consideration of identified 303(d) listed water body and the primary pollutants of concern, City staff has identified the locations of high threat to water quality residential areas as follows:

- All houses within 500 ft of Chollas Creek, USGS blueline
- All houses within 500 ft of any major Chollas Creek drainage channels

This primary affects houses along Main St, San Miguel, and Bakersfield at Ensenada.

6.1.3 Evaluation of Oversight of Residential Areas and Activities

The City is planning to conduct a formal evaluation of the methods used for oversight of residential areas and activities during the permit cycle of Order 2007-01. The evaluation will coincide with the City's effectiveness assessment for the Residential Component. Since the methods used for residential oversight were recently updated within this last fiscal year, City staff determined that it would be

most appropriate and most accurate to evaluate the success of these methods in following reporting periods.

6.2 Best Management Practice Requirements

This section describes the updates made to the City's minimum BMPs that were implemented during FY 2009-10. The minimum BMPs for residential high threat to water quality activities were established in the City's 2002 JURMP. As part of the 2008 updated, the minimum BMPs were reviewed and updated as necessary.

6.2.1 Pollution Prevention

Pollution prevention is the act of reducing or eliminating waste at the source by modifying production processes, promoting the use of non-toxic or less-toxic substances, implementing conservation techniques, and re-using materials rather than putting them into the waste stream. Pollution prevention methods have been integrated into the minimum BMPs established for high threat to water quality areas and activities.

6.2.2 List of Minimum BMPs

As part of the City's JURMP update, the City designated the following minimum BMPs for high threat to water quality residential activities and areas. The minimum BMPs are primarily nonstructural and area targeted at activities specified in Section 6.2 as having a high threat to water quality. Pollution prevention methods were incorporated into this set of BMPs, where appropriate.

Automobile Repair and Maintenance

Pollution Prevention: a) employ routine preventative maintenance practices, b) reduce vehicle use whenever possible (carpool, use public transportation, bike or walk for short trips, alter driving habits), c) make timely vehicle repairs
Leaks and Spills: prevent leaks and spills from entering the stormdrain by using or doing: drip pans, plastic sheeting, or other containment devices, work indoors or under shelter and never in the rain, immediately clean spills, use dry cleaning methods, establish clean up standards, and require that tools and parts be cleaned in a contained area
Materials and Waste Management: properly manage and dispose of automotive wastes and materials by: draining fluids from automobiles, disposing of wastes and fluids properly and lawfully, store materials, parts and tools indoors or under cover, use secure and watertight containers when storing materials and wastes

Automobile Washing

Management/Reduction of Wash Water: a) whenever possible, use commercial self-serve or full-serve car washes that properly dispose of or recycle the water, b) when washing at a residence be sure to: wash over a porous surface such as grass or dirt when possible, use dry cleaning methods, turn off the water when not in use or use a controllable spray nozzle, encourage the use of a neighborhood wash area where contaminants can be easily manged
Materials and Waste Management: a) properly dispose of soapy water or bucket water to a sanitary sewer or landscaped area, b) use dry methods to degrease or clean especially dirty areas such as tires

Automobile Parking

a) use routine preventative maintenance practices and make timely vehicle repairs to prevent fluid leaks
b) design and construct parking areas to minimize stormwater impacts; covered garages should be plumbed to the sanitary sewer

Home and Garden Care Activities and Product Use

Garden and Yard Care
Pollution Prevention: a) use safe substitutes and alternative gardening methods such as IPM techniques, native and drought tolerant plants, use compost or vermiculture for green waste recycling, follow manufacturers instructions for the application of any chemicals, identify pests before treatment, b) read all labels on products, c)implement water conservation, d) consider xeroscape gardens, e) repair and maintain irrigation system to prevent over watering, f) recycle green waste, g) plant or mulch hillsides and slopes to prevent erosion
Leaks and Spills: a) immediately clean any chemical spills, fertilizers, or soil, b) return spilt items to container for future use or proper disposal
Materials and Waste Management: a) store lawn care products in closed labeled containers indoors or covered areas, b) refrain from using chemicals on windy or rainy days, c) cover stockpiles of soil, compose, or fertilizer, d) dispose of chemicals through the HHW program, e) utilize dry sweeping methods for clean up
Restrictions on Activities: a) do not hose off paved surfaces to the street or gutter, b) do not put hazardous waste in the trash, landfill or stormdrain

Home Care and Maintenance
Pollution Prevention: a) utilize smart purchasing practices that reduce waste, b) use less toxic or non-toxic substitutes for cleaning, c) read and follow product labels, d) recycle used or unwanted products, e) use water based paints when possible, f) recycle unwanted appliances and equipment
Leaks and Spills: a) clean up spills immediately, b) properly dispose of waste from clean up materials

Materials and Waste Management: a) store HHW materials in closed labeled containers and in covered areas, b) recycle latex paint through local programs, c) dispose of hazardous products though the HHW program, d) dispose of trash in the proper receptacles with lids
Restrictions: do not dispose of wash waters (carpet cleaning, mop water, paint wash-up, etc.) to the street, gutter or storm drain

Disposal of Pet Waste

Pollution Prevention: spay or neuter pets to reduce feral populations
Waste Management/Disposal: a) clean up after pets when walking them in public places, b) clean up yards or other commonly used areas, c) properly dispose of the waste in the trash or toilet
Pet Management (Dogs and Cats): do not allow pets to run free in residential neighborhoods, whenever possible

6.3 Program Implementation

This section describes the steps that were taken in FY 2009-10 to require and verify the implementation of designated BMPs for residential areas and activities.

6.3.1 Outreach and Training

The City has an education program that is consistent with the Permit and the jurisdictional program. A significant element of this program consists of educating residents about ways in which they can minimize their impact on local waterways and the environment in general. Education of the citizens in Lemon Grove contributes to the implementation of the residential component of the stormwater program. Outreach messages that are relayed to the public include, but are not limited to:

- Impacts of urban runoff on receiving waters
- Distinction between the MS4 and the sanitary sewer
- Pollution prevention and safe alternatives
- HHW collection and recycling
- BMP implementation and maintenance
- Pet and animal waste disposal
- Equipment and vehicle maintenance and repair
- Spill response, containment and recovery
- Water conservation

During FY 2009-10, City staff conveyed these messages to the public through a variety of mechanisms, including:

- City's Website
- Production and distribution of brochures and promotional items

- Public participation in community events
- Response to residential complaints
- One on one conversations
- Public participation events such as clean-ups

Implementation of these mechanisms by the City helps to make the public aware of the types of activities that have the potential to impact water quality and the BMPs that can be implemented to reduce this impact. Awareness is the first step in the process towards behavioral change. A detailed description of the educational activities implemented by the City can be found in Section 8.

6.3.2 Used Oil, E-Waste, and HHW Collection Services

The City facilitates the proper management and disposal of used oil, toxic chemicals, and other household hazardous wastes (HHW) through various mechanisms. The City participates in door to door home collection, a permanent recycling facility is located in the City, and collection events for all HHW and e-waste. In addition, the City encourages weekly curbside garbage, recycling, and yard waste pick-up services through a franchise with EDCO. The various components of the solid waste and hazardous waste collection services provided by or for the City are described in detail below.

HHW Collection Program

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. This information is lengthy and is available upon request.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only two demolition sites qualified and completed the program during this reporting period. Both projects were very small private development projects and the City has not calculated the waste totals as of this report. The totals will be available upon request by October 30, 2010.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in eight collection events for solid waste disposal. All of the events were in cooperation with a Household Hazardous Waste grant through CIWMB. .

The City held one collection day through EDCO and their facilities at the same time as the curb side clean up day. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 24-25. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2009-10, as per the HHW program, are not due to the State regulating agency until October 1, 2010; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2010.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2009-10, the City held eleven e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2010.

Used Oil Recycling Program

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

Table 6-1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005 (Calendar Years)

Table 6-2 Annual Oil Sales and Used Oil Recycling Rates (in millions of gallons)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005
Lubricating Oil Sales	141.2	140.8	136.2	137.5	142.1	150.0	154.3	163.6	168.0	150.2	150.5	153.5
Industrial Oil Sales	78.0	117.3	140.9	141.7	152.4	176.4	155.7	149.1	147.1	135.8	144.6	123.1
Total Oil Sales*	219.2	258.1	277.1	279.5	294.5	326.4	310.0	312.7	315.1	286.0	295.0	276.6
Lubricating Oil Recycled**	59.9	54.6	56.8	60.9	73.6	76.9	80.0	81.9	83.1	83.7	87.0	91.3
Industrial Oil Recycled**	16.7	19.5	20.8	19.3	11.6	10.4	7.9	15.5	17.5	32.4	32.5	31.4
Total Oil Recycled	76.6	74.1	77.6	80.2	85.2	87.3	87.9	97.4	100.6	116.1	119.4	122.7

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

Table 6-3 Oil Collected by Public Collection Programs (in millions of gallons)

Table 6-4 Oil Collected by Public Collection Programs (in millions of gallons)

	94/95	95/96	96/97	97/98	98/99	99/00	00/01	01/02*	02/03*	03/04	04/05
Curbside	0.9	0.9	0.8	0.9	0.7	0.6	0.5	0.9	.9	1.0	1.0
Form 303	0.6	0.7	1.0	0.8	0.9	1.1	0.9	1.0	1.0	1.0	1.0
Certified Centers	5.6	8.7	10.2	11.3	13.2	15.2	16.3	18.5	19.9	20.6	19.9
Total Oil	7.1	10.3	12.0	13.0	14.8	16.9	17.7	20.4	21.8	22.6	21.9

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the two collection sites and the number for curb-side pick-up. See Attachment L-2 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment L-3 for copies of the Newsletter.

The two collection sites are:

- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

6.3.3 Complaint Investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the stormwater hotline or other form of communication such as e-mail, a County hotline referral, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or cleanup activities by the City or responsible party.

The City enforces its stormwater ordinance for all residential areas and activities as necessary to maintain compliance with the Permit and ensure water quality. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for the City to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the Code Enforcement data base.
In FY 2009-10, the City received 54 Residential IC/ID complaint calls. Six of those calls were construction related and are discussed in Section 3. Eight of them were related to illegal dumping in the street or gutter. All were abated within 24 hours of notification to the City and all known dischargers were educated on proper disposal methods. No citations or fines were leveed for residential complaints during this reporting period. The remaining calls were either unfounded or not related to stormwater and were delivered to the appropriate department.

6.3.4 Regional Residential Education Program

The City collaborated with other jurisdictions in the Education and Residential Sources Workgroup to develop the Regional Residential Education Plan. The Plan contains recommended strategies for the development and implementation of the Regional Residential Education Program. Implementing an enhanced regional program to target residential sources of stormwater pollution encourages the development of consistent messages throughout the region and enables Copermittees to better leverage resources and utilize economies of scale.

This reporting period's collaboration on a regional level was promotion of residential stormwater BMPs at the San Diego County Fair. The Copermittees combined funds to pay for a fair booth, material distribution, signage and advertisements at several locations on the fairgrounds for the duration of the fair. Booth staffers promoted the Think Blue message and presented stormwater educational materials to all fair attendees.

Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2009-10 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment.

7.1 Dry Weather Monitoring Program

This portion of the report will be submitted on December 15 as required in the Permit.

7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 54 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls eight were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 5 and follow-up and enforcement for residential complaints is dealt with in Section 6.

7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 6 of this report.

7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 4 of this report.

Section 8.0 Education Component

8.1 Overview of Education

The City's outreach program includes an education and public participation component. The education component is focused on disseminating educational information to increase public knowledge of stormwater issues, while the public participation component, discussed in Section 9, provides opportunities for the public to become involved in the process of reducing pollutants of concern in stormwater and urban runoff. The education component is primarily implemented by the City's water quality staff.

The Permit establishes the following five target communities which must be addressed by the education program:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

The overall goal of the education element is to provide an education program that will:

- Measurably increase the knowledge of the target audience regarding MS4s, impacts to urban runoff on receiving waters, and potential BMP solutions appropriate for the target audience and their activities.
- Measurably change the behavior of the target audience and thereby reduce pollutant releases to MS4s and the environment.

The City performed a wide variety of storm water education activities during FY 2009-10. Education and outreach was performed on three levels – Jurisdictional, Watershed, and Regional. Budgetary constraints are currently severely limiting the City's outreach abilities to in-house staff and resources only. However, the City has always worked hard to openly communicate with its community and staff has always been available for face to face meetings both at City facilities and while out in the community. The community also has easy access to all City staff by phone or e-mail. The City feels that this informal accessibility works in our favor and actually provides our residents with more meaningful, in depth education than multitudes of printed material.

8.2 Municipal Staff Training

Public Works. Water quality staff participates in monthly meetings with all of the public work division and weekly meetings with the public works supervisors. At these regular meetings, water quality staff provides updates on current policies

and areas of concern. Due to the regularity of interaction between water quality staff and public works staff, no separate annual training is currently being provided. Any questions or comments can be dealt with more effectively at the regular meetings and changes to regulations or activities can be instituted quickly and efficiently. Water quality staff is also integrally involved in ensuring that public works staff receives and maintains all required certifications, such as Confined Space certification, Hazwoper certification, Cal OSHA updates, pesticide application qualification, and other risk management trainings applicable to their daily jobs and their stormwater activities. Towards the end of this reporting period, the City began exploring a newly available training tracking program, which in future reporting periods will make it even easier to verify staff trainings.

New Employees. Water quality staff is working with the City's HR department to establish a new employee interactive training power point presentation, which will include basic stormwater information and an evaluation test at the end. This video will be shown to all new employees regardless of department and their end test results will be tracked. The City is participating in the Regional Municipal Workgroup, which is working on developing a series of employee educational videos that would be available to all Copermittees. These videos would include new employee, management and task specific trainings. With the City's new training tracking system, it will be easy to track employee trainings and track pre and post-test results to evaluate a change in knowledge.

Engineering and Planning Departments. Water quality staff meets weekly with these two departments to discuss development review projects, new policies, streamlining of existing policies and to participate in consistent interdepartmental education. The City finds these regularly scheduled meetings a much more efficient and effective way of updating and educating staff on water quality concerns, regulations and improvements. They are the foundation for the City's new sustainability mindset and have been vital initiating the overhaul of the City's General Plan. It allows the City to present an ideologically unified front to its residents, developers, contractors, and business owners.

8.3 Educational Outreach

This section describes education efforts conducted for each target community during FY 2009-10.

8.3.1 Underserved Target Audiences and Mobile Businesses

Underserved Target Audiences. For those segments of Lemon Grove community that do not speak English as their first language, the City provides many of its brochures and handouts in both English and Spanish. The City also employs bilingual staff to assist our residents, answer questions, and translate information. The current water quality brochures available in dual languages are

IPM pest tip cards, recycling and HHW information. The City also has available the Green Wrench BMP guide for automotive repair shops and the Green Cooking BMP guide for restaurants in Spanish. The City also works with the County's Green Business group which provides BMP information in Spanish and in English. Despite these efforts, the City realizes this continues to be an underserved audience and by collaborating with the other Copermittees hopes to continue to develop new ways to provide them with water quality data and information.

Mobile Businesses. During FY 2009-10, the continued to participate and provide information to the Regional Mobile Business Subcommittee for the development of the Regional Mobile Business Outreach and Education Strategy. Mobile businesses inherently provide services across jurisdictional lines; therefore the Copermittees chose to collaborate on a regional mobile business outreach and education strategy, which addresses the following elements:

- Inventory development and maintenance
- Establishment of minimum BMP requirements
- Outreach and education

The City's water quality staff, for several reporting periods, has reviewed any business license that pertains to a mobile business and required them to provide applicable BMP information on the business license application. Until the new Permit, however, these businesses were not an independent category in the business license directory. They were filed by business type, such as automotive or food service. During this reporting period, the City created the mobile business category and has begun transferring the known mobile businesses into the correct category. One of the challenges faced by Code Enforcement, in conjunction with mobile businesses, is their tendency to conduct business during off hours. City staff is very limited in their ability to work off hours and since the economic downfall, all overtime is prohibited unless emergency related. The City hopes that a Regional database of mobile businesses will help to track and regulate their activities and improve education opportunities.

8.3.2 New Development and Construction Communities

The City uses the following strategies to provide education and outreach to its development and construction communities:

- BMP training request as part of the permit application process
- Meetings with project developers, owners, on-site contractors and site supervisors
- SUSMP checklists as part of the development review process
- Signed BMP checklist for all ministerial permit applications (training request sheet is attached to this checklist)

- Informal meetings with developers and contractors due to questions, comments, concerns, etc. Generally occurs during the review process or normal site inspection process
- All changes to construction site BMPs are required to be submitted to City staff for approval

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

8.3.3 Commercial/Industrial Owners and Operators

The following is a summary of the education and outreach provided to commercial and industrial owners and operators during FY 2009-10.

- Annual inspections of all industrial facilities, restaurants and automotive facilities in the City by our in-house Code Enforcement staff. During these inspections, individual one-on-one education was presented to each facility manager/owner. Information presented included general storm water quality information and BMP requirements.
- The City also has Green Wrench and What's Cooking guides available for interested parties.
- Mailings to facilities about applicable local workshops and education opportunities, such as those offered by SDG&E and the San Diego Energy Commission.

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party. However, it is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation. They perceive stormwater inspections as part of this over-bearance and are often reluctant to make changes without the involvement of Code Enforcement proceedings.

8.3.4 Residential Community and General Public

The following is a summary of venues and media outlets utilized within the defined reporting period of this report to provide education and training to various residential and public audiences:

- City Newsletter containing an environmental section with water quality and environmental tips (such as how to properly care for your lawn, list of

basic household BMPs, or home improvement – BMPs your contractor should know) and information about HHW and recycling

- Various brochures available at City Hall: Used oil recycling, car washing, pet waste disposal, etc
- Maintenance of the stormwater hotline (619) 825-3827, which monitored by water quality staff
- Water quality staffed informational Booths at the following events: Fire Station Open House and Winter Bonfire.
- Participation and staffing at the Regional Education Outreach booth at the San Diego County Fair
- Participation and collaboration in watershed-based efforts such as Creek to Bay Clean-up and watershed based school presentations

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

The City is constantly striving to improve its outreach and education opportunities within the limited means of the current budget. Much of the current education is done by City staff in an informal manner with the public and business communities. Having a small City staff, means a consistent message is provided because staff is easily kept up to date on the current regulations and policies. This program will continue to evolve as necessary and as funds allow.

9.1 Public Participation

Public participation is one of the components of the City's outreach program. The goal of the education component, discussed in Section 8, is geared towards disseminating educational material to increase public knowledge of storm water issues. The goal of the public participation component is to provide opportunities for the public to become involved in the process of education and reducing pollutants in stormwater and urban runoff.

Public participation activities provide opportunities for the public to interact and become involved with water pollution issues. When the public has the opportunity to become involved there are several positive outcomes. First, those involved become more knowledgeable about stormwater issues. Second, they become educators and stewards for the stormwater program. Finally, they provide important feedback to the stormwater program regarding the concerns of the public and issues that may be overlooked. Ultimately, public participation help makes the education process more effective.

9.2 Public Participation Approach

The City's approach for the outreach program is to develop an understanding among its residents and businesses of some fundamental storm water concepts. These include:

- The difference between the sanitary sewer and the storm drain system (sanitary waste gets treated, but discharges into the storm drain system flow directly to our waterways and beaches untreated)
- The economic value of our beaches and inland waterways and the importance of protecting them.
- An understanding of illegal discharges, i.e. sidewalk and street wash water runoff, vehicle fluid (antifreeze and oil), landscape debris, sediment, etc.
- How to report a stormwater violation (stormwater hotline or website).
- The fact that we all live in a watershed and that the watershed is integral to wildlife, public health, and to the water quality of the rivers, streams, and oceans.
- Reducing pollutants of concern.
- Responsibility of citizens to participate in the cleaning and maintaining of the community (i.e. creeks and parks) and not to be part of the pollution problem (littering, illegal dumping, improper disposal of household chemicals).

Some of the tools that are used by the City to implement the public participation activities are:

- public outreach events
- public reporting methods
- pet waste dispensers
- Household Hazardous Waste Collection and Used Oil Recycling
- public opinion surveys
- copermittee collaborations

9.3 Program Implementation

This section describes the specific public participation tools used during the FY 2009-10 reporting period.

9.3.1 Public Outreach Events

The City participated in several outreach events during FY 2009-10:

- Coastal Clean up Day – September 19, 2009; 10 volunteers; Federal Blvd/San Miguel drainage channel
- Fire Station Open House – October 10, 2009; 60 participants
- Winter Bonfire – December 4, 2009, 800 participants
- Creek to Bay Clean up Day - April 24, 2010; 18 volunteers; Federal Blvd/San Miguel drainage channel
- San Diego County Fair – June 12, 2010; 4,500 participants

9.3.2 Public Reporting Methods

The City has a local hotline that connects the caller directly to the City's water quality staff. The number is (619) 825-3827. A public works person is available for after-hours emergencies, who will contact the best staff person to handle the emergency. There are also two regional stormwater hotline numbers promoted within San Diego County: a toll-free Regional Storm Water Hotline, 1-888-846-0800 and the Think Blue Hotline, 1-888-844-6525 (1-888-THINK BLUE). Both of these hotlines are staffed by the County of San Diego Monday through Friday, 8:00am - 5:00pm. In addition to personal service at these hotlines during regular business hours, the hotlines provide a voice mail message for 24-hour public access.

The City's stormwater hotline has been heavily advertised since the programs inception. In FY 2009-10, the hotline received eight stormwater related calls, typically pertaining to the illegal discharge of fluids in the gutter over the weekend or a business hosing off their parking lot. All calls are investigated by Code Enforcement and are usually handled with a verbal warning and education about household BMPs. None of the calls during this reporting period requied formal

Code Enforcement proceedings. The hotline is advertised in the newsletters and on the City's website, in brochures, on give-aways, and at City events like the Winter Bonfire and the Fire Station Open House.

The City's website also provides water quality information and event updates: www.ci.lemon-grove.ca.us.

9.3.3 Pet Waste Dispensers

Residents are encouraged to protect our creeks, lagoons, and ocean by cleaning up after their pets. To make this easier; pet waste dispensers can be found at all the City parks and in the vacinity of City Hall, all areas where people frequently walk their dogs. Trash cans are also readily available in all of these areas. Both the trash cans and bag dispensers are maintained by the City's Grounds division.

9.3.4 Household Hazardous Waste Collection and Used Oil Recycling

The City co-sponsors several HHW and e-waste events over the course of the reporting period. During these events, residents can drop off any HHW or e-waste free of charge. The City collaborates with the Cities of Chula Vista and La Mesa for HHW events and data collection. The City participated in eight HHW events and eleven e-waste events. The City has two used oil collection points in the City:

- EDCO Recycling Center 6670 Federal Blvd
- Kragen Auto Parts 6925 Federal Blvd

9.3.5 Copermittee Collaborations

The City continues its collaboration and encouragement of the County's Green Business program for restaurants and automotive repair shops. This effort continues to develop and explore a State wide collaboration and standards. The City will continue to promote these programs to the applicable commercial facilities where-ever possible.

Section 10.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

10.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 10.1.

Table 10.1 – 2009/2010 Fiscal Analysis Summary

Stormwater Cost Analysis
All costs covered in the General Fund.

ACTIVITY	CURRENT YEARLY BUDGET	CURRENT BUDGET LOCATION
STORM DRAINAGE CLEANING AND MAINTENANCE		
Public Street and Parking Lot Sweeping		Streets
Streets	$30,000	
Parking Lots	$2,000	
Public Street and Parking Lot Sweeping Total	$32,000	
Litter Removal		
Litter Removal	$13,000	
Litter Removal Total	$13,000	
Storm Drainage Cleaning		
Inlets		
Inspection and Cleaning	$19,820	
Fossil filter replacements	$1,400	
Inlets Subtotal	$21,220	
Basins and Channels		
Inspection and Cleaning (Note 1)	$38,829	
Basins and Channels Subtotal	$38,829	
Video Inspections		
Video Inspections (Note 1)	$50,000	

Video Inspection Subtotal	$50,000	
Storm Drainage Cleaning and Maintenance Total	**$155,049**	
STORM EVENT ACTIVITIES		
Sandbag stock piling and placement	$4,000	
Patrols	$3,089	
Storm Event Total	**$7,089**	
ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM		Engineering Services
Dry Weather Testing	$20,000	
Enforcement	$5,000	
Administration/Supervision	$1,000	
Stormwater HotlineComplaints	$2,000	
Illicit/Illegal Enforcement Program Total	**$28,000**	
STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)		
Construction Related SWPPP	$2,000	
Plan Review (including SUSMP's)	$15,000	
Inspection	$3,000	
Construction Related SWPPP Subtotal	$20,000	
Municipal Facility SWPPP		
SWPP Implementation, Inspection, and Maintenance of Municipal Facilities	$18,798	Streets
Municipal Facility SWPPP Subtotal	$18,798	
All SWPPP Activities Total	**$38,798**	
BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION		
Inspection of Industrial and Commercial Facilities	$50,000	
Inspection of Municipal Facilities	$1,000	
BMP Total	**$51,000**	
MISCELLANEOUS ACTIVITIES		Engineering Services
Annual Reporting (JURMP)	$5,000	
Administration (General)	$74,004	
NPDES Permit Fee	$7,500	
Public Education/Outreach	$5,000	
Miscellaneous Activities Total	**$77,504**	
PROGRAM TOTALS	**$371,440**	

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2009-10 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance

activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

10.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.
Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

11.1 Introduction

The City began applying baseline program effectiveness assessment methodologies soon after they were developed by the San Diego region stormwater Copermittees during the last permit cycle as described in the document titled "A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs" dated October 16, 2003. The City has also actively participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008 and as an ongoing process. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs, so the City prepared its own effectiveness assessment approach and measures modeled after conventional strategies and the existing levels of effectiveness assessment as detailed in the October 2003 document.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is anticipated that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will undertake the issue of standardized assessment metrics and procedures in the near future. The City is committed to engaging in the process of developing such regional standards and incorporating resulting work products into its own local program effectiveness assessment system. It is in consideration of the evolving and ongoing regional standardization process that the City has endeavored upon fine tuning its local effectiveness assessment approach as presented in the subsequent paragraphs and tables. Further, it is recognized that these methodologies and strategies must be adaptable as regionally developed procedures are solidified in the future.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The core structure of the City's stormwater program is composed of three primary drivers:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The programmatic process typically proceeds from planning to implementation to assessment, although in practice all three maybe in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program elements developed during the planning step are implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments

are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

As part of the JURMP update process, the City has identified a variety of significant activities uniques to each program element and metrics (numeric and/or narrative) to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics are provided in SEction 13 of the City's revised 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step towards the more difficult level of improvements to water quality in receiving waters. The levels are listed below.

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

11.2 Effectiveness Assessment Results

The new Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment - assessment that combines both monitoring data and programmatic data - are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome Level Assessments

Level 1

A requirements checklist, which includes a directory of permit compliance elements and where each is described within the JURMP annual report, can be found in Appendix G.

Level 2 and 3

Tables 11-3 at the end of this section include discussions of Level 2 and Level 3 outcomes for activities identified as significant by the City within each program component. Note that only Level 1 assessment applies to fiscal analysis, so a table for fiscal analysis is not included.

Level 4

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load reduction estimation methods have not yet been or cannot be developed.

Level 5

On September 10, 2008, the Regional Board adopted Addendum 2 to Order 2007-01, effectively extending the annual due date of the illicit Discharge Detection and Elimination reporting requirements to December 15. It is anticipated, consistent with previous Dry Weather Monitoring reports prepared by the City that baseline trend analysis will be provided for a number of constituents evaluated through the Dry Weather Monitoring Program. This information is further spatially correlated with sub-basins or drainage areas within the City, and evaluated against land-use areas and potential source areas.

Level 6

It has been determined, through ongoing development and discourse over long-term effectiveness assessment methodologies that relationships between programmatic activities and changes in receiving water quality are difficult to establish on an annual basis or a jurisdictional scale. As such, the City will point to future regionally coordinated efforts including Report of Waste Discharge (ROWD) and Long Term Effectiveness Assessment (LTEA) development to more holistically evaluate changes in receiving water quality. It is anticipated that such efforts will be further refined and supported by ongoing data gathering efforts both locally and regionally.

11.2.2 Overall Component Assessments

Development Planning

The City's review process for development projects is effectively requiring higher removal efficiency treatment control BMPs. Further, two new significant program elements were in production and in early stages of implementation within the defined reporting period of this report; both new programs are demonstrating positive trends. BMP installation verification and BMP operation and maintenance verification efforts, while not wholly implemented at the time of report production, have resulted in the establishment of programs that will support long term effectiveness assessment measures for development planning.

Construction

The City's review and approval process for construction related plans and documents is effectively verifying proposed construction specific BMPs. BMP implementation and maintenance is being effectively managed through construction site inspection activities, and validated through associated assessment measures. It is anticipated that in response to increased inspection frequencies and refined data gathering practices that this trend will continue.

Municipal

The defined reporting period of this report is marked by significant expansion of municipal operations and maintenance activities to meet the standards established in Order 2007-01. Enhanced stormwater conveyance, drainage facility, channel maintenance and inspection and street sweeping activities, were developed and implemented, equating to the removal of salient volumes of debris. Effective operations and maintenance activities are demonstrated in the Table 11-1 below, and it is anticipated that this continued level of service as well as enhancements in data gathering methods will support the efficacy of municipal activities.

Table 11-1

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Street Sweeping	150.75 tons	None	150.75 tons
MS4 Cleaning	3,360 pounds (1.815 tons)	None	3,360 pounds (1.815) tons
			Total 152.565 tons

Industrial and Commercial

Stormwater activities and actions related to industrial and commercial entities have exhibited positive trends within the defined reporting period. The City has identified inspection activities coupled with complaint response and enforcement as the significant activities by which to evaluate program effectiveness. During the defined reporting period, the City has been able to evaluate effectiveness on a number of levels (See Table 11-2) through the gathering of critical statistics, including a knowledge and BMP assessment scoring system. Data gathered and evaluated during the defined reporting period indicate that identified significant program activities targeting industrial and commercial sources have been effective.

Table 11-2 Program Scores for 2009-10**

	Knowledge Assessment *	BMP Assessment
Average Rating	2.6	3.5
Median Rating	3	3

# of “Level 5” Ratings	6	25
# of “Level 4” Ratings	28	34
# of “Level 3” Ratings	30	49
# of “Level 2” Ratings	22	12
# of “Level 1” Ratings	33	4

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

Table 11-2 cont. Program Scores for FY 2005-06
(This was the first year the analysis was done and is provided for comparision)

	Knowledge Assessment *	**BMP Assessment**
Average Rating	2.39	3.33
Median Rating	2	3
# of “Level 5” Ratings	0	14
# of “Level 4” Ratings	9	26
# of “Level 3” Ratings	34	30
# of “Level 2” Ratings	26	11
# of “Level 1” Ratings	18	7

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

Residential

Residential BMP implementation has been identified as the significant activity by which effectiveness has been assessed. Residential complaint response and enforcement constitute the core of residential BMP implementation assurance actions. Based upon an evaluation of data associated with these elements, including the number of incidents responded to and the ultimate resolution of these events, the City has demonstrated a notably effective program and level of service to the community of Lemon Grove.

Table 11-3

Activity	**Amount Collected**	**Adjustment Factor**	**Estimated Load Reduction**
Used Oil Recycling	25,600 gallons	10%	2,560 gallons
C&D Ordinance Recycling	17,852 pounds	1%	179 pounds

Education

Education effectiveness is assessed for a variety of program elements. In terms of education opportunities provided to the various community sectors and City staff and contractors, identified as the significant metric by which to evaluate education activities, the City has achieved a high level of success.

Public Participation

The City provides a variety of venues and outlets in support of public participation. The City has identified a number of measures to evaluate the effective implementation of this program element. As with education, public participation translates across a number of program areas; however the assessment measure are focused on success of the venues ad outlets supported by the City. From the measures identified and quantified, community partnerships, event attendance, hotline calls, and volumes of debris and hazardous materials collected through public participation, the City has established exceptional trends.

11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of this document.

LEMON GROVE
BEST CLIMATE ON EARTH
Incorporated in 1977

Executive Summary

The City's eighth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In 2008, the City updated its JURMP and Municipal Codes to reflect the requirements of the new Permit, Order 2007-01. The Model SUSMP was completed by the Copermittees and submitted for Regional Board approval during this reporting period and will be added to the City's Municipal Code in the next reporting period. In FY 2010-11, the City continued its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have

helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2010-11. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2010-11, the City continues to make significant steps toward the implementation of a City-wide GIS program, including the beginning of service contract to install GIS layers for the sanitary sewer system. Other departments and layers will be added as the budget allows. Currently the budget does not allow for other layers, but the City hopes this will change in future reporting periods, although perhaps not until the next permit cycle. The implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

Section 1.0 Introduction

Lemon Grove's ninth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit"), represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2010 through June 30, 2011). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City strongly supports the concept of an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City also feels a stronger regional program could help alleviate the cost burden the current program forces on the City. The end result would be a maximization of severely scarce funds and funding. The City is currently experiencing, as are many others, serious financial hardship due primarily to the economy and the State raids on local funds to support its own programs. The loss of revenue in the past year has forced the City to redistribute General Funds to maintain even basic service levels, such as pothole repair. The City feels the current program meets regulatory requirements, but is leery of program expansion without a secure revenue source. The unfunded mandate aspect of this program continues to stress the City's already stretched thin General Fund. The City encourages the Regional Board to take a stronger leadership role in facilitating more cooperation with State agencies in obtaining long-term funding for this program. The City hopes that in future reporting periods, some of these challenges can be met with more cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City's construction and BMP databases continue to evolve as more information is gathered and tracked. Water Quality staff continues active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City believes in a comprehensive and collaborative approach for environmental concerns and solutions. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a

city-wide GIS program. The City is currently working on implementing initial GIS programs and layers through the Sanitation District. These initial layers will include the mapping of our sewer mains and City maintained laterals, as well as the tracking of maintenance activities. All further implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with severe economic challenges both on a local and state level.

At the jurisdictional level, the City has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be sufficiently updated over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming
- A continuing sustainability effort of which stormwater is a key element

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 5.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2009-10. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

Section 2.0 Development Planning Component

This section describes actions taken by the City during FY 2010-11 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

2.1 Land Use Planning

The City's land use planning process facilitates the reduction of development project discharges of pollutants from the MS4 to the MEP, the prevention of development project discharges to the MS4 from causing or contributing to a violation of water quality standards, and of increases in runoff discharge rates and durations from development projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. The water quality staff works closely with engineering staff in these efforts, presenting a united, collaborative process to developers.

The City's land-use planning process consists of development and implementation of the following documents:

- General Plan
- Jurisdictional Urban Runoff Management Plan
- SUSMP
- Municipal Code, which includes the City's Development Code, Grading and Excavation standards, and all Stormwater regulations

The utilization and regular update of each of these documents enables the City to successfully conform to the requirements of section D.1 of the Municipal Permit. The following sections will describe the City's land use planning process and the four planning documents in more detail.

The City of Lemon Grove was incorporated in 1977 from the County of San Diego. The City's General Plan was adopted in 1996 and is currently undergoing an in-depth review and amendment process. The City's JURMP, Stormwater Ordinance and SUSMP were originally developed and adopted under Order 2001-01 in 2002-2003. These documents have been reviewed and updated under the new Order 2007-01.

2.1.1 Source Characterization

The City addresses eleven major land use categories in its General Plan:

- Low density residential
- Low/medium density residential
- Medium density residential
- Medium/high density residential
- Mixed use
- Retail commercial
- General Business
- Industrial
- Parks and recreation
- Transportation
- Special treatment area (STA)

The General Plan also recognizes eleven zoning categories:

- Residential low
- Residential low/medium
- Residential medium
- Residential medium/high
- Residential professional
- Central commercial
- General commercial
- Limited commercial
- Heavy commercial
- Light Industrial
- Special treatment area (STA)

Each of these land-use and zoning categories is associated with different combinations of pollutants and activities that have the potential to negatively affect the surrounding environment. A detailed discussion of the potential threats to water quality associated with existing residential, commercial, industrial, and municipal land uses can be found in their specific sections of this report.

Through the implementation of the land use planning policies, procedures, and requirements established in the General Plan, JURMP, Municipal Code, Grading Ordinance and SUSMP, the City aims to reduce the potential for pollutant discharges from all planned development and redevelopment land use sources.

2.1.2 Best Management Practice Requirements

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment H-1 shows the form that is presented to each applicant regardless of project size.

This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue by developers. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity. Through a series of updates and reviews, the City is working to include low impact development concepts through-out the applicant review process and in its codes and regulations, specifically the General Plan.

2.1.3 Program Implementation

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

2.1.3.1 General Plan/Municipal Code/SUSMP

As a component of the 2008 JURMP update (conducted during FY 2007-08), an assessment of the City's General Plan and Municipal Code were conducted to determine the City's consistency with the watershed protection policies and principles found in the Permit. The analysis found that the City's General Plan goals and policies are consistent with the Permit and that no amendments to General Plan were required as a direct result of the JURMP update. The

General Plan discourages the use of large amounts of connected impervious surfaces, requires a landscape minimum, works to protect environmental sensitive areas, and prohibits development near or in a known watercourse. However, the City's General Plan is currently undergoing a comprehensive review process with plans for amendments occurring over subsequent reporting cycles. The City plans to ensure that each area covered in the General Plan contains environmental and sustainable options and concepts. Low Impact Development ideas will be presented and encouraged throughout the document. The City's General Plan is meant to cross reference and openly comply with the City's Municipal Code and all other pertinent development documents.

The City's General Plan serves as the blueprint for the long-range, orderly, physical development of the City. The Development Code section of the Municipal Code contains all zoning and land use requirements and stipulations. These two documents together are designed to protect the City's environmental, social, cultural, and economic resources as the City develops and redevelops.

The Municipal Code did undergo a lengthy review and amendment process due to the issuance of Order 2007-01. Section 8.48 Stormwater Management and Discharge Control was broadened and made more comprehensive. A BMP specific section was added, Section 8.48.060-110. Section 8.48.140 contains regulations for all land development and redevelopment projects and Section 8.48.150 contains BMP maintenance requirements. All of these additional sections, strengthen the City's water quality program by providing a legal basis for implementation and enforcement. During the review process, the City decided to also include the SUSMP as a Municipal Code section, Section 8.52 now contains the City's SUSMP document. This section will be further updated during the next reporting period with the approval of the new County-wide SUSMP document. During this reporting period, the City collaborated with the Copermittees to create the final draft SUSMP, which was then turned over to the Regional Board for review and approval.

2.1.3.2 JURMP

In compliance with Order 2007-01, the City's JURMP document underwent a major update during FY 2007-08. This update process was continued after receiving comments from the Regional Board in early 2009. The JURMP document serves as the City's foundational storm water program management tool, capturing the developed process, procedure, and implementation strategies for described elements. The purpose of this document is to present an integrated approach to reducing the discharge of pollutants from the MS4 to the MEP, and to protect and improve the quality of water bodies in Lemon Grove.

2.2 Environmental Review Process

As part of the 2008 JURMP update, the City evaluated its environmental review process and confirmed that the current process accurately evaluates water quality, cumulative impacts, and identifies appropriate measures to avoid, minimize and mitigate those impacts for all development projects.

The California Environmental Quality Act (CEQA) requires environmental review of discretionary applications for development projects. Environmental initial studies are conducted to determine whether the project may have a significant impact on the environment. This review process evaluates a project's potential for significant impacts on water quality.

The environmental review process ensures that a project's impact on water quality is addressed early in the planning process. If a project is determined to have a significant environmental effect, mitigation measures are required under CEQA to avoid or reduce the effect to below a level of significance. The mitigation measures will normally take the form of adopted permanent Best Management Practices to be incorporated into project plans prior to discretionary approval.

2.3 Development Project Approval and Verification Process

As discussed previously, the City has an established multi-departmental review process for all new development and redevelopment projects. By using all of the above mentioned regulations, the City aims to mitigate the negative impacts of urban runoff from development projects to the MEP. Each proposed discretionary and ministerial project is subject to the City's development approval process. The following sections describe this process in detail.

2.3.1 Source Characterization

As discussed above, development projects have the potential to discharge different types and amounts of pollutants based on the project's size and intended land use. Pollutants such as trash and debris are anticipated from all developments, regardless of land use; however, pollutants like bacteria and viruses are more likely to originate from restaurants and residential developments, whereas grease and oil are more likely contributed by parking lots and automotive repair shops. Since the potential for a site to discharge pollutants is unique to each development, the City's design requirements for development projects vary according to size, project characteristics, and anticipated land use.

The City's SUSMP, which was updated and added to the Municipal Code during FY 2007-08, describes specific categories for priority projects and indicates common pollutants associated with each category. A priority project must

identify the potential pollutants anticipated from its development and implement design concepts and other BMPs to address these pollutants.

In the City, all development projects, including building and ministerial permits are required to implement minimum BMPs. These BMPs include construction BMPs and good housekeeping practices. Discretionary projects, however, generally pose a greater potential threat to water quality and are subject to an additional set of BMPs and more intense scrutiny.

2.3.2 Best Management Practice Requirements

The City's minimum BMP requirements for all discretionary development projects are summarized here and are included in the City's SUSMP. All discretionary development projects are required to explore and implement where applicable the following principles:

- Source control BMPs that reduce stormwater pollutants of concern in urban runoff, including but not limited to storm drain stenciling and signage, properly designated and covered material and trash storage areas, and the use of efficient irrigation systems.
- LID BMPs that provide retention, slow runoff, minimize impervious footprint, direct runoff into landscaping, and promote water conservation.
- Grading and construction activities must implement all requirements outlined in the City's JURMP and Municipal Code.
- Submittal of proof of on-going long term maintenance for all structural post-construction BMPs.

SUSMP priority projects must submit a water quality document, which includes identification of potential pollutants from the project, proposed LID, source control and treatment control BMPs, and an attached maintenance agreement. The document must also include how the project will manage increases in runoff discharge rates and durations associated with the project. It is the City's policy to prevent permitted projects from increasing the runoff coefficient that eventually enters the City's MS4. Both the water quality document and hydrology report must provide retention and detention details for any runoff increase due to the development or redevelopment of a site.

2.3.2.1 Hydromodification Management Plan and Interim Hydromodification Criteria

To reduce the negative impacts to beneficial uses and stream habitats that are attributed to increased runoff rates and in compliance with Order 2007-01, the City is currently collaborating with the other Copermittees to adopt a detailed Hydromodification Management Plan (HMP).

The final draft HMP was submitted to the Regional Board at the end of this reporting cycle and will be approved and integrated into the City's program during the next reporting cycle. However in FY 2007-08, the City established interim hydromodification criteria that will be in effect until the final HMP is approved by the Regional Board and adopted by the City. The City requires all priority projects disturbing 50 or more acres to comply with the interim hydromodification criteria, except those sites that are considered exempt as per Section D.1.(g)(6) of the Permit. These interim requirements are consistent with the regionally adopted interim hydromodification standards. The City of Lemon Grove is a small developed community and does not anticipate any projects during the following reporting period that will meet these criteria. The City also connects almost exclusively to concrete channelized streams at its borders and does not anticipate frequent projects subject to future hydromodification requirements.

The City does not issue permits to development projects until all minimum BMP requirements are met. Any changes made to the development project's proposed stormwater BMPs during project construct must be reviewed and reapproved by City staff before being implemented.

2.3.3 Program Implementation

As required by the Permit, the City has implemented a program to ensure that development and redevelopment projects comply with post-construction BMP requirements, including Low Impact Development (LID), source control, and treatment control BMPs. The Permit further requires the City ensure proper installation of treatment control BMPs and their maintenance into perpeturity through such procedures as BMP verification, maintenance agreements, and annual inspections.

The following sections provide an overview of the City's SUSMP implementation practices and tracking during FY 2009-010.

2.3.3.1 Model and Local SUSMP updates

As a part of the 2008 JURMP update process, the City updated its current SUSMP document to meet the interim requirements outlined in the Permit. The City's update followed the recommended language developed by the regional SUSMP update group. All required interim SUSMP updates were incorporated into the Municipal Code. In compliance with the interim SUSMP update standards established in Order 2007-01, the following tasks were performed during the review and interim update of the SUSMP:

- Priority project categories were updated
- The document was reviewed to ensure no obsolete or ineffective BMPs were retained

- LID requirements and additional source control requirements were added to meet or exceed Permit requirements
- LID BMPs that can be used as treatment control BMPs were added to appropriate tables and discussions of treatment control options were updated accordingly
- Pollution removal efficiencies of treatment control BMPs were reviewed and updated where necessary

In addition to the changes discussed above, a comprehensive model SUSMP update was completed by a regional workgroup during FY 2007-08. The comprehensive model SUSMP update includes the following as required by the Permit:

- Inclusion of LID, source control, and treatment control BMPs that meet or exceed the minimum requirements of the Permit
- Establishment of siting, design, and maintenance criteria for each LID and treatment control BMP listed in the model SUSMP
- Addition of criteria to help determine conditions where implementation of each LID BMP included in the model SUSMP is applicable and feasible
- Addition of a requirement for priority projects with low traffic areas and appropriate soil conditions to use permeable surfaces
- Addition of any necessary restrictions for infiltration BMPs from priority projects that generate high levels of pollutants

The City adopted the new Model SUSMP during this reporting period. The SUSMP includes a review process to verify all proposed BMPs for priority projects meet the criteria designated in the updated local SUSMP.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's local SUSMP during the next reporting period. The HMP was developed by a consultant and regional workgroup during this reporting period and the draft HMP was submitted to the Regional Board for approval.

2.3.3.2 Development Project Approval Process

The following includes a summary of the City's current development review process.

Discretionary Projects

Projects requiring a discretionary review are subject to an in-depth review by City staff. During the first submittal or pre-meeting, it is determined if the project is a SUSMP priority project and if a water quality document will be required. The project is reviewed by engineering, planning, sanitation, building, and water quality staff; through all permit phases. After review at the City, the project is reviewed by the City's Planning Commission and conditions of approval are set

for the project and approved by the City Council. These conditions require the applicant to uphold all proposed water quality measures and any changes are subject to review and approval by City staff and potentially the Planning Commission and City Council depending on the significance of the changes.

The City of Lemon Grove requires applicants to complete their water quality documents at the time of discretionary review and approval. During this process, the applicants and their engineers are guided by City staff to provide adequate post-construction BMP facilities and to document those facilities on the site plans and documents being submitted. This process results in better designed, more comprehensive, post-construction BMPs since the facilities are included in the project design even in the earliest phases of the project. Each applicant who prepares a water quality report for a priority project is provided a self checklist to assist in their report preparation. This checklist provides the applicant with an outline and details pertaining to the requirements of the SUSMP and the Permit for BMP implementation and sizing.

All hydrology reports and treatment control BMP sizing are done during this phase and are upheld through the remainder of the grading and building phase through the conditions of approval. The same City staff that performs the discretionary review also performs the grading and building permit reviews. This also maintains consistency throughout the review process and ensures the conditions of approval are upheld. City staff provides constant feedback and assistance to the applicant and their engineers through out this process and all additional permit processes. The City continues to discourage the use of mechanical treatment systems. Natural systems are easier and more cost effective to maintain in the long term, as well as encouraging landscaping and additional green space with little if any additional irrigation. All proposed BMPs must meet the standards set forth in the City's SUSMP document, which upholds the requirements put forth in the Permit. If the submittal is inadequate in any regard, approval is withheld and re-submittal is required.

Ministerial Projects

Grading, improvement plans and building permits are all ministerial permits, which means they only require the approval of City staff, not the Planning Commission or the City Council. However, if the project is not completed to staff's approval, no permits are issued and no actual work can be done on the project site. These projects are reviewed by all the same departments and staff as the discretionary projects. Lemon Grove is a small city and has a small staff, which allows the full spectrum of departments to be intimately knowledgeable about the projects being reviewed and any concerns pertaining to the project. If it is discovered that a ministerial project meets priority project conditions as per the SUSMP, all the requirements discussed above are applicable. No permits are issued by City staff until the project satisfactorily meets all of City staff's requirements, particularly water quality requirements.

All ministerial projects, except water heater installations and electrical wiring, are reviewed by water quality staff. Even if the project does not meet priority project standards, water quality staff reviews the project for LID concepts, proper drainage design, proper erosion control, and smart irrigation.

Post-Construction BMP Maintenance Agreements

All priority projects under review for permits must execute a stormwater maintenance agreement guaranteeing the maintenance and/or replacement of permanent BMPs as necessary into perpetuity. The maintenance agreement is recorded against and runs with the property. This ensures that all future owners maintain the permanent BMPs to the original standards and any changes require the approval of City staff.

Capital Improvement Projects

The City's Capital Improvement Projects (CIP) are subject to the same post-construction BMP requirements as private development. Because many projects are redevelopment, linear or repair projects, often only construction BMPs are necessary. However, SUSMP qualifying projects must also install post-construction BMPs. Priority CIP projects are designed to incorporate the City's SUSMP requirements and LID, source control, and treatment control BMPs will be implemented. The city takes responsibility for long-term maintenance and regular inspection of any installed permanent BMPs. Section 4 of this document provides a description of the City's MS4 maintenance and inspection program.

2.3.3.3 SUSMP Project Approval

During the planning process, the City reviewed eleven SUSMP projects during this reporting period. A list of those projects can be found in Appendix H4. All applicable SUSMP BMP requirements specified in the City's local SUSMP were applied to each of these projects. Under no circumstances was any priority project permitted to implement treatment control BMPs with low pollutant removal efficiency ratings. In addition, all of the development projects approved in FY 2008-09 were less than fifty acres in size; therefore none of the projects were required to meet Interim Hydromodification Standards. All treatment control BMPs met the treatment control BMP sizing requirements outlined in the City's local SUSMP; therefore, the City did not initiate a waiver mitigation program and did not issue any waivers of infeasibility during FY 2009-10. Depending on the date in which the project was reviewed and approved, conditional SUSMP requirements may vary as a result of the migration to the new Permit requirements and the required adoption of the new local SUSMP.

2.3.3.4 SUSMP Project and Treatment Control BMP Tracking

Over the past fiscal year, water quality staff worked to implement a watershed-based SUSMP tracking system. In the future, this tracking system will be transitioned to a GIS based system. However, it is currently only a tracking database. Since the City is predominately in the Chollas Creek watershed with only a small portion in the Sweetwater watershed, it is not difficult to track projects by watershed. The database tracks the following information:

- Type of treatment control BMP
- Location of the BMP
- Watershed within which the BMP is located
- Date of construction of the BMP
- Responsible BMP maintenance party information
- Owner information if different from maintainer
- Receipt of annual maintenance verification
- Inspection findings
- Corrective actions if necessary

The City is continually working to refine the database as more permanent BMPs are implemented and tracked. The City currently has less than 10 tracked BMPs, although several more are still in the proposal and review stage as evidenced by the priority project list. Due to the small number of permanent BMPs in the City, staff inspects all of them regardless of JURMP priority level. They are inspected formally on an annual basis, but frequently informally inspected when staff is in the vicinity. If, in the future, the number becomes significantly larger, the City will begin to utilize the priority rating to determine inspection frequency.

2.3.3.5 BMP Installation Verification Process

The City has always verified the proper installation of all permanent BMPs and LID components, which are similar to the site design elements of the previous Permit. The City continues this practice under the new Permit. Each project requires closing signatures from staff once construction is completed. This involves an on-site staff visit to verify the project was constructed per the plans and appropriate documents including any water quality reports, hydrology reports, and soil findings. If corrections are needed, staff does not provide a signature and can withhold that signature for as long as it is needed to gain compliance. Without compliance, the site cannot be used for its final purpose. If compliance is not reached within a reasonable amount of time, Code Enforcement proceedings are begun. Each project under goes frequent staff inspections during the construction as detailed in Chapter 3 of this report to ensure that any underground elements are being built according to the approved plans and provide regular staff feedback and assistance. All in the hopes of a properly designed site at signature request time. The final signature process involves the same departments that reviewed the project from its initial stages,

typically this includes planning, engineering, sanitation, and building. This means that the staff providing the final implementation inspection is the same staff that reviewed and approved the project, meaning they are very knowledgeable of the project and its requirements. The City's interdepartmental cooperation is instrumental in making this process effective and efficient. Problems are viewed and solved jointly and comprehensively.

2.3.3.6 Annual Treatment Control BMP Operation and Maintenance Verification and Inspection

As required by the new Permit, all treatment control BMPs installed at development projects must be inspected annually and maintained in perpetuity by the responsible party. As part of the JURMP update, the City established a Treatment Control BMP tracking program. Because implementation of the City's JURMP did not begin until January 2008, this reporting period is the second year the tracking system has been used. Annual inspections took place by City staff during this reporting period of all permanent BMPs that have been in operation for at least one full year and rainy season. Again, due to the small size of the City and the currently small number of permanent BMPs, the City was able to inspect all of the BMPs meeting the one full year of operation criteria. As stated before, should that number increase drastically, the City will then begin to use the priority ratings established in the JURMP. A listing of the BMPs inspected during this reporting period can be found in Appendix H5. The City is currently working to implement the annual verification letter requirement. As this is a new and additional requirement for businesses, there have been some initial delays in receipt of these letters and receipt of incomplete information. However, the City is working with the businesses to obtain all the required information in a more timely manner. The City is working to integrate the letter process into its annual commercial and industrial inspection program to solve the previously mentioned difficulties. This information is tracked in the same database that tracks BMP location and inspection results. The City has mailed a notification letter to all those owners/operators that will be required to provide annual BMP verification letters to the City. These letters must be submitted prior to the start of each year's rainy season.

In the first year of implementation, the City anticipates a significant amount of information gathering and validation. Through initial contacts with responsible parties, the City will refine its inventories as well as methodologies to effectively assure proper maintenance and management of permanent BMPs.

2.3.3.7 Enforcement Measures for Development Sites

Since the City's Treatment Control BMP Operation and Maintenance Verification and Inspection Programs did not commence until FY 2007-08 and prior to that the City had a very small inventory of operational treatment BMPs, no enforcement action was required. Verifications and inspections will be completed

as required prior to the rainy season of each reporting period and any subsequent enforcement action will be tracked and reported in the next annual report.

The City will use a variety of escalating enforcement methods to implement storm water requirements for all development projects within the City's jurisdiction. This process is standard for any code violation does not threaten the public's health or immediate safety. Most issues are handled informally with a verbal warning and follow up inspection. These are not always tracked, as this is considered the informal part of the compliance process. The City believes it is important to provide the owner/operator a chance to correct a violation prior to beginning a retribution process. However, if a verbal warning is insufficient, formal proceedings begin with a written notification sent certified mail to verify receipt and detailing the time of the next inspection. The City is flexible on the compliance time frame depending on the severity of the work required for compliance. If a swale needs to be mowed, the City would allow seven days for compliance. However, if a private channel needs concrete work, the City is apt to allow 30 days for compliance as this requires significantly more labor, equipment and cost. Subsequent inspections verify compliance and if continued non-compliance is found; notices of violation, monetary fines, property liens, withheld permits, and small claims court are all viable follow-up actions based on length and severity of non-compliance. A detailed description of the Code Enforcement process is available in the City's JURMP document or through the City's Municipal Code which can be found on-line at www.ci.lemon-grove.ca.us.

2.3.3.8 Notable Activities

Several notable activities were conducted as part of the Development Planning Component during the last several reporting periods. Notable activities included:

- Comprehensive review and update of the City's JURMP
- Comprehensive review and update of the City's Municipal Code
- Comprehensive review, update, and adoption of the regional Model SUSMP
- Development and Implementation of the BMP Verification and Inspection tracking database
- Comprehensive review and revamp of the annual report based on Regional Board feedback
- Continued education of project developers
- Revision of checklists provided to developers to reflect new standards and language

The City will continue to develop and amend its water quality development processes to meet new requirements and demands based on water quality results and improvements in technology. Future annual reports will detail these changes as they take place.

Section 3.0 Construction Component

The purpose of the City's construction component is to maintain an updated inventory of all construction projects, identify pollutant sources from construction projects, educate the construction community, implement construction site BMPs, inspect construction sites, provide proper enforcement of violations, and implement all of the requirements of the Permit as outlined in Section D.2.

3.1 Source Characterization

3.1.1 Site Inventory

Within the defined reporting period of this report, the City has compiled, maintained, and updated a watershed based inventory of all construction sites within its jurisdiction. The construction inventory for FY 2010-11 included a total of eight operating construction sites, mostly private driveways and private sewer laterals. Only two of the projects were SUSMP priority projects and they are discussed below. The City formally inspected all of these sites on a monthly basis and informally almost weekly. All of the sites during this reporting period were within the City's main watershed, Chollas Creek.

The City completed 12 minor infrastructure improvement projects during FY 2010-11. All of the projects were minor street resurfacing or pavement rehavilitation. The City has been forced to drastically decrease its street resurfacing due to current budgetary constraints.

- Hardy Drive
- Siegle Court
- Blossom Hill Drive and Court
- Craig Court
- El Verde Court
- Olive Street
- San Altos Place
- Loma Drive
- Circle Drive
- Roosevelt Street
- Edgerton Street
- Lemon Grove Ave, N
- Mount Vernon Street

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

According to the above definition, the City had no high priority construction sites during this reporting period. However, the City had one construction site that it monitored very closely during this reporting period.

- The rehabilitation project at the City's Recreation Center, which was not a priority project and had a decrease in impervious surface area.

The City performed weekly inspections this location, during both the dry and wet seasons, to ensure the proper placement of BMPs and general site upkeep.

3.1.2 Ordinance Updates

As required by Section d.2.a of the Permit, applicable City documents and ordinances were updated in March 2008 to establish adequate legal authority to enforce applicable storm water requirements. As part of the comprehensive JURMP update completed in March 2008, the City also updated Municipal Code 8.48 Stormwater Management and Discharge Control and 18.08 Excavation and Grading. The following construction specific provisions have been made to these two sections:

- Best Management Practice requirements and general requirements applicable to all dischargers (8.48.060)
- Additional requirements for land disturbance activity (8.48.130)
- Minimum BMPs for land disturbance activity (18.08.140)
- BMP maintenance (18.08.180)
- Stormwater runoff (18.08.450)
- General Construction permit requirements (18.08.900)

3.2 Best Management Practice Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment I-5 gives a breakdown of the City's grading permit requirements.

3.2.1 BMP Requirements for Permitted Construction Sites

Through the JURMP update process completed in March 2008, the City reviewed and updated a set of minimum BMps that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to implement general site management BMPs and erosion control BMPs to reduce, retain, and manage pollutant discharges to the MEP. During FY 2009-10, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);

- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

3.2.2 Seasonal Site Management Requirements

Construction sites are required to implement minimum construction BMPs to prevent pollution discharges to the MEP regardless of the season. However, the City also maintains requirements for erosion and sediment control BMPs that are additional for the wet season (October 1st – April 30th). These requirements include:

- If necessary, upgraded perimeter protection for pending storms
- Erosion prevention BMPs must be installed, maintained, repaired, improved or replaced to the MEP and as is safe
- Amount of exposed soil shall not exceed seventeen acres, exceptions must be approved by the City Engineer
- Any incomplete disturbed area not being actively graded must be fully protected if left inactive for 10 or more days

Prior to the beginning of the wet season, the City sends a letter to the owners of all active construction sites explaining the wet weather BMP requirements and reminding them of the standard minimum requirements.

3.3 Program Implementation

The City ensures that BMPs are implemented to the standards described in Section 3.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

3.3.1 Construction and Grading Approval Process

The City has an established and thorough interdepartmental review and approval process for local construction and grading permits. When a construction project comes to the City for approval, it is required to obtain a building permit, a grading permit, or both. A grading permit is required prior to any activity where the total volume of material disturbed, stored, disposed, or used as fill exceeds 50 cubic yards. All other projects require a building permit. Both permits require that plans be submitted and approved by the City. The City's grading ordinance

requires that all projects, whether subject to a grading plan or not, are required to minimize site runoff, erosion, and sedimentation. In addition, all projects requiring a grading permit are required to prepare an erosion and sediment control plan. All permits that go through the City's review and approval process are tracked within a City wide data management system called HdL.

The grading permit outlines the regulatory (Federal, State, and City) conditions for new construction. The grading permit requires that grading plans be prepared, reviewed, approved, and signed by the City Engineer. As part of this approval process, the City's water quality staff also reviews the grading plans to ensure compliance with applicable construction specific regulations.

The grading plan approval process consists of a series of plan checks, revisions, and final approvals. Plans are checked by planning, engineering, water quality, and sanitation. Engineering staff reviews the plans for overall compliance with the grading ordinance. Planning checks to verify the plans are consistent with any previously approved discretionary plans and to verify landscaping, if applicable. Sanitation checks for the location of any sewer laterals and ensures that all tie-ins are legal and properly located. Water quality staff checks the plans for specific compliance with the stormwater section of the Municipal Code, the Permit, the local SUSMP, and any other applicable State or Federal regulations. If the site falls under the jurisdiction of the State's General Construction Permit, staff follows up with the developer to ensure that a SWPPP is properly prepared and submitted. In addition, the SWPPP is reviewed and approved as part of the normal approval process and must be complete before the grading permit is issued to the applicant. The City also requires proof that a Notice of Intent (NOI) has been submitted for sites that are subject to the General Construction Permit.

Prior to issuing building and grading permits, staff verifies that the proposed construction project plans to implement all applicable required BMPs to reduce pollutant discharges to the MEP.

3.3.2 BMP Implementation

Water quality staff spends a significant amount of time coordinating storm water management and BMP implementation at construction sites with the help of the Engineering Department and the City Inspector.

Staff constantly monitors weather patterns and storms in the Pacific through the National Weather Service. Weather reports and forecasts are emailed to all applicable inspectors to inform them of the possibility of incoming rain. This e-mail reminds them to verify BMP compliance at all active construction sites. If the forecast exceeds 40% over the coming five day period, letters are sent to site owners and inspectors check for any additional, applicable BMPs at each of the active sites and any inactive sites with exposed soil. The upkeep of these BMPs is monitored daily while the rain lasts.

Staff approved only no projects with SWPPPs during this reporting period:

Other project reviews completed by staff as part of the permitting process are addressed in more detail in Section 2.0, Development Planning.

Through the review and plan check process, staff may require additional or alternative BMPs to be implemented on individual projects. This allows the stormwater program to ensure that the proper sediment control, erosion control, and materials management BMPs are shown on the plans and are to be implemented on-site. Any changes to on-site construction BMPs require the approval of the City Inspector and are tracked as red line changes on the construction site drawings.

3.3.3 Construction Sites Requiring Advanced Treatment

There were no sites in FY 2010-11 that required advanced treatment. For the majority of the construction sites with the City's jurisdiction, the minimum required BMPs, if correctly installed and maintained, adequately control sediment discharges from the site. If it is determined that a project site possesses characteristics that could result in standard construction BMPs being ineffective in the treatment of sediment, resulting in an exceptional Threat to Water Quality (TTWQ), advanced treatment will be required. Standard criteria for determining projects that pose an exceptional TTWQ and a description of advanced treatment methods are included in the City's Municipal Code and in the new local Model SUSMP.

3.3.4 Inspections and BMP Verification

The City has an established inspection program to evaluate compliance with stormwater regulations at all construction sites within the City's jurisdiction. The City Inspector is responsible for inspections at all construction sites in the City. Stormwater issues, such as compliance with the grading and stormwater ordinances, are a main focus, especially during the rainy season. It is quite common for water quality staff to also assist in regular inspections and for building inspectors to notify City staff if a violation is observed or if compliance is questionable.

Due to the small number of active sites in the City during any given reporting period, the City inspects all active construction sites regardless of priority and extra attention is paid to any site with a higher threat to water quality during the rainy season. All sites are formally inspected monthly at a minimum and often receive informal inspections on an almost weekly basis.

The City Inspector tracks all inspection notes in a tracking database for future reference and enforcement actions if applicable. This database is updated after each inspection performed, so on a monthly basis at a minimum.

3.3.5 Compliance and Enforcement Actions

3.3.5.1 General Compliance

The City is responsible for enforcement of local ordinances and applicable local permits at all construction sites in its jurisdiction. Enforcement for construction projects is administered by the City Inspector and other applicable City staff, such as Code Enforcement.

The City typically employs a tiered, escalating enforcement system which includes verbal warnings and education, written warnings, and administrative citations. However, the City reserves the right to determine the most appropriate enforcement course for a given situation, as dictated by the specifics of each case. For example, a stricter initial enforcement measure may by applied where significant noncompliance is noted or when a potential rain event increases the potential for the violation to have a negative impact on water quality.

Verbal warnings and education will typically be the initial enforcement methods employed, assuming that a) the site or individual does not have a history of non-compliance with storm water regulations, and b) there has not been an observed illegal discharge to the MS4. The inspector will educate the violator on what actions need to be taken to prevent a violation from occurring or to correct the violation and document the violation and verbal warning in the inspection file. A time frame will be given for an identified violation to b corrected and a follow-up inspection date will be scheduled, which will also be documented.

A written warning is typically issued to violators that are already aware of the City's stormwater regulations or to those who have not corrected their actions after being given a verbal warning. Written warnings can be given using a variety of methods, including the issuance of a Notice of Violation (NOV) or Stop Work Notice. The NOV will provide a description of the violation to be corrected, the time frame for correction, and a follow-up inspection date. All Stop Work Notices issued by the City for construction sites are reported to the RWQCB per the reporting requirements of the Permit.

Civil penalties for violations of the Municipal Code are established in Section 1.24 of the Municipal Code. Determined violations of the stormwater regulations may be subject to administrative citations and associated administrative fines. Administrative citations and fines are used in addition to other legal remedies as described in the paragraphs above.

All inspection personnel have the authority to take immediate enforcement actions when necessary. This facilitates timely correction of inadequate BMP implementation, reducing the risk of pollutants discharging from the site. City inspectors conduct follow-up inspections to determine if corrective actions have been taken to comply with City ordinances and minimum BMP requirements. The time frame for a violator to correct a documented violation is determined on a case-by-case basis at the discretion of the inspector and the severity of the violation.

3.3.5.2 Reporting and Non-Compliance

During the FY 2010-11, approximately six known complaints were received through the City's hotline and other phone lines pertaining to construction sites. All calls were investigated the day of the call; the majority of the complaints were unwarranted and not related to stormwater. Any violations that were discovered were corrected within 24 working hours of verbal notification to the site manager. The site was inspected by the Regional Board during this reporting period and only minimal corrections were required and all were completed within 24 hours of notification.

Section 4.0 Municipal Component

The municipal component of the City's stormwater program includes proper management of facilities owned and operated by the City of Lemon Grove to eliminate or reduce the amount of pollutants that enter the storm drain system. The City maintains streets, sewers, the storm drain system, and municipally owned facilities which includes six public parks, a fire station, a municipal yard, four office type buildings, a senior center, a public parking lot, one recreation center with a gymnasium, and one vacant lot. The updated municipal facilities index and inspection results are in Attachment J. The City also conducts high threat to water quality activities, as defined in the Permit, such as street and sidewalk repair, painting, graffiti abatement, equipment maintenance, and minor vehicle maintenance. The City, however, also performs a number of activities that are beneficial to water quality, such as street sweeping, inspections of municipal facilities, educational efforts geared toward municipal personnel, annual MS4 inspection and cleaning, and regular upkeep of the sanitary sewer to prevent overflows and illegal connections.

4.1 Roads, Streets, Highways, and Parking Facilities

Roads, streets, highways, and parking facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control pollutants such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities.

4.1.1 Source Characterization

The City maintains 65.5 miles of roadway in Lemon Grove and one public parking lot. This number includes main arterials, curbed residential, and non-curbed residential streets. The City also maintains center islands and medians on these streets and in all parking lots including those attached to municipal buildings. The City does not maintain any highways.

4.1.2 Best Management Practice Requirements

Both pollution prevention methods and BMPs are implemented for roads, streets, highways, and parking facilities throughout the City. The City utilizes both the City's JURMP and the CASQA Municipal Handbook to choose applicable BMPs to implement for roads, streets, and parking facilities within the City. Street sweeping is the main BMP that is implemented for these sources. Treatment control BMPs are used for all road sections which are subject to SUSMP requirements, described in more detail in Section 2.0.

4.1.3 Program Implementation

This section describes the steps that were taken in FY 2010-11 to require and verify the implementation of designated BMPs for all City maintained roads, streets, and parking areas and related activites as outlined in the Permit Section D.3.a(5)(a-c).

The City currently implements an aggressive sweeping schedule for its roads, streets, and parking facilities. Long before Order 2007-01 was approved, the City was sweeping to its standards.

The frequency of street sweeping is as follows:

- Major arterial curbed streets – weekly
- All other curbed streets – biweekly
- Non-curbed streets – monthly
- Center islands and medians – monthly
- Major parking lots and alleys – weekly
- All other parking lots and alleys – monthly

During FY 2010-11, the City maintained its street sweeping mileage from the previous reporting period, approximately 80 miles and 175 tons of debris were collected. These figures include the regular sweeping of roads and parking lots, as well as specialty or requested road sweeps and the municipal yard. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

4.2 Fixed Facilities

The City owns and operates a variety of fixed facilities that have been grouped in this section because these facilities received formal inspections as part of the stormwater program. Therefore, the program implementation for these facilities is generally the same. Municipal fixed facilities include the following:

- Parks and Recreation Facilities
- Public Works Facilities
- Fire Stations
- Other Fixed Facilities

4.2.1 Source Characterization

The City inspects all municipal facilities on an annual basis. This includes the following list of facilities:

- All six public parks (Kunkel, Berry Street, Lemon Grove, City Center, Fireman's, and Monterey Heights)

- Fire Station
- Recreation Center
- The Community Center
- City Hall/Sheriff's Station
- Senior Center
- City Hall Annex
- Trolley Depot

The City's JURMP does rank each of these facilities based on their threat to water quality, however due to the City's small size it is possible to inspect each facility on an annual basis.

Parks and Recreation Facilities

The City operates six public parks:

- Berry Street Park – 7101 Mt. Vernon St., Chollas Creek watershed
- City Center Park – 7715 Church St., Chollas Creek watershed
- Fireman's Park – School Ln and Central Ave, Chollas Creek watershed
- Kunkel Park – 8171 lemon Grove Way, Sweetwater River watershed
- Monterey Heights Park – Canton and Glencoe, Chollas Creek watershed
- Lemon Grove Park – Washington and Alton, Chollas Creek watershed

All landscape maintenance activities are performed through the City's Grounds Division. In previous reporting periods, a portion of the parks were maintained through a private contractor. However, due to current budget constraints, those services were cut and taken over in-house. The Grounds division is trained and certified to handle pesticides, herbicides and fertilizers properly. They perform all landscaping and irrigation maintenance, as well as all trash and debris removal for all six parks.

Public Works Facility

The City owns and operates one public works yard. The only equipment maintained on site is the landscaping equipment used by the Ground's Division. This frequently includes mowers, the Gator (a small all terrain vehicle), chain saws, and other small devices. The City maintains a small fleet of large vehicles including several pick-up trucks, a dump truck, a paver, a video camera truck, and a vactor truck. All large vehicle service is performed off site under a private contract at a non-City facility. The public works yard does not contain a gas filling station and all materials are stored under covered areas, in doors, or surrounded by BMPs like straw wattle and gravel bags.

Fire Stations

Fire fighting is an essential element of municipal activities conducted in the City. The City has one fire station at 7853 Central Ave. The fire station is home to three engines and one ambulance response vehicle. All servicing on these vehicles is done off site under contract at a non-City owned facility. Very minimal equipment maintenance is performed on site. It includes the cleaning and maintaining of the hoses and chainsaws.

Other Fixed Facilities

Other fixed facilities include the City's office and administrative facilities.

- City Hall/Sheriff's Station – 3232 and 3240 Main St.
- City Hall Annex – 3225 Olive St.
- Community Center – 3146 School Lane
- Recreation Center – 3131 Main St.
- Senior Center – 8235 Mt. Vernon St.

Despite theses facilities being low threats to water quality, all are inspected annually. Inspection results are in Appendix C.

4.2.2 Best Management Practices

4.2.2.1 Updated BMPs

In FY 2007-08, the City established minimum BMPs for various municipal activities at all fixed municipal facilities. The BMPs are outlined in the City's 2008 JURMP and the City's Municipal Code. The City also references the CASQA Municipal Handbook when choosing appropriate BMPs for various fixed facility types. More detailed information about BMP implementation at specific facility types is included in the following sub-sections. The City implements additional BMPs as deemed necessary, and implements equivalent BMPs when it is determined that a specific BMP is not feasible at a particular site. In addition to implementing BMPs, the City utilizes pollution prevention measures to reduce or eliminate the amount of pollutants generated from City-owned fixed facilities.

Parks and Recreation Facilities

In FY 2010-11, the City implemented a variety of BMPs to reduce or eliminate the amount of pollutants entering the MS4 from municipal parks and recreation facilities and other open landscaped areas, such as medians and traffic islands. The City is maintaining general waste management BMPs and encouraging facility users to recycle, properly dispose of trash, and pick up dog waste by providing conveniently located receptacles at parks and in common dog walk areas. Doggie bag dispensers are available at the 3 largest, most frequently

used parks (Berry Street, Lemon Grove, and Kunkel) and at City Center Park. These are frequently vandalized, but the City works hard to keep them full and operational. They are checked weekly and maintained as needed.

Due to their widespread outdoor use, pesticides, herbicides, and fertilizers can be common pollutants discharged to MS4s. Transport of these pollutants is often a result of the following: a) runoff from improper irrigation after application, b) application of chemicals during or prior to storm events, c) use of chemicals that do not properly absorb into soil or plants, and d) overspray from chemical applications that may eventually enter the MS4. The City maintains the following procedures and BMPs pertaining to integrated pest management:

- Educating and training staff and contractors on all BMPs
- Requiring any contracted party to adhere to all City codes and procedures pertaining to proper use of pesticides, herbicides and fertilizers
- Implementing a process for identifying pests and/or problems by site
- Selecting less toxic treatments
- Proper training and licensing of all personnel who handle pesticides, herbicides, and fertilizers
- Use integrated pest management techniques whenever possible
- Record keeping for application dates, times, locations, and quantities.
- Pesticides, herbicides and fertilizers are applied per manufacturers directions and only as needed.
- Compost, mulch, and soil amendments are used whenever possible.
- All federal, state and local regulations are followed
- Pesticides, herbicides and fertilizers are not applied prior to a predicted rain event
- Native and drought tolerant plants are used whenever possible
- Small weeding is done by hand
- Diseased or infected plants are removed completely, if proper treatment is ineffective
- Irrigation systems are remotely controlled and weather and flow sensitive to prevent over watering due to rain or a broken line

Public Works Facility

Public works staff implements appropriate BMPs for all activities that take place at the Public Works yard. This facility uses good housekeeping BMPs most frequently, including but not limited to spill kits, sweeping, dry clean up methods for any oil spills, and proper cleaning of painting equipment. Minimal small equipment maintenance is performed on site, limiting potential pollutants from vehicle maintenance and repair. All of the large vehicles are maintained off site. The site has a SWPPP which includes a site description, a description of potential sources of pollutants, a summary of existing BMPs, a description of BMPs to be implemented, and a monitoring and record keeping plan. The

SWPPPs is kept at the facility and the facility is inspected annually by water quality staff and monthly on an informal basis. All Public Works employees receive monthly informal training as detailed in Section 8 of this report.

Fire Stations

The City implements pollution prevention measures and BMPs to reduce or eliminate the amount of pollutants generated by fire fighting activities in the City. The City's fire station uses source control BMPs to minimize and control discharges related to washing activities. All fire fighting training activities which include aqueous film forming foam are conducted at a fire station outside of the City. All the engines and emergency vehicles are maintained off site. Only small equipment such as chainsaws are cleaned and maintained on site, always using best housekeeping practices to prevent pollutant generation. The Fire Marshal receives regular water quality updates at a weekly joint meeting with water quality, planning and engineering. Water quality staff has worked jointly with the fire department on several occasions when dealing weed abatement, commercial inspections, or illegal dumps. These occasions have provided excellent informal opportunities for education, which have been passed on to other fire personnel. It is common for fire personnel to call water quality personnel from the field with potential water quality concerns. They are an invaluable set of eyes in the community on a daily basis for potential water quality concerns.

Other Fixed Facilities

The City implements pollution prevention methods and BMPs to reduce or eliminate the amount of pollutants generated by the management of public buildings, other fixed facilities, and surrounding areas. The City implements BMPs to control erosion and sediment, during landscaping maintenance, and for waste management as per the Municipal Code and the CASQA Municipal Handbook.

The City employs a number of pollution prevention practices at City Hall. These practices have been expanded in recent years to include:

- The use of recycled paper for all copiers and printers
- Programmable thermostats to control heating and cooling systems
- Implementing a furlough work schedule, so main City buildings are closed very Friday
- Installing timers on exterior lighting
- Supplying each employee with a personal recycling container
- Providing large recycling containers near all dumpsters and access doors
- Lids on all dumpsters
- A battery collection site accessible by employees only
- Allowing City employees to participate in all local e-waste events

4.2.2.2 Additional Controls for Municipal Areas and Activities

If the City identifies any potential sources of other pollutants of concern for which water bodies in the City are 303(d) listed that could be a result of activities at fixed municipal facilities, additional controls will be required to be implemented where applicable. The City will implement additional controls for municipal areas and activities adjacent to or tributary to ESAs when determined to be necessary. Presently, there are no municipal fixed facilities that have been determined to need additional BMPs due to 303(d) listings. The City's primary watershed, Chollas Creek, is 303(d) listed for several pollutants, including heavy metals and Diazinon. The City's current BMPs are preventing these pollutants and many others to the MEP. Any changes would be detailed in the applicable future annual report.

4.2.3 Program Implementation

The City implements the municipal program using a variety of different processes, including maintenance, training and education, inspections, and enforcement actions if necessary. Program implementation also includes the continuous assessment of municipal programs to ensure that they are designed and executed in a manner that is most effective to reducing, and potentially eliminating, the threat of pollution from fixed municipal facilities.

4.2.3.1 Maintenance

In FY 2010-11, the City continued to conduct regular maintenance activities at fixed facilities, which included landscape maintenance, building maintenance, parking lot,and sidewalk repair, when necessary. Sweeping of the parking facilities associated with the municipal facility is conducted at these facilities during regular street sweeping hours.

City personnel are trained and required to implement the proper BMPs when at municipal facilities and when engaging in specific activities at those facilities. City personnel are also trained to dispose of any waste properly and to report illegal discharges/illicit connections, as they may come across them during normal work activities.

4.2.3.2 Training and Education

Municipal personnel are trained on implementing appropriate BMPs and preventing non-storm water discharges. In FY 2008-09, water quality staff provided regular training and updates to the following municipal departments: Public Works, Engineering, Planning, and Fire. A detailed description of the municipal education program can be found in Section 8 of this report.

4.2.3.3 Municipal Inspections

Water quality staff performs annual inspections at all of the City facilities. As part of the FY 2010-11 program, staff conducted 14 inspections, one at each facility. The results of these inspections can be found in Appendix J. Any required corrective actions have been taken. No enforcement actions were required at any of the municipal facilities during this reporting period.

4.3 MS4

The primary function of municipal separate storm sewer systems are to collect and transport surface runoff to receiving waters during storms in order to prevent flooding. The entire MS4 system is considered a high priority due to its tendency to collect and convey pollutants to receiving waters. The City's MS4 consists of streets, curbs, gutters, catch basins, inlets, pipes, natural channels, natural and piped creeks, and culverts. The City also maintains a number of treatment control BMPs such as filter inserts and curb inlet protection, which are included in the regular maintenance of the MS4. In order to reduce the transportation of pollutants into receiving water bodies, the City regularly maintains its MS4 to ensure that it remains both fully functional and free of pollutants to the MEP.

4.3.1 Source Characterization

The City maintains a variety of MS4 facilities which includes 190 catch basins and inlets, approximately 75 miles of piping, and approximately 2.5 miles of open channel. The City plans to put all of these facilities in GIS during future reporting periods. However, due to budget constraints, these plans are currently on hold.

4.3.2 Best Management Practice Requirements

4.3.2.1 Updated BMP Requirements

In FY 2007-08, the City prepared a JURMP update which directs staff to utilize the CASQA Municipal Handbook in addition to the Municipal code to choose applicable BMPs for municipal areas and activities, including MS4 maintenance. All of these BMPs are designed to prevent waste and pollutants from entering the MS4 system as well as ensuring that waste which is collected during maintenance for the City's MS4 does not re-enter the system.

The 2007 Permit requires that retrofitting flood management facilities be evaluated to determine the feasibility of providing additional pollutant removal from urban runoff and should only be conducted where determined to be effective. The City does not own or operate any flood management projects or flood control devices that may be retrofitted.

4.3.2.2 Additional Controls For Municipal Areas/Activities

The City will implement additional controls for MS4 facilities adjacent to or tributary to ESAs when determined necessary.

4.3.3 Program Implementation

The City's MS4 management program includes responding to complaints, detecting and ceasing IC/IDs; inspecting and maintaining MS4s by cleaning, removing sediment, debris, and excessive vegetation, by repairing and/or replacing damaged or failing MS4 structures; and by providing signage on storm drain inlets. The City trains and requires field staff to implement BMPs, inspect equipment and follow an action plan for regular maintenance, emergency maintenance, and/or discharge control. The City utilizes a vactor truck during MS4 maintenance to collect both dry and liquid debris from catch basins and inlets. Applicable BMPs are used during routine and emergency maintenance.

All maintenance activities during this reporting period were in compliance with the current Permit. All maintenance BMPs were updated in FY 2007-08 to correspond with any new Permit requirements.

4.3.3.1 Maintenance

A summary of the City's MS4 operation and maintenance activities that occurred throughout the fiscal year is included below:

- Within this reporting period, the City inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. The same numbers as the previous reporting cycle. Only seven conveyances and 68 catch basins were found to be in need of cleaning and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,860 pounds of trash and debris from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those seven conveyances, providing approximately another 1,500 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.
- The City continues to install Trident Curb screens and has added Streamhawks to several curb inlets as well. Both of these devices prevent trash, debris, and sediment from entering the MS4 by keeping the debris in the curb line and easily accessible to the street sweepers. The City attributes the decreases in trash quantities found in and around conveyances to these devices and the more efficient use of the street sweepers.

4.4 Sanitary Sewer System

Spills and/or leaks caused by a malfunction or failure of a component of the City's sanitary sewer system have the potential to introduce a significant volume of untreated sewage into receiving water bodies. Untreated sewage can contain high concentrations of bacteria, viruses, and parasites, all of which have the potential to negatively impact the environment and pose a significant threat to human health. Untreated sewage also has the potential to contain a variety of hazardous chemicals, which also pose threats to environmental and human health. The City conducts routine inspections and maintenance of the sanitary sewer system to ensure that the system is functioning properly. Routine inspections and maintenance of the sanitary sewer system reduces the potential for an overflow and helps prevent and eliminate infiltration of seepage to the MS4. The City also responds to sanitary sewer overflows to reduce or eliminate the amount of untreated sewage that reaches nearby portals to the MS4 and aids in cleaning up and disposing of overflow residue.

4.4.1 Source Characterization

The City maintains 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space and San Diego uses 986.20 EDU.

4.4.2 Best Management Practice Requirements

4.4.2.1 Updated BMP Requirements

The City has created and maintains basic BMPs in the JURMP and the Municipal Code. The City also utilizes the CASQA Municipal Handbook as a reference guide for BMP implementation, including the maintenance of the sanitary sewer system.

Similar to the MS4 maintenance program, the City trains field staff on implementing BMPs, equipment inspection, and the action plan that is followed for regular maintenance and emergency maintenance and/or discharge control. Structural BMPs are used during routine and emergency maintenance, where applicable.

4.4.2.1 Additional Controls for Municipal Areas and Activites

The City implements additional controls for sanitary sewer facilities adjacent to or tributary to ESAs, if applicable and when determined to be necessary. The City has a regular sanitary sewer maintenance program the minimizes sanitary sewer overflows (SSO) and is described briefly below and in more detail in the City's Sanitary Sewer Management Plan (SSMP) in accordance with Order 2006-03.

4.4.3 Program Implementation

The City's sanitary sewer management program includes responding to overflows and spills as necessary, identifying spills and leaks, containing and controlling spilled materials, repairing damaged and leaking sewer lines, remediation of existing lines as necessary, and proper disposal of hazardous waste.

4.4.3.1 Maintenance

The City maintains a routine maintenance schedule for the sanitary sewer system. In FY 2009-10, the City cleaned and maintained the following portions of the sewer system. Hotspots are inspected three times annually and easements are inspected twice annually.

Table 4.1
Sanitary Sewer Services in Feet

	Total FY 2006-07	Total FY 2007-08	Total FY 2008-09	Total FY 2009-10	Total FY 2010-11
Cleaned	**331,369**	**52,493**	**646,943**	**359,174**	**365,174**
Root Cut	**20,927**	**36,039**	**596,943**	**329,174**	**331,174**

Within those numbers is the following information:

- 26,919 feet of hotspot line was cleaned and root cut
- 124,265 feet of easement line was cleaned and root cut
- 207,990 feet of right of way line was cleaned and root cut

All SSO information was reported electronically to the Regional Board through the SSMP program. However, the City had no mainline overflows during this reporting period. The appropriate City staff are trained in detecting, reporting, and responding to all SSOs.

4.5 Mobile Municipal Activities

The City conducts a number of activities, which are not confined to any specific locations. Due to the nature of these mobile activities, temporary structural and source control BMPs are implemented as necessary.

4.5.1 Source Characterization

The City conducts a number of activities that are not designated to a specific location. Such activities include, but are not limited to, the following:

- Power washing for graffiti removal
- Street and sidewalk repair and maintenance (striping, repainting, and pothole repair)
- Landscape maintenance

4.5.2 Best Management Practice Requirements

4.5.2.1 Updated BMP requirements

The City implements good housekeeping and general pollution prevention measures during municipal maintenance activities, including the mobile activities described above. During the City's JURMP update, minimum BMPs were established for all municipal activities. The City also references the CASQA handbook and the Municipal Code to ensure the use of all applicable BMPs for any given activity.

4.5.2.2 Additional Controls for Municipal Areas and Activities

The City implements additional controls for municipal mobile activities adjacent to or tributary to ESAs when determined necessary. Presently, City related mobile activities have not been determined a high threat to water quality. Public Works and Grounds division staff are vigilant about the use of proper BMPs when doing any mobile activity. Pollutant generation is limited to the MEP through temporary BMPs such as gravel bags and straw wattles or good housekeeping practices such as dry spill cleaning, wet vacuums, and sweeping. During this reporting period, the current BMPs were evaluated and determined to be sufficient and to the MEP.

4.5.3 Program Implementation

In FY 2010-11, City staff were sufficiently educated in the proper BMPs to utilized during mobile activities. These BMPs include proper containment, control, and capture of any discharge generated by a mobile activity and possibly carrying pollutants.

4.6 Special Events

The City hosts a very limited number of special events each year and even fewer under the current economic climate. The current line-up consists of the Winter Bonfire, the Fire Station Open House, and Concerts in the Park. Special events have the potential to generate significant trash and litter caused by the patrons

and activities of the special event. The City utilizes many of the controls listed in Permit Section D.3(2)(f). These BMPs are described in more detail below and are implemented during and/or after special events, when and where applicable.

4.6.1 Source Characterization

The City hosts a few special events each year that have the potential to produce trash and debris pollutants.

4.6.2 Best Management Practice Requirements

4.6.2.1 Updated BMP Requirements

In FY 2010-11, the City implemented many of the controls specific to special events listed in Section D.3(2)(f) of the Permit. The City has chosen the following BMPs as most effective and efficient for City needs.

Anyone outside of the City seeking a Special Events Permit, must ensure the following BMPs are maintained:

- Proper management of trash and litter, including temporary trash receptacles
- Post clean up activities, such as catch basin cleaning and general litter pick-up, when necessary
- Post event street sweeping, when necessary
- Other BMPs when considered necessary by City staff

The City will consider implementing additional BMPs depending on the site location, site conditions, and/or type of special event.

4.6.2.2 Additional Controls for Municipal Areas and Activities

The City will implement additional controls for municipal special events adjacent to or tributary to ESAs when determined to be necessary.

4.6.2.3 Program Implementation

In FY 2010-11, there were the following City sponsored special events:

- Movie Night in the Park
- 6 Concerts in the Park
- Winter Bonfire
- Fire Station Open House

At a minimum, these events were required to provide extra trash and recycling containers, proper disposal of grease if food preparation was involved, and proper secondary containment for port-a-potties.

During the events, City staff was on hand to ensure that the event remained free of illegal discharges and/or illicit connections to the MS4. City staff were available for the duration of the event and afterwards for immediate trash removal and to notify the appropriate staff if a problem was observed.

Section 5.0 Industrial – Commercial Component

Activities associated with industrial and commercial businesses can contribute pollutants to the City's MS4. The City has implemented a program that aims to reduce and prevent industrial and commercial pollution discharges from the MS4 to the MEP, to protect local receiving water bodies, and to comply with the Permit.

Commercial facilities within the City include a wide range of oriented businesses from restaurants to nurseries. There is one main commercial area within the City, along Broadway and down Lemon Grove Ave. This area contains many different commercial businesses ranging from restaurants to automotive outlets. The City's industrial area runs along Federal Blvd adjacent to SR 94.

Throughout FY 2010-11, City staff has worked diligently to fulfill the requirements of Order 2007-01. The City worked to ensure our current inspection program met the requirements of the current Permit and made any adjustments necessary. Due to the City's small size, staff is able to inspect a larger than needed majority of its commercial facilities and all of its industrial facilities. The City also continues to participate in the development of a regional mobile business program. The following section will demonstrate the City's successful implementation of the requirements of the Permit (Section D.3.b) during FY 2009-10.

5.1 Industrial-Commercial Sites/Sources Element

Each stationary industrial and commercial facility has the potential to discharge pollutants into the MS4 and consequently degrade local water quality. Often, the most cost effective and simple solution to reducing pollution is to implement pollution prevention techniques at the source. The City emphasizes the use of pollution prevention methods as a primary mechanism for reducing commercial discharges of pollutants into the City's MS4. Further, the City requires minimum site and activity specific BMPs to be implemented, and inspections and enforcement procedures will be conducted where necessary, to comply with the Permit.

For the rest of Section 5.1, "commercial facilities" will be used to refer to stationary commercial facilities that are not mobile. The mobile commercial sites/sources component is described in Section 5.2.

5.1.1 Source Characterization

A watershed-based inventory of the industrial and commercial sites/sources within the City was compiled as part of the 2008 JURMP update. As required by the Permit, the inventory includes the following information for each site/source: facility name, address, possible pollutants, if the site drains to a 303(d) listed

waterbody, and a brief description including SIC codes which best reflect the principal products or services provide by each facility. This list can be found in the 2008 JURMP. Because mobile commercial businesses do not have a fixed address at which they operated, they are tracked within a separate, non-spatial database.

The commercial inventory is continually updated as facilities go out of business and new facilities open. This process is performed primarily through the business license data base. Staff also collaborates with the Fire Marshal to verify existing and new facilities and to combine inspections. In addition, the City identifies businesses that are not on the facility inventory when complaints are filed about businesses that are not registered or licensed with the City. When this occurs, these facilities are added to the inventory and the proper City staff are notified to ensure the business is brought into compliance with City licensing requirements. During annual facility inspections, City staff has the opportunity to identify new or closed businesses and update the inventory with these findings.

In FY 2010-11, the City continued its focus on high priority commercial businesses by inspecting all restaurants, manufacturers, and automotive repair facilities with in the City. This totaled 34 facilities for this reporting period, the list of which is located in Attachment K 2. Table 5-1 contains a summary of the commercial facilities found in the City. The summary includes home businesses like carpet cleaners and household cleaning services, which the City finds to be difficult to inspect due to their transitory nature and small size (typically one person operations). The City deals with these operations more from a residential perspective than a commercial perspective and requires the standard minimum residential BMPs of these services. The City also inspects parking lots in conjunction with their respective buildings and does count them separately in the site total.

Table 5-1 - Summary of High Priority Commercial Sources

Commercial Activity	Number of Facilities in Lemon Grove
Automobile Dealers/Rentals	18
Automobile Supply Stores	9
Automobile Repair/Paint	9
Automobile System and Tire Repair	56
Automobile Cleaning/Washing	3
Gas Stations	7
Eating/Drinking Establishments	60
Landscaping, includes lawn care	9
Nurseries and Greenhouses	1
Pest Control	3
Equipment Repair/Maintenance/Cleaning	3
Metalwork	6
Masonry	4
Parking Lots and Storage	3
Carpet/Building Cleaning	21

Pool and Fountain Cleaning	3
Total	**215**

The City has 19 industrial facilities, most of which are high priority due to their proximately to Chollas Creek, a 303(d) listed waterbody. The City inspects all of these facilities on an annual basis. This number includes the three facilities which fall under the Statewide Industrial Permit as well. Table 5-2 contains a summary of these facilities.

Table 5-2 - Summary of High Priority Industrial Sources

Industrial Activity	Number of Facilities in Lemon Grove	Revised High Priority Category Facilities
Waste Disposal and Recycling	1	
Equipment/Transportation	3	2
Metalwork	2	3
Building Supplies and Woodworking	3	2
Industrial Paper		1
Contractor, Special Trade		1
Specialty Hardware, Drapery		1
Total	**9**	**10**
	Total Facilities	**19**

As part of the 2008 JURMP update and development of the interim SUSMP, the City collaborated with Copermittees to identify the pollutant loading potentials of industrial and commercial sources. Table 5-3 in Attachment K2 lists the pollutants that may be generated by each category of business. The pollutants that many be generated by each individual business can be determined by matching the category of business noted for each of the businesses in the commercial inventory in the JURMP.

All industrial and commercial facilities that meet at least one of the following criteria are included in the inventory:

Industrial Facilities

- Industrial Facilities, as defined at 40 CFR S. 122.26 (b)(14)
- Facilities subject to the statewide General Industrial Permit or other individual NPDES permit
- Operating and closed landfills
- Facilities subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)
- Hazardous waste treatment, disposal, storage, and recovery facilities

Commercial Facilities

- Automobile repair, maintenance, fueling, or cleaning
- Airplane repair, maintenance, fueling, or cleaning
- Boat repair, maintenance, fueling, or cleaning
- Equipment repair, maintenance, fueling, or cleaning
- Automobile and other vehicle body repair or painting
- Mobile automobile or other vehicle washing*
- Automobile (or other vehicle) parking lots and storage facilities
- Retail or wholesale fueling
- Pest control services
- Eating and drinking establishments, including food markets
- Mobile carpet, drape, or furniture cleaning*
- Cement mixing and cutting*
- Masonry*
- Painting and Coating*
- Botanical or zoological gardens and exhibits
- Landscaping*
- Nurseries and green houses
- Golf courses, parks, and other recreational areas/facilities
- Cemetaries
- Pool and fountain cleaning*
- Marinas
- Portable sanitary services
- Building material retailers and storage
- Animal facilities
- Power washing services*

*All mobile commercial businesses are discussed in Section 5.2.

Both Industrial and Commercial Facilities

- All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired waterbody segment, where the site/source generates pollutants for which the waterbody is impaired
- All other commercial or industrial sites/sources within or directly adjacent to (i.e. within 200 feet of) or discharging directly to coastal lagoons or other receiving waters within an Environmentally Sensitive Area (ESA)
- All other commercial or industrial sites/sources that the City determines may contribute a significant pollutant load to the MS4.

5.1.2 Best Management Practice Requirements

5.1.2.1 Updated BMP Requirements

During the 2008 JURMP update, the City established a set of minimum BMPs for all industrial and commercial sties and incorporated these into the City's Municipal Code Sections 8.48.080 and 8.48.090. The list of minimum BMPs includes both structural and non-structural BMPs and is itemized specific to pollutant-generating activity. The City's set of minimum BMPs for industrial and commercial sites/sources also includes pollution prevention methods, where appropriate. A complete list of the City's minimum BMPs for industrial and commercial facilities can be found in the City's JURMP and Municipal Code. The Municipal Code can be accessed through the City's website: www.ci.lemon-grove.ca.us.

Industrial Facility Specific BMPs

Industries subject to the General Industrial Permit are required to prepare a SWPPP and implement the BMPs prescribed therein. At a minimum, the SWPPP should include sections which describe the significant materials present on site, areas and activities that are potential sources of pollutants, and BMPs to address the identified pollutants' sources onsite. In addition, because of the small scale of the City's industrial program, the City is able to require site-specific BMPs at its industrial sites. These BMPs are based on a review of the site's SWPPP and site inspections, where needed.

5.1.2.2 Additional Controls

The City requires the implementation of additional controls for industrial and commercial sties and sources that are 1) tributary to CWA Section 303(d) impaired water body segments or 2) directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

The City prescribed additional controls during inspections of commercial and industrial facilities, as needed, depending on the proximity of the facility to the waterbody and the observed potential of the site to be a significant source of pollutants that may threaten the downstream waterbody as necessary and appropriate.

5.1.3 Program Implementation

This section describes the steps employed by the City to require and verify the implementation of designated BMPs for stationary industrial and commercial sources. During FY 2010-11, the City updated its program as needed, provided education and outreach through inspection actions, inspected inventoried businesses to evaluate compliance with established minimum BMP requirements

and the local stormwater ordinance, and took enforcement action as necessary to bring violators into compliance.

5.1.3.1 Inventory Prioritization

Since the new Permit no longer requires industrial and commercial facilities to be prioritized as high, medium, or low; the City prioritized industrial and commercial businesses as either high priority or non-priority.

When evaluating threat to water quality, the City considered the following attributes of each industrial and commercial business to determine priority or non-priority status:

- Type of activity (SIC code)
- Materials used at the facility
- Wastes generated
- Pollutant discharge potential
- Non-stormwater discharges
- Size of facility
- Proximity to receiving water bodies
- Sensitivity of receiving water bodies
- If the facility is subject to the General Industrial Permit or an individual NPDES permit
- Filing of a No Exposure Certification/Notice of Non-Applicability
- Facility design
- Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff
- Compliance history
- Any other relevant factors

Although not specifically required by the Permit, the City will continue to classify industrial facilities that have obtained coverage under the General Industrial Permit as high priority. The City uses the following additional spatial attributes to prioritize industrial and commercial facilities:

- Proximity to a 303(d) listed waterbody
- Pollutant potential of the facility type
- Stormwater violation history

If a facility was identified as having a potential threat based on two or more of these criteria, the facility was determined to be a high priority commercial facility. In addition, if during the City's commercial inspection process or based on institutional knowledge, it is determined that additional sites that would otherwise have a lower priority should be classified as high priority industrial or commercial facilities based on the Permit criteria, they were noted as such in the inventory and inspected as required.

The City's commercial inventory was updated and prioritized during the 2008 JURMP update and will be prioritized at least once per year prior to conducting annual inspections.

5.1.3.2 Inspection Frequency

FY 2010-11 commercial facility inspection priorities were established in consideration of inspection frequencies and prioritization standards outlined in the Permit. As part of the JURMP update, a new process to determine high priority facilities was formulized and put into effect during the previous reporting period. To determine which industrial and commercial sites were inspected in FY 2009-10, the following steps were taken:

- Confirm that the current industrial and commercial inventories are up-to-date.
- Prioritize each facility based on the prioritization process described in Section 5.1.3.1 of this document
- Review the list of facilities that were inspected the previous year
- Determine the facilities that will be inspected in the current year based on each site's prioritization and inspection history and other relevant factors, such as TMDLs and 303(d) listings.

In compliance with Permit standards, the inspected over 50 percent of all stationary industrial and commercial facilities inventoried as high threat to water quality and over 20 percent of all stationary inventoried sites. Mobile businesses are not included when determining the inspection requirements based on percentages of the inventory. The City tracked completed inspections throughout the reporting period to ensure that the minimum inspection frequencies required by the Permit were met.

During the 2008 JURMP update, the City identified the businesses that would be inspected as part of the 2009-10 reporting period. The City's facility summaries can be found in Tables 5-1 and 5-2 of this section. The list of high treat to water quality stationary commercial facilities can be found in Attachment K2. The City inspected all of these facilities and all of the industrial facilities in Table 5-2 during FY 2010-11.

5.1.3.3 Routine Facility Inspections

The City routinely inspects its commercial and industrial facilities. Inspections are intended to:

- Provide facilities with information regarding the City's stormwater program
- Provide guidance in complying with stormwater regulations
- Validate and manage the inventory

During FY 2010-11, the City conducted 19 industrial and 34 commercial inspections for compliance with ordinances, permits, and policies. All inspections included, as applicable:

- Review of BMP implementation plans, if the site uses or is required to use such a plan
- Review of facility monitoring data, if the site monitors its runoff
- Check for coverage under the General Industrial Permit (NOI or WDID), if applicable
- Assessment of compliance with Copermittee ordinances and permits related to urban runoff
- Assessment of BMP implementation, maintenance, and effectiveness
- Visual observations for non-stormwater discharges, potential illicit connections, and potential discharge of pollutants to stormwater runoff
- Education and training on stormwater pollution prevention, as conditions warrant

Based on the results of each site evaluation, City staff completed an inspection form, which can be found in Attachment K1.

Staff generally works with site contacts to provide examples of BMP solutions that could be implemented. Effective, low-cost solutions were sought whenever possible, although in some cases more expensive BMPs were needed to reduce pollutant discharges to the MEP. Each business was also evaluated for staff training procedures and the stormwater quality awareness of the contact person; educational information was provided as appropriate. Whenever possible, the findings of the inspection and related corrective actions were discussed with the responsible party while the inspector is at the site. The responsible party is always provided a copy of the inspection findings after the inspection. For any sites found not in compliance, corrective actions are written on the inspection form along with any follow-up actions or inspections, as needed.

Inspection Tracking

Complaint and inspection documentation is filed in a tracking database and is kept up to date on a regular basis.

Third Party Inspections

All commercial inspections conducted in FY 2010-11 were completed by City staff. The City has one full-time Code Enforcement officer with a stormwater focus, who is dedicated to conducting routine commercial, industrial, and residential inspections and follow up for routine inspections as well as complaint calls. A third party was not employed to conduct inspections during this fiscal year. Therefore, verification of third party inspection effectiveness was not necessary.

City staff responsible for conducting stormwater compliance inspections and enforcement of industrial and commercial facilities are training regularly on inspection and enforcement procedures, BMP implementation, and assessment of monitoring data. Water quality staff actively collaborates with inspection staff throughout the region to share methodologies and approaches that may be beneficial region wide.

Inspection Follow-up and Enforcement

Staff conducted follow-up inspections at all facilities that were directed to implement corrective actions. Follow-up investigations are conducted to ensure that the required BMPs were implemented and confirm full compliance of the facility. The City only had one non-compliant industrial facility. The facility was storing materials uncovered, outside. The corrective actions were given to the facility contact and all corrections were made by the follow up inspection. Twelve restaurants were found in non-compliance on the initial inspections, all corrective actions were minor and completed by the follow-up inspections. The restaurants continue to display confusion over the water quality inspections versus health code inspections and fire code inspections. For this reason, staff has worked diligently to provide on site education and to coordinate inspections with the City's Fire Marshal. It is not possible to coordinate inspections with the health inspectors as that is a County program with its own staff and own time lines for inspection requirements.

5.1.3.4 Notification

The City will notify each inventoried industrial and commercial business of the City's updated BMP requirements that are applicable to the site/source. During FY 2010-11, the City provided a formal letter notifying the facilities of any changes and that a new Permit had been issued. During FY 2010-11, the City did not feel a second formal notification was required and dealt with education during the actual inspection.

5.1.3.5 Complaint investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the City's hotline, e-mail, other phone line, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or clean up activities by the City or responsible party.

As required by the Permit and depending on the severity of the violation, the City enforces its stormwater ordinances for all commercial and industrial facilities as

necessary to maintain compliance with the Permit. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for staff to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the City's Code Enforcement database.

During FY 2010-11, the City had four commercial related complaints and no industrial related complaints. The two commercial complaints were the hosing of parking lots. The behavior was stopped immediately upon investigation and both dischargers were educated on the proper dry methods for cleaning impervious surfaces.

Reporting of Non-Filers

The City did not identify any industrial sites that may require coverage under the General Industrial Permit, but which, to the City's knowledge did not file NOIs.

5.2 Mobile Sources

Illegal discharges tend to be the major area of concern with mobile businesses. Mobile businesses can be difficult to inventory because they may not be based in the City and do not typically have a permanent address. Additionally, new mobile businesses are started, and previously existing mobile businesses go out of business on a regular basis. For the reasons listed, and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

5.2.1 Source Characterization of Mobile Sources

The mobile businesses known to operate within the City's jurisdiction are listed on an inventory found in Attachment K2. This inventory was prepared as part of the 2008 JURMP update. The following business types are addressed by the mobile sources element of the City's industrial and commercial program:

- Mobile automobile and other vehicle washing
- Mobile carpet, drape, or furniture cleaning
- Mobile construction trades such as: cement mixing or cutting, masonry, painting and coating
- Landscaping
- Pool and fountain cleaning
- Power washing services

In addition to the types of businesses listed above, any other mobile businesses that the City determines to have a significant threat to water quality will be added

to the inventory. Because not all mobile businesses have obtained business licenses in the City or have a base of operations outside the City, staff is continually refining and updating the mobile inventory. In addition, the City is participating in the creation of a regional mobile businesses list.

5.2.2 Best Management Practice Requirements

5.2.2.1 Updated BMP Requirements for Mobile Sources

All BMPs required for station sources, described in Section 5.1.2.1 of this document and listed in detail in the City's JURMP, are also required of mobile businesse, where applicable. The most important BMPs for most mobile businesses are typically those that address non-stormwater discharge control and spill prevention, control, and clean-up.

5.2.3 Program Implementation

5.2.3.1 Education/Outreach and Notification of Mobile Sources

The City will provide information and outreach regarding stormwater quality to mobile business owners and operators. Businesses will be given educational materials outlining pollution prevention methods and other related BMPs if businesses are found to be in violation of the City's stormwater ordinance or the Permit. City staff will also give recommendations to businesses, where applicable.

Because the mobile business program is a new element of the industrial and commercial program; it is anticipated that some mobile businesses are not aware of stormwater requirements and that education will be a significant portion of the program. The education is described in more detail in Section 8 of this report. It is worthy to note, that even before the issuance of the new Permit, City staff reviewed and gave verbal stormwater education to any mobile or automotive business license applicant.

The City will continue to coordinate and collaborate with the regional Education and Outreach Workgroup to notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

5.2.3.2 Inter-Jurisdictional Cooperation

During this and the previous reporting periods, the City has participated with other Copermittees in a Mobile Business subcommittee to develop the Regional Mobile Business Outreach and Education Strategy. Because mobile businesses inherently provide services at offsite locations crossing jurisdictional lines, the

Copermittees have chose to collaborate on a regional mobile business strategy, which addresses the following elements:

- Inventory Development and Maintenance
- Establishment of Minimum BMP Requirements
- Outreach and Education including notifications

A consultant may be hired at some point to assist with this process. Compliance and enforcement responsibilities for mobile businesses will continue to reside with individual jurisdictions, and are therefore not addressed as shared regional tasks under this strategy.

5.2.3.3 Inspections

The inspections for mobile businesses generally follow the same procedure described in Section 5.1.3.3 of this report. The main focus of most mobile business inspections is on discharge control BMPs. After thorough investigation, enforcement, and follow-up as needed, none of the mobile businesses investigated warranted a formal inspection. Notably, as part of standard response actions, staff works directly with mobile business owners and employees to ensure that their business practices meet the City's minimum BMP standards.

5.2.3.4 Complaint Investigations, Violations, Enforcement, Follow-up, and Compliance

Complaint response, follow-up investigation, and compliance of mobile commercial businesses are handled in the same fashion as stationary commercial facilities. For a general description of the City's complaint response procedures, refer to Section 5.1.3.5 of this report.

In FY 2010-11, City staff investigated six complaints based on mobile business activities. Investigation of mobile business activities can be difficult based on the transient nature of their operations and their habit of operating primarily on weekends. The City has limited Code Enforcement abilities during non-working hours, but has managed to educated several mobile businesses by actual staff observation of activities. All calls were investigated and followed up with to the best of staff's ability to obtain contact information for the mobile business operator. All contacted operators were provided BMP requirement education and told if complaints persisted, administrative fines would be processed. To the City's knowledge, all have complied with the BMP requirements.

Section 6.0 Residential Component

Approximately 80 percent of the City's 3.7 square mile area is designated as residential on the land-use map. Residential land use comprises a large area of the City and residential activities can have a considerable effect on water quality of receiving waters. The City's residential component of the stormwater program aims to reduce pollutant runoff from residential areas and activities to the MEP.

The overall goal of the program is to minimize the impact of discharges from residential areas on receiving waters in Lemon Grove and, where possible, to enhance the quality of these resources. The following sections will describe the program activities conducted during FY 2010-11 that contributed to the successful implementation of the City's Residential Component.

6.1 Source Characterization

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment L-1 contains a demographics chart for the population of Lemon Grove. As Attachment L-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

This section identifies the high threat to water quality residential areas and activities that were focused on during FY 2010-11. The high threat to water quality areas and activities within the City were identified during the 2008 JURMP update process and are described in detail in the JURMP. The following section will briefly summarize this process.

6.1.1 High Threat to Water Quality Activities

In consideration of the minimum required high threat to water quality residential activities listed in Section D.3.c(1) of Order 2007-01, the following residential activities were identified as residential activities that hold the greatest threat potential to local receiving water quality:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home Improvement, Garden Care Activities, and Product Use
- Disposal of Trash, Pet Waste, Green Waste, and Household Hazardous Waste

6.1.2 High Threat to Water Quality Areas

Section D.3.c(1) of Order 2007-01, requires that Copermittees identify all high threat to water quality residential areas. During the 2008 JURMP update, the City identified high threat to water quality residential areas using the following criteria:

- Any residential areas tributary to a CWS section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within environmentally sensitive areas (as defined in Attachment C of the Permit)

The City has one section 303(d) impaired water body within or directly adjacent to its boundaries. The 303(d) impaired water body within the City is Chollas Creek and is the main watershed for the City. Based on the definition in Attachment C of the Permit, the City does not have any coastal lagoons or environmentally sensitive areas within its boundaries. By collaborating with other copermittees, the City has identified the following pollutants as pollutants of concern for residential areas:

- Bacteria
- Nutrients
- Sediment
- Pesticides
- Trash

In consideration of identified 303(d) listed water body and the primary pollutants of concern, City staff has identified the locations of high threat to water quality residential areas as follows:

- All houses within 500 ft of Chollas Creek, USGS blueline
- All houses within 500 ft of any major Chollas Creek drainage channels

This primary affects houses along Main St, San Miguel, and Bakersfield at Ensenada.

6.1.3 Evaluation of Oversight of Residential Areas and Activities

The City is planning to conduct a formal evaluation of the methods used for oversight of residential areas and activities during the permit cycle of Order 2007-01. The evaluation will coincide with the City's effectiveness assessment for the Residential Component. Since the methods used for residential oversight were recently updated within this last fiscal year, City staff determined that it would be

most appropriate and most accurate to evaluate the success of these methods in following reporting periods.

6.2 Best Management Practice Requirements

This section describes the updates made to the City's minimum BMPs that were implemented during FY 2010-11. The minimum BMPs for residential high threat to water quality activities were established in the City's 2002 JURMP. As part of the 2008 updated, the minimum BMPs were reviewed and updated as necessary.

6.2.1 Pollution Prevention

Pollution prevention is the act of reducing or eliminating waste at the source by modifying production processes, promoting the use of non-toxic or less-toxic substances, implementing conservation techniques, and re-using materials rather than putting them into the waste stream. Pollution prevention methods have been integrated into the minimum BMPs established for high threat to water quality areas and activities.

6.2.2 List of Minimum BMPs

As part of the City's JURMP update, the City designated the following minimum BMPs for high threat to water quality residential activities and areas. The minimum BMPs are primarily nonstructural and area targeted at activities specified in Section 6.2 as having a high threat to water quality. Pollution prevention methods were incorporated into this set of BMPs, where appropriate.

Automobile Repair and Maintenance

Pollution Prevention: a) employ routine preventative maintenance practices, b) reduce vehicle use whenever possible (carpool, use public transportation, bike or walk for short trips, alter driving habits), c) make timely vehicle repairs
Leaks and Spills: prevent leaks and spills from entering the stormdrain by using or doing: drip pans, plastic sheeting, or other containment devices, work indoors or under shelter and never in the rain, immediately clean spills, use dry cleaning methods, establish clean up standards, and require that tools and parts be cleaned in a contained area
Materials and Waste Management: properly manage and dispose of automotive wastes and materials by: draining fluids from automobiles, disposing of wastes and fluids properly and lawfully, store materials, parts and tools indoors or under cover, use secure and watertight containers when storing materials and wastes

Automobile Washing

Management/Reduction of Wash Water: a) whenever possible, use commercial self-serve or full-serve car washes that properly dispose of or recycle the water, b) when washing at a residence be sure to: wash over a porous surface such as grass or dirt when possible, use dry cleaning methods, turn off the water when not in use or use a controllable spray nozzle, encourage the use of a neighborhood wash area where contaminants can be easily manged
Materials and Waste Management: a) properly dispose of soapy water or bucket water to a sanitary sewer or landscaped area, b) use dry methods to degrease or clean especially dirty areas such as tires

Automobile Parking

a) use routine preventative maintenance practices and make timely vehicle repairs to prevent fluid leaks
b) design and construct parking areas to minimize stormwater impacts; covered garages should be plumbed to the sanitary sewer

Home and Garden Care Activities and Product Use

Garden and Yard Care
Pollution Prevention: a) use safe substitutes and alternative gardening methods such as IPM techniques, native and drought tolerant plants, use compost or vermiculture for green waste recycling, follow manufacturers instructions for the application of any chemicals, identify pests before treatment, b) read all labels on products, c)implement water conservation, d) consider xeroscape gardens, e) repair and maintain irrigation system to prevent over watering, f) recycle green waste, g) plant or mulch hillsides and slopes to prevent erosion
Leaks and Spills: a) immediately clean any chemical spills, fertilizers, or soil, b) return spilt items to container for future use or proper disposal
Materials and Waste Management: a) store lawn care products in closed labeled containers indoors or covered areas, b) refrain from using chemicals on windy or rainy days, c) cover stockpiles of soil, compose, or fertilizer, d) dispose of chemicals through the HHW program, e) utilize dry sweeping methods for clean up
Restrictions on Activities: a) do not hose off paved surfaces to the street or gutter, b) do not put hazardous waste in the trash, landfill or stormdrain

Home Care and Maintenance
Pollution Prevention: a) utilize smart purchasing practices that reduce waste, b) use less toxic or non-toxic substitutes for cleaning, c) read and follow product labels, d) recycle used or unwanted products, e) use water based paints when possible, f) recycle unwanted appliances and equipment
Leaks and Spills: a) clean up spills immediately, b) properly dispose of waste from clean up materials

Materials and Waste Management: a) store HHW materials in closed labeled containers and in covered areas, b) recycle latex paint through local programs, c) dispose of hazardous products though the HHW program, d) dispose of trash in the proper receptacles with lids
Restrictions: do not dispose of wash waters (carpet cleaning, mop water, paint wash-up, etc.) to the street, gutter or storm drain

Disposal of Pet Waste

Pollution Prevention: spay or neuter pets to reduce feral populations
Waste Management/Disposal: a) clean up after pets when walking them in public places, b) clean up yards or other commonly used areas, c) properly dispose of the waste in the trash or toilet
Pet Management (Dogs and Cats): do not allow pets to run free in residential neighborhoods, whenever possible

6.3 Program Implementation

This section describes the steps that were taken in FY 2010-11 to require and verify the implementation of designated BMPs for residential areas and activities.

6.3.1 Outreach and Training

The City has an education program that is consistent with the Permit and the jurisdictional program. A significant element of this program consists of educating residents about ways in which they can minimize their impact on local waterways and the environment in general. Education of the citizens in Lemon Grove contributes to the implementation of the residential component of the stormwater program. Outreach messages that are relayed to the public include, but are not limited to:

- Impacts of urban runoff on receiving waters
- Distinction between the MS4 and the sanitary sewer
- Pollution prevention and safe alternatives
- HHW collection and recycling
- BMP implementation and maintenance
- Pet and animal waste disposal
- Equipment and vehicle maintenance and repair
- Spill response, containment and recovery
- Water conservation

During FY 2009-10, City staff conveyed these messages to the public through a variety of mechanisms, including:

- City's Website
- Production and distribution of brochures and promotional items

- Public participation in community events
- Response to residential complaints
- One on one conversations
- Public participation events such as clean-ups

Implementation of these mechanisms by the City helps to make the public aware of the types of activities that have the potential to impact water quality and the BMPs that can be implemented to reduce this impact. Awareness is the first step in the process towards behavioral change. A detailed description of the educational activities implemented by the City can be found in Section 8.

6.3.2 Used Oil, E-Waste, and HHW Collection Services

The City facilitates the proper management and disposal of used oil, toxic chemicals, and other household hazardous wastes (HHW) through various mechanisms. The City participates in door to door home collection, a permanent recycling facility is located in the City, and collection events for all HHW and e-waste. In addition, the City encourages weekly curbside garbage, recycling, and yard waste pick-up services through a franchise with EDCO. The various components of the solid waste and hazardous waste collection services provided by or for the City are described in detail below.

HHW Collection Program

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. This information is lengthy and is available upon request.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only two demolition sites qualified and completed the program during this reporting period. Both projects were very small private development projects and the City has not calculated the waste totals as of this report. The totals will be available upon request by October 30, 2011.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in eight collection events for solid waste disposal. All of the events were in cooperation with a Household Hazardous Waste grant through CIWMB. .

The City held one collection day through EDCO and their facilities at the same time as the curb side clean up day. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 24-25. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2010-11, as per the HHW program, are not due to the State regulating agency until October 1, 2011; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2011.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2010-11, the City held eleven e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2011.

Used Oil Recycling Program

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

Table 6-1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005 (Calendar Years)

Table 6-2 Annual Oil Sales and Used Oil Recycling Rates (in millions of gallons)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005
Lubricating Oil Sales	141.2	140.8	136.2	137.5	142.1	150.0	154.3	163.6	168.0	150.2	150.5	153.5
Industrial Oil Sales	78.0	117.3	140.9	141.7	152.4	176.4	155.7	149.1	147.1	135.8	144.6	123.1
Total Oil Sales*	219.2	258.1	277.1	279.5	294.5	326.4	310.0	312.7	315.1	286.0	295.0	276.6
Lubricating Oil Recycled**	59.9	54.6	56.8	60.9	73.6	76.9	80.0	81.9	83.1	83.7	87.0	91.3
Industrial Oil Recycled**	16.7	19.5	20.8	19.3	11.6	10.4	7.9	15.5	17.5	32.4	32.5	31.4
Total Oil Recycled	76.6	74.1	77.6	80.2	85.2	87.3	87.9	97.4	100.6	116.1	119.4	122.7

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

Table 6-3 Oil Collected by Public Collection Programs (in millions of gallons)

Table 6-4 Oil Collected by Public Collection Programs (in millions of gallons)

	94/95	95/96	96/97	97/98	98/99	99/00	00/01	01/02*	02/03*	03/04	04/05
Curbside	0.9	0.9	0.8	0.9	0.7	0.6	0.5	0.9	.9	1.0	1.0
Form 303	0.6	0.7	1.0	0.8	0.9	1.1	0.9	1.0	1.0	1.0	1.0
Certified Centers	5.6	8.7	10.2	11.3	13.2	15.2	16.3	18.5	19.9	20.6	19.9
Total Oil	7.1	10.3	12.0	13.0	14.8	16.9	17.7	20.4	21.8	22.6	21.9

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the two collection sites and the number for curb-side pick-up. See Attachment L-2 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment L-3 for copies of the Newsletter.

The two collection sites are:

- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

6.3.3 Complaint Investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the stormwater hotline or other form of communication such as e-mail, a County hotline referral, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or cleanup activities by the City or responsible party.

The City enforces its stormwater ordinance for all residential areas and activities as necessary to maintain compliance with the Permit and ensure water quality. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for the City to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the Code Enforcement data base.
In FY 2010-11, the City received 54 Residential IC/ID complaint calls. Six of those calls were construction related and are discussed in Section 3. Eight of them were related to illegal dumping in the street or gutter. All were abated within 24 hours of notification to the City and all known dischargers were educated on proper disposal methods. No citations or fines were leveed for residential complaints during this reporting period. The remaining calls were either unfounded or not related to stormwater and were delivered to the appropriate department.

6.3.4 Regional Residential Education Program

The City collaborated with other jurisdictions in the Education and Residential Sources Workgroup to develop the Regional Residential Education Plan. The Plan contains recommended strategies for the development and implementation of the Regional Residential Education Program. Implementing an enhanced regional program to target residential sources of stormwater pollution encourages the development of consistent messages throughout the region and enables Copermittees to better leverage resources and utilize economies of scale.

This reporting period's collaboration on a regional level was promotion of residential stormwater BMPs at the San Diego County Fair. The Copermittees combined funds to pay for a fair booth, material distribution, signage and advertisements at several locations on the fairgrounds for the duration of the fair. Booth staffers promoted the Think Blue message and presented stormwater educational materials to all fair attendees.

Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2010-11 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment.

7.1 Dry Weather Monitoring Program

This portion of the report will be submitted on December 15 as required in the Permit.

7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 52 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls eight were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 5 and follow-up and enforcement for residential complaints is dealt with in Section 6.

7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 6 of this report.

7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 4 of this report.

Section 8.0 Education Component

8.1 Overview of Education

The City's outreach program includes an education and public participation component. The education component is focused on disseminating educational information to increase public knowledge of stormwater issues, while the public participation component, discussed in Section 9, provides opportunities for the public to become involved in the process of reducing pollutants of concern in stormwater and urban runoff. The education component is primarily implemented by the City's water quality staff.

The Permit establishes the following five target communities which must be addressed by the education program:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

The overall goal of the education element is to provide an education program that will:

- Measurably increase the knowledge of the target audience regarding MS4s, impacts to urban runoff on receiving waters, and potential BMP solutions appropriate for the target audience and their activities.
- Measurably change the behavior of the target audience and thereby reduce pollutant releases to MS4s and the environment.

The City performed a wide variety of storm water education activities during FY 2010-11. Education and outreach was performed on three levels – Jurisdictional, Watershed, and Regional. Budgetary constraints are currently severely limiting the City's outreach abilities to in-house staff and resources only. However, the City has always worked hard to openly communicate with its community and staff has always been available for face to face meetings both at City facilities and while out in the community. The community also has easy access to all City staff by phone or e-mail. The City feels that this informal accessibility works in our favor and actually provides our residents with more meaningful, in depth education than multitudes of printed material.

8.2 Municipal Staff Training

Public Works. Water quality staff participates in monthly meetings with all of the public work division and weekly meetings with the public works supervisors. At these regular meetings, water quality staff provides updates on current policies

and areas of concern. Due to the regularity of interaction between water quality staff and public works staff, no separate annual training is currently being provided. Any questions or comments can be dealt with more effectively at the regular meetings and changes to regulations or activities can be instituted quickly and efficiently. Water quality staff is also integrally involved in ensuring that public works staff receives and maintains all required certifications, such as Confined Space certification, Hazwoper certification, Cal OSHA updates, pesticide application qualification, and other risk management trainings applicable to their daily jobs and their stormwater activities. Towards the end of this reporting period, the City began exploring a newly available training tracking program, which in future reporting periods will make it even easier to verify staff trainings.

New Employees. Water quality staff is working with the City's HR department to establish a new employee interactive training power point presentation, which will include basic stormwater information and an evaluation test at the end. This video will be shown to all new employees regardless of department and their end test results will be tracked. The City is participating in the Regional Municipal Workgroup, which is working on developing a series of employee educational videos that would be available to all Copermittees. These videos would include new employee, management and task specific trainings. With the City's new training tracking system, it will be easy to track employee trainings and track pre and post-test results to evaluate a change in knowledge.

Engineering and Planning Departments. Water quality staff meets weekly with these two departments to discuss development review projects, new policies, streamlining of existing policies and to participate in consistent interdepartmental education. The City finds these regularly scheduled meetings a much more efficient and effective way of updating and educating staff on water quality concerns, regulations and improvements. They are the foundation for the City's new sustainability mindset and have been vital initiating the overhaul of the City's General Plan. It allows the City to present an ideologically unified front to its residents, developers, contractors, and business owners.

8.3 Educational Outreach

This section describes education efforts conducted for each target community during FY 2010-11.

8.3.1 Underserved Target Audiences and Mobile Businesses

Underserved Target Audiences. For those segments of Lemon Grove community that do not speak English as their first language, the City provides many of its brochures and handouts in both English and Spanish. The City also employs bilingual staff to assist our residents, answer questions, and translate information. The current water quality brochures available in dual languages are

IPM pest tip cards, recycling and HHW information. The City also has available the Green Wrench BMP guide for automotive repair shops and the Green Cooking BMP guide for restaurants in Spanish. The City also works with the County's Green Business group which provides BMP information in Spanish and in English. Despite these efforts, the City realizes this continues to be an underserved audience and by collaborating with the other Copermittees hopes to continue to develop new ways to provide them with water quality data and information.

Mobile Businesses. During FY 2010-11, the continued to participate and provide information to the Regional Mobile Business Subcommittee for the development of the Regional Mobile Business Outreach and Education Strategy. Mobile businesses inherently provide services across jurisdictional lines; therefore the Copermittees chose to collaborate on a regional mobile business outreach and education strategy, which addresses the following elements:

- Inventory development and maintenance
- Establishment of minimum BMP requirements
- Outreach and education

The City's water quality staff, for several reporting periods, has reviewed any business license that pertains to a mobile business and required them to provide applicable BMP information on the business license application. Until the new Permit, however, these businesses were not an independent category in the business license directory. They were filed by business type, such as automotive or food service. During this reporting period, the City created the mobile business category and has begun transferring the known mobile businesses into the correct category. One of the challenges faced by Code Enforcement, in conjunction with mobile businesses, is their tendency to conduct business during off hours. City staff is very limited in their ability to work off hours and since the economic downfall, all overtime is prohibited unless emergency related. The City hopes that a Regional database of mobile businesses will help to track and regulate their activities and improve education opportunities.

8.3.2 New Development and Construction Communities

The City uses the following strategies to provide education and outreach to its development and construction communities:

- BMP training request as part of the permit application process
- Meetings with project developers, owners, on-site contractors and site supervisors
- SUSMP checklists as part of the development review process
- Signed BMP checklist for all ministerial permit applications (training request sheet is attached to this checklist)

- Informal meetings with developers and contractors due to questions, comments, concerns, etc. Generally occurs during the review process or normal site inspection process
- All changes to construction site BMPs are required to be submitted to City staff for approval

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

8.3.3 Commercial/Industrial Owners and Operators

The following is a summary of the education and outreach provided to commercial and industrial owners and operators during FY 2010-11.

- Annual inspections of all industrial facilities, restaurants and automotive facilities in the City by our in-house Code Enforcement staff. During these inspections, individual one-on-one education was presented to each facility manager/owner. Information presented included general storm water quality information and BMP requirements.
- The City also has Green Wrench and What's Cooking guides available for interested parties.
- Mailings to facilities about applicable local workshops and education opportunities, such as those offered by SDG&E and the San Diego Energy Commission.

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party. However, it is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation. They perceive stormwater inspections as part of this over-bearance and are often reluctant to make changes without the involvement of Code Enforcement proceedings.

8.3.4 Residential Community and General Public

The following is a summary of venues and media outlets utilized within the defined reporting period of this report to provide education and training to various residential and public audiences:

- City Newsletter containing an environmental section with water quality and environmental tips (such as how to properly care for your lawn, list of

basic household BMPs, or home improvement – BMPs your contractor should know) and information about HHW and recycling

- Various brochures available at City Hall: Used oil recycling, car washing, pet waste disposal, etc
- Maintenance of the stormwater hotline (619) 825-3827, which monitored by water quality staff
- Water quality staffed informational Booths at the following events: Fire Station Open House and Winter Bonfire.
- Participation and staffing at the Regional Education Outreach booth at the San Diego County Fair
- Participation and collaboration in watershed-based efforts such as Creek to Bay Clean-up and watershed based school presentations

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

The City is constantly striving to improve its outreach and education opportunities within the limited means of the current budget. Much of the current education is done by City staff in an informal manner with the public and business communities. Having a small City staff, means a consistent message is provided because staff is easily kept up to date on the current regulations and policies. This program will continue to evolve as necessary and as funds allow.

9.1 Public Participation

Public participation is one of the components of the City's outreach program. The goal of the education component, discussed in Section 8, is geared towards disseminating educational material to increase public knowledge of storm water issues. The goal of the public participation component is to provide opportunities for the public to become involved in the process of education and reducing pollutants in stormwater and urban runoff.

Public participation activities provide opportunities for the public to interact and become involved with water pollution issues. When the public has the opportunity to become involved there are several positive outcomes. First, those involved become more knowledgeable about stormwater issues. Second, they become educators and stewards for the stormwater program. Finally, they provide important feedback to the stormwater program regarding the concerns of the public and issues that may be overlooked. Ultimately, public participation help makes the education process more effective.

9.2 Public Participation Approach

The City's approach for the outreach program is to develop an understanding among its residents and businesses of some fundamental storm water concepts. These include:

- The difference between the sanitary sewer and the storm drain system (sanitary waste gets treated, but discharges into the storm drain system flow directly to our waterways and beaches untreated)
- The economic value of our beaches and inland waterways and the importance of protecting them.
- An understanding of illegal discharges, i.e. sidewalk and street wash water runoff, vehicle fluid (antifreeze and oil), landscape debris, sediment, etc.
- How to report a stormwater violation (stormwater hotline or website).
- The fact that we all live in a watershed and that the watershed is integral to wildlife, public health, and to the water quality of the rivers, streams, and oceans.
- Reducing pollutants of concern.
- Responsibility of citizens to participate in the cleaning and maintaining of the community (i.e. creeks and parks) and not to be part of the pollution problem (littering, illegal dumping, improper disposal of household chemicals).

Some of the tools that are used by the City to implement the public participation activities are:

- public outreach events
- public reporting methods
- pet waste dispensers
- Household Hazardous Waste Collection and Used Oil Recycling
- public opinion surveys
- copermittee collaborations

9.3 Program Implementation

This section describes the specific public participation tools used during the FY 2010-11 reporting period.

9.3.1 Public Outreach Events

The City participated in several outreach events during FY 2009-10:

- Coastal Clean up Day – September 19, 2009; 10 volunteers; Federal Blvd/San Miguel drainage channel
- Fire Station Open House – October 10, 2009; 60 participants
- Winter Bonfire – December 4, 2009, 800 participants
- Creek to Bay Clean up Day - April 24, 2010; 18 volunteers; Federal Blvd/San Miguel drainage channel
- San Diego County Fair – June 12, 2010; 4,500 participants

9.3.2 Public Reporting Methods

The City has a local hotline that connects the caller directly to the City's water quality staff. The number is (619) 825-3827. A public works person is available for after-hours emergencies, who will contact the best staff person to handle the emergency. There are also two regional stormwater hotline numbers promoted within San Diego County: a toll-free Regional Storm Water Hotline, 1-888-846-0800 and the Think Blue Hotline, 1-888-844-6525 (1-888-THINK BLUE). Both of these hotlines are staffed by the County of San Diego Monday through Friday, 8:00am - 5:00pm. In addition to personal service at these hotlines during regular business hours, the hotlines provide a voice mail message for 24-hour public access.

The City's stormwater hotline has been heavily advertised since the programs inception. In FY 2010-11, the hotline received eight stormwater related calls, typically pertaining to the illegal discharge of fluids in the gutter over the weekend or a business hosing off their parking lot. All calls are investigated by Code Enforcement and are usually handled with a verbal warning and education about household BMPs. None of the calls during this reporting period requied formal

Code Enforcement proceedings. The hotline is advertised in the newsletters and on the City's website, in brochures, on give-aways, and at City events like the Winter Bonfire and the Fire Station Open House.

The City's website also provides water quality information and event updates: www.ci.lemon-grove.ca.us.

9.3.3 Pet Waste Dispensers

Residents are encouraged to protect our creeks, lagoons, and ocean by cleaning up after their pets. To make this easier; pet waste dispensers can be found at all the City parks and in the vacinity of City Hall, all areas where people frequently walk their dogs. Trash cans are also readily available in all of these areas. Both the trash cans and bag dispensers are maintained by the City's Grounds division.

9.3.4 Household Hazardous Waste Collection and Used Oil Recycling

The City co-sponsors several HHW and e-waste events over the course of the reporting period. During these events, residents can drop off any HHW or e-waste free of charge. The City collaborates with the Cities of Chula Vista and La Mesa for HHW events and data collection. The City participated in eight HHW events and eleven e-waste events. The City has two used oil collection points in the City:

- EDCO Recycling Center 6670 Federal Blvd
- Kragen Auto Parts 6925 Federal Blvd

9.3.5 Copermittee Collaborations

The City continues its collaboration and encouragement of the County's Green Business program for restaurants and automotive repair shops. This effort continues to develop and explore a State wide collaboration and standards. The City will continue to promote these programs to the applicable commercial facilities where-ever possible.

Section 10.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

10.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 10.1.

Table 10.1 – 2010/2011 Fiscal Analysis Summary

Stormwater Cost Analysis
All costs covered in the General Fund.

ACTIVITY	CURRENT YEARLY BUDGET	CURRENT BUDGET LOCATION
STORM DRAINAGE CLEANING AND MAINTENANCE		
Public Street and Parking Lot Sweeping		Streets
Streets	$30,000	
Parking Lots	$2,000	
Public Street and Parking Lot Sweeping Total	$32,000	
Litter Removal		
Litter Removal	$13,000	
Litter Removal Total	$13,000	
Storm Drainage Cleaning		
Inlets		
Inspection and Cleaning	$19,820	
Fossil filter replacements	$1,400	
Inlets Subtotal	$21,220	
Basins and Channels		
Inspection and Cleaning (Note 1)	$38,829	
Basins and Channels Subtotal	$38,829	
Video Inspections		
Video Inspections (Note 1)	$50,000	

Video Inspection Subtotal	$50,000	
Storm Drainage Cleaning and Maintenance Total	**$155,049**	
STORM EVENT ACTIVITIES		
Sandbag stock piling and placement	$4,000	
Patrols	$3,089	
Storm Event Total	**$7,089**	
ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM		Engineering Services
Dry Weather Testing	$20,000	
Enforcement	$5,000	
Administration/Supervision	$1,000	
Stormwater HotlineComplaints	$2,000	
Illicit/Illegal Enforcement Program Total	**$28,000**	
STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)		
Construction Related SWPPP	$2,000	
Plan Review (including SUSMP's)	$15,000	
Inspection	$3,000	
Construction Related SWPPP Subtotal	$20,000	
Municipal Facility SWPPP		
SWPP Implementation, Inspection, and Maintenance of Municipal Facilities	$18,798	Streets
Municipal Facility SWPPP Subtotal	$18,798	
All SWPPP Activities Total	**$38,798**	
BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION		
Inspection of Industrial and Commercial Facilities	$50,000	
Inspection of Municipal Facilities	$1,000	
BMP Total	**$51,000**	
MISCELLANEOUS ACTIVITIES		Engineering Services
Annual Reporting (JURMP)	$5,000	
Administration (General)	$74,004	
NPDES Permit Fee	$7,500	
Public Education/Outreach	$5,000	
Miscellaneous Activities Total	**$77,504**	
PROGRAM TOTALS	**$371,440**	

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2010-11 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance

activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

10.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.
Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

11.1 Introduction

The City began applying baseline program effectiveness assessment methodologies soon after they were developed by the San Diego region stormwater Copermittees during the last permit cycle as described in the document titled "A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs" dated October 16, 2003. The City has also actively participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008 and as an ongoing process. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs, so the City prepared its own effectiveness assessment approach and measures modeled after conventional strategies and the existing levels of effectiveness assessment as detailed in the October 2003 document.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is anticipated that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will undertake the issue of standardized assessment metrics and procedures in the near future. The City is committed to engaging in the process of developing such regional standards and incorporating resulting work products into its own local program effectiveness assessment system. It is in consideration of the evolving and ongoing regional standardization process that the City has endeavored upon fine tuning its local effectiveness assessment approach as presented in the subsequent paragraphs and tables. Further, it is recognized that these methodologies and strategies must be adaptable as regionally developed procedures are solidified in the future.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The core structure of the City's stormwater program is composed of three primary drivers:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The programmatic process typically proceeds from planning to implementation to assessment, although in practice all three maybe in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program elements developed during the planning step are implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments

are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

As part of the JURMP update process, the City has identified a variety of significant activities uniques to each program element and metrics (numeric and/or narrative) to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics are provided in SEction 13 of the City's revised 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step towards the more difficult level of improvements to water quality in receiving waters. The levels are listed below.

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

11.2 Effectiveness Assessment Results

The new Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment - assessment that combines both monitoring data and programmatic data - are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome Level Assessments

Level 1

A requirements checklist, which includes a directory of permit compliance elements and where each is described within the JURMP annual report, can be found in Appendix G.

Level 2 and 3

Tables 11-3 at the end of this section include discussions of Level 2 and Level 3 outcomes for activities identified as significant by the City within each program component. Note that only Level 1 assessment applies to fiscal analysis, so a table for fiscal analysis is not included.

Level 4

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load reduction estimation methods have not yet been or cannot be developed.

Level 5

On September 10, 2008, the Regional Board adopted Addendum 2 to Order 2007-01, effectively extending the annual due date of the illicit Discharge Detection and Elimination reporting requirements to December 15. It is anticipated, consistent with previous Dry Weather Monitoring reports prepared by the City that baseline trend analysis will be provided for a number of constituents evaluated through the Dry Weather Monitoring Program. This information is further spatially correlated with sub-basins or drainage areas within the City, and evaluated against land-use areas and potential source areas.

Level 6

It has been determined, through ongoing development and discourse over long-term effectiveness assessment methodologies that relationships between programmatic activities and changes in receiving water quality are difficult to establish on an annual basis or a jurisdictional scale. As such, the City will point to future regionally coordinated efforts including Report of Waste Discharge (ROWD) and Long Term Effectiveness Assessment (LTEA) development to more holistically evaluate changes in receiving water quality. It is anticipated that such efforts will be further refined and supported by ongoing data gathering efforts both locally and regionally.

11.2.2 Overall Component Assessments

Development Planning

The City's review process for development projects is effectively requiring higher removal efficiency treatment control BMPs. Further, two new significant program elements were in production and in early stages of implementation within the defined reporting period of this report; both new programs are demonstrating positive trends. BMP installation verification and BMP operation and maintenance verification efforts, while not wholly implemented at the time of report production, have resulted in the establishment of programs that will support long term effectiveness assessment measures for development planning.

Construction

The City's review and approval process for construction related plans and documents is effectively verifying proposed construction specific BMPs. BMP implementation and maintenance is being effectively managed through construction site inspection activities, and validated through associated assessment measures. It is anticipated that in response to increased inspection frequencies and refined data gathering practices that this trend will continue.

Municipal

The defined reporting period of this report is marked by significant expansion of municipal operations and maintenance activities to meet the standards established in Order 2007-01. Enhanced stormwater conveyance, drainage facility, channel maintenance and inspection and street sweeping activities, were developed and implemented, equating to the removal of salient volumes of debris. Effective operations and maintenance activities are demonstrated in the Table 11-1 below, and it is anticipated that this continued level of service as well as enhancements in data gathering methods will support the efficacy of municipal activities.

Table 11-1

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Street Sweeping	150.75 tons	None	150.75 tons
MS4 Cleaning	3,360 pounds (1.815 tons)	None	3,360 pounds (1.815) tons
			Total 152.565 tons

Industrial and Commercial

Stormwater activities and actions related to industrial and commercial entities have exhibited positive trends within the defined reporting period. The City has identified inspection activities coupled with complaint response and enforcement as the significant activities by which to evaluate program effectiveness. During the defined reporting period, the City has been able to evaluate effectiveness on a number of levels (See Table 11-2) through the gathering of critical statistics, including a knowledge and BMP assessment scoring system. Data gathered and evaluated during the defined reporting period indicate that identified significant program activities targeting industrial and commercial sources have been effective.

Table 11-2 Program Scores for 2010-11**

	Knowledge Assessment *	BMP Assessment
Average Rating	2.6	3.5

Median Rating	3	3
# of "Level 5" Ratings	6	25
# of "Level 4" Ratings	28	34
# of "Level 3" Ratings	30	49
# of "Level 2" Ratings	22	12
# of "Level 1" Ratings	33	4

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

Table 11-2 cont. Program Scores for FY 2005-06
(This was the first year the analysis was done and is provided for comparision)

	Knowledge Assessment *	**BMP Assessment**
Average Rating	2.39	3.33
Median Rating	2	3
# of "Level 5" Ratings	0	14
# of "Level 4" Ratings	9	26
# of "Level 3" Ratings	34	30
# of "Level 2" Ratings	26	11
# of "Level 1" Ratings	18	7

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

Residential

Residential BMP implementation has been identified as the significant activity by which effectiveness has been assessed. Residential complaint response and enforcement constitute the core of residential BMP implementation assurance actions. Based upon an evaluation of data associated with these elements, including the number of incidents responded to and the ultimate resolution of these events, the City has demonstrated a notably effective program and level of service to the community of Lemon Grove.

Table 11-3

Activity	**Amount Collected**	**Adjustment Factor**	**Estimated Load Reduction**
Used Oil Recycling	25,600 gallons	10%	2,560 gallons
C&D Ordinance Recycling	17,852 pounds	1%	179 pounds

Education

Education effectiveness is assessed for a variety of program elements. In terms of education opportunities provided to the various community sectors and City

staff and contractors, identified as the significant metric by which to evaluate education activities, the City has achieved a high level of success.

Public Participation

The City provides a variety of venues and outlets in support of public participation. The City has identified a number of measures to evaluate the effective implementation of this program element. As with education, public participation translates across a number of program areas; however the assessment measure are focused on success of the venues ad outlets supported by the City. From the measures identified and quantified, community partnerships, event attendance, hotline calls, and volumes of debris and hazardous materials collected through public participation, the City has established exceptional trends.

11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of this document.

EXECUTIVE SUMMARY

In January 2007, the Regional Water Quality Control Board (RWQCB) issued Order No. R9-2007-0001 (Municipal Permit), a National Pollution Discharge Elimination Permit regulating discharges to the storm drain system within 18 municipalities in San Diego County, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees"). As required by the Municipal Permit, the City of Lemon Grove (City) has created and maintains a Jurisdictional Urban Runoff Management Program (JURMP). The City's JURMP includes Best Management Practices (BMP) standards for businesses, construction and development projects, residents, and the City's own activities. The JURMP also includes programs for water quality monitoring and educational outreach.

This annual report presents the City's implementation efforts of its JURMP during Fiscal Year 2011-2012 (FY 2011-12), which began on July 1, 2011 and ended on June 30, 2012. Each section of this JURMP Annual Report discusses the City's efforts during FY 2011-12 and how those efforts met the requirements of the Municipal Permit. Key actions taken for the major components of the City's stormwater program are summarized below.

Development Planning Component

The City continued to implement the requirements of the *2011 Model Standard Urban Stormwater Mitigation Plan* and *Hydromodification Management Plan*. During this reporting period, three projects were identified as priority development projects but were not subject to hyromodification management due to no net increase in pervious area or discharge rates. The City reviewed last year's treatment control BMP inventory and addressed discrepancies. A new inspection form was also developed and used during the inspection of all five inventoried sites. A new self-certification letter and maintenance form were developed and used during this reporting period. Treatment control BMPs at all five sites were observed to be adequately maintained and no enforcement action was deemed necessary during this reporting period.

Construction Component

During FY 2011-12, the City had eight active construction sites: five private development projects and three Capital Improvement Projects. Three of the eight sites were prioritized as medium Threat To Water Quality (TTWQ) and five as low TTWQ. The City conducted checks of erosion control plans to ensure construction projects complied with the City's minimum BMP requirements. The City conducted 165 site visits to verify BMP implementation, and issued four verbal Correct Work Notices. Deficiencies associated with the four verbal Correct Work Notices were appropriately addressed within 24-hours.

Municipal Component

The City inspected 14 high TTWQ municipal fixed facilities during FY 2011-12. The City also continued its street sweeping and Municipal Separate Storm Sewer System (MS4) maintenance programs. A total of 147.15 tons of trash and debris was removed through street sweeping activities and 572.55 cubic yards of debris were removed during routine

MS4 maintenance activities. The City video inspected 16.75 miles of sewer main to locate blockages and areas of needed repair. All 67 miles of sewer main was cleaned during this reporting period. City personnel attended several in-house training on stormwater pollution prevention concepts and practices.

Industrial and Commercial Component

During this reporting period, the City conducted 59 site visits and inspections of industrial and commercial facilities considered high TTWQ. The overall inventory included 225 businesses as presented in the 2010-2011 JURMP Annual Report. The City was able to meet the Municipal Permit requirement of inspecting at least 25 percent of all inventoried sites. There were no industrial or commercial businesses found to be out of compliance. In-house training on the industrial commercial program was also conducted during this reporting period. At the end of the reporting period, City staff revised its prioritization process and established new industrial commercial and mobile business inventories. The pollutant loading potential for each stationary and mobile business was included in the respective inventories. The new inventory will be used in the FY 2012-13 reporting period to conduct stormwater compliance inspections.

Residential Component

Eighty percent of land use in the City is residential, and the City used a variety of methods to educate its residents. The City published the Summer 2011 and Spring 2012 editions of *The Grove Gazette* newsletter. Each issue was available on the City's website. The newsletters contained a variety of environmental and stormwater-related articles and opportunities for public involvement. During FY 2011-12 the City hosted a variety of waste disposal events and encouraged residents to participate in these events. Residents properly disposed of 570 pounds of household hazardous waste (HHW) and 15,425 gallons of used oil during these events. The City also responded to and resolved nine complaints made by residents to the City's stormwater hotline regarding residential areas.

Illicit Discharge Detection and Elimination Component

On September 10, 2008, the RWQCB adopted Addendum No. 2 to the Municipal Permit. This addendum requires the City to wait to submit the Illicit Discharge Detection and Elimination (IDDE) section of its JURMP Annual Report until the 2012 Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program) is finalized. This section must be submitted to the RWQCB no later than December 15, 2012.

During FY 2011-12, the City responded to 37 complaints made to its stormwater hotline and the Public Works maintenance hotline. The recommendations in the final report for the 2011 Dry Weather Monitoring Program were addressed during this reporting period. The City also continued maintenance of the sanitary sewer system to prevent sanitary sewer overflows (SSOs).

Education Component

The City continued to educate a variety of audiences within Lemon Grove as a means to raise stormwater awareness in various communities throughout FY 2011-12. During this reporting period, the City's efforts resulted in an estimated 6,757 impressions. City staff

attended municipal training sessions that covered different chapters of the JURMP and municipal permit requirements as well as proper BMP implementation. The City continued to post the *The Grove Gazette* newsletter on its website and to notify 411 subscribers of its posting. Newsletters issued during FY 2011-12 included stormwater-related articles aimed at both residents and businesses in the City. Industrial and commercial businesses met with the City's inspector who answered questions and provided information verbally on pollution prevention and BMPs pertaining to their business activities. Additionally, the City continued working with I Love a Clean San Diego to provide six educational presentations at four elementary schools and the Lemon Grove Public Library with a total of 398 participants. The presentations were interactive and used the hands-on watershed model to discuss topics including pollution prevention, waste reduction, recycling, and used motor oil recycling.

Public Participation Component

During FY 2011-12, the City continued to provide opportunities for the public to participate in stormwater related events and activities. Creek to Bay Cleanup event resulted in 42 volunteers participating, HHW comprised of 97 appointments for HHW drop off, and Spring Cleanup event counted 770 vehicles originating from Lemon Grove. Additionally, 750 reusable bags were distributed to the public on *A Day without a Bag*. The majority of these events were published in *The Grove Gazette* and the City's website and Facebook page to encourage public participation.

Fiscal Analysis Component

The City continues to use its General Fund as the primary source to fund the implementation of its stormwater program. During FY 2009-10, a fiscal analysis reporting template was developed collectively by the Copermittees. The City used this template to report the FY 2011-12 program budget in this JURMP Annual Report.

Effectiveness Assessment Component

During FY 2011-12, the City continued to evaluate the effectiveness of its JURMP implementation. The City has seen some encouraging signs of the effect of its program, such as lower amounts of pollutants in its Dry Weather Monitoring Program in recent years and increased public reporting of stormwater issues.

Special Investigations

The upstream investigation was conducted as part of the Dry Weather Monitoring and Sampling Program. A Total Maximum Daily Load compliance monitoring report and a special studies report were prepared during this reporting period.

Non-Emergency Fire Fighting

City staff continues to implement BMPs during regular maintenance of fire and emergency vehicles and equipment, training exercises, facilities maintenance, and post-emergency rehabilitation of response equipment.

JURMP Revisions

Any changes made to the JURMP since the JURMP update in the spring of 2008 and subsequent changes reported in the 2010 JURMP Annual Report are discussed throughout this JURMP Annual Report where applicable.

Conclusions and Recommendations

During future fiscal years, the City will continue to implement the programs detailed in its JURMP; it is anticipated that some program refinements will continue to be made as implementation progresses. The City will also continue to collaborate with the other Copermittees to improve the overall efficiency of its program and to develop updated methods of assessing program effectiveness.

1.0 INTRODUCTION

1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Program (JURMP) Annual Report presents an activity summary for the City of Lemon Grove (City) during the Fiscal Year 2011-2012 (FY 2011-12). The JURMP Annual Report preparation and submission are required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act, also known as the Clean Water Act, established a framework for regulating Municipal Separate Storm Sewer System (MS4) discharges under the National Pollutant Discharge Elimination System (NPDES). In 1990, the RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region, followed by a revised permit in 2001. RWQCB Order No. 2001-01 was replaced by the current Municipal Permit in 2007.

In 2002, the City, as all regulated municipalities in the San Diego region (collectively referred to as Copermittees), developed and submitted a JURMP to the RWQCB. The City then submitted an updated JURMP, as required by the Municipal Permit, in March 2008. The JURMP explains management measures for different sectors, including municipal, industrial, commercial, construction, and significant development and redevelopment activities.

Annual reports documenting the implementation of the JURMP are required to be submitted to the RWQCB by September 30. This JURMP Annual Report presents data from FY 2011-12, which extended from July 1, 2011, to June 30, 2012.

1.1.2 CITY SETTING

The City is located inland in the southwest portion of San Diego County, which encompasses the southwest corner of California. As of the year 2010, there are approximately 25,320 residents in the City. San Diego County is located about 130 miles south of downtown Los Angeles, and immediately north of the United States-Mexico border. The City is centrally located within the greater San Diego and Tijuana urban area. The City encompasses 3.75 square miles and its boundaries are delineated by the SR-94 freeway to the north, Sweetwater Road to the east, 69th Street and Madera Drive to the west, and various residential streets located within the City of San Diego to the south. The SR-125 freeway runs along the City's eastern border.

The City is characterized by a mix of commercial, industrial, residential, and natural settings, which require a detailed understanding of the City's drainage, the series of local canyons, and the upper elevation topography in developing proper stormwater quality

controls. Runoff characteristics within the San Diego Bay Watershed (Pueblo San Diego Hydrologic Unit (HU) and Sweetwater HU) affect recreational, commercial, and aesthetic properties in Lemon Grove.

1.2 Purpose and Objectives

The City's JURMP presents strategies to reduce the discharge of pollutants from the MS4 to the Maximum Extent Practicable (MEP). The JURMP describes various programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the implementation of the City of Lemon Grove's JURMP during the FY 2011-12 reporting period.

1.3 Report Organization

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

Section 1	**Introduction**
Section 2	**Development Planning**
Section 3	**Construction**
Section 4	**Municipal**
Section 5	**Industrial and Commercial**
Section 6	**Residential**
Section 7	**Illicit Discharge Detection and Elimination**
Section 8	**Education**
Section 9	**Public Participation**
Section 10	**Fiscal Analysis**
Section 11	**Effectiveness Assessment**
Section 12	**Special Investigations**
Section 13	**Non-Emergency Fire Fighting**
Section 14	**JURMP Revisions**
Section 15	**Conclusions and Recommendations**
Section 16	**References**

Each section includes all components required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a more detailed explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Background, subsection 1.1, has been divided into Regulatory Background, subsection 1.1.1, and City Setting, subsection 1.1.2, for clarity.

2.0 DEVELOPMENT PLANNING

2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall stormwater quality by reducing the discharge of pollutants from development projects to the MEP and managing increases in runoff from development projects that have the potential to negatively affect downstream water bodies.

The major components of the City's program include development project reviews to apply Standard Urban Stormwater Mitigation Plan (SUSMP) requirements inclusive of hydromodification management, Best Management Practice (BMP) inspections, and requiring parties responsible for installed treatment control BMPs to certify that appropriate maintenance has been conducted each fiscal year.

2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the reporting period are presented in the following bulleted list. More details about the City's activities for this component of its stormwater program are provided in the remainder of this section.

- Inspected treatment control BMPs at all five sites with approved treatment control BMPs and met the permit required inspection frequencies, as shown in Table 2-1.
- Reviewed and updated treatment control BMP inventory.
- Developed a new self-certification letter and form for use during this reporting period.
- Developed a new stormwater compliance inspection form for use during this reporting period.
- Attended Copermittees' Land Development Workgroup meetings.

2.2 LAND USE PLANNING

2.2.1 BACKGROUND

The City's General Plan was revised in October of 1996 and includes a Conservation and Recreation Element that address the water quality and watershed protection principles and policies. Chapter 6, Section 6.1 of the City's JURMP presents the various elements referenced in the General Plan that meet the Municipal Permit requirements. This provides the City with a sufficient framework for implementing the development planning requirements of the Municipal Permit. No changes to these policies were necessary during this reporting period.

2.2.2 Source Characterization

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to the development restrictions in the City's General Plan for stormwater purposes were implemented during the reporting period.

2.2.3 Best Management Practice Requirements

Please refer to the City's updated JURMP document Chapter 6, Section 6.1 for a list of the water protection policies presented in the JURMP and referenced in the City's General Plan. These policies remained the same throughout the reporting period.

2.2.4 Program Implementation

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code. Additionally, the City required project proponents to comply with the *2011 Countywide Model SUSMP* and *Hydromodification Management Plan (HMP)* developed by the San Diego Region Copermittees.

Sections 2.3 and 2.4 of this JURMP Annual Report detail how the City implemented its established water protection policies through its environmental review process and its development project approval and verification processes during the reporting period.

2.3 Environmental Review Process

The City's current environmental review process is detailed in Chapter 6 of the City's JURMP. No modifications to the City's environmental review process were made during the reporting period.

2.4 Development Project Approval and Verification Process

2.4.1 Background

During FY 2011-12, the City implemented the watershed protection principles in the City's General Plan (see Chapter 6 of the City's JURMP) through various aspects of the City's development project approval and verification process, as detailed below.

2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's Municipal Code, JURMP, and staff enforcement of the *2011 Countywide Model SUSMP* and *HMP*. Projects subject to SUSMP regulations are identified by completion of an applicability checklist (Attachment 2.1). More detail about this process is provided in Section 2.4.4.2.

2.4.3 Best Management Practice Requirements

City staff continues to implement the requirements of the *2011 Countywide Model SUSMP* and *HMP* for all development projects described in Section 2.2.4 above.

2.4.4 Program Implementation

During FY 2011-12, the City required implementation of its BMP requirements for all development projects through education, the development project approval process, and the treatment control BMP inspection and maintenance verification program.

In response to key staff turnover during the beginning of FY 2011-12, the City completed a comprehensive review of the treatment control BMP inspection and maintenance verification programs. As a result of that review, some discrepancies were noted relative to the number and specific location of previously reported Priority Development Projects (Priority Projects). Section 2.4.4.3 describes the discrepancies observed and Appendix A.1 presents the updated inventory.

2.4.4.1 Outreach and Staff Training

During FY 2011-12, the City's land development engineer and planning staff met regularly to discuss SUSMP and hydromodification management requirements as well as the status of SUSMP projects in the City. This regular communication among City staff ensures that development projects subject to SUSMP requirements are effectively identified and appropriate water quality protection measures are applied.

Project proponents were also made aware of SUSMP requirements through the development review process, including interaction with staff at the front counter as well as during meetings with City staff.

Distribution of maintenance verification letters to parties responsible for maintenance of treatment control BMPs at completed projects has also increased the level of knowledge of regulated parties.

The City's Land Development Engineer participated in the Copermittees' Land Development Workgroup meetings during this reporting period. This provided a forum for beneficial discussions on SUSMP requirements and hydromodification management.

2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were also required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Checklists were completed to determine stormwater requirements for each project, including whether SUSMP requirements applied. Attachment 2.1 shows the form that is presented to each applicant regardless of project size. The City has recently implemented a system to record SUSMP related information for each project in a spreadsheet continuously throughout the year. A summary of the projects submitted during the reporting period and whether each was subject to SUSMP requirements is presented in Table 2-2 at the end of this section.

Of the submitted projects, three were determined to be subject to SUSMP requirements. These three projects are listed with the types of treatment control BMPs proposed in Table 2-3 at the end of this section. City reviewers use requirement checklists to verify that applicable SUSMP requirements are addressed in the proposed designs and to document the proposed BMPs.

During FY 2011-12, every SUSMP project approved by the City proposed high or medium removal efficiency treatment control BMPs. No projects received a SUSMP waiver for implementation of treatment control BMPs, and at this time the City has no plans to develop a SUSMP waiver mitigation program.

Hydromodification Management Plan

The final regional HMP was approved by the RWQCB on July 14, 2010 and the City subsequently incorporated the updated standards into its review process for development projects, as discussed earlier in this section. City staff participated in the Copermittees' Land Development Workgroup, which regularly discussed the HMP and its implementation on a jurisdictional level. Of the three Priority Projects approved by the City during the reporting period, none were subject to hydromodification management requirements because they did not result in increased impervious area or discharge rates.

BMP Installation Verification

City inspectors check to see that proposed post construction BMPs have been implemented prior to granting occupancy for development projects subject to SUSMP. City inspectors continued documenting BMP installation during pre-occupancy verification visits using a camera during the reporting period, and are working to implement a system for documentation using Global Positioning System technology.

2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

Toward the beginning of each fiscal year, the City updates its inventory of completed projects with approved treatment control BMPs. Once the inventory is updated, City staff attains the required self-certification statement of BMP maintenance from all property owners with SUSMP treatment control BMPs. In addition to attaining the self-certification statements from the property owners, the City identifies the sites that require annual inspections based on the frequency established in the Municipal Permit.

Should additional projects be completed during the reporting period, but after the inventory is established for the fiscal year, the City's procedure is as follows: Complete the check for BMPs prior to occupancy, record the site information and assign it a Threat To Water Quality (TTWQ) priority, and then add the project and its BMPs to the inventory of projects subject to the City's inspection and annual maintenance verification program the following fiscal year.

In FY 2011-12, City staff reviewed the existing treatment control BMP inventory presented in the 2010-11 JURMP Annual Report and determined that two private residences were not Priority Projects and should not have been placed on the aforementioned inventory. A

private residence at 2210 & 2212 El Prado with a grassy swale and 2680 Davenport with a grassy swale were both removed from the treatment control inventory presented in last year's annual report. Both were not subject to SUSMP. The update has been made to the inventory of completed development projects with approved treatment control BMPs in Appendix A.1.

During this reporting period, the City developed a new self-certification letter and form (Attachment 2.2). Self-certification statements of BMP maintenance was received from four of the five properties listed in Appendix A.1. The City was not able to obtain a statement from residents at Mary Pat Lane; however, the City did conduct a stormwater compliance inspection of the treatment control BMPs. The treatment control BMPs were operational and no corrective actions were noted during the inspection. City staff will continue to work with the residence of Mary Pat Lane to attain the self-certification statements on an annual basis prior to October 1st.

The City's land development engineer conducted stormwater compliance inspections of all five post construction treatment control BMP sites (DCH Honda, Citron Court, Chevron, Mary Pat Lane, and EDCO). Although the Municipal Permit only requires the high and medium TTWQs to be inspected annually, City staff inspected all five sites. Appendix A.1 presents the project names, location, development type, BMP type, hydrologic subarea, fiscal year completed and TTWQ. Table 2-1 below summarizes all the relevant frequency requirements listed in the Municipal Permit. Table 2-4 at the end of this chapter presents the findings of the inspections. No corrective actions were required for any of the five sites inspected. The City also developed and used a new inspection form for the post construction treatment control BMP inspection during this reporting period (Attachment 2.3).

Table 2-1
Assessment of Compliance with Required Inspection Frequencies

Class	Number of Sites	Inspections	Percent Inspected	Permit Requirement	Requirement Met
All Inventoried Sites	5	5	100%	20%	**Yes**
Sites with Drainage Inserts	4	4	100%	50%	**Yes**
High Priority Sites	2	2	100%	100%	**Yes**

2.5 Development Planning Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

2.6 PROGRAM REVIEW AND MODIFICATION

The City created a new post construction treatment control BMP self-certification maintenance letter and form and a stormwater compliance inspection form for immediate implementation (Attachments 2.2 & 2.3). The City has also performed a thorough review of its treatment control BMP inventory and updated its records as discussed in section 2.4.4.3 above.

Table 2-2
Applicability of SUSMP Requirements to Development Projects

Project Number	Project Name	Subject to SUSMP (Yes or No?)
B11-000-288	**Citronica - 7755 North Avenue**	**Yes**

3.0 CONSTRUCTION

3.1 INTRODUCTION

The City's construction program is designed to control construction and grading activities in the City. These types of projects have the potential to affect nearby water bodies due to the presence of disturbed soils and building materials, and the potential for associated pollutants to be transported off site by stormwater or non-stormwater flows. The City continued to implement its construction program throughout FY 2011-12.

3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the construction component during the FY 2011-12 reporting period are presented in the bulleted list below. The following subsections provide more detail about how the City complied with the Municipal Permit during the reporting period.

- Conducted plan checks of erosion control plans to ensure construction projects were in compliance with the City's minimum BMP requirements.
- Educated project proponents and contractors on stormwater pollution prevention requirements at preconstruction meetings.
- Conducted Municipal Permit required training for appropriate City staff on the City's stormwater construction program requirements. This included the annual stormwater compliance inspector training and a general overview of the construction program for the City's Engineering Division.
- Conducted 165 site visits during the reporting period at five active private developments and three active Capital Improvement Project (CIP) sites to inspect BMP implementation. Three private development sites were designated as medium priority TTWQ and the remaining five as low priority TTWQ.
- Issued four Correct Work Notices in response to non-compliance with the City's minimum BMP requirements.

3.2 SOURCE CHARACTERIZATION

The City maintains a watershed-based inventory of all private and public construction projects, both active and completed. The database where the inventory is stored is updated on a regular basis. During this reporting period, there were eight active construction projects. A total of five of these projects were private development construction projects and three of these projects were CIPs. Appendix A.2 includes a list of all construction projects that were active during FY 2011-12.

3.3 Updates to Ordinances and Approval Process

The City addresses stormwater pollution through implementation of various components of its Municipal Code. The City's grading ordinance and JURMP Chapter 7 includes specific requirements for erosion prevention, seasonal restrictions on grading, slope stabilization, preservation of natural hydrologic features, and maintenance of all BMPs. The requirements of the 2007 Municipal Permit and the updated model SUSMP are also enforced by City staff through the review of grading plans and building permit applications. No changes were made to the City's project approval process during this reporting period.

3.4 Best Management Practice Requirements

The City requires BMP implementation at all construction sites to reduce and or eliminate the impact of discharges from construction site runoff on receiving water quality. Section 7.6 of the City's JURMP outlines the minimum construction BMPs required by the City. There were no changes to these requirements during this reporting period.

3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below. A discrepancy in the frequency of construction stormwater compliance inspections was observed in the City's JURMP and adjusted during this reporting period to reflect the 2007 Municipal Permit frequency of inspections.

3.5.1 Education and Staff Training

The City provides information regarding stormwater quality to project proponents, project personnel, employees, contractors, subcontractors, and other parties involved with construction activities. The following is a list of construction-related training activities that the City has provided or participated in during FY 2011-12:

- All new development and redevelopment project proponents attended preconstruction meetings that included education on stormwater management topics such as federal, state, and local regulations, compliance with grading ordinance, stormwater requirements, implementation of Stormwater Pollution Prevention Plans (SWPPPs), and implementation of BMPs.
- The City's inspector verbally notified construction site managers of enhanced construction BMP requirements prior to the rainy season and also prior to significant rain events during this reporting period.
- The annual construction inspector training was conducted during FY 2011-12.
- The City's Engineering Division participated in an overview of the City's construction program. The training session covered the inspection program, BMP

implementation, enforcement and other miscellaneous construction requirements including information on the new State of California General Construction Permit.

3.5.2 Construction and Grading Approval Process

The City requires that all proposed construction and grading projects implement measures to ensure that pollutants from the site will be reduced to MEP and will not cause or contribute to an exceedance of water quality objectives. Proponents of all construction and grading projects are required to comply with practices detailed in the City's JURMP Section 7.6 and the City's grading ordinance.

As previously mentioned, all new development and redevelopment project proponents are informed by City staff of stormwater management topics including federal, state, and local regulations, implementation of a SWPPP, if required, and implementation and maintenance of BMPs. The City also has an educational video covering construction site BMPs and stormwater management information that is available to the developer, owner, and contractor to view.

During FY 2011-12, all construction projects were required to undergo the approval process described above. These requirements are tracked by the City's staff as part of the routing and record-keeping database.

The City also continued implementing advanced treatment requirements during the reporting period as described in the Municipal Permit. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites. Advanced treatment methods were not required at any construction sites. Lastly, there were no construction sites that were greater than 17 acres that required additional erosion control and sediment control BMPs.

3.5.3 Inspection of Construction Sites

Construction inspections conducted during the reporting period were performed as described in the City's JURMP Chapter 7 and based on the frequency established in the 2007 Municipal Permit (high priority bi-monthly, medium priority monthly, and low priority as needed in the rainy season). A discrepancy was noted in the City's JURMP document for inspection frequency and it was adjusted during this reporting period to reflect the 2007 Municipal Permit requirements.

During the City's routine stormwater compliance inspections, inspectors discuss BMPs with each site project manager, developer, or owner and complete an inspection form for the high and medium TTWQ sites. Additionally, the City's building inspectors may forward non-compliant sites to the engineering inspector for follow-up inspections and enforcement.

Inspected construction sites, along with their TTWQ, the number of weeks the site was active within the rainy season, the number of inspections conducted during both the rainy and dry seasons, and the total number of inspections for each site is included with the inventory in Appendix A.2.

The City conducted 165 site visits and visual inspections at the eight active construction sites during FY 2011-12. Three of the eight sites were designated as medium priority TTWQ. Stormwater compliance inspection forms were only filled out for the medium priority construction sites at the frequency established in the 2007 Municipal Permit (monthly in the rainy season). Five of the eight sites were designated as low priority TTWQ and are required to be inspected as needed per the 2007 Municipal Permit. As noted above, the City's construction compliance inspection form is filled out for high and medium priority sites and not for the low priority sites; however, notes on some of the deficiencies for the low priority sites were included in the engineering inspector's journal. Many of the deficiencies observed during the site visits were corrected immediately.

It is worth noting that the City's small size and relatively low number of construction sites at any given time allow City staff to provide focused, personal attention to every active construction site with daily inspections and regular personal communication with project superintendents responsible for implementing and maintaining stormwater protection measures.

3.5.4 Enforcement Measures

The City's enforcement procedures require corrective actions when non-compliance is observed. Non-compliant sites receive a written or verbal Correct Work Notice and timeframe for compliance. They are also required to become compliant within one to three working days, unless rain is imminent, in which case a Stop Work Notice is issued immediately. Failure to install BMPs indicated in a Correct Work Notice within the appropriate timeframe results in issuance of a Stop Work Notice, and notification is sent to the RWQCB. Additional enforcement actions including revocation of permits, and issuance of citations also can be taken as necessary.

The City issued four verbal Correct Work Notices to four construction projects for stormwater BMP deficiencies during this reporting period. Table 3-1 describes each notice, along with the follow-up actions taken to correct the deficiency. Additional enforcement actions were not necessary during this reporting period.

3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

3.7 Program Review and Modification

A discrepancy was noted in the City's JURMP document Chapter 7 for inspection frequency and it was adjusted during this reporting period to reflect the 2007 Municipal Permit requirements. No other changes to the City's construction component were made during FY 2011-12.

Table 3-1
Enforcement Actions Taken at Construction Sites During FY 2011-12

#	Date	Project	Address	Type of Notice Issued	Resolution
1	October 2011	HAPPY TINNIE LLC	2889 ORANGE PLACE	Correct Work Notice: cover spoils (verbal)	Contractor Complied within 24 hours
2	January 2012	WALGREENS	7195 BROADWAY BOULEVARD	Correct Work Notice: concrete spill (verbal)	cleaned up, put in washout within 24 hours
3	January 2012	KROGER FOODS	7428 BROADWAY BOULEVARD	Correct Work Notice: re-establish construction entrance (verbal)	Contractor Complied within 24 hours
4	June 2012	IDA STREET DRAINAGE IMPROVEMENTS	IDA STREET CUL-DE-SAC	Correct Work Notice: cover spoil piles (verbal)	Contractor complied within 24 hours

4.0 MUNICIPAL

4.1 INTRODUCTION

Throughout FY 2011-12, the City of Lemon Grove continued to manage municipal areas and activities to reduce municipal discharges of pollutants to the MS4 and to the MEP. As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. Public parks and recreation facilities, administrative buildings, a fire station, and public works facilities make up the bulk of the municipal areas in the City. Municipal activities conducted by the City include power washing, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. These activities are conducted by City staff and or City contractors. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2. The City's municipal inspection results can be found in Table 4-3 and Sanitary Sewer Overflow (SSO) reports in Table 4-4. The City continued to respond to public stormwater related complaints at City Hall and the Public Works Yard. All stormwater related complaints made to the City are included in Appendix B; enforcement actions taken in response to complaint investigations are discussed in Section 4.8.

4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the municipal component of its stormwater program during the reporting period are provided in the remainder of Section 4.

- The City inspected 14 TTWQ fixed municipal facilities.
- The City performed nine special event inspections.
- The City conducted inspections at 23 restaurants for Fats, Oils, and Grease (FOG) program.
- The City reported five SSOs.
- The City responded to 37 stormwater related complaints.
- The City removed an estimated 147.15 tons of debris from street sweeping activities.
- The City removed an estimated 572.55 cubic yards of debris through standard MS4 cleaning activities.
- The City cleaned 100 percent of its sewer mains (67 miles) and video inspected 16.75 miles of its sewer main to locate blockages and areas of needed repair.
- The City conducted several in house training for Development Services and Public Works staff.

4.2 FIXED FACILITIES

4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category: fixed facilities. This is because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar.

4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included in the City's municipal inventory, which is included in this JURMP Annual Report as Appendix A.3. The designations of pollutants potentially generated by municipal facilities on the inventory are based on a pollutant loading potential table generated from the San Diego Region Copermittees' Baseline Long-Term Effectiveness Assessment report. The high TTWQ prioritizations are assigned based on criteria presented in the 2007 Municipal Permit.

4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs for fixed municipal facilities as set forth in the City's JURMP. City staff are trained to recognize the need for additional BMPs and implement them as necessary. The City maintains a contract with a landscape maintenance company, ensuring implementation of BMPs for the management of pesticides, herbicides, and fertilizers to be protective of water quality. Similarly City staff conducts some landscape maintenance activities and ensure implementation of Integrated Pest Management (IPM) principles. Public Works, Fire Station, and staff at other fixed municipal facilities in the City continue to implement BMPs appropriate to the facility type as described in the City's JURMP. Parking lots at fixed facilities are swept monthly. There have been no changes in BMP requirements for any fixed municipal facilities.

4.2.4 PROGRAM IMPLEMENTATION

Parks

During FY 2011-12, the City's Street Division and contractor continued to implement the BMPs described in its JURMP for the management and use of pesticides, herbicides, and fertilizers, including implementation of IPM principles. City staff and contractor implemented BMPs to control landscaping waste from parks and to keep City parks free of trash and other debris. Street sweeping was conducted in the parking lots at the parks on a monthly basis as part of their maintenance.

Public Works Yard, Fire Station, Other Fixed Facilities

As previously mentioned, City personnel continued to implement appropriate BMPs for fixed municipal facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance, such as landscaping and building maintenance, as necessary.

City staff implemented a series of BMPs to address the various activities conducted at the Public Works Yard. Monthly checklists are also used to maintain compliance with stormwater requirements. This facility, the fire station, and other fixed facilities receive annual inspections by stormwater staff as part of the City's stormwater municipal inspection program.

Municipal Inspections

Fourteen high TTWQ fixed municipal facilities received a formal annual inspection in FY 2011-12. There were an additional seven high TTWQ facilities and activities that were either not available for inspection or were inspected by staff on a regular basis that did not require a formal annual inspection. During this reporting period, City staff created and used a new inspection form based off of the City's existing industrial and commercial inspection form. The City's inspection approach, as described in the JURMP, was implemented for all inspections at fixed municipal facilities conducted in FY 2011-12. Inspected facilities and their associated corrective actions are included in Table 4-3. Inspections were also conducted at nine special events during this reporting period.

No municipal facilities, activities or special events were recommended for follow-up inspection based on routine municipal inspection results, but appropriate City staff members were notified of any recommended minor corrective actions. The City's municipal inspection form is included as Attachment 4.1.

4.3 Roads, Streets, and Parking Facilities

4.3.1 Background

The City conducts regular maintenance of roads, streets, and parking facilities in the City to control pollutants such as sediment, metals, and litter and debris.

4.3.2 Source Characterization

The City maintains 65.5 miles of roads and streets. Roads and streets are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

4.3.3 Best Management Practices

The City's primary BMP for roads, streets, and parking facilities is street sweeping; other BMPs are outlined in the JURMP. There were no changes to the BMPs implemented for roads, streets, and parking facilities in FY 2011-12.

4.3.4 Program Implementation

During FY 2011-12, 111.79 curb miles that comprises the City's sweeping route was swept at the appropriate frequencies. A cumulative total of 147.15 tons of debris was collected during this fiscal year. Table 4-1, below, describes the areas assigned high, medium, and

low sweeping priorities and the associated sweeping frequency. The City sweeps all major arterials every two weeks. Municipal parking lots and residential areas are swept monthly.

Table 4-1
Street Sweeping Prioritization and Frequency

Category	Description	Approximate Mileage of Route (curb miles)	Sweeping Frequency
High	Commercial Area Downtown	0.59 miles	Once a week
High	Main arterials/Business Areas/Residential	38.84 miles	Once every two weeks
Medium	Residential Areas	72.36 miles	Once every month
Parking Lots at Fixed Facilities	Seven Parking lots associated with fixed municipal facilities	147,979 square feet	Once every month
Total Amount of Debris Collected from Street Sweeping Activities: 147.15 tons			

Inspections
Trash, debris, and sediment that had accumulated on City streets is identified and cleaned up via street sweeping, so additional inspections beyond this effort are not necessary.

4.4 MS4

4.4.1 Background

The City's stormwater conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during rain events.

4.4.2 Source Characterization

The City's MS4, as one complete entity, is included in the City's high TTWQ municipal inventory. The City's MS4 consists of over 190 catch basins and drop inlets, 45 miles of underground drainage pipe, and approximately 2.5 miles of open channels.

4.4.3 Best Management Practices

The City maintained an MS4 inspection, maintenance, and cleaning schedule throughout the reporting period. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. BMPs for MS4 maintenance activities did not change during FY 2011-12.

4.4.4 Program Implementation

The City's MS4 inspection and cleaning schedule for FY 2011-12 is shown in Table 4-2. The City has approximately 2.5 miles of concrete and earthen channels within urban areas of the City that undergo routine inspections and maintenance as needed. Additional conveyances

are located on private property. The City does not maintain channels located on private property without dedicated easements. If maintenance of private channels is needed, the City requires the property owner to complete the maintenance.

Table 4-2
MS4 Maintenance Data

	Percent Inspected and or Cleaned*	Percent of Open Channels Found with Anthropogenic Litter	Amount of Material Removed by Cleaning Activities
Catch Basins/ Self-Cleaning MS4 Facilities	100%	N/A	Silt: 8.44 cubic yards Vegetation: 1.58 cubic yards Debris: 0.53 cubic yards
Concrete/ Earthen Channels	100%	100%	Silt: 0 cubic yards Vegetation: 500 cubic yards Debris: 62 cubic yards
Total Debris Removed From MS4 Maintenance Activities: 572.55 cubic yards			

* The City inspects 100% of the MS4 and cleans out all structures observed at or above 33% capacity at a minimum before the rainy season.

As described in Table 4-2, 572.55 cubic yards of material was removed during MS4 maintenance conducted in FY 2011-12. City staff involved in maintenance activities reported materials removed by category for each type of MS4 maintenance activity. The volumes were converted to estimated weights using the conversion factors of 2,300 pounds per cubic yard of sediment and silt and 400 pounds per cubic yard of vegetation, trash, and debris. The total vegetation collected was 200,632 pounds or 100.32 tons, total debris 25,012 pounds or 12.51 tons, and total sediment and silt 19,412 pounds or 9.71 tons. The total weight of material removed was estimated to be 122.5 tons.

All MS4 facilities were inspected and all inlets and catch basins observed at or above 33 percent capacity were cleaned before the rainy season. The remaining facilities were inspected and cleaned as needed throughout the fiscal year. Additional inspections beyond this effort, such as the formal inspections conducted for the fixed facilities, were not necessary.

4.5 Sanitary Sewer System

4.5.1 Background

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. A spill that introduces untreated sewage to receiving waters can contain high concentrations of bacteria, viruses, and even hazardous chemicals. Routine inspection and maintenance of the sanitary sewer system works to reduce the potential for a spill or SSO and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

4.5.2 SOURCE CHARACTERIZATION

The City maintains a system of public sanitary sewer facilities to convey wastewater from the City to be treated. The City's sanitary sewer system includes 67 miles of collection system and a lift station.

4.5.3 BEST MANAGEMENT PRACTICES

The City implements BMPs for the sanitary sewer system as per the City's JURMP. There have been no changes to these BMPs during FY 2011-12. The City inspects and maintains the sanitary sewer system as part of regular sanitation activities and clears blockages and repairs leaks as needed.

4.5.4 PROGRAM IMPLEMENTATION

The City continually inspects and maintains various aspects of the City's sanitary sewer system and cleans out or repairs any identified problem areas as necessary. The City continued to use a video camera to locate blockages, locate areas in need of repair, and identify any illegal connections during FY 2011-12. Identifying areas of the sewer system that require repair and making prompt repairs prevents those areas from becoming future seepage points or point of origin of an SSO. During FY 2011-12, the City used a video camera to inspect 16.75 miles of sewer mains to locate blockages and areas of needed repair. The City also cleaned 100 percent (67 miles) of its sewer mains during this reporting period. The City conducts monthly inspections at a City-owned lift station.

During FY 2011-12, the City continued to implement a FOG program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs. The City conducted FOG inspections at 23 eating establishments during FY 2011-12, and continued cross-referencing the City's business license database to verify that all grease-producing businesses are identified.

In case of an SSO, the City maintains a spill response plan that establishes procedures for responding to an SSO. There were five SSOs during FY 2011-12, which were appropriately reported through the California Integrated Water Quality System (CIWQS).

Table 4-4
FY 2011-12 Sanitary Sewer Overflows (SSO)

Date	Event ID	Location/Description	Volume
July 18, 2011, 11:00 am	768781	Private lateral cleanout in parking lot. 7155 Broadway, Lemon Grove, CA	220 Gallons
August 24, 2011	770584	City of San Diego Spill on Federal Blvd. 6588 Federal Blvd, Lemon Grove, CA	1,800 Gallons
December 22, 2011, 1:20pm	777399	Sewer Manhole (Mass Ave). 2211 Massachusetts Ave, Lemon Grove, CA	350 Gallons
March 7, 2012, 11:45 am	781944	Car Quest Auto Parts. 7702 Broadway, Lemon Grove, CA	540 Gallons
March 13, 2012, 7:30 pm	779418	Apartment Complex 3274 Main Street, Lemon Grove, CA	200 Gallons

4.6 Mobile Municipal Activities, Including Power Washing

4.6.1 Background

The City staff or contractors conduct a variety of mobile municipal activities, typically involving vehicle maintenance, landscape maintenance, street and sidewalk repair, and power washing. These activities are not confined to a specific location; as such, BMPs must be implemented wherever one of these activities is taking place.

4.6.2 Source Characterization

Emergency vehicle maintenance, landscape maintenance, power washing, and street and sidewalk repair are listed on the City's high TTWQ municipal inventory as mobile activities.

4.6.3 Best Management Practices

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel and contractors are trained to implement BMPs for the specific activity in which they are involved. The City's contractor continued to use a pressure-washing unit with a vacuum and debris boom to prevent discharge during pressure-washing operations. Contractor personnel performing power washing are trained to collect all waste water for proper disposal. City personnel and contractor conducting emergency vehicle maintenance activities are trained to use drip pans and other spill containment during emergency vehicle maintenance. City personnel and contractors for landscape maintenance are trained in IPM principles. Similarly, street and sidewalk repair personnel and contractors implement BMPs per the City's JURMP.

4.6.4 PROGRAM IMPLEMENTATION

Power washing (bus stop cleaning) and emergency vehicle maintenance are both high TTWQ activities. Neither power washing nor emergency vehicle maintenance was scheduled to be conducted during the timeframe that routine municipal inspections were conducted. BMPs are implemented during these activities to prevent discharge of any pollutants to the storm drain system. Wastewater from pressure-washing activities is not discharged to the MS4. Personnel responsible for these activities were contacted to discuss BMP implementation, and they confirmed the use of a vacuum and debris boom to prevent discharge of wastewater during cleaning activities. Similarly, City staff confirmed the use of spill kits and drip pans in the event of an emergency vehicle maintenance operation.

Municipal personnel and contractors that conduct other mobile activities such as infrastructure maintenance and landscape maintenance are trained regarding BMPs for material use and disposal during tail-gate meetings at the Public Works Yard. City personnel routinely inspect park facilities to ensure that the City's landscape maintenance contractor is implementing IPM principles and appropriate BMPs at municipal parks. City staff is trained to look for signs of over-irrigation, overspray of fertilizers and pesticides, and proper disposal of green waste. City staff and contractors will continue to be trained on appropriate BMPs for mobile activities as described in the City's JURMP.

4.7 SPECIAL EVENTS

4.7.1 BACKGROUND

As discussed in the City's JURMP, special events have the potential to generate trash and litter as a result of the patrons and activities of the special event. The City hosts several special events throughout the year. These events include annual bonfire, concerts in the park, and movies in the park, and other events for various causes and occasions.

4.7.2 SOURCE CHARACTERIZATION

As required by the Municipal Permit, special events are included on the City's high TTWQ municipal inventory.

4.7.3 BEST MANAGEMENT PRACTICES

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter and debris from the event, and raise stormwater awareness among the vendors and patrons of the event, as applicable.

4.7.4 PROGRAM IMPLEMENTATION

The City's minimum BMPs were in place for each special event in the City during FY 2011-12. Additionally, City staff was available throughout the duration of each event to address any immediate issues. Individuals applying for a permit (temporary use or encroachment permit) to hold an event on City property are notified that approval of the activity does not excuse compliance with City ordinances, including Chapter 8.48 of the Municipal Code Stormwater Management and Discharge Control (Storm Water Ordinance). Illegal discharges are prohibited and storm drain protection, trash BMPs, and appropriate storage of liquids are required.

During FY 2011-12, the City routinely inspected and cleaned-up during and after all nine special events, and took preventive measures as applicable. These events included six concerts held at Berry Street Park, two movies in the park at Lemon Grove Recreation Center, and a Bonfire at Civic Center Park. Additional trash receptacles were provided for the events to address litter and debris concerns.

4.8 PUBLIC REPORTING OF ILLICIT CONNECTIONS AND DISCHARGES

Reporting and Response

Public and municipal involvement is crucial to preventing and eliminating illicit connections and illegal discharges (IC/IDs) from the stormwater conveyance system. The Public Works and City Hall dispatch numbers provide effective means for individuals in the City to report suspected IC/IDs. All complaints received by the City are logged for documentation and tracking purposes. Each logged complaint is investigated by City personnel to determine if an IC/ID is present. Responsible parties for any confirmed IC/ID are sought out and educated and or cited as necessary and required to stop or clean up any and all illegal discharges.

Complaints received by the City during the FY 2011-12 reporting period and the City's response to each are listed in Appendix B. Thirty-seven complaints were documented this year.

Enforcement

As previously stated, complaints received by the City, are included in a table in Appendix B. The table also includes a description of how each complaint was resolved during the reporting period. Resolutions to investigated complaints included clean-up, discussing stormwater concepts with individuals involved in the complaint, and verbal warnings. Three verbal warnings and one written notice were given and no notice of violation was issued during this reporting period in response to stormwater related complaints received by the City. There are also three complaints that have not been fully resolved and are listed as *"In Progress"*.

4.9 Spill Reporting, Response, and Prevention

The City has documented procedures for preventing and responding to SSOs. Preventive maintenance is regularly conducted on the City's sanitary sewer system, and inspections are regularly conducted to monitor the condition of the public sewer mains and to determine the necessity of maintenance. Private lateral lines do not receive preventive maintenance, but the City assists in the containment and cleanup of sewer spills if the spill could potentially reach the City's MS4.

Individuals in the City are encouraged to report all SSOs. During the FY 2011-12 reporting period, there were five SSOs (Table 4-4). All SSOs were reported to the RWQCB via the CIWQS website.

4.10 Education and Outreach

During FY 2011-12, the City continued to educate municipal personnel regarding stormwater requirements and proper BMP implementation during several in-house training sessions. The City held five in-house training sessions for City personnel during this reporting period. City staff went over different sections of the JURMP including Municipal, Industrial, Commercial, and Construction chapters. Inspector training was also conducted as well as an in-house BMP refresher for Public Works staff. Detailed information regarding the education and outreach conducted for City personnel is provided in Section 8 of this Annual Report.

4.11 Municipal Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

4.12 Program Modification and Review

Minor updates were made to this component of the program. Updates were made to the municipal inventory to include pollutant loading potential. The length of storm drain pipe estimate presented in past annual reports was reduced from an estimated 75 miles to 45 miles based on City staff knowledge. A municipal inspection form similar to the industrial and commercial inspection form was developed for the fixed facilities inspections. A new special event inspection form and food vendor fact sheet will be developed and used in the next reporting period. Additional program modifications are anticipated for the next reporting period.

Table 4-3
Municipal Inspection Results

#	Facility Name	Facility Address	TTWQ	Facility Category	Inspection Date	Corrective Actions
1	Berry Street Park	7101 Mount Vernon Street	High	Recreational Park with Open Field	6/19/12	• No corrective actions noted.
2	Civic Center Park	7715 Church Street	High	Recreation, Museum, and Historic Site	6/19/12	• No corrective actions noted.
3	City Hall/Sheriff's Station	3232 Main Street/3240 Main Street	High	Administration and Public Safety and Jail	6/19/12	• No corrective actions noted.
4	Community Center	3146 School Lane	High	Public Service	6/19/12	• No corrective actions noted.
5	City Hall Annex	7853 Olive	High	Administrative Recreational Facility	6/19/12	• No corrective actions noted.
6	Emergency Vehicle Maintenance	Throughout City	High	Mobile Municipal Activities	*NA	• No corrective actions noted.
7	Fire Fighter's Park/Skate Park	School Lane/Central Avenue	High	Recreational Park, Skate Park and Open Field	6/19/12	• No corrective actions noted.
8	Kunkel Park	8171 Lemon Grove Way	High	Recreational Park	6/19/12	• No corrective actions noted.
9	Landscape Maintenance	Throughout City	High	Mobile Municipal Activities	*NA	• No corrective actions noted.

Table 4-3 (Continued)
Municipal Inspection Results

#	Facility Name	Facility Address	TTWQ	Facility Category	Inspection Date	Corrective Actions
10	Lemon Grove Fire Station	7853 Central Avenue	High	Fire and Safety	6/19/12	• Cover sandbag sand in parking lot. • Keep parking lot free of sediment.
11	Lemon Grove Park	Washington and Alton	High	Recreational Park	6/19/12	• No corrective actions noted.
12	Lemon Grove Senior Center	8235 Mount Vernon Street	High	Recreation, Nutrition, and Education	6/19/12	• No corrective actions noted.
13	Lemon Grove Little League Fields	Nichols and Glencoe	High	Recreational Park	6/19/12	• Keep parking lot free of sediment. • Increase frequency of lot sweeping. • Keep dumpster lids closed.
14	MS4	Throughout City	High	MS4	*NA	• No corrective actions noted.
15	Power Washing	Throughout City	High	Mobile Municipal Activities, Including Power Washing	*NA	• No corrective actions noted.
16	Public Works Yard	2873 Skyline Drive	High	Equipment Storage and Maintenance	6/19/12	• No corrective actions noted.
17	Recreation Center	3131 School Lane	High	Recreational Facility	6/19/12	• Increase frequency of trash removals. • Keep site free of litter.
18	Roads, Streets, and Parking Facilities	Throughout City	High	Roads, Streets, and Parking Facilities (Street Sweeping)	*NA	• No corrective actions noted.
19	Sanitary Sewer System	Throughout City	High	Sanitary Sewer System and Lift Station	*NA	• No corrective actions noted.
20	Special Events	Throughout City	High	Special Events	Various	• No corrective actions noted.
21	Street and Sidewalk Repair	Throughout City	High	Mobile Municipal Activities	*NA	• No corrective actions noted.

Municipal Inspection Results

#	Facility Name	Facility Address	TTWQ	Facility Category	Inspection Date	Corrective Actions
22	Trolley Depot	3443 Main Street	High	Office Space	6/19/12	• No corrective actions noted.

* These facilities and activities were either regularly inspected or did not occur during this reporting period or during regular working hours.

5.0 INDUSTRIAL AND COMMERCIAL

5.1 INTRODUCTION

During the FY 2011-12 reporting period, the City continued to implement its program to mitigate urban runoff pollution from industrial and commercial sites and sources. The City aims to reduce the amount of pollutants discharged from industrial and commercial facilities through various aspects of the industrial and commercial program.

5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Notable achievements for the industrial and commercial component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the industrial and commercial component of its stormwater program during the reporting period are provided in the remainder of Section 5.

- The City met the Municipal Permit requirement of inspecting at least 25 percent of its stationary industrial and commercial inventory.
- The City continued to inspect high TTWQ industrial and commercial facilities.
- Conducted training for City staff on the Industrial and Commercial Program.
- The City updated its prioritization process and developed a new updated inventory for both stationary industrial commercial facilities and mobile businesses.

5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES AND SOURCES ELEMENT

5.2.1 BACKGROUND

The City's updated industrial and commercial inventory (Appendix A.4) includes all stationary facilities known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, wholesalers, auto dealerships, auto repair shops, and restaurants. The City requires industrial and commercial businesses to implement pollution prevention measures and activity-specific minimum BMPs to mitigate the impacts of business activities on water quality.

5.2.2 SOURCE CHARACTERIZATION

As previously mentioned, the City's inventories include stationary industrial and commercial businesses, as required by the Municipal Permit. Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP.

The updated inventory presented in the FY 2010-11 JURMP Annual Report is what this reporting period's inspections are based on. However, it is worth noting that the updated inventory prepared for the FY 2012-13 as presented in Appendix A.4 in this report is based on a different prioritization flowchart that will be presented in the FY 2012-13 JURMP Annual Report. The new prioritization flowchart considered factors including those listed below when prioritizing the inventories:

- Subjectivity to coverage under the State of California Industrial General Permit, Order No. 97-03-DWQ (Industrial Permit)
- Consideration of downstream water body and whether the business is likely to discharge pollutants for which the water body is impaired
- Outdoor storage of material or activities
- Results from previous inspections and institutional knowledge
- Proximity to the receiving water body
- Municipal Permit requirements for prioritization of high TTWQ facilities

At the end of the FY 2011-12, the City updated its industrial and commercial inventory and prioritization flowchart. The list of all businesses with active business certificates was generated and prioritized to create a new and updated inventory. The City's updated inventory includes 324 stationary industrial and commercial facilities that will be used in the FY 2012-13 reporting period.

5.2.3 Best Management Practice Requirements

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other BMPs to reduce or potentially eliminate the generation of pollutants from business areas and activities. The City has established a set of minimum BMPs presented in Chapter 4 of the City's JURMP. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. No changes have been made to the City's BMP requirements during this reporting period.

5.2.4 Program Implementation

Industrial and Commercial Inspections

During FY 2011-12, the City conducted stormwater compliance inspections at selected stationary industrial and commercial facilities. The inspected facilities were selected by using the following criteria:

- High TTWQ facilities
- Facilities with History of Non-Compliance
- Inventory established FY 2010-11

Table 5-1 provides a summary of industrial and commercial site visits that occurred during FY 2011-12. The purpose of the City's inspection program is to confirm that the City's minimum BMPs are being implemented at stationary industrial and commercial facilities.

Table 5-1
Summary of Industrial and Commercial Inspections

Facility Category	Inventoried Sites	Inspections	Percentage Inspected
High TTWQ Sites	225*	59	26%
Totals	**225**	**59**	**26%**

*The number of facilities in the above table is based on the inventory established in the 2010-11 JURMP Annual Report and includes some mobile businesses.

Facility inspections were conducted in accordance with the protocol set in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. A training session on the industrial commercial inspection program was provided for staff conducting the City's industrial and commercial inspections. This training ensured the City met the Municipal Permit requirement for annual inspector training. More information about staff training is provided in Section 8 of this JURMP Annual Report.

BMP deficiencies and corrective actions were recorded on the City's industrial and commercial inspection form, which is included in the City's JURMP, and discussed with facility personnel present during the inspection. The City's industrial and commercial inspection form is included as Attachment 5.1. Table 5-2 provides a list of all facilities visited as part of the routine inspection program. The City completed 59 site visits with 50 facilities receiving full inspections.

During the inspection process, the City checked the Industrial Permit compliance status when applicable. The City also reviewed SWPPP and monitored results when applicable. There were no businesses observed to be in violation of the Industrial Permit.

The City did not rely on third-party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third-party inspection program.

General Industrial Permit

As previously mentioned, Industrial Permit compliance status was evaluated during the inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business' standard industrial classification (SIC) code(s). The inspector then evaluated Industrial Permit subjectivity based on the assigned SIC code(s). Violations of any aspect of Industrial Permit requirements were recorded on the standard industrial and commercial inspection form. There were no violations of any aspect of the Industrial Permit based on inspections conducted during this reporting period.

Education and Outreach

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to provide site-specific one-on-one education regarding stormwater concepts and BMPs. Inspectors discussed a variety of topics such as watershed concepts and the City's BMP requirements. Typically each inspected business that required corrective action was mailed a copy of the inspection form as a written record of the need for corrective actions observed at the time of inspection via post or electronic mail, as their preferences dictated. There were no significant recommended corrective actions during this reporting period based on inspection findings.

Enforcement

During FY 2011-12, none of the industrial and commercial facilities inspected were recommended for follow-up. In addition to the industrial and commercial stormwater compliance inspection program, the City regulates industrial and commercial facilities through complaints received by City's stormwater hotline. No complaints regarding stationary industrial and commercial facilities were received by the City's stormwater hotline (Appendix B).

5.3 Mobile Sources

5.3.1 Background

Due to the nature of activities of most mobile businesses, a major area of concern tends to be the potential for illegal discharges. In general, mobile businesses can be hard to identify, as many may not have City business licenses. Additionally, because many mobile businesses may be home based and activities do not occur in one fixed location, inspections of such facilities are impractical.

5.3.2 Source Characterization

Known mobile businesses described in the City's JURMP are included in Appendix A.5. The Regional Industrial and Commercial Workgroup also developed a web-based mobile business database for use by all Copermittees. The goal of developing this database is to allow Copermittees to share information about mobile businesses, which may be active in more than one jurisdiction. Appendix A.5 includes the mobile businesses presented in the 2010-11 Lemon Grove Annual Report combined with mobile businesses in the regional mobile business database.

5.3.3 Best Management Practice Requirements

BMPs for stationary industrial and commercial facilities, as discussed earlier in this section, are also required to be implemented for mobile activities, as applicable. BMPs applicable to mobile businesses, including key principles such as proper collection and disposal of any discharge, are discussed in the City's JURMP.

5.3.4 PROGRAM IMPLEMENTATION

The City continues to use business license records to identify mobile businesses located in or performing services within the City as well as the regional mobile business database. Complaints received by the City's stormwater hotline regarding mobile business activities also help the City identify mobile businesses. Complaints received by the stormwater hotline regarding insufficient BMP implementation by mobile businesses are responded to by code compliance officers or other City staff. During FY 2011-12, the City received no mobile business complaints.

Education and Outreach and Enforcement

During FY 2011-12, the City continued to use mobile business complaints as an opportunity for City personnel to discuss the BMP requirements of mobile businesses with the responsible party. There were no complaints or enforcement actions associated with mobile businesses this reporting period.

5.4 INDUSTRIAL AND COMMERCIAL COMPONENT EFFECTIVENESS ASSESSMENT

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

5.5 PROGRAM REVIEW AND MODIFICATION

The City used a new prioritization flowchart at the end of this reporting period to generate the industrial commercial inventory for the FY 2012-13 inspection program. The flowchart will be presented in the next annual report. The City also created a new mobile business inventory based on the City's 2010-11 JURMP Annual Report and the regional mobile business database. No other changes to its industrial and commercial inspection program were made during this reporting period.

Table 5-2
Industrial and Commercial Inspection Results

#	BUSINESS	STREET ADDRESS	TTWQ*	SIC Code	Hydrologic Area	Follow-Up Required?	Correction Status
1	ANTIQUE ROW CAFE	3251 LEMON GROVE AVE	High	5812	908.22	None

* Note that the TTWQ should coincide with the inventory established in the 2010-11 JURMP Annual Report. It will not coincide with the updated inventory presented in this report that will be used during the 2012-13 reporting period to conduct inspections.

6.0 RESIDENTIAL

6.1 INTRODUCTION

Eighty percent of land use in the City is residential. Due to the large residential area, activities that take place in residential areas have the potential to affect the quality of receiving waters. Residential activities such as vehicle washing, over-irrigation, and home maintenance can potentially contribute pollutants to the City's MS4 if BMPs are not implemented. Additionally, improper disposal of household hazardous waste (HHW) can also contribute pollutants to the City's MS4. The City has worked to implement a range of programs to address these high TTWQ residential activities with the goal of reducing pollutant loads associated with such activities. Pollutants of concern for Lemon Grove's watersheds include pesticides, metals, bacteria, and trash.

6.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the residential component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the residential component of its stormwater program during the reporting period are provided in the remainder of Section 6.

- The City has a contract with the City of La Mesa to use their permanent HHW collection facility; 97 participants from the City properly disposed of 570 pounds of HHW during the eight HHW events held during this reporting period.
- The City's Used Oil Recycling Program was available at five locations in Lemon Grove (O'Reilly Autoparts, DCH Honda of Lemon Grove, Bob Baker Toyota Scion, Autozone, and EDCO Waste & Recycling Services (EDCO)) with 15,425 gallons of used oil collected. Additionally, a Used Oil Filter Exchange event was held on February 18, 2012 in Lemon Grove.
- The City issued two editions of *The Grove Gazette* (Summer 2011 & Spring 2012) with dedicated pages to environmental concerns. The City's newsletter was distributed electronically to 411 residents and is available to residents on the City's website.
- I Love a Clean San Diego (ILACSD) conducted six presentations for adults and youths focused on pollution prevention. They also managed the Recycling and HHW Hotline and Database used by 52 residents this fiscal year.
- *A Day without a Bag* was held in the City with 750 reusable bags distributed at three locations on December 15, 2011.
- Residents of the City participated in Creek to Bay Cleanup and Spring Cleanup events on April 28, 2012.
- The City continued to promote the use of the stormwater hotline for residents to call in potential violations of the City's stormwater ordinance.

6.2 SOURCE CHARACTERIZATION

The City has identified high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities, which are discussed in the following subsections.

6.2.1 HIGH THREAT TO WATER QUALITY ACTIVITIES

During the FY 2011-12 reporting period the City continued to identify the following residential activities as high TTWQ:

- Automobile repair and maintenance,
- Automobile washing,
- Automobile parking,
- Home and garden care activities and product use, and
- Disposal of trash and pet waste.

6.2.2 HIGH THREAT TO WATER QUALITY AREAS

In addition to high TTWQ activities, the City has identified several residential areas that pose a high TTWQ. High TTWQ residential areas are designated by considering complaint investigations, institutional knowledge, data from the City's Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program), and criteria as defined in the Municipal Permit. Residential areas that have not been designated as high TTWQ but may be sources of pollutants are also monitored by the City.

The City has mapped out areas identified as high TTWQ. The maps delineate the residential areas described below, and a series of smaller maps provide more detail about each individual area. Public Works staff is aware of these high TTWQ locations and routinely monitor these areas.

Westview Place Residential Area
Located in the northern section of the City, Westview Place has been deemed by City staff as a high TTWQ residential area. Significant amount of trash and debris is regularly observed on this street by City staff. Storm drain inlets eventually flow to Chollas Creek from this area.

San Altos Place Residential Area
Located in the southern section of the City, San Altos Place has been deemed by City staff as a high TTWQ residential area. Significant amount of trash and debris is regularly observed in a swale just east of the street. Illegal dumping is a common occurrence in the swale.

Ensenada Street Residential Area
Located in the southeast section of the City, Ensenada Street has been deemed by City staff as a high TTWQ residential area. Significant amount of trash and debris is found in the

creek that runs parallel to the street. Illegal dumping may be a source of the trash and debris observed in the creek.

6.3 Best Management Practice Requirements

The City has continued to provide information regarding the implementation of pollution prevention measures, such as good housekeeping practices, for residential areas and activities. General residential BMPs include conscientious automotive maintenance and care, erosion control, and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Other residential BMPs include non-stormwater discharge management, including elimination of IC/IDs. There have been no changes to the City's residential BMP requirements.

6.4 Program Implementation

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting are conducted to ensure that the required BMPs are implemented. This minimizes pollutants associated with residential activities and areas. The residential program has an education component so that residents are made aware of appropriate BMPs, including pollution prevention methods that should be used during certain activities.

6.4.1 Training, Education, and Outreach

The City has continued to conduct training, education, and outreach activities for residents, which are described below.

***The Grove Gazette* Newsletter Articles**

The City publishes environmental articles in *The Grove Gazette* newsletter. Both newsletters published during the reporting period contained articles on stormwater pollution prevention. An electronic copy of each edition was provided to 411 residential subscribers within the City. Each issue was also available on the City's website. The stormwater-related articles published in FY 2011-12 are summarized below. All newsletters published during FY 2011-12 reporting period are included as Attachment 6.1 & 6.2.

The Summer 2011 newsletter contained the following stormwater-related and general environmental articles and announcements:

- "IT'S ALMOST HERE" reminded residents of stormwater pollution prevention measures. Good housekeeping measures and BMPs were presented in the article to better manage pollutants such as pesticides and fertilizers, trash and debris, pet waste, and erosion control.
- "ANTS!! A COMMON SUMMERTIME ANNOYANCE IN SOUTHERN CALIFORNIA" informed residents and businesses how to address ant infestations without using harmful pesticides that can be released into the environment and impact water quality.

- "CITY OF LEMON GROVE STORMDRAIN HOTLINE" reminded residents to contact the City's stormwater hotline number to report illegal dumping and other stormwater pollution concerns within the City.
- "RECYCLING CONSTRUCTION & DEMOLITION DEBRIS, SAN DIEGO COUNTY'S ULTIMATE RECYCLING SOURCES, FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL, HOUSEHOLD HAZARDOUS WASTE RECYCLING, FREE E-WASTE RECYCLING FOR RESIDENTS AND BUSINESSES" reminded residents of proper waste disposal in support of pollution prevention. All the aforementioned articles have stormwater pollution prevention benefits and are included in Attachment 6.1.

The Spring 2012 newsletter contained the following environmental articles and announcements:

- "I LOVE A CLEAN SAN DIEGO" article presented general information on the organization and also advertised the Creek to Bay Cleanup Day and cleanup site in Lemon Grove held on April 28, 2012.
- "SPRING CLEANUP DAY" informed residents of the April 28, 2012 self-haul cleanup event sponsored by EDCO. Residents were able to dispose of large items or unwanted household materials (not including HHW) free of charge.
- "FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL, HOUSEHOLD HAZARDOUS WASTE RECYCLING, FREE E-WASTE RECYCLING FOR RESIDENTS AND BUSINESSES" reminded residents of proper waste disposal in support of pollution prevention. All the aforementioned articles have stormwater pollution prevention benefits and are included in Attachment 6.2.

Other Educational Outreach Materials and Activities

Educational materials were distributed during community events to further encourage pollution prevention measures and to increase knowledge about stormwater. Efforts further included six adult and youth presentations by ILACSD on stormwater pollution prevention using the hands-on watershed model, waste reduction, proper waste disposal and recycling.

ILACSD also maintained the Recycling and HHW Hotline and Database on behalf of the City. This service helped residents with recycling and proper waste disposal questions. A total of 52 residents used this service during this fiscal year.

The City continued to provide stormwater information and contacts on its website (http://www.lemongrove.ca.gov/) and Facebook. The City's stormwater hotline provided a medium for City residents and business owners to obtain stormwater information and file stormwater related complaints.

Residents were also encouraged to participate in local activities to improve water quality, such as the Creek to Bay Cleanup event and EDCO sponsored cleanup events and HHW

drop offs, and recycling programs advertised in *The Grove Gazette*. More information regarding the City's public participation is included in Section 9 of this report.

6.4.1.1 Public Events

HHW Events

The City has a contract with the City of La Mesa to use their permanent collection facility for HHW and electronic waste. Residents must make an appointment with EDCO on select dates to drop of HHW. Ninety-Seven residents made appointments to drop off HHW. A total of 570 pounds of HHW was collected at this facility during eight events held during the fiscal year. For home-bound residents, door-to-door pickup services were provided.

BERRY STREET PARK CLEANUP Events

A group of two to four City residents participated in weekly cleanup of Berry Street Park during this fiscal year. The residents met at the park once a week for an estimated period of eight months to pick up trash to help keep the park free of trash and debris.

A DAY WITHOUT A BAG Event

The City contracted with ILACSD to coordinate the regional *Day without a Bag* campaign within the City on December 15, 2011. Reusable bags were distributed at three targeted locations in Lemon Grove: *Food 4 Less*, *City Hall*, and *The 99 Cent Only Store*. An estimated 750 reusable bags were distributed to City residents.

CHRISTMAS TREE RECYCLING Event

EDCO provided roll-off bins to encourage residents to properly dispose of their Christmas Trees. The event was held from December 26, 2011 through January 16, 2012. The roll-off bin was located at Central Avenue and Olive Street near City Hall.

USED OIL FILTER EXCHANGE Event

The City contracted with ILACSD to host a used oil filter exchange event on February 18, 2012. O'Reilly at 6925 Federal Boulevard was the drop off site from 9:00 a.m. to 12:00 p.m. A total of 14 filters were exchanged and 11 oil pans distributed. The event was published in the local *Penny Saver*. The City's five Used Oil Recycling Program collection centers (O'Reilly Autoparts, DCH Honda of Lemon Grove, Bob Baker Toyota Scion, Autozone, and EDCO) continued to collect used motor oil during the FY 2011-12 reporting year. A total of 15,425 gallons of used motor oil was dropped off at O'Reilly Autoparts and AutoZone.

CREEK TO BAY CLEANUP Event

The City hosted a cleanup site for the annual Creek to Bay Cleanup held on April 28, 2012. The site location was at Federal Boulevard and San Miguel Avenue, and Federal Boulevard and Central Avenue. There were 42 volunteers, including residents from the City. An estimated 1,486 pounds of trash and 213 pounds of recyclables were collected during the cleanup event. The City's Management Analyst introduced the cleanup site to volunteers, discussed watershed concepts inclusive of Total Maximum Daily Loads (TMDLs) and stormwater pollution prevention measures.

SPRING CLEANUP Event

EDCO hosted Spring Cleanup Day on April 28, 2012 from 7:00 a.m. to 4:00 p.m. The City advertised this event to Lemon Grove residents on the City's website and newsletter. An estimated 770 vehicles from the City participated in this event with 413.13 tons of debris collected.

6.4.2 Compliance and Enforcement

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the stormwater hotline, and observations made by the City's municipal personnel. If a potential to affect water quality is present, the City can provide a verbal warning, written warning, order to abate or correct, or monetary fines as applicable.

The City received nine residential-related complaints during this reporting period. Two of the nine received verbal warnings and one received a written letter from the City. Many of the verified complaints involved residents who were unaware of residential BMPs. The City's Code Compliance Officer educated residents during the complaint investigation. Public Works staff also cleaned areas in the public right of way as necessary to resolve complaints. The resolutions of all residential complaints are provided in Appendix B of this JURMP Annual Report.

6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

6.6 Program Review and Modification

The addition of three high TTWQ residential areas was added during this reporting period. No other changes to the residential component of the City's JURMP were made during the reporting period.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

7.1 INTRODUCTION

In accordance with the September 10, 2008, RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the FY 2011-12 Illicit Discharge Detection and Elimination (IDDE) section and attachments to the RWQCB no later than December 15, 2012.

8.0 EDUCATION

8.1 INTRODUCTION

During the FY 2011-12, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, and residents. The City aims to reduce stormwater pollution by increasing awareness about the stormwater conveyance system and promoting the implementation of BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community.

8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the education component of its stormwater program during the reporting period are provided in the remainder of Section 8.

- Five municipal staff trainings were conducted during this reporting period.
- The City's newsletter, *The Grove Gazette*, featured several articles highlighting stormwater and other relevant environmental topics in the Summer 2011 and Spring 2012 editions. These newsletters were made available to businesses and residents on the City's website.
- City staff provided education outreach at the Creek to Bay Cleanup in April 2012.
- ILACSD conducted six presentations for adults and youths focused on pollution prevention.

8.2 STAFF TRAINING ELEMENT

The City has provided training and educational outreach to its municipal personnel. Many municipal personnel are out in the field on a daily basis; as such, it is important that they understand the importance of implementing BMPs. Additionally, municipal personnel are encouraged to report any IC/IDs observed to the appropriate City staff and to educate other municipal personnel and the general public about stormwater pollution prevention. City staff provided five training sessions to other City staff during the fiscal year. In addition to the formal training sessions, City stormwater staff regularly provided guidance to other City staff on implementation of stormwater requirements. Table 8-1 includes all training sessions that were provided for various municipal staff and departments during FY 2011-12.

Table 8-1
Municipal Training Sessions

Date(s)	Event	Topic(s)	Number of Participants
5/08/12	NPDES Stormwater Training	Review Municipal Chapter of JURMP	5
5/22/12	NPDES Stormwater Training	Review Industrial/Commercial Chapter of JURMP	6
5/31/12	NPDES Stormwater Training	Review Construction Chapter of JURMP	5
6/19/12	NPDES Stormwater Training	Annual Construction Inspector Training	1
6/29/12	NPDES Stormwater Training	BMP Refresher at Public Works Yard	8

In addition to the training sessions discussed above, Public Works staff are aware of the high TTWQ residential areas, as discussed in Section 6 of this JURMP Annual Report.

8.3 EDUCATIONAL OUTREACH ELEMENT

In addition to municipal staff, the City has continued to provide education and outreach to industrial and commercial businesses, construction site owners and developers, and residents. These efforts promote stormwater awareness and BMP implementation and are discussed in the following subsections.

8.3.1 INDUSTRIAL AND COMMERCIAL BUSINESSES

As required by the Municipal Permit, the City inspects its inventoried businesses to evaluate compliance with the City's BMP requirements and provides site-specific education outreach to business owners and operators. Results of the inspections conducted in FY 2011-12 are discussed in Section 5 of this report. Each facility inspected received verbal education on stormwater issues and recommended corrective actions.

During the FY 2011-12 reporting period, the City's newsletter, *The Grove Gazette*, featured several stormwater-related articles (Attachment 6.2). The newsletters were made available on the City's website. Details about the newsletters can be found in Section 6 of this report.

8.3.1.1 MOBILE BUSINESSES

Mobile businesses, such as mobile car detailers or power washers, may present threats to water quality due to the nature of their business activities and the possibility of prohibited non-stormwater discharges if proper BMPs are not implemented. Mobile businesses are not confined to a single area and many may not have City business licenses, making them difficult to identify. The City keeps track of mobile businesses that are discovered through business licenses and during field inspections. Mobile businesses are directed to the *project clean water mobile business toolbox* for site specific BMPs.

8.3.2 Construction Site Owners and Developers

During the project design process, City Development Services staff work closely with developers and project engineers to ensure requirements are understood prior to and during the review process. SUSMP regulations and BMP information included in the City's JURMP are also made available at the front counter of Development Services.

Due to the nature of activities, construction sites have the potential to discharge various types of pollutants to receiving waters if not managed properly. To ensure that construction site owners, contractors, and developers are abiding by regional and federal regulation, new development and redevelopment project proponents are required to attend a preconstruction meeting that includes education on stormwater management topics. These meetings include federal, state, and local regulations, implementation of a SWPPP, if required, and implementation and maintenance of BMPs.

8.3.3 Residential Areas

Distribution of Educational Material

Since residential areas make up a large portion of Lemon Grove, the City understands the importance of reaching this particular audience through educational outreach programs. The City continued to publish and post the *The Grove Gazette* newsletter (Attachment 6.2) on the City's website and inform 411 resident subscribers. Two editions of *The Grove Gazette* (Summer 2011 and Spring 2012) were published during FY 2011-12. As detailed in Section 6, several stormwater and relevant environmental articles were included in the newsletters that were posted on the City's website.

The City website, http://www.lemongrove.ca.gov/, is another way in which City residents can become familiar with the design and intended use of the storm drain system, minimum BMPs for various high TTWQ activities, reporting illegal dumping, and City contact information.

Training Events

During FY 2011-12, ILACSD provided six presentations to students at four elementary schools and at the Lemon Grove Public Library. The presentations were interactive and used the hands-on watershed model to discuss topics including pollution prevention, waste reduction, recycling, and used motor oil recycling. A total of 398 students and adults attended these presentations. Table 8-2, below, includes the locations and number of presentations delivered to the select student groups.

Table 8-2
ILACSD Stormwater Presentations

Date	Location	Description
10/6/2011	Lemon Grove Library	Pollution Prevention Presentation with 18 Youth/Adults
5/30/12	San Miguel Elementary	1 Pollution Prevention Presentation, 3rd Graders with 90 Participants
6/04/12	Mount Vernon Elementary	1 Pollution Prevention Presentation, 5th Graders with 70 Participants
6/11/12	San Altos Elementary	1 Pollution Prevention Presentation, 3rd-4th Graders with 105 Participants
6/11/12	Monterey Heights Elementary	1 Pollution Prevention Presentation, 2nd Graders with 80 Participants
6/18/12	Mount Vernon Elementary	1 Pollution Prevention Presentation, 5th Graders with 35 Participants

8.3.4 Underserved Communities

The City of Lemon Grove is focusing on identifying underserved communities based on demographic and socioeconomic data provided by San Diego Association of Government. Once identified, education outreach efforts can be developed for the various underserved communities.

8.3.5 Complaint Investigations

To further aid the process of identifying illicit discharges, the City encourages the public and City staff to report IC/IDs to the City's stormwater hotline. All complaints are investigated by City staff. If a representative for the reported business, residential address, or construction site is present, the inspector will provide one-on-one verbal education about the complaint and stormwater in general. Pollution prevention concepts are emphasized, and educational materials are distributed as applicable. The City received 37 complaints during this reporting period.

8.4 Outreach Component Effectiveness Assessment

The estimated number of impressions made by the City's education and outreach efforts during FY 2011-12 is presented and described below.

Impressions Made
As discussed in this section, the City has continued to provide stormwater-related education to different audiences in the City through inspections, newsletter articles and during events throughout the year. The City calculates an estimate of impressions based on the number and type of educational materials distributed. Estimates of impressions generated by the City's efforts allow for a more realistic evaluation of the effectiveness of the NPDES stormwater program.

The estimated number of impressions was generated by multiplying each effort by the number of impressions thought to be generated by that particular effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections. Municipal inspections generally involve more people and are assumed to generate five impressions. Training sessions and cleanup events have been assumed to generate a number of impressions equal to four times the number of attendees because it is likely that the attendees will discuss the content with others after the training session or event. Printed educational materials distributed are assumed to generate three impressions each. Table 8-3, below, details the number of impressions made by the City during this reporting year.

Table 8-3
Impressions Made by the City

Impression Type	Count	Unit	Estimated Impressions
Industrial And Commercial Inspections	59*	Inspections	150
Municipal Inspections	14	Inspections	70
Municipal Staff Training Sessions	25	Attendees	100
School Presentations	398	Attendees	1,592
Creek To Bay Cleanup	42	Participants	168
HHW Drop Off Events	97	Participants	388
Used Oil Filter Exchange Event	14	Participants/Filters Exchanged	56
Day Without A Bag Event	750	Participants/Bags Distributed	3,000
The Grove Gazette Newsletter (Summer 2011 & Spring 2012)	411	Subscribers	1,233
Total City Impressions			***6,757***

Note:
*Nine Industrial and Commercial inspections were of facilities no longer in business; therefore, the nine inspections may not count towards impressions.

Please refer to Section 11 of this JURMP Annual Report for the remainder of the effectiveness assessment for this program component.

8.5 Program Review and Modification

No significant changes to the education component of the City's JURMP were made during FY 2011-12.

9.0 PUBLIC PARTICIPATION

9.1 INTRODUCTION

The City encourages public participation in the City's JURMP as a means to develop stormwater awareness and improve water quality. Public participation includes, but is not limited to, clean-up events, special community projects, reporting observed IC/IDs, and participating in City-hosted waste disposal and collection events. Collaboration between the City and the community should help foster a sense of shared responsibility in protecting water quality both locally and regionally. The City has encouraged public participation through the programs discussed in this section.

9.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the public participation component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the public participation component of its stormwater program during the reporting period are provided in the remainder of Section 9.

- City sponsored and coordinated with ILACSD to host the Creek to Bay Cleanup Event in April 2012. Forty-two volunteers collected 1,486 pounds of trash and 213 pounds of recyclables.
- Volunteers continued cleanup Berry Street Park on a weekly basis during the majority of the reporting period.
- The City's year-round HHW collection facility received 570 pounds of HHW from approximately 97 visits by City residents.
- The City's collected 15,425 gallons of used motor oil at the City's used oil recycling program collection centers. The City contracted with ILACSD for a used oil filter exchange event with 14 filters being exchanged.
- Spring Cleanup event and a self-haul clean-up event were hosted by the City in conjunction with EDCO. The events allowed residents to dispose of large items, unwanted household materials (not including HHW), and green waste free of charge. A total of 770 vehicles from the City participated in this event and 413.13 tons of debris was collected.
- The City sponsored and coordinated with ILACSD to participate in the regional *Day Without A Bag*-750 reusable bags were distributed to City residents.

9.2 PUBLIC PARTICIPATION ACTIVITIES

CREEK TO BAY CLEANUP Event

The City sponsored and coordinated with ILACSD to host a cleanup site on April 28, 2012. Information on how to participate was posted on ILACSD's website, the City's website and

Facebook page, and posters advertising the event at City Hall and Lemon Grove Public Library. Forty-two volunteers participated in the event, collecting 1,486 pounds of trash and 213 pounds of recyclables.

BERRY STREET PARK CLEANUP Events

Several residents participated in removing trash and debris from Berry Street Park on a weekly basis for an estimated period of eight months during this reporting period. The volunteers met on the weekends and walked through the park picking up litter to keep the park clean.

HHW Events

The City in conjunction with EDCO, hosted eight HHW drop off events during this reporting period. Although the City does not host the event within its jurisdiction, the City continues to contract with the City of La Mesa to use their permanent collection facility for HHW and electronic waste. A total of 97 City residents made appointments to drop off HHW at the EDCO HHW collection facility in the City of La Mesa. An estimated 570 pounds of HHW was collected during this FY 2011-12.

USED OIL FILTER EXCHANGE Events

The City hosted a used oil filter exchange event during this reporting period. The event was advertised in the local *Penny Saver* and held at O'Reilly at 6925 Federal Boulevard on February 18, 2012. A total of 14 filters were exchanged and 11 oil pans distributed. Additionally, the City's five Used Oil Recycling Program collection centers collected 15,425 gallons of used motor oil during this reporting period.

SPRING CLEANUP Event

The City hosted the annual Spring Cleanup event, a self-haul cleanup, on April 28, 2012 to encourage proper disposal of unwanted bulk items and other refuse. The City's waste hauler, EDCO, coordinated the event for Lemon Grove residents to drop off any unwanted trash and debris, excluding HHW, free of charge. An estimated 770 vehicles from the City participated in this event with 413.13 tons of debris dropped off at the EDCO facility.

CHRISTMAS TREE RECYCLING Event

EDCO provided roll-off bins at Central Avenue and Olive Street near City Hall to encourage residents to dispose of their Christmas Trees appropriately. The event was held from December 26, 2011 through January 16, 2012. EDCO advertised the event in its local newsletter to encourage public participation.

PUBLIC REPORTING

As discussed in Section 4, complaints are received through the City's stormwater hotline and through the City's Public Works Department. The number for the hotline is advertised in articles published in *The Grove Gazette* newsletter and on the City's website. The residential, industrial and commercial, construction, and municipal communities are encouraged to use the hotline to report IC/IDs. The City investigates each complaint and tracks the complaint and follow-up actions, as applicable. A total of 37 complaints and service requests were made and responded to during FY 2011-12.

9.3 Outreach Events

The City has continued to provide educational outreach programs for a variety of different communities in the City. Since it is an effective way of reaching large numbers of individuals, educational outreach is typically associated with an event. Another outreach event in the City included the City's participation in regional meetings and workgroups.

CREEK TO BAY CLEANUP Event

On April 28, 2012, San Miguel Avenue and Central Avenue at Federal Boulevard were selected for cleanup as part of the statewide California Creek to Bay Cleanup event. The event was sponsored by ILACSD and 42 volunteers participated in the event as presented in Section 9.2. Prior to commencing with the site cleanup, City staff conducted education outreach to the volunteers by introducing watershed concepts, TMDLs, and stormwater pollution prevention measures.

DAY WITHOUT A BAG Event

On December 15, 2011, the City participated in a region-wide effort to encourage the use of reusable shopping bags. The event included free reusable bag giveaways along with tips for remembering to bring reusable bags when shopping. Two retailers in the City (*Food 4 Less* and *The 99 Cent Only Store*) and City Hall participated in the event, and distributed 750 reusable bags. This event promoted waste reduction in the Lemon Grove community.

STORMWATER COPERMITTEE MEETING AND OTHER CITY PARTICIPATION

City personnel attended and were active in various stormwater Copermittee workgroups during FY 2011-12. The workgroups provide a forum for representatives from various jurisdictions within San Diego County and other interested parties, including the general public, to exchange information and ideas regarding the management of stormwater programs. The City participated in many Copermittee meetings and workgroups. These meetings will continue to be attended by City personnel during the FY 2012-13 reporting period. The City is also a member of the stakeholder advisory group for the Chollas Creek pesticide, metals, and bacteria TMDLs, which includes representatives of Caltrans, the United States Navy, the Port of San Diego, County and City of San Diego, and the City of La Mesa.

9.4 Public Participation Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

9.5 Program Review and Modification

No changes were made to the public participation component of the City's JURMP during the reporting period.

10.0 FISCAL ANALYSIS

10.1 INTRODUCTION

The City relies on several funding sources to support implementation of the Stormwater Program; however, the primary funding source is the City's General Fund. Other funding sources to assist offsetting the use of the General Fund include fees on building, residential and commercial pollutant sources. The City's Sanitation Fund and AB939 trash fee support multiple programs including implementation of the stormwater program.

During FY 2009-10, a fiscal analysis reporting template was developed collectively by the Copermittees. Fiscal information from FY 2011-12 is reported in the tables below, which follow the standard format adopted by the Copermittees.

Table 10-1
Expenditure Summary

JURISDICTIONAL COMPONENTS	
Administration	$35,270
Development Planning	$2,100
Construction	$7,439
Municipal	$67,340
Industrial and Commercial	$2,537
Residential	$6,755
IDDE	$19,375
Education	$2,250
Public Participation	$1,658
Special Investigations	$0
Non-Emergency Firefighting	$0
Jurisdictional Total	**$144,724**

WATERSHED And TMDL	
San Diego Bay Watershed	$895
Chollas Creek TMDLs	$49,991
Watershed And TMDL Total	**$50,886**

REGIONAL	**$37,865**

TOTAL COSTS	**$233,475**

Table 10-2
Fund Summary

FUNDING BY SOURCE	
General Fund	$162,012
Sanitation	$4,660
Commercial Fee	$44,929
Building Permit Cost Recovery	$8,370
Residential Fee	$2,841
AB 939 Fee	$10,663
Total	**$233,475**

Table 10-3
Watershed Urban Runoff Management Program (WURMP) Expenses

	San Diego Bay Watershed	Chollas Creek TMDL
Administration	$288	$900
Cost Share Contribution	$463	$48,947
Watershed Activities	$144	$144
SUBTOTAL	**$895**	**$49,991**
TOTAL		**$50,886**

Table 10-4
Regional Urban Runoff Management Program (RURMP) Expenses

Regional Programs	Jurisdictional Cost
Administration	$760
Cost Share Contribution	$28,305
RWQCB Annual Permit Fee	$8,800
TOTAL	**$37,865**

11.0 EFFECTIVENESS ASSESSMENT

11.1 INTRODUCTION

The City regularly evaluates its stormwater program to make it as effective as possible at reducing discharges of urban runoff related pollution to the MEP. The overall structure of the City's stormwater program has three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes as well as ways to measure those outcomes. Next, the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

Based on participation in regional efforts and its experience implementing its JURMP, the City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation.

The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge and Awareness
Level 3: Behavioral Change and BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

11.2 EFFECTIVENESS ASSESSMENT RESULTS

The Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes are discussed in Section 11.2.1. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in California

Stormwater Quality Association (CASQA) effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome Level Assessments

Level 1

Level 1 outcomes are essentially measures of Municipal Permit compliance. The component-specific sections in this JURMP Annual Report provide details of programmatic actions taken to comply with the applicable Municipal Permit requirements. Appendix C of this JURMP Annual Report also includes a checklist that matches the Municipal Permit's annual reporting requirements with the section(s) or appendix of this report that addresses each requirement.

The City's Management Analyst is responsible for coordinating with various staff in the City who have stormwater responsibilities, such as engineers, planners, and public works maintenance staff. Modifications have been made to improve the effectiveness of the implementation of several components of the City's stormwater program since the new Management Analyst was hired.

Levels 2 and 3

See Tables 11-2 through 11-9 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Please note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included. For example, see Figure 11-1 and Figure 11-2 for industrial and commercial business assessments of knowledge and BMP implementation, respectively.

Level 4

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load estimation methods have not yet been developed.

Level 5

The Dry Weather Monitoring Program is the City's primary mechanism of measuring the quality of discharges. Table 11-1 below presents historical dry weather data with percent of exceedances per year. The last three years has shown only one site out of 15 dry weather monitoring sites as having an exceedance of nitrate. The remaining constituents have been below the established Dry Weather Monitoring Program action levels. Bacteria results from the past three Dry Weather Monitoring Seasons have demonstrated a significant improvement, with no exceedances.

Table 11-1
Dry Weather Monitoring Historical Data
Percent of Sites With Exceedances Per Year

Year	Field Screening								Laboratory Analyses				
	Number of Field Screening Sites	pH	Turbidity	Conductivity *	Surfactants	Ammonia-N	Nitrate-N	Orthophosphate-P	**Number of Laboratory Sampling Sites**	Diazinon	Total Coliforms **	Fecal Coliforms **	Enterococci **
2002	15	7	7	27	7	33	13	13	4	0	0	0	0
2003	15	0	0	53	0	7	13	0	4	25	75	75	0
2004	15	0	0	0	7	7	7	0	4	0	50	25	25
2005	15	0	0	0	7	0	27	0	4	0	75	25	25
2006	15	0	0	0	7	7	13	0	4	0	75	25	0
2007	15	0	0	0	0	0	20	0	4	0	25	0	0
2008	15	0	0	0	0	0	7	0	4	0	50	25	25
2009	15	0	7	0	7	7	7	7	4	0	25	25	0
2010**	15	0	0	0	0	0	7	0	4	0	0	0	0
2011	15	0	0	0	0	0	7	0	4	0	0	0	0
2012	15	0	0	0	0	0	7	0	4	0	0	0	0

Notes:
Results are based on complete routine visits only. Confirmation visits, follow-up visits and dry sites not included.
*By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgement in order to account for sites in which salt water and groundwater increase the conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

**Note that dry weather action levels for bacterial indicators were revised in 2010. Constituents have been compared to action levels in effect at the time of sampling to identify exceedances.

Level 6

The City recognizes the importance of protecting water quality of receiving water bodies in and around the City, and continues to participate in regional monitoring efforts. The long-term trend monitoring station in the Chollas Creek subwatershed, referred to as a mass loading station (MLS), is well downstream of the City. However, results from water quality monitoring conducted along the City of San Diego and Lemon Grove jurisdictional boundary within Chollas Creek indicated that water quality objectives for metals were being met. Both acute and chronic water quality objectives for dissolved copper, lead, and zinc were met based on the results of two wet weather sampling events during this reporting period. Additional information can be found in the Chollas Creek TMDL 2011-

2012 Special Studies Report. However, it is worth noting that several years of wet weather monitoring data would be necessary for a Level 6 Assessment.

11.2.2 Overall Component Assessments

Development Planning

The operation and maintenance verification program, which requires responsible parties to certify that their BMPs have been maintained properly, along with site inspections, has increased the responsible parties' understanding of the requirements. As a result of this contact with the City, many sites have been able to conduct the necessary maintenance required of their treatment control BMPs.

Construction

The available data indicate that on the whole the City's construction program is effective in requiring BMP implementation at both public and private construction sites. Any BMP deficiencies noted are typically remedied promptly. The City's size and low number of construction projects allow the City's inspector to visit construction sites on a weekly basis, at a minimum. Any corrective actions or recommendations are dealt with in the field and addressed immediately. The City will continue its efforts to notify project proponents and homeowners of the City's BMP requirements. The City's engineering inspector attends annual stormwater inspector training.

Municipal

The City's municipal activities effectively implement BMPs and reduce pollutant loading. The City's staff are regularly trained on stormwater issues, and the City's MS4 cleaning and street sweeping programs meet or exceed minimum Municipal Permit frequency requirements. The City also continues to repair and clean sewer mains in an effort to prevent SSOs.

Industrial and Commercial

The City continues to implement its comprehensive inspection program. Inspection findings have demonstrated a high level of compliance with stormwater requirements. The City inspector continues to educate business owners verbally during the stormwater compliance inspection. Deficiencies noted are addressed immediately during the site inspection. The City continued to utilize BMP implementation and knowledge scores to assess the level of BMP implementation and level of knowledge at inspected facilities. These scores help the City understand which categories of businesses are most in need of education outreach and which will require additional attention during inspections.

Residential

The City's residential component achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. City staff that conduct routine maintenance in residential areas are trained to observe and respond to potential stormwater issues such as pet waste and minor trash and debris. Public Works staff has increased staff awareness of the location and sensitivity of high TTWQ residential areas.

Illicit Discharge Detection and Elimination

The City's IDDE program has effectively responded to complaints. No IC/IDs were identified during the 2012 Dry Weather Monitoring Program. There were five SSOs during the reporting period, which were reported through CIWQS to the RWQCB. The City will continue to take action to prevent and eliminate IC/IDs.

Education

During FY 2011-12, the City has continued to educate various audiences on stormwater concepts and BMPs. The estimated number of impressions made thorough the City's education component during FY 2011-12 was similar to those seen in previous years.

Public Participation

The City will continue looking for new opportunities for public involvement, while continuing the existing clean-up and recycling events. Attendance at public events was similar to those seen in previous years.

11.3 Program Review and Modification

No significant changes to the effectiveness assessment component of the City's JURMP were made during the reporting period.

Table 11-2
Development Planning Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4
Review and approve project plans	External A relatively small number of projects submitted reports during FY 2012-11. Based on meetings with applicants and BMPs proposed, it appears that the level of knowledge is the same, if not a little higher. Internal City stormwater staff provided informal training on post-construction BMPs. City staff also participated in Copermittee Land Development workgroup meetings that focused on SUSMP and Hydromodification Management.	Percent of approved projects implementing BMPs with high or medium removal efficiencies for key pollutants of concern	100%	N/A, addressed through other significant activities for this component
Verify proposed BMPs are implemented	External N/A, knowledge is evaluated by appropriate implementation of BMPs as shown in Level 3 Internal The City's Land Development Engineer performs treatment control BMP inspections.	Percent of inspected projects requiring follow-up	0%	BMP implementation is likely to have reduced pollutant loads.
		Resolution status of enforcement actions	See Section 2	
Verify BMPs are properly maintained	External Contacting responsible parties increased their awareness of the need for BMP maintenance. Internal N/A, City staff is aware of the need for BMP maintenance.	Percent of sites returning verification forms	100%	Additional load reduction could be achieved through improved BMP maintenance.
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-3
Construction Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4
Review proposed plans and BMPs	External Projects submit plans for construction BMP implementation for their projects; the level of awareness of construction BMP requirements is fairly high. Internal Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs.	BMPs proposed for construction projects generally meet requirements; no significant problems have been noted.		Proper pre-project planning is likely to have reduced pollutant loading.
Verify proposed BMPs are implemented	External Grading projects implement BMPs as required by their permits, and contractors are familiar with the City's requirements. Internal Training for City staff is described in Section 8. City inspector and engineers are familiar with relevant construction BMPs.	Percent of projects implementing required BMPs by end of reporting period	100%	Proper BMP implementation is likely to have reduced pollutant loading.
		Percent of projects in compliance with BMP requirements during all inspections	100%	
		Resolution status of enforcement actions	See Section 3	
		Number of dry weather monitoring exceedances traced to construction sources	0	
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-4
Municipal Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4	
Verify proposed BMPs are implemented at facilities	City staff is regularly trained on BMP implementation; see sections 4 and 8. Public Works staff attended annual training session in FY 2011-12, ensuring that they maintain a high level of stormwater knowledge.	Percent of inspected facilities and activities in compliance with BMP requirements	100%	Proper BMP implementation is likely to have reduced pollutant loading.	
		Resolution status of sites requiring follow-up inspections	N/A, see Section 4	Amount of sediment and debris removed from Street Sweeping (weight or volume)	147.15 tons
		Number of dry weather monitoring exceedances traced to municipal sites	0		
Sweep streets and parking facilities		N/A, streets and parking facilities are swept as often as directed by management.			
Maintain and clean out MS4		N/A, MS4 structures are maintained as often as directed by management.		Amount of sediment and debris removed from MS4 (weight or volume)	572.55 cubic yards
Maintain sanitary sewer system		N/A, the sanitary sewer system is maintained as often as directed by management.		Total volume of SSO recovered from MS4 (gallons)	1,240 gallons
Maintain an accurate inventory				BMP effectiveness studies	Attachment 11.1
	N/A, data management only	N/A, data management only		N/A, data management only	

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-5
Industrial and Commercial Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4	
Require BMP implementation	External Knowledge assessment scores indicated a mid to high level of understanding of relevant stormwater concepts. See Figure 11-1 on the following page for a score distribution. See Section 8 for more detail on education outreach efforts. Internal Staff was provided training on the industrial and commercial component of the JURMP prior to conducting field inspections during FY 2011-12 to ensure a high level of knowledge.	Percent of inspected sites requiring follow-up	0%	Proper BMP implementation is likely to have reduced pollutant loading.	
		Resolution status of enforcement actions	See Section 5		
		Number of dry weather monitoring exceedances traced to industrial or commercial sources	1	Number of IC/IDs eliminated (inspections and complaint investigations)	1
		Implementation of BMPs and a high rate of site cleanliness demonstrates a positive change in behavior. See Figure 11-2 on the following page for a score distribution based on site cleanliness and BMP implementation.			
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only	

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Figure 11-1
Knowledge Assessment Scores

Figure 11-2
BMP Assessment Scores

Table 11-6: Residential Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4
Require BMP implementation	External Residents were educated in a variety of ways in FY 2011-12; see sections 6 and 8 for details. Internal High TTWQ residential areas were identified by Public Works staff and conveyed to other City staff to increase their awareness of the location and sensitivity of these areas.	Number of residential incidents reported to stormwater hotline	9	Resolution of residential incidents reported to the hotline likely resulted in a decrease in pollutant loading through education outreach emphasizing appropriate BMP implementation.
		Resolution of enforcement actions	See Section 6	
		Number of dry weather monitoring exceedances traced to residential sources	0	
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-7: Illicit Discharge Detection and Elimination Component Assessment Measures

Significant Activity	Level 2	Level 3	Level 4
Conduct Dry Weather Monitoring Program	The City contracts with a qualified consultant to perform its Dry Weather Monitoring Program.	N/A, personnel conduct monitoring as directed by management.	No significant, long-term IC/IDs were eliminated, so a reliable estimate of load reduction cannot be made.
Respond to incidents reported to stormwater hotline	The City's Management Analyst trains City staff as needed. See sections 4 and 8. City staff was responsible for many of the reports made to the hotline, as shown in Appendix B.	N/A, personnel respond to incidents as directed by management.	Resolution of the incidents reported to the hotline and listed in Appendix B are likely to have resulted a pollutant loading reduction.
Respond to and clean up SSOs	City staff is thoroughly trained on how to respond to SSOs.	The City conducts sewer main cleaning annually and implements Fats Oils and Grease (F.O.G) program. See Section 4 for details.	1,240 gallons of sewage were recovered after SSOs during FY 2011-12.

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-8: Education Component Assessment Measures

Significant Activity	Level 2		Level 3	Level 4
Provide stormwater education to the public	External The City actively educates the various audiences in its jurisdiction. See Section 8 for details.		See Level 3 outcomes for other program components for information about behavior change.	Sufficient data to estimate load reductions due to educational efforts is not available for FY 2011-12.
	Estimated number of impressions made	6,757		

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-9: Public Participation Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4	
Involve the public in activities that relate to stormwater protection	External The City and City partners put on a number of opportunities for the public to participate. See section 9 for details.	Number of attendees at events	810	Amount of trash and debris collected at cleanup events (including large item disposal event)	413.98 tons
		Number of drop-offs of large items and HHW to the City's recycling facility	867		
		Number of complaints received (see Appendix B for details)	37	Amount of HHW collected	570 pounds of HHW, 15,425 gallons of used oil

Notes: Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

12.0 SPECIAL INVESTIGATIONS

The City takes a proactive approach to stormwater management in an attempt not only to protect receiving water quality, but also to improve the quality of water that is discharged from the City's MS4. Data collected through the City's various monitoring and inspection programs are used to identify locations within the City that may be contributing to stormwater contamination. Source identification investigations are then initiated to pinpoint the exact cause of detected pollution.

Aside from upstream investigations conducted as part of the dry weather monitoring and sampling program (to be reported as part of the IDDE component in December), a compliance monitoring report and a special studies report were submitted to the Regional Board during this reporting period. Both reports were in support of the Chollas Creek Pesticides and Metals TMDLs and are titled (1) *Final Chollas Creek Total Maximum Daily Load 2011-2012 Water Quality Compliance Monitoring Report*, and (2) *Final Chollas Creek Total Maximum Daily Load 2011-2012 Special Studies Report*.

13.0 NON-EMERGENCY FIRE FIGHTING

A program of BMPs for non-emergency fire fighting flows was adopted in March 2008 as part of the City's JURMP. These BMPs are implemented during regular maintenance of fire and emergency vehicles and equipment, training exercises, facilities maintenance, and post-emergency rehabilitation of response equipment. No significant changes to the program presented in the City's JURMP have been made since the submittal of that document.

In response to municipal facility inspections performed during FY 2011-12, the City provided recommended corrective actions to fire-fighting staff during this reporting period.

14.0 JURMP REVISIONS

Changes to the JURMP made during the reporting period are discussed in the individual "Program Review and Modification" subsections in the preceding sections in this JURMP Annual Report.

15.0 CONCLUSIONS AND RECOMMENDATIONS

During FY 2011-12, the City continued to implement its stormwater program based on its 2008 JURMP. During this time, the City identified several elements in the JURMP that required changes to improve program implementation. Updates to the City's program were made as necessary and are discussed in each individual section of this Annual Report. One highlight of the City's stormwater program for FY 2011-12 was the continued trend of increasing public participation through cleanup events, HHW waste recycling, and reporting stormwater concerns to the City's hotlines.

Additionally, the City continued to work collaboratively with the other Copermittees to facilitate sharing of information about how best to run these programs and to provide regional guidance on standardized implementation where applicable. The City will continue to refine and improve its stormwater program based on information made available by these collaborative efforts.

Lemon Grove, CA 91945

Re: Required Treatment Control BMP Maintenance Certification

Dear Mr. Sir/Madame,

According to City records, you are jointly responsible for the permanent storm water treatment devices, known as treatment control best management practices (BMPs), located at _____. Annual verification of effective operation and maintenance for all treatment control BMPs on this property was a condition of the permit to develop the site. Treatment control BMPs are required to be maintained by the appropriate party as stated in the site's operation and maintenance agreement.

You are required by City of Lemon Grove to perform annual maintenance of the treatment control BMPs and to complete a form certifying this maintenance before the beginning of the rainy season. This notice is being sent as a reminder of the upcoming deadline.

Please ensure that the BMPs have been maintained and are in proper working order. Once the maintenance has been performed, please complete the attached form and return it to the City along with any maintenance records. The completed form must be received no later than September 30, 2011.

If you would like more information regarding this program, please contact me at (619) 825-3800.

Sincerely,

Tamara O'Neal
Assistant Civil Engineer
City of Lemon Grove
3232 Main Street
Lemon Grove, CA 91945

Project Information

Project Name:_____

Project Address:_____

Project Size (acres):_____

Engineer:_____ Report Date:_____

SUSMP Category

Check all SUSMP categories that apply to the project:
☐Residential development of 10 or more units
☐Commercial development greater than 100,000 ft²
☐Automotive repair shops
☐Retail Gasoline Outlets
☐Restaurants
☐Developments of heavy industry greater than one acre
☐Steep hillside development >5,000 ft²
☐Projects discharging to receiving waters within Environmentally Sensitive Areas (ESA) that create 2,500 ft² or more of impervious surfaces or increases are of imperviousness of project site to 10% or more of its naturally occurring condition and:
    ☐Project is within 200 ft of an ESA
    ☐Project is more than 200 ft from and ESA but discharges urban runoff to receiving water within ESA without mixing with flows from adjacent land
☐Parking lots >5,000 ft² or with >15 parking spaces and potentially exposed to urban runoff
☐Streets, roads, highways, and freeways with would create a new paved surface that is ≥5,000 ft²
☐Pollutant generating development project disturbing one acre or more of land.

☐Significant redevelopment – create or add ≥ 5,000 ft² of impervious surfaces on an already developed site
☐None

IF NONE OF THE ABOVE STIPULATIONS APPLY TO YOUR PROJECT STOP HERE FOR NOW. City staff will need to verify SUSMP exemption.

Identify Pollutants from the Project Area

☐Check that all pollutants anticipated to be generated from the project area correspond with the anticipated pollutants in Table 1.

Identify Primary and Secondary Pollutants of Concern

Check that primary and secondary pollutants of concern for the project have been correctly identified and compared with pollutants identified in Table 1.
☐Which receiving water(s) does the project discharge to?

_____

☐What are the pollutants for which the receiving water is impaired?

_____
_____
_____

☐Did project compare receiving water pollutants with pollutants generated from project are? Y / N

☐What are the primary pollutants of concern?

_____
_____
_____

☐What are the secondary pollutants of concern?

_____
_____
_____

Identify Conditions of Concern
☐Was a drainage study report prepared? Y / N
☐Was the report prepared by a registered civil engineer? Y / N
Who?_____
☐Was a field reconnaissance conducted? Y / N
☐Did drainage study compute:

☐Peak flow rate	☐2-year frequency storm
☐Flow velocity	☐10-year frequency stormwater
☐Runoff volume	What duration storm was used?

☐Time of concentration ☐6 hour or ☐24 hour
☐Retention volume
☐Were conditions of concern adequately identified? Y / N
If so, has the project implemented site design, source control, and/or trea
control BMPs to maintain pre-project hydrologic conditions affecting dow
conditions of concern? Y / N

Establish Stormwater BMPs (Best Management Practices)

LID/Site Design BMPs

SUSMPs must consider, incorporate and implement where determined applicable and feasible by Lemon Grove (check all that were considered, incorporated, or implemented):
☐Maintain Pre-Development Rainfall Runoff Conditions
☐Minimize project's impervious footprint
☐Conserve natural areas
☐Construct low traffic areas (walkway, trails, patios, parking lots, etc.) of permeable surfaces
☐Construct streets, sidewalks, and parking lot aisles to minimum
☐Maximize canopy interception by preserving existing trees and
☐Minimize use of impervious surfaces, such as decorative concr landscape design
☐Preserve natural drainage systems
☐Minimize directly connected impervious areas
☐Drain rooftops into landscaping
☐Drain sidewalks, walkways, trails, and patios into landscaping
☐Protect slopes and channels
Comments:
_____
_____
_____

Source Control BMPs
Does the project:
☐Provide storm drain system stenciling and signage
☐Design outdoor material storage areas to reduce pollution introd
☐Design trash storage areas to reduce pollution introduction
☐Use efficient irrigations systems & landscape design

☐Outdoor Processing Areas

Treatment Control BMPs

Check the treatment control(s) selected:

- ☐Biofilters
- ☐Detention Basin
- ☐Infiltration Basin
  - ☐Infiltration Trench
  - ☐Porous asphalt, concrete, or modular concrete block
- ☐Drainage Insert
  - ☐Oil/Water Separator
  - ☐Catch Basin Insert
  - ☐Other: _____
- ☐Wet Pond
- ☐Constructed Wetland
- ☐Filtration System
- ☐Hydrodynamic Separation System

☐Do treatment controls effectively address primary pollutants of concern? Y / N

If No, describe:

_____

_____

_____

Verify the design of selected treatment controls:

Was the treatment control BMP designed for:

- ☐Volume
- ☐Flow

☐Did the project use the 85th percentile storm event? Y / N

☐Did the project consider both the 10 yr and 100 yr event? Y / N

If No, describe:

_____

_____

_____

☐Did the project cover both pre- and post- construction drainage? Y / N

If No, describe:

_____

_____

_____

☐Did the project calculate current usage of any existing drainage structures and compare post-construction increases to available capacity? Y / N

If No, describe:

_____

_____

_____

☐Is BMP(s) located near pollutant sources? Y / N
If No, describe:

_____
_____
_____

☐Is BMP(s) effective for primary pollutant type? Y / N
If No, describe:

_____
_____
_____

Maintenance Requirements

☐Was an O&M plan attached?

☐Does plan require annual inspection and maintenance of all structural BMPs?
If No, describe:

_____
_____
_____

☐Was an access easement/agreement included?
If No, describe:

_____
_____
_____

Hydromodification Management

☐ Is project a priority development project and if so, is there a net increase in impervious area and in runoff as a result of project? Project may be subject to 2011 Hydromodification Management. If yes, describe.

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by municipal activities:_____square feet

Approximate □ impervious surface of this area_____□

Exposed areas of intensive outdoor activity: _____

D. BMP ASSESSMENT

D.1 General

BMPs	N/A	Yes	No	Comments
Is the site free of litter and debris?				
Are discharge locations free of sediment and debris?				
Are parking lots, sidewalks and streets free of sediment and debris?				
Is pressure washing of parking lots or sidewalks conducted at the facility?				
Is pressure washing waste water captured and disposed appropriately?				
Are roof downspouts directly away from areas of potential pollutants?				
D.2 Landscaping				
Are adequate erosion prevention measures employed? (vegetation or physical stabilization)				
Are irrigation systems programmed to minimize over-watering and runoff?				
Are stockpiles of soil or landscape waste equipped to prevent runoff transport?				
D.3 Materials and Wastes				
Are adequate trash containers provided?				
Are adequate recycling containers provided?				
Is the trash/recycling area enclosed and free of litter and debris?				
Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing?				
Are outdoor material storage areas adequate (covered area with secondary containment)?				
Are outdoor storage containers properly labeled?				
Is there an accessible spill response kit?				
Are storage tanks equipped with secondary containment?				
Is secondary containment free of spills and rainwater?				
Are loading and unloading areas free of spills and debris?				
D.4 Equipment and Vehicles				
Are exposed parking areas free of significant spills and leaks?				
Are heavy equipment and vehicles stored in garages or under canopies?				
Are vehicle maintenance activities conducted within contained areas (garage, canopy, work shop)?				
Are vehicle-fueling areas covered and are storm drain inlets protected from spills and leaks?				
Is vehicle washing preformed in a contained area where runoff does not enter the MS4?				
Are biodegradable soaps used for cleaning activities?				
D.5 Food Establishments				
Does facility have a grease trap or grease interceptor?				
When was the last time the grease trap was maintained? _____				

Where is the grease trap located? ☐ Under the sink ☐ Outside ☐ Other _____

How many grease fryers are at the facility? _____

About how often is fryer oil replaced? ☐ Weekly ☐ Monthly ☐ Every 6 months ☐ Annually

BMPs	N/A	Yes	No	Comments
How is used oil disposed of? ☐ Outside rendering service ☐ Sanitary sewer/sink ☐ Other:_____				
Do oil-recycling/grease bins have overhead coverage?				
Do oil-recycling/grease bins have secondary containment?				
Are deep fryer oil-recycling drums stored properly?				
At what time is cleaning performed? _____				
What is the cleaning method? _____				
Does the restaurant hose off the site (parking lot, back lot, etc.)? If so, how often?				
How are kitchen floor mats cleaned? ☐ Hose off outside ☐ Clean inside (mop sink) ☐ Cleaning Service ☐ Other:_____				
Where is used cleaning water discharged? _____				
Are storm drain inlets free of grease and other food debris?				
D.6 Non-Storm Water Management				
Is the site free of evidence of illicit connections and illegal discharges?				
Is the site free of evidence of unauthorized releases to storm drains?				
If not, have the appropriate authorities been notified?				
D.7 Other				
Are there any other potential storm water pollution issues or concerns? If yes, explain below.				
Were any educational materials distributed? (Please list:)				

D.8 BMP Summary

E. SWPPP REVIEW

Does facility maintain a SWPPP: ☐ **Yes** ☐ **No** ☐ **Not Applicable**

SWPPP Component	Provided	Adequate	Comments
Site Map/Description	☐ Yes ☐ No	☐ Yes ☐ No	
Materials List	☐ Yes ☐ No	☐ Yes ☐ No	
Significant Spills/Leaks	☐ Yes ☐ No	☐ Yes ☐ No	
Pollution Prevention Team	☐ Yes ☐ No	☐ Yes ☐ No	
Industrial Activities	☐ Yes ☐ No	☐ Yes ☐ No	
Pollutant Sources/Risks	☐ Yes ☐ No	☐ Yes ☐ No	
Annual Compliance Activity	☐ Yes ☐ No	☐ Yes ☐ No	
Employee Training	☐ Yes ☐ No	☐ Yes ☐ No	
Accessible to staff	☐ Yes ☐ No	☐ Yes ☐ No	
Existing BMPs	☐ Yes ☐ No	☐ Yes ☐ No	

MONITORING PROGRAM REVIEW

☐ **Not Applicable**

Was sampling performed during the most recent, complete wet season? ☐ Yes ☐ No ☐ Unknown

If not: Does the facility have documentation of no qualifying rain events? ☐ Yes ☐ No

Was the facility in a GMP and not scheduled to sample that year? ☐ Yes ☐ No

Do recent monitoring results show that existing BMPs are effective in removing pollutants? ☐ Yes ☐ No ☐ None Available

If not, were potential sources of the identified pollutants observed during the inspection? ☐ No

If yes, list the potential sources and their associated pollutants: _____

_____

If exceedances were found in sampling results, were BMPs re-evaluated and were any modifications made to address the elevated constituents? ☐ Yes ☐ No ☐ Unknown

Was the monitoring program implemented in accordance with Industrial Permit requirements during the most recent, complete wet season? ☐ Yes ☐ No ☐ Unknown

(For exceedances noted (constituent(s) and numeric value(s)) and SWPPP/monitoring deficiency specifics, please see Section D.

F. RECOMMENDED CORRECTIVE ACTION

Is corrective action needed? ☐ Yes ☐ No

If **BMP-related** corrective action is required, describe below. If other corrective action, check the appropriate box in section G.

Owner/operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax

G. VIOLATIONS

☐ No violations have been noted at this time
☐ No violations have been noted, but recommend taking corrective action described in Section F.
☐ Violation of the City's storm water ordinance:
  ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
    Description
  ☐ Illegal connection(s) to the storm drain system
    Location_____
  ☐ Littering
  ☐ Failure to properly implement required BMPs
☐ Failure to comply with the requirements of applicable State or Regional Permit(s):
  ☐ Non-compliance with the State Industrial Storm Water General Permit.
    Subjectivity, based on SIC Code: ☐ Mandatory ☐ Conditional
    ☐ In the future, under a new Industrial Permit which has not yet been adopted, this facility may be able to qualify for a No Exposure Certification (NEC) and exemption from Permit coverage.
  ☐ Non-compliance with the Municipal Storm Water Permit (NPDES NO. CAS0108758).
☐ Other Violation_____

SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:

☐ Implement the recommended corrective actions listed in Section F.
☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit; see Attachment 3 of the Industrial Permit (http://www.waterboards.ca.gov/stormwtr/industrial.html).
  ☐ For "Conditional" facilities only: if you implement all the recommended BMPs and eliminate outdoor exposure, contact the City to request a re-inspection. If it is determined that you qualify, NONA/NEC paperwork will be provided for you to complete, and you will not have to file an NOI.
☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); see Section A of the Industrial Permit.
☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.
☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

Additional actions required:

H. RECOMMENDED CITY ACTIONS

☐ None
☐ A Follow-up action / inquiry is recommended.
☐ Update the following: ☐ JURMP priority ☐ SIC code ☐ Facility Contact Information

Other:

Does this business require a follow-up site inspection? ☐ **Yes** ☐ **No**

ASSESSMENT

Level of knowledge regarding stormwater issues: ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ Unknown

Level of cleanliness, BMP implementation, orderliness of site: ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

THE FUTURE OF REDEVELOPMENT IN LEMON GROVE

Recent actions taken by the California State Assembly and Senate threaten the existence of redevelopment in Lemon Grove. The City's redevelopment agency—the Lemon Grove Community Development Agency—has created significant economic stimulus over the years and is needed to revitalize the City's downtown district.

This newsletter article answers three questions:

1. **What has redevelopment done for Lemon Grove?**
2. **What was the State Legislature thinking?**
3. **How will this impact Lemon Grove?**

What has redevelopment done for Lemon Grove?

Since 1986, redevelopment has been a powerful tool to build the community's current economic base. The use of redevelopment has literally generated millions of sales tax dollars for the City and a significant amount of additional property tax dollars for Lemon Grove schools.

As an example, in 1993, the Lemon Grove Community Development Agency (the Agency) assisted in the attraction and development of The Home Depot. Since that time, this business has generated millions of dollars in sales and property tax revenue. These funds have helped pay for vital municipal services such as law enforcement, fire protection, street paving, and park maintenance.

Also, in 2007, the City used redevelopment resources to assist in the development of Citron Court, a mixed-use affordable housing project on Broadway (across the street from Food-4-Less).

Presently, the City is relying on redevelopment tools and funds to assist with the Lemon Grove Avenue Realignment project, the Main Street Promenade project, and mixed-use development projects adjacent to the Trolley Depot (for more information about these projects visit ***www.ci.lemon-grove.ca.us/redevelopment***).

What was the State Legislature thinking?

"The Goose that Laid the Golden Eggs" is a classic Aesop's Fable. In this story, we read about a peasant that kills a goose that lays golden eggs. Assuming the goose has a large lump of gold inside of it, the peasant kills the goose to get the gold. The phrase "killing the goose that laid the golden eggs" has become a common phrase in our language referring to a reckless action motivated by greed.

In June, the State legislature passed a bill that will end all redevelopment agencies by October 1, 2011. This action is an excellent illustration of the meaning of the phrase *"killing the goose that lays the golden eggs."*

Under its plan, the legislation would supposedly redistribute redevelopment funds to taxing agencies. In Lemon Grove, this would result in dividing up less than $800,000 a year among the City of Lemon Grove, Lemon Grove School District, Grossmont Unified High School District, Grossmont/Cuyamaca Community College District, Grossmont Healthcare District, County of San Diego, State of California, Helix Water District, Regional Occupation Centers, Lemon Grove Roadway Lighting District, as well as eight other entities.

Through this State plan, each taxing agency would receive a larger piece of the property tax pie. However, that pie's size would grow at a very slow pace. On the other hand, the purpose of redevelopment is to help property owners maximize the value of their property—thus growing a bigger pie. **Increasing property value more quickly is much like *taking good care of the goose, so it can lay even more golden eggs.***

The Future of Redevelopment in Lemon Grove—continued...

The California Redevelopment Association and the League of California Cities have petitioned the California Supreme Court to declare the recent legislation unconstitutional. If the court upholds the legislation, the City will be placed in a difficult dilemma — just as it is beginning to recover from the recent economic recession.

How will this Impact Lemon Grove?

The State legislation allows projects that are currently in the pipeline to continue to move forward. *However*, until the court rules on the redevelopment case, all Agency operations must cease. Since the State legislature adopted the redevelopment killing bill, the Agency has had opportunities to sell off land for future development. *But, with the pending case, the Agency's hands are tied.*

Critical projects currently in the pipeline:

- Lemon Grove Avenue Realignment project,
- Main Street Promenade project, and
- Two Citronica mixed-use development projects.

If any of these projects needs ***even one additional dollar***, the Agency will be ***unable*** to assist in any way, unless the court rules the State legislation unconstitutional. Stopping these projects will result in hundreds of lost jobs for engineers, architects, construction workers, inspectors, etc. who are currently working on them. Stopping these projects will *also* ensure that the Lemon Grove pie remains the same size, *rather than growing the City's economic base*.

Conclusion

The California Supreme Court indicates that it will render a decision by mid-January 2012. **In the next few months, we will all find out the future of redevelopment in Lemon Grove.**

Main Street Promenade Project

BUDGET RESTRUCTURE

On June 2, 2011, the Lemon Grove City Council adopted the Fiscal Year 2011-12 (FY 12) consolidated budget. As revenues grow and expenditures are kept in check, the City's General Fund will experience a balanced budget *for the first time in four years*.

Interesting highlights of the FY 12 budget:

***The Numbers*—Budget trends in the FY 12 budget:**

- Sales tax revenue is anticipated to increase by 3.5% over FY 11,
- Overall revenue is anticipated to increase by 3% over FY 11,
- Overall expenditures are anticipated to decrease by 1% over FY 11, and
- The City's reserve fund will grow by $234,000 in FY 12.

***The Outcomes & Policy Directions*—Outcomes and policy directions in the FY 12 budget:**

- A 12-day furlough plan,
- 6 positions were eliminated,
- City Departments were restructured, eliminating the Recreation Services Department and folding components into the Public Works Department, providing the opportunity to restructure the way recreation services are provided, and
- Employees now pay 100% of the employees' share of retirement costs.

See the City's FY 12 budget: *www.ci.lemon-grove.ca.us/budget*.

NOW YOU SEE THEM… SOON YOU WON'T!

Finally… it's time for some demolition! The empty buildings along Main Street and the self-storage buildings on North Avenue will soon be just a memory. Once the hazardous materials are removed from the buildings, the wrecking balls will be coming to town. *Watch for them in late August*.

Example of anamorph—this anamorph was created by István Orosz, a Hungarian artist known for his mathematically inspired works, impossible objects, optical illusions, double-meaning images and anamorphoses.

Making Way for the Main Street Promenade… Imagine a long, linear park and bustling transit plaza… with plenty of shady spots, broad walkways, benches and bike racks, and places to play.

Enjoy the artful nods to local history and learn about the water cycle and sustainability. Just wait until you see the windspire sitting atop the anamorph. *A what sitting atop a what??* The windspire is a vertical windmill that actually works and will produce energy for the night lighting.

Anamorphic art places a greatly distorted image on the ground around a mirrored surface (in this case a polished stainless steel cone), but when you look at the reflection, the image looks completely normal.

Project Funding: No City funds are being used for this project. Design and construction are primarily funded by two grants. The balance of the project, about 10% of the five million dollar project, will be funded by the City's redevelopment agency.

The Promenade will have a little something for everyone! The construction plans are almost complete. Watch for construction to begin in January. Completion is expected by late 2012.

Project questions? Call Barbara Kraber, Project Manager, 825-3800, ***bkraber@ci.lemon-grove.ca.us***.

GRANT FUNDS HELP MAKE LEMON GROVE A SAFER PLACE TO WALK AND BIKE FOR CHILDREN

The goals of the "Safe Routes to School Grant Program," managed by the California Department of Transportation, are to reduce injuries and fatalities to school children and encourage walking and bicycling.

Since 2008, the City has submitted Safe Routes to School Grant funding applications for three projects:

1. Palm Street/Golden Avenue,
2. Madera Street, and
3. San Miguel Avenue.

All three applications have been successful!

The projects include construction of sidewalk, curb, gutter, curb ramps, and pedestrian crosswalk improvements. Federal and State funds for the three projects total over $1.1 million and the City's share of the cost will total approximately $250,000.

Construction on both the Palm Street/Golden Avenue and Madera Street projects are expected to be complete by Fall, 2012. The San Miguel Avenue project is awaiting design consultant selection. Construction on this project is anticipated in the Fall of 2013.

SALES TAX DECREASE

With the cost of everything rising these days, it is good news that the sales tax rate in Lemon Grove actually ***decreased*** one percent on July 1st. A temporary rate increase enacted by the State Legislature a few years ago expired on June 30 2011.

WHAT'S HAPPENING IN PUBLIC WORKS?

The new fiscal year has brought with it a renewed goal of *"doing more with less."* At 6:00 a.m. each day, the eleven members of the Public Works field staff energetically tackle each day's tasks. The photograph at right is an example of a recent project is the completed by the Public Works crew.

City crews make the most of space and materials available in the median at Kempf Street and Broadway.

Projects completed during the past few months:

- ⇒ **Citywide restriping (white and yellow lines throughout the City),**
- ⇒ **Elkhorn Street storm drain improvements,**
- ⇒ **Kempf Street median improvements,**
- ⇒ **Lemon Grove Way, Grove Street, Buena Vista Avenue, Tweed Street, and Corona Street paving,**
- ⇒ **Lemon Grove Avenue median landscaping improvements,**
- ⇒ **Plant Lemon Grove improvements (at the LGA and SR94 on and off ramps), and**
- ⇒ **Installing speed limit signs on Massachusetts Avenue.**

Typically, the Public Works field staff performs three types of tasks — *Routine Tasks, Special Projects, and Response Tasks.*

Routine Tasks

While very few things in life are routine, these tasks are those that must be completed and integrated into the daily accomplishments. Routine tasks consist of picking up trash from the medians on Broadway and Lemon Grove Avenue, mowing grass in parks, filling potholes, repairing facilities, picking up illegal trash dumping, cleaning graffiti.

Special Projects

Special tasks are calls for service that are above and beyond routine tasks. Paving streets, replacing damaged signs from traffic accidents, inspecting tree fungus, and restriping City streets are a few examples of special projects performed by Public Works staff throughout the year.

Response Tasks

Response tasks consist of helping citizens with special requests. On average, the Public Works Department receives 50 services request per month. These sometimes complex projects must be scheduled with the routine tasks and special projects. Finding the time is the greatest challenge to completing the tasks associated with resident requests. As such, with a small staff of eleven (four less than 4 years ago because of staffing reductions), the Public Works Department asks that you allow 30 to 60 days complete these tasks. Projects are prioritized higher if there is a threat to public safety.

What's next on the horizon?

Public Works Projects Preview (Upcoming Projects Between July 2011 and June 2012)

- ⇒ 69th Street paving,
- ⇒ Buena Vista Avenue paving (between North Avenue and Broadway),
- ⇒ Installation of pavement markers on Lemon Grove Way,
- ⇒ Installation of thermal plastic crosswalks on Massachusetts Avenue at San Miguel Avenue and SR-94,
- ⇒ Mt. Vernon Street paving,
- ⇒ Mural revitalization at Lemon Grove Park,
- ⇒ Installation of stop and yield signs,
- ⇒ Landscape improvements at Veteran's Park, and
- ⇒ Weed abatement services.

FACILITY RENTALS: *Host a Quality Event Without Busting the Budget!*

The City of Lemon Grove offers facilities specifically designed for receptions, meetings, sporting events, and other special events. The facilities accommodate varying size groups and reservations may be made up to one year in advance. **Tours are available by appointment.**

Please call the Community Services Department at (619) 825-3830 ext. 3902 for information, or visit the City's website at: *www.ci.lemon-grove.ca.us/Rentals*

With the holidays just around the corner, many are starting to plan their holiday parties with friends, family and co-workers. Often times, this process also includes spending countless hours preparing the house weeks in advance, to ensure it's pristine for visitors. Not to mention the grueling days of clean-up that follow the shindig itself. **This year, the City of Lemon Grove invites you to skip the hassle of house parties and celebrate the holidays at one of our attractive, yet affordable, facilities.**

From grand receptions to intimate gatherings, our versatile facilities can accommodate any occasion of varying size:

- **Lemon Grove Senior Center** (8235 Mt. Vernon Street) is a refined facility that can seat up to 200 for banquet style events, and up to 300 for theater style events. Adjacent to Lemon Grove Park, this beautiful facility features large French doors that open to a spacious patio. Borders of grassy areas and walkways provide a private, peaceful setting amongst nature, ideal for a wedding ceremony. The large, fully equipped kitchen is designed to handle all of your catering needs.

- **Lemon Grove Community Center** (3146 School Lane) is appealing for its convenient location and full kitchen amenities, and an ideal setting for smaller meetings, conferences and private parties. The Community Center seats up to 75 for banquet style events, and up to 100 for theater style events. If needed, tables and chairs are provided free of charge and City staff will set up and break down the equipment for you.

- **Berry Street or Lemon Grove Park gazebos**—Does an indoor event seem too stuffy for your special occasion? Take advantage of the *"Best Climate on Earth,"* by holding a birthday party, shower or fundraiser outdoors. Both parks span six acres and offer playgrounds, picnic areas and tables, restrooms, a basketball court and walking paths. Gazebo rentals are $80 and provide you with peace of mind that no one else can intrude on your special day.

- **H. Lee House** (3225 Olive Street) — For a more private event, the historical H. Lee House boasts an elegant courtyard and features a stunning Victorian-style gazebo for ceremonies or entertainment surrounded by inlaid brickwork and grass. With a capacity for approximately 100 guests, the H. Lee House Courtyard is the perfect setting for a private outdoor wedding, anniversary party, or baby shower.

- **Lemon Grove Recreation Center Now Available for Birthday Parties & Sporting Events!**

Manny Jansen is a bona fide soccer fanatic! For his 10th birthday party, his parents wanted to incorporate his passion for the sport, while staying within their budget. After exhausting options at other corporate sports and play centers in San Diego, Manny's folks ventured into the Lemon Grove Recreation Center. *They were blown away with everything it had to offer*—**a full size gymnasium, two game rooms, an activity room and large shaded patio** *for only $50 an hour*. The kids had a blast playing soccer, creating arts & crafts in the activity room and playing pool, ping pong, and air hockey in the game rooms. ***"This is going to be a tough act to follow for his next birthday,"*** Manny's mom said with a smile.

Reduce the stress of holiday entertaining, and let the City of Lemon Grove host your social gathering. Reservations are made on a first come first serve basis, and fill up fast for the holiday season…so book your event today!

SHERIFF'S CORNER — Introducing Crime Prevention Specialist Jim Wieboldt

The Sheriff's Crime Prevention unit is an important part of Sheriff William Gore's overall program to make Lemon Grove and San Diego County ***"the safest urban county in the nation."***

Services provided to our community by Sheriff's Crime Prevention:

- **Neighborhood Watch**
- **Ranch Watch**
- **Business Alert**
- **Residential and Commercial Security Consultations**
- **Crime Free Multi-Housing (CFMH)**
- **Crime Prevention Through Environmental Design (CPTED)**
- **START SMART – Teen Driving and Safety**
- **Safe Streets**
- **Personal Safety – Home and Away**
- **Internet Safety**
- **Identity Theft Education and Prevention Techniques**
- **Senior Crime Alerts**
- **Crime Information Systems – NIXLE and CRIMEMAPPING.COM**
- **Children's Programs – McGruff, the "Crime Dog"**

Crime Prevention Specialist Jim Wieboldt

Jim Wieboldt joined the Lemon Grove Sheriff's Station on July 29, 2011 as the Crime Prevention Specialist assigned to the City of Lemon Grove.

An East County resident for more than fifty years, Jim has been with the Sheriff's Department since 2000 and brings a wide range of experience. He comes to Lemon Grove after serving as a Community Service Officer at the Santee Sheriff's Station since 2004.

Contact Jim directly:

(619) 337-2039 or *james.wieboldt@sdsheriff.org*.

CLEARING BRUSH THE NATURAL WAY—WITH GOATS!

The City of Lemon Grove's fire department took steps to clear brush from 8-1/2 acres of abandoned property on a hillside near Lawton Drive and Camino De Las Palmas—with help from a herd of "Boer" goats. According to City fire officials, this type of brush abatement is a tremendous help for firefighters in protecting land and nearby homes from fast moving brush fires.

Johnny Gonzalez, owner/operations manager of Environmental Land Management (ELM), brought the herd of about 150 goats to a staging area and paddock on July 29th where they were penned overnight. A shepherd and a herd dog were housed on site with the goats 24 hours a day until the job was done. Early Saturday morning, a small nursery paddock with baby goats was open to viewing. Afterward, the public was invited to watch the "running of the goats" as the herd was guided into the brush to get to work doing what they do best — eating the materials that fuel fires. The goats finished the job in four days.

On August 17, after making a clean sweep of the Lawton Drive job, the goats were moved to a lot across from the Lemon Grove Depot on Main Street, which is the site of the future "Main Street Promenade." City officials, several City staff members, and many residents were on hand for the "running of the goats" when the animals were transferred from the staging area onto the property to begin work.

A film crew was on site taping for a segment on the CBS national morning news show "The Early Show, which aired the next day." See the segment: ***The Early Show - Lemon Grove clearing brush with goats***.

Lemon Grove Mayor Mary Sessom was impressed with the way the goats got out and did the job and hoped that local children on site watch the goats clearing brush would learn that "not only can animals look cute and fuzzy, but they can also serve a purpose in our society, helping us to keep our environment clean," and Lemon Grove Fire Department Deputy Fire Chief Tim Smith called the operation "a win-win situation."

Allyson Russell and "friend."

"Running of the Goats" on Lawton Drive.

At work on Main Street property.

For more information on these weed abatement projects or future projects planned for Lemon Grove, please contact Lemon Grove Fire Inspector Thomas Rosenberger at (619) 573-7966. Contact Environmental Land Management at (619) 234-4555.

FIRE SEASON IS APPROACHING—Do you know what to do in a fire?

Tips For Fire Safety and Prevention:

⇒ **Smoke alarms save lives.** Install a smoke alarm outside each sleeping area and on each additional level of your home. If people sleep with doors closed, install smoke alarms inside sleeping areas, too.

- Use the test button to check each smoke alarm once a month and replace batteries immediately when necessary. Replace all batteries at least once a year.

⇒ **Consider having one or more working fire extinguishers in your home.**

⇒ **Consider installing an automatic fire sprinkler system in your home.** Sprinklers reduce the average property loss by 71% and the risk of dying *decreases* by about 80% when sprinklers are present.

Over 350,000 home fires occur every year in the United States and more than 2,500 people a year die in these home fires.

Odds are it could happen to you or someone you know. ..

⇒ **Determine at least two ways to escape from every room of your home.** If you see smoke or fire in your first escape route, use your second escape route. Consider escape ladders for sleeping areas on the second or third floor. Learn how to use them and store them near the window. **Select a location outside your home where everyone would meet after escaping.** Practice your escape plan at least twice a year.

⇒ **To escape a fire, you should:**

Escape Tips

1. ***Check closed doors for heat before you open them.*** Use the back of your hand to feel the top of the door, the doorknob, and the crack between the door and door frame before you open it. *Never use the palm of your hand or fingers to test for heat* - burning those areas could impair your ability to escape a fire (i.e., ladders and crawling).

Hot Door	Cool Door
Do not open! Escape through a window. If you cannot escape, hang a white or light-colored sheet outside the window, alerting fire fighters to your presence.	Open slowly and ensure fire and/or smoke is not blocking your escape route. If your escape route is blocked, shut the door immediately and use an alternate escape route, such as a window. If the escape route is clear, leave immediately through the door and close it behind you. Be prepared to crawl . Smoke and heat rise. The air is clearer and cooler near the floor. Close doors behind you as you escape to delay the spread of the fire.

2. ***If smoke, heat, or flames block your exit routes, stay in the room with the door closed.***
   - — If possible, stuff wet cloths around the door cracks and vents.
   - — Signal for help using a bright-colored cloth at the window.
   - — If there is a telephone in the room, call the fire department and tell them where you are.
3. ***If your clothes catch on fire – Stop, drop, and roll*** - until the fire is extinguished. Running only makes the fire burn faster.

⇒ **Once you are out, stay out! Call 9-1-1 from a neighbor's home.**

Your recovery from the emergency may greatly depend on your level of preparedness before the emergency happens. Take time now to prepare, visit www.heartlandfire.org, www.readysandiego.org, www.theredguidetorecovery.com or www.sdarc.org for preparedness tips and to download the **"Wildfire Preparedness Guide".**

Community Event—Wrap Up

RELAY FOR LIFE WRAP-UP

This year's **Lemon Grove Relay For Life,** held the weekend of May 21-22 at Lemon Grove Middle School, did not disappoint! This was the City's sixth annual partnership with the American Cancer Society to host one of their signature fundraisers, which brings together friends, family, and co-workers to **celebrate** the lives of those who have battled cancer; **remember** loved ones lost to the disease; and ***fight back*** against a disease that takes too much.

The event featured a moving opening ceremony, round-the-clock DJ, quality volunteer entertainment, food and drink to keep the walkers going, a kids corral with fun activities, and much, MUCH more…

Behind every successful event, there's a successful organizing committee. **MANY THANKS** to ours! Jennifer Mendoza, Event Chair; Elizabeth McBrayer, Team Development; Tammy Graham, Team Recruitment; Brenda Renfroe, Survivor Chair; Sophia Assaad, Fight Back Chair; Jesse Colmenero, Fight Back Sponsorship; Linda Fisher, Entertainment/Food/Hospitality; Amber Gentle, Registration; Stephanie Boyce, Online Chair; Marjie Cappiello, Off-line Donations; Faith Wilbur, Logistics; Katie Dexter, Accounting; Janet Colmenero, Luminaria; Shirley Burcks, Publicity; Bob Cota, American Cancer Society Liaison; and *MANY event-day volunteers who pitched in wherever needed!*

And the bottom line: $40,000
raised for cancer research and programs!

RECYCLING CONSTRUCTION & DEMOLITION DEBRIS

Did you know that most unwanted and leftover materials created by construction and demolition activities are *RECYCLABLE*?

Did you know that State and local laws require you to *recycle those items*?

Lemon Grove's ***Diversion Deposit Program*** establishes a deposit for construction and demolition projects. This program assists the City with its recycling efforts and with meeting State mandates.

What you need to know:

- To qualify for a complete refund, your paperwork must show that at least 75% of the debris was recycled or reused.
- Before starting your project – determine how you will manage the waste. Large projects must also submit a formal Waste Management Plan that includes estimating types and quantities of waste the project will generate.
- Then, when you apply for a building permit, the City will collect a deposit based on the size of the project.
- A list of nearby recycling centers is provided in the permit application. For small loads of mixed debris, the SANCO Resource Recovery is located on Federal Blvd. right here in Lemon Grove.
- Get receipts for everything!!! (including whatever goes to the landfill).
- If you donate the items, be sure to get a receipt. No receipt available? Take photos of the items being donated and attach a signed note that states the name and address of donation site.
- If you plan to reuse any of the items, take photos of the items and attach a signed note that states how you will be reusing the debris. (think scrap wood for firewood or installing old kitchen cabinets in the garage).

Help us create a sustainable Lemon Grove by participating in this required program!

SAN DIEGO COUNTY'S ULTIMATE RECYCLING RESOURCE

Over the last few years, "Going Green" has become a mainstream message. From the grocery store to car dealerships, there is no shortage of eco-friendly options. While not everyone can afford to buy a hybrid or always eat organic foods, there is a common factor shared between the levels of "green" lifestyles. The majority of people recycle and I Love A Clean San Diego provides the ultimate recycling resource. **WasteFreeSD.org** is an online database for all your recycling needs. The database is a quick and convenient way to find out what can be recycled and the closest location to take those items. I Love A Clean San Diego provides the only Disposal Solution Center database in the county. Just log onto ***www.wastefreesd.org*** and check out how easy it is!

- **Doing some spring cleaning? Find out where to get rid of hazardous cleaning products.**
- **Got leftover propane tanks from recent BBQs? Have extra pool chemicals lying around from recent cleanings? *WasteFreeSD.org* will show you where to get rid of these.**
- **Did you know all rigid plastics are now recyclable? That's right, your local trash hauler (EDCO) is now accepting things like yogurt containers, plastic toys, lawn furniture and much more.**

Log onto *www.wastefreesd.org* for all your recycling needs!

FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL

For your convenience, the **EDCO Buyback Center** located at 6700 Federal Boulevard, in Lemon Grove is **open every day of the week** from 8:00 a.m. to 4:00 p.m. for recycling household batteries and disposing of sharps waste. Questions? Call EDCO at (619) 287-7555.

Household Batteries — AAA, AA, C, D, AND 9V ONLY

Batteries contain heavy metals such as mercury, lead, cadmium, and nickel, which can contaminate the environment when batteries are improperly disposed of. Recycling batteries keeps heavy metals out of landfills and the air and saves resources because recovered plastic and metals can be used to make new batteries.

Sharps Waste (Needles, lancets, or other devices used to penetrate the skin for the delivery of medications.)

Put sharps in approved sharps containers or in sturdy, puncture resistant, tightly sealed containers like bleach bottles, liquid detergent bottles or coffee cans with lids. **DO NOT STORE IN:** paper or plastic bags, glass containers, cardboard or coated paper containers, plastic bottles that have a CRV (CA Redemption Value) or milk jugs. ***LOOSE SHARPS ARE NOT ACCEPTED.***

Environmental

IT'S ALMOST HERE...

That time of year so rare in Southern California – the rainy season. When it rains, the water washes into the gutters and then into nearby storm drains, eventually flowing into local creeks and to the ocean. Since water entering storm drains is not treated, it will also carry along with it various pollutants and debris, which can result in unsafe swimming conditions at the beaches of due to the pollution and toxins.

You can help! **Suggestions to help you prepare *and* assist the City's clean stormwater efforts:**

- Be aware of manufacturer's instructions on pesticides and fertilizers - a little goes a long way,
- Clear your yard and driveway of trash and debris to prevent it from flowing to the storm drains,
- Scoop the poop when walking your pooch! Dog droppings are big contributors to harmful bacteria levels in local creeks,
- Collect yard and green waste to recycle or to use as mulch and fertilizer,
- Protect bare slopes to prevent erosion and mudslides.

Call (619) 825-3800 to report illegal dumping or blocked storm drains. Questions about stormwater and what you can do? Email Cora Long at clong@ci.lemon-grove.ca.us.

ANTS!! A Common Summertime Annoyance in Southern California

Control ***ANTS*** *the non-toxic way!*

1. Ant-proof kitchen garbage pails with sticky barriers such as petroleum jelly under the lip.
2. Put pet dishes in a moat of water.
3. Sponge invaders with soapy water as soon as you see them enter.
4. Fill cracks and crevices that have become ant entryways with caulk or petroleum jelly.
5. Remove infested indoor plants.
6. Use baits to control the colony—sprays are rarely necessary.

Use NON-CHEMICAL methods & LEAST TOXIC pesticides.

WHY? Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.

For more information on ants and other household pests, go to *www.ThinkBlueSD.org*.

City of Lemon Grove

STORMDRAIN Hotline

(619) 825-3827

Please report illegal dumping (paint, chemicals, etc.) into the City's stormdrain system.

What is stormwater pollution? Untreated urban runoff (pollutants like trash, pet waste, cigarette butts, motor oil or antifreeze, paint, pesticide and fertilizer runoff) that flows untreated through the storm drain system, eventually making its way into the ocean.

CITY'S REDEVELOPMENT AGENCY DISSOLVED

Two California bills and one California Supreme Court case ended California's seventy year history of redevelopment. Lemon Grove's Community Development Agency—its redevelopment agency—has existed since 1983. Redevelopment abuses around the State have served as the poster child for terminating redevelopment; however, in Lemon Grove, redevelopment has been a powerful companion to the City.

Through its Community Development Agency, the City has been able to invest in aging business corridors, attract businesses that finance the backbone of community services, provide housing opportunities for residents, and create jobs that benefit the local economy.

A few of the more significant redevelopment projects in the City include:

- The Home Depot development
- Rehabilitated storefronts, inclusion of outdoor dining, and new business signs on Broadway between Grove Street and Lemon Grove Avenue
- Lester Street parking lot
- Bob Baker Toyota development
- Citron Court apartments on Broadway

Despite the decision by the State of California to terminate redevelopment in Lemon Grove, provisions in the law ***do*** allow the City to finish several of the projects currently in the redevelopment pipeline that rely on either grant funds or redevelopment bond proceeds—meaning no General Fund dollars are being used to complete these projects.

The following projects will continue to be constructed, despite the demise of redevelopment:

♦ ***Citronica I —*** this 56-unit mixed-use affordable housing and retail project is underway. Located at the corner of Main Street and North Avenue, the project will be complete by February 2013.

Citronica I

♦ ***Citronica II*** — located at the corner of Olive Street and North Avenue, the developer of this 86-unit senior apartment complex is currently seeking State housing tax credits to complete the financing of the project. Once financing is secured, The project should take 18 months to complete.

♦ ***Main Street Promenade*** — with funding secured through two grants, land acquired, and a contractor selected, the Main Street Promenade project is slated to begin construction in May 2012. This project will transform the existing Main Street, between Broadway and North Avenue, into a walkable park with energy generating components, educational features, a play area, and restrooms. The project will be complete by the end of 2012.

Continued on Page 2...

Community Interest

Revitalization Projects Around Town...continued from cover

- ***Lemon Grove Avenue Realignment*** — the City has been working to modify the alignment of Lemon Grove Avenue with Highway 94. The primary aim of the project is to improve traffic circulation for vehicles traveling on North Avenue, Lemon Grove Avenue, and entering and exiting Highway 94. The project will also allow for greater walkability in the area and will create a better "gateway" for the City. Due to unforeseen complications with land acquisition and coordination with other governmental agencies, this project is behind schedule. Currently, the City aims to complete this project by the end of 2013.

Re-routing of Lemon Grove Avenue

SHAKE, SHAKE, SHAKE— WHAT'S ALL THAT EARTH MOVEMENT ABOUT?

Have you noticed the new, non-City projects throughout Lemon Grove?

- ***Lemon Grove Middle School*** — the Lemon Grove School District secured bond funding to upgrade its campuses, including the conversion of Lemon Grove Middle School into a "STEM Academy" (Science, Technology, Engineering, and Math). In addition to the campus rehabilitation, the Lemon Grove School District is constructing a joint-use library for the community. The school is scheduled to open in Fall 2012 and the library is planned to be open March 2013.
- ***Walgreens*** — look for the new Walgreens opening in late summer 2012 at the corner of Massachusetts Avenue and Broadway .
- ***PetCo — a PetCo will soon be open for business*** in the shopping center at Massachusetts and the north side of Broadway next to In N Out Burger.
- ***Lemon Grove Community Church*** — construction has just begun on a Spanish Colonial Revival church on the south side of Civic Center Park at the corner of Central Avenue and Main Street. This 8,001 square foot building is planned to be completed by September 2012.
- ***Trolley Station Upgrades*** — the San Diego Metropolitan Transit Authority and SANDAG are coordinating trolley station upgrades at Lemon Grove's two trolley stops. The upgrades are intended to raise the platform to accommodate the new low-floor trolley cars that accommodate wheelchair access without a lift, making trips faster and more convenient for passengers.

Stay tuned – more building is in the pipeline!

CHANGE IN DOG LICENSING FEES

For the first time since 1990, the City modified dog licensing fees in 2011. The intention of the new fee schedule is to encourage spay and neutering of dogs to reduce the number of unwanted dogs in the City. The fee schedule also encourages the purchase of a 3-year license as opposed to a 1-year license, which should reduce the staff time involved in processing the licenses as well. The puppy and 2-year license options were eliminated.

New fee schedule:

1 Year License (Altered):	$15	Transfer Fee:	$10
1 Year License (Unaltered):	$40	Penalty (Altered):	$10
3 Year License (Altered):	$35	Penalty (Unaltered):	$25
3 Year License (Unaltered):	$75	Tag Replacement:	$ 5

6. Click **"Save Profile Information"** and you're done!

You will receive a confirmation e-mail with instructions on how to unsubscribe should you wish to do so. Your e-mail address is kept confidential and will not be sold or disclosed to third parties.

CLOTHING DONATION BOXES

Clothing donation boxes (sometimes red, sometimes blue) look very similar to mail collection boxes in our neighborhoods – ***but tend to attract illegal dumping that if not reported can continue to attract more trash and debris!*** **These boxes are not approved by the City for just that reason. Donate your clothes to a thrift store instead**. In Lemon Grove, there is a United Cerebal Palsy Thrift Store at 7875 Broadway. Donations benefit families afflicted with the disease and aid in pursuing a cure.

Please report locations of the donation boxes to the City at (619) 825-3800 so that they can be removed.

LOW-COST ALTERNATIVES FOR HIGH QUALITY EVENTS

The City of Lemon Grove offers facilities specifically designed for receptions, meetings, sporting events, and other special events. The facilities accommodate varying size groups and reservations may be made up to one year in advance. Tours are available by appointment.

For pricing, reservations, or more information, please contact the Community Services Division at (619) 825-3800 ext. 3902, or visit the City's website at: *www.ci.lemon-grove.ca.us/rentals*.

Lemon Blossom Hall
8235 Mt. Vernon Street

A refined facility that can seat up to 200 for banquet style events, and up to 300 for theater style events. Adjacent to Lemon Grove Park, this beautiful facility features large French doors that open to a spacious patio. Borders of grassy areas and walkways provide a private, peaceful setting amongst nature, ideal for a wedding ceremony. The large, fully equipped kitchen is designed to handle all of your catering needs.

Community Center
3146 School Lane

Appealing for its convenient location and full kitchen amenities, this is an ideal setting for smaller meetings, conferences and private parties. The Community Center seats up to 75 for banquet style events, and up to 100 for theater style events. Tables and chairs are provided free of charge and City staff will set up and break down the equipment for you.

Berry Street or Lemon Grove Park Gazebos

Does an indoor event seem too stuffy for your special occasion? Take advantage of the *"Best Climate on Earth,"* by holding a birthday party, shower or fundraiser outdoors. Both parks span six acres and offer playgrounds, picnic areas and tables, restrooms, a basketball court and walking paths. Gazebo rentals are $80 and provide you with peace of mind that no one else can intrude on your special day. To reserve a gazebo, visit City Hall at 3232 Main Street or call (619) 825-3800 for more information.

H. Lee House Courtyard
3225 Olive Street

For a more intimate outdoor event, the historical H. Lee House boasts an elegant courtyard and features a stunning Victorian-style gazebo for ceremonies or entertainment surrounded by inlaid brickwork and grass. With a capacity for approximately 100 guests, the H. Lee House Courtyard is the perfect setting for a private outdoor wedding, anniversary party, or baby shower.

Community Interest

ILLEGAL SIGNS ON PUBLIC PROPERTY

The City of Lemon Grove is stepping up its efforts to prevent illegal signs on public property that negatively impact the appearance of streets, neighborhoods and business districts throughout our city.

Illegal signs create an unsightly appearance in our neighborhoods and business districts, a distraction on street corners and along roadways, and pose a visual barrier to motorists. For the overall safety of our neighborhoods, posting illegal signs must be discouraged.

Section 18.12.070 of the Lemon Grove Municipal Code prohibits all signs displayed on public property that are not approved by the City Council. A few examples of illegally posted signs that Public Works staff has removed in the recent past include: Garage Sale, Work From Home, and Yard Care Services.

The City asks its residents, businesses, and visitors to be more conscious of posting signs on public property, and encourages everyone to help in the efforts to rid our community of unnecessary, unsightly and unsafe clutter. ***The end result is a cleaner, safer, more attractive city for everyone to enjoy!***

TAKING RECYCLABLES FROM RECYCLING BINS IS STEALING!

"When recyclable materials are placed in collection containers or any designated pickup location, they shall become the property of the city or its duly authorized agent. It is unlawful for any person other than the city or its agent to move, remove, interfere with, disturb, or tamper with said materials or their containers." **Lemon Grove Municipal Code, Section 13.24.140**

Have you ever seen someone rummaging through your blue recycling bin? They are usually looking for valuable CRV materials—soda cans and water bottles. ***And, they are stealing***.

The problem isn't just here in Lemon Grove. It is an issue throughout California, which is why Assembly Bill (AB) 1778 was passed. AB 1778 requires scrap yards that buy $100 or more of CRV bottles and cans or $50 or more of newsprint, to document transactions and to pay for these materials by check. AB 1778 is designed to reduce organized recycling theft in California.

Locally, scavenging recyclables is a violation of Lemon Grove Municipal Code Section 13.24.140. Violators may be prosecuted and are subject to a fine.

Scavengers are not only stealing from the City and EDCO, they're stealing from the residents of Lemon Grove. The revenue generated from the sale of recyclables goes directly back to the rate payers in the form of lower service rates. So, when scavengers steal the recyclables, they remove that revenue and cut the funding to the waste hauling.

The next time you see someone scavenging through a recycling bin, remember that it is a crime and YOU can do something about it!

Tips to help prevent recycling theft:

1. **Bring your recycling bins out to the curb the morning of your scheduled pick-up instead of the night before.**
2. **Remove all CRV containers from your recycling bin. You can either redeem them at a recycling center or drop them off at EDCO at 6700 Federal Boulevard.**

SEE IT, HEAR IT, REPORT IT! ***If you see someone removing recyclables from a bin:***

- **Get the license plate number of the vehicle being used to transport the recyclables.**
- **Get a detailed description of the individual scavenging.**
- **If possible and if it is safe, take a picture of the individual and send it to: mjames@ci.lemon-grove.ca.us.**
- **Call the Sheriff Department's non-emergency number (858) 565-5200 to report the crime.**
- **When reporting a theft, it is important that you provide your name and contact information to the Sheriff's Department.** ***Without your acknowledgement that you have witnessed a crime, action cannot be taken against the violator.***

POLITICAL CAMPAIGN SIGN REGULATIONS

Avoid Campaign Sign Chaos This Election Season

The City of Lemon Grove wants YOU to be aware of the regulations relating to posting political campaign signs:

- Signs are <u>not allowed</u> on public property.
- Maximum 16 square feet for any single temporary, noncommercial sign.
- There are no quantity limits of temporary, noncommercial signs on a private property.
- Display period for temporary, noncommercial signs is limited to a total of 60 days and not later than five days after the event conclusion.
- Signs that obstruct vehicular sight distance are prohibited.

More Information:
Please refer to the Lemon Grove Municipal Code, Chapter 18.12 or call the City's Development Services Department at (619) 825-3800.

HEARTLAND FIRE & RESCUE CELEBRATES TWO YEAR MARK

It has been two years since the cities of El Cajon, La Mesa and Lemon Grove entered into a joint powers agreement for management and delivery of fire protection and emergency medical services. This joint powers agreement is known as Heartland Fire & Rescue. The management team includes a fire chief, three deputy fire chiefs, two division chiefs, five battalion chiefs, and four support staff.

Together our departments provide services for all types of emergencies and hazards, including first responder advanced life support, paramedic transport services, structural fire protection, wildland fire protection, vehicle extrication, vehicle fires, airport responses, hazardous materials first responder, regional urban search and rescue program, public service calls, public education, community preparedness, fire prevention and fire code enforcement.

Through this cooperative effort, these three cities have realized a combined savings of over $1.2 million while improving service levels to the community. This relationship is a great example of how communities can come together for the greater good.

For more information, visit us on the web: *www.heartlandfire.org*.

HEARTLAND FIRE & RESCUE
SERVING THE CITIES OF EL CAJON, LA MESA AND LEMON GROVE

WEEDS. WEEDS, WEEDS...

It's time to cut down those pesky weeds that popped up after the winter rains! This is a *friendly reminder* from the Fire Department that we all need to do our part by voluntarily removing fire hazards before the summer fire season starts. **Be sure to remove weeds by May**.

In the meantime, Fire Inspectors will be actively making a list of properties that are already overgrown. Beginning in June, "NOTICE to ABATE" letters will be mailed to property owners whose properties have become a fire hazard. Noticed property owners then have 30 days to clear the property. If the property has still not been cleared by that time, the City may fine the owner, hire a contractor to cut the weeds to protect neighboring properties, and bill the property owner for the cost of removal.

To report a fire hazard, call the Fire Department at 619) 825-3835 or report it online at *www.ci.lemon-grove.ca.us*, click on *"Report a Problem"* in the left–hand panel, choose "Weed Abatement" and follow the simple instructions.

SHERIFF'S CORNER — DISTRACTED DRIVING

The San Diego Sheriff's Department conducted a distracted driver campaign in conjunction with the California Highway Patrol (CHP) during the week of February 13th – 17th, the first detail of its type for San Diego County and the CHP,

Deputies assigned to the City of Lemon Grove and unincorporated areas, cited **61 drivers** during the week-long campaign and the enforcement resulted in 467 adult drivers and 3 juveniles receiving citations for talking or texting while driving in San Diego County.

Distracted driving is an epidemic on America's roadways. You see it every day—drivers swerving in their lanes, stopping at green lights, running red ones, or narrowly missing a pedestrian because they have their eyes and minds on their phones instead of the road.

The *Minimum fine* for talking without a hands-free device or texting on a cell phone is $159 for the first offense. *Repeat offenders pay $279 or more.*

***For more information*: http://www.distraction.gov or http://www.dot.gov/**

SAN MIGUEL SCHOOL COMMUNITY GARDEN TRANSFORMED!

San Miguel Elementary School's community garden has been transformed by the popular Home and Garden Television (HGTV) television show "Yard Crashers," DIY Network's top show, and SCOTTS®! In preparation for the event day, 30,000 lbs of soil, 400 pavers, assorted plants, benches, wheel barrows and gardening materials were delivered to the grounds. The transformation took place on January 30th from 8:30 a.m. to dusk. Film crews from HGTV and the DIY Network were on campus to capture the day's excitement and the miracles of teamwork, community building and making dreams come true. After 15 retakes of the first scene caused by an overabundance of giggling sixth grade girls, the day's filming went smoothly. The show is scheduled to air on HGTV in late March.

All Students visited the garden during their regularly-scheduled school day and Extended Day Program students were invited to help out in shifts from 3:00-6:00 p.m. Principal Heidi Bergener invited community members, neighbors and San Miguel Elementary's extended family to stop by to see the action. In total, over 1,000 students, families, community members, and district employees took part in transforming the school's garden into a safe place where students can come to learn about giving back, gardening and the true meaning of building community.

Cooking demonstrations and taste testing in school will be the primary focus of the harvested produce and community members will benefit from the abundance of fruit as well.

Tomatoes, cucumbers, peppers, strawberries, onions, cabbage, lettuce and basic spices will grow in raised planter beds.

Stepping stone pathway created from pavers painted by students.

A variety of citrus trees.

Community Events

7TH ANNUAL LEMON GROVE RELAY FOR LIFE — MAY 19 - 20, 2012

RELAY FOR LIFE
American Cancer Society

One day. One night. One community. *One Fight.*

Relay For Life is a life-changing event that brings people together to **celebrate** the lives of those who have battled cancer; **remember** loved ones lost to the disease; and ***fight back*** against a disease that takes too much. ***Won't you join us?***

Relay For Life began in 1985 when Dr. Gordy Klatt, a colorectal surgeon in Tacoma, Washington, ran and walked around a track for 24 hours to raise money for the American Cancer Society. Since then, Relay has grown from a single man's passion to fight cancer into the world's largest movement to end the disease, with more than 3.5 million participants in 5,000 communities in the United States and 19 countries around the world.

The ***2012 Lemon Grove Relay For Life*** promises to be a great event featuring a moving opening ceremony, entertainment, food, activities for kids of all ages, and much, MUCH more!!

Throughout the event, we ***celebrate*** our cancer survivors, ***remember*** those who've lost their battle, and learn to ***fight back*** against a disease that takes too much. As darkness falls and the stars come out, the night is brightened by the glow of illuminated bags called luminarias, each bearing the name of someone who has battled cancer. The luminarias line the track and keep walkers motivated to keep going. The following morning as the event draws to a close, the crowd takes part in a meaningful closing ceremony and pledges to spend the next year ***fighting back*** against cancer!

Join us! **Saturday, May 19, 9:00am—Sunday, May 20, 9:00 am**

Palm Middle School, 8425 Palm Street (note new location for 2012)

Join teams of family, friends, neighbors, and co-workers at Palm Middle School. Teams are asked to have a representative on the track at all times during the event, representing the reality that *cancer never sleeps*. By participating, you ***celebrate*** cancer survivors, ***remember*** the lives we've lost to the disease, and raise money to help ***fight back*** against cancer in our community.

More information? **Call (619) 741-6748 or visit www.relayforlife.org/lemongroveca**

Relay For Life Needs You!

HOW YOU CAN GET INVOLVED:

- Form a team with friends, family, co-workers and neighbors.
- Join an existing team.
- Donate to a team or team member.
- Serve on the volunteer planning committee.
- Become an event-day volunteer.

Committee Volunteers WANTED!

Sponsor Opportunities Available!

Contact our American Cancer Society liaison Michelle Gonzales at (619) 682-7449 or *Michelle.Gonzales@cancer.org*.

Harvest C.R.O.P.S.—"Community Residents Offering Produce Seasonally"

Harvest C.R.O.P.S. ***(Community Residents Offering Produce Seasonally)*** was founded in 2009 after Lemon Grove resident Sergio Padilla decided to do something about the unpicked residential fruit he had observed rot and fall to the ground for years on his drive daily to and from work. Sponsored by Lemon Grove's St. John of the Cross Youth Group and currently operating under the umbrella of the church's tax-exempt status, *the organization's mission is to serve those less fortunate by coordinating volunteers to "pick to be brought," rather than "drop and rot."* Since 2009, volunteers have picked and distributed ***thousands of pounds*** of fruit to low-income families, seniors, and food banks.

Goals for the organization in 2012 are for the development and creation of a mobile display booth for public presentations and an independent California 501(c)(3) tax-exempt ID to "seed" into its own independent identity, encouraging all faiths to support the mission of feeding low-income families and seniors with residential fruit that would otherwise drop to the ground to rot.

Volunteers and tax-deductible contributions for expenses such as fuel and supplies for harvesting such as buckets, gloves, and tools make Harvest C.R.O.P.S. mission a reality.

HERE'S HOW YOU CAN HELP…

Volunteer:

Youth groups or clubs are encouraged to participate! **Most harvests take place on Saturday mornings. The average volunteer time commitment is 3-4 hours. Groups of 5-20 volunteers meet at 9:00 a.m. in the parking lot at St. John of the Cross Church, 8086 Broadway. Call (619) 318-3423 or email *info@harvestcrops.org* to be placed on the "Call-up" roster. Participants will receive an email or phone call prior to a harvest appointment.**

Make an Appointment for a Harvest:

Call (619) 461-2681 or email *info@harvestcrops.org* to make an appointment to have residential fruit picked.

Donate:

Harvest C.R.O.P.S. appreciates your support through donations for fuel and safety supplies for volunteers. Call (619) 318-3423 or visit *http://members.cox.net/harvestcrops/Donate.htm*.

The pictures at right are from the Harvest C.R.O.P.S. traditional first harvest of the year in January—32 lemon trees at Civic Center Park, behind City Hall.

The trees yielded 45 twenty-pound buckets of lemons picked by 16 volunteers from Harvest CR.O.P.S. and the Grossmont Interact Club.

The fruit was distributed to the Lemon Grove Senior Center and the El Cajon Chaldean Community.

TENANT/LANDLORD SERVICES

The **Center for Social Advocacy** promotes fair housing practices, and provides free assistance to renters, land owners, and property managers.

The Center for Social Advocacy provides many services including:

- education to tenants
- education to land owners and property managers
- fair housing advocacy

The Center's housing specialists are equipped to answer many questions and provide additional resources to those in need. To contact the Center for Social Advocacy, call (619) 444-5700 or visit ***www.c4sa.org***.

REPORT ILLEGAL DUMPING

City of Lemon Grove

STORMDRAIN Hotline

(619) 825-3827

Please report illegal dumping (paint, chemicals, etc.) into the City's stormdrain system.

What is stormwater pollution? Untreated urban runoff (pollutants like trash, pet waste, cigarette butts, motor oil or antifreeze, paint, pesticide and fertilizer runoff) that flows untreated through the storm drain system, eventually making its way into the ocean.

Find out more:
http://www.ci.lemon-grove.ca.us/stormwater

Environmental

FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL

For your convenience, the **EDCO Buyback Center** located at 6700 Federal Boulevard, in Lemon Grove is **open every day of the week** from 8:00 a.m. to 4:00 p.m. for recycling household batteries and disposing of sharps waste. ***Questions? Call EDCO at (619) 287-7555.***

Household Batteries — *AAA, AA, C, D, AND 9V ONLY*

Batteries contain heavy metals such as mercury, lead, cadmium, and nickel, which can contaminate the environment when batteries are improperly disposed of. Recycling batteries keeps heavy metals out of landfills and the air and saves resources because recoverd plastic and metals can be used to make new batteries.

Sharps Waste *(Needles, lancets, or other devices used to penetrate the skin for the delivery of medications.)*

Put sharps in approved sharps containers or in sturdy, puncture resistant, tightly sealed containers like bleach bottles, liquid detergent bottles or coffee cans with lids. **DO NOT STORE IN:** paper or plastic bags, glass containers, cardboard or coated paper containers, plastic bottles that have a CRV (CA Redemption Value) or milk jugs. ***LOOSE SHARPS ARE NOT ACCEPTED.***

I LOVE A CLEAN SAN DIEGO

Volunteers are instrumental in the I Love A Clean San Diego (ILACSD) mission by helping them to raise public awareness throughout the community and to protect and enhance the environment.

Each year, more than 30,000 volunteers are active in ILACSD's volunteer programs, including the following:

- Coastal and Inland Cleanups
- Creek to Bay Cleanup
- Coastal Cleanup Day
- Storm Drain Stenciling
- Adopt-A-Beach
- Non-Native Plant Removal
- Student Internships
- Office Support
- Community Outreach & Booth Events
- Recycling Events & Outreach Programs
- Corporate Teambuilding Events
- Coastal and Inland Cleanups

For more information about ILACSD's many programs call (619) 291-0103.

ILACSD's Community Events Department coordinates **monthly cleanup events** both on the coast as well as in local creek beds, canyons, open space parks and everywhere in between. Volunteers see first-hand how trash makes its way from inland communities all the way to the coast through San Diego County's vast watershed system.

Creek to Bay & Coastal Cleanup Day: Volunteers gather In April and September at more than 75 cleanup sites countywide to remove trash and beautify the local community. **The 2012 Lemon Grove cleanup site will be at San Miguel and Federal Boulevard on April 28 from 9:00 a.m. to Noon. Please register online at www.creektobay.org so that adequate volunteer supplies will be at the site for the cleanup.** ***Need more information?*** **Call Natalie Roberts at (619) 704-2778 or nroberts@cleansd.org.**

Storm Drain Stenciling: Volunteers use paint and stencils to create the message "NO DUMPING" on sidewalks, parking lots and any other places with storm drain inlets. See their Storm Drain Stenciling page for more information about how you can get involved in preventing pollution.

Adopt-A-Beach: Part of the statewide Adopt-A-Beach program, this program is great for groups who want to participate in volunteer work on an ongoing basis. It requires that you perform at least three cleanups per year. While the name suggests that only beaches are available for adoption, there are also a number of inland locations that need cleaning up. Visit the Adopt-A-Beach website to learn more about adopting a local beach or inland area.

Corporate Teambuilding: I Love A Clean San Diego assists local businesses to coordinate team building cleanups at local beaches & inland areas. For a small fee, ILACSD provides event planning, coordination, marketing and supplies to coordinate a cleanup for your business. Contact Director of Community Events, Natalie Roberts by phone at (619) 704.2773 or email nroberts@cleansd.org.

I Love A Clean San Diego organizes *Cleanups throughout San Diego County.* including beach cleanups and inland cleanups at parks, lakes, and other recreation areas that are littered with debris. These cleanups are open to the public, and volunteers of all ages are encouraged to participate.

For a current listing of events, please visit the event Calendar.

JURISDICTIONAL URBAN RUNOFF MANAGEMENT PROGRAM ANNUAL REPORT

APPENDICES

Appendix A.1
Inventory of Completed Development Projects with Approved Treatment Control BMPs

No.	Project Name	Project Address	Development Type	BMPs	HSA	Fiscal Year Completed	TTWQ
1	DCH HONDA	3615 LEMON GROVE AVE.	Commercial	Underground storage treatment facility, filter inserts, grassy swale	908.22	2007	High
2	CITRON COURT	7385 BROADWAY	Residential	LID	908.22	2008	Low
3	CHEVRON	7209 BROADWAY	Commercial	South Poway Business Park detention basin, catch basin inserts	908.22	2005	Medium
4	MARY PAT LANE	MARY PAT LANE	Residential	Sand filter, catch basin insert, roof downspout filters	909.12	2006	Medium
5	EDCO	6670 FEDERAL BLVD	Commercial	Vegetated swales, catch basin insert	908.22	1990	High

Appendix A.2
FY 2011-12 Construction Inventory

#	Project	Location	HSA	TTWQ	Rainy Season		Dry Season Number of Site Visits/ Visual Inspections	Total Site Visits/ Visual Inspections
					Weeks Active	Number of Site Visits/ Visual Inspections		
Private Developments								
1	Citronica*	7775 North Avenue	908.22	M	16	16	9	25
2	Happy Tinnie LLC	2889 Orange Place	908.22	L	11	11	13	24
3	Lemon Grove Comm. Church*	3132 Main Street	908.22	M	23	23	10	33
4	Walgreens*	7195 Broadway Avenue	908.22	M	24	24	9	33
5	Kroger Foods Gas Station Improvements	7428 Broadway Avenue	908.22	L	20	20	13	33
Capital Improvements (CIP)								
6	2011 CIP Street Rehab	Various	908.22 909.12	L	0	0	3	3
7	Ida Street Drainage Improvements	Ida Street & New Jersey Avenue	908.22	L	0	0	12	12
8	Federal Blvd. Sewer	Federal Boulevard	908.22	L	0	0	2	2

Note: The following three projects designated as medium priority included filling out the City's construction stormwater compliance inspection form. Citronica had an inspection form filled out for the months of January, February, March and April. Both Lemon Grove Community Church and Walgreens had inspection forms filled out monthly during the rainy season from October 2011 through April 2012. All other inspections noted in the table were visual inspections with some notes on BMP observations documented in the engineering inspector's journal.

Appendix A.3 (Continued)
Municipal Inventory

Notes

TTWQ – Threat to Water Quality

Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water.

L = Likely, PO = Possible, UL= Unlikely

* Discharge of heavy metals and oil and grease is possible if the facility has on-site parking

** Sediment and oxygen demanding substances are possible pollutants for earthen or natural conveyances. Bacteria, but generally not viruses and other pathogens, may regrow in MS4s under certain conditions. While other pollutants may be discharged from the MS4, the MS4 itself is not a direct source of those pollutants.

*** The sanitary sewer system is only a potential source of pollutants in the event of sewer line breaks or SSOs.

Notes
TTWQ – Threat to Water Quality
SIC –Standard Industrial Classification Code
L= Likely, PO= Possible, UL=Unlikely
Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water.
This table was generated using the Copermittee's Regional Mobile Business Inventory and mobile business presented in The City of Lemon Grove's 2010-11 JURMP Annual Report. The pollutant loading potential component of the table is based on the field experience of City staff and on tables in the Copermittees's Baseline Long-Term Effectiveness Assessment in determining pollutant discharge potential from commercial sources.

Appendix B
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
1	8/11/11	8170 Broadway	Municipal	Car wash water flowing into street	City staff investigated by touring the station. Station manager informed city staff that gas station employees were rinsing off tires and wheels (prior to entering car wash) on the side of the station and water was flowing down a ramp onto the sidewalk. City staff directed the gas station manager to cease rinsing vehicles where water would flow onto public right-of-way. Manager stated they would capture any water to prevent it from flowing off the property. As of this date, no additional complaints received. **Verbal Warning. No further action.**
2	2/3/12	3515 Olive Street	Municipal	Brine water spill at Culligan	City staff investigated by touring facility. No evidence found that water reached MS4. Brine spill (used during water treatment process) was contained on the property and drained into a collector on site. **No further action.**
3	8/16/12	BERRY STREET (EXACT ADDRESS UNKNOWN)	Residential	Neighbor doing laundry in front yard	City staff investigated and found no evidence of laundry washing in any front yards on Berry Street. City staff also contacted complainant who could not provide any specifics as to when alleged violation occurred. City staff asked the complainant to call Code Enforcement when the next violation occurs on Berry Street. As of this date, staff has not received any phone calls or new information regarding this complaint. **No further action.**
4	5/14/12	2796 DENNIS LANE	Residential	Waste water seeping above ground	City staff investigated and found no evidence of waste water seepage. No waste water smell was noted. As of this date, staff has not received additional complaints. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
5	4/9/12	6983 CENTRAL AVENUE	Residential	Trimmed vegetation left in drainage ditch.	City staff requested the property owner responsible for the trimming remove vegetation from drainage ditch. Property owner complied by the next day. **Verbal Warning. No further action.**
6	3/20/12	1901 ELDORA STREET	Residential	Oil leaking from vehicle	City staff investigated but found no "fresh" leak. Only an old stain most likely dried oil was noted. City staff did not cite as numerous dried oil stains can be found the length of Eldora Street. **No further action.**
7	6/2/12	1548 EL PRADO	Residential	Pool water draining into street	City staff made contact with the property owner who stated the pool water was free of chemicals as he let it stand for a couple weeks prior to release. City staff recommended that next time he have the water drain onto his lawn in the back and front yards over a period of time. Property owner stated he would do that next summer. **Verbal Warning. No further action.**
8	7/20/11	7662-64 BROADWAY	Municipal	Overgrowth in Ditch	City staff removed weeds and trash from ditch. **No further action.**
9	7/25/11	7630 BROADWAY	Municipal	Missing storm drain grate	Temporary covered was placed, while a permanent cover for the storm drain is being fabricated. **No further action**.
10	8/3/11	EASEMENT ON WASHINGTON ST	Municipal	Clear & clean out easement on Washington St – btw Darryl & Roy St. Lots of greenery & debris.	Removal of weeds and trash from easement ditch as requested. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
11	8/8/11	MAIN ST CHANNEL (BTW GRANGE – MASS AVE)	Municipal	Annual clean up/weed abatement in channel located on Main St - from Grange to Mass Ave (both sides of roadway).	Yearly clean up completed. **No further action.**
12	9/1/11	DRAINAGE DITCH (BTW LGA - CITRONELLA AVE)	Municipal	Clean out & remove growth from drainage ditch located behind Arco on LGA/Palm	Clean up on ditch completed. **No further action.**
13	9/19/11	DRAINAGE DITCH (BEHIND 1554 ANGELUS AVE)	Residential	Overgrowth & broken concrete is an issue.	Maintenance will be the responsibility of the neighboring property owners. City sent out letters informing residents to cleanup. **No further action.**
14	9/21/11	CITY WIDE	Municipal	Storm patrol, check storm grates and channels for debris.	Routine inspections & maintenance. **No further action.**
15	10/5/11	CITY WIDE	Municipal	Storm patrol, check storm grates and channels for debris.	Routine inspections & maintenance. **No further action.**
16	10/5/11	CITY WIDE	Municipal	Storm patrol, check storm grates and channels for debris.	Routine inspections & maintenance. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
17	11/14/11	DITCH BEHIND 1847 BAKERSFIELD	Residential	Assessment of large portion of eucalyptus tree that has fallen on home at 1847 Bakersfield. Reported by Prop Management - Tom Bell has gone out to take photos & we are determining if the tree is in fact on City property/ROW, no action yet	The tree poised a safety risk to the surrounding area so City staff removed the tree. But because there is no City-owned property along the area in question, the services that staff provided will be the final action that we provide for this property. **No further action.**
18	11/29/11	8061-8063 ALTON DR	Municipal	Please clean out storm drain west of 8063 Alton Dr (by the church) & across the street.	Routine clean up completed. **No further action.**
19	12/12/11	ACROSS THE STREET FROM 8227 DARRYL ST	Municipal	Please place sandbags at drainage ditch directly in front of 8227 Darryl St to avoid flooding.	Sandbags placed. **No further action.**
20	2/7/12	2618 BONITA ST	Residential	Flood control	Class 2 base placed and compacted in front of 2618 Bonita as requested. **No further action.**
21	2/16/12	1990 MADERA ST	Municipal	There is a tree/bush growing out of the storm drain on the corner of Madera Street and Massachusetts.	Removed as much silt & debris from out of storm drain as possible. **No further action.**
22	3/5/12	N/E CORNER OF LGA & CANTON DR	Municipal	Please remove a palm tree growing out of a storm drain on the N/E corner of LGA & Canton.	Removed palm tree growing out of storm drain channel @ LGA and Canton. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
23	3/6/12	SWEETWATER RD (NEXT TO 125 OVERPASS)	Municipal	Overgrowth & debris is blocking storm drain @ appx 2500 feet north of Hunter's Nursery on the west side of the road next to the I-125 overpass. Look for the trash and shopping carts.	Determined that ROW at this location belongs to CALTRANS. Maintenance Ticket created on CALTRANS website. **No further action.**
24	3/8/12	FEDERAL BLVD & CENTRAL AVE STORM DRAIN DITCH	Municipal	Clear vegetation, palm trees from storm drain ditch @ Federal & Central Ave.	All palm trees and tully's removed from storm drain channel. 100 yards of palms, trash, and debris were removed from the site. **No further action.**
25	3/21/12	2811 DREW LN	Residential	Storm drain grate needs to be clear of debris on & around 2811 Drew Lane. Resident says the street is flooding every time it rains. If the issue is within the drainage easement located btw 2812 & 2820 Drew Ln -It is PRIVATE.	Storm drain grate was cleared of debris, easement was determined to be private so nothing else was done. **No further action.**
26	3/28/12	SOUTHEND OF PERGL ST	Municipal	Take out the bushes on the S/E end of Pergl adjacent to property at 7276 Mt. Vernon because they are poisonous to horses on site. Can you please assess the area and let me know if they can be removed.	Site has a newly installed drain pipe & the easement was cleared of overgrowth. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
27	4/10/12	7008 LEMONWOOD LN	Municipal	Please schedule routine maintenance for Drainage Easement located between Lemonwood Lane & Central Ave. Back Neighbors at 6983 or 6995 Central were contacted to remove their tree trimmings that fell into easement.	Chain saw was used to make an access road for the 4x4 gator, and also used to cut up the tree trimmings in our storm channel left behind by the surrounding residents. Then the brush & tree trimmings were removed and disposed of appropriately. **No further action.**
28	4/24/12	2870 NEW JERSEY AVE	Municipal	Please perform routine maintenance on both New Jersey & Roosevelt side. Resident would like the City to consider alleviating high points in the easement so that water won't sit resulting in flooding to her property & high weed growth.	Trash picked up and weeds abated at 2870 New Jersey Ave. **No further action.**
29	5/1/12	ROY ST STORM DRAIN CHANNEL	Municipal	Please perform routine maintenance for drainage easement between Roy St & Darryl St	Routine clean up completed. **No further action.**
30	5/1/12	7252 BROADWAY	Municipal	Stolen storm drain grate in the alley behind Lido's Restaurant.	Calvin Hunt responded & placed barricades to block off storm drain inlet missing grate. Grates were ordered & installed 4-6 weeks later. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
31	6/4/12	2815 DENNIS LN	Municipal	Please assess storm drain cover that pops off & is now missing at this address. Also check that the drain is clear of debris.	Public Works staff secured storm drain cover and cleared the debris on 6/5/12. **No further action.**
32	6/6/12	8413-8427 BROADWAY	Municipal	John -manager at Broadway Manor Apts would like to meet with Tom regarding the overgrown eucalyptus trees in a drainage easement located behind apt property. Trees causing damage & they want to know who they belong to. Tom has been out there before.	Public Works staff met with property owner. Trees are responsibility of the property owner. **No further action**.
33	6/18/12	SITE 1 - 400′ S/E OF MILTON RD & BROADWAY	Municipal	Please start initial clean-up of sites proposed within the DRY WEATHER MONITORING report - sites 1,3,16, and 20 to be completed by the end of the week, per T.Bell	Trash removal & weed abatement completed. **No further action.**
34	6/18/12	SITE 3 – S/O 6691 FEDERAL BLVD	Municipal	Please start initial clean-up of sites proposed within the DRY WEATHER MONITORING report - sites 1,3,16, and 20 to be completed by the end of the week, per T.Bell	Trash removal & weed abatement completed. **No further action.**

Appendix B (Continued)
Complaint Log

#	Date	Location	Complaint Type	Complaint	Resolution
35	6/18/12	SITE 16 – CITRONELLA 150′ N/O PALM AVE	Municipal	Please start initial clean-up of sites proposed within the DRY WEATHER MONITORING report - sites 1,3,16, and 20 to be completed by the end of the week, per T.Bell	Trash removal & weed abatement completed. **No further action.**
36	6/18/12	SITE 20 – 200 YDS N/O INTRSTN @ SAN ALTOS	Municipal	Please start initial clean-up of sites proposed within the DRY WEATHER MONITORING report - sites 1,3,16, and 20 to be completed by the end of the week, per T.Bell	Trash removal & weed abatement completed. **No further action.**
37	6/18/12	2873 SKYLINE DR	Municipal	Ground water issue just outside the public works yard on Skyline Dr. Water would puddle & collect resulting in algae.	Issue had been resolved with the installation of the 6" pipe at this site. **No further action.**

Appendix C
JURMP Annual Report Requirements Checklist

Development Planning Component

Permit Annual Reporting Requirement—Section J.3.a.(3).(a)	Location in Report
i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements.	2.2, 2.3, 2.4
ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked.	2.4.4.2
iii. A listing of the development projects to which SUSMP requirements were applied.	Table 2-3
iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked.	Table 2-2, Table 2-3, 2.4.4.2
v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs.	2.4.4.2
vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible.	2.4.4.2
vii. An updated treatment control BMP inventory.	2.4.4.3, Appendix A.1
viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings.	2.4.4.3, Table 2-1, Table 2-4
ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings.	2.4.4.3
x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked.	2.4.4.2
xi. A listing of any projects which received a SUSMP waiver.	2.4.4.2
xii. A description of implementation of any SUSMP waiver mitigation program.	2.4.4.2
xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation.	2.4.4.2
xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented.	Table 2-3, 2.4.4.2
xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements.	Table 2-2, 2.4.4.2

Development Planning Component

Permit Annual Reporting Requirement—Section J.3.a.(3).(a)	**Location in Report**
xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project.	2.4.4.2
xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	2.4.4.3, Table 2-4
xviii. A description of notable activities conducted to manage urban runoff from development projects.	2.1.1

Construction

Permit Annual Reporting Requirement—Section J.3.a.(3).(b)	Location in Report
i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked.	3.5.2
ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed.	3.2
iii. A description of modifications made to the construction and grading ordinances and approval processes.	3.3
iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites.	3.5.3
v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites.	3.5.2
vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites.	3.5.2
vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites.	3.5, Appendix A.2
viii. A description of the general results of the inspections.	3.5.3
ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	3.5.4
x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	3.5.4, Table 3-1
xi. A description of notable activities conducted to manage urban runoff from construction sites.	3.1

Municipal

Permit Annual Reporting Requirement—Section J.3.a.(3).(c)	**Location in Report**
i. Any updates to the municipal inventory and prioritization.	Appendix A.3 (inventory)
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events.	4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4
iii. A description of inspections and maintenance conducted for municipal treatment controls.	2.4.4.2, 4.4.4
iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned.	4.4.2, 4.4.4 Table 4-2
v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned.	4.4.2, 4.4.4, Table 4-2
vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned.	4.4.4, Table 4-2
vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category.	4.4.4, Table 4-2
viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding.	4.4.4
ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities.	4.2.3
x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4, Table 4-1
xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4, Table 4-1
xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4, Table 4-1

Municipal

Permit Annual Reporting Requirement—Section J.3.a.(3).(c)	**Location in Report**
xiii. Identification of the total distance of curb-miles swept.	4.3.4, Table 4-1
xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping.	4.3.4, Table 4-1
xv. Amount of material (tons) collected from street and parking lot sweeping.	4.3.4, Table 4-1
xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4	4.5.4
xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections.	4.2.4, 4.3.4, Table 4-3
xviii. A description of the general results of the inspections.	Table 4-3
xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	4.2.4
xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	4.2.4
xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities.	Throughout Section 4

Industrial and Commercial

Permit Annual Reporting Requirement—Section J.3.a.(3).(d)	**Location in Report**
i. Any updates to the industrial and commercial inventory.	5.2.2 (stationary), 5.3.4 (mobile), Appendices A.4, A.5 (inventory)
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources.	5.2.4, 5.3.4
iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses.	5.2.4, 5.3.4
iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected.	5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1; Appendices A.4, A.5
v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection.	5.2.4
vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance.	5.2.4
vii. Identification of the number of third party inspections conducted.	5.2.4
viii. Identification of efforts conducted to verify third party inspection effectiveness.	5.2.4
ix. A description of efforts implemented to address mobile businesses.	5.3.4
x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	5.2.4, 5.3.4, Table 5-2
xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees.	5.2.4,
xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources.	Throughout Section

Residential

Permit Annual Reporting Requirement—Section J.3.a.(3).(e)	**Location in Report**
i. Identification of the high threat to water quality residential areas and activities that were focused on.	6.2
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities.	6.4
iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials.	6.4
iv. Types and amounts of household hazardous wastes collected, if applicable.	6.4.1
v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation.	6.4.2 (see discussion in JURMP)
vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	6.4; Appendix B
vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program.	6.4.1
viii. A description of notable activities conducted to manage urban runoff from residential areas and activities.	6.4

IDDE*

Permit Annual Reporting Requirement—Section J.3.a.(3).(f)	Location in Report
* Section 7, the Illicit Discharge Detection and Elimination component, of the FY 2011-12 Annual Report, will be submitted to the RWQCB no later than December 15, 2012.	

IDDE—Additional Dry Weather Monitoring Program Requirements*

Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d	Location in Report
* Section 7, the Illicit Discharge Detection and Elimination component, of the FY 2011-12 Annual Report, will be submitted to the RWQCB no later than December 15, 2012.	

Education

Permit Annual Reporting Requirement—Section J.3.a.(3).(g)	Location in Report
i. A description of education efforts conducted for each target community.	8.3
ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges.	8.3
iii. A description of education efforts conducted for municipal departments and personnel.	8.2, Table 8-1
iv. A description of education efforts conducted for the new development and construction communities.	8.3
v. A description of jurisdictional education efforts conducted for residents, the general public, and school children.	8.3, Tables 8-2, 8-3

Public Participation

Permit Annual Reporting Requirement—Section J.3.a.(3).(h)	Location in Report
i. A description of public participation efforts conducted.	9.2 and 9.3

Effectiveness Assessment

Permit Annual Reporting Requirement—Section J.3.a.(3).(i)	Location in Report
i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order.	11

Fiscal Analysis

Permit Annual Reporting Requirement—Section J.3.a.(3).(j)	Location in Report
i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order.	10

Special Investigations

Permit Annual Reporting Requirement—Section J.3.a.(3).(k)	Location in Report
i. A description of any special investigations conducted.	12

Non-Emergency Firefighting

Permit Annual Reporting Requirement—Section J.3.a.(3).(l)	**Location in Report**
i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows.	4.2.3, 13

JURMP Revisions

Permit Annual Reporting Requirement—Section J.3.a.(3).(m)	**Location in Report**
i. A description of any proposed revisions to the JURMP.	14 and each program component section

EXECUTIVE SUMMARY

In February 2001, the San Diego Regional Water Quality Control Board (RWQCB or Regional Board) issued Order No. 2001-01, a National Pollutant Discharge Elimination System (NPDES) Permit regulating discharges to storm drain systems within 18 municipalities in San Diego County, the County of San Diego, and the San Diego Unified Port District (collectively referred to a "Copermittees"). The San Diego County Regional Airport Authority was later added as the twenty-first Copermittee. Order No. 2001-01, generally referred to as the Municipal Permit, required each Copermittee, including the City of National City (City), to develop a comprehensive storm water management program known as a Jurisdictional Urban Runoff Management Program (JURMP). The City's JURMP includes storm water management strategies and protocols related to planning, construction, and existing developments. Major components include the implementation of Best Management Practices (BMP), water quality monitoring, and educational outreach efforts.

Each fiscal year, the City prepares an annual report on the implementation of its JURMP, as required by Municipal Permit Section I.1. The following JURMP Annual Report presents the activities implemented during the 2006/2007 fiscal year (July 1, 2006 through June 30, 2007). A brief summary of each of the 14 sections of the Annual Report is presented below.

Introduction
The introduction presents an overview of the City's storm water pollution prevention program and includes a bulleted summary of key accomplishments for the 2006/2007 reporting period.

Municipal
The City continues to invest significant resources in the further development and the implementation of its storm water management program. The City continues to implement an aggressive street sweeping schedule and MS4 maintenance schedule, removing approximately 1,300 tons of material from street sweeping and 23,200 pounds of material from MS4 maintenance during 2006/2007. Additionally, about 416 cubic yards of debris were removed during channel maintenance operations. The City dedicated 1,782 man-hours to clean 333,060 linear feet of sewer lines. Over 17,700 pounds of debris were removed during this maintenance.

The City held six training sessions for municipal personnel during 2006/2007. The City also developed an educational 2007 "Keep Our Community Clean" Calendar that was provided to various City departments in addition to the general public.

Industrial/Commercial
During 2006/2007 the City inspected all high priority industrial facilities. During this reporting period, 29 complete industrial inspections and 10 full commercial inspections were conducted. Visits were also made to industrial and commercial sites when warranted by public complaints, and the City ensured that such incidents were resolved satisfactorily. Based on inspection findings and complaints received by the City's storm water hotline, the City issued six Notices of Violation (NOV) to industrial facilities and 10 NOVs to

commercial facilities. The City continued to provide educational outreach material to industrial and commercial businesses, and the City continued to implement a rating system to assess BMP implementation and storm water knowledge. Additionally, the City worked with its contractor, D-MAX, to conduct two industrial/commercial-related educational workshops, one for industrial businesses and one for automotive-related businesses.

Residential

Because residential areas comprise a large portion of National City, the City has pursued a number of efforts to educate and involve residents in implementing the City's JURMP. The City held a workshop for residents in the City and provided them with a presentation and a variety of educational material, including the 2007 educational calendar. Residents of the City of National City, along with the citizens of the City of Imperial Beach and the City of Chula Vista, continue to utilize a common household hazardous waste facility. The total mass of household hazardous waste collected by all three cities during this reporting period was 142,572 pounds. Similar to previous years, the City held two large item disposal events in conjunction with EDCO. Additionally two neighborhood cleanups resulted in the disposal/removal of 12 tons of trash and debris. The City maintained residential storm water awareness through educational materials, including flyers, pamphlets, and calendars, many of which were bilingual. Residents also made use of the City's Storm Water Hotline to report observed storm water problems, including those in residential neighborhoods. The City issued seven NOVs, sent 23 corrective action letters, and gave numerous verbal warnings related to complaint investigations in residential areas.

Development Planning/Construction

All development projects that will disturb soil are required to complete a Storm Water Requirements Applicability Checklist. The checklist helps determine requirements for post-construction BMP implementation and whether the project will be subject to the State General Construction Permit or General Industrial Permit. Regardless of which department is initially contacted for the projects' permits, completed checklists are forwarded to the Engineering Department for sign off to ensure consistency. All construction projects subject to the General Construction Permit submitted SWPPPs, which the City's consultant reviewed. Twelve projects subject to the City's Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance were required to submit post-construction BMP plans, which were also reviewed. The City regularly inspected active construction sites in its jurisdiction, including weekly inspections for high priority sites. Storm water complaints received about construction sites were also promptly investigated, and enforcement actions were taken where necessary. A total of three NOVs and two administrative citations were issued to contractors or developers. The City held a SUSMP workshop for the development planning community and a construction-related workshop for construction site owners and operators. Though not required by the Municipal Permit, toward the end of the reporting period the City also inspected completed SUSMP projects for the first time. The City will use the results of this initial inspection effort to refine its SUSMP inspection programs in future years.

Illicit Discharge Detection and Elimination

The main avenues through which illicit connections and illegal discharges (IC/ID) are detected are the Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program), the storm water hotline, and by observations made by City

staff. Visual observations and field screening were conducted at 15 Dry Weather Monitoring Program sites, and water samples from over 25 percent of the sites underwent laboratory analysis for additional parameters. When routine monitoring found a parameter above its established action level, a follow-up source identification investigation was undertaken. Based on the results of the investigations, the City acted to eliminate the source(s) of pollution identified by these investigations. All 143 complaints received were documented and resolved by City staff. One sewage overflow occurred during 2006/2007 and was reported to the RWQCB. The spill was cleaned up, and enforcement action was taken against the responsible party. All IC/IDs detected in 2006/2007 were eliminated during the reporting period.

Education/Public Participation

During 2006/2007 the City continued to provide the general public with educational outreach material and opportunities to participate in the implementation of the storm water program. The City provided numerous training sessions and a variety of educational material for municipal personnel, industrial and commercial business owners/operators, development and construction project proponents, and residents. The City's outreach efforts were estimated to have made over 137,000 impressions during the reporting period. The City collaborated with I Love a Clean San Diego to stencil 30 storm drains in the City. Cleanup efforts in the City, including those put on by neighborhood councils, removed approximately 14.4 tons of trash and debris.

Assessment of JURMP Effectiveness

The regionally developed approach to program effectiveness assessment includes program planning, BMP selection, and evaluation of six tiered levels of targeted outcomes. As the system progresses from Level 1 to Level 6, targeted outcomes becoming less focused on activities conducted and more focused on changes in water quality. The City used this regionally developed approach to assess its program, incorporating some City-specific components such as historical water quality monitoring data. The City has also continued to employ a numeric scoring system to assess BMP implementation and the level of storm water knowledge during industrial and commercial inspections.

Fiscal Analysis

Section 12 of this JURMP Annual Report presents information about the costs and funding of the City's storm water program. Not including special projects, budgeted outlays were $939,500 for 2006/2007 and the $936,000 for the upcoming fiscal year.

Special Investigations

In response to Dry Weather Monitoring Program results, the City initiated a more focused investigation into sources of trash and debris that might affect the City's storm drain system. Findings of the study and the City's plans for follow-up actions are discussed in Section 13.

Conclusions and Recommendations

General conclusions and recommendations are presented in Section 14. During 2006/2007, the City continued to improve the planning and implementation of its program and began to prepare for the new requirements of the recently reissued Municipal Permit, Order No. 2007-0001. During 2007/2008, the City will continue to refine and adjust existing programs and will develop new programs to meet the requirements of Order No. 2007-0001.

CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki
City Engineer

Date: January 2008

1 INTRODUCTION

In early 2001, the San Diego Regional Water Quality Control Board (RWQCB or Regional Board) issued Order No. 2001-01 (Municipal Permit), a National Pollutant Discharge Elimination System (NPDES) permit that regulates discharges of urban runoff from Municipal Separate Storm Sewer Systems (MS4) in the San Diego area. The City of National City (City), like many other municipalities in California, maintains separate storm water and sanitary sewer systems. Water in the City's sanitary sewer system is directed to a wastewater treatment facility, while storm water flows directly to receiving water bodies and local beaches without being treated. The Municipal Permit regulates urban runoff discharges of 21 jurisdictions within the County of San Diego, including the City of National City, which are collectively referred to as "Copermittees."

The Municipal Permit required each Copermittee to prepare a Jurisdictional Urban Runoff Management Program (JURMP); the City's most recent JURMP was finalized in 2004. The JURMP includes program implementation and management strategies for development projects and the maintenance of existing development, including both public and private facilities. Within the JURMP document, the City included a variety of Best Management Practices (BMP), which are specific to municipal, industrial, commercial, residential, and construction sites/sources. In this document the City also outlined approaches for educating the public and encouraging public participation in the implementation of the JURMP; such measures are designed to raise awareness of storm water issues, promote BMP implementation, and foster a sense of shared responsibility in protecting water quality. The JURMP also presents procedures to prevent, detect, and eliminate illicit connections and illegal discharges (IC/ID) to the City's MS4. Various types of enforcement actions, which are at times necessary to bring about compliance, are also explained in the JURMP. Overall, the programs set forth in the JURMP document are intended to reduce the discharge of pollutants from the MS4 to the Maximum Extent Practicable (MEP). The ultimate goal of the implementation of the City's JURMP is to maintain or improve the quality of receiving waters.

To raise awareness and promote the implementation of the City's JURMP by the public, the City continues to provide educational outreach materials and host public participation events. The City continues to inspect municipal facilities, construction sites, and industrial and commercial businesses and to investigate all complaints received by the City's storm water hotline or online reporting system. During inspections and complaint investigations, City personnel are able to provide site-specific one-on-one discussions regarding storm water-related topics and BMPs. The City continues to issue verbal warnings, written warnings, Notices of Violation (NOV), and administrative citations, as necessary to bring about compliance. Sites that are an immediate threat to human or environmental health, or sites that refuse to comply with applicable permits and ordinances, are reported to the RWQCB.

The City has continued to conduct water quality monitoring, most notably the City's Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program). This program allows the City to characterize dry weather flows, alerts the City of a potential illicit connection or illegal discharge (IC/ID), and provides the City with some

level of assessment of the water quality in its storm drain system. When field monitoring or laboratory results indicate an exceedance of an established action level, upstream investigations are conducted to determine what source(s) may be responsible for the exceedance. Any identified sources of IC/IDs are dealt with as necessary to eliminate the connection or discharge.

As required by the Municipal Permit Section I.1, the City has developed this Annual Report to provide information regarding the City's implementation of its JURMP during the 2006/2007 fiscal year, which is the period from July 1, 2006 to June 30, 2007.

RWQCB COMMENTS

At the time of this writing, the City has not received any comments from the RWQCB on its 2005/2006 JURMP Annual Report.

GENERAL ACCOMPLISHMENTS

During 2006/2007 the City both initiated new programs and continued to implement and refine existing programs. The following bullets briefly summarize notable achievements and activities from the 2006/2007 reporting period. Additional detail can be found in the following sections of this Annual Report.

- Inspected all high priority municipal facilities.
- Began updating the SWPPP for the City's Public Works Yards.
- Provided training sessions for municipal employees. The sessions covered topics such as good housekeeping, BMPs, and specific training for fire fighting personnel.
- Swept 17,406 curb miles, removing 1,300 tons of sediment and debris from City streets.
- Removed over 416 cubic yards of trash and debris from open channels and removed 23,200 pounds of debris from City storm drains.
- Removed over 17,000 pounds of debris from sewer lines in the City.
- Completed the construction of Paradise Creek Educational Park, which preserves a portion of Paradise Creek and provides educational signs to park patrons.
- The City distributed "Preventing Urban Runoff Pollution" brochures to business license applicants.
- Inspected all high priority industrial facilities.
- Continued to maintain and refine databases for municipal activities, construction inspections, and industrial/commercial inspections.
- Conducted 29 industrial inspections and 10 commercial inspections. One-on-one site discussions were initiated, and educational information and materials were provided.
- Used rating system for BMP implementation and knowledge assessment during industrial and commercial business inspections.

- Issued 16 NOVs and 15 administrative citations to industrial and commercial businesses. These enforcement actions were mainly related to discharges of wash water investigated during responses to complaints or during the inspection process. In each case, the City actions resulted in the resolution of the observed problem.
- Conducted a workshop specifically designed for automotive repair/service shops.
- Continued distribution of educational brochures and fact sheets during routine inspections and complaint investigations.
- Conducted a workshop specifically designed for residents.
- Distributed over 6,000 "Do You Go To the Beach When it is Raining?" handouts in residential trash bills.
- Mailed over 1,470 letters to City residents and businesses in response to recommendations associated with the 2006 Dry Weather Monitoring Program findings. The letters included explanations of BMPs residents could use to help reduce pollution.
- Worked with the City of Chula Vista to provide a venue for proper household hazardous waste (HHW) disposal. Furthermore, the City worked with EDCO to hold two large item collection events to encourage residents to dispose of these items properly.
- Continued distribution of construction educational materials, including guides for construction activity and BMP fact sheets.
- Conducted technical reviews of Storm Water Pollution Prevention Plans (SWPPPs) for construction sites equal to or greater than an acre and Standard Urban Storm Water Mitigation Plans (SUSMP) reports for Priority Projects.
- Reviewed SUSMP reports for 12 Priority Projects.
- Conducted a SUSMP requirement and BMP training session for individuals involved in development and re-development program implementation.
- Continued to maintain electronic and paper record keeping systems for SUSMP projects.
- Inspected all high priority construction sites during the wet season (October through April) each week and generally at least twice during the wet season for medium and low priority construction sites. City building inspectors also check BMP implementation during inspections of small projects.
- The City identified five illicit connections and 64 illegal discharges to the City's storm drain system. In each instance, City staff ensured that the issue was resolved via an NOV, administrative citation, corrective action notice, and/or verbal warning.

- Completed the 2006 Dry Weather Monitoring Program and follow-up investigations. The City took action to address the recommendations listed in the 2006 Dry Weather Monitoring Program final report.
- Continued the use of the storm water hotline. A total of 143 public complaints were recorded, investigated, and resolved during this reporting period.
- Worked with I Love a Clean San Diego (ILACSD) to stencil 30 storm drains with "no dumping" or similar storm water-related message.
- Removed 14.4 tons of trash and debris during three cleanup events.
- Made over 137,000 impressions through outreach efforts.
- Distributed approximately 2,000 storm water educational calendars encouraging residents and businesses in the City to prevent storm water pollution.

JURMP ANNUAL REPORT ORGANIZATION

The following presents the organization of this Annual Report.

Section 1.0	Introduction
Section 2.0	Municipal
Section 3.0	Industrial
Section 4.0	Commercial
Section 5.0	Residential
Section 6.0	Land Use Planning for New Development and Redevelopment
Section 7.0	Construction
Section 8.0	Illicit Discharge Detection and Elimination
Section 9.0	Education
Section 10.0	Public Participation
Section 11.0	JURMP Effectiveness Assessment
Section 12.0	Fiscal Analysis
Section 13.0	Special Investigations
Section 14.0	Conclusions and Recommendations

2 MUNICIPAL

The City of National City owns and operates a variety of municipal facilities including parks and recreational facilities, public works facilities, public roads, administrative facilities, and the City's extensive MS4. The City sets a good example for City residents and businesses by implementing BMPs at all municipal facilities to reduce the discharge of pollutants to the maximum extent practicable (MEP). While all City divisions are involved in storm water responsibilities related to each specific division, the City's Engineering Department manages and oversees the bulk of the City's storm water program, including the management of the municipal component.

The City is aware that preventing pollutants from entering receiving waters through the implementation of BMPs is both more efficient and cost conscience than expensive remediation efforts. The City requires that minimum BMPs be implemented at each municipal facility and during municipal activities not confined to a specific location. BMPs must be implemented during routine activities that take place at municipal facilities, and during emergency situations when practicable. The City inspects all high priority municipal facilities on an annual basis to ensure BMPs are implemented correctly and functioning properly. Public Works employees maintain and implement a Storm Water Pollution Prevention Plan (SWPPP) at the east and west public works yards. In addition to the BMPs implemented at municipal areas and during municipal activities, the City maintains a rigorous street sweeping program and MS4 and sewer maintenance programs to further reduce or eliminate pollutants from being discharged from such areas.

MUNICIPAL ACTIVITIES

The City of National City is responsible for numerous municipal activities, including the maintenance of fixed facilities and the implementation of field programs. City personnel have been trained in eliminating storm water pollution during the implementation of their specific programs. Pollution prevention methods and BMP requirements are presented in Section 2 of the JURMP. The following presents the municipal activities implemented during the 2006/2007 reporting period, including updates to existing programs.

Erosion and Sediment Control

The City's Parks and Recreation Department continues to work to maintain and preserve existing vegetation in order to mitigate the occurrence of erosion and sediment discharge. Introduction of drought tolerant plants as well as mulching for erosion control have also been implemented, where practicable. City personnel conducting municipal maintenance projects that take place throughout the City are careful to protect storm drains from sediment by placing gravel bags around storm drain inlets and sweeping up any debris noted during routine activities.

Roadway Maintenance and Street Sweeping Activities

Streets and roadways are maintained on a daily, weekly, monthly, and as needed basis. The City's Street Maintenance Division maintains three sweepers and two operators. The City continues to sweep Highland Avenue, National City Boulevard and 8th Street on a daily basis. All other streets throughout the City are swept weekly. The City maintains five

municipal parking lots that are swept and cleaned monthly or as needed. During this reporting period, the City sweepers covered 17,406 curb miles, removing over 1,300 tons of sediment and debris from the City's 110 miles of streets and alleyways.

The Street Maintenance Division is also responsible for small street and sidewalk repairs. Copies of JURMP Appendix C is kept with City personnel to ensure appropriate BMPs such as vacuuming up materials, sweeping the work area during and after repairs, and placing gravel bags around storm drain inlets are implemented. The City's NPDES Storm Water Compliance Inspector also provides in-house training on BMPs and potential storm water pollutants.

Municipal Vehicle and Equipment Maintenance Facilities

The City of National City continues to operate one vehicle maintenance facility, part of the City's East Municipal Yard. The City maintains 221 active pieces of equipment and vehicles. A SWPPP for the East and West yards continues to ensure that pollution prevention measures are implemented. The City employs the following to ensure vehicle and equipment maintenance does not contribute to storm water pollution.

- All vehicles are inspected weekly to check for leaks or any other needed repairs.
- A wash rack is used to capture wastewater generated during routine cleaning of municipal vehicles and equipment. Wastewater entering the wash rack basin is filtered prior to discharge into the sewer system.
- Spill controls are utilized by mechanics within the shop work area.
- Secondary containment is provided for liquid storage containers. Coolants and oils are recycled.
- Filter fabric has been placed over storm drain inlets to capture debris. Some inlets also have been equipped with filter inserts, which are inspected routinely, cleaned four times a year, and replaced by BioClean on an as needed basis.
- Spill response kits are visible at various locations at the yard.
- Good housekeeping measures are emphasized by the maintenance facility manager.
- Weekly inspections of the yard are conducted by City personnel.
- Training is conducted by the City's NPDES Storm Water Compliance Inspector.

No significant spills were recorded during this reporting period. The Public Works Yard is swept on a weekly basis. Additionally, the City's NPDES Storm Water Compliance Inspector routinely inspects the facility to ensure compliance with the municipal permit and implementation of the SWPPP. During this reporting period, the City began to update and revise the SWPPP document, which should be finished during the 2007/2008 reporting period. The SWPPP is being updated to ensure that the most up-to-date BMP technologies are being implemented and that all activities at the yards are included the SWPPP.

Landscaping Maintenance

Personnel from the Parks and Recreation Department, a division of Public Works, are responsible for maintenance activities at park and recreational facilities throughout the City, including landscaping. Parks maintenance staff mow, mulch, and apply landscaping

chemicals as necessary. Proper management of landscaping chemicals, such as herbicides, fertilizers, and pesticides, can greatly reduce the potential of these chemicals reaching the MS4. The following bullets present the City's continued landscape maintenance activities, ensuring the City's program does not contribute potential pollutants to the storm drain system or receiving water bodies.

- City personnel have not administered pesticide application in the past several years. Diseased plants are rinsed off with water, pulled out and replaced, or treated with systemic pesticides in fertilizers that eliminate pests. Special fertilizers for rose bushes contain pesticide products. These are kept in limited quantities (approximately fifteen pounds) at any given time to minimize storage of these products.
- Herbicides are used during different times of the year as part of the City's weed control program, and the City has primarily continued to use less persistent herbicides such as Round-Up (glyphosate) rather than organophosphate pesticides. There were a total of 3.47 gallons of herbicide used this reporting period. City applicators are state certified.
- The City minimizes the use of fertilizers and is primarily fertilizing with a slow-release fertilizer on a less frequent basis (this allows more of the product to be accepted with less leaching and the reduced frequency creates less chance for the product to exit the target area).
- City personnel manually pull weeds, mow weeds, mulch, and disk and till twice a year to minimize the amount of herbicides utilized.
- All herbicides are stored in fire safe, self–closing, weatherproof metal cabinets. Material Safety Data Sheets are kept in the storage area, as well as spill kits.
- Mixing of herbicides is conducted on site to minimize areas of exposure.
- No spills have occurred during this reporting period for routine maintenance activities associated with the City's Parks and Recreation Department Program.
- Employees are certified to properly handle and manage herbicides. Certification is kept up to date in order to comply with all applicable laws and regulations. Qualified Applicator Certificates require applicators to renew certificates every two years. Requirements include 20 hours of training and four hours on laws and regulations. This may include topics such as over sprays of chemicals and potential pollutants/impacts, and water quality.
- The City has used drought tolerant plants and native vegetation for landscaping at a number of facilities in the City including the Paradise Creek Educational Park.
- Fertilizer stock is purchased as needed and quantities are used up immediately so that it is not necessary to stockpile this material. A few hundred pounds of fertilizer may be kept on-hand.
- All fertilizers and grass clippings particles are kept within the target areas.
- The City recycles wood scraps from all trees, except palm trees, to make mulch.

- In place of vegetation for erosion control, the City uses mulching in certain municipal areas. Mulching also minimizes the need for irrigation, fertilizers, and herbicides.
- The City aerates soils three or four times per year and applies soil treatments with gypsum to increase the absorptive capacity of the soil and reduce runoff.
- The irrigation systems are inspected every other day so that necessary repairs can be made as soon as possible.
- All timers for the irrigation system are adjusted with multiple start times to allow water time to percolate into the soil and to prevent runoff.
- Irrigation schedules are seasonal; the winter schedule is such that the amount of water used is half that used in the summer.
- Many sprinklers use low angle nozzles to prevent drift of water.
- Old sprinklers are continuing to be replaced with low volume heads with in-line checks. This prevents excessive runoff if the sprinkler head is broken.
- All Public Works staff are encouraged to participate in seminars pertaining to storm water management in order to improve education of all City employees.
- The City has not officially adopted all aspects of Integrated Pest Management (IPM), but it is current practice to minimize the use of pesticides to control pests, seeing pesticides as essentially a last resort. Only herbicides were used this reporting period.

Municipal Maintenance: Trash and Debris Removal

The City's Parks and Recreation Department continues to be proactive in litter removal and containment. City personnel are responsible for the upkeep of parks and recreational areas. Litter and debris are monitored and removed routinely. The City follows the trash and debris removal procedures listed below.

- During annual training sessions, Parks and Recreation staff are reminded to check daily for open dumpster lids and overfilled dumpsters.
- Litter and debris are removed from parks, parking lots, and landscaped areas around public buildings on a daily basis.
- Pick-up frequency is increased at parks and recreational during the summer months when necessary to account for the increased number of patrons at these facilities.
- All storm drain inlets within a close proximity to where maintenance activity is scheduled are protected with absorbent pads or gravel bags prior to beginning the activity to prevent litter and debris from being introduced to the storm drain system.
- Blowers may be used to divert leaves, grass clippings, and organic material back to landscaped areas. Residual litter and debris are picked up and disposed of properly.
- Green waste is recycled and converted to mulch to be used for landscaping.
- BMP implementation refresher courses are periodically conducted.

- The City ensures that dumpsters are not overfilled by contacting EDCO for additional pick-up when necessary.
- Annual BMP training for Public Works staff includes reminders to keep the dumpster lids closed when not in use.

Maintenance of the City's MS4s

The City continued to implement an aggressive MS4 inspection and maintenance schedule for MS4 facilities throughout the City. This includes cleaning the City's storm drains, storm drain boxes, and 30 open channel sections. Responsibilities for upkeep of the City's MS4 are divided between the Street Maintenance Division and the Wastewater Division of the City's Public Works Department. Maintenance of the channels occurs twice a month. During this reporting period, municipal employees removed approximately 416.57 cubic yards of trash and debris from the channels. The trash and debris was removed by hand. During the 2004/2005 period, the RWQCB issued a channel maintenance directive restricting the removal of vegetation from storm water channels. In response to this directive, the City no longer uses heavy equipment to clean out earthen channels, and does not remove vegetation or sediment supporting vegetation. Table 2.1 lists the channel maintenance locations.

The Wastewater Division continues to execute the twelve-month maintenance cycle developed to systematically inspect the entire storm drain system. The City has been divided into eleven zones; each zone is inspected and cleaned as necessary one month of the year, with at least two days a week devoted to this task. During this reporting period, approximately 1,329 man-hours were used to clean 100 percent of the MS4 clean-out locations and collect approximately 23,200 pounds of debris. Sediment and trash were the most commonly reported materials being removed from the storm drain cleanout locations, which is similar to previous years.

Wastewater Operations

The City continues to maintain a Sewer Overflow Prevention Plan and a Sewer Overflow Response Plan. The City ensures that staff who conduct wastewater operations activities are familiar with these documents, thereby ensuring staff are educated about the nature and effects of potential pollutants that may be released as a result of wastewater operations. The aforementioned plans also discuss various good housekeeping BMPs and other procedures to be implemented during wastewater maintenance operations.

During this reporting period, one sanitary sewer overflows (SSO) occurred in the City. The SSO was reported to the RWQCB and cleaned up to the extent possible. More information on the City's mechanism for receiving notification of spills from private sewer laterals is presented in the JURMP. Additional information on the SSO from 2006/2007 is presented in Section 8 of this JURMP Annual Report.

The City continues to monitor fifteen flow meter units that are distributed throughout the City's sewer system to check for evidence of a leak or possible overflow or infiltration. In addition, City crews also check for leaks in pipes or blockages during routine maintenance. If there is a block or leak, the City responds immediately to fix the problem. The City invested about 1,782 man-hours clearing 333,060 feet of sewer lines. Over 17,730 pounds of debris were removed from the City's sewer lines. Grease, silt, sand, and rocks were common items removed during maintenance. The City also uses cameras to investigate less

accessible sewer blockages. The City invested 26 hours and televised over 4,200 feet of sewer line during this reporting period.

Municipal Activities Database

The City of National City continues to use its Microsoft Access Database Program to assist with the tracking of municipal activities. The activities tracked include street sweeping, complaints, storm drain box cleaning, sewer cleaning, storm drain channel cleaning, and parks and recreation activities. Utilizing the database has become an integral part of the City's program to track data and follow-up when necessary. The City continues to enhance the database to improve accounting and better characterize storm water problems reported in the City. The City recently updated the database and associated forms to be able categorize complaints by sector (residential, municipal, commercial, industrial); this information was not available for all of 2006/2007 but is anticipated to be useful in future years. The City has also created a field to track units of debris collected from sewer clean outs. The City also used databases to track inspections of construction and commercial/industrial sites. More information regarding these databases can be found in other sections of this report.

NPDES Storm Water Compliance Inspector

The City has a full time NPDES Storm Water Compliance Inspector, who is also authorized to issue citations and other enforcement actions. The NPDES Storm Water Compliance Inspector inspects municipal facilities, industrial/commercial businesses, construction sites, as well as addressing public complaints and reported spills within the City. The NPDES Storm Water Compliance Inspector has also led storm water workshops and presentations for the commercial, industrial, and residential sectors.

San Diego County Copermittee Meetings

The City of National City attends the bimonthly Copermittee management meetings. Updates on the City's NPDES storm water program are presented during these meetings. Additionally, the City of National City continues to be an active participant in the San Diego Bay Watershed Urban Runoff Management Program (WURMP).

NPDES Storm Water Compliance Technical Support

The City of National City has continued to contract with D-MAX Engineering, Inc. (D-MAX) as the City's NPDES Storm Water Consultant. D-MAX provides the City with technical expertise in the field of storm water. They have conducted training sessions for City employees and work closely with the City's NPDES Storm Water Compliance Inspector to address a wide range of storm water issues. D-MAX Engineering also conducts the City's annual Dry Weather Monitoring Program, which includes recommendations and notification for storm water conveyances that appear to be affected by IC/IDs or maintenance issues. More information on the Dry Weather Monitoring Program is presented in Section 8 of this Annual Report.

MUNICIPAL PRIORITIZATION AND INSPECTIONS

The City continues to maintain a prioritized watershed-based inventory of municipal facilities. All facilities on the City's inventory have been prioritized based on threat to water

quality into one of three categories: high, medium, or low. The City updates the inventory and prioritizations annually. The City reassessed facility prioritizations based on the flow chart in the 2004 JURMP. Based on present criteria and site conditions, the Civic Center was moved from the medium priority inventory to the low priority inventory. Included on the City's inventory, tables 2.2, 2.3, and 2.4 at the end of this section, are public parks and recreational facilities, administrative facilities, fire stations, community service buildings, and public works facilities. Additionally, City roads, streets, and highways and the City's MS4 are included on the inventory. City roads, streets, and highways do not include Interstate 5, Interstate 805, and State Route 54, all of which are under Caltrans jurisdiction.

The City continues to conduct annual inspections of municipal facilities. Inspections are an integral part of the City's efforts to maintain the highest standards of compliance with the Municipal Permit and provide an example of storm water quality awareness for the rest of the community at municipal facilities. Of the high priority facilities, Kimball Park and the Municipal Golf Course receive annual inspections at a minimum, and the two Public Works Yards continue to implement a weekly self-inspection program in addition to the annual inspection conducted by the City's Storm Water Compliance Inspector. The City's road, streets, and highways and MS4 are inspected and maintained throughout the year.

In addition to the inspections performed at the high priority facilities, the City's Storm Water Compliance Inspector inspected the medium and low priority facilities during the 2006/2007 reporting period. Several of these facilities were found to be fully compliant at the time of inspection. At the remaining facilities improved good housekeeping measures were recommended. The City's NPDES Storm Water Compliance Inspector followed up on these recommendations via email or additional site visits.

Beyond the official inspection programs, the City monitors its municipal areas informally throughout the year to ensure BMPs recommended during inspections are implemented consistently. The City's NPDES Storm Water Compliance Inspector frequently provides verbal suggestions in person to City employees as necessary, and also occasionally sends written reminders. Because the corrective actions were implemented during the reporting period as directed by the inspector, no further enforcement actions were necessary.

COMPLIANCE & ENFORCEMENT

As previously mentioned the City's Storm Water Compliance Inspector continues to conduct inspections at municipal faculties and provides corrective actions to ensure that facilities are in compliance with the City's BMP requirements and City Ordinances. Municipal facilities are notified of BMP deficiencies and are provided documentation of necessary corrective actions. The City's Storm Water Compliance Inspector follows up with facilities to ensure that they have effectively implemented corrective actions.

EDUCATION AND OUTREACH

The City continues to provide municipal personnel with the most up-to-date information, training, and outreach available pertaining to the improvement of storm water quality. The City's Public Works Staff attended educational sessions during this reporting period. The workshops covered NPDES program components; SUSMP requirements; storm water legislation and policy; commercial BMPs; municipal BMPs; construction BMPs; and vehicle washing, repair, and service BMPs. More information about all municipal educational

events is provided in Section 9 of this document. Attachment 2.1 presents the sign in sheets of those who attended municipal presentations. Workshops and educational materials offered to municipal workers during this reporting period are summarized below:

- Consultant SUSMP training, August 2006.
- SUSMP coordination meetings held by the City throughout the reporting period.
- A 2007 calendar was posted in municipal facilities and distributed to municipal employees encouraging individuals to protect storm water (Attachment 2.2). The calendar was redesigned for 2007 to a more user-friendly City-specific format.
- The City's consultant held a three training sessions for a total of 34 fire department personnel in the City in June 2007. Training sessions reviewed the NPDES program, BMP implementation, specifically the importance of spill response BMPs, since many times fire fighting personnel are the first to respond in such situations.
- The City's NPDES Storm Water Compliance Inspector conducted a workshop for 25 Public Works employees in June 2007.
- The City conducted annual inspections of municipal facilities during this reporting period. The inspectors educated facility managers on any BMP deficiencies noted during the inspection. More detail on the inspections was provided earlier in this section.
- Eight members of the City's landscape maintenance personnel attended a six class irrigation management course in April 2007.
- An NPDES Knowledge Assessment Test was given to individuals, including City employees that attended any of the storm water workshops. Overall, Knowledge Assessment test scores increased for municipal employees.
- Five municipal employees attended the California Compliance School for training in hazardous waste identification and overview, onsite management requirements (tanks and containers), transportation, and preparedness and prevention training. Certificates of completion are included as Attachment 2.3.

In addition to the outreach efforts mentioned above, the City of National City has completed the construction of Paradise Creek Educational Park. Construction began in September 2005 and work was completed this reporting year. The project is located on an approximately half mile stretch of the creek that remains undeveloped and the park is designed to preserve that stretch of the creek and its habitat. Additionally, the park includes a boardwalk as well as other walking trails and educational signs. Native plants were used in the landscaping, and both a construction SWPPP and a SUSMP report were maintained throughout the project. On 4/21/2007, a few days after the park officially opened, an Earth Day celebration was held there to pick up trash and sow 300 plants.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the

requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

Table 2.1
Open Channel Maintenance and Cleaning Sites

Channel #	Location	Address	Channel Construction	Estimated Length, ft	Estimated Work Area, ft^2

3 INDUSTRIAL

During the 2006/2007 reporting period, the City of National City continued to mitigate urban runoff pollution through implementation of the industrial component of the City's JURMP. The basic components of the City's industrial program include site identification and prioritization, pollution prevention, dissemination of required general and activity-specific BMPs, education, compliance inspections, and enforcement actions. The City also requires all high priority industrial sites to conduct storm water monitoring in accordance with the requirements of the Municipal Permit.

PRIORITIZATION OF INDUSTRIAL FACILITIES

The 2006/2007 JURMP Annual Report presented an updated inventory of the known industrial facilities in the City, classifying them as 23 high priority, 133 medium priority, and 143 low priority industrial facilities. These facilities were prioritized based on Standard Industrial Classification (SIC) codes, proximity to environmentally sensitive areas (ESAs), whether they had filed a Notice of Intent (NOI) to obtain coverage under the State Industrial General Storm Water Permit (Industrial Permit), and the findings of the most recent storm water compliance inspections conducted. Please note that this inventory was developed with information as of the end of the 2006/2007 reporting period. Since that time, a new inventory is being developed for the JURMP update, which uses business license findings and information gathered after the end of the 2006/2007 reporting period.

During this reporting period, the City continued the ongoing process of industrial facility prioritization. Prioritization and SIC codes were re-evaluated after each inspection and adjusted if necessary to properly demonstrate their on-site activities. Any businesses found to be no longer operating in the City, or found to be a duplicate of another business in the inventory were removed from the inventory. The City's most current inventories include (Tables 3.2, 3.3, and 3.4). An in-depth accounting of the high priority industrial businesses is given below.

As mentioned above, there are 23 high priority industrial facilities in National City. Note that as of the end of the 2005/2006 reporting period, 27 businesses were listed as high priority industrial. During this reporting period, two businesses moved or went out of business, three high priority industrial facilities were reclassified as medium industrial, one business was reclassified from high industrial to low industrial, and one business was reclassified from low priority industrial to high priority industrial. The business that was added to the high priority industrial inventory, Melhorn Construction, was reprioritized because the business was found to have begun woodworking as part of the business activities.

POLLUTION PREVENTION AND BMP REQUIREMENTS AND IMPLEMENTATION

Implementing simple pollution prevention techniques can help avoid serious discharges of pollutants and is almost always more effective and less expensive than costly remediation efforts. Recognizing this, the City of National City requires industrial facilities in its jurisdiction to employ pollution prevention methods as appropriate to their activities and

site configurations. Included in Section 3.1 of the City's revised 2004 JURMP are the following pollution prevention measures:

- Use smaller quantities of toxic materials or substitute less toxic materials.
- Change production processes to reduce waste.
- Decrease wastewater flows.
- Recycle wastes as part of the production process (most preferred), off site, or on site (least preferred).
- Segregate wastes.
- Treat wastes on site to decrease volume and/or toxicity.
- Dispose of wastes properly.

The City has developed a list of required general BMPs for all industrial and commercial facilities (revised 2004 JURMP Appendix C.2), as well as activity specific BMPs for industrial facilities (revised 2004 JURMP Appendix C.3). No changes were made to the BMP requirements listed in the City's revised 2004 JURMP during this reporting period. To ensure compliance with the City's BMP requirements and the Industrial Permit, the City has conducted routine, follow-up, and complaint investigation inspections at industrial facilities. The City conducts detailed BMP assessments as part of each inspection; all inspection findings are entered into the City's industrial/commercial database.

INSPECTIONS

Inspections are the City's means to ensuring that facilities are in compliance with the City's BMP requirements and the Industrial Permit. The City conducts routine, follow-up, and/or complaint investigation inspections at industrial facilities. During each site visit, inspectors completed a storm water compliance inspection form to assess BMP implementation, compliance with the City's Storm Water Ordinance, compliance with the Industrial Permit, and list recommended corrective actions, if necessary. In addition, monitoring data and SWPPPs are evaluated at sites that have filed NOIs. Upon inspection, businesses are verbally informed of any corrective actions. The owner/responsible party is also provided with written notice of the corrective actions that are required. Inspection form data are then entered into the City's commercial and industrial inspection database. Further details about the City's inspection method can be found in Section 3.6 of the JURMP.

In total, there were 30 industrial site visits during the reporting period. Of these visits, 29 facilities received full inspections and one business was found to have moved/gone out of business.

All of the facilities included in the high priority industrial inventory submitted with the 2005/2006 Annual Report were visited at least once during the 2006/2007 reporting period. There are 23 high priority industrial facilities in National City. Note that as of the end of the 2005/2006 reporting period, 27 businesses were listed as high priority industrial. During this reporting period, two businesses moved or went out of business, three high priority industrial facilities were reclassified as medium industrial, and one was reclassified as low industrial. One business was reclassified from low priority industrial to high priority industrial and one business was added to the inventory. The two high priority industrial

businesses that moved were San Diego Wood Preserving and Unique Granite and Marble. John D'Marco Boat Storage was moved to the medium priority industrial inventory because boat repair is no longer conducted on site. Rob North Fab was reclassified as medium industrial due to changes in activities at the site that make it no longer subject to the Industrial Permit. Presently Rob North Fab primarily engages in design services with some minor repairs, not in metal fabrication. Prochem Specialty Products was reclassified as medium industrial and Tecnico Systems was reclassified as low industrial for reasons discussed later in this section under the "Permit Compliance" heading. A low priority industrial business, Melhorn Construction, was reprioritized to high priority industrial because the business was found to have begun woodworking as part of the business activities. A high priority industrial business in the City, Collin's Marine Repair, moved locations within the City, but the priority was not changed. The address change is reflected in the inventory, however.

BMP ASSESSMENT

As part of the inspection process, each facility inspected during the reporting period was evaluated for BMP implementation and effectiveness as well as the individual's knowledge of storm water issues. Facilities were advised that they are required to implement both general BMPs and activity-specific BMPs. Based on the assessment of the facility activities and site configuration, the inspectors notified the facility's responsible person regarding any observed BMP deficiencies. They were notified verbally of all corrective actions, and written notification was provided after the inspection.

BMP assessment ratings were assigned during inspections based on a scale of 1 (low) to 5 (high). This information is intended to help the City to conduct a more quantitative assessment of BMP implementation. In future years, as more data is collected, trend analyses can be undertaken to yield a more sophisticated program assessment. During 2006/2007, BMP assessment scores were assigned mainly at high priority industrial facilities. In an effort to standardize the assignment of these ratings, the inspectors used the following assessment criteria to assign scores:

- Level 5: All required general and activity specific BMPs have been implemented effectively.
- Level 4: BMPs have been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with this business's activities.
- Level 3: BMPs have been implemented with the exception of two corrective actions noted aside from dumpster lids being open or oil stains in the general parking lot.
- Level 2: Minimal BMP implementation is noted. Three or more corrective actions, with the exception of dumpster lids being open or oil stains in the general parking lot. No illegal discharge or illicit connection was noted.
- Level 1: Violation of the City's Storm Water Ordinances (illegal discharge, illicit connection, complete failure to implement BMPs, and/or significant littering).

Similar to previous years, many businesses needed to more effectively implement good housekeeping measures. The most common deficiencies included open dumpster lids, insufficient sweeping frequency resulting in sediment build-up on paved surfaces, and

insufficient frequency for cleanup of small oily leaks in parking lots. These businesses were advised to keep dumpster lids closed, to increase sweeping frequency, and/or to regularly check parking areas for spills, cleaning them up as needed using appropriate techniques. Over the course of the 2006/2007 industrial inspections, there was one illegal discharge to the storm drain system observed. The discharge was sediment from eroding areas of the site and the discharge had ceased upon re-inspection.

PERMIT COMPLIANCE

While conducting industrial BMP assessments, compliance with the General Industrial Permit was also evaluated. During the reporting period, the businesses inspected that were covered under the Industrial Permit were generally found to be implementing their SWPPPs and Monitoring Programs. All facilities listed on the high priority industrial list for the 2006/2007 reporting period are subject to the Industrial Permit.

At the time of inspection, four businesses were in violation of the Industrial Permit for not filing NOIs and developing and implementing a SWPPP. According to the State's Industrial Permit holder database, Valencia Stone and Tile has filed an NOI since the most recent inspection. During the next annual inspection the City's storm water compliance inspector will check to see if a SWPPP has been developed and implemented. One business, A-1 Alloys, has filed an NOI but has failed to develop and implement a SWPPP. The City's NPDES Storm Water Compliance Inspector also worked with the RWQCB's industrial compliance unit to clarify Industrial Permit requirements for industrial businesses in the City and work to bring them into compliance. The main businesses discussed during these conversations included Prochem Specialty Products, Tecnico Systems, and other ship repair facilities that conduct most repair offsite. After conversations with RWQCB staff, the SIC code for Tecnico Systems was changed to 7699, which is not subject to the Industrial Permit. Accordingly, the JURMP priority was changed to low industrial. Prochem is a detergents wholesaler that does some minor mixing; there is essentially no significant exposure at the site. As of this writing, it is still unclear if the business will be subject to the Industrial Permit. Because of its low potential to impact water quality and the uncertain status of its Industrial Permit subjectivity, it is included on the medium priority industrial this year.

During inspections, inspectors checked to see if high priority industrial facilities were conducting appropriate storm water monitoring in accordance with the Municipal Permit. If businesses had not conducted appropriate monitoring, the inspector checked to see that there was a valid reason for exemption. All sites that had not yet filed an NOI, listed previously in this section, had also not implemented a storm water monitoring program. Although they recently obtained coverage under the Industrial Permit, both Carroll Metal Works and A-1 Alloys had not yet developed and implemented a monitoring program. The City will follow-up with those businesses during the 2007/2008 reporting period, taking stricter enforcement actions as necessary. Those high priority industrial businesses that were in compliance with the Industrial Permit were conducting storm water monitoring programs that satisfy the Municipal Permit monitoring requirement for high priority industrial sites.

TRAINING AND EDUCATION

Educating all facilities about the potential threats their business poses to storm water is important in reducing and eliminating polluted runoff from industrial sites. The City

provided any business applying for a business license the "Preventing Urban Runoff Pollution" brochure (Attachment 3.1).

During inspections, facilities were primarily evaluated to determine whether they had implemented the required BMPs listed in the City's JURMP and whether they were in compliance with the Industrial Permit and the City's Storm Water Ordinance. The knowledge assessment component of the standard inspection form continued to be utilized. On a rating score of 1 (low) to 5 (high), the level of storm water knowledge of the facility representative present during an inspection was rated. The knowledge assessment scores are based on how many of the standardized questions the facility representative is able to answer correctly; a score of "1" indicates that no questions were answered correctly and a "5" indicates that all of the questions were answered correctly. These scores are intended to help the City to conduct a more quantitative assessment of business' knowledge. In addition, this allows the City to target educational materials to areas that might have a lower average score. In future years, as more data is collected, trend analyses can be undertaken to yield a more sophisticated program assessment. Each facility representative was asked the following series of questions:

Each facility representative was asked the following series of questions:

- What is storm water?
- What is the difference between storm drain system and the sanitary sewer system?
- Where does storm water flow?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good house keeping or best management practices are?
- Do you know what NPDES is or means?

Asking the eight questions listed above facilitates and engages the facility representative and the inspector in a conversation about storm water. Ideally, confusion and/or misconceptions are clarified, concepts are explained, and the facility representatives come away with a strong sense of what role they play in regard to water quality.

In addition to verbal education efforts, during inspections, the City distributed an informational handout regarding the upcoming industrial workshop and the City's user-friendly calendar explaining the importance of eliminating discharges of pollutants to the storm drain system. Businesses were encouraged to hang the calendar in their place of business. The calendar is included as Attachment 2.2. Written correspondence noting corrective actions required was provided to businesses, and corrective actions were also generally explained by inspectors while on site during inspections. During the reporting period, this direct, site-specific approach was the primary method used to educate industrial businesses about storm water pollution.

City industrial business management staff and employees were offered a free Storm Water Workshop in National City on April 25, 2007. This workshop was led by the City's

consultant, D-MAX, and provided information about how to comply with the Industrial Permit through NOIs, SWPPPs, water monitoring programs, and employee education. The workshop also provided information on how to comply with the City's storm water ordinance through implementing BMPs and what to expect from an inspection. They were presented with a PowerPoint presentation and given an NPDES Knowledge/Awareness Assessment Test before and after the presentation. The average post-workshop score was higher than the pre-workshop score. Attendees were also given a sheet listing benchmarks for common constituents analyzed for storm water monitoring, the bilingual flyer, "Everything that flows down into a storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" (Attachment 3.2), and the Storm Water Hotline Card (Attachment 3.3). The benchmark list was taken from the most recent draft of the proposed next version of the Industrial Permit. Industrial and commercial workshop sign in sheets are included as Attachment 3.4.

POLLUTANT DISCHARGE POTENTIAL

The City is continuously updating its inspection form to match its information needs. The Pollutant Discharge Potential Assessment (PDPA) is intended to be a semi-qualitative tool to identify which sites are major sources of the principal pollutants of concern for storm water. The table includes a list of 12 pollutants or classes of pollutants, which are ranked on a scale from zero (0) to five (5), with five being the highest pollutant discharge potential and one being the lowest discharge potential that can be recorded for any pollutant known to be onsite. The potential pollutants included in the form are sediments, nutrients, aluminum, iron, heavy metals, organic compounds, trash and debris, oxygen demanding, oil and grease, bacteria and viruses, pesticides, acid/base, and others. A score of zero is only given when the inspector finds no evidence that a certain pollutant is present at the site. Fields to note the sources of the observed pollutants and general classes of recommended BMPs for those sources are also marked on the table. Collection of this information is intended to help the City better identify the main sources of major classes of pollutants commonly found in storm water discharges. It is anticipated that this information will be especially useful in the implementation of total maximum daily loads (TMDL) and in the assessment of overall program effectiveness. The form also prompts the inspector to designate sources needing additional BMPs to lower the pollutant discharge potential as well as recommended BMPs for those sources.

COMPLIANCE AND ENFORCEMENT

In addition to routine inspections, the City also conducts inspections based on complaints received from citizens via the City's storm water hotline. When either type of inspection finds facilities are out of compliance with the City's BMP requirements and/or the Industrial Permit, the City enforcement process is initiated. In addition to a verbal description of the violation, the City may also employ phone calls, follow-up inspections, corrective action letters, notices of violation, fines, and/or legal action.

Generally, when significant problems are noted at a facility during a routine inspection, a corrective action letter is mailed to the business from the City Engineer. The letter identifies corrective actions that the business must undertake and lists the penalties and procedures for the business may face if the listed corrections are not made. An NOV may be sent to a business if an especially serious violation of the City's storm water ordinance is occurring at

the facility or follow-up inspection determines that essentially no corrections have been undertaken since the initial inspection. The NOV advises the facility owner that his or her business is in violation of the ordinance and that immediate corrective action is necessary to avoid civil and criminal prosecution, and a fine may also be assessed. The City NPDES Storm Water Compliance Inspector has authority to issue fines up to $500. Businesses receiving an NOV are required to submit a written plan of the corrective actions they would implement to the City. Follow-ups are conducted at non-compliant sites until they come into compliance. In the event that a business refuses to cooperate with the compliance process, it is reported to the RWQCB. Any sites deemed to pose significant threats to human health or the environment are reported to the RWQCB immediately.

During this reporting period, a total of four administrative citations, six NOVs, and seven corrective action letters were given to industrial businesses. The City's NPDES Storm Water Compliance Inspector follows up after enforcement actions are taken. Most of these problems were resolved at the first issuance of a citation, NOV, or warning, and all necessary corrective actions were implemented during follow-up visits. One industrial business, Carroll Metal Works, received one administrative citation and three NOVs during this reporting period for continued non-compliance with the City's BMP requirements and Industrial Permit requirements. The City's NPDES Storm Water Compliance Inspector continues to follow-up with the business to ensure progress is made toward compliance, and the RWQCB has been copied on recent enforcement correspondence with the business. No businesses were deemed to present a significant threat to human or environmental health, and consequently none were reported to the RWQCB. The City did, however, discuss Industrial Permit compliance issues with RWQCB staff during the reporting period. Overall, the City's enforcement efforts were successful in bringing businesses into compliance.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated revised JURMP document developed in 2004.

4 COMMERCIAL

Many different categories of commercial facilities, especially auto repair shops and restaurants, have the potential to discharge pollutants in storm water runoff. These sites may not be as large as some industrial facilities, but a somewhat significant pollutant potential remains if BMPs are not implemented properly. Activities that can pose potential problems to water quality include vehicle repair activities, power washing, improper grease handling and disposal, and improper trash management. In order to reduce and potentially eliminate the pollutants discharging from commercial facilities, the City has continued to investigate complaints regarding commercial businesses and implement an education program that targets commercial businesses in the City.

In order to reduce and potentially eliminate the pollutants discharging from commercial facilities, the City has continued to implement an education program that targets these businesses. The main way in which the City's educational information reaches commercial facilities is through activity specific educational fact sheets and through visits during routine or follow-up inspections and during complaint investigations.

PRIORITIZATION OF COMMERCIAL FACILITIES

The City's commercial inventory is updated throughout the reporting period as needed. Businesses that are no longer operational in the City are removed from the inventory, duplicate facility listings are consolidated, and any changes in SIC codes are updated as needed (and their priorities are adjusted accordingly). Some reprioritization was also conducted due to new business SIC codes and proximity to ESAs. As the result of inspection findings and a sort of the City's business license database, several facilities were reprioritized, and others were found to have moved, gone out of business, or be home-based businesses that did not pose a substantial threat to storm water quality. The City's current 2006/2007 high priority commercial inventory contains 587 businesses (Table 4.1).

POLLUTION PREVENTION AND BMP REQUIREMENTS AND IMPLEMENTATION

The City's JURMP requires that commercial businesses implement certain pollution prevention methods. The commercial activities with the largest potential to generate pollutants, such as food preparation and auto repair, are generally required to be conducted in contained areas. However, there is still a potential for significant storm water pollution if BMPs are not implemented properly. The City requires the implementation of general BMPs (JURMP Appendix C.2) at all facilities and activity-specific BMPs as appropriate (JURMP Appendix C.4). The City's inspectors typically emphasize good housekeeping measures and secondary containment and overhead coverage for automotive fluids and restaurant grease stored outside. Non-structural source control BMPs are strongly emphasized for commercial facilities, although structural BMPs may be required at some facilities depending on their activity. No changes have been made to the City's BMP requirements during this reporting period. The City employs both inspections and education to ensure the required BMPs and pollution prevention methods are being implemented. The goal of these inspections and management education is to reduce and/or eliminate the amount of storm water pollution being discharged from these commercial facilities.

INSPECTIONS

During storm water compliance inspections, the inspectors assessed the extent of each facility's implementation of required BMPs and compliance with the City's Storm Water Ordinance. Five-page inspection forms and a PDPA were completed. Inspected businesses were verbally notified of any recommended corrective actions or areas of special concern, and written notices of the required corrective actions were mailed later. As discussed earlier, the inspections also included an education component. Inspection results were entered into the City's commercial and industrial inspection database.

A total of 10 commercial sites were visited during this reporting period. The 10 site visits consisted of one routine inspection and several follow-up and complaint investigations. All 10 businesses received a full inspection.

This reporting period, five commercial facilities were found to be in violation of the municipal ordinance for illegal discharges, improper BMP implementation and/or littering. Each of these businesses was notified that site conditions violated the City's Storm Water Ordinance and were given instruction on actions necessary to remedy the situation. The City's Storm Water inspector followed-up fully with each business that was out of compliance.

TRAINING AND EDUCATION

The City has found that a lack of knowledge about storm water issues is a common problem at commercial facilities since they are not inspected as frequently as industrial businesses and often have higher turnover rates among management. Recognizing that personal interaction is often the most effective means of providing storm water education, City inspectors take time to educate the responsible person at each facility during every inspection and suggest and explain appropriate BMPs that are site-specific.

In addition to verbal education efforts, during inspections, the City distributed an informational handout regarding the upcoming commercial workshop and the City's user-friendly calendar explaining the importance of eliminating discharges of pollutants to the storm drain system. Businesses were encouraged to hang the calendar in their place of business. The calendar is included as Attachment 2.2.

On May 23, 2007, the City hosted a workshop for business owners and operators working in the automotive-related business. A total of 21 people attended this training. The presentation provided a background on NPDES, watersheds, BMPs, and pollutants likely to be discharged from automotive-related businesses. They were given an NPDES Knowledge/Awareness Assessment Test before and after the presentation, and on average there was an improvement in scores. "Your Shop Can Make a Difference" handouts (Attachment 4.1), "Put Toxic Waste in its Place" brochures and notepads (Attachment 4.2), "Everything that flows down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay" handout (Attachment 3.2), and HHW informational refrigerator magnets (Attachment 4.3) were distributed. Sign in sheets for industrial and commercial workshops can be found as Attachment 3.4.

COMPLIANCE AND ENFORCEMENT

When inspections find that facilities are out of compliance with the City's BMP requirements, the City enforcement process is initiated. In addition to a verbal description

of the violation, the City may also employ phone calls, follow-up inspections and compliance checks, corrective action letters, notices of violation, stop work orders, fines, and/or legal action. Most commercial businesses historically have cooperated with the compliance process after receiving education and being notified of necessary corrective actions. However, when a business has been educated and warned but persists in non-compliance, penalties are assessed. This approach has been effective in bringing about compliance with the City's Storm Water Ordinance.

The City continues to follow-up actions until the issue with a particular business is resolved. Facilities identified as having poor BMP implementation are often re-inspected to determine if the recommended corrective actions have been implemented. If the business repeatedly refuses to take corrective action, it is reported to the RWQCB. Any sites deemed to pose significant threats to human health or the environment are reported to the RWQCB immediately. Because facilities have not always implemented BMPs to a satisfactory level by the time of the re-inspection, additional follow-up inspections are sometimes necessary to ensure compliance. In some cases a stop work order is issued until the proper BMPs are implemented. The City follows up with non-compliant businesses until they come into compliance.

In some cases, a corrective action letter is mailed to the business from the City's NPDES Storm Water Compliance Inspector. The letter identifies corrective actions that the business must undertake and lists the penalties and procedures the business may face if the listed corrections are not made. An NOV may be sent to a business when it is observed committing a particularly serious violation of the City's storm water ordinance or when follow-up inspections determine that essentially no significant corrections have been made. The NOV advises the facility owner that his or her business is in violation of the ordinance and that immediate corrective action is necessary to avoid civil and criminal prosecution, and a fine may also be assessed. The City NPDES Storm Water Compliance Inspector has authority to issue fines up to $500. Businesses receiving an NOV are required to submit a written plan of the corrective actions they will implement to the City.

During this reporting period, a total of 11 administrative citations, 10 NOVs, and three corrective action letters were issued to commercial businesses for violations of the City's Storm Water Ordinance. These violations included discharges from activities such as vehicle washing, hosing down the sidewalk/street, and improperly disposing of wastewater. The City's NPDES Storm Water Compliance Inspector followed up on these incidents; the City's enforcement process was effective in bringing noncompliant businesses into compliance. Many of the problems were resolved upon the receipt of the first citation, NOV, or letter. No commercial businesses were found to present significant threats to human or environmental health during 2006/2007, so no reports to the RWQCB were necessary.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

5 RESIDENTIAL

Land use in the City of National City is largely residential. To address common residential activities that may pose a significant threat to storm water, the City has implemented many programs focused on reducing pollutant loads associated with such activities. Residential activities such as yard maintenance, landscaping, swimming pool and hot tub maintenance, home improvements, and vehicle care have the potential to introduce pollutants into the City's storm drain system if not managed properly. The City is dedicated to ensuring that residents are implementing activity-specific BMPs properly to eliminate the discharge of pollutants such as sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals into the storm drain system. The City recognizes the need for educational efforts and opportunities designed specifically for residents and residential activities.

The following sections present activities conducted during this reporting period with respect to priority residential sources, BMP requirements and implementation, pollution prevention, inspections, compliance and enforcement, and training, education, and outreach activities. These activities are associated with the residential component of the JURMP and include conducting ongoing HHW collection events, distributing educational materials, and participating in community events.

POLLUTION PREVENTION

The City continues to provide information regarding the implementation pollution prevention measures, such as good housekeeping practices, for residential areas and activities. Pollution prevention methods are BMPs that eliminate or reduce the generation of pollutants at the source. The City provides information regarding pollution prevention methods through targeted educational materials and one-on-one contact during complaint investigations.

BMP REQUIREMENTS AND IMPLEMENTATION

The City recognizes that preventative measures such as the implementation of BMPs are an integral part of the City's storm water pollution prevention program. The City requires the implementation of residential BMPs as described in the JURMP document and in Appendix C of the JURMP. The City has an extensive educational and public outreach program, details of which are given in Section 9 and Section 10 of this Annual Report, respectively.

The City continues to encourage residents to report observed illegal discharges and report other potential violations to the City's Storm Water Hotline. The number for this hotline is published on the City's website, in storm water brochures available in public locations, and on the City's storm water hotline business card, with the intention to reach as many people as possible. Complaints received from residents are the primary mechanism for notification of non-compliance with the City's Storm Water Ordinance in residential areas. Every effort is made to identify the responsible parties and to educate them regarding the NPDES program and City ordinances. Section 8 provides a summary of the public complaints received, all of which were investigated and resolved. The majority of the complaints were regarding residential activities. The complaints were received from individuals or City staff that witnessed potentially harmful activities, and each investigation was resolved.

PRIORITY RESIDENTIAL SOURCES

During 2006/2007, the City continued to identify priority residential sources. There have been no changes to the high threat to water quality residential areas that were designated during the last reporting period, however. High TTWQ areas are designated by considering visual observations, institutional knowledge, and Dry Weather Monitoring Program data, and the criteria as defined in updated Municipal Permit. The following residential areas were designated as being high threat to water quality:

- Similar to previous reporting periods, the residential area stretching from Highland Avenue to Euclid Avenue, north and south of Division Street was found to have elevated levels of bacteria during Dry Weather Monitoring Program. Continued irrigation seepage at a particular apartment complex was causing water to stagnant, possibly contributing to the high instances of bacterial growth in the samples taken. Evidence of illegal dumping was also noted.
- Similar to the last reporting period, residential area around 14th Street and Grove Street was found to be a source of detergents and ammonia. A significant amount of organic matter was noted in the catch basin and was determined to be the main pollutant source of ammonia. Detergents were generally traced to residences were people have recently washed a vehicle outdoors. During this reporting period, upstream investigations found levels of bacteria in this area. It was established that the cause of the elevated levels were most likely from the decomposing organic matter.
- The residential area around Harbison Avenue south of 18th Street has previously been listed as a priority residential source, mainly due to elevated levels of ammonia during dry weather monitoring events. During this reporting period, there were no exceedances above the action level on any constituent. The City has chosen to keep this residential area on this list of priority residential sources as a proactive measure.
- In previous reporting years, the residential areas off Arcadia Place have been observed to have elevated concentrations of ammonia and detergents in dry weather monitoring surveys. During this reporting period, there were no exceedances above the action level on any constituent. The City has chosen to keep this residential area on this list of priority residential sources as a proactive measure.

More information about follow-up actions to pollution observed during the Dry Weather Monitoring Program is presented in Section 8 of this Annual Report.

Because some commercial businesses or construction sites fall within residential areas, inspections at these sites may facilitate in identifying sources of pollutants from residential sources. Inspectors are able to assess BMP implementation in the residential areas around these sites while driving to and from the sites.

The City continues to maintain a storm water hotline. A business card featuring the City's storm water hotline number is available with other storm water pollution prevention material in City Hall and at other City facilities. Complaints can be submitted by phone or online and are directed to the City's NPDES Storm Water Compliance Inspector for investigation and follow-up. Once the City receives a complaint, it is investigated immediately. Section 8 presents a log of complaints, a number of which related to

residential areas and/or were reported by residents. Those complaints led to direct inspection and investigation of residential areas and activities.

TRAINING, EDUCATION AND OUTREACH

Education is a fundamental part of preventing pollutants from entering the storm water system. The City continues to provide educational materials to its residents in a variety of ways. The City has published most of their brochures in English as well as Spanish to provide the same educational opportunities to the large Spanish speaking population of National City. Training, education, and outreach activities for residents during this reporting period are described below.

2007 Calendar

The City developed a 2007 Calendar that was distributed to residents, and made available at City offices (Attachment 2.2). The calendar was printed in both English and Spanish and informs residents about pollutants found in San Diego Bay and neighboring waterways. It describes that pollutants such as fertilizers, pesticides, metals, paints, oil and grease and other debris can be transported from residential areas to the ocean. A list of BMPs and various cleanup days and HHW events are promoted. The theme for the calendar was "Let's keep our community clean" and each month showed a photograph of a landmark in the City.

Distribution of Educational Material

The City's Building and Safety division conducted inspections as part of the Healthy Homes Program in priority areas to check for lead in paint and other potential hazardous problems. Residents were provided IPM cards (Attachment 5.1) during these inspections. The IPM cards provide information regarding non-chemical solutions to pest-related problems. Additionally, in July 2007 the City sent a copy of the "Do You Go To the Beach When it is Raining" brochure (Attachment 5.2) in trash bills to residents.

As mentioned above, educational materials were provided to residents in National City in response to the recommendations from the 2006 Dry Weather Report. The City sent a letter, and applicable educational material to residences in areas where high levels of pollutants were noted.

Workshops

The City held a free storm water workshop on February 21, 2007, with 8 residents in attendance. Attendees were presented with a PowerPoint presentation on NPDES and BMPs for residential activities. A residential BMP handout was included with the presentation and is provided in Attachment 5.3. An NPDES Knowledge/Awareness Assessment Test before and after the presentation, which showed a marked improvement in awareness. Overall, post-workshop scores were higher than pre-workshop scores. In addition, attendees were provided information regarding how to properly dispose of HHW and other wastes and information regarding the storm water hotline and complaint system. 2007 Calendars (Attachment 2.2), "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochures (Attachment 3.2), "Put Toxic Waste in its Place" brochures (Attachment 4.2), HHW refrigerator magnets

(Attachment 4.3) and copies of the City's Storm Water Hotline Card (Attachment 3.3) were also distributed at the workshop.

Website

Additional information regarding the City's storm water program, pollution prevention measures and BMPs is posted and continually updated on the City of National City's website, under the Public Works/Engineering Department link. For additional information on the City's educational efforts and the educational materials distributed to its residents please refer to Section 9 of this report.

Household Hazardous Waste Disposal Program

The City of National City continues to work with the City of Chula Vista to allow National City residents to drop off HHW at Chula Vista's Household Hazardous Waste Collection Facility. The Household Hazardous Waste Collection Facility is the primary location for hazardous waste collection in the South Bay, receiving HHW from the City of National City, the City of Imperial Beach, and the City of Chula Vista. The amount of waste collected by National City residents alone is not available. The total amount for all three cities is 142,572 pounds of hazardous waste, however. The following provides a breakdown of the waste collected at the facility, including curbside and door-to-door collection:

- 11,358 pounds of used oil
- 114,549 pounds of antifreeze oils and paints
- 16,665 pounds of used oil filters and batteries

The City continues to distribute brochures "Put Toxic Waste in Its Place" (Attachment 4.2) to remind residents to dispose of HHW properly. This brochure is handed out at all workshops and is available at various locations in the City.

Other Waste Disposal Programs/Activities

In addition to proper HHW disposal, the City encourages residents to recycle used oil. The City maintains seven Certified Used Oil Recycling Centers for residential oil disposal. The volume of used oil dropped off at the collection centers was not immediately available.

The City's Public Works Department held two trash collection events (June and November) during this reporting period in conjunction with EDCO Disposal Company. During these events, residents were encouraged to dispose of any unwanted large items from their homes such as furniture and appliances.

Two neighborhood councils in the City held cleanup events, and a third event was hosted by City Hall. The Eastside Neighborhood Council and the Army National Guard painted and cleaned El Toyon Recreation Center and removed 4.8 tons of dirt/trash/debris from three surrounding neighborhoods (Granger/Northside/Old Town) on February 3-4, 2007. The Northside Neighborhood Council collected 7.2 tons of dirt/trash/debris from the Northside Neighborhood on March 31, 2007. City personnel and residents collected 2.4 tons of trash and debris over June 1-2, 2007 from the areas surrounding City Hall.

Additionally, residents of Sweetwater Heights, a neighborhood in National City, continue to maintain their own birdhouse for pet waste bags, encouraging neighbors to pick up after their pets.

In addition to the above efforts, the City completed the construction of the Paradise Creek Educational Center. The site offers educational signs about pollution prevention and improving water quality in National City. The area is designed to make people more aware of their surroundings and hopefully foster more effective pollution prevention programs. On April 21, 2007, a few days after the Paradise Creek Educational Park officially opened, an Earth Day celebration was held there. During the celebration, volunteers removed trash and sowed 300 plants.

Storm Drain Stenciling

During 2006/2007, the City worked with ILACSD to stencil storm drains in the City that remind people that the storm drains drain to local creeks and the ocean. A total of 19 volunteers stenciled 30 drains.

COMPLIANCE AND ENFORCEMENT

To help bring the priority residential areas that were listed above into compliance, the City of National City has worked to ensure that these residential areas are educated on storm water issues by providing educational brochures. Homes in areas where dry weather monitoring indicated high pollutant discharge were provided with educational mailers and were encouraged to learn more about the NPDES program.

The City continues to encourage all citizens to use the storm water public complaint hotline and/or website complaint system. The hotline is publicized as widely as possible to encourage the public to use the service. The telephone number has been mailed to every residence in the City and is also posted on the city website; the online complaint form is easy to find and easy to use. The storm water hotline card is available at the City's Engineering Department, and these cards are handed out during all inspections or complaint investigations. This hotline augments the City's ability to educate and enforce by allowing staff to immediately bring erring individuals or businesses into compliance. City personnel investigate each complaint received. The City makes every attempt to identify the responsible party. Potential sources of pollution are evaluated, immediate action is taken if necessary, and corrective action is recommended verbally or via a letter. In some cases, an administrative citation, or Notice of Violation (NOV) is issued. In addition, the City also provides as much educational material as possible to prevent future activities that may pose a threat to storm water quality.

Complaints received are the City's primary mechanism for notification of noncompliance with its storm water ordinance in residential areas. The City's NPDES Storm Water Compliance Inspector records the complaints and responds to them accordingly. During the 2006/2007 reporting period, the City received several storm water complaints related to residential areas, which are included in Table 8.4 of Section 8 below. In some cases the reported noncompliance was not observed when the City inspector visited the site. In those cases, no enforcement action was taken. When discharges or improper BMP implementation is observed, the City's NPDES Storm Water Compliance Inspector takes action to ensure the violations are promptly remedied. The City issued 12 administrative citations, seven NOVs, and 23 corrective action letters to residents during the reporting year. Common problems this reporting period were vehicle washing, oil leaking from vehicles onto the street, accumulation of trash and debris on the street, and hosing off the driveway

and/or sidewalk. In most cases, problems are resolved by a verbal warning and no further action is necessary.

A notable residential enforcement action occurred in response to a complaint that a resident's garbage disposal was plumbed improperly and that the resident hoses off concrete areas. Upon investigation, the inspector noted that the kitchen sink and several washing machines were plumbed outside. Discharge of sediment and food particles and improper storage of materials was also noted. The City issued an NOV and an Administrative Citation to the resident. Upon follow up, all issues were resolved.

Another complaint that was received was regarding a homeowner pumping sewage from under the house to the gutter. The water flowed for a total of approximately 5-6 hours through a garden hose. The City's storm water consultant, D-MAX Engineering, Inc. was called to test the water and the Sewer Department was called to clean up the spill. The Building Department was also called to check safety of residents; the house was tagged as unsafe to occupy. An administrative citation was issued. A follow-up investigation revealed that the hose and pump were still observed to be under the house with one end of the hose going to the front lawn. The inspector issued an NOV. The hose and pump were removed and all storm water issues were corrected.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

6 LAND-USE PLANNING FOR DEVELOPMENT

One of the major requirements of the Municipal Permit is to minimize pollutant discharges from new development and redevelopment projects in order to improve overall storm water quality in the City of National City. Development has the potential to contribute pollutants to the City's storm water runoff from demolition and construction as well as post-development activities. Thoughtful pre-construction planning has been shown to reduce the potential of pollutant discharge both during and after construction. Effective pre-construction planning activities can include identifying potential pollutants from the site, minimizing the potential for the development to negatively impact downstream channels and/or habitats, and establishing appropriate BMPs during and after construction. After the issuance of the Municipal Permit, the City of National City implemented pre-construction planning activities through revaluating the General Plan, making changes to the City's development approval process, and establishing educational programs for development projects. The City continues to reassess and update its development-related processes in order to ensure that storm water pollution is minimized.

SUSMP DATABASE AND POST-CONSTRUCTION BMP INSPECTIONS

To prepare for the treatment control BMP inspection requirement in the new Municipal Permit, D-MAX, the City's storm water consultant, developed an electronic database of the City's SUSMP projects and performed BMP inspections of completed SUSMP projects. In mid 2007, the City conducted inspections of all completed SUSMP projects within the City's jurisdiction. These projects are all included in the City's SUSMP database, which contains general site information, details on site and source control BMPs, descriptions and GIS coordinates of all treatment control BMPs, and responsible party contact information. In the future, the City plans to track inspection finding and enforcement actions using the database as well.

One of the advantages of having an electronic database is the ability to print out site specific inspection forms that contain information directly from the database. An example of a site specific inspection form generated from the City's SUSMP database is included as Attachment 6.1 of this report. Site specific inspection forms help inspectors know what BMPs to look for without having to bring the project's cumbersome SUSMP report or site plans with them to the inspection site. The form also includes the GIS coordinates of each site's treatment controls, which can be obtained during the initial BMP inspection, to help in locating the treatment controls during subsequent inspections.

To prepare the BMP database, information was gathered from the City's existing SUSMP filing system located in the City's Engineering Department and the electronic SUSMP project tracking spreadsheet maintained by the City's storm water consultant. The SUSMP and construction site plans for completed projects were reviewed and relevant information from these documents was entered into the database. The City plans on adding new projects to the database once a project's SUSMP report is approved.

Since this was the first year the City performed post-construction BMP inspections, sites were checked for proper construction of structural site and source control BMPs in addition to proper installation and maintenance of treatment control BMPs. The City does anticipate

the need to inspect site and source control BMPs during subsequent inspection at these sites, unless implementation problems in these BMPs were observed during the site's initial BMP inspection. The following deficiencies were noted during the BMP inspections of completed SUSMP projects:

- Storm drain inlets did not contain signage.
- Personnel on site were unaware of how to maintain treatment control BMPs or in some cases were not aware of the BMPs at all.
- Roof downspouts were constructed to drain towards impervious areas, despite there being adjacent landscaping available to drain to.
- Catch basin inserts contained significant trash and appeared in need of maintenance.
- BMPs included in the site's SUSMP were not included on the site's construction plans, and were not installed.

Since the City's SUSMP inspections were conducted late in the 2006/2007 reporting period, discussion of the City's follow-up actions will be included in the 2007/2008 annual report.

Many of the BMP deficiencies noted during inspections were errors in construction rather than maintenance related. Most of the completed SUSMP projects were approved early in the development of the City's SUSMP program before the City adopted their current SUSMP approval process. The City now requires all structural BMPs included in the site's SUSMP document to be included on the site's construction plans before construction may begin. This ensures that building inspectors will check for proper structural BMP construction during routine plan checks. Any changes made to structural BMPs on the site's construction plans must be approved by the City before they may be implemented. Due to the City's current review process, the City does not expect BMP deficiencies related to construction of structural BMPs to be a problem in the future. The City will assess the effectiveness of its review process once construction on Priority Project approved through the City current process are completed and post-construction BMP inspections can be conducted.

GENERAL PLAN ASSESSMENT

The City of National City General Plan currently includes policies and a number of strategies relating to water quality preservation. These are included in the Natural Setting Element of the General Plan. No modifications have been made to the City's General Plan during this reporting period.

DEVELOPMENT PROJECT APPROVAL PROCESS

Slight modifications were made to the project approval process, although the overall structure of the process remained the same. The City made minor modifications to its applicability checklist (Attachment 6.2) during this reporting period. All projects that disturb soil are required to complete the applicability checklist and the City requires that projects completing the checklist be directed to the Engineering Department for final sign off. As presented in the 2002/2003 JURMP Annual Report,

"Before permit applications are submitted to the [building] department, developers are required to fill out a storm water requirements applicability checklist that determines if the project is subject to SUSMP and if preparation of a Storm Water Pollution Prevention Plan (SWPPP) or Storm Water Management Plan (SWMP) is applicable….For public projects, project managers are required to ensure that SUSMP requirements are incorporated into the project design. The SUSMP requirements must be included in the plans before the project is allowed to proceed into the grading and/or construction phase. The SUSMP ordinance also requires that if a project requires a grading permit that the applicant complete a Storm Water Management Plan prior to the issuance of the grading permit. An erosion plan and a SWPPP are required for sites greater than an acre and must be submitted as part of the grading plans. Erosion Control Plans are required for sites smaller than an acre."

During this reporting period 12 projects submitted post-construction BMP reports. Table 6.1 presents a list of development projects that submitted reports during 2006/2007.

To more accurately track the implementation of required BMPs, the City uses a SUSMP review checklist. The City's consultant uses the checklist as a guideline when preparing written comments for submitted SUSMP reports. When a project proponent proposes a treatment control BMP that is not the most effective possible BMP for the anticipated pollutants, the City requires the proponent to either implement a more effective BMP or justify why the selected BMP is the best BMP that can feasibly be installed at the site. The City also now requires that structural BMPs be shown on the SUSMP maps and construction plans; this allows building inspectors to ensure that the BMPs are implemented during their inspections.

ENVIRONMENTAL REVIEW PROCESS

The City continues to follow the written departmental SUSMP responsibility checklist developed during the 2005/2006 reporting period during the environmental review process. The City's storm water consultant, D-MAX, generally conducts the technical reviews of WQTRs and SUSMPs submitted to the City during the project approval process. A detailed review of site design, source control, and treatment control BMPs, as well as potential impacts to the downstream hydrologic regime is conducted. The City uses its SUSMP Review Checklist to determine whether all SUSMP requirements have been met, after which a detailed letter explaining the deficiencies of the submitted document and recommendations for improvement/approval is provided to the City and then passed on to the developer. If the initial document did not meet the minimum requirements, a revised document addressing the review comments must be submitted. This process continues until the document is approved; at that time the project may commence. Reviews of post-construction BMP plans for non-priority projects follow a similar process, except that treatment control BMPs are not required. The City of National City's environmental review process did not change substantially during this reporting period.

NEW DEVELOPMENT AND REDEVELOPMENT EDUCATION

Applicants continue to be educated on the City's development and re-development requirements during pre-submittal application meetings held with City's Planning Department. Representatives from the City's Planning Department regularly attended the

interdepartmental SUSMP coordination meetings, and City planners were provided with guidance regarding site design and other post-construction BMPs. If project applications are determined to be subject to SUSMP, then discussion occurs on ways applicants can meet these requirements.

During this reporting period, the City continued to hold Development Service Group (DSG) meetings to establish policies and procedures to integrate SUSMP into the normal review process for development and redevelopment projects. Review comments on each submitted SUSMP are provided to the project proponent. These lists of comments, presented in letter format, explain to the developer what, if any, changes are required and why they must be made. Meetings and telephone conversations with project proponents also occur, during which additional instruction on SUSMP requirements may be given. These methods help promote better understanding of and compliance with SUSMP requirements. Because a relatively small group of consulting engineering firms prepare the bulk of SUSMPs for projects in National City, future submittals from those same companies are anticipated to show improved initial designs.

The City's consultant, D-MAX, conducted a training session on January 22, 2007, on SUSMP requirements and BMPs. The presentation included a development and re-development component. This included SUSMP requirements and BMPs for new development and redevelopment. Additional trainings are planned for 2007/2008.

DESCRIPTION OF SUSMP PROJECTS

During this reporting period, post-construction BMP reports were submitted for the following 12 projects. All 12 were Priority Projects subject to SUSMP. Additional information regarding these projects can be found in Table 6.1.

Carolino Hillside Homes

This project involves the construction of nine detached two-story single family homes on 1.41 acres located on a steep hillside.

Cypress Glen Condominiums and Cypress Glen Phase II

Cypress Glen Condominiums consists of the construction of 38 condominium units on a 4.22 acre site. Phase II of the project involves the construction of 6 single family residences and associated private roads on a 1.0 acre lot, adjacent to Cypress Glen Condominiums.

Harbor View Condos

This project involves demolition of four single family homes to build a multiunit condominium building with underground parking. The site covers a total of 0.67 acre.

Harley Davidson

This project consists of remodeling an existing commercial building for use as a motorcycle showroom and repair facility.

Marina Gateway

Marina Gateway consists of redevelopment of an existing industrial and commercial site into a commercial site consisting of a hotel, pool, IHOP restaurant, commercial building, and associated parking lots.

Pacific View Estates

This project includes the construction of 49 detached single family residences and associated private roads on 4.43 acres of undeveloped land.

Paradise Village

This project involves construction of a multi-family residential facility that will include residential housing, a multiple use community facility, parking, and an outdoor detention basin on 12.2 acres.

Paradise Walk

This project consists of the construction of 16 townhome buildings (96 individual units) on a 4.65 acre lot with existing single family residences.

Plaza Bonita Mall Expansion

The Plaza Bonita Mall Expansion involves a two level expansion of the Plaza Bonita Mall with retail and parking structures covering about 18 acres.

Plaza City Apartments

This project involves the construction of senior apartments on 1.67 acres.

Plaza Village

This project consists of the construction of a covered parking garage with multiple story residential units above on a 0.5 acre site.

COMMON PROBLEMS WITH SUSMP PROJECTS

While reviewing SUSMP reports as part of the approval process the City has noted a number of common problems with the documents, sometimes causing them to be unable to meet the City's requirements upon the first or second review. A submitted SUSMP report presents the developer's plan to identify pollutants likely to discharge from the site and the BMPs that are proposed to minimize potential storm water pollution. Often times, these reports lack complete or correct information on anticipated pollutants of concern and/or proposed BMPs. The City's technical review of the document results in a detailed letter explaining to the developer what changes must be made prior to the approval and commencement of the project. The following is a list of deficiencies noted during the reviews of SUSMP reports submitted during this reporting period.

- Calculation of pre- and post-development runoff is not present or not properly calculated.
- Watershed information and the project's receiving water body are missing or incorrectly identified.
- The list of anticipated and potential pollutants of concern is incomplete or incorrect. Also, if present, they are not designated as either primary or secondary pollutants of concern.
- Conditions of concern are either not discussed or not sufficiently addressed.

- Site design and source control BMP descriptions are generic, or not site specific.
- Site design BMPs are not implemented to the Maximum Extent Practicable (MEP), and there is no explanation of why more site design BMPs and/or more effective site design BMPs are not proposed.
- Individual Priority Project BMPs for applicable Priority Project categories are not proposed.
- Calculation of SUSMP flow or volume for treatment control BMP sizing is either not present or is not properly calculated.
- Calculated values are not consistent throughout the report's text, tables, and appendices.
- A treatment control BMP is chosen that does not have the highest possible removal efficiencies for anticipated pollutants, and there is no explanation present for why a more effective BMP could not be implemented.
- It is unclear whether runoff from all areas of the project site will be directed to a treatment control BMP, or the report states that some areas will not receive treatment at all. Also, the locations of these BMPs are often unclear.

The City continues to inform developers of these types of errors and has seen some improvements since the end of 2005/2006.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

Table 6.1
SUSMP Projects Submitted to the City for Review
During the 2006/2007 Reporting Year

#	Project Name	Location	Description	Project Type	Number of Reviews
1	Carolino Hillside Homes	16th Street & M Avenue	Residential Development on Steep Hillside	Priority	one
2	Cypress Glen Condos	3229, 3359, 3391 Cypress St	Residential Development	Priority	three
3	Cypress Glen Phase II	2501 E 32nd Street	Residential Development	Priority	three
4	Harbor View Condos	8th Street & D Avenue	Residential Development	Priority	one
5	Harley Davidson (Revised)	3201 Hoover Ave	Commercial Development	Priority	one
6	Marina Gateway	Marina Way, south of Bay Marina Dr	Commercial Development with Restaurant and Parking Lot	Priority	one
7	Pacific View Estates	Division St & Laurel Ave	Residential Development	Priority	one
8	Paradise Village	4th St., 8th St., Arcadia Ave., & Bowron St.	Residential Development	Priority	one
9	Paradise Walk	Arcadia Ave and E. 8th St	Residential Development	Priority	one
10	Plaza Bonita Mall Expansion	3030 Plaza Bonita Road	Commercial Development	Priority	five
11	Plaza City Apartments	1535 E. Plaza Blvd	Residential Development	Priority	three
12	Plaza Village	L Avenue & Plaza Boulevard	Residential Development	Priority	two

7 CONSTRUCTION

Construction and grading activities have the potential to negatively affect storm water quality due to the presence of large amounts of sediment. Sediment is a pollutant that can also carry other pollutants such as metals and nutrients into the storm drain system and ultimately to receiving waters. Effective sediment control and soil stabilization are necessary to prevent sediment and associated pollutants present at construction sites from entering the storm drain system. Both the Municipal Permit and General Construction Permit have regulations aimed at reducing the potential for sediment discharge from construction sites. Appropriate pollution prevention BMPs related to material and waste management and equipment cleaning can also help prevent materials like concrete, fuel, paint, and detergents from being transported from construction sites into the storm drain system.

Section 7 of the 2004 JURMP outlines the City's mechanism for ensuring that storm water pollution is eliminated at construction sites. Sites equal to or greater than one acre are required to comply with the State General Construction Permit (Construction Permit) as well as local requirements. Both sets of regulations ensure that BMPs are implemented effectively at all construction project sites. The City also conducts quick, minor repairs and improvements to curb gutters, sidewalks, and portions of streets. City staff responsible for these projects are trained in BMP implementation, and inspections are also conducted to make sure appropriate BMPs are in place for these small projects. See the municipal section of this JURMP Annual Report for more information about the City's BMP practices for street maintenance.

To ensure compliance with the City's Storm Water Ordinance and the Construction Permit, the City inspectors conduct inspections of project sites based on prioritization and inspection frequency as defined in the Municipal Permit and the City's JURMP. The City of National City maintains an inventory of all active construction project sites. During this reporting period, there were 3 high priority construction sites, 14 medium priority sites, and 72 low priority sites. Note that of the 3 high priority sites, only one was active during the entire 2006/2007 wet season. Tables 7.1, 7.2, and 7.3 present the inventories of the high, medium, and low priority sites, respectively. The following sections describe the City's construction-related activities during this reporting period.

POLLUTION PREVENTION AND BMP REQUIREMENTS AND IMPLEMENTATION

Section 7.1 of the JURMP addresses pollution prevention methods. The City's required pollution prevention methods ensure that potential pollutants associated with construction sites are prevented from entering the MS4s or receiving water bodies. The City's grading ordinance, building code, and Storm Water Ordinance provide legal authority for these requirements.

Section 7.6 of the JURMP presents a list of BMP requirements. Appendix C of the JURMP presents more detailed BMP fact sheets for effective implementation of those BMPs at construction project sites. Construction sites are required to implement the following BMPs where applicable.

- Soil stabilization and erosion prevention
- Sediment containment
- Materials and equipment management
- Non-storm water discharge and drainage control

No changes have been made to the City's BMP requirements during this reporting period. The City's BMP manual for construction activities, intended for site owners, developers, and contractors, is available to any interested parties through the Engineering Department. Most major developers working in the City have received these manuals. The City also discusses the manual at CIP project pre-construction meetings to ensure contractors have received a copy and are aware of the requirements, and manuals are occasionally given out during inspections at construction sites.

EDUCATION

During this reporting period, the City continued to conduct pre-construction meetings for Capital Improvement Projects (CIP). Private high priority sites have an onsite pre-job conference in most cases. The City also often conducts pre-job conferences at the Engineering Department front counter when a permit is pulled for smaller projects, typically classified as medium or low priority. City staff explain NPDES and relevant BMP requirements to the project proponents. The City's BMP manual (Appendix C of the JURMP) continues to be available at the City's Engineering Department counter; contractors or developers are asked to pay a minimal cost for the manual to cover copying expenses. Appendix C of the JURMP also may be given out to contractors at construction sites by the City's NPDES Storm Water Compliance Inspector.

During this reporting period, the City continued to distribute the "Construction Site Best Management Practices" fact sheet created during the 2005/2006 reporting year to all construction projects obtaining construction permits. The fact sheet lists the City's minimum BMP requirements for construction activities and the document is made a condition of permit issuance. This ensures that all projects are appraised of the City's BMP requirements, including even the smallest projects that require only building permits. A copy of the storm water hotline card may also be given to contractors at construction sites.

In January 2007 the City hosted a construction stormwater workshop for the City's construction and development community. Topics covered during this training included general storm water concepts, the City's construction BMP requirements, complying with the general construction permit, and a general overview of the City's SUSMP requirements. Similar to other workshops hosted by the City, pre- and post-workshop knowledge assessment tests were given. Overall, scores improved after the workshop. The City is planning another construction workshop for the 2007/2008 implementation year.

GENERAL CONSTRUCTION PERMIT

In addition to ensuring that construction sites are in compliance with the Municipal Permit, the City has taken a proactive role in ensuring that the applicable construction sites are in compliance with Construction Permit requirements. Before receiving City permits for work on their projects, project proponents are required to complete a Storm Water Requirements Applicability Checklist, which includes a section on Construction Permit subjectivity

(Attachment 6.2). Sites over one acre in size are subject to the Construction Permit and are required to obtain coverage. The City conducts a formal technical review of the SWPPP for sites subject to the Construction Permit prior to the start of construction. The SWPPP is reviewed against the Construction Permit SWPPP guidelines to ensure all sections of the permit are addressed. A formal letter with the technical review comments is sent to the developer, who must resubmit a revised SWPPP if it is found that the document did not meet the relevant requirements. Once comments are adequately addressed, the developer may commence with the project.

The City has noted some common SWPPP deficiencies during the review process. As noted above, the developer is required to correct the deficiencies before the project is allowed to proceed. Common deficiencies are listed below.

- Base SWPPP templates were not tailored to make them site specific.
    - BMPs were not site specific.
    - Material lists were not site specific or complete.
- Some information was missing or not included.
    - Attachments referenced in the text were missing.
    - Site maps did not include all necessary information, such as drainage patterns and BMP locations.
- Post-construction BMP implementation and short-term and long-term funding were not addressed. In some cases for Priority Projects, post-construction BMPs proposed in the SWPPP did not match those proposed in the SUSMP. In these cases the City required the developer to revise the documents to be in agreement with each other.
- Project schedules and contractor information were not available.
- NOIs had not yet been sent to the State Water Resource Control Board. In these instances, the City ensured Construction Permit coverage was obtained before the project was allowed to proceed.

While the project foremen were generally quite knowledgeable on storm water issues, it was noted during inspections that some personnel on construction sites did not receive training on SWPPP implementation. In a few instances, the SWPPP was not available onsite or was inaccessible to workers.

INSPECTIONS

The Municipal Permit requires that storm water compliance inspections for construction sites be conducted based on the following frequencies:

- During the wet season (October 1st through April 30th), designated high priority construction sites must be inspected weekly, while medium and low priority construction sites must be inspected twice during the wet season.
- During the dry season (May through September), constructions sites are to be inspected as needed. The City has gone beyond this minimum requirement, also inspecting high and medium priority sites during the dry season.

The City requires all construction sites to prevent discharges to the MEP through effective project planning and research, erosion prevention, sediment containment, materials and equipment management, and non-storm water discharge and drainage control. Common examples of these measures include fiber rolls, silt fences, rip-rap, and hydroseeding. Erosion prevention measures have been found to be the most effective and least costly BMPs. In some cases, additional BMPs beyond those specifically required by the City's JURMP must be implemented to meet the City's MEP standard. To ensure these requirements are met, the City performs inspections of construction sites to evaluate if project proponents are correctly implementing required BMPs. Data collected during this reporting period indicates that the City's program has continued to be fairly effective at ensuring compliance at construction sites. Most sites were in compliance, and the City's enforcement actions resulted in the non-compliant sites implementing the necessary corrective actions.

During this reporting period, the City of National City conducted all necessary inspections to ensure compliance with the Municipal Permit requirements and meet the inspection frequency goals outlined in the City's JURMP. The City's NPDES Storm Water Compliance Inspector and D-MAX inspectors visited medium and high priority construction sites according to the frequencies described earlier in this section. The low priority construction sites were visited by construction inspectors to ensure BMPs were implemented effectively. BMP implementation was checked at all permitted projects that disturb soil, and if the construction inspector noted deficiencies in BMP implementation or a threat to water quality, the City's Storm Water Compliance Inspector was contacted immediately to address the issue with the property owner and contractor. Many of the low priority construction sites were completed in a very short period of time; thus, two inspections during the wet season were not feasible for some small projects, such as construction of new driveways. Common deficiencies in BMP implementation were noted during the inspection process. Inspectors found that for some of the medium and high priority construction sites, contractors failed to implement structural and non-structural BMPs outlined in their SWPPPs or failed to actively maintain BMPs once implemented. Selected structural BMPs are outlined in Appendix C.6 of the JURMP manual and are required to be implemented in accordance with the guidelines outlined by the California Storm Water Quality Association. Common BMP deficiencies observed during this reporting period are listed below:

- Improper material storage and stockpile protection
- Improper equipment/vehicle storage
- Improper entrance/exit stabilization
- Sediment buildup around discharge locations
- Improper or insufficient erosion control BMP implementation
- Insufficient or failed perimeter protection

Most BMP deficiencies were primarily the result of not maintaining good housekeeping practices. General areas of improvement regarding good housekeeping practices include: sweeping around storm drain inlets and other discharge areas, keeping streets around the construction site free of sediment, properly containing waste materials, and properly covering or containing stockpiles.

Where BMP deficiencies were noted, corrective actions were recommended and follow-up inspections were performed to ensure compliance. Inspectors also educated contractors and developers by discussing storm water and erosion control requirements and providing written BMP information to ensure compliance with the Municipal Permit and the Construction Permit. In instances where additional enforcement actions are required, a stop work order is issued until proper BMPs are implemented (see Compliance and Enforcement Actions below). If necessary, the inspector may reclassify the priority of a construction site if it is found to consistently lack proper BMP implementation or receive stop work notices, citations, or notices of violation.

CONSTRUCTION SITE INSPECTION TRACKING SYSTEM

The City continues to input construction site inspection findings into a storm water database. For high and medium construction inspections, a four-page inspection form is filled out per inspection. The information from the inspection is entered into the database and used to keep track of each site's compliance. Queries can be conducted to track corrective actions and notices of violation observed at various construction sites.

COMPLIANCE AND ENFORCEMENT ACTIONS

The City has developed and continues to update the compliance and enforcement protocol as identified in the JURMP Section 8, Enforcement Measures for Construction Sites. The goal of the enforcement process is to ensure facilities are compliant with local, state and federal regulations and BMP requirements.

If relatively minor BMP problems are found during an inspection, the City's NPDES Storm Water Compliance Inspector issues a verbal warning to the responsible party and follows up with the site the next day. If the problem has not been corrected, a stop work order is issued until appropriate BMPs are implemented. Note that a Corrective Action Letter may be issued if no representative is on site when a minor BMP issue is discovered. The City also follows up at these sites to ensure that corrective actions are undertaken promptly. If an inspector finds an active discharge of pollutants or gross negligence on the part of the developer in implementing BMPs, the City's NDPES Storm Water Compliance Inspector immediately issues a stop work order, and in many cases an Administrative Citation is issued as well. The developer or contractor is also required to clean up discharged materials if possible. In some cases, the City will also issue a NOV, which requires the submittal of a written corrective action plan. The stop work order is not lifted until the required BMPs have been properly implemented. The City has found stop work orders to be effective enforcement tools, largely because they impose more significant costs than do citations in the range of several hundred dollars. In some cases, contractors will implement BMPs within a very short time frame when informed they are at risk of receiving stop work order.

The City's NPDES Storm Water Compliance Inspector is authorized to administer administrative citations, stop work orders, and NOVs. In many instances during the storm water compliance inspection, contractors and developers implemented corrective actions immediately. During this reporting period, the City administered four administrative citations, two corrective action letter, and three NOVs in support of its construction program. The administrative citations were given due to lack of BMP implementation, sediment discharge, and non-storm water discharge. Most of the regularly inspected construction sites had relatively good compliance records; the majority of the enforcement

actions were taken in response to complaints reported to the City. The complaints and the City's response are discussed in Section 8 of this Annual Report. Of the construction sites that were issued enforcement actions, all came into compliance after the first citation was issued and the City did not have to issue additional enforcement measures.

During the 2006/2007 reporting period, the City issued one stop work order to the Plaza Bonita Mall redevelopment when the site was found to have begun construction without submitting an NOI, SWPPP, or a SUSMP report. Construction was not allowed to resume until a SWPPP was submitted, reviewed, and approved and an NOI was filed with the RWQCB. The site complied promptly and construction was allowed to continue. In order to prevent extended delays on the project, the City allowed the project to resume construction before the SUSMP report was approved. Since this project was a redevelopment and site constraints limited the ability for the site to implement site design BMPs or larger treatment control BMPs, the City decided that allowing the project to begin construction would not further limit the site, source, and treatment control BMP options available to the site. The project was told that once the SUSMP for the project was approved, the construction plans would have to be changed to reflect the BMPs included in the SUSMP and final approval would not be given to the project until these BMPs were installed. When the final approved SUSMP for the site included new BMPs for the site's already completed dock areas, the City required the site to go back and rebuild the dock areas as described in the site's SUSMP. The City also took extra precaution with the site by assigning it a construction priority of high despite the site meeting medium priority criteria. The City conducted weekly inspections for the site during October and November of 2006 to ensure the site was complying with City requirements. Since the site was not found to have any major deficiencies in BMP implementation during these months, the City dropped the site's priority to medium, and subsequent inspections were less frequent.

During the reporting period the City did not have to issue any stop work orders to construction sites for failure to comply with previous enforcement measures.. The City has demonstrated in past implementation years that issuance of high level enforcement measures such as stop work orders are not just empty threats, and it is likely that construction sites are complying more quickly with the City's BMP requirements to avoid these costly penalties.

Section 7.9 of the City's JURMP, "Reporting of Non-Complaint Sites," states, "The City of National City will provide oral notification to the RWQCB within 24 hours of the discovery of any non-compliant sites within its jurisdiction that are determined to pose a threat to human or environmental health. Oral notification will be followed up by a written report and submitted to the RWQCB within 5 days of the incident as required in Attachment C (B.6) of Order 2001-01." Further, in the event that a contractor or site owner refuses to cooperate with the compliance process, it is reported to the RWQCB. During this reporting period, no construction sites were found to pose a threat to human or environmental health, and the RWQCB did not need to be contacted.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the

requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

8 ILLICIT DISCHARGE DETECTION AND ELIMINATION

The City of National City JURMP includes three mechanisms for detecting and eliminating IC/IDs within the municipality, all of which have been successfully implemented during the 2006/2007 reporting period. These programs continue to support each other, refining the City's ability to identify and eliminate sources of pollutant discharge. They are as follows:

- Conducting dry weather field screening and analytical monitoring
- Inspecting local businesses, municipal facilities, and construction sites
- Operating a public complaint hotline

Sections 2, 3, 4, and 7 of this report describe in detail the results of each of the inspection programs. This section provides a detailed discussion of the Dry Weather Monitoring Program and the public complaint hotline. During this reporting period, the Dry Weather Monitoring Program continued to identify residential and commercial areas across the City where the presence of certain pollutants warranted increased BMP implementation. Water quality data provided by the program proved again to be valuable in detecting and eliminating IC/IDs, as well as providing data about water quality in the MS4. The complaint hotline allows the public to take action and assist the City in identifying individual polluters. Public involvement proved to be greater than ever this year, as the number of hotline reports increased again during this reporting period.

DRY WEATHER MONITORING PROGRAM

The Municipal Permit and the National City JURMP state that the Dry Weather Monitoring Program's purpose is to eliminate IC/IDs to the storm drain system. An IC/ID upstream of a Dry Weather Monitoring Program field screening site is often evidenced by elevated constituent concentrations at the site itself, and in such a case the source of the IC/ID can usually be tracked. A summary of the results of the 2006 Dry Weather Field Screening and Analytical Monitoring Program is presented below. The program report is included as Attachment 8.1. The program consists of (1) field screening observations, (2) field screening analytical monitoring, and (3) laboratory analytical monitoring; all three parts of the program are conducted during the dry weather period. Data collected in the field and laboratory is compared against established action levels. Numeric action levels were adopted in 2003 based on statistical analysis of previous dry weather data. For dissolved metals, the California Toxics Rule gives the action level, which is dependent on the hardness value of the water sample. Best professional judgment was used in evaluating several field parameters, such as turbidity and temperature.

2006 Dry Weather Monitoring

The City of National City's 2006 Dry Weather Monitoring Program was conducted in September 2006. Of the fifteen primary monitoring stations, two sites were observed dry, Site 20 and Site 42. As a result, field screening was performed at two alternate stations, sites 48 and 49, to compensate for the dry sites. Dry weather site locations are listed in Table 8.1. Table 8.1 also includes a brief description of the sites, latitude and longitude coordinates,

primary and secondary land uses, and the type of storm water conveyance structure at the site. Field screening at these sites included qualitative observations, flow measurement, and field water quality analyses. Qualitative observations provided context for the quantitatively measured parameters. Water odor, color, and clarity were evaluated qualitatively along with current weather conditions, floating material, vegetation, deposition, and biological activity. Quantitative measurements were made of specific conductance, temperature, pH, turbidity, methylene blue-active substances (MBAS, typically indicative of surfactants), nitrate nitrogen, ammonia nitrogen, and orthophosphate phosphorus. Water samples for laboratory analysis were collected at four of these monitoring sites, representing more than the 25 percent of sites with ponded or flowing water. The laboratory analyses quantified total hardness, surfactants, oil and grease, diazinon, chlorpyrifos, dissolved metals (cadmium, copper, lead, and zinc), total coliform bacteria, fecal coliform bacteria, and *Enterococcus* bacteria.

During routine visits temperatures ranged from 18.4 to 29 °C, pH values ranged from 7.7 to 8.8, turbidity measurements from 1.1 to 28 NTU, and conductivity readings from 1.1 to greater than 20.0 mS/cm. Table 8.2 presents the results of all field analyses conducted at the sampled sites during the 2006 Dry Weather Monitoring Program.

Field analyses of chemical parameters resulted in a range of ammonia nitrogen concentrations from 0.1 to 1.5 mg/L NH_3-N, nitrate concentrations from 1.25 to 2.50 mg/L NO_3-N, orthophosphate phosphorus concentrations from 0.13 to 1.96 mg/L PO_4-P, and surfactants (MBAS) concentrations from 0.13 to greater than 3.0 mg/L.

There was one site that was found to have ammonia concentrations above the action level of 1.0 mg/L. Four sites initially had high surfactants concentrations, with Site 48 having the highest reading of greater than 3.0 mg/L. High conductivity was measured at three sites. These sites are located in the western part of the storm water system, which consistently have high conductivities attributed to residual salt water from the tides.

Laboratory analyses were conducted at four sites and bacterial contamination was found at three of the four sites, sites 1A, 32, and 46. The action levels for the three bacterial indicators are 50,000 MPN/100 mL for total coliform, 20,000 MPN/100 mL for fecal coliform, and 10,000 MPN/100 mL for *Enterococcus* bacteria. Elevated total coliform levels were recorded for all three of these sites. Sites 1A and 32 also had elevated fecal coliform levels, while sites 1A and 46 exceeded the action level for *Enterococcus*.

Dissolved cadmium and lead were not detected at any of the sites. The concentrations of dissolved zinc and copper did not exceed the California Toxics Rule benchmark at any site and were therefore not considered to impair water quality. None of the sites sampled for laboratory analysis had detectable levels of the pesticides diazinon or chlorpyrifos. No sites had detectable oil and grease concentrations. Laboratory analysis did not measure surfactant concentrations over the action level of 1.0 mg/L at any of the sites.

Table 8.3 presents the results of all laboratory analyses conducted during the 2006 Dry Weather Monitoring Program.

2006 Follow-Up Investigations

Data collected through the City's Dry Weather Monitoring Program are used to identify locations within National City that are contributing to storm water contamination. Source

identification investigations are then initiated to identify the causes of the detected pollution. Five sites received follow-up investigations for pollutants detected during field screening tests: Sites 1A, 11, 47, and 48 for surfactants, and Site 48 for ammonia. These follow-up visits were made within approximately 24 hours of the initial exceedance. The results of these immediate investigations were reported in the dry weather report and are summarized below.

A follow up investigation at Site 1A revealed that the surfactants concentrations had gone back below the action level and that this was most likely transient. Sites 11, and 47 had surfactants concentrations above the action level (1.5 mg/L) and Site 48 had surfactants concentrations greater than 3.0 mg/L. The elevated surfactants at Site 11 are likely to have come from illegal vehicle washing at a business upstream of the site, and during the follow up investigation surfactants concentrations had lowered below the action level, indicating that this was likely due to the cessation of washing activities. The elevated surfactants levels at Site 47 were most likely the result of run-off from commercial car washing in the vicinity of the Mile of Cars. The upstream investigation for Site 48 revealed that a resident was watering his yard and there was also evidence of washing activities, which could both contribute to the high surfactants concentrations. Site 48 also had ammonia concentrations during the initial visit at above the action level. During the follow up visit to Site 48, ammonia concentrations had dropped back below the action levels, so ammonia was likely transient.

Due to the time delay of laboratory analyses, any exceedances in constituents measured by laboratory analyses could not be investigated within 24 to 48 hours of sampling. After the laboratory analyses were received, however, a second round of follow up investigations was conducted to trace constituent exceedances detected by the laboratory testing. Three sites were included in this second round of follow-ups: Site 1A, Site 32, and Site 46. A brief description of the investigation procedure and results from these upstream investigations is summarized below; the follow-up investigations are discussed in more detail in Attachment 8.1.

During the follow-up investigations, visual observations were recorded including flow rate, floatable material, deposits, and water color, clarity, and odor. The physical parameters of temperature, pH, and conductivity were measured at all the sites, and chemical field tests were performed for ammonia and surfactants where necessary. When bacterial investigations were conducted, field investigators used 3M Petrifilm Coliform Count Plates to evaluate bacterial levels. This method provided a cost-effective and timely way to investigate bacterial contamination, compared to the expensive and relatively lengthy process of submitting samples for laboratory analysis. Field investigators began the investigations at the sites and then gradually worked upstream to try to identify sources.

Bacteria at Site 1A appeared to be from a combination of decaying trash, organic debris, and pet waste found at the site itself and in curb inlets in residential areas upstream of the site. At Site 32, the flow rate through the site was minimal, and litter at the site and human inhabitation upstream in the channel were possible contributors to the bacteria levels at the site. Debris in two catch basins upstream of Site 46 was the most likely source of bacteria at Site 46. These catch basins drain runoff from the surrounding shopping centers' parking lots, and decaying organic material and trash were also observed in the catch basins.

Follow-Up Actions

Once the sources of contaminants were identified, recommendations were made in the 2006 Dry Weather Monitoring Report. All recommendations that involved cleaning the MS4, including clean outs at sites 1A, 13A, 20, 32, 38, 40, 41, 44, and 48, completed by City Public Works crews. The City also completed an additional study to assess sources of trash and debris and has formed a working group from City departments to address sources of trash and debris. Please see Section 13 for details.

City staff did not find any more IC/IDs associated with Styler's Body Shop in 2006/2007, and the 2007 dry weather results did not find any detergents exceedances downstream of that body shop at Site 11. Courtesy inspections were conducted for businesses along Mile of Cars Way, and many of the businesses in the area also attended the City's educational workshop for commercial businesses. No exceedances for detergents were noted in that area (Site 47) during the 2007 Dry Weather Monitoring Program. To apply more pressure to businesses upstream of Site 46, the City initiated discussions with the property management about necessary improvements at the businesses. While some improvements have been made, efforts in this area are ongoing.

In response to the recommendations of the dry weather report, the City sent letters and educational materials to residences and businesses in areas believed to be sources of exceedances in monitoring results. The City also provided invitations to City hosted workshops. Educational materials were sent to areas upstream of Site 1A, Site 46, and Site 47. Over 1,470 notices were mailed.

2007 Dry Weather Monitoring

The 2007 Dry Weather Monitoring Program commenced in the late summer of 2007, beyond the date range covered by this Annual Report. Because 2007 data is utilized in some portions of this Annual Report, the 2007 dry weather monitoring and upstream investigations report is included as an attachment to this Annual Report (Attachment 8.3). The results of the 2007 report will be discussed in the 2007/2008 JURMP Annual Report.

HISTORICAL DATA

Evaluation of data collected during the Dry Weather Monitoring Programs since 2002 revealed that the City of National City has maintained relatively low levels of both nitrates and orthophosphates throughout the City. The specific conductance of the water measured throughout the City fell within normal ranges for all sites except those that were affected by tidal waters or permitted non-storm water discharges. Since 2003, all pH readings have been within the established range at each of the sites visited. Each year several of the sites have been identified to have ammonia concentrations above the established action level. The number of sites with a sample exceeding the ammonia action level has decreased from four in 2004 to two in 2005, and only one in 2006. Often the elevated ammonia concentrations are the result of stagnation and decay in sites with low flow rates or ponded water. To lessen surfactants pollution, the City of National City has inspected automotive-related businesses for uncontained washing and provided educational material to the public regarding surfactants pollution. The total number of sites with surfactants exceedances dropped from eight in 2004 to only two in 2005, and increased to four in 2006. Often

surfactants are transient and can be traced to uncontained commercial or residential washing.

The City is also able to utilize data from the Dry Weather Monitoring Program to focus its efforts on areas of the City and on particular pollutants that appear problematic. Priority residential areas are described in Section 5 of this report. The City will continue efforts to educate the public on washing practices, littering, irrigation, green waste disposal and pet waste disposal BMPs. For example, the City hosted a Residential workshop on 2/21/2007 where educational materials were distributed and residents were encouraged to ask questions.

COMPLAINT REPORTING OF IC/IDS, INVESTIGATION, AND ENFORCEMENT

The City has continued to encourage citizens and City personnel to become active participants in IC/ID elimination and storm water pollution prevention by utilizing the storm water public complaint hotline. The number for this hotline has been mailed to every residence in the City and is published in the contact information section of numerous brochures addressing storm water related issues. Additionally, the hotline number is distributed by the City Engineering Department in the form of a business card. City personnel investigate every complaint logged through the hotline to determine if pollutants are in fact being discharged to the MS4. The City's NPDES Storm Water Compliance Inspector can be contacted via cell phone to respond to calls about water main breaks, sewer spills, and other significant spills. This helps ensure that all reported spills are responded to as quickly as possible. If investigators find evidence of a violation or other IC/ID, every effort is made to find the responsible party and inform them of the complaint and their non-compliance. The responsible parties are educated or cited as necessary and required to cease any illegal discharges. If it is possible, they are required to conduct the immediate clean up of the polluting discharge. In some cases City crews conduct cleanup efforts and then bill responsible parties for cost recovery.

A summary of the reported violations that were investigated by the City between July 1, 2006 and June 30, 2007 is shown in Table 8.4. A total of 143 complaints were logged and responded to during this period. The total number of complaints handled is slightly less than the number reported during the previous reporting period.

RESPONSE TO SPILLS

The City of National City has developed a Sewer Overflow Prevention Program and a Sewer Overflow Response plan to facilitate, prompt and encourage effective spill response throughout the City. The response program includes information about safety, treatment, and reporting duties, as well as instruction on how to complete sewer spill reports.

Receipt of citizen complaints is the City's primary mechanism for notification of spills from private sewer laterals. The City typically receives about two calls per year regarding problems with private sewer laterals. These calls usually deal with roots, grease, or debris blocking the private lateral. In that case, the property owner is responsible for the resolving the problem; the City also clears the mainline sewer that services the property in every case, however. If the owner has a property line clear-out, the City tries to help out in any way it

can. Generally these minor problems with private laterals do not result in spills to the storm drain system, although more significant blockages are sometimes observed.

During this reporting period, only one SSO was documented and reported to the RWQCB, which is an improvement from the six that were reported during the last reporting period. The SSO was caused by a grease blockage that caused a pipe to rupture. Approximately 6,750 gallons of over flow was released, none of which could be recovered. None of the overflow reached any receiving waters, however. City crews flushed the line upstream of the blockage and cleaned area affected to the maximum extent practicable.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

TABLE 8.1
DRY WEATHER MONITORING SITES

Site No.	Location	Conveyance	Primary Land Use	Secondary Land Use	Hydrologic Unit	Latitude	Longitude
1A	Southwest of 43rd Street and Nordica Avenue	Concrete Channel	Residential	Commercial	908	32.68575	-117.10166

TABLE 8.5
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
1	7/5/2006	Public	1935 Via Las Palmas	Reported "dumping"	The inspector called P.D. regarding dumping. This call was from 6-30-06. The inspector went to site and found no evidence of discharge.
2	7/5/2006	Public	900 Block of Delta	Vehicle involved in accident leaking oil in gutter for approximately 1000 ft.	There was a black pick up truck parked on the south side of Delta at the 900 Block. There was front end damage to the vehicle and oil in the gutter for about 1000 ft. and on the sidewalk. The oil is not flowing and is not near an inlet. The truck had no plates and NCPD was called to tow vehicle.
3	7/10/2006	City Staff	3030 Plaza Bonita Rd.	No grading permits-stockpiles of soil.	The inspector went to site. Not all BMPs on the erosions and sediment control plan have been implemented. Stop work order issued. Need SWPPP, SUSMP, NOI, etc. Meeting was scheduled for 7/11/06.
4	7/10/2006	City Staff	Highland Avenue Medians	Stockpiles next to Paradise Creek.	Port-a-john without secondary containment. Concrete washed out onto asphalt parking lot. Topsoil stockpile not contained. Broken gravel bags in parking lot. Problems resolved upon follow up inspection. Work was stopped until BMPs were implemented. After inspector confirmed BMP implementation, work was allowed to resume.
5	7/11/2006	Storm Water Hotline	R Ave. between 4th and 5th.	Pick up truck leaking oil.	There was a 1988 white Toyota pick-up with a 1 gallon container bungee-strapped to the engine leaking oil on the street. The inspector received the registered owners' information from PD and tried to make contact. They were not home and case was referred to code enforcement

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
6	7/12/2006	Storm Water Hotline	R Ave. between 4th and 5th.	Pick up leaking oil.	Building Department unable to follow-up on vehicle leaking oil. The inspector returned today to find that vehicle has been moved about 50ft north but still on street leaking oil. N.O.V. issued with admin citation.
7	7/12/2006	Storm Water Hotline	16th and I	City vehicle leaking coolant.	City vehicle leaked coolant onto the street and in the gutter. Equipment maintenance cleaned with absorbent and pads. No further action.
8	7/18/2006	Storm Water Hotline	1500 Block Coolidge	Hosing down street.	The inspector explained NPDES and left educational material.
9	7/20/2006	Public	9th and M	Transmission fluid in gutter going into storm drain inlet.	A contractor re-surfaced a driveway. The tar ran into the street, gutter, and inlet. Property owner and contractor were contacted. Both agreed to clean street and gutter. Sewer crew was called to clean inlet.
10	7/24/2006	Storm Water Hotline	9th and M Ave.		Follow up to above complaint. Tar and sand has been removed form street and gutter. Some staining remains on street and gutter. Inlet clean.
11	7/27/2006	Public	Between Harrison Ave & 18th Street	Washing a truck at the corner of Harrison Ave and 18th Street.	Gave a warning not to wash at the public right of way.
12	8/1/2006	Storm Water Hotline	1535 NCB	Hosing down parking lot and water was entering inlet.	Second violation within 1 year period. Citation & NOV issued.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
13	8/1/2006	Public	18th & D	Wax residue in gutter.	Checked area for white wax residue. There were no signs of discharge of wax. A small amount of water was present in the surface to curb drains coming from the school. No further action.
14	8/1/2006	Public	17 E 2nd Street	Mechanical work being conducted on street. Oil being spilled.	There were signs that auto repairs had been conducted. There were 2 oil spills on the ground/street and lots of stains. There were no activities at the time of this inspection. No further action.
15	8/3/2006	Storm Water Hotline	100 Laurel Ave.	Washing paint to gutter.	There was a handyman washing drywall mud down the driveway and into the street. Admin citation issued for discharge. Area cleaned with broom and mop.
16	8/21/2006	Storm Water Hotline	42 Valva Avenue	Construction debris on property. Open paint cans on front lawn.	Open paint cans on front lawn. Building inspector stopped work and posted notice on site. Two contractors were issued citations for conducting business in National City without a valid business license. A site representative called City and agreed to have debris removed the next day. Came to the City tomorrow to required permits from building department.
17	8/21/2006	Storm Water Hotline	2744 Grove (County address)	Home business: Washing construction equipment with discharge going to inlet on Grove in N.C. possibly stucco or dry wall mud.	The inspector notified county. County phoned on 8/22/06 and agreed to take responsibility for following up with site.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
18	8/21/2006	Public	136 Valva Avenue	Paint in gutter from men washing paint brushes.	Drywall tools were washed in the street resulting a discharge of water and dry wall mud into the street, gutter and inlet. Admin citation issued. The inspector called sewer crew to clean gutter street and inlet, where pollutant was contained.
19	8/28/2006	Storm Water Hotline	1415 Orange	White lincoln leaking oil on street.	Vehicle parked legally on east side of street. There is evidence that the vehicle leaks oil, but oil is not flowing down street. Vehicle marked for 72 hours parking and referred to PD-traffic.
20	8/29/2006	Public	8th and Arcadia	Bags of trash on street, vehicle repairs being conducted on street.	There were several bags of trash, a trash can and lots of water in the street. There was no indication that auto repairs were being conducted. Trash can was placed on property by street supervisor who then called EDCO to have can removed. All bags and litter were packed up and taken to PW to properly dispose of. Asked code enforcement to notify property owner that there was debris on property.
21	8/29/2006	Storm Water Hotline	200 Block W. 35th St.	Motor home leaking sewage.	Motor home was moved from 400 block of W.35th to the 200 block. There was an odor of sewage. The inspector photographed the underside where sewage was leaking. Vehicle was towed by NCPD traffic division. Admin citation issued.

PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
22	8/29/2006	Public	1120 Hoover Avenue	Property owner requested courtesy inspection by City to check compliance.	8/30/06: Inspector went to location at 3:00 pm. The business was closed. 9/13/06: Inspector went to location and business was closed.
23	8/30/2006	Storm Water Hotline	2643 E 4th Street	Debris on site from house and vehicle burned six months prior.	Referred to code enforcement.
24	8/31/2006	Storm Water Hotline	17th St (Unpaved)	Trash, oil, debris etc. on street and in drainage ditch.	The inspector called PW to clean area. PW cleaned on 9/5/06.
25	8/31/2006	Storm Water Hotline	713 E 1st Street	Building in the City right of way.	Resident stated that he was building 2 play houses. There was saw dust in the gutter and on the street. Resident was told to remove lumber and clean gutter and street.
26	8/31/2006	Public	2605 Highland	Check site to make sure it is in compliance.	The inspector phoned 9-5-06 with recommendations to keep dumpster lid closed and provide tray (S/C) for port-a-potty, and clean all residue from ground.
27	9/5/2006	Storm Water Hotline	2221 E 16th Street	No BMPs.	Contractor called and will implement BMPs prior to conducting work. He will call for re-inspection when BMPs have been implemented.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
28	9/5/2006	Storm Water Hotline		Vehicle washing on the street.	The inspector explained NPDES in regards to vehicle washing for residential zones. Individual agreed to wash van in his private lot without having any discharge of soapy water. Verbal warning only.
29	9/6/2006	Storm Water Hotline	1215 Palmer Way	No Permit - dirt in city right of way.	Applicant came to Engineering counter. The inspector explained NPDES requirements for construction BMPs. Applicant purchased BMP manual to use as a guide to install BMPs, especially for soil containment and concrete washout. Permit withheld until BMPs are implemented.
30	9/6/2006	City Staff	2424 18th St.	Power washing house.	Power washing house blasting paint chips to ground. No discharge observed. The inspector explained NPDES and BMPs to prevent any discharge from leaving property.
31	9/7/2006	Storm Water Hotline	1710 Lanoitan	Hose down sidewalks.	The inspector talked with resident. The inspector explained NPDES and left flyers.
32	9/7/2006	Public	1619 Morning Breeze	Uncontained soil above inlet.	The inspector observed the landscape yard. The soil was not loose, just without ground cover.
33	9/11/2006	Storm Water Hotline	Civic Center Drive and Wilson Ave.	Truck hit and sheared off fire hydrant.	A truck hit and sheared off a fire hydrant. NCPD and Sweetwater Authority were notified. Sweetwater Authority shut off the water flow approximately 15-20 minutes after flow started. Approximately 121,100 gallons of water was discharged to the storm drain conveyance system. Verbal notification to RWQCB on 9-11-06. Written notification on 9-11-06.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
34	9/13/2006	Storm Water Hotline	1215 Palmer Way	Construction site - no BMPs and stockpiles of soil in the street.	The property owner came into Eng. to obtain a permit after beginning work. Site inspection found that a permit was required and that there were no BMPs implemented. The inspector issued a verbal stop work order until all BMPs were implemented and a permit is issued. Later inspection found BMPs in place and stockpiles in right of way removed.
35	9/13/2006	Storm Water Hotline	1512 Coolidge Ave.	Motor home leaking sewage.	Inspector observed an individual hosing down the street. Individual reported that the plumbing/pipe for the holding tank on his motor home broke loose when he was moving the motor home, discharging approximately 15 gallons of sewage to the street. The inspector stopped him from hosing down the street and immediately called the city sewer crew to conduct clean-up. Several individuals helped to contain spill until sewer crew arrived. The area was sanitized/deodorized and vacuumed up. The inlet at the corner of 15th and Wilson was cleaned. The street sweeper was called in on O/T to provide additional cleaning of the area.
36	9/13/2006	Storm Water Hotline	1507 Coolidge	Hosing down street.	While on site of a sewer spill in the street the resident at this address started hosing down the street. The inspector explained NPDES and let her know that it was against City orders to hose down street. The inspector gave a verbal warning and the problem is resolved.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
37	9/14/2006	Storm Water Hotline	1535 Tidelands	Power washing roof	The inspector explained NPDES and BMPs. The inspector notified foreman that all roofing residue must be cleaned from parking lot. The inspector did not witness any power washing. Required contractor to provide S/C for liquid in drums stored within 5ft of inlet or move to inside location.
38	9/18/2006	City Staff	3100 Block of Hoover		Homeless camp found in the storm water conveyance system (Sweetwater Marsh). Firefighters used approximately 5,000 gallons of water to extinguish a fire. Sewer crew was called to clean inlet basins on both sides of the street.Street crew was called to clean rubbish from area. Received approved to clean from state RWCB and Army Corps of Engineers.
39	9/18/2006	Storm Water Hotline	1329 Highland Ave.	Saw cutting concrete, waste entering inlet.	Waste from saw cutting concrete to install new gas line entered nearby inlet. No BMPs observed. Sewer crew was called to clean street and inlet.
40	9/19/2006	City Staff	221 W. 30th Street	Saw cutting on sidewalk with discharge to the gutter.	Discharge reached only gutter and not inlet, the nearest inlet is >1000 ft away. Verbal warning given, and company immediately began vacuuming the water.
41	9/19/2006	City Staff	1526 18th Street	Sewer coming out of clean out.	A ~ 3 in x 3 in moist area around clean out was observed but no discharge was noted.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
42	9/19/2006	City Staff	1610 E 8th (Parking lot)	Discharge of water to inlet.	There is a broken sprinkler leaking water to sidewalk gutter and inlet at the corner of 8th and Palm. Trash, landscape debris, and food in area. Corrective action sent.Remove excessive landscape debris and litter in parking lot.Remove stump grindings or provide erosion control in planting beds.Remove food products from planting beds.Repair and adjust irrigation system to prevent run-off into inlet at the corner of 8th street and Palm Ave. Follow up: parking lot cleaned of landscaping debris.Stump grindings and food particles removed.
43	9/19/2006	City Staff	835 Palm	Water leaving lot.	Employee was hosing down parking lot. Verbal warning and educational material given to employee.
44	9/20/2006	Storm Water Hotline	Site 1A (Division) Dry Weather	Significant trash.	The inspector called sewer crew to clean or refer to S.D. if under San Diego jurisdiction.
45	9/20/2006	Storm Water Hotline	14th & Grove	Decomposing trash.	The inspector called sewer crew to be cleaned.
46	9/20/2006	Storm Water Hotline	I54 and N 2nd/Edgemere	Trash dumped on side of road.	The inspector called street crew to be removed.
47	9/21/2006	Storm Water Hotline	Vacant lot on plaza, Parcel #558-0302500	Trash on lot.	There are several deteriorated bags with trash. NOV issued. Re-inspection on 10/16/2006. Trash was cleaned from lot.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
48	9/21/2006	City Staff	3116 Plaza Blvd,	Fire in Storm drain.	There was a fire along the bank of mainly concrete channel. Site was visited and no trash was noted in the area. Army Corp of Eng. Was contacted to ask if the City could remove vegetation from the bank. Authorization to remove vegetation was not given, no further action needed.
49	10/2/2006	Storm Water Hotline	Slope of I-54 at Hoover Ave and 32 Nol St	Dust (clearing and Grubbing the slope of I-54 at Hoover Ave and 32 Nol St).	The inspector spoke to contractor whom agreed to install sprinkler and shrubs on the slope of I-54. Not a NPDES issue, issue resolved.
50	10/5/2006	Storm Water Hotline	18th St. and D Ave.	White liquid coming from address and flowing into gutter.	The inspector saw white liquid along the gutter. Upon re-inspection on 10/9/2006, white liquid was gone. Inspector educated janitor about NPDES and proper BMPs.
51	10/10/2006	Storm Water Hotline	1526 E 18th St.	Pieces of old stucco scattered along alley.	The inspector went to the site and asked owner to clean the scattered stucco. Follow-up on 10/11/06, debris removed.
52	10/18/2006	Storm Water Hotline	3815 Holleyhock	Illegal fill dirt on slope.	Owner removed fill dirt. Problem resolved.
53	10/18/2006	Storm Water Hotline	2336 E 4th St	Illegal grading.	The owner was advised to implement erosion control along the fence on the east side of property. Problem resolved 10/18/06, owner to pull permit.
54	10/18/2006	Storm Water Hotline	1441 Manchester, Permit 06020011	Soil in catch basin.	Dirt was cleared by contractor when the inspector arrived on site. Dirt was contained in basin prior to being cleaned.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
55	10/18/2006	Storm Water Hotline	1140 E 7th St.	Garbage disposal plumbed to outside. Resident hoses off concrete area.	Inspection revealed several washing machines were plumbed to outside. Makeshift drain discharging sediment to area of inlet. Stockpile of soil. Two inlets dirty with food particles and sediment. Container of waste oil on slope. Several boxes and piles of landscape debris. The owner was required to pull permit within 24 hours to properly plumb kitchen sink. Owner complied. An NOV was issued on 10/23/06, along with an Administrative Citation. All issues have been resolved and an action plan for the NOV was submitted.
56	10/18/2006	Follow-up	1610 B 8th St.	Discharge of water to inlet.	Follow-up to investigation from 9/19, earlier issued observed that had previously been resolved had not recurred. No issues noted.
57	10/30/2006	Storm Water Hotline	1320 Highland Ave.	Hosing down concrete	Employees were cleaning concrete in back of store using concrete cleaner. They hosed down the area washing the waste water into nearby outlet. NOV and administrative citation issued on 10/30/2006. All issued resolved.
58	10/30/2006	Storm Water Hotline	2429 Prospect St.	Stockpiles of soil on property covering storm drain "outlet" in the basement.	Stockpiles were not from or on the construction site. The stockpiles were dumped on a vacant lot. Case referred to Engineering Department to have owner remove fill dirt from property. Visual follow up inspection found fill dirt removed.
59	11/1/2006	Storm Water Hotline	1700 Block of Roosevelt	Two trailers with oil tanks on public right of way	County of SD hazmat responded and wrote an NOV Tanks picked up on 11/1/06. PD towed trailers. Problem resolved.
60	11/1/2006	Storm Water Hotline	2nd Edgemere (site 32)	Approximately 5 truck loads of trash dumped.	Public Works cleaned area.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
61	11/1/2006	Storm Water Hotline	18th and D	Vehicle leaking oil on street.	Vehicle had recently been involved in an auto accident. The owner said he would have the vehicle moved. Sewer Department was called to clean oil from gutter. Upon re-inspection the area was clean and the vehicle had been moved.
62	11/1/2006	Storm Water Hotline	105 E 18th Street	Several containers of waste oil next to Paradise Creek.	The inspector observed landscape debris on property and several broken gravel bags. Administrative citation issued, debris was cleaned by property manager while inspector was on site.
63	11/1/2006	Storm Water Hotline	2130 Roosevelt Street	Black liquid coming from property to alley.	Business activities include detailing vehicles. At initial visit, no black liquid was observed draining to alley. 11-6-06 No black liquid was observed, but ground was damp in alley (likely from small amount of overspray/runoff from washing) at 9:20 AM. 11-9-06 No black liquid was observed, but inspector observed small amount of discharge to alley from washing. Discharge was stopped and water did not enter the storm drain system. A new owner had taken over since the previous days' visits, so that owner was given verbal instruction on BMPs and a Correction Action letter to confirm understanding of proper BMPs.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
64	11/2/2006	Storm Water Hotline	625 S Harbison Avenue	Water pumping to street.	Pipe to the toilet was broken. The owner was pumping sewage from under the house to the gutter. The water flowed for approximately 5-6 hours total through a garden hose. D-Max Engineering, Inc. was called to test the water. The Sewer Department was called to clean spill. The Building Department was called to check safety of residents. The House was red tagged unsafe to occupy. Administrative citation issued on 11/2/2006. NOV issued on 11/6/06. See complaint # 67 for follow up.
65	11/2/2006	Storm Water Hotline	National City Blvd & 3rd St	Water shooting up from ground.	A vehicle ran over a private water line. Sewage Water Authority was on site and shut water off. Owner repaired the water line.
66	11/2/2006	Storm Water Hotline	1700 Block of Roosevelt		Follow up to complaint # 59. Tanks were removed. County of San Diego Hazmat responded and wrote NOV.
67	11/6/2006	Storm Water Hotline	625 S Harbison Avenue		This was a follow up to complaint #64. Landscape debris, trash, and food have been removed from property. Hose and pump were under house with one end of hose to front lawn. Inspector told property manager to removed hose and pump. Storm water issues corrected, building dept continues with open case.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
68	11/6/2006	Storm Water Hotline	2200-2300 VanNess	Mechanic working on cars, spilling oil in the street.	White 2 door Nissan was parked on the west side of VanNess (2300) with significant oil on the ground. No one was at vehicle when inspector arrived. Owner came to site and agreed to clean oil and move vehicle to private property.
69	11/6/2006	Storm Water Hotline	1215 Harbison	Non-operational vehicles leaking oil on street.	There were 2 vehicles without plates. One was leaking oil and had airbags deployed. The other vehicle was not registered. The inspector referred to dispatch for traffic division to handle.
70	11/7/2006	Storm Water Hotline	1345 Highland Ave	No erosion and sediment control BMP.	The inspector called the contractor. The contractor agreed to implement BMP that day. 11/7/06 corrective action letter sent. 11/8/06 follow-up - BMPs in place, problem resolved
71	11/8/2006	Storm Water Hotline	1417 E 18th Street	Sewage draining to street between garage and apartment next door.	There was no discharge at time of inspection, however, there was an illegal connection on plumbing. The inspector referred to the Building Department.
72	11/9/2006	Storm Water Hotline	1525 McKinley	Oil spill in gutter.	There was oil in the gutter for about 25 feet. It was contained by landscape debris. The inspector called sewer crew to clean. Sewer crew cleaned, problem resolved.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
73	11/9/2006	Storm Water Hotline	2145 Wilson	Auto detailing with discharge.	New unlicensed business conducting auto detailing with discharge of waste water through surface to curb drain. Discharge was stopped after inspector arrived. The inspector required business to obtain business license and properly implement BMPs, and a citation was issued.
74	11/14/2006	Storm Water Hotline	303 Highland	Dead birds and grease on roof.	The inspector did not go on roof to inspect. There were no down spouts or observed discharge from roof. City consultant and contractor to clean roof prior to construction of new façade (CDC project). Problem resolved
75	11/14/2006	Storm Water Hotline	3300 Block of National City Blvd,	Road work being conducted without inlet protection.	Contractor did not have inlet protected. While inspector was on site they placed gravel bags at inlet.
76	11/16/2006	Storm Water Hotline	2200 Cleveland	2 inch pipe broke.	Contractor called to report discharge of water from 2 inch water supply line. Water was contained and disposed of.
77	11/21/2006	Storm Water Hotline	127 W 12th ST	Sewage coming from property	Upon inspection of property, it is determined that grey water is coming from 2 different units on property. The ground was saturated with several inches of water ponding above ground and running onto property at 1127 Hoover Ave. One unit appears to be an illegal dwelling. Housing Inspector was contacted to do inspection. Owner called City and said she would clean the area. Public Works was called to have main checked and flushed. Building has open case for violations.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
78	11/22/2006	Storm Water Hotline	127 W 12th ST	Sewage reportedly discharging to property.	Discharge contained on private property and resolved. No discharge was observed upon follow-up inspection.
79	11/30/2006	Storm Water Hotline	3815 Hollyhock Lane	Report of construction without permits.	Construction of retaining wall without permit was observed. No discharge or other major storm water issues noted. Responsible party was informed of the need to obtain proper permits, and the City also mailed a letter explaining the BMPs that are required for all construction permits.
80	12/4/2006	Storm Water Hotline	800 Block of Civic Center DR	Oil spill at the corner of Civic Center and Cleveland Avenue due to machinery being moved.	At approximately 10:20 a.m. there was an oil spill. There is a storm drain inlet approximately 20 feet from the spill. While lifting machinery, residual oil (estimated to be 5 gallons) in the equipment spilled onto the sidewalk, driveway, and gutter. The spill was immediately contained using absorbent and absorbent rolls. No oil or absorbent reached the inlet. Company hired another company to power wash the area after the absorbent was removed. All was re-claimed and disposed of by washing company.
81	12/7/2006	Storm Water Hotline	3102 E. 16th ST	Discharge of water hose used in dust central.	Hose was leaking or defective causing discharge into inlet approximately 100 feet down hill from site. The inspector observed some sediment and sidewalk. The inspector spoke with contractor and owner regarding NPDES and required BMPs. Administrative Citation was issued. BMPs implemented (new hose).

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
82	12/12/2006	Storm Water Hotline	3131 National City Blvd	Water from vehicle washing going to ditch then discharging off site.	Company has bermed area for vehicle washing, directing water to a brow ditch that leads to an underside-walk drain that discharged to the gutter. Inspector observed discharge of water from vehicle washing on used vehicle lot. The discharge was stopped while the inspector was on site, and a Notice of Violation and Administrative Citation were issued on 12/13/06.
83	12/18/2006	Storm Water Hotline	1213 E Avenue	A vehicle hit a fire hydrant.	A vehicle hit and sheared off the fire hydrant. The water flowed for approximately 1 hour discharging 338,160 gallons of water. There is an inlet on the northwest corner. Sweetwater Authority responded and secured the flow. Fire hydrant repair began on 12-18-06. Sewer crew was called to clean inlet. RWQCB was notified verbally on 12-18-06.
84	12/20/2006	Storm Water Hotline	2315 S. Lanoitan	Reported water discharge	The inspector could not locate flowing water or discharge and site address.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
85	1/10/2007	Storm Water Hotline	19th and Haffley	Fire hydrant sheared off.	Vehicle hit and sheared off fire hydrant. There is an inlet approximately 300 ft from hydrant (on 19th St) where water entered MS4s. Sweetwater Authority responded to the site and secured the flow.
86	1/17/2007	Storm Water Hotline	835 Bucky Lane	Auto repairs being conducted. Emptied radiator to gutter	The gutter was observed to be dry. There were no stains in front of address. Water was observed in the gutter at the end of the street.
87	1/17/2007	Storm Water Hotline	Cypress Glen	Discharge of water/sediment going down E. 32nd St - No BMPs at inlet.	The inspector went to the site to investigate, then called contractor, who stated that he would immediately implement BMPs or stop work. Provided with verbal warning, problem resolved.
88	1/17/2007	Storm Water Hotline	833 Angelo Dr	Dumping oil down storm drain and auto repairs conducted.	Oil traveled to 1001 Angelo Dr where landscape debris blocked and contained oil. Vehicles in driveway and garage unlicensed and appear to be non-operational. Driveway and sidewalk stained with what appears to be waste oil from a vehicle. Administrative Citation issued. Responsible party cleaned spill.
89	1/17/2007	Storm Water Hotline	3030 Plaza Bonita Rd	Tracking on Street.	The inspector went to the site then called contract to have tracking cleaned. Contractor reported sweeper would be on site later that day to clean area. Verbal warning, problem resolved.
90	1/24/2007	Storm Water Hotline	327 W. 11th St.	Vehicle washing	Two trucks were being washed on the sidewalk/street. Admin citation issued, but voided after violator agreed to and cleaned all water and debris from gutter.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
91	1/24/2007	Storm Water Hotline	1420 4th St	Possible storm water issues related to multiple vehicles on site.	The inspector checked site and spoke with owner. There is an oil spill in driveway and paint containers without secondary containment. A corrective action letter was issued on 1/25/07 Oil spill was cleaned up the same day.
92	1/24/2007	Storm Water Hotline	1302 E 1st	Erosion problem. Auto repair being conducted and possible oil discharging.	Owner agreed to clean junk from property, properly dispose of waste oil and prevent sediment around rose from discharging from property. A corrective action letter was issued on 1/25/2007.
93	1/24/2007	Storm Water Hotline	340 W 11th St.	Dumping engine oil on ground. No business license.	Observed car batteries being stored on the ground. Full inspection conducted. NOV issued. Batteries removed by time of follow up inspection.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
94	1/24/2007	Storm Water Hotline	1318 E 4th St	Check on possible storm water issues related to illegal construction/grading.	In the alley behind residence there was lots of litter landscape debris, tires, soil stockpile, etc.The inspector spoke with owner regarding clean-up.Within 24 hours all in entire alley loose trash must be bagged.Soil pile must be contained prior to next rain event.A notice of violation was issued 1/25/2007 Follow-Up conducted on 1/29/2007.All loose litter was bagged and placed on property.The inspector spoke with owner regarding immediately implementing BMPs for soil stockpile.All other debris must be removed and property disposed of by Feb 7, 2007. Second follow-up conducted on 4/19/2007. All loose trash in alley had been picked up and bagged within 24 hours and placed within her property. Landscape debris, roofing material, stockpiles, etc have been removed. Loose soil is still covered with tarp to prevent erosion.Most of the issue at the site were code enforcement issues, but has been addressed with Storm Water and Grading ordinances. There is no building permit or retaining wall permit for this property. Each department (Building and Engineering) will deal with their own items/permit.
95	1/24/2007	Storm Water Hotline	232 North Ave	Discharge of water.	The violator said he was cleaning the garage and hosing down floor and driveway. The inspector explained NPDES and gave the violator a calendar, magnet, and brochure.

PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
96	1/25/2007	Storm Water Hotline	2139 E 9th St	Cleaning engine with discharge going to gutter.	Owner/tenant said that he was working on the power steering unit on a truck when it sprang a leak. There are several oil spills on the side of the house and several in front on the driveway, included a long stain starting at the driveway and continuing down the street. A used battery was also observed on the ground uncovered. Admin citation and NOV were issued 1/29/2007 for illicit discharge of sediment and waste oil conducting auto repairs without implementing BMPs.
97	1/29/2007	Storm Water Hotline	203 Laurel Avenue	Over watering.	Corrective action letter mailed.
98	1/29/2007	Storm Water Hotline	1236 E 2nd St	Hosing down driveway.	Violator agreed to clean sidewalk and gutter. The inspector explained NPDES and gave the violator a flyer, calendar, and magnet.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
99	1/31/2007	Storm Water Hotline	410 W 30th St	Improper storage	Full inspection conducted. The following was observed: 1. No BMPs implemented for erosion and sediment control along open channel bank (south side of property) and along fence (west side of property). 2. Used battery uncovered and on the ground on the south side of property.3. Stockpile of soil without Best Management Practices (BMPs) implemented.4. Stockpile of asphalt waste on site.5. Concrete and asphalt waste and bricks along bank of open channel.6. Rusting material uncovered (rebar & stakes).7. Gas cans leaking and not protected from rainfall. Follow up inspection: Erosion control implemented. Stockpiles had been removed and used batteries and rusty materials were no longer observed outside.
100	1/31/2007	Storm Water Hotline	W 12th and Wilson	Illegal dumping of waste oil.	Inspector contacted resident supposedly responsible for the illegal dumping. They denied the allegation. Waste, oil, litter, TV, etc was picked up by the street division and contaminated rain water was removed by the sewer crew.. Parking Enforcement went to the site and said that they would return to issue tickets for the trucks parked on the sidewalk and double parked in the street. No further action will be taken on this site.
101	1/31/2007	Storm Water Hotline	340 W 30th St	Green fluid in street.	Absorbent rolls/pads were used to clean fluid. Pads were taken to PW for proper disposal.
102	2/1/2007	Storm Water Hotline	3000 Block of Hoover	Soil dumped in street at inlet.	Street division removed soil from street.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
103	2/5/2007	Storm Water Hotline	West side NC National City	Church holding on going car washes	After several visits to site, inspector was unable to find evidence that car washing is being conducted.
104	2/7/2007	Storm Water Hotline	2503 Highland	Pumping water to storm drain roof drains connected to sewer system.	Inspection found roof drains were connected to storm drain. The owner removed drains.
105	2/21/2007	Storm Water Hotline	Lot above 925 Plaza	Discharge of sediment to storm drains	No storm water issue.
106	2/22/2007	Storm Water Hotline	19th St and I 5	Sandy substance on sidewalk on 19th St under freeway.	Referred to Street Department. Returned to site 2-26-07 with street supervisor. All "blasting" sand was determined to be coming from nearby construction site. Contractor was notified to clean area.
107	2/22/2007	Storm Water Hotline	2525 Highland Ave	Open containers of oil.	Owner notified to remove and provide receipt for proper disposal.Proof of disposal provided 2-27-07.
108	2/26/2007	Storm Water Hotline	424 E Division	Sewage flowing to ground. Surface to curb drain near by but clogged.	Dumpster lid open and trash on ground in dumpster enclosure, several containers of paint and water stored behind building. Discharged sewer from an open line on the west side of building. Surface drain clogged with sediment. Corrective action letter was issued 2/26/2007. Open pipe was capped, trash was picked up, and paint cans were removed by the next day.
109	2/28/2007	Storm Water Hotline	3211 Alta Drive	Uncontained soil stockpiles and waste oil and filters on property.	The owner properly disposed of oil and filters. Stockpiles were covered and street was swept.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
110	3/1/2007	Storm Water Hotline	1900 National City Blvd.	Vehicle washing.	Inspector went to the site and found no washing. The ground was dry (sides, streets, front of property, back of property, and on Roosevelt). Inspector could not find any sign of a violation.
111	3/15/2007	Storm Water Hotline	3rd and National City Blvd.	Trash accumulates and sometimes blocks inlet causing water to pond.	Inspector did not see any trash on corners of National City Blvd. and 3rd Street.
112	3/19/2007	Storm Water Hotline	On Street between 836 and 904 Angelo	Police car lost power steering fluid (3-16-07) leaving fluid in street. Later tow-truck drove through fluid tracking fluid down street. Street sweeper swept area today, but fluid remains on street.	Street supervisor inspected area and found small amount of fluid that could be ATF. Fluid was not liquid and there was no means that would remove stain from street.
113	3/19/2007	Storm Water Hotline	3000 NC Blvd.	Saw cutting pavement with discharge to storm drain inlet.	Discharged water and sediment to inlet on NCB. Sewer crew called to clean inlet. Contractor to clean gutter. An administrative citation was given.
114	3/20/2007	Storm Water Hotline	2200 Block of Prospect (2302 Prospect St)	Mixing concrete in the street near a storm drain inlet.	The crew was mixing concrete in wheel barrels in the street. The sand was on the asphalt and concrete mix was on a tarp. Crew cleaned street.
115	3/20/2007	Storm Water Hotline	15th & 16th St (west side) 16th East Side	Tracking of newly installed ped ramps on west side.	Contractor notified to clean tracking at all ped ramps. Streets were cleaned.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
116	3/20/2007	Storm Water Hotline	16th & Coolidge	Van/motor home leaking fluids	There was a container under the vehicle on the driver's side at the rear collecting sewage from a leaking pipe at or near the holding tanks. There was also a wet spot under the vehicle in the same area on the street and a pail with a coffee can of wet paint inside. An absorbent pad was placed on the spill next to the container to help collect liquid spills, leaks, and splashes. Called 411 to obtain phone number for R.O. No number listed.No legal means to tow vehicle.No further action taken.
117	3/28/2007	Storm Water Hotline	100 Block of Roosevelt	Man working on truck allowing oil to spill into gutter.	There was an unattended Semi-truck and dump body. There was diesel fuel leaking from the tank on the right side. Public Works responded with an absorbent. P.D. notified the fire department of the fuel spill. Vehicle owner arrived on site and attempted to stop leak. He was not successful. Vehicle was towed from public street at the owner's request. Street sweeper swept area. Fuel spill was contained to gutter (approximately 40 ft). No discharge to inlet.
118	4/3/2007	Storm Water Hotline	16th and National City Blvd	Sediment on street.	Inspector noticed there was sediment on 16th Street and National City Blvd. The sediment washed down into gutter line and storm drain inlets. Inspector requested for a crew to bag around the down stream inlets and sweep the street. Public Works cleaned sediment from inlet.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
119	4/12/2007	Storm Water Hotline	14th Street	Sewer cap open on holding tanks. Vehicle parked with 15 ft of inlet	Diplomat II motor home-holding tank cap open with stains on street. Inspector called PD to have vehicle towed. Inspector contacted owner to remove vehicle immediately. Owner complied. Sewer crew cleaned sewage from street.
120	4/12/2007	Storm Water Hotline	16th and National City Blvd	Sediment going into inlet.	Contractor did not have effective BMP around inlet.Contractor opened water main when service had not yet been shut off. Emergency pumping of hole was necessary.Contractor immediately implemented effective BMPs when advised. Notice of Violation was issued.
121	4/12/2007	Storm Water Hotline	Kimball Park, National City CA 91950	Ice cream vendor putting trash (ice cream bags, boxes, etc) and bags of urine in dumpsters.	Inspector made contact with owner. Owner was notified that it was illegal for him to dispose of trash that was generated by his business activities. Area was re-inspected one week later, no problems found.
122	4/16/2007	Storm Water Hotline	1702 C St	Working on car in alley.	Checked alley from 16th to 18th and inspector did not locate problem.
123	4/18/2007	Storm Water Hotline	Alley East Coolidge between 16th & 17th St	Approximately 5 gallons of oil in alley.	Inspector called street supervisor. The street supervisor assigned clean up to his crew. The complaint has been resolved and no further action is needed.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
124	4/19/2007	Storm Water Hotline	1343 E 5th St	Landscape debris, drums, long term storage of vehicles, loose soil piles	Inspector observed relatively small amounts of uncontained soil and landscape debris as well as one 55-gallon drum, all on private property. No discharge or other major threats to storm water quality were observed. A Corrective Action letter was sent requiring the resident to clean up materials in the yard.
125	4/23/2007	Storm Water Hotline	16th and Roosevelt	Housing of equipment	Employee was hosing off equipment resulting in a discharge to the gutter on 16th St. There were gravel bags at driveway and at inlet on the corner of 16th and National City Blvd (construction site BMPs). Inspector gave verbal notification (warning) for discharge. Follow-up inspections conducted, problem resolved.
126	4/26/2007	Storm Water Hotline	130 W. 17th St	Business using residential trash cans to dispose of waste oil.	No waste oil found. There was some cardboard that had oil stains. Business owner cleaned up area and will order additional cans or recycling bin.
127	4/30/2007	Storm Water Hotline	4th and Laurel	Check inlets for debris.	The inspector did not find any debris on site.
128	4/30/2007	Storm Water Hotline	3844 Cherry Blossom St	Washing machine discharge	The inspector did not locate any discharge. The inspector referred to code enforcement.
129	5/1/2007	Storm Water Hotline	1000 Block of National City Blvd	Fire damage	PW Crew cleaned parking lot of burned furniture, lumber, ash, etc caused by fire.
130	5/3/2007	Storm Water Hotline	4th and F	Sweeper's hydraulic hose broke.	Street crew cleaned fluid from street. Mechanic repaired hose.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
131	5/7/2007	Storm Water Hotline	1243 National City Blvd	Homeless camp and toilet paper/stool in park area of Civic Center.	Public Works cleaned area.
132	5/14/2007	Storm Water Hotline	316 W 14th St	Washing machine discharging to alley then to street (W 14th St).	There was a discharge of grey water to the alley and an old battery inside yard. Owner stated that the drain for the washing machine was plugged, and agreed to not use washing machine unless waste water goes to sewer system.
133	5/15/2007	Storm Water Hotline	Bay Marina and Tidelands	Diesel fuel going into storm drain.	Driver was sleeping in his vehicle and accidentally hit the pump to the on position for the auxiliary diesel tank. Diesel overflowed to the gutter. There are no nearby inlets. Fire department contained spill until street division arrived to clean gutter of diesel fuel.
134	5/22/2007	Storm Water Hotline	340 W. 18th St	Oil spill at Paradise Creek	No oil spill was found in Paradise Creek, but some drips from a transmission were found along a walkway in Paradise Creek Educational Park. The son of the owner of a neighboring business said that a transmission was stolen from the back of a pick up truck (used as storage at the business) and taken to Paradise Creek. No transmission was found, but the truck and materials stored in it were removed from the business at the direction of the inspector.
135	5/23/2007	Storm Water Hotline	Kimball Park National City CA 91950	Washing cars in the park.	Owner was washing a car in the parking lot of Kimball Park. No water or soap reached inlet. Owner rinsed pavement and vacuumed water. Both parties were invited to automotive workshop and given NPDES flyers.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
136	6/11/2007	Storm Water Hotline	1040 Hoover Avenue	Hosing down sidewalk	Water from garden hose was traveling down 11th and down Roosevelt. Water did not make it to the inlet of time of inspection. Violators cleaned debris from gutter. NPDES was explained to violators and property owner. Inspector explained that irrigation is exempt from permit requirements, but hosing down sidewalks and over-watering was a violation. They assured the inspector that this won't happen in the future. Corrective Action Letter: 6/11/07
137	6/11/2007	Storm Water Hotline	1100 Highland Avenue	Water and sediment discharging to Highland Avenue.	Inspected site and found litter in most landscape areas and a broken irrigation pipe. Water from pipe was discharging water and litter to an inlet on Highland Avenue. Spoke with manager who said that the pipe has been broken for about 3 weeks. Initially, a plumber evaluated leak and supposedly secured water. A landscaper was scheduled to repair leak. Manager cleaned litter. Sewer crew cleaned inlet on Highland Avenue. NOV and Administrative Citation issued.
138	6/12/2007	Storm Water Hotline	545 Rachel Ave	Construction site without BMPs	There was sediment on the sidewalk and in the gutter and no BMPs in place for erosion and sediment control. Owner agreed to implement BMPs by tomorrow. Sidewalk and gutter was cleaned while inspector was on site. Stop work order was issued by the building department because permits had not been obtained. Problem Resolved.

TABLE 8.5 (CONTINUED)
PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)

#	Date	Origin of Complaint	Location	Violation or Complaint	Investigation Summary
139	6/19/2007	Storm Water Hotline	3618 Cherry Blossom St	Drain pipes coming out of back fence adjacent to Paradise Creek.	Inspector received several complaints in the past regarding this problem. Owner was verbally notified to disconnect drainpipes. On a recent inspection, inspector was unable to find pipes. While on an unrelated inspection in the area, the pipes were located. Notice of Violation issued 6/21/07.
140	6/20/2007	Storm Water Hotline	1026 E 8th St	Fixing sewer lateral.	Cutting the sidewalk to repair the sewer lateral. While cutting, the owner vacuumed water. No discharge to storm drain observed.
141	6/27/2007	Storm Water Hotline	1945 Orange Ave	Resident cut bushes and put debris in brow ditch going to storm drain.	Inspector spoke with the owner and explained NPDES. Park division cleaned debris.
142	6/27/2007	Storm Water Hotline	539 20th St	Piles of landscape debris in right of way.	There were grass clippings in the right of way. Inspector spoke with tenant who agreed to remove all landscape debris by Monday, July 2, 2007. Drive by re-inspection conducted, problem resolved.
143	6/29/2007	Storm Water Hotline	E Plaza Blvd	Traffic accident involving tanker truck. Approximately 120,000 gallons water, 10 gallons foam, and small quantity of unleaded fuel discharged to Paradise Creek.	Inspector called Public Works crew. Implemented BMPs (PW crew and private environmental company). Inspector gave courtesy notification to RWQCB. Present: S.D. County Hazmat, NRC Environment Services, NC PD NC Fire, County Environment Health

9 EDUCATION

The City continues to implement an extensive storm water education program to target individuals in the City and encourage storm water awareness and the implementation of pollution prevention measures and BMPs. By increasing public awareness and encouraging a change in both the attitude and the behavior of the general public and the regulated community, the City may reduce or eliminate storm water pollution caused by common daily activities. The City's program aims to increase the knowledge of City personnel, the regulated community, and the general public regarding the impacts of urban runoff and BMPs that can be implemented for certain activities to mitigate these impacts. The City's comprehensive storm water education program includes educational materials and opportunities to its personnel, industrial and commercial businesses, construction site owners and operators, and residents of the City.

EDUCATIONAL MATERIALS AVAILABLE TO THE PUBLIC AND CITY STAFF

National City is a growing community that is diverse in culture. The demographics of the City are unique, and to address various communities' needs, the City takes pride in servicing its residents by presenting some of its brochures in both English and Spanish. It is very important that educational material is not only available but also able to be understood by all residents. Therefore many of the City's educational materials are bilingual. The following brochures have been prepared and were distributed in the City during 2006/2007:

"Everything that flows down into a storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" Brochure

The City continues to distribute the "Everything that flows down into a storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochure (Attachment 3.2). The information is printed in English on one side of the brochure and Spanish on the other. The brochure educates residents and business owners on the difference between the storm drain and the sewer system, pollutants, pollution prevention such as recycling, proper landscaping practices, Municipal Code Chapter 14.22 Prohibitions, and the storm drain hotline number to contact with questions or to report IC/IDs.

The NPDES Storm Water Compliance Inspector continues to provide copies of this brochure during industrial and commercial inspections and to businesses and residences during public-complaint response investigations. Additionally, a copy of the brochure was provided in any storm water correspondence (corrective action letters, NOVs, etc.). This brochure may be found at various locations throughout the City such as the Chamber of Commerce, the public library, City buses, the public recreational centers, and the storm water display area at the City's Engineering Department.

"Put Toxic Waste In Its Place" Brochure

The City continued to distribute the "Put Toxic Waste In Its Place" brochure and accompanying notepad (Attachment 4.2). The brochure consists of 17 full-color pages featuring a tough-looking crowd of household hazardous waste caricatures. The brochure defines and gives examples of household hazardous waste; explains the consequences of improper storage and disposal of waste; describes the benefits of proper household hazardous waste controls; gives examples on the reduction household hazardous waste in

the home; describes proper disposal methods; provides in-depth sections regarding electronic waste, paint, and used oil; and gives contact information for local communities. The notepad has the same characters on it and says "put toxic waste in its place." The notepad also provides a website and phone number to use to gather information regarding hazardous waste disposal. During this reporting period, "Put Toxic Waste In Its Place" continued to be provided at workshops.

Integrated Pest Management (IPM) Cards

The City continued to distribute IMP cards (Attachment 5.1) to individuals in the City. The IPM cards were developed as part of a regional effort to combat pesticide pollution and encourage the use of IPM techniques. The packet of seven bound cards includes: "Gardening with Good Bugs," "Safe Use and Disposal of Pesticides," "Spiders," "Termites," "Lawn Insects," "Snails and Slugs," and "Head Lice."

"Keep the Cycle Spinning…" Brochure

The "Keep the Cycle Spinning" brochure (Attachment 9.1) was produced in English and Spanish to inform residents on recycling tips and provides information about how/where to recycle specific items. The brochure also encourages individuals to buy products made from recycled goods.

Storm Water Hotline Cards

The Storm Water Hotline Card (Attachment 3.3) was designed to inform residents and business owners of the City's storm water hotline. The City continues to provide business cards with the hotline number at the City's Engineering Department Counter. They are also distributed during inspections of construction sites and commercial and industrial facilities, and the City attaches the cards to most of its correspondences with residents, businesses, and developers.

Miscellaneous Educational Items and Sources of Information

The City distributed HHW refrigerator magnets (Attachment 4.3), which provides HHW disposal information for residents of National City and the HHW telephone number.

The City of National City's website provides information regarding the City's storm water program, pollution prevention measures, and phone numbers. The website address is http://www.ci.national-city.ca.us, with information under the Public Works/Engineering Department link.

MUNICIPAL STAFF EDUCATION AND TRAINING

Over the past year, the City of National City provided several training seminars to educate staff on both general and specific topics relating to the protection of water quality. A few City staff members also received additional training through outside educational programs. The following is a list of these educational activities, and Attachment 2.1 provides the sign in sheets from municipal training sessions:

- 2007 Calendars – bilingual calendars were available at the City library, Chamber of Commerce, City buses, public recreation centers, and the storm water display at the Engineering Department (Attachment 2.2).
- SUSMP Training - 13 people attended this training conducted by D-MAX on August 3, 2006. A handout was provided which contained a checklist, background, definitions and flowcharts for SUSMP.

- SUSMP Coordination Meetings - The City had regular SUSMP coordination meetings for Building, Planning, Engineering, and CDC departments. The meetings were to clarify departmental responsibilities. A SUSMP applicability checklist and flowchart were developed.
- Fire Department Training – The City's consultant, D-MAX, gave a presentation to 34 staff over three days from June 19, 2007 to June 21, 2007. The presentation included topics on urban runoff, storm water and sanitary sewer systems, City ordinances, BMPs, and reporting procedures. The presentation also included information regarding spill containment, since fire department personnel are often the first on scene in the event of a spill.
- Irrigation Management Course – Eight members of the City's Landscape Maintenance Personnel attended this six-class course, which focused on irrigation system design, troubleshooting and plant identification, among other topics. The course was held on April 6, 13, 20, and 27 2007 at the San Diego County Library Sunnyside Branch in Bonita.
- Public Works NPDES Training – 25 participants attended this workshop, which was held on June 7, 2007. The presentation included a background to NPDES, urban runoff, MS4s, and BMP requirements. Participants were provided with a Storm Drain Inlet Protection handout. A multiple-choice NPDES Knowledge/Awareness Assessment Test was administered to City Public Works employees before and after training sessions. By completing this test, the effectiveness of the workshops could be analyzed.

INDUSTRIAL/COMMERCIAL EDUCATION & TRAINING

The following list describes training for industrial or commercial businesses that the City of National City has provided or participated in during this reporting period. Attachment 3.4 provides the sign-in sheets from industrial and commercial training sessions.

- City industrial business management staff and employees were offered a free storm water workshop in National City on April 25, 2007. Approximately ten individuals attended the workshop. The workshop was led by the City's consultant, D-MAX, and provided information about how to comply with the State of California General Industrial Permit through NOIs, SWPPPs, water monitoring programs, and employee education. The workshop also provided information on how to comply with the City's storm water ordinance through implementing BMPs and what to expect from an inspection. They were presented with a PowerPoint presentation and given an NPDES Knowledge/Awareness Assessment Test before and after the presentation. Handouts included NONA/NEC, NOI, NOT, and SWPPP paperwork.
- Automotive Workshop – 21 people attended this training given by the City on May 23, 2007. The presentation gave a background on NPDES and the San Diego watersheds, and gave information on BMPs and pollutants participants should be aware of. They were given an NPDES Knowledge/Awareness Assessment Test before and after the presentation, and on average there was an improvement in scores. "Your Shop Can Make a Difference" handouts (Attachment 4.1), "Put Toxic Waste in its Place" brochures and notepads (Attachment 4.2), "Everything that flows

down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay" handout (Attachment 3.2), and HHW informational refrigerator magnets (Attachment 4.3) were distributed.

RESIDENTIAL

The City continues to make a variety of flyers, brochures, website postings, and other educational material available to residents of the City. Dry-weather educational mailers were mailed to homes in residential areas where dry weather monitoring indicated one or more pollutants exceeded dry weather action levels. In response to the mailers, some residents called to obtain more information about the program. Specific educational outreach designed for residents of National City is discussed below.

- "Do You Go To the Beach When it is Raining?" brochures were sent out in residential trash bills.
- Eight residents attended a City-hosted storm water workshop on February 21, 2007. Attendees were presented with a PowerPoint presentation on NPDES and BMPs for residential activities. 2007 Calendars (Attachment 2.2), "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochures (Attachment 3.2), "Put Toxic Waste in its Place" brochures (Attachment 4.2), HHW refrigerator magnets (Attachment 4.3) and copies of the City's Storm Water Hotline Card (Attachment 3.3) were distributed at the workshop. A residential BMP handout was also included with the presentation and is provided in Attachment 5.3.
- The City developed a 2007 calendar that was distributed to residents and made available at City offices (Attachment 2.2). The calendar, printed in both English and Spanish, informs residents about pollutants found in San Diego Bay and neighboring waterways, and describes that pollutants such as fertilizers, pesticides, metals, paints, oil and grease, and other debris can be transported from residential areas to the ocean. A list of BMPs and various cleanup days and HHW events are given. The theme for the calendar was "Let's Keep Our Community Clean" and each month showed a photograph of a landmark in the City.

NEW DEVELOPMENT & REDEVELOPEMENT AND CONSTRUCTION EDUCATION & TRAINING

Construction site owners and developers alter the landscape and natural flow of storm water runoff and generally create increased amounts of impervious surface. During such activities, construction site owners, developers, and employees have the potential to discharge a number of different types of pollutants to receiving waters, notably sediment. The City continued to provide educational information regarding BMPs during construction site inspections, and followed up to determine if BMP deficiencies were resolved.

- The City distributed the BMP fact sheet for construction sites that was prepared during the last reporting period. This fact sheet describes specific BMPs for construction activities including soil stabilization and erosion prevention, sediment containment, materials and equipment management, non-storm water discharge control, and drainage control. This sheet was distributed with all permits issued,

including building permits; implementing the BMPs listed on the sheet is a condition of the permits.

- The City continued to hold CIP project meetings during this reporting period and discussed implementation of various BMPs. As described in Section 7 of this Annual Report, onsite pre-job conferences were held for most high priority private projects. Pre-job conferences were also held at the Engineering Department front counter for many smaller projects.
- The City held a workshop on January 22, 2006 for Construction and Development staff, which informed participants about the NPDES program, BMPs, pollutants, and inspections. An NPDES Knowledge/Awareness Assessment Test was administered to the 22 participants before and after the presentation.
- The City continued to provide applicants with the Storm Water Requirements Applicability Checklist (Attachment 6.2). Once submitted, the City reviewed the checklist and prioritized the projects. Requirements to ensure compliance with the Municipal Permit and General Construction Permit were presented to the applicant and further discussed to ensure the applicant was educated on the process.
- The City continued to make available JURMP Appendix C, containing a list of required BMPs, to proponents of construction activities when applying for a construction permit. Appendix C is also distributed during CIP project pre-construction meetings.

COUNTY OUTREACH WORKGROUP

During 2006/2007 the City continued to be an active participate in the County Outreach Workgroup, which conducts the Regional Education and Outreach Program.

IMPRESSIONS MADE

During the 2006/2007 reporting period, the City provided education primarily through inspections, distribution and mailing of educational materials, and audience-specific training sessions. Based on the number of each of these efforts, a number of impressions can be estimated. However, impressions only measure quantity, not quality. The City has endeavored to make reasonable, conservative estimates of the numbers of impressions generated by its efforts.

In order to calculate the number of impressions, each effort was multiplied by the number of impressions thought to be generated by each effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections, which usually involve more personnel and have been assumed to generate five impressions. Since the inspector interacted with the facility manager/owner and discussed storm water, these site visits were included in the number of impressions. Training sessions and clean-up events have been assumed to generate a number of impressions equal to four times the number of attendees because it is likely that the attendees will discuss the content with at least one other person after the training. Most printed educational material distributed in mass numbers are assumed to generate three impressions each, and materials distributed in person during inspections are defined as generating five impressions due to several people

likely viewing them and the content being more directly relevant. A calendar is assumed to generate significantly more impressions, as it is typically viewed on a daily basis.

Table 9.1
Impressions Generated Through Outreach Efforts

Impression type	Actual Count 2006/2007	Unit	Estimated Impressions Generated
Municipal Inspections	20	Inspections	100
Industrial Inspections	29	Inspections	87
Commercial Inspections	10	Inspections	30
Complaints Investigated	143	Investigation	429
Training Session and Activity/Event Attendees	150	Events	600
Dry Weather Monitoring Letters	1,473	Letter	4,419
Trash Courtesy Notice (Building Dept)	100	Letter	300
Residential BMP Handout	25	Handout	75
Do you Go to the Beach When it Rains	6,236	Handout	18,708
Preventing Urban Runoff Pollution	500	Brochure	1,500
Everything that flows down the storm drain….	1,000	Sheets	3,000
Put Toxic Waste in its Place Brochure and Notepad	200	Brochure	600
2007 Storm Water Program Calendar	2,000	Calendar	100,000
IPM Cards	200	Info card set	600
HHW Refrigerator Magnets	1,000	Magnets	3,000
Your Shop Can Make a Difference	5	Handout	15
Storm Water Hotline Card	250	Card	750
Keep the Cycle Spinning	80	Handout	240
Construction BMP Handouts	1,000	Handout	3,000
Total			**137,453**

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

10 PUBLIC PARTICIPATION

In addition to providing education to encourage residents to implement pollution prevention measures and BMPs, the City encourages business owners and operators and the general public to participate in public participation programs. Public participation includes, but is not limited to, clean up events, reporting observed IC/IDs, and participating in City-hosted waste disposal events. Providing the community with opportunities to participate in the implementation of the City's storm water program helps foster a sense of shared responsibility in keeping the community clean. City personnel both facilitate and participate in many of the public participation events, which also provides a platform for municipal personnel to share storm water-related information with the general public.

City employees are an integral part of the transfer of information to the general public. They are educated in storm water pollution prevention and are expected to pass on that information to the general public as often as possible. The City considers its proper management of municipal facilities and activities to be a model for the rest of the community.

The City recognizes the need to build and maintain partnerships with other agencies in preventing storm water pollution. The City actively partners with other jurisdictions and ILACSD for outreach and public participation events. The following presents the City's efforts to encourage environmental stewardship within the community during this reporting period.

PUBLIC REPORTING

The City continues to encourage City employees and the general public to report illegal storm water activities via the City's storm water hotline or the reporting section of the City's website. Continuing to operate this reporting system is one of the mechanisms the City maintains to ensure that citizens have a means to prevent storm water pollution in their neighborhoods. By utilizing the reporting system, residents of National City are able to be accountable for their actions as well as those of their neighbors. The hotline number is available on the storm water hotline card, which is given out at inspections, complaint investigations, and is made available at many public facilities. The hotline number is also available on many of the brochures distributed by the City, as well as on the City's website. This reporting period there were 143 complaints received by the City, as compared to the 190 complaints received during the last reporting period. This number of complaints is a positive reflection of the City's educational efforts. All of the 143 complaints reported during the reporting period were investigated immediately and addressed appropriately by the City's NPDES Storm Water Compliance Inspector. Section 8 of this Annual Report includes a log of the complaints and associated responses.

HAZARDOUS WASTE COLLECTION AND USED OIL RECYCLING

The City continues to encourage recycling and proper disposal of household hazardous waste. Residents have access to proper disposal facilities for household hazardous wastes at the South Bay Regional Household Hazardous Waste drop-off center, located in Chula Vista. This facility is open on Saturdays from 9:00 a.m. to 1:00 p.m. and accepts up to 15

gallons or 125 lbs of waste per household for a small co-payment. This service is also available to residents in the cities of Chula Vista, Coronado, and Imperial Beach. The "Put Toxic Waste In Its Place" brochure continues to be used by the City to inform residents of how and where to dispose of HHW.

Additionally, the City offers a low cost door-to-door collection programs for residents. Residents may dispose of used oil at seven Certified Used Oil Recycling Centers are located around the City.

HOUSEHOLD TRASH COLLECTION EVENTS

The City also continued to hold household trash collection events for large items such as furniture and appliances. The City coordinates with EDCO to host both fall and spring collection events. These events are routinely held in June and November of each year. The City encourages the public to participate by bringing their debris for proper disposal. The City advertised these events with a flyer, which was distributed during the Residential workshop held on February 21, 2007 and in residential trash bills.

PUBLIC CLEANUP EVENTS AND EDUCATIONAL ACTIVITES

The City continued to collaborate with I Love a Clean San Diego (ILACSD) for the Earth Day Creek to Bay Cleanup event.

Two neighborhood councils in the City held cleanup events, and a third cleanup event was hosted by City Hall. The Eastside Neighborhood Council and the Army National Guard painted and cleaned El Toyon Recreation Center and removed 4.8 tons of dirt/trash/debris from three surrounding neighborhoods (Granger/Northside/Old Town) on February 3-4, 2007. The Northside Neighborhood Council collected 7.2 tons of dirt/trash/debris from the Northside Neighborhood on March 31, 2007. City personnel and residents collected 2.4 tons of trash and debris over June 1-2, 2007 from the areas surrounding City Hall.

On April 21, 2007, a few days after the Paradise Creek Educational Park officially opened, an Earth Day celebration was held there. During the celebration, volunteers removed trash and sowed 300 plants.

During 2006/2007, the City worked with ILACSD to stencil storm drains in the City that remind people that the storm drains drain to local creeks and the ocean. A total of 19 volunteers stenciled 30 drains.

PUBLIC WORKSHOPS

Workshops, information, and training sessions are necessary to provide the public with the tools and knowledge to participate effectively in a storm water program. This reporting period, the City took a proactive approach to storm water education by tailoring workshops for the specific needs of particular groups in National City. Workshops were provided to residents, automotive businesses, industrial businesses, and construction and development staff.

IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the

requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

11 ASSESSMENT OF JURMP EFFECTIVENESS

The City's storm water program consists of three major pieces, listed below:

- Program Planning: Includes source characterization, BMP selection, targeted outcomes, and measures of indicators.
- Program Implementation: Includes implementation of selected measures.
- Effectiveness Assessment: Includes water quality assessment, program assessment, and integrated assessment. Effectiveness is evaluated on six increasingly complex levels.

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. Assessment of the planning and implementation steps provides important information that in turn can be used to improve future planning and implementation efforts. Data is collected from a number of different sources for the assessment. The following subsections present the City's approach and activities in assessing the effectiveness of the JURMP.

PROGRAM PLANNING

When designing and modifying proposed storm water program actions, the City obtains and reviews information from inspections, water quality monitoring, complaint records, and institutional knowledge. Inventories of potential pollutant sources have been compiled based on this data; the most recent versions for the 2006/2007 reporting period have been presented earlier in this annual report. The City has further related known priority sources to key constituents, as shown in Table 11.1. Program planning involves ensuring that the City's actions will meet the minimum activity based Municipal Permit requirements and that City resources are used to reduce pollutant discharges as effectively as possible. City programs are tailored to the specific characteristics of the community. National City, for example, includes a relatively large industrial zone on the west side of the City. A focused training session for industrial businesses was held during 2006/2007, and compliance inspections are regularly conducted. The City has also regularly reviewed the monitoring results of industrial facilities that conduct sampling and analysis as part of their Industrial Permit compliance.

BMP SELECTION

To reduce discharges of pollutants from identified sources, the City requires implementation of BMPs. More detail about BMPs required for all identified sources is provided in the City's JURMP. Key BMPs for selected priority sources are also shown in Table 11.2 later in this section. Data from inspection and monitoring programs as well as overall land use information was used in preparing the table.

The City informs target audiences of the BMP requirements through general distribution of educational materials, focused distribution of specifically targeted materials, reviews of submitted plans, and direct interaction with City staff. Direct interaction may take place during inspections, when discussing comments on submitted plans, and/or when encountering City staff in the field. Providing material to the public broadly through

mailings, the City's website, and information stations in public places allows for a broader reach. The City employs a variety of methods to educate responsible parties of their responsibilities to implement BMPs. Fact sheets, brochures, and other reference materials are available at several City buildings and are periodically mailed out to members of the community.

TARGETED OUTCOMES

At the beginning of each reporting year, the City sets targets for its program. The actual numbers recorded during the year are then compared to the targets at the end of the year to assess progress. Typically, items mandated by the Permit, such conducting the Dry Weather Monitoring Program or investigating storm water complaints, are relatively easy to measure. Conversely, goals such as significant improvements in receiving water quality are more difficult to assess.

The effectiveness assessment approach jointly developed by the Copermittees recognizes this distinction by defining six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1:	Compliance with Activity-Based Permit Requirements
Level 2:	Changes in Knowledge/Awareness
Level 3:	Behavioral Change/BMP Implementation
Level 4:	Load Reductions
Level 5:	Changes in Discharge Quality
Level 6:	Changes in Receiving Water Quality

Level 1: Compliance with Activity-Based Permit Requirements

The Municipal Permit describes the requirements that Copermittees must meet. Examples of these types of requirements include, but are not limited to, inspecting construction sites on certain minimum frequencies, conducting the Dry Weather Monitoring Program, and reporting spills to the RWQCB within given time frames.

Table 11.3 summarizes the City's efforts toward meeting activity-based Municipal Permit requirements in 2006/2007. All high priority municipal and industrial facilities were inspected at least once during this reporting period. All high priority construction sites were inspected at least weekly during the time they were active in the wet season. Medium and low priority construction sites were generally inspected twice. In certain instances, low priority construction sites were inspected only once because the project was completed in a short period of time. One hundred percent of cleanout locations in the MS4 were maintained, and City streets were swept regularly.

The City regularly inspects industrial, commercial, and construction sites, which are some of the main potential sources of pollution. The inventories of these sources are also routinely updated to ensure the City has the most accurate inventory possible and have been presented in Sections 3, 4, and 7 of this Annual Report. The City inspected most industrial and commercial businesses during the current Municipal Permit cycle. Tables 11.4 and 11.5 present watershed-based inventories of various categories of industrial and commercial facilities, respectively, along with the numbers of facilities inspected and overall number of

inspections. The number of inspections is greater than the number of inspected facilities whenever facilities have been inspected more than once.

Level 2: Changes in Knowledge/Awareness

To increase storm water-related awareness and knowledge, the City provides a variety of educational outreach materials including, but not limited to training sessions, workshops, cleanup events, and the distribution of print media such as brochures and handouts.

The City continues to maintain a storm water hotline and online reporting system by which citizens may report potential storm water violations. Over the years, a general increasing trend has been observed, although the number of complaints recorded in 2006/2007 was somewhat lower than the 2005/2006 number. The overall upward trend indicates that City staff and residents are more aware of storm water requirements and how to report observed potential problems. Data from the City's Dry Weather Monitoring Program also indicates decreases in the levels of ammonia and detergents, which are typically good indicators of IC/IDs. Information regarding the City's storm water hotline is available on the City's website and is printed on a variety of print media distributed by the City, including a storm water hotline card. Figure 11.1 shows the trend in storm water complaints over the past few years.

Figure 11.1
Number of Complaints Logged

Public works employees have tailgate meetings and are aware of effective BMP implementation. The two Municipal Yards continue to maintain SWPPPs and undergo weekly inspections. Municipal staff also work closely with the City's NPDES Storm Water Compliance Inspector and implement recommended BMPs promptly. The Parks and Recreation landscape maintenance staff have been trained in proper techniques for application of chemicals. Pesticides are no longer applied to landscaping; however, fertilizers and herbicides are used. The City minimizes the use of fertilizers and herbicides and employs appropriate BMPs for their use and containment.

Storm water knowledge quizzes were given to attendees of training sessions hosted by the City. At the training sessions for public works employees, the pre-test scores were 55 percent and the post-test scores were 90 percent. At the industrial training session, the pre-test scores were 60 percent and the post-test scores were 70 percent. At the automotive workshop, pre-test scores were 70 percent and post-test scores were 90 percent. These are instances of measurable increases in knowledge.

Storm water compliance inspections of industrial facilities and commercial businesses have increased knowledge of storm water pollution prevention. During the inspection process, inspectors educate business owners on the difference between the storm drain system versus the sewer system, potential pollutants, pollution prevention measures, BMP implementation, and the Municipal Permit and General Industrial Permit requirements are discussed as deemed applicable. The City's knowledge assessment system rates the storm water knowledge of the responsible person at the facility on a scale of one (1) to five (5), with five representing the highest level of knowledge. More detail on the process is given in Section 3 of this Annual Report. Figure 11.3 presents a comparison of the 2004/2005, 2005/2006 and 2006/2007 ratings at high priority industrial facilities, which is the main place in which this type of data was collected during 2006/2007. The data are presented as relative frequencies so that differences in number of inspections between the two years do not affect the comparison. Scores of 1 and 5 have remained relatively similar from year to year with some changes in the 2 to 4 range. Though the data includes all high priority industrial businesses, these businesses change from year to year and therefore individuals with no prior knowledge of the City's NPDES program may be included in this assessment, therefore lowering the frequency of higher scores. The City plans to continue to conduct industry-specific workshops in the future.

During pre-project meetings, City representatives discuss general storm water pollution prevention concepts and site-specific BMP implementation with project proponents. The City's consultant also provides review comments on SWPPPs and SUSMP reports, which serve to further educate project proponents about City storm water requirements.

Educational information is provided to residents in areas targeted based on the results of Dry Weather Monitoring Program findings. The City's NPDES Storm Water Compliance Inspector also educates the public when responding to complaint investigations in residential areas. This approach provides residents with storm water pollution prevention material specifically targeted toward problems observed in their neighborhoods. The City also conducted a storm water workshop for residents, which discussed common BMPs residents can implement. More information about the materials distributed are presented in sections 5, 8, and 9 of this Annual Report.

Level 3: Behavioral Change/BMP Implementation

The City continues to provide education to the regulated community, municipal personnel, and the general public to not only increase knowledge regarding storm water issues, but to foster a behavioral change in regards to storm water-related activities. Such change is an important goal of the storm water program in the City.

The City's construction inspection program has resulted in proper BMP implementation at regularly inspected construction sites. Property owners and developers are compelled to be proactive in implementing proper BMPs at their sites because of the City's supervision and

strict enforcement program. During the 2006/2007 reporting period, the City inspected high priority construction sites on a weekly basis. This oversight likely led to more consistent and improved BMP implementation, which indicates a positive change in the behavior of developers and property owners directly responsible for the quality of storm water discharging from their sites.

As discussed earlier in this Annual Report, the City continued to assign a BMP assessment score during industrial and commercial inspections. Figure 11.3 presents a comparison of the 2004/2005, 2005/2006 and 2006/2007 ratings at high priority industrial facilities, which is the main place in which this type of data was collected during 2006/2007. The BMP implementation at inspected businesses is rated on a scale of one (1) to five (5), with five being the highest level. In general, scores decrease during this reporting period. Several industrial facilities in the City have had ongoing BMP implementation issues and were considered to be in violation of the City's municipal code during 2006/2007. Sites receiving a BMP-related violation are always assigned a BMP implementation score of 1.

National City municipal facilities are inspected on a regular basis. The inspections generally involve corrective actions being recommended. Corrective actions are typically minor housekeeping issues, but if more significant problems arise, the City's Storm Water Compliance Inspector works to resolve them immediately.

A total of 31 administrative citations were issued to businesses, construction sites, and residents during 2005/2006. As a result of these fines, the responsible parties were compelled to implement a more effective set of BMPs. Most violations were resolved by the first citation issued, although in a few cases additional enforcement actions were required. The City followed up in each case for which a citation was issued and ensured that the violation was resolved and any discharged material was cleaned up.

Level 4: Load Reduction

The City can qualitatively conclude that load reductions occur in many instances, although accurate estimation of numeric loads is often not possible. Numeric load data can be obtained through data from programs such as street sweeping and cleanup events.
The City reviews the SWPPP or erosion control plan that each grading project submits prior to the start of construction. This process furthers the implementation of more effective BMPs. The City's regular inspections then help ensure that the proposed BMPs are effectively implemented when construction is underway, ultimately reducing the potential load of sediment and other pollutants such as concrete waste and petroleum products.

During this reporting period, the City conducted workshops for industrial facilities, auto shops, and construction site owners/operators. It is likely that those in attendance improved BMP implementation at their businesses as a result of attending the workshops, thus resulting in reduction of pollutants discharged to the storm drain system. Municipal training sessions were provided as well. Municipal facilities promptly implemented corrective actions required by the City's NPDES Storm Water Compliance Inspector, and the staff at each municipal maintenance yard also implement SWPPPs. These actions likely resulted in a pollutant load reductions.

The City continues to implement street sweeping and storm drain inlet cleaning programs to reduce pollutants loads the MS4. During 2006/2007, 1,300 tons of debris was collected from street sweeping. Less debris was collected from street sweeping activities this

reporting period as compared last, however. The City's street sweeping schedule has not changed and the distance swept during 2006/2007 was about the same as in 2005/2006, so the decrease may suggest that there was less debris on the City's streets this reporting period as compared to last. A total of 23,200 pounds of debris was removed from the City's MS4. Over 416 cubic yards of debris was removed during channel maintenance activities, an increase from the 55 cubic yards of debris removed during 2005/2006. The City was also involved in a number of cleanup events during 2006/2007. Approximately 14.4 tons of trash and debris was collected and removed during those events. All these efforts directly led to reductions in loads of pollutants that otherwise would be discharged to receiving water bodies.

The continued use of the PDPA in inspections aided in identifying facilities that are potentially large sources of principal pollutants of concern for storm water. The form prompts the inspector to designate sources needing additional BMPs to lower the pollutant discharge potential as well as recommended BMPs for those sources. Facilities are expected to comply with these recommendations, which should result in decreases in the loads of various pollutants.

Level 5: Changes in Discharge Quality

Unlike assessments of levels 1 through 4, changes in storm water discharge quality are based on direct measurement of water quality.

In addition to helping locate IC/IDs, the City's Dry Weather Monitoring Program has provided useful water quality information for a rough Level 5 assessment. Figure 11.4 provides a graph with historical data based on the percent of sites exceeding action levels for various pollutants. Note that laboratory analyses are collected at four of the 15 dry weather sites. Exceedance rates for constituents measured in the laboratory are thus based on the number of exceedances at those four sites only. Figure 11.5 shows the median, average, and percent exceedance each year for ammonia and detergents, the two constituents with the longest historical records. The highest values were observed around 2002 and have generally decreased since then. Ammonia exceedances are usually traced to decomposing organic matter coupled with very low flows or ponded water. Detergents are typically the result of vehicle or equipment washing without proper BMPs. The City issued a relatively large number of citations for illegal discharges in 2006/2007, as described elsewhere in this Annual Report. The available monitoring data indicate that pollutants such as nitrate, orthophosphate, and oil and grease have almost never exceeded their action levels.

Level 6: Changes in Receiving Water Quality

Level 6 can be translated into the overall improvement of water quality in receiving water bodies. Examples of reaching Level 6 include changes in receiving water quality with respect to regulatory benchmarks, biological integrity, and beneficial use attainment. A long-term strategy is required to collect the volume of data necessary for assessment of Level 6. The Copermittees are collaborating as a group to establish a plan for collecting water quality data from receiving water bodies throughout the County. The City recognizes the importance of protecting the water quality of receiving water bodies in and around the City, and the City contributes to regional monitoring efforts. A sufficient data set is necessary prior to conducting a trend analysis to determine changes in receiving water

quality and further link those changes to activities conducted in the City. At this time such a data set is not available. It is therefore premature to make conclusions about the City's impact on downstream receiving water quality during this reporting period.

NARRATIVE ASSESSMENT OF PROGRAM COMPONENTS

Throughout 2006/2007 the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit, Order No. 2007-0001. Activities which have proven effective will be continued, and new or revised approaches will be suggested when the activities have proven less effective. Generally, the City has not identified one specific BMP as being ineffective for all facilities, but rather the City's inspectors recommend BMPs to each facility as are appropriate that facility's setting and potential sources of pollutants.

Permit Section F.1, Land Use

The City's SUSMP ordinance, which requires post-construction BMPs for Priority Projects, is the major land use related mechanism of mitigating urban runoff pollution. The City's storm water ordinance also includes provisions required certain non-Priority Projects to implement post-construction BMPs.

Due to additional BMP implementation, storm water runoff from SUSMP sites should carry significantly lower pollutant loads than runoff from similar non-SUSMP sites. The City has implemented both paper and electronic tracking systems for SUSMP project documents and approval status. During review of SUSMP reports, the City's storm water consultant has frequently found that a proposed project relies mainly on a treatment control BMP and does not propose adequate source control and site design BMPs. In those cases, the City requires that more comprehensive site design and source control BMPs be included to reduce storm water pollution to the MEP. For example, the City has encouraged sites to direct runoff into landscaped areas. The City's consultant also carefully examines sizing calculations, locations, and removal efficiencies for proposed treatment control BMPs. Revisions to the Storm Water Requirements Applicability Checklist have helped clarify the requirements for project proponents. Those revisions, the regular interdepartmental coordination meetings, and the recently revised Department Responsibility Checklist have helped City personnel understand their individual responsibilities for SUSMP implementation. All applicability checklists are forwarded to Engineering for final sign off as a standardization measure to make sure that the requirements are applied to projects consistently.

The City also began inspecting completed SUSMP sites in 2006/2007. This program was not yet required by the Municipal Permit, but the City initiated it to gain a better understanding of how well BMPs are being maintained. The program is also intended as a sort of pilot project that will allow the City to have a more refined program in place when SUSMP inspections are required by the new Municipal Permit. Additionally, a more advanced SUSMP database that includes entries for all BMPs at completed sites has been prepared. GPS coordinates for inspected sites were recorded during the site visits.

Permit Section F.2, Construction

Section 7 of the JURMP discusses the City's construction program; Section 7.6 lists the required BMPs. The City requires construction sites to implement BMPs for soil

stabilization and erosion control, sediment containment, materials and equipment management, and non-storm water discharge and drainage control. Common examples of these measures include fiber rolls, silt fences, rip-rap, and hydroseeding. Preventative, erosion control measures have been found to be the most effective and least costly BMPs.

In addition to inspections during the wet season, the City also inspects large construction sites during the dry season. Because contractors know that oversight does not stop during the summer, this practice has helped improve BMP implementation both during the summer and at the beginning of the wet season. The City has found stop work orders to be an effective means of achieving BMP implementation in a short amount of time, and overall the City's enforcement actions have been effective in bringing about proper BMP implementation. Quick responses to construction related complaints, backed by enforcement actions where necessary and the distribution of construction BMP fact sheets to all projects that disturb soil have helped improve BMP implementation at very small job sites.

Permit Section F.3.a, Municipal

Section 2 of the JURMP describes BMPs and pollution prevention measures for municipal activities. The City emphasizes good housekeeping BMPs, such as regular litter pick-up, in its approach because they have been observed to be effective without being prohibitively expensive.

Recognizing that proper implementation of good housekeeping and other BMPs requires informed employees; the City has conducted numerous formal storm water trainings for municipal employees. Further, the City's NPDES Storm Water Compliance Inspector regularly explains storm water concepts to City employees during inspections of municipal facilities and other interactions with them. The City's NPDES Storm Water Compliance Inspector has a good working relationship with municipal facility managers and staff, which helps ensure prompt implementation of corrective actions given during inspections. Municipal employees have also made reports to the City's storm water hotline more frequently during this reporting period. This is because the employees have a better understanding both of what constitutes a storm water violation and where to report it. Most of the reports come from municipal employees in the Public Works, Fire, and Police departments, since those staff drive around various portions of National City each day. Forming a partnership with these employees is an effective means of locating IC/IDs and other storm water violations without incurring extra expenses or hiring new staff. Street sweeping and maintenance of the MS4 are also conducted and logged into electronic reporting systems.

Permit Section F.3.b, Industrial

The City's BMP requirements for industrial facilities are listed in JURMP Appendices C.2 and C.3. Appendix C.2 includes general BMPs required of all industrial and commercial sites, while Appendix C.3 lists activity-specific BMPs for industrial sites. Almost all of the City's industrial facilities conduct their intensive industrial activities, such as cutting metal or maintaining buses, indoors. The outdoor industrial activities are usually limited to material storage, loading and unloading, and similar activities. This practice is effective in preventing many of the largest sources of pollutants from contacting storm water.

During inspections of industrial sites, the City emphasized the importance of good housekeeping measures, which are generally well known but are sometimes not conducted frequently enough. Industrial businesses in the City have typically been cooperative in the compliance process, and, when necessary, stricter enforcement measures have brought about compliance. The City conducts detailed BMP assessments as part of each inspection, and all inspection results are entered into the City's industrial/commercial database.

During the 2006/2007 reporting period, the City again updated its industrial and commercial inventories. The City's NPDES Storm Water Compliance Inspector regularly reviewed newly submitted businesses licenses to determine if new businesses needed to be added to the lists of industrial businesses. Facilities with industrial SIC codes were compared to the current industrial inventories, and those businesses not currently present were added to the inventories. All businesses that this process identified as potential new high priority industrial sites were inspected. The City also continues to update its inspection database.

As was discussed earlier in this Annual Report, the City has developed several methods to help analyze the effectiveness of its program. Storm water monitoring data is reviewed at industrial sites. BMP, knowledge, and PDPA assessments are also conducted at industrial sites and further aid the evaluation process. Regular inspections and education have helped improve BMP implementation at industrial facilities, especially high priority industrial sites.

Permit Section F.3.c, Commercial

The City's BMP requirements for commercial facilities are listed in JURMP Appendices C.2 and C.4. Similar to industrial facilities, at most commercial facilities the commercial activities with the largest potential to generate pollutants, such as food preparation and auto repair, are conducted indoors. The City's inspectors typically emphasize good housekeeping measures and secondary containment and overhead coverage for automotive fluids and cooking grease stored outdoors. Inspections are regularly conducted at commercial facilities, and the results are recorded in the City's industrial/commercial database.

The City has found that a lack of knowledge about storm water issues is a common problem at commercial facilities, particularly restaurants. This is most likely due to the relatively high level of turnover in that industry. City inspectors give verbal instruction and provide educational materials; workshops specifically for restaurants have also been held. Most commercial businesses historically have cooperated with the compliance process after receiving education and being notified of corrective actions to take. However, when a business has been educated and warned but persists in non-compliance, penalties are assessed. This approach has been effective in bringing about compliance with the City's Storm Water Ordinance.

The City developed and distributed a 2007 calendar, prompting user with ways to "keep our community clean." Workshops for automotive repair facilities and for restaurants will be held in 2007/2008. Similar to industrial facilities, the City will continue to work to identify and inspect new high priority commercial facilities. New facilities will likely be identified primarily through SIC code based searches of business license registry data. Similar to industrial facilities, BMP, knowledge, and PDPA scores will continue to be assigned during inspections.

Permit Section F.3.d, Residential

Section 5.3 of the City's JURMP lists pollution prevention measures and BMPs for residential activities.

The City's main avenue to improve BMP implementation in residential areas is storm water education and complaint responses. The City has distributed various educational materials, and during 2006/2007 the City offered a storm water workshop specifically tailored for residents. Residents were provided with a handout of residential BMPs and were encouraged to call the storm water hotline to report illegal discharges and storm water activities. The City also has an ordinance which prohibits car washing and repairs on public streets.

The City's Dry Weather Monitoring Program has found that residential areas contribute to constituent action level exceedances at several monitoring locations. Based on interactions with citizens, City staff have found that some residents do not have a good understanding of storm water issues. The City distributed the 2007 calendars to residents during 2007/2008, which was redesigned to be more user-friendly. The City has found that redesigning their calendars has them more appealing and useful to City residents. Residents then may see the materials on a fairly frequent basis, rather than reading a brochure once and setting it aside.

Permit Section F.4, Education

The City has developed a number of educational materials; they are listed in Section 9 of the Annual Report.

Many people who live and/or work in National City speak Spanish as their first language. As a result, the City has developed bilingual English/Spanish versions of educational materials. This approach has helped more effectively reach the Spanish-speaking population of National City. For example, a one page bilingual fact sheet was prepared to help people in the City to better understand that storm water flows to San Diego Bay through the City's creeks and rivers, not to the sanitary sewer. That sheet has been distributed during inspections and complaint investigations and is also readily available at the City's Engineering desk. The City's storm water calendars have also been prepared with messages in both English and Spanish. The number of impressions created by the City's storm water program during this reporting period was estimated to be over 137,000.

City staff, in particular those in the Engineering, Planning, and Public Works departments, are responsible for implementing the City's storm water program effectively. These individuals act as role models for the activities of City employees and residents. Because these staff can have a large impact on storm water quality, the City provides regular storm water training for them. Other educational activities are described in the above assessment of the residential program. The City has also been notifying industrial and commercial businesses, as well as residents of the City's storm water hotline to facilitate better reporting of non-compliance.

Permit Section F.5, IC/ID

Section 8 of the JURMP describes the City's IC/ID program.

The City's storm water hotline is a key component of IC/ID program. As mentioned previously, municipal employees have become much more involved with recognizing and

reporting storm water violations, resulting in a general increase in reports each year (Figure 11.1). The City's NPDES Storm Water Compliance Inspector has been issued a cellular phone so that contact can be made regarding complaints whenever they occur. This helps minimize the response time. Active discharges are stopped immediately, and cleanup actions are taken when necessary. Education is often provided for minor issues noted in residential areas.

The City's Dry Weather Monitoring Program, which includes upstream pollutant source investigations, has also been an effective means of identifying IC/IDs. The monitoring efforts allow identification of pollutant sources that are causing action level exceedances at regular dry weather monitoring sites. This information allows the City to more effectively target its educational and enforcement efforts on known sources of pollutants. If a live discharge, such as car washing, is observed, the City is also able to immediately respond and eliminate the discharge, resulting in an improvement in the quality of the discharge to the MS4 and to receiving waters. Importantly, the City typically conducts follow-up visits to sites where action levels are exceeded within 24 hours for field analyses and upon receiving laboratory results for lab analyses. This has helped the City more accurately identify and abate IC/IDs that have caused action level exceedances. As described in Section 8 of this Annual Report, the City has taken a number of actions in response to the 2006 dry weather monitoring findings.

Permit Section F.6, Public Participation

Section 10 of the JURMP discusses the City's public participation program.

The City has worked with outside organizations such as ILACSD and organizations within the City such as neighborhood councils during this reporting period. Other cleanup events included collaborations with neighborhood councils. The City plans to continue working with ILACSD to conduct clean up events in the City and to stencil storm drains with "no dumping, drains to ocean" or similar text. The City also participated in HHW and large waste collection events to keep residents from potentially dumping these items in a location where they would pose a threat to storm water. The City also seeks to become informed of pending public participation events by regularly attending the Copermittee Outreach Workgroup meetings.

IMPLEMENTATION PLANS AND JURMP UPDATE FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit, Order No. 2007-0001. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

Table 11.1
Source Characterization
Fiscal Year 2006/2007

Constituent	Geographic Area	Land Use	Potential High Priority Source	Estimated Percent (%) of Total Sources	Priority
Sediment	Jurisdictional: residential areas	Residential	Landscaping, vacant lots	15%	Low
	Industrial and commercial zones	Commercial	Landscaping, parking lots	10%	Low
	Jurisdictional: construction sites	Various	Construction activities	45%	High

12 FISCAL ANALYSIS

The City of National City's storm water program budget and expenditures consists of the following components:

- Staff
- Storm Water Operating Budget
- Drainage Capital Improvement Projects

City staff from different departments and divisions contribute to the implementation of the storm water program as follows:

- The Storm Water Management Team is responsible for the development and implementation of storm water programs, inspection of municipal, industrial, commercial, residential and construction sites, and responding to violations of the Municipal Storm Water Management and Discharge Control Ordinance.
- The Engineering Department is responsible for the majority of the NPDES program. The department reviews grading applications for compliance with the erosion control and other engineering ordinances, including that temporary and permanent BMPs are incorporated in the grading, proposed, and final maps. The Engineering Department is also responsible for reviewing SUSMP reports and construction SWPPPs.
- The Public Works operations crew is responsible for the maintenance of the City's storm drainage system and the sanitary sewer collection system. They are also responsible for emergency response to sewage overflows and pollutant spills on public streets. The Public Works operations crew also manages the street sweeping program and the Used Oil Recycling Program, the Household Hazardous Waste Collection Program, the Solid Waste Collection Program, the Solid Waste Reduction and Recycling Program, and the Energy Conservation Program.
- The Planning Department reviews development projects for environmental impacts to sensitive areas and requires developers to provide mitigation plans before permits are issued.
- The City Attorney's Office reviews all documents such as new ordinances and manuals and forms developed by the Storm Water Management Section, to ensure that they are in compliance with current laws and regulations. The City Attorney's Office also assists the Storm Water Management Section in the enforcement of the City's Municipal Code.

The City's storm water program is funded by sewer fees assessed for property owners or tenants of single family homes, multi-family buildings and commercial/industrial facilities, General Funds, the gas tax, community development block grant (CDBG) funds, zoning and CIP funds. No changes to the sources of funding for this program have been made during this reporting period. The implementation cost of the FY 06/07 program was $939,500. The proposed estimated budget for the FY 07/08 program implementation is $936,000. Table 12.1 presents an itemized breakdown of the program costs.

Table 12.1
Itemized Budget

Storm Water Program Fiscal Analysis	FY 06/07	FY 07/08
Staff		
Public Works	160,000	160,000
Planning	40,000	50,000
City Attorney	10,000	10,000
Building	30,000	20,000
Fire	10,000	10,000
Engineering	80,000	90,000
Community Development Center (CDC)	40,000	30,000
Sub-total	***$370,000***	***$370,000***
Operation Expenditures		
NPDES Fees	35,000	35,000
Consultant Fees for NPDES Program	200,000	200,000
Purchase Equipment	1,000	1,000
Miscellaneous Operations	5,000	5,000
Sub-total	***$241,000***	***$241,000***
CIP Appropriations		
Curb and Gutter	6,500	*
Alley Apron	7,000	*
X-Gutter	15,000	*
Drainage Improvements	300,000	325,000
Sub-total	***$328,500***	***$325,000***
Total	**$939,500**	**$936,000**
Additional Special Project Funding		
Paradise Creek Improvements	300,000	Complete
Sewer Pump Stations Rehabilitation Project	--	765,700
Grand Total	**$1,239,500**	**$1,701,700**

* Included in drainage improvements category for 2007/2008 reporting year

13 SPECIAL INVESTIGATIONS

The City takes a proactive approach to storm water management in an attempt to not only protect receiving water quality, but also to improve the quality of water that is discharged from the City's MS4 system. Data collected through the City's various monitoring and inspection programs is used to identify locations within the City that are contributing to storm water contamination. Source identification investigations are then initiated in order to pinpoint the exact cause of detected pollution.

Trash Assessment Project

During the City's 2006 Dry Weather Monitoring Program, conducted in September of that year, litter accumulation and illegally dumped objects were noted at some of the test sites. Since trash and illegally dumped items have the potential to negatively affect the quality of water discharged from the City's MS4, such as increasing the level of pollutants such as bacteria, oil and grease, and metals, the City contracted its storm water consultant, D-MAX, to perform a thorough trash assessment throughout the City. The trash assessment was a proactive measure to identify sources of trash within the City's jurisdiction to allow the City to focus future cleanup and education program.

During October and November of 2006, a D-MAX inspector drove the length of every street and alley within the City limits looking for areas of moderate to very heavy trash. Information such as location address, date and time of visit, trash amount, and trash type was recorded at each site noted to have at least moderate amounts of trash present. For the purpose of this assessment, different trash levels were recorded based on the field staff's visual estimates. The categories of different trash types were the following:

- Litter: paper, plastic bags, plastic bottles, glass, aluminum cans, etc.
- Household: household items such as small and large appliances, stereos, couches, mattresses, etc.
- Construction: wood scraps, drywall, rebar, etc.
- Large items: large items not obviously associated with household use, such as tires and shopping carts, etc.
- Yard waste: grass clippings, branches from tree trimming, etc.
- Hazardous waste: items generally considered hazardous and requiring special disposal, such as used oil, paint, or car batteries.

Results from the City's trash assessment show that litter and illegally dumped items tend to accumulate in places out of sight from the main roads within the City, such as alleys and channels. These areas also tend to be poorly lit, making it difficult to catch violators. Dumpster areas located in alleys in residential and commercial areas were a common area of litter and trash overflow. Larger trash such as mattresses, couches, and tires were also observed in alleys. While litter was found in a number of alleys within the City, these areas are typically located some distance away from storm drains, and household items such as furniture have low potential of transport from these areas into the MS4. Out of all the sites evaluated for the trash assessment, only one commercial location was found to have

hazardous waste present. Litter and large trash items were also observed in some channel locations.

In response to the trash assessment findings, the City's Public Works department cleaned City channels with observed trash accumulation. Courtesy notices discussing the negative impact litter and illegal dumping can have on receiving waters and contacts for trash and large item disposal were sent out to residents and businesses in specific areas of the City found to have multiple locations with moderate or higher levels of trash. The City has also formed a new trash management workgroup to further control trash within the City. The workgroup consists of representatives from the City Manager's office, Community Services Department, Public Works Department, and the Engineering Division. Collectively, these branches of the City are involved in a variety of programs involved with trash management including trash removals from channels, the City's storm water program, and community outreach. Together the workgroup is developing different approaches to managing trash within the City. The City plans on continuing efforts to address trash and debris during the 2007/2008 reporting period.

14 CONCLUSIONS AND RECOMMENDATIONS

The City has implemented its storm water program in accordance with Municipal Permit requirements since 2002. RWQCB Order No. 2007-0001, a revised municipal storm water permit, was issued on January 24, 2007. During the 2006/2007 reporting period the City began adjusting its program in anticipation of the new requirements of this permit and continued to refine programs already required under the existing Municipal Permit. During 2007/2008, the City will transition into implementing the requirements of the new permit. Additionally, the City will continue to work with other jurisdictions in the Paleta Creek watershed and the RWQCB to address TMDL requirements. The City will continue to refine implementation of existing programs and create new programs as needed to improve its ability to reduce or eliminate pollutant discharge and meet regulatory requirements. The City also plans to collaborate with other Copermittees to develop new programs, further refine existing programs, and develop methods for which program effectiveness may more accurately be assessed.

CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki, P.E.
City Engineer

Date: September 2008

Telephone Number: (619) 667-1105

EXECUTIVE SUMMARY

The City of National City (City) has been actively developing and implementing storm water pollution prevention measures since 1990. The City's Jurisdictional Urban Runoff Management Program (JURMP) was updated and submitted to the San Diego Regional Water Quality Control Board (RWQCB) in March 2008. The JURMP update was required by the recently re-issued storm water permit, RWQCB Order No. R9-2007-0001 (Municipal Permit). The Municipal Permit was jointly issued to 18 municipalities in San Diego County, including the City, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees").

The City's JURMP includes Best Management Practice (BMP) standards for businesses, construction and development projects, residents, and the City's own activities. The JURMP also includes programs for water quality monitoring and educational outreach.

This JURMP Annual Report presents the City's activities to implement its JURMP during the 2007/2008 fiscal year, which began on July 1, 2007 and ended on June 30, 2008. The exception to this is the illicit discharge detection and elimination component of the JURMP, which per the recently adopted Addendum No. 2 to the Municipal Permit now has a reporting period that extends to September 30, 2008, three months later than all the other components of the JURMP.

Two different storm water permits were in effect during 2007/2008 reporting period: the previous permit issued to the Copermittees, Order No. 2001-01, and the current Municipal Permit. The City was required to implement its newly updated JURMP to comply with the Municipal Permit no later than March 24, 2008, but the City began implementing some aspects of the new program prior to this deadline. Each section of this JURMP Annual Report discusses how the City's efforts during 2007/2008 met the requirements of the applicable permit and when the requirements of the new Municipal Permit were implemented. Key actions taken for the major components of the City's storm water program are summarized below.

Development Planning Component

During 2007/2008, the City continued to oversee development activities occurring in the City to mitigate potential threats to water quality due to such activities. The City developed a treatment control BMP operation and maintenance verification program, which included the development of an electronic treatment control BMP database, an inspection program, and an annual maintenance verification program. The City inspected 13 sites with approved treatment control BMPs. The City also updated its BMP requirements for all development projects to include Low Impact Development (LID) principles.

Construction Component

During 2007/2008, a total of 88 construction inspections were completed at 78 sites, not including inspections for building permits, which also include a brief check for storm water BMPs. The City updated minimum construction requirements to include a maximum disturbed area limitation and guidelines for advanced treatment. The City's plan check and inspection program required projects to comply with the City's minimum BMP requirements.

Municipal Component

The City inspected all high TTWQ municipal fixed facilities and continued its rigorous street sweeping and MS4 maintenance programs. A total of 1,151 tons of trash and debris was removed from street sweeping activities, and 39.6 tons of debris were removed from standard MS4 maintenance. An additional 10 pounds of debris was removed from the cleaning of filter inserts installed at the City's Public Works Yard. The City also continued to maintain and repair or replace sanitary sewer lines, as needed, to decrease the potential for a sanitary sewer overflow (SSO).

Industrial and Commercial Component

During 2007/2008 the City met the Municipal Permit requirement to inspect at least 20 percent of the City's industrial and commercial inventory, including at least 50 percent of its high threat to water quality (TTWQ) sites. During the inspections conducted during 2007/2008, the City notified industrial and commercial businesses of the City's new BMP requirements through the City's inspection program. Inspectors also assessed each facility's compliance with the General Industrial Permit (Industrial Permit) and worked with the RWQCB to resolve compliance issues. The City also initiated a special additional data collection program focused on pollutant discharge potential assessment.

Residential Component

The City worked to educate its residents through a variety of means. The City continued to collaborate with the cities of Chula Vista and Imperial Beach to make a household hazardous waste (HHW) disposal facility available to the public. During 2007/2008 the City hosted two large item waste disposal events and encouraged residents to participate in these events. The City also responded to calls made to the City storm water hotline regarding residential areas. The hotline call investigations were used as opportunities to enforce BMP requirements and to educate residents.

Illicit Discharge Detection and Elimination Component

As required by RWQCB Addendum No. 2 to the Municipal Permit, adopted on September 10, 2008, the reporting period for this component of the JURMP has been extended to September 30, 2008. The City will submit the details of how it implemented the illicit discharge detection and elimination component of its JURMP to the RWQCB no later than December 15, 2008.

Education Component

As a means to raise storm water awareness in various communities in the City, the City continued to conduct various education and outreach activities throughout 2007/2008.

The City hosted two training sessions: one was for members of the Kiwanis Club of National City; the other was geared toward the development planning and construction community. Similar to previous years, the City developed a bilingual 2008 storm water program calendar, which presented storm water concepts as well as photos of ocean scenes. To better serve the City's diverse population, a variety of educational materials were distributed in Spanish as well as English.

Public Participation Component

During 2007/2008, the City provided a variety of opportunities for individuals in the City to participate in the City's storm water program. Activities included cleanup events, which have a direct effect on water quality, and outreach activities, through which the City works to increase general knowledge and awareness regarding storm water issues. Most notably, the City hosted a themed art contest for third grade students at public schools in the City. Students submitted drawings with the "By Keeping our Community Clean, We Can Keep the Ocean Clean" theme; 12 winners will be chosen, and their drawings will be included on the 2009 storm water program calendar. A variety of waste disposal events were held for City residents, and 45 volunteers participated in the Creek to Bay Cleanup at the site in the City of National City.

Fiscal Analysis Component

The City continued to fund its storm water program as discussed in the City's JURMP. Itemized expenditures for 2007/2008 and estimated expenditures for 2008/2009 are presented in this section.

Effectiveness Assessment Component

The City updated its effectiveness assessment approach to comply with new Municipal Permit requirements. The City has identified significant activities within each program component and metrics to assess each one. Standard tables to report this information have been created and included in Section 11 of this JURMP Annual Report. The City also has continued to work with the regional Fiscal, Reporting, and Assessment Workgroup to help develop and implement the latest assessment methods.

Special Investigations

The City continued its Clean Community Program, which includes education and will include assessment of new trash monitoring results from the 2008 Dry Weather Monitoring Program. The City also assessed pollutant discharge potential of industrial and commercial businesses; sediment, trash, and oil and grease had the highest average pollutant discharge potential scores.

Conclusions and Recommendations

The City began implementing its newly updated March 2008 JURMP toward the end of 2007/2008. The City will continue to implement the new and updated programs in its JURMP during 2008/2009; it is anticipated that some program refinements will be made as implementation progresses. The City will also collaborate with the other Copermittees to improve the efficiency of its program and to develop updated methods of assessing program effectiveness.

1.0 INTRODUCTION

1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report presents a summary of the activities of the City of National City (City) during the 2007/2008 fiscal year. Preparation and submittal of the JURMP Annual Report is required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act (also known as the Clean Water Act, or CWA) established a framework for regulating MS4 discharges under the National Pollutant Discharge Elimination System (NPDES). The RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region in 1990, followed by a revised permit in 2001. The current Municipal Permit in turn replaced the 2001 permit, RWQCB Order No. 2001-01, in 2007.

Like all the other regulated municipalities in the San Diego region, collectively referred to as Copermittees, the City developed and submitted a JURMP to the RWQCB in 2002. As required by the Municipal Permit, the City submitted an updated JURMP in March 2008. The JURMP includes management measures for a variety of different sectors and activity types such as municipal, industrial, commercial, construction, and significant development and re-development activities.

Annual reports on the implementation of the JURMP are required to be submitted to the RWQCB September 30 of each year. This JURMP Annual Report presents information from the 2007/2008 fiscal year, which extended from July 1, 2007 to June 30, 2008.

1.1.2 CITY SETTING

The City of National City is located in southwest San Diego County, and is bordered by San Diego, Chula Vista, and unincorporated portions of San Diego County. The City itself includes approximately nine square miles and an estimated population of approximately 55,000. Land use within the City is mixed, with residential being the predominate land use. Land use categories with the corresponding percentage of the total area are included in Table 1-1, below, and illustrated in Figure 1-1.

Table 1-1
City of National City Land Use Breakdown

Land Use	Total Area (Acres)	Percentage
Single Family Residential	1,216	30%
Transportation	1,149	29%
Commercial	490	12%
Industrial	251	6%
Multi-Family Residential	215	5%
Open	202	5%
Public Facilities and Utilities	174	4%
Vacant	115	3%
Parks	114	3%
Other Residential	41	1%
Office	22	1%
Water	20	<1%
Construction	6	<1%
Recreation	2	<1%
Total	**4,016**	**100%**

Source: 2007 SANDAG land-use data

The City of National City lies entirely within the San Diego Bay Watershed. The City is located within two sub-watersheds: the Sweetwater and Pueblo San Diego sub-watersheds. Overall, the City of National City comprises approximately 1.6 percent of the total area of the San Diego Bay Watershed. Much of the southern portion of the City drains to the Sweetwater River, which ultimately terminates in San Diego Bay. The central portion of the City drains to Paradise Creek, a small salt marsh creek, which eventually discharges into the Sweetwater River. La Paleta Creek (also known as 7th Street Channel) drains the northern portion of the City and discharges directly to San Diego Bay. A very small western portion of the City drains directly to San Diego Bay shoreline. Virtually all of the areas of the City that drain directly to San Diego Bay are within the jurisdiction of the San Diego Unified Port District. Watersheds in the City are shown in Figure 1-2.

San Diego Bay, as a whole, is listed in the 2006 CWA Section 303(d) for polychlorinated biphenyls (PCB) based on fish tissues studies in recent years. The San Diego Bay shoreline at 7th Street Channel and at the 24th Street Marine Terminal are listed in the 2006 CWA Section 303(d) for benthic community effects and sediment toxicity. A TMDL is in progress for the mouth of 7th Street Channel. Because Sweetwater Marsh is part of a national wildlife refuge, it is considered an ESA. Paradise Creek is also considered an ESA by the City.

Figure 1-1
City of National City Land Use

Figure 1-2
City of National City Watersheds

Note: Marsh boundaries based on land use data from SANDAG. The portion of the marsh west of I-5 and south of the Sweetwater River is not in the City's Jurisdiction. Base Data Sources: City of National City, SANDAG, SanGIS, Port of San Diego

1.2 PURPOSE AND OBJECTIVES

The City's JURMP presents a strategy to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The JURMP includes a variety of programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the City's implementation of its JURMP during the 2007/2008 reporting period.

1.3 REPORT ORGANIZATION

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

Section 1	**Introduction**
Section 2	**Development Planning Component**
Section 3	**Construction Component**
Section 4	**Municipal Component**
Section 5	**Industrial and Commercial Component**
Section 6	**Residential Component**
Section 7	**Illicit Discharge Detection and Elimination Component**
Section 8	**Education Component**
Section 9	**Public Participation Component**
Section 10	**Fiscal Analysis Component**
Section 11	**Effectiveness Assessment Component**
Section 12	**Special Investigations**
Section 13	**Non-Emergency Fire Fighting**
Section 14	**JURMP Revisions**
Section 15	**Conclusions and Recommendations**
Section 16	**References**

Each section includes all the sections required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a clearer explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Subsection 1.1, Background, has been divided into subsections 1.1.1, Regulatory Background, and 1.1.2, City Setting, for the sake of clarity.

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall storm water quality by reducing the discharge of pollutants from development projects to the MEP and managing increases in runoff from development projects that have the potential to negatively affect downstream water bodies. During the 2007/2008 fiscal year, the City accomplished these goals through implementation of its JURMP document.

The City updated its JURMP during the reporting period and began implementing new Municipal Permit requirements for development planning on March 24, 2008. For the most part, the overall structure of the City's processes used to require post-construction BMPs of development projects remained similar throughout the reporting period. The most significant changes to the City's program apply to the implementation of the City's development project approval and verification process. For example, the City's SUSMP requirements were updated to include Low Impact Development (LID) and hydromodification concepts, and the City began a treatment control BMP inspection program and a BMP maintenance verification program.

2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- Updated the City's Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance, including addition of new Priority Development Project (Priority Project) categories required by the Municipal Permit.
- Updated the City's NPDES Project Applicability Form to reflect changes made to the City's updated JURMP, and distributed updated checklist starting late March 2008.
- Updated minimum BMP requirements for all development projects, including addition of Low Impact Development (LID) principles.
- Collaborated with the Copermittee hydromodification management workgroup to discuss key Hydromodification Management Plan (HMP) development issues.
- Developed an electronic SUSMP database that contains information related to all proposed site design, source control, and treatment control BMPs within the City's jurisdiction, and the parties responsible for BMP maintenance.
- Developed a treatment control BMP operation and maintenance verification program, which included the development of a treatment control BMP database,

a City-conducted inspection program, and an annual maintenance verification program.

- Conducted operation and maintenance inspections of site design, source control, and treatment control BMPs at 13 completed development projects throughout the City.
- Conducted trainings for City staff and developed educational materials for the development community regarding new Municipal Permit requirements related to development projects.

2.2 Land Use Planning

2.2.1 Background

The City's General Plan was adopted in 1996 and contains water quality and watershed protection principles in its Natural Settings Element. The comprehensive principles established in 1996 provide an ample framework for implementing the requirements of both the old permit and the new Municipal Permit, and no changes to these policies were necessary during the reporting period.

2.2.2 Source Characterization

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to development restrictions in the City's General Plan for storm water purposes were implemented during the reporting period.

2.2.3 Best Management Practice Requirements

Please refer to the City's updated JURMP document for a list of the water protection policies included in the City's General Plan. These policies remained the same throughout the reporting period.

2.2.4 Program Implementation

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code. During this time, the City's Storm Water Ordinance and Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance were updated to meet new Municipal Permit requirements. Descriptions of the changes made, as well as complete copies of the amended documents, can be found in the City's updated JURMP. Implementation of these new development requirements began on March 24, 2008. Prior to that date, the City implemented the Storm Water and SUSMP Ordinance as detailed in the 2006/2007 JURMP Annual Report.

Details on how the City implemented its established water protection policies through its environmental review process and its development project approval and verification

processes during the reporting period are provided in Sections 2.3 and 2.4 of this JURMP Annual Report document.

2.3 Environmental Review Process

The City's current environmental review process is detailed in the City's updated JURMP. While changes to specific requirements of the City's environmental review process were made during the reporting period as part of the JURMP update, the overall structure of the review process, such as the City's departments involved and the document submissions required, remains the same as in previous reporting years. No further modifications to the City's environmental review process have been made since the submittal of the updated JURMP.

2.4 Development Project Approval and Verification Process

2.4.1 Background

As previously discussed, the development project approval and verification process implemented prior to March was identical to the process described in the 2006/2007 JURMP Annual Report. The approval and verification process implemented after March 24, 2008 followed the process described in the City's updated JURMP.

2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's SUSMP Ordinance. Prior to March 2008, the SUSMP Ordinance included in the City's 2004 JURMP Revision document was used by the City and the development community, while the updated SUSMP Ordinance, revised as part of the JURMP update, was implemented starting in late March 2008. Details on changes to the City's SUSMP Ordinance, such as the addition of retail gas outlets (RGO) and industrial development as Priority Project categories, can be found in Section 4 of the updated JURMP.

2.4.3 Best Management Practice Requirements

No changes were made to the development BMP requirements presented in the 2006/2007 JURMP Annual Report prior to March 2008. The City's new BMP requirements, implemented after March 2008, are similar to the requirements prior to that date, with a few exceptions. In some cases, the new BMPs were already being required by the City, but the update provided an opportunity for the language in the JURMP to be strengthened for clarity. For example, the LID BMP requirements added to the City's SUSMP Ordinance are similar to site design concepts that were already required in the original SUSMP Ordinance developed in 2002 in compliance with the previous Municipal Permit. The City's SUSMP was only changed to stress the

importance of a few of these design principles, such as draining runoff from impervious surfaces to adjacent landscaping. Similarly, the City had already begun requiring project proponents to include justification whenever a treatment control BMP that did not have a high or medium removal efficiency for key pollutants was associated with the project. The new SUSMP Ordinance provided more explicit language in support of this requirement. All changes to BMP requirements made during the reporting period are detailed in the City's updated JURMP.

2.4.4 Program Implementation

During the 2007/2008 fiscal year, the City required implementation of its BMP requirements for all development projects through education, a comprehensive development project approval process, and a new treatment control BMP inspection and maintenance verification program.

2.4.4.1 Outreach and Staff Training

The City continually trains staff involved in the planning and review of development projects within the City and works closely with the development community to communicate its development requirements throughout the entire approval process. During the reporting period, staff and industry training was focused on changes being made to the City's JURMP in response to new Municipal Permit requirements. Details on trainings conducted and educational materials developed and distributed related to the new development during the reporting period can be found in Section 8 of this JURMP Annual Report document. Distribution of maintenance verification letters to parties responsible for maintenance of treatment control BMPs at completed projects, which began in August 2008, is also expected to increase the level of knowledge of regulated parties.

2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Forms completed by project applicants are kept with the project's file at the City for future reference. As discussed in the City's JURMP, the City required all projects applying for construction and building permits to complete a "National Pollutant Discharge Elimination System (NPDES) Project Applicability Form" (SUSMP Checklist) that guides project applicants to submit proper documents to the City for review. Prior to March 2008, the City distributed the SUSMP Checklist included in the City's 2006/2007 JURMP Annual Report. Starting in March 2008, the City began distributing an updated version of the SUSMP Checklist that included changes necessary to comply with the new Municipal Permit requirements. A copy of the updated SUSMP Checklist was included in the City's updated JURMP.

Starting in March 2008, certain non-priority development projects were required to complete a Standard Permanent Storm Water BMPs form, which was included as an Attachment to the City's updated JURMP document. This form includes a list of all standard permanent storm water BMPs required by the City's SUSMP and requires project proponents to indentify which BMPs will be implemented at the development. Note that the standard permanent storm water BMPs do not include treatment control BMPs. If any BMP is not selected, the project proponent must provide an explanation why the BMP is not applicable or feasible for the project. These completed forms are kept with the project's file at the City.

In preparation of the new BMP requirements going into effect during the middle of the reporting period, all development projects that submitted documents to the City for review were educated on upcoming changes to the City's SUSMP requirements. The City also held a workshop for the development community covering the City's updated requirements. Details on this workshop can be found in Section 8 of this Annual Report.

All development projects determined to be Priority Projects after completing the SUSMP Checklist were required to implement the City's SUSMP requirements and prepare a Storm Water Management Plan (SWMP). As part of the JURMP update, the City also developed a SWMP self checklist to be used by SWMP preparer, which was included as an attachment to the updated JURMP. In the past, the majority of deficiencies found in document reviews were missing information or sections not having enough detail about proposed BMPs. The self checklist provides a more detailed resource for project proponents to use when writing the SWMP, and the City hopes that the guidelines will reduce the number of document reviews required for development projects before they are approved. Table 2-1 lists the development projects subject to the City's SUSMP requirements during the 2007/2008 reporting period, the number of document reviews for each project, and their current approval statuses.

Table 2-1
Development Projects Subject to SUSMP Requirements During 2007/2008

#	Project Name	Location	Project Type	Number of Reviews during 07/08	Approved during 07/08?
1	940 W. 19th St.	940 W. 19th St.	Priority	2	Yes
2	Canyon Ridge (Resubmission)	Corner of Rachel Ave and Blueridge St.	Priority	2	Yes
3	Carolino Hillside Homes	NE Corner of 16th St. and M Ave.	Priority	3	Yes
4	Centro Condominiums	East side of the A Ave. extension between 11th St. and 12th St.	Priority	2	No
5	Grove Plaza	Grove St. and Plaza Blvd.	Priority	2	Yes
6	Harbor View Condos	SE Corner of 8th St and D Ave.	Priority	3	No

#	Project Name	Location	Project Type	Number of Reviews during 07/08	Approved during 07/08?
7	Hilltop View Homes	3000 8th St.	Priority	4	Yes
8	K Avenue Homes	K Ave., North of 13th St.	Priority	2	Yes
9	Marina Gateway	Marina Way, south of Bay Marina Dr.	Priority	3	Yes
10	Paradise Village	Area bounded by 4th St., 8th St., Arcadia Ave., and Bowron St.	Priority	3	Yes
11	Paradise Walk	Arcadia Ave and E. 8th St	Priority	3	Yes
12	Plaza Bonita Mall Expansion	3030 Plaza Bonita Rd.	Priority	2	Yes
13	Plaza Village	Corner of L Ave. and Plaza Blvd.	Priority	1	Yes
14	WestAir Gases	Haffley Ave. north of Bay Marina Dr.	Priority	2	Yes

Canyon Ridge went through multiple SUSMP reviews during the 2005/2006 reporting period and was found to meet the City's minimum BMP requirements late in that reporting year. Early in the 2007/2008 reporting period, changes were proposed to the project's treatment control BMPs during the site's construction. The City required the project to submit a revised SWMP with the proposed changes to the City for review before the changes were implemented at the site. The City requires that if a change to the proposed BMPs is made during construction that the substitute be comparable to the original in its efficiency and capacity to treat storm water runoff from the development. The resubmitted SWMP went through 2 reviews before the proposed changes met the City's minimum requirements.

K Avenue Homes and Plaza Bonita Mall Expansion are two additional projects that received initial approval early in the 2007/2008 reporting period and later resubmitted their SWMPs to include changes made to the proposed BMPs during construction. For Plaza Bonita, the change included the addition of a new store and restaurant in the mall's existing parking lot, which extended the footprint of the original project. The proposed site design, source control, and treatment control BMPs proposed for this additional area in the revised SWMP were found to meet the City's minimum requirements. For K Avenue Homes, changes were made to the design of the proposed grass filter strips on the property, with the new design resulting in an increase in treatment area.

Two Priority Projects, Grove Plaza and 940 W. 19th Street, were approved after March 24, 2008. Of these two projects, only Grove Plaza had approved treatment control BMPs with a low removal efficiency ranking approved (two hydrodynamic separators). Note that while the City approved this low removal efficiency BMP, the City worked closely

with the project to incorporate LID principles into the project's design throughout the review process. Flow-through planter boxes and grass swales have been proposed to treat roof and sidewalk runoff from the project. Also, instead of using conventional asphalt for the entire parking lot, the project has proposed to use pervious concrete in the parking stalls, limiting asphalt to only the drive isles. This design reduces the amount of impervious paving on the site by 48 percent. However, the proposed LID features could not be designed to meet the SUSMP's treatment control BMP sizing requirements. While the City believes that the combination of LID and treatment control BMPs for this project will provide storm water treatment to the maximum extent practicable, the City still required the project to prepare a feasibility analysis stating why the other treatment control BMPs in the City's SUSMP could not be used for the project. A copy of the project's feasibility analysis is included as Attachment 4.1 to this annual report.

During the reporting period, no projects received a SUSMP waiver for implementation of treatment control BMPs. The City has never issued a SUSMP waiver in the past, and at this time the City has no plans to develop a SUSMP waiver mitigation program.

Hydromodification Management Plan

During the reporting period the Copermittee hydromodification management workgroup met regularly to discuss key HMP development issues and provide updates on the status of consultant work products. The City of National City regularly participated in the hydromodification management workgroup during 2007/2008. Note that in the summer of 2008 the workgroup name was officially changed to the Land Development Workgroup.

The City's current SUSMP Ordinance contains detailed Interim Hydromodification Criteria (IHC) which the City will continue to implement until the HMP is finalized. None of the development projects undergoing the City's review process during the reporting period were subject to the IHC since all of these projects are less than 50 acres. Final HMP requirements have not yet been established by the Land Development Workgroup. Once the HMP is developed and approved by the Regional Board, the City will incorporate the HMP into its SUSMP Ordinance.

BMP Installation Verification

Both the Plaza Bonita Mall Expansion and Plaza City Apartments SUSMP projects were completed during the 2007/2008 reporting period. For these projects, City inspectors verified and documented that the proposed BMPs were installed according to the project's plans during routine plan checks, prior to granting occupancy for the site. Both projects have been finaled and added to the City's treatment control BMP inventory included in Appendix A. These projects have also been assigned a TTWQ priority using the prioritization flow chart presented in the City's JURMP. Operation and maintenance inspections for the installed BMPs will be performed as required for these projects during future reporting periods.

2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

The City's treatment control BMP inspection program did not go into effect until March 24, 2008, significantly after the start of the 2007/2008 wet season, which began on October 1, 2007. Therefore, the City did not have the opportunity to inspect the high TTWQ development projects included on its inventory prior to the start of the wet season during the reporting period. However, inspections were conducted for projects with treatment control BMPs during the 2007/2008 fiscal year after March 24, 2008 in compliance with the minimum inspection frequencies outlined in the City's updated JURMP. Only three completed SUSMP projects on the City's 2007/2008 inventory were not inspected during the reporting period. These sites have been categorized as either medium or low TTWQ, and they will still be required to submit an annual maintenance verification form documenting proper maintenance of their BMPs prior to October 1, 2008.

The site-specific inspection forms generated using the City's electronic BMP database to perform BMP inspections at the individual project sites were used. GPS coordinates and narrative location descriptions for many of the BMPs included in the City's inventory were collected during previous reporting periods are stored into the City's electronic BMP database. This location information is automatically printed on the project's customized inspection form and allows the inspector to locate BMPs efficiently without needing to carry cumbersome project plan sheets to the inspection site. While not explicitly required by the Municipal Permit, the City also examined structural site design and source control BMPs during each site visit. Table 2-2 lists the 13 development projects inspected during the reporting period, the percentage of BMPs at the site that were properly installed and maintained, and brief description of inspection findings. Public Priority Projects, known as Capital Improvement Projects (CIP) are marked as such in the table. The BMP types installed at these sites and the sites' TTWQ priorities are included in the City's treatment control BMP inventory, which is included in Appendix A.1 of this JURMP Annual Report.

Table 2-2
Summary of Treatment Control BMP Inspection Results

#	Project Name	Inspection Notes
1	Bonita Creek	Only site design/source control BMPs observed at the site.
2	Estrella Walk	CDS unit operational and well maintained.
3	Jack in the Box	All drainage inserts observed had moderate to high levels of trash and debris.
4	Mariposa Walk	Only site design/source control BMPs observed at the site.
5	National City Batch Plant	Wet ponds on site were operational and well maintained.

#	Project Name	Inspection Notes
6	National City Fire Station #34 (CIP)	All BMPs operational and well maintained.
7	Paradise Creek Park (CIP)	Only site design/source control BMPs observed at the site.
8	Penske Truck Leasing	All drainage inserts observed had moderate to high levels of trash and debris.
9	Plaza Village	No maintenance deficiencies noted.
10	Sweetwater Town & Country Mall	All drainage inserts observed had moderate to high level of trash and debris.
11	Tremont Court Condominiums	Grass filter strips and drainage inserts not observed. CDS unit operational and well-maintained.
12	Walgreens	All drainage inserts observed had moderate to high levels of trash and debris.
13	Wal-Mart	CDS unit contained significant trash and debris.

During routine inspections of SUSMP BMPs, the City discovered that some of the proposed BMPs were missing at Bonita Creek, Mariposa Walk, and Tremont Court. The City mailed letters requesting information about the status of all BMPs at the site, including BMPs that could not be located, to these sites early in the 2008/2009 reporting period. Depending on the results of the information returned from the projects and results of future site visits, the City will take additional enforcement action if necessary.

Two drainage insert were found to be missing during a routine SUSMP treatment control BMP inspection at Paradise Creek Educational Park, and the City will replace these BMPs.

Corrective actions were recommended for all development projects with BMPs observed in need of maintenance. Since inspections were conducted close to the end of the reporting period, follow-up actions were unable to be completed during the 2007/2008 fiscal year. The City did mail BMP operation and maintenance verification letters to all the inspected sites in early 2008/2009, and the City will continue to follow up with these sites during 2008/2009. No sites were observed to present a significant threat to human health or the environment during inspections, so none were reported to the RWQCB.

In addition to City-conducted maintenance inspections, the Municipal Permit requires annual verification of operation and maintenance of treatment control BMPs installed within the City's jurisdiction. Annual verification must be provided by the party responsible for treatment control BMP maintenance and must be returned to the City prior to the start of the wet season (October 1st). Since this portion of the City's program did not go into effect until March 2008, towards the end of the wet season, the City was not able to require annual maintenance verification of treatment control BMP maintenance prior to the 2007/2008 wet season, which began October 1, 2007. The City did, however, begin the process of obtaining annual BMP maintenance verifications for the 2008/2009 fiscal year.

A project-specific BMP maintenance verification form and introductory letter were developed during the 2007/2008 reporting period. Using the property owner names and addresses recorded in the City's BMP database, BMP maintenance verification forms were mailed to all the projects included in the City's BMP database in early 2008/2009. The template introductory letter and an example BMP maintenance verification form are included as Attachment 2.2 to this JURMP Annual Report. It is anticipated that this verification program will help raise the level of knowledge about storm water BMPs among the parties responsible for maintenance. The City will follow up with projects that do not return the annual maintenance verification forms or return incorrectly completed forms.

2.5 Development Planning Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

2.6 Program Review and Modification

The City's JURMP was recently updated in March 2008. No changes to the City's development planning component have been made since that time.

3.0 CONSTRUCTION

3.1 INTRODUCTION

The City began implementation of new Municipal Permit requirements related to construction activities on October 1, 2007. New inspection frequencies and minimum BMP requirements were implemented for the remainder of the fiscal year. As a result, the overall implementation of the City's construction program remained largely the same throughout the reporting period. The City made some additional modifications to improve its program in late March 2008 as part of its JURMP update. These changes included additions of requirements limiting maximum disturbed area and calling for the use of advanced treatment methods in certain instances. Some modifications to standard forms used in the construction program were also made.

3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- Distributed storm water requirements applicability checklists to all development projects in the City's jurisdiction.
- Conducted plan checks of erosion control plans and SWPPPs to ensure construction projects planned to comply with the City's minimum BMP requirements.
- Conducted training for applicable City staff regarding the construction requirements in the City's updated JURMP.
- Conducted 88 construction inspections at 78 sites per the frequency in the updated JURMP. During the wet season, high TTWQ sites were inspected bi-weekly, medium TTWQ sites monthly, and as needed for low TTWQ sites.
- Issued four verbal warnings, two administrative citations, and two stop work orders to construction sites in response to violations of the City's minimum BMP requirements.

3.2 SOURCE CHARACTERIZATION

An inventory of active construction projects during the reporting period is presented in Appendix A of this JURMP Annual Report document. The City's inventory was maintained throughout the reporting period by entering permit application forms into the City's inventory spreadsheet on a continuous basis. New construction projects were added to the inventory at the start of construction, and projects were removed from the inventory after construction was completed. Since construction projects were continually being added and removed throughout the fiscal year, inventory updates

were usually performed more frequently than the minimum once per month.

3.3 Updates to Ordinances and Approval Processes

The City updated its Grading Ordinance and its Storm Water Management and Discharge Control Ordinance during the reporting period as part of the City's JURMP update. Details on these revisions can be found in Section 5 of the City's updated JURMP. Details on any changes to the City's approval process during the reporting period are discussed in Section 3.5 of this document.

3.4 Best Management Practice Requirements

The City's updated construction and grading requirements are detailed in section 5.4 of the City's updated JURMP document. The City's updated BMP requirements were implemented starting in March 2008. The construction component of the updated JURMP is not significantly different than the construction element of the previous JURMP that was in effect prior to March 2008. The main differences are that the updated JURMP includes a provision that allows the City to require advanced treatment at sites that pose an exception threat to water quality and a provision that limits the maximum disturbed area to 17 acres unless special approval is obtained.

3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below.

3.5.1 Education and Staff Training

Education and staff training implemented during the 2007/2008 fiscal year focused on communicating changes made to the City's construction requirements to both City staff and the construction community. Please see Section 8 of this JURMP Annual Report document for details on trainings performed and educational materials distributed related to construction and grading activities.

3.5.2 Construction and Grading Approval Process

During the reporting period, City personnel verified that all construction projects planned to implement the City's minimum BMP requirements prior to issuing any building or grading permits. The City conducted its grading approval process as described thoroughly in Section 5 of the City's updated JURMP. The City requires grading construction projects to submit erosion control plans that indicate what BMPs are to be used at the site. These erosion control plans are reviewed by the City to ensure the site plans to meet the City's minimum construction BMP requirements. The City also reviews Storm Water Pollution Prevention Plans (SWPPPs) for sites greater than

one acre that are required to obtain coverage under the General Construction Permit. Approved forms and documents completed by project proponents are kept with each project's file at the City for reference. A Construction BMP fact sheet, known as the "Blue Sheet" within the City because the copies distributed are on blue paper, was also distributed with all construction permits issued (Attachment 3.1). Proper implementation of the minimum BMPs listed on the fact sheet was a condition of approval for all permits issued by the City during the 2007/2008 fiscal year.

During the report period the City began enforcing a 17 acre maximum of disturbed area for grading activities. During the reporting period, none of the City's active construction sites were larger than 17 acres, and the maximum disturbed area limitation did not apply. However, all construction sites were still required to limit exposed cleared or graded areas to the amount of area that could be protected prior to a rain event, as prescribed in the City's seasonal BMP requirements.

The City also began implementing advanced treatment requirements during the reporting period. Criteria for determining when advanced treatment is required are detailed in the City's updated JURMP. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites within the City's jurisdiction, and advanced treatment methods were not required at any construction sites.

3.5.3 Inspection of Construction Sites

Appendix A.2 of this JURMP Annual Report contains a list of construction projects that were active during the reporting period, along with their assigned TTWQ priorities, the number of weeks the site was active within the rainy season, the numbers of inspections conducted during the wet and dry seasons, the number of follow-up inspections and complaint investigations, and the total number of inspections for each site. In total, 88 construction inspections were performed for 78 construction sites, not including the building inspections at low priority sites, which also include a storm water component.

Construction inspections conducted during the reporting period were performed as described in the City's updated JURMP. Key components of the inspections include checks for coverage under the General Construction Permit during the initial inspection and assessments of compliance with the City's BMP and discharge requirements during all inspections. Responsible parties at the sites are educated as needed during inspections. Copies of the inspection forms are kept on file at the City. The City conducted inspections at high TTWQ construction sites bi-weekly during the wet season and monthly for medium TTWQ sites. Low TTWQ sites were inspected on an as needed basis. Typically, formal inspections were not conducted at low TTWQ sites unless a complaint was called into the City's storm water hotline. Building inspectors have been trained in the City's minimum construction BMP requirements and provided with additional oversight for low TTWQ construction sites that do not receive routine formal inspections. Any sites found to have problems with BMP implementation are forwarded to the City's Storm Water Compliance Inspector. During the reporting

period, 3 inspections of low TTWQ construction sites were conducted as complaint investigations. These sites are indicated on the City's inventory in Appendix A.2.

When any violations were noted during routine, follow-up, or complaint investigation inspections, these violations were noted on the project's inspection form, and the sites were given a list of corrective actions necessary to fix the observed violation. When necessary, appropriate enforcement actions were taken, and the City inspector followed up with the site until compliance was achieved. Details on the enforcement actions taken for construction sites during the implementation period are described below.

3.5.4 Enforcement Measures

Table 3-1 includes the number of violations and enforcement actions taken during the reporting period in response to violations of the City's minimum construction BMP requirements. Enforcement actions are administered in an escalating manner as described in the City's updated JURMP.

Table 3-1
Total Number of Violations and Enforcement Actions Taken

Violations	Verbal Warnings	Written Warnings	Follow-Up Inspections	Administrative Citations	Stop Work Orders
13	4	0	2	2	2

During the reporting period, two construction projects were observed to have illegal discharges and were issued administrative citations. Additionally, two low TTWQ construction sites were issued Stop Work Orders when they failed to implement the City's minimum construction BMP requirements. In both cases, proper BMPs were implemented promptly and the Stop Work Orders were lifted. The City's updated JURMP commits to notifying the Regional Board within five working days of issuing a Stop Work Order and the City began implementing this new procedure on October 1, 2007. Since both Stop Work Orders were issued prior to October 1, 2007, the Regional Board was not notified in these instances. Further details regarding all enforcement actions taken during the reporting period can be found in Section 7 of this document.

None of the violations observed at construction sites during the reporting period were found to endanger human health or the environment. The City was able to address these violations through the City's established enforcement process, and it was not necessary to report any of these sites to the RWQCB.

3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

3.7 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was recently updated in March 2008. No changes to the City's construction component have been made since that time.

4.0 MUNICIPAL COMPONENT

4.1 INTRODUCTION

Throughout 2007/2008, the City of National City continued to manage municipal areas and activities to reduce discharges of pollutants to the MS4 to the MEP. As required by the Municipal Permit, the City updated its JURMP document in March 2008. Any changes made to the City's Municipal Component were implemented by the formal adoption date required by the Municipal Permit, March 24, 2008.

As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. Public parks and recreation facilities, administrative buildings, fire stations, and public works facilities make up the bulk of the municipal areas in the City. Municipal activities conducted by the City include but are not limited to power washing, graffiti abatement, building maintenance, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2.

4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City inspected all high TTWQ fixed municipal facilities.
- The City removed a total of 1,151 tons of debris from street sweeping activities.
- The City removed a total of 39.6 tons of debris from standard MS4 cleaning activities, not including drainage insert maintenance. City personnel spent 826 man-hours completing this task.
- The City continued to maintain BioClean filter inserts in catch basins at the City's Public Works Yard. A total of 10 pounds of debris was removed from these filter inserts during 2007/2008.
- The City spent 1,500 man-hours maintaining 450,725 linear feet of sanitary sewer line.
- A total of 3,000 linear feet of sewer line was televised during 2007/2008, which led to the discovery of some areas of the sanitary sewer system in need of repair. The City replaced 500 linear feet of sewer line during 2007/2008. This prevented these areas from becoming future seepage points.

4.2 FIXED FACILITIES

4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category, fixed facilities, because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar. For the purposes of organization, municipal fixed facilities are divided into the following categories: Parks and Recreational Facilities, Public Works Facilities, Fire Stations, and Other Fixed Facilities, which includes fixed facilities that could not be placed into another category.

4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included on the City's municipal inventory, which was revised during the JURMP update in early 2008. The JURMP includes detailed descriptions of each of the categories mentioned in the previous subsection and a discussion of activities beyond what is suggested by the facility's category or facility name. There were no changes to the City's municipal inventory nor were there any updates to the discussions of any fixed facilities on the City's inventory. The City's inventory is included as Appendix A.3.

4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs at all fixed municipal facilities. As mentioned in the City's JURMP, the City uses the CASQA Municipal BMP Handbook to establish appropriate BMPs for fixed municipal facilities. Table 6-2 in the City's JURMP describes the CASQA fact sheets that are used for specific facility types.

The City continues to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. The BMP requirements have not been changed since the City's JURMP was updated in March 2008.

City public works employees, fire station employees, and employees at other fixed facilities in the City continue to implement BMPs appropriate to the facility type, as described in the City's JURMP. City fire response personnel continue to be trained in implementing BMPs for non-emergency fire fighting activities as described in Section 3 of the City's JURMP. There have been no changes in BMP requirements for public works facilities, fire stations, and other fixed facilities.

4.2.4 PROGRAM IMPLEMENTATION

As mentioned above, the City's BMP requirements have not changed since the development of the revised JURMP. Some notable examples of implementation of those BMPs are provided below.

Parks and Recreational Facilities
During 2007/2008, the City used six tons of fertilizer, 22 pounds of rose fertilizer, and 88 gallons of liquid herbicides. The rose fertilizer contains a pesticide component and is stored in limited quantities.

Public Works Facilities, Fire Stations, Other Fixed Facilities
As previously mentioned, City personnel continued to implement appropriate BMPs for municipal fixed facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance (i.e. landscaping, building maintenance, etc.) as necessary. Parking facilities associated with fixed municipal facilities were swept quarterly during 2007/2008, and the large paved areas at the City's Public Works Yard were swept weekly. Public Works employees continued to implement a SWPPP at the Public Works Yard. Public Works employees also continued to maintain the BioClean filter inserts on the property as needed.

Municipal Inspections
All high TTWQ fixed municipal facilities received an annual routine inspection in 2007/2008. An additional municipal inspection was conducted at a medium TTWQ fixed municipal facility, the George H. Waters Nutrition Center, to gain a better understanding of the type and extent of food preparation activities that take place there. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2007/2008. The City's municipal inspection form is included as Attachment 4.1.

Corrective actions recommended to the eight high TTWQ facilities were relatively minor. Table 4-3, at the end of the section, lists all inspections conducted at fixed municipal facilities in 2007/2008, the date the inspection was performed, and the recommended corrective actions from the inspections, as applicable. In addition to one annual inspection by other City personnel, public works personnel self inspect both the Public Works Yard East and Public Works Yard West weekly; street crew personnel inspect the Public Works Yard West and equipment maintenance crew inspect the Public Works Yard East. Inspection forms are completed and submitted to the City's Storm Water Compliance Inspector.

4.3 ROADS, STREETS, HIGHWAYS, AND PARKING FACILITIES

4.3.1 BACKGROUND

Roads, streets, highways, and parking facilities are often one of the first components of the City's MS4 to collect and convey runoff. These areas can collect a variety of

pollutants due to routine vehicle use and use of the surrounding areas. The City conducts regular maintenance of roads, streets, highways, and parking facilities in the City to control pollutants such as sediment, metals, and litter and debris, that may accumulate and then be discharged with runoff.

4.3.2 SOURCE CHARACTERIZATION

Roads, streets, and highways are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

4.3.3 BEST MANAGEMENT PRACTICES

The City's primary BMP for roads, streets, highways, and parking facilities is street sweeping. Other BMPs are chosen as needed based on the CASQA Municipal Handbook. The City's sweeping frequency is outlined in the JURMP and described in the following subsection. There were no changes to the BMPs implemented for roads, streets, highways, and parking facilities in 2007/2008.

4.3.4 PROGRAM IMPLEMENTATION

During 2007/2008, the City swept a total of 15,500 curb miles, removing approximately 1,151 tons of debris. High priority streets in the City are swept at least every two weeks, and medium priority streets in the City are swept at least monthly. The City has not designated any streets in the City as low priority. The City does not maintain any stand-alone parking facilities that are not associated with municipal facilities. Parking facilities that are associated with municipal facilities are maintained and swept during regular maintenance activities at the respective municipal facility, and are considered part of the municipal facility on the inventory. Table 4-1, below, describes the areas assigned high and medium priorities, and the associated sweeping frequency. The table also includes the sweeping frequency for areas of fixed municipal facilities.

As a means to address priority pollutants in the San Diego Bay Watershed, the City conducted additional sweepings of the all streets in the City. High priority streets were swept daily during 2007/2008; Medium priority streets were swept every two weeks during 2007/2008.

Table 4-1
Street Sweeping Prioritization and Frequency

Category	Description	Approximate Mileage of Route	Sweeping Frequency
High	8th Street, National City Boulevard, Highland Avenue, Plaza Boulevard	11.8 miles	At least every two weeks
Medium	All other streets in the City	98.2 miles	At least once per month
Fixed Facilities	Parking lots associated with municipal fixed facilities	N/A*	Quarterly

Table 4-1
Street Sweeping Prioritization and Frequency

Category	Description	Approximate Mileage of Route	Sweeping Frequency
Fixed Facilities - Parks	Parking lots associated with parks	N/A*	Every two weeks
Fixed Facilities – PW Yard	Public Works Operation Center	N/A*	Weekly
Total Amount of Debris Collected from Street Sweeping Activities: 1,151 tons			

* Mileage data is not available for the swept area of parking facilities associated with municipal facilities, and the PW Yard. Mileage accrued while sweeping these facilities is included in the total mileage.

4.4 MS4

4.4.1 Background

The City's extensive storm water conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during a rain event. The City's MS4 consists of approximately 19 miles of inlets, pipes of varying materials, natural channels, concrete channels, and culverts and 751 catch basins and inlets.

4.4.2 Source Characterization

The City's MS4 as one complete entity is included on the City's high TTWQ municipal inventory.

4.4.3 Best Management Practices

The City maintains a strict MS4 maintenance and cleaning schedule. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. As described in the City's JURMP, BMPs for MS4 maintenance activities are chosen based on the CASQA Municipal Handbook and have not changed during 2007/2008.

4.4.4 Program Implementation

The City implemented a rigorous MS4 inspection and cleaning schedule during 2007/2008. The City continues to track municipal activities, such as MS4 channel cleaning, in a Microsoft Access database. The City inspected and cleaned all MS4 cleanout locations in 2007/2008, as described in Table 4-2, below.

Table 4-2
MS4 Maintenance Data

	Percent inspected and/or cleaned*	Percent of open channels found with anthropogenic litter	Amount of debris removed from cleaning activities
Catch Basins/Self Cleaning MS4 Facilities	100%	N/A	2,213 pounds
Open Channels	100%	100%	192.6 cubic yards
Drainage Inserts	100%	N/A	10 pounds
Total Debris Removed From MS4 Maintenance Activities: 39.6 tons**			

* No structures were observed at least 33% of capacity during the reporting period. However, the City cleans out any structures, including self-cleaning structures, in which trash and debris is observed at the time of inspection.

** 192.6 cubic yards of debris was removed during channel maintenance activities. The weight of the material removed was not recorded. Since trash the most common item removed from channel maintenance activities, a conversion factor of 400 pounds per cubic yard was used to estimate the total weight of the material removed.

The City's cleanout locations are access points to various sections in the City's MS4, so no additional pipe beyond the cleanout location is typically cleaned. The City will use the vactor truck to clean the MS4 line in the event of a spill. During 2007/2008, there were two spills for which some additional cleaning of the MS4 had to be conducted. More information about the spills that occurred in the City during 2007/2008 is included in Section 7 of this Annual report.

During 2007/2008, the City continued to inspect the open channels in the City and remove trash and debris as necessary by hand. If litter or debris is observed during the routine inspections, it is removed immediately. The total length of the channel segments inspected and cleaned by City staff is approximately 19,045 linear feet.

4.5 Sanitary Sewer System

4.5.1 Background

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. Routine inspection and maintenance of the sanitary sewer system works to reduce the potential for a spill or SSO and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

4.5.2 Source Characterization

The City maintains a system of public sanitary sewer pipes to convey wastewater from the City to be treated. The sanitary sewer system, as one complete entity, is included on the City's high TTWQ municipal inventory.

4.5.3 BEST MANAGEMENT PRACTICES

The City implements BMPs from the CASQA Municipal Handbook, as described in the City's JURMP, during sanitary sewer maintenance. There have been no changes to these BMPs during 2007/2008. The City inspects and maintains the sanitary sewer system as part of regular wastewater activities. The City clears blockages and repairs leaks as needed.

4.5.4 PROGRAM IMPLEMENTATION

The City has also worked to develop a Fats, Oils, and Grease (FOG) program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs. The City is continuing to develop this program; updates to the program will be included in future JURMP Annual Reports.

The City seeks to eliminate seepage from the sanitary sewer system to the MS4 by routine preventative maintenance of both systems. Routine maintenance of both systems allows the City to find areas that are likely to become problems in the future and make the necessary repairs/replacements before any larger issues arise. The City also continued to conduct flow metering throughout its sanitary sewer system to monitor for evidence of potential problems. A total of 1,500 man-hours were spent maintaining a total of 450,725 linear feet of sewer line during 2007/2008. Silt and grease were listed as the most common items removed from sanitary sewer maintenance activities. A total of 3,000 linear feet of sewer line was televised during 2007/2008, which led to the discovery of some areas of the sanitary sewer in need of repair. During 2007/2008, the City replaced 500 linear feet of sewer line. This prevented these areas from becoming future seepage points.

The City maintains a Sanitary Sewer Management Plan (SSMP) which establishes procedures for responding to an SSO. Detailed information about the City's SSO spill response plan is included in the City's JURMP. There was one SSO during 2007/2008, which is detailed in Section 7 of this Annual Report.

4.6 MOBILE MUNICIPAL ACTIVITIES, INCLUDING POWER WASHING

4.6.1 BACKGROUND

The City conducts a variety of different mobile municipal activities, typically involving infrastructure maintenance, landscape maintenance, graffiti removal, and power washing.

4.6.2 SOURCE CHARACTERIZATION

Both power washing and graffiti removal are listed on the City's high TTWQ municipal inventory. Infrastructure maintenance and landscape maintenance are listed on the City's medium TTWQ municipal inventory.

4.6.3 BEST MANAGEMENT PRACTICES

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel are trained to implement BMPs for the specific activity in which they are involved. For example, City personnel performing power washing are trained to collect all waste water, and City personnel conducting graffiti removal are trained to store and handle any chemicals properly. A more detailed discussion of BMPs for specific mobile activities is included in the City's JURMP.

4.6.4 PROGRAM IMPLEMENTATION

During 2007/2008, City personnel continued to implement BMPs during mobile municipal activities such as power washing and graffiti removal. Most importantly, City personnel collect any water generated by activities such as power washing and dispose of it properly. City personnel are provided with a handout that gives a summary of appropriate BMPs for power washing activities and reminds personnel that water generated by such activities must always be collected and disposed of properly.

These activities were not available for inspection after the formal adoption of the JURMP in March 2008, so an inspection could not be conducted during the 2007/2008 reporting period. In the event that these activities are conducted during the 2008/2009 reporting period they will be inspected. There were no notable instances of BMP related infractions or other non-compliance relating to mobile municipal activities during 2007/2008.

4.7 SPECIAL EVENTS

4.7.1 BACKGROUND

As detailed in the City's JURMP, a variety of different special events are hosted within the City. Notably, the City's largest special event is an annual July 4th celebration.

4.7.2 SOURCE CHARACTERIZATION

As required by the Municipal Permit, special events are included on the City's high TTWQ municipal inventory.

4.7.3 BEST MANAGEMENT PRACTICES

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage

trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter/debris from the event, and raise storm water awareness among the vendors and patrons of the event, as applicable.

4.7.4 Program Implementation

The City did not host any special events after the formal adoption of the updated JURMP, so there were no special events available for inspection during 2007/2008.

4.8 Education and Outreach

During 2007/2008, the City continued to educate municipal personnel regarding proper BMP implementation and other storm water and watershed concepts. Information regarding the education and outreach conducted for City personnel is described in detail in Section 8 of this Annual Report.

4.9 Municipal Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

4.10 Program Modification and Review

The City's JURMP was recently updated in March 2008. No changes to the City's municipal component have been made since that time.

Table 4-3
Municipal Inspection Results

#	Facility Name	Facility Address	TTWQ	Inspection Date	Recommended Corrective Actions
1	Public Works West Yard	2100 Hoover Ave	High	6/25/2008	• Keep site free of litter and debris
2	Sweetwater Heights Park	Cagle Street & Stockman Street	High	6/25/2008	• None
3	Municipal Swimming Pool	1800 East 22nd Street	High	6/25/2008	• Keep parking lot free of oil stains, litter, and sediment • Cover small soil pile properly; keep sidewalk free of soil • Keep dumpster lids closed when not in use
4	Las Palmas Park	1800 Newell Street	High	6/25/2008	• Keep site free of sediment and debris
5	El Toyon Park	2005 East 4th Street	High	6/25/2008	• Keep site free of sediment and debris • Work to eliminate over-irrigation • Keep parking lot free of oil stains
6	Kimball Park	12th Street & D Avenue	High	6/25/2008	• Keep planters free of trash • Keep surface drains free of grass clippings and trash • Keep dumpster lids closed when not in use
7	Public Works East Yard	2100 Hoover Avenue	High	6/25/2008	• Keep storage yard free of oil stains
8	National City Municipal Golf Course	1439 Sweetwater Road	High	6/25/2008	• Large outlet channel needs to be cleaned. • Clean secondary containment of debris and rainwater; cover from rainfall
9	George H. Waters Nutrition Center	1415 D Avenue	Medium	1/31/2008	• Prevent all wash water generated from washing mats from entering the storm drain. • Keep dumpster lids closed when not in use. • Contact the waste management company to determine if disposal of contained grease to the dumpster is permissible.*

*Since this inspection the City determined that disposal of grease to the dumpster is permissible if the container is sealed.

Note: Roads, streets, highways, and parking lots; the MS4; and the sanitary sewer system were inspected via the maintenance effort described earlier in this section.

5.0 INDUSTRIAL AND COMMERCIAL

5.1 INTRODUCTION

During 2007/2008, the City continued to implement a program to mitigate urban runoff pollution from the areas and activities of industrial and commercial businesses. As part of the JURMP revision, updates were made to the City's industrial and commercial site/source prioritization process, minimum BMP requirements, and inspection frequencies. The City's updated program was implemented after the formal adoption date of the JURMP in March 2008. Through various aspects of the industrial and commercial program, the City aims to reduce the amount of pollutants discharged from these facilities.

5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the industrial and commercial component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City met the Municipal Permit requirement of inspecting at least 20 percent of its stationary industrial and commercial inventory.
- The City met the Municipal Permit requirement of inspecting at least 50 percent of inventoried high TTWQ industrial and commercial facilities.
- The City completed pollutant discharge potential assessment (PDPA) forms at inspections to aid in source identification efforts.
- Based on inspection findings and complaints made to the hotline, the City issued nine NOVs, 11 administrative citations, and 22 notices of correction to industrial and commercial businesses.

5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES / SOURCES ELEMENT

5.2.1 BACKGROUND

The City's industrial and commercial inventories, which can be found in Appendix A, include all stationary facilities known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, auto repair shops, restaurants, wholesalers, and contractors. As discussed in the following subsections, the City requires industrial and commercial businesses to implement pollution prevention measures and designated minimum BMPs to mitigate the impacts of business activities on water quality.

5.2.2 SOURCE CHARACTERIZATION

The City's industrial and commercial inventories are included as Appendix A.4 and A.5, respectively. The inventories include both stationary and mobile businesses, as required by the Municipal Permit. The inventories were updated in mid 2007/2008 as part of the JURMP update using applicable data from the City's business license registry, the 2006/2007 inventory and inspection records, and the State's list of industrial sites covered under the State of California Industrial General Permit (Industrial Permit).

Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP. The City considers factors including those listed below when prioritizing the inventories:

- Industrial Permit subjectivity
- Consideration of downstream waterbody and whether the business is likely to discharge pollutants for which the waterbody is impaired
- Results from previous inspections and institutional knowledge
- Proximity to the receiving waterbody

The City's updated inventories include a total of 813 stationary industrial and commercial facilities.

5.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other BMPs to reduce or potentially eliminate the generation of pollutants from business areas/activities. The City has established a set of minimum BMPs based on the CASQA Industrial and Commercial Handbook. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. The City's BMP requirements are described in more detail in the City of National City Best Management Practice Manual, which is an attachment to the City's JURMP.

5.2.4 PROGRAM IMPLEMENTATION

Industrial and Commercial Inspections

During 2007/2008, the City conducted storm water compliance inspections at selected stationary industrial and commercial facilities; Table 5-1 provides a summary of the industrial and commercial site visits. The purpose of the inspections is to confirm that the City's minimum BMPs are being implemented at stationary industrial and commercial facilities.

Since requirements of the new Municipal Permit did not go into effect until March 2008, the industrial and commercial component of the City's storm water program was conducted under the Order No. 2001-01 requirements for the first part of the 2007/2008 fiscal year and under the new Municipal Permit requirements for the latter part of the 2007/2008 fiscal year. The City inspected at least 50 percent of the inventoried high TTWQ industrial and commercial facilities, which met the Municipal Permit's requirements for the first year of program implementation. All facilities in the City with

Industrial Permit coverage were also all inspected in 2007/2008, which meets the requirements of the previous municipal permit.

Table 5-1 below provides a summary of the industrial and commercial site visits. At least 50 percent of the high TTWQ sites were selected for inspection, and additional medium TTWQ sites and industrial facilities not considered high TTWQ were also selected for routine inspection. Additional sites selected for inspections were medium TTWQ, and were industrial facilities that are subject to the Industrial Permit. During the inspection process, the City also checked Industrial Permit compliance status when applicable. Businesses observed to be in violation of the Industrial Permit are included in Table 5-2. Table 5-3, at the end of the section, summarizes the results of the 150 full inspections conducted as part of the routine inspection program. The remainder of the sites were visited, but during the visit were found to have moved, be duplicates of other businesses, or not to be conducting activities for which inclusion on the City's inventory is necessary.

Table 5-1
Summary of Industrial and Commercial Site Visits

Facility Category	Initial List	Accounted For*	Percentage of Total Inventory
High TTWQ Industrial	15	17	2%
High TTWQ Commercial	117	88	10.8%
Additional Sites Selected for Inspection	43	85	10.4%
All Stationary Inventoried Sites	**817****	**--**	**23.2%**

* "Accounted For" means that the business was inspected, assessed during a site visit and found to not need an inspection, or found to not need an inspection when called to schedule a site visit.

** The number of sites selected for inspection in 2007/2008 was based on the inventory presented in the JURMP, which included 817 businesses. The final inventory presented in this JURMP Annual Report has been updated to account for inspection results during 2007/2008 and includes 813 stationary businesses.

Facility inspections were conducted in accordance with the protocol set in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. BMP deficiencies and corrective actions were recorded on the City's industrial and commercial inspection form, which is included in the City's JURMP, and discussed with facility personnel present during the inspection. The City also completed PDPA forms during the inspections as part of an additional data collection effort. The PDPA form is included with the City's inspection form, which is included in Attachment 5.1. More information about the results of this process is presented in Section 12 of this JURMP Annual Report.

The City did not rely on third party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third party inspection program.

General Industrial Permit

Industrial Permit compliance status was evaluated during the industrial and commercial inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business's standard industrial classification (SIC) code(s). The inspector then determined Industrial Permit subjectivity based on SIC code. Violations of any aspect of Industrial Permit requirements were recorded on the standard industrial and commercial inspection form and are presented in Table 5-2. The table includes businesses directed to file a Notice of Intent (NOI) and develop a Storm Water Pollution Prevention Plan (SWPPP) and monitoring program, as well as businesses that had filed an NOI but had failed to develop a SWPPP and monitoring program. The table also includes facilities that could potentially gain exemption from Industrial Permit requirements by completing notice of non-applicability/no exposure certification (NONA/NEC) paperwork. Each business was notified of any Industrial Permit-related non-compliance by the inspector.

Table 5-2
Violations of the Industrial Permit

#	Business Name	Street Address	Permit Subjectivity	Action to Correct Violation				
				File NOI	Develop SWPPP	Develop / Implement Storm Water Monitoring	Complete NONA/ NEC	Other/Comments
1	BAY CITY MARINE INC.	1625 CLEVELAND AVENUE	Mandatory					Ensure appropriate storm water monitoring is conducted.
2	CARROLL METAL WORKS, INC.	740 W 16TH STREET	Mandatory		✔	✔		
3	EPSILON SYSTEMS SOLUTIONS INC	2101 A Haffley Ave	Mandatory	✔		✔		Update the SWPPP to include the items indicated as not provided on page 4 of this form.

#	Business Name	Street Address	Permit Subjectivity	Action to Correct Violation				
				File NOI	Develop SWPPP	Develop / Implement Storm Water Monitoring	Complete NONA/ NEC	Other/Comments
4	FABRICATION TECHNO-LOGIES INDUSTRIES	2401 HAFFLEY AVENUE, A	Conditional	✔	✔	✔		If no materials are stored outdoors once move is complete, business may not have to file NOI.
5	FUTURA FIBERGLASS	730 W 19TH STREET	Mandatory					Conduct storm water sampling as required by the Industrial Permit.
6	GREG'S FIBERGLASS AND PAINTING	1804 CLEVELAND AVENUE, A	Mandatory	✔	✔	✔		
7	HANSON AGGREGATES NATIONAL CITY BATCH PLANT (2003 NC LLC)	601 W 12TH STREET	Mandatory					Ensure appropriate storm water monitoring is conducted.
8	HYPERBARIC TECHNO-LOGIES	3224 HOOVER AVENUE	Conditional	✔	✔	✔		
9	LA ESPIGA DE ORO BAKERY	320 HIGHLAND AVENUE	Conditional				✔	
10	MELHORN CONST-RUCTION	410 W 30TH STREET, B	Conditional	✔	✔	✔		
11	MOTOR MACHINE & SUPPLY	1602 HOOVER AVENUE	Conditional	✔	✔	✔		
12	NATIONAL IRON WORKS	832 HOOVER AVENUE	Mandatory	✔	✔	✔		
13	PRESIDENTIAL LIMOUSINE LLC	1428 MCKINLEY AVE	Conditional	✔	✔	✔		
14	ROYCE CABINETS & GRANITE INC	2120 WILSON AVE	Mandatory	✔	✔	✔		

#	Business Name	Street Address	Permit Subjectivity	Action to Correct Violation				
				File NOI	Develop SWPPP	Develop / Implement Storm Water Monitoring	Complete NONA/ NEC	Other/Comments
15	SHUTTER BUS LEASING	1726 WILSON AVENUE	Conditional	✔	✔	✔		
16	TITAN MARINE, INC	2236 MCKINLEY AVE	Mandatory	✔	✔	✔		
17	VALENCIA STONE AND TILE	1124 COOLIDGE AVENUE	Mandatory					Provide complete SWPPP, ensure storm water monitoring is conducted, or provide documentation of no qualifying rain events.

Education and Outreach

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to provide site-specific one-on-one education regarding storm water concepts and BMPs. Educational materials were provided as applicable; many businesses received a copy of the City's 2008 Storm Water Calendar, which can be found in Attachment 5.2.

Enforcement

Several industrial and commercial facilities were observed to be out of compliance with the City's municipal storm water ordinance and/or the Industrial Permit during inspections conducted in 2007/2008. Additionally, the City received a number of complaints through the City's storm water hotline. Details of the industrial and commercial complaint investigations are included in Section 7 of this Annual Report. The City issued the following enforcement actions in response to complaints:

- 22 Notices of Correction
- 11 administrative citations
- Nine NOVs

There were no instances of noncompliance found to present a significant threat to human health or the environment observed at stationary businesses during 2007/2008, so none were reported to the RWQCB.

5.3 MOBILE SOURCES

5.3.1 BACKGROUND

Due to the nature of activities of most mobile businesses, a major area of concern tends to be illegal discharges. In general, mobile businesses can be hard to identify, as many may not have City business licenses. Additionally, because many mobile businesses may be home based and activities do not occur in one fixed location, inspections of such facilities are impractical.

5.3.2 SOURCE CHARACTERIZATION

Known mobile industrial and commercial businesses, as described in the City's JURMP, are included on the City's inventory and are marked as mobile.

5.3.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

BMPs for stationary industrial and commercial facilities, as discussed earlier in this section, are required to be implemented for mobile activities, as applicable. BMPs for mobile businesses, including key principles, such as proper collection and disposal of any discharge, are discussed in the City's JURMP. There have been no updates to the BMP requirements as described in the JURMP.

5.3.4 PROGRAM IMPLEMENTATION

The City responds to calls to the City's storm water hotline regarding mobile businesses; however, there were no complaints made to the City's storm water hotline regarding mobile businesses during 2007/2008.

Education and Outreach and Enforcement

Mobile businesses were provided education as applicable. There were no enforcement actions taken against mobile businesses during 2007/2008. There were no instances of noncompliance of mobile businesses that were believed to present potential threats to human health or the environment observed during 2007/2008, so none were reported to the RWQCB.

5.4 INDUSTRIAL AND COMMERCIAL COMPONENT EFFECTIVENESS ASSESSMENT

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

5.5 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was recently updated in March 2008. No changes to the City's industrial and commercial component have been made since that time.

Table 5-3
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
1	99 CENT ONLY STORES	1320 HIGHLAND AVENUE	2/5/2008	• Treat oil stains. • Clean up the oil spills. • Keep the parking area free of sediment and trash. • Remove trash more often to prevent the trash dumpster from overflowing. Provide one more dumpster if it is needed. • Keep the dumpster lids closed when not in use.
2	A-1 ALLOYS RECYCLING CENTER	724 CIVIC CENTER DRIVE	6/4/2008	• Keep site free of sediment. • Keep dumpster lids closed when not in use. • Cover materials stored outdoors.
3	A-1 ALLOYS/ABC METALS, INC	1401 CLEVELAND AVENUE	2/4/2008	• None
4	A-1 HYDRAULICS SERVICE	2100 ROOSEVELT AVENUE	1/9/2008	• Clean oil stains in front of shop. • Clean up sediment and black powder and keep the front of shop free of sediment and black powder. • Keep the scrap metal and hydraulic hose recycling bins indoors or cover them when not in use. • Keep the dumpster lids closed when not in use.
5	ASIAN MARKET	3400 E 8TH ST STE 111-112	3/12/2008	• Keep site free of oil stains.
6	ASIAN NOODLES	1430 E PLAZA BLVD., E-12	1/15/2008	• Work with neighbors to treat the grease spills. • Keep the dumpster lids closed when not in use.
7	ASWAN HALL CATERING & BANQUET	401 MILE OF CARS WAY	3/14/2008	• Keep dumpster lids closed when not in use. • Keep trash area/enclosure free of sediment and trash.
8	AUTO TECK	1023 COOLIDGE AVENUE	1/30/2008	• Treat oil stains and keep the area free of stains. • Clean up parking area and keep it free of sediment and trash. • Keep the dumpster lids closed when not in use.
9	BASKIN ROBBINS ICE CREAM	1493 E PLAZA BLVD.	1/21/2008	• Work with the neighbors to keep the dumpster area clean and free of trash. • Keep the dumpster lids closed when not in use.

Table 5-3 (Continued)
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
10	BAY CITY MARINE INC.	1625 CLEVELAND AVENUE	6/9/2008	• Keep discharge locations free of sediment. • Keep parking lots, sidewalks, and streets free of sediment. • Cover materials stored outdoors. • Contain outdoor work area to prevent storm water run-on or conduct all work indoors. • Keep outdoor work area(s) and/or areas behind shop free of sediment and spills. • Keep parking areas free of sediment.
11	BIRRIAS CHIVOS & CHEVES	2401 HIGHLAND AVE STE 104	3/12/2008	• Keep trash area/enclosure free of sediment, trash, and debris.
12	BREAD DELUX BAKERY, ETC.	1420 E PLAZA BLVD., D-1	1/17/2008	• Keep the dumpster lids closed when not in use.
13	C & W DIVING	1706 HOOVER AVENUE	2/1/2008	• Improve general housekeeping BMPs, including timely sweeping and clean up of sand, sediment, and metal debris. • Reduce material storage in outdoor exposed areas, especially corroding metal parts. • Keep dumpster lids closed when not in use.
14	C&M MOTORS INC.	904 ROOSEVELT AVENUE	3/14/2008	• Keep parking lots, sidewalks, and streets free of sediment and trash. • Keep dumpster lids closed when not in use. • Cover materials stored outdoors. • Raise materials stored outdoors off of the ground. • Keep outdoor work area(s) and/or areas behind shop free of sediment, trash, and spills. • Keep loading and unloading areas free of sediment, trash, and spills. • Keep parking areas free of sediment, trash, and spills. • Conduct vehicle maintenance activities in a covered area or indoors.
15	CAFÉ LA MAZE	1441 HIGHLAND AVENUE	3/12/2008	• Keep dumpster lids closed when not in use. • Keep parking areas free of spills/oil stains.

Table 5-3 (Continued)
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
16	CALIFORNIA AUTO DETAILING	1509.5 NATIONAL CITY BLVD.	2/1/2008	• Ensure that all spray water is prevented from leaving the building using the plastic curtains and any other means necessary. • Prevent transport of sediment in the case of water spillage by keeping sidewalk and outside free of sediment.
17	CALIFORNIA PRODUCE CORPORATION	1736 E PLAZA BL	3/13/2008	• Keep site free of sediment, trash and debris. • Ensure water generated by pressure washing activities is collected and disposed of properly. • Increase trash pick up frequency or acquire more dumpsters to prevent dumpsters from overflowing. • Keep dumpster lids closed when not in use. • Keep trash area/enclosure free of the trash. • Cover materials stored outdoors. • Do not hose off outdoor areas of site; if hosing is necessary, collect all wash water and dispose of to the sanitary sewer system. • Keep the area behind the shop free of food debris.
18	CAR SOURCE	1 W 35TH STREET	2/4/2008	• Work with neighbors to store exposed material raised off of the ground and covered. All fluid containers and batteries should also have secondary containment. • Remove all trash and debris from site. • Keep parking area free of sediment and leaves. • Dispose of waste at a hazardous material collection facility.
19	CARLS' JR.	1502 SWEETWATER ROAD	3/17/2008	• Keep trash enclosure area free of sediment, trash and debris. • Keep parking area free of spills and oil stains. • Keep the grease bin free of grease. • Provide overhead cover for waste grease bin.
20	CARLS JR. #120	1280 E PLAZA BLVD.	1/15/2008	• Clean up the grease bin and keep it free of grease. • Clean up dumpster enclosure area and ground. • Keep the eastern parking lot free of sediment.

Table 5-3 (Continued)
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
21	CARRERA'S AUTO DETAIL	2130 ROOSEVELT AVENUE	2/1/2008	• Clean up the trash and debris on the site and keep it clean. • Ensure that wash water does not exit the wash area on the site. • Keep dumpster lid closed when not in use.
22	CARERRA'S AUTO DETAILERS	2130 ROOSEVELT AVENUE	2/4/2008	• Eliminate outdoor exposure of material storage, including automotive parts, scrap metal bins and batteries. • Provide secondary containment for all automotive fluid containers. • Work with neighboring businesses to eliminate the uncontained trash observed in the northwest corner and trash enclosure. • Keep dumpster lids closed when not in use.
23	CARROLL METAL WORKS, INC.	740 W 16TH STREET	6/10/2008	• Keep discharge locations free of sediment. • Keep parking lots free of sediment. • Keep parking areas free of sediment.
24	CASA DE ORO RESTAURANT	1510 SWEETWATER ROAD, A	3/17/2008	• Keep the grease bin and surrounding area free of grease. • Provide overhead cover and secondary containment for waste grease bin.
25	CHINESE CANTON BAKERY	1132 E PLAZA BLVD., 204	1/21/2008	• Keep the rear parking lot clean and free of sediment.
26	CHOWKING	2220 E PLAZA BLVD., T	3/13/2008	• Keep dumpster lids closed when not in use. • Keep trash area/enclosure free of trash and debris. • Keep the grease bin and surrounding area free of grease. • Provide overhead cover and secondary containment for waste grease bin.
27	CHUCK E CHEESE'S	1143 HIGHLAND AVENUE	3/11/2008	• Keep dumpster lids closed when not in use.
28	CIVIC CENTER AUTO BODY	1304 ROOSEVELT AVENUE	1/29/2008	• Keep the oil recycling drum indoors or cover from rainfall. • Remove the hoods and bumpers or cover them and raise off ground. • Keep the parking area and dumpster enclosure area clean and free of sediment.
29	CONCHING'S CAFÉ	3400 E 08TH STREET	3/11/2008	• Keep the grease bin and area surrounding the grease bin free of grease. • Provide overhead cover and secondary containment for waste grease bin.

Table 5-3 (Continued)
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
30	COTIJAS MEXICAN FOOD	740 E 30TH STREET	2/7/2008	• Clean up the grease recycling bin. • Keep the trash enclosure area free of grease stains. • Keep the parking area clean and free of sediment.
31	COZINES GROCERY	402 CIVIC CENTER DRIVE	3/11/2008	• Keep trash area/enclosure free of sediment and trash.
32	CP MANUFACTURING	1300 WILSON AVENUE	6/5/2008	• Keep site free of sediment. • Keep dumpster lids closed when not in use. • Cover materials stored outdoors. • Keep parking areas free of sediment.
33	CRASH AND FIX AUTOBODY	202 , 210 W 11TH STREET	1/31/2008	• Clean up driveway and keep free of sanding materials. • Keep the scrap metals under cover and raised off ground or keep them indoors. • Keep the dumpster lids closed when not in use.
34	CROWN TRANSMISSION CENTER	1339 HOOVER AVENUE	2/5/2008	• Treat oil stains and oil spills. • Keep the auto parts indoors or under overhead coverage and raised off ground. • Keep site free of sediment accumulations.
35	DA KINES	1635 SWEETWATER ROAD #H	3/17/2008	• Keep dumpster lids closed when not in use. • Provide overhead cover and secondary containment for waste grease bin.
36	DISCOUNT TIRE CO. (SO. CA.)	1309 E PLAZA BLVD.	1/22/2008	• Clean up the dumpster enclosure area and keep it free of trash. • Keep the dumpster lids closed when not in use.
37	DIXIELINE LUMBER COMPANY	3450 HIGHLAND AVENUE	6/4/2008	• Keep site free of debris (sawdust). • Keep dumpster lids closed when not in use. • Cover materials stored outdoors. • Contain outdoor work area to prevent storm water run-on or conduct all work indoors. • Keep outdoor work area(s) and/or areas behind shop free of sawdust.

Table 5-3 (Continued)
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
38	EPSILON SYSTEMS SOLUTIONS INC	2101 A HAFFLEY AVE	6/25/2008	• Keep site free of sediment and trash. • Keep discharge locations free of sediment and debris. • Keep parking lot free of sediment. • Cover materials stored outdoors. • Raise materials stored outdoors off of the ground. • Keep outdoor work areas and/or areas behind shop free of sediment. • Protect the two storm drains on the north of the building to prevent sediment and debris from entering the drains.
39	FABRICATION TECHNOLOGIES INDUSTRIES	2401 HAFFLEY AVENUE, A	1/9/2008	• Keep the material storage area clean and free of black powder. • Minimize the materials stored outdoors and cover the rest when not in use. • Remove trash more often to prevent dumpsters from overflowing. • Keep the dumpster lids closed when not in use. • Keep the parking lot clean and free of debris.
40	FAMILY HOUSE OF PANCAKES	1900 E PLAZA BLVD	3/13/2008	• Keep discharge locations free of sediment. • Ensure water generated by pressure washing activities is collected and disposed of properly. • Keep dumpster lids closed when not in use. • Provide overhead cover and secondary containment for waste grease bin. • Do not hose off outdoor areas of site; if hosing is necessary, collect all wash water and dispose of to the sanitary sewer system.
41	FAMILY LOOMPYA SEAFOOD MARKET	2720 E PLAZA BLVD., A	3/13/2008	• Keep site free of sediment and trash. • Keep the dumpster lids closed when not in use. • Keep the trash area/enclosure free of sediment and trash. • Cover materials stored outdoors. • Raise materials stored outdoors off of the ground. • Keep the grease bin free of grease. • Provide secondary containment for the waste grease bin.
42	FIRESTONE	2531 E PLAZA BLVD.	1/31/2008	• Clean up spill in the parking lot in a timely manner.
43	FIRESTONE TIRE & SERVICE CENTER	943 HIGHLAND AVENUE	1/30/2008	• Keep dumpster lid closed when not in use. • Consider providing overhead coverage for the tire storage area.

143	WESTERN LIFT, INC/WESTERN HOIST, INC	1839 CLEVELAND AVENUE	6/6/2008	• Keep dumpster lids closed when not in use. • Keep parking areas free of sediment.
144	WESTSIDE BUILDING MATERIALS	500 W 16TH STREET	3/17/2008	• Keep parking lot free of sediment. • Keep dumpster lids closed when not in use. • Cover materials stored outdoors. • Keep loading and unloading areas free of sediment.
145	WILLIAM PAKCHUEN LAU	1918 CLEVELAND AVENUE	3/24/2008	• Provide secondary containment for liquids stored outside or remove. • Lift from ground and cover batteries or dispose of properly. • Lift from ground and cover used auto parts or properly dispose of. • Provide trash container(s). • Property dispose of waste oil. • Clean fresh oil spills from ground. • Obtain permit From DEH.
146	WILLIAM PAKCHUEN LAU	1918 CLEVELAND AVENUE	2/7/2008	• Clean up all oil spills and oil stains. • Keep the oil recycling drum indoors or provide a secondary containment and cover. • Remove all auto parts and loose materials from the yard. • Keep the yard clean and free of sediment. • Provide trash dumpster.
147	WINGS N THINGS	1499 E PLAZA BLVD	1/15/2008	• Clean up the top of the grease bin and keep it closed and free of grease. • Keep the back of restaurant clean and free of sediment and trash. • Work with neighbors to keep the dumpster lids closed when not in use.
148	WORLD TERMINAL PARKING INC	200 HIGHLAND AVENUE	3/11/2008	• Keep site free of sediment and debris. • Keep dumpster lids closed when not in use. • Keep parking areas free of sediment, debris, and spills/oil stains.

Table 5-3 (Continued)
Industrial and Commercial Inspection Results

#	Business Name	Address	Inspection Date	Recommended Corrective Actions
149	YUM YUM DONUT FRANCHISE #502	3122 E PLAZA BLVD.	3/14/2008	• Keep the trash area/enclosure free of trash. • Do not hose off outdoor areas of site; if hosing is necessary, collect all wash water and dispose of to the sanitary sewer system.
150	ZARLITOS FAMILY RESTAURANT	505 E 8TH STREET	3/12/2008	• Keep the area surrounding grease bin free of grease. • Provide overhead cover and secondary containment for waste grease bin.

6.0 RESIDENTIAL

6.1 INTRODUCTION

Land use in the City of National City is largely residential. Due to the large residential area, activities that take place in residential areas have the potential to impact the quality of receiving waters. Residential activities such as vehicle washing, over-irrigation, home maintenance, and Household Hazardous Waste (HHW) disposal can potentially contribute pollutants to the City's MS4 if BMPs are not implemented. Pollutants of concern include sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals. The City has worked to implement a range of programs to address these residential activities with the goal of to reducing pollutant loads associated with such activities. The City recognizes the need for educational efforts and opportunities designed specifically for residents and residential activities.

The following sections present activities conducted during this reporting period. These activities are associated with the residential component of the JURMP and include conducting ongoing HHW collection events, distributing educational materials, and participating in community events.

6.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the residential component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City developed a 2008 Calendar that was distributed to schools. The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways.
- The City collaborated with the cities of Chula Vista and Imperial Beach to make HHW disposal events available to residents. The total amount of HHW collected from residents of all three cities was 220,008 pounds. Door-to-door pick up service was available for the disabled and senior communities.
- The City hosted two large item disposal events. The event allowed residents to dispose of large items, like unwanted household materials (not including HHW).

6.2 SOURCE CHARACTERIZATION

The City has identified high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities. To reduce pollutant discharges from these high TTWQ areas and activities, the City has designated specific BMPs.

6.2.1 HIGH TTWQ ACTIVITIES

During the 2007/2008 reporting period, as outlined in the City's JURMP, the City continued to identify the following activities as high priority:

- Automobile repair and maintenance, washing, and parking
- Home and garden care activities and product use, including disposal
- Disposal of trash and pet waste

6.2.2 HIGH THREAT TO WATER QUALITY AREAS

In addition to these activity-based priorities, the City has noted several residential areas that pose higher threats to water quality. High priority residential areas are designated by considering complaint investigations, institutional knowledge, Dry Weather Monitoring data, and criteria as defined in the Municipal Permit. The following residential areas have been designated as being a high threat to water quality.

Division Avenue Area
The residential area located near Division Street, east of Highland Avenue, discharges to La Paleta Creek. Potential sources of pollutants may include residences located on East 2nd Street, Melrose Street, Eta Street, Fig Court, Scott Drive, 43rd Street, and Nordica Avenue. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents just downstream of these residential areas.

West 18th Street Area
Runoff from residential areas in the vicinity of West 18th Street eventually discharge to Paradise Creek. Potential sources of pollutants include residences along Hoover Avenue and Roosevelt Avenue. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents just downstream of these residential areas.

Paradise Creek Area, between F and L Avenues
The residential area that runs along the Southern side of Paradise Creek between F and L Avenues, which is adjacent to Paradise Creek, has been identified as being a potential source of pollutants. Residences in this area are located along East 12th Street, East 13th Street, and East 14th Street, and are upstream of dry weather site number 46. Past dry weather monitoring programs have detected elevated bacteria, ammonia, and oil and grease levels.

East 8th Street Area
The residential area near East 8th Street borders Paradise Creek and is also located upstream of dry weather site number 46, which has been found to have the same elevated constituents as the areas between F and L Avenues. Potential sources of pollution include residences near East 8th Street and East 9th Street, between L Avenue and N Avenue.

Grove Avenue Area
The residential area surrounding Grove Avenue has been identified during previous dry weather monitoring programs as a source of trash, ammonia, and detergents. This area includes residences along East 14th Street, Grove Avenue, Stancrest Lane, and Orange Street.

Arcadia Place Area
The residential area surrounding Arcadia Place has been identified during previous dry weather monitoring programs as a source of ammonia and detergents. Potential sources in this area include residences west of Harbison Avenue along East 11th Street, East 10th Street, and East Plaza Boulevard.

Harbison Avenue Area
The residential area along Harbison Avenue, between 20th Street and 24th Street, has been identified as a source of ammonia and excessive amounts of trash during past dry weather monitoring programs.

A Avenue Area
The residential area in the vicinity of the intersection of A Street and 22nd Street has been identified as a potential source of pollutants. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents. Likely sources of pollutants are residential landscaping and washing activities.

B Avenue Area
The residential area in the vicinity of the intersection of 28th Street and B Avenue, near Sweetwater High School, has been identified as a potential source of ammonia during past dry weather monitoring programs.

2nd Avenue Area
The residential area around 2nd Avenue, north of the Interstate 54, has been identified as a potential source of pollutants. Previous dry weather monitoring programs have detected elevated levels of bacteria. This area is adjacent to Sweetwater River. The most likely sources of bacteria appear to be from trash decomposition and human inhabitation.

6.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City has continued to provide information regarding the implementation of pollution prevention measures, such as good housekeeping practices, for residential areas and activities. The City's BMP Manual Part I includes lists of general residential BMP requirements and BMP requirements for specific residential activities. The manual is included in Appendix C of the JURMP. General residential BMPs include erosion control; non-storm water discharge management, including elimination of IC/IDs; and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Specific BMPs for the high priority activities outlined above are also included in the City's BMP Manual Part I.

6.4 PROGRAM IMPLEMENTATION

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting is conducted. This ensures that pollutants associated with residential activities and areas are minimized. The residential program has an education component so that residents are made aware of appropriate BMPs, including pollution prevention methods that should be used during certain activities.

6.4.1 TRAINING, EDUCATION, AND OUTREACH

The City has continued to conduct training, education, and outreach activities for residents, which are described below. For additional information on the City's educational efforts and the educational materials distributed to its residents please refer to Section 8 of this report.

2008 Calendar

The City developed a 2008 Calendar that was distributed to schools (Attachment 5.2). The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways. It described that pollutants such as fertilizers, pesticides, metals, paints, oil and grease and other debris can be transported from residential areas to the ocean. A list of BMPs and various cleanup days and HHW events are promoted. The theme for the calendar was "By Keeping our Community Clean, We Can Keep the Ocean Clean" and each month showed a photograph of an ocean scene.

Distribution of Educational Material

The City's Housing division conducted inspections as part of the Healthy Homes Program in high priority areas to check for lead in paint and other potential hazardous problems. Residents were provided IPM cards (Attachment 6.1) and "Put Toxic Waste in its Place" brochures during these inspections. The IPM cards provide information on topics such as non-chemical solutions and pest-related problems. The "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochure (Attachment 6.2) was distributed with written correspondence with residents.

As mentioned above, educational materials were provided to residents in National City in response to the recommendations from the 2007 Dry Weather Report. The City sent a letter and applicable educational material to residences in areas where high levels of pollutants were noted.

Workshops

On July 12, 2007, the City held a storm water training session for the City's Kiwanis Club. A total of 16 individuals attended the training session and were shown a Power Point presentation. More information about the presentation is included in Section 8.

Website
Additional information regarding the City's storm water program, pollution prevention measures, and BMPs is posted and continually updated on the City of National City's website (www.nationalcityca.gov), under the Public Works/Engineering Department link.

Household Hazardous Waste Disposal Program
The City continues to work with the City of Chula Vista to allow City residents to drop off HHW at Chula Vista's Household Hazardous Waste Collection Facility. The Household Hazardous Waste Collection Facility is the primary location for hazardous waste collection in the South Bay, receiving HHW from the City, the City of Imperial Beach, and the City of Chula Vista. Curbside pick up was made available to the disabled and elderly communities. The amount of waste collected by City residents of National City alone is not available; however, the total amount of HHW collected from residents of all three cities is 220,008 pounds. The City's programs

The Healthy Homes program continues to distribute "Put Toxic Waste in Its Place" brochures to remind residents to dispose of HHW properly. This brochure is handed out during routine activities conducted by the Healthy Homes program.

Other Waste Disposal Programs/Activities
In addition to proper HHW disposal, the City encourages residents to recycle used oil. The City maintains several Certified Used Oil Recycling Centers for residential oil disposal. The volume of used oil dropped off at the collection centers was not immediately available.

The City's Public Works Department held two trash collection events (June and November) during this reporting period in conjunction with EDCO Disposal Company. During these events, residents were encouraged to dispose of any unwanted large items from their homes such as furniture and appliances.

6.4.2 COMPLIANCE AND ENFORCEMENT

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the Storm Water Hotline, and observations made by the City's municipal personnel. If a potential to impact water quality is present the City provides a verbal warning, written warning, NTCs, and NOVs as applicable. The City received 6 residential-related complaints during this reporting period. Complaints were submitted through the Storm Water Hotline and internally through the Public Works Department.

The following enforcement actions were taken with respect to residents and/or landlords in 2007/2008:

- Three notices of correction
- Two NOVs

- Three administrative citations

Many of the complaints verified involved residents who were unaware of residential BMPs. These issues were resolved with a verbal warning and discussion of required BMPs. The City issued NOVs to more serious violations such as vehicle maintenance without BMPs or washing debris into the street. City personnel also cleaned areas in the public right of way as necessary to resolve complaints. All residential complaints were resolved it was not necessary to report any instances of non-compliance to the RWQCB.

6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

6.6 Program Review and Modification

The City's JURMP was recently updated in March 2008. No changes to the City's residential component have been made since that time.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

7.1 INTRODUCTION

In accordance with the September 10, 2008 RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the 2007/2008 illicit discharge detection and elimination section and attachments to the RWQCB no later than December 15, 2008.

8.0 EDUCATION COMPONENT

8.1 INTRODUCTION

During 2007/2008, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, residents, and underserved audiences. The City aims to reduce storm water pollution by increasing awareness about storm water and promoting the implementation of pollution prevention measures and BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community.

8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City has hosted a storm water training session for Kiwanis Club members.
- The City hosted a SUSMP training session for the development planning and construction communities.
- The City's Storm Water Inspector attended a Basic Inspector Training Course held by the California Environmental Protection Agency.
- The City distributed 2,000 2008 storm water calendars to businesses and schools.
- The City made an estimated 17,715 impressions through educational outreach material and activities.

8.2 STAFF TRAINING ELEMENT
