Leaks and Spills: prevent leaks and spills from entering the stormdrain by using or doing: drip pans, plastic sheeting, or other containment devices, work indoors or under shelter and never in the rain, immediately clean spills, use dry cleaning methods, establish clean up standards, and require that tools and parts be cleaned in a contained area
Materials and Waste Management: properly manage and dispose of automotive wastes and materials by: draining fluids from automobiles, disposing of wastes and fluids properly and lawfully, store materials, parts and tools indoors or under cover, use secure and watertight containers when storing materials and wastes

*Automobile Washing*

Management/Reduction of Wash Water: a) whenever possible, use commercial self-serve or full-serve car washes that properly dispose of or recycle the water, b) when washing at a residence be sure to: wash over a porous surface such as grass or dirt when possible, use dry cleaning methods, turn off the water when not in use or use a controllable spray nozzle, encourage the use of a neighborhood wash area where contaminants can be easily manged
Materials and Waste Management: a) properly dispose of soapy water or bucket water to a sanitary sewer or landscaped area, b) use dry methods to degrease or clean especially dirty areas such as tires

*Automobile Parking*

a) use routine preventative maintenance practices and make timely vehicle repairs to prevent fluid leaks
b) design and construct parking areas to minimize stormwater impacts; covered garages should be plumbed to the sanitary sewer

*Home and Garden Care Activities and Product Use*

Garden and Yard Care
Pollution Prevention: a) use safe substitutes and alternative gardening methods such as IPM techniques, native and drought tolerant plants, use compost or vermiculture for green waste recycling, follow manufacturers instructions for the application of any chemicals, identify pests before treatment, b) read all labels on products, c)implement water conservation, d) consider xeroscape gardens, e) repair and maintain irrigation system to prevent over watering, f) recycle green waste, g) plant or mulch hillsides and slopes to prevent erosion
Leaks and Spills: a) immediately clean any chemical spills, fertilizers, or soil, b) return spilt items to container for future use or proper disposal
Materials and Waste Management: a) store lawn care products in closed labeled containers indoors or covered areas, b) refrain from using chemicals on windy or rainy days, c) cover stockpiles of soil, compose, or fertilizer, d) dispose of chemicals through the HHW program, e) utilize dry sweeping methods for clean up
Restrictions on Activities: a) do not hose off paved surfaces to the street or gutter, b) do not put hazardous waste in the trash, landfill or stormdrain

Home Care and Maintenance
Pollution Prevention: a) utilize smart purchasing practices that reduce waste, b) use less toxic or non-toxic substitutes for cleaning, c) read and follow product labels, d) recycle used or unwanted products, e) use water based paints when possible, f) recycle unwanted appliances and equipment
Leaks and Spills: a) clean up spills immediately, b) properly dispose of waste from clean up materials

Materials and Waste Management: a) store HHW materials in closed labeled containers and in covered areas, b) recycle latex paint through local programs, c) dispose of hazardous products though the HHW program, d) dispose of trash in the proper receptacles with lids
Restrictions: do not dispose of wash waters (carpet cleaning, mop water, paint wash-up, etc.) to the street, gutter or storm drain

*Disposal of Pet Waste*

Pollution Prevention: spay or neuter pets to reduce feral populations
Waste Management/Disposal: a) clean up after pets when walking them in public places, b) clean up yards or other commonly used areas, c) properly dispose of the waste in the trash or toilet
Pet Management (Dogs and Cats): do not allow pets to run free in residential neighborhoods, whenever possible

## 6.3 Program Implementation

This section describes the steps that were taken in FY 2010-11 to require and verify the implementation of designated BMPs for residential areas and activities.

### 6.3.1 Outreach and Training

The City has an education program that is consistent with the Permit and the jurisdictional program. A significant element of this program consists of educating residents about ways in which they can minimize their impact on local waterways and the environment in general. Education of the citizens in Lemon Grove contributes to the implementation of the residential component of the stormwater program. Outreach messages that are relayed to the public include, but are not limited to:

- Impacts of urban runoff on receiving waters
- Distinction between the MS4 and the sanitary sewer
- Pollution prevention and safe alternatives
- HHW collection and recycling
- BMP implementation and maintenance
- Pet and animal waste disposal
- Equipment and vehicle maintenance and repair
- Spill response, containment and recovery
- Water conservation

During FY 2009-10, City staff conveyed these messages to the public through a variety of mechanisms, including:

- City's Website
- Production and distribution of brochures and promotional items

- Public participation in community events
- Response to residential complaints
- One on one conversations
- Public participation events such as clean-ups

Implementation of these mechanisms by the City helps to make the public aware of the types of activities that have the potential to impact water quality and the BMPs that can be implemented to reduce this impact. Awareness is the first step in the process towards behavioral change. A detailed description of the educational activities implemented by the City can be found in Section 8.

### 6.3.2 Used Oil, E-Waste, and HHW Collection Services

The City facilitates the proper management and disposal of used oil, toxic chemicals, and other household hazardous wastes (HHW) through various mechanisms. The City participates in door to door home collection, a permanent recycling facility is located in the City, and collection events for all HHW and e-waste. In addition, the City encourages weekly curbside garbage, recycling, and yard waste pick-up services through a franchise with EDCO. The various components of the solid waste and hazardous waste collection services provided by or for the City are described in detail below.

*HHW Collection Program*

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. This information is lengthy and is available upon request.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only two demolition sites qualified and completed the program during this reporting period. Both projects were very small private development projects and the City has not calculated the waste totals as of this report. The totals will be available upon request by October 30, 2011.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in eight collection events for solid waste disposal. All of the events were in cooperation with a Household Hazardous Waste grant through CIWMB. .

The City held one collection day through EDCO and their facilities at the same time as the curb side clean up day. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 24-25. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2010-11, as per the HHW program, are not due to the State regulating agency until October 1, 2011; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2011.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2010-11, the City held eleven e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2011.

*Used Oil Recycling Program*

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

**Table 6-1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005** (Calendar Years)

**Table 6-2 Annual Oil Sales and Used Oil Recycling Rates** (in millions of gallons)

| | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Lubricating Oil Sales** | 141.2 | 140.8 | 136.2 | 137.5 | 142.1 | 150.0 | 154.3 | 163.6 | 168.0 | 150.2 | 150.5 | 153.5 |
| **Industrial Oil Sales** | 78.0 | 117.3 | 140.9 | 141.7 | 152.4 | 176.4 | 155.7 | 149.1 | 147.1 | 135.8 | 144.6 | 123.1 |
| **Total Oil Sales*** | 219.2 | 258.1 | 277.1 | 279.5 | 294.5 | 326.4 | 310.0 | 312.7 | 315.1 | 286.0 | 295.0 | 276.6 |
| **Lubricating Oil Recycled**** | 59.9 | 54.6 | 56.8 | 60.9 | 73.6 | 76.9 | 80.0 | 81.9 | 83.1 | 83.7 | 87.0 | 91.3 |
| **Industrial Oil Recycled**** | 16.7 | 19.5 | 20.8 | 19.3 | 11.6 | 10.4 | 7.9 | 15.5 | 17.5 | 32.4 | 32.5 | 31.4 |
| **Total Oil Recycled** | 76.6 | 74.1 | 77.6 | 80.2 | 85.2 | 87.3 | 87.9 | 97.4 | 100.6 | 116.1 | 119.4 | 122.7 |

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

**Table 6-3 Oil Collected by Public Collection Programs** (in millions of gallons)

**Table 6-4 Oil Collected by Public Collection Programs** (in millions of gallons)

| | 94/95 | 95/96 | 96/97 | 97/98 | 98/99 | 99/00 | 00/01 | 01/02* | 02/03* | 03/04 | 04/05 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Curbside** | 0.9 | 0.9 | 0.8 | 0.9 | 0.7 | 0.6 | 0.5 | 0.9 | .9 | 1.0 | 1.0 |
| **Form 303** | 0.6 | 0.7 | 1.0 | 0.8 | 0.9 | 1.1 | 0.9 | 1.0 | 1.0 | 1.0 | 1.0 |
| **Certified Centers** | 5.6 | 8.7 | 10.2 | 11.3 | 13.2 | 15.2 | 16.3 | 18.5 | 19.9 | 20.6 | 19.9 |
| **Total Oil** | 7.1 | 10.3 | 12.0 | 13.0 | 14.8 | 16.9 | 17.7 | 20.4 | 21.8 | 22.6 | 21.9 |

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the two collection sites and the number for curb-side pick-up. See Attachment L-2 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment L-3 for copies of the Newsletter.

The two collection sites are:

- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

### 6.3.3 Complaint Investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the stormwater hotline or other form of communication such as e-mail, a County hotline referral, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or cleanup activities by the City or responsible party.

The City enforces its stormwater ordinance for all residential areas and activities as necessary to maintain compliance with the Permit and ensure water quality. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for the City to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the Code Enforcement data base.
In FY 2010-11, the City received 54 Residential IC/ID complaint calls. Six of those calls were construction related and are discussed in Section 3. Eight of them were related to illegal dumping in the street or gutter. All were abated within 24 hours of notification to the City and all known dischargers were educated on proper disposal methods. No citations or fines were leveed for residential complaints during this reporting period. The remaining calls were either unfounded or not related to stormwater and were delivered to the appropriate department.

### 6.3.4 Regional Residential Education Program

The City collaborated with other jurisdictions in the Education and Residential Sources Workgroup to develop the Regional Residential Education Plan. The Plan contains recommended strategies for the development and implementation of the Regional Residential Education Program. Implementing an enhanced regional program to target residential sources of stormwater pollution encourages the development of consistent messages throughout the region and enables Copermittees to better leverage resources and utilize economies of scale.

This reporting period's collaboration on a regional level was promotion of residential stormwater BMPs at the San Diego County Fair. The Copermittees combined funds to pay for a fair booth, material distribution, signage and advertisements at several locations on the fairgrounds for the duration of the fair. Booth staffers promoted the Think Blue message and presented stormwater educational materials to all fair attendees.

## Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2010-11 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment.

### 7.1 Dry Weather Monitoring Program

This portion of the report will be submitted on December 15 as required in the Permit.

### 7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 52 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls eight were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 5 and follow-up and enforcement for residential complaints is dealt with in Section 6.

### 7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

## 7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 6 of this report.

## 7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 4 of this report.

## Section 8.0 Education Component

### 8.1 Overview of Education

The City's outreach program includes an education and public participation component. The education component is focused on disseminating educational information to increase public knowledge of stormwater issues, while the public participation component, discussed in Section 9, provides opportunities for the public to become involved in the process of reducing pollutants of concern in stormwater and urban runoff. The education component is primarily implemented by the City's water quality staff.

The Permit establishes the following five target communities which must be addressed by the education program:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

The overall goal of the education element is to provide an education program that will:

- Measurably increase the knowledge of the target audience regarding MS4s, impacts to urban runoff on receiving waters, and potential BMP solutions appropriate for the target audience and their activities.
- Measurably change the behavior of the target audience and thereby reduce pollutant releases to MS4s and the environment.

The City performed a wide variety of storm water education activities during FY 2010-11. Education and outreach was performed on three levels – Jurisdictional, Watershed, and Regional. Budgetary constraints are currently severely limiting the City's outreach abilities to in-house staff and resources only. However, the City has always worked hard to openly communicate with its community and staff has always been available for face to face meetings both at City facilities and while out in the community. The community also has easy access to all City staff by phone or e-mail. The City feels that this informal accessibility works in our favor and actually provides our residents with more meaningful, in depth education than multitudes of printed material.

### 8.2 Municipal Staff Training

*Public Works*. Water quality staff participates in monthly meetings with all of the public work division and weekly meetings with the public works supervisors. At these regular meetings, water quality staff provides updates on current policies

and areas of concern. Due to the regularity of interaction between water quality staff and public works staff, no separate annual training is currently being provided. Any questions or comments can be dealt with more effectively at the regular meetings and changes to regulations or activities can be instituted quickly and efficiently. Water quality staff is also integrally involved in ensuring that public works staff receives and maintains all required certifications, such as Confined Space certification, Hazwoper certification, Cal OSHA updates, pesticide application qualification, and other risk management trainings applicable to their daily jobs and their stormwater activities. Towards the end of this reporting period, the City began exploring a newly available training tracking program, which in future reporting periods will make it even easier to verify staff trainings.

*New Employees.* Water quality staff is working with the City's HR department to establish a new employee interactive training power point presentation, which will include basic stormwater information and an evaluation test at the end. This video will be shown to all new employees regardless of department and their end test results will be tracked. The City is participating in the Regional Municipal Workgroup, which is working on developing a series of employee educational videos that would be available to all Copermittees. These videos would include new employee, management and task specific trainings. With the City's new training tracking system, it will be easy to track employee trainings and track pre and post-test results to evaluate a change in knowledge.

Engineering and Planning Departments. Water quality staff meets weekly with these two departments to discuss development review projects, new policies, streamlining of existing policies and to participate in consistent interdepartmental education. The City finds these regularly scheduled meetings a much more efficient and effective way of updating and educating staff on water quality concerns, regulations and improvements. They are the foundation for the City's new sustainability mindset and have been vital initiating the overhaul of the City's General Plan. It allows the City to present an ideologically unified front to its residents, developers, contractors, and business owners.

## 8.3 Educational Outreach

This section describes education efforts conducted for each target community during FY 2010-11.

### 8.3.1 Underserved Target Audiences and Mobile Businesses

*Underserved Target Audiences.* For those segments of Lemon Grove community that do not speak English as their first language, the City provides many of its brochures and handouts in both English and Spanish. The City also employs bilingual staff to assist our residents, answer questions, and translate information. The current water quality brochures available in dual languages are

IPM pest tip cards, recycling and HHW information. The City also has available the Green Wrench BMP guide for automotive repair shops and the Green Cooking BMP guide for restaurants in Spanish. The City also works with the County's Green Business group which provides BMP information in Spanish and in English. Despite these efforts, the City realizes this continues to be an underserved audience and by collaborating with the other Copermittees hopes to continue to develop new ways to provide them with water quality data and information.

*Mobile Businesses.* During FY 2010-11, the continued to participate and provide information to the Regional Mobile Business Subcommittee for the development of the Regional Mobile Business Outreach and Education Strategy. Mobile businesses inherently provide services across jurisdictional lines; therefore the Copermittees chose to collaborate on a regional mobile business outreach and education strategy, which addresses the following elements:

- Inventory development and maintenance
- Establishment of minimum BMP requirements
- Outreach and education

The City's water quality staff, for several reporting periods, has reviewed any business license that pertains to a mobile business and required them to provide applicable BMP information on the business license application. Until the new Permit, however, these businesses were not an independent category in the business license directory. They were filed by business type, such as automotive or food service. During this reporting period, the City created the mobile business category and has begun transferring the known mobile businesses into the correct category. One of the challenges faced by Code Enforcement, in conjunction with mobile businesses, is their tendency to conduct business during off hours. City staff is very limited in their ability to work off hours and since the economic downfall, all overtime is prohibited unless emergency related. The City hopes that a Regional database of mobile businesses will help to track and regulate their activities and improve education opportunities.

### 8.3.2 New Development and Construction Communities

The City uses the following strategies to provide education and outreach to its development and construction communities:

- BMP training request as part of the permit application process
- Meetings with project developers, owners, on-site contractors and site supervisors
- SUSMP checklists as part of the development review process
- Signed BMP checklist for all ministerial permit applications (training request sheet is attached to this checklist)

- Informal meetings with developers and contractors due to questions, comments, concerns, etc. Generally occurs during the review process or normal site inspection process
- All changes to construction site BMPs are required to be submitted to City staff for approval

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

### 8.3.3 Commercial/Industrial Owners and Operators

The following is a summary of the education and outreach provided to commercial and industrial owners and operators during FY 2010-11.

- Annual inspections of all industrial facilities, restaurants and automotive facilities in the City by our in-house Code Enforcement staff. During these inspections, individual one-on-one education was presented to each facility manager/owner. Information presented included general storm water quality information and BMP requirements.
- The City also has Green Wrench and What's Cooking guides available for interested parties.
- Mailings to facilities about applicable local workshops and education opportunities, such as those offered by SDG&E and the San Diego Energy Commission.

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party. However, it is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation. They perceive stormwater inspections as part of this over-bearance and are often reluctant to make changes without the involvement of Code Enforcement proceedings.

### 8.3.4 Residential Community and General Public

The following is a summary of venues and media outlets utilized within the defined reporting period of this report to provide education and training to various residential and public audiences:

- City Newsletter containing an environmental section with water quality and environmental tips (such as how to properly care for your lawn, list of

basic household BMPs, or home improvement – BMPs your contractor should know) and information about HHW and recycling

- Various brochures available at City Hall: Used oil recycling, car washing, pet waste disposal, etc
- Maintenance of the stormwater hotline (619) 825-3827, which monitored by water quality staff
- Water quality staffed informational Booths at the following events: Fire Station Open House and Winter Bonfire.
- Participation and staffing at the Regional Education Outreach booth at the San Diego County Fair
- Participation and collaboration in watershed-based efforts such as Creek to Bay Clean-up and watershed based school presentations

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

The City is constantly striving to improve its outreach and education opportunities within the limited means of the current budget. Much of the current education is done by City staff in an informal manner with the public and business communities. Having a small City staff, means a consistent message is provided because staff is easily kept up to date on the current regulations and policies. This program will continue to evolve as necessary and as funds allow.

## 9.1 Public Participation

Public participation is one of the components of the City's outreach program. The goal of the education component, discussed in Section 8, is geared towards disseminating educational material to increase public knowledge of storm water issues. The goal of the public participation component is to provide opportunities for the public to become involved in the process of education and reducing pollutants in stormwater and urban runoff.

Public participation activities provide opportunities for the public to interact and become involved with water pollution issues. When the public has the opportunity to become involved there are several positive outcomes. First, those involved become more knowledgeable about stormwater issues. Second, they become educators and stewards for the stormwater program. Finally, they provide important feedback to the stormwater program regarding the concerns of the public and issues that may be overlooked. Ultimately, public participation help makes the education process more effective.

## 9.2 Public Participation Approach

The City's approach for the outreach program is to develop an understanding among its residents and businesses of some fundamental storm water concepts. These include:

- The difference between the sanitary sewer and the storm drain system (sanitary waste gets treated, but discharges into the storm drain system flow directly to our waterways and beaches untreated)
- The economic value of our beaches and inland waterways and the importance of protecting them.
- An understanding of illegal discharges, i.e. sidewalk and street wash water runoff, vehicle fluid (antifreeze and oil), landscape debris, sediment, etc.
- How to report a stormwater violation (stormwater hotline or website).
- The fact that we all live in a watershed and that the watershed is integral to wildlife, public health, and to the water quality of the rivers, streams, and oceans.
- Reducing pollutants of concern.
- Responsibility of citizens to participate in the cleaning and maintaining of the community (i.e. creeks and parks) and not to be part of the pollution problem (littering, illegal dumping, improper disposal of household chemicals).

Some of the tools that are used by the City to implement the public participation activities are:

- public outreach events
- public reporting methods
- pet waste dispensers
- Household Hazardous Waste Collection and Used Oil Recycling
- public opinion surveys
- copermittee collaborations

## 9.3 Program Implementation

This section describes the specific public participation tools used during the FY 2010-11 reporting period.

### 9.3.1 Public Outreach Events

The City participated in several outreach events during FY 2009-10:

- Coastal Clean up Day – September 19, 2009; 10 volunteers; Federal Blvd/San Miguel drainage channel
- Fire Station Open House – October 10, 2009; 60 participants
- Winter Bonfire – December 4, 2009, 800 participants
- Creek to Bay Clean up Day - April 24, 2010; 18 volunteers; Federal Blvd/San Miguel drainage channel
- San Diego County Fair – June 12, 2010; 4,500 participants

### 9.3.2 Public Reporting Methods

The City has a local hotline that connects the caller directly to the City's water quality staff. The number is (619) 825-3827. A public works person is available for after-hours emergencies, who will contact the best staff person to handle the emergency. There are also two regional stormwater hotline numbers promoted within San Diego County: a toll-free Regional Storm Water Hotline, 1-888-846-0800 and the Think Blue Hotline, 1-888-844-6525 (1-888-THINK BLUE). Both of these hotlines are staffed by the County of San Diego Monday through Friday, 8:00am - 5:00pm. In addition to personal service at these hotlines during regular business hours, the hotlines provide a voice mail message for 24-hour public access.

The City's stormwater hotline has been heavily advertised since the programs inception. In FY 2010-11, the hotline received eight stormwater related calls, typically pertaining to the illegal discharge of fluids in the gutter over the weekend or a business hosing off their parking lot. All calls are investigated by Code Enforcement and are usually handled with a verbal warning and education about household BMPs. None of the calls during this reporting period requied formal

Code Enforcement proceedings. The hotline is advertised in the newsletters and on the City's website, in brochures, on give-aways, and at City events like the Winter Bonfire and the Fire Station Open House.

The City's website also provides water quality information and event updates: www.ci.lemon-grove.ca.us.

### 9.3.3 Pet Waste Dispensers

Residents are encouraged to protect our creeks, lagoons, and ocean by cleaning up after their pets. To make this easier; pet waste dispensers can be found at all the City parks and in the vacinity of City Hall, all areas where people frequently walk their dogs. Trash cans are also readily available in all of these areas. Both the trash cans and bag dispensers are maintained by the City's Grounds division.

### 9.3.4 Household Hazardous Waste Collection and Used Oil Recycling

The City co-sponsors several HHW and e-waste events over the course of the reporting period. During these events, residents can drop off any HHW or e-waste free of charge. The City collaborates with the Cities of Chula Vista and La Mesa for HHW events and data collection. The City participated in eight HHW events and eleven e-waste events. The City has two used oil collection points in the City:

- EDCO Recycling Center 6670 Federal Blvd
- Kragen Auto Parts 6925 Federal Blvd

### 9.3.5 Copermittee Collaborations

The City continues its collaboration and encouragement of the County's Green Business program for restaurants and automotive repair shops. This effort continues to develop and explore a State wide collaboration and standards. The City will continue to promote these programs to the applicable commercial facilities where-ever possible.

## Section 10.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

### 10.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 10.1.

**Table 10.1 – 2010/2011 Fiscal Analysis Summary**

Stormwater Cost Analysis
All costs covered in the General Fund.

| ACTIVITY | CURRENT YEARLY BUDGET | CURRENT BUDGET LOCATION |
|---|---|---|
| **STORM DRAINAGE CLEANING AND MAINTENANCE** | | |
| **Public Street and Parking Lot Sweeping** | | Streets |
| Streets | $30,000 | |
| Parking Lots | $2,000 | |
| *Public Street and Parking Lot Sweeping Total* | $32,000 | |
| | | |
| **Litter Removal** | | |
| Litter Removal | $13,000 | |
| *Litter Removal Total* | $13,000 | |
| | | |
| **Storm Drainage Cleaning** | | |
| Inlets | | |
| Inspection and Cleaning | $19,820 | |
| Fossil filter replacements | $1,400 | |
| *Inlets Subtotal* | $21,220 | |
| Basins and Channels | | |
| Inspection and Cleaning (Note 1) | $38,829 | |
| *Basins and Channels Subtotal* | $38,829 | |
| **Video Inspections** | | |
| Video Inspections (Note 1) | $50,000 | |

| | | |
|---|---|---|
| *Video Inspection Subtotal* | $50,000 | |
| ***Storm Drainage Cleaning and Maintenance Total*** | **$155,049** | |
| | | |
| **STORM EVENT ACTIVITIES** | | |
| Sandbag stock piling and placement | $4,000 | |
| Patrols | $3,089 | |
| ***Storm Event Total*** | **$7,089** | |
| | | |
| **ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM** | | Engineering Services |
| Dry Weather Testing | $20,000 | |
| Enforcement | $5,000 | |
| Administration/Supervision | $1,000 | |
| Stormwater HotlineComplaints | $2,000 | |
| ***Illicit/Illegal Enforcement Program Total*** | **$28,000** | |
| | | |
| **STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)** | | |
| Construction Related SWPPP | $2,000 | |
| Plan Review (including SUSMP's) | $15,000 | |
| Inspection | $3,000 | |
| *Construction Related SWPPP Subtotal* | $20,000 | |
| Municipal Facility SWPPP | | |
| SWPP Implementation, Inspection, and Maintenance of Municipal Facilities | $18,798 | Streets |
| *Municipal Facility SWPPP Subtotal* | $18,798 | |
| ***All SWPPP Activities Total*** | **$38,798** | |
| | | |
| **BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION** | | |
| Inspection of Industrial and Commercial Facilities | $50,000 | |
| Inspection of Municipal Facilities | $1,000 | |
| ***BMP Total*** | **$51,000** | |
| **MISCELLANEOUS ACTIVITIES** | | Engineering Services |
| Annual Reporting (JURMP) | $5,000 | |
| Administration (General) | $74,004 | |
| NPDES Permit Fee | $7,500 | |
| Public Education/Outreach | $5,000 | |
| ***Miscellaneous Activities Total*** | **$77,504** | |
| | | |
| | | |
| ***PROGRAM TOTALS*** | **$371,440** | |

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2010-11 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance

activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

## 10.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.
Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

## 11.1 Introduction

The City began applying baseline program effectiveness assessment methodologies soon after they were developed by the San Diego region stormwater Copermittees during the last permit cycle as described in the document titled "A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs" dated October 16, 2003. The City has also actively participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008 and as an ongoing process. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs, so the City prepared its own effectiveness assessment approach and measures modeled after conventional strategies and the existing levels of effectiveness assessment as detailed in the October 2003 document.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is anticipated that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will undertake the issue of standardized assessment metrics and procedures in the near future. The City is committed to engaging in the process of developing such regional standards and incorporating resulting work products into its own local program effectiveness assessment system. It is in consideration of the evolving and ongoing regional standardization process that the City has endeavored upon fine tuning its local effectiveness assessment approach as presented in the subsequent paragraphs and tables. Further, it is recognized that these methodologies and strategies must be adaptable as regionally developed procedures are solidified in the future.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The core structure of the City's stormwater program is composed of three primary drivers:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The programmatic process typically proceeds from planning to implementation to assessment, although in practice all three maybe in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program elements developed during the planning step are implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments

are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

As part of the JURMP update process, the City has identified a variety of significant activities uniques to each program element and metrics (numeric and/or narrative) to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics are provided in SEction 13 of the City's revised 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step towards the more difficult level of improvements to water quality in receiving waters. The levels are listed below.

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

## 11.2 Effectiveness Assessment Results

The new Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment - assessment that combines both monitoring data and programmatic data - are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 Outcome Level Assessments

*Level 1*

A requirements checklist, which includes a directory of permit compliance elements and where each is described within the JURMP annual report, can be found in Appendix G.

*Level 2 and 3*

Tables 11-3 at the end of this section include discussions of Level 2 and Level 3 outcomes for activities identified as significant by the City within each program component. Note that only Level 1 assessment applies to fiscal analysis, so a table for fiscal analysis is not included.

*Level 4*

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load reduction estimation methods have not yet been or cannot be developed.

*Level 5*

On September 10, 2008, the Regional Board adopted Addendum 2 to Order 2007-01, effectively extending the annual due date of the illicit Discharge Detection and Elimination reporting requirements to December 15. It is anticipated, consistent with previous Dry Weather Monitoring reports prepared by the City that baseline trend analysis will be provided for a number of constituents evaluated through the Dry Weather Monitoring Program. This information is further spatially correlated with sub-basins or drainage areas within the City, and evaluated against land-use areas and potential source areas.

*Level 6*

It has been determined, through ongoing development and discourse over long-term effectiveness assessment methodologies that relationships between programmatic activities and changes in receiving water quality are difficult to establish on an annual basis or a jurisdictional scale. As such, the City will point to future regionally coordinated efforts including Report of Waste Discharge (ROWD) and Long Term Effectiveness Assessment (LTEA) development to more holistically evaluate changes in receiving water quality. It is anticipated that such efforts will be further refined and supported by ongoing data gathering efforts both locally and regionally.

### 11.2.2 Overall Component Assessments

*Development Planning*

The City's review process for development projects is effectively requiring higher removal efficiency treatment control BMPs. Further, two new significant program elements were in production and in early stages of implementation within the defined reporting period of this report; both new programs are demonstrating positive trends. BMP installation verification and BMP operation and maintenance verification efforts, while not wholly implemented at the time of report production, have resulted in the establishment of programs that will support long term effectiveness assessment measures for development planning.

*Construction*

The City's review and approval process for construction related plans and documents is effectively verifying proposed construction specific BMPs. BMP implementation and maintenance is being effectively managed through construction site inspection activities, and validated through associated assessment measures. It is anticipated that in response to increased inspection frequencies and refined data gathering practices that this trend will continue.

*Municipal*

The defined reporting period of this report is marked by significant expansion of municipal operations and maintenance activities to meet the standards established in Order 2007-01. Enhanced stormwater conveyance, drainage facility, channel maintenance and inspection and street sweeping activities, were developed and implemented, equating to the removal of salient volumes of debris. Effective operations and maintenance activities are demonstrated in the Table 11-1 below, and it is anticipated that this continued level of service as well as enhancements in data gathering methods will support the efficacy of municipal activities.

**Table 11-1**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Street Sweeping | 150.75 tons | None | 150.75 tons |
| MS4 Cleaning | 3,360 pounds (1.815 tons) | None | 3,360 pounds (1.815) tons |
| | | | **Total 152.565 tons** |

*Industrial and Commercial*

Stormwater activities and actions related to industrial and commercial entities have exhibited positive trends within the defined reporting period. The City has identified inspection activities coupled with complaint response and enforcement as the significant activities by which to evaluate program effectiveness. During the defined reporting period, the City has been able to evaluate effectiveness on a number of levels (See Table 11-2) through the gathering of critical statistics, including a knowledge and BMP assessment scoring system. Data gathered and evaluated during the defined reporting period indicate that identified significant program activities targeting industrial and commercial sources have been effective.

**Table 11-2 Program Scores for 2010-11****

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.6 | 3.5 |

| | | |
|---|---|---|
| **Median Rating** | 3 | 3 |
| # of "Level 5" Ratings | 6 | 25 |
| # of "Level 4" Ratings | 28 | 34 |
| # of "Level 3" Ratings | 30 | 49 |
| # of "Level 2" Ratings | 22 | 12 |
| # of "Level 1" Ratings | 33 | 4 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

**Table 11-2 cont. Program Scores for FY 2005-06**
(This was the first year the analysis was done and is provided for comparision)

| | **Knowledge Assessment *** | **BMP Assessment** |
|---|---|---|
| **Average Rating** | 2.39 | 3.33 |
| **Median Rating** | 2 | 3 |
| # of "Level 5" Ratings | 0 | 14 |
| # of "Level 4" Ratings | 9 | 26 |
| # of "Level 3" Ratings | 34 | 30 |
| # of "Level 2" Ratings | 26 | 11 |
| # of "Level 1" Ratings | 18 | 7 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

*Residential*

Residential BMP implementation has been identified as the significant activity by which effectiveness has been assessed. Residential complaint response and enforcement constitute the core of residential BMP implementation assurance actions. Based upon an evaluation of data associated with these elements, including the number of incidents responded to and the ultimate resolution of these events, the City has demonstrated a notably effective program and level of service to the community of Lemon Grove.

**Table 11-3**

| **Activity** | **Amount Collected** | **Adjustment Factor** | **Estimated Load Reduction** |
|---|---|---|---|
| Used Oil Recycling | 25,600 gallons | 10% | 2,560 gallons |
| C&D Ordinance Recycling | 17,852 pounds | 1% | 179 pounds |

*Education*

Education effectiveness is assessed for a variety of program elements. In terms of education opportunities provided to the various community sectors and City

staff and contractors, identified as the significant metric by which to evaluate education activities, the City has achieved a high level of success.

*Public Participation*

The City provides a variety of venues and outlets in support of public participation. The City has identified a number of measures to evaluate the effective implementation of this program element. As with education, public participation translates across a number of program areas; however the assessment measure are focused on success of the venues ad outlets supported by the City. From the measures identified and quantified, community partnerships, event attendance, hotline calls, and volumes of debris and hazardous materials collected through public participation, the City has established exceptional trends.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of this document.

# EXECUTIVE SUMMARY

In January 2007, the Regional Water Quality Control Board (RWQCB) issued Order No. R9-2007-0001 (Municipal Permit), a National Pollution Discharge Elimination Permit regulating discharges to the storm drain system within 18 municipalities in San Diego County, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees"). As required by the Municipal Permit, the City of Lemon Grove (City) has created and maintains a Jurisdictional Urban Runoff Management Program (JURMP). The City's JURMP includes Best Management Practices (BMP) standards for businesses, construction and development projects, residents, and the City's own activities. The JURMP also includes programs for water quality monitoring and educational outreach.

This annual report presents the City's implementation efforts of its JURMP during Fiscal Year 2011-2012 (FY 2011-12), which began on July 1, 2011 and ended on June 30, 2012. Each section of this JURMP Annual Report discusses the City's efforts during FY 2011-12 and how those efforts met the requirements of the Municipal Permit. Key actions taken for the major components of the City's stormwater program are summarized below.

**Development Planning Component**

The City continued to implement the requirements of the *2011 Model Standard Urban Stormwater Mitigation Plan* and *Hydromodification Management Plan*. During this reporting period, three projects were identified as priority development projects but were not subject to hyromodification management due to no net increase in pervious area or discharge rates. The City reviewed last year's treatment control BMP inventory and addressed discrepancies. A new inspection form was also developed and used during the inspection of all five inventoried sites. A new self-certification letter and maintenance form were developed and used during this reporting period. Treatment control BMPs at all five sites were observed to be adequately maintained and no enforcement action was deemed necessary during this reporting period.

**Construction Component**

During FY 2011-12, the City had eight active construction sites: five private development projects and three Capital Improvement Projects. Three of the eight sites were prioritized as medium Threat To Water Quality (TTWQ) and five as low TTWQ. The City conducted checks of erosion control plans to ensure construction projects complied with the City's minimum BMP requirements. The City conducted 165 site visits to verify BMP implementation, and issued four verbal Correct Work Notices. Deficiencies associated with the four verbal Correct Work Notices were appropriately addressed within 24-hours.

**Municipal Component**

The City inspected 14 high TTWQ municipal fixed facilities during FY 2011-12. The City also continued its street sweeping and Municipal Separate Storm Sewer System (MS4) maintenance programs. A total of 147.15 tons of trash and debris was removed through street sweeping activities and 572.55 cubic yards of debris were removed during routine

MS4 maintenance activities. The City video inspected 16.75 miles of sewer main to locate blockages and areas of needed repair. All 67 miles of sewer main was cleaned during this reporting period. City personnel attended several in-house training on stormwater pollution prevention concepts and practices.

**Industrial and Commercial Component**

During this reporting period, the City conducted 59 site visits and inspections of industrial and commercial facilities considered high TTWQ. The overall inventory included 225 businesses as presented in the 2010-2011 JURMP Annual Report. The City was able to meet the Municipal Permit requirement of inspecting at least 25 percent of all inventoried sites. There were no industrial or commercial businesses found to be out of compliance. In-house training on the industrial commercial program was also conducted during this reporting period. At the end of the reporting period, City staff revised its prioritization process and established new industrial commercial and mobile business inventories. The pollutant loading potential for each stationary and mobile business was included in the respective inventories. The new inventory will be used in the FY 2012-13 reporting period to conduct stormwater compliance inspections.

**Residential Component**

Eighty percent of land use in the City is residential, and the City used a variety of methods to educate its residents. The City published the Summer 2011 and Spring 2012 editions of *The Grove Gazette* newsletter. Each issue was available on the City's website. The newsletters contained a variety of environmental and stormwater-related articles and opportunities for public involvement. During FY 2011-12 the City hosted a variety of waste disposal events and encouraged residents to participate in these events. Residents properly disposed of 570 pounds of household hazardous waste (HHW) and 15,425 gallons of used oil during these events. The City also responded to and resolved nine complaints made by residents to the City's stormwater hotline regarding residential areas.

**Illicit Discharge Detection and Elimination Component**

On September 10, 2008, the RWQCB adopted Addendum No. 2 to the Municipal Permit. This addendum requires the City to wait to submit the Illicit Discharge Detection and Elimination (IDDE) section of its JURMP Annual Report until the 2012 Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program) is finalized. This section must be submitted to the RWQCB no later than December 15, 2012.

During FY 2011-12, the City responded to 37 complaints made to its stormwater hotline and the Public Works maintenance hotline. The recommendations in the final report for the 2011 Dry Weather Monitoring Program were addressed during this reporting period. The City also continued maintenance of the sanitary sewer system to prevent sanitary sewer overflows (SSOs).

**Education Component**

The City continued to educate a variety of audiences within Lemon Grove as a means to raise stormwater awareness in various communities throughout FY 2011-12. During this reporting period, the City's efforts resulted in an estimated 6,757 impressions. City staff

attended municipal training sessions that covered different chapters of the JURMP and municipal permit requirements as well as proper BMP implementation. The City continued to post the *The Grove Gazette* newsletter on its website and to notify 411 subscribers of its posting. Newsletters issued during FY 2011-12 included stormwater-related articles aimed at both residents and businesses in the City. Industrial and commercial businesses met with the City's inspector who answered questions and provided information verbally on pollution prevention and BMPs pertaining to their business activities. Additionally, the City continued working with I Love a Clean San Diego to provide six educational presentations at four elementary schools and the Lemon Grove Public Library with a total of 398 participants. The presentations were interactive and used the hands-on watershed model to discuss topics including pollution prevention, waste reduction, recycling, and used motor oil recycling.

**Public Participation Component**

During FY 2011-12, the City continued to provide opportunities for the public to participate in stormwater related events and activities. Creek to Bay Cleanup event resulted in 42 volunteers participating, HHW comprised of 97 appointments for HHW drop off, and Spring Cleanup event counted 770 vehicles originating from Lemon Grove. Additionally, 750 reusable bags were distributed to the public on *A Day without a Bag*. The majority of these events were published in *The Grove Gazette* and the City's website and Facebook page to encourage public participation.

**Fiscal Analysis Component**

The City continues to use its General Fund as the primary source to fund the implementation of its stormwater program. During FY 2009-10, a fiscal analysis reporting template was developed collectively by the Copermittees. The City used this template to report the FY 2011-12 program budget in this JURMP Annual Report.

**Effectiveness Assessment Component**

During FY 2011-12, the City continued to evaluate the effectiveness of its JURMP implementation. The City has seen some encouraging signs of the effect of its program, such as lower amounts of pollutants in its Dry Weather Monitoring Program in recent years and increased public reporting of stormwater issues.

**Special Investigations**

The upstream investigation was conducted as part of the Dry Weather Monitoring and Sampling Program. A Total Maximum Daily Load compliance monitoring report and a special studies report were prepared during this reporting period.

**Non-Emergency Fire Fighting**

City staff continues to implement BMPs during regular maintenance of fire and emergency vehicles and equipment, training exercises, facilities maintenance, and post-emergency rehabilitation of response equipment.

**JURMP Revisions**

Any changes made to the JURMP since the JURMP update in the spring of 2008 and subsequent changes reported in the 2010 JURMP Annual Report are discussed throughout this JURMP Annual Report where applicable.

**Conclusions and Recommendations**

During future fiscal years, the City will continue to implement the programs detailed in its JURMP; it is anticipated that some program refinements will continue to be made as implementation progresses. The City will also continue to collaborate with the other Copermittees to improve the overall efficiency of its program and to develop updated methods of assessing program effectiveness.

| TTWQ | Threat to Water Quality |

# 1.0 INTRODUCTION

## 1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Program (JURMP) Annual Report presents an activity summary for the City of Lemon Grove (City) during the Fiscal Year 2011-2012 (FY 2011-12). The JURMP Annual Report preparation and submission are required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

### 1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act, also known as the Clean Water Act, established a framework for regulating Municipal Separate Storm Sewer System (MS4) discharges under the National Pollutant Discharge Elimination System (NPDES). In 1990, the RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region, followed by a revised permit in 2001. RWQCB Order No. 2001-01 was replaced by the current Municipal Permit in 2007.

In 2002, the City, as all regulated municipalities in the San Diego region (collectively referred to as Copermittees), developed and submitted a JURMP to the RWQCB. The City then submitted an updated JURMP, as required by the Municipal Permit, in March 2008. The JURMP explains management measures for different sectors, including municipal, industrial, commercial, construction, and significant development and redevelopment activities.

Annual reports documenting the implementation of the JURMP are required to be submitted to the RWQCB by September 30. This JURMP Annual Report presents data from FY 2011-12, which extended from July 1, 2011, to June 30, 2012.

### 1.1.2 CITY SETTING

The City is located inland in the southwest portion of San Diego County, which encompasses the southwest corner of California. As of the year 2010, there are approximately 25,320 residents in the City. San Diego County is located about 130 miles south of downtown Los Angeles, and immediately north of the United States-Mexico border. The City is centrally located within the greater San Diego and Tijuana urban area. The City encompasses 3.75 square miles and its boundaries are delineated by the SR-94 freeway to the north, Sweetwater Road to the east, 69th Street and Madera Drive to the west, and various residential streets located within the City of San Diego to the south. The SR-125 freeway runs along the City's eastern border.

The City is characterized by a mix of commercial, industrial, residential, and natural settings, which require a detailed understanding of the City's drainage, the series of local canyons, and the upper elevation topography in developing proper stormwater quality

controls. Runoff characteristics within the San Diego Bay Watershed (Pueblo San Diego Hydrologic Unit (HU) and Sweetwater HU) affect recreational, commercial, and aesthetic properties in Lemon Grove.

## 1.2 Purpose and Objectives

The City's JURMP presents strategies to reduce the discharge of pollutants from the MS4 to the Maximum Extent Practicable (MEP). The JURMP describes various programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the implementation of the City of Lemon Grove's JURMP during the FY 2011-12 reporting period.

## 1.3 Report Organization

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

| | |
|---|---|
| **Section 1** | **Introduction** |
| **Section 2** | **Development Planning** |
| **Section 3** | **Construction** |
| **Section 4** | **Municipal** |
| **Section 5** | **Industrial and Commercial** |
| **Section 6** | **Residential** |
| **Section 7** | **Illicit Discharge Detection and Elimination** |
| **Section 8** | **Education** |
| **Section 9** | **Public Participation** |
| **Section 10** | **Fiscal Analysis** |
| **Section 11** | **Effectiveness Assessment** |
| **Section 12** | **Special Investigations** |
| **Section 13** | **Non-Emergency Fire Fighting** |
| **Section 14** | **JURMP Revisions** |
| **Section 15** | **Conclusions and Recommendations** |
| **Section 16** | **References** |

Each section includes all components required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a more detailed explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Background, subsection 1.1, has been divided into Regulatory Background, subsection 1.1.1, and City Setting, subsection 1.1.2, for clarity.

# 2.0 DEVELOPMENT PLANNING

## 2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall stormwater quality by reducing the discharge of pollutants from development projects to the MEP and managing increases in runoff from development projects that have the potential to negatively affect downstream water bodies.

The major components of the City's program include development project reviews to apply Standard Urban Stormwater Mitigation Plan (SUSMP) requirements inclusive of hydromodification management, Best Management Practice (BMP) inspections, and requiring parties responsible for installed treatment control BMPs to certify that appropriate maintenance has been conducted each fiscal year.

### 2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the reporting period are presented in the following bulleted list. More details about the City's activities for this component of its stormwater program are provided in the remainder of this section.

- Inspected treatment control BMPs at all five sites with approved treatment control BMPs and met the permit required inspection frequencies, as shown in Table 2-1.
- Reviewed and updated treatment control BMP inventory.
- Developed a new self-certification letter and form for use during this reporting period.
- Developed a new stormwater compliance inspection form for use during this reporting period.
- Attended Copermittees' Land Development Workgroup meetings.

## 2.2 LAND USE PLANNING

### 2.2.1 BACKGROUND

The City's General Plan was revised in October of 1996 and includes a Conservation and Recreation Element that address the water quality and watershed protection principles and policies. Chapter 6, Section 6.1 of the City's JURMP presents the various elements referenced in the General Plan that meet the Municipal Permit requirements. This provides the City with a sufficient framework for implementing the development planning requirements of the Municipal Permit. No changes to these policies were necessary during this reporting period.

### 2.2.2 Source Characterization

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to the development restrictions in the City's General Plan for stormwater purposes were implemented during the reporting period.

### 2.2.3 Best Management Practice Requirements

Please refer to the City's updated JURMP document Chapter 6, Section 6.1 for a list of the water protection policies presented in the JURMP and referenced in the City's General Plan. These policies remained the same throughout the reporting period.

### 2.2.4 Program Implementation

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code. Additionally, the City required project proponents to comply with the *2011 Countywide Model SUSMP* and *Hydromodification Management Plan (HMP)* developed by the San Diego Region Copermittees.

Sections 2.3 and 2.4 of this JURMP Annual Report detail how the City implemented its established water protection policies through its environmental review process and its development project approval and verification processes during the reporting period.

## 2.3 Environmental Review Process

The City's current environmental review process is detailed in Chapter 6 of the City's JURMP. No modifications to the City's environmental review process were made during the reporting period.

## 2.4 Development Project Approval and Verification Process

### 2.4.1 Background

During FY 2011-12, the City implemented the watershed protection principles in the City's General Plan (see Chapter 6 of the City's JURMP) through various aspects of the City's development project approval and verification process, as detailed below.

### 2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's Municipal Code, JURMP, and staff enforcement of the *2011 Countywide Model SUSMP* and *HMP*. Projects subject to SUSMP regulations are identified by completion of an applicability checklist (Attachment 2.1). More detail about this process is provided in Section 2.4.4.2.

### 2.4.3 Best Management Practice Requirements

City staff continues to implement the requirements of the *2011 Countywide Model SUSMP* and *HMP* for all development projects described in Section 2.2.4 above.

### 2.4.4 Program Implementation

During FY 2011-12, the City required implementation of its BMP requirements for all development projects through education, the development project approval process, and the treatment control BMP inspection and maintenance verification program.

In response to key staff turnover during the beginning of FY 2011-12, the City completed a comprehensive review of the treatment control BMP inspection and maintenance verification programs. As a result of that review, some discrepancies were noted relative to the number and specific location of previously reported Priority Development Projects (Priority Projects). Section 2.4.4.3 describes the discrepancies observed and Appendix A.1 presents the updated inventory.

#### 2.4.4.1 Outreach and Staff Training

During FY 2011-12, the City's land development engineer and planning staff met regularly to discuss SUSMP and hydromodification management requirements as well as the status of SUSMP projects in the City. This regular communication among City staff ensures that development projects subject to SUSMP requirements are effectively identified and appropriate water quality protection measures are applied.

Project proponents were also made aware of SUSMP requirements through the development review process, including interaction with staff at the front counter as well as during meetings with City staff.

Distribution of maintenance verification letters to parties responsible for maintenance of treatment control BMPs at completed projects has also increased the level of knowledge of regulated parties.

The City's Land Development Engineer participated in the Copermittees' Land Development Workgroup meetings during this reporting period. This provided a forum for beneficial discussions on SUSMP requirements and hydromodification management.

#### 2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were also required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Checklists were completed to determine stormwater requirements for each project, including whether SUSMP requirements applied. Attachment 2.1 shows the form that is presented to each applicant regardless of project size. The City has recently implemented a system to record SUSMP related information for each project in a spreadsheet continuously throughout the year. A summary of the projects submitted during the reporting period and whether each was subject to SUSMP requirements is presented in Table 2-2 at the end of this section.

Of the submitted projects, three were determined to be subject to SUSMP requirements. These three projects are listed with the types of treatment control BMPs proposed in Table 2-3 at the end of this section. City reviewers use requirement checklists to verify that applicable SUSMP requirements are addressed in the proposed designs and to document the proposed BMPs.

During FY 2011-12, every SUSMP project approved by the City proposed high or medium removal efficiency treatment control BMPs. No projects received a SUSMP waiver for implementation of treatment control BMPs, and at this time the City has no plans to develop a SUSMP waiver mitigation program.

**Hydromodification Management Plan**

The final regional HMP was approved by the RWQCB on July 14, 2010 and the City subsequently incorporated the updated standards into its review process for development projects, as discussed earlier in this section. City staff participated in the Copermittees' Land Development Workgroup, which regularly discussed the HMP and its implementation on a jurisdictional level. Of the three Priority Projects approved by the City during the reporting period, none were subject to hydromodification management requirements because they did not result in increased impervious area or discharge rates.

**BMP Installation Verification**

City inspectors check to see that proposed post construction BMPs have been implemented prior to granting occupancy for development projects subject to SUSMP. City inspectors continued documenting BMP installation during pre-occupancy verification visits using a camera during the reporting period, and are working to implement a system for documentation using Global Positioning System technology.

#### 2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

Toward the beginning of each fiscal year, the City updates its inventory of completed projects with approved treatment control BMPs. Once the inventory is updated, City staff attains the required self-certification statement of BMP maintenance from all property owners with SUSMP treatment control BMPs. In addition to attaining the self-certification statements from the property owners, the City identifies the sites that require annual inspections based on the frequency established in the Municipal Permit.

Should additional projects be completed during the reporting period, but after the inventory is established for the fiscal year, the City's procedure is as follows: Complete the check for BMPs prior to occupancy, record the site information and assign it a Threat To Water Quality (TTWQ) priority, and then add the project and its BMPs to the inventory of projects subject to the City's inspection and annual maintenance verification program the following fiscal year.

In FY 2011-12, City staff reviewed the existing treatment control BMP inventory presented in the 2010-11 JURMP Annual Report and determined that two private residences were not Priority Projects and should not have been placed on the aforementioned inventory. A

private residence at 2210 & 2212 El Prado with a grassy swale and 2680 Davenport with a grassy swale were both removed from the treatment control inventory presented in last year's annual report. Both were not subject to SUSMP. The update has been made to the inventory of completed development projects with approved treatment control BMPs in Appendix A.1.

During this reporting period, the City developed a new self-certification letter and form (Attachment 2.2). Self-certification statements of BMP maintenance was received from four of the five properties listed in Appendix A.1. The City was not able to obtain a statement from residents at Mary Pat Lane; however, the City did conduct a stormwater compliance inspection of the treatment control BMPs. The treatment control BMPs were operational and no corrective actions were noted during the inspection. City staff will continue to work with the residence of Mary Pat Lane to attain the self-certification statements on an annual basis prior to October 1st.

The City's land development engineer conducted stormwater compliance inspections of all five post construction treatment control BMP sites (DCH Honda, Citron Court, Chevron, Mary Pat Lane, and EDCO). Although the Municipal Permit only requires the high and medium TTWQs to be inspected annually, City staff inspected all five sites. Appendix A.1 presents the project names, location, development type, BMP type, hydrologic subarea, fiscal year completed and TTWQ. Table 2-1 below summarizes all the relevant frequency requirements listed in the Municipal Permit. Table 2-4 at the end of this chapter presents the findings of the inspections. No corrective actions were required for any of the five sites inspected. The City also developed and used a new inspection form for the post construction treatment control BMP inspection during this reporting period (Attachment 2.3).

**Table 2-1**
**Assessment of Compliance with Required Inspection Frequencies**

| Class | Number of Sites | Inspections | Percent Inspected | Permit Requirement | Requirement Met |
|---|---|---|---|---|---|
| All Inventoried Sites | 5 | 5 | 100% | 20% | **Yes** |
| Sites with Drainage Inserts | 4 | 4 | 100% | 50% | **Yes** |
| High Priority Sites | 2 | 2 | 100% | 100% | **Yes** |

## 2.5 Development Planning Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 2.6 PROGRAM REVIEW AND MODIFICATION

The City created a new post construction treatment control BMP self-certification maintenance letter and form and a stormwater compliance inspection form for immediate implementation (Attachments 2.2 & 2.3). The City has also performed a thorough review of its treatment control BMP inventory and updated its records as discussed in section 2.4.4.3 above.

**Table 2-2**
**Applicability of SUSMP Requirements to Development Projects**

| Project Number | Project Name | Subject to SUSMP (Yes or No?) |
|---|---|---|
| **B11-000-288** | **Citronica - 7755 North Avenue** | **Yes** |

| No. | Project | Inspection Date | Inspection Findings | Follow-Up | Resolution Status |
|---|---|---|---|---|---|
| 1 | DCH Honda | 6/28/2012 | No corrective actions | None required | N/A |
| 2 | Citron Court | 6/28/2012 | No corrective actions | None required | N/A |
| 3 | Chevron | 6/28/2012 | No corrective actions | None required | N/A |
| 4 | Mary Pat Lane | 6/20/2012 | No corrective actions | None required | N/A |
| 5 | EDCO | 6/28/2012 | No corrective actions | None required | N/A |

# 3.0 CONSTRUCTION

## 3.1 INTRODUCTION

The City's construction program is designed to control construction and grading activities in the City. These types of projects have the potential to affect nearby water bodies due to the presence of disturbed soils and building materials, and the potential for associated pollutants to be transported off site by stormwater or non-stormwater flows. The City continued to implement its construction program throughout FY 2011-12.

### 3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the construction component during the FY 2011-12 reporting period are presented in the bulleted list below. The following subsections provide more detail about how the City complied with the Municipal Permit during the reporting period.

- Conducted plan checks of erosion control plans to ensure construction projects were in compliance with the City's minimum BMP requirements.
- Educated project proponents and contractors on stormwater pollution prevention requirements at preconstruction meetings.
- Conducted Municipal Permit required training for appropriate City staff on the City's stormwater construction program requirements. This included the annual stormwater compliance inspector training and a general overview of the construction program for the City's Engineering Division.
- Conducted 165 site visits during the reporting period at five active private developments and three active Capital Improvement Project (CIP) sites to inspect BMP implementation. Three private development sites were designated as medium priority TTWQ and the remaining five as low priority TTWQ.
- Issued four Correct Work Notices in response to non-compliance with the City's minimum BMP requirements.

## 3.2 SOURCE CHARACTERIZATION

The City maintains a watershed-based inventory of all private and public construction projects, both active and completed. The database where the inventory is stored is updated on a regular basis. During this reporting period, there were eight active construction projects. A total of five of these projects were private development construction projects and three of these projects were CIPs. Appendix A.2 includes a list of all construction projects that were active during FY 2011-12.

## 3.3 Updates to Ordinances and Approval Process

The City addresses stormwater pollution through implementation of various components of its Municipal Code. The City's grading ordinance and JURMP Chapter 7 includes specific requirements for erosion prevention, seasonal restrictions on grading, slope stabilization, preservation of natural hydrologic features, and maintenance of all BMPs. The requirements of the 2007 Municipal Permit and the updated model SUSMP are also enforced by City staff through the review of grading plans and building permit applications. No changes were made to the City's project approval process during this reporting period.

## 3.4 Best Management Practice Requirements

The City requires BMP implementation at all construction sites to reduce and or eliminate the impact of discharges from construction site runoff on receiving water quality. Section 7.6 of the City's JURMP outlines the minimum construction BMPs required by the City. There were no changes to these requirements during this reporting period.

## 3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below. A discrepancy in the frequency of construction stormwater compliance inspections was observed in the City's JURMP and adjusted during this reporting period to reflect the 2007 Municipal Permit frequency of inspections.

### 3.5.1 Education and Staff Training

The City provides information regarding stormwater quality to project proponents, project personnel, employees, contractors, subcontractors, and other parties involved with construction activities. The following is a list of construction-related training activities that the City has provided or participated in during FY 2011-12:

- All new development and redevelopment project proponents attended preconstruction meetings that included education on stormwater management topics such as federal, state, and local regulations, compliance with grading ordinance, stormwater requirements, implementation of Stormwater Pollution Prevention Plans (SWPPPs), and implementation of BMPs.
- The City's inspector verbally notified construction site managers of enhanced construction BMP requirements prior to the rainy season and also prior to significant rain events during this reporting period.
- The annual construction inspector training was conducted during FY 2011-12.
- The City's Engineering Division participated in an overview of the City's construction program. The training session covered the inspection program, BMP

implementation, enforcement and other miscellaneous construction requirements including information on the new State of California General Construction Permit.

### 3.5.2 Construction and Grading Approval Process

The City requires that all proposed construction and grading projects implement measures to ensure that pollutants from the site will be reduced to MEP and will not cause or contribute to an exceedance of water quality objectives. Proponents of all construction and grading projects are required to comply with practices detailed in the City's JURMP Section 7.6 and the City's grading ordinance.

As previously mentioned, all new development and redevelopment project proponents are informed by City staff of stormwater management topics including federal, state, and local regulations, implementation of a SWPPP, if required, and implementation and maintenance of BMPs. The City also has an educational video covering construction site BMPs and stormwater management information that is available to the developer, owner, and contractor to view.

During FY 2011-12, all construction projects were required to undergo the approval process described above. These requirements are tracked by the City's staff as part of the routing and record-keeping database.

The City also continued implementing advanced treatment requirements during the reporting period as described in the Municipal Permit. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites. Advanced treatment methods were not required at any construction sites. Lastly, there were no construction sites that were greater than 17 acres that required additional erosion control and sediment control BMPs.

### 3.5.3 Inspection of Construction Sites

Construction inspections conducted during the reporting period were performed as described in the City's JURMP Chapter 7 and based on the frequency established in the 2007 Municipal Permit (high priority bi-monthly, medium priority monthly, and low priority as needed in the rainy season). A discrepancy was noted in the City's JURMP document for inspection frequency and it was adjusted during this reporting period to reflect the 2007 Municipal Permit requirements.

During the City's routine stormwater compliance inspections, inspectors discuss BMPs with each site project manager, developer, or owner and complete an inspection form for the high and medium TTWQ sites. Additionally, the City's building inspectors may forward non-compliant sites to the engineering inspector for follow-up inspections and enforcement.

Inspected construction sites, along with their TTWQ, the number of weeks the site was active within the rainy season, the number of inspections conducted during both the rainy and dry seasons, and the total number of inspections for each site is included with the inventory in Appendix A.2.

The City conducted 165 site visits and visual inspections at the eight active construction sites during FY 2011-12. Three of the eight sites were designated as medium priority TTWQ. Stormwater compliance inspection forms were only filled out for the medium priority construction sites at the frequency established in the 2007 Municipal Permit (monthly in the rainy season). Five of the eight sites were designated as low priority TTWQ and are required to be inspected as needed per the 2007 Municipal Permit. As noted above, the City's construction compliance inspection form is filled out for high and medium priority sites and not for the low priority sites; however, notes on some of the deficiencies for the low priority sites were included in the engineering inspector's journal. Many of the deficiencies observed during the site visits were corrected immediately.

It is worth noting that the City's small size and relatively low number of construction sites at any given time allow City staff to provide focused, personal attention to every active construction site with daily inspections and regular personal communication with project superintendents responsible for implementing and maintaining stormwater protection measures.

### 3.5.4 Enforcement Measures

The City's enforcement procedures require corrective actions when non-compliance is observed. Non-compliant sites receive a written or verbal Correct Work Notice and timeframe for compliance. They are also required to become compliant within one to three working days, unless rain is imminent, in which case a Stop Work Notice is issued immediately. Failure to install BMPs indicated in a Correct Work Notice within the appropriate timeframe results in issuance of a Stop Work Notice, and notification is sent to the RWQCB. Additional enforcement actions including revocation of permits, and issuance of citations also can be taken as necessary.

The City issued four verbal Correct Work Notices to four construction projects for stormwater BMP deficiencies during this reporting period. Table 3-1 describes each notice, along with the follow-up actions taken to correct the deficiency. Additional enforcement actions were not necessary during this reporting period.

## 3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 3.7 Program Review and Modification

A discrepancy was noted in the City's JURMP document Chapter 7 for inspection frequency and it was adjusted during this reporting period to reflect the 2007 Municipal Permit requirements. No other changes to the City's construction component were made during FY 2011-12.

**Table 3-1**
**Enforcement Actions Taken at Construction Sites During FY 2011-12**

| # | Date | Project | Address | Type of Notice Issued | Resolution |
|---|---|---|---|---|---|
| 1 | October 2011 | HAPPY TINNIE LLC | 2889 ORANGE PLACE | Correct Work Notice: cover spoils (verbal) | Contractor Complied within 24 hours |
| 2 | January 2012 | WALGREENS | 7195 BROADWAY BOULEVARD | Correct Work Notice: concrete spill (verbal) | cleaned up, put in washout within 24 hours |
| 3 | January 2012 | KROGER FOODS | 7428 BROADWAY BOULEVARD | Correct Work Notice: re-establish construction entrance (verbal) | Contractor Complied within 24 hours |
| 4 | June 2012 | IDA STREET DRAINAGE IMPROVEMENTS | IDA STREET CUL-DE-SAC | Correct Work Notice: cover spoil piles (verbal) | Contractor complied within 24 hours |

# 4.0 MUNICIPAL

## 4.1 INTRODUCTION

Throughout FY 2011-12, the City of Lemon Grove continued to manage municipal areas and activities to reduce municipal discharges of pollutants to the MS4 and to the MEP. As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. Public parks and recreation facilities, administrative buildings, a fire station, and public works facilities make up the bulk of the municipal areas in the City. Municipal activities conducted by the City include power washing, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. These activities are conducted by City staff and or City contractors. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2. The City's municipal inspection results can be found in Table 4-3 and Sanitary Sewer Overflow (SSO) reports in Table 4-4. The City continued to respond to public stormwater related complaints at City Hall and the Public Works Yard. All stormwater related complaints made to the City are included in Appendix B; enforcement actions taken in response to complaint investigations are discussed in Section 4.8.

### 4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the municipal component of its stormwater program during the reporting period are provided in the remainder of Section 4.

- The City inspected 14 TTWQ fixed municipal facilities.
- The City performed nine special event inspections.
- The City conducted inspections at 23 restaurants for Fats, Oils, and Grease (FOG) program.
- The City reported five SSOs.
- The City responded to 37 stormwater related complaints.
- The City removed an estimated 147.15 tons of debris from street sweeping activities.
- The City removed an estimated 572.55 cubic yards of debris through standard MS4 cleaning activities.
- The City cleaned 100 percent of its sewer mains (67 miles) and video inspected 16.75 miles of its sewer main to locate blockages and areas of needed repair.
- The City conducted several in house training for Development Services and Public Works staff.

## 4.2 FIXED FACILITIES

### 4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category: fixed facilities. This is because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar.

### 4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included in the City's municipal inventory, which is included in this JURMP Annual Report as Appendix A.3. The designations of pollutants potentially generated by municipal facilities on the inventory are based on a pollutant loading potential table generated from the San Diego Region Copermittees' Baseline Long-Term Effectiveness Assessment report. The high TTWQ prioritizations are assigned based on criteria presented in the 2007 Municipal Permit.

### 4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs for fixed municipal facilities as set forth in the City's JURMP. City staff are trained to recognize the need for additional BMPs and implement them as necessary. The City maintains a contract with a landscape maintenance company, ensuring implementation of BMPs for the management of pesticides, herbicides, and fertilizers to be protective of water quality. Similarly City staff conducts some landscape maintenance activities and ensure implementation of Integrated Pest Management (IPM) principles. Public Works, Fire Station, and staff at other fixed municipal facilities in the City continue to implement BMPs appropriate to the facility type as described in the City's JURMP. Parking lots at fixed facilities are swept monthly. There have been no changes in BMP requirements for any fixed municipal facilities.

### 4.2.4 PROGRAM IMPLEMENTATION

**Parks**

During FY 2011-12, the City's Street Division and contractor continued to implement the BMPs described in its JURMP for the management and use of pesticides, herbicides, and fertilizers, including implementation of IPM principles. City staff and contractor implemented BMPs to control landscaping waste from parks and to keep City parks free of trash and other debris. Street sweeping was conducted in the parking lots at the parks on a monthly basis as part of their maintenance.

**Public Works Yard, Fire Station, Other Fixed Facilities**

As previously mentioned, City personnel continued to implement appropriate BMPs for fixed municipal facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance, such as landscaping and building maintenance, as necessary.

City staff implemented a series of BMPs to address the various activities conducted at the Public Works Yard. Monthly checklists are also used to maintain compliance with stormwater requirements. This facility, the fire station, and other fixed facilities receive annual inspections by stormwater staff as part of the City's stormwater municipal inspection program.

**Municipal Inspections**

Fourteen high TTWQ fixed municipal facilities received a formal annual inspection in FY 2011-12. There were an additional seven high TTWQ facilities and activities that were either not available for inspection or were inspected by staff on a regular basis that did not require a formal annual inspection. During this reporting period, City staff created and used a new inspection form based off of the City's existing industrial and commercial inspection form. The City's inspection approach, as described in the JURMP, was implemented for all inspections at fixed municipal facilities conducted in FY 2011-12. Inspected facilities and their associated corrective actions are included in Table 4-3. Inspections were also conducted at nine special events during this reporting period.

No municipal facilities, activities or special events were recommended for follow-up inspection based on routine municipal inspection results, but appropriate City staff members were notified of any recommended minor corrective actions. The City's municipal inspection form is included as Attachment 4.1.

## 4.3 Roads, Streets, and Parking Facilities

### 4.3.1 Background

The City conducts regular maintenance of roads, streets, and parking facilities in the City to control pollutants such as sediment, metals, and litter and debris.

### 4.3.2 Source Characterization

The City maintains 65.5 miles of roads and streets. Roads and streets are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

### 4.3.3 Best Management Practices

The City's primary BMP for roads, streets, and parking facilities is street sweeping; other BMPs are outlined in the JURMP. There were no changes to the BMPs implemented for roads, streets, and parking facilities in FY 2011-12.

### 4.3.4 Program Implementation

During FY 2011-12, 111.79 curb miles that comprises the City's sweeping route was swept at the appropriate frequencies. A cumulative total of 147.15 tons of debris was collected during this fiscal year. Table 4-1, below, describes the areas assigned high, medium, and

low sweeping priorities and the associated sweeping frequency. The City sweeps all major arterials every two weeks. Municipal parking lots and residential areas are swept monthly.

**Table 4-1**
**Street Sweeping Prioritization and Frequency**

| Category | Description | Approximate Mileage of Route (curb miles) | Sweeping Frequency |
|---|---|---|---|
| High | Commercial Area Downtown | 0.59 miles | Once a week |
| High | Main arterials/Business Areas/Residential | 38.84 miles | Once every two weeks |
| Medium | Residential Areas | 72.36 miles | Once every month |
| Parking Lots at Fixed Facilities | Seven Parking lots associated with fixed municipal facilities | 147,979 square feet | Once every month |
| **Total Amount of Debris Collected from Street Sweeping Activities: 147.15 tons** | | | |

**Inspections**
Trash, debris, and sediment that had accumulated on City streets is identified and cleaned up via street sweeping, so additional inspections beyond this effort are not necessary.

## 4.4 MS4

### 4.4.1 Background

The City's stormwater conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during rain events.

### 4.4.2 Source Characterization

The City's MS4, as one complete entity, is included in the City's high TTWQ municipal inventory. The City's MS4 consists of over 190 catch basins and drop inlets, 45 miles of underground drainage pipe, and approximately 2.5 miles of open channels.

### 4.4.3 Best Management Practices

The City maintained an MS4 inspection, maintenance, and cleaning schedule throughout the reporting period. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. BMPs for MS4 maintenance activities did not change during FY 2011-12.

### 4.4.4 Program Implementation

The City's MS4 inspection and cleaning schedule for FY 2011-12 is shown in Table 4-2. The City has approximately 2.5 miles of concrete and earthen channels within urban areas of the City that undergo routine inspections and maintenance as needed. Additional conveyances

are located on private property. The City does not maintain channels located on private property without dedicated easements. If maintenance of private channels is needed, the City requires the property owner to complete the maintenance.

**Table 4-2**
**MS4 Maintenance Data**

| | Percent Inspected and or Cleaned* | Percent of Open Channels Found with Anthropogenic Litter | Amount of Material Removed by Cleaning Activities |
|---|---|---|---|
| **Catch Basins/ Self-Cleaning MS4 Facilities** | 100% | N/A | Silt: 8.44 cubic yards<br>Vegetation: 1.58 cubic yards<br>Debris: 0.53 cubic yards |
| **Concrete/ Earthen Channels** | 100% | 100% | Silt: 0 cubic yards<br>Vegetation: 500 cubic yards<br>Debris: 62 cubic yards |
| **Total Debris Removed From MS4 Maintenance Activities: 572.55 cubic yards** | | | |

* The City inspects 100% of the MS4 and cleans out all structures observed at or above 33% capacity at a minimum before the rainy season.

As described in Table 4-2, 572.55 cubic yards of material was removed during MS4 maintenance conducted in FY 2011-12. City staff involved in maintenance activities reported materials removed by category for each type of MS4 maintenance activity. The volumes were converted to estimated weights using the conversion factors of 2,300 pounds per cubic yard of sediment and silt and 400 pounds per cubic yard of vegetation, trash, and debris. The total vegetation collected was 200,632 pounds or 100.32 tons, total debris 25,012 pounds or 12.51 tons, and total sediment and silt 19,412 pounds or 9.71 tons. The total weight of material removed was estimated to be 122.5 tons.

All MS4 facilities were inspected and all inlets and catch basins observed at or above 33 percent capacity were cleaned before the rainy season. The remaining facilities were inspected and cleaned as needed throughout the fiscal year. Additional inspections beyond this effort, such as the formal inspections conducted for the fixed facilities, were not necessary.

## 4.5 Sanitary Sewer System

### 4.5.1 Background

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. A spill that introduces untreated sewage to receiving waters can contain high concentrations of bacteria, viruses, and even hazardous chemicals. Routine inspection and maintenance of the sanitary sewer system works to reduce the potential for a spill or SSO and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

### 4.5.2 SOURCE CHARACTERIZATION

The City maintains a system of public sanitary sewer facilities to convey wastewater from the City to be treated. The City's sanitary sewer system includes 67 miles of collection system and a lift station.

### 4.5.3 BEST MANAGEMENT PRACTICES

The City implements BMPs for the sanitary sewer system as per the City's JURMP. There have been no changes to these BMPs during FY 2011-12. The City inspects and maintains the sanitary sewer system as part of regular sanitation activities and clears blockages and repairs leaks as needed.

### 4.5.4 PROGRAM IMPLEMENTATION

The City continually inspects and maintains various aspects of the City's sanitary sewer system and cleans out or repairs any identified problem areas as necessary. The City continued to use a video camera to locate blockages, locate areas in need of repair, and identify any illegal connections during FY 2011-12. Identifying areas of the sewer system that require repair and making prompt repairs prevents those areas from becoming future seepage points or point of origin of an SSO. During FY 2011-12, the City used a video camera to inspect 16.75 miles of sewer mains to locate blockages and areas of needed repair. The City also cleaned 100 percent (67 miles) of its sewer mains during this reporting period. The City conducts monthly inspections at a City-owned lift station.

During FY 2011-12, the City continued to implement a FOG program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs. The City conducted FOG inspections at 23 eating establishments during FY 2011-12, and continued cross-referencing the City's business license database to verify that all grease-producing businesses are identified.

In case of an SSO, the City maintains a spill response plan that establishes procedures for responding to an SSO. There were five SSOs during FY 2011-12, which were appropriately reported through the California Integrated Water Quality System (CIWQS).

**Table 4-4**
**FY 2011-12 Sanitary Sewer Overflows (SSO)**

| Date | Event ID | Location/Description | Volume |
|---|---|---|---|
| July 18, 2011, 11:00 am | 768781 | Private lateral cleanout in parking lot. 7155 Broadway, Lemon Grove, CA | 220 Gallons |
| August 24, 2011 | 770584 | City of San Diego Spill on Federal Blvd. 6588 Federal Blvd, Lemon Grove, CA | 1,800 Gallons |
| December 22, 2011, 1:20pm | 777399 | Sewer Manhole (Mass Ave). 2211 Massachusetts Ave, Lemon Grove, CA | 350 Gallons |
| March 7, 2012, 11:45 am | 781944 | Car Quest Auto Parts. 7702 Broadway, Lemon Grove, CA | 540 Gallons |
| March 13, 2012, 7:30 pm | 779418 | Apartment Complex 3274 Main Street, Lemon Grove, CA | 200 Gallons |

## 4.6 Mobile Municipal Activities, Including Power Washing

### 4.6.1 Background

The City staff or contractors conduct a variety of mobile municipal activities, typically involving vehicle maintenance, landscape maintenance, street and sidewalk repair, and power washing. These activities are not confined to a specific location; as such, BMPs must be implemented wherever one of these activities is taking place.

### 4.6.2 Source Characterization

Emergency vehicle maintenance, landscape maintenance, power washing, and street and sidewalk repair are listed on the City's high TTWQ municipal inventory as mobile activities.

### 4.6.3 Best Management Practices

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel and contractors are trained to implement BMPs for the specific activity in which they are involved. The City's contractor continued to use a pressure-washing unit with a vacuum and debris boom to prevent discharge during pressure-washing operations. Contractor personnel performing power washing are trained to collect all waste water for proper disposal. City personnel and contractor conducting emergency vehicle maintenance activities are trained to use drip pans and other spill containment during emergency vehicle maintenance. City personnel and contractors for landscape maintenance are trained in IPM principles. Similarly, street and sidewalk repair personnel and contractors implement BMPs per the City's JURMP.

### 4.6.4 PROGRAM IMPLEMENTATION

Power washing (bus stop cleaning) and emergency vehicle maintenance are both high TTWQ activities. Neither power washing nor emergency vehicle maintenance was scheduled to be conducted during the timeframe that routine municipal inspections were conducted. BMPs are implemented during these activities to prevent discharge of any pollutants to the storm drain system. Wastewater from pressure-washing activities is not discharged to the MS4. Personnel responsible for these activities were contacted to discuss BMP implementation, and they confirmed the use of a vacuum and debris boom to prevent discharge of wastewater during cleaning activities. Similarly, City staff confirmed the use of spill kits and drip pans in the event of an emergency vehicle maintenance operation.

Municipal personnel and contractors that conduct other mobile activities such as infrastructure maintenance and landscape maintenance are trained regarding BMPs for material use and disposal during tail-gate meetings at the Public Works Yard. City personnel routinely inspect park facilities to ensure that the City's landscape maintenance contractor is implementing IPM principles and appropriate BMPs at municipal parks. City staff is trained to look for signs of over-irrigation, overspray of fertilizers and pesticides, and proper disposal of green waste. City staff and contractors will continue to be trained on appropriate BMPs for mobile activities as described in the City's JURMP.

## 4.7 SPECIAL EVENTS

### 4.7.1 BACKGROUND

As discussed in the City's JURMP, special events have the potential to generate trash and litter as a result of the patrons and activities of the special event. The City hosts several special events throughout the year. These events include annual bonfire, concerts in the park, and movies in the park, and other events for various causes and occasions.

### 4.7.2 SOURCE CHARACTERIZATION

As required by the Municipal Permit, special events are included on the City's high TTWQ municipal inventory.

### 4.7.3 BEST MANAGEMENT PRACTICES

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter and debris from the event, and raise stormwater awareness among the vendors and patrons of the event, as applicable.

### 4.7.4 PROGRAM IMPLEMENTATION

The City's minimum BMPs were in place for each special event in the City during FY 2011-12. Additionally, City staff was available throughout the duration of each event to address any immediate issues. Individuals applying for a permit (temporary use or encroachment permit) to hold an event on City property are notified that approval of the activity does not excuse compliance with City ordinances, including Chapter 8.48 of the Municipal Code Stormwater Management and Discharge Control (Storm Water Ordinance). Illegal discharges are prohibited and storm drain protection, trash BMPs, and appropriate storage of liquids are required.

During FY 2011-12, the City routinely inspected and cleaned-up during and after all nine special events, and took preventive measures as applicable. These events included six concerts held at Berry Street Park, two movies in the park at Lemon Grove Recreation Center, and a Bonfire at Civic Center Park. Additional trash receptacles were provided for the events to address litter and debris concerns.

## 4.8 PUBLIC REPORTING OF ILLICIT CONNECTIONS AND DISCHARGES

**Reporting and Response**

Public and municipal involvement is crucial to preventing and eliminating illicit connections and illegal discharges (IC/IDs) from the stormwater conveyance system. The Public Works and City Hall dispatch numbers provide effective means for individuals in the City to report suspected IC/IDs. All complaints received by the City are logged for documentation and tracking purposes. Each logged complaint is investigated by City personnel to determine if an IC/ID is present. Responsible parties for any confirmed IC/ID are sought out and educated and or cited as necessary and required to stop or clean up any and all illegal discharges.

Complaints received by the City during the FY 2011-12 reporting period and the City's response to each are listed in Appendix B. Thirty-seven complaints were documented this year.

**Enforcement**

As previously stated, complaints received by the City, are included in a table in Appendix B. The table also includes a description of how each complaint was resolved during the reporting period. Resolutions to investigated complaints included clean-up, discussing stormwater concepts with individuals involved in the complaint, and verbal warnings. Three verbal warnings and one written notice were given and no notice of violation was issued during this reporting period in response to stormwater related complaints received by the City. There are also three complaints that have not been fully resolved and are listed as *"In Progress"*.

## 4.9 Spill Reporting, Response, and Prevention

The City has documented procedures for preventing and responding to SSOs. Preventive maintenance is regularly conducted on the City's sanitary sewer system, and inspections are regularly conducted to monitor the condition of the public sewer mains and to determine the necessity of maintenance. Private lateral lines do not receive preventive maintenance, but the City assists in the containment and cleanup of sewer spills if the spill could potentially reach the City's MS4.

Individuals in the City are encouraged to report all SSOs. During the FY 2011-12 reporting period, there were five SSOs (Table 4-4). All SSOs were reported to the RWQCB via the CIWQS website.

## 4.10 Education and Outreach

During FY 2011-12, the City continued to educate municipal personnel regarding stormwater requirements and proper BMP implementation during several in-house training sessions. The City held five in-house training sessions for City personnel during this reporting period. City staff went over different sections of the JURMP including Municipal, Industrial, Commercial, and Construction chapters. Inspector training was also conducted as well as an in-house BMP refresher for Public Works staff. Detailed information regarding the education and outreach conducted for City personnel is provided in Section 8 of this Annual Report.

## 4.11 Municipal Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 4.12 Program Modification and Review

Minor updates were made to this component of the program. Updates were made to the municipal inventory to include pollutant loading potential. The length of storm drain pipe estimate presented in past annual reports was reduced from an estimated 75 miles to 45 miles based on City staff knowledge. A municipal inspection form similar to the industrial and commercial inspection form was developed for the fixed facilities inspections. A new special event inspection form and food vendor fact sheet will be developed and used in the next reporting period. Additional program modifications are anticipated for the next reporting period.

**Table 4-3**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Facility Category | Inspection Date | Corrective Actions |
|---|---|---|---|---|---|---|
| 1 | Berry Street Park | 7101 Mount Vernon Street | High | Recreational Park with Open Field | 6/19/12 | • No corrective actions noted. |
| 2 | Civic Center Park | 7715 Church Street | High | Recreation, Museum, and Historic Site | 6/19/12 | • No corrective actions noted. |
| 3 | City Hall/Sheriff's Station | 3232 Main Street/3240 Main Street | High | Administration and Public Safety and Jail | 6/19/12 | • No corrective actions noted. |
| 4 | Community Center | 3146 School Lane | High | Public Service | 6/19/12 | • No corrective actions noted. |

| 22 | Trolley Depot | 3443 Main Street | High | Office Space | 6/19/12 | • No corrective actions noted. |

* These facilities and activities were either regularly inspected or did not occur during this reporting period or during regular working hours.

# 5.0 INDUSTRIAL AND COMMERCIAL

## 5.1 INTRODUCTION

During the FY 2011-12 reporting period, the City continued to implement its program to mitigate urban runoff pollution from industrial and commercial sites and sources. The City aims to reduce the amount of pollutants discharged from industrial and commercial facilities through various aspects of the industrial and commercial program.

### 5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Notable achievements for the industrial and commercial component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the industrial and commercial component of its stormwater program during the reporting period are provided in the remainder of Section 5.

- The City met the Municipal Permit requirement of inspecting at least 25 percent of its stationary industrial and commercial inventory.
- The City continued to inspect high TTWQ industrial and commercial facilities.
- Conducted training for City staff on the Industrial and Commercial Program.
- The City updated its prioritization process and developed a new updated inventory for both stationary industrial commercial facilities and mobile businesses.

## 5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES AND SOURCES ELEMENT

### 5.2.1 BACKGROUND

The City's updated industrial and commercial inventory (Appendix A.4) includes all stationary facilities known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, wholesalers, auto dealerships, auto repair shops, and restaurants. The City requires industrial and commercial businesses to implement pollution prevention measures and activity-specific minimum BMPs to mitigate the impacts of business activities on water quality.

### 5.2.2 SOURCE CHARACTERIZATION

As previously mentioned, the City's inventories include stationary industrial and commercial businesses, as required by the Municipal Permit. Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP.

The updated inventory presented in the FY 2010-11 JURMP Annual Report is what this reporting period's inspections are based on. However, it is worth noting that the updated inventory prepared for the FY 2012-13 as presented in Appendix A.4 in this report is based on a different prioritization flowchart that will be presented in the FY 2012-13 JURMP Annual Report. The new prioritization flowchart considered factors including those listed below when prioritizing the inventories:

- Subjectivity to coverage under the State of California Industrial General Permit, Order No. 97-03-DWQ (Industrial Permit)
- Consideration of downstream water body and whether the business is likely to discharge pollutants for which the water body is impaired
- Outdoor storage of material or activities
- Results from previous inspections and institutional knowledge
- Proximity to the receiving water body
- Municipal Permit requirements for prioritization of high TTWQ facilities

At the end of the FY 2011-12, the City updated its industrial and commercial inventory and prioritization flowchart. The list of all businesses with active business certificates was generated and prioritized to create a new and updated inventory. The City's updated inventory includes 324 stationary industrial and commercial facilities that will be used in the FY 2012-13 reporting period.

### 5.2.3 Best Management Practice Requirements

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other BMPs to reduce or potentially eliminate the generation of pollutants from business areas and activities. The City has established a set of minimum BMPs presented in Chapter 4 of the City's JURMP. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. No changes have been made to the City's BMP requirements during this reporting period.

### 5.2.4 Program Implementation

**Industrial and Commercial Inspections**

During FY 2011-12, the City conducted stormwater compliance inspections at selected stationary industrial and commercial facilities. The inspected facilities were selected by using the following criteria:

- High TTWQ facilities
- Facilities with History of Non-Compliance
- Inventory established FY 2010-11

Table 5-1 provides a summary of industrial and commercial site visits that occurred during FY 2011-12. The purpose of the City's inspection program is to confirm that the City's minimum BMPs are being implemented at stationary industrial and commercial facilities.

**Table 5-1**
**Summary of Industrial and Commercial Inspections**

| Facility Category | Inventoried Sites | Inspections | Percentage Inspected |
|---|---|---|---|
| High TTWQ Sites | 225* | 59 | 26% |
| **Totals** | **225** | **59** | **26%** |

*The number of facilities in the above table is based on the inventory established in the 2010-11 JURMP Annual Report and includes some mobile businesses.

Facility inspections were conducted in accordance with the protocol set in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. A training session on the industrial commercial inspection program was provided for staff conducting the City's industrial and commercial inspections. This training ensured the City met the Municipal Permit requirement for annual inspector training. More information about staff training is provided in Section 8 of this JURMP Annual Report.

BMP deficiencies and corrective actions were recorded on the City's industrial and commercial inspection form, which is included in the City's JURMP, and discussed with facility personnel present during the inspection. The City's industrial and commercial inspection form is included as Attachment 5.1. Table 5-2 provides a list of all facilities visited as part of the routine inspection program. The City completed 59 site visits with 50 facilities receiving full inspections.

During the inspection process, the City checked the Industrial Permit compliance status when applicable. The City also reviewed SWPPP and monitored results when applicable. There were no businesses observed to be in violation of the Industrial Permit.

The City did not rely on third-party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third-party inspection program.

**General Industrial Permit**

As previously mentioned, Industrial Permit compliance status was evaluated during the inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business' standard industrial classification (SIC) code(s). The inspector then evaluated Industrial Permit subjectivity based on the assigned SIC code(s). Violations of any aspect of Industrial Permit requirements were recorded on the standard industrial and commercial inspection form. There were no violations of any aspect of the Industrial Permit based on inspections conducted during this reporting period.

**Education and Outreach**

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to provide site-specific one-on-one education regarding stormwater concepts and BMPs. Inspectors discussed a variety of topics such as watershed concepts and the City's BMP requirements. Typically each inspected business that required corrective action was mailed a copy of the inspection form as a written record of the need for corrective actions observed at the time of inspection via post or electronic mail, as their preferences dictated. There were no significant recommended corrective actions during this reporting period based on inspection findings.

**Enforcement**

During FY 2011-12, none of the industrial and commercial facilities inspected were recommended for follow-up. In addition to the industrial and commercial stormwater compliance inspection program, the City regulates industrial and commercial facilities through complaints received by City's stormwater hotline. No complaints regarding stationary industrial and commercial facilities were received by the City's stormwater hotline (Appendix B).

## 5.3 Mobile Sources

### 5.3.1 Background

Due to the nature of activities of most mobile businesses, a major area of concern tends to be the potential for illegal discharges. In general, mobile businesses can be hard to identify, as many may not have City business licenses. Additionally, because many mobile businesses may be home based and activities do not occur in one fixed location, inspections of such facilities are impractical.

### 5.3.2 Source Characterization

Known mobile businesses described in the City's JURMP are included in Appendix A.5. The Regional Industrial and Commercial Workgroup also developed a web-based mobile business database for use by all Copermittees. The goal of developing this database is to allow Copermittees to share information about mobile businesses, which may be active in more than one jurisdiction. Appendix A.5 includes the mobile businesses presented in the 2010-11 Lemon Grove Annual Report combined with mobile businesses in the regional mobile business database.

### 5.3.3 Best Management Practice Requirements

BMPs for stationary industrial and commercial facilities, as discussed earlier in this section, are also required to be implemented for mobile activities, as applicable. BMPs applicable to mobile businesses, including key principles such as proper collection and disposal of any discharge, are discussed in the City's JURMP.

### 5.3.4 PROGRAM IMPLEMENTATION

The City continues to use business license records to identify mobile businesses located in or performing services within the City as well as the regional mobile business database. Complaints received by the City's stormwater hotline regarding mobile business activities also help the City identify mobile businesses. Complaints received by the stormwater hotline regarding insufficient BMP implementation by mobile businesses are responded to by code compliance officers or other City staff. During FY 2011-12, the City received no mobile business complaints.

**Education and Outreach and Enforcement**

During FY 2011-12, the City continued to use mobile business complaints as an opportunity for City personnel to discuss the BMP requirements of mobile businesses with the responsible party. There were no complaints or enforcement actions associated with mobile businesses this reporting period.

## 5.4 INDUSTRIAL AND COMMERCIAL COMPONENT EFFECTIVENESS ASSESSMENT

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 5.5 PROGRAM REVIEW AND MODIFICATION

The City used a new prioritization flowchart at the end of this reporting period to generate the industrial commercial inventory for the FY 2012-13 inspection program. The flowchart will be presented in the next annual report. The City also created a new mobile business inventory based on the City's 2010-11 JURMP Annual Report and the regional mobile business database. No other changes to its industrial and commercial inspection program were made during this reporting period.

**Table 5-2**
**Industrial and Commercial Inspection Results**

| # | BUSINESS | STREET ADDRESS | TTWQ* | SIC Code | Hydrologic Area | Follow-Up Required? | Correction Status |

* Note that the TTWQ should coincide with the inventory established in the 2010-11 JURMP Annual Report. It will not coincide with the updated inventory presented in this report that will be used during the 2012-13 reporting period to conduct inspections.

# 6.0 RESIDENTIAL

## 6.1 INTRODUCTION

Eighty percent of land use in the City is residential. Due to the large residential area, activities that take place in residential areas have the potential to affect the quality of receiving waters. Residential activities such as vehicle washing, over-irrigation, and home maintenance can potentially contribute pollutants to the City's MS4 if BMPs are not implemented. Additionally, improper disposal of household hazardous waste (HHW) can also contribute pollutants to the City's MS4. The City has worked to implement a range of programs to address these high TTWQ residential activities with the goal of reducing pollutant loads associated with such activities. Pollutants of concern for Lemon Grove's watersheds include pesticides, metals, bacteria, and trash.

### 6.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the residential component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the residential component of its stormwater program during the reporting period are provided in the remainder of Section 6.

- The City has a contract with the City of La Mesa to use their permanent HHW collection facility; 97 participants from the City properly disposed of 570 pounds of HHW during the eight HHW events held during this reporting period.
- The City's Used Oil Recycling Program was available at five locations in Lemon Grove (O'Reilly Autoparts, DCH Honda of Lemon Grove, Bob Baker Toyota Scion, Autozone, and EDCO Waste & Recycling Services (EDCO)) with 15,425 gallons of used oil collected. Additionally, a Used Oil Filter Exchange event was held on February 18, 2012 in Lemon Grove.
- The City issued two editions of *The Grove Gazette* (Summer 2011 & Spring 2012) with dedicated pages to environmental concerns. The City's newsletter was distributed electronically to 411 residents and is available to residents on the City's website.
- I Love a Clean San Diego (ILACSD) conducted six presentations for adults and youths focused on pollution prevention. They also managed the Recycling and HHW Hotline and Database used by 52 residents this fiscal year.
- *A Day without a Bag* was held in the City with 750 reusable bags distributed at three locations on December 15, 2011.
- Residents of the City participated in Creek to Bay Cleanup and Spring Cleanup events on April 28, 2012.
- The City continued to promote the use of the stormwater hotline for residents to call in potential violations of the City's stormwater ordinance.

## 6.2 SOURCE CHARACTERIZATION

The City has identified high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities, which are discussed in the following subsections.

### 6.2.1 HIGH THREAT TO WATER QUALITY ACTIVITIES

During the FY 2011-12 reporting period the City continued to identify the following residential activities as high TTWQ:

- Automobile repair and maintenance,
- Automobile washing,
- Automobile parking,
- Home and garden care activities and product use, and
- Disposal of trash and pet waste.

### 6.2.2 HIGH THREAT TO WATER QUALITY AREAS

In addition to high TTWQ activities, the City has identified several residential areas that pose a high TTWQ. High TTWQ residential areas are designated by considering complaint investigations, institutional knowledge, data from the City's Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program), and criteria as defined in the Municipal Permit. Residential areas that have not been designated as high TTWQ but may be sources of pollutants are also monitored by the City.

The City has mapped out areas identified as high TTWQ. The maps delineate the residential areas described below, and a series of smaller maps provide more detail about each individual area. Public Works staff is aware of these high TTWQ locations and routinely monitor these areas.

**Westview Place Residential Area**
Located in the northern section of the City, Westview Place has been deemed by City staff as a high TTWQ residential area. Significant amount of trash and debris is regularly observed on this street by City staff. Storm drain inlets eventually flow to Chollas Creek from this area.

**San Altos Place Residential Area**
Located in the southern section of the City, San Altos Place has been deemed by City staff as a high TTWQ residential area. Significant amount of trash and debris is regularly observed in a swale just east of the street. Illegal dumping is a common occurrence in the swale.

**Ensenada Street Residential Area**
Located in the southeast section of the City, Ensenada Street has been deemed by City staff as a high TTWQ residential area. Significant amount of trash and debris is found in the

creek that runs parallel to the street. Illegal dumping may be a source of the trash and debris observed in the creek.

## 6.3 Best Management Practice Requirements

The City has continued to provide information regarding the implementation of pollution prevention measures, such as good housekeeping practices, for residential areas and activities. General residential BMPs include conscientious automotive maintenance and care, erosion control, and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Other residential BMPs include non-stormwater discharge management, including elimination of IC/IDs. There have been no changes to the City's residential BMP requirements.

## 6.4 Program Implementation

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting are conducted to ensure that the required BMPs are implemented. This minimizes pollutants associated with residential activities and areas. The residential program has an education component so that residents are made aware of appropriate BMPs, including pollution prevention methods that should be used during certain activities.

### 6.4.1 Training, Education, and Outreach

The City has continued to conduct training, education, and outreach activities for residents, which are described below.

***The Grove Gazette* Newsletter Articles**

The City publishes environmental articles in *The Grove Gazette* newsletter. Both newsletters published during the reporting period contained articles on stormwater pollution prevention. An electronic copy of each edition was provided to 411 residential subscribers within the City. Each issue was also available on the City's website. The stormwater-related articles published in FY 2011-12 are summarized below. All newsletters published during FY 2011-12 reporting period are included as Attachment 6.1 & 6.2.

The Summer 2011 newsletter contained the following stormwater-related and general environmental articles and announcements:

- "IT'S ALMOST HERE" reminded residents of stormwater pollution prevention measures. Good housekeeping measures and BMPs were presented in the article to better manage pollutants such as pesticides and fertilizers, trash and debris, pet waste, and erosion control.
- "ANTS!! A COMMON SUMMERTIME ANNOYANCE IN SOUTHERN CALIFORNIA" informed residents and businesses how to address ant infestations without using harmful pesticides that can be released into the environment and impact water quality.

- "CITY OF LEMON GROVE STORMDRAIN HOTLINE" reminded residents to contact the City's stormwater hotline number to report illegal dumping and other stormwater pollution concerns within the City.
- "RECYCLING CONSTRUCTION & DEMOLITION DEBRIS, SAN DIEGO COUNTY'S ULTIMATE RECYCLING SOURCES, FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL, HOUSEHOLD HAZARDOUS WASTE RECYCLING, FREE E-WASTE RECYCLING FOR RESIDENTS AND BUSINESSES" reminded residents of proper waste disposal in support of pollution prevention. All the aforementioned articles have stormwater pollution prevention benefits and are included in Attachment 6.1.

The Spring 2012 newsletter contained the following environmental articles and announcements:

- "I LOVE A CLEAN SAN DIEGO" article presented general information on the organization and also advertised the Creek to Bay Cleanup Day and cleanup site in Lemon Grove held on April 28, 2012.
- "SPRING CLEANUP DAY" informed residents of the April 28, 2012 self-haul cleanup event sponsored by EDCO. Residents were able to dispose of large items or unwanted household materials (not including HHW) free of charge.
- "FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL, HOUSEHOLD HAZARDOUS WASTE RECYCLING, FREE E-WASTE RECYCLING FOR RESIDENTS AND BUSINESSES" reminded residents of proper waste disposal in support of pollution prevention. All the aforementioned articles have stormwater pollution prevention benefits and are included in Attachment 6.2.

**Other Educational Outreach Materials and Activities**

Educational materials were distributed during community events to further encourage pollution prevention measures and to increase knowledge about stormwater. Efforts further included six adult and youth presentations by ILACSD on stormwater pollution prevention using the hands-on watershed model, waste reduction, proper waste disposal and recycling.

ILACSD also maintained the Recycling and HHW Hotline and Database on behalf of the City. This service helped residents with recycling and proper waste disposal questions. A total of 52 residents used this service during this fiscal year.

The City continued to provide stormwater information and contacts on its website (http://www.lemongrove.ca.gov/) and Facebook. The City's stormwater hotline provided a medium for City residents and business owners to obtain stormwater information and file stormwater related complaints.

Residents were also encouraged to participate in local activities to improve water quality, such as the Creek to Bay Cleanup event and EDCO sponsored cleanup events and HHW

drop offs, and recycling programs advertised in *The Grove Gazette*. More information regarding the City's public participation is included in Section 9 of this report.

#### 6.4.1.1 Public Events

**HHW Events**

The City has a contract with the City of La Mesa to use their permanent collection facility for HHW and electronic waste. Residents must make an appointment with EDCO on select dates to drop of HHW. Ninety-Seven residents made appointments to drop off HHW. A total of 570 pounds of HHW was collected at this facility during eight events held during the fiscal year. For home-bound residents, door-to-door pickup services were provided.

**BERRY STREET PARK CLEANUP Events**

A group of two to four City residents participated in weekly cleanup of Berry Street Park during this fiscal year. The residents met at the park once a week for an estimated period of eight months to pick up trash to help keep the park free of trash and debris.

**A DAY WITHOUT A BAG Event**

The City contracted with ILACSD to coordinate the regional *Day without a Bag* campaign within the City on December 15, 2011. Reusable bags were distributed at three targeted locations in Lemon Grove: *Food 4 Less*, *City Hall*, and *The 99 Cent Only Store*. An estimated 750 reusable bags were distributed to City residents.

**CHRISTMAS TREE RECYCLING Event**

EDCO provided roll-off bins to encourage residents to properly dispose of their Christmas Trees. The event was held from December 26, 2011 through January 16, 2012. The roll-off bin was located at Central Avenue and Olive Street near City Hall.

**USED OIL FILTER EXCHANGE Event**

The City contracted with ILACSD to host a used oil filter exchange event on February 18, 2012. O'Reilly at 6925 Federal Boulevard was the drop off site from 9:00 a.m. to 12:00 p.m. A total of 14 filters were exchanged and 11 oil pans distributed. The event was published in the local *Penny Saver*. The City's five Used Oil Recycling Program collection centers (O'Reilly Autoparts, DCH Honda of Lemon Grove, Bob Baker Toyota Scion, Autozone, and EDCO) continued to collect used motor oil during the FY 2011-12 reporting year. A total of 15,425 gallons of used motor oil was dropped off at O'Reilly Autoparts and AutoZone.

**CREEK TO BAY CLEANUP Event**

The City hosted a cleanup site for the annual Creek to Bay Cleanup held on April 28, 2012. The site location was at Federal Boulevard and San Miguel Avenue, and Federal Boulevard and Central Avenue. There were 42 volunteers, including residents from the City. An estimated 1,486 pounds of trash and 213 pounds of recyclables were collected during the cleanup event. The City's Management Analyst introduced the cleanup site to volunteers, discussed watershed concepts inclusive of Total Maximum Daily Loads (TMDLs) and stormwater pollution prevention measures.

**SPRING CLEANUP Event**

EDCO hosted Spring Cleanup Day on April 28, 2012 from 7:00 a.m. to 4:00 p.m. The City advertised this event to Lemon Grove residents on the City's website and newsletter. An estimated 770 vehicles from the City participated in this event with 413.13 tons of debris collected.

### 6.4.2 Compliance and Enforcement

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the stormwater hotline, and observations made by the City's municipal personnel. If a potential to affect water quality is present, the City can provide a verbal warning, written warning, order to abate or correct, or monetary fines as applicable.

The City received nine residential-related complaints during this reporting period. Two of the nine received verbal warnings and one received a written letter from the City. Many of the verified complaints involved residents who were unaware of residential BMPs. The City's Code Compliance Officer educated residents during the complaint investigation. Public Works staff also cleaned areas in the public right of way as necessary to resolve complaints. The resolutions of all residential complaints are provided in Appendix B of this JURMP Annual Report.

## 6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 6.6 Program Review and Modification

The addition of three high TTWQ residential areas was added during this reporting period. No other changes to the residential component of the City's JURMP were made during the reporting period.

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

In accordance with the September 10, 2008, RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the FY 2011-12 Illicit Discharge Detection and Elimination (IDDE) section and attachments to the RWQCB no later than December 15, 2012.

# 8.0 EDUCATION

## 8.1 INTRODUCTION

During the FY 2011-12, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, and residents. The City aims to reduce stormwater pollution by increasing awareness about the stormwater conveyance system and promoting the implementation of BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community.

### 8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the education component of its stormwater program during the reporting period are provided in the remainder of Section 8.

- Five municipal staff trainings were conducted during this reporting period.
- The City's newsletter, *The Grove Gazette*, featured several articles highlighting stormwater and other relevant environmental topics in the Summer 2011 and Spring 2012 editions. These newsletters were made available to businesses and residents on the City's website.
- City staff provided education outreach at the Creek to Bay Cleanup in April 2012.
- ILACSD conducted six presentations for adults and youths focused on pollution prevention.

## 8.2 STAFF TRAINING ELEMENT

The City has provided training and educational outreach to its municipal personnel. Many municipal personnel are out in the field on a daily basis; as such, it is important that they understand the importance of implementing BMPs. Additionally, municipal personnel are encouraged to report any IC/IDs observed to the appropriate City staff and to educate other municipal personnel and the general public about stormwater pollution prevention. City staff provided five training sessions to other City staff during the fiscal year. In addition to the formal training sessions, City stormwater staff regularly provided guidance to other City staff on implementation of stormwater requirements. Table 8-1 includes all training sessions that were provided for various municipal staff and departments during FY 2011-12.

**Table 8-1**
**Municipal Training Sessions**

| Date(s) | Event | Topic(s) | Number of Participants |
|---|---|---|---|
| 5/08/12 | NPDES Stormwater Training | Review Municipal Chapter of JURMP | 5 |
| 5/22/12 | NPDES Stormwater Training | Review Industrial/Commercial Chapter of JURMP | 6 |
| 5/31/12 | NPDES Stormwater Training | Review Construction Chapter of JURMP | 5 |
| 6/19/12 | NPDES Stormwater Training | Annual Construction Inspector Training | 1 |
| 6/29/12 | NPDES Stormwater Training | BMP Refresher at Public Works Yard | 8 |

In addition to the training sessions discussed above, Public Works staff are aware of the high TTWQ residential areas, as discussed in Section 6 of this JURMP Annual Report.

## 8.3 EDUCATIONAL OUTREACH ELEMENT

In addition to municipal staff, the City has continued to provide education and outreach to industrial and commercial businesses, construction site owners and developers, and residents. These efforts promote stormwater awareness and BMP implementation and are discussed in the following subsections.

### 8.3.1 INDUSTRIAL AND COMMERCIAL BUSINESSES

As required by the Municipal Permit, the City inspects its inventoried businesses to evaluate compliance with the City's BMP requirements and provides site-specific education outreach to business owners and operators. Results of the inspections conducted in FY 2011-12 are discussed in Section 5 of this report. Each facility inspected received verbal education on stormwater issues and recommended corrective actions.

During the FY 2011-12 reporting period, the City's newsletter, *The Grove Gazette*, featured several stormwater-related articles (Attachment 6.2). The newsletters were made available on the City's website. Details about the newsletters can be found in Section 6 of this report.

#### 8.3.1.1 MOBILE BUSINESSES

Mobile businesses, such as mobile car detailers or power washers, may present threats to water quality due to the nature of their business activities and the possibility of prohibited non-stormwater discharges if proper BMPs are not implemented. Mobile businesses are not confined to a single area and many may not have City business licenses, making them difficult to identify. The City keeps track of mobile businesses that are discovered through business licenses and during field inspections. Mobile businesses are directed to the *project clean water mobile business toolbox* for site specific BMPs.

### 8.3.2 Construction Site Owners and Developers

During the project design process, City Development Services staff work closely with developers and project engineers to ensure requirements are understood prior to and during the review process. SUSMP regulations and BMP information included in the City's JURMP are also made available at the front counter of Development Services.

Due to the nature of activities, construction sites have the potential to discharge various types of pollutants to receiving waters if not managed properly. To ensure that construction site owners, contractors, and developers are abiding by regional and federal regulation, new development and redevelopment project proponents are required to attend a preconstruction meeting that includes education on stormwater management topics. These meetings include federal, state, and local regulations, implementation of a SWPPP, if required, and implementation and maintenance of BMPs.

### 8.3.3 Residential Areas

**Distribution of Educational Material**

Since residential areas make up a large portion of Lemon Grove, the City understands the importance of reaching this particular audience through educational outreach programs. The City continued to publish and post the *The Grove Gazette* newsletter (Attachment 6.2) on the City's website and inform 411 resident subscribers. Two editions of *The Grove Gazette* (Summer 2011 and Spring 2012) were published during FY 2011-12. As detailed in Section 6, several stormwater and relevant environmental articles were included in the newsletters that were posted on the City's website.

The City website, http://www.lemongrove.ca.gov/, is another way in which City residents can become familiar with the design and intended use of the storm drain system, minimum BMPs for various high TTWQ activities, reporting illegal dumping, and City contact information.

**Training Events**

During FY 2011-12, ILACSD provided six presentations to students at four elementary schools and at the Lemon Grove Public Library. The presentations were interactive and used the hands-on watershed model to discuss topics including pollution prevention, waste reduction, recycling, and used motor oil recycling. A total of 398 students and adults attended these presentations. Table 8-2, below, includes the locations and number of presentations delivered to the select student groups.

**Table 8-2**
**ILACSD Stormwater Presentations**

| Date | Location | Description |
|---|---|---|
| 10/6/2011 | Lemon Grove Library | Pollution Prevention Presentation with 18 Youth/Adults |
| 5/30/12 | San Miguel Elementary | 1 Pollution Prevention Presentation, 3rd Graders with 90 Participants |
| 6/04/12 | Mount Vernon Elementary | 1 Pollution Prevention Presentation, 5th Graders with 70 Participants |
| 6/11/12 | San Altos Elementary | 1 Pollution Prevention Presentation, 3rd-4th Graders with 105 Participants |
| 6/11/12 | Monterey Heights Elementary | 1 Pollution Prevention Presentation, 2nd Graders with 80 Participants |
| 6/18/12 | Mount Vernon Elementary | 1 Pollution Prevention Presentation, 5th Graders with 35 Participants |

### 8.3.4 Underserved Communities

The City of Lemon Grove is focusing on identifying underserved communities based on demographic and socioeconomic data provided by San Diego Association of Government. Once identified, education outreach efforts can be developed for the various underserved communities.

### 8.3.5 Complaint Investigations

To further aid the process of identifying illicit discharges, the City encourages the public and City staff to report IC/IDs to the City's stormwater hotline. All complaints are investigated by City staff. If a representative for the reported business, residential address, or construction site is present, the inspector will provide one-on-one verbal education about the complaint and stormwater in general. Pollution prevention concepts are emphasized, and educational materials are distributed as applicable. The City received 37 complaints during this reporting period.

## 8.4 Outreach Component Effectiveness Assessment

The estimated number of impressions made by the City's education and outreach efforts during FY 2011-12 is presented and described below.

**Impressions Made**
As discussed in this section, the City has continued to provide stormwater-related education to different audiences in the City through inspections, newsletter articles and during events throughout the year. The City calculates an estimate of impressions based on the number and type of educational materials distributed. Estimates of impressions generated by the City's efforts allow for a more realistic evaluation of the effectiveness of the NPDES stormwater program.

The estimated number of impressions was generated by multiplying each effort by the number of impressions thought to be generated by that particular effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections. Municipal inspections generally involve more people and are assumed to generate five impressions. Training sessions and cleanup events have been assumed to generate a number of impressions equal to four times the number of attendees because it is likely that the attendees will discuss the content with others after the training session or event. Printed educational materials distributed are assumed to generate three impressions each. Table 8-3, below, details the number of impressions made by the City during this reporting year.

**Table 8-3**
**Impressions Made by the City**

| Impression Type | Count | Unit | Estimated Impressions |
|---|---|---|---|
| Industrial And Commercial Inspections | 59* | Inspections | 150 |
| Municipal Inspections | 14 | Inspections | 70 |
| Municipal Staff Training Sessions | 25 | Attendees | 100 |
| School Presentations | 398 | Attendees | 1,592 |
| Creek To Bay Cleanup | 42 | Participants | 168 |
| HHW Drop Off Events | 97 | Participants | 388 |
| Used Oil Filter Exchange Event | 14 | Participants/Filters Exchanged | 56 |
| Day Without A Bag Event | 750 | Participants/Bags Distributed | 3,000 |
| *The Grove Gazette* Newsletter (Summer 2011 & Spring 2012) | 411 | Subscribers | 1,233 |
| ***Total City Impressions*** | | | ***6,757*** |

Note:
*Nine Industrial and Commercial inspections were of facilities no longer in business; therefore, the nine inspections may not count towards impressions.

Please refer to Section 11 of this JURMP Annual Report for the remainder of the effectiveness assessment for this program component.

## 8.5 Program Review and Modification

No significant changes to the education component of the City's JURMP were made during FY 2011-12.

# 9.0 PUBLIC PARTICIPATION

## 9.1 INTRODUCTION

The City encourages public participation in the City's JURMP as a means to develop stormwater awareness and improve water quality. Public participation includes, but is not limited to, clean-up events, special community projects, reporting observed IC/IDs, and participating in City-hosted waste disposal and collection events. Collaboration between the City and the community should help foster a sense of shared responsibility in protecting water quality both locally and regionally. The City has encouraged public participation through the programs discussed in this section.

### 9.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the public participation component during the FY 2011-12 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the public participation component of its stormwater program during the reporting period are provided in the remainder of Section 9.

- City sponsored and coordinated with ILACSD to host the Creek to Bay Cleanup Event in April 2012. Forty-two volunteers collected 1,486 pounds of trash and 213 pounds of recyclables.
- Volunteers continued cleanup Berry Street Park on a weekly basis during the majority of the reporting period.
- The City's year-round HHW collection facility received 570 pounds of HHW from approximately 97 visits by City residents.
- The City's collected 15,425 gallons of used motor oil at the City's used oil recycling program collection centers. The City contracted with ILACSD for a used oil filter exchange event with 14 filters being exchanged.
- Spring Cleanup event and a self-haul clean-up event were hosted by the City in conjunction with EDCO. The events allowed residents to dispose of large items, unwanted household materials (not including HHW), and green waste free of charge. A total of 770 vehicles from the City participated in this event and 413.13 tons of debris was collected.
- The City sponsored and coordinated with ILACSD to participate in the regional *Day Without A Bag*-750 reusable bags were distributed to City residents.

## 9.2 PUBLIC PARTICIPATION ACTIVITIES

**CREEK TO BAY CLEANUP Event**

The City sponsored and coordinated with ILACSD to host a cleanup site on April 28, 2012. Information on how to participate was posted on ILACSD's website, the City's website and

Facebook page, and posters advertising the event at City Hall and Lemon Grove Public Library. Forty-two volunteers participated in the event, collecting 1,486 pounds of trash and 213 pounds of recyclables.

**BERRY STREET PARK CLEANUP Events**

Several residents participated in removing trash and debris from Berry Street Park on a weekly basis for an estimated period of eight months during this reporting period. The volunteers met on the weekends and walked through the park picking up litter to keep the park clean.

**HHW Events**

The City in conjunction with EDCO, hosted eight HHW drop off events during this reporting period. Although the City does not host the event within its jurisdiction, the City continues to contract with the City of La Mesa to use their permanent collection facility for HHW and electronic waste. A total of 97 City residents made appointments to drop off HHW at the EDCO HHW collection facility in the City of La Mesa. An estimated 570 pounds of HHW was collected during this FY 2011-12.

**USED OIL FILTER EXCHANGE Events**

The City hosted a used oil filter exchange event during this reporting period. The event was advertised in the local *Penny Saver* and held at O'Reilly at 6925 Federal Boulevard on February 18, 2012. A total of 14 filters were exchanged and 11 oil pans distributed. Additionally, the City's five Used Oil Recycling Program collection centers collected 15,425 gallons of used motor oil during this reporting period.

**SPRING CLEANUP Event**

The City hosted the annual Spring Cleanup event, a self-haul cleanup, on April 28, 2012 to encourage proper disposal of unwanted bulk items and other refuse. The City's waste hauler, EDCO, coordinated the event for Lemon Grove residents to drop off any unwanted trash and debris, excluding HHW, free of charge. An estimated 770 vehicles from the City participated in this event with 413.13 tons of debris dropped off at the EDCO facility.

**CHRISTMAS TREE RECYCLING Event**

EDCO provided roll-off bins at Central Avenue and Olive Street near City Hall to encourage residents to dispose of their Christmas Trees appropriately. The event was held from December 26, 2011 through January 16, 2012. EDCO advertised the event in its local newsletter to encourage public participation.

**PUBLIC REPORTING**

As discussed in Section 4, complaints are received through the City's stormwater hotline and through the City's Public Works Department. The number for the hotline is advertised in articles published in *The Grove Gazette* newsletter and on the City's website. The residential, industrial and commercial, construction, and municipal communities are encouraged to use the hotline to report IC/IDs. The City investigates each complaint and tracks the complaint and follow-up actions, as applicable. A total of 37 complaints and service requests were made and responded to during FY 2011-12.

## 9.3 Outreach Events

The City has continued to provide educational outreach programs for a variety of different communities in the City. Since it is an effective way of reaching large numbers of individuals, educational outreach is typically associated with an event. Another outreach event in the City included the City's participation in regional meetings and workgroups.

**CREEK TO BAY CLEANUP Event**

On April 28, 2012, San Miguel Avenue and Central Avenue at Federal Boulevard were selected for cleanup as part of the statewide California Creek to Bay Cleanup event. The event was sponsored by ILACSD and 42 volunteers participated in the event as presented in Section 9.2. Prior to commencing with the site cleanup, City staff conducted education outreach to the volunteers by introducing watershed concepts, TMDLs, and stormwater pollution prevention measures.

**DAY WITHOUT A BAG Event**

On December 15, 2011, the City participated in a region-wide effort to encourage the use of reusable shopping bags. The event included free reusable bag giveaways along with tips for remembering to bring reusable bags when shopping. Two retailers in the City (*Food 4 Less* and *The 99 Cent Only Store*) and City Hall participated in the event, and distributed 750 reusable bags. This event promoted waste reduction in the Lemon Grove community.

**STORMWATER COPERMITTEE MEETING AND OTHER CITY PARTICIPATION**

City personnel attended and were active in various stormwater Copermittee workgroups during FY 2011-12. The workgroups provide a forum for representatives from various jurisdictions within San Diego County and other interested parties, including the general public, to exchange information and ideas regarding the management of stormwater programs. The City participated in many Copermittee meetings and workgroups. These meetings will continue to be attended by City personnel during the FY 2012-13 reporting period. The City is also a member of the stakeholder advisory group for the Chollas Creek pesticide, metals, and bacteria TMDLs, which includes representatives of Caltrans, the United States Navy, the Port of San Diego, County and City of San Diego, and the City of La Mesa.

## 9.4 Public Participation Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 9.5 Program Review and Modification

No changes were made to the public participation component of the City's JURMP during the reporting period.

# 10.0 FISCAL ANALYSIS

## 10.1 INTRODUCTION

The City relies on several funding sources to support implementation of the Stormwater Program; however, the primary funding source is the City's General Fund. Other funding sources to assist offsetting the use of the General Fund include fees on building, residential and commercial pollutant sources. The City's Sanitation Fund and AB939 trash fee support multiple programs including implementation of the stormwater program.

During FY 2009-10, a fiscal analysis reporting template was developed collectively by the Copermittees. Fiscal information from FY 2011-12 is reported in the tables below, which follow the standard format adopted by the Copermittees.

**Table 10-1**
**Expenditure Summary**

| JURISDICTIONAL COMPONENTS | |
|---|---|
| Administration | $35,270 |
| Development Planning | $2,100 |
| Construction | $7,439 |
| Municipal | $67,340 |
| Industrial and Commercial | $2,537 |
| Residential | $6,755 |
| IDDE | $19,375 |
| Education | $2,250 |
| Public Participation | $1,658 |
| Special Investigations | $0 |
| Non-Emergency Firefighting | $0 |
| | |
| **Jurisdictional Total** | **$144,724** |

| WATERSHED And TMDL | |
|---|---|
| San Diego Bay Watershed | $895 |
| Chollas Creek TMDLs | $49,991 |
| | |
| **Watershed And TMDL Total** | **$50,886** |

| | |
|---|---|
| **REGIONAL** | **$37,865** |

| | |
|---|---|
| **TOTAL COSTS** | **$233,475** |

**Table 10-2**
**Fund Summary**

| FUNDING BY SOURCE | |
|---|---|
| General Fund | $162,012 |
| Sanitation | $4,660 |
| Commercial Fee | $44,929 |
| Building Permit Cost Recovery | $8,370 |
| Residential Fee | $2,841 |
| AB 939 Fee | $10,663 |
| | |
| **Total** | **$233,475** |

**Table 10-3**
**Watershed Urban Runoff Management Program (WURMP) Expenses**

| | San Diego Bay Watershed | Chollas Creek TMDL |
|---|---|---|
| Administration | $288 | $900 |
| Cost Share Contribution | $463 | $48,947 |
| Watershed Activities | $144 | $144 |
| | | |
| ***SUBTOTAL*** | **$895** | **$49,991** |
| ***TOTAL*** | | **$50,886** |

**Table 10-4**
**Regional Urban Runoff Management Program (RURMP) Expenses**

| Regional Programs | Jurisdictional Cost |
|---|---|
| Administration | $760 |
| Cost Share Contribution | $28,305 |
| RWQCB Annual Permit Fee | $8,800 |
| | |
| ***TOTAL*** | **$37,865** |

# 11.0 EFFECTIVENESS ASSESSMENT

## 11.1 INTRODUCTION

The City regularly evaluates its stormwater program to make it as effective as possible at reducing discharges of urban runoff related pollution to the MEP. The overall structure of the City's stormwater program has three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes as well as ways to measure those outcomes. Next, the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

Based on participation in regional efforts and its experience implementing its JURMP, the City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation.

The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge and Awareness
Level 3: Behavioral Change and BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

## 11.2 EFFECTIVENESS ASSESSMENT RESULTS

The Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes are discussed in Section 11.2.1. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in California

Stormwater Quality Association (CASQA) effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 Outcome Level Assessments

**Level 1**

Level 1 outcomes are essentially measures of Municipal Permit compliance. The component-specific sections in this JURMP Annual Report provide details of programmatic actions taken to comply with the applicable Municipal Permit requirements. Appendix C of this JURMP Annual Report also includes a checklist that matches the Municipal Permit's annual reporting requirements with the section(s) or appendix of this report that addresses each requirement.

The City's Management Analyst is responsible for coordinating with various staff in the City who have stormwater responsibilities, such as engineers, planners, and public works maintenance staff. Modifications have been made to improve the effectiveness of the implementation of several components of the City's stormwater program since the new Management Analyst was hired.

**Levels 2 and 3**

See Tables 11-2 through 11-9 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Please note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included. For example, see Figure 11-1 and Figure 11-2 for industrial and commercial business assessments of knowledge and BMP implementation, respectively.

**Level 4**

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load estimation methods have not yet been developed.

**Level 5**

The Dry Weather Monitoring Program is the City's primary mechanism of measuring the quality of discharges. Table 11-1 below presents historical dry weather data with percent of exceedances per year. The last three years has shown only one site out of 15 dry weather monitoring sites as having an exceedance of nitrate. The remaining constituents have been below the established Dry Weather Monitoring Program action levels. Bacteria results from the past three Dry Weather Monitoring Seasons have demonstrated a significant improvement, with no exceedances.

**Table 11-1**
**Dry Weather Monitoring Historical Data**
**Percent of Sites With Exceedances Per Year**

| Year | Field Screening | | | | | | | | Laboratory Analyses | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | **Number of Field Screening Sites** | pH | Turbidity | Conductivity * | Surfactants | Ammonia-N | Nitrate-N | Orthophosphate-P | **Number of Laboratory Sampling Sites** | Diazinon | Total Coliforms ** | Fecal Coliforms ** | Enterococci ** |
| **2002** | 15 | 7 | 7 | 27 | 7 | 33 | 13 | 13 | 4 | 0 | 0 | 0 | 0 |
| **2003** | 15 | 0 | 0 | 53 | 0 | 7 | 13 | 0 | 4 | 25 | 75 | 75 | 0 |
| **2004** | 15 | 0 | 0 | 0 | 7 | 7 | 7 | 0 | 4 | 0 | 50 | 25 | 25 |
| **2005** | 15 | 0 | 0 | 0 | 7 | 0 | 27 | 0 | 4 | 0 | 75 | 25 | 25 |
| **2006** | 15 | 0 | 0 | 0 | 7 | 7 | 13 | 0 | 4 | 0 | 75 | 25 | 0 |
| **2007** | 15 | 0 | 0 | 0 | 0 | 0 | 20 | 0 | 4 | 0 | 25 | 0 | 0 |
| **2008** | 15 | 0 | 0 | 0 | 0 | 0 | 7 | 0 | 4 | 0 | 50 | 25 | 25 |
| **2009** | 15 | 0 | 7 | 0 | 7 | 7 | 7 | 7 | 4 | 0 | 25 | 25 | 0 |
| **2010**** | 15 | 0 | 0 | 0 | 0 | 0 | 7 | 0 | 4 | 0 | 0 | 0 | 0 |
| **2011** | 15 | 0 | 0 | 0 | 0 | 0 | 7 | 0 | 4 | 0 | 0 | 0 | 0 |
| **2012** | 15 | 0 | 0 | 0 | 0 | 0 | 7 | 0 | 4 | 0 | 0 | 0 | 0 |

**Notes:**
Results are based on complete routine visits only. Confirmation visits, follow-up visits and dry sites not included.
*By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgement in order to account for sites in which salt water and groundwater increase the conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

**Note that dry weather action levels for bacterial indicators were revised in 2010. Constituents have been compared to action levels in effect at the time of sampling to identify exceedances.

### Level 6

The City recognizes the importance of protecting water quality of receiving water bodies in and around the City, and continues to participate in regional monitoring efforts. The long-term trend monitoring station in the Chollas Creek subwatershed, referred to as a mass loading station (MLS), is well downstream of the City. However, results from water quality monitoring conducted along the City of San Diego and Lemon Grove jurisdictional boundary within Chollas Creek indicated that water quality objectives for metals were being met. Both acute and chronic water quality objectives for dissolved copper, lead, and zinc were met based on the results of two wet weather sampling events during this reporting period. Additional information can be found in the Chollas Creek TMDL 2011-

2012 Special Studies Report. However, it is worth noting that several years of wet weather monitoring data would be necessary for a Level 6 Assessment.

### 11.2.2 Overall Component Assessments

**Development Planning**

The operation and maintenance verification program, which requires responsible parties to certify that their BMPs have been maintained properly, along with site inspections, has increased the responsible parties' understanding of the requirements. As a result of this contact with the City, many sites have been able to conduct the necessary maintenance required of their treatment control BMPs.

**Construction**

The available data indicate that on the whole the City's construction program is effective in requiring BMP implementation at both public and private construction sites. Any BMP deficiencies noted are typically remedied promptly. The City's size and low number of construction projects allow the City's inspector to visit construction sites on a weekly basis, at a minimum. Any corrective actions or recommendations are dealt with in the field and addressed immediately. The City will continue its efforts to notify project proponents and homeowners of the City's BMP requirements. The City's engineering inspector attends annual stormwater inspector training.

**Municipal**

The City's municipal activities effectively implement BMPs and reduce pollutant loading. The City's staff are regularly trained on stormwater issues, and the City's MS4 cleaning and street sweeping programs meet or exceed minimum Municipal Permit frequency requirements. The City also continues to repair and clean sewer mains in an effort to prevent SSOs.

**Industrial and Commercial**

The City continues to implement its comprehensive inspection program. Inspection findings have demonstrated a high level of compliance with stormwater requirements. The City inspector continues to educate business owners verbally during the stormwater compliance inspection. Deficiencies noted are addressed immediately during the site inspection. The City continued to utilize BMP implementation and knowledge scores to assess the level of BMP implementation and level of knowledge at inspected facilities. These scores help the City understand which categories of businesses are most in need of education outreach and which will require additional attention during inspections.

**Residential**

The City's residential component achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. City staff that conduct routine maintenance in residential areas are trained to observe and respond to potential stormwater issues such as pet waste and minor trash and debris. Public Works staff has increased staff awareness of the location and sensitivity of high TTWQ residential areas.

**Illicit Discharge Detection and Elimination**

The City's IDDE program has effectively responded to complaints. No IC/IDs were identified during the 2012 Dry Weather Monitoring Program. There were five SSOs during the reporting period, which were reported through CIWQS to the RWQCB. The City will continue to take action to prevent and eliminate IC/IDs.

**Education**

During FY 2011-12, the City has continued to educate various audiences on stormwater concepts and BMPs. The estimated number of impressions made thorough the City's education component during FY 2011-12 was similar to those seen in previous years.

**Public Participation**

The City will continue looking for new opportunities for public involvement, while continuing the existing clean-up and recycling events. Attendance at public events was similar to those seen in previous years.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment component of the City's JURMP were made during the reporting period.

**Table 11-2**
**Development Planning Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Review and approve project plans | External<br>A relatively small number of projects submitted reports during FY 2012-11. Based on meetings with applicants and BMPs proposed, it appears that the level of knowledge is the same, if not a little higher.<br>Internal<br>City stormwater staff provided informal training on post-construction BMPs. City staff also participated in Copermittee Land Development workgroup meetings that focused on SUSMP and Hydromodification Management. | Percent of approved projects implementing BMPs with high or medium removal efficiencies for key pollutants of concern | 100% | N/A, addressed through other significant activities for this component |
| Verify proposed BMPs are implemented | External<br>N/A, knowledge is evaluated by appropriate implementation of BMPs as shown in Level 3<br>Internal<br>The City's Land Development Engineer performs treatment control BMP inspections. | Percent of inspected projects requiring follow-up | 0% | BMP implementation is likely to have reduced pollutant loads. |
| | | Resolution status of enforcement actions | See Section 2 | |
| Verify BMPs are properly maintained | External<br>Contacting responsible parties increased their awareness of the need for BMP maintenance.<br>Internal<br>N/A, City staff is aware of the need for BMP maintenance. | Percent of sites returning verification forms | 100% | Additional load reduction could be achieved through improved BMP maintenance. |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-3**
**Construction Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Review proposed plans and BMPs | External<br>Projects submit plans for construction BMP implementation for their projects; the level of awareness of construction BMP requirements is fairly high.<br>Internal<br>Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs. | BMPs proposed for construction projects generally meet requirements; no significant problems have been noted. | | Proper pre-project planning is likely to have reduced pollutant loading. |
| Verify proposed BMPs are implemented | External<br>Grading projects implement BMPs as required by their permits, and contractors are familiar with the City's requirements.<br>Internal<br>Training for City staff is described in Section 8. City inspector and engineers are familiar with relevant construction BMPs. | Percent of projects implementing required BMPs by end of reporting period | 100% | Proper BMP implementation is likely to have reduced pollutant loading. |
| | | Percent of projects in compliance with BMP requirements during all inspections | 100% | |
| | | Resolution status of enforcement actions | See Section 3 | |
| | | Number of dry weather monitoring exceedances traced to construction sources | 0 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-4**
**Municipal Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Verify proposed BMPs are implemented at facilities | City staff is regularly trained on BMP implementation; see sections 4 and 8. Public Works staff attended annual training session in FY 2011-12, ensuring that they maintain a high level of stormwater knowledge. | Percent of inspected facilities and activities in compliance with BMP requirements | 100% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of sites requiring follow-up inspections | N/A, see Section 4 | Amount of sediment and debris removed from Street Sweeping (weight or volume) | 147.15 tons |
| | | Number of dry weather monitoring exceedances traced to municipal sites | 0 | | |
| Sweep streets and parking facilities | | N/A, streets and parking facilities are swept as often as directed by management. | | | |
| Maintain and clean out MS4 | | N/A, MS4 structures are maintained as often as directed by management. | | Amount of sediment and debris removed from MS4 (weight or volume) | 572.55 cubic yards |
| Maintain sanitary sewer system | | N/A, the sanitary sewer system is maintained as often as directed by management. | | Total volume of SSO recovered from MS4 (gallons) | 1,240 gallons |
| Maintain an accurate inventory | | | | BMP effectiveness studies | Attachment 11.1 |
| | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-5**
**Industrial and Commercial Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Require BMP implementation | External<br>Knowledge assessment scores indicated a mid to high level of understanding of relevant stormwater concepts. See Figure 11-1 on the following page for a score distribution. See Section 8 for more detail on education outreach efforts.<br>Internal<br>Staff was provided training on the industrial and commercial component of the JURMP prior to conducting field inspections during FY 2011-12 to ensure a high level of knowledge. | Percent of inspected sites requiring follow-up | 0% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 5 | | |
| | | Number of dry weather monitoring exceedances traced to industrial or commercial sources | 1 | Number of IC/IDs eliminated (inspections and complaint investigations) | 1 |
| | | Implementation of BMPs and a high rate of site cleanliness demonstrates a positive change in behavior. See Figure 11-2 on the following page for a score distribution based on site cleanliness and BMP implementation. | | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Figure 11-1**
**Knowledge Assessment Scores**

**Figure 11-2**
**BMP Assessment Scores**

**Table 11-6: Residential Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Require BMP implementation | External<br>Residents were educated in a variety of ways in FY 2011-12; see sections 6 and 8 for details.<br>Internal<br>High TTWQ residential areas were identified by Public Works staff and conveyed to other City staff to increase their awareness of the location and sensitivity of these areas. | Number of residential incidents reported to stormwater hotline | 9 | Resolution of residential incidents reported to the hotline likely resulted in a decrease in pollutant loading through education outreach emphasizing appropriate BMP implementation. |
| | | Resolution of enforcement actions | See Section 6 | |
| | | Number of dry weather monitoring exceedances traced to residential sources | 0 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-7: Illicit Discharge Detection and Elimination Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | Level 4 |
|---|---|---|---|
| Conduct Dry Weather Monitoring Program | The City contracts with a qualified consultant to perform its Dry Weather Monitoring Program. | N/A, personnel conduct monitoring as directed by management. | No significant, long-term IC/IDs were eliminated, so a reliable estimate of load reduction cannot be made. |
| Respond to incidents reported to stormwater hotline | The City's Management Analyst trains City staff as needed. See sections 4 and 8. City staff was responsible for many of the reports made to the hotline, as shown in Appendix B. | N/A, personnel respond to incidents as directed by management. | Resolution of the incidents reported to the hotline and listed in Appendix B are likely to have resulted a pollutant loading reduction. |
| Respond to and clean up SSOs | City staff is thoroughly trained on how to respond to SSOs. | The City conducts sewer main cleaning annually and implements Fats Oils and Grease (F.O.G) program. See Section 4 for details. | 1,240 gallons of sewage were recovered after SSOs during FY 2011-12. |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-8: Education Component Assessment Measures**

| Significant Activity | Level 2 | | Level 3 | Level 4 |
|---|---|---|---|---|
| Provide stormwater education to the public | External<br>The City actively educates the various audiences in its jurisdiction. See Section 8 for details. | | See Level 3 outcomes for other program components for information about behavior change. | Sufficient data to estimate load reductions due to educational efforts is not available for FY 2011-12. |
| | Estimated number of impressions made | 6,757 | | |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-9: Public Participation Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Involve the public in activities that relate to stormwater protection | External<br>The City and City partners put on a number of opportunities for the public to participate. See section 9 for details. | Number of attendees at events | 810 | Amount of trash and debris collected at cleanup events (including large item disposal event) | 413.98 tons |
| | | Number of drop-offs of large items and HHW to the City's recycling facility | 867 | | |
| | | Number of complaints received (see Appendix B for details) | 37 | Amount of HHW collected | 570 pounds of HHW, 15,425 gallons of used oil |

**Notes:** Level 2 - Changes in Knowledge and Awareness; Level 3 - Behavioral Change and BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

# 12.0 SPECIAL INVESTIGATIONS

The City takes a proactive approach to stormwater management in an attempt not only to protect receiving water quality, but also to improve the quality of water that is discharged from the City's MS4. Data collected through the City's various monitoring and inspection programs are used to identify locations within the City that may be contributing to stormwater contamination. Source identification investigations are then initiated to pinpoint the exact cause of detected pollution.

Aside from upstream investigations conducted as part of the dry weather monitoring and sampling program (to be reported as part of the IDDE component in December), a compliance monitoring report and a special studies report were submitted to the Regional Board during this reporting period. Both reports were in support of the Chollas Creek Pesticides and Metals TMDLs and are titled (1) *Final Chollas Creek Total Maximum Daily Load 2011-2012 Water Quality Compliance Monitoring Report*, and (2) *Final Chollas Creek Total Maximum Daily Load 2011-2012 Special Studies Report*.

# 13.0 NON-EMERGENCY FIRE FIGHTING

A program of BMPs for non-emergency fire fighting flows was adopted in March 2008 as part of the City's JURMP. These BMPs are implemented during regular maintenance of fire and emergency vehicles and equipment, training exercises, facilities maintenance, and post-emergency rehabilitation of response equipment. No significant changes to the program presented in the City's JURMP have been made since the submittal of that document.

In response to municipal facility inspections performed during FY 2011-12, the City provided recommended corrective actions to fire-fighting staff during this reporting period.

# 14.0 JURMP REVISIONS

Changes to the JURMP made during the reporting period are discussed in the individual "Program Review and Modification" subsections in the preceding sections in this JURMP Annual Report.

# 15.0 CONCLUSIONS AND RECOMMENDATIONS

During FY 2011-12, the City continued to implement its stormwater program based on its 2008 JURMP. During this time, the City identified several elements in the JURMP that required changes to improve program implementation. Updates to the City's program were made as necessary and are discussed in each individual section of this Annual Report. One highlight of the City's stormwater program for FY 2011-12 was the continued trend of increasing public participation through cleanup events, HHW waste recycling, and reporting stormwater concerns to the City's hotlines.

Additionally, the City continued to work collaboratively with the other Copermittees to facilitate sharing of information about how best to run these programs and to provide regional guidance on standardized implementation where applicable. The City will continue to refine and improve its stormwater program based on information made available by these collaborative efforts.

Re: Required Treatment Control BMP Maintenance Certification

Dear Mr. Sir/Madame,

According to City records, you are jointly responsible for the permanent storm water treatment devices, known as treatment control best management practices (BMPs), located at _____. Annual verification of effective operation and maintenance for all treatment control BMPs on this property was a condition of the permit to develop the site. Treatment control BMPs are required to be maintained by the appropriate party as stated in the site's operation and maintenance agreement.

You are required by City of Lemon Grove to perform annual maintenance of the treatment control BMPs and to complete a form certifying this maintenance before the beginning of the rainy season. This notice is being sent as a reminder of the upcoming deadline.

Please ensure that the BMPs have been maintained and are in proper working order. Once the maintenance has been performed, please complete the attached form and return it to the City along with any maintenance records. The completed form must be received no later than September 30, 2011.

If you would like more information regarding this program, please contact me at (619) 825-3800.

Sincerely,

Tamara O'Neal
Assistant Civil Engineer
City of Lemon Grove
3232 Main Street
Lemon Grove, CA 91945

# Lemon Grove SUSMP Checklist
# Stormwater Compliance
# **For Personal Use Only**
# **Does not fulfill development review requirements**

**Project Information**

Project Name:_____

Project Address:_____

Project Size (acres):_____

Engineer:_____ Report Date:_____

**SUSMP Category**

Check all SUSMP categories that apply to the project:
☐Residential development of 10 or more units
☐Commercial development greater than 100,000 ft²
☐Automotive repair shops
☐Retail Gasoline Outlets
☐Restaurants
☐Developments of heavy industry greater than one acre
☐Steep hillside development >5,000 ft²
☐Projects discharging to receiving waters within Environmentally Sensitive Areas (ESA) that create 2,500 ft² or more of impervious surfaces or increases are of imperviousness of project site to 10% or more of its naturally occurring condition and:
    ☐Project is within 200 ft of an ESA
    ☐Project is more than 200 ft from and ESA but discharges urban runoff to receiving water within ESA without mixing with flows from adjacent land
☐Parking lots >5,000 ft² or with >15 parking spaces and potentially exposed to urban runoff
☐Streets, roads, highways, and freeways with would create a new paved surface that is ≥5,000 ft²
☐Pollutant generating development project disturbing one acre or more of land.

☐Significant redevelopment – create or add ≥ 5,000 ft² of impervious surfaces on an already developed site
☐None

IF NONE OF THE ABOVE STIPULATIONS APPLY TO YOUR PROJECT STOP HERE FOR NOW. City staff will need to verify SUSMP exemption.

**Identify Pollutants from the Project Area**

☐Check that all pollutants anticipated to be generated from the project area correspond with the anticipated pollutants in Table 1.

**Identify Primary and Secondary Pollutants of Concern**

Check that primary and secondary pollutants of concern for the project have been correctly identified and compared with pollutants identified in Table 1.
☐Which receiving water(s) does the project discharge to?

_____

☐What are the pollutants for which the receiving water is impaired?

_____
_____
_____

☐Did project compare receiving water pollutants with pollutants generated from project are? Y / N

☐What are the primary pollutants of concern?

_____
_____
_____

☐What are the secondary pollutants of concern?

_____
_____
_____

**Identify Conditions of Concern**
☐Was a drainage study report prepared? Y / N
☐Was the report prepared by a registered civil engineer? Y / N
Who?_____
☐Was a field reconnaissance conducted? Y / N
☐Did drainage study compute:

| | |
|---|---|
| ☐Peak flow rate | ☐2-year frequency storm |
| ☐Flow velocity | ☐10-year frequency stormwater |
| ☐Runoff volume | What duration storm was used? |

☐Time of concentration ☐6 hour or ☐24 hour
☐Retention volume
☐Were conditions of concern adequately identified? Y / N
If so, has the project implemented site design, source control, and/or trea
control BMPs to maintain pre-project hydrologic conditions affecting dow
conditions of concern? Y / N

**Establish Stormwater BMPs (Best Management Practices)**

***LID/Site Design BMPs***

SUSMPs must consider, incorporate and implement where determined applicable and feasible by Lemon Grove (check all that were considered, incorporated, or implemented):
☐Maintain Pre-Development Rainfall Runoff Conditions
☐Minimize project's impervious footprint
☐Conserve natural areas
☐Construct low traffic areas (walkway, trails, patios, parking lots, etc.) of permeable surfaces
☐Construct streets, sidewalks, and parking lot aisles to minimum
☐Maximize canopy interception by preserving existing trees and
☐Minimize use of impervious surfaces, such as decorative concr landscape design
☐Preserve natural drainage systems
☐Minimize directly connected impervious areas
☐Drain rooftops into landscaping
☐Drain sidewalks, walkways, trails, and patios into landscaping
☐Protect slopes and channels
Comments:
_____
_____
_____

***Source Control BMPs***
Does the project:
☐Provide storm drain system stenciling and signage
☐Design outdoor material storage areas to reduce pollution introd
☐Design trash storage areas to reduce pollution introduction
☐Use efficient irrigations systems & landscape design

☐Outdoor Processing Areas

***Treatment Control BMPs***

Check the treatment control(s) selected:

- ☐Biofilters
- ☐Detention Basin
- ☐Infiltration Basin
  - ☐Infiltration Trench
  - ☐Porous asphalt, concrete, or modular concrete block
- ☐Drainage Insert
  - ☐Oil/Water Separator
  - ☐Catch Basin Insert
  - ☐Other: _____
- ☐Wet Pond
- ☐Constructed Wetland
- ☐Filtration System
- ☐Hydrodynamic Separation System

☐Do treatment controls effectively address primary pollutants of concern? Y / N

If No, describe:

_____

_____

_____

Verify the design of selected treatment controls:

Was the treatment control BMP designed for:

- ☐Volume
- ☐Flow

☐Did the project use the 85th percentile storm event? Y / N

☐Did the project consider both the 10 yr and 100 yr event? Y / N

If No, describe:

_____

_____

_____

☐Did the project cover both pre- and post- construction drainage? Y / N

If No, describe:

_____

_____

_____

☐Did the project calculate current usage of any existing drainage structures and compare post-construction increases to available capacity? Y / N

If No, describe:

_____

_____

_____

☐Is BMP(s) located near pollutant sources? Y / N
If No, describe:

_____
_____
_____

☐Is BMP(s) effective for primary pollutant type? Y / N
If No, describe:

_____
_____
_____

**Maintenance Requirements**

☐Was an O&M plan attached?

☐Does plan require annual inspection and maintenance of all structural BMPs?
If No, describe:

_____
_____
_____

☐Was an access easement/agreement included?
If No, describe:

_____
_____
_____

**Hydromodification Management**

☐ Is project a priority development project and if so, is there a net increase in impervious area and in runoff as a result of project? Project may be subject to 2011 Hydromodification Management. If yes, describe.

Sensitivity of receiving waters: ☐ Sensitive (ESA, 303(d), or other) ☐ Non-sensitive

Discharge points along perimeter: _____

_____

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by municipal activities:_____square feet

Approximate □ impervious surface of this area_____□

Exposed areas of intensive outdoor activity: _____

## D. BMP ASSESSMENT

### D.1 General

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Is the site free of litter and debris? | | | | |
| Are discharge locations free of sediment and debris? | | | | |
| Are parking lots, sidewalks and streets free of sediment and debris? | | | | |
| Is pressure washing of parking lots or sidewalks conducted at the facility? | | | | |
| Is pressure washing waste water captured and disposed appropriately? | | | | |
| Are roof downspouts directly away from areas of potential pollutants? | | | | |
| **D.2 Landscaping** | | | | |
| Are adequate erosion prevention measures employed? (vegetation or physical stabilization) | | | | |
| Are irrigation systems programmed to minimize over-watering and runoff? | | | | |
| Are stockpiles of soil or landscape waste equipped to prevent runoff transport? | | | | |
| **D.3 Materials and Wastes** | | | | |
| Are adequate trash containers provided? | | | | |
| Are adequate recycling containers provided? | | | | |
| Is the trash/recycling area enclosed and free of litter and debris? | | | | |
| Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing? | | | | |
| Are outdoor material storage areas adequate (covered area with secondary containment)? | | | | |
| Are outdoor storage containers properly labeled? | | | | |
| Is there an accessible spill response kit? | | | | |
| Are storage tanks equipped with secondary containment? | | | | |
| Is secondary containment free of spills and rainwater? | | | | |
| Are loading and unloading areas free of spills and debris? | | | | |
| **D.4 Equipment and Vehicles** | | | | |
| Are exposed parking areas free of significant spills and leaks? | | | | |
| Are heavy equipment and vehicles stored in garages or under canopies? | | | | |
| Are vehicle maintenance activities conducted within contained areas (garage, canopy, work shop)? | | | | |
| Are vehicle-fueling areas covered and are storm drain inlets protected from spills and leaks? | | | | |
| Is vehicle washing preformed in a contained area where runoff does not enter the MS4? | | | | |
| Are biodegradable soaps used for cleaning activities? | | | | |
| **D.5 Food Establishments** | | | | |
| Does facility have a grease trap or grease interceptor? | | | | |
| When was the last time the grease trap was maintained? _____ | | | | |

Where is the grease trap located? ☐ Under the sink ☐ Outside ☐ Other _____

How many grease fryers are at the facility? _____

About how often is fryer oil replaced? ☐ Weekly ☐ Monthly ☐ Every 6 months ☐ Annually

## E. SWPPP REVIEW

**Does facility maintain a SWPPP:** ☐ **Yes** ☐ **No** ☐ **Not Applicable**

| SWPPP Component | Provided | Adequate | Comments |
|---|---|---|---|
| Site Map/Description | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Materials List | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Significant Spills/Leaks | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Pollution Prevention Team | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Industrial Activities | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Pollutant Sources/Risks | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Annual Compliance Activity | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Employee Training | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Accessible to staff | ☐ Yes ☐ No | ☐ Yes ☐ No | |
| Existing BMPs | ☐ Yes ☐ No | ☐ Yes ☐ No | |

## MONITORING PROGRAM REVIEW

☐ **Not Applicable**

Was sampling performed during the most recent, complete wet season? ☐ Yes ☐ No ☐ Unknown

*If not*: Does the facility have documentation of no qualifying rain events? ☐ Yes ☐ No

Was the facility in a GMP and not scheduled to sample that year? ☐ Yes ☐ No

Do recent monitoring results show that existing BMPs are effective in removing pollutants? ☐ Yes ☐ No ☐ None Available

If not, were potential sources of the identified pollutants observed during the inspection? ☐ No

If yes, list the potential sources and their associated pollutants: _____

_____

If exceedances were found in sampling results, were BMPs re-evaluated and were any modifications made to address the elevated constituents? ☐ Yes ☐ No ☐ Unknown

Was the monitoring program implemented in accordance with Industrial Permit requirements during the most recent, complete wet season? ☐ Yes ☐ No ☐ Unknown

*(For exceedances noted (constituent(s) and numeric value(s)) and SWPPP/monitoring deficiency specifics, please see Section D.*

## F. RECOMMENDED CORRECTIVE ACTION

Is corrective action needed? ☐ Yes ☐ No

If **BMP-related** corrective action is required, describe below. If other corrective action, check the appropriate box in section G.

Owner/operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax

## G. VIOLATIONS

☐ No violations have been noted at this time
☐ No violations have been noted, but recommend taking corrective action described in Section F.
☐ Violation of the City's storm water ordinance:
  ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
    Description
  ☐ Illegal connection(s) to the storm drain system
    Location_____
  ☐ Littering
  ☐ Failure to properly implement required BMPs
☐ Failure to comply with the requirements of applicable State or Regional Permit(s):
  ☐ Non-compliance with the State Industrial Storm Water General Permit.
    Subjectivity, based on SIC Code: ☐ Mandatory ☐ Conditional
    ☐ In the future, under a new Industrial Permit which has not yet been adopted, this facility may be able to qualify for a No Exposure Certification (NEC) and exemption from Permit coverage.
  ☐ Non-compliance with the Municipal Storm Water Permit (NPDES NO. CAS0108758).
☐ Other Violation_____

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:**

☐ Implement the recommended corrective actions listed in Section F.
☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit; see Attachment 3 of the Industrial Permit (http://www.waterboards.ca.gov/stormwtr/industrial.html).
  ☐ For "Conditional" facilities only: if you implement all the recommended BMPs and eliminate outdoor exposure, contact the City to request a re-inspection. If it is determined that you qualify, NONA/NEC paperwork will be provided for you to complete, and you will not have to file an NOI.
☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); see Section A of the Industrial Permit.
☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.
☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

Additional actions required:

## H. RECOMMENDED CITY ACTIONS

☐ None
☐ A Follow-up action / inquiry is recommended.
☐ Update the following: ☐ JURMP priority ☐ SIC code ☐ Facility Contact Information

Other:

**Does this business require a follow-up site inspection?** ☐ **Yes** ☐ **No**

**ASSESSMENT**

Level of knowledge regarding stormwater issues: ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ Unknown

Level of cleanliness, BMP implementation, orderliness of site: ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

.

## THE FUTURE OF REDEVELOPMENT IN LEMON GROVE

Recent actions taken by the California State Assembly and Senate threaten the existence of redevelopment in Lemon Grove. The City's redevelopment agency—the Lemon Grove Community Development Agency—has created significant economic stimulus over the years and is needed to revitalize the City's downtown district.

**This newsletter article answers three questions:**

1. **What has redevelopment done for Lemon Grove?**
2. **What was the State Legislature thinking?**
3. **How will this impact Lemon Grove?**

### *What has redevelopment done for Lemon Grove?*

Since 1986, redevelopment has been a powerful tool to build the community's current economic base. The use of redevelopment has literally generated millions of sales tax dollars for the City and a significant amount of additional property tax dollars for Lemon Grove schools.

As an example, in 1993, the Lemon Grove Community Development Agency (the Agency) assisted in the attraction and development of The Home Depot. Since that time, this business has generated millions of dollars in sales and property tax revenue. These funds have helped pay for vital municipal services such as law enforcement, fire protection, street paving, and park maintenance.

Also, in 2007, the City used redevelopment resources to assist in the development of Citron Court, a mixed-use affordable housing project on Broadway (across the street from Food-4-Less).

Presently, the City is relying on redevelopment tools and funds to assist with the Lemon Grove Avenue Realignment project, the Main Street Promenade project, and mixed-use development projects adjacent to the Trolley Depot (for more information about these projects visit ***www.ci.lemon-grove.ca.us/redevelopment***).

### *What was the State Legislature thinking?*

*"The Goose that Laid the Golden Eggs*" is a classic Aesop's Fable. In this story, we read about a peasant that kills a goose that lays golden eggs. Assuming the goose has a large lump of gold inside of it, the peasant kills the goose to get the gold. The phrase "killing the goose that laid the golden eggs" has become a common phrase in our language referring to a reckless action motivated by greed.

In June, the State legislature passed a bill that will end all redevelopment agencies by October 1, 2011. This action is an excellent illustration of the meaning of the phrase *"killing the goose that lays the golden eggs."*

Under its plan, the legislation would supposedly redistribute redevelopment funds to taxing agencies. In Lemon Grove, this would result in dividing up less than $800,000 a year among the City of Lemon Grove, Lemon Grove School District, Grossmont Unified High School District, Grossmont/Cuyamaca Community College District, Grossmont Healthcare District, County of San Diego, State of California, Helix Water District, Regional Occupation Centers, Lemon Grove Roadway Lighting District, as well as eight other entities.

Through this State plan, each taxing agency would receive a larger piece of the property tax pie. However, that pie's size would grow at a very slow pace. On the other hand, the purpose of redevelopment is to help property owners maximize the value of their property—thus growing a bigger pie. **Increasing property value more quickly is much like *taking good care of the goose, so it can lay even more golden eggs.***

*Continued on Page 2...*

***The Future of Redevelopment in Lemon Grove—continued...***

The California Redevelopment Association and the League of California Cities have petitioned the California Supreme Court to declare the recent legislation unconstitutional. If the court upholds the legislation, the City will be placed in a difficult dilemma — just as it is beginning to recover from the recent economic recession.

### *How will this Impact Lemon Grove?*

The State legislation allows projects that are currently in the pipeline to continue to move forward. *However*, until the court rules on the redevelopment case, all Agency operations must cease. Since the State legislature adopted the redevelopment killing bill, the Agency has had opportunities to sell off land for future development. *But, with the pending case, the Agency's hands are tied.*

**Critical projects currently in the pipeline:**

- Lemon Grove Avenue Realignment project,
- Main Street Promenade project, and
- Two Citronica mixed-use development projects.

If any of these projects needs ***even one additional dollar***, the Agency will be ***unable*** to assist in any way, unless the court rules the State legislation unconstitutional. Stopping these projects will result in hundreds of lost jobs for engineers, architects, construction workers, inspectors, etc. who are currently working on them. Stopping these projects will *also* ensure that the Lemon Grove pie remains the same size, *rather than growing the City's economic base*.

### *Conclusion*

The California Supreme Court indicates that it will render a decision by mid-January 2012. **In the next few months, we will all find out the future of redevelopment in Lemon Grove.**

Main Street Promenade Project

## *BUDGET RESTRUCTURE*

On June 2, 2011, the Lemon Grove City Council adopted the Fiscal Year 2011-12 (FY 12) consolidated budget. As revenues grow and expenditures are kept in check, the City's General Fund will experience a balanced budget *for the first time in four years*.

### Interesting highlights of the FY 12 budget:

***The Numbers*—Budget trends in the FY 12 budget:**

- Sales tax revenue is anticipated to increase by 3.5% over FY 11,
- Overall revenue is anticipated to increase by 3% over FY 11,
- Overall expenditures are anticipated to decrease by 1% over FY 11, and
- The City's reserve fund will grow by $234,000 in FY 12.

***The Outcomes & Policy Directions*—Outcomes and policy directions in the FY 12 budget:**

- A 12-day furlough plan,
- 6 positions were eliminated,
- City Departments were restructured, eliminating the Recreation Services Department and folding components into the Public Works Department, providing the opportunity to restructure the way recreation services are provided, and
- Employees now pay 100% of the employees' share of retirement costs.

**See the City's FY 12 budget: *www.ci.lemon-grove.ca.us/budget*.**

## NOW YOU SEE THEM… SOON YOU WON'T!

Finally… it's time for some demolition! The empty buildings along Main Street and the self-storage buildings on North Avenue will soon be just a memory. Once the hazardous materials are removed from the buildings, the wrecking balls will be coming to town. *Watch for them in late August*.

***Example of anamorph***—this anamorph was created by István Orosz, a Hungarian artist known for his mathematically inspired works, impossible objects, optical illusions, double-meaning images and anamorphoses.

**Making Way for the Main Street Promenade…** Imagine a long, linear park and bustling transit plaza… with plenty of shady spots, broad walkways, benches and bike racks, and places to play.

Enjoy the artful nods to local history and learn about the water cycle and sustainability. Just wait until you see the windspire sitting atop the anamorph. *A what sitting atop a what??* The windspire is a vertical windmill that actually works and will produce energy for the night lighting.

Anamorphic art places a greatly distorted image on the ground around a mirrored surface (in this case a polished stainless steel cone), but when you look at the reflection, the image looks completely normal.

**Project Funding: No City funds are being used for this project.** Design and construction are primarily funded by two grants. The balance of the project, about 10% of the five million dollar project, will be funded by the City's redevelopment agency.

The Promenade will have a little something for everyone! The construction plans are almost complete. Watch for construction to begin in January. Completion is expected by late 2012.

**Project questions?** Call Barbara Kraber, Project Manager, 825-3800, ***bkraber@ci.lemon-grove.ca.us***.

## GRANT FUNDS HELP MAKE LEMON GROVE A SAFER PLACE TO WALK AND BIKE FOR CHILDREN

The goals of the "Safe Routes to School Grant Program," managed by the California Department of Transportation, are to reduce injuries and fatalities to school children and encourage walking and bicycling.

**Since 2008, the City has submitted Safe Routes to School Grant funding applications for three projects:**

1. Palm Street/Golden Avenue,
2. Madera Street, and
3. San Miguel Avenue.

***All three applications have been successful!***

The projects include construction of sidewalk, curb, gutter, curb ramps, and pedestrian crosswalk improvements. Federal and State funds for the three projects total over $1.1 million and the City's share of the cost will total approximately $250,000.

Construction on both the Palm Street/Golden Avenue and Madera Street projects are expected to be complete by Fall, 2012. The San Miguel Avenue project is awaiting design consultant selection. Construction on this project is anticipated in the Fall of 2013.

## SALES TAX DECREASE

With the cost of everything rising these days, it is good news that the sales tax rate in Lemon Grove actually ***decreased*** one percent on July 1st. A temporary rate increase enacted by the State Legislature a few years ago expired on June 30 2011.

# Community Interest

## WHAT'S HAPPENING IN PUBLIC WORKS?

The new fiscal year has brought with it a renewed goal of *"doing more with less."* At 6:00 a.m. each day, the eleven members of the Public Works field staff energetically tackle each day's tasks. The photograph at right is an example of a recent project is the completed by the Public Works crew.

City crews make the most of space and materials available in the median at Kempf Street and Broadway.

***Projects completed during the past few months:***

- ⇒ **Citywide restriping (white and yellow lines throughout the City),**
- ⇒ **Elkhorn Street storm drain improvements,**
- ⇒ **Kempf Street median improvements,**
- ⇒ **Lemon Grove Way, Grove Street, Buena Vista Avenue, Tweed Street, and Corona Street paving,**
- ⇒ **Lemon Grove Avenue median landscaping improvements,**
- ⇒ **Plant Lemon Grove improvements (at the LGA and SR94 on and off ramps), and**
- ⇒ **Installing speed limit signs on Massachusetts Avenue.**

**Typically, the Public Works field staff performs three types of tasks — *Routine Tasks, Special Projects, and Response Tasks.***

### Routine Tasks

While very few things in life are routine, these tasks are those that must be completed and integrated into the daily accomplishments. Routine tasks consist of picking up trash from the medians on Broadway and Lemon Grove Avenue, mowing grass in parks, filling potholes, repairing facilities, picking up illegal trash dumping, cleaning graffiti.

### Special Projects

Special tasks are calls for service that are above and beyond routine tasks. Paving streets, replacing damaged signs from traffic accidents, inspecting tree fungus, and restriping City streets are a few examples of special projects performed by Public Works staff throughout the year.

### Response Tasks

Response tasks consist of helping citizens with special requests. On average, the Public Works Department receives 50 services request per month. These sometimes complex projects must be scheduled with the routine tasks and special projects. Finding the time is the greatest challenge to completing the tasks associated with resident requests. As such, with a small staff of eleven (four less than 4 years ago because of staffing reductions), the Public Works Department asks that you allow 30 to 60 days complete these tasks. Projects are prioritized higher if there is a threat to public safety.

What's next on the horizon?

***Public Works Projects Preview (Upcoming Projects Between July 2011 and June 2012)***

- ⇒ 69th Street paving,
- ⇒ Buena Vista Avenue paving (between North Avenue and Broadway),
- ⇒ Installation of pavement markers on Lemon Grove Way,
- ⇒ Installation of thermal plastic crosswalks on Massachusetts Avenue at San Miguel Avenue and SR-94,
- ⇒ Mt. Vernon Street paving,
- ⇒ Mural revitalization at Lemon Grove Park,
- ⇒ Installation of stop and yield signs,
- ⇒ Landscape improvements at Veteran's Park, and
- ⇒ Weed abatement services.

## FACILITY RENTALS: *Host a Quality Event Without Busting the Budget!*

The City of Lemon Grove offers facilities specifically designed for receptions, meetings, sporting events, and other special events. The facilities accommodate varying size groups and reservations may be made up to one year in advance. **Tours are available by appointment.**

**Please call the Community Services Department at (619) 825-3830 ext. 3902 for information, or visit the City's website at: *www.ci.lemon-grove.ca.us/Rentals***

With the holidays just around the corner, many are starting to plan their holiday parties with friends, family and co-workers. Often times, this process also includes spending countless hours preparing the house weeks in advance, to ensure it's pristine for visitors. Not to mention the grueling days of clean-up that follow the shindig itself. **This year, the City of Lemon Grove invites you to skip the hassle of house parties and celebrate the holidays at one of our attractive, yet affordable, facilities.**

### From grand receptions to intimate gatherings, our versatile facilities can accommodate any occasion of varying size:

- **Lemon Grove Senior Center** (8235 Mt. Vernon Street) is a refined facility that can seat up to 200 for banquet style events, and up to 300 for theater style events. Adjacent to Lemon Grove Park, this beautiful facility features large French doors that open to a spacious patio. Borders of grassy areas and walkways provide a private, peaceful setting amongst nature, ideal for a wedding ceremony. The large, fully equipped kitchen is designed to handle all of your catering needs.

- **Lemon Grove Community Center** (3146 School Lane) is appealing for its convenient location and full kitchen amenities, and an ideal setting for smaller meetings, conferences and private parties. The Community Center seats up to 75 for banquet style events, and up to 100 for theater style events. If needed, tables and chairs are provided free of charge and City staff will set up and break down the equipment for you.

- **Berry Street or Lemon Grove Park gazebos**—Does an indoor event seem too stuffy for your special occasion? Take advantage of the *"Best Climate on Earth,"* by holding a birthday party, shower or fundraiser outdoors. Both parks span six acres and offer playgrounds, picnic areas and tables, restrooms, a basketball court and walking paths. Gazebo rentals are $80 and provide you with peace of mind that no one else can intrude on your special day.

- **H. Lee House** (3225 Olive Street) — For a more private event, the historical H. Lee House boasts an elegant courtyard and features a stunning Victorian-style gazebo for ceremonies or entertainment surrounded by inlaid brickwork and grass. With a capacity for approximately 100 guests, the H. Lee House Courtyard is the perfect setting for a private outdoor wedding, anniversary party, or baby shower.

- **Lemon Grove Recreation Center Now Available for Birthday Parties & Sporting Events!**

Manny Jansen is a bona fide soccer fanatic! For his 10th birthday party, his parents wanted to incorporate his passion for the sport, while staying within their budget. After exhausting options at other corporate sports and play centers in San Diego, Manny's folks ventured into the Lemon Grove Recreation Center. *They were blown away with everything it had to offer*—**a full size gymnasium, two game rooms, an activity room and large shaded patio** *for only $50 an hour*. The kids had a blast playing soccer, creating arts & crafts in the activity room and playing pool, ping pong, and air hockey in the game rooms. ***"This is going to be a tough act to follow for his next birthday,"*** Manny's mom said with a smile.

***Reduce the stress of holiday entertaining, and let the City of Lemon Grove host your social gathering. Reservations are made on a first come first serve basis, and fill up fast for the holiday season…so book your event today!***

## SIGN-UP FOR E-SERVICES NOTIFICATION ON CITY WEBSITE

Sign up on the City's website for *automatic email and/or text message notification* for new issues of the City newsletter, City Council agendas and much more:

- Community Events
- Youth Activities
- Adult Sports
- City Newsletter
- City Council Agenda
- Planning Commission Agenda
- Contracting Opportunities
- Press Releases
- Job Postings

**Visit the City website at *www.ci.lemon-grove.ca.us* and follow these simple instructions:**

1. Click on **"E-Services"** on the left navigation bar.
2. Click on **"Notify Me."**
3. Enter your email address and click **"ok."**
4. Enter your cell phone number if you wish to be notified by text.
5. Select the items for which you'd like notification by clicking on the envelope and/or phone icon for each item.
6. Click **"Save Profile Information"** and you're done!

You will receive a confirmation e-mail with instructions on how to unsubscribe should you wish to do so. Your e-mail address is kept confidential and will not be sold or disclosed to third parties.

## SHERIFF'S CORNER — Introducing Crime Prevention Specialist Jim Wieboldt

The Sheriff's Crime Prevention unit is an important part of Sheriff William Gore's overall program to make Lemon Grove and San Diego County ***"the safest urban county in the nation."***

### Services provided to our community by Sheriff's Crime Prevention:

- **Neighborhood Watch**
- **Ranch Watch**
- **Business Alert**
- **Residential and Commercial Security Consultations**
- **Crime Free Multi-Housing (CFMH)**
- **Crime Prevention Through Environmental Design (CPTED)**
- **START SMART – Teen Driving and Safety**
- **Safe Streets**
- **Personal Safety – Home and Away**
- **Internet Safety**
- **Identity Theft Education and Prevention Techniques**
- **Senior Crime Alerts**
- **Crime Information Systems – NIXLE and CRIMEMAPPING.COM**
- **Children's Programs – McGruff, the "Crime Dog"**

Crime Prevention Specialist Jim Wieboldt

Jim Wieboldt joined the Lemon Grove Sheriff's Station on July 29, 2011 as the Crime Prevention Specialist assigned to the City of Lemon Grove.

An East County resident for more than fifty years, Jim has been with the Sheriff's Department since 2000 and brings a wide range of experience. He comes to Lemon Grove after serving as a Community Service Officer at the Santee Sheriff's Station since 2004.

**Contact Jim directly:**

(619) 337-2039 or *james.wieboldt@sdsheriff.org*.

**Lemon Grove Sheriff Station:** (619) 337-2000.

**For additional information about other programs the Sheriff's Department offers the citizens it serves, please visit: *www.sdsheriff.net*.**

## CLEARING BRUSH THE NATURAL WAY—WITH GOATS!

The City of Lemon Grove's fire department took steps to clear brush from 8-1/2 acres of abandoned property on a hillside near Lawton Drive and Camino De Las Palmas—with help from a herd of "Boer" goats. According to City fire officials, this type of brush abatement is a tremendous help for firefighters in protecting land and nearby homes from fast moving brush fires.

Johnny Gonzalez, owner/operations manager of Environmental Land Management (ELM), brought the herd of about 150 goats to a staging area and paddock on July 29th where they were penned overnight. A shepherd and a herd dog were housed on site with the goats 24 hours a day until the job was done. Early Saturday morning, a small nursery paddock with baby goats was open to viewing. Afterward, the public was invited to watch the "running of the goats" as the herd was guided into the brush to get to work doing what they do best — eating the materials that fuel fires. The goats finished the job in four days.

On August 17, after making a clean sweep of the Lawton Drive job, the goats were moved to a lot across from the Lemon Grove Depot on Main Street, which is the site of the future "Main Street Promenade." City officials, several City staff members, and many residents were on hand for the "running of the goats" when the animals were transferred from the staging area onto the property to begin work.

A film crew was on site taping for a segment on the CBS national morning news show "The Early Show, which aired the next day." See the segment: ***The Early Show - Lemon Grove clearing brush with goats***.

Lemon Grove Mayor Mary Sessom was impressed with the way the goats got out and did the job and hoped that local children on site watch the goats clearing brush would learn that "not only can animals look cute and fuzzy, but they can also serve a purpose in our society, helping us to keep our environment clean," and Lemon Grove Fire Department Deputy Fire Chief Tim Smith called the operation "a win-win situation."

Allyson Russell and "friend."

"Running of the Goats" on Lawton Drive.

At work on Main Street property.

**For more information on these weed abatement projects or future projects planned for Lemon Grove, please contact Lemon Grove Fire Inspector Thomas Rosenberger at (619) 573-7966. Contact Environmental Land Management at (619) 234-4555.**

## FIRE SEASON IS APPROACHING—Do you know what to do in a fire?

### Tips For Fire Safety and Prevention:

⇒ **Smoke alarms save lives.** Install a smoke alarm outside each sleeping area and on each additional level of your home. If people sleep with doors closed, install smoke alarms inside sleeping areas, too.

- Use the test button to check each smoke alarm once a month and replace batteries immediately when necessary. Replace all batteries at least once a year.

⇒ **Consider having one or more working fire extinguishers in your home.**

⇒ **Consider installing an automatic fire sprinkler system in your home.** Sprinklers reduce the average property loss by 71% and the risk of dying *decreases* by about 80% when sprinklers are present.

Over 350,000 home fires occur every year in the United States and more than 2,500 people a year die in these home fires.

*Odds are it could happen to you or someone you know. ..*

⇒ **Determine at least two ways to escape from every room of your home.** If you see smoke or fire in your first escape route, use your second escape route. Consider escape ladders for sleeping areas on the second or third floor. Learn how to use them and store them near the window. **Select a location outside your home where everyone would meet after escaping.** Practice your escape plan at least twice a year.

⇒ **To escape a fire, you should:**

### Escape Tips

1. ***Check closed doors for heat before you open them.*** Use the back of your hand to feel the top of the door, the doorknob, and the crack between the door and door frame before you open it. *Never use the palm of your hand or fingers to test for heat* - burning those areas could impair your ability to escape a fire (i.e., ladders and crawling).

| Hot Door | Cool Door |
|---|---|
| **Do not open!** Escape through a window. If you cannot escape, hang a white or light-colored sheet outside the window, alerting fire fighters to your presence. | Open slowly and ensure fire and/or smoke is not blocking your escape route. If your escape route is blocked, shut the door immediately and use an alternate escape route, such as a window. If the escape route is clear, leave immediately through the door and close it behind you. Be prepared to crawl . Smoke and heat rise. The air is clearer and cooler near the floor.<br>Close doors behind you as you escape to delay the spread of the fire. |

2. ***If smoke, heat, or flames block your exit routes, stay in the room with the door closed.***
   - — If possible, stuff wet cloths around the door cracks and vents.
   - — Signal for help using a bright-colored cloth at the window.
   - — If there is a telephone in the room, call the fire department and tell them where you are.
3. ***If your clothes catch on fire – Stop, drop, and roll*** - until the fire is extinguished. Running only makes the fire burn faster.

⇒ **Once you are out, stay out! Call 9-1-1 from a neighbor's home.**

***Your recovery from the emergency may greatly depend on your level of preparedness before the emergency happens.*** Take time now to prepare, visit www.heartlandfire.org, www.readysandiego.org, www.theredguidetorecovery.com or www.sdarc.org for preparedness tips and to download the **"Wildfire Preparedness Guide".**

# Community Event—Wrap Up

## RELAY FOR LIFE WRAP-UP

This year's **Lemon Grove Relay For Life,** held the weekend of May 21-22 at Lemon Grove Middle School, did not disappoint! This was the City's sixth annual partnership with the American Cancer Society to host one of their signature fundraisers, which brings together friends, family, and co-workers to **celebrate** the lives of those who have battled cancer; **remember** loved ones lost to the disease; and ***fight back*** against a disease that takes too much.

The event featured a moving opening ceremony, round-the-clock DJ, quality volunteer entertainment, food and drink to keep the walkers going, a kids corral with fun activities, and much, MUCH more…

Behind every successful event, there's a successful organizing committee. **MANY THANKS** to ours! Jennifer Mendoza, Event Chair; Elizabeth McBrayer, Team Development; Tammy Graham, Team Recruitment; Brenda Renfroe, Survivor Chair; Sophia Assaad, Fight Back Chair; Jesse Colmenero, Fight Back Sponsorship; Linda Fisher, Entertainment/Food/Hospitality; Amber Gentle, Registration; Stephanie Boyce, Online Chair; Marjie Cappiello, Off-line Donations; Faith Wilbur, Logistics; Katie Dexter, Accounting; Janet Colmenero, Luminaria; Shirley Burcks, Publicity; Bob Cota, American Cancer Society Liaison; and *MANY event-day volunteers who pitched in wherever needed!*

***And the bottom line: $40,000***
**raised for cancer research and programs!**

## TENANT/LANDLORD SERVICES

The **Center for Social Advocacy** promotes fair housing practices, and provides free assistance to renters, land owners, and property managers.

The Center for Social Advocacy provides many services including:

- tenant/landlord mediation
- education to tenants
- education to land owners and property managers
- fair housing advocacy

The Center's housing specialists are equipped to answer many questions and provide additional resources to those in need. To contact the Center for Social Advocacy, call (619) 444-5700 or visit ***www.c4sa.org***.

## TOO MUCH FRUIT ON THE VINE?

Don't let your unpicked fruit go to waste!... We're asking for the donation of your unwanted fruit from your residential property and ***we will come pick it!*** Think of it! Rather than have a peach, pear, plum or any fruit dry on your branch or drop, give this fruit to a child or senior who will savor every bite.

**Harvest C.R.O.P.S.**

*Community Residents Offering Produce Seasonally*

Sponsored by St. John Youth group

***Please call today!* (619) 461-2681**

***www.harvestcrops.org***

***Check the website for other ways you can donate.***

# Environmental

## RECYCLING CONSTRUCTION & DEMOLITION DEBRIS

**Did you know that most unwanted and leftover materials created by construction and demolition activities are *RECYCLABLE*?**

**Did you know that State and local laws require you to *recycle those items*?**

Lemon Grove's ***Diversion Deposit Program*** establishes a deposit for construction and demolition projects. This program assists the City with its recycling efforts and with meeting State mandates.

### What you need to know:

- To qualify for a complete refund, your paperwork must show that at least 75% of the debris was recycled or reused.
- Before starting your project – determine how you will manage the waste. Large projects must also submit a formal Waste Management Plan that includes estimating types and quantities of waste the project will generate.
- Then, when you apply for a building permit, the City will collect a deposit based on the size of the project.
- A list of nearby recycling centers is provided in the permit application. For small loads of mixed debris, the SANCO Resource Recovery is located on Federal Blvd. right here in Lemon Grove.
- Get receipts for everything!!! (including whatever goes to the landfill).
- If you donate the items, be sure to get a receipt. No receipt available? Take photos of the items being donated and attach a signed note that states the name and address of donation site.
- If you plan to reuse any of the items, take photos of the items and attach a signed note that states how you will be reusing the debris. (think scrap wood for firewood or installing old kitchen cabinets in the garage).

***Help us create a sustainable Lemon Grove by participating in this required program!***

## SAN DIEGO COUNTY'S ULTIMATE RECYCLING RESOURCE

Over the last few years, "Going Green" has become a mainstream message. From the grocery store to car dealerships, there is no shortage of eco-friendly options. While not everyone can afford to buy a hybrid or always eat organic foods, there is a common factor shared between the levels of "green" lifestyles. The majority of people recycle and I Love A Clean San Diego provides the ultimate recycling resource. **WasteFreeSD.org** is an online database for all your recycling needs. The database is a quick and convenient way to find out what can be recycled and the closest location to take those items. I Love A Clean San Diego provides the only Disposal Solution Center database in the county. Just log onto ***www.wastefreesd.org*** and check out how easy it is!

- **Doing some spring cleaning? Find out where to get rid of hazardous cleaning products.**
- **Got leftover propane tanks from recent BBQs? Have extra pool chemicals lying around from recent cleanings? *WasteFreeSD.org* will show you where to get rid of these.**
- **Did you know all rigid plastics are now recyclable? That's right, your local trash hauler (EDCO) is now accepting things like yogurt containers, plastic toys, lawn furniture and much more.**

**Log onto *www.wastefreesd.org* for all your recycling needs!**

## *FREE* HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL

For your convenience, the **EDCO Buyback Center** located at 6700 Federal Boulevard, in Lemon Grove is **open every day of the week** from 8:00 a.m. to 4:00 p.m. for recycling household batteries and disposing of sharps waste. Questions? Call EDCO at (619) 287-7555.

### *Household Batteries — AAA, AA, C, D, AND 9V ONLY*

Batteries contain heavy metals such as mercury, lead, cadmium, and nickel, which can contaminate the environment when batteries are improperly disposed of. Recycling batteries keeps heavy metals out of landfills and the air and saves resources because recovered plastic and metals can be used to make new batteries.

### *Sharps Waste (Needles, lancets, or other devices used to penetrate the skin for the delivery of medications.)*

Put sharps in approved sharps containers or in sturdy, puncture resistant, tightly sealed containers like bleach bottles, liquid detergent bottles or coffee cans with lids. **DO NOT STORE IN:** paper or plastic bags, glass containers, cardboard or coated paper containers, plastic bottles that have a CRV (CA Redemption Value) or milk jugs. ***LOOSE SHARPS ARE NOT ACCEPTED.***

# Environmental

## IT'S ALMOST HERE...

That time of year so rare in Southern California – the rainy season. When it rains, the water washes into the gutters and then into nearby storm drains, eventually flowing into local creeks and to the ocean. Since water entering storm drains is not treated, it will also carry along with it various pollutants and debris, which can result in unsafe swimming conditions at the beaches of due to the pollution and toxins.

***You can help!*** **Suggestions to help you prepare *and* assist the City's clean stormwater efforts:**

- Be aware of manufacturer's instructions on pesticides and fertilizers - a little goes a long way,
- Clear your yard and driveway of trash and debris to prevent it from flowing to the storm drains,
- Scoop the poop when walking your pooch! Dog droppings are big contributors to harmful bacteria levels in local creeks,
- Collect yard and green waste to recycle or to use as mulch and fertilizer,
- Protect bare slopes to prevent erosion and mudslides.

Call (619) 825-3800 to report illegal dumping or blocked storm drains. Questions about stormwater and what you can do? Email Cora Long at clong@ci.lemon-grove.ca.us.

## ANTS!! A Common Summertime Annoyance in Southern California

### Control ***ANTS*** *the non-toxic way!*

1. Ant-proof kitchen garbage pails with sticky barriers such as petroleum jelly under the lip.
2. Put pet dishes in a moat of water.
3. Sponge invaders with soapy water as soon as you see them enter.
4. Fill cracks and crevices that have become ant entryways with caulk or petroleum jelly.
5. Remove infested indoor plants.
6. Use baits to control the colony—sprays are rarely necessary.

**Use NON-CHEMICAL methods & LEAST TOXIC pesticides.**

***WHY?*** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.

**For more information on ants and other household pests, go to *www.ThinkBlueSD.org*.**

***City of Lemon Grove***

## STORMDRAIN Hotline

**(619) 825-3827**

Please report illegal dumping (paint, chemicals, etc.) into the City's stormdrain system.

**What is stormwater pollution?** Untreated urban runoff (pollutants like trash, pet waste, cigarette butts, motor oil or antifreeze, paint, pesticide and fertilizer runoff) that flows untreated through the storm drain system, eventually making its way into the ocean.

**Find out more:**
*http://www.ci.lemon-grove.ca.us/stormwater*

## I LOVE A CLEAN SAN DIEGO

***Organizes cleanups throughout San Diego County!***

Volunteer registration is open for the **27th Annual Coastal Cleanup Day** on **Saturday, September 17**. Visit *http://www.cleanupday.org/* for more information.

ILACSD also coordinates inland cleanups at parks, lakes, and other recreation areas that are littered with debris. These cleanups are open to the public, and volunteers of all ages are encouraged to participate.

**View calendar:**
*http://www.ilacsd.org/calendar/month.php?cid=3&catid=3*

## CITY'S REDEVELOPMENT AGENCY DISSOLVED

Two California bills and one California Supreme Court case ended California's seventy year history of redevelopment. Lemon Grove's Community Development Agency—its redevelopment agency—has existed since 1983. Redevelopment abuses around the State have served as the poster child for terminating redevelopment; however, in Lemon Grove, redevelopment has been a powerful companion to the City.

Through its Community Development Agency, the City has been able to invest in aging business corridors, attract businesses that finance the backbone of community services, provide housing opportunities for residents, and create jobs that benefit the local economy.

***A few of the more significant redevelopment projects in the City include:***

- The Home Depot development
- Rehabilitated storefronts, inclusion of outdoor dining, and new business signs on Broadway between Grove Street and Lemon Grove Avenue
- Lester Street parking lot
- Bob Baker Toyota development
- Citron Court apartments on Broadway

Despite the decision by the State of California to terminate redevelopment in Lemon Grove, provisions in the law ***do*** allow the City to finish several of the projects currently in the redevelopment pipeline that rely on either grant funds or redevelopment bond proceeds—meaning no General Fund dollars are being used to complete these projects.

***The following projects will continue to be constructed, despite the demise of redevelopment:***

♦ ***Citronica I —*** this 56-unit mixed-use affordable housing and retail project is underway. Located at the corner of Main Street and North Avenue, the project will be complete by February 2013.

***Citronica I***

♦ ***Citronica II*** — located at the corner of Olive Street and North Avenue, the developer of this 86-unit senior apartment complex is currently seeking State housing tax credits to complete the financing of the project. Once financing is secured, The project should take 18 months to complete.

♦ ***Main Street Promenade*** — with funding secured through two grants, land acquired, and a contractor selected, the Main Street Promenade project is slated to begin construction in May 2012. This project will transform the existing Main Street, between Broadway and North Avenue, into a walkable park with energy generating components, educational features, a play area, and restrooms. The project will be complete by the end of 2012.

*Continued on Page 2...*

# Community Interest

*Revitalization Projects Around Town...continued from cover*

- ***Lemon Grove Avenue Realignment*** — the City has been working to modify the alignment of Lemon Grove Avenue with Highway 94. The primary aim of the project is to improve traffic circulation for vehicles traveling on North Avenue, Lemon Grove Avenue, and entering and exiting Highway 94. The project will also allow for greater walkability in the area and will create a better "gateway" for the City. Due to unforeseen complications with land acquisition and coordination with other governmental agencies, this project is behind schedule. Currently, the City aims to complete this project by the end of 2013.

*Re-routing of Lemon Grove Avenue*

## SHAKE, SHAKE, SHAKE— WHAT'S ALL THAT EARTH MOVEMENT ABOUT?

***Have you noticed the new, non-City projects throughout Lemon Grove?***

- ***Lemon Grove Middle School*** — the Lemon Grove School District secured bond funding to upgrade its campuses, including the conversion of Lemon Grove Middle School into a "STEM Academy" (Science, Technology, Engineering, and Math). In addition to the campus rehabilitation, the Lemon Grove School District is constructing a joint-use library for the community. The school is scheduled to open in Fall 2012 and the library is planned to be open March 2013.
- ***Walgreens*** — look for the new Walgreens opening in late summer 2012 at the corner of Massachusetts Avenue and Broadway .
- ***PetCo — a PetCo will soon be open for business*** in the shopping center at Massachusetts and the north side of Broadway next to In N Out Burger.
- ***Lemon Grove Community Church*** — construction has just begun on a Spanish Colonial Revival church on the south side of Civic Center Park at the corner of Central Avenue and Main Street. This 8,001 square foot building is planned to be completed by September 2012.
- ***Trolley Station Upgrades*** — the San Diego Metropolitan Transit Authority and SANDAG are coordinating trolley station upgrades at Lemon Grove's two trolley stops. The upgrades are intended to raise the platform to accommodate the new low-floor trolley cars that accommodate wheelchair access without a lift, making trips faster and more convenient for passengers.

***Stay tuned – more building is in the pipeline!***

## CHANGE IN DOG LICENSING FEES

For the first time since 1990, the City modified dog licensing fees in 2011. The intention of the new fee schedule is to encourage spay and neutering of dogs to reduce the number of unwanted dogs in the City. The fee schedule also encourages the purchase of a 3-year license as opposed to a 1-year license, which should reduce the staff time involved in processing the licenses as well. The puppy and 2-year license options were eliminated.

***New fee schedule:***

| | | | |
|---|---|---|---|
| 1 Year License (Altered): | $15 | Transfer Fee: | $10 |
| 1 Year License (Unaltered): | $40 | Penalty (Altered): | $10 |
| 3 Year License (Altered): | $35 | Penalty (Unaltered): | $25 |
| 3 Year License (Unaltered): | $75 | Tag Replacement: | $ 5 |

## SUMMER DAY CAMP IS BACK!

The City's Summer Day Camp is designed to provide 1st through 8th graders with an active, safe and fun environment for ten weeks out of the year. Campers will enjoy a wide variety of activities that continues the learning process throughout the summer, all supervised by our trained, caring and enthusiastic staff. Your child's safety, well-being and positive camp experience are our top priorities.

Children will participate in a variety of games, sports, arts, and crafts including four square, tether ball, board games, pool, ping pong, air hockey, movies, reading, and more. All activities take place throughout the recreation center which includes a huge two court gymnasium, arts & crafts room, two game rooms and athletic fields. Children will also discover more of San Diego County on nine fun-filled field trips.

**June 25th to August 31st, 6:30 a.m. to 6:00 p.m.**
**Lemon Grove Recreation Center, 3131 School Lane**

**Registration begins: .....Monday, April 16, 2012**
**Registration/Information: .....Lemon Grove City Hall, 3232 Main Street, (619) 825-3800 (M-F, 8am-5pm, *Closed Fridays*)**

| *2012 Pricing* | |
|---|---|
| $95 | Weekly rate |
| $80 | 3-day rate |
| $35 | Single day rate |

| | |
|---|---|
| **Gym Activities:** | Pillow polo, dodge ball, indoor soccer, basketball, volleyball and mad ball. |
| **Athletic Fields:** | Flag footballs, kickball, capture the flag, wiffle ball, Kings & Queens and soccer. |

6. Click **"Save Profile Information"** and you're done!

You will receive a confirmation e-mail with instructions on how to unsubscribe should you wish to do so. Your e-mail address is kept confidential and will not be sold or disclosed to third parties.

## CLOTHING DONATION BOXES

Clothing donation boxes (sometimes red, sometimes blue) look very similar to mail collection boxes in our neighborhoods – ***but tend to attract illegal dumping that if not reported can continue to attract more trash and debris!*** **These boxes are not approved by the City for just that reason. Donate your clothes to a thrift store instead**. In Lemon Grove, there is a United Cerebal Palsy Thrift Store at 7875 Broadway. Donations benefit families afflicted with the disease and aid in pursuing a cure.

**Please report locations of the donation boxes to the City at (619) 825-3800 so that they can be removed.**

## LOW-COST ALTERNATIVES FOR HIGH QUALITY EVENTS

The City of Lemon Grove offers facilities specifically designed for receptions, meetings, sporting events, and other special events. The facilities accommodate varying size groups and reservations may be made up to one year in advance. Tours are available by appointment.

**For pricing, reservations, or more information, please contact the Community Services Division at (619) 825-3800 ext. 3902, or visit the City's website at: *www.ci.lemon-grove.ca.us/rentals*.**

**Lemon Blossom Hall**
8235 Mt. Vernon Street

A refined facility that can seat up to 200 for banquet style events, and up to 300 for theater style events. Adjacent to Lemon Grove Park, this beautiful facility features large French doors that open to a spacious patio. Borders of grassy areas and walkways provide a private, peaceful setting amongst nature, ideal for a wedding ceremony. The large, fully equipped kitchen is designed to handle all of your catering needs.

**Community Center**
3146 School Lane

Appealing for its convenient location and full kitchen amenities, this is an ideal setting for smaller meetings, conferences and private parties. The Community Center seats up to 75 for banquet style events, and up to 100 for theater style events. Tables and chairs are provided free of charge and City staff will set up and break down the equipment for you.

**Berry Street or Lemon Grove Park Gazebos**

Does an indoor event seem too stuffy for your special occasion? Take advantage of the *"Best Climate on Earth,"* by holding a birthday party, shower or fundraiser outdoors. Both parks span six acres and offer playgrounds, picnic areas and tables, restrooms, a basketball court and walking paths. Gazebo rentals are $80 and provide you with peace of mind that no one else can intrude on your special day. To reserve a gazebo, visit City Hall at 3232 Main Street or call (619) 825-3800 for more information.

**H. Lee House Courtyard**
3225 Olive Street

For a more intimate outdoor event, the historical H. Lee House boasts an elegant courtyard and features a stunning Victorian-style gazebo for ceremonies or entertainment surrounded by inlaid brickwork and grass. With a capacity for approximately 100 guests, the H. Lee House Courtyard is the perfect setting for a private outdoor wedding, anniversary party, or baby shower.

# Community Interest

## ILLEGAL SIGNS ON PUBLIC PROPERTY

The City of Lemon Grove is stepping up its efforts to prevent illegal signs on public property that negatively impact the appearance of streets, neighborhoods and business districts throughout our city.

Illegal signs create an unsightly appearance in our neighborhoods and business districts, a distraction on street corners and along roadways, and pose a visual barrier to motorists. For the overall safety of our neighborhoods, posting illegal signs must be discouraged.

**Section 18.12.070 of the Lemon Grove Municipal Code prohibits all signs displayed on public property that are not approved by the City Council.** A few examples of illegally posted signs that Public Works staff has removed in the recent past include: Garage Sale, Work From Home, and Yard Care Services.

The City asks its residents, businesses, and visitors to be more conscious of posting signs on public property, and encourages everyone to help in the efforts to rid our community of unnecessary, unsightly and unsafe clutter. ***The end result is a cleaner, safer, more attractive city for everyone to enjoy!***

## TAKING RECYCLABLES FROM RECYCLING BINS IS STEALING!

***"When recyclable materials are placed in collection containers or any designated pickup location, they shall become the property of the city or its duly authorized agent. It is unlawful for any person other than the city or its agent to move, remove, interfere with, disturb, or tamper with said materials or their containers."*** **Lemon Grove Municipal Code, Section 13.24.140**

Have you ever seen someone rummaging through your blue recycling bin? They are usually looking for valuable CRV materials—soda cans and water bottles. ***And, they are stealing***.

The problem isn't just here in Lemon Grove. It is an issue throughout California, which is why Assembly Bill (AB) 1778 was passed. AB 1778 requires scrap yards that buy $100 or more of CRV bottles and cans or $50 or more of newsprint, to document transactions and to pay for these materials by check. AB 1778 is designed to reduce organized recycling theft in California.

Locally, scavenging recyclables is a violation of Lemon Grove Municipal Code Section 13.24.140. Violators may be prosecuted and are subject to a fine.

***Scavengers are not only stealing from the City and EDCO, they're stealing from the residents of Lemon Grove. The revenue generated from the sale of recyclables goes directly back to the rate payers in the form of lower service rates.*** So, when scavengers steal the recyclables, they remove that revenue and cut the funding to the waste hauling.

***The next time you see someone scavenging through a recycling bin, remember that it is a crime and YOU can do something about it!***

### *Tips to help prevent recycling theft:*

1. **Bring your recycling bins out to the curb the morning of your scheduled pick-up instead of the night before.**
2. **Remove all CRV containers from your recycling bin. You can either redeem them at a recycling center or drop them off at EDCO at 6700 Federal Boulevard.**

***SEE IT, HEAR IT, REPORT IT!*** ***If you see someone removing recyclables from a bin:***

- **Get the license plate number of the vehicle being used to transport the recyclables.**
- **Get a detailed description of the individual scavenging.**
- **If possible and if it is safe, take a picture of the individual and send it to: mjames@ci.lemon-grove.ca.us.**
- **Call the Sheriff Department's non-emergency number (858) 565-5200 to report the crime.**
- **When reporting a theft, it is important that you provide your name and contact information to the Sheriff's Department.** ***Without your acknowledgement that you have witnessed a crime, action cannot be taken against the violator.***

# Community Interest

## *POLITICAL CAMPAIGN SIGN REGULATIONS*

# Avoid Campaign Sign Chaos This Election Season

**The City of Lemon Grove wants YOU to be aware of the regulations relating to posting political campaign signs:**

- Signs are <u>not allowed</u> on public property.
- Maximum 16 square feet for any single temporary, noncommercial sign.
- There are no quantity limits of temporary, noncommercial signs on a private property.
- Display period for temporary, noncommercial signs is limited to a total of 60 days and not later than five days after the event conclusion.
- Signs that obstruct vehicular sight distance are prohibited.

**More Information:**
**Please refer to the Lemon Grove Municipal Code, Chapter 18.12 or call the City's Development Services Department at (619) 825-3800.**

## HEARTLAND FIRE & RESCUE CELEBRATES TWO YEAR MARK

It has been two years since the cities of El Cajon, La Mesa and Lemon Grove entered into a joint powers agreement for management and delivery of fire protection and emergency medical services. This joint powers agreement is known as Heartland Fire & Rescue. The management team includes a fire chief, three deputy fire chiefs, two division chiefs, five battalion chiefs, and four support staff.

Together our departments provide services for all types of emergencies and hazards, including first responder advanced life support, paramedic transport services, structural fire protection, wildland fire protection, vehicle extrication, vehicle fires, airport responses, hazardous materials first responder, regional urban search and rescue program, public service calls, public education, community preparedness, fire prevention and fire code enforcement.

Through this cooperative effort, these three cities have realized a combined savings of over $1.2 million while improving service levels to the community. This relationship is a great example of how communities can come together for the greater good.

**For more information, visit us on the web: *www.heartlandfire.org*.**

HEARTLAND FIRE & RESCUE
SERVING THE CITIES OF EL CAJON, LA MESA AND LEMON GROVE

## WEEDS. WEEDS, WEEDS...

It's time to cut down those pesky weeds that popped up after the winter rains! This is a *friendly reminder* from the Fire Department that we all need to do our part by voluntarily removing fire hazards before the summer fire season starts. **Be sure to remove weeds by May**.

In the meantime, Fire Inspectors will be actively making a list of properties that are already overgrown. Beginning in June, "NOTICE to ABATE" letters will be mailed to property owners whose properties have become a fire hazard. Noticed property owners then have 30 days to clear the property. If the property has still not been cleared by that time, the City may fine the owner, hire a contractor to cut the weeds to protect neighboring properties, and bill the property owner for the cost of removal.

**To report a fire hazard, call the Fire Department at 619) 825-3835 or report it online at *www.ci.lemon-grove.ca.us*, click on *"Report a Problem"* in the left–hand panel, choose "Weed Abatement" and follow the simple instructions.**

## SHERIFF'S CORNER — DISTRACTED DRIVING

The San Diego Sheriff's Department conducted a distracted driver campaign in conjunction with the California Highway Patrol (CHP) during the week of February 13th – 17th, the first detail of its type for San Diego County and the CHP,

Deputies assigned to the City of Lemon Grove and unincorporated areas, cited **61 drivers** during the week-long campaign and the enforcement resulted in 467 adult drivers and 3 juveniles receiving citations for talking or texting while driving in San Diego County.

Distracted driving is an epidemic on America's roadways. You see it every day—drivers swerving in their lanes, stopping at green lights, running red ones, or narrowly missing a pedestrian because they have their eyes and minds on their phones instead of the road.

**The *Minimum fine* for talking without a hands-free device or texting on a cell phone is $159 for the first offense. *Repeat offenders pay $279 or more.***

***For more information*: http://www.distraction.gov or http://www.dot.gov/**

*Drivers using hand-held devices have a four times greater risk of a crash resulting in a serious injury - California Office of Traffic Safety (OTS)*

## SAN MIGUEL SCHOOL COMMUNITY GARDEN TRANSFORMED!

San Miguel Elementary School's community garden has been transformed by the popular Home and Garden Television (HGTV) television show "Yard Crashers," DIY Network's top show, and SCOTTS®! In preparation for the event day, 30,000 lbs of soil, 400 pavers, assorted plants, benches, wheel barrows and gardening materials were delivered to the grounds. The transformation took place on January 30th from 8:30 a.m. to dusk. Film crews from HGTV and the DIY Network were on campus to capture the day's excitement and the miracles of teamwork, community building and making dreams come true. After 15 retakes of the first scene caused by an overabundance of giggling sixth grade girls, the day's filming went smoothly. The show is scheduled to air on HGTV in late March.

All Students visited the garden during their regularly-scheduled school day and Extended Day Program students were invited to help out in shifts from 3:00-6:00 p.m. Principal Heidi Bergener invited community members, neighbors and San Miguel Elementary's extended family to stop by to see the action. In total, over 1,000 students, families, community members, and district employees took part in transforming the school's garden into a safe place where students can come to learn about giving back, gardening and the true meaning of building community.

Cooking demonstrations and taste testing in school will be the primary focus of the harvested produce and community members will benefit from the abundance of fruit as well.

*Tomatoes, cucumbers, peppers, strawberries, onions, cabbage, lettuce and basic spices will grow in raised planter beds.*

*Stepping stone pathway created from pavers painted by students.*

*A variety of citrus trees.*

## 7TH ANNUAL LEMON GROVE RELAY FOR LIFE — MAY 19 - 20, 2012

RELAY FOR LIFE
American Cancer Society

## One day. One night. One community. *One Fight.*

Relay For Life is a life-changing event that brings people together to **celebrate** the lives of those who have battled cancer; **remember** loved ones lost to the disease; and ***fight back*** against a disease that takes too much. ***Won't you join us?***

Relay For Life began in 1985 when Dr. Gordy Klatt, a colorectal surgeon in Tacoma, Washington, ran and walked around a track for 24 hours to raise money for the American Cancer Society. Since then, Relay has grown from a single man's passion to fight cancer into the world's largest movement to end the disease, with more than 3.5 million participants in 5,000 communities in the United States and 19 countries around the world.

The ***2012 Lemon Grove Relay For Life*** promises to be a great event featuring a moving opening ceremony, entertainment, food, activities for kids of all ages, and much, MUCH more!!

Throughout the event, we ***celebrate*** our cancer survivors, ***remember*** those who've lost their battle, and learn to ***fight back*** against a disease that takes too much. As darkness falls and the stars come out, the night is brightened by the glow of illuminated bags called luminarias, each bearing the name of someone who has battled cancer. The luminarias line the track and keep walkers motivated to keep going. The following morning as the event draws to a close, the crowd takes part in a meaningful closing ceremony and pledges to spend the next year ***fighting back*** against cancer!

*Join us!* **Saturday, May 19, 9:00am—Sunday, May 20, 9:00 am**

**Palm Middle School, 8425 Palm Street** (note new location for 2012)

Join teams of family, friends, neighbors, and co-workers at Palm Middle School. Teams are asked to have a representative on the track at all times during the event, representing the reality that *cancer never sleeps*. By participating, you ***celebrate*** cancer survivors, ***remember*** the lives we've lost to the disease, and raise money to help ***fight back*** against cancer in our community.

***More information?*** **Call (619) 741-6748 or visit www.relayforlife.org/lemongroveca**

## Harvest C.R.O.P.S.—"Community Residents Offering Produce Seasonally"

**Harvest C.R.O.P.S.** ***(Community Residents Offering Produce Seasonally)*** was founded in 2009 after Lemon Grove resident Sergio Padilla decided to do something about the unpicked residential fruit he had observed rot and fall to the ground for years on his drive daily to and from work. Sponsored by Lemon Grove's St. John of the Cross Youth Group and currently operating under the umbrella of the church's tax-exempt status, *the organization's mission is to serve those less fortunate by coordinating volunteers to "pick to be brought," rather than "drop and rot."* Since 2009, volunteers have picked and distributed ***thousands of pounds*** of fruit to low-income families, seniors, and food banks.

Goals for the organization in 2012 are for the development and creation of a mobile display booth for public presentations and an independent California 501(c)(3) tax-exempt ID to "seed" into its own independent identity, encouraging all faiths to support the mission of feeding low-income families and seniors with residential fruit that would otherwise drop to the ground to rot.

***Volunteers and tax-deductible contributions*** for expenses such as fuel and supplies for harvesting such as buckets, gloves, and tools make Harvest C.R.O.P.S. mission a reality.

### *HERE'S HOW YOU CAN HELP…*

### Volunteer:

***Youth groups or clubs are encouraged to participate!*** **Most harvests take place on Saturday mornings. The average volunteer time commitment is 3-4 hours. Groups of 5-20 volunteers meet at 9:00 a.m. in the parking lot at St. John of the Cross Church, 8086 Broadway. Call (619) 318-3423 or email *info@harvestcrops.org* to be placed on the "Call-up" roster. Participants will receive an email or phone call prior to a harvest appointment.**

### Make an Appointment for a Harvest:

**Call (619) 461-2681 or email *info@harvestcrops.org* to make an appointment to have residential fruit picked.**

### Donate:

**Harvest C.R.O.P.S. appreciates your support through donations for fuel and safety supplies for volunteers. Call (619) 318-3423 or visit *http://members.cox.net/harvestcrops/Donate.htm*.**

The pictures at right are from the Harvest C.R.O.P.S. traditional first harvest of the year in January—32 lemon trees at Civic Center Park, behind City Hall.

The trees yielded 45 twenty-pound buckets of lemons picked by 16 volunteers from Harvest CR.O.P.S. and the Grossmont Interact Club.

The fruit was distributed to the Lemon Grove Senior Center and the El Cajon Chaldean Community.

**Monday—Friday, 8:00 a.m.—2:00 p.m.**

***Senior Lunch Program***

***Hot, nutritious meals***

**Make reservations by 12:00Noon three days in advance.**

**Suggested donation $3.50 age 60 and over.**

### Services
Free Legal Services/Tax Preparation
Blood Pressure Checks
Home Delivered Meals
Hearing Aid Screening & Cleaning

### Activities
Tuesday Movies
Monthly Entertainment
Holiday Celebrations
Bingo and Billiards

### Exercise Classes
Aerobic Conditioning ($10/semester)
Feeling Fit Club ($10/semester)
Hatha Yoga ($5/class)

## TENANT/LANDLORD SERVICES

The **Center for Social Advocacy** promotes fair housing practices, and provides free assistance to renters, land owners, and property managers.

The Center for Social Advocacy provides many services including:

- education to tenants
- education to land owners and property managers
- fair housing advocacy

The Center's housing specialists are equipped to answer many questions and provide additional resources to those in need. To contact the Center for Social Advocacy, call (619) 444-5700 or visit ***www.c4sa.org***.

## REPORT ILLEGAL DUMPING

***City of Lemon Grove***

**STORMDRAIN Hotline**

**(619) 825-3827**

Please report illegal dumping (paint, chemicals, etc.) into the City's stormdrain system.

**What is stormwater pollution?** Untreated urban runoff (pollutants like trash, pet waste, cigarette butts, motor oil or antifreeze, paint, pesticide and fertilizer runoff) that flows untreated through the storm drain system, eventually making its way into the ocean.

**Find out more:**
***http://www.ci.lemon-grove.ca.us/stormwater***

## FREE HOUSEHOLD BATTERY RECYCLING AND SHARPS DISPOSAL

For your convenience, the **EDCO Buyback Center** located at 6700 Federal Boulevard, in Lemon Grove is **open every day of the week** from 8:00 a.m. to 4:00 p.m. for recycling household batteries and disposing of sharps waste. ***Questions? Call EDCO at (619) 287-7555.***

### Household Batteries — *AAA, AA, C, D, AND 9V ONLY*

Batteries contain heavy metals such as mercury, lead, cadmium, and nickel, which can contaminate the environment when batteries are improperly disposed of. Recycling batteries keeps heavy metals out of landfills and the air and saves resources because recoverd plastic and metals can be used to make new batteries.

### Sharps Waste *(Needles, lancets, or other devices used to penetrate the skin for the delivery of medications.)*

Put sharps in approved sharps containers or in sturdy, puncture resistant, tightly sealed containers like bleach bottles, liquid detergent bottles or coffee cans with lids. **DO NOT STORE IN:** paper or plastic bags, glass containers, cardboard or coated paper containers, plastic bottles that have a CRV (CA Redemption Value) or milk jugs. ***LOOSE SHARPS ARE NOT ACCEPTED.***

## I LOVE A CLEAN SAN DIEGO

Volunteers are instrumental in the I Love A Clean San Diego (ILACSD) mission by helping them to raise public awareness throughout the community and to protect and enhance the environment.

***Each year, more than 30,000 volunteers are active in ILACSD's volunteer programs, including the following:***

- Coastal and Inland Cleanups
- Creek to Bay Cleanup
- Coastal Cleanup Day
- Storm Drain Stenciling
- Adopt-A-Beach
- Non-Native Plant Removal
- Student Internships
- Office Support
- Community Outreach & Booth Events
- Recycling Events & Outreach Programs
- Corporate Teambuilding Events
- Coastal and Inland Cleanups

For more information about ILACSD's many programs call (619) 291-0103.

ILACSD's Community Events Department coordinates **monthly cleanup events** both on the coast as well as in local creek beds, canyons, open space parks and everywhere in between. Volunteers see first-hand how trash makes its way from inland communities all the way to the coast through San Diego County's vast watershed system.

***Creek to Bay & Coastal Cleanup Day:*** Volunteers gather In April and September at more than 75 cleanup sites countywide to remove trash and beautify the local community. **The 2012 Lemon Grove cleanup site will be at San Miguel and Federal Boulevard on April 28 from 9:00 a.m. to Noon. Please register online at www.creektobay.org so that adequate volunteer supplies will be at the site for the cleanup.** ***Need more information?*** **Call Natalie Roberts at (619) 704-2778 or nroberts@cleansd.org.**

***Storm Drain Stenciling:*** Volunteers use paint and stencils to create the message "NO DUMPING" on sidewalks, parking lots and any other places with storm drain inlets. See their Storm Drain Stenciling page for more information about how you can get involved in preventing pollution.

***Adopt-A-Beach:*** Part of the statewide Adopt-A-Beach program, this program is great for groups who want to participate in volunteer work on an ongoing basis. It requires that you perform at least three cleanups per year. While the name suggests that only beaches are available for adoption, there are also a number of inland locations that need cleaning up. Visit the Adopt-A-Beach website to learn more about adopting a local beach or inland area.

***Corporate Teambuilding:*** I Love A Clean San Diego assists local businesses to coordinate team building cleanups at local beaches & inland areas. For a small fee, ILACSD provides event planning, coordination, marketing and supplies to coordinate a cleanup for your business. Contact Director of Community Events, Natalie Roberts by phone at (619) 704.2773 or email nroberts@cleansd.org.

**I Love A Clean San Diego organizes *Cleanups throughout San Diego County.* including beach cleanups and inland cleanups at parks, lakes, and other recreation areas that are littered with debris. These cleanups are open to the public, and volunteers of all ages are encouraged to participate.**

**For a current listing of events, please visit the event Calendar.**

## HOUSEHOLD HAZARDOUS WASTE RECYCLING

FREE!

***By appointment only***, City residents may drop-off Household Hazardous Waste (HHW) on selected dates at **EDCO's La Mesa Station**.

### It's easy to dispose of HHW safely...

Call (**619**) **287-5696**, ext. **4270**, to make an appointment for an upcoming drop-off event. You may also request an appointment via email at ***lmhhw@edcodisposal.com***. Be sure to include your name, address, and daytime telephone number.

**Home Pickup Program**—Only seniors (65+) and disabled residents are eligible to participate in the HHW/Electronic Waste Home Pickup Program. (619) 287-5696, ext. 4270.

***It is illegal to dispose of hazardous materials such as these in the trash!***

| HOUSEHOLD | YARD AND GARDEN | GARAGE |
|---|---|---|
| All Purpose Cleaners | Lighter Fluid | Motor Oil and Filters |
| Ammonia, Disinfectants | Pesticides | Car Batteries, Gear Oil |
| Drain Cleaners, Polishes | Paints, Stains, Thinners | Transmission Fluid |
| Fluorescent Light Bulbs | Pool Chemicals | Antifreeze, Gasoline |
| Household Batteries | Fertilizers | Glues, Adhesives |

## FREE E-WASTE RECYCLING for Residents AND Businesses

**EDCO Disposal**
**6700 Federal Boulevard**
**(619) 287-7555**
**8:00 a.m.—4:00 p.m.**
***No appointment required***

## Items Accepted:

***Appliances
Batteries
Camcorders
Car batteries
CD players
Cell phones
Computers
Copiers
DVD players
Electric typewriters
Fax machines
Hard drives
Laptops
Modems
Monitors
Pagers and PDA's
PC boards
Personal computers
Phone systems
Printers
Radios
Remote controls
Scanners
Servers
Stereos
Tape players
Telephones
Televisions
Testing equipment
Transparency markers
Two-way radios
Typewriters
UPS's
VCR's
Word processors

***$27 fee.***

# CITY OF LEMON GROVE

## FY 2011-12

## JURISDICTIONAL URBAN RUNOFF MANAGEMENT PROGRAM ANNUAL REPORT

## APPENDICES

## Appendix A.1
## Inventory of Completed Development Projects with Approved Treatment Control BMPs

| No. | Project Name | Project Address | Development Type | BMPs | HSA | Fiscal Year Completed | TTWQ |
|---|---|---|---|---|---|---|---|
| 1 | DCH HONDA | 3615 LEMON GROVE AVE. | Commercial | Underground storage treatment facility, filter inserts, grassy swale | 908.22 | 2007 | High |
| 2 | CITRON COURT | 7385 BROADWAY | Residential | LID | 908.22 | 2008 | Low |
| 3 | CHEVRON | 7209 BROADWAY | Commercial | South Poway Business Park detention basin, catch basin inserts | 908.22 | 2005 | Medium |
| 4 | MARY PAT LANE | MARY PAT LANE | Residential | Sand filter, catch basin insert, roof downspout filters | 909.12 | 2006 | Medium |
| 5 | EDCO | 6670 FEDERAL BLVD | Commercial | Vegetated swales, catch basin insert | 908.22 | 1990 | High |

## Appendix A.2
## FY 2011-12 Construction Inventory

| # | Project | Location | HSA | TTWQ | Rainy Season | | Dry Season Number of Site Visits/ Visual Inspections | Total Site Visits/ Visual Inspections |
|---|---|---|---|---|---|---|---|---|
| | | | | | Weeks Active | Number of Site Visits/ Visual Inspections | | |
| **Private Developments** | | | | | | | | |
| 1 | Citronica* | 7775 North Avenue | 908.22 | M | 16 | 16 | 9 | 25 |
| 2 | Happy Tinnie LLC | 2889 Orange Place | 908.22 | L | 11 | 11 | 13 | 24 |
| 3 | Lemon Grove Comm. Church* | 3132 Main Street | 908.22 | M | 23 | 23 | 10 | 33 |
| 4 | Walgreens* | 7195 Broadway Avenue | 908.22 | M | 24 | 24 | 9 | 33 |
| 5 | Kroger Foods Gas Station Improvements | 7428 Broadway Avenue | 908.22 | L | 20 | 20 | 13 | 33 |
| **Capital Improvements (CIP)** | | | | | | | | |
| 6 | 2011 CIP Street Rehab | Various | 908.22<br>909.12 | L | 0 | 0 | 3 | 3 |
| 7 | Ida Street Drainage Improvements | Ida Street & New Jersey Avenue | 908.22 | L | 0 | 0 | 12 | 12 |
| 8 | Federal Blvd. Sewer | Federal Boulevard | 908.22 | L | 0 | 0 | 2 | 2 |

Note: The following three projects designated as medium priority included filling out the City's construction stormwater compliance inspection form. Citronica had an inspection form filled out for the months of January, February, March and April. Both Lemon Grove Community Church and Walgreens had inspection forms filled out monthly during the rainy season from October 2011 through April 2012. All other inspections noted in the table were visual inspections with some notes on BMP observations documented in the engineering inspector's journal.

## Appendix A.3 (Continued)
## Municipal Inventory

**Notes**

TTWQ – Threat to Water Quality

Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water.

L = Likely, PO = Possible, UL= Unlikely

* Discharge of heavy metals and oil and grease is possible if the facility has on-site parking

** Sediment and oxygen demanding substances are possible pollutants for earthen or natural conveyances. Bacteria, but generally not viruses and other pathogens, may regrow in MS4s under certain conditions. While other pollutants may be discharged from the MS4, the MS4 itself is not a direct source of those pollutants.

*** The sanitary sewer system is only a potential source of pollutants in the event of sewer line breaks or SSOs.

## Appendix A.4

**Notes**
SIC –Standard Industrial Classification Code
TTWQ – Threat to Water Quality
L= Likely, PO= Possible, UL=Unlikely
Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water.
This table is based on the field experience of City staff and on tables in the Copermittees's Baseline Long-Term Effectiveness Assessment in determining pollutant discharge potential from each facility.

**Notes**
TTWQ – Threat to Water Quality
SIC –Standard Industrial Classification Code
L= Likely, PO= Possible, UL=Unlikely
Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water.
This table was generated using the Copermittee's Regional Mobile Business Inventory and mobile business presented in The City of Lemon Grove's 2010-11 JURMP Annual Report. The pollutant loading potential component of the table is based on the field experience of City staff and on tables in the Copermittees's Baseline Long-Term Effectiveness Assessment in determining pollutant discharge potential from commercial sources.

## Appendix B
## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 1 | 8/11/11 | 8170 Broadway | Municipal | Car wash water flowing into street | City staff investigated by touring the station. Station manager informed city staff that gas station employees were rinsing off tires and wheels (prior to entering car wash) on the side of the station and water was flowing down a ramp onto the sidewalk.<br><br>City staff directed the gas station manager to cease rinsing vehicles where water would flow onto public right-of-way. Manager stated they would capture any water to prevent it from flowing off the property. As of this date, no additional complaints received. **Verbal Warning. No further action.** |
| 2 | 2/3/12 | 3515 Olive Street | Municipal | Brine water spill at Culligan | City staff investigated by touring facility. No evidence found that water reached MS4. Brine spill (used during water treatment process) was contained on the property and drained into a collector on site. **No further action.** |
| 3 | 8/16/12 | BERRY STREET (EXACT ADDRESS UNKNOWN) | Residential | Neighbor doing laundry in front yard | City staff investigated and found no evidence of laundry washing in any front yards on Berry Street. City staff also contacted complainant who could not provide any specifics as to when alleged violation occurred. City staff asked the complainant to call Code Enforcement when the next violation occurs on Berry Street. As of this date, staff has not received any phone calls or new information regarding this complaint. **No further action.** |
| 4 | 5/14/12 | 2796 DENNIS LANE | Residential | Waste water seeping above ground | City staff investigated and found no evidence of waste water seepage. No waste water smell was noted. As of this date, staff has not received additional complaints. **No further action.** |

## Appendix B (Continued)
## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 5 | 4/9/12 | 6983 CENTRAL AVENUE | Residential | Trimmed vegetation left in drainage ditch. | City staff requested the property owner responsible for the trimming remove vegetation from drainage ditch. Property owner complied by the next day. **Verbal Warning. No further action.** |
| 6 | 3/20/12 | 1901 ELDORA STREET | Residential | Oil leaking from vehicle | City staff investigated but found no "fresh" leak. Only an old stain most likely dried oil was noted. City staff did not cite as numerous dried oil stains can be found the length of Eldora Street. **No further action.** |
| 7 | 6/2/12 | 1548 EL PRADO | Residential | Pool water draining into street | City staff made contact with the property owner who stated the pool water was free of chemicals as he let it stand for a couple weeks prior to release. City staff recommended that next time he have the water drain onto his lawn in the back and front yards over a period of time. Property owner stated he would do that next summer. **Verbal Warning. No further action.** |
| 8 | 7/20/11 | 7662-64 BROADWAY | Municipal | Overgrowth in Ditch | City staff removed weeds and trash from ditch. **No further action.** |
| 9 | 7/25/11 | 7630 BROADWAY | Municipal | Missing storm drain grate | Temporary covered was placed, while a permanent cover for the storm drain is being fabricated. **No further action**. |
| 10 | 8/3/11 | EASEMENT ON WASHINGTON ST | Municipal | Clear & clean out easement on Washington St – btw Darryl & Roy St. Lots of greenery & debris. | Removal of weeds and trash from easement ditch as requested. **No further action.** |

## Appendix B (Continued)
## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 11 | 8/8/11 | MAIN ST CHANNEL (BTW GRANGE – MASS AVE) | Municipal | Annual clean up/weed abatement in channel located on Main St - from Grange to Mass Ave (both sides of roadway). | Yearly clean up completed. **No further action.** |
| 12 | 9/1/11 | DRAINAGE DITCH (BTW LGA - CITRONELLA AVE) | Municipal | Clean out & remove growth from drainage ditch located behind Arco on LGA/Palm | Clean up on ditch completed. **No further action.** |
| 13 | 9/19/11 | DRAINAGE DITCH (BEHIND 1554 ANGELUS AVE) | Residential | Overgrowth & broken concrete is an issue. | Maintenance will be the responsibility of the neighboring property owners. City sent out letters informing residents to cleanup. **No further action.** |
| 14 | 9/21/11 | CITY WIDE | Municipal | Storm patrol, check storm grates and channels for debris. | Routine inspections & maintenance. **No further action.** |
| 15 | 10/5/11 | CITY WIDE | Municipal | Storm patrol, check storm grates and channels for debris. | Routine inspections & maintenance. **No further action.** |
| 16 | 10/5/11 | CITY WIDE | Municipal | Storm patrol, check storm grates and channels for debris. | Routine inspections & maintenance. **No further action.** |

## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 17 | 11/14/11 | DITCH BEHIND 1847 BAKERSFIELD | Residential | Assessment of large portion of eucalyptus tree that has fallen on home at 1847 Bakersfield. Reported by Prop Management - Tom Bell has gone out to take photos & we are determining if the tree is in fact on City property/ROW, no action yet | The tree poised a safety risk to the surrounding area so City staff removed the tree. But because there is no City-owned property along the area in question, the services that staff provided will be the final action that we provide for this property. **No further action.** |
| 18 | 11/29/11 | 8061-8063 ALTON DR | Municipal | Please clean out storm drain west of 8063 Alton Dr (by the church) & across the street. | Routine clean up completed. **No further action.** |
| 19 | 12/12/11 | ACROSS THE STREET FROM 8227 DARRYL ST | Municipal | Please place sandbags at drainage ditch directly in front of 8227 Darryl St to avoid flooding. | Sandbags placed. **No further action.** |
| 20 | 2/7/12 | 2618 BONITA ST | Residential | Flood control | Class 2 base placed and compacted in front of 2618 Bonita as requested. **No further action.** |
| 21 | 2/16/12 | 1990 MADERA ST | Municipal | There is a tree/bush growing out of the storm drain on the corner of Madera Street and Massachusetts. | Removed as much silt & debris from out of storm drain as possible. **No further action.** |
| 22 | 3/5/12 | N/E CORNER OF LGA & CANTON DR | Municipal | Please remove a palm tree growing out of a storm drain on the N/E corner of LGA & Canton. | Removed palm tree growing out of storm drain channel @ LGA and Canton. **No further action.** |

## Appendix B (Continued)
## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 23 | 3/6/12 | SWEETWATER RD (NEXT TO 125 OVERPASS) | Municipal | Overgrowth & debris is blocking storm drain @ appx 2500 feet north of Hunter's Nursery on the west side of the road next to the I-125 overpass. Look for the trash and shopping carts. | Determined that ROW at this location belongs to CALTRANS. Maintenance Ticket created on CALTRANS website. **No further action.** |
| 24 | 3/8/12 | FEDERAL BLVD & CENTRAL AVE STORM DRAIN DITCH | Municipal | Clear vegetation, palm trees from storm drain ditch @ Federal & Central Ave. | All palm trees and tully's removed from storm drain channel. 100 yards of palms, trash, and debris were removed from the site. **No further action.** |
| 25 | 3/21/12 | 2811 DREW LN | Residential | Storm drain grate needs to be clear of debris on & around 2811 Drew Lane. Resident says the street is flooding every time it rains. If the issue is within the drainage easement located btw 2812 & 2820 Drew Ln -It is PRIVATE. | Storm drain grate was cleared of debris, easement was determined to be private so nothing else was done. **No further action.** |
| 26 | 3/28/12 | SOUTHEND OF PERGL ST | Municipal | Take out the bushes on the S/E end of Pergl adjacent to property at 7276 Mt. Vernon because they are poisonous to horses on site. Can you please assess the area and let me know if they can be removed. | Site has a newly installed drain pipe & the easement was cleared of overgrowth. **No further action.** |

## Appendix B (Continued)
## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 27 | 4/10/12 | 7008 LEMONWOOD LN | Municipal | Please schedule routine maintenance for Drainage Easement located between Lemonwood Lane & Central Ave. Back Neighbors at 6983 or 6995 Central were contacted to remove their tree trimmings that fell into easement. | Chain saw was used to make an access road for the 4x4 gator, and also used to cut up the tree trimmings in our storm channel left behind by the surrounding residents. Then the brush & tree trimmings were removed and disposed of appropriately. **No further action.** |
| 28 | 4/24/12 | 2870 NEW JERSEY AVE | Municipal | Please perform routine maintenance on both New Jersey & Roosevelt side. Resident would like the City to consider alleviating high points in the easement so that water won't sit resulting in flooding to her property & high weed growth. | Trash picked up and weeds abated at 2870 New Jersey Ave. **No further action.** |
| 29 | 5/1/12 | ROY ST STORM DRAIN CHANNEL | Municipal | Please perform routine maintenance for drainage easement between Roy St & Darryl St | Routine clean up completed. **No further action.** |
| 30 | 5/1/12 | 7252 BROADWAY | Municipal | Stolen storm drain grate in the alley behind Lido's Restaurant. | Calvin Hunt responded & placed barricades to block off storm drain inlet missing grate. Grates were ordered & installed 4-6 weeks later. **No further action.** |

## Complaint Log

| # | Date | Location | Complaint Type | Complaint | Resolution |
|---|---|---|---|---|---|
| 35 | 6/18/12 | SITE 16 – CITRONELLA 150′ N/O PALM AVE | Municipal | Please start initial clean-up of sites proposed within the DRY WEATHER MONITORING report - sites 1,3,16, and 20 to be completed by the end of the week, per T.Bell | Trash removal & weed abatement completed. **No further action.** |
| 36 | 6/18/12 | SITE 20 – 200 YDS N/O INTRSTN @ SAN ALTOS | Municipal | Please start initial clean-up of sites proposed within the DRY WEATHER MONITORING report - sites 1,3,16, and 20 to be completed by the end of the week, per T.Bell | Trash removal & weed abatement completed. **No further action.** |
| 37 | 6/18/12 | 2873 SKYLINE DR | Municipal | Ground water issue just outside the public works yard on Skyline Dr. Water would puddle & collect resulting in algae. | Issue had been resolved with the installation of the 6" pipe at this site. **No further action.** |

**Appendix C**
**JURMP Annual Report Requirements Checklist**

## Development Planning Component

| Permit Annual Reporting Requirement—Section J.3.a.(3).(a) | Location in Report |
|---|---|
| i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements. | 2.2, 2.3, 2.4 |
| ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked. | 2.4.4.2 |
| iii. A listing of the development projects to which SUSMP requirements were applied. | Table 2-3 |
| iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked. | Table 2-2, Table 2-3, 2.4.4.2 |
| v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs. | 2.4.4.2 |
| vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible. | 2.4.4.2 |
| vii. An updated treatment control BMP inventory. | 2.4.4.3, Appendix A.1 |
| viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings. | 2.4.4.3, Table 2-1, Table 2-4 |
| ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings. | 2.4.4.3 |
| x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked. | 2.4.4.2 |
| xi. A listing of any projects which received a SUSMP waiver. | 2.4.4.2 |
| xii. A description of implementation of any SUSMP waiver mitigation program. | 2.4.4.2 |
| xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation. | 2.4.4.2 |
| xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented. | Table 2-3, 2.4.4.2 |
| xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements. | Table 2-2, 2.4.4.2 |

## Development Planning Component

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(a)** | **Location in Report** |
|---|---|
| xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project. | 2.4.4.2 |
| xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 2.4.4.3, Table 2-4 |
| xviii. A description of notable activities conducted to manage urban runoff from development projects. | 2.1.1 |

## Construction

| Permit Annual Reporting Requirement—Section J.3.a.(3).(b) | Location in Report |
|---|---|
| i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked. | 3.5.2 |
| ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed. | 3.2 |
| iii. A description of modifications made to the construction and grading ordinances and approval processes. | 3.3 |
| iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites. | 3.5.3 |
| v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites. | 3.5.2 |
| vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites. | 3.5.2 |
| vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites. | 3.5, Appendix A.2 |
| viii. A description of the general results of the inspections. | 3.5.3 |
| ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 3.5.4 |
| x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 3.5.4, Table 3-1 |
| xi. A description of notable activities conducted to manage urban runoff from construction sites. | 3.1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| i. Any updates to the municipal inventory and prioritization. | Appendix A.3 (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events. | 4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4 |
| iii. A description of inspections and maintenance conducted for municipal treatment controls. | 2.4.4.2, 4.4.4 |
| iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned. | 4.4.2, 4.4.4 Table 4-2 |
| v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned. | 4.4.2, 4.4.4, Table 4-2 |
| vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned. | 4.4.4, Table 4-2 |
| vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category. | 4.4.4, Table 4-2 |
| viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding. | 4.4.4 |
| ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities. | 4.2.3 |
| x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| xiii. Identification of the total distance of curb-miles swept. | 4.3.4, Table 4-1 |
| xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping. | 4.3.4, Table 4-1 |
| xv. Amount of material (tons) collected from street and parking lot sweeping. | 4.3.4, Table 4-1 |
| xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4 | 4.5.4 |
| xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections. | 4.2.4, 4.3.4, Table 4-3 |
| xviii. A description of the general results of the inspections. | Table 4-3 |
| xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 4.2.4 |
| xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 4.2.4 |
| xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities. | Throughout Section 4 |

## Industrial and Commercial

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(d)** | **Location in Report** |
|---|---|
| i. Any updates to the industrial and commercial inventory. | 5.2.2 (stationary), 5.3.4 (mobile), Appendices A.4, A.5 (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources. | 5.2.4, 5.3.4 |
| iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses. | 5.2.4, 5.3.4 |
| iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected. | 5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1; Appendices A.4, A.5 |
| v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection. | 5.2.4 |
| vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance. | 5.2.4 |
| vii. Identification of the number of third party inspections conducted. | 5.2.4 |
| viii. Identification of efforts conducted to verify third party inspection effectiveness. | 5.2.4 |
| ix. A description of efforts implemented to address mobile businesses. | 5.3.4 |
| x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 5.2.4, 5.3.4, Table 5-2 |
| xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees. | 5.2.4, |
| xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources. | Throughout Section |

## Residential

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(e)** | **Location in Report** |
|---|---|
| i. Identification of the high threat to water quality residential areas and activities that were focused on. | 6.2 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities. | 6.4 |
| iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials. | 6.4 |
| iv. Types and amounts of household hazardous wastes collected, if applicable. | 6.4.1 |
| v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation. | 6.4.2 (see discussion in JURMP) |
| vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 6.4; Appendix B |
| vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program. | 6.4.1 |
| viii. A description of notable activities conducted to manage urban runoff from residential areas and activities. | 6.4 |

## IDDE*

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| * Section 7, the Illicit Discharge Detection and Elimination component, of the FY 2011-12 Annual Report, will be submitted to the RWQCB no later than December 15, 2012. | |

## IDDE—Additional Dry Weather Monitoring Program Requirements*

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| * Section 7, the Illicit Discharge Detection and Elimination component, of the FY 2011-12 Annual Report, will be submitted to the RWQCB no later than December 15, 2012. | |

## Education

| Permit Annual Reporting Requirement—Section J.3.a.(3).(g) | Location in Report |
|---|---|
| i. A description of education efforts conducted for each target community. | 8.3 |
| ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges. | 8.3 |
| iii. A description of education efforts conducted for municipal departments and personnel. | 8.2, Table 8-1 |
| iv. A description of education efforts conducted for the new development and construction communities. | 8.3 |
| v. A description of jurisdictional education efforts conducted for residents, the general public, and school children. | 8.3, Tables 8-2, 8-3 |

## Public Participation

| Permit Annual Reporting Requirement—Section J.3.a.(3).(h) | Location in Report |
|---|---|
| i. A description of public participation efforts conducted. | 9.2 and 9.3 |

## Effectiveness Assessment

| Permit Annual Reporting Requirement—Section J.3.a.(3).(i) | Location in Report |
|---|---|
| i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order. | 11 |

## Fiscal Analysis

| Permit Annual Reporting Requirement—Section J.3.a.(3).(j) | Location in Report |
|---|---|
| i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. | 10 |

## Special Investigations

| Permit Annual Reporting Requirement—Section J.3.a.(3).(k) | Location in Report |
|---|---|
| i. A description of any special investigations conducted. | 12 |

## Non-Emergency Firefighting

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(l)** | **Location in Report** |
|---|---|
| i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows. | 4.2.3, 13 |

## JURMP Revisions

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(m)** | **Location in Report** |
|---|---|
| i. A description of any proposed revisions to the JURMP. | 14 and each program component section |

# EXECUTIVE SUMMARY

In February 2001, the San Diego Regional Water Quality Control Board (RWQCB or Regional Board) issued Order No. 2001-01, a National Pollutant Discharge Elimination System (NPDES) Permit regulating discharges to storm drain systems within 18 municipalities in San Diego County, the County of San Diego, and the San Diego Unified Port District (collectively referred to a "Copermittees"). The San Diego County Regional Airport Authority was later added as the twenty-first Copermittee. Order No. 2001-01, generally referred to as the Municipal Permit, required each Copermittee, including the City of National City (City), to develop a comprehensive storm water management program known as a Jurisdictional Urban Runoff Management Program (JURMP). The City's JURMP includes storm water management strategies and protocols related to planning, construction, and existing developments. Major components include the implementation of Best Management Practices (BMP), water quality monitoring, and educational outreach efforts.

Each fiscal year, the City prepares an annual report on the implementation of its JURMP, as required by Municipal Permit Section I.1. The following JURMP Annual Report presents the activities implemented during the 2006/2007 fiscal year (July 1, 2006 through June 30, 2007). A brief summary of each of the 14 sections of the Annual Report is presented below.

**Introduction**
The introduction presents an overview of the City's storm water pollution prevention program and includes a bulleted summary of key accomplishments for the 2006/2007 reporting period.

**Municipal**
The City continues to invest significant resources in the further development and the implementation of its storm water management program. The City continues to implement an aggressive street sweeping schedule and MS4 maintenance schedule, removing approximately 1,300 tons of material from street sweeping and 23,200 pounds of material from MS4 maintenance during 2006/2007. Additionally, about 416 cubic yards of debris were removed during channel maintenance operations. The City dedicated 1,782 man-hours to clean 333,060 linear feet of sewer lines. Over 17,700 pounds of debris were removed during this maintenance.

The City held six training sessions for municipal personnel during 2006/2007. The City also developed an educational 2007 "Keep Our Community Clean" Calendar that was provided to various City departments in addition to the general public.

**Industrial/Commercial**
During 2006/2007 the City inspected all high priority industrial facilities. During this reporting period, 29 complete industrial inspections and 10 full commercial inspections were conducted. Visits were also made to industrial and commercial sites when warranted by public complaints, and the City ensured that such incidents were resolved satisfactorily. Based on inspection findings and complaints received by the City's storm water hotline, the City issued six Notices of Violation (NOV) to industrial facilities and 10 NOVs to

commercial facilities. The City continued to provide educational outreach material to industrial and commercial businesses, and the City continued to implement a rating system to assess BMP implementation and storm water knowledge. Additionally, the City worked with its contractor, D-MAX, to conduct two industrial/commercial-related educational workshops, one for industrial businesses and one for automotive-related businesses.

**Residential**

Because residential areas comprise a large portion of National City, the City has pursued a number of efforts to educate and involve residents in implementing the City's JURMP. The City held a workshop for residents in the City and provided them with a presentation and a variety of educational material, including the 2007 educational calendar. Residents of the City of National City, along with the citizens of the City of Imperial Beach and the City of Chula Vista, continue to utilize a common household hazardous waste facility. The total mass of household hazardous waste collected by all three cities during this reporting period was 142,572 pounds. Similar to previous years, the City held two large item disposal events in conjunction with EDCO. Additionally two neighborhood cleanups resulted in the disposal/removal of 12 tons of trash and debris. The City maintained residential storm water awareness through educational materials, including flyers, pamphlets, and calendars, many of which were bilingual. Residents also made use of the City's Storm Water Hotline to report observed storm water problems, including those in residential neighborhoods. The City issued seven NOVs, sent 23 corrective action letters, and gave numerous verbal warnings related to complaint investigations in residential areas.

**Development Planning/Construction**

All development projects that will disturb soil are required to complete a Storm Water Requirements Applicability Checklist. The checklist helps determine requirements for post-construction BMP implementation and whether the project will be subject to the State General Construction Permit or General Industrial Permit. Regardless of which department is initially contacted for the projects' permits, completed checklists are forwarded to the Engineering Department for sign off to ensure consistency. All construction projects subject to the General Construction Permit submitted SWPPPs, which the City's consultant reviewed. Twelve projects subject to the City's Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance were required to submit post-construction BMP plans, which were also reviewed. The City regularly inspected active construction sites in its jurisdiction, including weekly inspections for high priority sites. Storm water complaints received about construction sites were also promptly investigated, and enforcement actions were taken where necessary. A total of three NOVs and two administrative citations were issued to contractors or developers. The City held a SUSMP workshop for the development planning community and a construction-related workshop for construction site owners and operators. Though not required by the Municipal Permit, toward the end of the reporting period the City also inspected completed SUSMP projects for the first time. The City will use the results of this initial inspection effort to refine its SUSMP inspection programs in future years.

**Illicit Discharge Detection and Elimination**

The main avenues through which illicit connections and illegal discharges (IC/ID) are detected are the Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program), the storm water hotline, and by observations made by City

staff. Visual observations and field screening were conducted at 15 Dry Weather Monitoring Program sites, and water samples from over 25 percent of the sites underwent laboratory analysis for additional parameters. When routine monitoring found a parameter above its established action level, a follow-up source identification investigation was undertaken. Based on the results of the investigations, the City acted to eliminate the source(s) of pollution identified by these investigations. All 143 complaints received were documented and resolved by City staff. One sewage overflow occurred during 2006/2007 and was reported to the RWQCB. The spill was cleaned up, and enforcement action was taken against the responsible party. All IC/IDs detected in 2006/2007 were eliminated during the reporting period.

**Education/Public Participation**

During 2006/2007 the City continued to provide the general public with educational outreach material and opportunities to participate in the implementation of the storm water program. The City provided numerous training sessions and a variety of educational material for municipal personnel, industrial and commercial business owners/operators, development and construction project proponents, and residents. The City's outreach efforts were estimated to have made over 137,000 impressions during the reporting period. The City collaborated with I Love a Clean San Diego to stencil 30 storm drains in the City. Cleanup efforts in the City, including those put on by neighborhood councils, removed approximately 14.4 tons of trash and debris.

**Assessment of JURMP Effectiveness**

The regionally developed approach to program effectiveness assessment includes program planning, BMP selection, and evaluation of six tiered levels of targeted outcomes. As the system progresses from Level 1 to Level 6, targeted outcomes becoming less focused on activities conducted and more focused on changes in water quality. The City used this regionally developed approach to assess its program, incorporating some City-specific components such as historical water quality monitoring data. The City has also continued to employ a numeric scoring system to assess BMP implementation and the level of storm water knowledge during industrial and commercial inspections.

**Fiscal Analysis**

Section 12 of this JURMP Annual Report presents information about the costs and funding of the City's storm water program. Not including special projects, budgeted outlays were $939,500 for 2006/2007 and the $936,000 for the upcoming fiscal year.

**Special Investigations**

In response to Dry Weather Monitoring Program results, the City initiated a more focused investigation into sources of trash and debris that might affect the City's storm drain system. Findings of the study and the City's plans for follow-up actions are discussed in Section 13.

**Conclusions and Recommendations**

General conclusions and recommendations are presented in Section 14. During 2006/2007, the City continued to improve the planning and implementation of its program and began to prepare for the new requirements of the recently reissued Municipal Permit, Order No. 2007-0001. During 2007/2008, the City will continue to refine and adjust existing programs and will develop new programs to meet the requirements of Order No. 2007-0001.

# CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki
City Engineer

Date: January 2008

# 1 INTRODUCTION

In early 2001, the San Diego Regional Water Quality Control Board (RWQCB or Regional Board) issued Order No. 2001-01 (Municipal Permit), a National Pollutant Discharge Elimination System (NPDES) permit that regulates discharges of urban runoff from Municipal Separate Storm Sewer Systems (MS4) in the San Diego area. The City of National City (City), like many other municipalities in California, maintains separate storm water and sanitary sewer systems. Water in the City's sanitary sewer system is directed to a wastewater treatment facility, while storm water flows directly to receiving water bodies and local beaches without being treated. The Municipal Permit regulates urban runoff discharges of 21 jurisdictions within the County of San Diego, including the City of National City, which are collectively referred to as "Copermittees."

The Municipal Permit required each Copermittee to prepare a Jurisdictional Urban Runoff Management Program (JURMP); the City's most recent JURMP was finalized in 2004. The JURMP includes program implementation and management strategies for development projects and the maintenance of existing development, including both public and private facilities. Within the JURMP document, the City included a variety of Best Management Practices (BMP), which are specific to municipal, industrial, commercial, residential, and construction sites/sources. In this document the City also outlined approaches for educating the public and encouraging public participation in the implementation of the JURMP; such measures are designed to raise awareness of storm water issues, promote BMP implementation, and foster a sense of shared responsibility in protecting water quality. The JURMP also presents procedures to prevent, detect, and eliminate illicit connections and illegal discharges (IC/ID) to the City's MS4. Various types of enforcement actions, which are at times necessary to bring about compliance, are also explained in the JURMP. Overall, the programs set forth in the JURMP document are intended to reduce the discharge of pollutants from the MS4 to the Maximum Extent Practicable (MEP). The ultimate goal of the implementation of the City's JURMP is to maintain or improve the quality of receiving waters.

To raise awareness and promote the implementation of the City's JURMP by the public, the City continues to provide educational outreach materials and host public participation events. The City continues to inspect municipal facilities, construction sites, and industrial and commercial businesses and to investigate all complaints received by the City's storm water hotline or online reporting system. During inspections and complaint investigations, City personnel are able to provide site-specific one-on-one discussions regarding storm water-related topics and BMPs. The City continues to issue verbal warnings, written warnings, Notices of Violation (NOV), and administrative citations, as necessary to bring about compliance. Sites that are an immediate threat to human or environmental health, or sites that refuse to comply with applicable permits and ordinances, are reported to the RWQCB.

The City has continued to conduct water quality monitoring, most notably the City's Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program). This program allows the City to characterize dry weather flows, alerts the City of a potential illicit connection or illegal discharge (IC/ID), and provides the City with some

level of assessment of the water quality in its storm drain system. When field monitoring or laboratory results indicate an exceedance of an established action level, upstream investigations are conducted to determine what source(s) may be responsible for the exceedance. Any identified sources of IC/IDs are dealt with as necessary to eliminate the connection or discharge.

As required by the Municipal Permit Section I.1, the City has developed this Annual Report to provide information regarding the City's implementation of its JURMP during the 2006/2007 fiscal year, which is the period from July 1, 2006 to June 30, 2007.

## RWQCB COMMENTS

At the time of this writing, the City has not received any comments from the RWQCB on its 2005/2006 JURMP Annual Report.

## GENERAL ACCOMPLISHMENTS

During 2006/2007 the City both initiated new programs and continued to implement and refine existing programs. The following bullets briefly summarize notable achievements and activities from the 2006/2007 reporting period. Additional detail can be found in the following sections of this Annual Report.

- Inspected all high priority municipal facilities.
- Began updating the SWPPP for the City's Public Works Yards.
- Provided training sessions for municipal employees. The sessions covered topics such as good housekeeping, BMPs, and specific training for fire fighting personnel.
- Swept 17,406 curb miles, removing 1,300 tons of sediment and debris from City streets.
- Removed over 416 cubic yards of trash and debris from open channels and removed 23,200 pounds of debris from City storm drains.
- Removed over 17,000 pounds of debris from sewer lines in the City.
- Completed the construction of Paradise Creek Educational Park, which preserves a portion of Paradise Creek and provides educational signs to park patrons.
- The City distributed "Preventing Urban Runoff Pollution" brochures to business license applicants.
- Inspected all high priority industrial facilities.
- Continued to maintain and refine databases for municipal activities, construction inspections, and industrial/commercial inspections.
- Conducted 29 industrial inspections and 10 commercial inspections. One-on-one site discussions were initiated, and educational information and materials were provided.
- Used rating system for BMP implementation and knowledge assessment during industrial and commercial business inspections.

- Issued 16 NOVs and 15 administrative citations to industrial and commercial businesses. These enforcement actions were mainly related to discharges of wash water investigated during responses to complaints or during the inspection process. In each case, the City actions resulted in the resolution of the observed problem.
- Conducted a workshop specifically designed for automotive repair/service shops.
- Continued distribution of educational brochures and fact sheets during routine inspections and complaint investigations.
- Conducted a workshop specifically designed for residents.
- Distributed over 6,000 "Do You Go To the Beach When it is Raining?" handouts in residential trash bills.
- Mailed over 1,470 letters to City residents and businesses in response to recommendations associated with the 2006 Dry Weather Monitoring Program findings. The letters included explanations of BMPs residents could use to help reduce pollution.
- Worked with the City of Chula Vista to provide a venue for proper household hazardous waste (HHW) disposal. Furthermore, the City worked with EDCO to hold two large item collection events to encourage residents to dispose of these items properly.
- Continued distribution of construction educational materials, including guides for construction activity and BMP fact sheets.
- Conducted technical reviews of Storm Water Pollution Prevention Plans (SWPPPs) for construction sites equal to or greater than an acre and Standard Urban Storm Water Mitigation Plans (SUSMP) reports for Priority Projects.
- Reviewed SUSMP reports for 12 Priority Projects.
- Conducted a SUSMP requirement and BMP training session for individuals involved in development and re-development program implementation.
- Continued to maintain electronic and paper record keeping systems for SUSMP projects.
- Inspected all high priority construction sites during the wet season (October through April) each week and generally at least twice during the wet season for medium and low priority construction sites. City building inspectors also check BMP implementation during inspections of small projects.
- The City identified five illicit connections and 64 illegal discharges to the City's storm drain system. In each instance, City staff ensured that the issue was resolved via an NOV, administrative citation, corrective action notice, and/or verbal warning.

- Completed the 2006 Dry Weather Monitoring Program and follow-up investigations. The City took action to address the recommendations listed in the 2006 Dry Weather Monitoring Program final report.
- Continued the use of the storm water hotline. A total of 143 public complaints were recorded, investigated, and resolved during this reporting period.
- Worked with I Love a Clean San Diego (ILACSD) to stencil 30 storm drains with "no dumping" or similar storm water-related message.
- Removed 14.4 tons of trash and debris during three cleanup events.
- Made over 137,000 impressions through outreach efforts.
- Distributed approximately 2,000 storm water educational calendars encouraging residents and businesses in the City to prevent storm water pollution.

## JURMP ANNUAL REPORT ORGANIZATION

The following presents the organization of this Annual Report.

| | |
|---|---|
| Section 1.0 | Introduction |
| Section 2.0 | Municipal |
| Section 3.0 | Industrial |
| Section 4.0 | Commercial |
| Section 5.0 | Residential |
| Section 6.0 | Land Use Planning for New Development and Redevelopment |
| Section 7.0 | Construction |
| Section 8.0 | Illicit Discharge Detection and Elimination |
| Section 9.0 | Education |
| Section 10.0 | Public Participation |
| Section 11.0 | JURMP Effectiveness Assessment |
| Section 12.0 | Fiscal Analysis |
| Section 13.0 | Special Investigations |
| Section 14.0 | Conclusions and Recommendations |

# 2 MUNICIPAL

The City of National City owns and operates a variety of municipal facilities including parks and recreational facilities, public works facilities, public roads, administrative facilities, and the City's extensive MS4. The City sets a good example for City residents and businesses by implementing BMPs at all municipal facilities to reduce the discharge of pollutants to the maximum extent practicable (MEP). While all City divisions are involved in storm water responsibilities related to each specific division, the City's Engineering Department manages and oversees the bulk of the City's storm water program, including the management of the municipal component.

The City is aware that preventing pollutants from entering receiving waters through the implementation of BMPs is both more efficient and cost conscience than expensive remediation efforts. The City requires that minimum BMPs be implemented at each municipal facility and during municipal activities not confined to a specific location. BMPs must be implemented during routine activities that take place at municipal facilities, and during emergency situations when practicable. The City inspects all high priority municipal facilities on an annual basis to ensure BMPs are implemented correctly and functioning properly. Public Works employees maintain and implement a Storm Water Pollution Prevention Plan (SWPPP) at the east and west public works yards. In addition to the BMPs implemented at municipal areas and during municipal activities, the City maintains a rigorous street sweeping program and MS4 and sewer maintenance programs to further reduce or eliminate pollutants from being discharged from such areas.

## MUNICIPAL ACTIVITIES

The City of National City is responsible for numerous municipal activities, including the maintenance of fixed facilities and the implementation of field programs. City personnel have been trained in eliminating storm water pollution during the implementation of their specific programs. Pollution prevention methods and BMP requirements are presented in Section 2 of the JURMP. The following presents the municipal activities implemented during the 2006/2007 reporting period, including updates to existing programs.

### Erosion and Sediment Control

The City's Parks and Recreation Department continues to work to maintain and preserve existing vegetation in order to mitigate the occurrence of erosion and sediment discharge. Introduction of drought tolerant plants as well as mulching for erosion control have also been implemented, where practicable. City personnel conducting municipal maintenance projects that take place throughout the City are careful to protect storm drains from sediment by placing gravel bags around storm drain inlets and sweeping up any debris noted during routine activities.

### Roadway Maintenance and Street Sweeping Activities

Streets and roadways are maintained on a daily, weekly, monthly, and as needed basis. The City's Street Maintenance Division maintains three sweepers and two operators. The City continues to sweep Highland Avenue, National City Boulevard and 8th Street on a daily basis. All other streets throughout the City are swept weekly. The City maintains five

municipal parking lots that are swept and cleaned monthly or as needed. During this reporting period, the City sweepers covered 17,406 curb miles, removing over 1,300 tons of sediment and debris from the City's 110 miles of streets and alleyways.

The Street Maintenance Division is also responsible for small street and sidewalk repairs. Copies of JURMP Appendix C is kept with City personnel to ensure appropriate BMPs such as vacuuming up materials, sweeping the work area during and after repairs, and placing gravel bags around storm drain inlets are implemented. The City's NPDES Storm Water Compliance Inspector also provides in-house training on BMPs and potential storm water pollutants.

**Municipal Vehicle and Equipment Maintenance Facilities**

The City of National City continues to operate one vehicle maintenance facility, part of the City's East Municipal Yard. The City maintains 221 active pieces of equipment and vehicles. A SWPPP for the East and West yards continues to ensure that pollution prevention measures are implemented. The City employs the following to ensure vehicle and equipment maintenance does not contribute to storm water pollution.

- All vehicles are inspected weekly to check for leaks or any other needed repairs.
- A wash rack is used to capture wastewater generated during routine cleaning of municipal vehicles and equipment. Wastewater entering the wash rack basin is filtered prior to discharge into the sewer system.
- Spill controls are utilized by mechanics within the shop work area.
- Secondary containment is provided for liquid storage containers. Coolants and oils are recycled.
- Filter fabric has been placed over storm drain inlets to capture debris. Some inlets also have been equipped with filter inserts, which are inspected routinely, cleaned four times a year, and replaced by BioClean on an as needed basis.
- Spill response kits are visible at various locations at the yard.
- Good housekeeping measures are emphasized by the maintenance facility manager.
- Weekly inspections of the yard are conducted by City personnel.
- Training is conducted by the City's NPDES Storm Water Compliance Inspector.

No significant spills were recorded during this reporting period. The Public Works Yard is swept on a weekly basis. Additionally, the City's NPDES Storm Water Compliance Inspector routinely inspects the facility to ensure compliance with the municipal permit and implementation of the SWPPP. During this reporting period, the City began to update and revise the SWPPP document, which should be finished during the 2007/2008 reporting period. The SWPPP is being updated to ensure that the most up-to-date BMP technologies are being implemented and that all activities at the yards are included the SWPPP.

**Landscaping Maintenance**

Personnel from the Parks and Recreation Department, a division of Public Works, are responsible for maintenance activities at park and recreational facilities throughout the City, including landscaping. Parks maintenance staff mow, mulch, and apply landscaping

chemicals as necessary. Proper management of landscaping chemicals, such as herbicides, fertilizers, and pesticides, can greatly reduce the potential of these chemicals reaching the MS4. The following bullets present the City's continued landscape maintenance activities, ensuring the City's program does not contribute potential pollutants to the storm drain system or receiving water bodies.

- City personnel have not administered pesticide application in the past several years. Diseased plants are rinsed off with water, pulled out and replaced, or treated with systemic pesticides in fertilizers that eliminate pests. Special fertilizers for rose bushes contain pesticide products. These are kept in limited quantities (approximately fifteen pounds) at any given time to minimize storage of these products.
- Herbicides are used during different times of the year as part of the City's weed control program, and the City has primarily continued to use less persistent herbicides such as Round-Up (glyphosate) rather than organophosphate pesticides. There were a total of 3.47 gallons of herbicide used this reporting period. City applicators are state certified.
- The City minimizes the use of fertilizers and is primarily fertilizing with a slow-release fertilizer on a less frequent basis (this allows more of the product to be accepted with less leaching and the reduced frequency creates less chance for the product to exit the target area).
- City personnel manually pull weeds, mow weeds, mulch, and disk and till twice a year to minimize the amount of herbicides utilized.
- All herbicides are stored in fire safe, self–closing, weatherproof metal cabinets. Material Safety Data Sheets are kept in the storage area, as well as spill kits.
- Mixing of herbicides is conducted on site to minimize areas of exposure.
- No spills have occurred during this reporting period for routine maintenance activities associated with the City's Parks and Recreation Department Program.
- Employees are certified to properly handle and manage herbicides. Certification is kept up to date in order to comply with all applicable laws and regulations. Qualified Applicator Certificates require applicators to renew certificates every two years. Requirements include 20 hours of training and four hours on laws and regulations. This may include topics such as over sprays of chemicals and potential pollutants/impacts, and water quality.
- The City has used drought tolerant plants and native vegetation for landscaping at a number of facilities in the City including the Paradise Creek Educational Park.
- Fertilizer stock is purchased as needed and quantities are used up immediately so that it is not necessary to stockpile this material. A few hundred pounds of fertilizer may be kept on-hand.
- All fertilizers and grass clippings particles are kept within the target areas.
- The City recycles wood scraps from all trees, except palm trees, to make mulch.

- In place of vegetation for erosion control, the City uses mulching in certain municipal areas. Mulching also minimizes the need for irrigation, fertilizers, and herbicides.
- The City aerates soils three or four times per year and applies soil treatments with gypsum to increase the absorptive capacity of the soil and reduce runoff.
- The irrigation systems are inspected every other day so that necessary repairs can be made as soon as possible.
- All timers for the irrigation system are adjusted with multiple start times to allow water time to percolate into the soil and to prevent runoff.
- Irrigation schedules are seasonal; the winter schedule is such that the amount of water used is half that used in the summer.
- Many sprinklers use low angle nozzles to prevent drift of water.
- Old sprinklers are continuing to be replaced with low volume heads with in-line checks. This prevents excessive runoff if the sprinkler head is broken.
- All Public Works staff are encouraged to participate in seminars pertaining to storm water management in order to improve education of all City employees.
- The City has not officially adopted all aspects of Integrated Pest Management (IPM), but it is current practice to minimize the use of pesticides to control pests, seeing pesticides as essentially a last resort. Only herbicides were used this reporting period.

**Municipal Maintenance: Trash and Debris Removal**

The City's Parks and Recreation Department continues to be proactive in litter removal and containment. City personnel are responsible for the upkeep of parks and recreational areas. Litter and debris are monitored and removed routinely. The City follows the trash and debris removal procedures listed below.

- During annual training sessions, Parks and Recreation staff are reminded to check daily for open dumpster lids and overfilled dumpsters.
- Litter and debris are removed from parks, parking lots, and landscaped areas around public buildings on a daily basis.
- Pick-up frequency is increased at parks and recreational during the summer months when necessary to account for the increased number of patrons at these facilities.
- All storm drain inlets within a close proximity to where maintenance activity is scheduled are protected with absorbent pads or gravel bags prior to beginning the activity to prevent litter and debris from being introduced to the storm drain system.
- Blowers may be used to divert leaves, grass clippings, and organic material back to landscaped areas. Residual litter and debris are picked up and disposed of properly.
- Green waste is recycled and converted to mulch to be used for landscaping.
- BMP implementation refresher courses are periodically conducted.

- The City ensures that dumpsters are not overfilled by contacting EDCO for additional pick-up when necessary.
- Annual BMP training for Public Works staff includes reminders to keep the dumpster lids closed when not in use.

**Maintenance of the City's MS4s**

The City continued to implement an aggressive MS4 inspection and maintenance schedule for MS4 facilities throughout the City. This includes cleaning the City's storm drains, storm drain boxes, and 30 open channel sections. Responsibilities for upkeep of the City's MS4 are divided between the Street Maintenance Division and the Wastewater Division of the City's Public Works Department. Maintenance of the channels occurs twice a month. During this reporting period, municipal employees removed approximately 416.57 cubic yards of trash and debris from the channels. The trash and debris was removed by hand. During the 2004/2005 period, the RWQCB issued a channel maintenance directive restricting the removal of vegetation from storm water channels. In response to this directive, the City no longer uses heavy equipment to clean out earthen channels, and does not remove vegetation or sediment supporting vegetation. Table 2.1 lists the channel maintenance locations.

The Wastewater Division continues to execute the twelve-month maintenance cycle developed to systematically inspect the entire storm drain system. The City has been divided into eleven zones; each zone is inspected and cleaned as necessary one month of the year, with at least two days a week devoted to this task. During this reporting period, approximately 1,329 man-hours were used to clean 100 percent of the MS4 clean-out locations and collect approximately 23,200 pounds of debris. Sediment and trash were the most commonly reported materials being removed from the storm drain cleanout locations, which is similar to previous years.

**Wastewater Operations**

The City continues to maintain a Sewer Overflow Prevention Plan and a Sewer Overflow Response Plan. The City ensures that staff who conduct wastewater operations activities are familiar with these documents, thereby ensuring staff are educated about the nature and effects of potential pollutants that may be released as a result of wastewater operations. The aforementioned plans also discuss various good housekeeping BMPs and other procedures to be implemented during wastewater maintenance operations.

During this reporting period, one sanitary sewer overflows (SSO) occurred in the City. The SSO was reported to the RWQCB and cleaned up to the extent possible. More information on the City's mechanism for receiving notification of spills from private sewer laterals is presented in the JURMP. Additional information on the SSO from 2006/2007 is presented in Section 8 of this JURMP Annual Report.

The City continues to monitor fifteen flow meter units that are distributed throughout the City's sewer system to check for evidence of a leak or possible overflow or infiltration. In addition, City crews also check for leaks in pipes or blockages during routine maintenance. If there is a block or leak, the City responds immediately to fix the problem. The City invested about 1,782 man-hours clearing 333,060 feet of sewer lines. Over 17,730 pounds of debris were removed from the City's sewer lines. Grease, silt, sand, and rocks were common items removed during maintenance. The City also uses cameras to investigate less

accessible sewer blockages. The City invested 26 hours and televised over 4,200 feet of sewer line during this reporting period.

**Municipal Activities Database**

The City of National City continues to use its Microsoft Access Database Program to assist with the tracking of municipal activities. The activities tracked include street sweeping, complaints, storm drain box cleaning, sewer cleaning, storm drain channel cleaning, and parks and recreation activities. Utilizing the database has become an integral part of the City's program to track data and follow-up when necessary. The City continues to enhance the database to improve accounting and better characterize storm water problems reported in the City. The City recently updated the database and associated forms to be able categorize complaints by sector (residential, municipal, commercial, industrial); this information was not available for all of 2006/2007 but is anticipated to be useful in future years. The City has also created a field to track units of debris collected from sewer clean outs. The City also used databases to track inspections of construction and commercial/industrial sites. More information regarding these databases can be found in other sections of this report.

**NPDES Storm Water Compliance Inspector**

The City has a full time NPDES Storm Water Compliance Inspector, who is also authorized to issue citations and other enforcement actions. The NPDES Storm Water Compliance Inspector inspects municipal facilities, industrial/commercial businesses, construction sites, as well as addressing public complaints and reported spills within the City. The NPDES Storm Water Compliance Inspector has also led storm water workshops and presentations for the commercial, industrial, and residential sectors.

**San Diego County Copermittee Meetings**

The City of National City attends the bimonthly Copermittee management meetings. Updates on the City's NPDES storm water program are presented during these meetings. Additionally, the City of National City continues to be an active participant in the San Diego Bay Watershed Urban Runoff Management Program (WURMP).

**NPDES Storm Water Compliance Technical Support**

The City of National City has continued to contract with D-MAX Engineering, Inc. (D-MAX) as the City's NPDES Storm Water Consultant. D-MAX provides the City with technical expertise in the field of storm water. They have conducted training sessions for City employees and work closely with the City's NPDES Storm Water Compliance Inspector to address a wide range of storm water issues. D-MAX Engineering also conducts the City's annual Dry Weather Monitoring Program, which includes recommendations and notification for storm water conveyances that appear to be affected by IC/IDs or maintenance issues. More information on the Dry Weather Monitoring Program is presented in Section 8 of this Annual Report.

## MUNICIPAL PRIORITIZATION AND INSPECTIONS

The City continues to maintain a prioritized watershed-based inventory of municipal facilities. All facilities on the City's inventory have been prioritized based on threat to water

quality into one of three categories: high, medium, or low. The City updates the inventory and prioritizations annually. The City reassessed facility prioritizations based on the flow chart in the 2004 JURMP. Based on present criteria and site conditions, the Civic Center was moved from the medium priority inventory to the low priority inventory. Included on the City's inventory, tables 2.2, 2.3, and 2.4 at the end of this section, are public parks and recreational facilities, administrative facilities, fire stations, community service buildings, and public works facilities. Additionally, City roads, streets, and highways and the City's MS4 are included on the inventory. City roads, streets, and highways do not include Interstate 5, Interstate 805, and State Route 54, all of which are under Caltrans jurisdiction.

The City continues to conduct annual inspections of municipal facilities. Inspections are an integral part of the City's efforts to maintain the highest standards of compliance with the Municipal Permit and provide an example of storm water quality awareness for the rest of the community at municipal facilities. Of the high priority facilities, Kimball Park and the Municipal Golf Course receive annual inspections at a minimum, and the two Public Works Yards continue to implement a weekly self-inspection program in addition to the annual inspection conducted by the City's Storm Water Compliance Inspector. The City's road, streets, and highways and MS4 are inspected and maintained throughout the year.

In addition to the inspections performed at the high priority facilities, the City's Storm Water Compliance Inspector inspected the medium and low priority facilities during the 2006/2007 reporting period. Several of these facilities were found to be fully compliant at the time of inspection. At the remaining facilities improved good housekeeping measures were recommended. The City's NPDES Storm Water Compliance Inspector followed up on these recommendations via email or additional site visits.

Beyond the official inspection programs, the City monitors its municipal areas informally throughout the year to ensure BMPs recommended during inspections are implemented consistently. The City's NPDES Storm Water Compliance Inspector frequently provides verbal suggestions in person to City employees as necessary, and also occasionally sends written reminders. Because the corrective actions were implemented during the reporting period as directed by the inspector, no further enforcement actions were necessary.

## COMPLIANCE & ENFORCEMENT

As previously mentioned the City's Storm Water Compliance Inspector continues to conduct inspections at municipal faculties and provides corrective actions to ensure that facilities are in compliance with the City's BMP requirements and City Ordinances. Municipal facilities are notified of BMP deficiencies and are provided documentation of necessary corrective actions. The City's Storm Water Compliance Inspector follows up with facilities to ensure that they have effectively implemented corrective actions.

## EDUCATION AND OUTREACH

The City continues to provide municipal personnel with the most up-to-date information, training, and outreach available pertaining to the improvement of storm water quality. The City's Public Works Staff attended educational sessions during this reporting period. The workshops covered NPDES program components; SUSMP requirements; storm water legislation and policy; commercial BMPs; municipal BMPs; construction BMPs; and vehicle washing, repair, and service BMPs. More information about all municipal educational

events is provided in Section 9 of this document. Attachment 2.1 presents the sign in sheets of those who attended municipal presentations. Workshops and educational materials offered to municipal workers during this reporting period are summarized below:

- Consultant SUSMP training, August 2006.
- SUSMP coordination meetings held by the City throughout the reporting period.
- A 2007 calendar was posted in municipal facilities and distributed to municipal employees encouraging individuals to protect storm water (Attachment 2.2). The calendar was redesigned for 2007 to a more user-friendly City-specific format.
- The City's consultant held a three training sessions for a total of 34 fire department personnel in the City in June 2007. Training sessions reviewed the NPDES program, BMP implementation, specifically the importance of spill response BMPs, since many times fire fighting personnel are the first to respond in such situations.
- The City's NPDES Storm Water Compliance Inspector conducted a workshop for 25 Public Works employees in June 2007.
- The City conducted annual inspections of municipal facilities during this reporting period. The inspectors educated facility managers on any BMP deficiencies noted during the inspection. More detail on the inspections was provided earlier in this section.
- Eight members of the City's landscape maintenance personnel attended a six class irrigation management course in April 2007.
- An NPDES Knowledge Assessment Test was given to individuals, including City employees that attended any of the storm water workshops. Overall, Knowledge Assessment test scores increased for municipal employees.
- Five municipal employees attended the California Compliance School for training in hazardous waste identification and overview, onsite management requirements (tanks and containers), transportation, and preparedness and prevention training. Certificates of completion are included as Attachment 2.3.

In addition to the outreach efforts mentioned above, the City of National City has completed the construction of Paradise Creek Educational Park. Construction began in September 2005 and work was completed this reporting year. The project is located on an approximately half mile stretch of the creek that remains undeveloped and the park is designed to preserve that stretch of the creek and its habitat. Additionally, the park includes a boardwalk as well as other walking trails and educational signs. Native plants were used in the landscaping, and both a construction SWPPP and a SUSMP report were maintained throughout the project. On 4/21/2007, a few days after the park officially opened, an Earth Day celebration was held there to pick up trash and sow 300 plants.

## IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the

requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

# 3 INDUSTRIAL

During the 2006/2007 reporting period, the City of National City continued to mitigate urban runoff pollution through implementation of the industrial component of the City's JURMP. The basic components of the City's industrial program include site identification and prioritization, pollution prevention, dissemination of required general and activity-specific BMPs, education, compliance inspections, and enforcement actions. The City also requires all high priority industrial sites to conduct storm water monitoring in accordance with the requirements of the Municipal Permit.

## PRIORITIZATION OF INDUSTRIAL FACILITIES

The 2006/2007 JURMP Annual Report presented an updated inventory of the known industrial facilities in the City, classifying them as 23 high priority, 133 medium priority, and 143 low priority industrial facilities. These facilities were prioritized based on Standard Industrial Classification (SIC) codes, proximity to environmentally sensitive areas (ESAs), whether they had filed a Notice of Intent (NOI) to obtain coverage under the State Industrial General Storm Water Permit (Industrial Permit), and the findings of the most recent storm water compliance inspections conducted. Please note that this inventory was developed with information as of the end of the 2006/2007 reporting period. Since that time, a new inventory is being developed for the JURMP update, which uses business license findings and information gathered after the end of the 2006/2007 reporting period.

During this reporting period, the City continued the ongoing process of industrial facility prioritization. Prioritization and SIC codes were re-evaluated after each inspection and adjusted if necessary to properly demonstrate their on-site activities. Any businesses found to be no longer operating in the City, or found to be a duplicate of another business in the inventory were removed from the inventory. The City's most current inventories include (Tables 3.2, 3.3, and 3.4). An in-depth accounting of the high priority industrial businesses is given below.

As mentioned above, there are 23 high priority industrial facilities in National City. Note that as of the end of the 2005/2006 reporting period, 27 businesses were listed as high priority industrial. During this reporting period, two businesses moved or went out of business, three high priority industrial facilities were reclassified as medium industrial, one business was reclassified from high industrial to low industrial, and one business was reclassified from low priority industrial to high priority industrial. The business that was added to the high priority industrial inventory, Melhorn Construction, was reprioritized because the business was found to have begun woodworking as part of the business activities.

## POLLUTION PREVENTION AND BMP REQUIREMENTS AND IMPLEMENTATION

Implementing simple pollution prevention techniques can help avoid serious discharges of pollutants and is almost always more effective and less expensive than costly remediation efforts. Recognizing this, the City of National City requires industrial facilities in its jurisdiction to employ pollution prevention methods as appropriate to their activities and

site configurations. Included in Section 3.1 of the City's revised 2004 JURMP are the following pollution prevention measures:

- Use smaller quantities of toxic materials or substitute less toxic materials.
- Change production processes to reduce waste.
- Decrease wastewater flows.
- Recycle wastes as part of the production process (most preferred), off site, or on site (least preferred).
- Segregate wastes.
- Treat wastes on site to decrease volume and/or toxicity.
- Dispose of wastes properly.

The City has developed a list of required general BMPs for all industrial and commercial facilities (revised 2004 JURMP Appendix C.2), as well as activity specific BMPs for industrial facilities (revised 2004 JURMP Appendix C.3). No changes were made to the BMP requirements listed in the City's revised 2004 JURMP during this reporting period. To ensure compliance with the City's BMP requirements and the Industrial Permit, the City has conducted routine, follow-up, and complaint investigation inspections at industrial facilities. The City conducts detailed BMP assessments as part of each inspection; all inspection findings are entered into the City's industrial/commercial database.

**INSPECTIONS**

Inspections are the City's means to ensuring that facilities are in compliance with the City's BMP requirements and the Industrial Permit. The City conducts routine, follow-up, and/or complaint investigation inspections at industrial facilities. During each site visit, inspectors completed a storm water compliance inspection form to assess BMP implementation, compliance with the City's Storm Water Ordinance, compliance with the Industrial Permit, and list recommended corrective actions, if necessary. In addition, monitoring data and SWPPPs are evaluated at sites that have filed NOIs. Upon inspection, businesses are verbally informed of any corrective actions. The owner/responsible party is also provided with written notice of the corrective actions that are required. Inspection form data are then entered into the City's commercial and industrial inspection database. Further details about the City's inspection method can be found in Section 3.6 of the JURMP.

In total, there were 30 industrial site visits during the reporting period. Of these visits, 29 facilities received full inspections and one business was found to have moved/gone out of business.

All of the facilities included in the high priority industrial inventory submitted with the 2005/2006 Annual Report were visited at least once during the 2006/2007 reporting period. There are 23 high priority industrial facilities in National City. Note that as of the end of the 2005/2006 reporting period, 27 businesses were listed as high priority industrial. During this reporting period, two businesses moved or went out of business, three high priority industrial facilities were reclassified as medium industrial, and one was reclassified as low industrial. One business was reclassified from low priority industrial to high priority industrial and one business was added to the inventory. The two high priority industrial

businesses that moved were San Diego Wood Preserving and Unique Granite and Marble. John D'Marco Boat Storage was moved to the medium priority industrial inventory because boat repair is no longer conducted on site. Rob North Fab was reclassified as medium industrial due to changes in activities at the site that make it no longer subject to the Industrial Permit. Presently Rob North Fab primarily engages in design services with some minor repairs, not in metal fabrication. Prochem Specialty Products was reclassified as medium industrial and Tecnico Systems was reclassified as low industrial for reasons discussed later in this section under the "Permit Compliance" heading. A low priority industrial business, Melhorn Construction, was reprioritized to high priority industrial because the business was found to have begun woodworking as part of the business activities. A high priority industrial business in the City, Collin's Marine Repair, moved locations within the City, but the priority was not changed. The address change is reflected in the inventory, however.

**BMP ASSESSMENT**

As part of the inspection process, each facility inspected during the reporting period was evaluated for BMP implementation and effectiveness as well as the individual's knowledge of storm water issues. Facilities were advised that they are required to implement both general BMPs and activity-specific BMPs. Based on the assessment of the facility activities and site configuration, the inspectors notified the facility's responsible person regarding any observed BMP deficiencies. They were notified verbally of all corrective actions, and written notification was provided after the inspection.

BMP assessment ratings were assigned during inspections based on a scale of 1 (low) to 5 (high). This information is intended to help the City to conduct a more quantitative assessment of BMP implementation. In future years, as more data is collected, trend analyses can be undertaken to yield a more sophisticated program assessment. During 2006/2007, BMP assessment scores were assigned mainly at high priority industrial facilities. In an effort to standardize the assignment of these ratings, the inspectors used the following assessment criteria to assign scores:

- Level 5: All required general and activity specific BMPs have been implemented effectively.
- Level 4: BMPs have been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with this business's activities.
- Level 3: BMPs have been implemented with the exception of two corrective actions noted aside from dumpster lids being open or oil stains in the general parking lot.
- Level 2: Minimal BMP implementation is noted. Three or more corrective actions, with the exception of dumpster lids being open or oil stains in the general parking lot. No illegal discharge or illicit connection was noted.
- Level 1: Violation of the City's Storm Water Ordinances (illegal discharge, illicit connection, complete failure to implement BMPs, and/or significant littering).

Similar to previous years, many businesses needed to more effectively implement good housekeeping measures. The most common deficiencies included open dumpster lids, insufficient sweeping frequency resulting in sediment build-up on paved surfaces, and

insufficient frequency for cleanup of small oily leaks in parking lots. These businesses were advised to keep dumpster lids closed, to increase sweeping frequency, and/or to regularly check parking areas for spills, cleaning them up as needed using appropriate techniques. Over the course of the 2006/2007 industrial inspections, there was one illegal discharge to the storm drain system observed. The discharge was sediment from eroding areas of the site and the discharge had ceased upon re-inspection.

**PERMIT COMPLIANCE**

While conducting industrial BMP assessments, compliance with the General Industrial Permit was also evaluated. During the reporting period, the businesses inspected that were covered under the Industrial Permit were generally found to be implementing their SWPPPs and Monitoring Programs. All facilities listed on the high priority industrial list for the 2006/2007 reporting period are subject to the Industrial Permit.

At the time of inspection, four businesses were in violation of the Industrial Permit for not filing NOIs and developing and implementing a SWPPP. According to the State's Industrial Permit holder database, Valencia Stone and Tile has filed an NOI since the most recent inspection. During the next annual inspection the City's storm water compliance inspector will check to see if a SWPPP has been developed and implemented. One business, A-1 Alloys, has filed an NOI but has failed to develop and implement a SWPPP. The City's NPDES Storm Water Compliance Inspector also worked with the RWQCB's industrial compliance unit to clarify Industrial Permit requirements for industrial businesses in the City and work to bring them into compliance. The main businesses discussed during these conversations included Prochem Specialty Products, Tecnico Systems, and other ship repair facilities that conduct most repair offsite. After conversations with RWQCB staff, the SIC code for Tecnico Systems was changed to 7699, which is not subject to the Industrial Permit. Accordingly, the JURMP priority was changed to low industrial. Prochem is a detergents wholesaler that does some minor mixing; there is essentially no significant exposure at the site. As of this writing, it is still unclear if the business will be subject to the Industrial Permit. Because of its low potential to impact water quality and the uncertain status of its Industrial Permit subjectivity, it is included on the medium priority industrial this year.

During inspections, inspectors checked to see if high priority industrial facilities were conducting appropriate storm water monitoring in accordance with the Municipal Permit. If businesses had not conducted appropriate monitoring, the inspector checked to see that there was a valid reason for exemption. All sites that had not yet filed an NOI, listed previously in this section, had also not implemented a storm water monitoring program. Although they recently obtained coverage under the Industrial Permit, both Carroll Metal Works and A-1 Alloys had not yet developed and implemented a monitoring program. The City will follow-up with those businesses during the 2007/2008 reporting period, taking stricter enforcement actions as necessary. Those high priority industrial businesses that were in compliance with the Industrial Permit were conducting storm water monitoring programs that satisfy the Municipal Permit monitoring requirement for high priority industrial sites.

**TRAINING AND EDUCATION**

Educating all facilities about the potential threats their business poses to storm water is important in reducing and eliminating polluted runoff from industrial sites. The City

provided any business applying for a business license the "Preventing Urban Runoff Pollution" brochure (Attachment 3.1).

During inspections, facilities were primarily evaluated to determine whether they had implemented the required BMPs listed in the City's JURMP and whether they were in compliance with the Industrial Permit and the City's Storm Water Ordinance. The knowledge assessment component of the standard inspection form continued to be utilized. On a rating score of 1 (low) to 5 (high), the level of storm water knowledge of the facility representative present during an inspection was rated. The knowledge assessment scores are based on how many of the standardized questions the facility representative is able to answer correctly; a score of "1" indicates that no questions were answered correctly and a "5" indicates that all of the questions were answered correctly. These scores are intended to help the City to conduct a more quantitative assessment of business' knowledge. In addition, this allows the City to target educational materials to areas that might have a lower average score. In future years, as more data is collected, trend analyses can be undertaken to yield a more sophisticated program assessment. Each facility representative was asked the following series of questions:

Each facility representative was asked the following series of questions:

- What is storm water?
- What is the difference between storm drain system and the sanitary sewer system?
- Where does storm water flow?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good house keeping or best management practices are?
- Do you know what NPDES is or means?

Asking the eight questions listed above facilitates and engages the facility representative and the inspector in a conversation about storm water. Ideally, confusion and/or misconceptions are clarified, concepts are explained, and the facility representatives come away with a strong sense of what role they play in regard to water quality.

In addition to verbal education efforts, during inspections, the City distributed an informational handout regarding the upcoming industrial workshop and the City's user-friendly calendar explaining the importance of eliminating discharges of pollutants to the storm drain system. Businesses were encouraged to hang the calendar in their place of business. The calendar is included as Attachment 2.2. Written correspondence noting corrective actions required was provided to businesses, and corrective actions were also generally explained by inspectors while on site during inspections. During the reporting period, this direct, site-specific approach was the primary method used to educate industrial businesses about storm water pollution.

City industrial business management staff and employees were offered a free Storm Water Workshop in National City on April 25, 2007. This workshop was led by the City's

consultant, D-MAX, and provided information about how to comply with the Industrial Permit through NOIs, SWPPPs, water monitoring programs, and employee education. The workshop also provided information on how to comply with the City's storm water ordinance through implementing BMPs and what to expect from an inspection. They were presented with a PowerPoint presentation and given an NPDES Knowledge/Awareness Assessment Test before and after the presentation. The average post-workshop score was higher than the pre-workshop score. Attendees were also given a sheet listing benchmarks for common constituents analyzed for storm water monitoring, the bilingual flyer, "Everything that flows down into a storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" (Attachment 3.2), and the Storm Water Hotline Card (Attachment 3.3). The benchmark list was taken from the most recent draft of the proposed next version of the Industrial Permit. Industrial and commercial workshop sign in sheets are included as Attachment 3.4.

## POLLUTANT DISCHARGE POTENTIAL

The City is continuously updating its inspection form to match its information needs. The Pollutant Discharge Potential Assessment (PDPA) is intended to be a semi-qualitative tool to identify which sites are major sources of the principal pollutants of concern for storm water. The table includes a list of 12 pollutants or classes of pollutants, which are ranked on a scale from zero (0) to five (5), with five being the highest pollutant discharge potential and one being the lowest discharge potential that can be recorded for any pollutant known to be onsite. The potential pollutants included in the form are sediments, nutrients, aluminum, iron, heavy metals, organic compounds, trash and debris, oxygen demanding, oil and grease, bacteria and viruses, pesticides, acid/base, and others. A score of zero is only given when the inspector finds no evidence that a certain pollutant is present at the site. Fields to note the sources of the observed pollutants and general classes of recommended BMPs for those sources are also marked on the table. Collection of this information is intended to help the City better identify the main sources of major classes of pollutants commonly found in storm water discharges. It is anticipated that this information will be especially useful in the implementation of total maximum daily loads (TMDL) and in the assessment of overall program effectiveness. The form also prompts the inspector to designate sources needing additional BMPs to lower the pollutant discharge potential as well as recommended BMPs for those sources.

## COMPLIANCE AND ENFORCEMENT

In addition to routine inspections, the City also conducts inspections based on complaints received from citizens via the City's storm water hotline. When either type of inspection finds facilities are out of compliance with the City's BMP requirements and/or the Industrial Permit, the City enforcement process is initiated. In addition to a verbal description of the violation, the City may also employ phone calls, follow-up inspections, corrective action letters, notices of violation, fines, and/or legal action.

Generally, when significant problems are noted at a facility during a routine inspection, a corrective action letter is mailed to the business from the City Engineer. The letter identifies corrective actions that the business must undertake and lists the penalties and procedures for the business may face if the listed corrections are not made. An NOV may be sent to a business if an especially serious violation of the City's storm water ordinance is occurring at

the facility or follow-up inspection determines that essentially no corrections have been undertaken since the initial inspection. The NOV advises the facility owner that his or her business is in violation of the ordinance and that immediate corrective action is necessary to avoid civil and criminal prosecution, and a fine may also be assessed. The City NPDES Storm Water Compliance Inspector has authority to issue fines up to $500. Businesses receiving an NOV are required to submit a written plan of the corrective actions they would implement to the City. Follow-ups are conducted at non-compliant sites until they come into compliance. In the event that a business refuses to cooperate with the compliance process, it is reported to the RWQCB. Any sites deemed to pose significant threats to human health or the environment are reported to the RWQCB immediately.

During this reporting period, a total of four administrative citations, six NOVs, and seven corrective action letters were given to industrial businesses. The City's NPDES Storm Water Compliance Inspector follows up after enforcement actions are taken. Most of these problems were resolved at the first issuance of a citation, NOV, or warning, and all necessary corrective actions were implemented during follow-up visits. One industrial business, Carroll Metal Works, received one administrative citation and three NOVs during this reporting period for continued non-compliance with the City's BMP requirements and Industrial Permit requirements. The City's NPDES Storm Water Compliance Inspector continues to follow-up with the business to ensure progress is made toward compliance, and the RWQCB has been copied on recent enforcement correspondence with the business. No businesses were deemed to present a significant threat to human or environmental health, and consequently none were reported to the RWQCB. The City did, however, discuss Industrial Permit compliance issues with RWQCB staff during the reporting period. Overall, the City's enforcement efforts were successful in bringing businesses into compliance.

**IMPLEMENTATION PLANS FOR 2007/2008**

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated revised JURMP document developed in 2004.

# 4 COMMERCIAL

Many different categories of commercial facilities, especially auto repair shops and restaurants, have the potential to discharge pollutants in storm water runoff. These sites may not be as large as some industrial facilities, but a somewhat significant pollutant potential remains if BMPs are not implemented properly. Activities that can pose potential problems to water quality include vehicle repair activities, power washing, improper grease handling and disposal, and improper trash management. In order to reduce and potentially eliminate the pollutants discharging from commercial facilities, the City has continued to investigate complaints regarding commercial businesses and implement an education program that targets commercial businesses in the City.

In order to reduce and potentially eliminate the pollutants discharging from commercial facilities, the City has continued to implement an education program that targets these businesses. The main way in which the City's educational information reaches commercial facilities is through activity specific educational fact sheets and through visits during routine or follow-up inspections and during complaint investigations.

## PRIORITIZATION OF COMMERCIAL FACILITIES

The City's commercial inventory is updated throughout the reporting period as needed. Businesses that are no longer operational in the City are removed from the inventory, duplicate facility listings are consolidated, and any changes in SIC codes are updated as needed (and their priorities are adjusted accordingly). Some reprioritization was also conducted due to new business SIC codes and proximity to ESAs. As the result of inspection findings and a sort of the City's business license database, several facilities were reprioritized, and others were found to have moved, gone out of business, or be home-based businesses that did not pose a substantial threat to storm water quality. The City's current 2006/2007 high priority commercial inventory contains 587 businesses (Table 4.1).

## POLLUTION PREVENTION AND BMP REQUIREMENTS AND IMPLEMENTATION

The City's JURMP requires that commercial businesses implement certain pollution prevention methods. The commercial activities with the largest potential to generate pollutants, such as food preparation and auto repair, are generally required to be conducted in contained areas. However, there is still a potential for significant storm water pollution if BMPs are not implemented properly. The City requires the implementation of general BMPs (JURMP Appendix C.2) at all facilities and activity-specific BMPs as appropriate (JURMP Appendix C.4). The City's inspectors typically emphasize good housekeeping measures and secondary containment and overhead coverage for automotive fluids and restaurant grease stored outside. Non-structural source control BMPs are strongly emphasized for commercial facilities, although structural BMPs may be required at some facilities depending on their activity. No changes have been made to the City's BMP requirements during this reporting period. The City employs both inspections and education to ensure the required BMPs and pollution prevention methods are being implemented. The goal of these inspections and management education is to reduce and/or eliminate the amount of storm water pollution being discharged from these commercial facilities.

## INSPECTIONS

During storm water compliance inspections, the inspectors assessed the extent of each facility's implementation of required BMPs and compliance with the City's Storm Water Ordinance. Five-page inspection forms and a PDPA were completed. Inspected businesses were verbally notified of any recommended corrective actions or areas of special concern, and written notices of the required corrective actions were mailed later. As discussed earlier, the inspections also included an education component. Inspection results were entered into the City's commercial and industrial inspection database.

A total of 10 commercial sites were visited during this reporting period. The 10 site visits consisted of one routine inspection and several follow-up and complaint investigations. All 10 businesses received a full inspection.

This reporting period, five commercial facilities were found to be in violation of the municipal ordinance for illegal discharges, improper BMP implementation and/or littering. Each of these businesses was notified that site conditions violated the City's Storm Water Ordinance and were given instruction on actions necessary to remedy the situation. The City's Storm Water inspector followed-up fully with each business that was out of compliance.

## TRAINING AND EDUCATION

The City has found that a lack of knowledge about storm water issues is a common problem at commercial facilities since they are not inspected as frequently as industrial businesses and often have higher turnover rates among management. Recognizing that personal interaction is often the most effective means of providing storm water education, City inspectors take time to educate the responsible person at each facility during every inspection and suggest and explain appropriate BMPs that are site-specific.

In addition to verbal education efforts, during inspections, the City distributed an informational handout regarding the upcoming commercial workshop and the City's user-friendly calendar explaining the importance of eliminating discharges of pollutants to the storm drain system. Businesses were encouraged to hang the calendar in their place of business. The calendar is included as Attachment 2.2.

On May 23, 2007, the City hosted a workshop for business owners and operators working in the automotive-related business. A total of 21 people attended this training. The presentation provided a background on NPDES, watersheds, BMPs, and pollutants likely to be discharged from automotive-related businesses. They were given an NPDES Knowledge/Awareness Assessment Test before and after the presentation, and on average there was an improvement in scores. "Your Shop Can Make a Difference" handouts (Attachment 4.1), "Put Toxic Waste in its Place" brochures and notepads (Attachment 4.2), "Everything that flows down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay" handout (Attachment 3.2), and HHW informational refrigerator magnets (Attachment 4.3) were distributed. Sign in sheets for industrial and commercial workshops can be found as Attachment 3.4.

## COMPLIANCE AND ENFORCEMENT

When inspections find that facilities are out of compliance with the City's BMP requirements, the City enforcement process is initiated. In addition to a verbal description

of the violation, the City may also employ phone calls, follow-up inspections and compliance checks, corrective action letters, notices of violation, stop work orders, fines, and/or legal action. Most commercial businesses historically have cooperated with the compliance process after receiving education and being notified of necessary corrective actions. However, when a business has been educated and warned but persists in non-compliance, penalties are assessed. This approach has been effective in bringing about compliance with the City's Storm Water Ordinance.

The City continues to follow-up actions until the issue with a particular business is resolved. Facilities identified as having poor BMP implementation are often re-inspected to determine if the recommended corrective actions have been implemented. If the business repeatedly refuses to take corrective action, it is reported to the RWQCB. Any sites deemed to pose significant threats to human health or the environment are reported to the RWQCB immediately. Because facilities have not always implemented BMPs to a satisfactory level by the time of the re-inspection, additional follow-up inspections are sometimes necessary to ensure compliance. In some cases a stop work order is issued until the proper BMPs are implemented. The City follows up with non-compliant businesses until they come into compliance.

In some cases, a corrective action letter is mailed to the business from the City's NPDES Storm Water Compliance Inspector. The letter identifies corrective actions that the business must undertake and lists the penalties and procedures the business may face if the listed corrections are not made. An NOV may be sent to a business when it is observed committing a particularly serious violation of the City's storm water ordinance or when follow-up inspections determine that essentially no significant corrections have been made. The NOV advises the facility owner that his or her business is in violation of the ordinance and that immediate corrective action is necessary to avoid civil and criminal prosecution, and a fine may also be assessed. The City NPDES Storm Water Compliance Inspector has authority to issue fines up to $500. Businesses receiving an NOV are required to submit a written plan of the corrective actions they will implement to the City.

During this reporting period, a total of 11 administrative citations, 10 NOVs, and three corrective action letters were issued to commercial businesses for violations of the City's Storm Water Ordinance. These violations included discharges from activities such as vehicle washing, hosing down the sidewalk/street, and improperly disposing of wastewater. The City's NPDES Storm Water Compliance Inspector followed up on these incidents; the City's enforcement process was effective in bringing noncompliant businesses into compliance. Many of the problems were resolved upon the receipt of the first citation, NOV, or letter. No commercial businesses were found to present significant threats to human or environmental health during 2006/2007, so no reports to the RWQCB were necessary.

**IMPLEMENTATION PLANS FOR 2007/2008**

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

# 5 RESIDENTIAL

Land use in the City of National City is largely residential. To address common residential activities that may pose a significant threat to storm water, the City has implemented many programs focused on reducing pollutant loads associated with such activities. Residential activities such as yard maintenance, landscaping, swimming pool and hot tub maintenance, home improvements, and vehicle care have the potential to introduce pollutants into the City's storm drain system if not managed properly. The City is dedicated to ensuring that residents are implementing activity-specific BMPs properly to eliminate the discharge of pollutants such as sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals into the storm drain system. The City recognizes the need for educational efforts and opportunities designed specifically for residents and residential activities.

The following sections present activities conducted during this reporting period with respect to priority residential sources, BMP requirements and implementation, pollution prevention, inspections, compliance and enforcement, and training, education, and outreach activities. These activities are associated with the residential component of the JURMP and include conducting ongoing HHW collection events, distributing educational materials, and participating in community events.

**POLLUTION PREVENTION**

The City continues to provide information regarding the implementation pollution prevention measures, such as good housekeeping practices, for residential areas and activities. Pollution prevention methods are BMPs that eliminate or reduce the generation of pollutants at the source. The City provides information regarding pollution prevention methods through targeted educational materials and one-on-one contact during complaint investigations.

**BMP REQUIREMENTS AND IMPLEMENTATION**

The City recognizes that preventative measures such as the implementation of BMPs are an integral part of the City's storm water pollution prevention program. The City requires the implementation of residential BMPs as described in the JURMP document and in Appendix C of the JURMP. The City has an extensive educational and public outreach program, details of which are given in Section 9 and Section 10 of this Annual Report, respectively.

The City continues to encourage residents to report observed illegal discharges and report other potential violations to the City's Storm Water Hotline. The number for this hotline is published on the City's website, in storm water brochures available in public locations, and on the City's storm water hotline business card, with the intention to reach as many people as possible. Complaints received from residents are the primary mechanism for notification of non-compliance with the City's Storm Water Ordinance in residential areas. Every effort is made to identify the responsible parties and to educate them regarding the NPDES program and City ordinances. Section 8 provides a summary of the public complaints received, all of which were investigated and resolved. The majority of the complaints were regarding residential activities. The complaints were received from individuals or City staff that witnessed potentially harmful activities, and each investigation was resolved.

**PRIORITY RESIDENTIAL SOURCES**

During 2006/2007, the City continued to identify priority residential sources. There have been no changes to the high threat to water quality residential areas that were designated during the last reporting period, however. High TTWQ areas are designated by considering visual observations, institutional knowledge, and Dry Weather Monitoring Program data, and the criteria as defined in updated Municipal Permit. The following residential areas were designated as being high threat to water quality:

- Similar to previous reporting periods, the residential area stretching from Highland Avenue to Euclid Avenue, north and south of Division Street was found to have elevated levels of bacteria during Dry Weather Monitoring Program. Continued irrigation seepage at a particular apartment complex was causing water to stagnant, possibly contributing to the high instances of bacterial growth in the samples taken. Evidence of illegal dumping was also noted.
- Similar to the last reporting period, residential area around 14th Street and Grove Street was found to be a source of detergents and ammonia. A significant amount of organic matter was noted in the catch basin and was determined to be the main pollutant source of ammonia. Detergents were generally traced to residences were people have recently washed a vehicle outdoors. During this reporting period, upstream investigations found levels of bacteria in this area. It was established that the cause of the elevated levels were most likely from the decomposing organic matter.
- The residential area around Harbison Avenue south of 18th Street has previously been listed as a priority residential source, mainly due to elevated levels of ammonia during dry weather monitoring events. During this reporting period, there were no exceedances above the action level on any constituent. The City has chosen to keep this residential area on this list of priority residential sources as a proactive measure.
- In previous reporting years, the residential areas off Arcadia Place have been observed to have elevated concentrations of ammonia and detergents in dry weather monitoring surveys. During this reporting period, there were no exceedances above the action level on any constituent. The City has chosen to keep this residential area on this list of priority residential sources as a proactive measure.

More information about follow-up actions to pollution observed during the Dry Weather Monitoring Program is presented in Section 8 of this Annual Report.

Because some commercial businesses or construction sites fall within residential areas, inspections at these sites may facilitate in identifying sources of pollutants from residential sources. Inspectors are able to assess BMP implementation in the residential areas around these sites while driving to and from the sites.

The City continues to maintain a storm water hotline. A business card featuring the City's storm water hotline number is available with other storm water pollution prevention material in City Hall and at other City facilities. Complaints can be submitted by phone or online and are directed to the City's NPDES Storm Water Compliance Inspector for investigation and follow-up. Once the City receives a complaint, it is investigated immediately. Section 8 presents a log of complaints, a number of which related to

residential areas and/or were reported by residents. Those complaints led to direct inspection and investigation of residential areas and activities.

## TRAINING, EDUCATION AND OUTREACH

Education is a fundamental part of preventing pollutants from entering the storm water system. The City continues to provide educational materials to its residents in a variety of ways. The City has published most of their brochures in English as well as Spanish to provide the same educational opportunities to the large Spanish speaking population of National City. Training, education, and outreach activities for residents during this reporting period are described below.

### 2007 Calendar

The City developed a 2007 Calendar that was distributed to residents, and made available at City offices (Attachment 2.2). The calendar was printed in both English and Spanish and informs residents about pollutants found in San Diego Bay and neighboring waterways. It describes that pollutants such as fertilizers, pesticides, metals, paints, oil and grease and other debris can be transported from residential areas to the ocean. A list of BMPs and various cleanup days and HHW events are promoted. The theme for the calendar was "Let's keep our community clean" and each month showed a photograph of a landmark in the City.

### Distribution of Educational Material

The City's Building and Safety division conducted inspections as part of the Healthy Homes Program in priority areas to check for lead in paint and other potential hazardous problems. Residents were provided IPM cards (Attachment 5.1) during these inspections. The IPM cards provide information regarding non-chemical solutions to pest-related problems. Additionally, in July 2007 the City sent a copy of the "Do You Go To the Beach When it is Raining" brochure (Attachment 5.2) in trash bills to residents.

As mentioned above, educational materials were provided to residents in National City in response to the recommendations from the 2006 Dry Weather Report. The City sent a letter, and applicable educational material to residences in areas where high levels of pollutants were noted.

### Workshops

The City held a free storm water workshop on February 21, 2007, with 8 residents in attendance. Attendees were presented with a PowerPoint presentation on NPDES and BMPs for residential activities. A residential BMP handout was included with the presentation and is provided in Attachment 5.3. An NPDES Knowledge/Awareness Assessment Test before and after the presentation, which showed a marked improvement in awareness. Overall, post-workshop scores were higher than pre-workshop scores. In addition, attendees were provided information regarding how to properly dispose of HHW and other wastes and information regarding the storm water hotline and complaint system. 2007 Calendars (Attachment 2.2), "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochures (Attachment 3.2), "Put Toxic Waste in its Place" brochures (Attachment 4.2), HHW refrigerator magnets

(Attachment 4.3) and copies of the City's Storm Water Hotline Card (Attachment 3.3) were also distributed at the workshop.

**Website**

Additional information regarding the City's storm water program, pollution prevention measures and BMPs is posted and continually updated on the City of National City's website, under the Public Works/Engineering Department link. For additional information on the City's educational efforts and the educational materials distributed to its residents please refer to Section 9 of this report.

**Household Hazardous Waste Disposal Program**

The City of National City continues to work with the City of Chula Vista to allow National City residents to drop off HHW at Chula Vista's Household Hazardous Waste Collection Facility. The Household Hazardous Waste Collection Facility is the primary location for hazardous waste collection in the South Bay, receiving HHW from the City of National City, the City of Imperial Beach, and the City of Chula Vista. The amount of waste collected by National City residents alone is not available. The total amount for all three cities is 142,572 pounds of hazardous waste, however. The following provides a breakdown of the waste collected at the facility, including curbside and door-to-door collection:

- 11,358 pounds of used oil
- 114,549 pounds of antifreeze oils and paints
- 16,665 pounds of used oil filters and batteries

The City continues to distribute brochures "Put Toxic Waste in Its Place" (Attachment 4.2) to remind residents to dispose of HHW properly. This brochure is handed out at all workshops and is available at various locations in the City.

**Other Waste Disposal Programs/Activities**

In addition to proper HHW disposal, the City encourages residents to recycle used oil. The City maintains seven Certified Used Oil Recycling Centers for residential oil disposal. The volume of used oil dropped off at the collection centers was not immediately available.

The City's Public Works Department held two trash collection events (June and November) during this reporting period in conjunction with EDCO Disposal Company. During these events, residents were encouraged to dispose of any unwanted large items from their homes such as furniture and appliances.

Two neighborhood councils in the City held cleanup events, and a third event was hosted by City Hall. The Eastside Neighborhood Council and the Army National Guard painted and cleaned El Toyon Recreation Center and removed 4.8 tons of dirt/trash/debris from three surrounding neighborhoods (Granger/Northside/Old Town) on February 3-4, 2007. The Northside Neighborhood Council collected 7.2 tons of dirt/trash/debris from the Northside Neighborhood on March 31, 2007. City personnel and residents collected 2.4 tons of trash and debris over June 1-2, 2007 from the areas surrounding City Hall.

Additionally, residents of Sweetwater Heights, a neighborhood in National City, continue to maintain their own birdhouse for pet waste bags, encouraging neighbors to pick up after their pets.

In addition to the above efforts, the City completed the construction of the Paradise Creek Educational Center. The site offers educational signs about pollution prevention and improving water quality in National City. The area is designed to make people more aware of their surroundings and hopefully foster more effective pollution prevention programs. On April 21, 2007, a few days after the Paradise Creek Educational Park officially opened, an Earth Day celebration was held there. During the celebration, volunteers removed trash and sowed 300 plants.

**Storm Drain Stenciling**

During 2006/2007, the City worked with ILACSD to stencil storm drains in the City that remind people that the storm drains drain to local creeks and the ocean. A total of 19 volunteers stenciled 30 drains.

**COMPLIANCE AND ENFORCEMENT**

To help bring the priority residential areas that were listed above into compliance, the City of National City has worked to ensure that these residential areas are educated on storm water issues by providing educational brochures. Homes in areas where dry weather monitoring indicated high pollutant discharge were provided with educational mailers and were encouraged to learn more about the NPDES program.

The City continues to encourage all citizens to use the storm water public complaint hotline and/or website complaint system. The hotline is publicized as widely as possible to encourage the public to use the service. The telephone number has been mailed to every residence in the City and is also posted on the city website; the online complaint form is easy to find and easy to use. The storm water hotline card is available at the City's Engineering Department, and these cards are handed out during all inspections or complaint investigations. This hotline augments the City's ability to educate and enforce by allowing staff to immediately bring erring individuals or businesses into compliance. City personnel investigate each complaint received. The City makes every attempt to identify the responsible party. Potential sources of pollution are evaluated, immediate action is taken if necessary, and corrective action is recommended verbally or via a letter. In some cases, an administrative citation, or Notice of Violation (NOV) is issued. In addition, the City also provides as much educational material as possible to prevent future activities that may pose a threat to storm water quality.

Complaints received are the City's primary mechanism for notification of noncompliance with its storm water ordinance in residential areas. The City's NPDES Storm Water Compliance Inspector records the complaints and responds to them accordingly. During the 2006/2007 reporting period, the City received several storm water complaints related to residential areas, which are included in Table 8.4 of Section 8 below. In some cases the reported noncompliance was not observed when the City inspector visited the site. In those cases, no enforcement action was taken. When discharges or improper BMP implementation is observed, the City's NPDES Storm Water Compliance Inspector takes action to ensure the violations are promptly remedied. The City issued 12 administrative citations, seven NOVs, and 23 corrective action letters to residents during the reporting year. Common problems this reporting period were vehicle washing, oil leaking from vehicles onto the street, accumulation of trash and debris on the street, and hosing off the driveway

and/or sidewalk. In most cases, problems are resolved by a verbal warning and no further action is necessary.

A notable residential enforcement action occurred in response to a complaint that a resident's garbage disposal was plumbed improperly and that the resident hoses off concrete areas. Upon investigation, the inspector noted that the kitchen sink and several washing machines were plumbed outside. Discharge of sediment and food particles and improper storage of materials was also noted. The City issued an NOV and an Administrative Citation to the resident. Upon follow up, all issues were resolved.

Another complaint that was received was regarding a homeowner pumping sewage from under the house to the gutter. The water flowed for a total of approximately 5-6 hours through a garden hose. The City's storm water consultant, D-MAX Engineering, Inc. was called to test the water and the Sewer Department was called to clean up the spill. The Building Department was also called to check safety of residents; the house was tagged as unsafe to occupy. An administrative citation was issued. A follow-up investigation revealed that the hose and pump were still observed to be under the house with one end of the hose going to the front lawn. The inspector issued an NOV. The hose and pump were removed and all storm water issues were corrected.

**IMPLEMENTATION PLANS FOR 2007/2008**

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

# 6 LAND-USE PLANNING FOR DEVELOPMENT

One of the major requirements of the Municipal Permit is to minimize pollutant discharges from new development and redevelopment projects in order to improve overall storm water quality in the City of National City. Development has the potential to contribute pollutants to the City's storm water runoff from demolition and construction as well as post-development activities. Thoughtful pre-construction planning has been shown to reduce the potential of pollutant discharge both during and after construction. Effective pre-construction planning activities can include identifying potential pollutants from the site, minimizing the potential for the development to negatively impact downstream channels and/or habitats, and establishing appropriate BMPs during and after construction. After the issuance of the Municipal Permit, the City of National City implemented pre-construction planning activities through revaluating the General Plan, making changes to the City's development approval process, and establishing educational programs for development projects. The City continues to reassess and update its development-related processes in order to ensure that storm water pollution is minimized.

## SUSMP DATABASE AND POST-CONSTRUCTION BMP INSPECTIONS

To prepare for the treatment control BMP inspection requirement in the new Municipal Permit, D-MAX, the City's storm water consultant, developed an electronic database of the City's SUSMP projects and performed BMP inspections of completed SUSMP projects. In mid 2007, the City conducted inspections of all completed SUSMP projects within the City's jurisdiction. These projects are all included in the City's SUSMP database, which contains general site information, details on site and source control BMPs, descriptions and GIS coordinates of all treatment control BMPs, and responsible party contact information. In the future, the City plans to track inspection finding and enforcement actions using the database as well.

One of the advantages of having an electronic database is the ability to print out site specific inspection forms that contain information directly from the database. An example of a site specific inspection form generated from the City's SUSMP database is included as Attachment 6.1 of this report. Site specific inspection forms help inspectors know what BMPs to look for without having to bring the project's cumbersome SUSMP report or site plans with them to the inspection site. The form also includes the GIS coordinates of each site's treatment controls, which can be obtained during the initial BMP inspection, to help in locating the treatment controls during subsequent inspections.

To prepare the BMP database, information was gathered from the City's existing SUSMP filing system located in the City's Engineering Department and the electronic SUSMP project tracking spreadsheet maintained by the City's storm water consultant. The SUSMP and construction site plans for completed projects were reviewed and relevant information from these documents was entered into the database. The City plans on adding new projects to the database once a project's SUSMP report is approved.

Since this was the first year the City performed post-construction BMP inspections, sites were checked for proper construction of structural site and source control BMPs in addition to proper installation and maintenance of treatment control BMPs. The City does anticipate

the need to inspect site and source control BMPs during subsequent inspection at these sites, unless implementation problems in these BMPs were observed during the site's initial BMP inspection. The following deficiencies were noted during the BMP inspections of completed SUSMP projects:

- Storm drain inlets did not contain signage.
- Personnel on site were unaware of how to maintain treatment control BMPs or in some cases were not aware of the BMPs at all.
- Roof downspouts were constructed to drain towards impervious areas, despite there being adjacent landscaping available to drain to.
- Catch basin inserts contained significant trash and appeared in need of maintenance.
- BMPs included in the site's SUSMP were not included on the site's construction plans, and were not installed.

Since the City's SUSMP inspections were conducted late in the 2006/2007 reporting period, discussion of the City's follow-up actions will be included in the 2007/2008 annual report.

Many of the BMP deficiencies noted during inspections were errors in construction rather than maintenance related. Most of the completed SUSMP projects were approved early in the development of the City's SUSMP program before the City adopted their current SUSMP approval process. The City now requires all structural BMPs included in the site's SUSMP document to be included on the site's construction plans before construction may begin. This ensures that building inspectors will check for proper structural BMP construction during routine plan checks. Any changes made to structural BMPs on the site's construction plans must be approved by the City before they may be implemented. Due to the City's current review process, the City does not expect BMP deficiencies related to construction of structural BMPs to be a problem in the future. The City will assess the effectiveness of its review process once construction on Priority Project approved through the City current process are completed and post-construction BMP inspections can be conducted.

## GENERAL PLAN ASSESSMENT

The City of National City General Plan currently includes policies and a number of strategies relating to water quality preservation. These are included in the Natural Setting Element of the General Plan. No modifications have been made to the City's General Plan during this reporting period.

## DEVELOPMENT PROJECT APPROVAL PROCESS

Slight modifications were made to the project approval process, although the overall structure of the process remained the same. The City made minor modifications to its applicability checklist (Attachment 6.2) during this reporting period. All projects that disturb soil are required to complete the applicability checklist and the City requires that projects completing the checklist be directed to the Engineering Department for final sign off. As presented in the 2002/2003 JURMP Annual Report,

*"Before permit applications are submitted to the [building] department, developers are required to fill out a storm water requirements applicability checklist that determines if the project is subject to SUSMP and if preparation of a Storm Water Pollution Prevention Plan (SWPPP) or Storm Water Management Plan (SWMP) is applicable….For public projects, project managers are required to ensure that SUSMP requirements are incorporated into the project design. The SUSMP requirements must be included in the plans before the project is allowed to proceed into the grading and/or construction phase. The SUSMP ordinance also requires that if a project requires a grading permit that the applicant complete a Storm Water Management Plan prior to the issuance of the grading permit. An erosion plan and a SWPPP are required for sites greater than an acre and must be submitted as part of the grading plans. Erosion Control Plans are required for sites smaller than an acre."*

During this reporting period 12 projects submitted post-construction BMP reports. Table 6.1 presents a list of development projects that submitted reports during 2006/2007.

To more accurately track the implementation of required BMPs, the City uses a SUSMP review checklist. The City's consultant uses the checklist as a guideline when preparing written comments for submitted SUSMP reports. When a project proponent proposes a treatment control BMP that is not the most effective possible BMP for the anticipated pollutants, the City requires the proponent to either implement a more effective BMP or justify why the selected BMP is the best BMP that can feasibly be installed at the site. The City also now requires that structural BMPs be shown on the SUSMP maps and construction plans; this allows building inspectors to ensure that the BMPs are implemented during their inspections.

## ENVIRONMENTAL REVIEW PROCESS

The City continues to follow the written departmental SUSMP responsibility checklist developed during the 2005/2006 reporting period during the environmental review process. The City's storm water consultant, D-MAX, generally conducts the technical reviews of WQTRs and SUSMPs submitted to the City during the project approval process. A detailed review of site design, source control, and treatment control BMPs, as well as potential impacts to the downstream hydrologic regime is conducted. The City uses its SUSMP Review Checklist to determine whether all SUSMP requirements have been met, after which a detailed letter explaining the deficiencies of the submitted document and recommendations for improvement/approval is provided to the City and then passed on to the developer. If the initial document did not meet the minimum requirements, a revised document addressing the review comments must be submitted. This process continues until the document is approved; at that time the project may commence. Reviews of post-construction BMP plans for non-priority projects follow a similar process, except that treatment control BMPs are not required. The City of National City's environmental review process did not change substantially during this reporting period.

## NEW DEVELOPMENT AND REDEVELOPMENT EDUCATION

Applicants continue to be educated on the City's development and re-development requirements during pre-submittal application meetings held with City's Planning Department. Representatives from the City's Planning Department regularly attended the

interdepartmental SUSMP coordination meetings, and City planners were provided with guidance regarding site design and other post-construction BMPs. If project applications are determined to be subject to SUSMP, then discussion occurs on ways applicants can meet these requirements.

During this reporting period, the City continued to hold Development Service Group (DSG) meetings to establish policies and procedures to integrate SUSMP into the normal review process for development and redevelopment projects. Review comments on each submitted SUSMP are provided to the project proponent. These lists of comments, presented in letter format, explain to the developer what, if any, changes are required and why they must be made. Meetings and telephone conversations with project proponents also occur, during which additional instruction on SUSMP requirements may be given. These methods help promote better understanding of and compliance with SUSMP requirements. Because a relatively small group of consulting engineering firms prepare the bulk of SUSMPs for projects in National City, future submittals from those same companies are anticipated to show improved initial designs.

The City's consultant, D-MAX, conducted a training session on January 22, 2007, on SUSMP requirements and BMPs. The presentation included a development and re-development component. This included SUSMP requirements and BMPs for new development and redevelopment. Additional trainings are planned for 2007/2008.

## DESCRIPTION OF SUSMP PROJECTS

During this reporting period, post-construction BMP reports were submitted for the following 12 projects. All 12 were Priority Projects subject to SUSMP. Additional information regarding these projects can be found in Table 6.1.

### *Carolino Hillside Homes*

This project involves the construction of nine detached two-story single family homes on 1.41 acres located on a steep hillside.

### *Cypress Glen Condominiums and Cypress Glen Phase II*

Cypress Glen Condominiums consists of the construction of 38 condominium units on a 4.22 acre site. Phase II of the project involves the construction of 6 single family residences and associated private roads on a 1.0 acre lot, adjacent to Cypress Glen Condominiums.

### *Harbor View Condos*

This project involves demolition of four single family homes to build a multiunit condominium building with underground parking. The site covers a total of 0.67 acre.

### *Harley Davidson*

This project consists of remodeling an existing commercial building for use as a motorcycle showroom and repair facility.

### *Marina Gateway*

Marina Gateway consists of redevelopment of an existing industrial and commercial site into a commercial site consisting of a hotel, pool, IHOP restaurant, commercial building, and associated parking lots.

*Pacific View Estates*

This project includes the construction of 49 detached single family residences and associated private roads on 4.43 acres of undeveloped land.

*Paradise Village*

This project involves construction of a multi-family residential facility that will include residential housing, a multiple use community facility, parking, and an outdoor detention basin on 12.2 acres.

*Paradise Walk*

This project consists of the construction of 16 townhome buildings (96 individual units) on a 4.65 acre lot with existing single family residences.

*Plaza Bonita Mall Expansion*

The Plaza Bonita Mall Expansion involves a two level expansion of the Plaza Bonita Mall with retail and parking structures covering about 18 acres.

*Plaza City Apartments*

This project involves the construction of senior apartments on 1.67 acres.

*Plaza Village*

This project consists of the construction of a covered parking garage with multiple story residential units above on a 0.5 acre site.

## COMMON PROBLEMS WITH SUSMP PROJECTS

While reviewing SUSMP reports as part of the approval process the City has noted a number of common problems with the documents, sometimes causing them to be unable to meet the City's requirements upon the first or second review. A submitted SUSMP report presents the developer's plan to identify pollutants likely to discharge from the site and the BMPs that are proposed to minimize potential storm water pollution. Often times, these reports lack complete or correct information on anticipated pollutants of concern and/or proposed BMPs. The City's technical review of the document results in a detailed letter explaining to the developer what changes must be made prior to the approval and commencement of the project. The following is a list of deficiencies noted during the reviews of SUSMP reports submitted during this reporting period.

- Calculation of pre- and post-development runoff is not present or not properly calculated.
- Watershed information and the project's receiving water body are missing or incorrectly identified.
- The list of anticipated and potential pollutants of concern is incomplete or incorrect. Also, if present, they are not designated as either primary or secondary pollutants of concern.
- Conditions of concern are either not discussed or not sufficiently addressed.

- Site design and source control BMP descriptions are generic, or not site specific.
- Site design BMPs are not implemented to the Maximum Extent Practicable (MEP), and there is no explanation of why more site design BMPs and/or more effective site design BMPs are not proposed.
- Individual Priority Project BMPs for applicable Priority Project categories are not proposed.
- Calculation of SUSMP flow or volume for treatment control BMP sizing is either not present or is not properly calculated.
- Calculated values are not consistent throughout the report's text, tables, and appendices.
- A treatment control BMP is chosen that does not have the highest possible removal efficiencies for anticipated pollutants, and there is no explanation present for why a more effective BMP could not be implemented.
- It is unclear whether runoff from all areas of the project site will be directed to a treatment control BMP, or the report states that some areas will not receive treatment at all. Also, the locations of these BMPs are often unclear.

The City continues to inform developers of these types of errors and has seen some improvements since the end of 2005/2006.

## IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

**Table 6.1**
**SUSMP Projects Submitted to the City for Review**
**During the 2006/2007 Reporting Year**

| # | Project Name | Location | Description | Project Type | Number of Reviews |
|---|---|---|---|---|---|
| 1 | Carolino Hillside Homes | 16th Street & M Avenue | Residential Development on Steep Hillside | Priority | one |
| 2 | Cypress Glen Condos | 3229, 3359, 3391 Cypress St | Residential Development | Priority | three |
| 3 | Cypress Glen Phase II | 2501 E 32nd Street | Residential Development | Priority | three |
| 4 | Harbor View Condos | 8th Street & D Avenue | Residential Development | Priority | one |
| 5 | Harley Davidson (Revised) | 3201 Hoover Ave | Commercial Development | Priority | one |
| 6 | Marina Gateway | Marina Way, south of Bay Marina Dr | Commercial Development with Restaurant and Parking Lot | Priority | one |
| 7 | Pacific View Estates | Division St & Laurel Ave | Residential Development | Priority | one |
| 8 | Paradise Village | 4th St., 8th St., Arcadia Ave., & Bowron St. | Residential Development | Priority | one |
| 9 | Paradise Walk | Arcadia Ave and E. 8th St | Residential Development | Priority | one |
| 10 | Plaza Bonita Mall Expansion | 3030 Plaza Bonita Road | Commercial Development | Priority | five |
| 11 | Plaza City Apartments | 1535 E. Plaza Blvd | Residential Development | Priority | three |
| 12 | Plaza Village | L Avenue & Plaza Boulevard | Residential Development | Priority | two |

# 7 CONSTRUCTION

Construction and grading activities have the potential to negatively affect storm water quality due to the presence of large amounts of sediment. Sediment is a pollutant that can also carry other pollutants such as metals and nutrients into the storm drain system and ultimately to receiving waters. Effective sediment control and soil stabilization are necessary to prevent sediment and associated pollutants present at construction sites from entering the storm drain system. Both the Municipal Permit and General Construction Permit have regulations aimed at reducing the potential for sediment discharge from construction sites. Appropriate pollution prevention BMPs related to material and waste management and equipment cleaning can also help prevent materials like concrete, fuel, paint, and detergents from being transported from construction sites into the storm drain system.

Section 7 of the 2004 JURMP outlines the City's mechanism for ensuring that storm water pollution is eliminated at construction sites. Sites equal to or greater than one acre are required to comply with the State General Construction Permit (Construction Permit) as well as local requirements. Both sets of regulations ensure that BMPs are implemented effectively at all construction project sites. The City also conducts quick, minor repairs and improvements to curb gutters, sidewalks, and portions of streets. City staff responsible for these projects are trained in BMP implementation, and inspections are also conducted to make sure appropriate BMPs are in place for these small projects. See the municipal section of this JURMP Annual Report for more information about the City's BMP practices for street maintenance.

To ensure compliance with the City's Storm Water Ordinance and the Construction Permit, the City inspectors conduct inspections of project sites based on prioritization and inspection frequency as defined in the Municipal Permit and the City's JURMP. The City of National City maintains an inventory of all active construction project sites. During this reporting period, there were 3 high priority construction sites, 14 medium priority sites, and 72 low priority sites. Note that of the 3 high priority sites, only one was active during the entire 2006/2007 wet season. Tables 7.1, 7.2, and 7.3 present the inventories of the high, medium, and low priority sites, respectively. The following sections describe the City's construction-related activities during this reporting period.

## POLLUTION PREVENTION AND BMP REQUIREMENTS AND IMPLEMENTATION

Section 7.1 of the JURMP addresses pollution prevention methods. The City's required pollution prevention methods ensure that potential pollutants associated with construction sites are prevented from entering the MS4s or receiving water bodies. The City's grading ordinance, building code, and Storm Water Ordinance provide legal authority for these requirements.

Section 7.6 of the JURMP presents a list of BMP requirements. Appendix C of the JURMP presents more detailed BMP fact sheets for effective implementation of those BMPs at construction project sites. Construction sites are required to implement the following BMPs where applicable.

- Soil stabilization and erosion prevention
- Sediment containment
- Materials and equipment management
- Non-storm water discharge and drainage control

No changes have been made to the City's BMP requirements during this reporting period. The City's BMP manual for construction activities, intended for site owners, developers, and contractors, is available to any interested parties through the Engineering Department. Most major developers working in the City have received these manuals. The City also discusses the manual at CIP project pre-construction meetings to ensure contractors have received a copy and are aware of the requirements, and manuals are occasionally given out during inspections at construction sites.

## EDUCATION

During this reporting period, the City continued to conduct pre-construction meetings for Capital Improvement Projects (CIP). Private high priority sites have an onsite pre-job conference in most cases. The City also often conducts pre-job conferences at the Engineering Department front counter when a permit is pulled for smaller projects, typically classified as medium or low priority. City staff explain NPDES and relevant BMP requirements to the project proponents. The City's BMP manual (Appendix C of the JURMP) continues to be available at the City's Engineering Department counter; contractors or developers are asked to pay a minimal cost for the manual to cover copying expenses. Appendix C of the JURMP also may be given out to contractors at construction sites by the City's NPDES Storm Water Compliance Inspector.

During this reporting period, the City continued to distribute the "Construction Site Best Management Practices" fact sheet created during the 2005/2006 reporting year to all construction projects obtaining construction permits. The fact sheet lists the City's minimum BMP requirements for construction activities and the document is made a condition of permit issuance. This ensures that all projects are appraised of the City's BMP requirements, including even the smallest projects that require only building permits. A copy of the storm water hotline card may also be given to contractors at construction sites.

In January 2007 the City hosted a construction stormwater workshop for the City's construction and development community. Topics covered during this training included general storm water concepts, the City's construction BMP requirements, complying with the general construction permit, and a general overview of the City's SUSMP requirements. Similar to other workshops hosted by the City, pre- and post-workshop knowledge assessment tests were given. Overall, scores improved after the workshop. The City is planning another construction workshop for the 2007/2008 implementation year.

## GENERAL CONSTRUCTION PERMIT

In addition to ensuring that construction sites are in compliance with the Municipal Permit, the City has taken a proactive role in ensuring that the applicable construction sites are in compliance with Construction Permit requirements. Before receiving City permits for work on their projects, project proponents are required to complete a Storm Water Requirements Applicability Checklist, which includes a section on Construction Permit subjectivity

(Attachment 6.2). Sites over one acre in size are subject to the Construction Permit and are required to obtain coverage. The City conducts a formal technical review of the SWPPP for sites subject to the Construction Permit prior to the start of construction. The SWPPP is reviewed against the Construction Permit SWPPP guidelines to ensure all sections of the permit are addressed. A formal letter with the technical review comments is sent to the developer, who must resubmit a revised SWPPP if it is found that the document did not meet the relevant requirements. Once comments are adequately addressed, the developer may commence with the project.

The City has noted some common SWPPP deficiencies during the review process. As noted above, the developer is required to correct the deficiencies before the project is allowed to proceed. Common deficiencies are listed below.

- Base SWPPP templates were not tailored to make them site specific.
    - BMPs were not site specific.
    - Material lists were not site specific or complete.
- Some information was missing or not included.
    - Attachments referenced in the text were missing.
    - Site maps did not include all necessary information, such as drainage patterns and BMP locations.
- Post-construction BMP implementation and short-term and long-term funding were not addressed. In some cases for Priority Projects, post-construction BMPs proposed in the SWPPP did not match those proposed in the SUSMP. In these cases the City required the developer to revise the documents to be in agreement with each other.
- Project schedules and contractor information were not available.
- NOIs had not yet been sent to the State Water Resource Control Board. In these instances, the City ensured Construction Permit coverage was obtained before the project was allowed to proceed.

While the project foremen were generally quite knowledgeable on storm water issues, it was noted during inspections that some personnel on construction sites did not receive training on SWPPP implementation. In a few instances, the SWPPP was not available onsite or was inaccessible to workers.

## INSPECTIONS

The Municipal Permit requires that storm water compliance inspections for construction sites be conducted based on the following frequencies:

- During the wet season (October 1st through April 30th), designated high priority construction sites must be inspected weekly, while medium and low priority construction sites must be inspected twice during the wet season.
- During the dry season (May through September), constructions sites are to be inspected as needed. The City has gone beyond this minimum requirement, also inspecting high and medium priority sites during the dry season.

The City requires all construction sites to prevent discharges to the MEP through effective project planning and research, erosion prevention, sediment containment, materials and equipment management, and non-storm water discharge and drainage control. Common examples of these measures include fiber rolls, silt fences, rip-rap, and hydroseeding. Erosion prevention measures have been found to be the most effective and least costly BMPs. In some cases, additional BMPs beyond those specifically required by the City's JURMP must be implemented to meet the City's MEP standard. To ensure these requirements are met, the City performs inspections of construction sites to evaluate if project proponents are correctly implementing required BMPs. Data collected during this reporting period indicates that the City's program has continued to be fairly effective at ensuring compliance at construction sites. Most sites were in compliance, and the City's enforcement actions resulted in the non-compliant sites implementing the necessary corrective actions.

During this reporting period, the City of National City conducted all necessary inspections to ensure compliance with the Municipal Permit requirements and meet the inspection frequency goals outlined in the City's JURMP. The City's NPDES Storm Water Compliance Inspector and D-MAX inspectors visited medium and high priority construction sites according to the frequencies described earlier in this section. The low priority construction sites were visited by construction inspectors to ensure BMPs were implemented effectively. BMP implementation was checked at all permitted projects that disturb soil, and if the construction inspector noted deficiencies in BMP implementation or a threat to water quality, the City's Storm Water Compliance Inspector was contacted immediately to address the issue with the property owner and contractor. Many of the low priority construction sites were completed in a very short period of time; thus, two inspections during the wet season were not feasible for some small projects, such as construction of new driveways. Common deficiencies in BMP implementation were noted during the inspection process. Inspectors found that for some of the medium and high priority construction sites, contractors failed to implement structural and non-structural BMPs outlined in their SWPPPs or failed to actively maintain BMPs once implemented. Selected structural BMPs are outlined in Appendix C.6 of the JURMP manual and are required to be implemented in accordance with the guidelines outlined by the California Storm Water Quality Association. Common BMP deficiencies observed during this reporting period are listed below:

- Improper material storage and stockpile protection
- Improper equipment/vehicle storage
- Improper entrance/exit stabilization
- Sediment buildup around discharge locations
- Improper or insufficient erosion control BMP implementation
- Insufficient or failed perimeter protection

Most BMP deficiencies were primarily the result of not maintaining good housekeeping practices. General areas of improvement regarding good housekeeping practices include: sweeping around storm drain inlets and other discharge areas, keeping streets around the construction site free of sediment, properly containing waste materials, and properly covering or containing stockpiles.

Where BMP deficiencies were noted, corrective actions were recommended and follow-up inspections were performed to ensure compliance. Inspectors also educated contractors and developers by discussing storm water and erosion control requirements and providing written BMP information to ensure compliance with the Municipal Permit and the Construction Permit. In instances where additional enforcement actions are required, a stop work order is issued until proper BMPs are implemented (see Compliance and Enforcement Actions below). If necessary, the inspector may reclassify the priority of a construction site if it is found to consistently lack proper BMP implementation or receive stop work notices, citations, or notices of violation.

## CONSTRUCTION SITE INSPECTION TRACKING SYSTEM

The City continues to input construction site inspection findings into a storm water database. For high and medium construction inspections, a four-page inspection form is filled out per inspection. The information from the inspection is entered into the database and used to keep track of each site's compliance. Queries can be conducted to track corrective actions and notices of violation observed at various construction sites.

## COMPLIANCE AND ENFORCEMENT ACTIONS

The City has developed and continues to update the compliance and enforcement protocol as identified in the JURMP Section 8, Enforcement Measures for Construction Sites. The goal of the enforcement process is to ensure facilities are compliant with local, state and federal regulations and BMP requirements.

If relatively minor BMP problems are found during an inspection, the City's NPDES Storm Water Compliance Inspector issues a verbal warning to the responsible party and follows up with the site the next day. If the problem has not been corrected, a stop work order is issued until appropriate BMPs are implemented. Note that a Corrective Action Letter may be issued if no representative is on site when a minor BMP issue is discovered. The City also follows up at these sites to ensure that corrective actions are undertaken promptly. If an inspector finds an active discharge of pollutants or gross negligence on the part of the developer in implementing BMPs, the City's NDPES Storm Water Compliance Inspector immediately issues a stop work order, and in many cases an Administrative Citation is issued as well. The developer or contractor is also required to clean up discharged materials if possible. In some cases, the City will also issue a NOV, which requires the submittal of a written corrective action plan. The stop work order is not lifted until the required BMPs have been properly implemented. The City has found stop work orders to be effective enforcement tools, largely because they impose more significant costs than do citations in the range of several hundred dollars. In some cases, contractors will implement BMPs within a very short time frame when informed they are at risk of receiving stop work order.

The City's NPDES Storm Water Compliance Inspector is authorized to administer administrative citations, stop work orders, and NOVs. In many instances during the storm water compliance inspection, contractors and developers implemented corrective actions immediately. During this reporting period, the City administered four administrative citations, two corrective action letter, and three NOVs in support of its construction program. The administrative citations were given due to lack of BMP implementation, sediment discharge, and non-storm water discharge. Most of the regularly inspected construction sites had relatively good compliance records; the majority of the enforcement

actions were taken in response to complaints reported to the City. The complaints and the City's response are discussed in Section 8 of this Annual Report. Of the construction sites that were issued enforcement actions, all came into compliance after the first citation was issued and the City did not have to issue additional enforcement measures.

During the 2006/2007 reporting period, the City issued one stop work order to the Plaza Bonita Mall redevelopment when the site was found to have begun construction without submitting an NOI, SWPPP, or a SUSMP report. Construction was not allowed to resume until a SWPPP was submitted, reviewed, and approved and an NOI was filed with the RWQCB. The site complied promptly and construction was allowed to continue. In order to prevent extended delays on the project, the City allowed the project to resume construction before the SUSMP report was approved. Since this project was a redevelopment and site constraints limited the ability for the site to implement site design BMPs or larger treatment control BMPs, the City decided that allowing the project to begin construction would not further limit the site, source, and treatment control BMP options available to the site. The project was told that once the SUSMP for the project was approved, the construction plans would have to be changed to reflect the BMPs included in the SUSMP and final approval would not be given to the project until these BMPs were installed. When the final approved SUSMP for the site included new BMPs for the site's already completed dock areas, the City required the site to go back and rebuild the dock areas as described in the site's SUSMP. The City also took extra precaution with the site by assigning it a construction priority of high despite the site meeting medium priority criteria. The City conducted weekly inspections for the site during October and November of 2006 to ensure the site was complying with City requirements. Since the site was not found to have any major deficiencies in BMP implementation during these months, the City dropped the site's priority to medium, and subsequent inspections were less frequent.

During the reporting period the City did not have to issue any stop work orders to construction sites for failure to comply with previous enforcement measures.. The City has demonstrated in past implementation years that issuance of high level enforcement measures such as stop work orders are not just empty threats, and it is likely that construction sites are complying more quickly with the City's BMP requirements to avoid these costly penalties.

Section 7.9 of the City's JURMP, "Reporting of Non-Complaint Sites," states, "The City of National City will provide oral notification to the RWQCB within 24 hours of the discovery of any non-compliant sites within its jurisdiction that are determined to pose a threat to human or environmental health. Oral notification will be followed up by a written report and submitted to the RWQCB within 5 days of the incident as required in Attachment C (B.6) of Order 2001-01." Further, in the event that a contractor or site owner refuses to cooperate with the compliance process, it is reported to the RWQCB. During this reporting period, no construction sites were found to pose a threat to human or environmental health, and the RWQCB did not need to be contacted.

## IMPLEMENTATION PLANS FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the

requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

# 8 ILLICIT DISCHARGE DETECTION AND ELIMINATION

The City of National City JURMP includes three mechanisms for detecting and eliminating IC/IDs within the municipality, all of which have been successfully implemented during the 2006/2007 reporting period. These programs continue to support each other, refining the City's ability to identify and eliminate sources of pollutant discharge. They are as follows:

- Conducting dry weather field screening and analytical monitoring
- Inspecting local businesses, municipal facilities, and construction sites
- Operating a public complaint hotline

Sections 2, 3, 4, and 7 of this report describe in detail the results of each of the inspection programs. This section provides a detailed discussion of the Dry Weather Monitoring Program and the public complaint hotline. During this reporting period, the Dry Weather Monitoring Program continued to identify residential and commercial areas across the City where the presence of certain pollutants warranted increased BMP implementation. Water quality data provided by the program proved again to be valuable in detecting and eliminating IC/IDs, as well as providing data about water quality in the MS4. The complaint hotline allows the public to take action and assist the City in identifying individual polluters. Public involvement proved to be greater than ever this year, as the number of hotline reports increased again during this reporting period.

## DRY WEATHER MONITORING PROGRAM

The Municipal Permit and the National City JURMP state that the Dry Weather Monitoring Program's purpose is to eliminate IC/IDs to the storm drain system. An IC/ID upstream of a Dry Weather Monitoring Program field screening site is often evidenced by elevated constituent concentrations at the site itself, and in such a case the source of the IC/ID can usually be tracked. A summary of the results of the 2006 Dry Weather Field Screening and Analytical Monitoring Program is presented below. The program report is included as Attachment 8.1. The program consists of (1) field screening observations, (2) field screening analytical monitoring, and (3) laboratory analytical monitoring; all three parts of the program are conducted during the dry weather period. Data collected in the field and laboratory is compared against established action levels. Numeric action levels were adopted in 2003 based on statistical analysis of previous dry weather data. For dissolved metals, the California Toxics Rule gives the action level, which is dependent on the hardness value of the water sample. Best professional judgment was used in evaluating several field parameters, such as turbidity and temperature.

### 2006 Dry Weather Monitoring

The City of National City's 2006 Dry Weather Monitoring Program was conducted in September 2006. Of the fifteen primary monitoring stations, two sites were observed dry, Site 20 and Site 42. As a result, field screening was performed at two alternate stations, sites 48 and 49, to compensate for the dry sites. Dry weather site locations are listed in Table 8.1. Table 8.1 also includes a brief description of the sites, latitude and longitude coordinates,

primary and secondary land uses, and the type of storm water conveyance structure at the site. Field screening at these sites included qualitative observations, flow measurement, and field water quality analyses. Qualitative observations provided context for the quantitatively measured parameters. Water odor, color, and clarity were evaluated qualitatively along with current weather conditions, floating material, vegetation, deposition, and biological activity. Quantitative measurements were made of specific conductance, temperature, pH, turbidity, methylene blue-active substances (MBAS, typically indicative of surfactants), nitrate nitrogen, ammonia nitrogen, and orthophosphate phosphorus. Water samples for laboratory analysis were collected at four of these monitoring sites, representing more than the 25 percent of sites with ponded or flowing water. The laboratory analyses quantified total hardness, surfactants, oil and grease, diazinon, chlorpyrifos, dissolved metals (cadmium, copper, lead, and zinc), total coliform bacteria, fecal coliform bacteria, and *Enterococcus* bacteria.

During routine visits temperatures ranged from 18.4 to 29 °C, pH values ranged from 7.7 to 8.8, turbidity measurements from 1.1 to 28 NTU, and conductivity readings from 1.1 to greater than 20.0 mS/cm. Table 8.2 presents the results of all field analyses conducted at the sampled sites during the 2006 Dry Weather Monitoring Program.

Field analyses of chemical parameters resulted in a range of ammonia nitrogen concentrations from 0.1 to 1.5 mg/L $NH_3$-N, nitrate concentrations from 1.25 to 2.50 mg/L $NO_3$-N, orthophosphate phosphorus concentrations from 0.13 to 1.96 mg/L $PO_4$-P, and surfactants (MBAS) concentrations from 0.13 to greater than 3.0 mg/L.

There was one site that was found to have ammonia concentrations above the action level of 1.0 mg/L. Four sites initially had high surfactants concentrations, with Site 48 having the highest reading of greater than 3.0 mg/L. High conductivity was measured at three sites. These sites are located in the western part of the storm water system, which consistently have high conductivities attributed to residual salt water from the tides.

Laboratory analyses were conducted at four sites and bacterial contamination was found at three of the four sites, sites 1A, 32, and 46. The action levels for the three bacterial indicators are 50,000 MPN/100 mL for total coliform, 20,000 MPN/100 mL for fecal coliform, and 10,000 MPN/100 mL for *Enterococcus* bacteria. Elevated total coliform levels were recorded for all three of these sites. Sites 1A and 32 also had elevated fecal coliform levels, while sites 1A and 46 exceeded the action level for *Enterococcus*.

Dissolved cadmium and lead were not detected at any of the sites. The concentrations of dissolved zinc and copper did not exceed the California Toxics Rule benchmark at any site and were therefore not considered to impair water quality. None of the sites sampled for laboratory analysis had detectable levels of the pesticides diazinon or chlorpyrifos. No sites had detectable oil and grease concentrations. Laboratory analysis did not measure surfactant concentrations over the action level of 1.0 mg/L at any of the sites.

Table 8.3 presents the results of all laboratory analyses conducted during the 2006 Dry Weather Monitoring Program.

**2006 Follow-Up Investigations**

Data collected through the City's Dry Weather Monitoring Program are used to identify locations within National City that are contributing to storm water contamination. Source

identification investigations are then initiated to identify the causes of the detected pollution. Five sites received follow-up investigations for pollutants detected during field screening tests: Sites 1A, 11, 47, and 48 for surfactants, and Site 48 for ammonia. These follow-up visits were made within approximately 24 hours of the initial exceedance. The results of these immediate investigations were reported in the dry weather report and are summarized below.

A follow up investigation at Site 1A revealed that the surfactants concentrations had gone back below the action level and that this was most likely transient. Sites 11, and 47 had surfactants concentrations above the action level (1.5 mg/L) and Site 48 had surfactants concentrations greater than 3.0 mg/L. The elevated surfactants at Site 11 are likely to have come from illegal vehicle washing at a business upstream of the site, and during the follow up investigation surfactants concentrations had lowered below the action level, indicating that this was likely due to the cessation of washing activities. The elevated surfactants levels at Site 47 were most likely the result of run-off from commercial car washing in the vicinity of the Mile of Cars. The upstream investigation for Site 48 revealed that a resident was watering his yard and there was also evidence of washing activities, which could both contribute to the high surfactants concentrations. Site 48 also had ammonia concentrations during the initial visit at above the action level. During the follow up visit to Site 48, ammonia concentrations had dropped back below the action levels, so ammonia was likely transient.

Due to the time delay of laboratory analyses, any exceedances in constituents measured by laboratory analyses could not be investigated within 24 to 48 hours of sampling. After the laboratory analyses were received, however, a second round of follow up investigations was conducted to trace constituent exceedances detected by the laboratory testing. Three sites were included in this second round of follow-ups: Site 1A, Site 32, and Site 46. A brief description of the investigation procedure and results from these upstream investigations is summarized below; the follow-up investigations are discussed in more detail in Attachment 8.1.

During the follow-up investigations, visual observations were recorded including flow rate, floatable material, deposits, and water color, clarity, and odor. The physical parameters of temperature, pH, and conductivity were measured at all the sites, and chemical field tests were performed for ammonia and surfactants where necessary. When bacterial investigations were conducted, field investigators used 3M Petrifilm Coliform Count Plates to evaluate bacterial levels. This method provided a cost-effective and timely way to investigate bacterial contamination, compared to the expensive and relatively lengthy process of submitting samples for laboratory analysis. Field investigators began the investigations at the sites and then gradually worked upstream to try to identify sources.

Bacteria at Site 1A appeared to be from a combination of decaying trash, organic debris, and pet waste found at the site itself and in curb inlets in residential areas upstream of the site. At Site 32, the flow rate through the site was minimal, and litter at the site and human inhabitation upstream in the channel were possible contributors to the bacteria levels at the site. Debris in two catch basins upstream of Site 46 was the most likely source of bacteria at Site 46. These catch basins drain runoff from the surrounding shopping centers' parking lots, and decaying organic material and trash were also observed in the catch basins.

**Follow-Up Actions**

Once the sources of contaminants were identified, recommendations were made in the 2006 Dry Weather Monitoring Report. All recommendations that involved cleaning the MS4, including clean outs at sites 1A, 13A, 20, 32, 38, 40, 41, 44, and 48, completed by City Public Works crews. The City also completed an additional study to assess sources of trash and debris and has formed a working group from City departments to address sources of trash and debris. Please see Section 13 for details.

City staff did not find any more IC/IDs associated with Styler's Body Shop in 2006/2007, and the 2007 dry weather results did not find any detergents exceedances downstream of that body shop at Site 11. Courtesy inspections were conducted for businesses along Mile of Cars Way, and many of the businesses in the area also attended the City's educational workshop for commercial businesses. No exceedances for detergents were noted in that area (Site 47) during the 2007 Dry Weather Monitoring Program. To apply more pressure to businesses upstream of Site 46, the City initiated discussions with the property management about necessary improvements at the businesses. While some improvements have been made, efforts in this area are ongoing.

In response to the recommendations of the dry weather report, the City sent letters and educational materials to residences and businesses in areas believed to be sources of exceedances in monitoring results. The City also provided invitations to City hosted workshops. Educational materials were sent to areas upstream of Site 1A, Site 46, and Site 47. Over 1,470 notices were mailed.

**2007 Dry Weather Monitoring**

The 2007 Dry Weather Monitoring Program commenced in the late summer of 2007, beyond the date range covered by this Annual Report. Because 2007 data is utilized in some portions of this Annual Report, the 2007 dry weather monitoring and upstream investigations report is included as an attachment to this Annual Report (Attachment 8.3). The results of the 2007 report will be discussed in the 2007/2008 JURMP Annual Report.

## HISTORICAL DATA

Evaluation of data collected during the Dry Weather Monitoring Programs since 2002 revealed that the City of National City has maintained relatively low levels of both nitrates and orthophosphates throughout the City. The specific conductance of the water measured throughout the City fell within normal ranges for all sites except those that were affected by tidal waters or permitted non-storm water discharges. Since 2003, all pH readings have been within the established range at each of the sites visited. Each year several of the sites have been identified to have ammonia concentrations above the established action level. The number of sites with a sample exceeding the ammonia action level has decreased from four in 2004 to two in 2005, and only one in 2006. Often the elevated ammonia concentrations are the result of stagnation and decay in sites with low flow rates or ponded water. To lessen surfactants pollution, the City of National City has inspected automotive-related businesses for uncontained washing and provided educational material to the public regarding surfactants pollution. The total number of sites with surfactants exceedances dropped from eight in 2004 to only two in 2005, and increased to four in 2006. Often

surfactants are transient and can be traced to uncontained commercial or residential washing.

The City is also able to utilize data from the Dry Weather Monitoring Program to focus its efforts on areas of the City and on particular pollutants that appear problematic. Priority residential areas are described in Section 5 of this report. The City will continue efforts to educate the public on washing practices, littering, irrigation, green waste disposal and pet waste disposal BMPs. For example, the City hosted a Residential workshop on 2/21/2007 where educational materials were distributed and residents were encouraged to ask questions.

## COMPLAINT REPORTING OF IC/IDS, INVESTIGATION, AND ENFORCEMENT

The City has continued to encourage citizens and City personnel to become active participants in IC/ID elimination and storm water pollution prevention by utilizing the storm water public complaint hotline. The number for this hotline has been mailed to every residence in the City and is published in the contact information section of numerous brochures addressing storm water related issues. Additionally, the hotline number is distributed by the City Engineering Department in the form of a business card. City personnel investigate every complaint logged through the hotline to determine if pollutants are in fact being discharged to the MS4. The City's NPDES Storm Water Compliance Inspector can be contacted via cell phone to respond to calls about water main breaks, sewer spills, and other significant spills. This helps ensure that all reported spills are responded to as quickly as possible. If investigators find evidence of a violation or other IC/ID, every effort is made to find the responsible party and inform them of the complaint and their non-compliance. The responsible parties are educated or cited as necessary and required to cease any illegal discharges. If it is possible, they are required to conduct the immediate clean up of the polluting discharge. In some cases City crews conduct cleanup efforts and then bill responsible parties for cost recovery.

A summary of the reported violations that were investigated by the City between July 1, 2006 and June 30, 2007 is shown in Table 8.4. A total of 143 complaints were logged and responded to during this period. The total number of complaints handled is slightly less than the number reported during the previous reporting period.

## RESPONSE TO SPILLS

The City of National City has developed a Sewer Overflow Prevention Program and a Sewer Overflow Response plan to facilitate, prompt and encourage effective spill response throughout the City. The response program includes information about safety, treatment, and reporting duties, as well as instruction on how to complete sewer spill reports.

Receipt of citizen complaints is the City's primary mechanism for notification of spills from private sewer laterals. The City typically receives about two calls per year regarding problems with private sewer laterals. These calls usually deal with roots, grease, or debris blocking the private lateral. In that case, the property owner is responsible for the resolving the problem; the City also clears the mainline sewer that services the property in every case, however. If the owner has a property line clear-out, the City tries to help out in any way it

can. Generally these minor problems with private laterals do not result in spills to the storm drain system, although more significant blockages are sometimes observed.

During this reporting period, only one SSO was documented and reported to the RWQCB, which is an improvement from the six that were reported during the last reporting period. The SSO was caused by a grease blockage that caused a pipe to rupture. Approximately 6,750 gallons of over flow was released, none of which could be recovered. None of the overflow reached any receiving waters, however. City crews flushed the line upstream of the blockage and cleaned area affected to the maximum extent practicable.

**IMPLEMENTATION PLANS FOR 2007/2008**

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

## TABLE 8.1
## DRY WEATHER MONITORING SITES

| Site No. | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Unit | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908 | 32.68575 | -117.10166 |
| 11 | North of 18th Street, between Roosevelt Avenue and Hoover Avenue | Earthen Channel | Commercial | Commercial | 908 | 32.66695 | -117.10516 |

**TABLE 8.5**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 1 | 7/5/2006 | Public | 1935 Via Las Palmas | Reported "dumping" | The inspector called P.D. regarding dumping. This call was from 6-30-06. The inspector went to site and found no evidence of discharge. |
| 2 | 7/5/2006 | Public | 900 Block of Delta | Vehicle involved in accident leaking oil in gutter for approximately 1000 ft. | There was a black pick up truck parked on the south side of Delta at the 900 Block. There was front end damage to the vehicle and oil in the gutter for about 1000 ft. and on the sidewalk. The oil is not flowing and is not near an inlet. The truck had no plates and NCPD was called to tow vehicle. |
| 3 | 7/10/2006 | City Staff | 3030 Plaza Bonita Rd. | No grading permits-stockpiles of soil. | The inspector went to site. Not all BMPs on the erosions and sediment control plan have been implemented. Stop work order issued. Need SWPPP, SUSMP, NOI, etc. Meeting was scheduled for 7/11/06. |
| 4 | 7/10/2006 | City Staff | Highland Avenue Medians | Stockpiles next to Paradise Creek. | Port-a-john without secondary containment.<br>Concrete washed out onto asphalt parking lot.<br>Topsoil stockpile not contained.<br>Broken gravel bags in parking lot. Problems resolved upon follow up inspection.<br>Work was stopped until BMPs were implemented. After inspector confirmed BMP implementation, work was allowed to resume. |
| 5 | 7/11/2006 | Storm Water Hotline | R Ave. between 4th and 5th. | Pick up truck leaking oil. | There was a 1988 white Toyota pick-up with a 1 gallon container bungee-strapped to the engine leaking oil on the street. The inspector received the registered owners' information from PD and tried to make contact. They were not home and case was referred to code enforcement |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 6 | 7/12/2006 | Storm Water Hotline | R Ave. between 4th and 5th. | Pick up leaking oil. | Building Department unable to follow-up on vehicle leaking oil. The inspector returned today to find that vehicle has been moved about 50ft north but still on street leaking oil. N.O.V. issued with admin citation. |
| 7 | 7/12/2006 | Storm Water Hotline | 16th and I | City vehicle leaking coolant. | City vehicle leaked coolant onto the street and in the gutter. Equipment maintenance cleaned with absorbent and pads. No further action. |
| 8 | 7/18/2006 | Storm Water Hotline | 1500 Block Coolidge | Hosing down street. | The inspector explained NPDES and left educational material. |
| 9 | 7/20/2006 | Public | 9th and M | Transmission fluid in gutter going into storm drain inlet. | A contractor re-surfaced a driveway. The tar ran into the street, gutter, and inlet. Property owner and contractor were contacted. Both agreed to clean street and gutter. Sewer crew was called to clean inlet. |
| 10 | 7/24/2006 | Storm Water Hotline | 9th and M Ave. | | Follow up to above complaint. Tar and sand has been removed form street and gutter. Some staining remains on street and gutter.<br>Inlet clean. |
| 11 | 7/27/2006 | Public | Between Harrison Ave & 18th Street | Washing a truck at the corner of Harrison Ave and 18th Street. | Gave a warning not to wash at the public right of way. |
| 12 | 8/1/2006 | Storm Water Hotline | 1535 NCB | Hosing down parking lot and water was entering inlet. | Second violation within 1 year period. Citation & NOV issued. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 13 | 8/1/2006 | Public | 18th & D | Wax residue in gutter. | Checked area for white wax residue. There were no signs of discharge of wax. A small amount of water was present in the surface to curb drains coming from the school. No further action. |
| 14 | 8/1/2006 | Public | 17 E 2nd Street | Mechanical work being conducted on street. Oil being spilled. | There were signs that auto repairs had been conducted. There were 2 oil spills on the ground/street and lots of stains. There were no activities at the time of this inspection. No further action. |
| 15 | 8/3/2006 | Storm Water Hotline | 100 Laurel Ave. | Washing paint to gutter. | There was a handyman washing drywall mud down the driveway and into the street. Admin citation issued for discharge. Area cleaned with broom and mop. |
| 16 | 8/21/2006 | Storm Water Hotline | 42 Valva Avenue | Construction debris on property. Open paint cans on front lawn. | Open paint cans on front lawn. Building inspector stopped work and posted notice on site. Two contractors were issued citations for conducting business in National City without a valid business license.<br>A site representative called City and agreed to have debris removed the next day. Came to the City tomorrow to required permits from building department. |
| 17 | 8/21/2006 | Storm Water Hotline | 2744 Grove (County address) | Home business: Washing construction equipment with discharge going to inlet on Grove in N.C. possibly stucco or dry wall mud. | The inspector notified county. County phoned on 8/22/06 and agreed to take responsibility for following up with site. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 18 | 8/21/2006 | Public | 136 Valva Avenue | Paint in gutter from men washing paint brushes. | Drywall tools were washed in the street resulting a discharge of water and dry wall mud into the street, gutter and inlet. Admin citation issued. The inspector called sewer crew to clean gutter street and inlet, where pollutant was contained. |
| 19 | 8/28/2006 | Storm Water Hotline | 1415 Orange | White lincoln leaking oil on street. | Vehicle parked legally on east side of street. There is evidence that the vehicle leaks oil, but oil is not flowing down street. Vehicle marked for 72 hours parking and referred to PD-traffic. |
| 20 | 8/29/2006 | Public | 8th and Arcadia | Bags of trash on street, vehicle repairs being conducted on street. | There were several bags of trash, a trash can and lots of water in the street. There was no indication that auto repairs were being conducted. Trash can was placed on property by street supervisor who then called EDCO to have can removed. All bags and litter were packed up and taken to PW to properly dispose of. Asked code enforcement to notify property owner that there was debris on property. |
| 21 | 8/29/2006 | Storm Water Hotline | 200 Block W. 35th St. | Motor home leaking sewage. | Motor home was moved from 400 block of W.35th to the 200 block. There was an odor of sewage. The inspector photographed the underside where sewage was leaking. Vehicle was towed by NCPD traffic division. Admin citation issued. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 22 | 8/29/2006 | Public | 1120 Hoover Avenue | Property owner requested courtesy inspection by City to check compliance. | 8/30/06: Inspector went to location at 3:00 pm. The business was closed.<br>9/13/06: Inspector went to location and business was closed. |
| 23 | 8/30/2006 | Storm Water Hotline | 2643 E 4th Street | Debris on site from house and vehicle burned six months prior. | Referred to code enforcement. |
| 24 | 8/31/2006 | Storm Water Hotline | 17th St (Unpaved) | Trash, oil, debris etc. on street and in drainage ditch. | The inspector called PW to clean area. PW cleaned on 9/5/06. |
| 25 | 8/31/2006 | Storm Water Hotline | 713 E 1st Street | Building in the City right of way. | Resident stated that he was building 2 play houses. There was saw dust in the gutter and on the street. Resident was told to remove lumber and clean gutter and street. |
| 26 | 8/31/2006 | Public | 2605 Highland | Check site to make sure it is in compliance. | The inspector phoned 9-5-06 with recommendations to keep dumpster lid closed and provide tray (S/C) for port-a-potty, and clean all residue from ground. |
| 27 | 9/5/2006 | Storm Water Hotline | 2221 E 16th Street | No BMPs. | Contractor called and will implement BMPs prior to conducting work. He will call for re-inspection when BMPs have been implemented. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 28 | 9/5/2006 | Storm Water Hotline | | Vehicle washing on the street. | The inspector explained NPDES in regards to vehicle washing for residential zones. Individual agreed to wash van in his private lot without having any discharge of soapy water. Verbal warning only. |
| 29 | 9/6/2006 | Storm Water Hotline | 1215 Palmer Way | No Permit - dirt in city right of way. | Applicant came to Engineering counter. The inspector explained NPDES requirements for construction BMPs. Applicant purchased BMP manual to use as a guide to install BMPs, especially for soil containment and concrete washout. Permit withheld until BMPs are implemented. |
| 30 | 9/6/2006 | City Staff | 2424 18th St. | Power washing house. | Power washing house blasting paint chips to ground. No discharge observed. The inspector explained NPDES and BMPs to prevent any discharge from leaving property. |
| 31 | 9/7/2006 | Storm Water Hotline | 1710 Lanoitan | Hose down sidewalks. | The inspector talked with resident. The inspector explained NPDES and left flyers. |
| 32 | 9/7/2006 | Public | 1619 Morning Breeze | Uncontained soil above inlet. | The inspector observed the landscape yard. The soil was not loose, just without ground cover. |
| 33 | 9/11/2006 | Storm Water Hotline | Civic Center Drive and Wilson Ave. | Truck hit and sheared off fire hydrant. | A truck hit and sheared off a fire hydrant. NCPD and Sweetwater Authority were notified. Sweetwater Authority shut off the water flow approximately 15-20 minutes after flow started. Approximately 121,100 gallons of water was discharged to the storm drain conveyance system. Verbal notification to RWQCB on 9-11-06. Written notification on 9-11-06. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 34 | 9/13/2006 | Storm Water Hotline | 1215 Palmer Way | Construction site - no BMPs and stockpiles of soil in the street. | The property owner came into Eng. to obtain a permit after beginning work. Site inspection found that a permit was required and that there were no BMPs implemented. The inspector issued a verbal stop work order until all BMPs were implemented and a permit is issued. Later inspection found BMPs in place and stockpiles in right of way removed. |
| 35 | 9/13/2006 | Storm Water Hotline | 1512 Coolidge Ave. | Motor home leaking sewage. | Inspector observed an individual hosing down the street. Individual reported that the plumbing/pipe for the holding tank on his motor home broke loose when he was moving the motor home, discharging approximately 15 gallons of sewage to the street. The inspector stopped him from hosing down the street and immediately called the city sewer crew to conduct clean-up. Several individuals helped to contain spill until sewer crew arrived. The area was sanitized/deodorized and vacuumed up. The inlet at the corner of 15th and Wilson was cleaned. The street sweeper was called in on O/T to provide additional cleaning of the area. |
| 36 | 9/13/2006 | Storm Water Hotline | 1507 Coolidge | Hosing down street. | While on site of a sewer spill in the street the resident at this address started hosing down the street. The inspector explained NPDES and let her know that it was against City orders to hose down street. The inspector gave a verbal warning and the problem is resolved. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 37 | 9/14/2006 | Storm Water Hotline | 1535 Tidelands | Power washing roof | The inspector explained NPDES and BMPs. The inspector notified foreman that all roofing residue must be cleaned from parking lot. The inspector did not witness any power washing. Required contractor to provide S/C for liquid in drums stored within 5ft of inlet or move to inside location. |
| 38 | 9/18/2006 | City Staff | 3100 Block of Hoover | | Homeless camp found in the storm water conveyance system (Sweetwater Marsh). Firefighters used approximately 5,000 gallons of water to extinguish a fire. Sewer crew was called to clean inlet basins on both sides of the street.Street crew was called to clean rubbish from area. Received approved to clean from state RWCB and Army Corps of Engineers. |
| 39 | 9/18/2006 | Storm Water Hotline | 1329 Highland Ave. | Saw cutting concrete, waste entering inlet. | Waste from saw cutting concrete to install new gas line entered nearby inlet. No BMPs observed. Sewer crew was called to clean street and inlet. |
| 40 | 9/19/2006 | City Staff | 221 W. 30th Street | Saw cutting on sidewalk with discharge to the gutter. | Discharge reached only gutter and not inlet, the nearest inlet is >1000 ft away. Verbal warning given, and company immediately began vacuuming the water. |
| 41 | 9/19/2006 | City Staff | 1526 18th Street | Sewer coming out of clean out. | A ~ 3 in x 3 in moist area around clean out was observed but no discharge was noted. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 42 | 9/19/2006 | City Staff | 1610 E 8th (Parking lot) | Discharge of water to inlet. | There is a broken sprinkler leaking water to sidewalk gutter and inlet at the corner of 8th and Palm. Trash, landscape debris, and food in area. Corrective action sent.Remove excessive landscape debris and litter in parking lot.Remove stump grindings or provide erosion control in planting beds.Remove food products from planting beds.Repair and adjust irrigation system to prevent run-off into inlet at the corner of 8th street and Palm Ave. Follow up: parking lot cleaned of landscaping debris.Stump grindings and food particles removed. |
| 43 | 9/19/2006 | City Staff | 835 Palm | Water leaving lot. | Employee was hosing down parking lot. Verbal warning and educational material given to employee. |
| 44 | 9/20/2006 | Storm Water Hotline | Site 1A (Division) Dry Weather | Significant trash. | The inspector called sewer crew to clean or refer to S.D. if under San Diego jurisdiction. |
| 45 | 9/20/2006 | Storm Water Hotline | 14th & Grove | Decomposing trash. | The inspector called sewer crew to be cleaned. |
| 46 | 9/20/2006 | Storm Water Hotline | I54 and N 2nd/Edgemere | Trash dumped on side of road. | The inspector called street crew to be removed. |
| 47 | 9/21/2006 | Storm Water Hotline | Vacant lot on plaza, Parcel #558-0302500 | Trash on lot. | There are several deteriorated bags with trash. NOV issued. Re-inspection on 10/16/2006. Trash was cleaned from lot. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 48 | 9/21/2006 | City Staff | 3116 Plaza Blvd, | Fire in Storm drain. | There was a fire along the bank of mainly concrete channel. Site was visited and no trash was noted in the area. Army Corp of Eng. Was contacted to ask if the City could remove vegetation from the bank. Authorization to remove vegetation was not given, no further action needed. |
| 49 | 10/2/2006 | Storm Water Hotline | Slope of I-54 at Hoover Ave and 32 Nol St | Dust (clearing and Grubbing the slope of I-54 at Hoover Ave and 32 Nol St). | The inspector spoke to contractor whom agreed to install sprinkler and shrubs on the slope of I-54. Not a NPDES issue, issue resolved. |
| 50 | 10/5/2006 | Storm Water Hotline | 18th St. and D Ave. | White liquid coming from address and flowing into gutter. | The inspector saw white liquid along the gutter. Upon re-inspection on 10/9/2006, white liquid was gone. Inspector educated janitor about NPDES and proper BMPs. |
| 51 | 10/10/2006 | Storm Water Hotline | 1526 E 18th St. | Pieces of old stucco scattered along alley. | The inspector went to the site and asked owner to clean the scattered stucco. Follow-up on 10/11/06, debris removed. |
| 52 | 10/18/2006 | Storm Water Hotline | 3815 Holleyhock | Illegal fill dirt on slope. | Owner removed fill dirt.<br>Problem resolved. |
| 53 | 10/18/2006 | Storm Water Hotline | 2336 E 4th St | Illegal grading. | The owner was advised to implement erosion control along the fence on the east side of property. Problem resolved 10/18/06, owner to pull permit. |
| 54 | 10/18/2006 | Storm Water Hotline | 1441 Manchester, Permit 06020011 | Soil in catch basin. | Dirt was cleared by contractor when the inspector arrived on site. Dirt was contained in basin prior to being cleaned. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 55 | 10/18/2006 | Storm Water Hotline | 1140 E 7th St. | Garbage disposal plumbed to outside. Resident hoses off concrete area. | Inspection revealed several washing machines were plumbed to outside. Makeshift drain discharging sediment to area of inlet. Stockpile of soil. Two inlets dirty with food particles and sediment. Container of waste oil on slope. Several boxes and piles of landscape debris. The owner was required to pull permit within 24 hours to properly plumb kitchen sink. Owner complied. An NOV was issued on 10/23/06, along with an Administrative Citation. All issues have been resolved and an action plan for the NOV was submitted. |
| 56 | 10/18/2006 | Follow-up | 1610 B 8th St. | Discharge of water to inlet. | Follow-up to investigation from 9/19, earlier issued observed that had previously been resolved had not recurred. No issues noted. |
| 57 | 10/30/2006 | Storm Water Hotline | 1320 Highland Ave. | Hosing down concrete | Employees were cleaning concrete in back of store using concrete cleaner. They hosed down the area washing the waste water into nearby outlet. NOV and administrative citation issued on 10/30/2006. All issued resolved. |
| 58 | 10/30/2006 | Storm Water Hotline | 2429 Prospect St. | Stockpiles of soil on property covering storm drain "outlet" in the basement. | Stockpiles were not from or on the construction site. The stockpiles were dumped on a vacant lot. Case referred to Engineering Department to have owner remove fill dirt from property. Visual follow up inspection found fill dirt removed. |
| 59 | 11/1/2006 | Storm Water Hotline | 1700 Block of Roosevelt | Two trailers with oil tanks on public right of way | County of SD hazmat responded and wrote an NOV Tanks picked up on 11/1/06. PD towed trailers. Problem resolved. |
| 60 | 11/1/2006 | Storm Water Hotline | 2nd Edgemere (site 32) | Approximately 5 truck loads of trash dumped. | Public Works cleaned area. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 61 | 11/1/2006 | Storm Water Hotline | 18th and D | Vehicle leaking oil on street. | Vehicle had recently been involved in an auto accident. The owner said he would have the vehicle moved. Sewer Department was called to clean oil from gutter. Upon re-inspection the area was clean and the vehicle had been moved. |
| 62 | 11/1/2006 | Storm Water Hotline | 105 E 18th Street | Several containers of waste oil next to Paradise Creek. | The inspector observed landscape debris on property and several broken gravel bags. Administrative citation issued, debris was cleaned by property manager while inspector was on site. |
| 63 | 11/1/2006 | Storm Water Hotline | 2130 Roosevelt Street | Black liquid coming from property to alley. | Business activities include detailing vehicles. At initial visit, no black liquid was observed draining to alley.<br>11-6-06 No black liquid was observed, but ground was damp in alley (likely from small amount of overspray/runoff from washing) at 9:20 AM.<br>11-9-06 No black liquid was observed, but inspector observed small amount of discharge to alley from washing. Discharge was stopped and water did not enter the storm drain system. A new owner had taken over since the previous days' visits, so that owner was given verbal instruction on BMPs and a Correction Action letter to confirm understanding of proper BMPs. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 64 | 11/2/2006 | Storm Water Hotline | 625 S Harbison Avenue | Water pumping to street. | Pipe to the toilet was broken. The owner was pumping sewage from under the house to the gutter. The water flowed for approximately 5-6 hours total through a garden hose. D-Max Engineering, Inc. was called to test the water. The Sewer Department was called to clean spill. The Building Department was called to check safety of residents. The House was red tagged unsafe to occupy. Administrative citation issued on 11/2/2006. NOV issued on 11/6/06. See complaint # 67 for follow up. |
| 65 | 11/2/2006 | Storm Water Hotline | National City Blvd & 3rd St | Water shooting up from ground. | A vehicle ran over a private water line. Sewage Water Authority was on site and shut water off. Owner repaired the water line. |
| 66 | 11/2/2006 | Storm Water Hotline | 1700 Block of Roosevelt | | Follow up to complaint # 59. Tanks were removed. County of San Diego Hazmat responded and wrote NOV. |
| 67 | 11/6/2006 | Storm Water Hotline | 625 S Harbison Avenue | | This was a follow up to complaint #64. Landscape debris, trash, and food have been removed from property. Hose and pump were under house with one end of hose to front lawn. Inspector told property manager to removed hose and pump. Storm water issues corrected, building dept continues with open case. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 68 | 11/6/2006 | Storm Water Hotline | 2200-2300 VanNess | Mechanic working on cars, spilling oil in the street. | White 2 door Nissan was parked on the west side of VanNess (2300) with significant oil on the ground. No one was at vehicle when inspector arrived. Owner came to site and agreed to clean oil and move vehicle to private property. |
| 69 | 11/6/2006 | Storm Water Hotline | 1215 Harbison | Non-operational vehicles leaking oil on street. | There were 2 vehicles without plates. One was leaking oil and had airbags deployed. The other vehicle was not registered. The inspector referred to dispatch for traffic division to handle. |
| 70 | 11/7/2006 | Storm Water Hotline | 1345 Highland Ave | No erosion and sediment control BMP. | The inspector called the contractor. The contractor agreed to implement BMP that day. 11/7/06 corrective action letter sent. 11/8/06 follow-up - BMPs in place, problem resolved |
| 71 | 11/8/2006 | Storm Water Hotline | 1417 E 18th Street | Sewage draining to street between garage and apartment next door. | There was no discharge at time of inspection, however, there was an illegal connection on plumbing. The inspector referred to the Building Department. |
| 72 | 11/9/2006 | Storm Water Hotline | 1525 McKinley | Oil spill in gutter. | There was oil in the gutter for about 25 feet. It was contained by landscape debris. The inspector called sewer crew to clean. Sewer crew cleaned, problem resolved. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 73 | 11/9/2006 | Storm Water Hotline | 2145 Wilson | Auto detailing with discharge. | New unlicensed business conducting auto detailing with discharge of waste water through surface to curb drain. Discharge was stopped after inspector arrived. The inspector required business to obtain business license and properly implement BMPs, and a citation was issued. |
| 74 | 11/14/2006 | Storm Water Hotline | 303 Highland | Dead birds and grease on roof. | The inspector did not go on roof to inspect. There were no down spouts or observed discharge from roof. City consultant and contractor to clean roof prior to construction of new façade (CDC project). Problem resolved |
| 75 | 11/14/2006 | Storm Water Hotline | 3300 Block of National City Blvd, | Road work being conducted without inlet protection. | Contractor did not have inlet protected. While inspector was on site they placed gravel bags at inlet. |
| 76 | 11/16/2006 | Storm Water Hotline | 2200 Cleveland | 2 inch pipe broke. | Contractor called to report discharge of water from 2 inch water supply line. Water was contained and disposed of. |
| 77 | 11/21/2006 | Storm Water Hotline | 127 W 12th ST | Sewage coming from property | Upon inspection of property, it is determined that grey water is coming from 2 different units on property. The ground was saturated with several inches of water ponding above ground and running onto property at 1127 Hoover Ave. One unit appears to be an illegal dwelling. Housing Inspector was contacted to do inspection. Owner called City and said she would clean the area. Public Works was called to have main checked and flushed. Building has open case for violations. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 78 | 11/22/2006 | Storm Water Hotline | 127 W 12th ST | Sewage reportedly discharging to property. | Discharge contained on private property and resolved. No discharge was observed upon follow-up inspection. |
| 79 | 11/30/2006 | Storm Water Hotline | 3815 Hollyhock Lane | Report of construction without permits. | Construction of retaining wall without permit was observed. No discharge or other major storm water issues noted. Responsible party was informed of the need to obtain proper permits, and the City also mailed a letter explaining the BMPs that are required for all construction permits. |
| 80 | 12/4/2006 | Storm Water Hotline | 800 Block of Civic Center DR | Oil spill at the corner of Civic Center and Cleveland Avenue due to machinery being moved. | At approximately 10:20 a.m. there was an oil spill. There is a storm drain inlet approximately 20 feet from the spill. While lifting machinery, residual oil (estimated to be 5 gallons) in the equipment spilled onto the sidewalk, driveway, and gutter. The spill was immediately contained using absorbent and absorbent rolls. No oil or absorbent reached the inlet. Company hired another company to power wash the area after the absorbent was removed. All was re-claimed and disposed of by washing company. |
| 81 | 12/7/2006 | Storm Water Hotline | 3102 E. 16th ST | Discharge of water hose used in dust central. | Hose was leaking or defective causing discharge into inlet approximately 100 feet down hill from site. The inspector observed some sediment and sidewalk. The inspector spoke with contractor and owner regarding NPDES and required BMPs. Administrative Citation was issued. BMPs implemented (new hose). |

**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 82 | 12/12/2006 | Storm Water Hotline | 3131 National City Blvd | Water from vehicle washing going to ditch then discharging off site. | Company has bermed area for vehicle washing, directing water to a brow ditch that leads to an underside-walk drain that discharged to the gutter. Inspector observed discharge of water from vehicle washing on used vehicle lot. The discharge was stopped while the inspector was on site, and a Notice of Violation and Administrative Citation were issued on 12/13/06. |
| 83 | 12/18/2006 | Storm Water Hotline | 1213 E Avenue | A vehicle hit a fire hydrant. | A vehicle hit and sheared off the fire hydrant. The water flowed for approximately 1 hour discharging 338,160 gallons of water. There is an inlet on the northwest corner. Sweetwater Authority responded and secured the flow. Fire hydrant repair began on 12-18-06. Sewer crew was called to clean inlet. RWQCB was notified verbally on 12-18-06. |
| 84 | 12/20/2006 | Storm Water Hotline | 2315 S. Lanoitan | Reported water discharge | The inspector could not locate flowing water or discharge and site address. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 85 | 1/10/2007 | Storm Water Hotline | 19th and Haffley | Fire hydrant sheared off. | Vehicle hit and sheared off fire hydrant. There is an inlet approximately 300 ft from hydrant (on 19th St) where water entered MS4s. Sweetwater Authority responded to the site and secured the flow. |
| 86 | 1/17/2007 | Storm Water Hotline | 835 Bucky Lane | Auto repairs being conducted. Emptied radiator to gutter | The gutter was observed to be dry. There were no stains in front of address. Water was observed in the gutter at the end of the street. |
| 87 | 1/17/2007 | Storm Water Hotline | Cypress Glen | Discharge of water/sediment going down E. 32nd St - No BMPs at inlet. | The inspector went to the site to investigate, then called contractor, who stated that he would immediately implement BMPs or stop work. Provided with verbal warning, problem resolved. |
| 88 | 1/17/2007 | Storm Water Hotline | 833 Angelo Dr | Dumping oil down storm drain and auto repairs conducted. | Oil traveled to 1001 Angelo Dr where landscape debris blocked and contained oil. Vehicles in driveway and garage unlicensed and appear to be non-operational. Driveway and sidewalk stained with what appears to be waste oil from a vehicle. Administrative Citation issued. Responsible party cleaned spill. |
| 89 | 1/17/2007 | Storm Water Hotline | 3030 Plaza Bonita Rd | Tracking on Street. | The inspector went to the site then called contract to have tracking cleaned. Contractor reported sweeper would be on site later that day to clean area. Verbal warning, problem resolved. |
| 90 | 1/24/2007 | Storm Water Hotline | 327 W. 11th St. | Vehicle washing | Two trucks were being washed on the sidewalk/street. Admin citation issued, but voided after violator agreed to and cleaned all water and debris from gutter. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 91 | 1/24/2007 | Storm Water Hotline | 1420 4th St | Possible storm water issues related to multiple vehicles on site. | The inspector checked site and spoke with owner. There is an oil spill in driveway and paint containers without secondary containment. A corrective action letter was issued on 1/25/07 Oil spill was cleaned up the same day. |
| 92 | 1/24/2007 | Storm Water Hotline | 1302 E 1st | Erosion problem. Auto repair being conducted and possible oil discharging. | Owner agreed to clean junk from property, properly dispose of waste oil and prevent sediment around rose from discharging from property. A corrective action letter was issued on 1/25/2007. |
| 93 | 1/24/2007 | Storm Water Hotline | 340 W 11th St. | Dumping engine oil on ground. No business license. | Observed car batteries being stored on the ground. Full inspection conducted. NOV issued. Batteries removed by time of follow up inspection. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 94 | 1/24/2007 | Storm Water Hotline | 1318 E 4th St | Check on possible storm water issues related to illegal construction/grading. | In the alley behind residence there was lots of litter landscape debris, tires, soil stockpile, etc.The inspector spoke with owner regarding clean-up.Within 24 hours all in entire alley loose trash must be bagged.Soil pile must be contained prior to next rain event.A notice of violation was issued 1/25/2007 Follow-Up conducted on 1/29/2007.All loose litter was bagged and placed on property.The inspector spoke with owner regarding immediately implementing BMPs for soil stockpile.All other debris must be removed and property disposed of by Feb 7, 2007. Second follow-up conducted on 4/19/2007. All loose trash in alley had been picked up and bagged within 24 hours and placed within her property. Landscape debris, roofing material, stockpiles, etc have been removed. Loose soil is still covered with tarp to prevent erosion.Most of the issue at the site were code enforcement issues, but has been addressed with Storm Water and Grading ordinances. There is no building permit or retaining wall permit for this property. Each department (Building and Engineering) will deal with their own items/permit. |
| 95 | 1/24/2007 | Storm Water Hotline | 232 North Ave | Discharge of water. | The violator said he was cleaning the garage and hosing down floor and driveway. The inspector explained NPDES and gave the violator a calendar, magnet, and brochure. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 96 | 1/25/2007 | Storm Water Hotline | 2139 E 9th St | Cleaning engine with discharge going to gutter. | Owner/tenant said that he was working on the power steering unit on a truck when it sprang a leak. There are several oil spills on the side of the house and several in front on the driveway, included a long stain starting at the driveway and continuing down the street. A used battery was also observed on the ground uncovered. Admin citation and NOV were issued 1/29/2007 for illicit discharge of sediment and waste oil conducting auto repairs without implementing BMPs. |
| 97 | 1/29/2007 | Storm Water Hotline | 203 Laurel Avenue | Over watering. | Corrective action letter mailed. |
| 98 | 1/29/2007 | Storm Water Hotline | 1236 E 2nd St | Hosing down driveway. | Violator agreed to clean sidewalk and gutter. The inspector explained NPDES and gave the violator a flyer, calendar, and magnet. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 99 | 1/31/2007 | Storm Water Hotline | 410 W 30th St | Improper storage | Full inspection conducted. The following was observed: 1. No BMPs implemented for erosion and sediment control along open channel bank (south side of property) and along fence (west side of property). 2. Used battery uncovered and on the ground on the south side of property.3. Stockpile of soil without Best Management Practices (BMPs) implemented.4. Stockpile of asphalt waste on site.5. Concrete and asphalt waste and bricks along bank of open channel.6. Rusting material uncovered (rebar & stakes).7. Gas cans leaking and not protected from rainfall. Follow up inspection: Erosion control implemented. Stockpiles had been removed and used batteries and rusty materials were no longer observed outside. |
| 100 | 1/31/2007 | Storm Water Hotline | W 12th and Wilson | Illegal dumping of waste oil. | Inspector contacted resident supposedly responsible for the illegal dumping. They denied the allegation. Waste, oil, litter, TV, etc was picked up by the street division and contaminated rain water was removed by the sewer crew.. Parking Enforcement went to the site and said that they would return to issue tickets for the trucks parked on the sidewalk and double parked in the street. No further action will be taken on this site. |
| 101 | 1/31/2007 | Storm Water Hotline | 340 W 30th St | Green fluid in street. | Absorbent rolls/pads were used to clean fluid. Pads were taken to PW for proper disposal. |
| 102 | 2/1/2007 | Storm Water Hotline | 3000 Block of Hoover | Soil dumped in street at inlet. | Street division removed soil from street. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 103 | 2/5/2007 | Storm Water Hotline | West side NC National City | Church holding on going car washes | After several visits to site, inspector was unable to find evidence that car washing is being conducted. |
| 104 | 2/7/2007 | Storm Water Hotline | 2503 Highland | Pumping water to storm drain roof drains connected to sewer system. | Inspection found roof drains were connected to storm drain. The owner removed drains. |
| 105 | 2/21/2007 | Storm Water Hotline | Lot above 925 Plaza | Discharge of sediment to storm drains | No storm water issue. |
| 106 | 2/22/2007 | Storm Water Hotline | 19th St and I 5 | Sandy substance on sidewalk on 19th St under freeway. | Referred to Street Department.<br>Returned to site 2-26-07 with street supervisor. All "blasting" sand was determined to be coming from nearby construction site. Contractor was notified to clean area. |
| 107 | 2/22/2007 | Storm Water Hotline | 2525 Highland Ave | Open containers of oil. | Owner notified to remove and provide receipt for proper disposal.Proof of disposal provided 2-27-07. |
| 108 | 2/26/2007 | Storm Water Hotline | 424 E Division | Sewage flowing to ground. Surface to curb drain near by but clogged. | Dumpster lid open and trash on ground in dumpster enclosure, several containers of paint and water stored behind building. Discharged sewer from an open line on the west side of building. Surface drain clogged with sediment. Corrective action letter was issued 2/26/2007. Open pipe was capped, trash was picked up, and paint cans were removed by the next day. |
| 109 | 2/28/2007 | Storm Water Hotline | 3211 Alta Drive | Uncontained soil stockpiles and waste oil and filters on property. | The owner properly disposed of oil and filters. Stockpiles were covered and street was swept. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 110 | 3/1/2007 | Storm Water Hotline | 1900 National City Blvd. | Vehicle washing. | Inspector went to the site and found no washing. The ground was dry (sides, streets, front of property, back of property, and on Roosevelt). Inspector could not find any sign of a violation. |
| 111 | 3/15/2007 | Storm Water Hotline | 3rd and National City Blvd. | Trash accumulates and sometimes blocks inlet causing water to pond. | Inspector did not see any trash on corners of National City Blvd. and 3rd Street. |
| 112 | 3/19/2007 | Storm Water Hotline | On Street between 836 and 904 Angelo | Police car lost power steering fluid (3-16-07) leaving fluid in street. Later tow-truck drove through fluid tracking fluid down street. Street sweeper swept area today, but fluid remains on street. | Street supervisor inspected area and found small amount of fluid that could be ATF. Fluid was not liquid and there was no means that would remove stain from street. |
| 113 | 3/19/2007 | Storm Water Hotline | 3000 NC Blvd. | Saw cutting pavement with discharge to storm drain inlet. | Discharged water and sediment to inlet on NCB. Sewer crew called to clean inlet. Contractor to clean gutter. An administrative citation was given. |
| 114 | 3/20/2007 | Storm Water Hotline | 2200 Block of Prospect (2302 Prospect St) | Mixing concrete in the street near a storm drain inlet. | The crew was mixing concrete in wheel barrels in the street. The sand was on the asphalt and concrete mix was on a tarp. Crew cleaned street. |
| 115 | 3/20/2007 | Storm Water Hotline | 15th & 16th St (west side) 16th East Side | Tracking of newly installed ped ramps on west side. | Contractor notified to clean tracking at all ped ramps. Streets were cleaned. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 116 | 3/20/2007 | Storm Water Hotline | 16th & Coolidge | Van/motor home leaking fluids | There was a container under the vehicle on the driver's side at the rear collecting sewage from a leaking pipe at or near the holding tanks. There was also a wet spot under the vehicle in the same area on the street and a pail with a coffee can of wet paint inside. An absorbent pad was placed on the spill next to the container to help collect liquid spills, leaks, and splashes. Called 411 to obtain phone number for R.O. No number listed.No legal means to tow vehicle.No further action taken. |
| 117 | 3/28/2007 | Storm Water Hotline | 100 Block of Roosevelt | Man working on truck allowing oil to spill into gutter. | There was an unattended Semi-truck and dump body. There was diesel fuel leaking from the tank on the right side. Public Works responded with an absorbent. P.D. notified the fire department of the fuel spill. Vehicle owner arrived on site and attempted to stop leak. He was not successful. Vehicle was towed from public street at the owner's request. Street sweeper swept area. Fuel spill was contained to gutter (approximately 40 ft). No discharge to inlet. |
| 118 | 4/3/2007 | Storm Water Hotline | 16th and National City Blvd | Sediment on street. | Inspector noticed there was sediment on 16th Street and National City Blvd. The sediment washed down into gutter line and storm drain inlets. Inspector requested for a crew to bag around the down stream inlets and sweep the street. Public Works cleaned sediment from inlet. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 119 | 4/12/2007 | Storm Water Hotline | 14th Street | Sewer cap open on holding tanks. Vehicle parked with 15 ft of inlet | Diplomat II motor home-holding tank cap open with stains on street. Inspector called PD to have vehicle towed. Inspector contacted owner to remove vehicle immediately. Owner complied. Sewer crew cleaned sewage from street. |
| 120 | 4/12/2007 | Storm Water Hotline | 16th and National City Blvd | Sediment going into inlet. | Contractor did not have effective BMP around inlet.Contractor opened water main when service had not yet been shut off. Emergency pumping of hole was necessary.Contractor immediately implemented effective BMPs when advised. Notice of Violation was issued. |
| 121 | 4/12/2007 | Storm Water Hotline | Kimball Park, National City CA 91950 | Ice cream vendor putting trash (ice cream bags, boxes, etc) and bags of urine in dumpsters. | Inspector made contact with owner. Owner was notified that it was illegal for him to dispose of trash that was generated by his business activities. Area was re-inspected one week later, no problems found. |
| 122 | 4/16/2007 | Storm Water Hotline | 1702 C St | Working on car in alley. | Checked alley from 16th to 18th and inspector did not locate problem. |
| 123 | 4/18/2007 | Storm Water Hotline | Alley East Coolidge between 16th & 17th St | Approximately 5 gallons of oil in alley. | Inspector called street supervisor. The street supervisor assigned clean up to his crew. The complaint has been resolved and no further action is needed. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 124 | 4/19/2007 | Storm Water Hotline | 1343 E 5th St | Landscape debris, drums, long term storage of vehicles, loose soil piles | Inspector observed relatively small amounts of uncontained soil and landscape debris as well as one 55-gallon drum, all on private property. No discharge or other major threats to storm water quality were observed. A Corrective Action letter was sent requiring the resident to clean up materials in the yard. |
| 125 | 4/23/2007 | Storm Water Hotline | 16th and Roosevelt | Housing of equipment | Employee was hosing off equipment resulting in a discharge to the gutter on 16th St. There were gravel bags at driveway and at inlet on the corner of 16th and National City Blvd (construction site BMPs). Inspector gave verbal notification (warning) for discharge. Follow-up inspections conducted, problem resolved. |
| 126 | 4/26/2007 | Storm Water Hotline | 130 W. 17th St | Business using residential trash cans to dispose of waste oil. | No waste oil found. There was some cardboard that had oil stains. Business owner cleaned up area and will order additional cans or recycling bin. |
| 127 | 4/30/2007 | Storm Water Hotline | 4th and Laurel | Check inlets for debris. | The inspector did not find any debris on site. |
| 128 | 4/30/2007 | Storm Water Hotline | 3844 Cherry Blossom St | Washing machine discharge | The inspector did not locate any discharge. The inspector referred to code enforcement. |
| 129 | 5/1/2007 | Storm Water Hotline | 1000 Block of National City Blvd | Fire damage | PW Crew cleaned parking lot of burned furniture, lumber, ash, etc caused by fire. |
| 130 | 5/3/2007 | Storm Water Hotline | 4th and F | Sweeper's hydraulic hose broke. | Street crew cleaned fluid from street. Mechanic repaired hose. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 131 | 5/7/2007 | Storm Water Hotline | 1243 National City Blvd | Homeless camp and toilet paper/stool in park area of Civic Center. | Public Works cleaned area. |
| 132 | 5/14/2007 | Storm Water Hotline | 316 W 14th St | Washing machine discharging to alley then to street (W 14th St). | There was a discharge of grey water to the alley and an old battery inside yard. Owner stated that the drain for the washing machine was plugged, and agreed to not use washing machine unless waste water goes to sewer system. |
| 133 | 5/15/2007 | Storm Water Hotline | Bay Marina and Tidelands | Diesel fuel going into storm drain. | Driver was sleeping in his vehicle and accidentally hit the pump to the on position for the auxiliary diesel tank. Diesel overflowed to the gutter. There are no nearby inlets. Fire department contained spill until street division arrived to clean gutter of diesel fuel. |
| 134 | 5/22/2007 | Storm Water Hotline | 340 W. 18th St | Oil spill at Paradise Creek | No oil spill was found in Paradise Creek, but some drips from a transmission were found along a walkway in Paradise Creek Educational Park. The son of the owner of a neighboring business said that a transmission was stolen from the back of a pick up truck (used as storage at the business) and taken to Paradise Creek. No transmission was found, but the truck and materials stored in it were removed from the business at the direction of the inspector. |
| 135 | 5/23/2007 | Storm Water Hotline | Kimball Park National City CA 91950 | Washing cars in the park. | Owner was washing a car in the parking lot of Kimball Park. No water or soap reached inlet. Owner rinsed pavement and vacuumed water. Both parties were invited to automotive workshop and given NPDES flyers. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 136 | 6/11/2007 | Storm Water Hotline | 1040 Hoover Avenue | Hosing down sidewalk | Water from garden hose was traveling down 11th and down Roosevelt. Water did not make it to the inlet of time of inspection. Violators cleaned debris from gutter. NPDES was explained to violators and property owner. Inspector explained that irrigation is exempt from permit requirements, but hosing down sidewalks and over-watering was a violation. They assured the inspector that this won't happen in the future. Corrective Action Letter: 6/11/07 |
| 137 | 6/11/2007 | Storm Water Hotline | 1100 Highland Avenue | Water and sediment discharging to Highland Avenue. | Inspected site and found litter in most landscape areas and a broken irrigation pipe. Water from pipe was discharging water and litter to an inlet on Highland Avenue. Spoke with manager who said that the pipe has been broken for about 3 weeks. Initially, a plumber evaluated leak and supposedly secured water. A landscaper was scheduled to repair leak. Manager cleaned litter. Sewer crew cleaned inlet on Highland Avenue. NOV and Administrative Citation issued. |
| 138 | 6/12/2007 | Storm Water Hotline | 545 Rachel Ave | Construction site without BMPs | There was sediment on the sidewalk and in the gutter and no BMPs in place for erosion and sediment control. Owner agreed to implement BMPs by tomorrow. Sidewalk and gutter was cleaned while inspector was on site. Stop work order was issued by the building department because permits had not been obtained. Problem Resolved. |

**TABLE 8.5 (CONTINUED)**
**PUBLIC COMPLAINT REPORTS (JULY 1, 2006 THROUGH JUNE 30, 2007)**

| # | Date | Origin of Complaint | Location | Violation or Complaint | Investigation Summary |
|---|---|---|---|---|---|
| 139 | 6/19/2007 | Storm Water Hotline | 3618 Cherry Blossom St | Drain pipes coming out of back fence adjacent to Paradise Creek. | Inspector received several complaints in the past regarding this problem. Owner was verbally notified to disconnect drainpipes. On a recent inspection, inspector was unable to find pipes. While on an unrelated inspection in the area, the pipes were located. Notice of Violation issued 6/21/07. |
| 140 | 6/20/2007 | Storm Water Hotline | 1026 E 8th St | Fixing sewer lateral. | Cutting the sidewalk to repair the sewer lateral. While cutting, the owner vacuumed water. No discharge to storm drain observed. |
| 141 | 6/27/2007 | Storm Water Hotline | 1945 Orange Ave | Resident cut bushes and put debris in brow ditch going to storm drain. | Inspector spoke with the owner and explained NPDES. Park division cleaned debris. |
| 142 | 6/27/2007 | Storm Water Hotline | 539 20th St | Piles of landscape debris in right of way. | There were grass clippings in the right of way. Inspector spoke with tenant who agreed to remove all landscape debris by Monday, July 2, 2007. Drive by re-inspection conducted, problem resolved. |
| 143 | 6/29/2007 | Storm Water Hotline | E Plaza Blvd | Traffic accident involving tanker truck. Approximately 120,000 gallons water, 10 gallons foam, and small quantity of unleaded fuel discharged to Paradise Creek. | Inspector called Public Works crew. Implemented BMPs (PW crew and private environmental company). Inspector gave courtesy notification to RWQCB. Present: S.D. County Hazmat, NRC Environment Services, NC PD NC Fire, County Environment Health |

# 9 EDUCATION

The City continues to implement an extensive storm water education program to target individuals in the City and encourage storm water awareness and the implementation of pollution prevention measures and BMPs. By increasing public awareness and encouraging a change in both the attitude and the behavior of the general public and the regulated community, the City may reduce or eliminate storm water pollution caused by common daily activities. The City's program aims to increase the knowledge of City personnel, the regulated community, and the general public regarding the impacts of urban runoff and BMPs that can be implemented for certain activities to mitigate these impacts. The City's comprehensive storm water education program includes educational materials and opportunities to its personnel, industrial and commercial businesses, construction site owners and operators, and residents of the City.

**EDUCATIONAL MATERIALS AVAILABLE TO THE PUBLIC AND CITY STAFF**

National City is a growing community that is diverse in culture. The demographics of the City are unique, and to address various communities' needs, the City takes pride in servicing its residents by presenting some of its brochures in both English and Spanish. It is very important that educational material is not only available but also able to be understood by all residents. Therefore many of the City's educational materials are bilingual. The following brochures have been prepared and were distributed in the City during 2006/2007:

*"Everything that flows down into a storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" Brochure*

The City continues to distribute the "Everything that flows down into a storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochure (Attachment 3.2). The information is printed in English on one side of the brochure and Spanish on the other. The brochure educates residents and business owners on the difference between the storm drain and the sewer system, pollutants, pollution prevention such as recycling, proper landscaping practices, Municipal Code Chapter 14.22 Prohibitions, and the storm drain hotline number to contact with questions or to report IC/IDs.

The NPDES Storm Water Compliance Inspector continues to provide copies of this brochure during industrial and commercial inspections and to businesses and residences during public-complaint response investigations. Additionally, a copy of the brochure was provided in any storm water correspondence (corrective action letters, NOVs, etc.). This brochure may be found at various locations throughout the City such as the Chamber of Commerce, the public library, City buses, the public recreational centers, and the storm water display area at the City's Engineering Department.

*"Put Toxic Waste In Its Place" Brochure*

The City continued to distribute the "Put Toxic Waste In Its Place" brochure and accompanying notepad (Attachment 4.2). The brochure consists of 17 full-color pages featuring a tough-looking crowd of household hazardous waste caricatures. The brochure defines and gives examples of household hazardous waste; explains the consequences of improper storage and disposal of waste; describes the benefits of proper household hazardous waste controls; gives examples on the reduction household hazardous waste in

the home; describes proper disposal methods; provides in-depth sections regarding electronic waste, paint, and used oil; and gives contact information for local communities. The notepad has the same characters on it and says "put toxic waste in its place." The notepad also provides a website and phone number to use to gather information regarding hazardous waste disposal. During this reporting period, "Put Toxic Waste In Its Place" continued to be provided at workshops.

*Integrated Pest Management (IPM) Cards*

The City continued to distribute IMP cards (Attachment 5.1) to individuals in the City. The IPM cards were developed as part of a regional effort to combat pesticide pollution and encourage the use of IPM techniques. The packet of seven bound cards includes: "Gardening with Good Bugs," "Safe Use and Disposal of Pesticides," "Spiders," "Termites," "Lawn Insects," "Snails and Slugs," and "Head Lice."

*"Keep the Cycle Spinning…" Brochure*

The "Keep the Cycle Spinning" brochure (Attachment 9.1) was produced in English and Spanish to inform residents on recycling tips and provides information about how/where to recycle specific items. The brochure also encourages individuals to buy products made from recycled goods.

*Storm Water Hotline Cards*

The Storm Water Hotline Card (Attachment 3.3) was designed to inform residents and business owners of the City's storm water hotline. The City continues to provide business cards with the hotline number at the City's Engineering Department Counter. They are also distributed during inspections of construction sites and commercial and industrial facilities, and the City attaches the cards to most of its correspondences with residents, businesses, and developers.

*Miscellaneous Educational Items and Sources of Information*

The City distributed HHW refrigerator magnets (Attachment 4.3), which provides HHW disposal information for residents of National City and the HHW telephone number.

The City of National City's website provides information regarding the City's storm water program, pollution prevention measures, and phone numbers. The website address is http://www.ci.national-city.ca.us, with information under the Public Works/Engineering Department link.

## MUNICIPAL STAFF EDUCATION AND TRAINING

Over the past year, the City of National City provided several training seminars to educate staff on both general and specific topics relating to the protection of water quality. A few City staff members also received additional training through outside educational programs. The following is a list of these educational activities, and Attachment 2.1 provides the sign in sheets from municipal training sessions:

- 2007 Calendars – bilingual calendars were available at the City library, Chamber of Commerce, City buses, public recreation centers, and the storm water display at the Engineering Department (Attachment 2.2).
- SUSMP Training - 13 people attended this training conducted by D-MAX on August 3, 2006. A handout was provided which contained a checklist, background, definitions and flowcharts for SUSMP.

- SUSMP Coordination Meetings - The City had regular SUSMP coordination meetings for Building, Planning, Engineering, and CDC departments. The meetings were to clarify departmental responsibilities. A SUSMP applicability checklist and flowchart were developed.
- Fire Department Training – The City's consultant, D-MAX, gave a presentation to 34 staff over three days from June 19, 2007 to June 21, 2007. The presentation included topics on urban runoff, storm water and sanitary sewer systems, City ordinances, BMPs, and reporting procedures. The presentation also included information regarding spill containment, since fire department personnel are often the first on scene in the event of a spill.
- Irrigation Management Course – Eight members of the City's Landscape Maintenance Personnel attended this six-class course, which focused on irrigation system design, troubleshooting and plant identification, among other topics. The course was held on April 6, 13, 20, and 27 2007 at the San Diego County Library Sunnyside Branch in Bonita.
- Public Works NPDES Training – 25 participants attended this workshop, which was held on June 7, 2007. The presentation included a background to NPDES, urban runoff, MS4s, and BMP requirements. Participants were provided with a Storm Drain Inlet Protection handout. A multiple-choice NPDES Knowledge/Awareness Assessment Test was administered to City Public Works employees before and after training sessions. By completing this test, the effectiveness of the workshops could be analyzed.

**INDUSTRIAL/COMMERCIAL EDUCATION & TRAINING**

The following list describes training for industrial or commercial businesses that the City of National City has provided or participated in during this reporting period. Attachment 3.4 provides the sign-in sheets from industrial and commercial training sessions.

- City industrial business management staff and employees were offered a free storm water workshop in National City on April 25, 2007. Approximately ten individuals attended the workshop. The workshop was led by the City's consultant, D-MAX, and provided information about how to comply with the State of California General Industrial Permit through NOIs, SWPPPs, water monitoring programs, and employee education. The workshop also provided information on how to comply with the City's storm water ordinance through implementing BMPs and what to expect from an inspection. They were presented with a PowerPoint presentation and given an NPDES Knowledge/Awareness Assessment Test before and after the presentation. Handouts included NONA/NEC, NOI, NOT, and SWPPP paperwork.
- Automotive Workshop – 21 people attended this training given by the City on May 23, 2007. The presentation gave a background on NPDES and the San Diego watersheds, and gave information on BMPs and pollutants participants should be aware of. They were given an NPDES Knowledge/Awareness Assessment Test before and after the presentation, and on average there was an improvement in scores. "Your Shop Can Make a Difference" handouts (Attachment 4.1), "Put Toxic Waste in its Place" brochures and notepads (Attachment 4.2), "Everything that flows

down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay" handout (Attachment 3.2), and HHW informational refrigerator magnets (Attachment 4.3) were distributed.

## RESIDENTIAL

The City continues to make a variety of flyers, brochures, website postings, and other educational material available to residents of the City. Dry-weather educational mailers were mailed to homes in residential areas where dry weather monitoring indicated one or more pollutants exceeded dry weather action levels. In response to the mailers, some residents called to obtain more information about the program. Specific educational outreach designed for residents of National City is discussed below.

- "Do You Go To the Beach When it is Raining?" brochures were sent out in residential trash bills.
- Eight residents attended a City-hosted storm water workshop on February 21, 2007. Attendees were presented with a PowerPoint presentation on NPDES and BMPs for residential activities. 2007 Calendars (Attachment 2.2), "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochures (Attachment 3.2), "Put Toxic Waste in its Place" brochures (Attachment 4.2), HHW refrigerator magnets (Attachment 4.3) and copies of the City's Storm Water Hotline Card (Attachment 3.3) were distributed at the workshop. A residential BMP handout was also included with the presentation and is provided in Attachment 5.3.
- The City developed a 2007 calendar that was distributed to residents and made available at City offices (Attachment 2.2). The calendar, printed in both English and Spanish, informs residents about pollutants found in San Diego Bay and neighboring waterways, and describes that pollutants such as fertilizers, pesticides, metals, paints, oil and grease, and other debris can be transported from residential areas to the ocean. A list of BMPs and various cleanup days and HHW events are given. The theme for the calendar was "Let's Keep Our Community Clean" and each month showed a photograph of a landmark in the City.

## NEW DEVELOPMENT & REDEVELOPEMENT AND CONSTRUCTION EDUCATION & TRAINING

Construction site owners and developers alter the landscape and natural flow of storm water runoff and generally create increased amounts of impervious surface. During such activities, construction site owners, developers, and employees have the potential to discharge a number of different types of pollutants to receiving waters, notably sediment. The City continued to provide educational information regarding BMPs during construction site inspections, and followed up to determine if BMP deficiencies were resolved.

- The City distributed the BMP fact sheet for construction sites that was prepared during the last reporting period. This fact sheet describes specific BMPs for construction activities including soil stabilization and erosion prevention, sediment containment, materials and equipment management, non-storm water discharge control, and drainage control. This sheet was distributed with all permits issued,

including building permits; implementing the BMPs listed on the sheet is a condition of the permits.

- The City continued to hold CIP project meetings during this reporting period and discussed implementation of various BMPs. As described in Section 7 of this Annual Report, onsite pre-job conferences were held for most high priority private projects. Pre-job conferences were also held at the Engineering Department front counter for many smaller projects.
- The City held a workshop on January 22, 2006 for Construction and Development staff, which informed participants about the NPDES program, BMPs, pollutants, and inspections. An NPDES Knowledge/Awareness Assessment Test was administered to the 22 participants before and after the presentation.
- The City continued to provide applicants with the Storm Water Requirements Applicability Checklist (Attachment 6.2). Once submitted, the City reviewed the checklist and prioritized the projects. Requirements to ensure compliance with the Municipal Permit and General Construction Permit were presented to the applicant and further discussed to ensure the applicant was educated on the process.
- The City continued to make available JURMP Appendix C, containing a list of required BMPs, to proponents of construction activities when applying for a construction permit. Appendix C is also distributed during CIP project pre-construction meetings.

**COUNTY OUTREACH WORKGROUP**

During 2006/2007 the City continued to be an active participate in the County Outreach Workgroup, which conducts the Regional Education and Outreach Program.

**IMPRESSIONS MADE**

During the 2006/2007 reporting period, the City provided education primarily through inspections, distribution and mailing of educational materials, and audience-specific training sessions. Based on the number of each of these efforts, a number of impressions can be estimated. However, impressions only measure quantity, not quality. The City has endeavored to make reasonable, conservative estimates of the numbers of impressions generated by its efforts.

In order to calculate the number of impressions, each effort was multiplied by the number of impressions thought to be generated by each effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections, which usually involve more personnel and have been assumed to generate five impressions. Since the inspector interacted with the facility manager/owner and discussed storm water, these site visits were included in the number of impressions. Training sessions and clean-up events have been assumed to generate a number of impressions equal to four times the number of attendees because it is likely that the attendees will discuss the content with at least one other person after the training. Most printed educational material distributed in mass numbers are assumed to generate three impressions each, and materials distributed in person during inspections are defined as generating five impressions due to several people

likely viewing them and the content being more directly relevant. A calendar is assumed to generate significantly more impressions, as it is typically viewed on a daily basis.

**Table 9.1**
**Impressions Generated Through Outreach Efforts**

| Impression type | Actual Count 2006/2007 | Unit | Estimated Impressions Generated |
|---|---|---|---|
| Municipal Inspections | 20 | Inspections | 100 |
| Industrial Inspections | 29 | Inspections | 87 |
| Commercial Inspections | 10 | Inspections | 30 |
| Complaints Investigated | 143 | Investigation | 429 |
| Training Session and Activity/Event Attendees | 150 | Events | 600 |
| Dry Weather Monitoring Letters | 1,473 | Letter | 4,419 |
| Trash Courtesy Notice (Building Dept) | 100 | Letter | 300 |
| Residential BMP Handout | 25 | Handout | 75 |
| Do you Go to the Beach When it Rains | 6,236 | Handout | 18,708 |
| Preventing Urban Runoff Pollution | 500 | Brochure | 1,500 |
| Everything that flows down the storm drain…. | 1,000 | Sheets | 3,000 |
| Put Toxic Waste in its Place Brochure and Notepad | 200 | Brochure | 600 |
| 2007 Storm Water Program Calendar | 2,000 | Calendar | 100,000 |
| IPM Cards | 200 | Info card set | 600 |
| HHW Refrigerator Magnets | 1,000 | Magnets | 3,000 |
| Your Shop Can Make a Difference | 5 | Handout | 15 |
| Storm Water Hotline Card | 250 | Card | 750 |
| Keep the Cycle Spinning | 80 | Handout | 240 |
| Construction BMP Handouts | 1,000 | Handout | 3,000 |
| **Total** | | | **137,453** |

**IMPLEMENTATION PLANS FOR 2007/2008**

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

# 10 PUBLIC PARTICIPATION

In addition to providing education to encourage residents to implement pollution prevention measures and BMPs, the City encourages business owners and operators and the general public to participate in public participation programs. Public participation includes, but is not limited to, clean up events, reporting observed IC/IDs, and participating in City-hosted waste disposal events. Providing the community with opportunities to participate in the implementation of the City's storm water program helps foster a sense of shared responsibility in keeping the community clean. City personnel both facilitate and participate in many of the public participation events, which also provides a platform for municipal personnel to share storm water-related information with the general public.

City employees are an integral part of the transfer of information to the general public. They are educated in storm water pollution prevention and are expected to pass on that information to the general public as often as possible. The City considers its proper management of municipal facilities and activities to be a model for the rest of the community.

The City recognizes the need to build and maintain partnerships with other agencies in preventing storm water pollution. The City actively partners with other jurisdictions and ILACSD for outreach and public participation events. The following presents the City's efforts to encourage environmental stewardship within the community during this reporting period.

## PUBLIC REPORTING

The City continues to encourage City employees and the general public to report illegal storm water activities via the City's storm water hotline or the reporting section of the City's website. Continuing to operate this reporting system is one of the mechanisms the City maintains to ensure that citizens have a means to prevent storm water pollution in their neighborhoods. By utilizing the reporting system, residents of National City are able to be accountable for their actions as well as those of their neighbors. The hotline number is available on the storm water hotline card, which is given out at inspections, complaint investigations, and is made available at many public facilities. The hotline number is also available on many of the brochures distributed by the City, as well as on the City's website. This reporting period there were 143 complaints received by the City, as compared to the 190 complaints received during the last reporting period. This number of complaints is a positive reflection of the City's educational efforts. All of the 143 complaints reported during the reporting period were investigated immediately and addressed appropriately by the City's NPDES Storm Water Compliance Inspector. Section 8 of this Annual Report includes a log of the complaints and associated responses.

## HAZARDOUS WASTE COLLECTION AND USED OIL RECYCLING

The City continues to encourage recycling and proper disposal of household hazardous waste. Residents have access to proper disposal facilities for household hazardous wastes at the South Bay Regional Household Hazardous Waste drop-off center, located in Chula Vista. This facility is open on Saturdays from 9:00 a.m. to 1:00 p.m. and accepts up to 15

gallons or 125 lbs of waste per household for a small co-payment. This service is also available to residents in the cities of Chula Vista, Coronado, and Imperial Beach. The "Put Toxic Waste In Its Place" brochure continues to be used by the City to inform residents of how and where to dispose of HHW.

Additionally, the City offers a low cost door-to-door collection programs for residents. Residents may dispose of used oil at seven Certified Used Oil Recycling Centers are located around the City.

**HOUSEHOLD TRASH COLLECTION EVENTS**

The City also continued to hold household trash collection events for large items such as furniture and appliances. The City coordinates with EDCO to host both fall and spring collection events. These events are routinely held in June and November of each year. The City encourages the public to participate by bringing their debris for proper disposal. The City advertised these events with a flyer, which was distributed during the Residential workshop held on February 21, 2007 and in residential trash bills.

**PUBLIC CLEANUP EVENTS AND EDUCATIONAL ACTIVITES**

The City continued to collaborate with I Love a Clean San Diego (ILACSD) for the Earth Day Creek to Bay Cleanup event.

Two neighborhood councils in the City held cleanup events, and a third cleanup event was hosted by City Hall. The Eastside Neighborhood Council and the Army National Guard painted and cleaned El Toyon Recreation Center and removed 4.8 tons of dirt/trash/debris from three surrounding neighborhoods (Granger/Northside/Old Town) on February 3-4, 2007. The Northside Neighborhood Council collected 7.2 tons of dirt/trash/debris from the Northside Neighborhood on March 31, 2007. City personnel and residents collected 2.4 tons of trash and debris over June 1-2, 2007 from the areas surrounding City Hall.

On April 21, 2007, a few days after the Paradise Creek Educational Park officially opened, an Earth Day celebration was held there. During the celebration, volunteers removed trash and sowed 300 plants.

During 2006/2007, the City worked with ILACSD to stencil storm drains in the City that remind people that the storm drains drain to local creeks and the ocean. A total of 19 volunteers stenciled 30 drains.

**PUBLIC WORKSHOPS**

Workshops, information, and training sessions are necessary to provide the public with the tools and knowledge to participate effectively in a storm water program. This reporting period, the City took a proactive approach to storm water education by tailoring workshops for the specific needs of particular groups in National City. Workshops were provided to residents, automotive businesses, industrial businesses, and construction and development staff.

**IMPLEMENTATION PLANS FOR 2007/2008**

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit. All programs during the 2006/2007 reporting period were conducted under the

requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

# 11 ASSESSMENT OF JURMP EFFECTIVENESS

The City's storm water program consists of three major pieces, listed below:

- Program Planning: Includes source characterization, BMP selection, targeted outcomes, and measures of indicators.
- Program Implementation: Includes implementation of selected measures.
- Effectiveness Assessment: Includes water quality assessment, program assessment, and integrated assessment. Effectiveness is evaluated on six increasingly complex levels.

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. Assessment of the planning and implementation steps provides important information that in turn can be used to improve future planning and implementation efforts. Data is collected from a number of different sources for the assessment. The following subsections present the City's approach and activities in assessing the effectiveness of the JURMP.

## PROGRAM PLANNING

When designing and modifying proposed storm water program actions, the City obtains and reviews information from inspections, water quality monitoring, complaint records, and institutional knowledge. Inventories of potential pollutant sources have been compiled based on this data; the most recent versions for the 2006/2007 reporting period have been presented earlier in this annual report. The City has further related known priority sources to key constituents, as shown in Table 11.1. Program planning involves ensuring that the City's actions will meet the minimum activity based Municipal Permit requirements and that City resources are used to reduce pollutant discharges as effectively as possible. City programs are tailored to the specific characteristics of the community. National City, for example, includes a relatively large industrial zone on the west side of the City. A focused training session for industrial businesses was held during 2006/2007, and compliance inspections are regularly conducted. The City has also regularly reviewed the monitoring results of industrial facilities that conduct sampling and analysis as part of their Industrial Permit compliance.

## BMP SELECTION

To reduce discharges of pollutants from identified sources, the City requires implementation of BMPs. More detail about BMPs required for all identified sources is provided in the City's JURMP. Key BMPs for selected priority sources are also shown in Table 11.2 later in this section. Data from inspection and monitoring programs as well as overall land use information was used in preparing the table.

The City informs target audiences of the BMP requirements through general distribution of educational materials, focused distribution of specifically targeted materials, reviews of submitted plans, and direct interaction with City staff. Direct interaction may take place during inspections, when discussing comments on submitted plans, and/or when encountering City staff in the field. Providing material to the public broadly through

mailings, the City's website, and information stations in public places allows for a broader reach. The City employs a variety of methods to educate responsible parties of their responsibilities to implement BMPs. Fact sheets, brochures, and other reference materials are available at several City buildings and are periodically mailed out to members of the community.

## TARGETED OUTCOMES

At the beginning of each reporting year, the City sets targets for its program. The actual numbers recorded during the year are then compared to the targets at the end of the year to assess progress. Typically, items mandated by the Permit, such conducting the Dry Weather Monitoring Program or investigating storm water complaints, are relatively easy to measure. Conversely, goals such as significant improvements in receiving water quality are more difficult to assess.

The effectiveness assessment approach jointly developed by the Copermittees recognizes this distinction by defining six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

| | |
|---|---|
| Level 1: | Compliance with Activity-Based Permit Requirements |
| Level 2: | Changes in Knowledge/Awareness |
| Level 3: | Behavioral Change/BMP Implementation |
| Level 4: | Load Reductions |
| Level 5: | Changes in Discharge Quality |
| Level 6: | Changes in Receiving Water Quality |

***Level 1: Compliance with Activity-Based Permit Requirements***

The Municipal Permit describes the requirements that Copermittees must meet. Examples of these types of requirements include, but are not limited to, inspecting construction sites on certain minimum frequencies, conducting the Dry Weather Monitoring Program, and reporting spills to the RWQCB within given time frames.

Table 11.3 summarizes the City's efforts toward meeting activity-based Municipal Permit requirements in 2006/2007. All high priority municipal and industrial facilities were inspected at least once during this reporting period. All high priority construction sites were inspected at least weekly during the time they were active in the wet season. Medium and low priority construction sites were generally inspected twice. In certain instances, low priority construction sites were inspected only once because the project was completed in a short period of time. One hundred percent of cleanout locations in the MS4 were maintained, and City streets were swept regularly.

The City regularly inspects industrial, commercial, and construction sites, which are some of the main potential sources of pollution. The inventories of these sources are also routinely updated to ensure the City has the most accurate inventory possible and have been presented in Sections 3, 4, and 7 of this Annual Report. The City inspected most industrial and commercial businesses during the current Municipal Permit cycle. Tables 11.4 and 11.5 present watershed-based inventories of various categories of industrial and commercial facilities, respectively, along with the numbers of facilities inspected and overall number of

inspections. The number of inspections is greater than the number of inspected facilities whenever facilities have been inspected more than once.

*Level 2: Changes in Knowledge/Awareness*

To increase storm water-related awareness and knowledge, the City provides a variety of educational outreach materials including, but not limited to training sessions, workshops, cleanup events, and the distribution of print media such as brochures and handouts.

The City continues to maintain a storm water hotline and online reporting system by which citizens may report potential storm water violations. Over the years, a general increasing trend has been observed, although the number of complaints recorded in 2006/2007 was somewhat lower than the 2005/2006 number. The overall upward trend indicates that City staff and residents are more aware of storm water requirements and how to report observed potential problems. Data from the City's Dry Weather Monitoring Program also indicates decreases in the levels of ammonia and detergents, which are typically good indicators of IC/IDs. Information regarding the City's storm water hotline is available on the City's website and is printed on a variety of print media distributed by the City, including a storm water hotline card. Figure 11.1 shows the trend in storm water complaints over the past few years.

**Figure 11.1**
**Number of Complaints Logged**

Public works employees have tailgate meetings and are aware of effective BMP implementation. The two Municipal Yards continue to maintain SWPPPs and undergo weekly inspections. Municipal staff also work closely with the City's NPDES Storm Water Compliance Inspector and implement recommended BMPs promptly. The Parks and Recreation landscape maintenance staff have been trained in proper techniques for application of chemicals. Pesticides are no longer applied to landscaping; however, fertilizers and herbicides are used. The City minimizes the use of fertilizers and herbicides and employs appropriate BMPs for their use and containment.

Storm water knowledge quizzes were given to attendees of training sessions hosted by the City. At the training sessions for public works employees, the pre-test scores were 55 percent and the post-test scores were 90 percent. At the industrial training session, the pre-test scores were 60 percent and the post-test scores were 70 percent. At the automotive workshop, pre-test scores were 70 percent and post-test scores were 90 percent. These are instances of measurable increases in knowledge.

Storm water compliance inspections of industrial facilities and commercial businesses have increased knowledge of storm water pollution prevention. During the inspection process, inspectors educate business owners on the difference between the storm drain system versus the sewer system, potential pollutants, pollution prevention measures, BMP implementation, and the Municipal Permit and General Industrial Permit requirements are discussed as deemed applicable. The City's knowledge assessment system rates the storm water knowledge of the responsible person at the facility on a scale of one (1) to five (5), with five representing the highest level of knowledge. More detail on the process is given in Section 3 of this Annual Report. Figure 11.3 presents a comparison of the 2004/2005, 2005/2006 and 2006/2007 ratings at high priority industrial facilities, which is the main place in which this type of data was collected during 2006/2007. The data are presented as relative frequencies so that differences in number of inspections between the two years do not affect the comparison. Scores of 1 and 5 have remained relatively similar from year to year with some changes in the 2 to 4 range. Though the data includes all high priority industrial businesses, these businesses change from year to year and therefore individuals with no prior knowledge of the City's NPDES program may be included in this assessment, therefore lowering the frequency of higher scores. The City plans to continue to conduct industry-specific workshops in the future.

During pre-project meetings, City representatives discuss general storm water pollution prevention concepts and site-specific BMP implementation with project proponents. The City's consultant also provides review comments on SWPPPs and SUSMP reports, which serve to further educate project proponents about City storm water requirements.

Educational information is provided to residents in areas targeted based on the results of Dry Weather Monitoring Program findings. The City's NPDES Storm Water Compliance Inspector also educates the public when responding to complaint investigations in residential areas. This approach provides residents with storm water pollution prevention material specifically targeted toward problems observed in their neighborhoods. The City also conducted a storm water workshop for residents, which discussed common BMPs residents can implement. More information about the materials distributed are presented in sections 5, 8, and 9 of this Annual Report.

***Level 3: Behavioral Change/BMP Implementation***

The City continues to provide education to the regulated community, municipal personnel, and the general public to not only increase knowledge regarding storm water issues, but to foster a behavioral change in regards to storm water-related activities. Such change is an important goal of the storm water program in the City.

The City's construction inspection program has resulted in proper BMP implementation at regularly inspected construction sites. Property owners and developers are compelled to be proactive in implementing proper BMPs at their sites because of the City's supervision and

strict enforcement program. During the 2006/2007 reporting period, the City inspected high priority construction sites on a weekly basis. This oversight likely led to more consistent and improved BMP implementation, which indicates a positive change in the behavior of developers and property owners directly responsible for the quality of storm water discharging from their sites.

As discussed earlier in this Annual Report, the City continued to assign a BMP assessment score during industrial and commercial inspections. Figure 11.3 presents a comparison of the 2004/2005, 2005/2006 and 2006/2007 ratings at high priority industrial facilities, which is the main place in which this type of data was collected during 2006/2007. The BMP implementation at inspected businesses is rated on a scale of one (1) to five (5), with five being the highest level. In general, scores decrease during this reporting period. Several industrial facilities in the City have had ongoing BMP implementation issues and were considered to be in violation of the City's municipal code during 2006/2007. Sites receiving a BMP-related violation are always assigned a BMP implementation score of 1.

National City municipal facilities are inspected on a regular basis. The inspections generally involve corrective actions being recommended. Corrective actions are typically minor housekeeping issues, but if more significant problems arise, the City's Storm Water Compliance Inspector works to resolve them immediately.

A total of 31 administrative citations were issued to businesses, construction sites, and residents during 2005/2006. As a result of these fines, the responsible parties were compelled to implement a more effective set of BMPs. Most violations were resolved by the first citation issued, although in a few cases additional enforcement actions were required. The City followed up in each case for which a citation was issued and ensured that the violation was resolved and any discharged material was cleaned up.

***Level 4: Load Reduction***

The City can qualitatively conclude that load reductions occur in many instances, although accurate estimation of numeric loads is often not possible. Numeric load data can be obtained through data from programs such as street sweeping and cleanup events.
The City reviews the SWPPP or erosion control plan that each grading project submits prior to the start of construction. This process furthers the implementation of more effective BMPs. The City's regular inspections then help ensure that the proposed BMPs are effectively implemented when construction is underway, ultimately reducing the potential load of sediment and other pollutants such as concrete waste and petroleum products.

During this reporting period, the City conducted workshops for industrial facilities, auto shops, and construction site owners/operators. It is likely that those in attendance improved BMP implementation at their businesses as a result of attending the workshops, thus resulting in reduction of pollutants discharged to the storm drain system. Municipal training sessions were provided as well. Municipal facilities promptly implemented corrective actions required by the City's NPDES Storm Water Compliance Inspector, and the staff at each municipal maintenance yard also implement SWPPPs. These actions likely resulted in a pollutant load reductions.

The City continues to implement street sweeping and storm drain inlet cleaning programs to reduce pollutants loads the MS4. During 2006/2007, 1,300 tons of debris was collected from street sweeping. Less debris was collected from street sweeping activities this

reporting period as compared last, however. The City's street sweeping schedule has not changed and the distance swept during 2006/2007 was about the same as in 2005/2006, so the decrease may suggest that there was less debris on the City's streets this reporting period as compared to last. A total of 23,200 pounds of debris was removed from the City's MS4. Over 416 cubic yards of debris was removed during channel maintenance activities, an increase from the 55 cubic yards of debris removed during 2005/2006. The City was also involved in a number of cleanup events during 2006/2007. Approximately 14.4 tons of trash and debris was collected and removed during those events. All these efforts directly led to reductions in loads of pollutants that otherwise would be discharged to receiving water bodies.

The continued use of the PDPA in inspections aided in identifying facilities that are potentially large sources of principal pollutants of concern for storm water. The form prompts the inspector to designate sources needing additional BMPs to lower the pollutant discharge potential as well as recommended BMPs for those sources. Facilities are expected to comply with these recommendations, which should result in decreases in the loads of various pollutants.

***Level 5: Changes in Discharge Quality***

Unlike assessments of levels 1 through 4, changes in storm water discharge quality are based on direct measurement of water quality.

In addition to helping locate IC/IDs, the City's Dry Weather Monitoring Program has provided useful water quality information for a rough Level 5 assessment. Figure 11.4 provides a graph with historical data based on the percent of sites exceeding action levels for various pollutants. Note that laboratory analyses are collected at four of the 15 dry weather sites. Exceedance rates for constituents measured in the laboratory are thus based on the number of exceedances at those four sites only. Figure 11.5 shows the median, average, and percent exceedance each year for ammonia and detergents, the two constituents with the longest historical records. The highest values were observed around 2002 and have generally decreased since then. Ammonia exceedances are usually traced to decomposing organic matter coupled with very low flows or ponded water. Detergents are typically the result of vehicle or equipment washing without proper BMPs. The City issued a relatively large number of citations for illegal discharges in 2006/2007, as described elsewhere in this Annual Report. The available monitoring data indicate that pollutants such as nitrate, orthophosphate, and oil and grease have almost never exceeded their action levels.

***Level 6: Changes in Receiving Water Quality***

Level 6 can be translated into the overall improvement of water quality in receiving water bodies. Examples of reaching Level 6 include changes in receiving water quality with respect to regulatory benchmarks, biological integrity, and beneficial use attainment. A long-term strategy is required to collect the volume of data necessary for assessment of Level 6. The Copermittees are collaborating as a group to establish a plan for collecting water quality data from receiving water bodies throughout the County. The City recognizes the importance of protecting the water quality of receiving water bodies in and around the City, and the City contributes to regional monitoring efforts. A sufficient data set is necessary prior to conducting a trend analysis to determine changes in receiving water

quality and further link those changes to activities conducted in the City. At this time such a data set is not available. It is therefore premature to make conclusions about the City's impact on downstream receiving water quality during this reporting period.

## NARRATIVE ASSESSMENT OF PROGRAM COMPONENTS

Throughout 2006/2007 the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit, Order No. 2007-0001. Activities which have proven effective will be continued, and new or revised approaches will be suggested when the activities have proven less effective. Generally, the City has not identified one specific BMP as being ineffective for all facilities, but rather the City's inspectors recommend BMPs to each facility as are appropriate that facility's setting and potential sources of pollutants.

Permit Section F.1, Land Use

The City's SUSMP ordinance, which requires post-construction BMPs for Priority Projects, is the major land use related mechanism of mitigating urban runoff pollution. The City's storm water ordinance also includes provisions required certain non-Priority Projects to implement post-construction BMPs.

Due to additional BMP implementation, storm water runoff from SUSMP sites should carry significantly lower pollutant loads than runoff from similar non-SUSMP sites. The City has implemented both paper and electronic tracking systems for SUSMP project documents and approval status. During review of SUSMP reports, the City's storm water consultant has frequently found that a proposed project relies mainly on a treatment control BMP and does not propose adequate source control and site design BMPs. In those cases, the City requires that more comprehensive site design and source control BMPs be included to reduce storm water pollution to the MEP. For example, the City has encouraged sites to direct runoff into landscaped areas. The City's consultant also carefully examines sizing calculations, locations, and removal efficiencies for proposed treatment control BMPs. Revisions to the Storm Water Requirements Applicability Checklist have helped clarify the requirements for project proponents. Those revisions, the regular interdepartmental coordination meetings, and the recently revised Department Responsibility Checklist have helped City personnel understand their individual responsibilities for SUSMP implementation. All applicability checklists are forwarded to Engineering for final sign off as a standardization measure to make sure that the requirements are applied to projects consistently.

The City also began inspecting completed SUSMP sites in 2006/2007. This program was not yet required by the Municipal Permit, but the City initiated it to gain a better understanding of how well BMPs are being maintained. The program is also intended as a sort of pilot project that will allow the City to have a more refined program in place when SUSMP inspections are required by the new Municipal Permit. Additionally, a more advanced SUSMP database that includes entries for all BMPs at completed sites has been prepared. GPS coordinates for inspected sites were recorded during the site visits.

Permit Section F.2, Construction

Section 7 of the JURMP discusses the City's construction program; Section 7.6 lists the required BMPs. The City requires construction sites to implement BMPs for soil

stabilization and erosion control, sediment containment, materials and equipment management, and non-storm water discharge and drainage control. Common examples of these measures include fiber rolls, silt fences, rip-rap, and hydroseeding. Preventative, erosion control measures have been found to be the most effective and least costly BMPs.

In addition to inspections during the wet season, the City also inspects large construction sites during the dry season. Because contractors know that oversight does not stop during the summer, this practice has helped improve BMP implementation both during the summer and at the beginning of the wet season. The City has found stop work orders to be an effective means of achieving BMP implementation in a short amount of time, and overall the City's enforcement actions have been effective in bringing about proper BMP implementation. Quick responses to construction related complaints, backed by enforcement actions where necessary and the distribution of construction BMP fact sheets to all projects that disturb soil have helped improve BMP implementation at very small job sites.

Permit Section F.3.a, Municipal

Section 2 of the JURMP describes BMPs and pollution prevention measures for municipal activities. The City emphasizes good housekeeping BMPs, such as regular litter pick-up, in its approach because they have been observed to be effective without being prohibitively expensive.

Recognizing that proper implementation of good housekeeping and other BMPs requires informed employees; the City has conducted numerous formal storm water trainings for municipal employees. Further, the City's NPDES Storm Water Compliance Inspector regularly explains storm water concepts to City employees during inspections of municipal facilities and other interactions with them. The City's NPDES Storm Water Compliance Inspector has a good working relationship with municipal facility managers and staff, which helps ensure prompt implementation of corrective actions given during inspections. Municipal employees have also made reports to the City's storm water hotline more frequently during this reporting period. This is because the employees have a better understanding both of what constitutes a storm water violation and where to report it. Most of the reports come from municipal employees in the Public Works, Fire, and Police departments, since those staff drive around various portions of National City each day. Forming a partnership with these employees is an effective means of locating IC/IDs and other storm water violations without incurring extra expenses or hiring new staff. Street sweeping and maintenance of the MS4 are also conducted and logged into electronic reporting systems.

Permit Section F.3.b, Industrial

The City's BMP requirements for industrial facilities are listed in JURMP Appendices C.2 and C.3. Appendix C.2 includes general BMPs required of all industrial and commercial sites, while Appendix C.3 lists activity-specific BMPs for industrial sites. Almost all of the City's industrial facilities conduct their intensive industrial activities, such as cutting metal or maintaining buses, indoors. The outdoor industrial activities are usually limited to material storage, loading and unloading, and similar activities. This practice is effective in preventing many of the largest sources of pollutants from contacting storm water.

During inspections of industrial sites, the City emphasized the importance of good housekeeping measures, which are generally well known but are sometimes not conducted frequently enough. Industrial businesses in the City have typically been cooperative in the compliance process, and, when necessary, stricter enforcement measures have brought about compliance. The City conducts detailed BMP assessments as part of each inspection, and all inspection results are entered into the City's industrial/commercial database.

During the 2006/2007 reporting period, the City again updated its industrial and commercial inventories. The City's NPDES Storm Water Compliance Inspector regularly reviewed newly submitted businesses licenses to determine if new businesses needed to be added to the lists of industrial businesses. Facilities with industrial SIC codes were compared to the current industrial inventories, and those businesses not currently present were added to the inventories. All businesses that this process identified as potential new high priority industrial sites were inspected. The City also continues to update its inspection database.

As was discussed earlier in this Annual Report, the City has developed several methods to help analyze the effectiveness of its program. Storm water monitoring data is reviewed at industrial sites. BMP, knowledge, and PDPA assessments are also conducted at industrial sites and further aid the evaluation process. Regular inspections and education have helped improve BMP implementation at industrial facilities, especially high priority industrial sites.

Permit Section F.3.c, Commercial

The City's BMP requirements for commercial facilities are listed in JURMP Appendices C.2 and C.4. Similar to industrial facilities, at most commercial facilities the commercial activities with the largest potential to generate pollutants, such as food preparation and auto repair, are conducted indoors. The City's inspectors typically emphasize good housekeeping measures and secondary containment and overhead coverage for automotive fluids and cooking grease stored outdoors. Inspections are regularly conducted at commercial facilities, and the results are recorded in the City's industrial/commercial database.

The City has found that a lack of knowledge about storm water issues is a common problem at commercial facilities, particularly restaurants. This is most likely due to the relatively high level of turnover in that industry. City inspectors give verbal instruction and provide educational materials; workshops specifically for restaurants have also been held. Most commercial businesses historically have cooperated with the compliance process after receiving education and being notified of corrective actions to take. However, when a business has been educated and warned but persists in non-compliance, penalties are assessed. This approach has been effective in bringing about compliance with the City's Storm Water Ordinance.

The City developed and distributed a 2007 calendar, prompting user with ways to "keep our community clean." Workshops for automotive repair facilities and for restaurants will be held in 2007/2008. Similar to industrial facilities, the City will continue to work to identify and inspect new high priority commercial facilities. New facilities will likely be identified primarily through SIC code based searches of business license registry data. Similar to industrial facilities, BMP, knowledge, and PDPA scores will continue to be assigned during inspections.

Permit Section F.3.d, Residential

Section 5.3 of the City's JURMP lists pollution prevention measures and BMPs for residential activities.

The City's main avenue to improve BMP implementation in residential areas is storm water education and complaint responses. The City has distributed various educational materials, and during 2006/2007 the City offered a storm water workshop specifically tailored for residents. Residents were provided with a handout of residential BMPs and were encouraged to call the storm water hotline to report illegal discharges and storm water activities. The City also has an ordinance which prohibits car washing and repairs on public streets.

The City's Dry Weather Monitoring Program has found that residential areas contribute to constituent action level exceedances at several monitoring locations. Based on interactions with citizens, City staff have found that some residents do not have a good understanding of storm water issues. The City distributed the 2007 calendars to residents during 2007/2008, which was redesigned to be more user-friendly. The City has found that redesigning their calendars has them more appealing and useful to City residents. Residents then may see the materials on a fairly frequent basis, rather than reading a brochure once and setting it aside.

Permit Section F.4, Education

The City has developed a number of educational materials; they are listed in Section 9 of the Annual Report.

Many people who live and/or work in National City speak Spanish as their first language. As a result, the City has developed bilingual English/Spanish versions of educational materials. This approach has helped more effectively reach the Spanish-speaking population of National City. For example, a one page bilingual fact sheet was prepared to help people in the City to better understand that storm water flows to San Diego Bay through the City's creeks and rivers, not to the sanitary sewer. That sheet has been distributed during inspections and complaint investigations and is also readily available at the City's Engineering desk. The City's storm water calendars have also been prepared with messages in both English and Spanish. The number of impressions created by the City's storm water program during this reporting period was estimated to be over 137,000.

City staff, in particular those in the Engineering, Planning, and Public Works departments, are responsible for implementing the City's storm water program effectively. These individuals act as role models for the activities of City employees and residents. Because these staff can have a large impact on storm water quality, the City provides regular storm water training for them. Other educational activities are described in the above assessment of the residential program. The City has also been notifying industrial and commercial businesses, as well as residents of the City's storm water hotline to facilitate better reporting of non-compliance.

Permit Section F.5, IC/ID

Section 8 of the JURMP describes the City's IC/ID program.

The City's storm water hotline is a key component of IC/ID program. As mentioned previously, municipal employees have become much more involved with recognizing and

reporting storm water violations, resulting in a general increase in reports each year (Figure 11.1). The City's NPDES Storm Water Compliance Inspector has been issued a cellular phone so that contact can be made regarding complaints whenever they occur. This helps minimize the response time. Active discharges are stopped immediately, and cleanup actions are taken when necessary. Education is often provided for minor issues noted in residential areas.

The City's Dry Weather Monitoring Program, which includes upstream pollutant source investigations, has also been an effective means of identifying IC/IDs. The monitoring efforts allow identification of pollutant sources that are causing action level exceedances at regular dry weather monitoring sites. This information allows the City to more effectively target its educational and enforcement efforts on known sources of pollutants. If a live discharge, such as car washing, is observed, the City is also able to immediately respond and eliminate the discharge, resulting in an improvement in the quality of the discharge to the MS4 and to receiving waters. Importantly, the City typically conducts follow-up visits to sites where action levels are exceeded within 24 hours for field analyses and upon receiving laboratory results for lab analyses. This has helped the City more accurately identify and abate IC/IDs that have caused action level exceedances. As described in Section 8 of this Annual Report, the City has taken a number of actions in response to the 2006 dry weather monitoring findings.

Permit Section F.6, Public Participation

Section 10 of the JURMP discusses the City's public participation program.

The City has worked with outside organizations such as ILACSD and organizations within the City such as neighborhood councils during this reporting period. Other cleanup events included collaborations with neighborhood councils. The City plans to continue working with ILACSD to conduct clean up events in the City and to stencil storm drains with "no dumping, drains to ocean" or similar text. The City also participated in HHW and large waste collection events to keep residents from potentially dumping these items in a location where they would pose a threat to storm water. The City also seeks to become informed of pending public participation events by regularly attending the Copermittee Outreach Workgroup meetings.

## IMPLEMENTATION PLANS AND JURMP UPDATE FOR 2007/2008

At the time of the writing of this JURMP Annual Report, the City has been working to update the City's JURMP document to meet the requirements of the new Municipal Permit, Order No. 2007-0001. All programs during the 2006/2007 reporting period were conducted under the requirements of the previous permit (Order No. 2001-01) and the associated JURMP document developed in 2004.

**Table 11.1**
**Source Characterization**
**Fiscal Year 2006/2007**

| Constituent | Geographic Area | Land Use | Potential High Priority Source | Estimated Percent (%) of Total Sources | Priority |
|---|---|---|---|---|---|
| Sediment | Jurisdictional: residential areas | Residential | Landscaping, vacant lots | 15% | Low |
| | Industrial and commercial zones | Commercial | Landscaping, parking lots | 10% | Low |
| | Jurisdictional: construction sites | Various | Construction activities | 45% | High |
| | Slopes around shopping centers, streets without designed curbs, canyons | Commercial, Roads, Open | Slopes | 30% | Medium |
| Fertilizers (Nitrate, Phosphate) | Jurisdictional: residential areas | Residential | Landscaping | 75% | Low |
| | Jurisdictional: industrial/commercial | Commercial, Industrial | Landscaping | 20% | Low |
| | City parks | Parks | Fertilizer application | 5% | Medium |
| Bacteria | North and south of Division Street, east and west of I-805 | Residential | Waste management | 15% | Medium |
| | South Bay Plaza | Commercial | Dumping, restaurants | 15% | High |
| | Jurisdictional | Various | Wildlife waste, animal waste, SSOs, decomposing organic material | 70% | Medium |
| Oil and Grease | Jurisdictional | Various | Roads, parking lots, vehicle maintenance, improper storage | 100% | Low |
| Metals | Western National City, along I-5 | Industrial | Outdoor storage and processing | 25% | High |
| | Commercial zones, including area east of I-5 around Civic Center Dr. | Commercial | Automotive repair | 15% | Medium |
| | Jurisdictional | Various | Parking Lots, Streets | 60% | Low |

**Table 11.1 (Continued)**
**Source Characterization**
**Fiscal Year 2006/2007**

| Constituent | Geographic Area | Land Use | Potential High Priority Source | Estimated Percent (%) of Total Sources | Priority |
|---|---|---|---|---|---|
| Organics (Surfactants) | North and south of Division Street, east and west of I-805; area east of I-805 | Residential | Washing activities | 70% | Medium |
| | East of I-5, from around 18th Street to 32nd Street | Commercial | Car washing | 30% | High |
| Pesticides | Jurisdictional | Residential | Landscaping | 90% | Medium |
| | | Commercial | Landscaping | 10% | Low |
| Gross pollutants (Trash, Debris) | North and south of Division Street, east and west of I-805; area east of I-805 | Residential | Dumping, litter | 25% | Medium |
| | Commercial complexes | Commercial | Dumping, litter | 20% | Medium |
| | Jurisdictional | Various | Litter | 25% | Low |
| | Alleyways | Roads | Dumping | 20% | Medium |
| | Schools | School | Litter | 5% | Low |
| | Parks | Parks | Litter | 5% | Low |
| Ammonia | North and south of Division Street, east and west of I-805; area east of I-805 | Residential | Decomposing materials, SSOs | 50% | Medium |
| | East of I-5, from around 18th Street to 32nd Street | Commercial | Decomposing materials | 10% | Low |
| | Jurisdictional | Various | Decomposing materials | 40% | Low |

**Table 11.2**
**BMP Selection**
**Fiscal Year 2006/2007**

| Constituent | Geographic Area | Potential High Priority Source | Potential Activities | Potential BMPs |
|---|---|---|---|---|
| Sediment | Jurisdictional: residential areas | Landscaping, vacant lots | Soil erosion | Street sweeping, erosion control, sediment control/perimeter protection |
| | Industrial and commercial zones | Landscaping, parking lots | Soil erosion | Street sweeping, erosion control, sediment control/perimeter protection |
| | Jurisdictional: construction sites | Construction activities | Soil erosion, sediment tracking | Erosion control, sediment control, inlet protection, tire wash, dewatering properly, structural BMPs |
| | Slopes around shopping centers, streets without designed curbs, canyons | Slopes | Soil erosion | Street sweeping, erosion control, maintaining vegetation on slopes, sediment control/perimeter protection |
| Fertilizers (Nitrate, Phosphate) | Jurisdictional: residential areas | Landscaping | Fertilizer application, over irrigation | Minimize use of fertilizers, keep chemicals in a covered storage, irrigation control |
| | Jurisdictional: industrial/commercial | Landscaping | Fertilizer application, over irrigation | Minimize use of fertilizers, keep chemicals in a covered storage, irrigation control |
| | City parks | Landscaping | Fertilizer application, over irrigation | Minimize use of fertilizers, keep chemicals in a covered storage, irrigation control |
| Bacteria | North and south of Division Street, east and west of I-805 | Waste management | Dumping, SSOs, littering | Maintain private sewer laterals and public sewer system, education and enforcement for illegal dumping and littering, street sweeping and MS4 maintenance |
| | South Bay Plaza | Dumping, restaurants | Dumping, illegal discharges, improper grease bin maintenance | Keep grease bin clean, cover/contain grease bins, use only dry cleaning methods or retain and dispose of wash water properly, post signs discouraging illegal dumping |

# 12 FISCAL ANALYSIS

The City of National City's storm water program budget and expenditures consists of the following components:

- Staff
- Storm Water Operating Budget
- Drainage Capital Improvement Projects

City staff from different departments and divisions contribute to the implementation of the storm water program as follows:

- The Storm Water Management Team is responsible for the development and implementation of storm water programs, inspection of municipal, industrial, commercial, residential and construction sites, and responding to violations of the Municipal Storm Water Management and Discharge Control Ordinance.
- The Engineering Department is responsible for the majority of the NPDES program. The department reviews grading applications for compliance with the erosion control and other engineering ordinances, including that temporary and permanent BMPs are incorporated in the grading, proposed, and final maps. The Engineering Department is also responsible for reviewing SUSMP reports and construction SWPPPs.
- The Public Works operations crew is responsible for the maintenance of the City's storm drainage system and the sanitary sewer collection system. They are also responsible for emergency response to sewage overflows and pollutant spills on public streets. The Public Works operations crew also manages the street sweeping program and the Used Oil Recycling Program, the Household Hazardous Waste Collection Program, the Solid Waste Collection Program, the Solid Waste Reduction and Recycling Program, and the Energy Conservation Program.
- The Planning Department reviews development projects for environmental impacts to sensitive areas and requires developers to provide mitigation plans before permits are issued.
- The City Attorney's Office reviews all documents such as new ordinances and manuals and forms developed by the Storm Water Management Section, to ensure that they are in compliance with current laws and regulations. The City Attorney's Office also assists the Storm Water Management Section in the enforcement of the City's Municipal Code.

The City's storm water program is funded by sewer fees assessed for property owners or tenants of single family homes, multi-family buildings and commercial/industrial facilities, General Funds, the gas tax, community development block grant (CDBG) funds, zoning and CIP funds. No changes to the sources of funding for this program have been made during this reporting period. The implementation cost of the FY 06/07 program was $939,500. The proposed estimated budget for the FY 07/08 program implementation is $936,000. Table 12.1 presents an itemized breakdown of the program costs.

**Table 12.1**
**Itemized Budget**

| Storm Water Program Fiscal Analysis | FY 06/07 | FY 07/08 |
|---|---|---|
| *Staff* | | |
| Public Works | 160,000 | 160,000 |
| Planning | 40,000 | 50,000 |
| City Attorney | 10,000 | 10,000 |
| Building | 30,000 | 20,000 |
| Fire | 10,000 | 10,000 |
| Engineering | 80,000 | 90,000 |
| Community Development Center (CDC) | 40,000 | 30,000 |
| *Sub-total* | ***$370,000*** | ***$370,000*** |
| *Operation Expenditures* | | |
| NPDES Fees | 35,000 | 35,000 |
| Consultant Fees for NPDES Program | 200,000 | 200,000 |
| Purchase Equipment | 1,000 | 1,000 |
| Miscellaneous Operations | 5,000 | 5,000 |
| *Sub-total* | ***$241,000*** | ***$241,000*** |

| **Grand Total** | **$1,239,500** | **$1,701,700** |

* Included in drainage improvements category for 2007/2008 reporting year

# 13 SPECIAL INVESTIGATIONS

The City takes a proactive approach to storm water management in an attempt to not only protect receiving water quality, but also to improve the quality of water that is discharged from the City's MS4 system. Data collected through the City's various monitoring and inspection programs is used to identify locations within the City that are contributing to storm water contamination. Source identification investigations are then initiated in order to pinpoint the exact cause of detected pollution.

**Trash Assessment Project**

During the City's 2006 Dry Weather Monitoring Program, conducted in September of that year, litter accumulation and illegally dumped objects were noted at some of the test sites. Since trash and illegally dumped items have the potential to negatively affect the quality of water discharged from the City's MS4, such as increasing the level of pollutants such as bacteria, oil and grease, and metals, the City contracted its storm water consultant, D-MAX, to perform a thorough trash assessment throughout the City. The trash assessment was a proactive measure to identify sources of trash within the City's jurisdiction to allow the City to focus future cleanup and education program.

During October and November of 2006, a D-MAX inspector drove the length of every street and alley within the City limits looking for areas of moderate to very heavy trash. Information such as location address, date and time of visit, trash amount, and trash type was recorded at each site noted to have at least moderate amounts of trash present. For the purpose of this assessment, different trash levels were recorded based on the field staff's visual estimates. The categories of different trash types were the following:

- Litter: paper, plastic bags, plastic bottles, glass, aluminum cans, etc.
- Household: household items such as small and large appliances, stereos, couches, mattresses, etc.
- Construction: wood scraps, drywall, rebar, etc.
- Large items: large items not obviously associated with household use, such as tires and shopping carts, etc.
- Yard waste: grass clippings, branches from tree trimming, etc.
- Hazardous waste: items generally considered hazardous and requiring special disposal, such as used oil, paint, or car batteries.

Results from the City's trash assessment show that litter and illegally dumped items tend to accumulate in places out of sight from the main roads within the City, such as alleys and channels. These areas also tend to be poorly lit, making it difficult to catch violators. Dumpster areas located in alleys in residential and commercial areas were a common area of litter and trash overflow. Larger trash such as mattresses, couches, and tires were also observed in alleys. While litter was found in a number of alleys within the City, these areas are typically located some distance away from storm drains, and household items such as furniture have low potential of transport from these areas into the MS4. Out of all the sites evaluated for the trash assessment, only one commercial location was found to have

hazardous waste present. Litter and large trash items were also observed in some channel locations.

In response to the trash assessment findings, the City's Public Works department cleaned City channels with observed trash accumulation. Courtesy notices discussing the negative impact litter and illegal dumping can have on receiving waters and contacts for trash and large item disposal were sent out to residents and businesses in specific areas of the City found to have multiple locations with moderate or higher levels of trash. The City has also formed a new trash management workgroup to further control trash within the City. The workgroup consists of representatives from the City Manager's office, Community Services Department, Public Works Department, and the Engineering Division. Collectively, these branches of the City are involved in a variety of programs involved with trash management including trash removals from channels, the City's storm water program, and community outreach. Together the workgroup is developing different approaches to managing trash within the City. The City plans on continuing efforts to address trash and debris during the 2007/2008 reporting period.

# 14 CONCLUSIONS AND RECOMMENDATIONS

The City has implemented its storm water program in accordance with Municipal Permit requirements since 2002. RWQCB Order No. 2007-0001, a revised municipal storm water permit, was issued on January 24, 2007. During the 2006/2007 reporting period the City began adjusting its program in anticipation of the new requirements of this permit and continued to refine programs already required under the existing Municipal Permit. During 2007/2008, the City will transition into implementing the requirements of the new permit. Additionally, the City will continue to work with other jurisdictions in the Paleta Creek watershed and the RWQCB to address TMDL requirements. The City will continue to refine implementation of existing programs and create new programs as needed to improve its ability to reduce or eliminate pollutant discharge and meet regulatory requirements. The City also plans to collaborate with other Copermittees to develop new programs, further refine existing programs, and develop methods for which program effectiveness may more accurately be assessed.

## CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki, P.E.
City Engineer

Date: September 2008

Telephone Number: (619) 667-1105

# EXECUTIVE SUMMARY

The City of National City (City) has been actively developing and implementing storm water pollution prevention measures since 1990. The City's Jurisdictional Urban Runoff Management Program (JURMP) was updated and submitted to the San Diego Regional Water Quality Control Board (RWQCB) in March 2008. The JURMP update was required by the recently re-issued storm water permit, RWQCB Order No. R9-2007-0001 (Municipal Permit). The Municipal Permit was jointly issued to 18 municipalities in San Diego County, including the City, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees").

The City's JURMP includes Best Management Practice (BMP) standards for businesses, construction and development projects, residents, and the City's own activities. The JURMP also includes programs for water quality monitoring and educational outreach.

This JURMP Annual Report presents the City's activities to implement its JURMP during the 2007/2008 fiscal year, which began on July 1, 2007 and ended on June 30, 2008. The exception to this is the illicit discharge detection and elimination component of the JURMP, which per the recently adopted Addendum No. 2 to the Municipal Permit now has a reporting period that extends to September 30, 2008, three months later than all the other components of the JURMP.

Two different storm water permits were in effect during 2007/2008 reporting period: the previous permit issued to the Copermittees, Order No. 2001-01, and the current Municipal Permit. The City was required to implement its newly updated JURMP to comply with the Municipal Permit no later than March 24, 2008, but the City began implementing some aspects of the new program prior to this deadline. Each section of this JURMP Annual Report discusses how the City's efforts during 2007/2008 met the requirements of the applicable permit and when the requirements of the new Municipal Permit were implemented. Key actions taken for the major components of the City's storm water program are summarized below.

**Development Planning Component**

During 2007/2008, the City continued to oversee development activities occurring in the City to mitigate potential threats to water quality due to such activities. The City developed a treatment control BMP operation and maintenance verification program, which included the development of an electronic treatment control BMP database, an inspection program, and an annual maintenance verification program. The City inspected 13 sites with approved treatment control BMPs. The City also updated its BMP requirements for all development projects to include Low Impact Development (LID) principles.

**Construction Component**

During 2007/2008, a total of 88 construction inspections were completed at 78 sites, not including inspections for building permits, which also include a brief check for storm water BMPs. The City updated minimum construction requirements to include a maximum disturbed area limitation and guidelines for advanced treatment. The City's plan check and inspection program required projects to comply with the City's minimum BMP requirements.

**Municipal Component**

The City inspected all high TTWQ municipal fixed facilities and continued its rigorous street sweeping and MS4 maintenance programs. A total of 1,151 tons of trash and debris was removed from street sweeping activities, and 39.6 tons of debris were removed from standard MS4 maintenance. An additional 10 pounds of debris was removed from the cleaning of filter inserts installed at the City's Public Works Yard. The City also continued to maintain and repair or replace sanitary sewer lines, as needed, to decrease the potential for a sanitary sewer overflow (SSO).

**Industrial and Commercial Component**

During 2007/2008 the City met the Municipal Permit requirement to inspect at least 20 percent of the City's industrial and commercial inventory, including at least 50 percent of its high threat to water quality (TTWQ) sites. During the inspections conducted during 2007/2008, the City notified industrial and commercial businesses of the City's new BMP requirements through the City's inspection program. Inspectors also assessed each facility's compliance with the General Industrial Permit (Industrial Permit) and worked with the RWQCB to resolve compliance issues. The City also initiated a special additional data collection program focused on pollutant discharge potential assessment.

**Residential Component**

The City worked to educate its residents through a variety of means. The City continued to collaborate with the cities of Chula Vista and Imperial Beach to make a household hazardous waste (HHW) disposal facility available to the public. During 2007/2008 the City hosted two large item waste disposal events and encouraged residents to participate in these events. The City also responded to calls made to the City storm water hotline regarding residential areas. The hotline call investigations were used as opportunities to enforce BMP requirements and to educate residents.

**Illicit Discharge Detection and Elimination Component**

As required by RWQCB Addendum No. 2 to the Municipal Permit, adopted on September 10, 2008, the reporting period for this component of the JURMP has been extended to September 30, 2008. The City will submit the details of how it implemented the illicit discharge detection and elimination component of its JURMP to the RWQCB no later than December 15, 2008.

**Education Component**

As a means to raise storm water awareness in various communities in the City, the City continued to conduct various education and outreach activities throughout 2007/2008.

The City hosted two training sessions: one was for members of the Kiwanis Club of National City; the other was geared toward the development planning and construction community. Similar to previous years, the City developed a bilingual 2008 storm water program calendar, which presented storm water concepts as well as photos of ocean scenes. To better serve the City's diverse population, a variety of educational materials were distributed in Spanish as well as English.

**Public Participation Component**

During 2007/2008, the City provided a variety of opportunities for individuals in the City to participate in the City's storm water program. Activities included cleanup events, which have a direct effect on water quality, and outreach activities, through which the City works to increase general knowledge and awareness regarding storm water issues. Most notably, the City hosted a themed art contest for third grade students at public schools in the City. Students submitted drawings with the "By Keeping our Community Clean, We Can Keep the Ocean Clean" theme; 12 winners will be chosen, and their drawings will be included on the 2009 storm water program calendar. A variety of waste disposal events were held for City residents, and 45 volunteers participated in the Creek to Bay Cleanup at the site in the City of National City.

**Fiscal Analysis Component**

The City continued to fund its storm water program as discussed in the City's JURMP. Itemized expenditures for 2007/2008 and estimated expenditures for 2008/2009 are presented in this section.

**Effectiveness Assessment Component**

The City updated its effectiveness assessment approach to comply with new Municipal Permit requirements. The City has identified significant activities within each program component and metrics to assess each one. Standard tables to report this information have been created and included in Section 11 of this JURMP Annual Report. The City also has continued to work with the regional Fiscal, Reporting, and Assessment Workgroup to help develop and implement the latest assessment methods.

**Special Investigations**

The City continued its Clean Community Program, which includes education and will include assessment of new trash monitoring results from the 2008 Dry Weather Monitoring Program. The City also assessed pollutant discharge potential of industrial and commercial businesses; sediment, trash, and oil and grease had the highest average pollutant discharge potential scores.

**Conclusions and Recommendations**

The City began implementing its newly updated March 2008 JURMP toward the end of 2007/2008. The City will continue to implement the new and updated programs in its JURMP during 2008/2009; it is anticipated that some program refinements will be made as implementation progresses. The City will also collaborate with the other Copermittees to improve the efficiency of its program and to develop updated methods of assessing program effectiveness.

# 1.0 INTRODUCTION

## 1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report presents a summary of the activities of the City of National City (City) during the 2007/2008 fiscal year. Preparation and submittal of the JURMP Annual Report is required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

### 1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act (also known as the Clean Water Act, or CWA) established a framework for regulating MS4 discharges under the National Pollutant Discharge Elimination System (NPDES). The RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region in 1990, followed by a revised permit in 2001. The current Municipal Permit in turn replaced the 2001 permit, RWQCB Order No. 2001-01, in 2007.

Like all the other regulated municipalities in the San Diego region, collectively referred to as Copermittees, the City developed and submitted a JURMP to the RWQCB in 2002. As required by the Municipal Permit, the City submitted an updated JURMP in March 2008. The JURMP includes management measures for a variety of different sectors and activity types such as municipal, industrial, commercial, construction, and significant development and re-development activities.

Annual reports on the implementation of the JURMP are required to be submitted to the RWQCB September 30 of each year. This JURMP Annual Report presents information from the 2007/2008 fiscal year, which extended from July 1, 2007 to June 30, 2008.

### 1.1.2 CITY SETTING

The City of National City is located in southwest San Diego County, and is bordered by San Diego, Chula Vista, and unincorporated portions of San Diego County. The City itself includes approximately nine square miles and an estimated population of approximately 55,000. Land use within the City is mixed, with residential being the predominate land use. Land use categories with the corresponding percentage of the total area are included in Table 1-1, below, and illustrated in Figure 1-1.

**Table 1-1**
**City of National City Land Use Breakdown**

| Land Use | Total Area (Acres) | Percentage |
|---|---|---|
| Single Family Residential | 1,216 | 30% |
| Transportation | 1,149 | 29% |
| Commercial | 490 | 12% |
| Industrial | 251 | 6% |
| Multi-Family Residential | 215 | 5% |
| Open | 202 | 5% |
| Public Facilities and Utilities | 174 | 4% |
| Vacant | 115 | 3% |
| Parks | 114 | 3% |
| Other Residential | 41 | 1% |
| Office | 22 | 1% |
| Water | 20 | <1% |
| Construction | 6 | <1% |
| Recreation | 2 | <1% |
| **Total** | **4,016** | **100%** |

Source: 2007 SANDAG land-use data

The City of National City lies entirely within the San Diego Bay Watershed. The City is located within two sub-watersheds: the Sweetwater and Pueblo San Diego sub-watersheds. Overall, the City of National City comprises approximately 1.6 percent of the total area of the San Diego Bay Watershed. Much of the southern portion of the City drains to the Sweetwater River, which ultimately terminates in San Diego Bay. The central portion of the City drains to Paradise Creek, a small salt marsh creek, which eventually discharges into the Sweetwater River. La Paleta Creek (also known as 7th Street Channel) drains the northern portion of the City and discharges directly to San Diego Bay. A very small western portion of the City drains directly to San Diego Bay shoreline. Virtually all of the areas of the City that drain directly to San Diego Bay are within the jurisdiction of the San Diego Unified Port District. Watersheds in the City are shown in Figure 1-2.

San Diego Bay, as a whole, is listed in the 2006 CWA Section 303(d) for polychlorinated biphenyls (PCB) based on fish tissues studies in recent years. The San Diego Bay shoreline at 7th Street Channel and at the 24th Street Marine Terminal are listed in the 2006 CWA Section 303(d) for benthic community effects and sediment toxicity. A TMDL is in progress for the mouth of 7th Street Channel. Because Sweetwater Marsh is part of a national wildlife refuge, it is considered an ESA. Paradise Creek is also considered an ESA by the City.

**Figure 1-1**
**City of National City Land Use**

**Figure 1-2**
**City of National City Watersheds**

Note: Marsh boundaries based on land use data from SANDAG. The portion of the marsh west of I-5 and south of the Sweetwater River is not in the City's Jurisdiction. Base Data Sources: City of National City, SANDAG, SanGIS, Port of San Diego

## 1.2 PURPOSE AND OBJECTIVES

The City's JURMP presents a strategy to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The JURMP includes a variety of programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the City's implementation of its JURMP during the 2007/2008 reporting period.

## 1.3 REPORT ORGANIZATION

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

| | |
|---|---|
| **Section 1** | **Introduction** |
| **Section 2** | **Development Planning Component** |
| **Section 3** | **Construction Component** |
| **Section 4** | **Municipal Component** |
| **Section 5** | **Industrial and Commercial Component** |
| **Section 6** | **Residential Component** |
| **Section 7** | **Illicit Discharge Detection and Elimination Component** |
| **Section 8** | **Education Component** |
| **Section 9** | **Public Participation Component** |
| **Section 10** | **Fiscal Analysis Component** |
| **Section 11** | **Effectiveness Assessment Component** |
| **Section 12** | **Special Investigations** |
| **Section 13** | **Non-Emergency Fire Fighting** |
| **Section 14** | **JURMP Revisions** |
| **Section 15** | **Conclusions and Recommendations** |
| **Section 16** | **References** |

Each section includes all the sections required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a clearer explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Subsection 1.1, Background, has been divided into subsections 1.1.1, Regulatory Background, and 1.1.2, City Setting, for the sake of clarity.

# 2.0 DEVELOPMENT PLANNING COMPONENT

## 2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall storm water quality by reducing the discharge of pollutants from development projects to the MEP and managing increases in runoff from development projects that have the potential to negatively affect downstream water bodies. During the 2007/2008 fiscal year, the City accomplished these goals through implementation of its JURMP document.

The City updated its JURMP during the reporting period and began implementing new Municipal Permit requirements for development planning on March 24, 2008. For the most part, the overall structure of the City's processes used to require post-construction BMPs of development projects remained similar throughout the reporting period. The most significant changes to the City's program apply to the implementation of the City's development project approval and verification process. For example, the City's SUSMP requirements were updated to include Low Impact Development (LID) and hydromodification concepts, and the City began a treatment control BMP inspection program and a BMP maintenance verification program.

### 2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- Updated the City's Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance, including addition of new Priority Development Project (Priority Project) categories required by the Municipal Permit.
- Updated the City's NPDES Project Applicability Form to reflect changes made to the City's updated JURMP, and distributed updated checklist starting late March 2008.
- Updated minimum BMP requirements for all development projects, including addition of Low Impact Development (LID) principles.
- Collaborated with the Copermittee hydromodification management workgroup to discuss key Hydromodification Management Plan (HMP) development issues.
- Developed an electronic SUSMP database that contains information related to all proposed site design, source control, and treatment control BMPs within the City's jurisdiction, and the parties responsible for BMP maintenance.
- Developed a treatment control BMP operation and maintenance verification program, which included the development of a treatment control BMP database,

a City-conducted inspection program, and an annual maintenance verification program.

- Conducted operation and maintenance inspections of site design, source control, and treatment control BMPs at 13 completed development projects throughout the City.
- Conducted trainings for City staff and developed educational materials for the development community regarding new Municipal Permit requirements related to development projects.

## 2.2 Land Use Planning

### 2.2.1 Background

The City's General Plan was adopted in 1996 and contains water quality and watershed protection principles in its Natural Settings Element. The comprehensive principles established in 1996 provide an ample framework for implementing the requirements of both the old permit and the new Municipal Permit, and no changes to these policies were necessary during the reporting period.

### 2.2.2 Source Characterization

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to development restrictions in the City's General Plan for storm water purposes were implemented during the reporting period.

### 2.2.3 Best Management Practice Requirements

Please refer to the City's updated JURMP document for a list of the water protection policies included in the City's General Plan. These policies remained the same throughout the reporting period.

### 2.2.4 Program Implementation

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code. During this time, the City's Storm Water Ordinance and Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance were updated to meet new Municipal Permit requirements. Descriptions of the changes made, as well as complete copies of the amended documents, can be found in the City's updated JURMP. Implementation of these new development requirements began on March 24, 2008. Prior to that date, the City implemented the Storm Water and SUSMP Ordinance as detailed in the 2006/2007 JURMP Annual Report.

Details on how the City implemented its established water protection policies through its environmental review process and its development project approval and verification

processes during the reporting period are provided in Sections 2.3 and 2.4 of this JURMP Annual Report document.

## 2.3 Environmental Review Process

The City's current environmental review process is detailed in the City's updated JURMP. While changes to specific requirements of the City's environmental review process were made during the reporting period as part of the JURMP update, the overall structure of the review process, such as the City's departments involved and the document submissions required, remains the same as in previous reporting years. No further modifications to the City's environmental review process have been made since the submittal of the updated JURMP.

## 2.4 Development Project Approval and Verification Process

### 2.4.1 Background

As previously discussed, the development project approval and verification process implemented prior to March was identical to the process described in the 2006/2007 JURMP Annual Report. The approval and verification process implemented after March 24, 2008 followed the process described in the City's updated JURMP.

### 2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's SUSMP Ordinance. Prior to March 2008, the SUSMP Ordinance included in the City's 2004 JURMP Revision document was used by the City and the development community, while the updated SUSMP Ordinance, revised as part of the JURMP update, was implemented starting in late March 2008. Details on changes to the City's SUSMP Ordinance, such as the addition of retail gas outlets (RGO) and industrial development as Priority Project categories, can be found in Section 4 of the updated JURMP.

### 2.4.3 Best Management Practice Requirements

No changes were made to the development BMP requirements presented in the 2006/2007 JURMP Annual Report prior to March 2008. The City's new BMP requirements, implemented after March 2008, are similar to the requirements prior to that date, with a few exceptions. In some cases, the new BMPs were already being required by the City, but the update provided an opportunity for the language in the JURMP to be strengthened for clarity. For example, the LID BMP requirements added to the City's SUSMP Ordinance are similar to site design concepts that were already required in the original SUSMP Ordinance developed in 2002 in compliance with the previous Municipal Permit. The City's SUSMP was only changed to stress the

importance of a few of these design principles, such as draining runoff from impervious surfaces to adjacent landscaping. Similarly, the City had already begun requiring project proponents to include justification whenever a treatment control BMP that did not have a high or medium removal efficiency for key pollutants was associated with the project. The new SUSMP Ordinance provided more explicit language in support of this requirement. All changes to BMP requirements made during the reporting period are detailed in the City's updated JURMP.

### 2.4.4 Program Implementation

During the 2007/2008 fiscal year, the City required implementation of its BMP requirements for all development projects through education, a comprehensive development project approval process, and a new treatment control BMP inspection and maintenance verification program.

#### 2.4.4.1 Outreach and Staff Training

The City continually trains staff involved in the planning and review of development projects within the City and works closely with the development community to communicate its development requirements throughout the entire approval process. During the reporting period, staff and industry training was focused on changes being made to the City's JURMP in response to new Municipal Permit requirements. Details on trainings conducted and educational materials developed and distributed related to the new development during the reporting period can be found in Section 8 of this JURMP Annual Report document. Distribution of maintenance verification letters to parties responsible for maintenance of treatment control BMPs at completed projects, which began in August 2008, is also expected to increase the level of knowledge of regulated parties.

#### 2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Forms completed by project applicants are kept with the project's file at the City for future reference. As discussed in the City's JURMP, the City required all projects applying for construction and building permits to complete a "National Pollutant Discharge Elimination System (NPDES) Project Applicability Form" (SUSMP Checklist) that guides project applicants to submit proper documents to the City for review. Prior to March 2008, the City distributed the SUSMP Checklist included in the City's 2006/2007 JURMP Annual Report. Starting in March 2008, the City began distributing an updated version of the SUSMP Checklist that included changes necessary to comply with the new Municipal Permit requirements. A copy of the updated SUSMP Checklist was included in the City's updated JURMP.

Starting in March 2008, certain non-priority development projects were required to complete a Standard Permanent Storm Water BMPs form, which was included as an Attachment to the City's updated JURMP document. This form includes a list of all standard permanent storm water BMPs required by the City's SUSMP and requires project proponents to indentify which BMPs will be implemented at the development. Note that the standard permanent storm water BMPs do not include treatment control BMPs. If any BMP is not selected, the project proponent must provide an explanation why the BMP is not applicable or feasible for the project. These completed forms are kept with the project's file at the City.

In preparation of the new BMP requirements going into effect during the middle of the reporting period, all development projects that submitted documents to the City for review were educated on upcoming changes to the City's SUSMP requirements. The City also held a workshop for the development community covering the City's updated requirements. Details on this workshop can be found in Section 8 of this Annual Report.

All development projects determined to be Priority Projects after completing the SUSMP Checklist were required to implement the City's SUSMP requirements and prepare a Storm Water Management Plan (SWMP). As part of the JURMP update, the City also developed a SWMP self checklist to be used by SWMP preparer, which was included as an attachment to the updated JURMP. In the past, the majority of deficiencies found in document reviews were missing information or sections not having enough detail about proposed BMPs. The self checklist provides a more detailed resource for project proponents to use when writing the SWMP, and the City hopes that the guidelines will reduce the number of document reviews required for development projects before they are approved. Table 2-1 lists the development projects subject to the City's SUSMP requirements during the 2007/2008 reporting period, the number of document reviews for each project, and their current approval statuses.

**Table 2-1**
**Development Projects Subject to SUSMP Requirements During 2007/2008**

| # | Project Name | Location | Project Type | Number of Reviews during 07/08 | Approved during 07/08? |
|---|---|---|---|---|---|
| 1 | 940 W. 19th St. | 940 W. 19th St. | Priority | 2 | Yes |
| 2 | Canyon Ridge (Resubmission) | Corner of Rachel Ave and Blueridge St. | Priority | 2 | Yes |

| 8 | K Avenue Homes | K Ave., North of 13th St. | Priority | 2 | Yes |
| 9 | Marina Gateway | Marina Way, south of Bay Marina Dr. | Priority | 3 | Yes |
| 10 | Paradise Village | Area bounded by 4th St., 8th St., Arcadia Ave., and Bowron St. | Priority | 3 | Yes |
| 11 | Paradise Walk | Arcadia Ave and E. 8th St | Priority | 3 | Yes |
| 12 | Plaza Bonita Mall Expansion | 3030 Plaza Bonita Rd. | Priority | 2 | Yes |
| 13 | Plaza Village | Corner of L Ave. and Plaza Blvd. | Priority | 1 | Yes |
| 14 | WestAir Gases | Haffley Ave. north of Bay Marina Dr. | Priority | 2 | Yes |

Canyon Ridge went through multiple SUSMP reviews during the 2005/2006 reporting period and was found to meet the City's minimum BMP requirements late in that reporting year. Early in the 2007/2008 reporting period, changes were proposed to the project's treatment control BMPs during the site's construction. The City required the project to submit a revised SWMP with the proposed changes to the City for review before the changes were implemented at the site. The City requires that if a change to the proposed BMPs is made during construction that the substitute be comparable to the original in its efficiency and capacity to treat storm water runoff from the development. The resubmitted SWMP went through 2 reviews before the proposed changes met the City's minimum requirements.

K Avenue Homes and Plaza Bonita Mall Expansion are two additional projects that received initial approval early in the 2007/2008 reporting period and later resubmitted their SWMPs to include changes made to the proposed BMPs during construction. For Plaza Bonita, the change included the addition of a new store and restaurant in the mall's existing parking lot, which extended the footprint of the original project. The proposed site design, source control, and treatment control BMPs proposed for this additional area in the revised SWMP were found to meet the City's minimum requirements. For K Avenue Homes, changes were made to the design of the proposed grass filter strips on the property, with the new design resulting in an increase in treatment area.

Two Priority Projects, Grove Plaza and 940 W. 19th Street, were approved after March 24, 2008. Of these two projects, only Grove Plaza had approved treatment control BMPs with a low removal efficiency ranking approved (two hydrodynamic separators). Note that while the City approved this low removal efficiency BMP, the City worked closely

with the project to incorporate LID principles into the project's design throughout the review process. Flow-through planter boxes and grass swales have been proposed to treat roof and sidewalk runoff from the project. Also, instead of using conventional asphalt for the entire parking lot, the project has proposed to use pervious concrete in the parking stalls, limiting asphalt to only the drive isles. This design reduces the amount of impervious paving on the site by 48 percent. However, the proposed LID features could not be designed to meet the SUSMP's treatment control BMP sizing requirements. While the City believes that the combination of LID and treatment control BMPs for this project will provide storm water treatment to the maximum extent practicable, the City still required the project to prepare a feasibility analysis stating why the other treatment control BMPs in the City's SUSMP could not be used for the project. A copy of the project's feasibility analysis is included as Attachment 4.1 to this annual report.

During the reporting period, no projects received a SUSMP waiver for implementation of treatment control BMPs. The City has never issued a SUSMP waiver in the past, and at this time the City has no plans to develop a SUSMP waiver mitigation program.

**Hydromodification Management Plan**

During the reporting period the Copermittee hydromodification management workgroup met regularly to discuss key HMP development issues and provide updates on the status of consultant work products. The City of National City regularly participated in the hydromodification management workgroup during 2007/2008. Note that in the summer of 2008 the workgroup name was officially changed to the Land Development Workgroup.

The City's current SUSMP Ordinance contains detailed Interim Hydromodification Criteria (IHC) which the City will continue to implement until the HMP is finalized. None of the development projects undergoing the City's review process during the reporting period were subject to the IHC since all of these projects are less than 50 acres. Final HMP requirements have not yet been established by the Land Development Workgroup. Once the HMP is developed and approved by the Regional Board, the City will incorporate the HMP into its SUSMP Ordinance.

**BMP Installation Verification**

Both the Plaza Bonita Mall Expansion and Plaza City Apartments SUSMP projects were completed during the 2007/2008 reporting period. For these projects, City inspectors verified and documented that the proposed BMPs were installed according to the project's plans during routine plan checks, prior to granting occupancy for the site. Both projects have been finaled and added to the City's treatment control BMP inventory included in Appendix A. These projects have also been assigned a TTWQ priority using the prioritization flow chart presented in the City's JURMP. Operation and maintenance inspections for the installed BMPs will be performed as required for these projects during future reporting periods.

### 2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

The City's treatment control BMP inspection program did not go into effect until March 24, 2008, significantly after the start of the 2007/2008 wet season, which began on October 1, 2007. Therefore, the City did not have the opportunity to inspect the high TTWQ development projects included on its inventory prior to the start of the wet season during the reporting period. However, inspections were conducted for projects with treatment control BMPs during the 2007/2008 fiscal year after March 24, 2008 in compliance with the minimum inspection frequencies outlined in the City's updated JURMP. Only three completed SUSMP projects on the City's 2007/2008 inventory were not inspected during the reporting period. These sites have been categorized as either medium or low TTWQ, and they will still be required to submit an annual maintenance verification form documenting proper maintenance of their BMPs prior to October 1, 2008.

The site-specific inspection forms generated using the City's electronic BMP database to perform BMP inspections at the individual project sites were used. GPS coordinates and narrative location descriptions for many of the BMPs included in the City's inventory were collected during previous reporting periods are stored into the City's electronic BMP database. This location information is automatically printed on the project's customized inspection form and allows the inspector to locate BMPs efficiently without needing to carry cumbersome project plan sheets to the inspection site. While not explicitly required by the Municipal Permit, the City also examined structural site design and source control BMPs during each site visit. Table 2-2 lists the 13 development projects inspected during the reporting period, the percentage of BMPs at the site that were properly installed and maintained, and brief description of inspection findings. Public Priority Projects, known as Capital Improvement Projects (CIP) are marked as such in the table. The BMP types installed at these sites and the sites' TTWQ priorities are included in the City's treatment control BMP inventory, which is included in Appendix A.1 of this JURMP Annual Report.

**Table 2-2**
**Summary of Treatment Control BMP Inspection Results**

| # | Project Name | Inspection Notes |
|---|---|---|
| 1 | Bonita Creek | Only site design/source control BMPs observed at the site. |
| 2 | Estrella Walk | CDS unit operational and well maintained. |
| 3 | Jack in the Box | All drainage inserts observed had moderate to high levels of trash and debris. |
| 4 | Mariposa Walk | Only site design/source control BMPs observed at the site. |
| 5 | National City Batch Plant | Wet ponds on site were operational and well maintained. |

| # | Project Name | Inspection Notes |
|---|---|---|
| 6 | National City Fire Station #34 (CIP) | All BMPs operational and well maintained. |
| 7 | Paradise Creek Park (CIP) | Only site design/source control BMPs observed at the site. |
| 8 | Penske Truck Leasing | All drainage inserts observed had moderate to high levels of trash and debris. |
| 9 | Plaza Village | No maintenance deficiencies noted. |
| 10 | Sweetwater Town & Country Mall | All drainage inserts observed had moderate to high level of trash and debris. |
| 11 | Tremont Court Condominiums | Grass filter strips and drainage inserts not observed. CDS unit operational and well-maintained. |
| 12 | Walgreens | All drainage inserts observed had moderate to high levels of trash and debris. |
| 13 | Wal-Mart | CDS unit contained significant trash and debris. |

During routine inspections of SUSMP BMPs, the City discovered that some of the proposed BMPs were missing at Bonita Creek, Mariposa Walk, and Tremont Court. The City mailed letters requesting information about the status of all BMPs at the site, including BMPs that could not be located, to these sites early in the 2008/2009 reporting period. Depending on the results of the information returned from the projects and results of future site visits, the City will take additional enforcement action if necessary.

Two drainage insert were found to be missing during a routine SUSMP treatment control BMP inspection at Paradise Creek Educational Park, and the City will replace these BMPs.

Corrective actions were recommended for all development projects with BMPs observed in need of maintenance. Since inspections were conducted close to the end of the reporting period, follow-up actions were unable to be completed during the 2007/2008 fiscal year. The City did mail BMP operation and maintenance verification letters to all the inspected sites in early 2008/2009, and the City will continue to follow up with these sites during 2008/2009. No sites were observed to present a significant threat to human health or the environment during inspections, so none were reported to the RWQCB.

In addition to City-conducted maintenance inspections, the Municipal Permit requires annual verification of operation and maintenance of treatment control BMPs installed within the City's jurisdiction. Annual verification must be provided by the party responsible for treatment control BMP maintenance and must be returned to the City prior to the start of the wet season (October 1st). Since this portion of the City's program did not go into effect until March 2008, towards the end of the wet season, the City was not able to require annual maintenance verification of treatment control BMP maintenance prior to the 2007/2008 wet season, which began October 1, 2007. The City did, however, begin the process of obtaining annual BMP maintenance verifications for the 2008/2009 fiscal year.

A project-specific BMP maintenance verification form and introductory letter were developed during the 2007/2008 reporting period. Using the property owner names and addresses recorded in the City's BMP database, BMP maintenance verification forms were mailed to all the projects included in the City's BMP database in early 2008/2009. The template introductory letter and an example BMP maintenance verification form are included as Attachment 2.2 to this JURMP Annual Report. It is anticipated that this verification program will help raise the level of knowledge about storm water BMPs among the parties responsible for maintenance. The City will follow up with projects that do not return the annual maintenance verification forms or return incorrectly completed forms.

## 2.5 Development Planning Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 2.6 Program Review and Modification

The City's JURMP was recently updated in March 2008. No changes to the City's development planning component have been made since that time.

# 3.0 CONSTRUCTION

## 3.1 INTRODUCTION

The City began implementation of new Municipal Permit requirements related to construction activities on October 1, 2007. New inspection frequencies and minimum BMP requirements were implemented for the remainder of the fiscal year. As a result, the overall implementation of the City's construction program remained largely the same throughout the reporting period. The City made some additional modifications to improve its program in late March 2008 as part of its JURMP update. These changes included additions of requirements limiting maximum disturbed area and calling for the use of advanced treatment methods in certain instances. Some modifications to standard forms used in the construction program were also made.

### 3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- Distributed storm water requirements applicability checklists to all development projects in the City's jurisdiction.
- Conducted plan checks of erosion control plans and SWPPPs to ensure construction projects planned to comply with the City's minimum BMP requirements.
- Conducted training for applicable City staff regarding the construction requirements in the City's updated JURMP.
- Conducted 88 construction inspections at 78 sites per the frequency in the updated JURMP. During the wet season, high TTWQ sites were inspected bi-weekly, medium TTWQ sites monthly, and as needed for low TTWQ sites.
- Issued four verbal warnings, two administrative citations, and two stop work orders to construction sites in response to violations of the City's minimum BMP requirements.

## 3.2 SOURCE CHARACTERIZATION

An inventory of active construction projects during the reporting period is presented in Appendix A of this JURMP Annual Report document. The City's inventory was maintained throughout the reporting period by entering permit application forms into the City's inventory spreadsheet on a continuous basis. New construction projects were added to the inventory at the start of construction, and projects were removed from the inventory after construction was completed. Since construction projects were continually being added and removed throughout the fiscal year, inventory updates

were usually performed more frequently than the minimum once per month.

## 3.3 Updates to Ordinances and Approval Processes

The City updated its Grading Ordinance and its Storm Water Management and Discharge Control Ordinance during the reporting period as part of the City's JURMP update. Details on these revisions can be found in Section 5 of the City's updated JURMP. Details on any changes to the City's approval process during the reporting period are discussed in Section 3.5 of this document.

## 3.4 Best Management Practice Requirements

The City's updated construction and grading requirements are detailed in section 5.4 of the City's updated JURMP document. The City's updated BMP requirements were implemented starting in March 2008. The construction component of the updated JURMP is not significantly different than the construction element of the previous JURMP that was in effect prior to March 2008. The main differences are that the updated JURMP includes a provision that allows the City to require advanced treatment at sites that pose an exception threat to water quality and a provision that limits the maximum disturbed area to 17 acres unless special approval is obtained.

## 3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below.

### 3.5.1 Education and Staff Training

Education and staff training implemented during the 2007/2008 fiscal year focused on communicating changes made to the City's construction requirements to both City staff and the construction community. Please see Section 8 of this JURMP Annual Report document for details on trainings performed and educational materials distributed related to construction and grading activities.

### 3.5.2 Construction and Grading Approval Process

During the reporting period, City personnel verified that all construction projects planned to implement the City's minimum BMP requirements prior to issuing any building or grading permits. The City conducted its grading approval process as described thoroughly in Section 5 of the City's updated JURMP. The City requires grading construction projects to submit erosion control plans that indicate what BMPs are to be used at the site. These erosion control plans are reviewed by the City to ensure the site plans to meet the City's minimum construction BMP requirements. The City also reviews Storm Water Pollution Prevention Plans (SWPPPs) for sites greater than

one acre that are required to obtain coverage under the General Construction Permit. Approved forms and documents completed by project proponents are kept with each project's file at the City for reference. A Construction BMP fact sheet, known as the "Blue Sheet" within the City because the copies distributed are on blue paper, was also distributed with all construction permits issued (Attachment 3.1). Proper implementation of the minimum BMPs listed on the fact sheet was a condition of approval for all permits issued by the City during the 2007/2008 fiscal year.

During the report period the City began enforcing a 17 acre maximum of disturbed area for grading activities. During the reporting period, none of the City's active construction sites were larger than 17 acres, and the maximum disturbed area limitation did not apply. However, all construction sites were still required to limit exposed cleared or graded areas to the amount of area that could be protected prior to a rain event, as prescribed in the City's seasonal BMP requirements.

The City also began implementing advanced treatment requirements during the reporting period. Criteria for determining when advanced treatment is required are detailed in the City's updated JURMP. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites within the City's jurisdiction, and advanced treatment methods were not required at any construction sites.

### 3.5.3 Inspection of Construction Sites

Appendix A.2 of this JURMP Annual Report contains a list of construction projects that were active during the reporting period, along with their assigned TTWQ priorities, the number of weeks the site was active within the rainy season, the numbers of inspections conducted during the wet and dry seasons, the number of follow-up inspections and complaint investigations, and the total number of inspections for each site. In total, 88 construction inspections were performed for 78 construction sites, not including the building inspections at low priority sites, which also include a storm water component.

Construction inspections conducted during the reporting period were performed as described in the City's updated JURMP. Key components of the inspections include checks for coverage under the General Construction Permit during the initial inspection and assessments of compliance with the City's BMP and discharge requirements during all inspections. Responsible parties at the sites are educated as needed during inspections. Copies of the inspection forms are kept on file at the City. The City conducted inspections at high TTWQ construction sites bi-weekly during the wet season and monthly for medium TTWQ sites. Low TTWQ sites were inspected on an as needed basis. Typically, formal inspections were not conducted at low TTWQ sites unless a complaint was called into the City's storm water hotline. Building inspectors have been trained in the City's minimum construction BMP requirements and provided with additional oversight for low TTWQ construction sites that do not receive routine formal inspections. Any sites found to have problems with BMP implementation are forwarded to the City's Storm Water Compliance Inspector. During the reporting

period, 3 inspections of low TTWQ construction sites were conducted as complaint investigations. These sites are indicated on the City's inventory in Appendix A.2.

When any violations were noted during routine, follow-up, or complaint investigation inspections, these violations were noted on the project's inspection form, and the sites were given a list of corrective actions necessary to fix the observed violation. When necessary, appropriate enforcement actions were taken, and the City inspector followed up with the site until compliance was achieved. Details on the enforcement actions taken for construction sites during the implementation period are described below.

### 3.5.4 Enforcement Measures

Table 3-1 includes the number of violations and enforcement actions taken during the reporting period in response to violations of the City's minimum construction BMP requirements. Enforcement actions are administered in an escalating manner as described in the City's updated JURMP.

**Table 3-1**
**Total Number of Violations and Enforcement Actions Taken**

| Violations | Verbal Warnings | Written Warnings | Follow-Up Inspections | Administrative Citations | Stop Work Orders |
|---|---|---|---|---|---|
| 13 | 4 | 0 | 2 | 2 | 2 |

During the reporting period, two construction projects were observed to have illegal discharges and were issued administrative citations. Additionally, two low TTWQ construction sites were issued Stop Work Orders when they failed to implement the City's minimum construction BMP requirements. In both cases, proper BMPs were implemented promptly and the Stop Work Orders were lifted. The City's updated JURMP commits to notifying the Regional Board within five working days of issuing a Stop Work Order and the City began implementing this new procedure on October 1, 2007. Since both Stop Work Orders were issued prior to October 1, 2007, the Regional Board was not notified in these instances. Further details regarding all enforcement actions taken during the reporting period can be found in Section 7 of this document.

None of the violations observed at construction sites during the reporting period were found to endanger human health or the environment. The City was able to address these violations through the City's established enforcement process, and it was not necessary to report any of these sites to the RWQCB.

## 3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 3.7 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was recently updated in March 2008. No changes to the City's construction component have been made since that time.

# 4.0 MUNICIPAL COMPONENT

## 4.1 INTRODUCTION

Throughout 2007/2008, the City of National City continued to manage municipal areas and activities to reduce discharges of pollutants to the MS4 to the MEP. As required by the Municipal Permit, the City updated its JURMP document in March 2008. Any changes made to the City's Municipal Component were implemented by the formal adoption date required by the Municipal Permit, March 24, 2008.

As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. Public parks and recreation facilities, administrative buildings, fire stations, and public works facilities make up the bulk of the municipal areas in the City. Municipal activities conducted by the City include but are not limited to power washing, graffiti abatement, building maintenance, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2.

### 4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City inspected all high TTWQ fixed municipal facilities.
- The City removed a total of 1,151 tons of debris from street sweeping activities.
- The City removed a total of 39.6 tons of debris from standard MS4 cleaning activities, not including drainage insert maintenance. City personnel spent 826 man-hours completing this task.
- The City continued to maintain BioClean filter inserts in catch basins at the City's Public Works Yard. A total of 10 pounds of debris was removed from these filter inserts during 2007/2008.
- The City spent 1,500 man-hours maintaining 450,725 linear feet of sanitary sewer line.
- A total of 3,000 linear feet of sewer line was televised during 2007/2008, which led to the discovery of some areas of the sanitary sewer system in need of repair. The City replaced 500 linear feet of sewer line during 2007/2008. This prevented these areas from becoming future seepage points.

## 4.2 FIXED FACILITIES

### 4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category, fixed facilities, because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar. For the purposes of organization, municipal fixed facilities are divided into the following categories: Parks and Recreational Facilities, Public Works Facilities, Fire Stations, and Other Fixed Facilities, which includes fixed facilities that could not be placed into another category.

### 4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included on the City's municipal inventory, which was revised during the JURMP update in early 2008. The JURMP includes detailed descriptions of each of the categories mentioned in the previous subsection and a discussion of activities beyond what is suggested by the facility's category or facility name. There were no changes to the City's municipal inventory nor were there any updates to the discussions of any fixed facilities on the City's inventory. The City's inventory is included as Appendix A.3.

### 4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs at all fixed municipal facilities. As mentioned in the City's JURMP, the City uses the CASQA Municipal BMP Handbook to establish appropriate BMPs for fixed municipal facilities. Table 6-2 in the City's JURMP describes the CASQA fact sheets that are used for specific facility types.

The City continues to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. The BMP requirements have not been changed since the City's JURMP was updated in March 2008.

City public works employees, fire station employees, and employees at other fixed facilities in the City continue to implement BMPs appropriate to the facility type, as described in the City's JURMP. City fire response personnel continue to be trained in implementing BMPs for non-emergency fire fighting activities as described in Section 3 of the City's JURMP. There have been no changes in BMP requirements for public works facilities, fire stations, and other fixed facilities.

### 4.2.4 PROGRAM IMPLEMENTATION

As mentioned above, the City's BMP requirements have not changed since the development of the revised JURMP. Some notable examples of implementation of those BMPs are provided below.

**Parks and Recreational Facilities**
During 2007/2008, the City used six tons of fertilizer, 22 pounds of rose fertilizer, and 88 gallons of liquid herbicides. The rose fertilizer contains a pesticide component and is stored in limited quantities.

**Public Works Facilities, Fire Stations, Other Fixed Facilities**
As previously mentioned, City personnel continued to implement appropriate BMPs for municipal fixed facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance (i.e. landscaping, building maintenance, etc.) as necessary. Parking facilities associated with fixed municipal facilities were swept quarterly during 2007/2008, and the large paved areas at the City's Public Works Yard were swept weekly. Public Works employees continued to implement a SWPPP at the Public Works Yard. Public Works employees also continued to maintain the BioClean filter inserts on the property as needed.

**Municipal Inspections**
All high TTWQ fixed municipal facilities received an annual routine inspection in 2007/2008. An additional municipal inspection was conducted at a medium TTWQ fixed municipal facility, the George H. Waters Nutrition Center, to gain a better understanding of the type and extent of food preparation activities that take place there. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2007/2008. The City's municipal inspection form is included as Attachment 4.1.

Corrective actions recommended to the eight high TTWQ facilities were relatively minor. Table 4-3, at the end of the section, lists all inspections conducted at fixed municipal facilities in 2007/2008, the date the inspection was performed, and the recommended corrective actions from the inspections, as applicable. In addition to one annual inspection by other City personnel, public works personnel self inspect both the Public Works Yard East and Public Works Yard West weekly; street crew personnel inspect the Public Works Yard West and equipment maintenance crew inspect the Public Works Yard East. Inspection forms are completed and submitted to the City's Storm Water Compliance Inspector.

## 4.3 ROADS, STREETS, HIGHWAYS, AND PARKING FACILITIES

### 4.3.1 BACKGROUND

Roads, streets, highways, and parking facilities are often one of the first components of the City's MS4 to collect and convey runoff. These areas can collect a variety of

pollutants due to routine vehicle use and use of the surrounding areas. The City conducts regular maintenance of roads, streets, highways, and parking facilities in the City to control pollutants such as sediment, metals, and litter and debris, that may accumulate and then be discharged with runoff.

### 4.3.2 SOURCE CHARACTERIZATION

Roads, streets, and highways are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

### 4.3.3 BEST MANAGEMENT PRACTICES

The City's primary BMP for roads, streets, highways, and parking facilities is street sweeping. Other BMPs are chosen as needed based on the CASQA Municipal Handbook. The City's sweeping frequency is outlined in the JURMP and described in the following subsection. There were no changes to the BMPs implemented for roads, streets, highways, and parking facilities in 2007/2008.

### 4.3.4 PROGRAM IMPLEMENTATION

During 2007/2008, the City swept a total of 15,500 curb miles, removing approximately 1,151 tons of debris. High priority streets in the City are swept at least every two weeks, and medium priority streets in the City are swept at least monthly. The City has not designated any streets in the City as low priority. The City does not maintain any stand-alone parking facilities that are not associated with municipal facilities. Parking facilities that are associated with municipal facilities are maintained and swept during regular maintenance activities at the respective municipal facility, and are considered part of the municipal facility on the inventory. Table 4-1, below, describes the areas assigned high and medium priorities, and the associated sweeping frequency. The table also includes the sweeping frequency for areas of fixed municipal facilities.

As a means to address priority pollutants in the San Diego Bay Watershed, the City conducted additional sweepings of the all streets in the City. High priority streets were swept daily during 2007/2008; Medium priority streets were swept every two weeks during 2007/2008.

**Table 4-1**
**Street Sweeping Prioritization and Frequency**

| Category | Description | Approximate Mileage of Route | Sweeping Frequency |
|---|---|---|---|
| High | 8th Street, National City Boulevard, Highland Avenue, Plaza Boulevard | 11.8 miles | At least every two weeks |
| Medium | All other streets in the City | 98.2 miles | At least once per month |
| Fixed Facilities | Parking lots associated with municipal fixed facilities | N/A* | Quarterly |

**Table 4-1**
**Street Sweeping Prioritization and Frequency**

| Category | Description | Approximate Mileage of Route | Sweeping Frequency |
|---|---|---|---|
| Fixed Facilities - Parks | Parking lots associated with parks | N/A* | Every two weeks |
| Fixed Facilities – PW Yard | Public Works Operation Center | N/A* | Weekly |
| **Total Amount of Debris Collected from Street Sweeping Activities: 1,151 tons** | | | |

* Mileage data is not available for the swept area of parking facilities associated with municipal facilities, and the PW Yard. Mileage accrued while sweeping these facilities is included in the total mileage.

## 4.4 MS4

### 4.4.1 Background

The City's extensive storm water conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during a rain event. The City's MS4 consists of approximately 19 miles of inlets, pipes of varying materials, natural channels, concrete channels, and culverts and 751 catch basins and inlets.

### 4.4.2 Source Characterization

The City's MS4 as one complete entity is included on the City's high TTWQ municipal inventory.

### 4.4.3 Best Management Practices

The City maintains a strict MS4 maintenance and cleaning schedule. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. As described in the City's JURMP, BMPs for MS4 maintenance activities are chosen based on the CASQA Municipal Handbook and have not changed during 2007/2008.

### 4.4.4 Program Implementation

The City implemented a rigorous MS4 inspection and cleaning schedule during 2007/2008. The City continues to track municipal activities, such as MS4 channel cleaning, in a Microsoft Access database. The City inspected and cleaned all MS4 cleanout locations in 2007/2008, as described in Table 4-2, below.

**Table 4-2**
**MS4 Maintenance Data**

| | Percent inspected and/or cleaned* | Percent of open channels found with anthropogenic litter | Amount of debris removed from cleaning activities |
|---|---|---|---|
| **Catch Basins/Self Cleaning MS4 Facilities** | 100% | N/A | 2,213 pounds |
| **Open Channels** | 100% | 100% | 192.6 cubic yards |
| **Drainage Inserts** | 100% | N/A | 10 pounds |
| **Total Debris Removed From MS4 Maintenance Activities: 39.6 tons**** | | | |

* No structures were observed at least 33% of capacity during the reporting period. However, the City cleans out any structures, including self-cleaning structures, in which trash and debris is observed at the time of inspection.

** 192.6 cubic yards of debris was removed during channel maintenance activities. The weight of the material removed was not recorded. Since trash the most common item removed from channel maintenance activities, a conversion factor of 400 pounds per cubic yard was used to estimate the total weight of the material removed.

The City's cleanout locations are access points to various sections in the City's MS4, so no additional pipe beyond the cleanout location is typically cleaned. The City will use the vactor truck to clean the MS4 line in the event of a spill. During 2007/2008, there were two spills for which some additional cleaning of the MS4 had to be conducted. More information about the spills that occurred in the City during 2007/2008 is included in Section 7 of this Annual report.

During 2007/2008, the City continued to inspect the open channels in the City and remove trash and debris as necessary by hand. If litter or debris is observed during the routine inspections, it is removed immediately. The total length of the channel segments inspected and cleaned by City staff is approximately 19,045 linear feet.

## 4.5 Sanitary Sewer System

### 4.5.1 Background

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. Routine inspection and maintenance of the sanitary sewer system works to reduce the potential for a spill or SSO and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

### 4.5.2 Source Characterization

The City maintains a system of public sanitary sewer pipes to convey wastewater from the City to be treated. The sanitary sewer system, as one complete entity, is included on the City's high TTWQ municipal inventory.

### 4.5.3 BEST MANAGEMENT PRACTICES

The City implements BMPs from the CASQA Municipal Handbook, as described in the City's JURMP, during sanitary sewer maintenance. There have been no changes to these BMPs during 2007/2008. The City inspects and maintains the sanitary sewer system as part of regular wastewater activities. The City clears blockages and repairs leaks as needed.

### 4.5.4 PROGRAM IMPLEMENTATION

The City has also worked to develop a Fats, Oils, and Grease (FOG) program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs. The City is continuing to develop this program; updates to the program will be included in future JURMP Annual Reports.

The City seeks to eliminate seepage from the sanitary sewer system to the MS4 by routine preventative maintenance of both systems. Routine maintenance of both systems allows the City to find areas that are likely to become problems in the future and make the necessary repairs/replacements before any larger issues arise. The City also continued to conduct flow metering throughout its sanitary sewer system to monitor for evidence of potential problems. A total of 1,500 man-hours were spent maintaining a total of 450,725 linear feet of sewer line during 2007/2008. Silt and grease were listed as the most common items removed from sanitary sewer maintenance activities. A total of 3,000 linear feet of sewer line was televised during 2007/2008, which led to the discovery of some areas of the sanitary sewer in need of repair. During 2007/2008, the City replaced 500 linear feet of sewer line. This prevented these areas from becoming future seepage points.

The City maintains a Sanitary Sewer Management Plan (SSMP) which establishes procedures for responding to an SSO. Detailed information about the City's SSO spill response plan is included in the City's JURMP. There was one SSO during 2007/2008, which is detailed in Section 7 of this Annual Report.

## 4.6 MOBILE MUNICIPAL ACTIVITIES, INCLUDING POWER WASHING

### 4.6.1 BACKGROUND

The City conducts a variety of different mobile municipal activities, typically involving infrastructure maintenance, landscape maintenance, graffiti removal, and power washing.

### 4.6.2 SOURCE CHARACTERIZATION

Both power washing and graffiti removal are listed on the City's high TTWQ municipal inventory. Infrastructure maintenance and landscape maintenance are listed on the City's medium TTWQ municipal inventory.

### 4.6.3 BEST MANAGEMENT PRACTICES

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel are trained to implement BMPs for the specific activity in which they are involved. For example, City personnel performing power washing are trained to collect all waste water, and City personnel conducting graffiti removal are trained to store and handle any chemicals properly. A more detailed discussion of BMPs for specific mobile activities is included in the City's JURMP.

### 4.6.4 PROGRAM IMPLEMENTATION

During 2007/2008, City personnel continued to implement BMPs during mobile municipal activities such as power washing and graffiti removal. Most importantly, City personnel collect any water generated by activities such as power washing and dispose of it properly. City personnel are provided with a handout that gives a summary of appropriate BMPs for power washing activities and reminds personnel that water generated by such activities must always be collected and disposed of properly.

These activities were not available for inspection after the formal adoption of the JURMP in March 2008, so an inspection could not be conducted during the 2007/2008 reporting period. In the event that these activities are conducted during the 2008/2009 reporting period they will be inspected. There were no notable instances of BMP related infractions or other non-compliance relating to mobile municipal activities during 2007/2008.

## 4.7 SPECIAL EVENTS

### 4.7.1 BACKGROUND

As detailed in the City's JURMP, a variety of different special events are hosted within the City. Notably, the City's largest special event is an annual July 4$^{th}$ celebration.

### 4.7.2 SOURCE CHARACTERIZATION

As required by the Municipal Permit, special events are included on the City's high TTWQ municipal inventory.

### 4.7.3 BEST MANAGEMENT PRACTICES

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage

trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter/debris from the event, and raise storm water awareness among the vendors and patrons of the event, as applicable.

### 4.7.4 Program Implementation

The City did not host any special events after the formal adoption of the updated JURMP, so there were no special events available for inspection during 2007/2008.

## 4.8 Education and Outreach

During 2007/2008, the City continued to educate municipal personnel regarding proper BMP implementation and other storm water and watershed concepts. Information regarding the education and outreach conducted for City personnel is described in detail in Section 8 of this Annual Report.

## 4.9 Municipal Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 4.10 Program Modification and Review

The City's JURMP was recently updated in March 2008. No changes to the City's municipal component have been made since that time.

**Table 4-3**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Inspection Date | Recommended Corrective Actions |
|---|---|---|---|---|---|
| 1 | Public Works West Yard | 2100 Hoover Ave | High | 6/25/2008 | • Keep site free of litter and debris |
| 2 | Sweetwater Heights Park | Cagle Street & Stockman Street | High | 6/25/2008 | • None |
| 3 | Municipal Swimming Pool | 1800 East 22nd Street | High | 6/25/2008 | • Keep parking lot free of oil stains, litter, and sediment<br>• Cover small soil pile properly; keep sidewalk free of soil<br>• Keep dumpster lids closed when not in use |
| 4 | Las Palmas Park | 1800 Newell Street | High | 6/25/2008 | • Keep site free of sediment and debris |
| 5 | El Toyon Park | 2005 East 4th Street | High | 6/25/2008 | • Keep site free of sediment and debris<br>• Work to eliminate over-irrigation<br>• Keep parking lot free of oil stains |
| 6 | Kimball Park | 12th Street & D Avenue | High | 6/25/2008 | • Keep planters free of trash<br>• Keep surface drains free of grass clippings and trash<br>• Keep dumpster lids closed when not in use |
| 7 | Public Works East Yard | 2100 Hoover Avenue | High | 6/25/2008 | • Keep storage yard free of oil stains |
| 8 | National City Municipal Golf Course | 1439 Sweetwater Road | High | 6/25/2008 | • Large outlet channel needs to be cleaned.<br>• Clean secondary containment of debris and rainwater; cover from rainfall |
| 9 | George H. Waters Nutrition Center | 1415 D Avenue | Medium | 1/31/2008 | • Prevent all wash water generated from washing mats from entering the storm drain.<br>• Keep dumpster lids closed when not in use.<br>• Contact the waste management company to determine if disposal of contained grease to the dumpster is permissible.* |

*Since this inspection the City determined that disposal of grease to the dumpster is permissible if the container is sealed.

**Note:** Roads, streets, highways, and parking lots; the MS4; and the sanitary sewer system were inspected via the maintenance effort described earlier in this section.

# 5.0 INDUSTRIAL AND COMMERCIAL

## 5.1 INTRODUCTION

During 2007/2008, the City continued to implement a program to mitigate urban runoff pollution from the areas and activities of industrial and commercial businesses. As part of the JURMP revision, updates were made to the City's industrial and commercial site/source prioritization process, minimum BMP requirements, and inspection frequencies. The City's updated program was implemented after the formal adoption date of the JURMP in March 2008. Through various aspects of the industrial and commercial program, the City aims to reduce the amount of pollutants discharged from these facilities.

### 5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the industrial and commercial component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City met the Municipal Permit requirement of inspecting at least 20 percent of its stationary industrial and commercial inventory.
- The City met the Municipal Permit requirement of inspecting at least 50 percent of inventoried high TTWQ industrial and commercial facilities.
- The City completed pollutant discharge potential assessment (PDPA) forms at inspections to aid in source identification efforts.
- Based on inspection findings and complaints made to the hotline, the City issued nine NOVs, 11 administrative citations, and 22 notices of correction to industrial and commercial businesses.

## 5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES / SOURCES ELEMENT

### 5.2.1 BACKGROUND

The City's industrial and commercial inventories, which can be found in Appendix A, include all stationary facilities known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, auto repair shops, restaurants, wholesalers, and contractors. As discussed in the following subsections, the City requires industrial and commercial businesses to implement pollution prevention measures and designated minimum BMPs to mitigate the impacts of business activities on water quality.

### 5.2.2 SOURCE CHARACTERIZATION

The City's industrial and commercial inventories are included as Appendix A.4 and A.5, respectively. The inventories include both stationary and mobile businesses, as required by the Municipal Permit. The inventories were updated in mid 2007/2008 as part of the JURMP update using applicable data from the City's business license registry, the 2006/2007 inventory and inspection records, and the State's list of industrial sites covered under the State of California Industrial General Permit (Industrial Permit).

Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP. The City considers factors including those listed below when prioritizing the inventories:

- Industrial Permit subjectivity
- Consideration of downstream waterbody and whether the business is likely to discharge pollutants for which the waterbody is impaired
- Results from previous inspections and institutional knowledge
- Proximity to the receiving waterbody

The City's updated inventories include a total of 813 stationary industrial and commercial facilities.

### 5.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other BMPs to reduce or potentially eliminate the generation of pollutants from business areas/activities. The City has established a set of minimum BMPs based on the CASQA Industrial and Commercial Handbook. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. The City's BMP requirements are described in more detail in the City of National City Best Management Practice Manual, which is an attachment to the City's JURMP.

### 5.2.4 PROGRAM IMPLEMENTATION

**Industrial and Commercial Inspections**

During 2007/2008, the City conducted storm water compliance inspections at selected stationary industrial and commercial facilities; Table 5-1 provides a summary of the industrial and commercial site visits. The purpose of the inspections is to confirm that the City's minimum BMPs are being implemented at stationary industrial and commercial facilities.

Since requirements of the new Municipal Permit did not go into effect until March 2008, the industrial and commercial component of the City's storm water program was conducted under the Order No. 2001-01 requirements for the first part of the 2007/2008 fiscal year and under the new Municipal Permit requirements for the latter part of the 2007/2008 fiscal year. The City inspected at least 50 percent of the inventoried high TTWQ industrial and commercial facilities, which met the Municipal Permit's requirements for the first year of program implementation. All facilities in the City with

Industrial Permit coverage were also all inspected in 2007/2008, which meets the requirements of the previous municipal permit.

Table 5-1 below provides a summary of the industrial and commercial site visits. At least 50 percent of the high TTWQ sites were selected for inspection, and additional medium TTWQ sites and industrial facilities not considered high TTWQ were also selected for routine inspection. Additional sites selected for inspections were medium TTWQ, and were industrial facilities that are subject to the Industrial Permit. During the inspection process, the City also checked Industrial Permit compliance status when applicable. Businesses observed to be in violation of the Industrial Permit are included in Table 5-2. Table 5-3, at the end of the section, summarizes the results of the 150 full inspections conducted as part of the routine inspection program. The remainder of the sites were visited, but during the visit were found to have moved, be duplicates of other businesses, or not to be conducting activities for which inclusion on the City's inventory is necessary.

**Table 5-1**
**Summary of Industrial and Commercial Site Visits**

| Facility Category | Initial List | Accounted For* | Percentage of Total Inventory |
|---|---|---|---|
| High TTWQ Industrial | 15 | 17 | 2% |
| High TTWQ Commercial | 117 | 88 | 10.8% |
| Additional Sites Selected for Inspection | 43 | 85 | 10.4% |
| **All Stationary Inventoried Sites** | **817**** | **--** | **23.2%** |

* "Accounted For" means that the business was inspected, assessed during a site visit and found to not need an inspection, or found to not need an inspection when called to schedule a site visit.

** The number of sites selected for inspection in 2007/2008 was based on the inventory presented in the JURMP, which included 817 businesses. The final inventory presented in this JURMP Annual Report has been updated to account for inspection results during 2007/2008 and includes 813 stationary businesses.

Facility inspections were conducted in accordance with the protocol set in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. BMP deficiencies and corrective actions were recorded on the City's industrial and commercial inspection form, which is included in the City's JURMP, and discussed with facility personnel present during the inspection. The City also completed PDPA forms during the inspections as part of an additional data collection effort. The PDPA form is included with the City's inspection form, which is included in Attachment 5.1. More information about the results of this process is presented in Section 12 of this JURMP Annual Report.

The City did not rely on third party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third party inspection program.

**General Industrial Permit**

Industrial Permit compliance status was evaluated during the industrial and commercial inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business's standard industrial classification (SIC) code(s). The inspector then determined Industrial Permit subjectivity based on SIC code. Violations of any aspect of Industrial Permit requirements were recorded on the standard industrial and commercial inspection form and are presented in Table 5-2. The table includes businesses directed to file a Notice of Intent (NOI) and develop a Storm Water Pollution Prevention Plan (SWPPP) and monitoring program, as well as businesses that had filed an NOI but had failed to develop a SWPPP and monitoring program. The table also includes facilities that could potentially gain exemption from Industrial Permit requirements by completing notice of non-applicability/no exposure certification (NONA/NEC) paperwork. Each business was notified of any Industrial Permit-related non-compliance by the inspector.

**Table 5-2**
**Violations of the Industrial Permit**

| # | Business Name | Street Address | Permit Subjectivity | Action to Correct Violation | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | File NOI | Develop SWPPP | Develop / Implement Storm Water Monitoring | Complete NONA/ NEC | Other/Comments |
| 1 | BAY CITY MARINE INC. | 1625 CLEVELAND AVENUE | Mandatory | | | | | Ensure appropriate storm water monitoring is conducted. |
| 2 | CARROLL METAL WORKS, INC. | 740 W 16TH STREET | Mandatory | | ✔ | ✔ | | |
| 3 | EPSILON SYSTEMS SOLUTIONS INC | 2101 A Haffley Ave | Mandatory | ✔ | | ✔ | | Update the SWPPP to include the items indicated as not provided on page 4 of this form. |

| # | Business Name | Street Address | Permit Subjectivity | Action to Correct Violation | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | File NOI | Develop SWPPP | Develop / Implement Storm Water Monitoring | Complete NONA/ NEC | Other/Comments |
| 4 | FABRICATION TECHNO-LOGIES INDUSTRIES | 2401 HAFFLEY AVENUE, A | Conditional | ✔ | ✔ | ✔ | | If no materials are stored outdoors once move is complete, business may not have to file NOI. |
| 5 | FUTURA FIBERGLASS | 730 W 19TH STREET | Mandatory | | | | | Conduct storm water sampling as required by the Industrial Permit. |
| 6 | GREG'S FIBERGLASS AND PAINTING | 1804 CLEVELAND AVENUE, A | Mandatory | ✔ | ✔ | ✔ | | |
| 7 | HANSON AGGREGATES NATIONAL CITY BATCH PLANT (2003 NC LLC) | 601 W 12TH STREET | Mandatory | | | | | Ensure appropriate storm water monitoring is conducted. |
| 8 | HYPERBARIC TECHNO-LOGIES | 3224 HOOVER AVENUE | Conditional | ✔ | ✔ | ✔ | | |
| 9 | LA ESPIGA DE ORO BAKERY | 320 HIGHLAND AVENUE | Conditional | | | | ✔ | |
| 10 | MELHORN CONST-RUCTION | 410 W 30TH STREET, B | Conditional | ✔ | ✔ | ✔ | | |
| 11 | MOTOR MACHINE & SUPPLY | 1602 HOOVER AVENUE | Conditional | ✔ | ✔ | ✔ | | |
| 12 | NATIONAL IRON WORKS | 832 HOOVER AVENUE | Mandatory | ✔ | ✔ | ✔ | | |
| 13 | PRESIDENTIAL LIMOUSINE LLC | 1428 MCKINLEY AVE | Conditional | ✔ | ✔ | ✔ | | |
| 14 | ROYCE CABINETS & GRANITE INC | 2120 WILSON AVE | Mandatory | ✔ | ✔ | ✔ | | |

| # | Business Name | Street Address | Permit Subjectivity | Action to Correct Violation | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | File NOI | Develop SWPPP | Develop / Implement Storm Water Monitoring | Complete NONA/ NEC | Other/Comments |
| 15 | SHUTTER BUS LEASING | 1726 WILSON AVENUE | Conditional | ✔ | ✔ | ✔ | | |
| 16 | TITAN MARINE, INC | 2236 MCKINLEY AVE | Mandatory | ✔ | ✔ | ✔ | | |
| 17 | VALENCIA STONE AND TILE | 1124 COOLIDGE AVENUE | Mandatory | | | | | Provide complete SWPPP, ensure storm water monitoring is conducted, or provide documentation of no qualifying rain events. |

**Education and Outreach**

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to provide site-specific one-on-one education regarding storm water concepts and BMPs. Educational materials were provided as applicable; many businesses received a copy of the City's 2008 Storm Water Calendar, which can be found in Attachment 5.2.

**Enforcement**

Several industrial and commercial facilities were observed to be out of compliance with the City's municipal storm water ordinance and/or the Industrial Permit during inspections conducted in 2007/2008. Additionally, the City received a number of complaints through the City's storm water hotline. Details of the industrial and commercial complaint investigations are included in Section 7 of this Annual Report. The City issued the following enforcement actions in response to complaints:

- 22 Notices of Correction
- 11 administrative citations
- Nine NOVs

There were no instances of noncompliance found to present a significant threat to human health or the environment observed at stationary businesses during 2007/2008, so none were reported to the RWQCB.

## 5.3 MOBILE SOURCES

### 5.3.1 BACKGROUND

Due to the nature of activities of most mobile businesses, a major area of concern tends to be illegal discharges. In general, mobile businesses can be hard to identify, as many may not have City business licenses. Additionally, because many mobile businesses may be home based and activities do not occur in one fixed location, inspections of such facilities are impractical.

### 5.3.2 SOURCE CHARACTERIZATION

Known mobile industrial and commercial businesses, as described in the City's JURMP, are included on the City's inventory and are marked as mobile.

### 5.3.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

BMPs for stationary industrial and commercial facilities, as discussed earlier in this section, are required to be implemented for mobile activities, as applicable. BMPs for mobile businesses, including key principles, such as proper collection and disposal of any discharge, are discussed in the City's JURMP. There have been no updates to the BMP requirements as described in the JURMP.

### 5.3.4 PROGRAM IMPLEMENTATION

The City responds to calls to the City's storm water hotline regarding mobile businesses; however, there were no complaints made to the City's storm water hotline regarding mobile businesses during 2007/2008.

**Education and Outreach and Enforcement**

Mobile businesses were provided education as applicable. There were no enforcement actions taken against mobile businesses during 2007/2008. There were no instances of noncompliance of mobile businesses that were believed to present potential threats to human health or the environment observed during 2007/2008, so none were reported to the RWQCB.

## 5.4 INDUSTRIAL AND COMMERCIAL COMPONENT EFFECTIVENESS ASSESSMENT

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 5.5 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was recently updated in March 2008. No changes to the City's industrial and commercial component have been made since that time.

**Table 5-3**
**Industrial and Commercial Inspection Results**

| # | Business Name | Address | Inspection Date | Recommended Corrective Actions |
|---|---|---|---|---|
| 1 | 99 CENT ONLY STORES | 1320 HIGHLAND AVENUE | 2/5/2008 | • Treat oil stains.<br>• Clean up the oil spills.<br>• Keep the parking area free of sediment and trash.<br>• Remove trash more often to prevent the trash dumpster from overflowing. Provide one more dumpster if it is needed.<br>• Keep the dumpster lids closed when not in use. |
| 2 | A-1 ALLOYS RECYCLING CENTER | 724 CIVIC CENTER DRIVE | 6/4/2008 | • Keep site free of sediment.<br>• Keep dumpster lids closed when not in use.<br>• Cover materials stored outdoors. |
| 3 | A-1 ALLOYS/ABC METALS, INC | 1401 CLEVELAND AVENUE | 2/4/2008 | • None |
| 4 | A-1 HYDRAULICS SERVICE | 2100 ROOSEVELT AVENUE | 1/9/2008 | • Clean oil stains in front of shop.<br>• Clean up sediment and black powder and keep the front of shop free of sediment and black powder.<br>• Keep the scrap metal and hydraulic hose recycling bins indoors or cover them when not in use.<br>• Keep the dumpster lids closed when not in use. |
| 5 | ASIAN MARKET | 3400 E 8TH ST STE 111-112 | 3/12/2008 | • Keep site free of oil stains. |
| 6 | ASIAN NOODLES | 1430 E PLAZA BLVD., E-12 | 1/15/2008 | • Work with neighbors to treat the grease spills.<br>• Keep the dumpster lids closed when not in use. |
| 7 | ASWAN HALL CATERING & BANQUET | 401 MILE OF CARS WAY | 3/14/2008 | • Keep dumpster lids closed when not in use.<br>• Keep trash area/enclosure free of sediment and trash. |
| 8 | AUTO TECK | 1023 COOLIDGE AVENUE | 1/30/2008 | • Treat oil stains and keep the area free of stains.<br>• Clean up parking area and keep it free of sediment and trash.<br>• Keep the dumpster lids closed when not in use. |
| 9 | BASKIN ROBBINS ICE CREAM | 1493 E PLAZA BLVD. | 1/21/2008 | • Work with the neighbors to keep the dumpster area clean and free of trash.<br>• Keep the dumpster lids closed when not in use. |

**Table 5-3 (Continued)**
**Industrial and Commercial Inspection Results**

| # | Business Name | Address | Inspection Date | Recommended Corrective Actions |
|---|---|---|---|---|
| 10 | BAY CITY MARINE INC. | 1625 CLEVELAND AVENUE | 6/9/2008 | • Keep discharge locations free of sediment.<br>• Keep parking lots, sidewalks, and streets free of sediment.<br>• Cover materials stored outdoors.<br>• Contain outdoor work area to prevent storm water run-on or conduct all work indoors.<br>• Keep outdoor work area(s) and/or areas behind shop free of sediment and spills.<br>• Keep parking areas free of sediment. |
| 11 | BIRRIAS CHIVOS & CHEVES | 2401 HIGHLAND AVE STE 104 | 3/12/2008 | • Keep trash area/enclosure free of sediment, trash, and debris. |
| 12 | BREAD DELUX BAKERY, ETC. | 1420 E PLAZA BLVD., D-1 | 1/17/2008 | • Keep the dumpster lids closed when not in use. |
| 13 | C & W DIVING | 1706 HOOVER AVENUE | 2/1/2008 | • Improve general housekeeping BMPs, including timely sweeping and clean up of sand, sediment, and metal debris.<br>• Reduce material storage in outdoor exposed areas, especially corroding metal parts.<br>• Keep dumpster lids closed when not in use. |
| 14 | C&M MOTORS INC. | 904 ROOSEVELT AVENUE | 3/14/2008 | • Keep parking lots, sidewalks, and streets free of sediment and trash.<br>• Keep dumpster lids closed when not in use.<br>• Cover materials stored outdoors.<br>• Raise materials stored outdoors off of the ground.<br>• Keep outdoor work area(s) and/or areas behind shop free of sediment, trash, and spills.<br>• Keep loading and unloading areas free of sediment, trash, and spills.<br>• Keep parking areas free of sediment, trash, and spills.<br>• Conduct vehicle maintenance activities in a covered area or indoors. |
| 15 | CAFÉ LA MAZE | 1441 HIGHLAND AVENUE | 3/12/2008 | • Keep dumpster lids closed when not in use.<br>• Keep parking areas free of spills/oil stains. |

**Table 5-3 (Continued)**
**Industrial and Commercial Inspection Results**

| # | Business Name | Address | Inspection Date | Recommended Corrective Actions |
|---|---|---|---|---|
| 16 | CALIFORNIA AUTO DETAILING | 1509.5 NATIONAL CITY BLVD. | 2/1/2008 | • Ensure that all spray water is prevented from leaving the building using the plastic curtains and any other means necessary.<br>• Prevent transport of sediment in the case of water spillage by keeping sidewalk and outside free of sediment. |
| 17 | CALIFORNIA PRODUCE CORPORATION | 1736 E PLAZA BL | 3/13/2008 | • Keep site free of sediment, trash and debris.<br>• Ensure water generated by pressure washing activities is collected and disposed of properly.<br>• Increase trash pick up frequency or acquire more dumpsters to prevent dumpsters from overflowing.<br>• Keep dumpster lids closed when not in use.<br>• Keep trash area/enclosure free of the trash.<br>• Cover materials stored outdoors.<br>• Do not hose off outdoor areas of site; if hosing is necessary, collect all wash water and dispose of to the sanitary sewer system.<br>• Keep the area behind the shop free of food debris. |
| 18 | CAR SOURCE | 1 W 35TH STREET | 2/4/2008 | • Work with neighbors to store exposed material raised off of the ground and covered. All fluid containers and batteries should also have secondary containment.<br>• Remove all trash and debris from site.<br>• Keep parking area free of sediment and leaves.<br>• Dispose of waste at a hazardous material collection facility. |
| 19 | CARLS' JR. | 1502 SWEETWATER ROAD | 3/17/2008 | • Keep trash enclosure area free of sediment, trash and debris.<br>• Keep parking area free of spills and oil stains.<br>• Keep the grease bin free of grease.<br>• Provide overhead cover for waste grease bin. |
| 20 | CARLS JR. #120 | 1280 E PLAZA BLVD. | 1/15/2008 | • Clean up the grease bin and keep it free of grease.<br>• Clean up dumpster enclosure area and ground.<br>• Keep the eastern parking lot free of sediment. |

**Table 5-3 (Continued)**
**Industrial and Commercial Inspection Results**

| # | Business Name | Address | Inspection Date | Recommended Corrective Actions |
|---|---|---|---|---|
| 21 | CARRERA'S AUTO DETAIL | 2130 ROOSEVELT AVENUE | 2/1/2008 | • Clean up the trash and debris on the site and keep it clean.<br>• Ensure that wash water does not exit the wash area on the site.<br>• Keep dumpster lid closed when not in use. |
| 22 | CARERRA'S AUTO DETAILERS | 2130 ROOSEVELT AVENUE | 2/4/2008 | • Eliminate outdoor exposure of material storage, including automotive parts, scrap metal bins and batteries.<br>• Provide secondary containment for all automotive fluid containers.<br>• Work with neighboring businesses to eliminate the uncontained trash observed in the northwest corner and trash enclosure.<br>• Keep dumpster lids closed when not in use. |
| 23 | CARROLL METAL WORKS, INC. | 740 W 16TH STREET | 6/10/2008 | • Keep discharge locations free of sediment.<br>• Keep parking lots free of sediment.<br>• Keep parking areas free of sediment. |
| 24 | CASA DE ORO RESTAURANT | 1510 SWEETWATER ROAD, A | 3/17/2008 | • Keep the grease bin and surrounding area free of grease.<br>• Provide overhead cover and secondary containment for waste grease bin. |
| 25 | CHINESE CANTON BAKERY | 1132 E PLAZA BLVD., 204 | 1/21/2008 | • Keep the rear parking lot clean and free of sediment. |
| 26 | CHOWKING | 2220 E PLAZA BLVD., T | 3/13/2008 | • Keep dumpster lids closed when not in use.<br>• Keep trash area/enclosure free of trash and debris.<br>• Keep the grease bin and surrounding area free of grease.<br>• Provide overhead cover and secondary containment for waste grease bin. |
| 27 | CHUCK E CHEESE'S | 1143 HIGHLAND AVENUE | 3/11/2008 | • Keep dumpster lids closed when not in use. |

# 6.0 RESIDENTIAL

## 6.1 INTRODUCTION

Land use in the City of National City is largely residential. Due to the large residential area, activities that take place in residential areas have the potential to impact the quality of receiving waters. Residential activities such as vehicle washing, over-irrigation, home maintenance, and Household Hazardous Waste (HHW) disposal can potentially contribute pollutants to the City's MS4 if BMPs are not implemented. Pollutants of concern include sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals. The City has worked to implement a range of programs to address these residential activities with the goal of to reducing pollutant loads associated with such activities. The City recognizes the need for educational efforts and opportunities designed specifically for residents and residential activities.

The following sections present activities conducted during this reporting period. These activities are associated with the residential component of the JURMP and include conducting ongoing HHW collection events, distributing educational materials, and participating in community events.

### 6.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the residential component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City developed a 2008 Calendar that was distributed to schools. The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways.
- The City collaborated with the cities of Chula Vista and Imperial Beach to make HHW disposal events available to residents. The total amount of HHW collected from residents of all three cities was 220,008 pounds. Door-to-door pick up service was available for the disabled and senior communities.
- The City hosted two large item disposal events. The event allowed residents to dispose of large items, like unwanted household materials (not including HHW).

## 6.2 SOURCE CHARACTERIZATION

The City has identified high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities. To reduce pollutant discharges from these high TTWQ areas and activities, the City has designated specific BMPs.

### 6.2.1 HIGH TTWQ ACTIVITIES

During the 2007/2008 reporting period, as outlined in the City's JURMP, the City continued to identify the following activities as high priority:

- Automobile repair and maintenance, washing, and parking
- Home and garden care activities and product use, including disposal
- Disposal of trash and pet waste

### 6.2.2 HIGH THREAT TO WATER QUALITY AREAS

In addition to these activity-based priorities, the City has noted several residential areas that pose higher threats to water quality. High priority residential areas are designated by considering complaint investigations, institutional knowledge, Dry Weather Monitoring data, and criteria as defined in the Municipal Permit. The following residential areas have been designated as being a high threat to water quality.

**Division Avenue Area**
The residential area located near Division Street, east of Highland Avenue, discharges to La Paleta Creek. Potential sources of pollutants may include residences located on East 2nd Street, Melrose Street, Eta Street, Fig Court, Scott Drive, 43rd Street, and Nordica Avenue. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents just downstream of these residential areas.

**West 18th Street Area**
Runoff from residential areas in the vicinity of West 18th Street eventually discharge to Paradise Creek. Potential sources of pollutants include residences along Hoover Avenue and Roosevelt Avenue. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents just downstream of these residential areas.

**Paradise Creek Area, between F and L Avenues**
The residential area that runs along the Southern side of Paradise Creek between F and L Avenues, which is adjacent to Paradise Creek, has been identified as being a potential source of pollutants. Residences in this area are located along East 12th Street, East 13th Street, and East 14th Street, and are upstream of dry weather site number 46. Past dry weather monitoring programs have detected elevated bacteria, ammonia, and oil and grease levels.

**East 8th Street Area**
The residential area near East 8th Street borders Paradise Creek and is also located upstream of dry weather site number 46, which has been found to have the same elevated constituents as the areas between F and L Avenues. Potential sources of pollution include residences near East 8th Street and East 9th Street, between L Avenue and N Avenue.

**Grove Avenue Area**
The residential area surrounding Grove Avenue has been identified during previous dry weather monitoring programs as a source of trash, ammonia, and detergents. This area includes residences along East 14th Street, Grove Avenue, Stancrest Lane, and Orange Street.

**Arcadia Place Area**
The residential area surrounding Arcadia Place has been identified during previous dry weather monitoring programs as a source of ammonia and detergents. Potential sources in this area include residences west of Harbison Avenue along East 11th Street, East 10th Street, and East Plaza Boulevard.

**Harbison Avenue Area**
The residential area along Harbison Avenue, between 20th Street and 24th Street, has been identified as a source of ammonia and excessive amounts of trash during past dry weather monitoring programs.

**A Avenue Area**
The residential area in the vicinity of the intersection of A Street and 22nd Street has been identified as a potential source of pollutants. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents. Likely sources of pollutants are residential landscaping and washing activities.

**B Avenue Area**
The residential area in the vicinity of the intersection of 28th Street and B Avenue, near Sweetwater High School, has been identified as a potential source of ammonia during past dry weather monitoring programs.

**2nd Avenue Area**
The residential area around 2nd Avenue, north of the Interstate 54, has been identified as a potential source of pollutants. Previous dry weather monitoring programs have detected elevated levels of bacteria. This area is adjacent to Sweetwater River. The most likely sources of bacteria appear to be from trash decomposition and human inhabitation.

## 6.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City has continued to provide information regarding the implementation of pollution prevention measures, such as good housekeeping practices, for residential areas and activities. The City's BMP Manual Part I includes lists of general residential BMP requirements and BMP requirements for specific residential activities. The manual is included in Appendix C of the JURMP. General residential BMPs include erosion control; non-storm water discharge management, including elimination of IC/IDs; and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Specific BMPs for the high priority activities outlined above are also included in the City's BMP Manual Part I.

## 6.4 PROGRAM IMPLEMENTATION

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting is conducted. This ensures that pollutants associated with residential activities and areas are minimized. The residential program has an education component so that residents are made aware of appropriate BMPs, including pollution prevention methods that should be used during certain activities.

### 6.4.1 TRAINING, EDUCATION, AND OUTREACH

The City has continued to conduct training, education, and outreach activities for residents, which are described below. For additional information on the City's educational efforts and the educational materials distributed to its residents please refer to Section 8 of this report.

**2008 Calendar**

The City developed a 2008 Calendar that was distributed to schools (Attachment 5.2). The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways. It described that pollutants such as fertilizers, pesticides, metals, paints, oil and grease and other debris can be transported from residential areas to the ocean. A list of BMPs and various cleanup days and HHW events are promoted. The theme for the calendar was "By Keeping our Community Clean, We Can Keep the Ocean Clean" and each month showed a photograph of an ocean scene.

**Distribution of Educational Material**

The City's Housing division conducted inspections as part of the Healthy Homes Program in high priority areas to check for lead in paint and other potential hazardous problems. Residents were provided IPM cards (Attachment 6.1) and "Put Toxic Waste in its Place" brochures during these inspections. The IPM cards provide information on topics such as non-chemical solutions and pest-related problems. The "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochure (Attachment 6.2) was distributed with written correspondence with residents.

As mentioned above, educational materials were provided to residents in National City in response to the recommendations from the 2007 Dry Weather Report. The City sent a letter and applicable educational material to residences in areas where high levels of pollutants were noted.

**Workshops**

On July 12, 2007, the City held a storm water training session for the City's Kiwanis Club. A total of 16 individuals attended the training session and were shown a Power Point presentation. More information about the presentation is included in Section 8.

**Website**
Additional information regarding the City's storm water program, pollution prevention measures, and BMPs is posted and continually updated on the City of National City's website (www.nationalcityca.gov), under the Public Works/Engineering Department link.

**Household Hazardous Waste Disposal Program**
The City continues to work with the City of Chula Vista to allow City residents to drop off HHW at Chula Vista's Household Hazardous Waste Collection Facility. The Household Hazardous Waste Collection Facility is the primary location for hazardous waste collection in the South Bay, receiving HHW from the City, the City of Imperial Beach, and the City of Chula Vista. Curbside pick up was made available to the disabled and elderly communities. The amount of waste collected by City residents of National City alone is not available; however, the total amount of HHW collected from residents of all three cities is 220,008 pounds. The City's programs

The Healthy Homes program continues to distribute "Put Toxic Waste in Its Place" brochures to remind residents to dispose of HHW properly. This brochure is handed out during routine activities conducted by the Healthy Homes program.

**Other Waste Disposal Programs/Activities**
In addition to proper HHW disposal, the City encourages residents to recycle used oil. The City maintains several Certified Used Oil Recycling Centers for residential oil disposal. The volume of used oil dropped off at the collection centers was not immediately available.

The City's Public Works Department held two trash collection events (June and November) during this reporting period in conjunction with EDCO Disposal Company. During these events, residents were encouraged to dispose of any unwanted large items from their homes such as furniture and appliances.

### 6.4.2 COMPLIANCE AND ENFORCEMENT

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the Storm Water Hotline, and observations made by the City's municipal personnel. If a potential to impact water quality is present the City provides a verbal warning, written warning, NTCs, and NOVs as applicable. The City received 6 residential-related complaints during this reporting period. Complaints were submitted through the Storm Water Hotline and internally through the Public Works Department.

The following enforcement actions were taken with respect to residents and/or landlords in 2007/2008:

- Three notices of correction
- Two NOVs

- Three administrative citations

Many of the complaints verified involved residents who were unaware of residential BMPs. These issues were resolved with a verbal warning and discussion of required BMPs. The City issued NOVs to more serious violations such as vehicle maintenance without BMPs or washing debris into the street. City personnel also cleaned areas in the public right of way as necessary to resolve complaints. All residential complaints were resolved it was not necessary to report any instances of non-compliance to the RWQCB.

## 6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 6.6 Program Review and Modification

The City's JURMP was recently updated in March 2008. No changes to the City's residential component have been made since that time.

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

In accordance with the September 10, 2008 RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the 2007/2008 illicit discharge detection and elimination section and attachments to the RWQCB no later than December 15, 2008.

# 8.0 EDUCATION COMPONENT

## 8.1 INTRODUCTION

During 2007/2008, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, residents, and underserved audiences. The City aims to reduce storm water pollution by increasing awareness about storm water and promoting the implementation of pollution prevention measures and BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community.

### 8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City has hosted a storm water training session for Kiwanis Club members.
- The City hosted a SUSMP training session for the development planning and construction communities.
- The City's Storm Water Inspector attended a Basic Inspector Training Course held by the California Environmental Protection Agency.
- The City distributed 2,000 2008 storm water calendars to businesses and schools.
- The City made an estimated 17,715 impressions through educational outreach material and activities.

## 8.2 STAFF TRAINING ELEMENT

The City has provided extensive training and educational outreach to its municipal personnel. Many municipal personnel are out in the field on a daily basis, so it is important that they understand the importance of implementing BMPs. Additionally, municipal personnel are encouraged to report any IC/IDs observed to the appropriate City staff and to educate other municipal personnel and the general public about storm water pollution prevention.

The City's Storm Water Inspector successfully completed the California Environmental Protection Agency Basic Inspector Training Course during the 2007/2008 reporting period. The four-day course is designed to teach environmental agency inspectors the knowledge and skills needed to ensure consistent, effective, and coordinated compliance and enforcement actions to protect public health and the environment according to all applicable laws or regulations within the jurisdiction of the California Environmental

Protection Agency. Topics covered during the training included: an inspection overview, elements of a violation, report writing, interviewing, sampling and evidence collection, report analysis, and testimony skills.

## 8.3 EDUCATIONAL OUTREACH ELEMENT

In addition to municipal staff, the City has continued to provide education and outreach to industrial and commercial businesses, construction site owners and developers, residential areas, and underserved audiences. These efforts promote storm water awareness and BMP implementation.

### 8.3.1 INDUSTRIAL AND COMMERCIAL BUSINESSES

As required by the Municipal Permit, the City inspects its inventoried businesses to evaluate compliance with the City's BMP requirements and provides site-specific education outreach to business owners and operators. Violations to the City's BMP requirements are corrected through enforcement actions as necessary. Site-specific information relating to the facility's activities were discussed with businesses personnel during inspections. Some businesses also received the City's storm water calendar, which is included as Attachment 5.2. The "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochure provided to industrial and commercial businesses with any written correspondence, this brochure can be found in Attachment 6.2. "Preventing Urban Runoff" trifolds were also distributed to some industrial and commercial businesses.

#### 8.3.1.1 MOBILE BUSINESSES

Mobile businesses, specifically mobile car detailers or power washers, are considered a high threat to water quality due to the nature of the business activities and the likelihood of prohibited non-storm water discharges. Mobile businesses are not confined to a single area and many do not have City business licenses, making them difficult to identify. The City continues to respond to complaints regarding mobile businesses and provides one-on-one education during the investigation and educational outreach material as applicable.

### 8.3.2 CONSTRUCTION SITE OWNERS AND DEVELOPERS

Due to the nature of activities, construction sites have the potential to discharge many types of pollutants to receiving waters if not managed properly. Many construction site owners, contractors, and developers visit the City's Engineering Division to apply for necessary permits. Through this interaction with City staff, owners and developers are able to gain a better insight on required BMPs, watershed concepts, and potential pollutants.

On February 28, 2008, the City held a workshop for project proponents. Thirteen people attended the workshop; a sign in sheet is included in Attachment 8.1. The workshop

included a variety of background information, such as a characterization of the watersheds in the City as well as the impaired waterbodies in the City. The workshop included discussions of the following topics related to development planning and construction:

- SUSMP requirements
- Writing a SWMP
- Common problems with SUSMP reports
- LID concepts
- Examples of treatment control BMPs
- Project resources
- What to expect from City inspections

Attendees were given a test before the presentation and a test after the presentation to gauge the increase in knowledge of attendees. The pre-test average was 60 percent and the post-test average increased to 80 percent. At the end of the workshop, attendees were prompted to rate how helpful they found the workshop to be on a scale from one to five, five being most helpful. The average rating was a four.

In addition, the City has also provided various construction site-specific educational materials targeting various storm water concepts. This educational material includes:

- A BMP fact sheet for construction sites (Attachment 3.1) that describes specific BMPs for construction activities including soil stabilization and erosion prevention, sediment containment, materials and equipment management, non-storm water discharge control, and drainage control. This sheet was distributed with all permits issued, including building permits; implementing the BMPs listed on the sheet is a condition of the permits.
- The Storm Water Requirements Applicability Checklist. Once submitted, the City reviewed the checklist and prioritized the projects. Requirements to ensure compliance with the Municipal Permit and General Construction Permit were presented to the applicant and further discussed to ensure the applicant was educated on the process.
- Copies of JURMP Appendix C, which contains a list of required construction BMPs, is made available upon request for proponents of construction activities within the City.

In addition to distributing the previously listed construction educational materials, the City continued to hold pre-construction meetings for significant private and CIP development projects during which the implementation of various BMPs were discussed.

### 8.3.3 Residential Areas

Since residential areas compose most of the City, it is important to reach this particular audience through educational outreach programs. The City continued to make a variety of flyers, brochures, website postings, and other educational material available to residents of the City. Dry weather educational mailers were mailed to homes in residential areas where dry weather monitoring indicated pollutant exceedances. In response to the mailers, some residents called to obtain more information about the program.

The City developed a 2008 calendar that was distributed to schools (Attachment 5.2). The calendar, which presents information in both English and Spanish, informs residents about pollutants found in San Diego Bay and neighboring waterways, and describes that pollutants such as fertilizers, pesticides, metals, paints, oil and grease, and other debris can be transported from residential areas to the ocean. The calendar provided key dates, such as HHW events and scheduled training sessions. During 2007/2008, the City began developing a 2009 storm water calendar. The City arranged an art contest for 3rd graders in the City, which will provide images for the calendar. A handout was provided to 3rd grade students in the City informing of the contest, which also provided information about the City's storm water program (Attachment 8.2). More information about the development of the 2009 calendar is included in Section 9 of this Annual Report.

Other educational materials distributed during 2007/2008 include "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochures (Attachment 6.2), "Put Toxic Waste in its Place," HHW refrigerator magnets, and copies of the City's Storm Water Hotline Card.

On July 12, 2007, the City held a storm water presentation for the City's Kiwanis Club. A total of 16 individuals attended the training session and were shown a Power Point presentation that provided information on the regulatory background of the City's program, the City's JURMP, the difference between the sanitary sewer system and the storm drain system, and the basic principals of BMPs. A sign in sheet for this event can be found in Attachment 8.1.

The City website, www.nationalcityca.gov, is another way in which City residents can become familiar with the design and intended use of the storm drain system, HHW, alternatives to hazardous household products, find information regarding volunteer opportunities, applicable City contact information, and IPM cards.

### 8.3.4 Underserved Communities

The City is a growing community that is diverse in culture. The demographics of the City are unique, and to address various communities' needs, the City takes pride in servicing its residents by presenting some of its brochures in English and Spanish. Additionally, brochures may be found at various locations throughout the City such as

the Chamber of Commerce, the public library, public recreational centers, and the storm water display area at the City's Engineering Department.

In addition, the City includes the bilingual educational handout entitled "Everything that flows down into a storm drains goes untreated directly to our creeks, lagoons, and San Diego Bay" in all mail-based correspondence (i.e. NOV, notice of corrective action, etc.) with residents and industrial and commercial businesses in the City.

### 8.3.5 Complaint Investigations

To further aid the process of identifying illicit discharges, the City encourages the public and City staff to report IC/IDs. The City's Storm Water Compliance Inspector follows up on all complaints made to the hotline. If a representative for the business, residential area, or construction site is present, the inspector will provide site-specific information regarding storm water issues including applicable educational materials.

## 8.4 Outreach Component Effectiveness Assessment

The estimated number of impressions made by the City's education and outreach efforts during 2007/2008 is presented and described below. Please refer to Section 11 of this JURMP Annual Report for the remainder the effectiveness assessment for this program component.

**Impressions Made**

The City has continued to provide residents and businesses storm water-related education through inspections, distribution and mailing of educational materials, and various events throughout the year. The City calculates an estimate of impressions based on the number and type of educational materials distributed. Estimates of the numbers of impressions generated by the City's efforts allow for a more realistic evaluation of the effectiveness of the NPDES storm water program.

The estimated number of impressions was generated by multiplying each effort by the number of impressions thought to be generated by that particular effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections. Municipal inspections generally involve more people and are assumed to generate five impressions. Training sessions and cleanup events have been assumed to generate a number of impressions equal to four times the number of attendees because it is likely that the attendees will discuss the content with others after the training session. Printed educational materials distributed in mass numbers are assumed to generate three impressions each. Impressions generated by the 2009 calendar contest are likely to generate five impressions because multiple people (teachers, students, and parents) were involved in the contest and were likely to share information about the contest with others. Table 8-1 details the number of impressions made by the City during this reporting year.

**Table 8-1**
**Impressions Made by the City**

| Impression Type | Estimated Count | Unit | Estimated Impressions Generated |
|---|---|---|---|
| Municipal Inspections | 9 | Inspections | 45 |
| Industrial Inspections | 32 | Inspections | 96 |
| Commercial Inspections | 118 | Inspections | 354 |
| Complaints Investigated | 48 | Investigation | 144 |
| Training Session and Activity/Event Attendees | 74 | Events | 296 |
| Dry Weather Monitoring Letters | 50 | Letter | 150 |
| Residential BMP Handout | 10 | Handout | 30 |
| Preventing Urban Runoff Pollution | 300 | Brochure | 900 |
| Everything that flows down the storm drain…. | 800 | Sheets | 2,400 |
| 2008 Storm Water Program Calendar | 2,000 | Calendar | 6,000 |
| 2009 Storm Water Program Calendar Art Contest Handouts | 860 | Handout | 4,300 |
| IPM Cards | 200 | Info card set | 600 |
| HHW Refrigerator Magnets | 500 | Magnets | 1,500 |
| Storm Water Hotline Card | 100 | Card | 300 |
| Construction BMP Handouts | 200 | Handout | 600 |
| **Total** | | | **17,715** |

## 8.5 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was recently updated in March 2008. No changes to the City's education component have been made since that time.

# 9.0 PUBLIC PARTICIPATION COMPONENT

## 9.1 INTRODUCTION

The City encourages public participation in the City's JURMP as a means to foster storm water awareness and improve water quality. Public participation includes, but is not limited to, cleanup events, special community projects, reporting observed IC/IDs, and participating in City-hosted waste disposal events. Collaboration between the City and the community should help encourage a sense of shared responsibility in protecting water quality both locally and regionally. The City has encouraged public participation through the programs discussed in this section.

### 9.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the public participation component during the 2007/2008 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- The City collaborated with I Love a Clean San Diego (ILACSD) to host a site for the Earth Day Creek to Bay Cleanup event. A total of 45 volunteers participated.
- The City continued to collaborate with the cities of Chula Vista and Imperial Beach to provide HHW disposal for residents of the City of National City.
- The City continued to operate a storm water hotline to receive complaints from businesses and residents in the City.
- The City held two large-item disposal events, which allowed residents to dispose of large items (not including HHW).

## 9.2 PUBLIC PARTICIPATION ACTIVITIES

**Cleanup Events and Programs**

During 2007/2008, the City hosted various cleanup events and activities at various locations in the City. Cleanup events provide a direct benefit to water quality and provide an opportunity for the City to distribute educational materials and information to the event's volunteers. The City continued to collaborate with I Love a Clean San Diego (ILACSD) for the Earth Day Creek to Bay Cleanup event. A total of 45 volunteers cleaned an area of Paradise Creek for the Creek to Bay Clean Up, which was held on 4/26/2008. As of this writing, ILACSD was not able to provide the data for the amount of debris removed from cleaning activities at the location in National City.

**2009 Calendar Development**

As previously mentioned, during 2007/2008, the City began to develop the 2009 storm water program calendar. Dissimilar to previous calendars developed by the City, the

City worked to involve the public in the development of the 2009 calendar. An art contest was held for 3rd grade students attending public school in the City; the 12 winning images will be included for each month of the calendar. The theme of the contest was "By keeping our community clean, we can keep the ocean clean." Teachers were provided guidelines for the contest, and were provided ideas on how they could incorporate storm water concepts into their lesson plans. An informational flyer was provided to the students that outlined the rules of the contest and presented some storm water concepts; all students that submitted an entry received a certificate of participation signed by the mayor. Winners will be selected in the 2008/2009 reporting period. The contest, which was sponsored by EDCO, will provide prizes, such as gift cards, to the contest winners. A total of forty-three 3rd grade classes in the City participated in the contest. The teacher guideline sheet, flyer, and certificate of completion are included in Attachment 8.2.

**Hazardous Waste Collection and Used Oil Recycling Program**

The City's Hazardous Waste Collection and Used Oil Recycling Program encourages City residents and business owners to properly dispose of HHW. Residents have access to proper disposal facilities for household hazardous wastes at the South Bay Regional Household Hazardous Waste drop-off center, located in Chula Vista. This facility is open on Saturdays from 9:00 a.m. to 1:00 p.m. and accepts up to 15 gallons or 125 lbs of waste per household for a small co-payment. This service is also available to residents in the cities of Chula Vista, Coronado, and Imperial Beach.

The "Put Toxic Waste In Its Place" brochure continues to be used by the City to inform residents of how and where to dispose of HHW; the brochure directs people to www.1800cleanup.com, which provides further information about identification and disposal of HHW.

Additionally, the City offers a low cost door-to-door collection programs for residents. Residents may dispose of used oil at seven Certified Used Oil Recycling Centers are located around the City.

**Other Waste Disposal**

The City also continued to hold household trash collection events for large items such as furniture and appliances. The City coordinates with EDCO to host both fall and spring collection events. These events are routinely held in June and November of each year. The City encourages the public to bring their debris for proper disposal.

**Public Reporting**

As discussed in Section 7, complaints are received through the City's storm water hotline and online website reporting system. The residential, industrial and commercial, construction, and municipal communities are encouraged to utilize the hotline to report IC/IDs. The City investigates each complaint and tracks the complaint and follow-up actions, as applicable. By utilizing the reporting system, residents of the City are held accountable for their actions as well as those of their neighbors. The hotline number is available on the storm water hotline card, which is given out at inspections, complaint

investigations, and is made available at many public facilities. The hotline number is also available on brochures distributed by the City, as well as on the City's website. This reporting period there were 48 complaints received by the City. All complaints reported during the reporting period were investigated immediately and addressed appropriately by the City's NPDES Storm Water Compliance Inspector.

## 9.3 OUTREACH EVENTS

The City has continued to provide educational outreach programs for variety of different communities in the City.

**Public Workshops**

Workshops, information, and training sessions are necessary to provide the public with the tools and knowledge to participate effectively in the City's storm water program. This reporting period, the City held two separate workshops, one for the Kiwanis Club of National City and one for the development planning and construction community. These events were discussed in detail in Section 8 of this Annual Report.

**Storm Drain Stenciling**

In the past, ILACSD has done storm drain stenciling in the City. Due to the shorter timeline for the submittal of the JURMP Annual Report, ILACSD was not able to provide an update on any storm drain stenciling that took place in the City in 2007/2008.

# 10.0 FISCAL ANALYSIS

No changes to the sources of funding for this program listed in the City's update JURMP have been made during this reporting period. The budgeted cost of the 2007/2008 program was $1,701,700. The proposed estimated budget for the 2008/2009 program is $1,317,000. Table 10-1, below, presents an itemized breakdown of the program budgets.

**Table 10-1**
**Itemized Budgets For Fiscal Years 2007/2008 and 2008/2009**

| Storm Water Program Fiscal Analysis | Budgeted FY 07/08 | Budget FY 08/09 |
|---|---|---|
| ***Staff*** | | |
| Public Works | 160,000 | 350,000 |
| Planning | 40,000 | 40,000 |
| City Attorney | 10,000 | 10,000 |
| Building | 30,000 | 20,000 |
| Fire | 10,000 | 10,000 |
| Engineering | 80,000 | 90,000 |
| Community Development Department (CDD) | 40,000 | 30,000 |
| *Sub-total* | ***$370,000*** | ***$550,000*** |
| ***Operation Expenditures*** | | |
| NPDES Fees | 35,000 | 40,000 |
| Consultant Fees for NPDES Program | 200,000 | 200,000 |
| Purchase Equipment | 1,000 | 1,000 |
| Miscellaneous Operations | 5,000 | 5,000 |
| *Sub-total* | ***$241,000*** | ***$246,000*** |
| ***CIP Appropriations*** | | |
| Drainage Improvements (Curb & Gutter, Alley Apron, X-Gutter) | 325,000 | ** |
| Curb and Gutter | * | 68,500 |
| Alley Apron | * | 6,000 |
| X-Gutter | * | 46,500 |
| *Sub-total* | ***$325,000*** | ***$121,000*** |
| ***Special Projects*** | | |
| Sewer Pump Stations Rehabilitation Project | 765,700 | *** |
| Storm Drain Improvements | | 400,000 |
| **Grand Total** | **$1,701,700** | **$1,317,000** |

* Included in drainage improvements
** Drainage improvement costs are broken out into specific categories for 2008/2009. Also, a special storm drain (inlets, piping, etc.) improvement project will occur in 2008/2009.
** Project complete

# 11.0 EFFECTIVENESS ASSESSMENT

## 11.1 INTRODUCTION

The City began using the standardized program effectiveness assessment soon after it was developed by the Copermittees during the last permit cycle. The City also participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs. Due to a variety of complications on a regional level, that process could not be completed prior to the submittal of the City's JURMP, so the City prepared its own effectiveness assessment approach and measures.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is likely that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will revisit the issue of standardized assessment metrics and procedures in the near future. The City anticipates participating in the process of developing such regional standards and incorporating work products produced into its own local program effectiveness assessment system.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

The City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics were provided in Section 13 of the City's 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted

outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge/Awareness
Level 3: Behavioral Change/BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

## 11.2 EFFECTIVENESS ASSESSMENT RESULTS

The new Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Level 1, Level 5, and Level 6 outcomes are discussed in the text below. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 OUTCOME LEVEL ASSESSMENTS

**Level 1**
Level 1 outcomes essentially are measures of permit compliance. The component-specific sections in this JURMP Annual Report provide details of programmatic actions taken to comply with the applicable Municipal Permit requirements. Appendix B of this JURMP Annual Report also includes a checklist that matches the Municipal Permit's annual reporting requirements with the section(s) or appendix of this report that addresses each requirement. .

**Levels 2 and 3**
See the tables 11-1 through 11-8 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Please note that the number of hotline calls and Dry Weather Monitoring Program results are used in the assessments for other program components besides illicit discharge detection and elimination. Those numbers are taken from the work done within the period from July 1, 2007 through June 30, 2008 to be comparable with previous years' assessments and data. Also note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included.

**Level 4**
The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly

measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs reliable load estimation methods have not yet been developed.

**Level 5**

The Dry Weather Monitoring Program is the City's primary mechanism of measuring the quality of discharges. The City will also begin collecting MS4 monitoring data in 2008/2009, which should also provide information about discharge quality.

Several graphs demonstrating historical Dry Weather Monitoring results are provided at the end of this section as figures 11-4 through 11-6. Ammonia and detergents, the two constituents with the longest historical data record, both show decreasing trends over time. Relatively few action level exceedances have been noted in recent monitoring years; only two measurements from the 2007 Dry Weather Monitoring Program exceeded their respective action levels.

**Level 6**

No Regional Monitoring Program water quality monitoring stations are located within the City of National City. The Sweetwater Mass Loading Station is located just outside the southeastern border of the City, but only a very minimal portion of the City would drain to that site. Some sediment sampling has been completed in the Sweetwater River flood control channel along southern side of the City as part of the regional Ambient Bay and Lagoon Monitoring Program. The results of that program have been relatively inconclusive to date. The RWQCB contracted Southern California Coastal Waters Research Project (SCCWRP) to conduct some wet weather monitoring in Paleta Creek (Seventh Street Channel) in support of a pending TMDL. At this point, the amount of data collected at these sites is not sufficient to determine any positive or negative trends for water quality at the site. Typically several years of data are needed before any trends become apparent. The City will continue to work with the San Diego Bay WURMP workgroup and TMDL stakeholder workgroups to improve the quality of water bodies in and around the City of National City.

### 11.2.2 Overall Component Assessments

**Development Planning**

The City's review process for development projects is effectively requiring higher removal efficiency BMPs. Based on the results of the treatment control inspections and some interaction with responsible parties after the end of the reporting period, it appears that there is a low level of awareness of the need for regular treatment control BMP maintenance. The City will work with the parties responsible for maintenance of treatment control BMPs to address this issue and improve maintenance rates during 2008/2009.

**Construction**

The available data indicate that on the whole the City's construction program effectively requires BMP implementation. Any BMP deficiencies noted are typically remedied promptly. The City has also implemented an approval process that notifies all

construction projects that will disturb soil of the City's BMP requirements before a permit is issued. This process has helped bring about better BMP implementation at small projects that otherwise might not be aware of the BMP requirements.

**Municipal**

The City's municipal staff are regularly trained on storm water issues, and the City's MS4 cleaning and street sweeping programs meet or exceed minimum Municipal Permit frequency requirements. In particular, the City sweeps its streets more often than the permit requirements to aid in WURMP efforts. City storm water staff are in close contact with municipal facility managers and maintenance staff, and storm water issues observed during inspections are typically corrected promptly.

**Industrial and Commercial**

The City has a comprehensive inspection program that utilizes experienced consultant inspectors. Results are tracked through a database. A comparatively high number of noncompliant sites were identified in 2007/2008. While this indicates the City correctly identified high TTWQ sites when prioritizing its inventory, the City will also need to follow up with these sites in 2008/2009 so that they comply with the City's regulations. Many of the businesses inspected had a low level of knowledge about storm water requirements, especially restaurants. Sixty-six restaurants were inspected, of which 61 had the lowest possible storm water knowledge assessment score (1). The City has held workshops for restaurants in the past, but these have not proven very effective. The City has initiated some conversations with property management companies for businesses in multi-suite complexes to see if the landlords can provide some additional assistance in bringing about compliance with storm water requirements. It is too early to determine how effective this approach is, but the City may continue to investigate it in 2008/2009, particularly for non-compliant businesses and businesses like restaurants that tend to have high staff turnover.

**Residential**

The City's residential component achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. A somewhat lower number of hotline calls was recorded during the July 1, 2007 to June 30, 2008 reporting period than had been observed in previous years, but the reason for the decrease is unknown. The City will continue to educate residents about how and when to report incidents to the hotline, and data from 2008/2009 will be assessed to see if current patterns continue or if hotline calls increase again.

**IDDE**

A recent RWQCB has extended the reporting period for the IDDE component of the City's program, so a full assessment of the programs effectiveness cannot be provided at this time. Some initial metrics are presented in Table 11-6.

**Education**

The City has expanded its education program over each of the last several years. As has already been described above, data from 2007/2008 indicate that two key target

audiences in need of additional education are industrial and commercial businesses and parties responsible for treatment control BMP maintenance.

**Public Participation**

New clean-up events have been added over the years, and the City will continue looking for new opportunities for public involvement. The number of hotline calls decreased in 2007/2008, but the reason for the decrease is unknown. The City will continue to ensure its own staff are aware of the hotline and when to call it and that members of the public also receive this information.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of that document.

**Table 11-1**
**Development Planning Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Review and approve project plans | External<br>A relatively small number of projects submitted reports during 2008/2009. Based on meetings with applicants and BMPs proposed, it appears that the level of knowledge is increasing.<br>Internal<br>The City's storm water consultant and the City's Stormwater Program Manager worked with engineers in the City to improve their level of understanding of the SUSMP program. City personnel also attended training sessions—see Section 8. The City's consultant reviews SWMPs submitted to the City. | Overall SWMP approval rate during reporting period | 41% | N/A, addressed through other significant activities for this component | |
| | | Number of projects requiring three or more reviews prior to SWMP approval | 7 | | |
| Verify proposed BMPs are implemented | External<br>N/A, knowledge is evaluated by appropriate implementation of BMPs as shown in Level 3<br>Internal<br>The City contracts with a qualified consultant to perform treatment control BMP inspections. | Percent of projects implementing all proposed BMPs | 69% | Percent of projects proposing BMPs besides filter inserts* | 100% |
| | | Resolution status of enforcement actions | See Section 2 | Percent of approved projects implementing BMPs with high or medium removal efficiencies for key pollutants of concern* | 50%** |
| Verify BMPs are properly maintained | External<br>N/A, verification letters were not sent out until 2008/2009.<br>Internal<br>N/A, verification letters were prepared by the City's consultant. | Percent of sites properly maintaining BMPs | 50% | N/A, verification letters were not sent out until 2008/2009. | |
| | | Resolution status of enforcement actions | See Section 2 | | |
| | | Percent of sites submitting proper verification forms | N/A | | |
| | | Percent of sites certifying proper maintenance | N/A | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
* For period from 3/24/2008 to 6/30/2008
** One of two projects proposed a hydrodynamic separator, so a feasibility analysis was required. The project also implemented LID. See Section 2 for details.

**Table 11-2**
**Construction Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Review proposed plans and BMPs | External<br>Projects submit plans for construction BMP implementation for their projects; the level of awareness of construction BMP requirements is fairly high.<br>Internal<br>Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs. | BMPs proposed for construction projects generally meet requirements; no significant problems have been noted. | | Proper pre-project planning is likely to have reduced pollutant loading. |
| Verify proposed BMPs are implemented | External<br>Grading projects implement BMPs as required by their permits, and contractors are familiar with the City's requirements.<br>Internal<br>Training for City staff is described in Section 8. City inspectors are familiar with relevant construction BMPs. | Percent of projects implementing required BMPs by end of reporting period | 100% | Proper BMP implementation is likely to have reduced pollutant loading. |
| | | Percent of projects in compliance with BMP requirements during all inspections | 86% | |
| | | Resolution status of enforcement actions | See Section 3 | |
| | | Number of dry weather monitoring exceedances traced to construction sources | 0 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-3**
**Municipal Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Verify proposed BMPs are implemented at facilities | City staff are regularly trained on BMP implementation; see sections 4 and 8. | Percent of inspected facilities/activities in compliance with BMP requirements | 100% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of sites requiring follow-up inspections | See Section 4 | Number of pet waste bags distributed | Unknown |
| | | Number of dry weather monitoring exceedances traced to municipal sites | 0 | | |
| Sweep streets and parking facilities | | N/A, streets and parking facilities are swept as often as directed by management. | | Amount of sediment and debris removed (weight or volume) | 1,151 pounds |
| | | | | Amount of sediment and debris removed per length of street swept (weight or volume per curb mile) | 0.07 pounds/ curb mile |
| Maintain and clean out MS4 | | N/A, MS4 structures are maintained as often as directed by management. | | Amount of sediment and debris removed (weight or volume) | 39.6 tons |
| Maintain sanitary sewer system | | N/A, the sanitary sewer system is maintained as often as directed by management. | | Total volume of SSO discharge to MS4 (gallons) | 4,200 |
| Maintain municipal treatment control BMPs | | N/A, treatment control BMPs are maintained as often as directed by management. | | Amount of sediment and debris removed from treatment BMPs | 10 pounds |
| | | | | BMP effectiveness studies | N/A |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-4**
**Industrial and Commercial Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Require BMP implementation | External<br>Knowledge assessment scores indicated a slightly low level of understanding of relevant storm water concepts. See Figure 11-1 on the following page for a score distribution. See Section 8 for more detail on educational materials and other outreach efforts.<br>Internal<br>The City contracts with a qualified consultant to perform industrial and commercial inspections. | Percent of inspected sites in compliance with BMP requirements (not including additional study) | 66% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 5 | | |
| | | Number of dry weather monitoring exceedances traced to industrial or commercial sources | 1 | Number of IC/IDs eliminated (inspections and complaint investigations) | 8 |
| | | Consistent with the intentional selection of sites with the highest TTWQ potential, many sites had a low BMP score of 1. Aside from those problem sites, the most common score was three. See Figure 11-2 on the following page for a score distribution. | | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Figure 11-1**
**Knowledge Assessment Scores, 2007/2008 Inspections**

**Figure 11-2**
**BMP Assessment Scores, 2007/2008 Inspections**

**Table 11-5: Residential Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Require BMP implementation | External<br>Residents were educated in variety of ways in 2007/2008; see sections 6 and 8 for details.<br>Internal<br>The City's Stormwater Program Manager is heavily involved in the implementation of the residential component. Other City staff involved in the program also have a good understanding of the goals of the storm water program. | Number of residential incidents reported to storm water hotline | 9 | Resolution of residential incidents reported to the hotline likely resulted in a decrease in pollutant loading through improved BMP implementation. |
| | | Resolution of enforcement actions | See Section 6 | |
| | | Number of dry weather monitoring exceedances traced to residential sources | 1 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-6: Illicit Discharge Detection and Elimination Component Assessment Measures***

| Significant Activity | Level 2 | Level 3 | Level 4 |
|---|---|---|---|
| Conduct Dry Weather Monitoring Program | The City contracts with a qualified consultant to perform its Dry Weather Monitoring Program. | N/A, personnel conduct monitoring as directed by management. | No significant, long term IC/IDs were eliminated, so a reliable estimate of load reduction cannot be made. |
| Respond to incidents reported to storm water hotline | The City's Stormwater Program Manager trains City staff as needed. See sections 4 and 8. City staff were responsible for many of the reports made to the hotline, as shown in Section 7. | N/A, personnel respond to incidents as directed by management. | Resolution of the incidents reported to the hotline and listed in Section 7 are likely to have resulted a pollutant loading reduction. |
| Respond to and clean up SSOs | City staff are thoroughly trained on how to respond to SSOs. | See Section 4 for details. | There was one SSO during the reporting period. |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
*Although the overall IDDE component is not being submitted until December 2008, a preliminary assessment of that component's effectiveness is provided here.

**Table 11-7: Education Component Assessment Measures**

| Significant Activity | Level 2 | | Level 3 | Level 4 |
|---|---|---|---|---|
| Provide storm water education to the public | External<br>The City actively educates the various audiences in its jurisdiction. See Section 8 for details. | | See Level 3 outcomes for other program components for information about behavior change. | Sufficient data to estimate load reductions due to educational efforts is not available for 2007/2008. |
| | Estimated number of impressions made | 17,715 | | |

**Notes**

Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-8: Public Participation Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Involve the public in activities that relate to storm water protection | External<br>The City and City partners put on a number of opportunities for the public to participate. See section 9 for details. See Figure 11-3 for a summary of hotline reports in recent years. | Number of attendees at events | 74 | Amount of trash and debris collected at cleanup events | Unknown |
| | | Number of calls received to the storm water hotline | 48 | Amount of HHW collected | 220,008 pounds between three cities. |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

# 12.0 SPECIAL INVESTIGATIONS

During the reporting period the City undertook two additional programs: the Clean Community Program and a pollutant discharge potential assessment component during industrial and commercial inspections.

## 12.1 CLEAN COMMUNITY PROGRAM

Results from the City's trash assessment, conducted in 2006/2007, showed that litter and illegally dumped items tended to consist of household trash and large household items, likely from residents in the City. During 2007/2008, the City continued to implement its Clean Community Program. This program is designed to foster a sense of shared responsibility in keeping the community of National City clean and free of pollutants that may otherwise be carried to local receiving water bodies.

The theme of the 2008 community calendar was "By Keeping our Community Clean, We can Keep the Ocean Clean!" This slogan was printed in both English and Spanish on every month of the calendar. Each month showed a different ocean scene and featured sea life such as schools of fish or sea turtles. Storm water facts were also presented throughout the calendar in both English and Spanish; such facts included "Only rain down the drain," "Programming sprinklers to reduce over watering helps reduce pollution," and "You can dispose of large items (mattresses, appliances, etc.) twice per year during the National City Clean-Up days. Watch for event details in your trash bill." The back of the calendar provides numerous City resources for residents who choose to take action in the City's program.

As discussed in detail in Section 9 of this Annual Report, during 2007/2008, the City worked to continue implementing part of the Clean Community Program though the development of a 2009 calendar. Through integrating public participation into the development of the 2009 calendar, the City hopes increase attention to the "By Keeping our Community Clean, We Can Keep the Ocean Clean" message. The City will also use the results of the new trash assessment component of the 2008 Dry Weather Monitoring Program to better gauge the progress of its program. This data is being collected as of this writing, and an assessment cannot be completed yet.

## 12.2 POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

During 2007/2008, the City conducted pollutant discharge potential assessments (PDPA) at industrial and commercial facilities that received full inspection; the purpose of the assessment is to assist in source identification. The assessment is intended to be a semi-quantitative tool to identify which sites are major sources of the principal pollutants of concern for storm water. For each of several main categories of pollutants, a numeric pollutant discharge potential (PDP) on a scale from 0 (not present) to 5 (severe) is

assigned. A copy of the PDPA form is included with the standard inspection form in Attachment 5.1.

Table 12-1 shows the average scores for each pollutant; note that pH indicates substances likely to cause either an abnormally low (acidic) or abnormally high (basic) pH.

**Table 12-1**
**Pollutant Discharge Potential Score Averages, By Category**

| Pollutant Category | Potential Discharge Assessment Score |
|---|---|
| Sediment | 2.7 |
| Nutrients | 1.8 |
| Aluminum | 1.5 |
| Iron | 1.6 |
| Heavy Metals | 1.9 |
| Organics | 1.6 |
| Trash | 2.5 |
| Oxygen Demanding | 1.8 |
| Oil and Grease | 2.9 |
| Bacteria | 1.9 |
| Pesticides | 1.0 |
| Acid/Base | 1.3 |

Sediment, trash, and oil and grease were observed to be the largest issues during the industrial and commercial inspections conducted during 2007/2008. The City will use this information to help target businesses for inspection during 2008/2009. Figure 12-1, on the following page, show the distribution of PDP scores for each pollutant on the PDPA table.

**Figure 12-1**
**PDPA Score Distribution for Facilities Inspected in 2007/2008**

# 13.0 NON-EMERGENCY FIRE FIGHTING

Please reference Section 4.2.3 of this JURMP Annual Report for information about BMPs and procedures associated with non-emergency fire fighting activities.

# 14.0 JURMP REVISIONS

The City's JURMP was rewritten in the spring of 2008 in response to new Municipal Permit requirements. Section 14 of the updated JURMP document includes a list of the changes made to the JURMP at that time. Any other changes to the JURMP made since the overall JURMP update in the spring of 2008 are discussed in the individual "Program Review and Modification" subsections in the preceding sections in this JURMP Annual Report.

# 15.0 CONCLUSIONS AND RECOMMENDATIONS

During the 2007/2008 reporting period the City of National City updated its JURMP, which was finalized and submitted to the RWQCB in March 2008. The City has begun implementing the new and revised programs in its updated JURMP. The Copermittees have created several new regional workgroups to facilitate sharing of information about how best to run these programs and to provide regional guidance on standardized implementation where applicable. The City of National City will work collaboratively with the other Copermittees in this process and continue to refine its program implementation as needed to improve its ability to reduce or eliminate pollutant discharges and meet regulatory requirements. The City will also continue its efforts related to pending TMDLs for both Seventh Street Channel and Switzer Creek.

# APPENDIX B

**Appendix B**
**JURMP Annual Report Requirements Checklist**

## Development Planning Component

| Permit Annual Reporting Requirement—Section J.3.a.(3).(a) | Location in Report |
|---|---|
| i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements. | 2.2, 2.3 |
| ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked. | 2.4.3, 2.4.4.2 |
| iii. A listing of the development projects to which SUSMP requirements were applied. | Table 2-1 |
| iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked. | 2.4.4.2 |
| v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs. | 2.4.4.2 |
| vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible. | 2.4.4.2 |
| vii. An updated treatment control BMP inventory. | Appendix A (inventory) |
| viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings. | 2.4.4.3, Table 2-2 |
| ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings. | 2.4.4.3 |
| x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked. | 2.4.4.2 |
| xi. A listing of any projects which received a SUSMP waiver. | 2.4.4.2 |
| xii. A description of implementation of any SUSMP waiver mitigation program. | 2.4.4.2 |
| xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation. | 2.4.4.2 |
| xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented. | 2.4.4.2 |
| xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements. | 2.4.4.2 |

## Development Planning Component

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(a)** | **Location in Report** |
|---|---|
| xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project. | 2.4.4.2 |
| xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 2.4.4.3 |
| xviii. A description of notable activities conducted to manage urban runoff from development projects. | 2.1 |

## Construction

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(b)** | **Location in Report** |
|---|---|
| i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked. | 3.5 |
| ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed. | 3.2 |
| iii. A description of modifications made to the construction and grading ordinances and approval processes. | 3.3 |
| iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites. | 3.5 |
| v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites. | 3.5 |
| vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites. | 3.5 |
| vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites. | 3.5, Appendix A (inventory) |
| viii. A description of the general results of the inspections. | 3.5 |
| ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 3.5 |
| x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 3.5 Table 3-1 |
| xi. A description of notable activities conducted to manage urban runoff from construction sites. | 3.1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| i. Any updates to the municipal inventory and prioritization. | Appendix A (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events. | 4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4 |
| iii. A description of inspections and maintenance conducted for municipal treatment controls. | 2.4.3.2 |
| iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned. | 4.4.4 Table 4-2 |
| v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned. | 4.4.4, Table 4-2 |
| vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned. | 4.4.4, Table 4-2 |
| vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category. | 4.4.4, Table 4-2 |
| viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding. | **(N/A for 07-08)** |
| ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities. | 4.2.3 |
| x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-2 |
| xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| xiii. Identification of the total distance of curb-miles swept. | 4.3.4, Table 4-1 |
| xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping. | 4.3.4, Table 4-1 |
| xv. Amount of material (tons) collected from street and parking lot sweeping. | 4.3.4, Table 4-1 ( |
| xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4 | 4.35.4 |
| xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections. | 4.2.4, 4.3.4, Table 4-3 |
| xviii. A description of the general results of the inspections. | Table 4-3 |
| xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 4.2.4 |
| xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 4.2.4, |
| xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities. | Throughout Section |

## Industrial and Commercial

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(d)** | **Location in Report** |
|---|---|
| i. Any updates to the industrial and commercial inventory. | 5.2.2 (stationary), 5.3.2 (mobile), Appendix A (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources. | 5.2.4, 5.3.4 |
| iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses. | 5.2.4, 5.3.4 |
| iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected. | 5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1 |
| v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection. | 5.2.4 |
| vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance. | 5.2.4 |
| vii. Identification of the number of third party inspections conducted. | 5.2.4 (will be N/A) |
| viii. Identification of efforts conducted to verify third party inspection effectiveness. | 5.2.4 (will be N/A) |
| ix. A description of efforts implemented to address mobile businesses. | 5.3.4 |
| x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 5.2.4, 5.3.4 |
| xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees. | 5.2.4, Table 5-2 |
| xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources. | Throughout Section |

## Residential

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(e)** | **Location in Report** |
|---|---|
| i. Identification of the high threat to water quality residential areas and activities that were focused on. | 6.2 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities. | 6.4 |
| iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials. | 6.4 |
| iv. Types and amounts of household hazardous wastes collected, if applicable. | 6.4 |
| v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation. | 6.4 (see discussion in JURMP) |
| vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 6.4 |
| vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program. | 6.4 |
| viii. A description of notable activities conducted to manage urban runoff from residential areas and activities. | 6.4 |

## IDDE

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(f)** | **Location in Report** |
|---|---|
| i. Correction of any inaccuracies in either the MS4 map or the Dry Weather Field Screening and Analytical Stations Map. | 7.4 |
| ii. Reporting of all dry weather field screening and analytical monitoring results. The data should be presented in tabular and graphical form. The reporting shall include station locations, all dry weather field screening and analytical monitoring results, identification of sites where results exceeded action levels, follow-up and elimination activities for potential illicit discharges and connections, the rationale for why follow-up investigations were not conducted at sites where action levels were exceeded, any Copermittee or consultant program recommendations/changes resulting from the monitoring, and documentation that these recommendations/changes have been implemented. Dry weather field screening and analytical monitoring reporting shall comply with all monitoring and standard reporting requirements in Attachment B of Order No. R9-2007-0001 and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001. | 7.4, Table 7-2, 7-3, and 7-4 |
| iii. Any dry weather field screening and analytical monitoring consultant reports generated, to be provided as an attachment to the annual report. | 7.4, Attachment 7.1 |
| iv. A brief description of any other investigations and follow-up activities for illicit discharges and connections. | 7.5 |
| v. The number and brief description of illicit discharges and connections identified. | 7.5, Table 7-5 |
| vi. The number of illicit discharges and connections eliminated. | 7.5, Table 7-5 |
| vii. Identification and description of all spills to the MS4 and response to the spills. | 7.3, Table 7-5 |
| viii. A description of activities implemented to prevent sewage and other spills from entering the MS4. | 7.3 |
| ix. A description of the mechanism whereby notification of sewage spills from private laterals and septic systems is received. | 7.3 |
| x. Number of times the hotline was called, as compared to previous reporting periods, and a summary of the calls. | 7.2, Table 7-5 |
| xi. A description of efforts to publicize and facilitate public reporting of illicit discharges. | 7.2 |
| xii. The number of violations and enforcement actions (including types) taken for illicit discharges and connections, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 7.5, Table 7-1 and 7-5 |

## IDDE

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| xiii. A description of notable activities conducted to manage illicit discharges and connections. | 7.5, Table 7-1 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| Meets applicable standard monitoring and reporting requirements listed in Municipal Permit Attachment B. | 7.4 |
| c. (1) Determining Sampling Frequency: Dry weather field screening and analytical monitoring shall be conducted at each identified station at least once between May 1st and September 30th of each year or as often as the Copermittee determines is necessary to comply with the requirements of section D.4 of Order No. R9-2007-0001. | 7.4 |
| c. (2) If flow or ponded runoff is observed at a dry weather field screening or analytical monitoring station and there has been at least seventy-two (72) hours of dry weather, make observations and collect at least one (1) grab sample. Record general information such as time since last rain, quantity of last rain, site descriptions (i.e., conveyance type, dominant watershed land uses), flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate), and visual observations (i.e., odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biology). | 7.4 |
| c. (3) At a minimum, collect samples for analytical laboratory analysis of the following constituents for at least twenty five percent (25%) of the dry weather monitoring stations where water is present: (a) Total Hardness, (b) Oil and Grease, (c) Diazinon and Chlorpyrifos, (d) Cadmium (Dissolved), (e) Lead (Dissolved), (f) Zinc (Dissolved), (g) Copper (Dissolved), (h) Enterococcus bacteria, (i) Total Coliform bacteria, (j) Fecal Coliform bacteria | 7.4 |
| c.(4) At a minimum, conduct field screening analysis of the following constituents at all dry weather monitoring stations where water is present: | 7.4 |
| c. (a) Specific conductance (calculate estimated Total Dissolved Solids), (b) Turbidity, (c) pH, (d) Reactive Phosphorus, (e) Nitrate Nitrogen, (f) Ammonia Nitrogen, (g) Surfactants (MBAS) | 7.4 |
| c. (5) If the station is dry (no flowing or ponded runoff), make and record all applicable observations and select another station from the list of alternate stations for monitoring. | 7.4 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| c. (6) Develop and/or update criteria for dry weather field screening and analytical monitoring results whereby exceedance of the criteria will require follow-up investigations to be conducted to identify and eliminate the source causing the exceedance of the criteria. | 7.4 |
| c. (7) Assess the presence of trash in receiving waters and urban runoff at each dry weather field screening or analytical monitoring station. Assessments of trash shall provide information on the spatial extent and amount of trash present, as well as the nature of the types of trash present. | 7.4 |
| c. (8) Dry weather field screening and analytical monitoring stations identified to exceed dry weather monitoring criteria for any constituents shall continue to be screened in subsequent years. | 7.4 |
| c. (9) Develop and/or update procedures for source identification follow up investigations in the event of exceedance of dry weather field screening and analytical monitoring result criteria. These procedures shall be consistent with procedures required in section D.4.d of Order No. R9-2007-0001. | 7.4 |
| c. (10) Develop and/or update procedures to eliminate detected illicit discharges and connections. These procedures shall be consistent with each Copermittees Illicit Discharge and Elimination component of its Jurisdictional Urban Runoff Management Plan as discussed in section D.4 of Order No. R9-2007-0001. | 7.4 |
| d. The Copermittees shall commence implementation of dry weather field screening and analytical monitoring under the requirements of this Order by May 1, 2008. Each Copermittee shall conduct dry weather analytical and field screening monitoring in accordance with its storm water conveyance system map and dry weather analytical and field screening monitoring procedures as described in section II.B.3 above. If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and sections D.4.d and D.4.e of Order No. R9-2007-0001. Until the dry weather field screening and analytical monitoring program is implemented under the requirements of this Order, each Copermittee shall continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2001-01. | 7.4 |

## Education

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(g)** | **Location in Report** |
|---|---|
| i. A description of education efforts conducted for each target community. | 8.3 |
| ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges. | 8.3 |
| iii. A description of education efforts conducted for municipal departments and personnel. | 8.3 |
| iv. A description of education efforts conducted for the new development and construction communities. | 8.3 |
| v. A description of jurisdictional education efforts conducted for residents, the general public, and school children. | 8.3 |

## Public Participation

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(h)** | **Location in Report** |
|---|---|
| i. A description of public participation efforts conducted. | 9.2 and 9.3 |

## Effectiveness Assessment

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(i)** | **Location in Report** |
|---|---|
| i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order. | 11 |

## Fiscal Analysis

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(j)** | **Location in Report** |
|---|---|
| i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. (For 2007-2008, the requirements that apply are essentially the same as those found in Order No. 2001-01) | 10 |

Same as old Permit for 2007-2008

## Special Investigations

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(k)** | **Location in Report** |
|---|---|
| i. A description of any special investigations conducted. | 12 |

## Non-Emergency Firefighting

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(l)** | **Location in Report** |
|---|---|
| i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows. | 4.2.3, 13 |

## JURMP Revisions

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(m)** | **Location in Report** |
|---|---|
| i. A description of any proposed revisions to the JURMP. | 14 and each program component section |

# TREATMENT CONTROL BMP FEASIBILITY ANALYSIS FOR GROVE PLAZA

## STRUCTURAL TREATMENT

### Structural Treatment

Structural treatment The area for treatment by structural treatment is very small, 0.39 acres for Building A and 0.40 acres for Building B. The small size of the parcel, the nature of the commercial development and the small flow eliminates most treatment methods.

**Detention Basin** – Traditional detention basins require very large amounts of area to operate properly, large enough to detain the total design flow or long enough to provide gravity sedimentation while the clarified effluent is allowed to spill out. There is no space for this type of device and given the low intermittent low flow, it would not work properly. If a water volume could be maintained long enough to operate properly, it would become a breeding area for insects and mosquitoes located in a residential neighborhood.

**Infiltration Basin** - An infiltration basin requires an even larger space than a detention basin to retain the runoff volume. The water detained in the basin, with all the pollutants, would be allowed to filter into the ground water. It is a better solution to treat the water and release it to the existing storm drain system. Also, the adjoining residential neighborhood would not tolerate a large muddy hole.

**Wet Ponds or Wetlands** - Wet ponds are similar in size to an infiltration basin but larger and, by definition, constantly filled with water. The pond uses natural plants and bacteria to process the pollutants. It is a living organism and is extremely difficult to maintain during the widely varied inflow of storm water and varied concentrations of pollutants. This solution is not suitable for the neighborhood or the size of the site. The danger of a drowning child alone would preclude the implementation of this solution.

**Filtration** – A media filter, constructed as part of the natural environment, as opposed to a manufactured filter treatment plant, requires a large amount of space for pretreatment and then filtration. Pretreatment usually removes trash and sediment in a settling basin then filters the effluent down through media of varying sizes to remove sediment, oil & grease and other contaminants . The method requires a large amount of space and a large elevation differential or pumping to process the storm runoff. The site neither has the space nor the elevation difference to accommodate this process.

**Drainage Inserts** – Drainage inserts remove sediment and trash by filtering the incoming flow through a proprietary filter. Oil and grease and other contaminates are removed by filtering through activate charcoal and other adsorbing / absorbing materials. The filters are inserted in standard trench and storm drain inlets. They are protected by a grate and un-noticed by the casual public, yet they are simple and easy to maintain. This could be a good solution but is not allowed by the city.

**Biofilters** – A type of biofilter will be used to treat the runoff from the south roof of Building B. However, this solution requires too much space to be used as structural treatment for the entire site. See hydrology report for calculations.

**Hydrodynamic Separator Systems** – These proprietary devices work in various ways or combinations to physically separate sediment and other pollutants by gravity sedimentation, centrifugal force or filtration with varying degrees of success. The most applicable methods for this site would be a combination of sedimentation and filtration. This is the Structural treatment for most of the runoff from the project.

Structural Treatment would consist of a Flo-Guard Hydrodynamic Separator, 36" square, DVA-36s, a 36". The separators are oversized and can easily handle the anticipated hydraulic and pollution loading. One each of the filters would be installed in each of the two outlets to the street and would treat all runoff from the parcels.

The listed Pollutant Categories for a Parking Lot are Heavy Metals, Trash & Debris, Oil & Grease and potentially Sediments, Nutrients, Oxygen Demanding Substances and Pesticides. Nutrients and Pesticides can be reduced by careful landscaping design and maintenance. Trash and Debris and Oxygen Demanding Substances can be controlled by maintenance of the site. The selected filtration method will remove Trash & Debris, Sediments and floating oil.

**Design of the Separators** The peak 100 year flow for area A1 (Building A) is calculated to be 2.38 cfs; the flow from a uniform flow of 0.2 inches per hour is 0.077 cfs. The filtered flow capacity of the DVA-36s is 0.9 cfs (see Flow Guard Capacity charts in the Appendix). The safety factor of the proposed filter is approximately 11 times the design size. The bypass capacity is 8.0 cfs or approximately 3.3 times the calculated 100 year storm runoff.

The peak 100 year flow for area A2 (Building B) is calculated to be 1.91 cfs; the flow from a uniform flow of 0.2 inches per hour is 0.147 cfs. The filtered flow capacity of the DVA-36s is 0.9 cfs . The safety factor of the proposed filter is approximately 6 times the design size. The bypass capacity is 8.0 cfs or approximately 4 times the calculated 100 year storm runoff.

**Maintenance** Maintenance will be the responsibility of the owner. It is recommended that the separator be inspected each month. The sediment in the tank should be vacuumed out once each year. Detailed service procedures are outlined in the Appendix.

The cost of the separators is approximately $5,000 or $10,000 for both separators. The annual cost of maintenance is approximately $300/each or $600/ year for both separators.

# *BMP Operation and Maintenance Verification Form*

## National City Library

**Address:** 1401 National City Blvd
National City, CA 91950

Annual verification of effective operation and maintenance of all installed treatment control Best Management Practices (BMPs) was a condition of the permit to develop this site. Chapter 14.22 of the City's Municipal Code requires property owners to provide annual verification of proper operation and maintenance of BMPs. Please complete this form and return no later than September 10th, 2008 to the following address:

City of National City, Engineering Department
1243 National City Boulevard
National City, CA 91950
Attn: SUSMP BMP Verification Project

Please list the inspection and maintenance dates for each treatment control BMP listed at each described location. If maintenance was performed, include a brief description of the maintenance performed. If maintenance was performed by an outside company, include documentation of services.

### *BMP:* Drainage Insert Filter

***BMP Description:*** **Drainage insert filter**

## New Storm Water Treatment Device Inspection and Maintenance Requirements for Property Owners

Address and Property Owner:

Dear Property Owner,

Under a current environmental permit issued by the Regional Water Quality Control Board (RWQCB), National City is required to regularly inspect all completed new and redevelopment projects with permanent storm water treatment devices (also known as treatment control Best Management Practices (BMPs)). In addition to City conducted inspections of these devices, the permit requires that the individuals responsible for these treatment control BMPs conduct their own regular inspections and perform maintenance on these devices as needed, and submit documentation of these activities to the City.

If you are receiving this notice, it is because our City records indicate that you are the responsible party for the treatment control BMP(s) on your property. **You are required to complete and sign the attached form regarding the inspection and maintenance activities you have conducted in the past year for the treatment control(s) indicated.** Also, please correct any incorrect information on the form so we can update our records accordingly. **You must return the completed form to the City by no later than September 10th**. You can drop the form off at City Hall or mail the form to the following address:

City of National City, Engineering Department
1243 National City Boulevard
National City, CA 91950
Attn: SUSMP BMP Verification Project

Failure to comply with this requirement could result in issuing a notice of violation and being turned over to the City Attorney for legal action in accordance with the City of National City Storm Water Ordinance, Chapter 14.22. **Civil liability fines (up to $10,000 a day) could be imposed for extended non compliance.**

Please refer to your property's Standard Urban Stormwater Mitigation Plan (SUSMP) document and signed maintenance agreement for details on what maintenance is required for the treatment controls on your site. If you have any questions about this program, or would like to view your site's SUSMP report or maintenance agreement, please contact the City of National City's Storm Water Compliance Officer, Barbra Tipton, at (619) 336-4583.

For further information on maintenance of treatment control BMPs, refer to the documentation provided from the manufacturer (for commercially sold treatment control BMPs) or the California's Stormwater Quality Association's (CASQA) New Development and Redevelopment Handbook. A hard copy of the handbook is available

to read at the City's engineering counter, or you can access the handbook on CASQA's website at:

http://www.cabmphandbooks.com/Development.asp

We appreciate your cooperation with the City's storm water pollution prevention program. Your efforts help make the City's waterways and oceanfront safe and enjoyable for everyone.

Sincerely,

| | | |
|---|---|---|
| Barby Tipton<br>Storm Water Compliance Inspector | Din Daneshfar<br>Project Manager | Maryam Babaki<br>City Engineer |

BMP Operation and Maintenance Verification Form

# ATTACHMENT 3.1

# CONSTRUCTION BMP FACT SHEET

# Construction Site Best Management Practices

As a condition of your permit, you are required to prevent construction generated or related pollutants from discharging from your project site. All construction projects within the City of National City are required to implement at least one of the Best Management Practices (BMPs) from each category and subcategory listed below, where applicable. Property owners and/or permit holders will be responsible for the selection, installation and maintenance of proper BMPs in accordance with industry recommended standards such as the Caltrans or California Storm Water BMP handbooks or in accordance with the California General Permit for Construction. Depending on site-specific information such as project scope and potential associated discharges. Additional BMPs may be required where appropriate. Project proponents will need approval from the City prior to installation of any alternate BMPs not listed below.

**Minimum BMPs for Construction Activities:**

1. **Planning and Scheduling**
   Planning and scheduling BMPs such as minimizing grading are required where feasible to help reduce the amount and duration of soil exposure.
   a. Preservation of natural hydrologic features
   b. Preservation of riparian buffers and corridors
   c. Minimization of areas that are cleared and graded to only the portion of the site necessary for construction
   d. Minimization of exposure time of disturbed soil areas
   e. Minimization of grading during the wet season and correlation of grading with seasonal dry weather periods
   f. Temporary stabilization and reseeding of disturbed soil areas as rapidly as feasible
   g. Employee and Subcontractor Training

2. **Soil Stabilization and Erosion Prevention**
   Physical Stabilization BMPs such as vegetation, landscaping or structural methods are required to prevent erosion from exposed slopes.
   a. Planning and Scheduling
   b. Preservation of Existing Vegetation
   c. Physical Stabilization
      - Hydraulic Mulch
      - Hydro-seeding
      - Soil Binders
      - Straw Mulch
      - Geo-textiles, Plastic Covers, and Erosion Control Blankets/Mats
      - Wood Mulching
      - Earth Dikes/Drainage Swales and Lined Ditches
   d. Site Drainage
      - Outlet Protection/Velocity Dissipation
      - Slope Drains
   e. Permanent re-vegetation or landscaping as early as feasible

See reverse side

3. **Sediment Containment**

Sediment containment controls should be used to supplement erosion prevention methods not as a substitute for erosion control. Sediment controls act to contain sediment that has been previously eroded and may get carried on-site and/or discharged from the site in sheet flow or from tracking by equipment and vehicles.

a. Perimeter Protection
   - Silt Fencing
   - Gravel Bag Berm
   - Fiber Rolls

b. Sediment Capture
   - Storm Drain Inlet Protection
   - Sediment Trap
   - De-silting Basins designed in accordance with industry standards such as Caltrans, California Storm Water BMP manual. If the project is five acres or greater the de-silting basin must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.
   - Gravel bag Barrier

c. Sediment Tracking
   - Stabilize Construction Entrances and Exits
   - Construction Road Stabilization
   - Entrance/ Outlet Tire Wash
   - Street Sweeping

4. **Materials and Equipment Management**

Pollution Prevention measures are required were applicable to prevent the contamination of storm water from waste materials, construction materials, vehicles, and equipment stored on-site. Each site must evaluate the potential pollutants on-site, which may be discharged during construction activities.

a. Materials Management
   - Material Delivery and Storage
   - Material Use
   - Stockpile Management
   - Spill Prevention and Control

b. Vehicle and Equipment Operations
   - Vehicle and Equipment Cleaning
   - Vehicle and Equipment Fueling
   - Vehicle and Equipment Maintenance

c. Waste Management
   - Solid
   - Liquid
   - Sanitary
   - Concrete
   - Hazardous
   - Contaminated Soil

5. **Non-Storm Water Discharge and Drainage Control**

Management of non-storm water discharges involves pollution prevention methods as well as drainage control. Project managers must implement appropriate drainage control methods to divert, contain and properly discharge drainage generated by construction activities.

a. General
   - Paving and Grinding Operations

b. Non-storm water discharges
   - Water Conservation Practices
   - Dewatering Operations
   - Potable Water/Irrigation and Flushing

Exposed areas of intensive outdoor activity: _____

## D. Best Management Practices (BMPs) Assessment

### D.1 General

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Is the site free of litter and debris? | | | | |
| Are discharge locations free of sediment and debris? | | | | |
| Are parking lots, sidewalks and streets free of sediment and debris? | | | | |
| Is pressure washing conducted at this facility? If yes, is wash water captured? | | | | |

## D.2 Landscaping

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Are adequate erosion prevention measures employed? (vegetation or physical stabilization) | | | | |
| Are irrigation systems programmed to minimize overwatering and runoff? | | | | |
| Are stockpiles of soil or landscape waste equipped to prevent runoff transport? | | | | |
| Are pest management techniques employed? | | | | |
| Is drought-resistant vegetation incorporated into landscaping? | | | | |
| Are pesticides, herbicides, and fertilizers managed in accordance with the JURMP BMPs? | | | | |

## D.3 Materials and Wastes

| | | | | |
|---|---|---|---|---|
| Are adequate trash containers provided? | | | | |
| Are adequate recycling containers provided? | | | | |
| Is the trash/recycling area free of litter and debris? | | | | |
| Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing? | | | | |
| Are outdoor storage areas adequate (i.e., covered area with secondary containment)? | | | | |
| Is there an accessible spill response kit? | | | | |
| Are storage tanks equipped with secondary containment? | | | | |
| Is secondary containment free of spills and rainwater? | | | | |
| Are loading and unloading areas free of spills and debris? | | | | |

## D.4 Equipment and Vehicles

| | | | | |
|---|---|---|---|---|
| Are parking areas exposed to storm water free of significant spills and leaks? | | | | |
| Are heavy equipment and vehicles stored in garages or under canopies? | | | | |
| Are vehicle maintenance activities conducted within contained areas (garage, canopy, work shop)? | | | | |
| Are equipment and vehicles inspected daily for leaks and repaired as necessary? | | | | |
| Are vehicle fueling areas covered and are nearby storm drain inlets protected from spills and leaks? | | | | |
| Is vehicle washing preformed in a contained area where runoff does not enter the MS4? | | | | |
| Are biodegradable soaps used for cleaning activities? | | | | |

## D.5 Construction

| | | | | |
|---|---|---|---|---|
| Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization) | | | | |
| Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters) | | | | |

### D.6 Non-Storm Water Management

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Is the site free of evidence of illicit connections and illegal discharges? | | | | |
| Is the site free of evidence of unauthorized releases to storm drains? | | | | |
| If not, have the appropriate authorities been notified? | | | | |

### D.7 Other

| | | | | |
|---|---|---|---|---|
| Are all activity-specific BMPs from Appendix C of the JURMP being implemented? | | | | |
| Are there any other potential storm water pollution issues or concerns? If yes, explain below. | | | | |

### D.8 Notes:

## E. SWPPP Review (PW Yard ONLY)

Does the Public Works Yard SWPPP need to be updated to reflect any changes in area/activities? ☐ Yes ☐ No

## F. Recommended Corrective Action

Is corrective action needed? ☐ Yes ☐ No If yes, describe below.

Owner/operator has been notified of recommended corrective actions: ☐ Verbally ☐ Photocopy ☐ Fax ☐ E-Mail

## G. Violations

☐ No violations have been noted at this time

☐ No violations have been noted, but recommend taking corrective action described above.

☐ Violation of storm water ordinance or other applicable regulations were found.

Type of violation:

☐ Illegal discharge(s) of pollutants into the storm drain or receiving waters

Description

☐ Illegal connection(s) to the storm drain system

Location_____

☐ Littering

☐ Improper implementation of required BMPs

☐ Other_____

Specific action required to the correct violation described above:

_____

_____

## B. FACILITY/SITE INFORMATION

Principal activity:_____

Assigned JURMP Classification: ☐ High Ind ☐ Medium Ind ☐ Low Ind ☐ High Comm ☐ Unassigned

Is this facility currently listed in the City's JURMP Inventories? ☐ Yes ☐ No

Assigned SIC Code(s)_____ _____

Does SIC Code best represent principal activity: ☐ Yes ☐ No

Recommended change of SIC Code(s)?_____ _____

New JURMP Classification?_____

Does facility have a current business certificate? ☐ Yes ☐ No _____ Exp._____

Is facility subject to CA Statewide General Industrial Permit? ☐ Yes ☐ No

If yes, has facility filed a Notice of Intent (NOI) to comply? ☐ Yes ☐ No WDID _____

If no, does facility have a Notice of Non-Applicability (NONA/NEC)? ☐ Yes ☐ No

Does facility maintain SWPPP or BMP Plan? ☐ Yes ☐ No

Has facility conducted previous storm water monitoring programs? ☐ Yes ☐ No

**Existing Status**: ☐ High Ind ☐ Med Ind ☐ Low Ind ☐ High Com ☐ Moved/Out of Business ☐ Dup ☐ Low Com
☐ Not in City Jurisdiction

**Existing SIC code(s)** _____ _____

## C. INITIAL OBSERVATIONS

Nearest conveyances or water bodies: _____ Watershed:_____San Diego Bay_____

Approximate distance to water bodies: ☐ □200 ft. ☐ 200 □1000 ft. ☐ 1000 ft.

Sensitivity of receiving waters: ☐ Sensitive (ESA, 303(d), or other) ☐ Non-sensitive

Discharge points along perimeter: _____

_____

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by industrial or commercial activities:_____square feet

Approximate □ impervious surface of this area_____□

Exposed areas of intensive outdoor activity: _____

## D. BMP Assessment

### D.1 General

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Is the site free of litter and debris? | | | | |
| Are discharge locations free of sediment and debris? | | | | |
| Are parking lots, sidewalks and streets free of sediment and debris? | | | | |
| Is pressure washing of parking lots or sidewalks conducted at the facility? Is wash water captured? | | | | |
| Are roof downspouts directly away from areas of potential pollutants? | | | | |
| **D.2 Landscaping** | | | | |
| Are adequate erosion prevention measures employed? (vegetation or physical stabilization) | | | | |
| Are irrigation systems programmed to minimize over-watering and runoff? | | | | |
| Are stockpiles of soil or landscape waste equipped to prevent runoff transport? | | | | |
| **D.3 Materials and Wastes** | | | | |
| Are adequate trash containers provided? | | | | |
| Are adequate recycling containers provided? | | | | |
| Is the trash/recycling area enclosed and free of litter and debris? | | | | |
| Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing? | | | | |
| Are outdoor material storage areas adequate (covered area with secondary containment)? | | | | |
| Are outdoor storage containers properly labeled? | | | | |
| Is there an accessible spill response kit? | | | | |
| Are storage tanks equipped with secondary containment? | | | | |
| Is secondary containment free of spills and rainwater? | | | | |
| Are loading and unloading areas free of spills and debris? | | | | |
| **D.4 Equipment and Vehicles** | | | | |
| Are exposed parking areas free of significant spills and leaks? | | | | |
| Are heavy equipment and vehicles stored in garages or under canopies? | | | | |
| Are vehicle maintenance activities conducted within contained areas (garage, canopy, work shop)? | | | | |
| Are vehicle-fueling areas covered and are storm drain inlets protected from spills and leaks? | | | | |
| Is vehicle washing preformed in a contained area where runoff does not enter the MS4? | | | | |
| Are biodegradable soaps used for cleaning activities? | | | | |
| **D.5 Food Establishments** | | | | |
| Does facility have a grease trap or grease interceptor? | | | | |

When was the last time the grease trap was maintained? _____

Where is the grease trap located? ☐ Under the sink ☐ Outside ☐ Other _____

How many grease fryers are at the facility? _____

About how often is fryer oil replaced? ☐ Weekly ☐ Monthly ☐ Every 6 months ☐ Annually

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| How is used oil disposed of? ☐ Outside rendering service ☐ Sanitary sewer/sink ☐ Other:_____ | | | | |
| Do oil-recycling/grease bins have overhead coverage? | | | | |
| Do oil-recycling/grease bins have secondary containment? | | | | |
| Are deep fryer oil-recycling drums stored properly? | | | | |
| At what time is cleaning performed? _____ | | | | |
| What is the cleaning method? _____ | | | | |
| Does the restaurant hose off the site (parking lot, back lot, etc.)? If so, how often? | | | | |
| How are kitchen floor mats cleaned? ☐ Hose off outside ☐ Clean inside (mop sink) ☐ Cleaning Service ☐ Other:_____ | | | | |
| Where is used cleaning water discharged? _____ | | | | |
| Are storm drain inlets free of grease and other food debris? | | | | |
| **D.6 Non-Storm Water Management** | | | | |
| Is the site free of evidence of illicit connections and illegal discharges? | | | | |
| Is the site free of evidence of unauthorized releases to storm drains? | | | | |
| If not, have the appropriate authorities been notified? | | | | |
| **D.7 Other** | | | | |
| Are there any other potential storm water pollution issues or concerns? If yes, explain below. | | | | |
| Are all applicable activity-specific BMPs from Appendix C of the JURMP being implemented? | | | | |
| Were any educational materials distributed? | | | | |

**D.8 BMP Summary**

## E. SWPPP REVIEW

**Does facility maintain a SWPPP:** ☐ **Yes** ☐ **No** ☐ **Not Applicable**

| SWPPP Component | Provided | Adequate | Comments |
|---|---|---|---|
| Site Map/Description | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Materials List | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Significant Spills/Leaks | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Pollution Prevention | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Industrial Activities | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Pollutant Sources/Risks | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Compliance Activity Schedule | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Employee Training | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Accessible to staff | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |
| Existing BMPs | ☐ Yes ☐ No | ☐ Yes ☐ No | _____ |

Does this facility have a storm water monitoring program? ☐ Yes ☐ No ☐ N/A

Was appropriate monitoring conducted during the most recent wet season? ☐ Yes ☐ No

If not, does the facility have documentation of no qualifying rain events? ☐ Yes ☐ No

If not, is the facility in a GMP and not scheduled for most recent year ? ☐ Yes ☐ No

Do monitoring results show that existing BMPs are effective in removing pollutants? ☐ Yes ☐ No

**Recommended changes**:

_____

_____

## F. RECOMMENDED CORRECTIVE ACTION

Is corrective action needed? ☐ Yes ☐ No

If **BMP-related** corrective action is required, describe below. If other corrective action, check the appropriate box in section G.

_____

Owner/operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax

## G. VIOLATIONS

- ☐ No violations have been noted at this time
- ☐ No violations have been noted, but recommend taking corrective action described in Section F.
- ☐ Violation of the City's storm water ordinance (Municipal Code Chapter 14.22):
  - ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
    Description_____
  - ☐ Illegal connection(s) to the storm drain system
    Location_____
  - ☐ Littering
  - ☐ Failure to properly implement required BMPs
- ☐ Failure to comply with the requirements of applicable State or Regional Permit(s):
  - ☐ Non-compliance with the State Industrial Storm Water General Permit.
    Subjectivity, based on SIC Code: ☐ Mandatory ☐ Conditional
    - ☐ In the future, under a new Industrial Permit which has not yet been adopted, this facility may be able to qualify for a No Exposure Certification (NEC) and exemption from Permit coverage.
  - ☐ Non-compliance with the Municipal Storm Water Permit (NPDES NO. CAS0108758).
- ☐ Other Violation_____

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:**

- ☐ Implement the recommended corrective actions listed in Section F.
- ☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit; see Attachment 3 of the Industrial Permit (http://www.waterboards.ca.gov/stormwtr/industrial.html).
  - ☐ For "Conditional" facilities only: if you implement all the recommended BMPs and eliminate outdoor exposure, contact the City to request a re-inspection. If it is determined that you qualify, NONA/NEC paperwork will be provided for you to complete, and you will not have to file an NOI.
- ☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); see Section A of the Industrial Permit.
- ☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.
- ☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

Additional actions required:_____

## H. RECOMMENDED CITY ACTIONS*

- ☐ None
- ☐ Follow-up to ensure the observed violation is corrected (see Section G)
- ☐ Update the following: ☐ JURMP priority ☐ SIC code ☐ Facility Contact Information
- ☐ Add this business to the City's JURMP inventories.
- ☐ Based on the observed business activities, this facility may be reclassified as "low priority commercial" and may be removed from the City's JURMP inventories.
- ☐ This business is no longer at its listed address. If further investigation does not determine that it is still operating at another address within City jurisdiction, it should be removed from the JURMP inventories.
- ☐ No current business license was available. Review City business license records to determine if this business has a current license on file.

Other:_____

**Does this business require a follow-up inspection?** ☐ **Yes** ☐ **No**

**ASSESSMENT**

Level of knowledge regarding stormwater issues: ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Level of cleanliness, BMP implementation, orderliness of site: ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

*Recommended City Actions listed at the time of inspection are subject to change based on later review by office staff.

## I. FOLLOW-UP (IF PREVIOUSLY INSPECTED)

Corrective actions implemented since last inspection:

Corrective actions still needed:

Corrective Action Letter Sent? ☐ Yes ☐ No Date Sent (mm/dd/yyyy): _____/_____/_____

Notice of Violation Issued? ☐ Yes ☐ No Date Issued (mm/dd/yyyy): _____/_____/_____

Administrative Citation Issued? ☐ Yes ☐ No Date Issued (mm/dd/yyyy): _____/_____/_____

Citation Number: _____

Fine Amount (if applicable): ☐_____

## D. POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

Site Name:_____

| Pollutant | RW 303(d) (Y N) | WS COC (Y N) | PDP | Sources Needing More BMPs | | | | | | | Recommended BMPs (check if applicable) | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | Trash Area | Material Storage | Prkng Lot | Load/ Unload | Land-scape | Veh/Eqp Maint | Exposed Work Area | Emp. Training | House-keeping | Minor Struct. | Major Struct. |
| Sediments | | | | | | | | | | | | | | |
| Nutrients | | | | | | | | | | | | | | |
| Aluminum | | | | | | | | | | | | | | |
| Iron | | | | | | | | | | | | | | |
| Heavy Metals | | | | | | | | | | | | | | |
| Check if evidence indicates specific metals may have significant PDPs: Copper Cadmium Lead Zinc Mercury | | | | | | | | | | | | | | |
| Organic Compounds | | | | | | | | | | | | | | |
| Check if evidence indicates there may be historical soil contamination associated with any of the following: PCBs PAHs Chlordane DDT | | | | | | | | | | | | | | |
| Trash & Debris | | | | | | | | | | | | | | |
| Oxygen Demanding | | | | | | | | | | | | | | |
| Oil & Grease | | | | | | | | | | | | | | |
| Bacteria & Viruses | | | | | | | | | | | | | | |
| Pesticides | | | | | | | | | | | | | | |
| Check if evidence indicates the following are used on site: Diazinon Chlorpyrifos | | | | | | | | | | | | | | |
| Acid/Base (pH effects) | | | | | | | | | | | | | | |
| Others (list): | | | | | | | | | | | | | | |

RW 303(d) Receiving water impairments, as listed in the most recent 303(d) list
WS COC High priority watershed constituents of concern (COC), as listed in the most recent WURMP Annual Report
PDP pollutant discharge potential.
Emp. Training employee training activities focused on storm water pollution prevention
Housekeeping standard good housekeeping BMPs, such as sweeping, regular trash pickup, etc.
Minor Struct. minor structural BMPs that do not require building permits, such as covering with tarps or building berms
Major Struct. major structural BMPs that require a building permit or are especially expensive, such as detention basins, oil/water separators, grease interceptors, overhead coverage for storage areas, etc.

Criteria

0 - no appreciable quantity observed on site
1 - very small potential for pollutant discharge; monitoring results are well below the EPA benchmark
2 - Small potential for pollutant discharge; monitoring results are close to the EPA benchmark but still below it
3 - Moderate potential for pollutant discharge; monitoring results are at or slightly above the EPA benchmark
4 - Large potential for pollutant discharge; monitoring results above the EPA benchmark but are within an order of magnitude
5 - Severe potential for pollutant discharge; monitoring results exceed the EPA benchmark by an order of magnitude or more

if available

# 2008 Storm Water Program Calendar

## National Pollutant Discharge Elimination System (NPDES)

## Do You Go To The Beach When It Is Raining?

Do you go to the beach when it is raining? Probably not, but pollution does! Our individual daily activities create pollution that is washed into our ocean every time it rains.

Urban-runoff pollution in storm water is one of the biggest threats to our waterways and San Diego Bay. The majority of water pollution today is from urban run-off. Things that contribute to pollution in urban run-off include cars leaking oil, overuse or misuse of pesticides and fertilizers, garden debris, pet waste, litter, automotive oils and metals, vehicle washing, improper disposal of trash, and many other activities in which we partake and choices that we make daily.

Rainwater running over streets, roofs, parking lots, driveways and other developed areas carry pollutants into the bay through our storm water conveyance system. Unlike the sewer system, which carries water from indoor drains to the Point Loma Wastewater Treatment Plant, urban runoff is carried directly to the storm drain system which then releases this polluted water into the City's creeks, local channels and ultimately, into the ocean. Storm drains are not connected to the sewer system and everything that enters the storm drains goes directly to our waterways, untreated.

By following these simple guidelines of implementing Best Management Practices (BMPs), it will help reduce the pollutants in the storm water that leaves your property:

- Repair auto leaks.
- Use pesticides and fertilizers sparingly.
- Dispose of household hazardous waste, used auto fluids (antifreeze, oil, etc.) and batteries at designated collection or recycling locations.
- Clean up after your pet.
- Use a commercial car wash or wash your car on a lawn or other unpaved surface.
- Sweep up yard debris rather than hosing down areas.
- Compost or recycle yard waste when possible.
- Clean paint brushes in a sink, not outdoors.
- Properly dispose of excess paints through a household hazardous waste collection program.
- Sweep up and properly dispose of construction debris like concrete and mortar.
- Use secondary containment for liquids stored outside.
- Dry sweep driveways & sidewalks.
- Prevent accumulation of unwanted items on your property by taking advantage of National City Clean Up Day

## National City Clean Up Day

The City Of National City has National City Clean Up Day, twice a year, once in the spring and again in the fall. Residents can dispose of items such as garbage, appliances, furniture, etc. Hazardous materials are not permitted in the disposal dumpsters at this event. Information regarding this event will be enclosed with your Edco Disposal Service trash bill.

## Hazardous Waste Disposal

The City Of National City contracts with the City of Chula Vista to provide hazardous waste disposal for the residents of National City. The Chula Vista Household Hazardous Waste Collection Facility (1800 Maxwell Road, Chula Vista) is open on Saturdays from 9 a.m.-1 p.m. For a $5.00 fee, up to 15 gallons or 125 pounds of hazardous waste is accepted. AutoZone, Kragen, Napa, and Firestone accept used oil at no charge and other automotive fluids. Call the individual stores for details.

# IPM CARDS

# Gardening with Good Bugs

HEALTHY GARDEN HEALTHY HOME

**Most gardens contain far more types of good bugs,or beneficial insects, than pest insects.** Beneficial insects and other organisms that kill pest insects are called natural enemies. In any pest management or plant care program, it is important to encourage these natural enemies by avoiding pesticides that kill them. You can also encourage beneficial insects by choosing plants that provide them with pollen, nectar, and shelter and keeping ants out of pest-infested plants. Learn to identify good bugs, both in their adult forms and immature (larval) stages.

## Common good bugs found in California gardens include:

- Lady beetles: Both adults and larvae consume aphids.
- Lacewings: Lacewing larvae feed on many insect pests; adults are often seen around lights.
- Syrphid flies: Syrphid fly larvae consume aphids; adults hover around flowers.
- Parasitic mini-wasps: Many species of tiny wasps lay their eggs in pests like aphids or caterpillars; their hatching larvae consume the pest and kill it.
- Spiders: All spiders feed on insects or other arthropods and are beneficial in the garden.

*(See reverse for drawings of good bugs mentioned above.)*

## What is Integrated Pest Management?

Integrated pest management (IPM) uses environmentally sound, yet effective, ways to keep pests from annoying you or damaging plants. IPM programs usually combine several pest control methods for long- term prevention and management of pest problems without harming you, your family, or the environment — IPM also reduces pollution in California waterways. Successful IPM begins with correct identification of the pest. Only then can selection of the appropriate IPM methods and materials be made.

## Preferred IPM methods include:

- Planting pest-resistant or well-adapted plant varieties like native plants.
- Discouraging pests by modifying the way you design, irrigate, fertilize, and manage your garden.
- Altering the garden or home environment to deprive pests of the food, water, shelter or other requirements they need to thrive.
- Keeping pests out of the home and garden using barriers, screens, and caulking.
- Squashing, trapping, washing off or pruning out pests.
- Relying on good bugs in your garden to eat pests, thereby eliminating the need for insecticides that may end up in our waterways.

## Turning to pesticides:

- Only use pesticides when non-chemical controls are ineffective and pests are reaching intolerable levels.
- Use pesticides in combination with the methods described above.
- Choose pesticides carefully so that the least toxic, most effective material is used to protect human health and the environment.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Head Lice

HEALTHY GARDEN HEALTHY HOME

**Head lice can infest anybody, but children are prone to infestations because they play closely and share items that come in contact with the head like hats, headphones, and combs.** Head lice are not known to transmit any infectious diseases; they are more of a nuisance than a health risk. Children with head lice, however, are generally not allowed to attend school as long as nits are found in their hair.

## Head lice facts:

- Head lice cannot hop, fly, or jump; they crawl. Lice spread only through direct contact with an infested object or person.
- Head lice spend their entire life in head hair and can only survive off a human head for about 1 or 2 days.
- A newly hatched louse must ingest blood within minutes of birth to survive.
- Head lice cannot live on family pets.
- Nits (eggs) that are more than 1 1/4 inch from the scalp probably are dead or have already hatched.

## What to look for:

- Intense scratching on the back of the head or neck.
- Tiny white eggs (nits) glued to hair near the scalp.
- Small, rapidly crawling flat insects.

## Four steps necessary to manage an infestation of head lice:

1 Use a head louse shampoo if you observe active lice or viable eggs.

- Avoid shampoo products containing lindane, which are available by prescription only. Pyrethrin and permethrin are safer, more effective, and less polluting to wastewater than lindane. Not all eggs will be killed.
- To avoid insecticides entirely, use soap shampoos that contain coconut or olive oils. Most soap shampoos kill all stages of the louse except the egg. Because they are not as effective as products containing pesticides, you must be sure to comb and repeat these shampoos four times at 3-day intervals. Successive shampooing kills newly hatched lice.

## 2 Remove nits from the head by combing with a specially designed nit comb.

- This step is the key to successful control. Repeat daily as long as you find live lice or nits within 1¦4 inch of the scalp. Use a metal comb specially designed for removing head lice and their eggs. Combs sold with head lice shampoos are not generally effective. Infested hair can also be cut out with small safety scissors.

## 3 Remove lice and nits from the household.

- Wash clothing and bedding of the infested person in hot water (at least 140°F) and dry in a hot dryer or have them dry cleaned. Place other items (earphones, bike helmets) in plastic and put in a freezer that is 5°F or lower for at least 10 hours. Clean any object that might have come in contact with the infested person's head (stuffed animals, car seats). Vacuum carpets and upholstery. Pesticide sprays are not recommended.

## 4 Check heads and remove nits daily until infestation is gone. Follow with weekly head checks to detect reinfestation.

For more information see Pest Notes: Head Lice, available at Cooperative Extension offices and at www.ipm.ucdavis.edu

# Lawn Insects

HEALTHY GARDEN HEALTHY HOME

**Contrary to popular belief, insects are not a common cause of residential lawn damage in California.** Poor lawn care, especially improper watering and planting inappropriate grass species, are more likely causes of unhealthy or dying lawns. Disease-causing agents, excess orinappropriate use of chemicals such as fertilizer and herbicides, or dog urine also produce lawn damage resembling that of insects. Many insects in the lawn are beneficial. Never apply an insecticide unless a damaging level of a known insect pest is confirmed. Insecticides are only effective if applied at the right time and in the right manner. Some insecticides may kill good bugs too.

## How do you know if insects are causing damage?

- Brown spots in lawns can be caused by over- or under-irrigation, plant disease, improper use of chemicals, or dog urine as well as insects.
- Confirm presence of insects before applying an insecticide. For grubs, dig around roots, for other insects perform a drench test. (See reverse.)

## Keep your lawn healthy by:

- Planting grass species that do well in your area
- Irrigating deeply and infrequently
- Doing routine maintenance on sprinkler heads
- Applying only 3 to 6 pounds of actual nitrogen per 1000 square feet per year when fertilizing
- Aerating your lawn annually; remove thatch if it exceeds 1/2 inch
- Cutting only one-third to one-half of grass height at each mowing and keeping lawnmower blades sharp

See the UC Guide to Healthy Lawns at www.ipm.ucdavis.edu

## If a damaging level of insects is confirmed, do the following:

- Choose an insecticide based on the pest you're targeting.
- Find out which insecticide ingredients target specific lawn insects:
  - *Bacillus thuringiensis* (Bt) kills only caterpillars, including cutworms, lawn moths, and skippers.
  - Insect-attacking nematodes control caterpillars or grubs.
  - Azadirachtin controls cutworms, armyworms, and larvae of lawn moths.
  - Imidacloprid is effective against young lawn grubs.
  - Pyrethroids (e.g., cyfluthrin, bifenthrin) are broadly toxic insecticides that kill chinch bugs, lawn moths, and cutworms, but also kill beneficial insects and should be avoided.
- Get help from UC Cooperative Extension.

### HOW TO PERFORM A DRENCH TEST

- Mix 3–4 tablespoons of dishwashing liquid to 2 gallons of water.
- Evenly apply the 2 gallons to 1 square yard of your lawn.
- Monitor the area for 10 minutes and count the number of armyworms, cutworms, or lawn moth larvae that rise to the surface.
- Treat the area only if insect numbers exceed 5 armyworms or cutworms or 15 lawn moths per square yard.

# Safe Use & Disposal of Pesticides

HEALTHY GARDEN HEALTHY HOME

**Pesticides are designed to be toxic to the pests they target — insects, weeds, and other unwanted home and garden invaders.** Always read pesticide product labels carefully and follow all directions on proper use, storage, and disposal of empty pesticide containers. Product labels are your main source of information on how to use a product safely and legally. They include guidelines needed to protect you, your family, and pets. The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For the site nearest you in San Diego County call 1-877-713-2784 .

## If you must use pesticides, follow these tips to reduce pesticide effects on your local waterways:

- Identify your pest problem and choose the least toxic pesticide that targets your pest and achieves the results you want. If you need help identifying the least toxic pest control method, contact your University of California Cooperative Extension office.
- Determine the right amount of pesticide to purchase. Purchasing exactly the amount you need for the application eliminates the need for storing unused pesticides.
- Use spot treatments whenever possible.

### Outdoors

- Avoid overwatering after applying pesticides. Never let pesticide runoff flow into storm drains.
- Do not apply pesticides outdoors when rain is forecast or when it is windy.
- Avoid applying pesticides on paved areas.

### Indoors

- Avoid applying pesticides in or near floor drains or sinks.
- Avoid applying pesticides on areas that will be washed or mopped with water, or where food is prepared or stored.

## When using and storing pesticides take these precautions:

- Always wear a long-sleeved shirt, pants, and eye protection, and other equipment suggested on the label.
- Store products tightly capped in a locked cabinet out of reach from children and pets.
- Always keep pesticides in their original container.
- Know where to call for help in an emergency!

## Pesticide disposal:

- If you cannot use up your pesticides, fertilizers, and weed killers, give them to a friend who may need them.
- Sewage treatment plants are not designed to treat for certain toxic pesticides like diazinon and chlorpyrifos — dumping pesticides into the stormdrain or down the sink is never an option.
- The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For household pesticide disposal information for San Diego County, call 877-713-2784.

## Finding active ingredients on a pesticide label:

Pesticide labels are required by law to show the active ingredient and its percentage. Minimize or avoid the use of products that contain diazinon and chlorpyrifos – these materials are polluting our waterways. Always read the label before you buy!

Active Ingredient
Chlorpyrifos ..... 4.38%
Inactive Ingredients ..... 95.62%
KEEP OUT OF REACH OF CHILDREN
CAUTION See back panel booklet for additional precautionary statements.
NET CONTENTS 32 FL OZ (1 QT) 946mL

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Snails & Slugs

HEALTHY GARDEN HEALTHY HOME

**Snails and slugs rank among our most despised garden pests.** These slimy mollusks emerge from hiding at night and chew holes in leaves and flowers of many succulent garden plants and fruit. Slugs and snails are similar in structure and biology, except slugs lack the snails' external spiral shell. Management requires a vigilant and integrated approach that includes eliminating moisture and hiding spots, trapping, barriers, and handpicking. Baits can be helpful, but by themselves, don't provide adequate control in gardens that contain plenty of shelter, food, and moisture.

## How do you know snails and slugs are causing damage?

- You may not observe these pests at first because they feed at night and hide during the day. Go out at night or early morning to view them in action.
- Other pests can cause holes in leaves, flowers, and fruit. Look for the shiny, slimy trails slugs and snails leave behind.

## What must be done to reduce snails and slugs?

- Remove daytime hiding places — ivy, weedy areas, debris, or boards.
- Regularly remove snails from shelters you cannot eliminate such as low ledges on fences, undersides of decks, meter boxes.
- Place traps in your garden and dispose of trapped snails and slugs daily.
- Reduce moist surfaces by switching to drip irrigation or sprinkling in the morning rather than later in the day.
- Consider snail-proof plants such as impatiens, geraniums, begonias, lantana, nasturtiums, and many plants with stiff leaves and highly scented foliage like sage, rosemary,and lavender.

## How can I manage snails and slugs without using pesticides?

- Make sure the garden is mollusk-free before planting. Then erect a copper barrier around it. Use a 4- to 6-inch-wide band of copper, buried an inch below the soil and bent over at the top or attach it around the edge of a raised bed.
- Place your garden in the sunniest spot possible. Remove garden objects or adjacent plants or ground cover that may serve as shady shelter. Reduce moist surfaces as much as possible.
- Build a trap using a 12"x15" board raised off the ground by 1-inch runners. As the mollusks collect under the board, scrape them off and destroy them daily.

## What about baits?

- Baits will not be very effective unless you also remove shelter, food, and moisture.
- Metaldehyde baits are especially poisonous to dogs and birds. Metaldehyde also loses its effectiveness rapidly in sunlight and after rain or irrigation.
- Iron phosphate baits are safe for use around dogs, children, and wildlife.
- Irrigate before applying bait and apply in evening on warm days when mollusks are active.
- Scatter bait around sprinklers and in moist and protected areas where snails and slugs travel.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Spiders

HEALTHY GARDEN HEALTHY HOME

**Spiders are mostly beneficial because they feed on pest insects.** However, many people think that all spiders are dangerous and aggressive. In California, the main spider capable of causing serious injury is the black widow, which generally remains outdoors and out of sight. Spiders seen out in the open during the day are unlikely to bite people. Focus pest management efforts on removing webs and hiding places. Pesticides are not generally recommended.

## What to know about spiders:

- In California, the main spider capable of causing serious injury is the black widow:
  - The poisonous black widow spider is commonly found outdoors, in sheltered, dry, undisturbed areas such as wood piles.
  - Female black widows have shiny black bodies with a red hourglass marking on the underside.
  - Only large female black widows can injure people.

    Anyone bitten by a black widow spider should remain calm and seek medical advice, or call California's Poison Control Center at 1-800-8-POISON (1-800-876-4766).
- The brown recluse spider does not live in California.
- The jaws of most spiders are too small to bite humans.
- Some other spiders bite when trapped in clothing, but the reaction is usually no more severe than itching or a bee sting. See www.ipm.ucdavis.edu for more information about these spiders.

## To prevent spiders from entering your house, take these steps:

- Seal home foundation cracks and other access holes.
- Inspect window and door screens for good seals that keep out spiders and the insects they prey on.
- Keep areas around home foundations free of clutter.

## Manage spiders using these tips:

- Indoors, regular housecleaning provides adequate spider control.
- Vacuum up the spider and its web.
- Prevent clutter buildup that can provide hiding places.
- Remove spider webs from the exterior of the house with a broom or high pressure hose.
- Indoors, squash spiders or capture them in a jar and release them outdoors.

When removing spiders, don't overlook the fact that spiders eat a large number and variety of nuisance and pest insects. Spiders also have natural enemies — wasps, other spiders, birds, reptiles, and others — that sometimes keep them from becoming too numerous.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

UC IPM
University of California Cooperative Extension

UNIVERSITY of CALIFORNIA

MASTER GARDENER ASSOCIATION SAN DIEGO COUNTY

# Termites

**Because of the serious damage they can cause to wooden structures, termites are among the pests most feared by homeowners.** However, swarms of flying termites do not always mean your building is infested. A careful inspection of the structure is required to confirm an infestation. People also frequently mistake swarms of flying ants for termites. If you suspect that your house is infested, call a professional. Do-it-yourself sprays cannot be relied on to reduce a damaging infestation. Common termites in California are the subterranean termites that build nests in soil, dampwood termites that nest in moist wood and soil, and drywood termites that nest above ground in dry wood. Management of each termite species is different.

## Distinguish flying ants from termites:

- Check the antennae, wings and waist to confirm that pest insects are termites. (Please refer to ant vs. termite drawing on back.)

## Design your building to keep termites out:

- Keep a 12-inch barrier of smooth concrete, sand, or other material between the soil surface and substructure wood beneath a building.
- Choose termite-resistant wood for fences or other structures that must contact soil.
- Remove wood piles, untreated fence posts, and buried scrap wood near structures.
- Provide adequate ventilation to substructures and keep them dry.
- Immediately repair foundation cracks.

## If termites are invading your home:

- Destroy shelter tubes that subterranean termites build between soil and wood structures.
- If dampwood termite nests are accessible, remove infested wood and eliminate excess moisture.
- Drywood termites can be controlled with heat, freezing, electricity, microwaves, fumigation, or spot treatments of chemicals.
- For any infestation, contact a professional for help. Pesticides licensed only for use by a pest control operator are usually necessary to control subterranean and dampwood infestations.

## Using pesticides for termite control:

- Pesticides may be injected into the soil by professional applicators through drilling or rodding. Special procedures must be followed to prevent contamination of ground or surface water.
- For soil injections, ask your applicator to use a product other than chlorpyrifos. Newer types of products such as fipronil and chloronicotinyls are safer for your health and the environment.
- Baits can be effective in some cases, but may take several months to control the problem and must be followed up with constant monitoring.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

## "EVERYTHING THAT RUNS INTO THE STORM DRAIN GOES UNTREATED DIRECTLY INTO OUR CREEKS, LAGOONS, AND SAN DIEGO BAY"

# City of National City

Office of the Public Works/Engineering Director
1243 National City Blvd. National City, CA 91950-4397
(619) 336-4580, Fax (619) 336-4397 www.ci.national-city.ca.us

**Everything that flows down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay.** When it rains o when water flows out of yards, it flows directly into storm drains. Many people think that everything that flows into a storm drain gets treated at the Point Loma Sewage Treatment Plant, just like wastewater in the sewer system, but these two systems are not connected.

The sources of pollution that must be controlled and eliminated result from urbanization and the choices that are made every day by residents, businesses and industry alike. For example, detergents, oil, grease, and other pollutants have been shown to be toxic to wildlife in local streams and San Diego Bay. **Recycling** of oil, antifreeze, glass, plastic, and other materials can prevent their improper disposal into the stormwater drainage system. **Proper landscaping practices** include minimization of the use of herbicides, pesticides and fertilizers together with conservation of water to minimize runoff of pollutants from landscaped areas, lawns, golf courses, etc.

**The City of National City's Stormwater Management & Discharge Control of the National City Municipal Code Chapter 14.22, prohibits non-stormwater discharges, such as car washwater, pesticides, fertilizers, pet waste, litter, oil, and other automobile fluids, to run into the City's storm drain system.** This ordinance is based on regulations set forth by the State Regional Water Quality Control Board and the U.S. Environmental Protection Agency in connection with the State and Federal Clean Water Acts.

Your help is needed, and by doing your part, by changing your washwater and trash disposal practices, you will help reduce the pollution problems in the community where you and your family live, work and play. Please call **Storm Drain Hotline** at **(619) 336-4389** if you have **any questions** regarding this matter and **to report any illegal discharges and /or dumping.**

# City of National City

Office of the Public Works/Engineering Director
1243 National City Blvd. National City, CA 91950-4397
619) 336-4580, Fax (619) 336-4397 www.ci.national-city.ca.us

**Todo lo que desemboca en las alcantarillas no esta tratado y va a parar directamente a nuestras lagunas, esteros y Bahia de San Diego.** Cuando llueve o cuando escurre agua de algun patio, desemboca directamente a las alcantarillas. Mucha gente piensa que todo lo que desemboja en una alcantarilla es tratado en la planta de Tratamiento de Agua Negras en Point Loma, como las aguas negras del sistema de drenaje, pero estos dos sistemas **no** estan conectados.

Las causas de contaminacion que tienen que ser controladas y eliminadas resultan de la urbanizacion y las elecciones que hacen todos los dias los residentes, negocios y la industria. Por ejemplo, detergentes, aceite, grasa, ya otros contaminantes se ha visto que son toxicos para la vida silvestre en nuestros arroyos locales y Bahia de San Diego. **Reciclando** el aceite, antifreeze, vidrio, plastico y otros productos que sean desechados de un modo inadecuado llegen a parar al sistema de alcantarillado de la ciudad. **Los metodos de mantener el jardin**, como usar menos los herbicidas, pesticidas y fertilisantes.Tambien como conservar el agua para que esa agua con contaminantes de los jardines, pastos, canchas de golf, etc.

**El Codigo Municipal No. 14.22 de las aguas pluviales de la Ciudad de National City, prohibe aguas que no sean pluviales como las aguas negras, pesticidas, fertilisantes, basura, aceite y otros liquidos de carros que sean depositadas en el sistema de alcantarillado de la ciudad.** Esta regla esta basada en las regulaciones puesta por "State Regional Water Quality Control Board" y "U.S. Environmental Protection Agency" en conneccion con "State and Federal Clean Water Acts."

Su ayuda es necesaria, y haciendo su parte como cambiar el modo de tirar su basura, usted ayudara a reducir la contaminacion en la comunidad donde usted y su familia viven, trabajan y juegan.

Por favor llame a la linea de **"Storm Drain Hotline"** al **(619) 336-4389**, si tiene **alguna pregunta** si quiere **reportar un desague ilegal**.

# 2009 CALENDAR ART CONTEST INFORMATION

City of National City

# 2009 Storm Water Program Calendar Art Contest

## Guidelines for Teachers

The City of National City invites all third grade students attending public schools in the City to participate in this fun and educational art contest. We are asking students to provide original art pieces for the upcoming 2009 National City Storm Water Program Calendar. The theme of this year's contest is **"By keeping our community clean, we can keep the ocean clean"**.

The City plans to select 12 original art pieces to feature in the 2009 National City Calendar. The first place winner will also be featured on the cover of the calendar. The goal of the contest is to promote understanding of the local natural environment in National City and to educate students on ways they can help protect local waterways. The contest provides a way for children to share their ideas on ways to protect our creeks and oceans with the entire National City community.

We encourage teachers to relate this contest to various aspects of the third grade curriculum. Some relevant curriculum ties include the following:

History-Social Science, Reflections

- Unit 1, Chapter 2 – People and Their Environment (pages 41-71)
    - Lesson 1 – Many Natural Resources (pages 46-51)
    - Lesson 2 – Using Our Resources (pages 54-59)

English Language Development, Rigby On Our Way to English

- Thematic Unit 6: "Our Valuable Earth"
    - Teacher's Edition U137 – Big Book: Diego Saves the Planet! (if this has not yet been read in class, reading this book before handing out flyers for the contest would be ideal).
    - Teacher's Edition U141 – Active Social Studies: Important Rules

Contest Rules

**Guidelines:**

- **Media:** Paint, color pencils, marker, or crayon.
- **Paper:** White paper, 8 1/2 inches by 11 inches in landscape format.

(Continued on Back)

- **Text:** Drawings can include text and original slogans, however, names will not be allowed on front of the drawing. The artist's first name and school will be printed below the drawing in the calendar. All words must be spelled correctly.

**Submittals:**

- All participants must submit a release form with their name, school, room number, teacher's name, and parent or guardian signature.
- The student's name, school, and teacher must also be taped to the back of the artwork on a piece of paper or index card.

**Deadline:**

- Teachers should submit their students' artwork to City Hall no later than **June 6, 2008.** If you cannot submit entries directly to City Hall, you can contact Barby Tipton (see bottom of page) to arrange for a pick up. Note that for teachers with Combination classes (2nd and 3rd grades), we encourage 2nd graders to participate, but only 3rd grade work should be submitted to the City for entry into the contest.

**Judging:**

- Drawings will be judged by various City officials and representatives involved in the City's Storm Water Pollution Prevention Program. 12 winners will be chosen based on originality and representation of the contest's theme. At least one winner will be chosen from each school.

**Prizes:**

- Teachers can hand out personalized participation certificates ( to be filled out by the teacher) to all participating students when artwork is submitted in class.
- Winning art pieces will be featured in the 2009 National City Storm Water Program Calendar. Winners will be honored at a National City Council Meeting in the fall and will receive a special certificate signed by the Mayor, along with additional prizes sponsored by EDCO.

**Contact Information:**

- If you have additional questions about how you can integrate this contest into your 3rd grade curriculum, please contact:

  Stephanie Maxin Phone: (619) 336-8306
  Email: stephanieb@national.k12.ca.us

- If you would like to contact a representative at the City, please contact:

  Barbra Tipton, National City Storm Water Compliance Inspector
  Phone: (619) 336-4583 Email: btipton@ci.national-city.ca.us

# 3rd Grade Art Contest!!

## Theme: By keeping our community clean, we can keep the ocean clean!!!

### Deadline: June 6, 2008

**Winning drawings will be featured in National City's 2009 Storm Water Program Calendar!**

**Do you go to the beach when its raining?**

Probably not, but pollution does! When it rains, pollutants like litter and oil are carried from our streets and sidewalks to our local creeks and ocean. Pollution can hurt plants and animals and can also make water unhealthy for humans. **By keeping our community clean, we can keep the ocean clean!**

## Rules:

- **Drawings should show how you and other members of your community can help prevent pollution in creeks, rivers, and oceans.**
- **Drawings must be on white 8 1/2 inch by 11 inch paper, in landscape format.**
- **Only color drawings made with markers, colored pencils, crayons, or paint will be accepted. Bright colors are best.**
- **Do NOT write your first or last name on the front of your drawing.**
- **Use original artwork only. Slogans and messages are ok, but all words must be spelled correctly.**
- **Drawings must be submitted to your teacher by June 6, 2008 with a completed entry form (on the back of this flyer) signed by a parent or guardian.**
- **Your name, teacher, and school must be on a piece of paper or card taped to the back of the artwork**
- **Winners will be notified in the Fall. All winners will be featured in the 2009 National City Storm Water Program Calendar. Winners will also receive a prize and be honored at a future City Council Meeting!**

YOU CAN BE A CLEAN WATER SUPERSTAR!

☆ Don't litter

☆ Never pour anything into the storm drain

☆ Pick up after your pets

☆ Spread the word! Tell your friends and family why its important to keep National City clean!

**2009 Storm Water Calendar Artwork Rights**
**Parental Approval Form**

Any submission becomes the property of the City of National City (City) and the submission may or may not be returned. The City of National City has the right to use any selected artwork for the 2009 Storm Water Calendar and for any other City use, including, but not limited to, display of the original or copies of the artwork at exhibit events and reproduction of copies on such items as T-shirts, postcards and book covers.

Students participating in the 2009 Storm Water Calendar assign to the City and expressly waive and disclaim, any copyright in and the right to reproduce, all artwork submitted to the City for the 2009 Storm Water Calendar project. Participating students also agree to execute any further document(s) necessary to further effectuate this waiver and disclaimer, upon the City's request.

The City may use, reuse, alter, reproduce, modify, assign, transfer, or in any other way, medium or method use the artwork product for the City's purposes, and a participating student expressly waives and disclaims any residual rights granted to him or her by Civil Code Sections 980 through 989 relating to intellectual property and artistic works.

_____ **Yes**, I approve of my child's artwork being featured on the City of National City's Storm Water Calendar and city related uses and agree to the terms, waivers, and disclaimers stated above.

_____ **No**, I do not approve of my child's art work being featured on the City of National City's Storm Water Calendar or any related use.

# INTRODUCTION AND CONTENTS

**Introduction**

The 2007/2008 reporting period as originally written in Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit) was defined as July 1, 2007 through June 30, 2008. Reporting on the City's implementation of all components of its JURMP was originally required to be submitted to the RWQCB by September 30, 2008. However, on September 10, 2008, the RWQCB adopted Addendum No. 2 to the Municipal Permit, which required that the City discuss its 2008 Dry Weather Monitoring Program activities in Section 7 of its 2007/2008 JURMP Annual Report.

Section 7 of the Annual Report discusses the implementation of the illicit discharge detection and elimination (IDDE) component of the City's storm water program. This program component includes both dry weather monitoring activities and other activities to prevent and respond to illicit connection and illicit discharges, such as operating a storm water hotline. The reporting period for the portions of this section that discuss dry weather monitoring activities was changed to extend through September 30, 2008, but the reporting period for other activities described in the section was not changed and thus extends through June 30, 2008, the same reporting period as applies to the rest of the JURMP Annual Report. Because the field work for the dry weather monitoring program is not required to be completed until September 30, 2008, the same day that the JURMP Annual Report is to be submitted, the RWQCB extended the submittal deadline for all of Section 7 of the 2007/2008 JURMP Annual Report until December 15, 2008.

**Contents**

This submittal includes a certification statement, the text of Section 7 of the 2007/2008 JURMP Annual Report, and the attachments associated with that section. For clarity, the items included in this submittal are listed below.

- Certification statement for Section 7 submittal
- Introduction and Contents
- Section 7 (IDDE component) of the 2007/2008 JURMP Annual Report
- JURMP Annual Report Requirements Checklist (for Section 7 only)
- Attachment 7.1, City of National City Dry Weather Field Screening and Analytical Monitoring Program 2007
- Attachment 7.2, City of National City Dry Weather Field Screening and Analytical Monitoring Program 2008

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

Recognizing that illicit connections and illicit discharges can be significant sources of pollutants to the City's MS4, the City maintains several programs to prevent and to seek out and eliminate IC/IDs. Illicit discharges may result from activities such as vehicle washing or equipment cleaning without the use of proper BMPs. Sewer pipes and drains in car washes connected the MS4 are examples of illicit connections. City storm water personnel work with residents, businesses, and City staff to make them aware of BMPs to prevent IC/IDs and to encourage reporting of IC/IDs. The following activities are the primary components of the City's program to combat IC/IDs:

- Inspecting local businesses, construction sites, and municipal facilities
- Conducting the Dry Weather Monitoring Program
- Operating a Public Complaint Hotline

These mechanisms enable the City to provide a comprehensive system to better the quality of storm water and urban runoff throughout the City.

### 7.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the illicit discharge detection and elimination component during the 2007/2008 reporting period are presented in the following bulleted list. Please note that the reporting period for the dry weather monitoring program extended through September 30, 2008, but the reporting period for all other components of the City's IDDE program ended on June 30, 2008. The following subsections of this section provide more details on how the City complied with both the previous permit and the new Municipal Permit during the reporting period.

- Two IC/IDs were discovered/reported during the 2007/2008 reporting period. Both were followed up on by City personnel and enforcement measures were applied as necessary.
- The City recorded and investigated 48 Storm Water Hotline complaints.
- The City performed all of the recommended corrective actions proposed in the 2007 Dry Weather Field Screening and Analytical Monitoring Program Report to prevent possible pollutants from entering the storm drain system.
- The City conducted the 2008 Dry Weather Field Screening and Analytical Monitoring Program.

## 7.2 Public Reporting of Illicit Discharges and Connections

Public and municipal involvements are crucial to preventing and eliminating IC/IDs from the storm water conveyance system. The Storm Water Hotline provides an effective means for individuals in the City to report suspected IC/IDs. The hotline number is provided on the City's website and in distributed storm water educational material. Storm water complaints may also be reported through the City's website. All complaints received through the hotline and website are logged into a spreadsheet for documentation and tracking. Each logged complaint is investigated by City personnel to determine if an IC/ID is present. Responsible parties for any confirmed IC/ID are sought out and educated and/or cited as necessary and required to stop any and all illegal discharges.

Complaints received by the City during the 2007/2008 reporting period and the City's response to each are listed in Table 7-7. A total of 48 complaints were documented this year, a decrease from the 143 that were recorded last year. The decrease in documented complaints may indicate that individuals in the City are more aware of the impact of certain activities on the storm drain system and are implementing proper BMPs to ensure that pollutants do not reach the City's MS4.

## 7.3 Spill Reporting, Response, and Prevention

The City has documented procedures for preventing and responding to sanitary sewer overflows. Preventative maintenance is regularly conducted on the City's sanitary sewer system, and video inspections and sewer surveys are regularly conducted to monitor the condition of the public sewer lines and to determine the necessity of maintenance. Private lateral lines do not receive preventative maintenance, but the City assists in the containment and cleanup of sewer spills if the spill could potentially reach the City's MS4.

Individuals in the City are encouraged to report any SSOs or other spills to the City's Storm Water Hotline. During the 2007/2008 reporting period, eight spills occurred and were reported to the RWQCB within 24 hours. The following list outlines the spills reported and investigated by the City:

- On 7/11/2007 an oil spill was reported to the Storm Water Hotline and an inspector from the City found equipment for oil/hydraulic fluid lying on its side with approximately 5 gallons of oil spilled out onto a concrete slab at 3000 National City Boulevard. Workers had spread absorbent onto the oil and had used additional dirt to form a dam. The inspector spoke with the manager of the dealership, who stated that they would apply more absorbent the next day (as they had run out) and then place all contaminated materials into a drum and have it taken to a hazardous waste site.

- On 7/17/2007 a spill of diesel in the gutter approximately 40 ft (linear) discharged to a storm drain inlet at 4th and Roosevelt. Sewer and street crew were called and the spill was cleaned using sand as an absorbent and was then swept up by the street sweeper. The diesel that entered the inlet was soaked up by the small amount of sediment in the inlet. The sediment and diesel was vacuumed out of the inlet with the vactor truck. The inlet was then power washed and the water was also recovered by the vactor truck.
- On 7/19/2007 a semi-tractor parked on Roosevelt Street (near 3rd Street) was leaking diesel fuel to the gutter. The fire department placed absorbent on the leaked diesel and Public Works crew placed additional sand on the spill. The street sweeper cleaned the sand with the absorbed diesel from the street.
- On 8/16/2007 an employee of Auto Buyers Plus spilled approximately 20 gallons of fuel from a tank that had been removed from a motor home. The employee hosed the fuel to a surface drain in the parking lot that leads to Plaza Boulevard. The nearest inlet is approximately 725 feet west on Plaza Boulevard. The discharge entered the inlet on the south side of the North bound Interstate 5 off ramp to Plaza Boulevard. The business owner was issued a citation, and the fire department contained flow until the Public Works crew arrived to clean the street, gutter, and inlet.
- On 10/3/2007 an overflowing sewer manhole was reported close to E. 30th Street and B Avenue. The sewer crew responded and flushed the line from A Avenue; flushing activities dislodged a grease blockage in the pipe. A dirt dam was placed in front of inlet to prevent additional discharge from entering the MS4 and sewer crew began vacuuming sewage from the ground. About 10,800 gallons of sewage was recovered from the ground and properly disposed of, but an estimated 4,200 gallons could not be recovered and were released to the environment. The discharge occurred in the Sweetwater River Watershed. Public Works notified required agencies and verbal and written notifications were sent to the RWQCB.
- On 10/15/2007 a water main break was reported at 8th and D Streets. The Sweetwater Authority arrived at the site and repaired the line.
- On 11/9/2007 a fire hydrant was reported broken and spilling water on Euclid Avenue and Division Street. Sweetwater Authority repaired the hydrant and collected the water discharged from it.
- On 12/13/2007 an oil spill was reported at 840 W 19th Street. A City inspector went to the site where the fire department and another inspector were already present. The individual that reported the spill and the owner of the neighboring property were also at the site. The inspector saw an oil spill that came from an oil drum that had spilled onto the ground and mixed with standing water. The oil did not reach the storm drain.

## 7.4 URBAN RUNOFF MONITORING

The City has continued to conduct a Dry Weather Monitoring Program, as required by the Municipal Permit. This program assists the City in detecting and eliminating IC/IDs to the storm drain system. There are three major components to the Dry Weather Monitoring Program:

- Field observations, which include site description and qualitative observations
- Field screening monitoring, which include flow estimation and sample testing using meters and test kits at the site
- Analytical monitoring, which involves submittal of collected samples from selected sites to an analytical laboratory for additional testing

Numeric action levels are used as the primary approach for the interpretation of most constituent concentrations measured in the field and laboratory. The California Toxics Rule (CTR) Criteria Maximum Concentration (CMC) is used as the action level for dissolved trace metals. Temperature and turbidity parameters are evaluated using best professional judgment to determine the necessity of an upstream investigation. The action levels for all other pollutants were adopted in 2003 and were based on statistical analyses of previous Dry Weather Monitoring Program data and existing water quality benchmarks.

The City visited 15 primary monitoring stations in 2007 and in 2008 to collect Dry Weather Monitoring Program data. When a primary monitoring site was found to be dry, the City visited designated alternate monitoring stations. Table 7-3 includes the sites visited and their locations.

### 7.4.1 2007 DRY WEATHER MONITORING PROGRAM

The City's 2007 Dry Weather Monitoring Program was conducted in September 2007. The 2007 Dry Weather Monitoring Program Report has been included as Attachment 7.1. For further information about how the City addressed issues discovered during the 2007 Dry Weather Monitoring Program and responded to the resulting recommendations, see Section 7.5.1 of this report.

### 7.4.2 2008 DRY WEATHER MONITORING PROGRAM

The 2008 Dry Weather Monitoring Program was conducted during the 2008 dry season, including routine site visits at the monitoring stations listed in Table 7-4 at the end of this section. Also at the end of this section, Table 7-5 and Table 7-6 provide the field analytical results and laboratory analytical results, respectively, from the 2008 Dry Weather Monitoring Program.

Routine visits and any necessary follow-up investigations were conducted at 15 monitoring locations for the 2008 Dry Weather Monitoring Program. Table 7-1 provides a summary of action level exceedances.

**Table 7-1**
**Summary of Action Level Exceedances**

| Field Screening (15 samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Site(s) Exceeding Action Level** |
| pH | 0 | 0 % | --- |
| Conductivity | 0 | 0 % | --- |
| Turbidity | 0 | 0 % | --- |
| Surfactants | 6 | 40 % | 1A, 6, 38, 45, 47, 48 |
| Ammonia-Nitrogen | 0 | 0 % | --- |
| Nitrate-Nitrogen | 0 | 0 % | --- |
| Orthophosphate-Phosphorus | 1 | 7 % | 48 |
| **Laboratory Analyses (4 samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Site(s) Exceeding Action Level** |
| Oil & Grease | 0 | 0 % | -- |
| Cadmium | 0 | 0 % | -- |
| Copper | 1 | 25 % | 32 |
| Lead | 0 | 0 % | -- |
| Zinc | 0 | 0 % | -- |
| Diazinon | 0 | 0 % | -- |
| Chlorpyrifos | 0 | 0 % | -- |
| Total Coliforms | 2 | 50 % | 1A, 32 |
| Fecal Coliforms | 1 | 25 % | 1A |
| *Enterococcus* | 2 | 50 % | 1A, 46 |

Note: Data is from the initial site visits only; data from follow-up investigations is not included.

Follow-up investigations conducted in response to action level exceedances are summarized in Section 7.5.2 of this report.

A formal trash assessment was performed for the first time in 2008 in accordance with the Municipal Permit requirements. The San Diego Copermittee Dry Weather Monitoring Workgroup developed five categories to describe the amount and extent of trash. The definitions are primarily qualitative, although numbers of trash pieces are also included in each category as a rough guideline. The five categories are listed below.

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.

- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is assessed at each site using the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* – Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers fall in this category.

Nineteen sites, including dry sites, were assessed, and nine of the sites were scored as "optimal" or "suboptimal", having little or no trash. Five sites had "marginal" levels of trash. Four sites were considered "submarginal" and one site was considered "poor" due to significant amounts or types of trash consistent with human use and dumping. Two of the sites that were "submarginal" or "poor" also had trash that was considered a threat to aquatic and/or human health. Actions taken by the City in response to the results of the trash assessment are described in Section 7.5.2 of this report.

The 2008 Dry Weather Monitoring Program Report, which includes results of field screening and analytical monitoring, can be found as Attachment 7.2.

## 7.5 Follow-up and Enforcement

### 7.5.1 Actions Taken in Response to the 2007 Dry Weather Monitoring Program Findings

Based on the 2007 Dry Weather Monitoring Program results, several recommendations were made. In response to these recommendations, educational materials were distributed, the City's Public Works Department employees performed necessary

maintenance, and inspections as well as follow-up inspections were performed on the South Bay Plaza Shopping Center facilities.

The City's storm water compliance inspector visited the Park Villas Apartments to drop off educational material focusing on minimizing irrigation runoff and to discuss corrective actions and recommendations with the landscapers of the facility. The inspector also visited the South Bay Plaza Shopping Center facilities to distribute educational materials on general housekeeping BMPs and provided verbal instructions during inspections. The property management company was also contacted to resolve housekeeping issues; property management committed to working with tenants to fix housekeeping problems.

Several sites were found to have trash and debris accumulating in the channel. Site 1A, 32, 40 and the channel within Kimball Park had a significant accumulation of trash and debris and were cleaned out by the City's Public Works staff.

In addition to providing educational material to South Bay Plaza Shopping Center facilities, inspections were performed on restaurants and other inventoried businesses in and around the shopping center. Follow-up visits were performed to ensure that BMPs were being implemented for the proper storage of grease bins, containment of trash, and reducing discharges from businesses in the shopping center. Some improvement was noted at these follow-up visits; trash bins had locked lids or covers, and the grease bins and surrounding areas were kept free of major grease spills and leaks.

### 7.5.2 2008 Dry Weather Monitoring Follow-Up Investigations

If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. Upstream investigations are performed when exceedances are verified during confirmation visits. See the City's JURMP for a complete discussion of upstream investigation procedures.

Table 7-2 presents conclusions based on the results of confirmation visits and, where necessary, upstream investigations conducted at eight sites during the 2008 Dry Weather Monitoring Program.

**Table 7-2**
**Summary of Follow-Up Investigations**

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 1A | Surfactants | Total Coliforms, Fecal Coliforms, *Enterococcus* | Surfactants level was below the action level when tested the next day, but washing activities were observed upstream later. Washing activities and trash in the storm drain conveyance were observed upstream of the site. |
| 6 | Surfactants | | No potential source of surfactants was observed for this ponded water. High conductivity and direct observation indicated a strong tidal influence on the site. |
| 32 | | Copper, Total Coliforms | No potential source of copper was observed and the concentration (0.00917 mg/L ) was lower than the action level (CTR CMC = 0.0305 mg/L, total hardness = 239) during the confirmation visit. It may have been due to a transient flow. Total coliforms were at high levels upstream, but were reduced at the site during confirmation. Potential sources included human feces at the site and trash in stagnant water in an upstream catch basin. |
| 38 | Surfactants | | No potential source of surfactants was observed for this ponded water in an earthen channel. No runoff noted upstream of the site. Ponded water may have been from a transient flow. |
| 45 | Surfactants | | Evidence of laundry hand washing in a parking lot at an upstream residential complex at 4616 Delta Street in the City of San Diego. |

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 46 | | *Enterococcus* | Puddle of runoff near site had very high levels of *Enterococcus* and appeared likely to be from adjacent commercial businesses. While grease bins were in better condition than in 2007, food waste was observed in a parking area and may have entered an upstream catch basin. A second confirmation visit indicated *Enterococcus* levels at the site fell to 1607 MPN/100 mL, below the action level of 10,000 MPN/100 mL. |
| 47 | Surfactants | | High conductivity indicated a strong tidal influence on the site. However, immediate investigation also found a high surfactants concentration in a discharge from Frank Toyota. The City was contacted and stopped the discharge. The business was issued a Notice of Violation and a citation. |
| 48 | Surfactants, Orthophosphate-P | | Detergent from residential car washing activities was observed upstream as the only source of flow and the likely source of both surfactants and orthophosphate-phosphorus. |

The City has begun taking actions in response to the 2008 Dry Weather Monitoring Program findings. As of this writing the City has issued a Notice of Violation and a citation to Frank Toyota, where the surfactants discharge was stopped. A Notice of Violation was also issued to the owner of a property on Melrose Street where recycling container cleaning water had been hosed to the street. Additionally the City has hired a contractor to remove trash twice per month at open channel portions of Paradise Creek, including trash observed near Site 13A. The City has scheduled trash removal at the remaining dry weather sites.

Other actions taken during the remainder of the reporting period will be described in the 2008/2009 JURMP Annual Report.

### 7.5.3 IC/IDs Identified

During the 2007/2008 reporting period, a number of IC/IDs were discovered based on facility inspections or complaints submitted to the storm water hotline or the City website. During each inspection or complaint investigation, the inspector discussed

proper BMP implementation methods as well as storm water concepts with the person responsible for the spill or discharge.

Two IC/IDs were discovered during routine industrial and commercial inspections. Both IC/IDs were observed at commercial facilities and were discharges from car washing activities. At the time of inspection, the inspector notified the facility personnel that the activities taking place were prohibited by City ordinance and discussed the importance of BMPs for such activities. Site-specific discussions of both IC/IDs discovered during routine industrial and commercial inspections are provided below:

- On 1/30/2008, Meza Auto Body, located at 420 W 12th Street, received a routine inspection, during which the inspector observed vehicle washing in the parking area in front of the shop. Water from the washing activities was mixing with paint dust and discharging to the street. The inspector discussed necessary BMPs with facility personnel and recommended that the City follow-up on the facility to ensure that required BMPs were being implemented.
- On 1/29/2008, National City Car Wash, located at 2550 E Plaza Boulevard, received a routine inspection. During which the inspector observed wash water passing through several filters to be reused for car washing activities; however, the inspector noted a small flow of wash water discharging at the end of the washing tunnel. The wash water flowed out the tunnel and into a nearby catch basin. The inspector discussed the implementation of necessary BMPs and recommended the City perform a follow-up inspection to ensure that required BMPs were being implemented.

### 7.5.4 ENFORCEMENT

As previously stated, investigated complaints from the storm water hotline and City website are included as Table 7-7. The table also includes relevant Public Works Department complaints and a description of how each complaint was resolved during the reporting period. Resolutions to investigated complaints included issuing warnings, violations, and/or educational material. Table 7-3 summarizes the enforcement actions taken in response to complaints received by the City's Storm Water Hotline.

**Table 7-3**
**Enforcement Actions Resulting from Complaints Received by the Storm Water Hotline**

| | Notice of Correction | Administrative Citation | NOV |
|---|---|---|---|
| **Commercial** | 0 | 10 | 6 |
| **Industrial** | 22 | 1 | 3 |
| **Mobile** | 0 | 0 | 0 |
| **Municipal** | 0 | 0 | 0 |
| **Residential** | 3 | 3 | 2 |
| **Construction** | 0 | 1 | 0 |

## 7.6 Illicit Discharge Detection and Elimination Component Effectiveness Assessment

The assessment of the effectiveness of this program component is provided in Section 11 of this JURMP Annual Report.

## 7.7 Program Review and Modification

The City's JURMP was recently updated in March 2008. No changes to the City's illicit discharge detection and elimination component have been made since that time.

**Table 7-4**
**2008 Dry Weather Monitoring Locations**

| Site No | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908.31 | 32.68575 | -117.10166 |

**Notes**

**Red Bold Type** = Values that exceed action levels
nd = Not detected
*= Total hardness is not considered a pollutant and thus has no established action level for the purposes of dry weather monitoring. Total hardness is measured because the CTR action levels for metals are dependant on the total hardness value of the water sample. Total hardness measurements are thus required to calculate action levels for dissolved metals.

**Table 7-7**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 1 | 7/9/2007 | Residential | Hotline Caller | 1345 or 1405 I Avenue | Grey water from washing machine going to street | No discharge was observed at the time of inspection. Case was referred to code enforcement. |
| 2 | 7/9/2007 | Construction | Hotline Caller | Highland Avenue | Fence down, hanging into alley. Litter on site. | Inspector called the property owner on July 10, 2007. Property owner reported he will remove fence and clean lot. |
| 3 | 7/9/2007 | Commercial | Hotline Caller | 1320 Highland Avenue | Pipe on west side of building discharging water. | Pipe appears to be A/C from roof.<br>Upon investigation, the following violations were observed:<br>▪ Evidence of discharge from dumpster area to inlet leading to Paradise Creek<br>▪ Dumpster overflowing with lid in the open position.<br>▪ Rotting food on ground.<br>▪ Landscape debris, litter, tar, waste oil, shopping carts, and clothing on property adjacent to Paradise Creek.<br>▪ Litter, food, and landscape debris in parking lot.<br>NOV issued for dumpster area, citation was also issued (citation #2623; $200). Re-inspection on or after 7/19/07. |
| 4 | 7/10/2007 | Commercial | Hotline Caller | 840 Highland Avenue | Broken irrigation pipe. | Inspector faxed photos to business manager on July 10, 2007 so the landscaper can be shown where problem is located. Business manager will have the landscaper repair the pipe. |
| 5 | 7/11/2007 | Municipal | Hotline Caller | Sweetwater and Grove | Gutter full of water and mud because of irrigation run-off. | Inspector spoke with EPI. He said that the product in the roll off was kelp. The roll off was being dumped/removed on 7/12/07. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 6 | 7/11/2007 | Commercial | Hotline Caller | 3000 National City Blvd | Oil spill 7/11/07 mid-day | Inspector found equipment for oil/hydraulic fluid lying on its side with approximately 5 gallons of oil spilled out onto a concrete slab. Workers had spread absorbent onto the oil and had used additional dirt to form a dam. Inspector spoke with manager of business, who stated that they would apply more absorbent the next day (as they had run out) and then place all materials into a drum and have it taken to a hazardous waste site. |
| 7 | 7/11/2007 | Commercial | Hotline Caller | 1804 A Cleveland | Strong smell of sewer coming from roll off box. | Sewer crew cleaned area. Golf course requested to minimize water time. |
| 8 | 7/16/2007 | Residential | Hotline Caller | 431 T Avenue | Sewer being pumped to street | Inspector spoke with the property owner's mother. Inspector told her that the contaminated spill must be cleaned and properly disposed of. Sewer crew came to clean sewage from street. NOV and citation (#2625, $100) were issued. Case was referred case to building department to evaluate unsafe living conditions. |
| 9 | 7/17/2007 | Commercial | Hotline Caller | 2829 National City | Strong smell of sewer and water coming out of private storm drain inlet via an under sidewalk drain. | There is a trench drain between two mechanical stalls on the east side of property. There are 2 valves that prevent the fluid (in the trench drain) from discharging to the private inlet on the west side of property. A service department employee opened the valves after/while cleaning the trench drain. This allowed the wastewater (and oil) to discharge to the gutter. The sewer crew used the high pressure hose and vac truck and to clean area and reclaim water. The sewer crew assisted in determining if both valves diverted water to inlet or if one went to sanitary sewer system. It was determined that both valve release fluids to storm drains. Service Manager the business arranged for Safety Kleen to come clean private trench and inlet. Citation (#2701, $100) issued. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 10 | 7/17/2007 | Municipal | Hotline Caller | 4th and Roosevelt | Diesel fuel spill. | Approximately 40 linear feet of diesel fuel was spilled into a storm drain inlet. Sewer and street crews were called to clean the spill. Sand was used as an absorbent and collected by street sweeper. Diesel fuel that entered the inlet was soaked up by a small amount of sediment in the inlet, which was vacuumed out with the vac truck. The inlet was power washed and the water reclaimed. |
| 11 | 7/18/2007 | Construction | Hotline Caller | 3425 Cagle St | No BMP on construction | Fuel tank was observed leaking diesel. Owner was contacted to go to site. Street crew was dispatched to clean gutter. No diesel reached inlet. |
| 12 | 7/18/2007 | Municipal | NCPD | 300 Block of Roosevelt | Truck leaking fuel | Conducted full routine inspect. Directed to implement sediment control BMPs within 48 hours, provide secondary containment for toilet and fuel container, clean debris from site, and clean sediment from sidewalk. |
| 13 | 7/19/2007 | | Hotline Caller | 3rd and Roosevelt | Diesel Spill | A semi-tractor parked on Roosevelt was leaking diesel fuel to the gutter. Fire department placed absorbent on diesel. PW crew placed additional sand on spill. Street sweeper cleaned sand from street. |
| 14 | 8/6/2007 | Residential | Community Services Department | 321 E 2nd Street | Leaking vehicle. | The vehicle was not observed to be leaking any fluids. Referred as abandoned vehicle to NCPD. |
| 15 | 8/9/2007 | Construction | City of National City | 102/104 E. 2nd Street | No BMPs implemented | Stop work order issued until BMPs are implemented. Instructed contractor to call for re-inspection. Contractor given a verbal warning. BMPs were implemented upon re-inspection. |
| 16 | 8/15/2007 | Residential | Hotline Caller | 622 1st Street | Sewage discharging from property | Discharge of gray water from a plugged sink in garage at rear of property was observed. Owner reported that blockage would be repaired today. Verbal warning was issued. Issue was resolved, plumbing issues were repaired. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 17 | 8/16/2007 | Commercial | Hotline Caller | 110 W. Plaza Boulevard | Hosing fuel down gutter | An employee spilled approximately 20 gallons of fuel from tank that had been removed from a motor home. The employee hosed the fuel to a surface drain in the parking lot that leads to Plaza Boulevard. The nearest inlet is approximately 725 feet west on Plaza Boulevard. The discharge entered the inlet on the south side of the North bound Interstate 5 off ramp to Plaza Boulevard. Citation issued (#2703, $100). NC Fire Dept contained flow until PW crew arrived. Street, gutter, and inlet were cleaned. |
| 18 | 8/22/2007 | Commercial | NCPD | 800 Block of W 19th St. | Leaking fuel | A semi-tractor/trailer parked on the south side of the street was observed with a ruptured fuel tank (right). Diesel fuel was leaking out of the tank. Fire Dept personnel contained the spill until Public Works crew arrived on site. Public Works crew cleaned the spill. No fuel entered any inlet. A Courtesy Notice (verbal) was provided to the RWQCB and a verbal warning was given to the vehicle owner. |
| 19 | 8/27/2007 | Construction | Building Department | 2707 L Avenue | No BMPs | Contractor was provided a verbal warning and notified to clean sidewalk and implement sediment control BMPs today. BMPs were verified the next day. |
| 20 | 8/29/2007 | Commercial | Engineering | 1904 Highland | Power washing building | Business reported being new tenants of the property. They were clearing facility/parking lot in preparation of the "move in." Inspector gave a verbal warning and told facility representative that the filter around property needs additional cleaning, and business would be billed for clean up conducted by Public Works. City cleaned area, business reimbursed City for clean-up. |
| 21 | 8/29/2007 | Commercial | Hotline Caller | 1839 Cleveland | Hosing dark fluid to gutter | Spoke with facility representative who reported he was power washing the building. He was provided a verbal warning and he stated that he will implement BMPs to prevent run off in the future. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 22 | 9/5/2007 | Commercial | Hotline Caller | 24th Street & Wilson Ave. | Doing maintenance in the parking lot, but they washed some portion of parking lot and water went through the SD inlet. | Facility personnel given a verbal warning. Service manager reported that they will not discharge water in the future and that they will clean the inlet. |
| 23 | 9/27/2007 | Municipal | Hotline Caller | 16th & J | Sediment in street/gutter | Inspector spoke with contractor regarding tracking and was given a verbal warning. Silt fence being installed to prevent driveway from being used. |
| 24 | 9/27/2007 | Residential | Hotline Caller | 1411 J Street | Dumpster open and enclosure has trash and liquid on the ground. | Inspector observed a bin dumped on its side spilling what appeared to be sewage into the gutter. Sewer crew was dispatched to site; the gutter was cleaned. |
| 25 | 9/27/2007 | Construction | Hotline Caller | 1620 J. Ave. | Tracking | Called property manager and explained violation. They will have the area cleaned this week. Issued verbal warning and a corrective action letter. |
| 26 | 10/3/2007 | Municipal | Engineering | 30th St and B Avenue | Water flowing over vacant lot. 207 E 30th Street | Inspector observed a sewer manhole overflowing with sewage. The sewer crew arrived and flushed the line from A Avenue, breaking loose a grease obstruction. A dirt dam was placed in front of the inlet located on site to prevent additional discharge from entering the MS4. Sewage was vacuumed from the ground; 10,800 gallons of sewage was recovered and properly disposed of. Approximately 4,200 gallons of sewage was discharged to the MS4. Verbal and written notification was sent to the RWQCB. Letter was sent to property owner notifying owner that a city crew was on property. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 27 | 10/9/2007 | Residential | Hotline Caller | 2201 E 4th St | Open sewer lateral | Sewer maintenance crew called inspector to an open sewer lateral. When inspector arrived the lateral line from the point of connection at the house to the property line had been excavated (including saw cutting and removal of portion of driveway) and lateral had been removed from trench. Appropriate permitting procedures had not been followed, and required BMPs were not implemented. The City ensured that storm water BMPs were installed and that the area was cleaned up. There was no discharge to the City's MS4. The City also followed up with the owner to ensure compliance with all City permit requirements. Note that all work has since been completed. |
| 28 | 10/10/2007 | Commercial | Engineering | 14th and Highland | Discharge going to the gutter | Inspector found that the hot water heater was leaking. The water was running through the parking lot to the gutters. Owner was contacted and cleaned water from gutter. |
| 29 | 10/15/2007 | Commercial | Hotline Caller | 19th and Harrison | Trash on lot | Street crew went to site and photographed debris. Letter was sent to owner. Issue was resolved by City Code Enforcement. |
| 30 | 10/15/2007 | | Hotline Caller | In front of 1705 & 1646 Prospect | Van - Silver, Van - White, Black Jetta, Gold Sedan 2 door- leaking fluids | A total of 4 vehicles were leaking oil. A corrective action letter was sent and the issue was resolved. |
| 31 | 11/5/2007 | Construction | Hotline Caller | 3030 Plaza Bonita Road | Concrete washout overflowing into parking lot | Full inspection conducted; improperly disposed of concrete waste was observed leaking from a dumpster in a private parking lot. The responsible contractor was notified. City staff remained onsite until the responsible contractor thoroughly cleaned the dumpster, the surrounding area, and the private inlet by the dumpster. City staff determined that there was no discharge to the public MS4, as it was noted that no evidence of discharge was observed at a downstream CDS unit installed in the private MS4 associated with the parking lot. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 32 | 12/13/2007 | Industrial | Hotline Caller | 840 W 19th Street | Oil spill and leak | The inspector went to the site; fire dept was already on site. Oil spill appeared to have come from a drum and mixed with standing water on the pavement. There was no discharge to the MS4. Area was cleaned and issue resolved. |
| 33 | 1/7/2008 | | Hotline Caller | 15th Street and Highland Avenue | Fire hydrant broken | At about 2:00pm the fire hydrant at 15th street and Highland was hit by a SWA vehicle and according to SWA personnel about 86,400 gallons were wasted and flowed along the gutter through the inlet of the storm drain. |
| 34 | 1/8/2008 | Commercial | Hotline Caller | (car wash) 200 Highland Ave | Green water flowing to street. | Facility personal was trying to break blockage in lateral-felled car. He was washing area with garden hose causing wastewater to discharge to Highland Avenue to 3rd (westerly direction). Sewer crew was called to clean wastewater from street. Issued citation (2708, $100). |
| 35 | 1/22/2008 | Municipal | Hotline Caller | 220 West 14th Street | Sewer overflow | Sewer crew dispatched to flush lines and drain sewer discharge. Private plumber called to clear lateral blockage. |
| 36 | 1/22/2008 | Commercial | Hotline Caller | 11th and Hoover | Lunch truck discharging fluid to gutter. | An NOV and citation issued based on proof from photographs submitted by County employee. City consulted with business owner and there have been no further issues. |
| 37 | 2/7/2008 | Residential | Hotline Caller | 726 E. 1st | Sewer discharge | A sewer lateral was blocked and there was no cap on the line, which allowed discharge to the front lawn of the property. The sewage was contained to the property. The property owner hired a plumber to clear the line and someone to clean the sewage from the ground. |
| 38 | 3/5/2008 | Commercial | Hotline Caller | Rachel and Blueridge | Stamp concrete - washing to gutter | Owner had swept most concrete residue up, but was hosing down the remaining residue. Owner was given a verbal warning and cleaned up residue from gutter. |
| 39 | 3/6/2008 | Construction | Hotline Caller | 2622 E. 8th St | Discharge of gas and water to gutter | Employee of construction contractor was using gasoline to clean sidewalk and hosing down the area. The gas/water flowed west on E. 8th street to Euclid Ave. Issued citation (#2711, $100). Issue resolved. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 40 | 3/13/2008 | Commercial | Hotline Caller | 3300 National City Blvd | Dumped 55 gallon drum on ground behind paint booth | At about 10:25 AM went to the site and met John Higgins and showed me the area where the paint booth was and walked around the site and saw nothing except some liquid marks on the ground and took pictures. Complaint could not be substantiated. No drum located. |
| 41 | 3/24/2008 | Residential | Hotline Caller | 1614 Gamma Street | Stucco stock in the storm drain | Inspector went to the site at 1614 Gamma Street and found stucco stock in the storm drain. Nobody could tell who was responsible. PW cleaned up the stucco. |
| 42 | 3/25/2008 | Commercial | Fire Dept | 511 Highland Avenue | Stock pile of soil without BMPs | Stockpile was observed without BMPs. The stockpile was covered and equipped with gravel bags and directed to stop work until necessary permits were obtained and other BMPs implemented. Problem was resolved. |
| 43 | 3/25/2008 | Construction | Engineering | 1506 Highland Avenue | Pesticide in gutter | Approximately 4 oz of pesticide spilled in driveway. Owner hosed to street. Liquid flowed approximately 15 linear feet. Owner mopped up liquid while inspector was on site. No liquid reached any storm drain inlet. Given a verbal warning. |
| 44 | 4/15/2008 | Commercial | Hotline Caller | 1126 E 7th St | Carpet cleaners dumping water into storm drain. | There was soapy water in the drain, called sewer department to clean. Will monitor area inlet for discharges. |
| 45 | 5/19/2008 | Commercial | Hotline Caller | Alley way between Palm Ave & R Ave | Eight to ten gallons of cooking oil spill | Approximately 8 to 10 gallons of cooking oil spilled in the alleyway; no one knew who was responsible for the spill. PW cleaned up spill. |
| 46 | 6/4/2008 | Commercial | Hotline Caller | Behind In & Out burger | Misc debris, batteries, waste oil, etc behind warehouse. | Inspector found scattered debris around the dumpster and the boundary fence at 2626 and 2702 Southport Way. Corrective action letter was issued to the business. |

**Table 7-7 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 47 | 6/4/2008 | Residential | Hotline Caller | 399 Civic Center Drive | Washing vehicle leading to discharge of wash water. Appears to be related to maintenance of a racecar. | Party present at site stated that he has a personal racecar that he maintains, but it is not a business. Inspector explained that no discharge of water to the storm drain system is allowed. No discharge or evidence of discharge was noted during the visit. Inspector also explained that any materials used to service the racecar should be kept in covered, contained areas. No discharges have been noted in the vicinity of this address since the complaint investigation. |
| 48 | 6/20/2008 | | Hotline Caller | 1701 D Ave | Janitors dumping wax/water | Inspector observed a milky white water flowing from the D-25 curb outlet on the east side of D Avenue north of 18th Street. While looking for possible sources of the discharge around the adjacent school, the inspector was approached by the school's principal. The inspector explained the reason why they were there; the principal said that he did not know that dumping mop water outside was not allowed. The inspector explained the requirements for proper disposal of mop water and asked the principal to explain to his crew such disposal methods. The principal stated that he would speak with the crew the following day. No further discharges have been observed in this area. |

## IDDE

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| i. Correction of any inaccuracies in either the MS4 map or the Dry Weather Field Screening and Analytical Stations Map. | 7.4 |
| ii. Reporting of all dry weather field screening and analytical monitoring results. The data should be presented in tabular and graphical form. The reporting shall include station locations, all dry weather field screening and analytical monitoring results, identification of sites where results exceeded action levels, follow-up and elimination activities for potential illicit discharges and connections, the rationale for why follow-up investigations were not conducted at sites where action levels were exceeded, any Copermittee or consultant program recommendations/changes resulting from the monitoring, and documentation that these recommendations/changes have been implemented. Dry weather field screening and analytical monitoring reporting shall comply with all monitoring and standard reporting requirements in Attachment B of Order No. R9-2007-0001 and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001. | 7.4, 7.5; Tables 7-1 through 7-2; Tables 7-4 through 7-6; Attachments 7.1 and 7.2 |
| iii. Any dry weather field screening and analytical monitoring consultant reports generated, to be provided as an attachment to the annual report. | Attachments 7.1 and 7.2 |
| iv. A brief description of any other investigations and follow-up activities for illicit discharges and connections. | 7.5, Table 7-7 |
| v. The number and brief description of illicit discharges and connections identified. | 7.5, Table 7-7 |
| vi. The number of illicit discharges and connections eliminated. | 7.5, Table 7-7 |
| vii. Identification and description of all spills to the MS4 and response to the spills. | 7.3, Table 7-7 |
| viii. A description of activities implemented to prevent sewage and other spills from entering the MS4. | 7.3 |
| ix. A description of the mechanism whereby notification of sewage spills from private laterals and septic systems is received. | 7.3 |
| x. Number of times the hotline was called, as compared to previous reporting periods, and a summary of the calls. | 7.2, Table 7-7 |
| xi. A description of efforts to publicize and facilitate public reporting of illicit discharges. | 7.2 |
| xii. The number of violations and enforcement actions (including types) taken for illicit discharges and connections, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 7.5, Table 7-7 |
| xiii. A description of notable activities conducted to manage illicit discharges and connections. | 7.1, 7.5 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| Meets applicable standard monitoring and reporting requirements listed in Municipal Permit Attachment B. | Attachments 7.1 and 7.2 |
| c. (1) Determining Sampling Frequency: Dry weather field screening and analytical monitoring shall be conducted at each identified station at least once between May 1st and September 30th of each year or as often as the Copermittee determines is necessary to comply with the requirements of section D.4 of Order No. R9-2007-0001. | 7.4, Attachments 7.1 and 7.2 |
| c. (2) If flow or ponded runoff is observed at a dry weather field screening or analytical monitoring station and there has been at least seventy-two (72) hours of dry weather, make observations and collect at least one (1) grab sample. Record general information such as time since last rain, quantity of last rain, site descriptions (i.e., conveyance type, dominant watershed land uses), flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate), and visual observations (i.e., odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biology). | 7.4, Attachments 7.1 and 7.2 |
| c. (3) At a minimum, collect samples for analytical laboratory analysis of the following constituents for at least twenty five percent (25%) of the dry weather monitoring stations where water is present: (a) Total Hardness, (b) Oil and Grease, (c) Diazinon and Chlorpyrifos, (d) Cadmium (Dissolved), (e) Lead (Dissolved), (f) Zinc (Dissolved), (g) Copper (Dissolved), (h) Enterococcus bacteria, (i) Total Coliform bacteria, (j) Fecal Coliform bacteria | 7.4, Table 7-6, Attachments 7.1 and 7.2 |
| c.(4) At a minimum, conduct field screening analysis of the following constituents at all dry weather monitoring stations where water is present: | (n/a) |
| c. (a) Specific conductance (calculate estimated Total Dissolved Solids), (b) Turbidity, (c) pH, (d) Reactive Phosphorus, (e) Nitrate Nitrogen, (f) Ammonia Nitrogen, (g) Surfactants (MBAS) | 7.4, Table 7-5, Attachments 7.1 and 7.2 |
| c. (5) If the station is dry (no flowing or ponded runoff), make and record all applicable observations and select another station from the list of alternate stations for monitoring. | 7.4, Attachments 7.1 and 7.2 |
| c. (6) Develop and/or update criteria for dry weather field screening and analytical monitoring results whereby exceedance of the criteria will require follow-up investigations to be conducted to identify and eliminate the source causing the exceedance of the criteria. | 7.4, Attachments 7.1 and 7.2 |
| c. (7) Assess the presence of trash in receiving waters and urban runoff at each dry weather field screening or analytical monitoring station. Assessments of trash shall provide information on the spatial extent and amount of trash present, as well as the nature of the types of trash present. | 7.4, Attachment 7.2 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| c. (8) Dry weather field screening and analytical monitoring stations identified to exceed dry weather monitoring criteria for any constituents shall continue to be screened in subsequent years. | 7.4, Attachments 7.1 and 7.2 |
| c. (9) Develop and/or update procedures for source identification follow up investigations in the event of exceedance of dry weather field screening and analytical monitoring result criteria. These procedures shall be consistent with procedures required in section D.4.d of Order No. R9-2007-0001. | 7.5, Attachments 7.1 and 7.2 |
| c. (10) Develop and/or update procedures to eliminate detected illicit discharges and connections. These procedures shall be consistent with each Copermittees Illicit Discharge and Elimination component of its Jurisdictional Urban Runoff Management Plan as discussed in section D.4 of Order No. R9-2007-0001. | 7.5, Attachments 7.1 and 7.2 |
| d. The Copermittees shall commence implementation of dry weather field screening and analytical monitoring under the requirements of this Order by May 1, 2008. Each Copermittee shall conduct dry weather analytical and field screening monitoring in accordance with its storm water conveyance system map and dry weather analytical and field screening monitoring procedures as described in section II.B.3 above. If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and sections D.4.d and D.4.e of Order No. R9-2007-0001. Until the dry weather field screening and analytical monitoring program is implemented under the requirements of this Order, each Copermittee shall continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2001-01. | 7.4, 7.5, Attachments 7.1 and 7.2 |

**Re: 2007 Dry Weather Field Screening and Analytical Monitoring Program City of National City, California**

Dear Mr. Daneshfar:

Per your request D-MAX Engineering, Inc. (D-MAX) conducted the routing phase of the Dry Weather Field Screening and Analytical Monitoring Program for the City of National City during the summer of 2007. Subsequently, we conducted follow-up investigations to identify the sources of pollutants detected during the monitoring program.

This report presents the results of the monitoring program and follow-up investigations. The contents include field screening data and analytical laboratory test results, analysis of the collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations and our recommendations for additional actions.

Review comments from the draft report submitted to the City have been incorporated into this final report. It has been our pleasure working with the City of National City on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.
Project Manager

# 1.0 INTRODUCTION

## 1.1 Regulatory Requirements

San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (the recently adopted Municipal Permit) requires that the Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program) in 2007 be conducted in accordance with RWQCB Order 2001-01 (the previous Municipal Permit) requirement. Under Order No. 2001-01, each of the Copermittees, including the City of National City, must annually conduct dry weather field screening of discharges into its storm drain system. This procedure consists of recording field observations, estimating observed flow rates, and conducting field testing at selected locations along the storm drain conveyance system during the dry weather season (May 1st through September 30th). The Permit also requires Copermittees to conduct laboratory analysis for at least 25 percent of the visited sites that have flowing or ponded water. At each sampling location that exhibits no flowing or ponded water, an alternate sampling station must be selected and sampled. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required.

## 1.2 Hydrologic Setting

The City of National City (the City) lies entirely within the San Diego Bay Watershed. The City makes up only 1.6 of the area of the San Diego Bay Watershed, but is one of the most densely populated areas. The City encompasses parts of two sub-watersheds: Sweetwater and Pueblo San Diego. The major receiving water body in the City is the San Diego Bay, which lies due west of the City (Hydrological Unit 908.00). The Sweetwater River (Hydrological Unit 909.00) initially receives much of the runoff from the southern part of the City, ultimately conveying it into the bay. The Sweetwater River and the Sweetwater Marsh are identified by the City as Environmentally Sensitive Areas (ESA). The river flows along the southern border of the City through the Sweetwater Marsh and into the San Diego Bay. Paradise Creek is a small salt marsh creek that receives runoff from the northern areas of the City and discharges into the Sweetwater River. Paradise Creek and Paradise Marsh have been identified as ESAs. La Paleta Creek traces the northern border of the City, and is 303(d) listed for benthic community effects and sediment toxicity. In the Sweetwater Sub-watershed, sediment was also cited as an additional, lower priority COC. In the Pueblo San Diego Sub-watershed, trash has also been included a lower priority COC. As a whole, the San Diego Bay Watershed Urban Runoff Management Program identified diazinon, bacteria, copper (total and dissolved) and zinc (total) as high priority Constituents of Concern (COC) in its 2005-2006 Annual Report.

## 1.3 Program Overview

To comply with the San Diego Municipal Storm Water Permit adopted by the RWQCB, the City of National City is required to conduct field screening and analytical monitoring at different sampling locations throughout the City during the dry weather season. The purpose of the Dry Weather Monitoring Program is to detect and eliminate illicit connections and illegal discharges (IC/IDs) to the storm drain conveyance system, minimizing the negative impacts of human activities on receiving water bodies.

The Dry Weather Monitoring Program consists of the following three components:

- Field screening observations
- Field analytical testing
- Laboratory analytical testing

Information collected from the dry weather monitoring is also used to characterize dry weather discharges in the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations are conducted as necessary, to detect and eliminate the sources of these pollutants. This report presents the results of the City of National City 2007 Dry Weather Monitoring Program.

## 1.4 Previous Work

The City of National City has conducted dry weather field screening programs since 1996 at several locations within the City's storm water conveyance system. A summary of the screening results obtained for each year is discussed below and presented in Table 1-1.

Prior to **1996**, the field screening programs were limited to visual observations. In the summer of 1996, a complete Dry Weather Monitoring Program was conducted. Twenty sites were visited, at which time measurable flow was observed at three sites and ponded water was observed at four sites.

In **1997**, the City staff conducted a preliminary dry weather field observation. This activity was limited to field visual observations and did not include any field tests or sampling. Based on the results of the field observation, seven sites that had flow at the time of the field visit were selected by the City to be further screened. All seven sites were among the sites that had been screened during the 1996 Dry Weather Monitoring Program. During the field screening program, water flowed at four sites that were subsequently sampled, while tidal flow influenced three sites that were subsequently not sampled. Relatively low concentrations of phenols, chlorine, and copper were detected. An ammonia concentration of 1.5 mg/L and a surfactant concentration in excess of 3.0 mg/L were detected at Site 1.

In **1998**, the City performed dry weather monitoring at seven sites. Five of the selected sites had been screened during the 1997 dry weather field screening program. Four sites had either flowing or ponded water. Low concentrations of phenols were detected at three sites. Copper was not detected at any site. The maximum detected ammonia concentration was 0.7 mg/L. Detected surfactant concentrations did not exceed 0.75 mg/L, and maximum detected chlorine was 0.8 mg/L.

In **1999**, the City conducted preliminary dry weather field observations. Based on the results of the field observations, five sites had flowing or ponded water, and two sites were dry at the time of the field visit. Upon testing, a phenol concentration of 0.1 mg/L was detected at one location. Relatively low concentrations of chlorine were found at all locations with flowing or ponded water. Copper at a low concentration was detected at Site 40. An ammonia concentration of 2.5 mg/L was observed at Site 20, and surfactant concentrations of 2.0 mg/L were detected at sites 1 and 20.

In **2000**, the City conducted dry weather monitoring at seven sites. Five sites had either flowing or ponded water, and two sites were dry. Low concentrations of phenols were detected at two sites. Copper and chlorine were not detected at any sites. The maximum detected ammonia concentration was 0.8 mg/L. Surfactants were detected at Site 11 at a concentration of 1.5 mg/L.

In **2001,** the City conducted field screening at 10 sites, six of which were visited during previous screening programs. The field tests showed relatively low concentrations of constituents tested during the site visits. Phenols were not detected at any sites. Copper was detected at only one site at a low concentration of 0.1 mg/L. Surfactants were detected at all locations sampled, with the highest readings observed at sites 11 and 38 at a concentration of 0.75 mg/L. Ammonia was found in relatively low quantities at most locations, with the highest concentration of 0.7 mg/L found at Site 42.

In **2002**, the City conducted field screening at 15 primary monitoring stations and two alternate stations. The City also conducted laboratory analysis at 25 of the sites with flowing or standing water. Ammonia varied from a minimum of 0.3 mg/L to a maximum of 5.0 mg/L, with the highest concentration detected at Site 1A. Nitrate concentrations peaked at 2.0 mg/L, which is well below the action level of 10.0 mg/L. Orthophosphate-P was found in low concentrations ranging from 0.16 mg/L to 1.96 mg/L. Surfactant concentrations ranged from 0.25 mg/L to a maximum of 24 mg/L. The highest surfactant concentration found was at Site 1A. Laboratory analysis found surfactants reaching a concentration of 6.76 mg/L at Site 1A. Oil and grease measurements ranged from 8.0 mg/L to 25.0 mg/L, with the highest concentration noted at Site 41. Zinc was detected at 0.26 mg/L at Site 1A. All of the other dissolved metal measurements were found below the laboratory detection levels. Bacterial analysis found contamination at two of the sites. Laboratory results for pesticides found all concentrations below the method detection limit.

In **2003**, of the 15 primary sites, two sites were found to be dry and thus were replaced by two alternate sites. The flow rates ranged from less than 1.0 gallon per minute (gpm) to 175 gpm. An ammonia concentration of 1.0 mg/L or greater was found at five sites. Nitrate concentrations did not exceed the action level of 10.0 mg/L at any of the selected sites. Orthophosphate-P concentrations were below the action level of 2.0 mg/L for all of the selected sites. Surfactant concentrations were found to exceed the action level of 1.0 mg/L at three of the sites. Two of the sites had conductivity measurements exceeding 20,000 mhos/cm. Laboratory analyses indicated bacterial contamination at all four sampled sites. Dissolved copper was detected at three sites, while dissolved zinc was detected at two sites, but all measured values for copper and zinc were found to be below the action level. None of the sites had laboratory-detectable levels of dissolved cadmium or lead. Surfactants were not detected by laboratory analyses at any of the sampled sites. Oil and grease were detected at only one of the sites. Diazinon and chlorpyrifos levels were all below the laboratory detection limit of 0.05 g/L.

In **2004,** of the 15 dry weather monitoring sites, two sites, sites 20 and 42, were found to be dry and were replaced by two alternate sites, sites 48 and 49. The flow rates ranged from less than one gpm to 230 gpm. An ammonia concentration of 1.0 mg/L or greater was found at four sites. Nitrate concentrations did not exceed the action level of 10.0 mg/L at any of the sites. Orthophosphate-P concentrations were below the action level of 2.0 mg/L for all of the sites, except for Site 44, where the concentration was 3.26 mg/L. The

orthophosphate-P concentration fell below 2.0 mg/L during the follow-up visit. Surfactant concentrations were found to exceed the action level of 1.0 mg/L at eight sites. High conductivity due to residual salt water was measured at three sites. Laboratory analyses indicated bacterial contamination of all four sites sampled. None of the sites had dissolved lead or cadmium above the laboratory detection limit. Dissolved copper concentrations were detected at one site, and dissolved zinc was detected at all four sites. None of the detected values for zinc and copper were above the action levels. Surfactants were not measured above the laboratory detection limit at any of the sites. Oil and grease were detected below the action level at two of the sites. Diazinon and chlorpyrifos levels were below the laboratory detection level of 0.05 g/L.

In **2005**, all 15 primary dry weather monitoring sites were visited. Two of these sites (sites 20 and 42) were dry, and thus replaced by alternate sampling sites 48 and 49. Flow rates ranged from less than one gpm to 187 gpm. A pH of greater than the action level of 9.0 was not detected at any of the sites. Ammonia concentrations exceeding the action level of 1.0 mg/L $NH_3$-N were measured at two of the sites. Neither nitrate concentrations nor orthophosphate-P concentrations exceeded their respective action levels of 10.0 mg/L $NO_3$-N and 2.0 mg/L $PO_4$-P. No site had a conductivity reading above 20,000 mhos/cm, but two sites had conductivity readings above 10,000 mhos/cm. These reading can be attributed to residual tidal salt water. Only two sites were found to have surfactant concentrations measured above the action level of 1.0 mg/L MBAS, an improvement over the eight sites the previous year. Laboratory analyses once again indicated that all four sample sites had bacterial contamination. Dissolved copper was detected at one site, and dissolved zinc was detected at two sites. Neither dissolved cadmium nor lead were detected at any of the sites. No metals were detected at levels above those set by the California Toxics Rule benchmark for the sampled water hardness. Oil and grease were not detected at any of the sites. Laboratory surfactant concentrations did not exceed the action level. Diazinon was detected at one site, but was well below the action level of 0.5 g/L. Chlorpyrifos was below the laboratory detection level of 0.05 g/L.

In **2006**, all 15 primary dry weather monitoring sites were visited. Site 20 was the only site found to be dry and was replaced with alternate monitoring Site 49. Of the 15 sites sampled, 14 had flowing water. Flow rates ranged from less than one gpm to 281 gpm. All pH measurements were within the acceptable range of 6.0 to 9.0. Ammonia nitrogen exceeded the action level of 1.0 mg/L at one site. Nitrate nitrogen and orthophosphate phosphorus concentrations were below their respective action levels for all of the sites sampled. Two of the sites recorded conductivity readings above 20.0 mS/cm. In both circumstances the high conductivity was attributed to tidal influence at the sites. Surfactants were measured above the action level of 1.0 mg/L MBAS at four different sites, during the field screening portion of the Dry Weather Monitoring Program. Laboratory analysis indicated bacterial contamination at three of the four sites sampled. Similar to the previous year, dissolved cadmium and lead were not detected at any of the sites. Dissolved zinc and copper were detected at sites 32, 41 and 46, but not at concentrations exceeding the California Toxics Rule benchmark for a given water hardness. The pesticides diazinon and chlorpyrifos were not detected at any of the laboratory sampling sites. Oil and grease, and surfactants were also not detected at any of the sites.

## 1.5 Report Outline

This report is presented in the following order:

**Section 1** provides a regulatory background, discusses the hydrologic setting of the City of National City, describes the objectives of the Dry Weather Monitoring Program, summarizes historical field screening data and provides an outline to the report.

**Section 2** describes the sampling locations and the site selection criteria.

**Section 3** describes the field screening and laboratory analytical procedures. This section also discusses quality assurance protocols used during sampling and lists appropriate action levels for initiating follow-up investigations.

**Section 4** discusses the results of the field screening analyses.

**Section 5** discusses the results of the laboratory analyses.

**Section 6** provides a thorough analysis of the collected field and laboratory data and includes descriptions of each site with evidence of physical, chemical or biological pollution.

**Section 7** details the results of follow up investigations undertaken to isolate the source(s) of water contamination detected during the field screening program.

**Section 8** provides a summary of the program results and recommendations for follow-up actions.

**Appendix A** contains photographs of each of the investigated sites.

**Appendix B** contains the laboratory analytical reports.

**Appendix C** contains original copies of the field data sheets.

**TABLE 1-1**

# 2.0 SAMPLING LOCATIONS

In 2007, the City of National City had 15 primary monitoring stations. Additionally, the City acknowledged that alternate stations would be identified and monitored in the event that any of the primary stations did not have ponded or flowing water. All sampling sites are located in San Diego Hydrologic Units 908 and 909.

During the 2007 Dry Weather Monitoring Program, it was noted that Site 38 is located on enclosed private property; therefore the site has been moved to a new location approximately 100 yards downstream.

All 15 primary sampling locations were visited and samples were collected when flowing or ponded water was observed. Primary Site 20 was found to be dry, thus alternate sampling Site 49 was chosen as a replacement.

Table 2-1 provides the site number, location, conveyance configuration, primary and secondary land uses, hydrologic unit, and GPS coordinates of the sampling locations that were visited. Photographs of sampling locations are included as Appendix A. A complete map of the MS4 system, including sampling locations and drainage basins, is included as Figure 1. A map of the watersheds in and around National City, broken down into HSAs, is included as Figure 2.

**TABLE 2-1**
**2007 DRY WEATHER MONITORING STATIONS**

| Site No | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Unit | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908 | 32.68575 | -117.10166 |
| 11 | North of 18th Street, between Roosevelt Avenue and Hoover Avenue | Earthen Channel | Commercial | Commercial | 908 | 32.66695 | -117.10516 |
| 13A | Northeast of 16th Street and National City Boulevard, inside Kimball Park | Outlet | Commercial | Residential | 908 | 32.66942 | -117.10326 |
| 20 | East of Lanoitan Avenue, across from East 13th Street, south of Palmer Way Middle School | Earthen Channel | Residential | Residential | 908 | 32.67894 | -117.07808 |
| 31 | On the Sweetwater River, west of 2nd Avenue and Edgemere Avenue | Outlet | Commercial | Residential | 909 | 32.65861 | -117.08447 |
| 32 | East of 2nd Avenue, north of Freeway 54 and the Sweetwater River | Outlet | Commercial | Open | 909 | 32.65887 | -117.08274 |
| 38 | Dirt road, west of Harbison Avenue, between 20th Street and 24th Street, at the end of fence line | Earthen Channel | Residential | Residential | 909 | 32.67265 | -117.07057 |
| 40 | Southwest corner of Sweetwater Road and Plaza Bonita/Stockman Street, down in channel | Outlet | Commercial | Residential | 909 | 32.65961 | -117.06677 |
| 41 | Northeast of San Miguel Court and Valley Road, inside Park Bonita Apartment complex | Earthen Channel | Residential | Residential | 909 | 32.66588 | -117.05083 |
| 42 | Southwest of Euclid Avenue and 24th Street, south of Southern Community Church | Outlet | Residential | Commercial | 909 | 32.66785 | -117.07691 |
| 43 | Southeast of National City Boulevard and 30th Street, north of South Bay Volkswagen | Manhole | Commercial | Residential | 909 | 32.65620 | -117.09911 |

**TABLE 2-1**
**2007 DRY WEATHER MONITORING STATIONS (CONTINUED)**

| Site No | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Unit | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 44 | Northeast of 16th Street and National City Boulevard, under the Kimball Park bridge | Concrete Channel | Commercial | Residential | 908 | 32.66982 | -117.10247 |
| 45 | In front of 1243-1305 Fig Court, in the middle of street | Manhole | Residential | Parks | 908 | 32.68739 | -117.09690 |
| 46 | South of South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop | Manhole | Commercial | Residential | 908 | 32.67584 | -117.09539 |
| 47 | Southeast corner of the Mile of Cars Way and Transportation Avenue | Manhole | Commercial | Residential | 908 | 32.66163 | -117.10275 |
| 49 | South end of Arcadia Place (through Harbison Avenue and 11th Street) | Concrete Channel | Residential | Commercial | 908 | 32.68102 | -117.07751 |

Alternate Site 49 was selected to substitute for dry primary monitoring Site 20.

# 3.0 FIELD AND LABORATORY ANALYTICAL METHODS

## 3.1 Field Screening Procedures and Methods

Field screening techniques consisted of qualitative field observations, flow measurement, and field analyses of selected water quality parameters. Information relating to weather conditions, the amount of time since last rainfall, and the type of storm water conveyance was recorded. Specific observations and results of the field water quality analyses were documented on field data sheets, which are included in Appendix C. The data sheets also serve as a record of the field visit and were completed for every site visit regardless of whether or not samples were collected.

Field screening and analyses were conducted according to the following procedures and methods.

Qualitative Observations

Qualitative field observations were made during each site visit whether or not ponded or flowing water was observed. These observations were intended to provide a general assessment of the site and include variables like odor, water clarity, the presence of floatables, visible deposits, stains and biological status. Evidence of present or past illicit connections and illegal discharges to the storm drain system may be ascertained by careful field observations. Each field screening location was photographed to provide additional information and documentation of site conditions. Photos are included in Appendix A.

Field Water Quality Analyses

At each site with ponded or flowing water, water samples were collected and analyzed in the field for the following constituents:

- Specific Conductance
- Temperature
- pH
- Turbidity
- Surfactants (MBAS)
- Nitrate-N
- Ammonia-N
- Orthophosphate Phosphorus (Orthophosphate-P)

Surfactants are also referred to as detergents, specifically with respect to discussion of field test kit results. Due to the importance of surfactants, the City conducted analysis for this parameter in both the field and laboratory. Surfactant concentration was measured as Methylene Blue Active Substances (MBAS).

Flow Measurement

Flow measurements can be used to estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may be indicative

of an illegal release upstream. Various field methods can be used to estimate the discharge rate. These include visual estimation, measuring the velocity, depth and width of the flowing water, or recording the amount of time required to fill a bottle of known volume with sample water.

The methods that were used to perform the above field analyses, along with the detection limit, range and accuracy of each method, are listed in Table 3-2 at the end of this section.

## 3.2 Laboratory Analytical Methods

In accordance with Order 2001-01 requirements, water samples were collected at five sites (greater than 25 percent of the sites) where ponded or flowing water was observed. Samples were submitted to EnviroMatrix Analytical, Inc., a California Department of Health Services certified laboratory, for analysis of the following constituents:

- Total Hardness
- Surfactants, measured as MBAS
- Oil and grease
- Diazinon
- Chlorpyrifos
- Cadmium (dissolved)
- Copper (dissolved)
- Lead (dissolved)
- Zinc (dissolved)
- Total Coliform bacteria
- Fecal Coliform bacteria
- *Enterococcus*

The methods used to perform each of the above analyses along with method reporting limits and holding times are listed in Table 3-3.

## 3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project included the United States Environmental Protection Agency (USEPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

### 3.3.1 Field Sampling and Analysis QA/QC

The pH meters were calibrated periodically with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube was kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter was calibrated and periodically checked for accuracy using standard solutions. The conductivity meter was checked periodically with standard solutions and calibrated as necessary.

Field sample collection containers were first rinsed with distilled water and then with the sample water before sample collection. Upon completion of sampling at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water.

The accuracy of field analytical techniques was assessed at the beginning of the sampling program by analyzing solutions of known concentrations for ammonia, surfactants, nitrate, and orthophosphate. The results of the assessment are shown below in Table 3-1.

**TABLE 3-1**
**FIELD ANALYSIS QA QC RESULTS**

| Date | Analyte | Known Concentration | Acceptable Range | Field Test Kit Results |
|---|---|---|---|---|
| 9/17/07 | Ammonia Nitrogen | 1.0 mg/L | 0.8 1.2 mg/L | 0.9 mg/L |
| 9/17/07 | Surfactants | 1.0 mg/L | 0.75 1.25 mg/L | 1.0 mg/L |
| 9/17/07 | Nitrate Nitrogen | 10.0 mg/L | 7.0 13.0 mg/L | 10.4 mg/L |
| 9/17/07 | Orthophosphate | 3.0 mg/L | 2.5 3.5 mg/L | 2.8 mg/L |

**Note**
Acceptable range is calculated based on the error associated with the methods as listed in Table 3-2.

### 3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis were collected concurrently with field samples and utilized the same sampling procedures. Pre-sterilized sample bottles were obtained from the laboratory and thus did not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples were kept in a cooler on ice until picked up by the laboratory. Strict chain-of-custody procedures were followed and samples were delivered and analyzed within the appropriate holding times, as listed in Table 3-3. Completed chain-of-custody forms are included in Appendix B.

## 3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation was necessary, numeric action levels and best professional judgment (described below) were used to interpret the field screening results. If visual and/or analytical evidence of gross contamination was present at a site (e.g., substantial petroleum sheen, extremely high ammonia concentration, evidence of a sewage release, etc.), then an immediate source identification investigation was initiated. For sites that exceeded numeric action levels but were not perceived as an immediate threat to water quality, a re-sampling was conducted within 24 hours. A comprehensive source investigation was conducted thereafter if elevated concentrations persisted. The results of these investigations are included in Section 7 of this report. Recommendations based on these investigations are included in Section 8.

If elevated levels of pollutants were detected after laboratory analyses, a comprehensive follow-up investigation including re-sampling was conducted. The following three methods were employed to determine whether immediate or comprehensive follow-up investigations were necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment. All three approaches are described in detail below and presented in Table 3-4.

**Numeric Action Levels**

Numeric action levels were used as the primary approach for interpreting pH, orthophosphate-P, nitrate nitrogen, ammonia nitrogen, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels, which are based on county-wide sampling data and have been used by all Copermittees since the 2003 dry weather season. If pH, orthophosphate-P, nitrate, ammonia, or surfactants were observed above the numeric action level, a follow-up investigation was conducted within 24 hours to investigate the source unless best professional judgment indicated otherwise. If oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, or *Enterococcus* laboratory analytical results exceeded numeric action levels, then source investigations were conducted.

**California Toxics Rule**

The CTR criterion maximum concentration (CMC) was used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in USEPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total hardness of the sampled water, with the action levels increasing as hardness increases.

**Best Professional Judgment**

Best professional judgment was utilized as the primary approach for interpreting turbidity, conductivity, and water temperature. Best professional judgment was also the secondary approach for interpreting the results of all other field and laboratory analyses. Under best professional judgment, the need for a follow-up investigation is left to the discretion of the D-MAX field crew due to their familiarity with the City of National City's Dry Weather Monitoring Program and their knowledge of typical levels for the tested parameters. Best professional judgment may indicate that results which either exceed certain action levels or are statistical outliers may be the result of natural or background factors.

## TABLE 3-2
## FIELD ANALYTICAL METHODS

| Parameter | Method | Reporting Limit | Range | Accuracy |
|---|---|---|---|---|
| Specific Conductance | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter□□□ | 0.01 mS/cm | 0 □20 mS/cm | ± 2□ of functional sensitivity[1] |

**Notes:**

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20□. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L $NO_3$. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the $NO_3$ molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14g/mol) to $NO_3$ (62 g/mol). The detection limit for nitrate is 10.0 mg/L; however, the detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30□ at PDL, ±20□ for 25□ of full range, ±10□ for 75□ of full range, ±10□ for 120□ of full range.

[6] This method determines the concentration of orthophosphate in mg/L $PO_4$. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the $PO_4$ molecule. Oxygen is 67.4□ of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31g/mol) to $PO_4$ (95 g/mol). The detection limit for orthophosphate is 0.75 mg/L; however, the detection limit for orthophosphate phosphorus is lowered due to the conversion.

□Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

□□Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

□□□Reporting limit, range, and accuracy information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com.

**TABLE 3-3**
**LABORATORY ANALYTICAL METHODS**

| Analyte | Analytical Method | Method Reporting Limit | Maximum Holding Time |
|---|---|---|---|
| Surfactants, measured as MBAS | SM 5540 C | 0.5 mg/L | 48 hours |
| Oil and Grease | USEPA 1664 | 5 mg/L | 28 days |
| Total Hardness | USEPA 200.7 | 10 mg/L | 14 days |
| Cadmium | USEPA 6010, 6020, 200.8 | 0.005 mg/L | 6 months |
| Copper | USEPA 6010, 6020, 200.8 | 0.005 mg/L | 6 months |
| Lead | USEPA 6010, 6020, 200.8 | 0.005 mg/L | 6 months |
| Zinc | USEPA 6010, 6020, 200.8 | 0.020 mg/L | 6 months |
| Diazinon | USEPA 8141A | 0.05 g/L | 7 days |
| Chlorpyrifos | USEPA 8141A | 0.05 g/L | 7 days |
| Total Coliforms | SM 9221 | 20 1,600,000 MPN/100 mL | 6 hours |
| Fecal Coliforms | SM 9221 | 20 160,000 MPN/100 mL | 6 hours |
| Enterococci | SM 9230 | 20 160,000 MPN/100 mL | 6 hours |

**Notes:**

For D-Max s Dry Weather Monitoring Program, EnviroMatrix Analytical, Inc. (EMA) performs standard dilutions for total coliforms to quantify from 20-1,600,000 most probable number per 100 milliliters (MPN/100mL). For fecal coliforms and enterococci, EMA performs standard dilutions to quantify from 20-160,000 MPN/100 mL. During the analysis and interpretation of the results, the number of tubes used to quantify the sample must fit the MPN index table from Standard Method 9221. The dilution set used will determine the detection limit. A standard dilution analysis is set up with 15 tubes at different concentrations. The reporting limit will always be adjusted depending on the dilution factor used for quantifying the actual results based on the MPN table. If the result for the analysis was less than 16,000 MPN/100 mL, the reporting limit will always be 20, and the dilution factor will be 10. As the dilution factor goes up, the reporting limit listed in the results from EMA will also go up based on the calculation made with EMA s data system. However, the lowest quantifiable number or reporting limit would still be 20 based on how the standard tubes for the sample is set up.

Maximum Holding Time values listed here apply to samples collected and preserved in accordance with the QA/QC procedures listed in Section 3.3.2.

## TABLE 3-4
## ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

| Field Screening Analytes | Action Levels[1] | Source□Notes |
|---|---|---|
| pH | □6.5 or 9.0 | Basin Plan[2], with allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia. |
| Orthophosphate-P (mg/L) | 2.0 | USEPA Multi-sector General Permit |
| Nitrate-N (mg/L) | 10.0 | Basin Plan and drinking water standards |
| Ammonia-N (mg/L) | 1.0 | Based on Workgroup experience. May also consider unionized ammonia fraction. |
| Turbidity (NTU)[2] | Best Professional Judgment | WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity) and unusual odors. |
| Temperature (□C) | Best Professional Judgment | Base judgment on season, air temperature, channel type, shading, etc. |
| Conductivity (mS/cm) | Best Professional Judgment | Conductivity may be highly elevated in some regions due to high TDS, groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values □0.75 may indicate excessive potable water discharge or flushing. |
| **Laboratory Analytes** | **Action Levels** | **Source□Notes** |
| Surfactants (mg/L MBAS) | 1.0 | Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences. |
| Oil and Grease (mg/L) | 15 | USEPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation. |
| Diazinon (□g/L) | 0.5 | Response to diazinon and chlorpyrifos levels above 0.5 □g/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs. |
| Chlorpyrifos (□g/L) | 0.5 | |
| Dissolved Cadmium (□g/L) | California Toxics Rule | Use California Toxics Rule, CMC criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd □ 14 ppb; Cu □ 38 ppb; Pb □ 209 ppb; and Zn □ 297 ppb. |
| Dissolved Copper (□g/L) | California Toxics Rule | |
| Dissolved Lead (□g/L) | California Toxics Rule | |
| Dissolved Zinc (□g/L) | California Toxics Rule | |
| Total Coliforms (MPN/100 mL) | 50,000 | Bacteria levels in many storm drains are likely to exceed public health guidance criteria. Use confidence interval test and best professional judgment to identify conveyances for source ID. |
| Fecal Coliforms (MPN/100 mL) | 20,000 | |
| Enterococci (MPN/100 mL) | 10,000 | |

**Notes**

[1]The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry weather monitoring data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.

| | |
|---|---|
| □C | degrees Celsius |
| mS/cm | milli Siemens per centimeter |
| mg/L | milligram per liter |
| IC/ID | illegal connection/illicit discharge |
| MBAS | methylene blue active substances |
| MPN/100 mL | most probable number (of colony forming units) per 100 milliliters |
| NTU | nephelometric turbidity unit |
| ppb | parts per billion |
| USEPA | United States Environment Protection Agency |
| WQO | Water Quality Objectives |
| CMC | criterion maximum concentration |

# 4.0 FIELD SCREENING RESULTS

The Dry Weather Monitoring Program was started on September 17, 2007 and completed on September 20, 2007. A total of 15 monitoring stations were visited, and field screening was conducted at the sites where ponded or flowing water was observed. 12 sites had measurable flow, and three sites were ponded. A total of 20 site visits were performed, including one dry site and four follow-up visits to sites where one or more constituents were found to exceed specified action levels.
Primary sampling Site 20 was dry, therefore alternate Site 49 was selected as a replacement.

## 4.1 Qualitative Observations

Qualitative observations are a routine and important part of the field screening program. Weather conditions were recorded at each site and any evidence of dry weather flows was documented. Observations of the sample water and the vicinity of the sampling location such as odor, color, clarity, floatable materials, vegetation, and biological activity were also recorded. Observations are summarized below and presented in Table 4-1.

***Light Conditions***
Sunny, partly cloudy and overcast weather were the conditions during the routine field screening visits.

***Odor***
Site 11, had a fishy odor during the visit to the site. No other visited sites had observable odors during the 2007 field screening program.

***Color***
Water from nine sites had a yellow tint, while water samples taken from six of the sites were colorless.

***Clarity***
The majority of the water samples collected from the visited sites were clear, with negligible amounts of suspended particles observed. The water sample taken at Site 11 appeared to be slightly cloudy.

***Floatable Materials***
During routine field screening visits, nine of the 15 visited sites were observed to have trash in or around the sampling location. A relatively small amount of trash was encountered at most of these sites, however, illegal dumping was more severe at a few sites; Sites 1A, 40, 44 had particularly extensive amounts of trash. The trash observed included materials such as paper, plastics, Styrofoam, aluminum cans, glass bottles, and shopping carts.

***Vegetation***
Vegetative growth ranged from no growth to naturally vegetated riparian areas. Seven of the 16 visited sites had normal vegetation. No growth was observed at the rest of sites, which included manholes, catch basins, and some outlets that received no sunlight, or concrete channels that had no soil.

***Biology***
Eight of the sites exposed to sunlight had algal growth, which indicates persistent water flow. A few of the sampling locations had a more extensive array of organisms such as insects, snails, fish, crawfish and cockroaches.

***Deposits***
Coarse and fine particulate deposition was observed at nearly all of the sites visited, but no other deposits were noted.

**TABLE 4-1**
**SUMMARY OF DRY WEATHER FIELD OBSERVATIONS**

| Site No. | Date | Time | Light Conditions | Odor | Color | Clarity | Floatables | Deposits | Vegetation | Biology |
|---|---|---|---|---|---|---|---|---|---|---|
| 1A | 9/18/07 | 11:10 | Partly Cloudy | None | None | Clear | Trash | Fine Particulates | Normal | Insects, Algae, Snails |

## 4.2 Field Analytical Results

Field analyses were conducted at all sites with ponded or flowing water. Chemical analyses were conducted using a CHEMetrics field test kits for surfactants and CHEMetrics V-2000 Multi-Analyte LED Photometer and Vacu-vials for nitrate, ammonia, and orthophosphate. The pH, conductivity, and temperature were measured using a Hanna Instruments Portable pH/EC/TDS/Temperature Meter (HI 991301); turbidity was measured using a Hanna Instruments Portable Turbidity Meter (HI 93203-11). A summary of the field analytical results is presented in Table 4-2. Table 4-3 presents the results of all field analyses conducted at the sampled sites. Graphs of each parameter analyzed and appropriate action levels for follow-up investigations are included at the end of this section.

**TABLE 4-2**
**FIELD ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum | Average | Median |
|---|---|---|---|---|
| Flow Rate (gpm) | 218 | 1.0 | 20.2 | 2.0 |
| Temperature (C) | 28.5 | 19.1 | 22.0 | 21.8 |
| pH | 10.0 | 7.3 | 8.0 | 8.0 |
| Turbidity (NTU) | 18.43 | 0.1 | 3.62 | 2.67 |
| Conductivity (mS/cm) | 12.44 | 1.1 | 3.26 | 1.74 |
| Ammonia (mg/L $NH_3$-N) | 0.4 | nd | 0.2 | 0.1 |
| Surfactants (mg/L MBAS) | 1.25 | 0.38 | 0.73 | 0.75 |
| Nitrate (mg/L $NO_3$-N) | 2.24 | 0.43 | 0.87 | 0.59 |
| Orthophosphate-P (mg/L $PO_4$-P) | 1.17 | 0.07 | 0.57 | 0.46 |

nd not detected

**Flow rates** at sites with measurable flow ranged from less than 1.0 gpm to 218 gpm, with an average of 20.2 gpm and a median of 2 gpm, as shown in Table 4-2. The highest flow rate of 218 gpm was measured at Site 31.

**Water temperature** is an important physical parameter because it is needed to assess the significance of other parameters such as pH, conductivity, and dissolved oxygen. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. Water temperature was measured in the field immediately upon sample collection at each site with ponded or flowing water. Temperature readings ranged from 19.1 to 28.5 degrees Celsius (C), with an average of 22C and a median of 21.8 C. The maximum water temperature of 28.5C was recorded at Site 44 during the afternoon. The minimum water temperature of 19.1C was measured in the morning at Site 32 with ponded water. Graph 4-1 presents the results of temperature readings at all sites.

The **pH** is a measure of whether water is acidic or basic. This is a critical factor in determining water quality, as the pH of an aquatic system will drive a multitude of chemical reactions, including the availability of nutrients and the solubility of chemical substances, especially heavy metals. The pH values ranged from 7.3 to 10, with an average and median of 8. The highest pH reading of 10 was observed at Site 44, while the lowest pH during routine field screening was 7.3, recorded at Site 46. Graph 4-2 presents the results of pH readings at all sites.

**Turbidity** indicates the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation (thus reducing photosynthetic capacity), but excessive suspended particles can also absorb heat and elevate water temperatures. Turbidity measurements ranged from 0.1 to 18.43 NTU, with an average of 3.62 NTU and a median of 2.67 NTU. The highest turbidity reading of 18.43 NTU was recorded at Site 11, and the lowest measurement of 0.1 NTU was observed at Sites 1A, 31, 40, and 45. Graph 4-3 presents the results of turbidity measurements at all sites.

**Conductivity** values indicate the total concentration of ions in an aquatic system and the ns ability of water to conduct electricity. This parameter can be used to assess the mineral content of water or to help determine the presence of dissolved pollutants. Conductivity readings ranged from 1.1 to 12.44 mS/cm, with an average of 3.26 mS/cm and a median of 1.74 mS/cm. The highest conductivity measurement of 12.44 mS/cm was recorded at Site 31, while the lowest reading of 1.1 mS/cm was taken at Site 45. Graph 4-4 illustrates the results of conductivity measurements at all sites.

**Ammonia Nitrogen** ($NH_3$-N) is a common indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment, however, in higher quantities it can become toxic to fish and other organisms. Ammonia concentrations measured in sampled water ranged from not detected to 0.4 mg/L, with an average of 0.2 mg/L and a median of 0.1 mg/L. The highest ammonia concentration, measured at 0.4 mg/L, was observed at Sites 41, and 47. Ammonia was not detected at Site 45. Graph 4-5 shows the results of the ammonia analyses at all sampling locations.

**Surfactants** in water samples often indicate illegal discharges from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms. During field analysis, surfactant concentrations ranged from 0.38 mg/L to 1.25 mg/L, with an average of 0.73 mg/L and a median of 0.75 mg/L. The highest concentration of 1.25 mg/L was found at Site 13A. Surfactant concentration of 1.0 mg/L was recorded at Sites 1A and 46 at the first visit to the sites. Graph 4-6 reflects the results of the surfactants analyses at all sampling locations.

**Nitrate Nitrogen** ($NO_3$-N) is a common indicator of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, which can later cause the suffocation of fish and other aquatic organisms by depleting oxygen from the water during decomposition. During the field analysis, nitrate was measured in mg/L $NO_3$ and converted into mg/L $NO_3$-N using a conversion factor of 0.226. This process is explained in footnote 3 of Table 3-2. Measured nitrate concentrations ranged from 0.43 to 2.24 mg/L, with an average of 0.87 mg/L and a median of 0.59 mg/L. The highest nitrate concentration of 2.24 mg/L was observed at Site 38, while the lowest concentration of 0.43 mg/L was recorded at alternate Site 49. Graph 4-7 presents the results of the nitrate analyses at all sampling locations

**Orthophosphate Phosphorus**($PO_4$-P), also known as reactive phosphorus, is also a common indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate, phosphate pollution can cause nutrient enrichment (eutrophication), which stimulates algal growth and eventually lowers aquatic dissolved oxygen to levels that are dangerous for aquatic life. Because it is commonly the limiting nutrient in plant growth, even low levels of phosphate can cause significant algal growth. During the field analysis, orthophosphate was measured in mg/L $PO_4$ and converted into mg/L $PO_4$-P using a conversion factor of 0.326. This process is explained above in note 6 of Table 3-2. Orthophosphate-P was measured at concentrations ranging from 0.07 to 1.17 mg/L, with an average of 0.57 mg/L and a median of 0.46 mg/L. The highest nitrate concentration of 1.17 mg/L was observed at Site 11, while the lowest concentration of 0.07 mg/L was recorded at Site 31. Graph 4-8 illustrates the results of orthophosphate-P at all sampling locations.

# 5.0 LABORATORY ANALYTICAL RESULTS

## 5.1 Summary

Laboratory analyses were conducted at four sites, representing over 25 percent of all sites with ponded or flowing water. A summary of the laboratory analytical results is presented in Table 5-1. Table 5-2 presents the laboratory results from all samples. Laboratory reports are included as Appendix B.

**TABLE 5-1**
**LABORATORY ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum |
|---|---|---|
| Surfactants ( mg/L MBAS) | 0.8 | nd |
| Oil and grease (mg/L) | nd | nd |
| Total Hardness (mg/L $CaCO_3$) | 1010 | 234 |
| Cadmium (dissolved, mg/L) | nd | nd |
| Copper (dissolved, mg/L) | 0.008 | nd |
| Lead (dissolved, mg/L) | 0.008 | nd |
| Zinc (dissolved, mg/L) | 0.041 | nd |
| Diazinon (□g/L) | nd | nd |
| Chlorpyrifos (□g/L) | nd | nd |
| Total Coliform (MPN/100 mL) | 1,600,000 | 23,000 |
| Fecal Coliform (MPN/100 mL) | 160,000 | 2,300 |
| *Enterococcus* Bacteria (MPN/100 mL) | 160,000 | 13,000 |

**nd not detected**

**Surfactants (MBAS)** are analyzed to detect surfactant pollution from residential, commercial, or industrial washing activities. Surfactants were detected at Sites 1A and 46 with concentrations of 0.7 and 0.8 mg/L respectively.

**Oil and grease** analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities. Oil and grease levels were non-detectable for all four tested sites.

**Total hardness** measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Although it is not itself considered a pollutant, total hardness is measured in order to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals, as well as other minerals and ions. Total hardness values ranged from 234 to 1,010 mg/L.

**Diazinon** and **chlorpyrifos** are organophosphate pesticides that are detrimental to birds, mammals, beneficial insects, freshwater fish, invertebrates, and other aquatic organisms. Neither diazinon nor chlorpyrifos were detected at any of the sampled sites.

**Metal** contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the

survival and development of aquatic organisms, including fish and waterfowl. The laboratory samples collected were analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Cadmium was not detected at any of the sampled sites. Dissolved copper was detected with concentration of 0.008 mg/L, at the Site 32. Dissolved lead, with concentration of 0.008 mg/L, was recorded at Site 1A. Dissolved zinc was detected at Sites 1A and 32 with concentrations of 0.041 and 0.034 mg/L, respectively.

The California Toxics Rule (CMC) for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness, with toxicity decreasing as hardness increases. The CTR limit was calculated using the lowest total hardness value from all the sites that has detectable levels of any metal, 234 mg/L, to use the strictest action level. The action levels for dissolved copper, lead and zinc in a water sample corresponding to a hardness value of 234 mg/L $CaCO_3$ are 0.03, 0.161, and 0.24 mg/L respectively. Therefore, since measured copper and zinc concentrations were below the action levels for the lowest measured hardness value, pollutant source investigations were not required.

**Coliform bacteria** are relatively harmless to humans and are typically present at high levels in mammalian digestive tracts, as well as naturally found in most surface waters and soils. They are also present in soil and decomposing organic matter, so measurements of total coliform bacteria are not typically considered to be very accurate indicators of fecal contamination. Water samples are analyzed for total coliform bacteria because it is a historically accepted public health practice and because the Municipal Permit requires it. During the 2007 Dry Weather Monitoring Program, total coliform count ranged from 23,000 to greater than 1,600,000 MPN/100 mL. The highest level of greater than 1,600,000 MPN/100ml was found at Site 46. Total coliform concentration at Site 1A was 50,000 MPN/100mL. Upstream investigations were conducted at all four sites; the results are detailed in Section 7 of this report.

**Fecal coliform**, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastro-intestinal (GI) tracts of humans and animals, so they are commonly used as indicators of water contamination by fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material was human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain. Fecal coliform counts ranged from 8,000 to greater than 160,000 MPN/100 mL, and exceeded the action level of 20,000 MPN/100 mL at sites 1A and 46. *Enterococcus* counts ranged from 13,000 to greater than 160,000 MPN/100 mL. Three of the four sampled sites, exceeded the established action level 10,000 MPN/100 mL for *Enterococcus* bacteria. Site 41 was the only site to record all three bacterial indicators below their respective action levels. Sites 1A and 46 exceeded the action levels for all three bacterial indicators, while Site 32 exceeded the action level for *Enterococcus* bacteria only.

## TABLE 5-2

# 6.0 DATA ANALYSIS

Based on qualitative observations and field and laboratory analytical testing, the following sites demonstrated physical and chemical evidence of possible illegal discharges and/or illicit connections.

## Site 1A

Site 1A is a concrete channel located in the southwest corner of the 43rd Street and Nordica Avenue intersection (see Appendix A for photo). A significant amount of trash and debris accumulation was observed in the vegetation at the site. The trash was composed primarily of plastic bottles, plastic wrappers, paper waste and aluminum cans (see Photo 6-1). A sample was collected from a section of the channel which was flowing at 3 gallons per minute (gpm). The sample appeared clear and colorless with no discernable odor. Field screening tests performed during the initial visit to the site indicated a surfactant concentration equal to the action level of 1.0 mg/L MBAS. Since elevated surfactant levels are often the result of washing activities, areas upstream of the site were searched, but no washing activities were observed at that time. It should also be noted that laboratory analysis of the sample collected indicated a surfactant concentration of 0.7 mg/L MBAS, which is below the established action level. However, these results were not available by the following day, therefore a follow-up visit to the site was performed based on the field screening results.

**Photo 6-1** Trash accumulation observed at Site 1A

By the time of the follow-up visit to the site the next day, the surfactant concentration had dropped below the action level to a concentration of 0.75 mg/L MBAS. The field crew believes that the surfactants initially measured at the site were transient, and likely the result of washing activities occurring upstream of the site. In 2005, elevated surfactant levels at Site 1A were traced to an individual washing his car upstream of the site. Last year surfactants were measured above the action level during the initial site visit, but not during the follow-up. The area surrounding Site 1A is comprised primarily of residences and commercial establishments where vehicle washing and other surfactant generating wash activities are likely to occur. As a result, elevated surfactant levels have been intermittently observed at Site 1A.

Sampling for laboratory analyses was also conducted at Site 1A. Results indicated that all three bacterial indicators (total coliform, fecal coliform and *Enterococcus*) were counted at values above their respective action levels. Total coliform was measured to be 500,000 MPN/100 mL, fecal coliform was measured to be 24,000 MPN/100 mL and *Enterococcus* bacteria was measured to be 24,000 MPN/100mL. In order to identify the source(s) contributing to the elevated bacteria levels observed at the site, further upstream investigation was performed by the field crew (see Section 7).

## Site 13A

Site 13A is a concrete outlet located northeast of the 16th Street and National City Boulevard intersection, inside Kimball Park (see Appendix A for photo). The outlet discharges into the downstream end of the concrete channel running through the park. A small flow of less than one gallon per minute was sampled. Field screening test indicated a surfactant concentration of 1.25 mg/L, above the action level. The site was visited several times the following two days, but no flow or ponded water was observed. Since no follow-up sample could be collected, the surfactants measured at the site are likely transient. This was the first year on record that surfactants have been measured above the action level for this site.

## Site 32

Site 32 is an outlet located along the north bank of the Sweetwater River, just east of 2nd Avenue nearby State Route 54 (see Appendix A for photo). This site drains the commercial area upstream of the outlet to Sweetwater River. Only a relatively small amount of trash was observed at the outlet itself. However, in the vegetated area downstream of the site, evidence indicating human inhabitation was noticed. No individuals were present at the time, but a backpack and a few articles of clothing were observed. Water was not flowing at the site, so a sample of ponded water was collected from the outlet. Field screening tests performed indicated that all constituents tested were within an acceptable range or at concentrations below their respective action levels. Laboratory analysis of the collected sample indicated slightly elevated *Enterococcus* bacteria counts, 13,000 MPN/100 mL. Further upstream investigation was conducted in order to identify the source(s) responsible for the elevated *Enterococcus* bacteria levels identified at Site 32 (see Section 7).

## Site 44

Site 44 is a section of concrete channel located northeast of the 16th Street and National City Boulevard intersection, underneath the Kimball Park Bridge (see Appendix A for photo). A significant amount of trash, including plastic bottles, wrappers, glass and aluminum cans, was observed in the channel upstream of the site. Algal growth was also noted throughout the channel. During the initial visit to the site, a sample of ponded water was collected. Field screening tests performed indicated a pH of 10.0, above the established action level of 9.0. It should be noted that the sample was collected during a sunny afternoon, and that the water sampled was relatively warm, 28.5 °C. The follow-up visit to the site was conducted in the early morning on an overcast day. This time a sample was collected from a small trickle of water flowing at less than 1 gpm. The water temperature, 19.6 °C, was much lower than measured during the initial visit to the site. The pH was now within the acceptable range, at a value 7.9. Exposed concrete channels with algal growth often have elevated pH values in the latter part of relatively sunny days for the reasons described below.

**Photo 6-2** Trash observed upstream in the concrete channel within Kimball Park

The field crew believes that the high pH reading resulted primarily from algal photosynthesis and increased temperature, which remove carbon dioxide from the water. Because carbon dioxide forms carbonic acid when dissolved in water, removal of carbon dioxide from water makes the water more basic and results in higher pH readings. Typically the pH increases during daylight hours as sunlight stimulates algal photosynthesis and carbon dioxide is removed from water. During the night when algae is not photosynthesizing, the carbon dioxide level in the water increases due to biological respiration and physical diffusion of carbon dioxide from air into water, and the pH decreases. Because the solubility of gas in water is inversely proportional to the water temperature, carbon dioxide is less soluble in warmer water. Sunlight heats the shallow, unshaded water in a concrete channel, resulting in lower solubility for carbon dioxide later in the day when the water is warmer. The effects of temperature and algal photosynthesis lead to lower pH values in the morning and higher values in the afternoon.

## Site 46

Site 46 is a manhole located on the southern side of the South Bay Plaza Shopping Center (see Appendix A for photo). The site primarily receives runoff from the commercial area around the shopping center, but also from the residential area further to the south. When the site was first visited, several of the catch basins located behind shopping center smelled of rotting grease. A sample was collected from water flowing at 1 gpm within the manhole. The sample appeared slightly yellow, but was clear with no discernable odor. Surfactants were measured at a concentration of 1.0 mg/L MBAS, equal to the established action level. Since elevated surfactant levels are often the result of washing activities, the field crew immediately searched upstream in an attempt to identify any potential surfactant sources. No washing activities were observed upstream of the site or within the shopping center at that time. It should also be noted that laboratory analysis of the sample collected indicated a surfactant concentration of 0.8 mg/L MBAS, which is below the established action level. However, these results were not available by the following day, and therefore a follow-up visit to the site was performed based on the field screening results.

During the follow-up visit to the site, conditions at the site were similar to the initial visit. The water was still clear, odorless and slightly yellow in tint. A flow of 1 gpm was observed within the manhole. This time, surfactants were measured at a concentration of 0.75 mg/L MBAS, below the action level. Again, no individuals were observed conducting washing activities within the shopping center. The decrease in surfactant concentration between visits, since action level exceedances have not typically been measured at Site 46, likely indicates that the elevated surfactant levels are transient.

The results of the laboratory analysis performed showed that all three bacterial indicators (total coliform, fecal coliform and *Enterococcus*) were counted at levels well above their respective action levels. Total coliform was measured to be greater than 1,600,000 MPN/100 mL, fecal coliform was measured to be greater than 160,000 MPN/100 mL and *Enterococcus* bacteria was measured to be greater than 160,000 MPN/100 mL. Further upstream investigation was conducted in order to identify any source(s) contributing to the elevated bacteria levels observed at Site 46 (see Section 7).

# 7.0 UPSTREAM INVESTIGATIONS

## 7.1 Purpose

The purpose of the upstream investigations is to find the source of the pollutants that were identified during initial field screening and laboratory testing.

The field screening program performed in September 2007 found elevated surfactant concentrations at Sites 1A, 13A, and 46. Surfactant concentrations were transient at each of these sites, and therefore no further upstream investigation was required. A high pH reading was recorded at Site 44 during the initial site investigation. The pH dropped within the acceptable range by the time of the follow-up visit, requiring no further upstream investigation. Samples were collected for laboratory analysis at four sites during the initial round of field screening. Complete results of these analyses, showed bacteria levels in excess of their established action levels for three of the four sites. Upstream investigations were undertaken for Sites 1A, 32 and 46 to identify the source(s) of the high bacteria counts.

## 7.2 Investigation Procedure

Upstream investigations were conducted in two rounds. The first upstream investigations were for the sites at which field tests indicated elevated constituent levels. These investigations were conducted immediately after confirming the elevated concentrations via additional field testing. The second round of upstream investigations was carried out for the sites at which laboratory testing had found elevated constituent levels. These investigations were conducted after receiving the test results from the laboratory.

During the investigations, the D-MAX field crew measured flow rates, performed visual observations, and conducted field testing. Visual observations, such as water color, clarity, odor, floatable materials, vegetation and biology, and physical parameters, such as temperature, pH and conductivity, were recorded on field data sheets at each official sampling site. Observations and data for locations upstream of the official sites were recorded in the field crew's log notebooks. Field data sheets are included in Appendix C.

In order to determine the potential sources of bacteria to sites with high bacteria, the D-MAX field crew used 3M Petrifilm *E. coli* /Coliform Count plates as a rapid method to trace sources of both total coliform bacteria and *E. coli* bacteria in the storm water conveyance system. Because laboratory microbiological analyses take a significant amount of time, relying primarily on laboratory analyses can significantly delay an upstream investigation for bacteria. Also, due to the cost of these tests, often only a few locations can be examined, giving a less comprehensive picture. Using the Petrifilm plates allowed the field crew to quickly sample numerous branches or locations upstream of the sites.

Samples were taken in the field and preserved with Butterfield's phosphate buffer to keep the pH close to 7. Sample containers were kept on ice in a cooler and then plated within 6 hours of collection to ensure proper holding times were observed. The plates were then incubated at 35°C ± 1°C. After 24 hours of incubation, total coliform bacterial concentrations were enumerated, and after an additional 24 hours (48 hours incubation

total) *E. coli* levels could be read from the same plates, helping investigators identify potential bacterial sources over a large area in a timely manner.

This method is an improvement over the technique used in the past because it now also tests for *E. coli* bacteria. *E. coli* bacteria, a subset of fecal coliform bacteria, are better indicators of fecal contamination than total coliform alone. Additionally, since total coliforms and *E. coli* are enumerated on the same plate, a rough ratio of *E. coli* (more likely to be from fecal sources) to total coliforms can be ascertained. While not unequivocally conclusive, this information allows for a better determination as to whether observed high bacteria levels likely came from fecal or non-fecal sources. Note that *E. coli* are only one class of fecal coliform bacteria, and they are not enumerated for upstream analyses as an equivalent replacement for laboratory fecal coliform testing.

It should be noted that although laboratory analyses are done for total coliform, fecal coliform, and *Enterococcus* bacteria, field bacteria analyses using Petrifilm plates are used to test only for total coliform bacteria and *E. coli*. As noted in Section 4, total coliform bacteria themselves are generally harmless to humans but are a commonly-used indicator of harmful, pathogenic organisms, especially those found in fecal matter. Because the total coliform group of bacteria includes many species of bacteria of non-fecal origin, it is not as precise an indicator of fecal contamination as fecal coliforms or enterococci. A high total coliform count does not necessarily indicate fecal contamination of water, as total coliforms can also be found in soil, grain, and water, especially stagnant water. Therefore, a water sample with a high level of total coliform bacteria does not necessarily have a correspondingly high level of pathogens.

Fecal coliforms and enterococci are found mainly (but not solely) in the digestive tracts of humans and warm-blooded animals. With a few notable exceptions, fecal coliforms and enterococci are not themselves hazardous to humans, but their presence is usually a good indication of the presence of animal or human waste. Fecal contamination from animal sources may be less hazardous to humans than fecal contamination from human sources; however, standard tests for fecal coliform and *Enterococcus* bacteria cannot reliably distinguish between human and animal sources.

Field bacteria tests using Petrifilm plates use Colony Forming Units per milliliter (CFU/ml) as the measurement unit, rather than the Most Probable Number (of colony forming units) per 100 milliliters (MPN/100 mL) unit used in laboratory analyses. These units are generally comparable, although the laboratory value is one hundred times greater because the volume is 100 times greater. D-MAX has created a stringent field protocol to control sample development as consistently as possible. Sterile dilution vials containing pre-measured amounts of sterile buffer solutions for dilution are used for sample collection, the diluted samples are kept on ice in a cooler while in the field, and chilled samples are collected from the field crew twice daily to be plated within the proper holding time. Plated samples are then developed in an incubator for a total of 48 hours. While this method is not conducted at a certified laboratory, it is still useful for determining which locations have relatively higher or relatively lower bacteria levels. The action level for total coliform bacteria is 50,000 MPN/100 mL, which roughly corresponds to 500 CFU/mL. However, only about 150 or fewer colony forming units can be accurately enumerated using a Petrifilm plate. This would correspond to 15,000 MPN/100 mL. Therefore, all samples were first diluted 1:10 with sterile buffer solution before Petrifilm analysis, thus adjusting the

detection limits for Petrifilm plates from the standard value of 1-150 CFU/mL to 10-1,500 CFU/mL. This adjusted range corresponds to approximately 10,000 to 150,000 MPN/100 mL, a much more useful range when dealing with total coliform bacteria levels around the action level of 50,000 MPN/mL.

Field investigators began the source identification investigations by testing the water at the site itself; they then gradually worked upstream until potential pollutant sources could be identified. If follow-up field testing at a site resulted in constituent concentrations below specified action levels, it was concluded that the pollution found during the initial field screening and laboratory analysis phase of the 2007 Dry Weather Monitoring Program was due to a transient flow.

## 7.3 Investigated Sites

### Site 1A

Site 1A is a broad concrete channel located southwest of the 43rd Street and Nordica Avenue intersection. A follow-up investigation was conducted at Site 1A due to all three bacterial indicators being measured at levels exceeding their respective action levels. Similar to the initial visit to the site, significant amounts of trash were observed accumulating in the vegetation at the site during the follow-up investigation (see Photo 7-1). The water at the site appeared almost ponded, however the field crew was able to calculate a flow rate 3 gpm downstream where the vegetation is less dense. The sample collected indicated elevated levels of both total coliform and *E. coli* bacteria. The decomposition of trash and debris at the site, along with the slow flow of the water likely is a source of bacteria to the site. Further upstream was investigated in order to identify any more sources potentially contributing bacteria to Site 1A.

**Photo 7-1** Trash accumulation at Site 1A.

**Photo 7-2** Irrigation water sampled outside of the Park Villas Apartment Complex

Based on the conveyance map provided by the City, it appears that three different conveyance lines connect upstream of the site. The longest of those lines originates from the east. There are also two lateral lines, one from the north and one from the south, which also contribute to the site. The field crew began by investigating the northern line first. Most of the locations investigated along the northern line were dry, but the field crew was able to collect a sample or runoff discharging to Eta Street (1A-1 shown in the following map and table). The runoff appeared to be the result of irrigation coming from the Park Villas Apartments (see photo 7-2). Bacterial counts indicated fairly high levels of total coliform bacteria. The *E. coli* counts were not as significant (see table below).

The upstream investigation continued along the southern lateral lines. Similar to the northern line, most of the locations checked along this line were dry. A sample was collected from some ponded water in a manhole located between 843 and 905 Melrose Street (1A-2). Sizeable accumulations of organic debris (fallen leaves) were observed along the gutters of this residential area. The sample collected appeared brown in color and had a musty odor. Bacterial counts indicated fairly high levels of both total coliform and *E. coli* bacteria.

The first location sampled along the eastern line, was Site 45. Inside the manhole, water was observed coming from two different directions. The first sample collected, was from the water from the north (1A-3). This sample appeared slightly greenish-yellow in color. Upstream of this line, the field crew observed significant amounts of trash and debris along the gutters of Scott Drive (see photo 7-3). Bacteria counts for both total coliform and *E. coli* bacteria were extremely high (see table below).

**Photo 7-3** Trash and debris observed along the gutter of Scott Street, upstream of Site 1A

A sample of the water coming into Site 45 from the east was also sampled (1A-4). A flow of 2 gpm was observed and the water appeared brown and turbid. Both *E. coli* and total coliform bacteria counts for this sample were quite high. The field crew followed this line upstream checking several manholes and catch basin for the source of the turbid water. The source of the turbid water was the apartment complex located at 228 to 238 Palm Avenue. An irrigation pipe had broken, and individuals were attempting to repair the pipe. As a result, soil and debris had been washed into the street (see photo 7-4). The individuals conducting the repairs were instructed to block off and contain the little water still discharging from the site and to clean up the remaining sediment and debris. The field crew remained at the site and observed the individuals stop the remaining discharge. The field crew also reported this event to one of the City's storm water officials, Mr. Charles Nissley, during the upstream investigation for another site later in the day. A fifth upstream sample was collected from a manhole on U Avenue further upstream along the eastern line (1A-5). This sample showed moderate levels of both total coliform and *E. coli* bacteria.

**Photo 7-4** Turbid water and organic debris entering a catch basin on Palm Avenue.

In conclusion, the field crew believes that the overall conditions of the areas upstream of the site are responsible for the elevated bacteria levels found at Site 1A, rather than a particular point source. Trash and organic debris were observed in several locations throughout the upstream area. The decomposition of all this material, combined with the slow flow of water through the system provides many possible sources of bacteria. Recommendations regarding the particularly problematic areas are provided in Section 8 of this report. A map and a table summarizing the upstream investigation for Site 1A are provided below.

| ID | Location | Latitude | Longitude | Flow (gpm) | Total Coliform (CFU / mL) | *E. coli* (CFU / mL) |

□TNTC □ □Too Numerous to Count□

## Site 32

Site 32 is an outlet that drains directly to the northern bank of the Sweetwater River. Laboratory analyses of the sample collected during the initial round of field screening indicated *Enterococcus* bacteria levels at the site exceeded the action level of 10,000 MPN/100 mL. *Enterococcus* bacteria were measured at a level of 13,000 MPN/100 mL. Unlike the previous year, both total coliform and fecal coliform bacteria were measured below their respective action levels.

Similar to the initial visit, the water at the site was ponded and appeared slightly yellow in color. Various types of trash including a spray paint can, plastic bags and food wrappers, were observed around the site. Further inside the outlet, evidence likely indicating human inhabitation was observed. The sample collected from the site showed moderate levels of both total coliform bacteria and *E. coli* (see table below).

Just north of Freeway 54 and behind the Sweetwater Crossing Shopping Center is an open concrete channel that drains directly to Site 32. Samples were collected from both the western end (32-1 shown in the following map and table) and eastern end (32-2) of the channel. The flow rate within the channel was less than one gpm. Sediment, algae and organic material were observed within the channel (see photo 7-5). The field crew also observed fecal material along the northern bank of the channel (see photo 7-6). The *E. coli* counts were high for both of the samples collected from the channel (see table below). Similar to *Enterococcus* bacteria, *E. coli* bacteria is a subset of fecal coliform bacteria and can be used as an indicator of fecal contamination. Although the fecal matter (shown below) was not in direct contact with the water, its presence likely indicates that wildlife or humans have defecated in this area.

**Photo 7-5** Sediment and organic material within the concrete channel upstream of Site 32.

**Photo 7-6** Fecal matter observed along the bank of the concrete channel upstream of Site 32.

The field crew continued upstream collecting a sample from a catch basin located within the Sweetwater Plaza Shopping Center (32-3). The water in the catch basin was ponded and decomposing leaves were observed inside. Several other conveyance lines were checked, but most were either completely dry or slightly damp and could not be sampled. A fourth upstream sample was collected from the outlet at Site 42 (32-4). Both samples 32-3 and 32-4 showed moderate total coliform counts, but *E. coli* counts were substantially lower than those from the concrete channel (32-1 and 32-2).

The results of the upstream investigation seem to show that the concrete channel located behind the Sweetwater Crossing Shopping Center is the most likely source of *Enterococcus* bacteria to Site 32. The two samples collected from the concrete channel had the highest

*E. coli* counts of any of the upstream samples collected. The presence of fecal matter was also observed in the immediate area around the channel. Humans have been observed living within this channel, and it is possible that they defecate in some areas of the channel. Also, the decomposing organic debris, combined with the slow flowing water within the channel, provide excellent conditions for bacterial growth. A summary of the upstream investigation for Site 32 is provided in the table and map below.

| ID | Location | Latitude | Longitude | Flow (gpm) | Total Coliform (CFU / mL) | *E. coli* (CFU / mL) |
|---|---|---|---|---|---|---|
| 32 | Site 32: Tunnel outlet on the north bank of the Sweetwater River, east of 2nd Avenue | 32.65887 | -117.08274 | Ponded | 430 | 20 |
| 32-1 | Open concrete channel south of Sweetwater Town and Country Shopping Center, western downstream end | 32.65978 | -117.08224 | □1 | 260 | 140 |
| 32-2 | Open concrete channel south of Sweetwater Town and Country Shopping Center, eastern upstream end | 32.66029 | -117.08045 | □1 | 270 | 120 |

| ID | Location | Latitude | Longitude | Flow (gpm) | Total Coliform (CFU / mL) | *E. coli* (CFU / mL) |

| 32-4 | Site 42, southwest of Euclid Avenue and 24th Street, south of Southern Community Church | 32.66785 | -117.07691 | □1 | 55 | 30 |

## Site 46

Site 46 is a manhole located at the southern end of the South Bay Plaza Shopping Center. Various commercial businesses, including several restaurants and a grocery store, are located within the shopping center. When the site was initially sampled, the area around the site smelled faintly of rotten grease. Laboratory analyses revealed that all three bacterial indicators were in exceedance of their respective action levels.

**Photo 7-7** Trash observed around the catch basin behind Seafood City

During the follow-up visit to the site, sediment deposits along with some trash and fallen leaves were observed in the manhole. The water inside was flowing at approximately one gpm. The sample collected appeared yellow in color and had a musty odor. Bacterial counts from the sampled showed elevated levels of total coliform bacteria but minimal levels of *E. coli* (see table below). A few yards south of Site 46 is a catch basin that collects runoff from behind the commercial shopping center. What appeared to be grease residue was observed on the grate of the catch basin. A sample was collected from the ponded water inside (46-1 shown in the following map and table). *E. coli* counts were moderate, while total coliform counted very high.

Other than the surface runoff from the surrounding commercial area, Site 46 appears to receive flow from two main lines. The first line investigated originates from southeast of the site. The field crew traced this line upstream searching for signs of surface runoff or locations with ponded or flowing water. Damp pavement with a trickle of flow (less than one gpm) was observed behind the Seafood City at 1420 E. Plaza Boulevard. Uncontained trash and debris were observed behind the Seafood City and the area smelled faintly of rotten food and grease (see photo 7-7). The field crew also observed an uncovered grease bin behind the site,

**Photo 7-8** Uncovered grease bins located behind Seafood City

with some grease residue on the outer surfaces. Dry absorbent material was noted around the outside of the bin (see photo 7-8). A sample was collected from the water discharging into a catch basin behind the store (46-2). Both total coliform and *E. coli* bacteria counts were significantly high. Employees from the business would not specify as to the origin of the water, but the field crew believes it is possibly the result of washing activities.

The field crew continued to investigate the area around this shopping center. A couple grease bins were observed, including a particularly dirty one located behind the Plaza Terrace section of the shopping center (see photo 7-9). Although no surface runoff or water was observed around this grease bin, it is a potential source of bacteria. The field crew continued upstream, collecting a sample from a manhole located in the driveway to 1539 Plaza Blvd (46-3). Both total coliform and *E. coli* bacteria counts were fairly low.

**Photo 7-9** Uncovered grease bin and grease residue located behind the Plaza Terrace Shopping Center, upstream of Site 46

The other main line to Site 46 originates from the northeast of the site. During the upstream investigation, it did not appear that this line was contributing much flow to the site. Almost all of the conveyance lines checked were dry and no significant surface runoffs were observed. The field crew was able to collect a sample of ponded water from a manhole located at E. 8th Street, just east of the M Avenue and 8th Street intersection (46-4). Sediment deposits and some trash and organic debris were observed within the manhole. Both total coliform and *E. coli* counts were significantly high. The elevated bacteria levels are likely the result of decomposition of the materials within the ponded water, as opposed to an illicit connection or illegal discharge. However due to the limited amount of water observed throughout the northeastern line, it seems unlikely that this site is responsible for the elevated bacteria levels at Site 46. The field crew believes that the commercial shopping center located around the site is more likely the source. Both of the catch basins sampled in this area (46-1 and 46-2) showed significantly high levels or bacteria, particularly the catch basin behind Seafood City. Grease residue and trash were the most likely sources of bacteria observed in the shopping centers. Recommendations regarding these sites are provided in Section 8 of this report. A table and map summarizing the upstream investigation for Site 46 are presented below.

| ID | Location | Latitude | Longitude | Flow (gpm) | Total Coliform (CFU / mL) | *E. coli* (CFU / mL) |
|---|---|---|---|---|---|---|
| 46 | Site 46: Manhole in south parking lot of South Bay Plaza shopping center | 32.67584 | -117.09539 | 1 | 680 | □10 |
| 46-1 | Catch basin a few yards south of Site 46 | 32.67574 | -117.09539 | ponded | 1,470 | 30 |
| 46-2 | Catch basin behind the Seafood City located at 1420 E. Plaza Boulevard | 32.67448 | -117.09132 | □1 | TNTC | 120 |
| 46-3 | Manhole located in front of the Palm Avenue entrance to 1539 Plaza Boulevard | 32.67738 | -117.08949 | ponded | 120 | 10 |
| 46-4 | Manhole on E. 8th Street, east of the 8th Street and □M□Avenue intersection | 32.67969 | -117.09357 | ponded | 1,550 | 280 |

# 8.0 SUMMARY AND RECOMMENDATIONS

## 8.1 Summary

### 8.1.1 Summary of Field Screening and Laboratory Analysis Data

All 15 primary monitoring sites were visited during the 2007 Dry Weather Monitoring Program. Alternate monitoring Site 49 was also visited and used as a replacement for Site 20 which was observed to be dry. Follow-up visits were required at four of the sites, based on results found during the field screening portion of the program. Three sites required further upstream investigation for elevated levels of bacterial indicators.

Of the 15 sites sampled, flowing water was observed at 12 of the sites. Flow rates ranged from less than 1 gpm to 218 gpm. Consistent with the previous year, the highest flow rate was measured at Site 31.

pH was measured outside of the acceptable range of 6.5 to 9.0 at only one site in 2007. A pH of 10.0 was measured at Site 44 during the initial site visit. Site 44 also had the highest recorded pH in 2006 as well. The lowest pH, 7.3, was measured at sites 1A, 38, and 46.

Conductivity readings ranged from 1.1 mS/cm to 12.44 mS/cm, the highest being recorded at Site 31. Turbidity measurements ranged from 0.1 NTU to 18.43 NTU. The average turbidity of all the sites visited was 3.62 NTU, which is an improvement over last year when an the average turbidity was 9.90 NTU.

Ammonia nitrogen concentrations were below the action level of 1.0 mg/L at all 15 sites sampled. The highest ammonia concentration, 0.4 mg/L, was recorded at sites 41 and 47. This is an improvement over the previous year, in which ammonia levels ranged up to 1.5 mg/L, exceeding the action level at one site.

For the fifth straight year, no site had a nitrate nitrogen concentration above the action level. Nitrate concentrations ranged from 0.43 mg/L to 2.24 mg/L, well below the 10.0 mg/L action level.

Orthophosphate phosphorus concentrations were below the action level at all 15 sites sampled. Orthophosphate phosphorus concentrations ranged from 0.07 mg/L to 1.17 mg/L.

Surfactant concentrations were above the action level at three of the sites sampled during field screening. Surfactant concentrations dropped below the action level by the time of the follow-up visits for sites 1A and 46. The highest surfactant concentration, 1.25 mg/L, was measured at Site 13A. However, Site 13A was dry on several follow-up visits.

Laboratory analyses were conducted at four sites. Similar to the previous year, elevated levels of bacteria were found at sites 1A, 32, and 46. All three bacterial indicators were recorded above their action levels at sites 1A and 46. Site 32 exceeded the action level for *Enterococcus* bacteria only. All three bacterial indicators were recorded below their action levels at Site 41.

Dissolved cadmium was not detected at any of the sites sampled in 2007. Dissolved copper, lead, and zinc were detected at some of the sites, but not at concentrations exceeding the California Toxics Rule benchmark, given the water hardness.

Pesticides diazinon and chlorpyrifos were not detected at any of the sites selected for laboratory analysis. Oil and grease were also not detected at any of the sites. Surfactants were detected at sites 1A and 46, but at concentrations below the 1.0 mg/L action level.

Waste materials such as glass bottles, aluminum cans, plastic wrappers, Styrofoam, and even a shopping cart were observed at nine of the 15 sites sampled. This is an improvement over the previous year when trash was observed at 13 of the sites. Three of the sites, 1A, 40, and 44 had significant accumulations of waste requiring clean up.

Vegetative growth ranged from no growth to naturally vegetated riparian areas. The sites lacking vegetation were those with minimal exposure sunlight such as manholes, catch basins or well covered outlets. Sediment deposits ranged from coarse to fine, with all of the sites having some size and shape of deposits.

The amount and variety of biological organisms ranged from site to site. Algae was observed at eight of the sites visited. Other various biological organisms observed included fish, insects, snails, crayfish and cockroaches.

In conclusion, the City of National City continues to show some improvement in overall water quality as monitored by the Dry Weather Monitoring Program. The same number of sites required follow-up visits for field screening parameters in 2007 as in 2006. In 2006, three of the four sites continued to have elevated parameters when sampled during the follow-up visit. In 2007, no action level exceedances were noted during the follow-up site visits. A general improvement in the amount and number of sites with trash was also observed in 2007. Only nine sites had noticeable amounts of trash with three of those sites being recommended for clean up. In 2006, 13 sites had noticeable amounts of trash, five of those sites being recommended for clean up. Further field screening and monitoring is still needed in order to determine the extent that water quality has improved in the City of National City.

### 8.1.2 Summary of Upstream Investigation Data

Based on the results of the upstream investigations and follow-up actions conducted at three sites for the 2007 Dry Weather Monitoring Program for the City of National City, the following conclusions have been developed:

Similar to 2006, sites 1A, 32, and 46 were investigated to locate potential sources of the elevated bacteria levels found during the 2007 Dry Weather Monitoring Program. Petrifilm plates were used in order to perform a quick and comprehensive analysis of bacterial levels present to each site and upstream. Bacteria were generally not found to be originating from a particular source, but rather from conditions present upstream of the site or at the site itself. Various non-point sources such as trash, decomposing algae, and decomposing leaves contributed to the bacteria levels measured at the sites. These sources combined with the slow flow of water through the conveyances system, provide excellent conditions

for bacterial growth. A brief summary of the upstream investigations for bacteria is listed below:

- The elevated bacteria levels at Site 1A do not appear to be the result of a particular point source, but rather the general conditions at the site and further upstream. Decomposing organic material (leaves, grass, algae, seeds) and trash accumulations were observed to be the most likely sources of bacteria at the site and upstream locations. Samples collected from the site and most of the upstream locations all showed elevated levels of bacteria.

- The elevated bacteria levels at Site 32 are likely the result of conditions within the open concrete channel located behind the Sweetwater Crossing Shopping Center. The slow flow of water through the channel, along with the presence of decomposing trash and organic material, provide excellent conditions for bacterial growth. Fecal matter was observed along the channel, and is a likely the source of Enterococcus bacteria to the site. Human inhabitation of the site is also a likely source of bacteria, and may explain the fecal matter observed.

- The commercial shopping centers (South Bay Plaza and Plaza Terrace) surrounding the site and immediately upstream are likely responsible for the elevated levels of bacteria measured at Site 46. Uncontained trash, exposed grease bins and grease residue were observed behind several businesses, particularly behind the Seafood City. Samples collected from catch basins within the shopping centers confirmed the elevated presence of bacteria.

## 8.2 Recommendations

Based on the results of the year 2007 Dry Weather Monitoring Program for the City of National City, the following actions are recommended for consideration.

### Education

- Send out educational material regarding storm water Best Management Practices (BMPs) to the property manager of the Park Villas Apartments, located on Eta Street. Educational material should focus on minimizing irrigation runoff. Excessive irrigation was observed at this apartment complex during the upstream investigation for Site 1A.
- Send out educational material to the businesses of the South Bay Plaza shopping center regarding general housekeeping BMPs for commercial businesses. BMPs should also focus on the proper storage, containment and maintenance of grease bins. Uncontained trash and exposed grease residue are likely sources of bacteria to Site 46.

### Maintenance

- Clean out the significant accumulation of trash observed within the concrete channel at Site 1A. Since the downstream section of channel is located within the San Diego City limits, officials from the City of San Diego should be contacted regarding

the clean up of the channel. In order to prevent trash and debris accumulation from occurring at the site, the City should clean out as many catch basins and curbs upstream of Site 1A as possible. In particular, sizeable accumulations of trash were observed along the gutters of Scott Drive. Trash and debris at the site, and further upstream are likely responsible for the elevated levels of bacteria measured at Site 1A.

- Clean out the open concrete channel located behind the Sweetwater Crossing Shopping Center, upstream of Site 32. Decomposing organic material and trash are likely sources of bacteria to Site 32. This area should also be monitored for the presence of human inhabitation. Cleaning activities and fecal matter from the inhabitants may also influence bacteria levels at the site.
- Provide regular trash removal from Site 40. A large volume of trash was observed in the pond of water located beneath the outlet. Items including plastic bottles, wrappers, aluminum cans and Styrofoam were observed caught in the vegetation downstream of the site.
- Provide regular trash removal from the concrete channel located within Kimball Park. The trash was primarily composed of litter such as plastic bottles, aluminum cans, plastic wrappers and Styrofoam. Bulk items of trash, including shopping carts and the lid to a BBQ were observed in the channel, possibly indicating illegal dumping.
- Continue to inspect and monitor the commercial businesses of the South Bay Plaza Shopping Center. Proper storage of grease bins, containment of trash and reducing discharges from these businesses should reduce bacteria levels at Site 46. In particular, the City should contact the manger of the Seafood City located at 1420 E. Plaza Boulevard, to ensure the dumpster and grease bin area behind the store is cleaned up and that no commercial wash water are allowed to discharge from the site to the storm water conveyance system.
- Continue to inspect and monitor the commercial business of the South Bay Plaza Shopping Center. The communal grease bin located behind this small shopping center was particularly dirty. Grease residue was noted on the outer surfaces of the grease bin and surrounding pavement. The significant amount of grease residue observed is potentially a source of bacteria to Site 46. The City should ensure this area is cleaned up and that the grease bin is stored in a manner minimizing the exposure of grease to storm water.

## Notes and Definitions

| | |
|---|---|
| S-04 | The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect. |
| S-02 | The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract. |
| GC-05 | Results confirmed by GCMS. |
| A-07 | >1600000 |
| A-06 | >160000 |
| ND | Analyte NOT DETECTED at or above the reporting limit |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

**Re: 2008 Dry Weather Field Screening and Analytical Monitoring Program**
**City of National City, California**

Dear Mr. Daneshfar:

Per your request D-MAX Engineering, Inc. (D-MAX) has completed the 2008 Dry Weather Field Screening and Analytical Monitoring Program. This report presents the results of the monitoring program conducted in the City of National City during the 2008 dry weather season. The contents include field screening data and analytical laboratory test results, trash assessment, analyses of the collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations conducted to identify the sources of pollutants detected during the field screening program and our recommendations for additional actions.

Review comments from the draft report submitted to the City have been incorporated into this final report. It has been our pleasure working with the City of National City on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.
Project Manager

# 1 INTRODUCTION

## 1.1 Regulatory Requirements

In accordance with San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit), each of the Copermittees, including the City of National City (City), is required to annually perform dry weather field screening of discharges into its storm drain system. This procedure is comprised of recording field observations, estimating observed flow rates, and conducting field testing at selected locations along the storm drain conveyance system during the dry weather season, May 1 through September 30. The Municipal Permit also necessitates that Copermittees conduct laboratory analyses for at least 25 percent of the visited sites with flowing or ponded water. If a sampling location is dry, meaning there is no flowing or ponded water, an alternate sampling station should be visited. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. A more detailed trash assessment component has also been required. The Dry Weather Monitoring Program is an integral part of the City's Urban Runoff Monitoring Program.

## 1.2 Hydrologic Setting

The City lies entirely within the San Diego Bay Watershed Management Area, which includes three watersheds. The City is one of the most densely populated areas of the San Diego Bay Watershed Management Area, but makes up only 1.6% of the total area. The City encompasses hydrologic areas 909.1 and 908.3, of the Sweetwater and Pueblo San Diego Watersheds, respectively. The major receiving water body in the City is the San Diego Bay, which lies due west of the City. Runoff from the southern part of the City initially drains to the Sweetwater River, which ultimately conveys it into the bay. The Sweetwater River and the Sweetwater Marsh are identified by the City as Environmentally Sensitive Areas (ESA). The river flows along the southern border of the City through the Sweetwater Marsh and into the San Diego Bay. Paradise Creek is a small salt marsh creek that receives runoff from the northern areas of the City and discharges into the Sweetwater River. Paradise Creek and Paradise Marsh have also been identified as ESAs. La Paleta Creek traces the northern border of the City, and is 303(d) listed for benthic community effects and sediment toxicity as Seventh Street Channel. The 2008 San Diego Bay Watershed Urban Runoff Management Program (WURMP) Document identified bacteria, sediment, and trash as high priority water quality problems in hydrologic area 908.3 of the Pueblo San Diego Watershed. The San Diego Bay WURMP also identified bacteria as a high priority pollutant category in hydrologic area 909.1 of the Sweetwater Watershed.

## 1.3 Program Overview

The primary purpose of the Dry Weather Monitoring Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. The Dry Weather Monitoring Program consists of the following three components.

- Field screening observations
- Field analytical testing
- Laboratory analytical testing

Information collected from the dry weather monitoring is used to characterize dry weather discharges to the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations were conducted as necessary to detect and eliminate the sources of these pollutants. The results from the 2008 Dry Weather Monitoring Program conducted by D-MAX Engineering, Inc., (D-MAX) are presented herein.

## 1.4 Previous Work

The City of National City has conducted dry weather field screening programs since 1996 at several locations within the City's storm water conveyance system. A summary of the screening results obtained for each year is presented in Table 1-1.

**TABLE 1-1**
**SUMMARY OF HISTORICAL DRY WEATHER SITES**

| Year | Number of Sites Screened [1] | Number of Flowing Sites | Number of Ponded Sites | Number of Dry Sites | Number of Lab Analysis Sites [2] |
|---|---|---|---|---|---|
| 1996 | 20 | Data not available [3] | | 13 | --- |

Notes:
1 Number of Sites Screened = Number Flowing + Number Ponded. Field screening cannot be conducted at sites found to be dry. Dry sites are replaced by either a flowing or ponded site
2 Laboratory analyses commenced in 2002 as required by RWQCB Order 2001-001
3 Available information does not distinguish between flowing and ponded sites during this period.

## 1.5 Report Outline

This report is presented in the following order:

**Section 1** includes regulatory background, a program overview, a discussion of the City hydrologic setting, a summary of historical field screening data, and the report outline.

**Section 2** describes the sampling locations and the site selection criteria.

**Section 3** describes the field screening and laboratory analytical procedures. This section also discusses quality assurance protocols used during sampling and lists appropriate action levels for initiating follow-up investigations.

**Section 4** discusses the results of the field screening analyses.

**Section 5** discusses the results of the trash assessment.

**Section 6** discusses the results of the laboratory analyses.

**Section 7** provides an analysis of field and laboratory data collected this year, as well as a comparison of past results.

**Section 8** details the results of follow-up investigations undertaken to isolate the sources of water contamination detected during the field screening program.

**Section 9** provides a summary of the program results and recommendations for follow-up actions.

**Appendix A** contains historical dry weather monitoring data.

**Appendix B** contains photographs of each of the investigated sites.

**Appendix C** contains the laboratory analytical reports.

**Appendix D** contains original copies of the field data sheets.

# 2 SAMPLING LOCATIONS

In 2008, the City of National City had 15 designated primary monitoring stations, as well as 6 alternate stations to replace any primary sites that did not have ponded or flowing water. All sampling sites are located in San Diego Hydrologic Units 908 and 909. These sites are also presented in the City's Jurisdictional Urban Runoff Management Program (JURMP), updated in 2007.

Since the previous year of dry weather monitoring, several changes were made to the primary monitoring stations which resulted in the 15 primary sites of the 2008 program. These changes included:

- Moving Site 38 downstream, off private property;
- Removing sites 11, 20, and 31;
- Changing primary sites 43 and 44 to alternate sites;
- Adding new primary sites 3, 4, 43A, and 44A; and
- Adding new alternate sites 6 and 10.

More information about these site changes may be viewed in the City's JURMP (2007). In addition, laboratory sampling was moved from Site 41 to Site 40 in order to more accurately represent runoff that is generated within the City's jurisdictional boundaries.

All 15 primary monitoring stations were visited; the four primary sites found to be dry (4, 13A, 31A, and 42) were replaced by four alternate sites (6, 44, 48, and 49).

Table 2-1 provides the location, conveyance configuration, primary and secondary land uses, hydrologic subarea, and GPS coordinates of the primary and alternate monitoring stations that were visited. Photographs of sampling locations are included as Appendix B. A complete map of the MS4 system, including sampling locations, is included as Figure A. A map of the watersheds in and around National City, broken down into HSAs, is included as Figure B.

**TABLE 2-1**
**2008 DRY WEATHER MONITORING STATIONS**

| Site No | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908.31 | 32.68575 | -117.10166 |
| 3 | E. 7th Street and R Avenue | Manhole | Residential | Commercial | 908.32 | 32.68183 | -117.08894 |
| 4 | E. 1st Street and U Avenue | Manhole | Parks | Residential | 908.31 | 32.68726 | -117.08749 |
| 6* | North bank of Sweetwater River ~500 feet east of Highland Ave, access from North 2nd Ave. | Outlet | Industrial | Commercial | 909.12 | 32.65668 | -117.08844 |
| 13A | Northeast of 16th Street and National City Boulevard, inside Kimball Park | Outlet | Commercial | Residential | 908.32 | 32.66942 | -117.10326 |
| 31A | North of Sweetwater Road, across from 2nd Avenue at the corner of the golf course | Earthen Channel | Parks | Commercial | 909.12 | 32.66121 | -117.08453 |
| 32 | East of 2nd Avenue, north of Freeway 54 and the Sweetwater River | Outlet | Commercial | Open | 909.12 | 32.65887 | -117.08274 |
| 38 | Dirt road, west of Harbison Avenue, between 20th Street and 24th Street, at the end of fence line | Earthen Channel | Residential | None | 909.12 | 32.67265 | -117.07057 |
| 40 | Southwest corner of Sweetwater Road and Plaza Bonita Road/Stockman Street, down in channel | Outlet | Commercial | Residential | 909.12 | 32.65961 | -117.06677 |
| 41 | Northeast of San Miguel Court and Valley Road, inside Park Bonita Apartment complex | Earthen Channel | Residential | None | 909.12 | 32.66588 | -117.05083 |
| 42 | Southwest of Euclid Avenue and 24th Street, south of Southern Community Church | Outlet | Residential | Commercial | 909.12 | 32.66785 | -117.07691 |
| 43A | F Avenue between East 24th Street and East 28th Street, west of Olivewood Elementary School | Catch Basin | Residential | Commercial | 909.12 | 32.66134 | -117.09447 |
| 44* | Northeast of 16th Street and National City Boulevard, under the Kimball Park bridge | Concrete Channel | Commercial | Residential | 908.32 | 32.66982 | -117.10247 |

**TABLE 2-1**
**2008 DRY WEATHER MONITORING STATIONS (CONTINUED)**

| Site No | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 44A | D Avenue behind Boys and Girls Club in Kimball Park | Outlet | Commercial | Residential | 908.32 | 32.67151 | -117.10123 |
| 45 | In front of 1243-1305 Fig Court, in the middle of street | Manhole | Residential | Parks | 908.31 | 32.68739 | -117.09690 |
| 46 | South of South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop | Manhole | Commercial | Residential | 908.32 | 32.67584 | -117.09539 |
| 47 | Southeast corner of the Mile of Cars Way and Transportation Avenue | Manhole | Commercial | Residential | 908.32 | 32.66163 | -117.10275 |
| 48* | Northwest of East 14th Street and Grove Street | Catch Basin | Residential | None | 908.32 | 32.67673 | -117.08321 |
| 49* | South end of Arcadia Place (through Harbison Avenue and 11th Street) | Concrete Channel | Residential | Commercial | 908.32 | 32.68095 | -117.07770 |

* Alternate sites 6, 44, 48, and 49 were selected to substitute for dry primary monitoring sites 4, 13A, 31A, and 42.

# 3 FIELD AND LABORATORY ANALYTICAL METHODS

## 3.1 Field Screening Procedures and Methods

Field screening techniques consist of flow measurement, quantitative field analyses of selected water quality parameters, and qualitative field observations. Information relating to weather conditions, the amount of time since last rainfall, and the type of storm water conveyance are recorded. Specific observations and results of the field water quality analyses are documented on field data sheets, which are included in Appendix D. The data sheets also serve as a record of the field visit and are completed for every site visit regardless of whether or not samples were collected.

For 2008, field data sheets were updated to include three categories of visits. Previously they included check boxes for either routine field screening or follow-up visits. This year there are check boxes for routine field screening, confirmation, and IC/ID follow-up visits. A confirmation visit is a revisit of the original site, whereas an IC/ID follow-up is an upstream investigation. For the purposes of this report, confirmation and IC/ID follow-up visits are both referred to as "follow-up" visits.

Field screening and analyses were conducted according to the following procedures and methods.

Qualitative Observations

Irrespective of flow, qualitative field observations are made during each site visit. These observations provide a general site assessment and describe factors like water odor, clarity, the presence of floatables, visible deposits or stains, vegetation and biological organisms. Evidence of present or past illicit connections and illegal discharges to the storm drain system may also be ascertained through careful field observations. Each field screening location is photographed to provide additional information and documentation of site conditions. Photographs are included in Appendix B.

Flow Measurement

Flow measurements can be utilized to estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may indicate an illegal discharge upstream. Various field methods are used in formulas to estimate the flow rate. These include measuring the velocity, depth and width of the flowing water; recording the amount of time required to fill a bottle of known volume with sample water; or, if measuring flow within a cylindrical pipe, measuring the pipe diameter as well as the depth and velocity of the flow. Low levels of flow may also be assessed visually.

Field Water Quality Analyses

At each site with ponded or flowing water, grab samples were collected and analyzed in the field for the following constituents:

- Specific conductance
- Temperature
- pH
- Turbidity
- Surfactants (MBAS)*
- Nitrate-Nitrogen (Nitrate-N)
- Ammonia-Nitrogen (Ammonia-N)

- Orthophosphate-Phosphorus (Orthophosphate-P)

* Surfactants are also referred to as detergents, specifically with respect to discussion of field test kit results.

The methods that were used to perform the above field analyses along with each method's detection limit, range and accuracy, are listed in Table 3-1.

## 3.2 Laboratory Analytical Methods

Grab samples were collected at four sites (over 25 percent of all sites) where ponded or flowing water was observed, to fulfill the requirements of Order R9-2007-0001. These samples were submitted to EnviroMatrix Analytical, Inc., a California Department of Health Services-certified laboratory, for analysis of the following constituents:

- Oil and grease
- Total hardness
- Diazinon
- Chlorpyrifos
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- *Enterococcus* bacteria
- Total Coliform bacteria
- Fecal Coliform bacteria

The methods used to perform each of the above laboratory analyses along with method detection limits and holding times are listed in Table 3-2.

**TABLE 3-1**
**FIELD ANALYTICAL METHODS**

| Parameter | Method | Reporting Limit | Range | Accuracy |
|---|---|---|---|---|
| Specific conductance | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter*** | 0.01 mS/cm | 0 – 20 mS/cm | ± 2% of functional sensitivity[1] |
| Temperature | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter*** | 0.1°C | 0.0°C – 60.0°C | ± 0.5°C |
| pH | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter*** | 0.01 | 0.00 – 14.00 | ± 0.01 pH |
| Turbidity | Hanna Instruments HI 93703-11 Portable Turbidity Meter*** | 0.01 NTU | 0.01 – 50.00 NTU and 50 – 1000 NTU | ± 0.5 NTU or 5% of reading (whichever is greater) |
| Surfactants | CHEMetrics CHEMets Kit (K-9400) Methylene Blue Active Substances | 0.13 mg/L | 0.0 mg/L – 3.0 mg/L* | ± 0.13 & ± 0.5 mg/L[2] |
| Nitrate-N | CHEMetrics V-2000 Multi-Analyte LED Photometer – Nitrate 3 Vacu-vials® (K-6933) Cadmium reduction[3]*** | 2.26 mg/L** | 2.26 mg/L –13.6 mg/L** | ± 30% |
| Ammonia-N | CHEMetrics V-2000 Multi-Analyte LED Photometer – Ammonia 3 Vacu-vials® (K-1403) Salicylate*** | 0.10 mg/L** | 0.10 mg/L – 3.00 mg/L** | Varies with measured concetration[4,5] |
| Ortho-phosphate-P | CHEMetrics V-2000 Multi-Analyte LED Photometer – Phosphate 2 Vacu-vials® (K-8513) Stannous chloride chemistry[6]*** | 0.25 mg/L** | 0.25 mg/L – 2.61 mg/L** | Varies with measured concetration[4,5] |

**Notes:**

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20%. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L $NO_3$. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the $NO_3$ molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14 g/mol) to $NO_3$ (62 g/mol). The detection limit for nitrate is 10.0 mg/L; however, the detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30% at PDL, ±20% for 25% of full range, ±10% for 75% of full range, ±10% for 120% of full range. "Full range" is equal to the upper limit of the test kit's range.

[6] This method determines the concentration of orthophosphate in mg/L $PO_4$. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the $PO_4$ molecule. Oxygen is 67.4% of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31 g/mol) to $PO_4$ (95 g/mol). The detection limit for orthophosphate is 0.75 mg/L; however, the detection limit for orthophosphate-P is lowered due to the conversion.

*Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

** Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

***Reporting limit, range, and accuracy information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com. Additional information regarding CHEMetrics accuracy was obtained from the manufacturer via email.

**TABLE 3-2**
**LABORATORY ANALYTICAL METHODS**

| Analyte | Analytical Method | Method Detection Limit | Maximum Holding Time [1] |
|---|---|---|---|
| Oil and Grease | USEPA 1664 | 5 mg/L | 28 days |
| Total Hardness | USEPA 200.7 | 10 mg/L | 14 days |
| Dissolved Cadmium | USEPA 6020 | [5] 0.00200 mg/L | 24 hours |
| Dissolved Copper | USEPA 6020 | [5] 0.00200 mg/L | 24 hours |
| Dissolved Lead | USEPA 6020 | [5] 0.00200 mg/L | 24 hours |
| Dissolved Zinc | USEPA 6020 | [5] 0.0100 mg/L | 24 hours |
| Diazinon | USEPA 8141A | 0.05 µg/L | 7 days |
| Chlorpyrifos | USEPA 8141A | 0.05 µg/L | 7 days |
| Total Coliforms | SM 9221 | [2] 20 – 1,600,000 MPN/100 mL | 6 hours |
| Fecal Coliforms | SM 9221 | [2] 20 – 160,000 MPN/100 mL | 6 hours |
| *Enterococcus* | SM 9230 | [2] 20 – 160,000 MPN/100 mL | 6 hours |
| Total Coliforms | SM 9223 (IDEXX Colilert) [4] | 10 – 2,400,000 MPN/100 mL | 6 hours |
| *Escherichia coli* (*E. coli*) [3] | SM 9223 (IDEXX Colilert) [4] | 10 – 2,400,000 MPN/100 mL | 6 hours |
| *Enterococcus* | IDEXX Enterolert [4] | 10 – 240,000 MPN/100 mL | 6 hours |

**Notes:**

µg/L = micrograms per liter

MPN/100 mL = most probable number (of colony-forming units) per 100 milliliters

[1] Maximum Holding Time values listed here apply to samples collected and preserved in accordance with the quality assurance and quality control procedures listed in Section 3.3.2.

[2] For D-MAX's Dry Weather Monitoring Program, EnviroMatrix Analytical, Inc. (EMA) performs standard dilutions for total coliforms to quantify from 20-1,600,000 most probable number per 100 milliliters (MPN/100mL). For fecal coliforms and *Enterococci*, EMA performs standard dilutions to quantify from 20-160,000 MPN/100 mL. During the analysis and interpretation of the results, the number of tubes used to quantify the sample must fit the MPN index table from Standard Method 9221. The dilution set used will determine the detection limit. A standard dilution analysis is set up with 15 tubes at different concentrations. The reporting limit will always be adjusted depending on the dilution factor used for quantifying the actual results based on the MPN table. If the result for the analysis was less than 16,000 MPN/100 mL, the reporting limit will always be 20, and the dilution factor will be 10. As the dilution factor goes up, the reporting limit listed in the results from EMA will also go up based on the calculation made with EMA's data system. However, the lowest quantifiable number or reporting limit would still be 20 based on how the standard tubes for the sample is set up.

[3] Number of fecal coliforms is derived from number of *E. coli* through the following formula:
Fecal Coliforms = *E. coli* / 0.85. The converted fecal coliform count, not the number of *E. coli*, is reported in this report's data tables.

[4] IDEXX Colilert and Enterolert tests are performed by EnviroMatrix Analytical. This test is used during upstream investigations only.

[5] I Metals analyses in 2008 were subcontracted to Calscience Environmental Laboratories, Inc.

## 3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project included the United States Environmental Protection Agency (USEPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

### 3.3.1 Field Sampling and Analysis QA/QC

The pH meters are calibrated periodically with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube is kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter is calibrated and periodically checked for accuracy using standard solutions. The conductivity meter is checked periodically with standard solutions and calibrated as necessary.

Field sample collection containers are first rinsed with distilled water and then with the sample water before sample collection. Upon completion of sampling at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water and dried.

The accuracy of field analytical techniques is assessed at the beginning of each sampling week by analyzing solutions of known concentrations for ammonia-nitrogen, surfactants, nitrate, and orthophosphate. The results of the assessment are shown in Table 3-3.

**TABLE 3-3**
**FIELD ANALYSIS QA/QC RESULTS**

| Date | Analyte | Known Concentration | Acceptable Range | Field Test Kit Results |
|---|---|---|---|---|
| 8/25/08 | Ammonia-Nitrogen | 1.0 mg/L | 0.8 – 1.2 mg/L | 0.930 mg/L |
| 8/25/08 | Surfactants | 1.0 mg/L | 0.75 – 1.25 mg/L | 1.0 mg/L |
| 8/25/08 | Nitrate** | 44.3 mg/L | 31.0 – 57.6 mg/L | 47.29 mg/L |
| 8/25/8 | Orthophosphate** | 1.0 mg/L | 0.75 – 1.25 mg/L | 0.890 mg/L |
| 9/3/08 | Ammonia-Nitrogen | 1.0 mg/L | 0.8 – 1.2 mg/L | 0.905 mg/L |
| 9/3/08 | Surfactants | 1.0 mg/L | 0.75 – 1.25 mg/L | 1.0 mg/L |
| 9/3/08 | Nitrate** | 44.3 mg/L | 31.0 – 57.6 mg/L | 51.32 mg/L |
| 9/3/08 | Orthophosphate** | 1.0 mg/L | 0.75 – 1.25 mg/L | 0.814 mg/L |

**Note**

* Acceptable range is calculated based on the error associated with the methods as listed in Table 3-2.

** Nitrate and orthophosphate are converted to nitrate-nitrogen and orthophosphate-phosphorus, respectively, when conducting standard field screening. This is accomplished by multiplying the results by 0.226 for nitrate and 0.326 for orthophosphate. To simplify the calibration process, the unconverted numbers are used when calibrating the instruments.

### 3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis were collected concurrently with field samples and utilized the same sampling procedures. Pre-sterilized sample bottles were obtained from the laboratory and thus did not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples were kept in a cooler on ice until picked up by the laboratory. Strict chain-of-custody procedures were followed and samples were delivered

and analyzed within the appropriate holding times, as listed in Table 3-2. Completed chain-of-custody forms are included with the laboratory analytical reports in Appendix C.

## 3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation is necessary, numeric action levels and best professional judgment are used to interpret the field screening results. If visual and/or analytical evidence of gross contamination are present at a site (e.g., substantial petroleum sheen, extremely high ammonia-nitrogen concentration, evidence of a sewage release, etc.), then an immediate source identification investigation is initiated. For sites that exceed numeric action levels but are not perceived as an immediate threat to water quality, a re-sampling is conducted within one day. An upstream pollutant source investigation is conducted thereafter if elevated concentrations persist and no sources can be identified in the immediate vicinity of the monitoring station. If elevated levels of pollutants are detected by the laboratory analyses, a comprehensive follow-up pollutant source investigation is conducted within two days of receiving the analytical reports from the lab. The results of these investigations are included in Section 8 of this report. Recommendations based on these investigations are included in Section 9.

The following three methods are employed to determine whether immediate or comprehensive follow-up investigations are necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment. All three approaches are described in detail below and presented in Table 3-4.

**Numeric Action Levels**

Numeric action levels are used as the primary approach for interpreting pH, orthophosphate-P, nitrate-N, ammonia-N, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (see Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels, which are based on county-wide sampling data and have been used by all Copermittees since the 2003 dry weather season. If pH, orthophosphate-P, nitrate-N, ammonia-N, or surfactants are observed above the numeric action level, a follow-up investigation is conducted within 24 hours to investigate the source unless best professional judgment indicated otherwise. If oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, or *Enterococcus* laboratory analytical results exceeded numeric action levels, then source investigations are conducted within two business days of receiving the test results from the lab.

**California Toxics Rule**

The CTR criterion maximum concentration (CMC) is used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in USEPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total hardness of the sampled water, with the action levels increasing as hardness increases. More information on the CTR is available at http://www.epa.gov/region09/water/ctr.

**Best Professional Judgment**

Best professional judgment is utilized as the primary approach for interpreting turbidity, water temperature, and conductivity and as a secondary approach for interpreting the results of all other field and laboratory analyses. Under best professional judgment, the need for a follow-up investigation is left to the discretion of the D-MAX field crew due to their familiarity with the City's Dry Weather Monitoring Program and their knowledge of typical levels for the tested parameters. Best professional judgment may indicate that results which either exceed certain action levels or statistical outliers may be the result of natural or background factors.

## TABLE 3-4
## ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

| Field Screening Analytes | Action Levels[1] | Source/ Notes |
|---|---|---|
| pH | <6.5 or >9.0 | Basin Plan, w/ allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia-nitrogen. |
| Orthophosphate-P (mg/L) | 2.0 | USEPA Multi-sector General Permit |
| Nitrate-N (mg/L) | 10.0 | Basin Plan, and drinking water standards |
| Ammonia-N (mg/L) | 1.0 | Based on Workgroup experience. May also consider unionized ammonia fraction. |
| Surfactants (MBAS) (mg/L) | 1.0 | Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences. |
| Turbidity (NTU) | Best Professional Judgment | WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity), and unusual odors. |
| Temperature ($^{o}$C) | Best Professional Judgment | Base judgment on season, air temperature, channel type, shading, etc. |
| Conductivity (mS/cm) | Best Professional Judgment | Values > 5 mS/cm may indicate IC/ID however; EC may be highly elevated in some regions due to high-TDS groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values < 0.75 mS/cm may indicate excessive potable water discharge or flushing. |
| **Laboratory Analytes** | **Action Levels** | **Source/ Notes** |
| Oil and Grease (mg/L) | 15 | USEPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation. |
| Diazinon (µg/L) | 0.5 | Response to diazinon and chlorpyrifos levels above 0.5 µg/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs. |
| Chlorpyrifos (µg/L) | 0.5 | |
| Dissolved Cadmium (µg/L) | California Toxic Rule | Use California Toxics Rule Table, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd – 14 ppb; Cu – 38 ppb; Pb – 209 ppb; and Zn – 297 ppb. |
| Dissolved Copper (µg/L) | California Toxic Rule | |
| Dissolved Lead (µg/L) | California Toxic Rule | |
| Dissolved Zinc (µg/L) | California Toxic Rule | |
| Total Coliform (MPN/ 100 mL) | 50,000 | Bacteria levels in many storm drains are likely to exceed public health guidance criteria. Use confidence interval test and best professional judgment to identify conveyances for source ID. |
| Fecal Coliform (MPN/ 100 mL) | 20,000 | |
| *Enterococcus* (MPN/ 100 mL) | 10,000 | |

**Notes**

[1]The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry Weather Monitoring Program data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.

| | |

# 4 FIELD SCREENING RESULTS

The Dry Weather Monitoring Program field screening was conducted from late August to early September of 2008. Since four primary sites were found to be dry, a total of 19 monitoring stations were visited including alternate sites. Field screening was conducted at the 15 sites where ponded or flowing water was observed. Of the screened sites 12 had measurable flow, and three sites had ponded water. A total of 30 site visits were performed, including the four dry sites and 11 confirmation visits to sites where one or more constituents were found to exceed specified action levels.

## 4.1 Qualitative Observations

Qualitative observations, which are a routine part of the Dry Weather Monitoring Program, are summarized below and presented in Table 4-1:

***Light Conditions***
The weather varied from sunny to partly cloudy to overcast during the site visits.

***Tide***
Two sites visited during dry weather monitoring were observed to be tidally influenced. The tide was relatively low during the initial visits to Site 47 and Site 6, but no tide height data was available near the sites since they were one to two miles east of the San Diego Bay. See Section 8 of this report for the results of initial and confirmation screening visits.

***Odor***
Samples from Site 1A and Site 48 had an odor similar to that of sewage. Site 40 smelled faintly of chemicals. None of the other visited sites had observable odors during field screening.

***Color***
Water from one site had a yellow tint, and water samples taken from three of the sites were brown (and slightly cloudy). The rest of the samples collected were colorless.

***Clarity***
The majority of water samples collected from the visited sites were clear, with negligible amounts of suspended particles observed. The water samples taken at three sites were observed to be slightly cloudy.

***Floatable Materials***
During routine field screening visits, trash was assessed at each site. Section 5 of this report includes the complete results of Trash Assessment. At fifteen of the nineteen visited sites trash was observed in contact with the water. One site had a slight sheen and two sites had some bubbles on the surface of the water during the site visit.

***Deposits***
Sediment and fine particulate deposition was observed at nearly all of the visited sites. No other deposits were noted.

***Vegetation***
Taking into account exposure to sunlight and soil, all sites displayed appropriate vegetation. Manholes lacking soil and sunlight showed no vegetation. Concrete channels had either limited or normal vegetation; earthen channels supported normal vegetative growth. Only one site had what was considered excessive vegetation for a concrete channel, but the vegetation would not likely impair flow significantly.

***Biology***
The presence of aquatic flora and fauna can indicate healthy water conditions. Algal growth is an indicator of persistent water flow. Some of the sampling locations were also home to insects, snails, and/or fish.

**TABLE 4-1**
**DRY WEATHER FIELD OBSERVATIONS**

| Site No. | Date | Time | Light Conditions | Odor | Color | Clarity | Floatables | Deposits | Vegetation | Biology |

## 4.2 Field Analytical Results

Field analyses are conducted al all sites with flowing or ponded water. The measured constituents are described below.

**Flow rates** are the measurements of the volume of fluid passing through a given surface per unit time. Flow rate measurements are needed to calculate the load or particular amount of a pollutant discharged.

**Water temperature** is needed to assess the significance of other parameters, such as pH and conductivity. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. In the field, water temperature is measured immediately upon sample collection at each site with ponded or flowing water.

The **pH** is an expression of acidity or alkalinity of a water sample. The pH of an aquatic system will drive a variety of chemical reactions, including the availability of nutrients or the solubility of chemical substances, particularly heave metals.

**Turbidity** describes the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation, thus reducing photosynthetic capacity, but excessive suspended particles can also absorb heat and increase water temperatures.

**Specific Conductance (Conductivity)** values indicate the total concentration of ions in an aquatic system and the ability of the water to conduct electricity. This parameter can be used to assess the mineral content of water and potentially help indicate the presence of dissolved pollutants.

**Surfactant** concentrations in water samples often reflect illegal discharge from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms

**Ammonia-Nitrogen** (ammonia-N) is an indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia-nitrogen occurs naturally in the environment; however, in higher quantities it can become toxic to fish and other organisms.

**Nitrate-Nitrogen** (nitrate-N) is a common sign of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, which can deplete oxygen from the water during decomposition and eventually suffocate other aquatic life. During the field analysis, nitrate is measured in milligrams per liter (mg/L) $NO_3$ and converted into mg/L nitrate-N using a conversion factor of 0.226. This process is explained in Note 3 of Table 3-1.

**Orthophosphate-Phosphorus** (orthophosphate-P) is also an indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate-N, orthophosphate-P pollution can cause nutrient enrichment (eutrophication), stimulate algal growth, and thus deplete oxygen in the water to levels that are dangerous for aquatic life. Even low levels of orthophosphate-P can cause significant algal growth, as it is commonly the limiting nutrient

in plant growth. During the field analysis, orthophosphate is measured in mg/L $PO_4$ and converted into mg/L orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 6 of Table 3-1.

A statistical summary of the routine field analytical results is presented in Table 4-2. Table 4-3 shows the results of all field analyses conducted at the sampled sites. Graphs of the various parameters and appropriate action levels for follow-up investigations are included at the end of this section.

**TABLE 4-2**
**FIELD ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum | Average | Median | Number of Exceedances | Graph No. |
|---|---|---|---|---|---|---|
| Flow Rate (gpm) | 9 | <1 | 2.33 | 0.75 | --- | 4-1 |

# 5 Trash Assessment

## 5.1 Regulatory Requirements

Section II.B.3.C.(7) of the Municipal Permit's Receiving Waters and Urban Runoff Monitoring and Reporting Program requires Copermittees to assess the presence of trash in receiving waters and urban runoff at each dry weather field screening site. This trash assessment program is designed to provide information on the spatial extent and relative amount of trash present, as well at the nature and origin of the trash at the site.

## 5.2 Procedure and Definitions

The San Diego Copermittee Dry Weather Monitoring Workgroup developed a two-page Trash Assessment Form to document the amount and extent of trash and the threat to human and aquatic health. The first page is completed at every site. The second page, which includes information about the types, prevalence, potential routes, and sources of trash, is also completed at sites where a larger amount of trash is observed.

A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form includes five categories to describe the amount and extent of trash. The definitions are primarily qualitative, although numbers of trash pieces are also included in each category as a rough guideline. The five categories are listed below.

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.
- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is assessed at each site using the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* – Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and

debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category.

In the event that a site is noted as potentially posing a threat to human or aquatic health, additional descriptive comments are recorded in the "Comments" section of the Trash Assessment Forms, included in Appendix D.

If a site is labeled as submarginal or poor, it is then assessed for types of trash present (e.g., automotive, biohazard, food waste), which are ranked based on the prevalence and potential threat to water quality of the items. Lastly, the potential mechanism through which trash reached the site (e.g., dumping, littering, upstream sources) and the potential source of the trash (e.g., construction, commercial, transient) are identified.

## 5.3 Trash Assessment Results

Trash assessments were conducted at 19 sites, including four dry sites. Table 5-1 and Graph 5-1 summarize the trash assessment results. Figure 5-1 provides a map of sampling sites and their corresponding trash assessment.

**TABLE 5-1**
**TRASH ASSESSMENT RESULTS**

| **Optimal** (1 site) | **Suboptimal** (8 sites) | **Marginal** (5 sites) | **Submarginal** (4 sites) | **Poor** (1 site) |
|---|---|---|---|---|
| 47 | 3<br>38<br>41<br>43A<br>45<br>46<br>48<br>49 | 4<br>31A<br>42<br>44<br>44A | 1A<br>13A<br>32<br>40 | 6 |

**FIGURE 5-1**
**TRASH ASSESSMENT SUMMARY**

The most frequent trash assessment score in the City of National City for 2008 was a suboptimal trash rating. Only one of the sites was considered to have "poor" trash levels. Only Site 32 was determined to pose a threat to human health, but both Site 6 and Site 32 were a threat to aquatic health.

### 5.3.1 Threat to Human or Aquatic Health

**Site 6** is an outlet on the north bank of the Sweetwater River, approximately 500 feet east of Highland Avenue, near the pedestrian path accessible from 2nd Avenue. This is the only site in the City that was assessed as having "poor" levels of trash. A large pile of trash was observed at the site, backed up against the outlet's metal lid. In addition to a number of other trash items, detailed in the next section, several rusty alkaline batteries were noted in pools of water at the site, which are considered toxic waste. Site 6 was determined to be tidally influenced during dry weather monitoring, which keeps trash at the site continuously damp and increases the risk of trash floating away. The trash at this site was considered a threat to aquatic health.

**Site 32** is an outlet to the Sweetwater River, east of Second Avenue, north of Freeway 54. During the site visit food packaging, plastic six-pack rings, newspaper used as toilet paper, and human waste were observed under the nearby road, where the creek was dry. This site also had bacterial indicator exceedances, which may be related to the presence of human waste although it was not in contact with water at that time. The trash at this site was considered a threat to both human and aquatic health.

### 5.3.2 Submarginal or Poor Sites

**TABLE 5-2**
**BREAKDOWN OF SUBMARGINAL SITES**

| Site | Types of Trash | Ranking | Potential Route 1 | Potential Route 2 | Potential Source 1 | Potential Source 2 |
|---|---|---|---|---|---|---|
| 1A | Food Packaging | 1 | Littering | Upstream | Household | Commercial |
| | Fabric/Clothing | 2 | Dumping | Upstream | Transient | --- |
| 6 | Household | 1 | Dumping | Upstream | Transient | Unable to determine |
| | Food Packaging | 2 | Littering | Upstream | Commercial | Transient |
| | Yard Waste | 3 | Dumping | Upstream | Commercial | Unable to determine |
| | Toxic | 4 | Littering | Upstream | Transient | Unable to determine |
| 13A | Shopping Carts | 1 | Dumping | --- | Transient | Unable to determine |
| | Food Packaging | 2 | Littering | Upstream | Commercial | --- |
| | Household | 3 | Upstream | --- | Household | --- |
| 32 | Biohazard Waste | 1 | Dumping | --- | Transient | --- |
| | Food Packaging | 2 | Littering | Upstream | Transient | Commercial |
| 40 | Food Packaging | 1 | Littering | Upstream | Commercial | --- |
| | Fabric/Clothing | 2 | Dumping | --- | Transient | --- |
| | Household | 3 | Dumping | Upstream | Transient | Household |
| | Automotive | 4 | Dumping | Upstream | Unable to determine | --- |

**Site 1A** is located in a concrete channel southwest of 43rd Street and Nordica Avenue. Most of the observed trash items were food packaging waste that was likely littered near the site or carried from upstream. The trash was caught in dense cattail vegetation. Some clothes and a clothes hanger were also observed in the vegetation, potentially due to use of the site by transients.

**Site 6** is an outlet on the north bank of the Sweetwater River, approximately 500 feet east of Highland Avenue, near the pedestrian path accessible from 2nd Avenue. This is the only site in the City that was assessed as having "poor" levels of trash. A large pile of trash was observed at the site, backed up against the outlet's metal lid. Some of the trash was protruding from the pipe, from under the lid. Observed items of trash included household trash such as a large blanket, bicycles and parts, toys, tarps, plastic clothes hangers, a metal pole, and a five-gallon bucket. Other trash items noted at the site included palm

fronds, bamboo poles, styrofoam packaging, plastic bottles with and without liquids, and alkaline batteries, a type of hazardous waste. Site 6 was determined to be tidally influenced during dry weather monitoring, which keeps trash at the site continuously damp and increases the risk of trash floating away. Some of the items may even have arrived at the site by tidal action. It appears likely that some of the large household items had been brought to the site by transients, while other smaller items could have come from upstream commercial areas. Visual observations of upstream catch basins near the upstream shopping mall found significant amounts of food packaging litter had accumulated. The trash at Site 6 was also considered a threat to aquatic health.

**Site 13A** is an outlet to the Paradise Creek channel at its furthest downstream point in Kimball Park. While the outlet was observed to be dry, trash assessment included both the MS4 and the receiving water. Four to five dumped shopping carts were observed mostly submerged in the water of the channel, where it goes into a box culvert. Littered bottles, cans, and other food packaging were also visible in the water. A few small household items were also noted, including a game piece and a makeup sponge, which may have been transported from upstream residential areas.

**Site 32** is an outlet to the Sweetwater River, east of Second Avenue, north of Freeway 54. During the site visit food packaging, plastic six-pack rings, newspaper used as toilet paper, and human waste were observed under the nearby road, where the creek was dry. The most likely source of waste at this site was use by transients, although food packaging also could come from upstream. The trash at this site was also considered a threat to human and aquatic health.

**Site 40** is an outlet at the southwest corner of Sweetwater Road and Plaza Bonita Road, near the shopping mall. A number of trash items were visible in the outlet and caught in nearby piles of vegetation, including plastic bags, food and beverage containers, clothing, toys, plastic molding, a car bumper, and a car tire. Food packaging and plastic bags may have been littered at the site due to the nearby shopping mall, however clothing and automotive trash items were likely dumped at the site. Approximately 100 feet away from the site in the same open area, items were observed that likely belonged to a transient, suggesting another potential source for trash observed at the site.

**FIGURE 5-2**
**TRASH ASSESSMENT GIS MAP**

# 6 LABORATORY ANALYTICAL RESULTS

## 6.1 Summary

Laboratory analyses were conducted at four sites, representing over 25 percent of all sites with ponded or flowing water. A summary of the laboratory analytical results is presented in Table 6-1. Table 6-3 presents the laboratory results from all samples. Laboratory reports are included as Appendix C.

**TABLE 6-1**
**LABORATORY ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum | Number of Exceedances |
|---|---|---|---|
| Total Hardness (mg/L $CaCO_3$) | 820 | 101 | --- |
| Oil and grease (mg/L) | nd | nd | 0 |
| Diazinon (µg/L) | nd | nd | 0 |
| Chlorpyrifos (µg/L) | nd | nd | 0 |
| Cadmium (dissolved, mg/L) | nd | nd | 0 |
| Copper (dissolved, mg/L) | 0.0243 | nd | 1 |
| Lead (dissolved, mg/L) | nd | nd | 0 |
| Zinc (dissolved, mg/L) | 0.0652 | nd | 0 |
| Total Coliform (MPN/100 mL) | >1,600,000 | 800 | 2 |
| Fecal Coliform (MPN/100 mL) | >160,000 | 40 | 1 |
| *Enterococcus* Bacteria (MPN/100 mL) | 50,000 | 70 | 2 |

**Note**:
nd = not detected

**Oil and grease** analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities.

**Total hardness** measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Hardness itself is not considered a pollutant, but is measured to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions.

**Diazinon** and **chlorpyrifos** are organophosphate pesticides that can be harmful to aquatic organisms if transported in urban runoff. Diazinon and chlorpyrifos are highly toxic to birds, mammals, and insects. They are also highly toxic to freshwater fish and invertebrates following acute exposure.

**Metal** contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms.

The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness, with toxicity decreasing as hardness increases. Therefore,

each dissolved metal has a Criterion Maximum Concentration (CMC) for a specific total hardness. The laboratory samples are analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Table 6-1 shows the sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

**TABLE 6-2**
**CTR – CMC FOR DISSOLVED METALS[1]**

| Dissolved Copper | | | |
|---|---|---|---|
| **Site** | **Total Hardness (mg/L)** | **CMC (mg/L)** | **Concentration (mg/L)** |
| 32 | 138 | 0.0182 | 0.0243 |
| 40 | 820 | 0.0976 | 0.00518 |
| 46 | 101 | 0.0136 | 0.0131 |
| 32 (confirm) | 239 | 0.0305 | 0.00917 |
| **Dissolved Zinc** | | | |
| **Site** | **Total Hardness (mg/L)** | **CMC (mg/L)** | **Concentration (mg/L)** |
| 32 | 138 | 0.154 | 0.0652 |
| 40 | 820 | 0.697 | 0.0204 |
| 46 | 101 | 0.118 | 0.041 |

**Note:** Table 6-2 lists only those sites where a particular dissolved metal was detected. Cadmium and Lead were not detected in any of the samples.

**Coliform bacteria** are relatively harmless to humans and are present in mammalian digestive tracts and are naturally found in most surface waters and soils. Testing water samples for total coliform bacteria is a standard practice in public health since a high level of total coliform bacteria often may indicate the presence of other more harmful, pathogenic organisms, sometimes of fecal origin. Total coliform is measured in lieu of these pathogens since the various pathogens are generally present in much smaller quantities and are difficult to detect.

**Fecal coliform**, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastro-intestinal tracts of humans and animals and are commonly used as indicators of water contamination by fecal matter. A host of human diseases, particularly those of the gastro-intestinal tract, are spread through water contaminated with fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material was human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain.

A summary of the laboratory analytical results is presented in Table 6-2. Table 6-3 presents the laboratory results from all samples. Laboratory reports are included in Appendix C.

## TABLE 6-3

**Notes:**

**Red** values were at or above the measured constituent's action level
nd = not detected
* = Total hardness is not considered a pollutant (see section 3.4 for details), and thus has no established action level for the purposes of dry weather monitoring. Total hardness is measured because the CTR action levels for metals are dependent on the total hardness value of the water sample.

# 7 DATA ANALYSIS

This first part of this section provides an overall evaluation of test results obtained from the 2008 Dry Weather Monitoring Program. The second portion of this section describes historical trends for various constituent exceedances.

## 7.1 2008 Results

Of the 15 sites sampled, one site had an exceedance for orthophosphate-phosphorus, six sites had exceedances for surfactants concentration, one site had a copper exceedance, and three sites exceeded fecal indicator bacteria action levels. Specifically one site exceeded action levels for total coliforms, fecal coliforms, and *Enterococcus*, but the other two each had an exceedance only for total coliforms or only for *Enterococcus*.

**TABLE 7-1**

**Note:** Table reflects exceedances occurring during routine visits only, not confirmation or follow-up visits.

## 7.2 Previous Results

Historical exceedance results are presented in Table 7-2, Graph 7-1, and Graph 7-2. Table 7-2 shows the percentage of sampled sites that have had exceedances each year of the Dry Weather Monitoring Program. Graph 7-1 illustrates the percentage of exceedances for field constituents, and Graph 7-2 presents the percentage exceedances by year for laboratory analyses.

Since 2002, no exceedances were measured in nitrate-nitrogen, lead, diazinon, or chlorpyrifos. Thus, these constituents have not been included in the following graphs.

The historical data for the results of field analyses presented in Graph 7-1 indicate a decreasing trend in ammonia-nitrogen exceedances, with zero ammonia-nitrogen exceedances in the last two years of monitoring. There have been no exceedances in turbidity or conductivity in the last four years, in part because there is no longer a numeric action level for conductivity. No discernable trend is apparent for pH, surfactants, or orthophosphate-phosphorus.

Historical data for laboratory analyses presented in Graph 7-2 indicate that oil and grease and metals exceedances are a rare event. There have been no oil and grease or zinc exceedances since 2002 and no cadmium exceedances since 2003. This year the percentage exceedance for each bacteria constituent is lower than the historical average.

**TABLE 7-2**
**PERCENT OF SITES WITH EXCEEDANCES BY YEAR**

| Year | Field Screening | | | | | | | | Laboratory Analysis | | | | | | | | | | |

Results based on complete routine visits only. Confirmation visits, follow-up visits, and dry sites not included.

* By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgment in order to account for sites in which salt water and groundwater increase conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

**FIGURE 7-1**
**PERCENT OF SITES WITH FIELD CONSTITUENT EXCEEDANCES BY YEAR**

Note: Action level for turbidity is best professional judgment.

**FIGURE 7-2**
**PERCENT OF SITES WITH LABORATORY ANALYSIS EXCEEDANCES BY YEAR**

# 8 UPSTREAM INVESTIGATIONS

One of the main purposes of the Dry Weather Monitoring Program is to identify IC/IDs. Both field screening and laboratory analytical results are compared to regionally developed action levels (Table 3-4). When a parameter is measured at or above its action level, it is possible that an IC/ID is present. To further investigate potential IC/IDs, additional investigation is initiated whenever action levels are exceeded. Procedures for such investigations are described below.

## 8.1 Investigation Procedures

When Dry Weather Monitoring Program results exceed action levels, the City either conducts an investigation to identify the source of the discharge or provides rationale for why the discharge does not pose a threat to water quality and does not need further investigation. An immediate source identification investigation is initiated if visual and/or analytical evidence of gross contamination is present at a site during a routine investigation. Examples of gross contamination include substantial petroleum sheens, constituent concentrations well above action levels, abnormal colors or odors not attributable to natural site conditions, or evidence of a sewage release; such conditions would typically be considered a threat to human health or the environment. Immediate source identification investigations are also often conducted when surfactants exceedances are noted. Past experience has shown that an immediate investigation is much more likely to identify the source of the exceedance for this particular constituent. This is because such exceedances are often related to washing activities, which are typically intermittent in nature.

When further investigation is needed but an immediate upstream investigation is not necessary, the City initially confirms the results by resampling within two business days of being informed of the exceedance. For field screening, this is within two business days of the initial test. The overall time frame for laboratory analytical results depends on the time that results are received from the lab, but investigations will be conducted within two days of receiving the data, where applicable. These investigations are labeled as “confirmation” visits in this report, and they are used to guide further upstream investigations where necessary.

When confirmation sampling confirms continued exceedance of action levels, then the City conducts further investigation to identify the source of the exceedance. This type of investigation is referred to as “follow-up” in this report. Additional investigation is not conducted when exceedances are not noted during the confirmation visit or when the exceedance is known not to be the result of IC/IDs, as without a high constituent level to track upstream, the investigation is unlikely to identify any sources. As noted earlier, when gross contamination is observed during a routine visit, an immediate upstream source investigation is initiated. Prior to beginning an upstream source investigation, field staff review previous dry weather monitoring reports and consult MS4 maps to plan the investigation.

Dry weather flows are generally traced from the site in an upstream direction along the conveyance system. Photos, narrative descriptions of relevant visual observations made, and GPS coordinates are recorded to aid in documentation and in potential enforcement procedures. Water samples are collected at upstream confluences for analyses of the constituent(s) being tracked. All samples are documented through the completion of field

data sheets, which are provided in Appendix D. If the samples are being submitted for laboratory analysis, they are delivered within the appropriate holding time, and all appropriate chain-of-custody procedures are followed. Sampling and analysis methods are typically the same as those used for the routine portion of the Dry Weather Monitoring Program, with the exception of bacteria analyses. During confirmation and follow-up sampling IDEXX Colilert and Enterolert methods are used instead of the multiple tube fermentation (MTF) methods used for routine visits. The IDEXX methods provide faster turn-around time than the MTF methods: results can be provided within 24 hours instead of several days. Shorter turn-around time allows investigators to conduct further follow-up testing sooner where necessary. The IDEXX methods are also less expensive than MTF methods, which allows field investigators to take samples from a larger number of locations.

If the results of the upstream investigation indicate that an IC/ID may be present, appropriate City personnel will be notified. Where appropriate and feasible, field staff may also contact the party responsible for the discharge directly regarding the IC/IDs and potential BMPs.

## 8.2 Investigated Sites

During the 2008 Dry Weather Monitoring Program additional investigations to investigate potential IC/IDs were completed at eight sites. Six sites had field surfactants exceedances, one had an orthophosphate-phosphorus exceedance, three sites had exceedances for bacteria, and one site was investigated for a dissolved copper exceedance. A brief description of each site, the field and/or laboratory analytical results, photographs of selected upstream locations, and the results of upstream investigations are included below. Table 9-2 in Section 9 of this report provides a summary of the investigation results.

### Site 1A

Site 1A is in a concrete channel that runs west at 43rd Street, south of Nordica Avenue. During the initial site visit the water at the site was ponded and slightly cloudy. A significant amount of trash was observed caught in the dense vegetation. The measured surfactants concentration was greater than 3.0 mg/L, above the action level of 1.0 mg/L. At that time no runoff appeared to be arriving at the site from upstream, and no evidence was found of washing or other source activities. A confirmation visit was conducted the following day, when it was observed that the water had begun to flow at a rate of approximately 3 gpm. The water was clearer and the surfactants concentration dropped below the action level to 0.875 mg/L. No further investigation was required since the high concentration appeared to be transient. However, later in the dry weather monitoring program some washing was observed upstream as described below.

Photo 8-1 Dense vegetation at Site 1A

All three bacterial indicators were measured at levels exceeding their respective action levels, so a confirmation visit and upstream investigation were conducted. Upon returning to the site, the conditions appeared to be similar to the initial visit, with no measurable flow,

Photo 8-2 Recycling container washing at Melrose Street.

but a long ponded and marshy area. A water sample from the site during the confirmation visit also showed high levels of all three indicator bacteria, which exceeded their respective action levels.

Of the northern, eastern, and southern upstream lines investigated for high bacteria levels, it appeared that only the eastern line had existing ponded and flowing water. However, near the southern line a woman was observed washing out her trash and recycling containers with a hose near 907 Melrose Street. This upstream sample was taken at a curb and gutter immediately before an inlet on the southern line (upstream location 1A-1). This water smelled slightly like cleaning agent and appeared soapy. A high concentration of total coliform bacteria (2,420,000 MPN/mL) was found that exceeded the action level, but *E. coli* and *Enterococcus* levels were within acceptable ranges (see table below). The washing activity was immediately reported to the City.

Up the eastern line, a sample was taken at primary site 45, a manhole on Fig Court (upstream location 1A-2). While no runoff was entering the site, it had ponded and was slowly seeping over a damp area to the downstream pipe. This sample had very high levels of total coliform, *E. coli* and *Enterococcus* bacteria (see table below). Note that a portion of the area tributary to upstream location 1A-2 (also Site 45) is outside of the jurisdiction of the City of National City, originating from the City of San Diego. Another branch of this eastern line was sampled further upstream at a catch basin on Palm Avenue, south of the intersection with Division Street (upstream location 1A-3). A small amount of runoff entered the inlet from the nearby school, where a hose and damp ground were noted. The sample from the main pipe below the catch basin had high levels of total coliform and *Enterococcus* bacteria, with relatively low levels of *E. coli* (see table below).

In conclusion, the field crew believes that the high bacteria levels are a combination of conditions at the site itself, runoff from the eastern line, and residential washing activities. The trash and dense vegetation at the site likely promote bacterial growth, particularly when the water is ponded, as it was during these visits. Runoff from the eastern line at upstream location 1A-2 passes through a significant amount of trash in upstream catch basins before the sampling location. Part of this runoff also originates in the adjacent City of San Diego. Recommendations for action corresponding to the problematic areas are provided in Section 9 of this report. A map and a table summarizing the upstream investigation for Site 1A are provided below.

| 1A-3 | 200 feet south of Palm Avenue and Division Street intersection near National City sign | < 1 | 242,000 | 14,118* | 31,300 |

* Derived from E. coli results, divided by a factor of 0.85.

## Site 6

Photo 8-3 Sweetwater River water overwhelms Site 6 tidally.

Site 6 is an outlet to the north bank of the Sweetwater River about 500 feet east of Highland Avenue. During the initial site visit the Sweetwater River water level was about 1.5 feet below the outlet. Water was ponded on the concrete of the outlet structure but appeared to be trickling down to the river. The water sample had a high specific conductance of over 20.00 mS/cm, which is often indicative of salt water in sites where tidal influence is possible. The surfactants test measured a concentration of 2.50 mg/L MBAS, however sea water is known to interfere with the field test kit for surfactants and cause artificially high measurements. The storm drain inlets upstream of the site were visually inspected for runoff, but no water was observed. During the confirmation visit, the tide was evidently higher than during the initial visit and the bottom of the outlet was submerged in the Sweetwater River water. A sample of the water confirmed that it also had a concentration of 2.50 mg/L MBAS according to the field test kit and a specific conductance over 20.00 mS/cm. Since no evidence of storm water runoff was found, and all water appeared to be sea water, no further investigation was required.

## Site 32

Photo 8-4 Litter and human feces in the outlet at Site 32.

Site 32 is an outlet that drains directly to the northern bank of the Sweetwater River. During the initial visit, the water sample appeared yellow in color. Low levels of litter were observed at the site, but human fecal matter and used toilet paper were found within the outlet structure, adjacent to the flowing water. Laboratory analyses of the sample collected during the initial round of field screening measured total coliform bacteria levels at 70,000 MPN/mL, above the action level of 50,000 MPN/mL. Unlike the previous year, *Enterococcus* bacteria were measured below the action level. The dissolved copper analysis also returned a result that, considering the total hardness, was above the acceptable California Toxics Rule (CTR) Criterion Maximum Concentration (CMC), the action level for metals. Two separate confirmation visits were conducted since the metal analyses were received later than the other laboratory analyses.

Photo 8-5 Slow-moving water and litter in catch basin at upstream location 32-3.

The water sample collected during the confirmation visit for the bacteria exceedance revealed reasonably low levels of total coliform bacteria. Despite a much diminished bacteria level at the site, upstream locations 32-1, 32-2, and 32-3 all had total coliform bacteria above the action level (see table below).

While high bacteria levels were noted upstream of Site 32, the most obvious source of bacteria was observed at the site itself, where human feces and used toilet paper were deposited. Another potential source of bacteria noted was a significant amount of litter in the catch basin at the most upstream site (32-3). Between Site 32-3 and the original site a concrete channel has dense vegetation and decomposing organic debris that also could promote bacterial growth (32-2). A summary of the bacteria upstream investigation for Site 32 is provided in the table and map below.

When the site was revisited for the copper exceedance, the total hardness had increased and the dissolved copper concentration had decreased, resulting in a value below the action level (CMC). Since the copper concentration appeared to have been a transient condition with no apparent source, no further investigation was conducted.

**FIGURE 8-2**
**SITE 32 BACTERIA UPSTREAM INVESTIGATION MAP**

**TABLE 8-2**
**SITE 32 BACTERIA UPSTREAM INVESTIGATION**

| Site ID | Location | Flow (gpm) | Total Coliform (MPN/mL) |
|---|---|---|---|
| 32 | East of 2nd Avenue, north of Freeway 54 and the Sweetwater River | <1 | 70,000 |
| 32 (confirm) | East of 2nd Avenue, north of Freeway 54 and the Sweetwater River | <1 | 6,020 |
| 32-1 | Open concrete channel south of Sweetwater Town and Country Shopping Center, western downstream end | <1 | 68,700 |
| 32-2 | Open concrete channel south of Sweetwater Town and Country Shopping Center, eastern upstream end | <1 | 120,000 |
| 32-3 | Catch basin at the northwest corner of Sweetwater Rd. and Prospect St. intersection, inside the Sweetwater Plaza Shopping Center | <1 | 83,000 |

## Site 38

Photo 8-6 Small area of ponded water at Site 38.

Site 38 is an earthen channel just downstream of an outlet, along Harbinson Avenue. During the initial site visit, the water was ponded with an unidentifiable sheen on the surface. Water sampled had a surfactants concentration of 1.25 mg/L, above the action level of 1.0 mg/L. Upon immediate inspection, it did not appear that any water had recently entered the storm drain conveyance system upstream of the site. During the confirmation visit, the conditions of the site had not changed in any notable way, and the surfactants concentration was the same as the initial visit.

Properties adjacent to the earthen channel consist mainly of pervious ground and no evidence of washing or other runoff was noted. An upstream investigation was conducted at two sequential inlets on Rachael Avenue, upstream of the outlet. Though both on Rachael Avenue, one inlet was within the City of National City and the other was in the City of San Diego. The catch basin below the inlet in the City of National City was dry, but the slightly upstream catch basin in the City of San Diego had a small amount of ponded water (upstream location 38-1). The water at upstream location 38-1 had a lower surfactants concentration of 0.5 mg/L, indicating that it was not a likely recent source of surfactants. No other sources of runoff were observed. Since the water at the site was ponded, and the upstream lines were dry and ponded, it is unclear how long the water had been ponded at the site. The ponded water may have been the result of a transient flow, which later pooled and evaporated, increasing the surfactants concentration in the remaining water at the site. Recommended action is described in Section 9 of this report.

## Site 45

Site 45 is a manhole in front of 1243 and 1305 Fig Court, in the middle of the street. At the time of the initial visit, water was coming only from the pipe to the north of the junction. The sample water had a surfactants concentration of 3.0 mg/L. Immediately the upstream investigation began with tracing the pipe upstream to a catch basin on the south side of Scott Drive (upstream location 45-1). Trash and ponded water were observed in the catch basin, and the sample was yellow and smelled like sewage. The surfactants concentration was greater than 3 mg/L, but no recent flow to the storm drain was apparent.

During the confirmation visit, the surfactants concentration at Site 45 was unchanged at 3.0 mg/L. The upstream location 45-1 was inaccessible due to a parked car, but a puddle of water was observed at the northeast corner of Delta Street and Scott Drive (upstream location 45-2). A sample from the puddle had a surfactants concentration of 2.0 mg/L. Up the hill on Delta Street evidence of outdoor laundry washing was observed at the apartment complex at 4616 Delta Street. Several shirts were hung on the fence to dry and an empty bucket and bottle of laundry detergent were noted in front of unit 4 of the complex. Since water stains were evident in the parking lot, it appeared likely that irrigation runoff would transport surfactants generated by outdoor washing. Recommended action is described in Section 9 of this report. A map and a table summarizing the upstream investigation for Site 45 are provided below.

Photo 8-7 Evidence of outdoor laundry washing near upstream location 45-2.

## Site 46

Photo 8-8 Upstream location 46-1, a puddle in the concrete swale by a catch basin.

Photo 8-9 Food waste on the ground near the catch basin.

Site 46 is a manhole located at the southern end of the South Bay Plaza Shopping Center, behind various commercial businesses, including several restaurants. Laboratory analyses measured the *Enterococcus* bacterial indicator at 30,000 MPN/mL, in exceedance of the action level of 20,000 MPN/mL. Unlike last year, both total and fecal coliform bacteria levels were relatively low.

During the confirmation visit to the site, conditions similar to the initial visit were observed in the manhole. The sample collected was clear and odorless. Bacterial counts from the sampled showed even higher levels of *Enterococcus* bacteria than the initial visit (see table below). While at Site 46, a puddle of runoff was observed in a concrete swale by the catch basin a few yards south of the site that collects runoff from behind the commercial shopping center. This puddle consisted of opaque brown water that smelled strongly of decaying food. Analysis of a sample taken from this puddled water (upstream location 46-1) resulted in a very high *Enterococcus* bacteria level. In previous years, high levels of bacteria at this site had been attributed to poor waste disposal and washing activities of businesses near the site and upstream in the shopping centers. This puddled water is an example of a likely source of bacteria, which may have been a result of the same type of business activities in the immediate area. Improper disposal of food waste and litter was also observed at the site, near the shopping center's dumpster enclosure. It was also noted that a small amount of the food waste had fallen into the catch basin upstream of the site.

A second confirmation visit at Site 46 was performed to determine whether *Enterococcus* levels were still high. The sample had an *Enterococcus* count of only 1,607 MPN/100mL, suggesting that the high bacteria levels at the site may have been a temporary condition arising from intermittent discharges in the area. Recommendations regarding this site are provided in Section 9 of this report. A table summarizing the upstream investigation for Site 46 is presented below.

**TABLE 8-4**
**SITE 46 BACTERIA UPSTREAM INVESTIGATION**

| ID | Location | Flow (gpm) | *Enterococcus* (MPN/mL) |
|---|---|---|---|
| 46 | South of South Bay Plaza center, between Fashion Plaza and Fiesta Pet Shop | 9 | 30,000 |
| 46 (confirmation) | South of South Bay Plaza center, between Fashion Plaza and Fiesta Pet Shop | 6 | 86,640 |
| 46-1 | Concrete swale by catch basin a few yards south of Site 46 | ponded | 241,960 |
| 46 (confirmation) | South of South Bay Plaza center, between Fashion Plaza and Fiesta Pet Shop | 1 | 1,607 |

## Site 47

Site 47 is the southern of two manholes located on the south side of the intersection of Mile-Of-Cars Way with Transportation Avenue. This part of the storm drain conveyance has an elevation that is lower than the high tide at the nearby San Diego Bay, and has the potential to be tidally influenced. During the initial site visit, the water level in the manhole cleanout was low (0.5 inches deep) and a small flow of 5 gpm was observed. The conductivity of the sample indicated some tidal influence, and the tide height was about 3.22 feet and incoming. The surfactants concentration appeared to be 1.75 mg/L; however this test kit could have been influenced by the salinity of the bay water, which interferes with the test for MBAS. This is likely since the conductivity of the sample exceeded the range of the meter at 20.00 mS/cm. In case a discharge of surfactants was also present, an upstream investigation was conducted the same day.

Photo 8-10 Runoff from car dealership entering drains on lot.

Photo 8-11 Runoff from car dealership at curb/gutter (upstream location 47-1) entering the storm drain inlet.

Immediately the area upstream of the site was investigated for any visible surface runoff. On the west side National City Boulevard, just south of Mile-Of-Cars Way, runoff was observed draining from two catch basins on the property of the Frank Toyota car dealership to the curb via four-inch pipes. This water was beginning to evaporate but still reached a nearby storm drain inlet. A sample of this runoff at the curb gutter had a surfactants concentration of greater than 3 mg/L and was not tidally influenced (Site 47-1). Brief observations of the Frank Toyota dealership indicated that the asphalt beneath each of cars in the lot was wet, with evidence of runoff. An automated carwash in the rear of the property did not drain in the direction of the sample, but was not completely contained. Personnel present reported that no soap was used on the cars in

the parking area and that plain water only was used. The City was notified of the action level exceedance, and illegal discharge and City action stopped the discharge.

A second upstream location with ponded water was sampled at the southern line leading to Site 47 (upstream location 47-2), but the surfactants concentration was below the action level. A confirmation visit to Site 47 at a lower tide height (-0.44 feet, incoming) still resulted in a water sample that appeared tidally influenced. The water level in the manhole was significantly higher than the initial visit, more than one foot deep. The surfactants test indicated a value of 1.25 mg/L, but no surface runoff was visible upstream of the site. The high conductivity level and large amount of water draining from the site seem to indicate that the site was tidally influenced again during the confirmation visit. Recommended action is described in Section 9 of this report. A map and a table summarizing the upstream investigation for Site 47 are provided below.

**FIGURE 8-4**

**SITE 47 SURFACTANTS UPSTREAM INVESTIGATION MAP**

**TABLE 8-5**

**SITE 47 SURFACTANTS UPSTREAM INVESTIGATION**

| Site ID | Location | Flow (gpm) | Surfactants (mg/L) |
|---|---|---|---|
| 47 (routine) | Southeast corner of the Mile of Cars Way and Transportation Avenue | 5.0 | 1.75 |
| 47-1 | In front of Frank Toyota on National City Boulevard, south of mile of Cars Way | < 1 | > 3.0 |
| 47-2 | Outside west entrance to Frank Toyota, south of Mile of Cars Way and Transportation Ave. | ponded | 0.63 |
| 47 (confirm) | Southeast corner of the Mile of Cars Way and Transportation Avenue | 8.0 | 1.25 |

## Site 48

Site 48 is a catch basin at the northwest corner of the western intersection of East 14th Street and Grove Street. In the catch basin, fine sediment, decomposing organic material, and trash were observed in the ponded water, including a tied bag of kitchen vegetable waste. The sample smelled like sewage and was a slightly cloudy brown. The surfactants concentration was greater than 3 mg/L, and the orthophosphate-phosphorus concentration was 4.63 mg/L, both above their respective action levels. An immediate investigation for sources of surfactants was conducted, which found evidence that a resident had recently washed his vehicle at 1414 Stancrest Lane.

Photo 8-12 Evidence of recent residential car washing, including hose and bucket.

During the confirmation visit, additional trash and bagged vegetable waste was noted in the catch basin since the last visit. Both constituents were still above their respective action levels so a more thorough upstream investigation was performed. The main upstream line was traced east of the site to a catch basin on the east side of Euclid Avenue, just south of Seawind Drive. The same sewage odor, brown color, and cloudiness were observed in the sample taken from the gutter by the catch basin. The sample had a surfactants concentration much greater than 3 mg/L and an orthophosphate-phosphorus concentration of 1.956 mg/L, nearly at the action level. In that residential area evidence of recent car washing was also observed at 2436 Seawind Drive. Since the surfactants concentration appeared to be unusually high, the detergents used for car washing may have been a significant source of orthophosphate-phosphorus, depending on the type of detergent used. Since no recent fertilizer use was evident during the investigation, and the high surfactants and orthophosphate-phosphorus concentrations were coincident, the detergent appears likely to be the source of orthophosphate-

phosphorus. From the available evidence, it appeared that washing activities had transported surfactants and orthophosphate-phosphorus from upstream to the site, where it ponded. Recommended actions are described in Section 9 of this report. A map and a table summarizing the upstream investigation for Site 48 are provided below.

# 9 SUMMARY AND RECOMMENDATIONS

## 9.1 Summary

### 9.1.1 Summary of Field Screening and Laboratory Analysis Data

Fifteen primary monitoring locations were selected and visited for the 2008 Dry Weather Monitoring Program. Four alternate sites were visited and sampled to replace the four primary sites that were dry. Laboratory analyses were performed on water samples from four of the primary sites. Table 9-1 provides a summary of action level exceedances.

**TABLE 9-1**
**SUMMARY OF ACTION LEVEL EXCEEDANCES**

| Field Screening (15 samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Site(s) Exceeding Action Level** |
| pH | 0 | 0 % | --- |
| Conductivity | 0 | 0 % | --- |
| Turbidity | 0 | 0 % | --- |
| Surfactants | 6 | 40 % | 1A, 6, 38, 45, 47, 48 |
| Ammonia-Nitrogen | 0 | 0 % | --- |
| Nitrate-Nitrogen | 0 | 0 % | --- |
| Orthophosphate-Phosphorus | 1 | 7 % | 48 |
| **Laboratory Analyses (4 samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Site(s) Exceeding Action Level** |
| Oil & Grease | 0 | 0 % | -- |
| Cadmium | 0 | 0 % | -- |
| Copper | 1 | 25 % | 32 |
| Lead | 0 | 0 % | -- |
| Zinc | 0 | 0 % | -- |
| Diazinon | 0 | 0 % | -- |
| Chlorpyrifos | 0 | 0 % | -- |
| Total Coliforms | 2 | 50 % | 1A, 32 |
| Fecal Coliforms | 1 | 25 % | 1A |
| *Enterococcus* | 2 | 50 % | 1A, 46 |

**Note:** Data is from the initial site visits only.

In general, the City of National City's Dry Weather Monitoring Program can be characterized by very low flows and ponded water. Ten of the 15 routine visits to screened sites found flows less than or equal to 1 gpm, excluding the four dry sites. The low level of

dry weather flows in the City can be attributed to a lack of groundwater seepage and a low incidence of irrigation runoff. Therefore concentrations of pollutants may be elevated in the runoff, but in many cases the water will never reach a receiving water body due to evaporation or infiltration, and if runoff does reach a water body, the pollutant load is likely to be relatively small.

A formal trash assessment was performed for the first time in 2008 in accordance with the Municipal Permit. Nineteen sites, including dry sites, were assessed, and nine of the sites were scored as "optimal" or "suboptimal", having little or no trash. Five sites had "marginal" levels of trash. Four sites were considered "submarginal" and one site was considered "poor" due to significant amounts or types of trash consistent with human use and dumping. Two of the sites that were "submarginal" or "poor" also had trash that was considered a threat to aquatic and/or human health.

### 9.1.2 Summary of Follow-Up Investigation Data

Table 9-2 presents the conclusions based on the results of confirmation visits and upstream investigations conducted at eight sites for the 2008 Dry Weather Monitoring Program.

**TABLE 9-2**
**SUMMARY OF FOLLOW-UP INVESTIGATIONS**

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 1A | Surfactants | Total Coliforms, Fecal Coliforms, *Enterococcus* | Surfactants level was below the action level when tested the next day, but washing activities were observed upstream later. Washing activities and trash in the storm drain conveyance were observed upstream of the site. |
| 6 | Surfactants | | No potential source of surfactants was observed for this ponded water. High conductivity and direct observation indicated a strong tidal influence on the site. |
| 32 | | Copper, Total Coliforms | No potential source of copper was observed and the concentration was much lower during the confirmation visit. It may have been due to a transient flow. Total coliforms were at high levels upstream, but were reduced at the site during confirmation. Potential sources included human feces at the site and trash in stagnant water in an upstream catch basin. |

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 38 | Surfactants | | No potential source of surfactants was observed for this ponded water in an earthen channel. No runoff noted upstream of the site. Ponded water may have been from a transient flow. |
| 45 | Surfactants | | Evidence of laundry hand washing in a parking lot at an upstream residential complex at 4616 Delta Street, in the City of San Diego. |
| 46 | | *Enterococcus* | Puddle of runoff near site had very high levels of *Enterococcus* and appeared likely to be from adjacent commercial businesses. while grease bins were in better condition than in 2007, food waste was observed in a parking area and may have entered an upstream catch basin. A second confirmation visit indicated *Enterococcus* levels at the site fell below the action level. |
| 47 | Surfactants | | High conductivity indicated a strong tidal influence on the site. However, immediate investigation also found a high surfactants concentration in a discharge from Frank Toyota. The City was contacted and stopped the discharge. The business was issued a Notice of Violation and a citation. |
| 48 | Surfactants, Orthophosphate-P | | Detergent from residential car washing activities was observed upstream as the only source of flow and the likely source of both surfactants and orthophosphate-phosphorus. |

## 9.2 Recommendations

Based on the results of the 2008 Dry Weather Monitoring Program for the City of National City, these follow-up actions are recommended for consideration.

### 9.2.1 Education

- Provide educational materials regarding BMPs for outdoor washing activities to the following areas of the City:
    - All residences on Melrose Street,

- All residences on Scott Drive,
- Integrity Charter School on Palm Avenue,
- Rachael Avenue residences between East 20th Street and East 24th Street,
- 1414 Stancrest Lane, and
- 2436 Seawind Drive.

- Work with the City of San Diego to provide educational materials regarding BMPs for outdoor washing activities to the residential complex at 4616 Delta Street, which is outside of the jurisdiction of the City of National City but upstream of Site 45 and Site 1A.

### 9.2.2 Inspection and Maintenance

- Follow up as necessary with Frank Toyota on National City Boulevard and Mile-of-Cars Way to ensure no future discharge of water containing surfactants to the storm drain.
- While a more recent confirmation visit indicated much lower bacteria levels at Site 46, conduct further source investigation due to the history of high bacterial levels at this site. In particular, investigate whether the activities of nearby businesses could cause bacterial growth in the storm drain. Contact the property management to keep the dumpster enclosure and grease bin areas free of loose trash and food waste.
- Trash and debris at the site, and further upstream are likely responsible for the elevated levels of bacteria measured at Site 1A. In order to discourage bacterial growth, the City should clean out trash and debris accumulation in catch basins and curbs upstream of Site 1A. In particular, significant amounts of trash were observed in the catch basins on Scott Drive. Work with the City of San Diego to prevent discharges and minimize trash generation in areas outside the City of National City but tributary to Site 1A (e.g., portions of Delta Street).
- Decomposing trash and human waste are likely sources of bacteria to Site 32. Schedule cleaning for the inside of the outlet at Site 32 to prevent waste accumulation. This area should also be monitored as feasible to discourage human inhabitation. Also remove trash from the manhole at the northwest corner of the Sweetwater Road and Prospect Street intersection, which is upstream of Site 32.
- Remove trash from all sites in the City where trash was observed (i.e., every site except Site 47). Prioritize regular removal of trash from sites 1A, 6, 13A, 32, and 40, which were scored as submarginal or poor by the trash assessment during routine site visits, and two of which were considered a potential threat to aquatic and/or human health. Additionally, remove trash found at sites 4, 31A, 42, 44, and 44A, which were scored as marginal. Add these sites to the City's existing clean up schedule as appropriate. The remaining sites with a suboptimal trash score should also be cleaned up and added to the City's existing clean up schedule as appropriate, including sites 3, 38, 41, 43A, 45, 46, 48, and 49.

# Laboratory Analytical Reports

**EnviroMatrix Analytical, Inc.**

11 September 2008

D-Max Engineering
Attn: Arsalan Dadkhah
7220 Trade Street, Suite 119
San Diego, California 92121

**EMA Log #: 0808485**

**Project Name: National City Dry Weather Monitoring**
**Project Desc./#:200840W-5**

Enclosed are the results of analyses for samples received by the laboratory on 08/27/08 14:29. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that this data is in compliance both technically and for completeness.

**Dan Verdon**
**Laboratory Director**

CA ELAP Certification #: 2564

4340 Viewridge Avenue, Suite A - San Diego, California 92123 - (858) 560-7717 - Fax (858) 560-7763

## ANALYTICAL REPORT FOR SAMPLES

| Sample ID | Laboratory ID | Matrix | Date Sampled | Date Received |
|---|---|---|---|---|
| 32 | 0808485-01 | Water | 08/27/08 10:00 | 08/27/08 14:29 |
| 40 | 0808485-02 | Water | 08/27/08 11:15 | 08/27/08 14:29 |
| 46 | 0808485-03 | Water | 08/27/08 12:25 | 08/27/08 14:29 |
| 1A | 0808485-04 | Water | 08/27/08 13:15 | 08/27/08 14:29 |

NOTE: Due to a instrument failure the dissolved metals were performed by a subcontract laboraory, results to follow in a separate report.

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

*I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.*

Subject: **Calscience Work Order No.: 08-09-0953**
**Client Reference: 0808485**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/10/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

## Glossary of Terms and Qualifiers

Work Order Number: 08-09-0953

| Qualifier | Definition |
|---|---|
| * | See applicable analysis comment. |
| 1 | Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification. |
| 2 | Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification. |
| 3 | Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification. |
| 4 | The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification. |
| 5 | The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required. |
| A | Result is the average of all dilutions, as defined by the method. |
| B | Analyte was present in the associated method blank. |
| C | Analyte presence was not confirmed on primary column. |
| E | Concentration exceeds the calibration range. |
| H | Sample received and/or analyzed past the recommended holding time. |
| J | Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated. |
| ME | LCS Recovery Percentage is within LCS ME Control Limit range. |
| N | Nontarget Analyte. |
| ND | Parameter not detected at the indicated reporting limit. |
| Q | Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater. |
| U | Undetected at the laboratory method detection limit. |
| X | % Recovery and/or RPD out-of-range. |
| Z | Analyte presence was not confirmed by second column or GC/MS analysis. |

**Project Number: 200840W-6**

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

*I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.*

Subject: **Calscience Work Order No.: 08-10-0873**
**Client Reference: 0810183**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 10/9/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

## Glossary of Terms and Qualifiers

Work Order Number: 08-10-0873

| Qualifier | Definition |
|---|---|
| * | See applicable analysis comment. |
| 1 | Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification. |
| 2 | Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification. |
| 3 | Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification. |
| 4 | The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification. |
| 5 | The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required. |
| A | Result is the average of all dilutions, as defined by the method. |
| B | Analyte was present in the associated method blank. |
| C | Analyte presence was not confirmed on primary column. |
| E | Concentration exceeds the calibration range. |
| H | Sample received and/or analyzed past the recommended holding time. |
| J | Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated. |
| ME | LCS Recovery Percentage is within LCS ME Control Limit range. |
| N | Nontarget Analyte. |
| ND | Parameter not detected at the indicated reporting limit. |
| Q | Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater. |
| U | Undetected at the laboratory method detection limit. |
| X | % Recovery and/or RPD out-of-range. |
| Z | Analyte presence was not confirmed by second column or GC/MS analysis. |

# Trash Assessment Form

SITE ID: 1A

DATE: 8/27/08

LOCATION: Southwest of 43rd St. and Nordica Ave.

TIME: 13:15

OBSERVER: CG, JP

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): ——

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 x 10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☐ MS4 ☒ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☒ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

- **Complete the following section for Submarginal, and Poor Evaluations ONLY**

| TYPE | Ranking or Count by Type * | POTENTIAL ROUTE (CHECK UP TO 2) | | | | POTENTIAL SOURCE (CHECK UP TO 2) | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Dumping | Littering | Upstream | Unable to determine | Household | Construction | Commercial | Industrial | School | Transient | Unable to determine |
| Automotive | | | | | | | | | | | | |
| Biohazard Waste | | | | | | | | | | | | |
| Business Related | | | | | | | | | | | | |
| Cigarette Butts | | | | | | | | | | | | |
| Construction | | | | | | | | | | | | |
| Fabric/Clothing | 2 | ✓ | | ✓ | | | | | | | ✓ | |
| Food Packaging | 1 | | ✓ | ✓ | | ✓ | | ✓ | | | | |
| Food Waste | | | | | | | | | | | | |
| Household | | | | | | | | | | | | |
| Shopping Carts | | | | | | | | | | | | |
| Toxic | | | | | | | | | | | | |
| Yard Waste | | | | | | | | | | | | |

* Only rank the types of trash PRESENT in evaluated area from 1 through 12 (1 is most prevalent – 12 is least prevalent). DO NOT rank types of trash that are not present in evaluated area.

Comments: Fast food packaging waste, plastic bags, hanger, and some clothes.

# Trash Assessment Form

SITE ID: 3 DATE: 8/27/08

LOCATION: E. 7th Street and R. Avenue TIME: 15:30

OBSERVER: JP / CG

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): ——

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 x 5

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

**COMMENTS:** Manhole was inaccessible since it appeared to have been sealed over with asphalt/tar. No adjacent other access was found.
8/29/08 - manhole opened - pipe damp

Revised 4/20/2004. 4/15/2005. 4/19/2006, 3/13/2008

# Trash Assessment Form

SITE ID: 4 DATE: 8/29/08

LOCATION: 4 E. 1st Street and U Avenue TIME: 11:10 a.m.

OBSERVER: JP/MD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 X 10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☒ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

# Trash Assessment Form

SITE ID: 32 DATE: 8/27/08

LOCATION: East of 2nd Ave. north of Freeway 54 and the Sweetwater River TIME: 10:12

OBSERVER: JP/CG

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 40 x 30

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☒ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☒ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☒ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

- **Complete the following section for Submarginal, and Poor Evaluations ONLY**

| TYPE | Ranking or Count by Type * | POTENTIAL ROUTE (CHECK UP TO 2) | | | | POTENTIAL SOURCE (CHECK UP TO 2) | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Dumping | Littering | Upstream | Unable to determine | Household | Construction | Commercial | Industrial | School | Transient | Unable to determine |
| Automotive | | | | | | | | | | | | |
| Biohazard Waste | 1 | X | | | | | | | | | X | |
| Business Related | | | | | | | | | | | | |
| Cigarette Butts | | | | | | | | | | | | |
| Construction | | | | | | | | | | | | |
| Fabric/Clothing | | | | | | | | | | | | |
| Food Packaging | 2 | | X | X | | | | X | | | X | |
| Food Waste | | | | | | | | | | | | |
| Household | | | | | | | | | | | | |
| Shopping Carts | | | | | | | | | | | | |
| Toxic | | | | | | | | | | | | |
| Yard Waste | | | | | | | | | | | | |

* Only rank the types of trash PRESENT in evaluated area from 1 through 12 (1 is most prevalent – 12 is least prevalent). DO NOT rank types of trash that are not present in evaluated area.

Comments: Human Feces, plastic 6-pack rings,

# Trash Assessment Form

SITE ID: 38 DATE: 8/26/08

LOCATION: Dirt road, west of Harbison Ave, between 20th St and 24th St., at the end of fence line. TIME: 15:50

OBSERVER: CG, JP

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 30 x 10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

# Trash Assessment Form

SITE ID: 42 DATE: 8/26/08

LOCATION: South west of Euclid Ave. and 24th St., South of Southern Community Church TIME: 15:20

OBSERVER: JP / CG

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 40 x 10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☒ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

# Trash Assessment Form

SITE ID: 46 DATE: 8/27/08

LOCATION: South of South Bay Plaza Center, Between Fashion Plaza + Fiesta Pet Shop. TIME: 12:25

OBSERVER: CG, JP

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L X W (FT): 5 x 5

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

**COMMENTS:** Site may be tidally influenced, but no tide information was available near the sampling location because the site is about one mile upstream of the San Diego Bay in the MS4.

# Trash Assessment Form

SITE ID: 47 DATE: 8/26/08

LOCATION: southeast corner of Mile of Cars Way and Transportation Ave TIME: 12:20

OBSERVER: JP / CG

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): ——

ESTIMATED AREA OF ASSESSMENT L x W (FT): 4x4

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☒ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

# Trash Assessment Form

SITE ID: 49 DATE: 8/29/08

LOCATION: South end of Arcadia Pl (through Hubison Ave and 11th St.) TIME: 9:10 am

OBSERVER: JP/CG

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): —

ESTIMATED AREA OF ASSESSMENT L x W (FT): 50 x 30

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

## CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki, P.E.
City Engineer

Date: September 2009

Telephone Number: (619) 336-4380

# EXECUTIVE SUMMARY

The City of National City (City) has been actively developing and implementing storm water pollution prevention measures since 1990. The City's current Jurisdictional Urban Runoff Management Program (JURMP) was prepared in March 2008 in response to San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit). The Municipal Permit was jointly issued to 18 municipalities in San Diego County, including the City, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees").

The City's JURMP includes Best Management Practice (BMP) standards for businesses, construction and development projects, residents, and the City's own activities. The JURMP also includes programs for water quality monitoring and educational outreach.

This JURMP Annual Report presents the City's activities to implement its JURMP during the 2008/2009 fiscal year, which began on July 1, 2008 and ended on June 30, 2009. The exception to this is the illicit discharge detection and elimination component of the JURMP, which per Addendum No. 2 to the Municipal Permit now has a reporting period that extends to September 30 each year, three months later than all the other components of the JURMP.

The 2008/2009 reporting period is the first complete year under the requirements of the current Municipal Permit. Each section of this JURMP Annual Report discusses how the City's efforts during 2008/2009 met the requirements of the Municipal Permit. Key actions taken for the major components of the City's storm water program are summarized below.

**Development Planning Component**

During 2008/2009, the City continued to oversee development activities occurring in the City to mitigate potential threats to water quality due to such activities. The City continued to require all development projects to submit applicability checklists to determine subjectivity to the City's Standard Urban Storm Water Mitigation Plan (SUSMP) requirements. Four Priority Projects were identified and required to submit Storm Water Management Plans (SWMP) to comply with the City's SUSMP requirements. The City implemented its treatment control BMP operation and maintenance verification program, which included the utilization of a Microsoft Access treatment control BMP database to track information and prepare the maintenance verification letters distributed to responsible parties. The City also inspected 10 sites with approved treatment control BMPs.

**Construction Component**

During 2008/2009, a total of 111 construction storm water compliance inspections were completed at 66 sites, not including inspections for building permits, which also include a brief check for storm water BMPs. The City checked all construction projects for

applicability to the maximum disturbed area limitation and guidelines for advanced treatment. The City's plan check process provided construction BMP fact sheets, and the inspection program required projects to comply with the City's minimum BMP requirements.

**Municipal Component**

The City inspected all high TTWQ municipal fixed facilities and continued its rigorous street sweeping and MS4 maintenance programs. A total of 1,004 tons of trash and debris were removed from street sweeping activities, and 42.2 tons of debris were removed from standard MS4 maintenance. The City also developed and updated the forms used to record the types of debris removed during MS4 maintenance, the inspections conducted at special events, and the inspections conducted at municipal facilities. The City also continued to maintain and repair or replace sanitary sewer lines, as needed, to decrease the potential for a sanitary sewer overflow (SSO). No SSOs were reported in 2008/2009. The City received and appropriately addressed 27 complaints from the Storm Water Hotline, the City website, and other City departments.

**Industrial and Commercial Component**

During 2008/2009 the City met the Municipal Permit requirement to inspect at least 25 percent of the City's industrial and commercial inventory, including 100 percent of its high threat to water quality (TTWQ) sites. During the inspections conducted during 2008/2009, the City notified industrial and commercial businesses of the City's BMP requirements through the City's inspection program. Inspectors also assessed each facility's compliance with the General Industrial Permit (Industrial Permit) and worked with the RWQCB to resolve compliance issues. The City also continued a special additional data collection program focused on pollutant discharge potential assessment.

**Residential Component**

The City worked to educate its residents through a variety of means. During 2008/2009 the City completed a special study to assess levels of knowledge and BMP implementation in high TTWQ residential areas. The study included door-to-door surveys, verbal education, distribution of educational materials, and inspection for high priority residential activities. Information gathered from this program allowed the City to update its list of high TTWQ residential areas. The City continued to collaborate with the cities of Chula Vista and Imperial Beach to encourage residents to dispose of household hazardous waste (HHW) appropriately at a facility available to the public. The City also continued to host large item waste disposal events in fall and spring, as well as respond to calls made to the City storm water hotline regarding residential areas.

**Illicit Discharge Detection and Elimination Component**

As required by RWQCB Addendum No. 2 to the Municipal Permit, adopted on September 10, 2008, the reporting period for this component of the JURMP has been extended to September 30, 2009. The City will submit the details of how it implemented the illicit discharge detection and elimination component of its JURMP to the RWQCB no later than December 15, 2009.

**Education Component**

As a means to raise storm water awareness in various communities in the City, the City continued to conduct various education and outreach activities throughout 2008/2009. The City's efforts resulted in an estimated 34,339 impressions. The City also initiated a High TTWQ Residential Education Program, which involved door-to-door education and outreach. Through this program, 1,341 households received storm water educational materials. The City developed a bilingual 2009 storm water program calendar, which presented storm water concepts as well as storm water related drawing created by local third grade students. Approximately 5,740 calendars were distributed to municipal staff, industrial and commercial business representatives, school-aged children, and residents. To better serve the City's diverse population, a variety of educational materials were distributed in Spanish as well as English.

**Public Participation Component**

During 2008/2009, the City provided a variety of opportunities for individuals in the City to participate in the City's storm water program. Activities included cleanup events, which have a direct effect on water quality, and outreach activities, through which the City works to increase general knowledge and awareness regarding storm water issues. The City sponsored a themed art contest for third grade students at public schools in the City. Similar to last year, students submitted drawings with the "By Keeping our Community Clean, We Can Keep the Ocean Clean" theme. Twelve winners will be chosen, and their drawings will be included on the 2010 storm water program calendar. City residents continued to participate in routine large item and HHW waste disposal events. Additionally, 118 volunteers participated in the Creek to Bay Cleanup at three different sites throughout the City.

**Fiscal Analysis Component**

The City continued to fund its storm water program as discussed in the City's JURMP. Fiscal data for 2008/2009 and 2009/2010 are presented in this section.

**Effectiveness Assessment Component**

The City continued to evaluate the effectiveness of its storm water program based on the approach presented in the City's March 2008 JURMP update. The City has identified significant activities within each program component and metrics to assess each one. Standard tables to report this information have been created and included in Section 11 of this JURMP Annual Report.

**Special Investigations**

The City continued its Clean Community Program, which this year included extensive door-to-door surveys and education in residential areas. Residents were provided an in-person opportunity to share ideas about ways to keep the community clean. The City also assessed pollutant discharge potential of industrial and commercial businesses; sediment, trash, and oil and grease had the highest average pollutant discharge potential scores.

**Conclusions and Recommendations**

The City will continue to implement the new and updated programs in its JURMP during 2009/2010; it is anticipated that some program refinements will be made as implementation progresses. The City will also continue to collaborate with the other Copermittees to improve the efficiency of its program.

# 1.0 INTRODUCTION

## 1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report presents a summary of the activities of the City of National City (City) during the 2008/2009 fiscal year. Preparation and submittal of the JURMP Annual Report is required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

### 1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act (also known as the Clean Water Act, or CWA) established a framework for regulating Municipal Separate Storm Sewer System (MS4) discharges under the National Pollutant Discharge Elimination System (NPDES). The RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region in 1990, followed by a revised permit in 2001. The current Municipal Permit in turn replaced the 2001 permit, RWQCB Order No. 2001-01, in 2007.

Like all the other regulated municipalities in the San Diego region, collectively referred to as Copermittees, the City developed and submitted a JURMP to the RWQCB in 2002. As required by the Municipal Permit, the City submitted an updated JURMP in March 2008. The JURMP includes management measures for a variety of different sectors and activity types such as municipal, industrial, commercial, construction, and significant development and re-development.

Annual reports on the implementation of the JURMP are required to be submitted to the RWQCB September 30 of each year. This JURMP Annual Report presents information from the 2008/2009 fiscal year, which extended from July 1, 2008 to June 30, 2009.

### 1.1.2 CITY SETTING

The City of National City is located in southwest San Diego County, and is bordered by San Diego, Chula Vista, and unincorporated portions of San Diego County. The City itself includes approximately nine square miles and an estimated population of approximately 61,000. Land use within the City is mixed, with residential being the predominant land use. Land use categories with the corresponding percentage of the total area are included in Table 1-1, below, and illustrated in Figure 1-1.

**Table 1-1**
**City of National City Land Use Breakdown**

| Land Use | Total Area (Acres) | Percentage |
|---|---|---|
| Single Family Residential | 1,216 | 30% |
| Transportation | 1,149 | 29% |
| Commercial | 490 | 12% |
| Industrial | 251 | 6% |
| Multi-Family Residential | 215 | 5% |
| Open | 202 | 5% |
| Public Facilities and Utilities | 174 | 4% |
| Vacant | 115 | 3% |
| Parks | 114 | 3% |
| Other Residential | 41 | 1% |
| Office | 22 | 1% |
| Water | 20 | <1% |
| Construction | 6 | <1% |
| Recreation | 2 | <1% |
| **Total** | **4,016** | **100%** |

Source: 2007 SANDAG land-use data

The City of National City lies entirely within the San Diego Bay Watershed. The City is located within two sub-watersheds: the Sweetwater and Pueblo San Diego sub-watersheds. Overall, the City of National City comprises approximately 1.6 percent of the total area of the San Diego Bay Watershed. Much of the southern portion of the City drains to the Sweetwater River, which ultimately terminates in San Diego Bay. The central portion of the City drains to Paradise Creek, a small salt marsh creek, which eventually discharges into the Sweetwater River. La Paleta Creek (also known as 7th Street Channel) drains the northern portion of the City and discharges directly to San Diego Bay. A very small western portion of the City drains directly to San Diego Bay shoreline. Virtually all of the areas of the City that drain directly to San Diego Bay are within the jurisdiction of the San Diego Unified Port District. Watersheds in the City are shown in Figure 1-2.

San Diego Bay, as a whole, is listed in the 2006 CWA Section 303(d) for polychlorinated biphenyls (PCB) based on fish tissues studies in recent years. The San Diego Bay shoreline at 7th Street Channel and at the 24th Street Marine Terminal are listed in the 2006 CWA Section 303(d) for benthic community effects and sediment toxicity. A TMDL is in progress for the mouth of 7th Street Channel. Because Sweetwater Marsh is part of a national wildlife refuge, it is considered an ESA. Paradise Creek is also considered an ESA by the City.

Note: Marsh boundaries based on land use data from SANDAG. The portion of the marsh west of I-5 and south of the Sweetwater River is not in the City's Jurisdiction. Base Data Sources: City of National City, SANDAG, SanGIS, Port of San Diego

## 1.2 PURPOSE AND OBJECTIVES

The City's JURMP presents a strategy to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The JURMP includes a variety of programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the City's implementation of its JURMP during the 2008/2009 reporting period.

In addition, this JURMP Annual Report addresses the comments of the RWQCB on the previous year's annual report and the City's recently updated JURMP. A response to those review comments is available as Attachment 1.1.

## 1.3 REPORT ORGANIZATION

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

| | |
|---|---|
| **Section 1** | **Introduction** |
| **Section 2** | **Development Planning Component** |
| **Section 3** | **Construction Component** |
| **Section 4** | **Municipal Component** |
| **Section 5** | **Industrial and Commercial Component** |
| **Section 6** | **Residential Component** |
| **Section 7** | **Illicit Discharge Detection and Elimination Component** |
| **Section 8** | **Education Component** |
| **Section 9** | **Public Participation Component** |
| **Section 10** | **Fiscal Analysis Component** |
| **Section 11** | **Effectiveness Assessment Component** |
| **Section 12** | **Special Investigations** |
| **Section 13** | **Non-Emergency Fire Fighting** |
| **Section 14** | **JURMP Revisions** |
| **Section 15** | **Conclusions and Recommendations** |
| **Section 16** | **References** |

Each section includes all the sections required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a clearer explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Subsection 1.1, Background, has been divided into subsections 1.1.1, Regulatory Background, and 1.1.2, City Setting, for the sake of clarity.

# 2.0 DEVELOPMENT PLANNING COMPONENT

## 2.1 INTRODUCTION
