registered products that contain more than one a.i. (Table 61). Carbaryl is a common component in several fertilizer products used on turf. It is also commonly formulated with other pesticidal ingredients including rotenone, a botanical extract used to eradicate fish and as an insecticide. Carbaryl is formulated with malathion (another cholinesterase-inhibiting insecticide), bifenthrin (a neurotoxic synthetic pyrethroid) and copper sulfate (registered for use as an insecticide, algicide, and fungicide). Methomyl is formulated with muscalure, a fly attractant used in fly bait formulations. NMFS is not aware of any carbofuran products that contain other a.i.s.

Table 61. Examples of listed a.i.s on pesticide products containing carbaryl and methomyl.

EPA Product Registration Number	A.i.s	Other Ingredients
4-29	Basic cupric sulfate 7%, carbaryl 1.25%, rotenone 0.5%, cube resins other than rotenone 1%	90.25%
4-59	Carbaryl 0.5%, malathion 3%, captan 5.87%	90. 63%
4-122	Carbaryl 0.3%, malathion 6%, captan 11.7%	82%
4-458	Basic cupric sulfate 7%, carbaryl 2%	19%
4-333, 239-2514, 8119-5, 71096-15	Metaldehyde 2%, carbaryl 5%	93%
9198-233, 9198-234, 9198-235	Carbaryl 2.3%, Bifenthrin 0.058%	97.642%
270-255	Methomyl 1%, component of muscalure 0.025%	98.975%
2724-274	Methomyl 1%, component of muscalure 0.049%	98.951%
7319-6	Methomyl 1%, component of muscalure 0.026%	98.974%
53871-3	Methomyl 1%, component of muscalure 0.04%	98.96%

Nonylphenol (NP) and nonylphenol polyethoxylates are inert ingredients that may be part of a pesticide product formulation and are common adjuvant ingredients added during pesticide applications. NP and nonylphenol polyethoxylates are also ingredients in detergents, cosmetics, and other industrial products and are a common wastewater contaminant from industrial and municipal sources. NP has been linked to endocrine disrupting effects in aquatic systems. A national survey of streams found that NP was among the most ubiquitous organic wastewater contaminants in the U.S., detected in more than 50% of the samples tested. The median concentration of NP in streams surveyed was 0.8 μg/L and the maximum concentration detected was 40.0 μg/L (Table 62). Related compounds were also detected at a relatively high frequency (Koplin, Furlong et al. 2002).

Table 62. Detection of nonionic detergent degradates in streams of the U.S. (Koplin, Furlong et al. 2002)

Chemical	Frequency Detected	Maximum (μg/L)	Median (μg/L)
4-nonylphenol	50.6	40	0.8
4-nonylphenol monoethoxylate	45.9	20	1
4-nonylphenol diethoxylate	36.5	9	1
4-octylphenol monoethoxylate	43.5	2	0.2
4-octylphenol diethoxylate	23.5	1	0.1

We are uncertain to what degree NP and NP-ethoxylates may or may not occur in carbaryl, carbofuran, and methomyl product formulations and/or are added prior to application. Inert ingredients are often not specified on product labels. Additionally, NP and NP-ethoxylates represent a very small portion of the more than 4,000 inert ingredients that EPA permits for use in pesticide formulations (EPA 2008). Many of these inerts are known to be hazardous in their own right (*e.g.,* xylene is a neurotoxin and coal tar is a known carcinogen). Several permitted inerts are also registered a.i.s (*e.g.,* copper, zinc, chloropictrin, chlorothalonil). Inerts can be more than 50% of the mass of pesticide products, and millions of lbs of these products are applied to the landscape each year (CDPR 2007). This equates to large contaminant loads of inerts that may adversely affect salmon or their habitat. Uncertainty regarding exposure to these ingredients will be qualitatively incorporated into our analysis.

Tank Mixtures

Several pesticide labels authorize the co-application of other pesticide products and other materials in tank mixes, thereby increasing the likelihood of exposure to multiple chemical stressors. For example, Sevin XLR Plus (EPA Reg. No. 264-333), which contains carbaryl, specifies the product is compatible with a wide range of pesticides. The label indicates that when used as a fruit thinner, Sevin XLR Plus may be mixed with other fruit thinners. Although mixtures with other pesticides products are not specifically recommended on the Furadan LFR label (EPA Reg. No. 279-3310, containing carbofuran), they are not prohibited. Furadan LFR does specifically indicate that the product may be mixed with liquid fertilizer. Lannate SP (EPA Reg. No. 352-342, containing methomyl) also provides instructions for tank mixing with other products and identifies some tank mixes that are not compatible. These ingredients and the other inert ingredients in these products are considered part of the action because they are authorized by EPA's approval of the FIFRA label. Exposure, and consequently risk associated with

potential ingredients in tank mixtures were not addressed in EPA's BEs and remain a significant source of uncertainty.

Environmental Mixtures

As described in the *Approach to the Assessment*, we analyze the status of listed species, in conjuction with the *Environmental Baseline* in evaluating the likelihood that action stressors will reduce the viability of populations of listed salmonids. This involves considering interactions between the stressors of the action and the *Environmental Baseline*. For example, we consider that listed salmonids may be exposed to the wide array of chemical stressors that occur in the various marine, estuarine, and freshwater habitats they occupy throughout their life cycle. Exposure to multiple pesticide ingredients is most likely in freshwater habitats and nearshore environments adjacent to areas where pesticides are used. As of 1997, about 900 a.i.s were registered in the U.S. for use in more than 20,000 different pesticide products (Aspelin and Grube 1999). Typically 10 to 20 new a.i.s are registered each year (Aspelin and Grube 1999). In a typical year in the U.S., pesticides are applied at a rate of approximately five billion lbs of a.i. per year (Kiely, Donaldson et al. 2004). Pesticide contamination in the nation's freshwater habitats is ubiquitous and pesticides usually occur in the environment as mixtures (Gilliom, Barbash et al. 2006). "More than 90% of the time, water from streams with agricultural, urban, or mixed-land-use watersheds had detections of two or more pesticides or degradates, and about 20% of the time they had detections of 10 or more (Gilliom, Barbash et al. 2006)." The likelihood of exposure to multiple pesticides throughout a listed salmonids' lifetime is great considering their migration routes and habitats occupied for spawning and rearing. In a three-year monitoring study conducted by the Washington DOE, pesticide mixtures were found to be common in both urban and agricultural watersheds (Burke, Anderson et al. 2006). An average of three pesticides was found in each sample collected on urban sampling sites with as many as nine pesticides found in a single sample. Agricultural sites averaged three to five pesticides per sample with as many as 14 pesticides being detected in a single sample (Burke, Anderson et al. 2006). Mixtures of chemicals that share a common mode or mechanism of action are of particular concern. Six to 11 million lbs of cholinesterase-inhibiting insecticides are used annually in California (CDPR 2007). One a.i., thiodicarb, degrades into methomyl. Potential

effects of thiodicarb and other pesticide mixtures containing carbaryl, carbofuran, and methomyl were not addressed in the BEs.

Cholinesterase inhibiting insecticides, including carbaryl, diazinon, chlorpyrifos, and malathion are the most frequently detected mixtures in urban streams across the U.S. (Gilliom, Barbash et al. 2006).

Gilliom and others (2006) suggested that assessment of pesticide mixture toxicity to aquatic life is needed given the widespread and common occurrence of pesticide mixtures, particularly in streams, because the total combined toxicity of pesticides in water is often greater than that of any single pesticide compound. Exposure to multiple pesticide ingredients can result in additive and synergistic responses as described below in the *Risk Characterization* section. It is reasonable to conclude that compounds sharing a common mode of action cause additive effects and in some cases synergistic effects. CDPR's most recent pesticide use report indicates 6,857,530 lbs of cholinesterase-inhibiting insecticides were applied in California during 2006. Over 60 cholinesterase-inhibiting a.i.s are currently registered in California (CDPR 2007). Exposure to these compounds and other baseline stressors (*e.g.,* thermal stress) was not a consideration in the BEs. Therefore, risk to listed species may be underestimated.

Exposure Conclusions

Pacific salmon and steelhead use a wide range of freshwater, estuarine, and marine habitats and many migrate hundreds of miles to complete their life cycle. Carbaryl, carbofuran, and methomyl are commonly detected in freshwater habitats within the four western states where listed Pacific salmonids are distributed. Because the proposed action of registration of the three a.i.s for the next 15 years authorizes many of the same uses, these three a.i.s will continue to be present in the action area. Therefore, we expect some individuals within all the listed Pacific salmon and steelhead ESUs/DPSs will be exposed to these chemicals and other stressors of the action. Carbaryl can exceed several mg/L in coastal estuaries based on measured environmental concentrations. Carbaryl and carbofuran concentrations in off-channel habitat can also exceed several mg/L where buffers are lacking. Peak concentrations of methomyl are expected to be significantly lower given label restrictions that require buffers to aquatic habitats and a relatively

low maximum application rate. However, model estimates indicate methomyl can reach concentrations of several hundred μg/L in surface waters given some uses that allow repeated applications at short re-application intervals. Given variable use of these pesticides across the landscape, and variable temporal and spatial distributions of listed salmonids, we expect exposure is also highly variable among individuals and populations of listed salmon. However, defining exposure and distributions of exposure among differing life stages of each independent population is complicated by several factors. Paramount among these is the uncertainty associated with the use of pesticide products containing these a.i.s. More specifically:

- Although the BEs and RED documents provide information on EPA regulatory decisions, they lack a full characterization of label-specific information needed to assess exposure (*e.g.,* application restrictions including application methods, rates, and intervals are lacking for many non-agricultural uses);

- EPA-authorized labels contain language that frequently does not provide clear boundaries on product use (*e.g.,* the maximum number of applications is commonly not specified and labels often instruct applicators to repeat applications "as necessary");

- Product labels authorize the application of chemical mixtures that are not specified or not clearly defined (*e.g.,* the ingredients of pesticide formulations are not fully disclosed, labels recommend tank mixture applications with other pesticides and adjuvants and tank mixtures with other pesticides are permitted unless specifically stated otherwise);

- Defining use of these products is highly uncertain because products are not likely to be used to the full extent permitted on the labels and historical use information is limited and may not reflect future use.

A major limitation of these assessments is that the majority of monitoring data used were not designed to determine exposure to listed salmonids, with the exception of specific studies conducted in Washington. Therefore, caution should be exercised in using these data for that purpose. Additionally, the assessments lack uncertainty analyses of the monitoring and toxicity data used, which limit the confidence in the given estimates (Warren-Hicks and Moore 1998). Given the complexity and scale of this action we are unable to accurately define exposure distributions for the chemical stressors. We assume the highest probability of exposure occurs in freshwater, and nearshore estuarine/marine environments with close proximity to areas where

pesticide products containing carbaryl, carbofuran, and methomyl are applied. We considered several sources of information to define the range of potential exposure to action stressors. EPA provided a number of exposure estimates with maximum concentrations of 153, 35, and 99 μg/L predicted for registered uses of carbaryl, carbofuran, and methomyl, respectively. We generated additional exposure estimates for shallow off-channel habitats with predicted concentrations exceeding 1,000 μg/L for carbaryl and carbofuran, and a peak concentration of 58 μg/L for methomyl. Additionally, we considered monitoring data presented by EPA and from other sources which indicate comparable concentrations of carbaryl, carbofuran, and methomyl have been detected in surface waters within the four states where the listed salmon and steelhead are distributed (85, 32, and 175 μg/L, respectively).

We assume that the exposure estimates provided by EPA in the BEs and additional modeling and monitoring information provided above represent realistic exposure levels for some individuals of the listed species. Further, we assume the distribution within the range of exposures is a function of pesticide use and the duration of time listed salmonids spend in these habitats. All listed Pacific salmon and steelhead occupy habitats that could contain high concentrations of these pesticides at one or more life stages. However, the time spent in these habitats varies among species. Adult salmon and steelhead spend weeks to several months in freshwater habitats during their migration and spawning activities. Immediately after emerging from the gravel substrate and transitioning from alevins to fry, salmonids move to habitats where they can swim freely and forage. At this point in their development most salmon occupy freshwater habitats. Chum salmon are an exception. They immediately migrate downstream following emergence to nearshore environments in estuaries near the mouth of their parent stream. Upon arrival in the estuary the chum salmon fry inhabit nearshore areas at a preferred depth of 1.5-5 m. In Puget Sound, WA, surveys indicate chum salmon fry are distributed extremely close to the shoreline and concentrated in the top 6 inches of water. Therefore, chum salmon fry are less likely to be exposed to high concentrations of pesticides than other salmonids given the duration of time spent in shallow water habitats and the habitat they occupy. They may reside immediately next to the shore in estuaries for as little as one or two weeks before moving offshore or into deeper-water habitats within the nearshore environment. Sockeye salmon fry most frequently distribute to shallow beach areas in the littoral zones of lakes. They initially

occupy shoreline habitats of only a few centimeters in depth before moving further off-shore and taking on a more pelagic existence. Coho salmon, Chinook salmon, and steelhead fry typically select off-channel habitats associated with their natal rivers and streams. These species are most likely to experience higher pesticide exposures given their utilization of shallow freshwater habitats as juveniles for rearing. Coho salmon and steelhead have a greater preference for the shallow habitats and rear in freshwater for more than a year.

Substantial data gaps in EPA's exposure characterization include exposure estimates associated with product uses on many crops and particularly, on non-crop uses. The highest concentrations detected in surface waters were those associated with applications to aquatic habitats. Those types of applications although mentioned, were not evaluated in EPA's BEs. Additionally, exposure estimates for other chemical stressors including other ingredients in pesticide formulations, other pesticide products authorized for co-application, adjuvants, degradates, and metabolites are not available or are non-existent. Although NMFS is unable to comprehensively quantify exposure to these chemical stressors, we are aware that exposure to these stressors is likely. We assume these chemical stressors may pose additional risk to listed Pacific salmonids. However, in order to ensure that EPA's action is not likely to jeopardize listed species or destroy or adversely modify critical habitat, NMFS analyzes exposure based on all stressors that could result from all uses authorized by EPA's action.

Response Analysis

In this section, we identify and evaluate toxicity information from the stressors of the action and organize the information under assessment endpoints (Figure 37). The endpoints target potential effects from the stressors of the action to individual salmonids and their supporting habitats. The assessment endpoints represent biological attributes that, when adversely affected, lead to reduced fitness of individual salmonids or degrade PCEs (*e.g.,* prey abundance and water quality). We constructed a visual conceptual model to guide development of risk hypotheses and assessment endpoints to highlight potential uncertainties uncovered by our analysis of the available information. We begin the response analysis by describing the toxic mode and mechanism of action of carabaryl, carbofuran, and methomyl. Next we summarize the toxicity data presented in the three BEs and organize the information to applicable assessment endpoints

(*e.g.*, survival, growth, etc.). The information provided by EPA addressed aspects of survival, growth and reproduction of aquatic species (freshwater and saltwater), as well as providing some discussion on other information found in the open literature, such as results from some field experiments and experiments that evaluated sublethal effects. NMFS is charged under the ESA to evaluate all direct and indirect effects of an action. We therefore evaluate all aspects of an action that may reduce fitness of individuals or reduce primary constituent elements of designated critical habitat. The evaluation includes information that EPA provided on survival, growth, or reproduction, but also encompasses a broader range of endpoints including behaviors, endocrine disruption, and other physiological alterations. The information we assessed is derived from published, scientific journals and information from government agency reports, theses, books, information and data provided by the registrants identified as applicants, and independent reports. Typically, the most relevant study results are those that directly measure effects to an identified assessment endpoint derived from experiments with salmonids, preferably listed Pacific salmonids or hatchery surrogates, exposed to the stressors of the action.

Figure 37. Response analysis

Mode and Mechanism of Action

Carbaryl, carbofuran, and methomyl share a similar mode and mechanism of toxic action and are a part of a group known as *N*-methyl carbamates. All three have similar chemical structures and act as neurotoxicants by impairing nerve cell transmission in vertebrates and invertebrates. They inhibit the enzyme AChE, which is present in cholinergic synapses. The normal function of AChE is to break down (hydrolyze) the neurotransmitter, acetylcholine, thereby serving as an "off-switch" for the electrochemical signal transmissions along nerve cells and neuromuscular junctions. AChE is prevalent in a variety of cell and organ types throughout the body of

vertebrates and invertebrates (Walker and Thompson 1991). Interference of normal nerve transmission by *N*-methyl carbamates may affect a wide array of physiological systems in fish (Figure 4). Organophosphates (OPs) share this mode of action and physiological responses are similar.

The mechanism of action of *N*-methyl carbamates, inhibition of AChE, involves a series of enzyme-mediated reactions. Briefly, in a reversible reaction carbamates bind to AChE, thereby inhibiting AChE's normal activity to hydrolyze the neurotransmitter acetylcholine at nerve synapses. This reaction is similar to organophosphorus insecticides with the main exception being a carbamylation of AChE instead of a phosphorylation. Carbamate inhibition of AChE is "reversible" in cases of sublethal exposure and recovery of *N*-methyl carbamate-inhibited AChE is typically rapid compared to OP-inhibited AChE. The key result of AChE inhibition by carbamate and OP insecticides is accumulation of acetylcholine in a cholinergic synapse. The buildup of acetylcholine causes continuous nerve firing and eventual failure of nerve impulse propagation. A variety of adverse effects to organisms can result ranging from sublethal behavioral effects to death (Mineau 1991).

Incidences of acute poisoning from AChE inhibitors are prevalent for wildlife, particularly for birds and fish (Mineau 1991). The following passage describes the classic signs of AChE-inhibiting insecticide poisonings of fish:

> "Fish initially change normal swimming behavior to rapid darting about with loss of balance. This hyper excitability is accompanied by sharp tremors which shake the entire fish. The pectoral fins are extended stiffly at right angles from the body instead of showing the usual slow back and forth motion normally used to maintain balance. The gill covers open wide, and opercular movements become more rapid. With death the mouth is open and the gill covers are extended. Hemorrhaging appears around the pectoral girdle and base of the fins (Weiss and Botts 1957)."

Numerous reports, peer-reviewed journal articles (Williams and Sova 1966; Holland, Coppage et al. 1967; Coppage and Matthews 1974; Rabeni and Stanley 1975; Haines 1981; Antwi 1985) as well as multiple reviews, text books (Mineau 1991; Smith 1993; Geisy, Solomon et al. 1999), and wildlife poisoning cases document inhibition of AChE activity in exposed invertebrates

(Detra and Collins 1986; Detra and Collins 1991) and vertebrates including salmonids following exposures to carbamates and OPs (Beyers and Sikoski 1994, Eder et al. 2007, Grange 2002, Hoy et al. 1991, Laetz et al. 2009, Li H. X. et al. 2008, Li S. N. and Fan 1996, Liu et al. 2007, Sandahl J. F. et al. 2004, Sandahl J.F. et al. 2005, Scholz et al. 2006, St. Aubin 2004, Tierney et al. 2007, Yi et al. 2006, Zinkl et al. 1987).

One highly relevant study measured inhibition of brain AChE, duration of recovery, survival at 24 h, and tissue concentrations in juvenile rainbow trout (*O. mykiss*) following exposure to carbaryl at 0, 250, 500, 1,000, 2,000, and 4,000 μg/L (Zinkl, Shea et al. 1987). Rainbow trout showed dose-dependent AChE inhibition from 61 to 91 % when exposed to 250 – 4,000 μg/L for 24 h. Most trout that died had 85% or greater inhibition. Trout recovered AChE activity following 24 h in uncontaminated water, indicating that fish recover if given the opportunity following carbamate exposures (Zinkl, Shea et al. 1987). This study showed that carbaryl is acutely toxic to rainbow trout in a matter of hours (incidences of death at 1.5 – 4 h) at concentrations at or above 1,000 μg/L.

pH and toxicity

We located several data sets on toxicity to freshwater fish and aquatic invertebrates exposed to carbaryl and carbofuran at different pHs (Mayer and Ellersieck 1986). Acute toxicity of carbaryl and carbofuran increases as pH increased, based on the available freshwater fish assays (Mayer and Ellersieck 1986). This largely is considered a result of the influence pH has on the creation of hydrolysis products (Mayer and Ellersieck 1986). However, the persistence of carbaryl and carbofuran is reduced as pH increases. As noted in the exposure section, degradation half-lives can vary from hours (in alkaline waters) to weeks (in acidic waters) depending on pH. Within the Pacific Northwest and California pH varies seasonally and typically may range from 6 – 9. For methomyl, pH seems to have less of an influence on hydrolysis rates. Due to the influence of pH on persistence of carbaryl and carbofuran, we evaluated reported toxic effects within the context of pH if provided and discuss pH in relationship to salmonid habitat utilization.

Temperature and toxicity

We found no consistent correlation with temperature and toxicity of the three *N*-methyl carbamates.

Studies with mixtures of AChE inhibiting insecticides

Because the three carbamates share a common mechanism of action, are registered for use and applied in the same watersheds, and have demonstrated additive and synergistic effects in aquatic organisms, we evaluate the response of salmonids and their habitat not just from exposure to single carbamates, but also to common mixtures of *N*-methyl carbamates. We therefore include an analysis of combinations of carbaryl, carbofuran, and methomyl based on additive toxicity observed in recent publications with Chinook and coho salmon (discussed in the *Risk Characterization* section) (Scholz, Truelove et al. 2006; Laetz, Baldwin et al. 2009). Because NMFS identified mixture effects to listed salmonids as a critical data gap in understanding the occurrences of multiple insecticides in salmonid habitats, a number of the experiments described below were conducted by researchers at or associated with NOAA's Northwest Fisheries Science Center.

One of the earliest mixture studies available evaluated bluegill survival following a range of exposure durations (24, 48, 72, or 96 h) to binary combinations of 19 insecticide mixtures (Macek 1975). Carbaryl and several of the OP pesticides were tested. Macek (1975) used the equation AB/(A+B) = X to calculate mixture toxicity; where AB was the number of dead fish from a mixture of pesticides A and B, and A + B was the sum of dead fish from A and B alone. The resulting ratios, X, were designated by the author as less than additive for a ratio of less than 0.5, additive when the ratio fell between 0.5 and 1.5, and synergistic for a ratio of more than 1.5. Carbaryl containing mixtures resulted in additive toxicity for some compounds (DDT, methoxychlor, parathion, methyl parathion) and synergistic toxicity for other compounds (malathion, copper sulfate). Antagonism is when the cumulative toxicity of a mixture is less than additive. In this study, mixtures containing carbaryl were not antagonistic. Differences in classification between additive and synergistic combinations should be interpreted cautiously, as the threshold for synergism was arbitrarily set at 1.5 by the authors. Mixture results with DDT and toxaphene were 1.31 and 1.14, respectively. The binary combination of diazinon and

parathion was classified as synergistic toxicants, (*i.e.,* more fish died than predicted based on an additive response). Validation of chemical concentrations with analytical chemistry was not conducted. Although the lack of raw data makes it difficult to determine exact concentrations tested and the lack of analytical confirmation precludes determination of precise concentrations, the study shows that binary combinations containing carbaryl exhibit greater toxicity than exposure to carbaryl alone. Additionally, the majority of pesticide-containing mixtures tested resulted in either additive or synergistic responses including mixtures containing carbamate and OP insecticides.

Additive toxicity of binary combinations of carbamates and OPs at a cellular level was demonstrated from *in vitro* experiments with Chinook salmon (Scholz, Truelove et al. 2006). Carbaryl and carbofuran, in addition to the oxons of diazinon, chlorpyrifos, and malathion caused additive toxicity as measured by AChE inhibition in salmonid brain tissue (Scholz, Truelove et al. 2006). Further, the joint toxicity of the mixtures could be accurately predicted from each insecticide's toxic potency, simply by adding the two potencies together at a given concentration. Since the experiments were conducted using *in vitro* exposures with the oxon degradates and not with the parent compounds, the authors conducted subsequent experiments to investigate whether additive toxicity as measured by AChE inhibition also occurred when live, juvenile coho salmon were exposed for 96 h to the parent compounds, *i.e., in vivo* exposures.

The results of the second set of experiments were unexpected by the authors (Laetz, Baldwin et al. 2009). Measured AChE inhibition from some of the binary combinations was significantly greater than the expected additive toxicity, *i.e.,* synergistic toxic responses were found (Laetz, Baldwin et al. 2009). As with the *in vitro* study, brain AChE inhibition in juvenile coho salmon (*O. kisutch*) exposed to sublethal concentrations of the carbamates carbaryl and carbofuran, as well as the OPs chlorpyrifos, diazinon, and malathion, was measured (Laetz, Baldwin et al. 2009). Dose-response data for individual chemicals were normalized to their respective EC_{50} concentrations (AChE activity compared to control) and collectively fit to a non-linear regression. The regression line was used to determine whether toxicological responses to binary mixtures were antagonistic, additive, or synergistic. No binary mixtures resulted in antagonism. Additivity and synergism were both observed, with a greater degree of synergism at higher

exposure concentrations. Moreover, certain combinations of OPs were lethal at concentrations that were sublethal in single chemical trials. Concentrations of each insecticide are listed in Table 63. Based on a default assumption of dose-addition, the five pesticides were combined in all possible pairings to yield target levels of AChE inhibitions in the brains of exposed coho salmon.

Table 63. Concentrations (μg/L) of insecticides used in mixture exposures. EC50s were calculated from dose-response data of AChE activity using non-linear regression. Coho salmon exposed to 1.0, 0.4, or 0.1 EC50 treatments had an equipotent amount of each carbamate or OP within the treatment *e.g.,* to attain the 1.0 EC50 treatment for diazinon and chlorpyrifos, 1.0 μg/L of chlorpyrifos (0.5 the EC50) was combined with 72.5 μg/L of diazinon (0.5 of the EC50).

Insecticide	Measured EC50	Concentration of each ingredient in binary combination to achieve treatment level		
		1.0 EC50 units	0.40 EC50 units	0.10 EC50 units
Carbaryl	145.8	72.9	29.2	7.3
Carbofuran	58.4	29.2	11.7	2.9
Chlorpyrifos	2.0	1.0	0.4	0.1
Diazinon	145.0	72.5	29.0	7.3
Malathion	74.5	37.3	14.9	3.7

As determined by the regression, these levels of enzyme inhibition would result from exposure to 0.1, 0.4, and 1.0 EC50 units, respectively. Two thirds (20/30) of pesticide pairs yielded AChE levels that were significantly lower, *i.e.,* indicative of synergism, than would be expected based on additivity *i.e.,* dose-addition (t-test with Bonferroni correction, $p < 0.005$). The number of combinations that were statistically synergistic increased with increasing exposure concentrations. All pairings analyzed at 1.0 EC50 showed synergism in AChE inhibition.

The combination of carbaryl at 79.9 μg/L and carbofuran at 29.2 μg/L to achieve 1.0 EC50 produced synergistic toxicity, however no incidences of coho mortality were observed. At 0.1 and 0.4 EC50 levels with the two carbamates, synergistic toxicity was observed, although the deviation from the predicted additive response was not statistically significant. In binary mixtures containing an OP and a carbamate synergistic toxicity occurred with some of the combinations at 0.1 and 0.4 EC50 treatments. The mechanism for synergistic toxicity in salmonids is unknown.

Additionally, pairings of two OPs produced a greater degree of synergism than mixtures containing one or two carbamates. This was particularly true for mixtures containing malathion coupled with either diazinon or chlorpyrifos. At the highest exposure treatment, 1.0 EC50 (malathion at 37.3, chlorpyrifos at 2, diazinon at 72.5 μg/L), binary combinations produced synergistic toxicity. Many fish species die following high rates of acute brain AChE inhibition, between 70-90% (Fulton and Key 2001).

Coho salmon exposed to combinations of diazinon and malathion (1.0 and 0.4 EC_{50}) as well as chlorpyrifos and malathion (1.0 EC_{50}) all died (Laetz, Baldwin et al. 2009). This result was in contrast to the predicted AChE inhibition from *in vitro* tests with Chinook salmon. Coho exposed to these OP mixtures showed toxic symptoms of inhibition of AChE, including loss of equilibrium, rapid gilling, altered startle response, and increased mucus production before dying. OP combinations were also synergistic at the lowest concentrations tested. Diazinon and chlorpyrifos were synergistic when combined at 7.3 μg/L and 0.1 μg/L, respectively. The pairing of diazinon (7.3 μg/L) with malathion (3.7 μg/L) produced severe (> 90%) AChE inhibition, including classical signs of poisoning as well as death. We expect that juvenile salmonids exposed to these effect concentrations in the environment will respond similarly.

Multiple studies indicate compounds that share a common mode of action frequently result in additive and at times synergistic responses in aquatic organisms (Anderson T. D. and Lydy 2002, Belden et al. 2007, Bocquene et al. 1995, Jin-Clark et al. 2002, Laetz et al. 2009, Lydy and Austin 2005, Macek 1975, Monserrat et al. 2001, Scholz et al. 2006). Unfortunately, we are unable to create a predictive model of synergistic toxicity as dose-response relationships with multiple ratios of pesticides are not available at the present time and the mechanism of synergism remains to be determined. That said, we conducted a mixture analysis with carbaryl, carbofuran, and methomyl based on additive toxicity with the caveat that synergism is likely where circumstances mirror the experimental conditions of this study, *i.e.,* similar exposure durations and pesticide concentrations. This is a reasonable approach based on the current state of the science. We used the mixture work of Laetz, Baldwin et al. (2009) and Scholz, Truelove et al. (2006) to construct mixture dose-response relationships predicated on additivity (see mixture analyses in the *Risk Characterization* section).

Summary of Toxicity Information Presented in the Biological Evaluations

Each BE primarily summarized acute and chronic toxicity data from "standardized toxicity tests" submitted by pesticide registrants during the registration process, tests from government laboratories available in EPA databases, or from published, peer-reviewed scientific publications (books and journals). The assessment endpoints from these tests for an individual organism generally included aspects of survival (death), reproduction, and growth measured in laboratory dose-response experiments (EPA 2004). Survival is measured in both acute and chronic tests. Reproduction and growth are generally measured and reported in the chronic tests. Population-level endpoints and analyses were generally absent in the BEs, other than a few measurements of fish and aquatic invertebrate reproduction. Adverse effects to organisms were not translated into consequences to populations. The BEs also presented some information on multispecies microcosm and mesocosm studies. For this Opinion, NMFS translates effects to individual salmonids into potential population-level consequences as explained in the *Risk Characterization* portion of the *Effects of the Proposed Action* section, and ultimately draws a conclusion on the likely risk to listed salmonids based on exposure and anticipated individual and population-level effects.

Survival of individual fish is typically measured by incidences of death following 96 h exposures (acute test) and incidences of death following 21 d, 30 d, 32 d, and "full life cycle" exposures (chronic tests) to a subset of freshwater and marine fish species reared in laboratories under controlled conditions (temperature, pH, light, salinity, dissolved oxygen, etc.,) (EPA 2004). Lethality of the pesticide is usually reported as the median lethal concentration (LC50), the statistically-derived concentration sufficient to kill 50% of the test population. For aquatic invertebrates it may be reported as an EC50, because death of these organisms may be difficult to detect and immobilization is considered a terminal endpoint. An LC50 is derived from the number of surviving individuals at each concentration tested following a 96 h exposure and is typically estimated by probit or logit analysis and recently by statistical curve fitting techniques. In FIFRA guideline tests, LC50s are typically calculated by probit analysis. If the data are not normally distributed for a probit analysis, than either a moving average or binomial is used, resulting in no slope being reported. Ideally, to maximize the utility of a given LC50 study, a slope, variability around the LC50, and a description of the experimental design- such as

experimental concentrations tested, number of treatments and replicates used, solvent controls, etc.- are needed. The slope of the observed dose-response relationship is particularly useful in interpolating incidences of death at concentrations below or above an estimated LC50. The variability of an LC50 is usually depicted by a confidence interval (95% CI) or standard deviation/error and is illustrative of the degree of confidence associated with a given LC50 estimate *i.e.,* the smaller the range of uncertainty the higher the confidence in the estimate. Without an estimate of variability, it is difficult to infer the precision of the estimate. Furthermore, survival experiments are of most utility when conducted with the most sensitive life stage of the listed species or a representative surrogate. In the case of ESA-listed Pacific salmonids, there are several surrogates that are available for toxicity testing including hatchery reared coho salmon, Chinook salmon, steelhead, and chum salmon, as well as rainbow trout[2]. The available toxicity data include a varitety of salmonids. Unfortunately, slopes, estimates of variability for an LC50, and experimental concentrations frequently are not reported. In our review of the BEs, we did not locate any reported slopes of dose-response curves, although some of this information was presented in some of the corresponding Science Chapters. Consequently, we must err on the side of the species in the face of these uncertainties and select LC50s from the lower range of available salmonid studies. We selected LC50s and associated slopes as input in the population modeling exercises discussed later. We evaluate the likelihood of concentrations that are expected to kill fish and apply qualitative and quantitative methods to infer population-level responses of ESA-listed salmonids within the *Risk Characterization* section (Figure 2).

Growth of individual organisms is an assessment endpoint derived from standard chronic fish and invertebrate toxicity tests summarized in the BEs. It is difficult to translate the significance of impacted growth derived from a guideline study to fish growth in aquatic ecosystems. The health of the fish, availability and abundance of prey items, and the ability of the fish to adequately feed are not assessed in standard chronic fish tests. These are important factors affecting the survival of wild fish. What is generally assessed is size or weight of fish measured

[2] Rainbow trout and steelhead are the same genus species (*Oncorhynchus mykiss*), with the key differentiation that steelhead migrate to the ocean while rainbow trout remain in freshwaters. Rainbow trout are therefore good toxicological surrogates for freshwater life stages of steelhead, but are less useful as surrogates for life stages that use estuarine and ocean environments.

at several times during an experiment. The test fish are usually fed twice daily, *ad libitum, i.e.,* an over abundance of food is available to the fish. Therefore, any reductions in size are a result of fish being affected to such an extent that they are not feeding even when presented with an abundance of food. Subtle changes in feeding behaviors or availability of food would not be detected from these types of experiments. If growth is affected in these experiments, it is highly probable that growth of fish in natural aquatic systems would be severely affected. If effects to growth are likely, we assess salmonid population-level consequences based on reductions in juvenile growth and subsequent reduction in size prior to ocean entry.

Reproduction, at the scale of an individual, can be measured by the number of offspring per female (fecundity), and at the scale of a population by measuring the number of offspring per females in a population over multiple generations. The BEs summarized reproductive endpoints at the individual scale from chronic freshwater fish experiments where hatchability and juvenile and larval survival are measured. NMFS considers many other assessment measures of reproduction, including egg size, spawning success, sperm and egg viability, gonadal development, reproductive behaviors, and hormone levels. These endpoints are not generally measured in standardized toxicity assays used in pesticide registration.

Sometimes qualitative observations of sublethal effects are summarized from 96 h lethality dose-response bioassays in EPA's risk assessments. These observations generally were limited in the BEs for carabaryl, carbofuran, and methomyl, and when noted, pertained to unusual swimming behaviors. None of these behaviors were rigorously measured and therefore are of limited value in assessing the effects of the three insecticides on Pacific salmonids. We do, however note a few of the observations when they pertained to a relevant assessment endpoint, such as impaired swimming. Some BEs presented toxicity information on degradates, metabolites, and formulations. However, toxicity information on other or "inert" ingredients found in pesticide formulations was usually not presented.

Results from multiple species tests, called microcosm and mesocosm studies, were also discussed in the BEs to a varying degree. These types of experiments are likely closer approximations of potential ecosystem-level responses such as interactions among species (predator-prey dynamics), recovery of species, and indirect effects to fish. However, the

interpretation of results is complicated by how well the results represent natural aquatic ecosystems and how well the studies apply to salmonid-specific assessment endpoints and risk hypotheses. These studies typically measured individual responses of aquatic organisms to contaminants in the presence of other species. Some are applicable to questions of trophic effects and invertebrate recovery, as well as providing pesticide fate information. The most useful mesocosm study results for this Opinion are those that directly pertain to identified assessment endpoints and risk hypotheses. We discuss study results in the context of salmonid prey responses, emphasizing survival and recovery of prey taxa as well as shifts from preferred taxa to other taxa if measured. One of the notable limitations of these study types is they do not take represent real world aquatic ecosystems that are degraded from various stressors including contaminants and elevated water temperature..

Results from aquatic field studies were generally not discussed in great detail within the BEs. We discuss field studies that evaluated identified assessment endpoints, particularly those which address salmonid prey responses in systems with ESA-listed salmonids.

Ranges in toxicity values presented in the BEs for each a.i. are summarized in Table 64. Ranges in toxicity values (µg/L) are organized by assessment endpoint and associated assessment measures. The BEs provided toxicity information from EPA's EFED Pesticide Toxicity Database and from the ACQUIRE database.

Table 64. Assessment endpoint toxicity values (μg/L) presented in BEs and REDs for carbaryl, carbofuran, and methomyl

Assessment Endpoint		carbaryl (μg/L)			carbofuran (μg/L)			methomyl (μg/L)		
	Assessment measure	> 95% a.i.	< 95% a.i.	degradate (s)	> 95% a.i.	< 95% a.i.	degradate (s)	> 95% a.i.	< 95% a.i.	degradate (s)

1. Larval survival derived from 28 day fish assays
2. Juvenile growth measured at 60, 75, 90 d exposure
n is the number of studies

Assessment endpoint: Fish survival

Assessment measure: 96 h survival from laboratory bioassays reported as an LC50.

Carbofuran is the most toxic of three insecticides based on fish survival values (LC50s) followed by carbaryl and methomyl, respectively (Table 64). All three carbamates have a range of acute freshwater fish LC50s spanning 1 to 2 orders of magnitude. EPA reported the following ranges of LC50s: carbofuran LC50s ranged from 88-3,100 μg/L; carbaryl LC50s ranged from 250-290,000 μg/L; and methomyl LC50s ranged from 300-7,700 μg/L. Based on these LC50 ranges, EPA classified these insecticides as "highly toxic" to "moderately toxic". Salmonids were well represented in the data set, with 11 results for carbaryl, 11 for carbofuran, and 13 for methomyl. A cumulative frequency distribution of carbaryl LC50s for freshwater fish indicated that Atlantic salmon were the most sensitive of the species tested, and salmonids as a group were much more sensitive than fathead minnow and bluegill sunfish (EPA 2003).

EPA classified the three carbamates as very highly toxic to moderately toxic to estuarine and salt water species depending on the chemical and the fish species tested. Carbofuran LC50s for marine and estuarine fish ranged from 33 μg/L to more than 100 μg/L (n=5), indicating that saltwater/estuarine species were more sensitive to carbofuran than salmonids tested in freshwater. Two LC50s (2,200 and 2,600 μg/L, both sheepshead minnow) were reported for carbaryl and one LC50 (1,160 μg/L, sheepshead minnow) was reported for methomyl. Based on available data presented in EPA documents, it is uncertain whether marine and estuarine species are more sensitive, less sensitive, or equally sensitive to carbaryl and methomyl compared to freshwater fish. No data were presented on salmonids exposed in saline environments.

Assessment endpoint: Reproduction

Assessment measure: Number of offspring, hatchability, number of fish that attained sexual maturity by 136 d, and number of spawns per spawning pair

For carbaryl, one chronic study was listed in the BE (EPA 2003) and briefly discussed in the Science Chapter (EPA 2003), which evaluated a variety of assessment endpoints of fathead minnows including reproductive endpoints (referenced in (EPA 2003) as TOUCAR05 Carlson 1972, although this is an erroneous citation of (Carlson 1971)). Reproductive endpoints measured included number of mature males, number of mature females, number of immature

fish, number of eggs per mature female, number of eggs spawned, and hatchability of eggs (Carlson 1971). Fathead minnows were exposed to five treatments (8, 17, 62, 210, and 680 µg/L [analytically verified]) of carbaryl in a flow through system for nine months; capturing the life cycle of the fathead minnow. Fathead minnows showed reduced number of eggs per female and reduced number of eggs spawned when exposed to 680 µg/L and of the eggs spawned, none hatched (Carlson 1971).

The carbofuran BE (EPA 2004) stated that no full life cycle fish tests were available, and as it did not report any early-life stage test results, presumably none of those were available either, as the only data reported were for a partial life cycle test for rainbow trout (*O. mykiss*). Reported NOAECs were based on growth effects, and no reproductive endpoints were discussed. A definitive reference to the study was not provided in the BE. The carbofuran Science Chapter (EPA 2005) reports on an early life stage test for rainbow trout, referring to it as Acc.# GEOCAR08. We were unable to locate a specific citation for this study in the references but the reported NOAEC (24.8 µg/L) and LOAEC (56.7 µg/L) were the same as the unreferenced study discussed in the BE. However, the Science Chapter stated that larval survival was the most sensitive endpoint of those evaluated, and that scoliosis was observed in the larval fish at carbofuran concentrations ≥56.7 µg/L. The Science Chapter also references a sheepshead minnow (*Cyprinodon varigatus*) early life stage study (MRID 432505-01) that resulted in a NOAEC of 2.6 µg/L and LOAEC of 6.0 µg/L based on reduced embryo hatching. Specific extent of reduced hatching was not reported. No sublethal effects, such as the scoliosis in the rainbow trout, were mentioned in this study or two other studies on sheepshead minnow (MRIDs 408184-01 and 426974-01) that were submitted but did not produce definitive NOAECs or LOAECs.

The Science Chapter for methomyl (EPA 1998) reports a NOAEC (57 µg/L) and LOAEC (117 µg/L) for fathead minnow (*Pimephales promelus*) based on larval survival. Specific reductions in larval survival were not reported. In the Science Chapter for methomyl (EPA 1998), the study is referred to as MRID 00131255 and Driscoll 1982 and appears to reference the same study as Acc. 251424. The same data are reported in the BE (EPA 2003), but without any

citation. We located the data report and confirmed that embryo hatchability was not affected by the dose regime tested: 0, 57, 113, 254, 395, and 972 µg/L (measured concentrations).

Assessment endpoint: Fish growth

Assessment Measure: Growth rate, weight, length, or biomass of second generation as measured in chronic toxicity tests

The carbaryl BE (EPA 2003) did not report any effects on growth for either freshwater or estuarine/marine species, although reduced growth is listed as the affected endpoint in a fathead minnow (*Pimephales promelas*) study referenced in the Science Chapter (EPA 2003). For this study, the NOAEC is given as 210 µg/L and the LOAEC as 680 µg/L However, the fathead minnow study discussed within the reproductive endpoints summary measured growth of fathead minnow larvae (length) at 30 and 60 days (Carlson 1971). Although statistical tests were not used, no differences in growth were apparent between exposed and control fish at the concentrations tested: 8, 17, 62, 210, and 680 µg/L (Carlson 1971).

The carbofuran BE (EPA 2004) reports larval rainbow trout (*O. mykiss*) exposed to 56.7 and 88.7 µg/L carbofuran had significantly reduced lengths and reduced survival at 60, 75, and 90 d compared to unexposed trout in a partial life cycle test. Additionally, trout weight was significantly reduced after 75 d of exposure to 56.7 and 88.7 µg/L. Although, no definitive reference was provided for these data, NMFS obtained the study report to verify study results. Upon review, several additional adverse effects to fry were noted throughout the experiment. At day 20, trout exposed to 57.8 and 88.7 µg/L respired rapidly compared to control fish and were hyperactive at 88.7 µg/L. These effects continued for the remainder of the experiment (~ 70 days). Following 75 d of exposure to carbofuran at 56.7 and 88.7 µg/L, 23 and 35% of the fish, respectively, had curved spines. The Science Chapter (EPA 2005) reports growth was the most sensitive endpoint in two sheepshed minnow studies (*Cyprinodon varigatus*, MRIDs 40818401 and 42697401), but notes that neither of these tests produced a definitive NOAEC or LOAEC.

The methomyl BE (EPA 2003) lists a NOAEC of 76 µg/L and a LOAEC of 142 µg/L based on growth endpoints for fathead minnow (*Pimephales promelas*), a freshwater species. It also lists a NOAEC of 260 µg/L and a LOAEC of 490 µg/L for sheepshead minnow (*Cyprinodon*

varigatus), an estuarine species, but the endpoint affected is described as reproduction and/or growth, so whether or not growth was affected is uncertain. The Science Chapter (EPA 1998) does not describe any data for estuarine/marine species.

Assessment endpoint: Habitat- salmonid prey

Assessment measure: Aquatic invertebrate survival, growth, reproduction from acute and chronic laboratory toxicity tests

The carbaryl BE (EPA 2003) lists a range of acute EC50 values for freshwater aquatic invertebrate survival. Six EC50 values are given for *Daphnia magna*, ranging from 4.3 -13.0 µg/L (mean 7.3 µg/L). Although not specified as such, given the test organism, the fact that they are noted as 48 h tests, and the range of percent a.i., we assume that these are guideline tests conducted by the registrant or an acceptable government lab. EC50s were also given for three species of stoneflies, ranging from 1.7-5.6 µg/L (mean 3.6 µg/L). An EC50 for an amphipod (*Gammarus fasciatus*) of 26 µg/L was also given. There were also EC50 values for a number of estuarine species. There were five EC50 values given for mysid shrimp (*Mysidopsis bahia*), a common guideline test organism, ranging from 5.7-20.2 µg/L (mean 10.3 µg/L. EC50s for various other shrimp species were given, ranging from 1.5-170 µg/L. All of these tests appear to have been conducted on the a.i. An LC50 for blue crab of 320 µg/L was given. The BE also reported a number of EC50/LC50 values for aquatic insects and other invertebrates derived from the USEPA ECOTOX database.

The carbaryl Science Chapter (EPA 2003) used an acute value of 5.1 µg/L (stonefly, *Chlorperla grammatica*) as the survival assessment endpoint for freshwater aquatic invertebrates, and 5.7 µg/L (mysid shrimp) as the survival assessment endpoint for estuarine/marine aquatic invertebrates. The chapter also notes:

> "Studies have indicated that acute exposure to carbaryl impacts predator avoidance mechanisms in invertebrates, reduces overall zooplankton abundance (Hanazato and Yasuno 1989; Havens 1995), and may actually promote phytoplankton growth through reduced predation by zooplankton."

Acute toxicity data for 1-napthol presented in the BE (EPA 2003) listed 48 h EC50s of 700-730 µg/L for *D. magna*, and EC50s of 200-210 µg/L for *M. bahia*. No additional information

regarding acute toxicity of 1-napthol to aquatic invertebrates was provided in the Science Chapter (EPA 2003).

Overall, results presented show that carbaryl and formulations of carbaryl are acutely toxic to a wide array of aquatic invertebrates in the low µg/L range, frequently with EC50s/LC50s of less than 10 µg/L. The degradate, 1-napthol, appears less toxic with respect to comparable invertebrates; acute survival EC50s ranged from 200-730 µg/L. However, no data for the genera more sensitive to the parent carbaryl, such as the stoneflies, caddisflies, or mayflies, are available. Thus the lower end of the toxicity range is not well established.

The carbaryl BE (EPA 2003) lists a NOAEC of 1.5 µg/L and a LOAEC of 3.3 µg/L for *D. magna* based on reproduction and a NOAEC of 500 µg/L and a LOAEC of 1,000 µg/L for the midge fly (*Chironomous riparius*) based on emergence/developmental rate. Specific percentages of inhibition are not noted. The Science Chapter (EPA 2003) does not add any additional detail, but does note:

> "midge larvae are benthic macroinvertebrates and exposure may have been better characterized had it been based on sediment pore water concentrations as opposed to carbaryl concentrations in overlying water"

as a potential explanation for the difference in sensitivity between *D. magna* and *C. riparius*. No data regarding reproductive endpoints were presented for 1-napthol.

The carbofuran BE (EPA 2004) included acute EC50s for the *D. magna* (29-38.6 µg/L) and pink shrimp (*Penaeus duorarum,* 4.6-7.3 µg/L). All tests appear to have been conducted with the a.i. EC50s of 2.2-2.6 µg/L were reported in the Science Chapter (EPA 2005) for the freshwater water flea *Ceriodaphnia dubia*. The Science Chapter also provided toxicity values for the freshwater red crayfish (*Procambarus clarkii,* LC50 2,700 µg/L) and the eastern oyster (*Crassostrea virginica*, EC50s of >1,000->5,000 µg/L). Probit slopes were included in Appendix H of Appendix 1 (EPA 2005) for studies where they were reported or data were available to calculate them. Probit slopes were not available for *D. magna* or *C. dubia*, but were available for the red crayfish (slope 2.91) and the pink shrimp (slope 2.25). Data provided from chronic toxicity tests

included a NOAEC of 9.8 µg/L and a LOAEC of 27 µg/L for the freshwater aquatic invertebrate *D. magna*, and NOAEC of 0.4 µg/L and a LOAEC of 0.98 µg/L for the estuarine invertebrate *M. bahia*. In both cases, the most sensitive endpoints appeared to be survival of the adults and/or growth rather than decreased production of offspring.

The BE (EPA 2004) and Science Chapter (EPA 2005) reference several field studies from the open literature that examined effects on aquatic invertebrates following application of carbofuran either to fields or directly to water. One study (Matthiessen, Shearan et al. 1995) noted complete mortality of caged amphipods (*Gammarus pulex)* in a stream draining a field treated with granular carbofuran at 2.7 lbs a.i./acre. EPA documents reported a pond enclosure study (Wayland 1991) noting decreases in amphipod *(Hyallela azteca)* abundance and biomass and Chironominae larvae biomass at concentrations of 25 µg/L in a pond enclosure study. EPA also reported several studies in which carbofuran applied directly to water caused mortality in aquatic invertebrates at concentrations ranging from 5-25 µg/L (Flickinger et al. 1986, Mullie et al. 1991, Wayland and Boag 1990).

The methomyl BE (EPA 2003) reported acute survival EC50s for the freshwater invertebrates water flea (*D. magna*), amphipod (*Gammarus pseudolimnaeus*), midge (*Chironomous plumosus*) and three genera of stoneflies (*Skwala* sp., *Pteronarcella badia*, and *Isogenus* sp.). Most values appeared to be derived from 48-or 96 h standard laboratory tests. Many of the tests were with a.i. (95-99% a.i.), but others were conducted with a 24% formulation (EPA 2003). The product name was not specified. Information in the BE is noted as having come from the EFED Pesticide Ecotoxicity Database, not the RED Science Chapter. There are some inconsistencies between these two documents regarding which EC50 is associated with the formulation versus the technical a.i. Based on information in the BE, which lists data for a formulation test on all species, the 24% formulation appears to be more toxic than the technical. EC50s for the technical range from 8.8-31.8 µg/L for *D. magna*, and are reported as 920 µg/L for *G. psuedolimnaeus*, 88 µg/L for *C .plumosus,* 34 µg/L for *Skwala* sp, 69 µg/L for *P. badia*, and 343 for *Isogenus* sp. EC50s for the 24% formulation are reported as 7.6 µg/L for *D. magna*, 720 µg/L for *G. psuedolimnaeus*, 32 µg/L for *C. plumosus* 29 µg/L for *Skwala* sp, 60 µg/L for *P. badia*, and 29 for *Isogenus* sp.

Acute EC50s are also reported for several species of estuarine/marine shrimp in both the BE (EPA 2003) and the RED Science Chapter (EPA 1998). Again, there are inconsistencies between the documents, with the same EC50s from formulation tests reported in the BE as 30% a.i. and in the Science Chapter as 24% a.i. Some EC50s were also reported for the a.i. Only one species, grass shrimp (*Palmonetes vulgaris*) appears to have been tested with both the a.i. and the formulation (EPA 2003). In this case, the formulation (EC50 130 µg/L, reported as a 30% a.i.), appears less toxic than the technical (EC50 49 µg/L). Other EC50s listed in the BE were for pink shrimp (*P. duorarum*, 19 µg/L) and mysid shrimp (*M. bahia*, 230 µg/L), both of which appear to be technical a.i. (90-98.4%).

The methomyl BE (EPA 2003) reports NOAECs and LOAECs for reproductive endpoints for two studies conducted on *D. magna*, both with the technical a.i. In one study, with a NOAEC of 0.4 µg/L and a LOAEC of 0.8 µg/L, the number of young per female was reduced. A second resulted in a NOAEC of 1.6 µg/L and a LOAEC of 3.1 µg/L, based on an unspecified reproductive endpoint. The BE also reports a NOAEC of 29 µg/L and a LOAEC of 59 µg/L for the estuarine mysid shrimp, based on "reproduction and/or growth."

The BE and Science Chapter both report on an outdoor microcosom study conducted with methomyl (MRID 437444-02). The Science Chapter, Appendix C (EPA 1998), describes the study design as: "Methomyl was applied to seven treatment groups, at two application rates, at three different application intervals, over a period of 22 days (pg 51)." Specific application rates and intervals were not provided, nor was use of a control specifically mentioned. Zooplankton (Cladocera, Copepodia and Rotifera) abundance and community composition were altered in at least some treatments, and Ephemeroptera abundance decreased in the two highest treatments.

Toxicity of Carbaryl, Carbofuran, and Methomyl Degradates

The BEs briefly addressed the issues of degradates. The carbaryl BE (EPA 2003c) provides acute fish and invertebrate toxicity data the degradate, 1-napthol. The LC50s for three species of fish tested (freshwater (*O. mykiss*, *Lepomis macrochirus*)) and marine/estuarine (*Cyprinodon varigatus*) range from 750 – 1,800 µg/L. LC50s presented for aquatic invertebrates include 700-

730 μg/L for *D. magna* (freshwater organism), 200-210 μg/L for *M. bahia* (estuarine organism) and 2,100 μg/L for *C. virginica* (estuarine organism).

During our open literature review, we located a study that compared acute lethalities between carbaryl and 1-naphthol in two species of fish (Shea and Berry 1983). In goldfish (*Carassius auratus*) and killifish (*Fundulus heteroclitus*), 1-naphtol was significantly more toxic than carbaryl based on 10 d acute lethality tests (Shea and Berry 1983). The degradate 1-naphthol was approximately five times more toxic than carbaryl in goldfish, and in killifish twice as toxic as carbaryl (Shea and Berry 1983). Additionally, fish exposed to 1-naphthol showed neurological trauma including pronounced erratic swimming behaviors and increased opercula beats following exposure to 5 and 10 mg/L after 4 and 24 h exposures, respectively. None of these symptoms were observed in the carbaryl treatments (Shea and Berry 1983).

Other degradates identified in fate studies submitted to EPA included 5-hydroxy-1-napthylmethylcarbamate (aerobic soil metabolism and anaerobic aquatic); 1-naphthyl (hydroxymethyl) carbamate (aerobic soil metabolism and anaerobic aquatic); 1,4-napththoquinones (degradates of 1-napthol); 4-hydroxy-1-napthyl methylcarbamate (anaerobic aquatic); 1,5-naphthalenediol (anaerobic aquatic); and 1,4-naphthalenediol (anaerobic aquatic). No toxicity information was presented for these degradates.

The carbofuran BE (EPA 2005) describes three degradates: 3-hydroxycarbofuran, 3-ketocarbofuran, and carbofuran 7-phenol in the toxicity section, and refers to two additional degradates: 3-hydroxy-7-phenol, and 3-keto-7-phenol in the section on environmental fate and transport. No toxicity data are included, and the document noted that "inclusion of environmental transformation products in the risk analysis of carbofuran would not be expected to result in substantive changes to conclusions drawn using the parent alone (pg 30)" (EPA 2005).

Based on the more detailed fate information in the Science Chapter for the Carbofuran RED (EPA 2005), carbofuran 7-phenol is a hydrolysis product (up to 75% of applied). Carbofuran 7-phenol is expected to be less toxic than parent carbofuran, as the toxic moiety (the carbamylating

radical) has already dissociated (EPA 2005). No toxicity data for this compound are provided in either the BE or the Science Chapter. The degradates 3-hydroxycarbofuran and 3-ketocarbofuran are detected in soil photolysis and aerobic soil metabolism studies. These compounds were each approximately 3-5% of applied (EPA 2004a), and are structurally more similar to the parent carbofuran. The Science Chapter cites an open literature study using Microtox (Kross, et. al., as cited in EPA 2005) noting "3-ketocarbofuran appears as toxic or slightly more toxic than the parent, but 3-hydroxycarbofuran is much less toxic." A second study evaluated (Gupta 1994, as cited in EPA 2005) indicates 3-hydroxycarbofuran is "equally as toxic as the parent." No specific toxicity values were presented. Other degradates mentioned in the fate summary are 3-hydroxycarbofuran phenol (3-hydrocy-7-pheonl) and 3-ketocarbofuran phenol (3-keto-7-phenol), which are less than 5% of applied (EPA 2005).

The methomyl BE notes "a degradate (thiolacetohyroxamic acid 5-methyl ester)… was tested and found to be practically nontoxic to bluegill" (EPA 2003a). This study is also mentioned in the Environmental Risk Assessment for the RED (EPA 1998c). The bluegill LC50 for this degradate is 462,000 μg/L. No other degradate toxicity data were presented. The fate portion of the BE (EPA 2003a) and the Environmental Risk Assessment (EPA 1998c) both reference S-methyl-N-hydroxythioacetamidate as a product of hydrolysis in both water and soil. This may be the same compound expressed under different naming conventions, but no structures were provided to confirm this identification. No toxicity data were presented for acetonitrile or acetamide.

Formulations and other (inert) ingredients found in carbaryl's, carbofuran's, and methomyl's formulations

Assessment endpoint: Fish survival, aquatic invertebrate survival, and primary production

Assessment measure: Aquatic invertebrate survival, growth, and reproduction from acute and chronic laboratory toxicity tests

The carabaryl BE (EPA 2003c) and the carbaryl Science Chapter (EPA 2003b) provide some toxicity data on formulations containing 5-81.5% carbaryl for both aquatic invertebrates and fish. We did not receive information on whether the formulations tested are currently registered. Data for formulations (referred to in the Science Chapter (EPA 2003b) as technical end-product or

TEP) are contained in Appendix D-1. The technical a.i. EC50 for water flea (*D. magna*), based on a single test, is 5.6 µg/L. No 95% confidence interval is given for the test. Data for several formulations with 43.7-81.5% carbaryl are presented. EC50s for the formulations range from 4.3-13.0 µg/L. Data are also available to compare toxicity of the technical grade to formulations (43.7-81.5%) for the estuarine mysid shrimp, *M. bahia*. No 95% confidence intervals are given. Two technical a.i. LC50s were provided in the data, 5.7 µg/L and 6.7 µg/L. Tests with formulations (n=3) resulted in LC50s of 9.3-20.2 µg/L. No chronic tests were described for any formulations.

For carbaryl, acute LC50 formulation data are also given for two species of fish, rainbow trout (*O. mykiss*, 44-81.5 % carbaryl) and bluegill sunfish (*Lepomis macrochirus*, 5-50% carbaryl). No 95% confidence intervals are given. Although other fish data for the technical carbofuran are provided, a same-species comparison of toxicity data is better than evaluating against a range of species, as the various species will exhibit a range of sensitivity. A single a.i. LC50 (1,200 µg/L) is given for rainbow trout. A total of four LC50s are given for formulations, ranging from 1,400-4,500µg/L. Three a.i. LC50s for bluegill are given, ranging from 5,000-14,000 µg/L. The bluegill LC50s (n=4) for formulations range from 9,800-290,000 µg/L. Based on these data, it appears the formulations tested are relatively similar in toxicity to the a.i. on an acute lethality basis (survival endpoint). No chronic tests, which evaluate reproduction and growth, were described for any formulations.

The carbofuran BE (EPA 2004a) lists some formulation toxicity data for aquatic invertebrates, referenced to the EFED Science Chapter and other data referenced to the EPA Acquire Database. In some cases, the formulation data referenced to the Science Chapter provides percent a.i. and in others it contains designations such as “5G” or “50 WP”. In cases where the percent a.i. is reported as a number, we presume the toxicity value has been corrected to percent a.i. It is unclear whether the others have been corrected, whether the data from the Acquire database has been corrected, or the specific products with which the toxicity data are associated.

Toxicity data presented in the carbofuran Science Chapter (EPA 2005) were found in Appendix H of Appendix 1 to the main document, titled Animal Toxicity Tests with DERs. Study data on

formulations were presented for bluegill sunfish (*L. macrochirus*) and rainbow trout (*O. mykiss*). A single test on rainbow trout was conducted using the formulation Furadan 75WP with a reported LC50 of 458 μg/L. LC50s for rainbow trout tested with technical carbofuran ranged from 362-600 μg /L. A number of different formulations (Furadan 4F, Furadan 10G, Furadan 50WP and Furadan 75WP) were tested with bluegill sunfish. LC50s ranged from 240-488 μg carbofuran/L. LC50s for bluegill sunfish tested with technical carbofuran ranged from 88-126 μg a.i/L. Only one formulation test for freshwater invertebrates was reported. *D. magna* exposed to "5G" had a survival EC50 of 41 μg /L. Tests with *D. magna* on technical carbofuran produced survival EC50s of 29-38.6 μg /L. The estuarine fish Atlantic silverside (*Mendia menidia*) was tested in two formulations, Furadan 4F and Furadan 15G. LC50s from these tests were 36 μg a.i./L and 64 μg a.i./L, respectively. A test with technical grade on the same species produced an LC50 of 33 μg a.i./L. (95% CI 27-41 μg a.i./L). The estuarine/marine invertebrate pink shrimp was tested both in a formulation (Furadan 15G) EC50 13.3 μg a.i./L and with technical (EC50s 4.6-7.3 μg a.i./L, n=2). Based on these data, there is no indication that the carbofuran formulations tested are more toxic than the a.i. on survival as an endpoint. No long term studies, such as life cycle studies, with formulations were reported for either fish or invertebrates.

The methomyl BE (EPA 2003a) and Science Chapter for the RED (EPA 1998c) both reported toxicity data for a 24% formulation and a 29% formulation for both fish and aquatic invertebrates. In addition, the BE reported some toxicity data for a 30% formulation. While it is difficult to make a definitive comparison given the structure of the data, the 24% formulation appears more toxic to both fish and invertebrates. Neither the toxicity section of the BE nor the use characterization in the Science Chapter list specific products. Thus, we cannot cross-reference the data to a product or determine if it is a currently registered product.

Identified data gaps and uncertainties of carbofuran's, carbaryl's and methomyl's toxicity information presented in BEs and REDs:

Overall, data provided in the BEs and their Science Chapters were insufficient to allow a thorough evaluation of all identified assessment endpoints and measures considered by NMFS. The Data Evaluation Reviews (DERs) or the original studies may have helped reduce some of

the uncertainties related to experimental design, dose-response slopes, and confidence estimates of the data, but we did not receive summaries of this information from EPA when preparing this Opinion. However, even if the DER data were submitted, other aspects of EPA's assessment endpoints (survival, reproduction, and growth) were not presented. When this missing information is combined with the absence of information presented on other non-assessed endpoints such as AChE inhibition in fish and invertebrates, swimming behaviors, and olfactory-mediated impairments, an incomplete picture emerges on the potential effects of EPA's action to listed salmonid and habitat endpoints.

Toxicity information presented in the BEs (EPA 2003c, EPA 2004a, and EPA 2003a) lacks details NMFS requires for analyses in support of this consultation. More complete information is presented in the Science Chapters for carbaryl (EPA 2003c) and carbofuran (EPA 2005), yet the information was not applied by EPA in its characterization of risk to listed salmonids or salmonid habitats. Specific data gaps identified include the following, although not all gaps apply to all three carbamates.

- Reported LC50s not accompanied by slopes, experimental design (number of treatments and replicates, life stage of organism, concentrations tested), measures of variability such as confidence intervals or standard deviations/errors;
- No analysis of the degree or magnitude of inhibition of acetylcholinesterase by the three carbamates and expected response by listed salmonids or aquatic, salmonid prey communities;
- Summary and discussion of fish sublethal data absent from BEs including effects to swimming and chemoreception;
- Limited or no toxicity data on current formulations,
- Limited or no toxicity data presented for identified surface water degradates of the three carbamates;
- Sensitivity of surrogate lab strains compared to wild, listed fish, particularly comparisons between warm and cold water fish species used in chronic guideline tests;
- No data summarized for mixture toxicity including tank mixtures and environmental mixtures to assessment endpoints;
- No toxicity data presented on "inert" or other ingredients present in formulations containing each of the a.i.s;
- No analysis of influence of environmental factors (pH, temperature) on exposure and toxicity.

Summary of Toxicity Information from Open Literature

To organize the available toxicity information on listed salmonids and habitat, we developed risk hypotheses with associated assessment endpoints as described in the *Approach to the Assessment* section. Recall that assessment endpoints are biological attributes of salmonids and their habitat potentially susceptible to the stressors of the action. In addition to toxicity data presented in the BEs, we also considered information from other sources to evaluate both individual and population-level endpoints. The results of those studies are summarized below under corresponding assessment endpoints. We qualitatively assigned the most significance to study results that were: 1) derived from experiments using salmonids (preferably listed Pacific salmonids or hatchery surrogates); 2) measured an assessment endpoint of concern *e.g.*, survival, growth, behavior, reproduction, abundance etc., identified in a risk hypothesis; 3) resulted from exposure to stressors of the action or relevant chemical surrogates (*i.e.*, other AChE inhibitors); and 4) had no substantial flaws in the experimental design. When a study did not meet these criteria, we highlighted the issue(s) and discussed how the information was used or why the information could not be used.

Assessment endpoint: Swimming

Assessment measures: Burst swimming speed, distance swam, rate of turning, baseline speed, tortuosity of path, acceleration, swimming stamina, and spontaneous swimming activity

Swimming is a critical function for anadromous salmonids that is necessary to complete their life cycle. Impairment of swimming may affect feeding, migrating, predator avoidance, and spawning (Little and Finger 1990). It is the most frequently assessed behavioral response of toxicity investigations with fish (Little and Finger 1990). Swimming activity and swimming capacity of salmonids have been measured following exposures to a variety of AChE-inhibiting insecticides including the carbamates carbaryl and carbofuran and a variety of OP insecticides. Swimming capacity is a measure of orientation to flow as well as the physical capacity to swim against it (Howard 1975; Dodson and Mayfield 1979). Swimming activity includes measurements of frequency and duration of movements, speed and distance traveled, frequency and angle of turns, position in the water column, and form and pattern of swimming. A review paper summarized many of the experimental swimming behavioral studies and concluded that effects to swimming activity generally occur at lower concentrations than effects to swimming

capacity (Little and Finger 1990). Therefore, measurements of swimming activity are usually more sensitive than measurements of swimming capacity. A likely reason is that fishes having impaired swimming to the degree that they cannot orient to flow or maintain position in the water column are moribund (*i.e.,* death is imminent). The authors of the review also concluded that swimming-mediated behaviors are frequently adversely affected at 0.3 – 5.0% of reported fish LC50s[3], and that 75% of reported adverse effects to swimming occurred at concentrations lower than reported LC50s (Little and Finger 1990). Both swimming activity and swimming capacity are adversely affected by AChE-inhibiting insecticides.

We located studies that measured impacts to salmonid swimming behaviors from exposure to carbaryl. Several studies also measured AChE inhibition from OPs and provided correlations between AChE activity and swimming behaviors. We did not locate any studies that tested mixtures of AChE-inhibiting insecticides on swimming behaviors of any aquatic species.

Carbaryl

Experiments with carbaryl have shown that cutthroat trout's (*Oncorhynchus clarki clarki*) swimming abilities are compromised by 6 h exposures to 750 and 1,000 µg/L, resulting in increased susceptibility to predation (Labenia, Baldwin et al. 2007). Cutthroat trout swimming capacity was not significantly affected by carbaryl at 500 µg/L, although muscle AChE activity was 29% relative to unexposed cutthroat. More sensitive swimming activity measurements were not evaluated. At 750 and 1,000 µg/L, AChE activity was 24 and 23% relative to unexposed fish, respectively. A known predator of juvenile cutthroat, lingcod (*Ophiodon elongates*), consumed on average more cutthroat that were exposed to carbaryl compared to those that were not exposed to carbaryl. The experimental design ensured that the predator was exposed to minimal concentrations when carbaryl-exposed fish were transferred in a large experimental chamber along with unexposed cuthroat. In the predation experiment with lingcod, cutthroat were exposed for 2 h to 200, 500, and 1,000 µg/L carbaryl. Results indicated a dose-dependent decrease in the ability of carbaryl-exposed trout to avoid being eaten by the lingcod predator. At

[3] The current hazard quotient-derived threshold for effects to threatened and endangered species used by EPA is 5 % (1/20th) of the lowest fish LC50 reported. If the exposure concentration is less than 5 % of the LC50 a no effect determination is made which likely underestimates risk to listed salmonids based on swimming behaviors.

200 μg/L, an increase in predation was evident, although not statistically significant. At 500 and 1,000 μg/L carbaryl, cutthroat trout were consumed at significantly higher rates than unexposed fish. Cutthroat trout's AChE activity was also reduced in a dose-dependent fashion showing greater reductions with increasing carbaryl concentrations. Six hour exposures significantly reduced AChE activity in brain and muscle, where 50% reductions (IC50) in brain AChE occurred at 213 μg/L carbaryl. The onset of inhibition occurred within 2 hours, at which point AChE activity was near its lowest value. Benchmark concentrations corresponding to 20% inhibition were 32 μg/L in brain and 23 μg/L in muscle tissues. Recovery of AChE activity (to pre-exposure levels) took 42 hours at 500 μg/L carbaryl. We ranked these sets of experiments as highly relevant to understanding the effects of carbaryl on inhibition of AChE and subsequent salmonid swimming behaviors. The test also provided information on lack of predator avoidance behaviors by salmonids.

Catfish (*Mystus vittatus*) showed increased swimming activity following 72 h of exposure to 12,500 μg/L and no mortalities were noted (Arunachalam, Jeyalakshmi et al. 1980). The 72 h LC50 for catfish was 17,000 μg/L, indicating this species of catfish is much less sensitive to acute concentrations of carbaryl than salmonids. Other sublethal endpoints were also affected by carbaryl, including food intake, growth, metabolism, and rate of opercular beats. Catfish increased their rates of opercular beats from 74 per minute exposed to freshwater alone to 124 per minute when exposed to 12,500 μg/L carbaryl, which the authors attributed to acute stress from carbaryl. We ranked this study as relevant because swimming was measured, but the high concentrations used, lack of chemical verification, and lack of compatibility to listed salmonids introduces uncertainty.

Multiple behavioral responses related to swimming were assessed in rainbow trout fry (0.5-1 g) following 96 h exposures to carbaryl at 10, 100, and 1,000 μg/L; nominal concentrations (Little, Archeski et al. 1990). These included swimming capacity (cm/sec), swimming activity (sec), prey strike frequency, daphnids consumed, percent consuming daphnids, and percent survival from predation. All endpoints were significantly affected at 1,000 μg/L carbaryl relative to unexposed fry. At 10, 100, and 1,000 μg/L carbaryl, significantly more rainbow trout were

consumed relative to unexposed fish. By using very young fry, the studies also provide information on a sensitive early lifestage where swimming behaviors are critical to survival (*i.e.,* feeding and predator avoidance). We ranked these studies as highly relevant to a variety of essential swimming-associated behaviors.

One study tested whether schooling of fish in estuarine waters was affected by a single short-term exposure of carbaryl at 100 μg/L (Weis and Weis 1974). Carbaryl impaired schooling of Atlantic silversides (*M. menidia*) by increasing the school area by up to twice that of control groups. Recovery of schooling behavior took three days (Weis and Weis 1974). The authors suggested that increased schooling areas would increase energy expenditures of individual fish and also increase rates of predation. The study lacked analytical verification of exposure concentrations; only one concentration was tested; and the study was conducted with a non-salmonid fish. The study is relevant because it addressed an important swimming behavior (*i.e.,* schooling), which juvenile salmonids use at times, and presented data on time to recovery following an adverse behavioral affect. However, it remains uncertain at which concentrations juvenile salmonids that school would be affected.

Neurological effects on the startle response and ability to avoid predation by juvenile medaka (*Oryzias latipes*) were evaluated following exposures of 2.5, 5.1, 7.0, and 9.4 mg/L carbaryl (Carlson, Bradbury et al. 1998). At 5.1 mg/L and higher, carbaryl increased the time between motor neuron peak and initiation of muscle activity (*i.e.,* swimming response) and at 7.0 mg/L and higher response to stimuli ratios were also higher. Predation trials showed no differences between medaka exposed to carbaryl and unexposed fish. While these concentrations are extremely high compared to concentrations affecting salmonids, the results indicate that neurological-associated swimming behaviors are affected by carbaryl. Given that the 48 h LC50 of juvenile medaka is estimated at 9.4 mg/L and that detectable sublethal neurological effects occurred at 5.1 mg/L, roughly half the LC50, it is uncertain at what concentrations juvenile salmonids neurological endpoints would be affected. We ranked this experiment as relevant as it provided evidence that neurological effects manifest at lower concentrations than 48 h LC50s.

Carbofuran

Carbofuran adversely affected swimming behaviors in goldfish (*C. auratus*) following 24 and 48 h exposures to the lowest concentration tested, 5 μg/L (Bretaud, Saglio et al. 2002). Swimming activity (fish swimming from one zone to another), the least sensitive endpoint, was significantly affected at 500 μg/L carbofuran, while burst swimming, the most sensitive endpoint, was significantly affected at 5 μg/L following 24 h exposure (Bretaud, Saglio et al. 2002). Burst swimming behavior, sheltering, and nipping in goldfish were significantly increased by a 4 h exposure to 1 μg/L carbofuran (Saglio, Trijasse et al. 1996). At 12 h exposures, significant effects were observed at 100 μg/L for sheltering, nipping, and burst swimming. Grouping of goldfish showed non dose-dependent responses as significant effects ($p<0.05$) appeared at 10 μg/L, but were absent at 1 and 100 μg/L (Saglio, Trijasse et al. 1996). We ranked both of these studies as relevant, but due to difficulties inherent in translating the observed behavioral effects in goldfish to salmonids, combined with the lack of analytical verification of concentrations, the study did not receive a highly relevant ranking. The results support that ecologically relevant swimming-related behaviors are impacted at lower concentrations than more coarse measures of swimming such as swimming stamina or swimming capacity.

Methomyl

We were unable to locate any studies that evaluated effects to swimming related behaviors in fish. Although this is a data gap, we assume methomyl does inhibit swimming in the same fashion as the other carbamates because swimming behaviors are typically affected when AChE is sufficiently inhibited (*e.g.* by 30% or more). A review also concluded that swimming-mediated behaviors are frequently adversely affected at 0.3 – 5.0% of reported fish LC50s, and that 75% of reported adverse effects to swimming occurred at concentrations lower than reported LC50s (Little and Finger 1990).

Other AChE-inhibiting insecticides effects on swimming and related behaviors

We also reviewed study results conducted with other carbamate and OP insecticides because both classes of compounds share the same mode of action. Recovery of swimming to pre-exposure levels is much more rapid in carbamate-affected fish compared to OP-affected fish due to the reversible binding of carbamates with AChE (Mineau 1991). In one study with carbaryl and rainbow trout, AChE activity returned to control levels after 24 h in clean water following

24 hr exposure (Zinkl, Shea et al. 1987). In another study with cutthroat trout within 42 h recovery occurred following 6 h exposure(Labenia, Baldwin et al. 2007). In the latter study, cutthroat trout recovered approximately half of their pre-exposure AChE activity within 6 h, following peak AChE inhibition within 2 h. Both of these studies indicate that recovery of AChE activity following exposure to carbamates occurs quickly and is highly dependent on environmental exposure conditions found in aquatic habitats.

We did not locate additional studies with other carbamates, but located multiple studies with OP insecticides. The OPs chlorpyrifos, diazinon, and malathion showed significant and persistent effects to a suite of swimming related behaviors in salmonids at concentrations expected in salmonid habitats; as reviewed in NMFS' November 18, 2008 Opinion on these three OP insecticides (NMFS 2008). Robust evidence of the three OPs showed reductions in swimming speed (Brewer, Little et al. 2001), distance swam (Brewer, Little et al. 2001), acceleration (Tierney, Casselman et al. 2007), food strikes (Sandahl, Baldwin et al. 2005) and significant correlations with AChE activity (Brewer, Little et al. 2001; Sandahl, Baldwin et al. 2005). Additionally, other OPs including fenitrothion, parathion, and methyl parathion, adversely affected a suite of swimming behaviors reviewed by (Little and Finger 1990). One noteworthy study investigated the effects of six pesticides including methyl parathion (OP) and tribufos (OP) on rainbow trout swimming behavior (Little, Archeski et al. 1990). All insecticides adversely affected spontaneous swimming activity, while DEF also reduced swimming capacity in juvenile rainbow trout (Little, Archeski et al. 1990). In bluegill, methyl parathion adversely affected burst swimming behavior at 300 μg/L (Henry and Atchison 1984). Respiratory disruptions, comfort movements, and aggression behaviors in bluegill were all adversely affected by 24 h exposures to methyl parathion at 3.5 μg/L. This suggests that these social behaviors are very sensitive to AChE inhibition (Henry and Atchison 1984).

Two month old juvenile rainbow trout, brook trout, and coho were exposed to malathion (Phillaps Malathion 55%) for 7-10 days depending on species (Post and Leasure 1974). Swimming performance, brain AChE activity, and recovery time were measured following exposure to malathion concentrations of 0, 40, 90, 120 μg/L in brook trout; 0, 55, 112, 175 μg/L in rainbow trout; and 0, 100, 200, 300 μg/L in coho. Additionally, once fish recovered AChE

activity, they were subjected to a second exposure to determine if prior exposure altered susceptibility to malathion. Swimming performance and AChE activity did not differ from values of the initial exposure *i.e.,* a second exposure resulted in no evidence of increased susceptibility. Brook trout were the most sensitive based on AChE inhibition followed by rainbow trout and coho salmon, respectively. AChE inhibition of 25% relative to control fish occurred at 40 μg/L (brook trout), 55 μg/L (rainbow trout), and 100 μg/L (coho). Swimming performance was affected at the lowest concentrations tested in each salmonid species and showed a dose-dependent decrease in swimming performance as malathion concentration increased. The data indicated that AChE inhibition of approximately 20-30% resulted in a 5% or less reduction in swimming performance and as inhibition increased, swimming performance decreased. Note, however, that the swimming test conducted in the study is a coarse measure of swimming capacity. Thus, other non-measured swimming activity endpoints would likely be affected at lower concentrations (Little and Finger 1990; Little, Archeski et al. 1990).

In summary, the information presented on swimming behaviors from AChE-inhibiting insecticides provide a weight of evidence that carbamates (and OPs) adversely affect swimming behaviors which can reduce the fitness of affected salmonids.

Assessment endpoints: Olfaction and olfactory-mediated behaviors: Predator avoidance, prey detection and subsequent growth, imprinting of juvenile fish to natal waters, homing of adults returning from the ocean, and spawning/reproduction

Assessment measures: Olfactory recordings (electro-olfactogram), behavioral measurements such as detection of predator cues and alarm response, adult homing success, AChE activity in olfactory rosettes and bulbs, and avoidance/preference

The olfactory sensory system in salmonids is particularly sensitive to toxic effects of metals and organic contaminants. This is likely a result of the direct contact of olfactory neurons and dissolved contaminants in surface waters. Olfactory-mediated behaviors play an essential role in the successful completion of anadromous salmonid life cycles, and include detecting and avoiding predators, recognizing kin, imprinting and homing in natal waters, and reproducing. It is well established that Pacific salmon lose navigation skills when olfactory function is lost and consequently are unable to return to natal streams (Wisby and Hasler 1954).

We located studies that measured olfactory responses of fish to carbofuran and carbaryl. We found no studies with methomyl. Several studies with other carbamates were found, but most were with thiocarbamates which have a different mode of action than *N*-methyl carbamates, *i.e.,* they do not inhibit acetylcholineterase. We do not discuss or use studies with OPs as surrogates for effect to olfaction in salmonids because AChE inhibition does not appear to be the putative mode of action affecting olfaction, although more empirical data are needed to confirm this. Below we discuss the available literature of carbamate effects on fish olfaction.

The olfactory activity of juvenile cutthroat trout appeared unresponsive to carbaryl following 10 second pulses across the olfactory epithelia, and juveniles showed no preference/avoidance to carbaryl (Labenia, Baldwin et al. 2007). No departures relative to unexposed fish were observed at 5, 50, or 500 μg/L carbaryl from neurophysiological recordings *i.e.,* electro-olfactograms. Additionally, in a behavioral avoidance assay, cutthroat trout did not avoid seawater containing carbaryl at 500 μg/L. These results suggest that cutthroat trout do not actively avoid carbaryl and that short term exposures do not affect olfaction at the concentrations tested. We found no other studies that evaluated other salmonids in estuarine conditions or in freshwaters. We ranked these study results as highly relevant to the effects of carbaryl on salmonid olfaction and an olfactory-mediated behavior, avoidance.

In one set of experiments, coho salmon exposed for 30 minutes to three carbamates (carbofuran, antisapstain IPBC, mancozeb) separately, had reduced olfactory ability as well as disruption of normal AChE activity (Jarrard, Delaney et al. 2004). Carbofuran reduced olfaction by 50% (EC50) at 10.4 μg/L; IPBC reduced olfaction at 1.28 μg/L (EC50); and mancozeb reduced olfaction at 2.05 mg/L (EC50). In addition, carbofuran reduced AChE activity in the olfactory receptor at at 200 μg/L (68%), but none of the treatments (0.1, 10, or 200 μg/L) reduced brain or olfactory bulb AChE activity. This could be a result of the limited exposure duration. The authors concluded that too little information exists to develop a causal relationship between AChE inhibition and olfaction (Jarrard, Delaney et al. 2004). The data do show that carbofuran inhibited both olfaction and AChE activity at 10 and 200 μg/L, respectively. We ranked these study results as highly relevant to carbofuran's effect on salmonid olfaction.

Goldfish showed no avoidance of carbofuran up to a concentration of 10 mg/L, but at the onset of the contaminated flow goldfish showed increased and immediate burst swimming responses relative to unexposed fish (Saglio, Trijasse et al. 1996). In the same study, olfactometric tests were performed to assess the influence of 1, 10, and 100 μg/L carbofuran on a suite of behavioral responses to a food extract (a chironomid–containing solution). Sheltering, grouping, nipping, burst swimming, and attraction behaviors were assessed for ten minutes at 4, 8, and 12 h time points. Significant effects to goldfish behavior in the presence of food stimuli were observed as low as 1 μg/L carbofuran. Sheltering activity increased, while attraction decreased in a dose-dependent manner at 4 h across treatment range (1-100 μg/L) relative to unexposed fish. At 10 and 100 μg/L, goldfish nipped more, relative to controls; which may be representative of increased aggression and stress. The authors concluded that olfactory-mediated behaviors in goldfish were adversely affected by sublethal concentrations of carbofuran. We ranked this study as relevant to the assessment endpoint of olfaction, as ecologically relevant olfactory-mediated behaviors were tested with sublethal concentrations of carbofuran. We note that concentrations were not analytically verified and direct correlation of olfactory-affected goldfish behaviors to salmonid behaviors remains uncertain.

The olfactory ability of male Atlantic salmon to detect a female priming hormone was measured following 5 d exposures to carbofuran (1.1, 2.7, 6.5, 13.9, 22.7 μg/L) (Waring and Moore 1997). The response to the female pheromone prostaglandin F2α, by male olfactory epithelium was reduced at carbofuran concentrations as low as 1.0 μg/L., while the threshold for detection was reduced 10-fold. Furthermore, at 2.7 μg/L carbofuran, male fish completely lost priming ability induced by the female pheromone resulting in no increase in milt or plasma steroids at 2.7 μg/L. These results suggest that Atlantic salmon exposed to these concentrations would have difficulty preparing for spawning due to their impaired priming. Reductions in productivity are possible if male fish miss spawning opportunities. We ranked this study as highly relevant to the effects of carbofuran on olfactory–mediated behaviors such as spawning synchronization.

Mixtures containing carbaryl, carbofuran, and methomyl

We located no experiments that tested mixtures of the three a.i.s, nor did we find mixture studies with other *N*-methyl carbamates. Therefore, the potential for mixture toxicity to olfactory

endpoints of salmonids remains a recognized data gap. Given the differences in olfactory toxicity in salmonids for carbaryl (no observed toxicity) and carbofuran (inhibited olfaction at 10 μg/L) combined with no available information on methomyl's affect on olfaction, no apparent dose-response pattern of toxicity emerges for the three a.i.s.

Assessment endpoints: Toxic effects in salmonids from consuming contaminated prey

Assessment measures: Survival, swimming performance

A current uncertainty is the degree to which secondary poisoning of juvenile salmonids may occur from feeding on contaminated dead and dying drifting insects. Secondary poisoning is a frequent occurrence with OPs and carbamates in bird deaths (Mineau 1991), yet is much less studied in fish. Uptake, metabolism, and accumulation of carbaryl by a salmonid prey item, *Chironomus riparius* (midge), exposed for 24 h indicated significant uptake over the first 8 h, significant metabolism (more than 85-99%) of parent carbaryl to metabolites and low bioconcentration factors (5-10) (Lohner and Fisher 1990). These results suggest that contaminated prey items, such as aquatic invertebrates, do not accumulate significant carbaryl, and what they do accumulate is likely rapidly metabolized. That said, juvenile salmonids could still get a dose of carbaryl from feeding on drifting, contaminated insects that have not had time to metabolize carbaryl. Juvenile brook trout gorged on drifting insects following applications of carbaryl and AChE activity was reduced (15-34%) in the trout (Haines 1981). However, it is not possible to differentiate the contribution to AChE inhibition from the aqueous and dietary routes because concentrations were not measured in the water, prey, or fish. In another study, resident trout feeding on dying and dead drifting invertebrates (from the pyrethroid cypermethrin) caused a range of physiological symptoms in brook trout: loss of self-righting ability and startle response; lethargy; hardening and haemolysis of muscular tissue similar to muscle tetany; and anemic appearance of blood and gills (Davies and Cook 1993). The possibility that the adverse effects in the trout manifested from exposure to the water column instead of from feeding on contaminated prey was ruled out by the authors as measured field concentrations of pesticides did not produce known toxic responses. In a laboratory feeding study with the OP fenitrothion, brook trout (*S. fontinalis*) were fed contaminated pellets (1 or 10 mg/g fenitrothion for four wks) (Wildish and Lister 1973). Growth was reduced in both treatments. AChE inhibition was measured at 2, 12, and 27 d following termination of contaminated diet treatments. Trout had lower AChE activity than unexposed fish at both treatments, and by 27 d following termination,

AChE levels recovered slightly. The treatment concentrations used in this study are very high and indicate that brook trout are not sensitive to diet-induced toxicity of fenitrothion. The experiment did show that AChE inhibition from the diet is possible, yet it is difficult to determine the relative toxicity of carbaryl, carbofuran, and methomyl found in contaminated insects consumed by Pacific salmonids.

Habitat assessment endpoints:

Prey survival, prey drift, nutritional quality of prey, abundance of prey, health of aquatic prey community, and recovery of aquatic communities following N-methyl carbamate exposures

Assessment measures: 24, 48, and 96 h survival of prey items from laboratory bioassays reported as EC/LC50s; sublethal effects to prey items; field studies on community abundance; indices of biological integrity (IBI); community richness; and community diversity.

Death of aquatic invertebrates in laboratory toxicity tests were reported in each of the BEs. Salmonid aquatic and terrestrial prey are highly sensitive to the three carbamate insecticides. Death of individuals and reductions in individual taxa and prey communities have been documented and are expected following applications of *N*-methyl carbamates that achieve effect concentrations-several of which are at the low μg/L levels (Schulz 2004). Complete or partial elimination of aquatic invertebrates from streams contaminated by insecticides has been documented for carbaryl (Muirhead-Thomson 1987) as well as many other insecticides. A review of field studies published from 1982-2003 on insecticide contamination concluded that "about 15 of the 42 studies revealed a clear relationship between quantified, non-experimental exposure and observed effects in situ, on abundance [aquatic invertebrate], drift, community structure, or dynamics" (Schulz 2004). Although the top three insecticides most frequently detected at levels expected to result in toxicity were chlorpyrifos (OP), azinphos-methyl (OP), and endosulfan, the *N*-methyl carbamates carbaryl, carbofuran, oxymyl, and fenobucarb all showed clear or assumed relationships between exposure and effect (Schulz 2004).

Drift, feeding behavior, swimming activity, and growth are sublethal endpoints of aquatic prey negatively affected by exposure to AChE inhibitors (Courtemanch and Gibbs 1980; Haines 1981; Hatakeyama, Shiraishi et al. 1990; Davies and Cook 1993; Beyers, Farmer et al. 1995; Schulz 2004). Drift of aquatic invertebrates is an evolutionary response to aquatic stressors. However, insecticides, particularly carbamates and OPs, can trigger catastrophic drift of salmonid prey

items (Courtemanch and Gibbs 1980; Haines 1981; Hatakeyama, Shiraishi et al. 1990; Davies and Cook 1993; Schulz 2004). Some invertebrates may drift actively to avoid pesticides and settle further downstream, which can provide temporary spikes in available food items for feeding salmonids. Catastrophic drift can also deplete benthic populations resulting in long-term prey reduction that may affect salmonid growth at critical time periods. We located no studies that address this line of reasoning directly with Pacific salmonids. Davies and Cook (1993) did show aquatic invertebrate community changes, mortality of invertebrates, drift of dying and dead invertebrates, and affected trout following spraying of a pyrethroid pesticide, cypermethrin, an invertebrate and fish neurotoxicant (Davies and Cook 1993). Effect concentrations were estimated at 0.1-0.5 μg/L cypermethrin. It is difficult to compare these effect concentrations to carbamate insecticides. However, it is illustrative of how insecticides can damage multiple endpoints of an aquatic community including reducing abundance of prey (Davies and Cook 1993).

Several scientific peer-reviewed publications and EPA documents have reviewed aspects of the available information on multi-organism microcosm, mesocosm, and field test results for the AChE insecticides (Leeuwangh 1994; Barron and Woodburn 1995; Schulz 2004; Van Wijngaarden, Brock et al. 2005). Van Wijngaarden et al. (2005) conducted a literature review that listed ecological threshold values (*e.g.,* $NOEC_{eco}$ and $LOEC_{eco}$) for carbaryl, carbofuran, and bendiocarb (another *N*-methyl carbamate) from model ecosystems or "adequate" field studies. A $NOEC_{eco}$ represented "the highest tested concentration at which no, or hardly any, effects on the structure and functioning of the studied model ecosystem were observed. The $LOEC_{eco}$ is the lowest tested concentration at which significant treatment-related effects occurred" (Van Wijngaarden, Brock et al. 2005). Below we discuss some of this information in relation to effects on salmonid prey. The majority of studies were conducted in littoral systems, *i.e.,* ponds, and other static systems, but one study with carbaryl was conducted in a running water (lotic) system (Courtemanch and Gibbs 1980). Population densities of salmonid prey items (*i.e.*, Ephemeroptera, Diptera, Amphipoda, Cladocera, Copepoda, Isopoda, Ostracada, Trichoptera) decline following exposures to AChE-inhibiting insecticide concentrations, including carbaryl and carbofuran (Van Wijngaarden, Brock et al. 2005). Adverse effects to these groups occurred

at or below "1 toxic unit"-where a toxic unit equals field concentrations normalized by dividing them by the 48 h EC50 of *Daphnia magna* for a given AChE inhibitor.

We did not locate any microcosm, mesocosm, or field experiments that measured responses of aquatic communities that contained salmonids and salmonid prey simultaneously; a recognized data gap. Several studies evaluated aquatic invertebrate responses to *N*-methyl carbamates (carbaryl, carbofuran, and bendiocarb) in static and running water systems. We found no field studies with methomyl. We summarize open literature studies with aquatic invertebrates organized by insecticide in Table 65. We found no studies that addressed effects of methomyl on aquatic invertebrates in the field or from multispecies microcosms or mesocosms.

The available literature from field experiments indicates that populations of aquatic insects and crustaceans are likely the first aquatic organisms damaged by exposures to carbaryl, carbofuran, and methomyl contamination. Benthic community shifts from sensitive mayfly, stonefly and caddisfly taxa, the preferred prey of salmonids, to worms and midges occur in areas with degraded water quality including from contaminants such as pesticides (Cuffney, Meador et al. 1997; Hall, Killen et al. 2006). Reduced salmonid prey availability correlated to OP use in salmonid bearing watersheds (Hall, Killen et al. 2006). We found no studies that evaluated the effects on carbamates and that made correlations to salmonid bearing watersheds. Subsequent effects to salmonid's growth from reduced prey availability and quality remain untested and are a current data gap.

We located a study addressing impacts on fish growth due to prey reduction. Although this study was conducted on chlorpyrifos, an insecticide not considered in this Opinion, we deemed it highly relevant due to the ecological context it provided. The study indicated that native fathead minnows exposed to chlorpyrifos had reduced growth due to reductions in prey item abundance in littoral enclosures (pond compartments) (Brazner and Kline 1990). The experiment tested the hypothesis that, "addition of chlorpyrifos would reduce the abundance of invertebrates and cause diet changes that would result in reduced growth rates." Nominal, chlorpyrifos treatment concentrations of 0.5, 5.0, and 20 μg/L (chemical analysis of water concentrations provided at 0, 12, 24, 96, 384, 768 h) all resulted in statistically significant reductions in growth at 31 days. A

single pulse of chlorpyrifos was introduced into each enclosure at day 0. Invertebrate abundance was determined in each replicate on days -3, 4, 16, and 32. Fathead minnows were sampled from enclosures on days -2, 7, 15, and 31 where fish were weighed, measured, and dissected to determine gut content (dietary items identified). By day 7, significant differences in mean numbers of rotifers, cladocerans, protozoans, chironomids, mean total number of prey being eaten per fish, and mean species richness were greater in fish from the control enclosures than in some of the treatments. By day 15, control minnows were significantly larger than fish from treated levels. These experimental results support the conclusion that reductions in abundance of prey to juvenile fish can result in significant growth effects. It is reasonable to assume that reductions in prey from carbamate insecticides can also result in reduced juvenile salmonid growth and ultimately reduced survival and productivity. The precise levels of prey reduction necessary to cause subsequent reductions in salmonid growth remain a recognized data gap.

Recent declines in aquatic species in the Sacramento-San Joaquin River Delta in California have been attributed in part to toxic pollutants, including pesticides (Werner, Deanovic et al. 2000). Significant mortality or reproductive toxicity in *C. dubia* was detected in water samples collected at 24 sites in the Sacramento-San Joaquin River Delta in California. Ecologically important back sloughs had the largest percentage of toxic samples (14 - 19%). The TIEs identified carbofuran and carbaryl as well as the OPs chlorpyrifos, diazinon, and malathion as the primary toxicants in these samples responsible for the adverse effects (Werner, Deanovic et al. 2000).

Recovery of salmonid prey communities following acute and chronic exposures from carbaryl, carbofuran, and methomyl depends on the organism's sensitivity, life stage, length of life cycle, among other characteristics. Univoltine species will take longer than multivoltine species to recover (Liess and Schulz 1999). Recovery of salmonid prey items such as caddisflies, stoneflies, and mayflies will be slow, considering their long life cycles and infrequent reproduction. Additionally, these species also require clean, cool waters to both recover and maintain self-sustaining populations. In several salmonid-supporting systems these habitats are continually exposed to anthropogenic disturbances, including pesticide contamination, which limits their recovery and can also limit recovery of multivoltine species. For example, urban environments are seasonally affected by stormwater runoff that introduces toxic levels of

contaminants and scours stream bottoms with high flows. Consequently, urban environments do not typically support diverse communities of aquatic invertebrates (Paul and Meyer 2001; Morley and Karr 2002).

Similarly, yet due to a different set of circumstances, watersheds with intensive agriculture land uses show compromised invertebrate communities (Cuffney, Meador et al. 1997). Indices of biological integrity (IBI) and other invertebrate community metrics are useful measures of the health of an aquatic community because cumulative impacts of aquatic stressors are integrated over time. The IBI is also valuable because it converts relative abundance data of a species assemblage into a single index of biological integrity (Allan 1995). Salmonid-inhabited watersheds have been assessed using IBIs and other metrics of aquatic community health.

A study on the condition of Yakima River Basin's aquatic benthic community found that invertebrate taxa richness was directly related to the intensity of agriculture *i.e.,* at higher agriculture intensities taxa richness declined significantly both for invertebrates as well as for fish (Cuffney, Meador et al. 1997). Locations with high levels of impairment were associated with high levels of pesticides and other agricultural activities, which together with habitat degradation were likely responsible for poor aquatic conditions in the Yakima (Cuffney, Meador et al. 1997). Salmonid ESUs and DPSs occur in the Yakima River Basin as well as other watersheds where invertebrate community measurements indicate severely compromised aquatic invertebrate communities such as the Willamette River Basin, Puget Sound Basin, and the Sacramento-San Joaquin River Basin.

Table 65. Study designs and results with freshwater aquatic invertebrates

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
Carbaryl	multiple n= 25; including predators, herbivores, zooplankton	species richness, biomass, abundance, survival	510 μg/L; single application; simulating direct overspray	13 d	Reduced richness of community (by 15%), predators, zoo plankton; reduced biomass of predators; increased abundance of large herbivores; No effect on zooplankton abundance; elimination of diving beetle larvae, *Daphnia pulex*, *D. ambigua*	(Relyea 2005)
Carbaryl	*C. californica* (stonefly) *C. sp.* (mayfly) *A. sp* (mayfly) *B. americanus* (caddisfly) *P. sp.* (caddisfly) early instar *P. sp.* (caddisfly) late instar *L. unicolor* (caddisfly)	Survival; LC1,LC50	1-30 μg/L 4-100,000 μg/L 10-28 μg/L 5-55 μg/L 5-80 μg/L 5-80 μg/L 5- 80 μg/L	96 h	9.0 (LC1); 17.3 (LC50) μg/L 3.0; 11.1 7.5; 20.4 28.8; 41.2 14.8; 30.3 33.8; 61.0 9.5; 29.0	(Peterson, Jepson et al. 2001)
Carbaryl	Coleopteran (beetles), Diptera (flies), Trichoptera (caddisflies), terrestrial insects, Emphemeroptera (mayflies)	salmonid stomach contents	0.5 lbs/acre, 2 applications, 7 days interval	na	Increased numbers of Diptera in stomach after first spray; increased numbers of Emphemeroptera, Trichoptera, Diptera, and terrestrial insects indicating drift; condition factor of fish increased following applications due to increased feeding; fish AChE inhibited 15-34%fish AChE inhibited 15-34%	(Haines 1981)
Carbaryl	*Chironomus riparius* (midge)	Survival (EC50); Uptake rate; Bioconcentration factors (BCFs)	Multiple concentration ranges at pH 4,6,8; temps 12, 20, 30 °C	24 h	EC50s (61-133 μg/L); Lowest EC50 at 30 °C, pH 4 and 6; Highest EC50s at 10°C, pH 4 and 6. Uptake rates increased with temp. BCFs = 5.36-10.12	(Lohner and Fisher 1990)

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
Carbaryl	*C. californica* (stonefly) *Cinygma sp.* (mayfly)	Survival (EC50)	17.3, 173, 1730 μg/L 10.2, 102, 204, 408, 1020 μg/L	15 min 30 60 15 min 30 60 96 h recovery period	EC50= na EC50= na EC50 = 1139 95% CI (370-15400) μg/L EC50 = 848 no CI EC50 = 220 no CI EC50 = 165 95% CI (124-232)	(Peterson, Jepson et al. 2001)
carbaryl	Stream invertebrate aquatic community	Aquatic invertebrate drift, survival; presence and abundance of riffle invertebrates; recovery of benthic invertebrates	0.75 lbs/ acre; 1 lb/acre	2, 30, 60, 365 day drift sampling post spray; 1,2, 3, 30, 60 day benthic samples	170-fold increase in drift at 2 d. All invertebrates in drift samples dead at 2 d (Plecoptera, Ephemeroptera Diptera were common), at 30 and 60 d drift below prey-spray levels. Within hrs larger stream inverts found dead (Plecoptera, Trichoptera, Emphemerptera), Tricoptera abandoned their cases; at 30 and 60 d significant population declines of salmonid-prey invertebrates compared to pre-spray levels. Total number of organisms not significantly reduced.	(Courtemanch and Gibbs 1980)
carbaryl	*Xathocnemis zealandica* (damselfly)	Emergence of damselflies, % emerged	1, 10, 100 μg/L (concentrations replenished every 12 days at ½ the nominal treatment level)	67 days	90% reduction in emergence at 100 μg/L no significant differences at 1 and 10 μg/L.	(Hardersen and Wratten 1998)

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
carbaryl	*Daphnia magna* (daphnids)	Population abundance at different phases; Life stage sensitivity (survival, 48 h LC50)	15 μg/L applied as a single pulse at different population phases (treatments): growing, density peak, stable	1 pulse at day 8 to growing treatment (3 replicates), day 11 to density peak treatment , day 25 stable treatment; 48 h	70% decline in abundance during growth phase, 92.6% decline in peak phase, 34.8 % decline in stable phase , compare to a 61% decline in control population; Survival (48h LC50s)	(Takahashi and Hanazato 2007)
carbaryl	Zooplankton pond community	Abundance of zooplankton species	500 μg/L; 1-3 applications to pond mesocosms; 0.1 mg/L	0 – 3 months	At 500 μg/L sustained reductions in daphnid and copepod populations. No observable reductions in rotifer populations. At 100 μg/L, reductions in daphnid population observed, but not with copepods or rotifers	(Hanazato and Yasuno 1990)
carbaryl formulation (43.3% a.i.)	Bluegill sunfish, multiple aquatic species including phytoplankton, macrophytes, zooplankton, and macroinvertebrates	Abundance and richness of species groups; Fish survival and growth	2, 6, 20, 60, 200 μg/L; applications at weekly intervals for 6 weeks	0 – 12 weeks, with 6 weekly pulses beginning at week 10	no long term reductions in major invertebrate groups were observed; no detectable differences in bluegill survival or growth between control and pesticide treatments, carbaryl half life was 30 min, mean pH of treatment groups in application events ranged from 9.2-10.3; mean temperatures ranged from 17 – 27 ◦C, with the majority between 20-24 ◦C.	Registrant-submitted study (1993)

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
carbaryl formulation (Sevin-4-Oil)	Aquatic macroinvertebrate community; *Platygobio gracilis* (Flathead chub)	Invertebrate drift; AChE inhibition in resident fish	Aerial application in 1991 and 1993 applied at 0.5 lbs carabaryl/acre and 0.4 lbs/acre, respectively	River water sampled at 1, 2, 4, 8, 12, 24, 48, 96 h; AChE inhibition measured at 24 h; Drift sampled 4 times daily for 4 days	1 h average 85 μg/L and declined to 0.100 μg/L by 96 h in 1991; 2 h average 12 μg/L L and declined to 5.14 μg/L by 96 h in 1993; No detectable differences in AChE inhibition at 24 h, low statistical power (0.82 and 1); Note: AChE is expected to recover by 24 h; Increase in coefficient of variation of drift measure from day 1and 2 post application compared to reference site drift in 1991; Similar increase on day 2 in 1993; drift composed primarily of live mayflies (Emphemeroptera)	(Beyers, Farmer et al. 1995)
carbofuran	*Gammarus pulex* (fw amphipod)	*in situ* survival, feeding rates; laboratory bioassays measured 24 h survival (LC50) and feeding rates	Field study: measured stream concentrations in stormwater runoff following an application of 3 kg a.i./ ha; 27 μg/L stream, 256 μg/L in agricultural field ditch Lab study: Feeding rate- 0.75,1.25,2.25,4.0,7.0, 12.0 μg/L	Field study: 5 day; 2 rain events captured Lab study: Survival- 24-, 48- 96-hr Feeding rate- 7 day exposures	Field study: All amphipod chambers showed reduced feeding rates at time during rain events and all amphipods died in 10 experimental chambers Lab study: Survival- μg/L (95% CI) 24 h LC50 = 21 (14.7-30) 48 h LC50 = 12.5 (5.7-27.5) 96 h LC50 = 9 (5.8-13.9) Feeding rate- >3 μg/L feeding rates reduced to 0	(Matthiessen , Shearan et al. 1995)

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
carbofuran	1 h average 85 μg/L and declined to 0.100 μg/L by 96 h in 1991; 2 h average 12 μg/L L and declined to 5.14 μg/L by 96 h in 1993; No detectable differences in AChE inhibition at 24 h, low statistical power (0.82 and 1); Note: AChE is expected to recover by 24 h; Increase in coefficient of variation of drift measure from day 1and 2 post application compared to reference site drift in 1991; Similar increase on day 2 in 1993; drift composed primarily of live mayflies (Emphemeroptera)	Taxa abundance and biomass	5 μg/L 25 μg/L Note: pH of 9 in experimental pond reduced persistence of carbofuran by increasing the rate of hydrolysis (Chapman and Cole 1982)	Taxa assessed at 5, 11, 32, 55 days post application	No detectable reductions to abundance or biomass of taxa from 5 μg/L; *H azteca*: 10% reduction in abundance; 6% reduction in biomass Chironominae: 77% dead in 48-72 h dip net samples compared to 0% dead in control and 5 μg/L treatment; biomass reduced by 17% at 55 d; evidence that younger larvae were less sensitive than older larvae; No detectable reductions in remaining taxa	(Wayland 1991)
carbofuran	Aquatic invertebrate community in rice fields: ostracada, copepod, cladocera, mosquito larvae, chironomid larvae	Abundance of ostracada, copepod, cladocera, mosquito larvae, chironomid larvae	0.1 kg carbofuran/ha-applied once 0.3 kg carbofuran/ha applied in two regimes: 3, 52, 85, 97 days; 16, 57, 69 days	variable application intervals and frequencies	Ostracada: timing and magnitude of peak abundances not affected by carbofuran, multiple application regimes of 0.3 k/ha significantly reduced abundance compared to one application of 0.1 kg/ha Copepods: significant reductions at 45 and 57 d at 0.3 kg/ha. Cladoceran: rate of population growth significantly affected from 52 and 85 days at 0.3 kg/ha. Abundance lower at 0.1 kg/ha compared to 0.3 kg/ha. Chironomid larvae: isolated significant differences in abundances were found (P<0.05), but showed no dose-response relationship Mosquito larvae: No change in abundances	(Simpson, Roger et al. 1994)

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
carbofuran	*Cerodaphnia dubia* (daphnids)	Survival (24 and 48 h LC50s); survival from mixture of carbofuran and methylpararthion (48 h LC50); Mean young per female and percent survival from 7 day chronic assays	Irrigation field-collected water samples (toxicity identification evaluations employed) Mixture toxicity (1:1, 3:1, 1:3 ratios tested) 0.16, 0.33, 0.65, 1.3, 2.6 μg/L	24, 48 hours 7 days	Carbofuran and methyl-parathion putative agents of toxicity in field-collected samples from CA rice drain. Carbofuran acute toxicity: 24 h LC50 3.4 μg/L (95% CI 2.8-4.3; 48 h LC50 2.6 μg/L (95% CI NA); chronic study- NOEC 1.3 μg/L; LOEC at 2.6 μg/L Strict additive toxicity of combinations tested of carbofuran and methyl-parathion.	(Norberg-King, Durhan et al. 1991)
carbofuran	*Chironomus tentans* (midge)	Survival in spiked-sediments, mixed with atrazine, and field-collected runoff	Spiked sediment concentrations: 25, 45, 83, 150 μg/kg; Mixture concentrations: 25, 45, 80 μg/kg carbofuran + 5, 10, 20 mg/kg atrazine; Field collected sediments in runoff: collected sediments in runoff: 186 μg/kg sediment-associated 73 μg/L pore water	10 days	Spiked sediment results: Nominal [carbofuran] LC50 47.9 μg/kg (95% CI 43.9-52.1); Sediment bound LC50 20.9 μg/kg (95% CI 18.4-33.2); Interstitial water LC50 11.8 μg/L (95% CI 10.9-17.1) Mixture results: Additive toxicity present with atrazine + carbofuran, no synergistic or antagonistic toxicity responses. Atrazine affected survival in the low mg/kg range. Field collected sediments in runoff: No chironomids survived exposure, note control survival was low (57%)	(Douglas, McIntosh et al. 1993)
carbofuran	*Chorophium volutator* (estuarine amphipod)	Survival and avoidance behavior in contaminated spiked sediments	2.5, 25, 250 ng/g (dry weight sediment)	48 and 96 h exposures	48 h LC 50 = 73 ng/g (95% CI 0-128); 48 h LC20 = 41 (95% CI 2-82) ng/g; no effect on avoidance behavior of sediment	(Hellou, Leonard et al. 2009)

Chemical	Taxa/species	Assessment measures	Concentrations tested	Exposure duration	Effects	Data source
carbofuran	*Daphnia magna* (daphnid) *Hydra attenuate* (fw jellyfish) *Macrobrachium rosenbergii* (fw shrimp) Aquatic macroinvertebrate community	Survival (acute LC50); macroinvertebrate community structure	Average concentrations detected 5 d post application 0.7 and 0.16 μg/L maximum carbofuran detection 2.1 μg/L	24 , 48, 72, 96 h exposures to field collected water samples	No acute toxicity reported to tested species. Significant reduction of % EPT taxa and increase in community loss indices at treated sites. Mayflies were primary affected species from carbofuran applications	(Castillo, Martinez et al. 2006)
carbofuran	*Ceriodaphnia dubia (daphnid)* *Neomysis mercedi(* mysid*)* *Pimephales promelas (*fathead minnow*)*	Survival (% mortality)	Not reported; conducted toxicity identification evaluations (TIE)	96 h exposures to field collected water samples	3/47 irrigation samples had 100% toxicity to *C. dubia* attributed to carbofuran	(de Vlaming, DiGiorgio et al. 2004)
carbofuran	Wetland invertebrate aquatic community*:* *Daphnia magna,* *Chironomus riparius*	Survival (EC50) Primary productivity	10, 100, 1,000 μg/L water only 48 h test; 10, 100, 1,000 μg/L mixed with soil and added to microcosms	48- hr; 30 day microcosm test	*D. magna* EC50 = 48 μg/L *C. riparius* EC50 = 56 μg/L Populations of *D. magna* were viable at day 1 in 10 and 100 μg/L, it took 4 d for a viable population (*i.e.,* 5 or more live daphnids) to establish at 1000 μg/L . No dead daphnids or chironomids observed at 14 d and 30 d. No effects to microbial community enzyme activity were found.	(Johnson 1986)

Studies with other AChE inhibitors on salmonid prey items:

Robust evidence shows that salmonid prey taxa and communities can be substantially reduced following exposures to the OP insecticides chlorpyrifos, diazinon, and malathion. NMFS reviewed these data and presented its findings in a biological opinion (NMFS 2007d). We use these findings to show the types of aquatic community responses following exposures to AChE inhibiting insecticides. The toxic potency of a pesticide is a function of concentration and duration of exposure, which in turn is a function of a pesticide's physical properties and interactions of the pesticide with environmental variables such as temperature, pH, sunlight, soil micro-organisms, etc. With this in mind, if carbaryl, carbofuran, and methomyl are at concentrations individually (or together in mixtures) expected to reduce salmonid prey communities, we infer a similar magnitude of response (reductions in abundance from death and catastrophic drift) and similar recovery period for those observed in affected aquatic communities treated with OP insecticides.

We note that individual aquatic invertebrates exhibiting adverse sublethal responses from carbamates will likely recover much more quickly than those exposed to OPs (Kallander, Fisher et al. 1997). The midge, *Chironomus tentans*, showed complete recovery of AChE activity in 24 h following two 1 h pulses of carbaryl separated by 24 h. Additionally, two, 1 h pulses of carbamates (carbaryl, carbofuran, aldicarb, propoxur) caused significantly fewer symptoms of intoxication than 2 h of continuous exposure when chironomids were given 2 to6 h of recovery in clean water between doses (Kallander, Fisher et al. 1997). In contrast, sublethal exposures to OPs were equally toxic when exposures are either pulsed or continuous.

Reviews of field, mesocosm, and microcosm studies with the three OPs document reductions in aquatic invertebrate populations and lengthy recovery times for populations of some taxa (Giesy, Solomon et al. 1998; Van Wijngaarden, Brock et al. 2005). A recent study found significant changes to macroinvertebrate assemblages of artificial stream systems following a 6 h exposure to chlorpyrifos at 1.2 μg/L (Colville, Jones et al. 2008). The addition of chlorpyrifos to the artificial streams resulted in a rapid (6 h) change in the macroinvertebrate assemblages of the streams, which persisted for at least 124 d after dosing (Colville, Jones et al. 2008). The chlorpyrifos dissipated from the system within 48 h (Pablo, Krassoi et al. 2008), however the

macroinvertebrate community did not recover rapidly. Several species similar to salmonid prey items were significantly affected.

Zooplankton and insect taxa appeared the most sensitive in studies with diazinon. In particular, the salmonid prey taxa Trichoptera, Diptera, and Cladocera were highly sensitive (Giddings, Hall et al. 2000). Field studies in salmonid habitat also show reductions in salmonid prey abundances. For example, in listed steelhead habitat in the Salinas River, California, abundances of the salmonid prey items including mayfly taxa, daphnids, and an amphipod (*Hyalella azteca*) were significantly reduced downstream of an irrigation return drain compared to upstream (Anderson, Hunt et al. 2003; Anderson, Hunt et al. 2003; Anderson, Phillips et al. 2006). Diazinon and chlorpyrifos were detected above acute toxicity thresholds in surface waters and sediments. Combined toxicity of the two OPs using a toxic unit approach correlated strongly with mortality of daphnids. For *H. azteca*, acute toxicity was attributed to sediment pore-water concentrations of chlorpyrifos (Anderson, Hunt et al. 2003). Other pesticides, including carbaryl, were likely present and responsible for some of the toxicity in the Salinas River,. In a subsequent study on the Salinas River, TIE demonstrated that chlorpyrifos and diazinon were responsible for the observed death of the daphnid *C. dubia* (Hunt, Anderson et al. 2003). These data support the line of evidence that field concentrations of OPs can and do adversely affect aquatic invertebrates in salmonid habitats. It is reasonable to assume that the same situation occurs with carbamates, given the toxicity of the compounds and the similar mode of action.

Adjuvant toxicity

Assessment endpoints: Survival of fish and aquatic prey items, endocrine disruption in fish

Assessment measures: 24, 48, 96 h LC50s, and vitellogenin levels in fish plasma

Although no data were provided in the BEs related to adjuvant toxicity, an abundance of toxicity information is available on the effects of the alkylphenol polyethoxylates, a family of non-ionic surfactants used extensively in combination with pesticides as dispersing agents, detergents, emulsifiers, adjuvants, and solubilizers (Xie, Thrippleton et al. 2005). Two types of alkylphenol polyethoxylates, NP ethoxylates and octylphenol ethoxylates, degrade in aquatic environments to the more persistent, toxic, and bioaccumulative degradates, NP and octylphenol, respectively. We note that the technical registrant of methomyl stated that no nonylphenol ethoxylates are used within methomyl formulations. We did not receive information on the presence or absence

of alkylphenol polyethoxylates in carbaryl- or carbofuran- containing formulations. Adjuvants are frequently mixed with formulations prior to applications, so although they may not be present in the formulations they could still be co-applied. Below we discuss NP's toxicity as an example of potential adjuvant toxicity, as we received no information on adjuvant use or toxicity within the BEs.

We queried EPA's ECOTOX online database and retrieved 707 records of nonylphenol's (NP) acute toxicity to freshwater and saltwater species. The lowest reported LC50 for a salmonid was 130 μg/L for Atlantic salmon. Aquatic invertebrates, particularly crustaceans, were killed at low concentrations of NP, with the lowest reported LC50 = 1 μg/L for *H. azteca*. These data indicate that a wide array of aquatic species are killed by NP at μg/L concentrations. We also queried EPA's ECOTOX database for sublethal toxicity and retrieved 689 records of freshwater and saltwater species tested in chronic experiments. The lowest fish LOEC reported was 0.15 μg/L for fathead minnow reproduction. Numerous fish studies reported LOECs at or below 10 μg/L. Additionally, salmonid prey species are sensitive to sublethal effects of NP at low μg/L concentrations. The amphipod, *Corophium volutator*, grew less and had disrupted sexual differentiation (Brown, Conradi et al. 1999). Multiple studies with fish indicated that NP disrupts fish endocrine systems by mimicking the female hormone 17β-estradiol (Brown and Fairchild 2003; Arsenault, Fairchild et al. 2004; Madsen, Skovbolling et al. 2004; Jardine, MacLatchy et al. 2005; Luo, Ban et al. 2005; McCormick, O'Dea et al. 2005; Segner 2005; Hutchinson, Ankley et al. 2006; Lerner, Bjornsson et al. 2007; Lerner, Bjornsson et al. 2007). NP induced the production of vitellogenin in fish at concentrations ranging from 5-100 μg/L (Hemmer, Bowman et al. 2002; Ishibashi, Hirano et al. 2006; Arukwe and Roe 2008; Schoenfuss, Bartell et al. 2008). Vitellogenin is an egg yolk protein produced by mature females in response to 17-β estradiol, however immature male fish have the capacity to produce vitellogenin if exposed to estrogenic compounds. As such, vitellogenin is a robust biomarker of exposure. A retrospective analysis of an Atlantic salmon population crash suggested the crash was due to NP applied as an adjuvant in a series of pesticide applications in Canada (Fairchild, Swansburg et al. 1999; Brown and Fairchild 2003). Additionally, processes involved in sea water adaptation of salmonid smolts are impaired by NP (Madsen, Skovbolling et al. 2004;

Jardine, MacLatchy et al. 2005; Luo, Ban et al. 2005; McCormick, O'Dea et al. 2005; Lerner, Bjornsson et al. 2007; Lerner, Bjornsson et al. 2007).

These results demonstrate NP is of concern to aquatic life, particularly salmonid endocrine systems involved in reproduction and smoltification. This summary is for one of the more than 4,000 inerts/other ingredients and adjuvants currently registered for use in pesticide formulations and there are likely others with equally deleterious effects. Unfortunately we received minimal information on the constituents found in carbaryl-, carbofuran-, and methomyl-containing formulations. Consequently, the effects that these other ingredients may have on listed salmonids and designated critical habitat remain an uncertainty and are a recognized data gap in EPA's action under this consultation.

Summary of Response Analysis:

We summarize the available toxicity information by assessment endpoint in Table 66. Data and information reviewed for each assessment endpoint was assigned a general qualitative ranking of either "low", "medium", or "high." To achieve a high confidence ranking, the information stemmed from direct measurements of an assessment endpoint, conducted with a listed species or appropriate surrogate, and was from a well-conducted experiment with stressors of the action or relevant chemical surrogates. A medium ranking was assigned if one of these three general criteria was absent and low ranking was assigned if two criteria were absent. Evidence of adverse effects to assessment endpoints for salmonids and their habitat from the three a.i.s was prevalent. However, much less information was available for other ingredients, in part, due to the lack of formulation information provided in the BEs as well as the statutory mandate under FIFRA for toxicity data on the a.i.s to support registration. We did locate a substantial amount of data on one group of adjuvants/surfactants, the NP ethoxylates. However, we received and located minimal information for the majority of tank mixes and other ingredients within formulations.

Table 66. Summary of assessment endpoints and effect concentrations

Assessment Endpoint	Evidence of adverse responses (yes/no)	Concentration range of observed effect or concentrations tested showing absence of effect (µg/L)	Degree of confidence in effects (low, medium, high)
Carbaryl			
Fish:			
-survival (LC50)	yes	250-4,500	high
-growth	no	8,17,62,210, 680	medium
-reproduction	yes	680	medium
-swimming	yes	10-12,500	high
-olfactory-mediated behaviors	no	5, 50, 500	high
Habitat: -prey survival (LC50)	yes	1.5-35[1]	high
Carbofuran			
Fish:			
-survival (LC50)	yes	88-3,100	high
-growth	yes	56.7	medium
-reproduction	yes	6	low
-swimming	yes	5, 100	medium
-olfactory-mediated behaviors	yes	1-200	high
Habitat: -prey survival (LC50)	yes	1.6[2]-2,700	high
Methomyl			
Fish:			
-survival (LC50)	yes	300-7,700	high
-growth	yes	142, 243	medium
-reproduction	no	31-500	low
-swimming	-	-	-
-olfactory-mediated behaviors	-	-	-
Habitat: -prey survival (LC50)	yes	8.8-920	high
Other ingredient:			
Nonylphenol (NP)			
Fish:			
-survival (LC50)	yes	130 - >1,000	high
-reproduction	yes	0.15 - 10	high
-smoltification	yes	5 - 100	medium
-endocrine disruption	yes	5.0 – 100	high
Habitat: -prey survival (LC50)	yes	1- >1,000	high
Additive toxicity of *N*-methyl carbamates	yes	multiple	high
Synergistic toxicity of *N*-methyl carbamates	yes	multiple	high

[1] reported 48 h EC50s of *D. magna* are low and high values of the range (Takahashi and Hanazato 2007)
[2] 48 h survival EC50 of *Chironomus tentans* (Karnak and Collins 1974)

Risk Characterization

In this section we integrate our exposure and response analyses to evaluate the likelihood of adverse effects to individuals, populations, species, and designated critical habitat (Figure 38). We combined the exposure analysis with the response analysis to: 1) determine the likelihood of salmonid and habitat effects occurring from the stressors of the action; 2) evaluate the evidence presented in the exposure and response analyses to support or refute risk hypotheses; 3) translate fitness level consequences of individual salmonids to population-level effects; and 4) translate habitat-associated effects to potential impacts on PCEs of critical habitat. The risk characterization section concludes with a general summary of species responses from population-level effects. We then evaluate the effects to specific ESUs and designated critical habitat in the *Integration and Synthesis* section.

Figure 38. Schematic of the Risk Characterization Phase

Exposure and Response Integration

In Figures 39-41, we show the overlap between exposure estimates for the three carbamates and concentrations that affect assessment endpoints. The figures show the exposure concentration ranges (minimum – maximum values) gleaned from the three predominant sources of exposure data we analyzed: monitoring data; EPA's estimates presented in the BEs that represent crop uses; and NMFS' modeling estimates for off-channel habitats. None of the modeled exposure estimates were derived for non-crop use. This is a major data gap as carbaryl is used extensively in urban and residential areas. The effect concentrations are values taken from the toxicity data reviewed in the *Response Analysis Section*. With respect to the assessment endpoint survival, recall that the effect concentrations are LC50s, thus death of sensitive individuals is not represented by this metric and can occur at concentrations well below LC50s. Additionally, we cannot accurately predict at what concentrations death first occurs because dose-response slope information was generally not provided for most of the acute lethality studies. Although we are unable to determine at what concentration an individual organism might die, we do incorporate survival endpoints from acute 96 h studies using a default slope in a population modeling exercise discussed below. This slope is recommended by EPA when more relevant information is unavailable (EPA 2004). Where overlap occurs between exposure concentrations and effect concentrations NMFS explores the likelihood of adverse effects. If data suggest exposure exceeds adverse effects thresholds, we discuss the likelihood and expected frequency of effects based on species information and results of the exposure and response analyses.

This is a coarse analysis because it does not present temporal aspects of exposure nor does it show the distribution of toxicity values. However, it does allow us to systematically address which assessment endpoints are affected from carbaryl, carbofuran, and methomyl exposure. Where significant uncertainty arises, NMFS highlights the information and discusses its influence on our inferences and conclusions. We discuss the uncertainties related to these endpoints under associated risk hypotheses later in this section.

Carbaryl

Concentration ranges overlap with most of the assessment endpoint ranges indicating that adverse effects are expected in salmonids if exposed for sufficient durations (Figure 39). Prey

survival appears to be the most sensitive endpoint as all three ranges encompass this endpoint and the maximum concentration values far exceed the prey survival range. Swimming is likely impaired at the higher end of the concentration range from monitoring data, at the middle and higher range from EPA estimates, and throughout the range predicted in the off-channel habitat estimates. Concentrations occurring in the off-channel habitats that NMFS modeled will kill juvenile salmonids. Furthermore, given the LC50 values for salmonids following 96 h exposures, we expect that fewer deaths of juveniles will occur in many of the freshwater habitats exposed to carbaryl. Fish reproduction (based on a single fathead minnow study) would be affected by concentrations in the off-channel habitat. We also note minimal data exist on effects to fish growth: only a single study with fathead minnows. We expect that carbaryl will impair swimming of salmonids, kill salmonid prey, and in certain circumstances kill salmonids when exposed for sufficient durations. The effect concentrations shown in the figure do not account for the potential enhanced toxicity of carbaryl to salmonids or their prey items in aquatic habitats where other AChE inhibitors are present. We also note that pH is a major factor in carbaryl's persistence in aquatic habitats. At pHs above 8, carbaryl breaks down fairly rapidly (half-life of 24 h) while at pHs less than 8 carbaryl is much more resistant to hydrolysis (half-life of 1- 30 d for pH of 7.9 – 5.7). The pH of natural surface waters commonly ranges from 7 to 9, thus pH is an important consideration when evaluating toxicity of carbaryl.

Figure 39. Carbaryl exposure concentrations and salmonid assessment endpoints' effect concentrations in µg/L

Carbofuran

Concentration ranges overlap with most of the assessment endpoint ranges, indicating that adverse effects are expected in salmonids if exposed for a sufficient duration (Figure 40). Salmonid prey items appear just as sensitive to carbofuran as to carbarylalthough significant variation among prey species was observed in reported acute survival EC/LC 50s. Fish reproduction, swimming and salmonid olfactory-mediated behaviors are encompassed or exceeded by all three exposure ranges. The fish growth value (56 µg/L LOEC) was exceeded by the off-channel habitat concentrations. Salmonid survival was the least sensitive response reviewed. As with carbaryl, concentrations of carbofuran occurring in the off-channel habitats that NMFS modeled will kill juvenile salmonids. Furthermore, given the LC50 values for salmonids following 96 h exposures, we expect that fewer deaths of juveniles will occur in many of the freshwater habitats exposed to carbofuran. As with carbaryl, we note that pH is a major

factor in the degree of toxicity of carbofuran. At pHs above 9, carbofuran breaks down fairly rapidly (half-life of 0.8-15 h) while at pH 7 reported half-lives range from 2- 28 d. Therefore, pH is an important consideration when evaluating toxicity of carbofuran in the aquatic environment. We discuss these effects and other considerations in more detail under the risk hypotheses.

Figure 40. Carbofuran exposure concentrations and salmonid assessment endpoints' effect concentrations in µg/L

Methomyl

We expect a portion of fish to be exposed to upper end concentrations which would overlap with most of the effect thresholds. (Figure 41). As with carbaryl and carbofuran, prey survival was the most sensitive endpoint assessed. More sensitive prey, with EC50s at the lower end of the

distribution, are expected to die based on all three exposure estimate ranges, with the highest rates of mortality based on EPA estimates and NMFS' off-channel habitat estimates. The magnitude of reduction in prey abundance will depend on which taxa are present in the exposed water body and the actual concentrations and exposure durations. If reductions in prey abundance, especially of the smaller organisms, coincide with fry feeding for the first time following yolk sac absorption, starvation is likely. We discuss this in greater detail in the risk hypotheses below. The lower value of the fish reproduction endpoint, 31 µg/L, overlapped with both EPA's and NMFS' off-channel habitat estimates, and the highest value in the monitoring data was greater. A notable data gap is the absence of information on methomyl's toxicity to olfactory-mediated behaviors. Although we found no studies that evaluated swimming, we expect swimming impairment at concentrations less than LC50s because swimming is impaired with other AChE inhibitors and AChE inhibition correlates to impaired swimming (Little and Finger 1990; Little, Archeski et al. 1990).

Figure 41. Methomyl exposure concentrations and salmonid assessment endpoints' effect concentrations in µg/L

Relationship of pesticide use to effects in the field

Schulz (2004) reviewed 45 field and *in situ* studies published in peer-reviewed journals (from 1982-2003) that evaluated relationships between insecticide contamination and biological effects in freshwater aquatic ecosystems and included invertebrates and fishes. For each study, the authors classified the relationship of exposure to effect in one of four categories: no relation, assumed relation, likely relation, and clear relation based on the cited authors' judgment of their own results. A relationship was classified as clear only if the exposure was quantified and the effects were linked to exposure temporally and spatially. The review concluded that "about 15 of the 42 studies revealed a clear relationship between quantified, non-experimental exposure and observed effects *in situ*, on abundance [aquatic invertebrate], drift, community structure, or dynamics" (Schulz 2004). Although the top three insecticides most frequently detected at levels

expected to result in toxicity were chlorpyrifos (OP), azinphos-methyl (OP), and endosulfan, the *N*-methyl carbamates carbaryl, carbofuran, oxymyl, and fenobucarb all showed clear, likely or assumed relationships between exposure and effect (Schulz 2004). No studies involving methomyl were evaluated. It should be noted that these studies were not designed to establish effect thresholds and in our review, are not sufficient to define thresholds. However, the data do provide information on concentrations of insecticides known to cause biological and ecological effects under field conditions.

Schulz (2004) noted that for all of the studies "that seem to establish a clear link between exposure and effect, the pesticide concentrations measured in the field were not high enough to support an explanation of the observed effects simply based on [laboratory bioassays] acute toxicity." Some authors have suggested differences in field measured exposure and actual organismal exposure (aquatic, sediment, dietary; environmental variables that affect exposure) as a reason for higher mortalities *in situ* than predicted by laboratory toxicity data. Schulz concluded that on the basis of present knowledge, it cannot be determined whether the measured concentration in the field regularly underestimates the actual exposure or if a general difference between the field and laboratory reactions of aquatic invertebrates is responsible; both are reasonable assertions. The review by Schulz shows a body of evidence that natural aquatic ecosystems can be adversely affected by AChE inhibitors including carbaryl and carbofuran. We expect a similar relationship for methomyl because it shares the same mechanism of action as carbaryl and carbofuran (AChE inhibition) and concentrations that lead to death of aquatic invertbrates are similar to carbaryl and carbofuran.

We reviewed multiple studies that showed direct, adverse effects to salmonid prey species following exposures to *N*-methyl carbamates (Table 67). These included reduction in individual aquatic species, changes in community abundance, richness, and diversity with salmonid prey items.

Table 67. . Examples of published field studies designed to establish a relationship between *N*-methyl carbamate contamination of aquatic habitats and agricultural practices (adapted from Table 2 in Schulz 2004).

Source	Concentration µg/L	Duration	Endpoint	Species	Relationship of exposure and effect
Carbaryl					
Aerial application	0.1-85.1	24	aquatic invertebrate Drift	Various invertebrates	Likely
Carbofuran					
	0.05-26.8	Few hours	mortality	Amphipod (*Gammarus pulex*)	Clear

Field studies in ESA-listed salmonid habitats with other AChE inhibitors

A group of field studies evaluated macroinvertebrate community responses in the orchard-dominated Hood River Basin, Oregon and correlated results with chlorpyrifos and azinphos-methyl use and detections (Grange 2002, St. Aubin 2004, Van der Linde 2005). Hood River Basin contains several listed anadromous salmonids, including lower Columbia River steelhead. The goals of the studies were to determine whether in-stream OPs affected steelhead AChE activity and changed the aquatic macroinvertebrate community. An additional objective addressed how changes in macroinvertebrate community might affect salmonid growth. A suite of reference and orchard-dominated sampling sites within the Hood River Basin were sampled pre and post the two primary application seasons, spring (chlorpyrifos) and summer (azinphos-methyl). Significant differences in macroinvertebrate community assemblages were found between upstream reference sites and downstream agricultural sites (St. Aubin 2004), similar to the results described in a California stream (Hall, Killen et al. 2006). However, no significant differences were found at each individual site, before and after summer spraying (St. Aubin 2004). Therefore, the second Hood River study investigated the spring spray events as well as the summer spray events to determine seasonal effects (Van der Linde 2005). Sharp declines in species abundance between reference sites and downstream sites during the spring-spray period correlated to chlorpyrifos applications and subsequent aquatic detections (one site over an 8 d period showed chlorpyrifos ranging from 0.032 -0.183 µg/L). There were more pollutant tolerant taxa and less intolerant taxa at the agricultural sites (Van der Linde 2005). Collector-gatherer species, many of which are salmonid prey items, declined rapidly at agricultural sites

compared to abundances at the reference sites following applications. Interestingly, reductions in biodiversity in 2001 agricultural sites compared to reference sites was not seen in 2002 (Van der Linde 2005). The authors commented that diversity metrics do not always behave consistently or predictably in response to environmental stress. More than two years of data are likely needed to more sufficiently address community variability at this site.

Two sets of field experiments directly investigated juvenile steelhead (hatchery- reared) AChE activity from caged-fish studies in an agricultural basin in Hood River Basin, OR (Grange 2002; St. Aubin 2004). The studies analyzed water samples for chlorpyrifos, azinphos-methyl, and malathion before, during, and after orchard spray periods. One of the studies also monitored the aquatic invertebrate community's response (discussed later under prey effects) in conjunction with the AChE inhibition (St. Aubin 2004). Steelhead from reference sites had statistically significantly greater AChE activity than steelhead from orchard-dominated areas. The reductions in AChE activity corresponded to the application seasons and detections of chlorpyrifos and azinphos-methyl insecticides.

The data from one study indicated that OP-insecticides inhibited AChE activity in steelhead held in cages in the Hood River Basin and this inhibition correlated to chlorpyrifos and azinphos-methyl detections and to a lesser degree with malathion detections (Grange 2002). None of the pesticides were detected at reference sites and both chlorpyrifos (range in maxima of (0.077-0.196 µg/L) and azinphos-methyl were frequently detected at orchard stream and river sites. AChE activity was inhibited up to 21% in smolts, and 33% in juveniles relative to reference locations. Temperature was a confounding factor as lower temperatures showed lower AChE activity while higher temperatures showed higher AChE activity at reference sites. The authors normalized data to temperature and found a greater number of statistically significant reductions in AChE in steelhead. Study results show that steelhead in these systems exposed to OP insecticides lose AChE activity (up to 33%) which, depending on the percentage of inhibition, can manifest into fitness level consequences (Grange 2002; St. Aubin 2004).

The field studies conducted in Hood River Basin, Oregon show that salmonids' AChE activity was reduced in streams near orchards during chlorpyrifos and azinphos-methyl applications.

Additionally, the macroinvertebrate communities in these systems were compromised to such an extent that there was a reduction in salmonid prey abundance. These findings highlight the importance of characterizing the presence of AChE insecticides, *N*-methyl carbamates and OPs, within aquatic habitats because the compounds share a mode of action and adverse biological responses to mixtures containing multiple AChE insecticides are likely cumulative. These data can serve as a surrogate for expected effects of the aquatic community when concentrations of carbaryl, carbofuran, and methomyl attain effect thresholds.

Field studies in ESA-listed salmonid habitats: Willapa Bay and Grays Harbor Washington

History of Carbaryl use in Washington estuaries

Willapa Bay and Grays Harbor support large commercial oyster-producing areas (approximately 600 acres in Willapa and 200 acres in Grays Harbor) and are located north of the Columbia River along the southwestern coast of Washington. The Pacific oyster (*Crassostrea gigas*), introduced from Japan in the 1920s, is the principal species cultivated in those estuaries (Feldman, Armstrong et al. 2000). Two species of endemic shrimp, ghost shrimp (*Neotrypaea californiensis*) and mud shrimp (*Upogebia pugettensis*), are abundant in the oyster growing areas of these estuaries and create burrows in the sediment that are unfavorable for optimal oyster cultivation. The Washington State oyster industry has used aerial applications of carbaryl to kill the burrowing shrimp in oyster beds since the early 1960s. EPA authorizes the use of carbaryl on oyster beds in Washington through a SLN label, or Section 24(c) (EPA Reg. No. 264-316). Carbaryl is applied directly to intertidal areas when they are exposed at low tide, primarily by helicopter (Dumbauld, Brooks et al. 2001). This use has been controversial and there have been numerous studies dating back several decades that evaluated the ecological impact of carbaryl use in these two estuaries (Feldman, Armstrong et al. 2000). Although the EPA label does not limit applications to Willapa Bay and Grays Harbor, historically these have been the only areas treated with carbaryl. Additionally, Washington State requires applicators to obtain NPDES permits for applications to aquatic habitats.

ESA-Listed Pacific salmonids that occur in Willapa Bay and Grays Harbor

Juvenile and adult Chinook salmon from ESA-listed populations are expected to be present in Willapa Bay and Grays Harbor at the time of carbaryl applications. It is expected that juvenile

Chinook salmon from the Lower Columbia River use these estuaries during the period when carbaryl is applied based on their behaviors (Personal communication Eduardo Casillas NMFS 2/18/2009, Anne Shaffer WDFW 3/04/2009, and Thom Hooper NMFS, 2/12/2009). Specifically, their use of dendritic channels to access inundated mud flats suggests juvenile Chinook salmon will be exposed to peak carbaryl concentrations in the water column and also from feeding on live and dead contaminated prey. Also, recent information (six years of coastline surveys) shows that juvenile Columbia River Chinook salmon "bounce" north along the Washington coastline and south along the Oregon coastline in the nearshore surf zones (Personal communication Eduardo Casillas NMFS 2/18/2009) and have been found occupying nearshore habitats as far North as the Strait of Juan de Fuca (Shaffer, Crain et al. submitted). In one study, juvenile Chinook salmon captured along the coast Washington State were genetically analyzed to determine natal river origins. Of the fish collected for genetic analysis, 45% of juvenile Chinook salmon collected in Crescent Bay, 75% of those in Freshwater Bay, and 60% of those in Pysht Bay were from ESA-listed stocks of the Columbia River (Shaffer, Crain et al. submitted).

DNA analysis revealed that adult salmonids harvested in Willapa Bay in July and August, when carbaryl is typically applied, include several ESA-listed species: Lower Columbia River Chinook salmon, California Coastal Chinook salmon, Puget Sound Chinook salmon, and Snake River Fall-run Chinook salmon (Kassler and Marshall 2004). Given this information we also expect these same species of Chinook salmon will be present in Grays Harbor as Grays Harbor is located just north of Willapa Bay. Further, we expect adults of these stocks may be exposed to carbaryl given that they occupy the estuary during the application periods and oyster plots occur throughout the Bay. It is possible that chum salmon from the Columbia River also occur in the Willipa Bay and Grays Harbor estuaries. However, we are unaware of documentation of their occurrence at those locations, and unlike juvenile Chinook salmon from the Columbia River, juvenile chum have not been found in recent sampling efforts of nearshore surf zones. We therefore conclude that Columbia River ESA-listed chum are unlikely to be present in Willapa Bay or Grays Harbor.

Measured Concentrations in Willapa Bay and Grays Harbor following Carbaryl Applications

Numerous monitoring studies have been conducted in coordination with applications of carbaryl to control burrowing shrimp in commercial oyster beds in Washington State. The results of the studies are quite variable, as are the study designs and objectives. Several investigations have documented water column concentrations exceeding several mg/L (which is substantially higher than the µg/L concentrations observed in freshwater aquatic habitats) following the first flood tide post-application (Hurlburt 1986; Creekman and Hurlburt 1987; Tufts 1989; Tufts 1990). Water column concentrations measured at Willapa Bay in 1984 detected a mean concentration of 10.6 mg/L upon initial flooding of the treated area (Hurlburt 1986). Concentrations were monitored at varying depths for several hours following flooding. The concentrations decreased rapidly but were detectable in the low µg/L range throughout sampling. In 1985 samples were collected along transects from treated areas following the direction of the tide to monitor the dispersal of carbaryl (Creekman and Hurlburt 1987). The data indicate that carbaryl is transported off the treated area by the tide. Average concentrations measured above the treated area ranged from 2.4 – 5.5 mg/L. The highest average concentration (7.9 mg/L) was collected 510 ft from the treated area. Average concentrations at the most distant sampling point (650 ft from initial treated area) were 2.5 mg/L. In 1996, further study evaluated carbaryl movement off the treated spray area (Tufts 1989). Samples were collected along a transect corresponding to the direction of the incoming tide. The peak concentration measured was 27.8 mg/L. Over one treated area, the concentration of carbaryl decreased from 13.2 mg/L to 9.3 mg/L as the water depth increased from 1.5 to 10 inches. The concentration further decreased to 600 µg/L when the water rose to 16 inches. The monitoring indicated concentrations of carbaryl decreased with increasing distances along the transect, but concentrations greater than 1 mg/L were detected in several instances at distances several hundred feet from treated plots. Carbaryl was found in the water column at the detection limit (0.1 mg/L) as far as 1,725 ft from the treated area.

In 1987, surface water monitoring was conducted in Willapa Bay to determine "the dilution pattern of carbaryl washed from sprayed oyster beds, and to determine carbaryl concentrations in shallow pools and streams where marine fish might be found" (Tufts 1990). Carbaryl concentrations in the mg/L range were frequently detected with the incoming tide. Peak concentration for one sample site was 18.8 mg/L upon initial flooding. The concentrations

decreased to 0.2 mg/L when covered by 18 inches of water. Concentrations of carbaryl were variable among sites. For example, at one of the sampling sites carbaryl was not detected until the water was 7 inches deep. A peak concentration of 8 mg/L was detected at this site when the water depth was 11 inches. This sample station was located 300 ft from a treated area. Maximum carbaryl concentrations detected at other sites were 17.4, 7.8, and 4 mg/L with samples collected at depths of 6, 4, and 13 inches from the bottom. Carbaryl's primary toxic degradate, 1-naphthol, was detected at concentrations as high as 1.4 mg/L. Average concentrations of carbaryl detected in tide pools and small streams ranged from 3.6 to 11.2 mg/L. The 11.2 mg/L detection was associated with application of 5 lbs carbaryl/acre. An average concentration of 7.8 mg/L in tide pools and streams was associated with an application rate of 4 lbs carbaryl/acre, approximately half the maximum rate allowed. Similarly, a more recent study found a peak of 820 µg/L in the water column 50 ft from the application site following a typical treatment application at the maximum rate of 8 lbs/acre (n=3) (Weisskopf and Felsot 1998).

Several studies demonstrate that carbaryl dissipates fairly rapidly from over the treatment site due to degradation, metabolism, dilution, and off-site transport (Hurlburt 1986; Creekman and Hurlburt 1987; Tufts 1989; Tufts 1990; Weisskopf and Felsot 1998). In 2006 and 2007, samples collected at the mouth of channels adjacent to treated oyster beds in Willapa Bay had maximum concentrations of 29.1 µg/L after 6 h (high tide), 38 µg/L after 12 h (low tide), and 21.1 µg/L after 24 h (low tide) (Major, Grue et al. 2005).

The NPDES permit for Willapa Bay and Grays Harbor requires annual monitoring of water column concentrations in treated areas. It specifies an acute effluent limit of 3 µg/L and a chronic limit of 0.06 µg/L. However, those data are of highly questionable value because the monitoring plan specifies that monitoring is suspended for the first 48 h following application to assess the acute effluent, and further suspends monitoring for 30 days from the last application to assess the chronic limit. We expect that most of the carbaryl will be degraded and transported to other locations by the time carbaryl monitoring is initiated.

Carbaryl sprayed on mud flats can be transported substantial distances at concentrations that may have ecological impacts. Researchers found that close to 100% of Dungeness crabs were killed

up to 100 m off the carbaryl application area (Doty, Armstrong et al. 1990). Levels decrease to below 1 mg/L when transported more than 200m or more. Washington DOE reports that carbaryl concentrations in the "potential effects threshold range" of 0.1-0.7 µg/L have been detected at locations several miles from oyster beds soon after large areas were treated (Johnson 2001).

Measured Concentrations in Invertebrates

Samples of crustaceans from carbaryl treated areas in 1984 showed high tissue levels (Table 68). A single ghost shrimp and Dungeness crab were analyzed and contained concentrations of 24.9 and 41.9 mg/kg (ppm), respectively (Hurlburt 1986). Analysis of dead shrimp in 1985 following treatment at 7.5 lbs carbaryl/acre revealed average concentrations of approximately 4.5 mg/kg. When left on the treated oyster beds the concentrations declined to approximately 10% of the initial concentration 24 h post-treatment, then remained relatively stable at the 48, 72, and 96 h sampling events. Concentrations in shrimp and annelid worms were investigated following the 1985 applications and associated with different application rates (Tufts 1989). Average concentrations in shrimp ranged from 5.3 to 13.8 mg/kg. The concentration in worms ranged from 57-58.6 mg/kg. The 10 lb application rate is less relevant as the current label restricts applications to 8 lbs a.i./acre. Concentrations in other, more relevant salmonid prey items were apparently not assessed although we assume they may be comparable for other organisms that occupy similar habitat.

Table 68. Carbaryl concentrations in aquatic organisms on treated sites (mg/kg).

Year	Dungeness Crab	Burrowing Shrimp	Annelid Worms
1984	41.9	24.9 (rate not reported)	-
1985	-	4.5 (7.5 lb a.i./acre)	-
1986	-	13.8 (10 lb a.i./acre) 8.7 (7.5 lb a.i./acre) 5.3 (5 lb a.i./acre)	75.5 (5 lb a.i./acre) 57 (7.5 lb a.i./acre) 58.6 (5 lb a.i./acre)

Ecological Effects

There have been concerns that carbaryl applications in Willapa Bay and Grays Harbor may have adverse effects to the commercial Dungeness crab fishery (Feldman, Armstrong et al. 2000). Consequently, Washington Department of Fisheries conducted several surveys to estimate the number of crabs killed (Hurlburt 1986; Creekman and Hurlburt 1987; Tufts 1989; Tufts 1990).

Transect surveys conducted on treatment beds the day following applications indicate large numbers of crabs are killed by the applications (Table 69). Other acute mortalities to non-target organisms were generally not reported. However, transect surveys were conducted during 1986 and 1987 due to concerns over potential impacts to fish given staff observations from the Washington Department of Fisheries reported that fish mortality was "routinely" noted, but not quantitatively assessed following applications of carbaryl (Tufts 1989). Mortalities were characterized as small fish apparently trapped in shallow pools during low tide and directly exposed during carbaryl treatments. The surveys indicate several thousand fish were killed each year from carbaryl applications to approximately 400 acres at rates of ≤ 7.5 lbs a.i./acre (Table 70). Currently, the NPDES permit allow for treatment of up to 600 acres. The current 24 (c) label does not specify acreage restrictions and allows for applications of carbaryl up to 8 lbs a.i./acre.

Table 69. Estimated dungeness crab mortalities resulting from carbaryl applications in Willapa Bay and Grays Harbor, Washington

Year	Maximum Application Rates*	Total Acres Treated**	Dungeness Crab Killed
1984	≤ 10 lbs a.i. / acre	490	38,410
1985	≤ 7.5 lbs a.i./acre	391	59,933
1986	≤ 7.5 lbs a.i./acre	398	16,286
1987	≤ 7.5 lbs a.i./acre	434	44,053

* Current 24(c) label allows for application of up to 8 lbs a.i./acre
** Current NPDES permit allows for a total of 600 hundred acres to be treated in Willapa Bay and Grays Harbor, WA. The Label places no restrictions on acres or geographic restrictions for use of carbaryl on oyster beds in Washington.

Given that the fish that reside in standing water on mud flats are likely to be the most vulnerable to carbaryl exposure, staff from the Washington Department of Fisheries also estimated the available marine fish habitat that existed on exposed mudflats of treated areas. They characterized water that was at least 2 inches in depth, a depth that is adequate for salmon fry, as marine habitat. This habitat comprised substantial portions of the treated areas. In 1986, surveys indicate 135 acres of the 398 of the treated area (approximately 34%) were marine fish habitat (Tufts 1989). In 1987, 67 of the 434 (15%) acres were characterized by Washington Department of Fisheries as marine fish habitat. The current NPDES permit specifies that there be a 200 ft buffer zone for sloughs and channels when carbaryl is applied by helicopter. A 50 ft buffer is required for those aquatic habitats when carbaryl is applied by hand sprayer. AgDrift estimates for aerial application at an application rate of 8 lbs a.i./acre with a 200 ft buffer indicate the

average initial concentration from drift to a body of water that is 2 inches deep (~ 5 cm) and 10 m wide would be 771 µg/L. It seems highly unlikely that helicopter applications would be able to successfully avoid direct overspray of some of the marine fish habitats on the exposed mudflats. Additionally, the 24(C) labels do not contain buffer zone restrictions. A direct overspray of 2 inches of water would result in an average initial concentration of approximately 18 mg/L, a concentration comparable to measured concentrations associated with initial tidal inundation of treated mud flats (see surface water detections above). Acute exposure to these concentrations are expected to kill a portion of exposed salmonids in a matter of hours *i.e.,* 24 h LC50s for carbaryl range from 948-8,000 µg/L, n= 60 (Mayer and Ellersieck 1986), and significantly reduce AChE activity that will lead to myriad sublethal effects such as impaired swimming.

Table 70. Estimated fish mortalities resulting from carbaryl applications in Willapa Bay and Grays Harbor, Washington

Year	Maximum Application Rates*	Total Acres Treated**	Fish Killed
1986	≤ 7.5 lbs a.i./acre	398	14, 954
1987	≤ 7.5 lbs a.i./acre	434	8,041

* Current 24(c) label allows for application of up to 8 lbs a.i./acre
** Current NPDES permit allows for a total of 600 hundred acres to be treated in Willapa Bay and Grays Harbor, WA. The Label places no restrictions on acres or geographic restrictions for use of carbaryl on Oyster beds in Washington.

Salmonids were not reported in the sampling data, which was taken over two seasons. The authors report that the fish kills were extremely variable and unpredictable. The fish mortality reported for transect surveys included only four species in 1986: saddleback gunnel, threespine stickleback, staghorn sculpin, and arrow goby. In 1987, mortalities included English sole, sand sole, kelp greenlings, shiner perch, saddleback gunnels, staghorn sculpin, and arrow goby.

Response of benthic community

Samples were collected in 1985 to assess impacts of carbaryl on the intertidal invertebrate community (Tufts 1990). Treated area showed decreases in numbers of infaunal benthic crustaceans at 15 and 30 d post-treatment while a concurrent increase in crustacean abundance was observed on control plots (Table 71). Abundance of benthic crustaceans was low on both control and treated plots 5 months after application in December. The authors suggest the data may represent a seasonal decline in benthic crustaceans.

Table 71. Total number of benthic crustaceans (tanaids, cumaceans, amphipods, copepods, and ostracods; adapted from Tufts 1990).

Date	Sampling	Control Plot (change from pretreatment)	Treated Plot (change from pretreatment)
June 30	Pretreatment	75	33
July 16	15 days post-treatment	96 (+28%)	2 (-94%)
August 01	30 days post-treatment	136(+181%)	4 (-82%)
December 10	161 days post-treatment	2	6

Field incidents reported in EPA incident database

NMFS reviewed reported incidents of fish deaths from field observations throughout the U.S. because the information reflects real world scenarios of pesticide applications and corresponding death of freshwater fish. We recognize that much of the information is not described in sufficient detail to attribute an incident to a label-permitted use leading to the death of fish, or to make conclusions regarding the frequency of fish kills that may be associated with the use of pesticides. NMFS uses the information as a component to evaluate a line of evidence- whether or not fish kills have been observed from labeled uses of the three pesticide products. EPA categorizes incidents in the database into one of five levels of certainty: highly probable, probable, possible, unlikely, or unrelated. The certainty level indicates the likelihood that a particular pesticide caused the observed effects. EPA uses the following definitions to classify fish kill incidents:

- Highly probable (4): Pesticide was confirmed as the cause through residue analysis or other reliable evidence, or the circumstances of the incident along with knowledge of the pesticides toxicity or history of previous incidents give strong support that this pesticide was the cause.

- Probable (3): Circumstances of the incident and properties of the pesticide indicate that this pesticide was the cause, but confirming evidence is lacking.

- Possible (2): The pesticide possibly could have caused the incident, but there are possible explanations that are at least as plausible. Often used when organisms were exposed to more than one pesticide.
- Unlikely (1): Evidence exists that a stressor other than exposure to this pesticide caused the incident, but that evidence is not conclusive.

- Unrelated (0): Conclusive evidence exists that a stressor other than exposure to the given pesticide caused the incident.

NMFS reviewed several incident reports provided by EPA from OPP's incident database. This database is populated with reports received by EPA from registrants that are defined as reportable under FIFRA 6(a)(2) and includes other information received from registrants and other sources.

Relatively few incidents involving lethality to fish were documented in the database, considering the length of time these products have been registered and their toxicity profiles. EPA provided the following table summarizing known mortality incidents (Table 72). NMFS is uncertain as to how representative this database is of known fish kills and the level of coordination that has occurred with various state and federal agencies that investigate these incidents. The mortality events discussed above for carbaryl applications in Willapa Bay and Grays Harbor were not recorded in the database. Several of the incidents provided by EPA are discussed in more detail below.

Table 72. EPA summary of field incident data with carbaryl, carbofuran, and methomyl; highlighted incidents (*) are discussed.

Carbaryl		Carbofuran		Methomyl

[1]Waterfowl mortality incident in flooded rice

Incident I013436-001: A report of a large fish kill on October 16, 2001, was investigated by the California Department of Fish and Game. The kill involved several thousand fish. Although salmonids were not identified, it occurred in the San Joaquin River, which is used by listed salmonids. EPA characterized this event as "possible" regarding its association with carbaryl, carbofuran, and methomyl. Methomyl was detected in fish gills and several other pesticides

were detected in the water including azinphos-methyl, another cholinesterase inhibitor, and several chlorinated hydrocarbons (chlordane, DDT, dieldrin, methoxychlor, mirex, and others). It is likely that the kill was in part due to mixture toxicity, particularly with the combinations of carbamates and OP insecticides.

Incident I000599-008: A report by the California Department of Fish and Game indicates approximately 3,000 fish, 4,000 crayfish and frogs, 200 birds, and at least 5,000 invertebrates were killed on North Temple Creek in San Joaquin County, California. The adjacent vineyard had been treated with Furadan 4F (carbofuran). Chemical analysis confirmed carbofuran in the gizzards of starling up to 9.8 mg/kg, crayfish collected on site had 0.6 mg/kg, the stomach contents of great egrets, which were primarily crayfish, contained 0.3 mg/kg, and surface water had detections up to 7,800 µg/L. The California Department of Fish and Game concluded that the preponderance of evidence indicated carbofuran was the cause of death. EPA characterized the cause of death as probable.

Incident B0000-246-01: According to a 1975 report by EPA, 22,000 catfish were killed in 7 miles of stream at an agricultural site in Oklahoma. Minimal information on the incident was reported. Chemical analysis was not conducted but EPA classified this association with carbaryl as probable. Other a.i.s were identified as possibly contributing to the kill were toxaphene, methyl parathion, and endrin.

Incident B0000-501-92: EPA concluded that a fish kill in a New Jersey pond was caused by drift of carbaryl following the application of Sevin in 2000. This incident was characterized as probable. No chemical analysis was conducted.

FMC reported several incidents called in to their emergency telephone number in the second quarter of 1992. One incident reported a small number of dead bluegill observed in a drain pond adjacent to corn and tobacco fields. The caller indicated Furadan 15G (carbofuran), Counter (chlorpyrifos), and Temik (aldicarb) had been applied to the crops. Chlorpyrifos is an AChE inhibiting organophosphate insecticide. Aldicarb and carbaryl are both cholinesterase inhibiting *N*-methyl carbamates. Dead fish were observed following heavy rains. No analysis was done on

the fish to determine the cause of death. EPA characterized carbofuran as a "possible" cause of the incident. It seems likely that the three cholinesterase inhibiting insecticides may have resulted in a cumulative exposure that was sufficient to cause the fish kill due to mixture toxicity.

Incident I000108-001: DuPont reported a fish kill in 1992 in southern Georgia that occurred following an application of Lannate LV (methomyl). One hundred and twenty-five fish were found dead in a pond located 50 to 75 yards from a large field of sweet corn. The 200 acre field was treated with Lannate LV five times between June 1 and June 16. Additionally, Lorsban insecticide (chlorpyrifos) was applied four times during the same interval including co-applications of four fertilizer treatments. On the day of the fish kill (June 16), applications of both Lannate and Lorsban were made. Lannate LV was applied at rates of 1.5 pints/acre and Lorsban was applied at a rate of 1 pint/acre. During the first 16 days of June a total of 10.52 inches of rain were received. The State of Georgia took water samples on June 17. Analysis indicated 136 µg/L of methomyl in the pond. Chlorpyrifos concentrations were not reported and it is not known if it was an analyte. Water temperatures were relatively high (reported to be about 90ºF) but dissolved oxygen was reported to be "normal (7.2-10)". DuPont suggested the high temperatures, fertilizers, and suspended solids could be stressful to fish and low oxygen content at night might have played a part in the deaths. The species involved in the incident (carp and bluegill) were warm water fishes. EPA characterized methomyl as a "probable" cause of the fish kill. Given the reported rapid dissipation of methomyl it is likely that the concentrations measured do not represent peak concentrations that occurred in the pond. It seems likely that chlorpyrifos may have also been a contributing factor in this incident.

Mixture Analysis of Carbaryl, Carbofuran, and Methomyl

As noted earlier, pesticides most often occur in the aquatic environment as mixtures. In our review and synthesis of the available exposure and response information, we find the three *N*-methyl carbamates carbaryl, carbofuran, and methomyl share the same mechanism of toxic action (AChE inhibition) and are expected to co-occur in salmonid habitats. Therefore, we employ a simple mixture analysis derived from empirical data with Pacific salmonids to predict potential effects to individual salmonid's AChE activity and their survival from short-term

exposures. The analysis is predicated on the toxic potencies of the three insecticides added together to predict the resulting cumulative effect to AChE activity and mortality.

Mixture toxicity is typically described by three general responses: antagonistic, additive, or synergistic. Antagonism and synergism are where the toxic response is not predicted by the individual potencies of the pesticides found in the mixture. Antagonistic effects of a mixture lead to less than expected toxicity on the organismal endpoint. Mechanistically, the pesticides are likely interacting with one another to reduce the toxic potency of individual pesticides. Synergistic effects of a mixture lead to a greater than expected effect on the organismal endpoint and the pesticides within the mixture enhance the toxicity of one another. The third general type of mixture toxicity and the one most frequently reported is additivity (known also as dose-addition or concentration-addition). This type of response is defined by adding the individual potencies of pesticides together to predict the effect on the biological endpoint. Additivity has been demonstrated for many pesticide classes as well as other organic compounds such as PAHs, PCBs, and dioxins.

Additive toxicity of chemicals that share a mode or mechanism of toxic action is well established in the scientific literature, and as a result has been informing regulatory decisions for more than a decade. In 1996, the National Academy of Sciences recommended a dose-additive approach to assessing risks to human infants and children from pesticide exposure. EPA currently assesses human risk of pesticide mixtures for pesticides that share a common mechanism of toxic action *e.g., N*-methyl carbamates [such as carbaryl, carbofuran, methomyl], organophosphorus insecticides, chloroacetanilide and triazine herbicides, as mandated by FQPA. The analysis EPA conducts is predicated on additive toxicity and applies dose-addition to set tolerance limits of pesticide residues on food. For example, the toxic potencies of the *N*-methyl carbamates are added together to determine pesticide tolerance limits for edible crops. Although additive toxicity is evaluated when determining risk to humans, EPA OPP has yet to apply a similar approach to address cumulative toxicity of pesticides that share a common mode or mechanism of action in the evaluation of terrestrial and aquatic species. That said, the use of dose-addition for mixtures containing acetylcholinesterase-inhibiting pesticides is well established and has been extended to protection of aquatic life (Belden, Gilliom et al. 2007).

Dose-addition assumes the cumulative toxicity of the mixture can be predicted from the sum of the individual toxic potencies of each component of the mixture. Within the past decade, government regulatory bodies started to use dose-addition models to predict toxicity for those chemicals that share a common mode of action. In California, the CVRWQB used dose-addition models (based on the toxic-unit approach) to develop TMDLs for the OP insecticides diazinon and malathion. NMFS Biological Opinions have also recognized the environmental reality of co-occurring pesticides in species' aquatic habitats and applied additive toxicity models to predict potential responses of salmonids (NMFS 2004; NMFS 2005; NMFS 2005; NMFS 2005; NMFS 2008).

In salmon, dose-additive inhibition of brain AChE activity by mixtures of OPs and carbamates was demonstrated *in vitro* (Scholz, Truelove et al. 2006). More recently, it has been found that salmonid responses to OP and carbamate mixtures vary *in vivo*; some interactions were synergistic, rather than just additive (Laetz, Baldwin et al. 2009). We used the dose-addition method to predict responses by applying the modeling exposure estimates and measured concentrations of carbaryl, carbofuran, and methomyl presented in the *Exposure Analysis*. Effects of the three carbamates individually and in combination on AChE inhibition Figure 42 (A) and survival (B), are shown below. Based on additivity, the mixture is expected to be more toxic than the individual carbamates for both endpoints. Due to the steep slopes of the two dose-response curves, and especially the mortality slope, small changes in concentrations elicit large changes in observed toxicity. The exposure values represent concentrations from EPA PRZM-EXAMs 60 d average modeling estimates for surface waters (carbaryl: 4 aerial applications at 5 lbs a.i./acre, citrus in FL; carbofuran: 1 ground application at 2 lbs a.i./acre, artichokes in CA; methomyl: 3 aerial applications at 1.8 lbs a.i./acre, peaches). We recognize that this approach is likely to under-predict toxicity for mixtures that produce synergistic rather than additive responses (Laetz, Baldwin et al. 2009).

Figure 42. Percent AChE inhibition (A.) and percent mortality (B.) for salmonids expected from exposure to carbaryl (Cl), carbofuran (Cn), and methomyl (M) as separate constituents and as mixtures (Cl 41 µg/L, Cn 19 µg/L, and M 85 µg/L)[4].

We used a variety of exposure estimates and monitoring data to evaluate responses to different mixtures of carbaryl, carbofuran, and methomyl (Table 73). The predicted additive responses from these mixtures ranged from 16-74% inhibition of AChE and 0.01-74% mortality. The predicted additive response to AChE inhibition is likely to result in increased behavioral consequences to salmonids. What is not captured in these responses is the likelihood of exposure to the various mixture concentrations. The PRZM-EXAMS values were estimates selected from EPA simulations of western crops. The scenarios were representative of use rates and numbers of applications on current product labels. Additionally, we used 60 d, time-weighted averages of exposure rather than predicted peak concentrations as exposure to multiple pesticides would be expected to occur more frequently over chronic durations. This may underestimate effects as responses assumed 96 h exposure. Site specific considerations will also have an influence on the frequency of exposure.

[4] EPA's default pesticide slope was used for acute mortality (3.63 or probit slope of 4.5) [EPA 2004]. The slope used for AChE inhibition was based on pooling data from five cholinesterase-inhibiting insecticides; including carbofuran, carbaryl, chlorpyrifos, diazinon, and malathion Laetz, C. A., D. H. Baldwin, et al. (2009). "The synergistic toxicity of pesticide mixtures: Implications for risk assessment and the conservation of endangered Pacific salmon." Environmental Health Perspectives **117**: 348-353..

Table 73. Predicted AChE inhibition and mortality from estimated and measured exposure to carbaryl, carbofuran, and methomyl.

	Concentration (µg/L)	% AChE Inhibition	% Mortality

[1]PRZM-EXAMS estimates for carbaryl in California peaches (2 applications at 7 lb a.i./acre), carbofuran in California artichokes (1 application at 2 lb a.i./acre), and methomyl in lettuce (10 applications at 0.9 lb a.i./acre). Although current labeling may not be consistent for these uses (peaches, artichokes, and lettuce), the use rate and number of applications are consistent with other labeled uses within the action area.

The GENEEC estimates are 90 d, time-weighted averages that were based on labeled uses of the three compounds in sweet corn, potatoes, and citrus. We found no restrictions that would

prevent co-application or sequential applications of carbaryl, carbofuran, and methomyl. The application rates assumed were consistent with current labels and generally representative of use rates authorized for many crop and non-crop uses. An exception was the assumed carbaryl use rate in citrus (12 lb a.i./acre), which is substantially higher than the maximum use rate approved for most crops.

The NAWQA, CDPR, and EIM monitoring values represent the maximum concentrations found in the respective databases. The values cited were all measured within the four states and the vast majority is from waters that contain or drain to listed salmonid habitats. Most of the detections in these, and other monitoring studies that did not target specific applications of the three chemicals occurred at or below the µg/L level. We expect that exposure at these levels will be common in drainages where the three products are used extensively.

Evaluation of Risk Hypotheses: Individual Salmonids

In this phase of our analysis we examine the weight of evidence from the scientific and commercial data to determine whether it supports or refutes a given risk hypothesis. We also highlight general uncertainties and data gaps associated with the data. In some instances there may be no information related to a given hypothesis. If the evidence supports the hypothesis we determine whether it warrants an assessment either at the population-level, or affects PCEs to such a degree, to warrant an analysis on the potential to reduce the conservation value of designated critical habitat.

1. Exposure to carbaryl, carbofuran, and methomyl is sufficient to:

A. Kill salmonids from direct, acute exposure.

A large body of laboratory toxicity data indicates that anadromous salmonids die following short-term (< 96 h) exposure to the three insecticides at levels above 200 µg/L. We expect concentrations of carbaryl, carbofuran, and methomyl in salmonid off-channel habitats will reach lethal levels based on exposure concentrations derived from monitoring data, EPA's modeling estimates, and NMFS modeling estimates (See *Exposure Analysis*). The youngest swimming salmonids appear to be the most likely to die from short-term, acutely toxic exposures in these habitats. It is less likely that adults would be killed by acute concentrations in most freshwater aquatic habitats compared to juveniles. However, if adults are present in smaller off-channel

habitats during aerial applications or severe runoff events death is possible, particularly from carbaryl and carbofuran. The available monitoring data, if representative of salmonid habitats, indicated that concentrations rarely achieve LC50 values for the three compounds in freshwaters. However, it is unlikely that peak concentrations are reflected in the monitoring data, and given the acutely toxic nature of carbamates, a brief exposure would be sufficient to cause effects. As described in the *Exposure Analysis*, monitoring data are limited when compared to the range of habitats used by salmonids. Few data were found that targeted applications and subsequent concentrations in edge of field habitats which typically show much higher concentrations than weekly, monthly, or seasonal monitoring efforts. Although we found no information on egg survival following acute exposures, we do not expect death of eggs from these insecticides as entry into the eggs via the water column is unlikely. Further support for acute lethality to fish is found in field incidences of death attributed to carbaryl, carbofuran, and methomyl that EPA ranked as "probable". We located several incidents showing death of freshwater fish following exposures to *N*-methyl carbamates. We expect juveniles of listed salmonids to be at the highest risk of death when in small freshwater off-channel and edge habitats, and secondarily in estuarine habitats where carbaryl is applied directly to mudflats. In conclusion, the available information on measured and expected concentrations of the three insecticides supports this hypothesis. We translate the fitness level consequences of reduced survival from mortality of juvenile salmonids to potential population-level consequences using population models (see population modeling section below).

B. Reduce salmonid survival through impacts to growth.

Fish growth is reduced following long-term exposures to carbofuran and methomyl in fathead minnows and rainbow trout, respectively. EPA reported on a single test that measured growth effects to fathead minnows following 30 and 60 d exposure to carbaryl at 0, 8, 17, 62, 210, and 680 µg/L (Carlson 1971). No statistically significant effects on growth were reported in this study. It is difficult to extrapolate from this one study with a warm water species to potential growth effects to ESA-listed salmonids especially given that salmonids appear substantially more sensitive to carbaryl's acute toxicity than fathead minnows (96 h LC50s for salmonids range from 250-4,500µg/L carbaryl and for fathead minnows 7,700-14,600 µg/L). Additionally, 20% and 50% inhibition of AChE in salmonids occurs at concentrations as low as 23 and 185 µg/L, respectively (Labenia, Baldwin et al. 2007) and this inhibition was found to affect

swimming behavior (Labenia, Baldwin et al. 2007). Reduced growth occurred at 56 µg/L for carbofuran and 142 µg/L for methomyl. Only one test result was reported for each pesticide. We did not identify any studies that provided a quantitative relationship between growth and fish survival in the field or lab. However, there is abundant literature that shows salmonids that are smaller in size have reduced first year survival (Appendix 1). Additionally, exposure to sublethal concentrations of other AChE inhibitors (chlorpyrifos and diazinon) for acute durations does cause reduced feeding success, which likely results in impacts to growth (Scholz, Truelove et al. 2000; Sandahl, Baldwin et al. 2005). We expect that juvenile fish exposed to carbaryl, carbofuran, and methomyl during their freshwater residency will feed less successfully, resulting in lower growth rates and reduced sizes. Exposure concentrations will likely vary temporally and spatially for salmonids depending on life history, pesticide use, and environmental conditions. The available information support that growth is likely reduced where salmonids are exposed to more than 56 µg/L carbofuran and to concentrations below LC50 for carbaryl and methomyl, although the exact concentrations that may cause growth reduction are currently unknown. The weight of evidence supports the conclusion that fitness level consequences from reduced size are likely to occur in individual salmonids exposed to the three *N*-methyl carbamates. Therefore, we address the potential for population-level repercussions due to reduced growth using species-specific population models.

C. Reduce salmonid growth through impacts on the availability and quantity of salmonid prey

We address several lines of evidence to determine the likelihood of reduced salmonid growth from impacts to aquatic invertebrate prey. The first line of evidence we evaluated is whether salmonid prey items are sensitive to acute and chronic exposures from expected concentrations of the three carbamates. These primarily involved evaluating laboratory experimental results that reported on incidences of death or sublethal effects. We located a total of 10, 4, and 14 survival estimates (24, 48, 72, and 96 h EC/LC50s) for carbaryl, carbofuran, and methomyl, respectively. Based on an evaluation of the assessment endpoints, we found a robust body of exposure and toxicity data that indicated salmonid aquatic prey are highly sensitive and affected by expected exposures to each of the insecticides as well as from mixtures containing the three insecticides. We expect death and a variety of sublethal effects to salmonid prey items.

The second line of evidence is whether field level reductions in aquatic invertebrates correlate to *N*-methyl carbamate insecticide use and/or concentrations in salmonid habitats. We found several examples supporting this line of evidence. The available laboratory and field data show reductions in aquatic invertebrate taxa and reductions in invertebrate abundances following applications of carbofuran and carbaryl (Table 67). Furthermore, field studies explicitly investigated whether real world applications and subsequent pesticide drift and/or runoff into aquatic environments affected receiving water aquatic communities. One compelling study measured pre- and post-application aquatic community responses from field applications of carbaryl at 0.75 and 1 lb/acre (these rates are at the lower end of approved maximum application rates, up to 12 lbs/acre) (Courtemanch and Gibbs 1980). Applications correlated to substantial drift of salmonid prey type aquatic invertebrates, of which most were dead or dying. More striking was that population reductions of plecoptera (stoneflies) persisted for sixty days (Courtemanch and Gibbs 1980). Runoff from fields treated with carbofuran at 2.68 lbs a.i./ acre contained concentrations as high as 264 µg/L in the field ditches that drained to a stream where carbofuran was measured at 27 µg/L (Matthiessen, Shearan et al. 1995). Caged amphipods present in the stream all died during peak runoff following a rain event one month after the carbofuran application. This indicated that carbofuran can persist in soil and mobilize by rain into subsequent runoff and ultimately elicit toxic responses from stream invertebrates (Matthiessen, Shearan et al. 1995). Although we found no field studies with methomyl, we expect that it would similarly reduce aquatic invertebrate populations at higher concentrations than carbaryl and carbofuran based on its toxicity profile.

The third line of evidence we evaluated was whether salmonids showed reduced growth in areas of low prey availability, particularly those areas coinciding with use of carbaryl, carbofuran, and methomyl. An evaluation of this line is complicated by multiple factors affecting habitat quality *i.e.,* water quantity, quality, riparian zone condition, etc., which in turn affects prey items and salmonids. We were unable to locate information attributing reduced growth in salmonids to specific insecticide exposures that reduced prey, as most studies focused on measuring direct effects on salmonids or direct effects on invertebrates (see review by Schulz 2004). However, there are multiple field experiments and studies that demonstrate reduced fish growth resulting from reduced prey availability (Brazner and Kline 1990; Metcalfe, Fraser et al. 1999; Baxter,

Fresh et al. 2007) or document fish growth rates below maximal potential growth rates when prey are limited (Dineen, Harrison et al. 2007).

One study, in particular, tested the hypothesis that single applications of the OP insecticide chlorpyrifos (0.5, 5, 20 μg/L) to outdoor ponds (littoral enclosures) would reduce the abundance of invertebrates and cause diet changes that would result in reduced growth rates of juvenile fish (Brazner and Kline 1990). The results are direct, empirical evidence that support this hypothesis. Growth rates of fathead minnow larvae were reduced significantly in all chlorpyrifos-containing treatments due to reduction in prey abundance. At 15 d post-treatment, the reductions in growth rate compared to control fish were the most pronounced and coincided with the greatest reductions in invertebrates. Stomach contents of minnows were identified throughout the experiment. By day 7 mean numbers of protozoans, chironomids, rotifers, cladocerans, mean total number of prey being eaten per fish, and mean species richness were greater in unexposed treatments compared to some of the other treatments. On day 15, most of the differences were more pronounced. The results strongly support the conclusion that foraging opportunities were better in untreated enclosures and unexposed larvae grew significantly more compared to chlorpyrifos-treated enclosures. Furthermore, the reductions in prey items in diets mirrored the reduction in prey items in the enclosures. We did not find any study results with *N*-methyl carbamates, but we make the inference that concentrations of the three *N*-methyl carbamates that are sufficient to reduce aquatic prey would also lead to reduced fish growth. This further supports the hypothesis that reduction in prey abundances translates to reductions in subsequent ration as well as individual growth. The authors concluded that "low levels of contaminants that induce slower growth in young-of-the-year fish through food chain effects or other means may eventually reduce the survival and recruitment of these fish."

Collectively, the lines of evidence strongly support the overall hypothesis. Thus, we carry reduced prey impacts to the next level of analysis (*i.e.,* the population-level). We conducted population modeling exercises based on reduced abundances of salmonid prey, presented in the next section, (*Effects to Salmonid Populations from the Proposed Action*).

D. Impair swimming which leads to reduced growth (via reductions in feeding), delayed and interrupted migration patterns, survival (via reduced predator avoidance), and reproduction (reduced spawning success).

Swimming is a critical function for anadromous salmonids. The primary line of evidence for this hypothesis is impaired swimming behaviors following exposure to carbaryl, carbofuran, and methomyl. A secondary line of evidence for this hypothesis is studies showing swimming behavior modification following exposure to other AChE-inhibiting chemicals such as the OPs, as we anticipate the results are similar in nature. Several studies regarding the effects of carbaryl on the swimming related behaviors were reviewed, with effects on predator avoidance, schooling, and feeding behaviors occurring at carbaryl concentrations of ~100-1,000 µg/L in laboratory studies (Weis and Weis 1974; Arunachalam, Jeyalakshmi et al. 1980; Little, Archeski et al. 1990; Carlson, Bradbury et al. 1998; Labenia, Baldwin et al. 2007). Only one study was available for carbofuran showing effects to social behaviors at 5 µg/L (Saglio, Trijasse et al. 1996), and no studies were located for methomyl. Concentrations at which effects were noted for carbaryl and carbofuran are within the ranges of concentrations estimated by the various modeling methods, especially for the off-channel habitat locations. We anticipate similar effects will occur with methomyl because it has the same mechanism of action as carbaryl and carbofuran, inhibition of AChE (which is correlated to swimming impacts). However, we expect it will take greater concentrations of methomyl compared to carbaryl and carbofuran to affect swimming. We expect that these levels are likely from concentrations resulting from aerial drift into off-channel habitats. This is because concentrations of methomyl necessary for AChE inhibition and acute lethality (LC50) are greater than carbaryl and carbofuran concentrations necessary to inhibit AChE and kill fish. We also discussed compelling evidence that OPs impair salmonid swimming behaviors and also show associated reductions in AChE activity.

The most sensitive swimming endpoints are those associated with swimming activity compared to those that measure swimming capacity (Little and Finger 1990; Little, Archeski et al. 1990). The ecological consequences to salmonids from aberrant swimming behaviors are implied primarily through the impairment of feeding, translating to reduced growth. Impaired swimming behavior correlated with both AChE inhibition and increased mortality from predation (Labenia, Baldwin et al. 2007). Although NMFS was unable to locate results from field or laboratory experiments for the other remaining endpoints of this hypothesis, we conclude that swimming

behaviors are affected by the three insecticides. Adverse effects to swimming-associated behaviors are directly attributed to AChE inhibition, leading to potential reductions in an individual's fitness (*i.e.,* growth, migration, survival, and reproduction). We therefore translate impaired swimming to potential impacts on salmonid populations. Based on concentrations generated in modeling, NMFS believes concentrations of carbaryl and carbofuran, applied in accordance with current labels, are sufficient to impair swimming behavior of salmonids in some environments. As we located no studies that evaluated the effects of methomyl on swimming behaviors in fish, we do not know the exact levels sufficient to impair swimming except to say that levels well below reported LC50s can impair swimming. Swimming-mediated behaviors are frequently impaired at 0.3 – 5.0% of reported fish LC50s, and that 75% of reported adverse effects to swimming occurred at concentrations lower than reported LC50s (Little and Finger 1990). Taken together this information supports methomyl affecting swimming behaviors below reported LC50s. We expect methomyl at hundreds of µg/L (expected from currently approved applications) to impair swimming.

E. Reduce olfactory-mediated behaviors resulting in consequences to survival, migration, and reproduction.

In the Opinion regarding effects of chlorpyrifos, diazinon, and malathion on listed salmonids (NMFS 2008), sufficient data were available to conclude that olfactory-mediated behaviors were affected by those pesticides. Fewer data were available to assess the effects of carbaryl, carbofuran, and methomyl on these endpoints. Evidence is unclear as to mode of action for insecticide-mediated olfactory impairment. Thus, conclusions drawn based on data for OPs may not necessarily be applicable to *N*-methyl carbamates. Data currently available are conflicting, with the one study available for carbaryl showing no apparent effect on olfaction on juvenile cutthroat trout at concentrations of up to 500 µg/L. Three studies regarding olfactory effects of carbofuran were located and reviewed, and these indicated olfactory effects in several species of fish (including two salmonids) at concentrations ranging from 1-10 µg/L. These concentrations are within both the ranges estimated by modeling, and the ranges measured in all monitoring data sets. No data were available for methomyl. While data are not conclusive, based on what is known, and giving the benefit of the doubt to the species, NMFS believes it is reasonable to assume that these types of effects will occur from carbofuran exposures. Therefore, we discuss the potential implications at the population-level.

F. Exposure to mixtures of carbaryl, carbofuran, and methomyl can act in combination to increase adverse effects to salmonids and salmonid habitat.

The exposure and toxicity information we compiled, reviewed, and analyzed support the risk hypothesis, although less mixture data were available for the carbamates addressed in this Opinion than the OPs addressed in the previous Opinion (NMFS 2008). Evidence of additive and synergistic effects on survival and AChE inhibition in salmonids were identified. Multiple, independent study results supported additive toxicity from measured AChE inhibition. We therefore conducted an analysis of potential mixtures on the levels of AChE inhibition and the potential for a greater reduction in survival predicated on simple additivity. The analysis showed that both survival and AChE inhibition of individuals is likely affected to a greater degree than from exposure to a single chemical alone. We also expect that assessment endpoints influenced by AChE inhibition are likely affected to a greater degree when in the presence of more than one of the three insecticides. Considerable uncertainty arises as to the level of impairment caused by mixtures for some endpoints, as dose responses have not been characterized for some pesticide combinations. We conclude that this hypothesis is supported by the available information and we assess the potential for population-level consequences below.

G. Exposure to other stressors of the action including degradates, adjuvants, tank mixtures, and other active and other ingredients in pesticide products containing carbaryl, carbofuran, and methomyl cause adverse effects to salmonids and their habitat.

Fifteen of the carbamate formulations contain other a.i.s, including malathion (OP insecticide), bifenthrin (pyrethroid insecticide), rotenone (insecticide/piscicide), metaldehyde (mulloscicide), captan (phthalidimide fungicide), and cupric sulfate (toxic to algae, aquatic invertebrates, and fish). No data regarding the joint toxicity of these multi-a.i. products were presented in the BEs or located in open literature. However, given that these pesticides are also toxic to aquatic life it is reasonable to assume the salmonids and/or their prey items will exhibit a greater toxic response when exposed to multiple a.i.s than to a single one. We are unable to estimate the magnitude of such a response, and other than for malathion, are not currently able to evaluate whether the response would fall into an additive, synergistic, or antagonistic category. Based on mixture data discussed elsewhere in this Opinion, we assume additivity for carbaryl, carbofuran, and methomyl.

Some toxicity data were available in the BEs for formulations not containing additional a.i.s. Based on that data, no specific conclusions can be drawn as to whether formulations are, in general, more or less toxic than the technical grade a.i. However, it should be noted that adjuvants which increase either uptake (such as penetrants or surfactants that make physiological membranes more permeable) or length of exposure (attractants, or emulsions that increase time in the water column) are likely to increase toxicity of the a.i.

Only a limited amount of data were available to evaluate toxicity of the degradates of carbaryl, carbofuran, and methomyl. Monitoring data indicate that 1-napthol, a degradate of carbaryl, and 3-hydoxycarbofuran, a degradate of carbofuran, occur in measurable quantities in the environment. Based on the monitoring data, 1-napthol co-occurs with carbaryl in both water column and sediment. Toxicity information presented in the BE indicates that 1-napthol is approximately an order of magnitude less toxic than parent carbaryl for aquatic invertebrates. No data were given in the BE regarding the toxicity of 1-napthol to fish. We did locate one open literature study evaluating the effects of 1-napthol on fish, which indicated it was 2-5 times more toxic than the parent carbaryl (Shea and Berry 1983). No toxicity data were located for 3-hydroxycarbofuran or 3-ketocarbofuran, but based on structural similarities, the toxicity is likely similar to the parent carbofuran. Based on fate data presented in the BEs, 3-hydroxycarbofuran and 3-ketocarbofuran appear to occur in soil rather than in the water column. Both are shown as being non-detectable to representing 2-5% of applied parent material. Together, they could represent 6-7% of applied, assuming they were measured in the same test. Neither the BE nor the Science Chapter specify if that is the case.

Overall, while NMFS cannot quantify the increased toxicity of exposure to other stressors of the action such as additional a.i.s, degradates, and adjuvants, the existing body of information indicates these compounds are likely to cause and/or exacerbate adverse effects on salmonids and their habitat caused by carbaryl, carbofuran, and methomyl.

We did not receive a complete list of the currently registered formulations containing carbaryl, carbofuran, and methomyl from EPA. Thus, we cannot make any definitive conclusions for every stressor of the action. However, we did evaluate the exposure and response to a commonly

used surfactant/adjuvant mixed with, or found in pesticide formulations. We reasoned if the data support adverse effects from this one of more than 4,000 substances, then other unidentified inert ingredients could also be toxic and may pose a significant risk to salmonids and their habitat. We selected NP polyethoxylates and NP because of their widespread use in pesticide formulations and abundance of information regarding environmental concentrations and adverse effects to salmonids and their prey. The data indicated that these surfactants can kill outright, disrupt endocrine systems, particularly reproductive physiology, and bioaccumulate in benthic invertebrates from expected concentrations in the environment (Arsenault, Fairchild et al. 2004; Madsen, Skovbolling et al. 2004; Jardine, MacLatchy et al. 2005; Luo, Ban et al. 2005; McCormick, O'Dea et al. 2005; Segner 2005; Hutchinson, Ankley et al. 2006; Lerner, Bjornsson et al. 2007; Lerner, Bjornsson et al. 2007). Importantly, we found studies that linked Atlantic salmon population crashes in Canada to use of NP in insecticide formulations. However, the BEs did not provide any information as to the prevalence of this material in formulations of the three OP insecticides that pertain to this consultation. We did receive confirmation from the technical registrant of methomyl that no methomyl containing formulation they make contains NP. Significant uncertainty surrounds the number and type of compounds, as well as the toxicity of these other materials used in pesticide formulations. As a result, we must caveat our conclusions regarding population-level responses with the uncertainty that the actual risk posed to listed salmonids and their habitat is likely greater when all ingredients are taken into account.

H. Exposure to other pesticides present in the action area can act in combination with carbaryl, carbofuran, and methomyl to increase effects to salmonids and their habitat.

The available toxicity and exposure data support the hypothesis. Other carbamates and OPs found in the action area likely result in additive or synergistic effects to exposed salmonids and aquatic invertebrates. The magnitude of effects will depend on the duration and concentrations of exposure.

I. Exposure to elevated temperatures can enhance the toxicity of the stressors of the action.

We found no consistent correlation with elevated temperature and toxicity of the three *N*-methyl carbamates. However, salmonids are coldwater species, and exposure to elevated temperatures increases physiological stress, thus making them more susceptible to other stressors. Additionally, other AChE inhibitors such as OPs are more toxic to salmonids and aquatic

invertebrates exposed to elevated temperatures, so where elevated temperatures co-occur with OPs and carbamates the effect to aquatic life is likely greater than at lower temperatures. Many salmonid populations reside in watersheds which have been listed by the four western states as impaired due to temperature exceedances. We therefore discuss qualitatively temperature impacts on salmonids population responses to the stressors of the action.

J. Exposure to specific pH ranges can affect the toxicity of the stressors of the action.

Some data indicate acute toxicity of carbaryl and carbofuran increases as pH increased based on the available freshwater fish assays (Mayer and Ellersieck 1986). Other data indicated that toxicity was reduced in pH greater than 9 due to rapid hydrolysis *i.e.,* a half-life of 30 minutes in pond mesocosms. For methomyl, pH seems to have less of an influence on hydrolysis rates. Within the Pacific Northwest and California pH varies seasonally and typically may range from 6 – >9. We expect that salmonids exposed to both pH ranges at or near physiological tolerance limits and the three insecticides concurrently may die at relatively lower concentrations compared to salmonids exposed in laboratory assays. We therefore discuss qualitatively pH impacts on salmonids population responses to the stressors of the action.

Effects to Salmonid Populations from the Proposed Action

Here we translate individual fitness consequences to potential population-level effects using both quantitative and qualitative methods. We quantitatively translate reduced survival of juveniles based on four-day exposures to four populations of salmonids including ocean-type Chinook, stream-type Chinook, coho, and sockeye salmon. We employ a life history population model that incorporates changes in first-year juvenile survival rates and then translates them into predicted changes in the modeled population's intrinsic rate of growth, *i.e.,* lambda (Appendix 1). We discuss the percent change in lambda in the context of expected concentrations of the three insecticides in salmonid habitats. We focus on the concentrations at which a significant departure occurs from the unexposed population and compare them to expected environmental concentrations described in the *Exposure Analysis*. We also discuss in general terms the likelihood of exposure to the range of pesticide concentrations that occur in salmonid habitats.

In a second modeling exercise, we translate reductions in growth of juvenile salmon from AChE inhibition and from reduced prey abundances to potential population impacts using individual-based growth and life history population models (Appendix 1). These two endpoints (AChE inhibition and reduced prey abundance) are combined in the model to evaluate population-level effects due to reductions in first year survival of juveniles (Appendix 1). Similar to the survival models, percent change in lambda is the output. We discuss the significance of population changes in the context of departures from normal variability of the unexposed population and expected environmental concentrations. We conclude this section on population-level effects with a discussion of population-level responses to other affected salmonid endpoints that were not modeled. These include effects from other stressors of the proposed action, mixture effects, and effects to behaviors from impaired olfaction and AChE inhibition such as swimming behaviors.

Salmonid Population Models

We selected four generalized life history strategies to model (Appendix 1). We ran general life history matrix models for coho salmon (*Oncorhynchus kisutch*), sockeye salmon (*O. nerka*) and ocean-type and stream-type Chinook salmon (*O. tshawytscha*). We did not construct a steelhead (*O. mykiss*) life history model due to the lack of demographic information. Chum salmon (*O. keta*) were omitted from the growth model exercise because they migrate to marine systems soon after emerging from the gravel and the model assesses early life stage growth effects over a minimum of 140 d in freshwater systems. The basic salmonid life history we modeled consisted of hatching and rearing in freshwater, smoltification in estuaries, migration to the ocean, maturation at sea, and returning to the natal freshwater stream for spawning followed shortly by death. For specific information on how we constructed the models see Appendix 1.

Effects to salmonid populations from death of sub-yearling juveniles

An acute toxicity model was constructed that estimated the population-level impacts of subyearling juvenile (referred to as juveniles within this section) mortality resulting from exposure to concentrations of carbaryl, carbofuran, and methomyl. These models excluded sublethal and indirect effects of the pesticide exposures and focused on the population-level outcomes resulting from an annual 4 d exposure of all juveniles in the population to carbaryl, carbofuran, and methomyl from single exposures. Death of juveniles was implemented as a

change in first-year survival rate for each of the salmon life-history strategies modeled. We also addressed mixture toxicity of the three insecticides in the model using exposure concentrations derived from EPA modeling estimates and from NMFS' modeling estimates of off-channel habitats. Model output is displayed in Tables 74-77.

The percent changes in lambdas increased as concentrations of the three carbamates increased. Increases in direct mortality during the first year of life produced large impacts on the population growth rates for all the life history strategies. Model results for stream-type Chinook salmon showed significant impacts at lower concentrations than the other modeled populations. This result is primarily due to the size of the standard deviation of the unexposed population. Percent changes in lambda were deemed significant if they were outside of one standard deviation from the unexposed population. The relative sensitivity of the life history models producing the greatest to the least changes in population growth rate for equivalent impact on survival rates was coho salmon, ocean-type Chinook salmon, stream-type Chinook salmon, and sockeye salmon. We note that the choice of LC50 is an important driver for these results. Therefore, an LC50 above or below the ones used here will result in a different dose-response. We selected the lowest reported salmonid LC50 from the available information to ensure that risk is not underestimated. However, if the actual environmental 96 h LC50 is lower, then the model will under-predict mortality. If the actual environmental acute LC50 is higher, then the model will over-predict mortality.

These results indicate that exposure of salmonid populations to carbaryl, carbofuran, and methomyl for four days at the reported LC50s would have severe consequences to the population's growth rate. If exposure occurred every year for each new cohort, population growth rate would be reduced and recovery efforts would be slowed. For those natural populations with current lambdas of less than one, risk of extinction would increase substantially, especially if several successive generations were exposed. For each of the combinations of species and insecticide, we denoted the relative concentration at which the percent change in lambda is deemed significantly different from the unexposed populations *e.g.,* a 9.1% change in lambda is estimated at 190 µg/L carbaryl for ocean-type Chinook salmon. These population effect thresholds assume exposure to all the juveniles in the population.

Carbaryl's thresholds for the four species ranged from 129-190 μg/L, carbofuran's from 89-126 μg/L, and methomyl's from 287-431 μg/L. These results can be compared to expected concentrations shown in Figure 39, Figure 40, and Figure 41. All of the thresholds overlap with expected concentrations for the three insecticides. The overlap primarily occurs with NMFS modeled estimates for off-channel habitats.

When we compare the population threshold concentrations to expected levels in salmonid habitats described in the exposure section, it is likely that some individuals within a population will be exposed during their freshwater juvenile life stage, particularly those juveniles exposed while using off-channel habitats. Additionally, four day averages from GENEEC runs, but not from PRZM-EXAMS, exceed these threshold concentrations. It is uncertain how appropriate EPA's model estimates are for salmonid habitats, but taken at face value juveniles exposed to GENEEC-derived concentrations would die. Population-level effects are expected from these exposures if the majority of the individuals that comprise the populations are exposed during their freshwater residency. The likelihood of population effects from death of juveniles increases for those populations that spend longer periods in freshwaters such as steelhead, stream-type Chinook, and coho salmon. We also expect additional acute mortalities from juveniles that are exposed to 24(c) carbaryl applications in Washington estuaries, although we do not know how many individuals are exposed each year. For those populations with lambdas greater than one, reductions in lambda from death of juveniles can also lead to consequences to abundance and productivity. Consequently, attainment of recovery goals would take longer to achieve for populations with reduced lambdas. Many of the populations that are categorized as core populations or are important to individual strata, have lambdas just above one and are essential to survival and recovery goals. Slight changes in lambda, even as small as 3-4%, would result in reduced abundances and/or increased time to meet population recovery goals.

Table 74. Modeled output for Ocean-type Chinook salmon exposed to 4 d exposures of carbaryl, carbofuran, and methomyl reporting the impacted factors of survival as percent dead, lambda and standard deviation, and percent change in lambda compared to an unexposed population.

Carbaryl	0 µg/L	50 µg/L	100 µg/L	200 µg/L	250 µg/L	350 µg/L	500 µg/L	750 µg/L

The population exercises discussed thus far focused on the effects from exposures to a single annual application of an insecticide; however, we know that these insecticides likely occur together in environmental mixtures and are frequently applied multiple times. To address the potential population-level effects to environmental mixtures of the three insecticides, we ran the same models with a calculated percent mortality predicted using dose-addition. We applied the

same additivity model described in the previous *Mixtures* section to predict the cumulative percentage of death in an exposed population. Table 78 shows the model's prediction from three scenarios. We did not use the data from ambient monitoring programs to devise a scenario because the programs were not designed to capture peak concentrations from drift or runoff into juvenile salmonid rearing areas. We did run a few modeling runs with median values of the three insecticides taken from ambient monitoring data. The results showed no statistically significant reductions in lambda for the four populations. In scenario 1, 5% of exposed individuals are expected to die following 4 d exposures to the estimated concentrations from PRZM-EXAMS 24 h averages from EPA's BEs. For carbaryl, we selected a 2 lbs/acre applied aerially with four applications to apples in Oregon which resulted in a concentration of 19 μg/L. For carbofuran, we selected a 2 lb/acre ground application to artichokes in California which resulted in a concentration of 35 μg/L. For methomyl, we selected 0.9 lbs/acre applied ten times to lettuce in California which resulted in a concentration of 88 μg/L. If these events were to occur in a watershed, 5% of the individuals are expected to die, which would not lead to a population-level effect (*i.e.,* reduction in lambda), based on juvenile mortality.

In contrast, the other two scenarios showed substantial and severe percent reductions in lambda for each of the modeled populations; reductions in lambda ranged from 27-52% (Table 78) In scenario 2, we selected 90 d GENEEC-modeled scenarios for corn from Table 50. Concentrations of the three insecticides were as follows: carbaryl = 229 μg/L, carbofuran = 53 μg/L, and methomyl = 49 μg/L. The toxicity is largely a result of the carbaryl concentration, as it was close to the 96 h LC50 of 250 μg/L. In scenario 3, concentrations from drift into off-channel habitats (0.5 m deep) were calculated using the AgDrift model and included a 100 ft no-spray buffer for methomyl. For carbaryl, 5 lb/acre applied once aerially with a fine-medium spray droplet size resulted in a concentration of 335 μg/L. For carbofuran, 1 lb/acre applied once also with a fine-medium spray droplet size resulted in a concentration of 67 μg/L. For methomyl, 0.9 lbs/acre applied once resulted in a concentration of 17.1 μg/L. Cumulatively, these three concentrations would result in 89% mortality of exposed juveniles which reduce lambdas of the four salmonid populations by 41-52%, a substantial effect.

The likelihood of scenarios 2 and 3 occurring is difficult to predict due to the lack of detailed information on watershed characteristics, salmonid presence, the numbers of salmonids exposed, the duration of exposure, and the climatic variables leading to drift. Scenarios 2 and 3 may represent infrequent events, but if a substantial part of a population of listed salmonids is exposed to these mixtures, a severe reduction in a population's abundance is expected.

Table 78. Modeled output for Ocean-type Chinook, Stream-type Chinook, Sockeye, and Coho salmon exposed to 4 d exposures of carbaryl-, carbofuran-, and methomyl-containing mixtures. The table denotes the impacted factors of survival as percent dead, lambda and standard deviation, and percent change in lambda compared to an unexposed population

Scenario 1: PRZM-EXAMS 24-h averages	Ocean-type Chinook	Stream-type Chinook	Sockeye	Coho
% dead	5	5	5	5

Effects to salmonid populations from reduced size of juveniles due to impaired feeding and reduced abundance of aquatic prey

To evaluate the potential for adverse effects to juvenile growth resulting from carbaryl, carbofuran, and methomyl on Pacific salmonid populations, we developed a model (Appendix 1). The model links AChE inhibition, feeding behavior, prey availability, and somatic growth of individual salmon to the productivity of salmon populations expressed as a percent change in lambda (a population's intrinsic rate of growth). The model scenarios (single insecticide or multiple pulses of single insecticides) assume annual exposure of all the subyearling juveniles in the population and their prey to the insecticide. Similar to the survival model, we developed the growth model for four populations of salmonids: ocean-type Chinook, stream-type Chinook, sockeye, and coho salmon.

We integrated two avenues of effect to juvenile salmonids' growth from exposure to the three *N*-methyl carbamates (Appendix 1). The first avenue is a result of AChE inhibition on the feeding success and subsequent effects to growth of juvenile salmonids. Study results with juvenile salmonids show that feeding success is reduced following exposures to AChE inhibitors (Sandahl, Baldwin et al. 2005). The second avenue the model addresses is the potential for reductions in juvenile growth due to reduction in available prey. Salmon are often found to be food limited in freshwater aquatic habitats, suggesting that a reduction in prey due to insecticide exposure may further stress salmon and lead to reduced growth rates. Field mesocosm data support this assertion, showing reduced growth of juvenile fish following exposure to the AChE inhibitor, chlorpyrifos (Brazner and Kline 1990). Furthermore, based on our review of the sensitivities of aquatic invertebrates to the three insecticides, we expect reductions in densities and altered composition of the salmonid prey communities.

Reductions in aquatic prey are included in the model because of the high relative toxicity of pesticides to salmonid prey and the extended duration of effects on prey communities. Juvenile salmonids are largely opportunistic, feeding on a diverse community of aquatic and terrestrial invertebrate taxa that are entrained in the water column or on the surface (Higgs, Macdonald et al. 1995). As a group, these invertebrates are among the more sensitive taxa for which there is toxicity data, but within this group, there is a wide range of sensitivities (Table 64, Table 65).

The three insecticides are highly toxic to aquatic macroinvertebrates; and concentrations that are not expected to kill salmonids are often lethal for their invertebrate prey (*e.g.,* for carbaryl, range of mean LC50s for salmonids = 250-3,000 μg/L, vs. range of geometric mean EC50s for water fleas = 3-120 μg/L). In particular, prey items that are preferred by small juvenile salmonids (including midge larvae, water fleas, mayflies, caddisflies, and stoneflies) are among the most sensitive aquatic macroinvertebrates. In addition, effects on the prey community can persist for extended periods of time (weeks, months, years), resulting in effects on fish feeding and growth long after an exposure has ended (Ward, Arthington et al. 1995; Van den Brink, van Wijngaarden et al. 1996; Liess and Schulz 1999; Colville, Jones et al. 2008).

Selection of aquatic invertebrate toxicity values to represent salmonid prey items

The model requires for each insecticide an EC50 (defined as a 50% reduction in the biomass of salmonid prey items) and a corresponding slope (Appendix 1). The term "EC50" will be used in this section to describe short-term survival data for aquatic invertebrates (death and immobility). To determine what levels of the three pesticides reduce aquatic invertebrate numbers, we reviewed the available field and laboratory studies. We found robust data for carbaryl, carbofuran, and methomyl with respect to laboratory acute toxicity tests that measured survival at 24-, 48-, 72-, and 96 h with an array of aquatic invertebrates. We did not locate a field study that measured aquatic community response to a range of concentrations of the three insecticides. Therefore, we did not select concentration data from field experiments as we did in NMFS' 2008 Opinion on the registration of chlorpyrifos, diazinon, and malathion (NMFS 2008).

To determine a single effect concentration to use in the model analyses, a search was completed using the EPA's ECOTOX database for each pesticide (http://cfpub.epa.gov/ecotox/). Several criteria were used to determine which reported effect concentrations were included in the final analysis. The data included were from studies on taxa that are known to be salmonid prey (or are functionally similar to salmonid prey); these include a diverse group of aquatic insects and worms and fresh and saltwater crustaceans. Studies with exposures of at least 24 h and not more than 96 h were included. Studies examining shorter and longer exposure times are known to affect invertebrates (Peterson, Jepson et al. 2001), but these were excluded so that estimated EC50s would be comparable. Studies reporting survival EC50s in which mortality or immobilization was the recorded endpoint were included. Data derived for sublethal endpoints

(*e.g.*, growth or reproduction) were not included. If specific data were represented more than once in the ECOTOX output, duplicates were eliminated. Data from recent peer-reviewed studies that report survival EC50s were also included (Norberg-King, Durhan et al. 1991; Takahashi and Hanazato 2007). Next, we calculated the geometric mean when more than one survival EC50 was reported for a species.

Probability distributions of aquatic prey survival toxicity values (EC50s)

We plotted the survival EC50 data for each of the three insecticides using cumulative probability distributions. We also plotted the data based on all test results for the species without taking the geometric means. From the distributions of the data, a single effect concentration and slope were derived to best represent the diverse community of prey available in juvenile salmonid freshwater and estuarine habitats. The distributions of individual EC50s and the geometric means of EC50s by taxa were analyzed to estimate the 50th, 10th, and 5th percentiles. Figure 43 shows the distributions of geometric means of EC50s by taxa. Specifically, for each pesticide, a probability plot was used to graph the EC50 concentrations normalized to a normal probability distribution. For each plot, the X axis is scaled in probability (between zero and 100%) and shows the percentage of entire data whose value is less than the data point. The Y axis displays the range of the data on a log scale. The results of a linear regression of the log-transformed concentrations are shown and highlight the lognormal distribution of the data (Figure 43). In the regression equation, the normsinv function returns the inverse of the standard normal cumulative distribution. The standard normal distribution has a mean of zero and a standard deviation of one. For example, given a percentile value of 50 (*i.e.,* a probability of 0.5), normsinv(50) returns a value of zero. The plots and regressions were performed using KaleidaGraph 4.03 (Synergy Software).

Figure 43. Probability plot for each pesticide showing the distribution of the geometric means of the EC50s for each aquatic invertebrate species. The straight line shows the result of a linear regression. In the regression equation, the normsinv() function returns the inverse of the standard normal cumulative distribution. See text for more details. A) Plot of carbaryl EC50s. B) Plot of carbofuran EC50s. C) Plot of methomyl EC50s.

In Table 79, concentrations are reported for each insecticide associated with either the 50th, 10th, or 5th percentiles derived from probability distribution plots with all study results (plots not shown) or with species geometric means. Percentiles from the species geometric means show

higher concentrations compared to the "all studies" plots. This is likely a reflection that when individual study results are considered separately, the species with the greater number of EC50 study results is found at the lower end of the distribution.

Table 79. Carbaryl, carbofuran, and methomyl survival EC50 concentrations at 50th , 10th , and 5th percentiles from probability distribution plots.

	Concentration of EC50 at each percentile (μg/L)		
	50%	10%	5%
All studies probability distribution plot			
Carbaryl	45.23	2.29	0.98
Carbofuran	58.95	0.94	0.29
Methomyl	128.9	12.93	6.74
Species geometric means probability distribution plot			
Carbaryl	69.53	4.33	1.97
Carbofuran	89.95	1.22	0.37
Methomyl	150.76	20.74	11.82

We selected the 10th percentile from each of the pesticide plots to represent the survival EC50 for salmonid prey. The associated 10th percentile for carbaryl (4.33 μg/L), carbofuran (1.22 μg/L), and methomyl (20.74 μg/L) was used as input for the population growth model exercises. The 10th percentile is a reasonable selection because the data included in the meta-analysis were limited to concentrations that caused mortality or immobilization within a short period of time (1-4 days). A growing number of studies on a variety of insecticides have reported that concentrations well below LC50s can cause delayed mortality or sublethal effects that may scale up to affect aquatic invertebrate populations, especially in scenarios with multiple exposures and/or other stressors. Evidence for ecologically significant sublethal or delayed effects to aquatic invertebrates includes reduced growth rates (Schulz and Liess 2001; Forbes and Cold 2005), altered behavior (Johnson, Jepson et al. 2008), reduced emergence (Schulz and Liess 2001; Johnson, Jepson et al. 2008), reduced reproduction (Cold and Forbes 2004; Forbes and Cold 2005), and reduced predator defenses (Sakamoto, Chang et al. 2006; Johnson, Jepson et al. 2008).

Additionally, the available toxicity data – and therefore the data included for these analyses– are from studies using taxa hearty enough to survive laboratory conditions. Studies specifically examining salmonid prey that are more difficult to rear in the laboratory have documented

relatively low survival EC50 values when exposed to current use insecticides (Johnson, Jepson et al. 2008), including carbaryl (Peterson, Jepson et al. 2001; Johnson, Jepson et al. 2008).

The selection of the 10th percentile is a reasonable choice in keeping with general risk management practices of protecting the aquatic community. The standard procedure the U.S. EPA Office of Water uses in establishing Aquatic Life Criteria is to protect to the 5th percentile of a species sensitivity distribution that includes all genera of aquatic species for which valid data are available (EPA 1995). Their procedure involves combining species data into a genus mean value so that multiple tests on one sensitive species do not unduly influence the outcome, and evaluating a specified group of taxa. As we had already selected for the sensitive end of the spectrum by using salmonid prey items, and did not collapse species data into a genus mean, we used the 10th percentile. In the probabilistic risk assessment for carbofuran (EPA 2005), OPP evaluated effects on the 5th, 50th, and 95th percentiles of separate species sensitivity distributions for fish and invertebrates, although it was not clear in the document which was the preferred percentile for risk management.

Modeling availability of unaffected prey

Reductions in benthic invertebrate densities can lead to long-term reductions in prey availability and reductions in fish growth (Davies and Cook 1993). That said, prey densities are not usually reduced to zero (Wallace, Lugthart et al. 1989). Therefore, it is assumed that regardless of the exposure scenario, prey abundance would not drop below a specific "floor" of prey availability. This floor is included in the model to reflect an assumption that a minimal yet constant terrestrial subsidy of prey and/or an aquatic community with tolerant individuals would be available as prey, regardless of pesticide exposure and in addition to the constant recovery rate (see below).

Therefore, even in extreme exposure scenarios, some prey will be available, as determined by the value assigned to the floor; in some highly degraded systems this may or may not be the case. No studies have quantified this floor for the purpose of estimating prey availability, but several studies have documented reductions in overall benthic insect densities of 75-98% (Wallace, Lugthart et al. 1989; Anderson, Hunt et al. 2003; Anderson, Phillips et al. 2006). Because benthic densities are typically correlated with drift densities (Hildebrand 1974; Waters and Hokenstrom 1980), these reductions likely result in similar reductions of prey. Therefore,

assuming there is also some constant rate of terrestrial invertebrate subsidy in addition to a residual aquatic community, a floor of 0.20, or 20% of fish ration, is reasonable. The model does not include any additional impacts to fish via dietary exposure from contaminated prey, or any potential synergistic or additive effects to the aquatic invertebrates that may be result from multiple stressors (Schulz and Liess 2001).

Modeling spikes in invertebrate drift following insecticide exposure

"Catastrophic drift" of invertebrates, due to acute mortality and/or emigration of benthic prey into the water column is frequently observed following exposure to insecticides (Davies and Cook 1993; Schulz and Liess 2001; Schulz 2004). Drift rates within hours of exposure can be more than 10,000 times the natural background drift (Cuffney 1984), and fish have been found to exploit this by feeding beyond satiation (Haines 1981; Davies and Cook 1993). The duration and magnitude of the spike in drift of prey is dependent in part on the physical properties and dose of the pesticide; however, the spike is generally ephemeral and returns to natural, background levels within hours to days (Haines 1981; Kreutzweiser and Sibley 1991). Likewise, the magnitude of the spike is dependent in part on the benthic density of prey; the spike in drift from communities that have been reduced by previous exposures is smaller than the spike from previously undisturbed communities (Cuffney 1984; Wallace, Huryn et al. 1991). To reflect this temporary increase in prey availability, the model includes a one-day prey spike for the day following an exposure (Appendix 1). The model also accounts for this short-term increase in prey availability by allowing fish to feed at a maximum rate of 1.5 times their normal, optimal ration.

Modeling recovery of salmonid prey

We selected a 1% recovery in prey biomass per day. Reports of recovery of invertebrate prey populations, once pesticide exposure has ended, range from within days to more than a year (Cuffney 1984; Kreutzweiser and Sibley 1991; Pusey, Arthington et al. 1994; Ward, Arthington et al. 1995; Van den Brink, van Wijngaarden et al. 1996; Liess and Schulz 1999; Colville, Jones et al. 2008). The dynamics of recovery are complicated by several factors, including the details of the pesticide exposure(s) as well as habitat and landscape conditions (Liess and Schulz 1999) (Van den Brink, Baveco et al. 2007). In watersheds with undisturbed upstream habitats, recovery can be rapid due to a healthy source of invertebrates that can immigrate via drift and/or aerial colonization (for adult insects) (Heckmann and Friberg 2005). However, in watersheds

dominated by agricultural or urban land uses, healthy upstream or nearby habitats may be limited and consequently, recolonization by salmonid prey is likely reduced (Liess and Von der Ohe 2005; Schriever, Ball et al. 2007). Additionally, many large, high-quality prey take a year or more to develop (Merritt and Cummins 1995) indicating that recovery of biomass (as compared to prey density) is likely a limiting factor (Cuffney 1984). Recovery to pre-disturbance levels is unlikely in aquatic habitats where invertebrate abundances are repeatedly reduced by stressors. We consider a 1% (control prey abundance per day) recovery rate as ecologically realistic to represent recolonization by invertebrates in salmonid habitats (Ward, Arthington et al. 1995; Van den Brink, van Wijngaarden et al. 1996; Colville, Jones et al. 2008).

Growth model results

Exposure to single insecticides for 4-, 21- , and 60 day exposure durations

Population model outputs for the four salmon populations are summarized as dose-response curves in Figures 44-47. As expected, greater reductions in population growth resulted from longer exposures to the insecticides. The primary factor driving the magnitude of change in lambda was the Prey Abundance parameter for each insecticide *i.e.*, the 10th percentile survival EC50 for salmonid prey. The AChE parameter for each of the insecticides was a secondary factor compared to Prey Abundance. This is largely because the salmonid EC50s for AChE were much higher, typically by an order of magnitude, than the prey survival EC50s.

Similar trends in effects were seen for each pesticide across all four life history strategies modeled. This is apparent by the similar shape of the dose-response curves across species. The curves plateau when there is no more reduction possible in the aquatic community *i.e.,* the 20% biomass of the aquatic invertebrate community is reached. Once that plateau is achieved, further reductions in lambda are minimal with increasing concentrations. Clearly, the most toxic of the pesticides affected salmon populations at lower concentrations, as is observed with carbaryl and carbofuran where concentrations in the low μg/L range are sufficient to reduce populations' growth rates compared to methomyl where 20 μg/L or greater are needed to reduce lambdas. One factor that contributed to the similar responses observed was the use of the same surrogate toxicity values for all four life history strategies. The stream-type Chinook salmon (Figure 45) and sockeye salmon **(**Figure 46) models produced very similar results as measured as the final

output of percent change in population growth rate. The ocean-type Chinook salmon model output (Figure 44) produced the next most extreme response, and coho salmon output (Figure 46) showed the greatest changes in lambda resulting from the pesticide exposures. When looking for similarities in parameters to explain the ranking, no single life history parameter or characteristic, such as lifespan, reproductive ages, age distribution, lambda and standard deviation, or first-year survival show a pattern that matches this consistent output **(**Appendix 1**)**. Combining these factors into the transition matrix for each life history and conducting the sensitivity and elasticity analyses revealed that changes in first-year survival produced the greatest changes in lambda. While some life history characteristics may lead a population to be more vulnerable to an impact, the culmination of age structure, survival and reproductive rates as a whole strongly influences the population-level response.

Figure 44. Percent change in lambda for Ocean-type Chinook salmon following 4 d, 21 d, and 60 d exposures to carbaryl, carbofuran, and methomyl. Open symbols denote a percent change in lambda of less than one standard deviation from control population. Closed symbols represent a percent change in lambda of more than one standard deviation from control population.

Figure 45. Percent change in lambda for Stream-type Chinook salmon following 4 d, 21 d, and 60 d exposures to carbaryl, carbofuran, and methomyl. Open symbols denote a percent change in lambda of less than one standard deviation from control population. Closed symbols represent a percent change in lambda of more than one standard deviation from control population.

Figure 46. Percent change in lambda for Coho salmon following 4 d, 21 d, and 60 d exposures to carbaryl, carbofuran, and methomyl. Open symbols denote a percent change in lambda of less than one standard deviation from control population. Closed symbols represent a percent change in lambda of more than one standard deviation from control population.

Figure 47. Percent change in lambda for sockeye salmon following 4 d, 21 d, and 60 d exposures to carbaryl, carbofuran, methomyl. Open symbols denote a percent change in lambda of less than one standard deviation from control population. Closed symbols represent a percent change in lambda of more than one standard deviation from control population.

By applying some of these changes in lambda to known threatened and endangered populations' lambdas from Appendix 2, significant reductions in population viabilities are anticipated. For example, if the Puget Sound Chinook salmon Green River population with a lambda of 0.67 is exposed to carbaryl at 10.0 μg/L for 4 d, a concentration attainable in off-channel habitats, we would expect a reduction in lambda by 11% (Table 74) or 8% (Table 75) depending whether the individuals exhibit ocean-type or stream-type life histories. These reductions would be severe to the population and are primarily a result of reductions in juvenile growth from impacts to salmonid prey. Even for those lambdas that are well above one such as Central Valley Chinook salmon Spring Runs' Butte Creek population (lambda = 1.3), reductions of 11% would have major consequences to a population's viability from reduced growth of juveniles. The repercussions to these populations' viabilities are increased with increasing concentrations, durations, multiple applications, and when mixtures are incorporated.

Exposure to multiple applications of carbaryl or methomyl

We constructed two scenarios to evaluate the potential population effects from multiple applications of carbaryl and methomyl (Table 80). We used concentrations from AgDrift model outputs to estimate drift contributions of carbaryl into an off-channel habitat (Table 52). Populations exposed to carbaryl drift within off-channel habitats following four applications would experience severe declines in population growth rate ranging from 15-19%. Interestingly, a single application would result in notable reductions in the four modeled population's lambdas as well, ranging from 8-11%. Similar to the carbaryl modeled scenario, methomyl applied to sweet corn ten times (the label allows for 14 applications at 1 d intervals) resulted in significant reductions in lambdas ranging from 6-8%. A single application did not result in a significant reduction in lambda for any of the four populations.

Table 80. Multiple application scenarios for carbaryl and methomyl and predicted percent change in lambdas for salmon populations

	Carbaryl	Methomyl
Crop examples	Almonds, chestnuts, pecans, filberts, walnuts, pistachios	Sweet corn
Application rate	5 lbs a.i./acre	0.45 lbs a.i./acre
Number of applications/yr	4	10
Application interval	14 days	3 days
Method of application	Aerial (fine-medium droplet distribution)	aerial (fine-medium droplet distribution)
No-application Buffer	none	100 ft
Off-channel habitat characteristics	water depth = 0.5 m Initial average concentration 335 μg/L; 24 h exposure	water depth = 0.5 m Initial average concentration 8.55 μg/L; 96 h exposure
% change in Lambda		
Ocean-type Chinook	-19%	-8%
Stream-type Chinook	-15%	-6%
Sockeye	-16%	-7%
Coho	-18%	-8%

Population-level consequences from other affected salmonid assessment endpoints and other stressors of the action

In this section we present the population-level consequences from individual effects that are not amenable to population modeling. In most cases we lack the empirical data to conduct population modeling for these endpoints. Thus, we use qualitative methods to infer population-level responses. We focus on the population metrics of abundance and productivity. Both are metrics used by NMFS to assess a population's viability and both can be compromised by the chemicals assessed in this Opinion. Individual fitness consequences that reduce survival, growth, reproduction, or migration can lead to reduced salmonid population viability if sufficient numbers of individuals comprising a population are affected, and are more pronounced when affected over multiple generations. If the reductions in fitness result in reducing a population's survival or recovery potential, then we consider whether the ESU or DPS is impacted (See *Integration and Synthesis* section).

With the proposed action it is difficult to place an exact number on the percentage of a population that is affected or how frequently a population is affected because of the lack of information on and wide variability in the spatial and temporal uses of the registered formulations containing carbaryl, carbofuran, and methomyl, compounded by the imperfect data on where salmonids are at any given time. However, NMFS has sufficient information to make reasonable inferences from the available use, exposure, and response data on the likelihood of population-level consequences. Below we address whether the remaining fitness level consequences identified from the risk hypotheses affect the viability of salmonid populations. As mentioned earlier, we focus on the potential for reduced population abundance and productivity.

Impaired swimming and olfactory–mediated behaviors

All life stages of salmonids rely on their inherent ability to smell, to swim, and to navigate through a variety of habitats over their life span and to ultimately spawn successfully in natal waters and complete their life cycle. We have shown that exposure to carbaryl and carbofuran, compared to effects concentrations necessary to impair swimming behaviors, appears sufficient to do so in some environments, especially in rearing locations for the juveniles. Although no data were available to evaluate the effect of methomyl on swimming behavior, we find it reasonable to apply the conclusions drawn for carbaryl and carbofuran due to the chemicals sharing a similar mechanism of toxic action. Specifically, we expect that salmonids with impaired swimming behaviors from AChE inhibition will show reduced feeding, delayed or interrupted migration, reduced survival, and reduced reproductive success. We conclude that exposed populations are likely to have reduced abundance and productivity as a result of impaired swimming.

Based on the information we reviewed for carbaryl, carbofuran, and methomyl on salmonid olfaction, we find differences in expected responses. For carbaryl, we conclude that it is unlikely to affect salmonid olfaction at estimated concentrations. For methomyl, we located no information on its effects to fish olfaction, and given the variation in olfactory responses measured from other AChE inhibitors (OPs and carbamates) it is uncertain whether methomyl will affect olfaction. For carbofuran, definitive evidence shows that olfaction in fish is affected at low μg/L concentrations.

Because olfaction plays an important role in a suite of ecologically relevant behaviors that are affected when an individual salmonid's olfaction is impaired, we include this endpoint in our analysis. Lack of predator avoidance behaviors by juvenile and adult salmonids reduces the probability of surviving predation events. Juvenile salmonids with impaired olfaction may fail to properly imprint on their natal waters, which later in life leads to adults straying *i.e.,* migrating into and spawning in streams other than their natal stream. Adults that do not return to natal waters are a functional loss to recruitment of a population. Adult male salmonids that do find their way back to natal stream or river reaches and are subsequently exposed to the three insecticides may lose some or all of their olfactory capacity, even from a short-term exposure. Female salmonids release odorants to trigger male priming hormones and to alert males of a female's spawning condition. However, male fish with reduced olfactory capacity may not detect these cues, as demonstrated in a study on carbofuran (Bretaud, Saglio et al. 2002). Thus spawning synchronization could be compromised and recently laid eggs may go unfertilized. Unfertilized eggs may result in reduced productivity and abundance for a population if sufficient numbers of spawning events are missed. Again, we find it difficult to accurately predict when these impairments and missed spawning opportunities occur, primarily as a result of incomplete pesticide use information, difficulty in conducting field experiments with adult salmonids, and uncertainties surrounding extent of effects and concentrations which may trigger them. Because imprinting, avoiding predators, homing, and spawning are likely affected when exposed to carbofuran, we conclude these additional effects cannot be dismissed. Therefore, we expect populations exposed to carbofuran will show reduced reproductive rates, reduced return rates, and reduced intrinsic rates of growth when sufficient numbers of individuals are affected.

Starvation during a critical life stage transition

Salmonids emerge from redds (nests) with a yolk-sac as their initial food source (yolk-sac fry). Once the yolk-sac has been completely absorbed, they must begin exogenous feeding. Fry have limited energy reserves, and if they are unable to properly swim or detect and capture prey the onset of starvation occurs rapidly. Because juvenile salmon are limited by gape width, prey at this stage are limited to very small aquatic invertebrates. The stressors of the action likely affect this critical life stage transition in several ways, leading to increased early life stage mortality. Impaired swimming and olfaction affects the fry's ability to detect and capture prey. Prey may

be killed outright by the stressors of the action leading to reduced prey availability or the complete absence of prey. These same areas also have off-channel habitats where fry seek shelter and food and those areas are highly susceptible to the highest concentrations of the three insecticides. Therefore, we expect reductions in a population's abundance where transitioning yolk-sac fry are exposed to the stressors of the action. All salmonid ESUs share this common life stage transition and therefore are at risk.

Death of returning adults

We discussed and analyzed with models the importance of juveniles to population viability. However, we did not address possible implications of returning adults dying from exposure to the stressors of the action. An adult returning from the ocean to natal freshwaters is important to a population's survival and recovery for many reasons. Notably, less than one percent of adults generally complete their life cycle. For populations with lambdas well below 1, every adult is crucial to a population's viability. We expect that some sensitive adults will die from short-term exposures before they spawn within some of the populations, particularly those that spawn in intensive agricultural watersheds and urban/suburban environments where elevated temperatures, other AChE-inhibiting insecticides, and low pHs are present. The lower end concentrations that kill 50% of exposed salmonids fall in the hundreds of μg/L. For methomyl, we expect that fewer adults would die compared to carbofuran and carbaryl based on differences in toxic potencies. We still expect that sensitive individuals exposed to concentrations below the LC50 will die. These concentrations are expected in habitats receiving drift from aerial applications. The persistence of these concentrations will vary with habitat, but for those habitats with lower pHs and minimal flow sensitive adult salmonids are expected to be killed. We cannot quantify the number of adults lost to a given population in a given year. For those populations where each adult salmonid is important to viability, we expect reductions in both productivity and abundance.

Synergistic toxicity

With certain combinations and specific concentrations of carbaryl and carbofuran, synergism occurs, translating into increased inhibition of AChE and in some cases increased rates of mortality among exposed salmonids. We have no data either supporting or refuting synergism for methomyl. We have no predictive models for synergistic toxicity. However, where we

expect co-occurrence of the three insecticides, we expect synergism may occur if high enough concentrations exist. Generally, these concentrations must exceed individual LC50s for the three compounds, which is most likely to occur in areas with extensive crop uses where applications overlap in space and time. In these areas, even more fish would die from synergistic effects than predicted based on the additive toxicity for carbaryl, carbofuran, and methomyl. Juveniles and returning adults may experience synergistic toxicity. Whether or not death occurs is dependent on exposure duration and concentrations of the three insecticides. Typically, adults are less sensitive than early lifestages, however it is very difficult to conduct toxicity assays with pre-spawn adult salmoninds. Pre-spawn adults have used up most of their accumulated fat, converting it into gamete production, and will die soon after spawning. We are unsure how sensitive these adults are to toxic pesticides, but expect in their physiological state that they will be as or more sensitive than juveniles. We expect that some adults that occupy or spawn in shallow, low flow systems will be impacted from synergistic toxicity. Therefore, population-level effects could be more pronounced, depending upon the number of individuals and the importance of those individuals to the survival and recovery of the population. We conclude that based on the expected environmental concentrations of the three insecticides, synergism is likely in many off-channel habitats resulting in increased rates of death to juveniles and to adults.

Toxicity from other stressors of the action

We identified inert ingredients, adjuvants (NP), tank mixtures (recommended on pesticide product labels), degradates (1-napthol, 3-hydroxycarbofuran), and other pesticide a.i.s (malathion, bifenthrin, rotenone, metaldehyde, captan, and cupric sulfate) as toxic to salmonids and their prey. There remain substantial data gaps on the expected concentrations of these chemicals in salmonid habitats. However, some chemicals are detected at concentrations that pose substantial risk to listed salmonids and their prey (*e.g.,* malathion, NP). The risk posed by these other stressors to salmonid populations is complicated by the same factors we discussed for carbaryl, carbofuran, and methomyl (*i.e.,* the numbers of individuals exposed, the uncertainty surrounding the temporal and spatial uses of these chemicals, etc.). Severe population reductions of Atlantic salmon in Canada were attributed specifically to the use of NP within a pesticide formulation (Fairchild, Swansburg et al. 1999; Brown and Fairchild 2003). We conclude that given the use and co-application of these chemicals with carbaryl, carbofuran, and methomyl, exposed individuals are at increased risk of the suite of toxic effects expected from these

substances. Substantial uncertainty also exists regarding the identity of other ingredients in formulations further complicating our ability to predict overall toxicity to salmonids and their prey as a result of pesticide use. Exposed populations are at increased risk of reduced abundance and productivity from these chemicals. However, NMFS is unable to accurately describe the level of risk.

Conclusion on population-level effects

We conclude that many of the populations of threatened and endangered salmonids covered by this consultation will likely show reductions in viability, particularly those that are comprised of juvenile life histories that rear for weeks to years in freshwater habitats found in intensive agricultural and residential/urban areas. Juvenile coho salmon, steelhead, and ocean- and stream-type Chinook salmon use these types of rearing areas for extended periods which overlaps with pesticide applications. Of greatest concern are for those independent populations for each ESU or DPS distributed in high use areas of carbaryl, carbofuran, and methomyl.

Based on these facts, we expect that where the geographic range of listed populations overlaps with intensive cropping patterns and urban/residential areas severe effects to abundance and productivity are anticipated from exposure to the three pesticides. However, due to the impending phase out of carbofuran, we expect the likelihood of exposure and therefore toxicity to decline rapidly as existing products stocks are depleted. Population effects are largely a result of reduced salmonid prey abundances and subsequent reduced growth of juveniles. Although less of a factor, individual fitness consequences are also likely in some areas due to impaired swimming.

Effects to Designated Critical Habitat: Evaluation of Risk Hypotheses

Presently, critical habitat has been designated for 26 of the 28 listed salmonid ESUs, all of which is located within the action area. Designated critical habitat within the action area includes spawning and rearing areas, freshwater migratory corridors, and nearshore and estuarine areas, and includes essential physical and biological features. When NMFS designated critical habitat for the 26 salmonid ESU/DPSs, NMFS identified PCEs essential for the conservation of the species. The PCEs NMFS identified are those sites and habitat components that function to

support one or more lifestages. For this opinion, the primary PCEs potentially affected are prey availability and water quality degradation in spawning and rearing areas, freshwater migratory corridors, and nearshore and estuarine areas.

The effects of the proposed action on prey and water quality PCEs are addressed below by weighing the available evidence either supporting or refuting the critical habitat-related risk hypotheses. NMFS reviewed and presented the toxicological information available for habitat assessment endpoints within the *Response Analysis* section. Included are the PCEs prey availability and water quality. If these PCEs are likely impacted by the stressors of the action, we address the potential for reductions to the associated conservation value of the designated critical habitat in the *Effects of the Proposed Action to Designated Critical Habitat* Section.

Critical Habitat Risk Hypotheses based on potential effects to PCEs:

> *Risk Hypothesis 1. Exposure to the stressors of the action is sufficient to reduce abundances of aquatic prey items of salmonids.*

We evaluated two lines of evidence to determine whether this hypothesis is supported by the available information. The first is whether data support the occurrence of adverse effects to salmonid prey items from the stressors of the action. The second is whether reductions in abundances of salmonid prey items occur in areas of documented exposure to the stressors of the action. We found overwhelming evidence in support of the first line of evidence. The stressors of the action are expected to kill large numbers and types of aquatic species that serve as prey to salmonids, especially when carbaryl, carbofuran, and methomyl are present together and/or co-occur with other insecticides. The concentrations we summarized indicate that alone each of the insecticides can also kill prey at expected environmental concentrations.

The IBI and other metrics of aquatic community health were reviewed to evaluate the second line of evidence. In areas of intensive agriculture, where we expect use of the stressors of the action, biological integrity is often significantly reduced (Cuffney et al 1997). Many of the preferred salmonid prey items are present only in low numbers or absent altogether in these areas. We see similar depauperate communities in urban areas. We recognize many other limiting factors contribute to poor condition of these aquatic communities. However, these

insecticides and their formulations may be responsible for a substantial portion. In fact, several studies have shown toxicity to salmonid prey items from field collected waters and sediment due to pesticide residues (Cuffney, Meador et al. 1997; Hall, Killen et al. 2006).

We therefore expect that spawning, rearing, and migratory areas will be affected by the stressors of the action resulting in reduced abundances of aquatic prey items. The magnitude in reduction of prey is difficult to ascertain, however where designated critical habitats overlap with high potential use areas such as agricultural or urban dominated flood plains, we expect pronounced reductions. These areas support fry and juvenile growth and development which are predicated on an abundant and diverse source of prey. Reductions in prey availability may affect the conservation value and the ability of the habitat features to support salmonids. In summary, the available information shows prey items of ESA-listed salmonids are affected by the stressors of the action to an extent warranting an analysis of whether the conservation value of designated critical habitat is negatively affected.

> *Risk hypothesis 2. Exposure to the stressors of the action is sufficient to degrade water quality in designated critical habitat.*

We addressed this hypothesis by comparing exposure concentrations to toxicity data. The results of the comparison indicate that expected concentrations from the proposed action trigger adverse effect levels for salmonids and their prey (see *Exposure Analysis* and *Response Analysis* sections). Based on pesticide uses described in the *Description of the Action* section coupled with expected concentrations presented in the *Exposure Analysis* section (*i.e.,* concentrations derived from surface water monitoring data, EPA and NMFS modeling estimates), we expect these concentrations to be present in designated critical habitat and therefore to degrade water quality. In many of the watersheds containing designated critical habitats, water quality is identified as a major limiting factor to salmonid production. The proposed action is likely to further degrade water quality in spawning, rearing, and migratory areas. Collectively, this information supports the conclusion that designated critical habitats are likely degraded throughout the four states and further analysis is warranted to determine the potential to reduce the conservation value of designated critical habitats.

We attempted to compare expected concentrations of these pesticides to U.S. Water Quality Criteria designated pursuant the Clean Water Act, however none are published. We then evaluated whether any of the state waters within designated critical habitat are listed as impaired by carbaryl, carbofuran, and/or methomyl by searching state 303(d) lists (discussed in the *Environmental Baseline* section). Currently, state water quality standards have been developed for carbaryl and carbofuran, but not for methomyl. Unfortunately, surface water sampling is not conducted on all freshwater habitats (including designated critical habitats) within the action area and as a result we do not discount areas not sampled. For these reasons, it is also not possible to determine from 303(d) lists the magnitude of water quality degradation to designated critical habitat. We also do not rely on 303(d) lists as the sole source of information for degradation of water quality. In California, Oregon, and Washington some streams have been placed on the 303(d) list for carbaryl and carbofuran (see *Environmental Baseline* section) which indicates that water quality can be degraded by the stressors of the action in salmonid habitats. We located no listings for methomyl, and we located no listings for the three pesticides in the state of Idaho.

Areas of Uncertainty

In this section we list the predominant uncertainties and data gaps uncovered by our analysis of the effects of the proposed action. We do not discuss the entire suite of uncertainties, but highlight those likely have the most influence on the present analysis.

- Description of the action. We lacked a complete description of EPA-authorized uses of pesticides containing carbaryl, carbofuran, and methomyl as described in labeling of all pesticide products containing these a.i.s.

- Exposure resulting from non-agricultural uses. We lacked exposure estimates of stressors of the action associated with non-agricultural uses of these pesticides.

- Exposure to and toxicity of pesticide formulations and adjuvants. Minimal information was found on formulations, adjuvants, and on other/inert ingredients within registered formulations.

- Exposure to mixtures. We lacked information on permitted tank mixtures. Additionally, given that relatively few tank mix combinations are prohibited, it was not feasible to evaluate all potential combinations of tank mixtures. Pesticide mixtures are found in

freshwater throughout the listed-salmonid habitat areas. However, mixture constituents and concentrations are highly variable.

- Toxicity of mixtures. The toxicity of most environmental mixtures is unknown.

- Synergistic responses. Exposure to combinations of carbaryl, carbofuran, methomyl, and/or other combinations of OP and carbamate insecticides can result in synergistic responses. However, we are not aware of a method to predict synergistic responses.

Cumulative Effects

Cumulative effects include the effects of future state, tribal, local, or private actions that are reasonably certain to occur in the action area considered by this Opinion. Future federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA.

During this consultation, NMFS searched for information on future state, tribal, local, or private actions that were reasonably certain to occur in the action area. NMFS conducted electronic searches of business journals, trade journals, and newspapers using Google and other electronic search engines. Those searches produced reports on projected population growth, commercial and industrial growth, and global warming. Trends described below highlight the effects of population growth on existing populations and habitats for all 28 ESUs/DPSs. Changes in the near-term (five-years; 2014) are more likely to occur than longer-term projects (10-years; 2019). Projections are based upon recognized organizations producing best available information and reasonable rough-trend estimates of change stemming from these data. NMFS analysis provides a snapshot of the effects from these future trends on listed ESUs.

States along the Pacific west coast, which also contribute water to major river systems, are projected to have the most rapid growth of any area in the U.S. within the next few decades. This is particularly true for coastal states. California, Idaho, Oregon, and Washington are forecasted to have double digit increases in population for each decade from 2000 to 2030 (USCB 2005). Overall, the west coast region [which also includes four additional states (Arizona, Utah, Nevada, and Alaska) beyond the action area] had a projected population of 65.6 million people in 2005. This figure will eventually grow to 70.0 million in 2010 and 74.4 million in 2015. At this rate, such growth will make the Pacific coast states the most populous region in the nation.

Although general population growth stems from development of metropolitan areas, growth in the western states is projected from the enlargement of smaller cities rather than from major metropolitan areas. Of the 42 metropolitan areas that experienced a 10% growth or greater

between 2000 and 2007, only seven have populations greater than one million people. Of these major cities, one and two cities are from Oregon and California, respectively. They include Portland-Vancouver-Beaverton, OR (1.83%/year), Riverside-San Bernadino-Ontario, CA (3.63%/year), and Sacramento-Arden-Arcade-Roseville, CA (2.34%/year).

Urban Growth

As these cities border coastal or riverine systems, diffuse and extensive growth will increase overall volume of contaminant loading from wastewater treatment plants and sediments from sprawling urban and suburban development into riverine, estuarine, and marine habitats. Urban runoff from impervious surfaces and roadways may also contain oil, heavy metals, PAHs, and other chemical pollutants and flow into state surface waters. Inputs of these point and non-point pollution sources into numerous rivers and their tributaries will affect water quality in available spawning and rearing habitat for salmon. Based on the increase in human population growth, we expect an associated increase in the number of NPDES permits issued and the potential listing of more 303(d) waters with high pollutant concentrations in state surface waters.

Mining

Mining has historically been a major component of western state economies. With national output for metals increasing at 4.3% annually (little oil, but some gas is drawn from western states), output of western mines should increase markedly (Woods and Figueroa 2007). Increases in mining activity will add to existing significant levels of mining contaminants entering river basins. Given this trend, we expect existing water degradation in many western streams that feed into or provide spawning habitat for threatened and endangered salmonid populations will be exacerbated.

Agriculture

As the western states have large tracts of irrigated agriculture, a rise in agricultural output is anticipated. Impacts from heightened agricultural production will likely result in two negative impacts on listed Pacific salmonids (Woods and Figueroa 2007). The first impact is the greater use and application of pesticide, fertilizers, and herbicides and their increased concentrations and

entry into freshwater systems. Carbaryl, carbofuran, and methomyl, and other pollutants from agricultural runoff may further degrade existing salmonid habitats. Second, increased output and water diversions for agriculture may also place greater demands upon limited water resources. Water diversions will reduce flow rates and alter habitat throughout freshwater systems. As water is drawn off, contaminants will become more concentrated in these systems, exacerbating contamination issues in habitats for protected species.

Recreation

The western states are widely known for scenic and natural beauty. Increasing resident and tourist use will place additional strain on the natural state of park and nature areas that are also utilized by protected species. Hiking, camping, and recreational fishing in these natural areas is unlikely to have any extensive effects on water quality.

The above non-federal actions are likely to pose continuous unquantifiable negative effects on listed salmonids addressed in this Opinion. Each activity has undesirable negative effects on water quality. They include increases in sedimentation, loss of riparian shade (increasing temperatures), increased point and non-point pollution discharges, decreased infiltration of rainwater (leading to decreases in shallow groundwater recharge, decreases in hyporheic flow, and decreases in summer low flows).

Nevertheless, there are also non-federal actions likely to occur in or near surface waters in the action area that may have beneficial effects on the 28 ESUs. They include implementation of riparian improvement measures, fish habitat restoration projects, and BMPs (*e.g.,* associated with timber harvest, grazing, agricultural activities, urban development, road building, recreational activities, and other non-point source pollution controls).

NMFS expects many of the current anthropogenic effects described in the *Environmental Baseline* will continue. Listed Pacific salmonids are exposed to harvest, hatchery, hydropower, and habitat degradation activities. With regard to water quality, fish are continually exposed to pesticides, contaminants, and other pollutants during their early life history phase and during adult migratory returns to their natal streams for spawning.

NMFS also expects the natural phenomena in the action area (*e.g.,* oceanographic features, ongoing and future climate change, storms, natural mortality) will continue to influence listed Pacific salmonids as described in the *Environmental Baseline*. Climate change effects are expected to be evident as alterations to water yield, peak flows, and stream temperature. Other effects, such as increased vulnerability to catastrophic wildfires, may occur as climate change alters the structure and distribution of forest and aquatic systems.

Coupled with EPA's registration of carbaryl, carbofuran, and methomyl, climate change, and the effects from anthropogenic growth on the natural environment will continue to affect and influence the overall distribution, survival, and recovery of Pacific salmonids in California, Idaho, Oregon, and Washington.

Integration and Synthesis

The Integration and Synthesis section is the final step of NMFS' assessment of the risk posed to listed Pacific salmonids and critical habitat as a result of EPA's registration of carbaryl, carbofuran, and methomyl. In this section, we perform two evaluations: whether it is reasonable to expect the proposed action is likely to (1) reduce both survival and recovery of the species in the wild and (2) result in the destruction or adverse modification of designated critical habitat.

To address species survival and recovery, we discuss the likelihood of the proposed action to reduce the viability of the salmonid species to such an extent that increased extinction rates are likely. Specifically, we address whether we expect reductions in a population's abundance and productivity from the stressors of the action to affect a species (ESU or DPS). We also address whether the conservation value of the physical and biological features of critical habitat is retained. We address whether we expect reductions in the PCEs for prey availability and degradation of water quality from the stressors of the action to reduce the conservation value of designated critical habitat. Conclusions for each ESU/DPS and associated designated critical habitat are found in the *Conclusion* section.

Effects of the Proposed Action at the Species Level

In our *Effects of the Proposed Action* section we assessed the effects of the federal action to listed Pacific salmonids. We discussed the exposure, response, and risks to individuals when they co-occur with the allowable uses of carbaryl, carbofuran, and methomyl. In addition to the a.i.s, we also considered their metabolites and degradates, other active and inert ingredients included in their product formulations, tank mixtures, and adjuvants authorized on their product labels within the action area. Our analysis also considered the possibility of co-occurrence of carbaryl, carbofuran, or methomyl with other AChE-inhibiting pesticides resulting in additive or synergistic effects to salmonids within freshwater habitats. We assessed the stressors of the action in the context of differing life histories, declining populations, and degraded water quality and habitat conditions within the distribution of listed species.

The life history of listed salmonids plays a large role in determining exposure. Adult salmon and steelhead spend weeks to several months in freshwater habitats during their migration and spawning. Immediately after emerging from the gravel substrate, salmonid fry move to habitat where they can swim freely and forage. Chinook salmon, coho salmon, and steelhead fry typically select off-channel habitats associated with their natal rivers and streams. Off-channel habitats provide fry with protection from the primary water flow within rivers and streams. Diverse invertebrate communities also populate off-channel habitats, adding to juvenile salmonids' reliance on these areas. Coho salmon and steelhead rear in freshwater for more than a year. Sockeye salmon fry most frequently distribute to shallow beach areas in the littoral zones of lakes before moving into deeper water and taking on a more pelagic existence. In contrast, chum salmon migrate downstream to estuaries near the mouth of their parent stream almost immediately. Fry reside in estuaries for as little as one or two weeks before moving offshore or into deeper habitats within the nearshore environment.

Based on general knowledge of field runoff and drift from pesticide applications, we expect higher pesticide concentrations in edge-of-field, low-flow, and shallow aquatic systems. Therefore, Chinook salmon, coho salmon, and steelhead have an increased risk of exposure due to their preference for off-channel habitats. Coho salmon and steelhead are at greater risk of exposure because of their extended residency periods.

We expect carbaryl, carbofuran, and methomyl found in surface water runoff and pesticide drift will cause acute lethality and sublethal effects to juvenile salmonids. Based on exposure for four days at the reported LC50s, a severe consequence to a salmonid population's growth rate is expected. The most pronounced effects are within off-channel habitats based on NMFS exposure estimates. The likelihood of population-level effects as a result of mortalities of juvenile salmonids increases as populations spend longer periods in freshwater adjacent to agricultural or developed areas. Species at the greatest risk include steelhead, coho, stream-type Chinook, and ocean-type Chinook salmon.

Methomyl concentrations required to result in population-level impacts are not expected to occur in the majority of aquatic habitats used by juveniles. However, we expect that carbaryl and

carbofuran applications could cause population-level effects through acute mortality of juveniles, particularly in areas of intensive agriculture and large urban or residential areas. We also expect acute mortalities of juveniles from applications of carbaryl to forests and from exposure to 24(c) carbaryl applications in estuaries in Washington State. However, we do not know how many individuals are exposed each year due to these uses.

Sublethal effects caused by AChE inhibition, such as impaired swimming and olfactory-mediated behaviors, are also expected to result in adverse population-level effects. Swimming is a critical function for salmonids. Individuals with impaired swimming ability will show reduced feeding, delayed or interrupted migration, reduced survival, and reduced reproductive success. We expect that carbaryl, carbofuran, and methomyl will occur at concentrations high enough to impair swimming ability in occupied shallow water habitats. These effects may lead to population-level consequences that hinder the survival and recovery of listed species.

Olfactory-mediated behaviors are also vital for salmonid survival. These behaviors include detecting and avoiding predators, recognizing kin, locating natal waters for spawning, and reproduction. Juvenile salmonids with impaired olfactory-mediated behaviors can lose their ability to imprint on natal streams and avoid predators. Spawning is triggered by olfactory-mediated cues given and received by both sexes. If olfaction is inhibited, salmon may not recognize these cues, resulting in reduced reproduction. The available information suggests that carbaryl does not inhibit olfaction. Therefore, we do not expect to see effects to olfactory mediated behaviors from carbaryl exposure. Currently there is not enough information to determine the effect of methomyl on olfaction. However, exposure to carbofuran at low µg/L concentrations will likely result in the impairment of olfactory-mediated behaviors. That in turn will lead to increased predation and ultimately reduced juvenile and adult survivorship. As pesticide exposure increases we expect to see more pronounced effects due to additive and synergistic effects.

We also expect indirect effects from the a.i.s through reduced salmonid prey abundance and subsequent reduced juvenile growth and probability of survival. Feeding during the period immediately following emergence is vital for the survival of all ESA-listed Pacific salmonid fry.

Once fry have completely absorbed the yolk-sac, they are dependent on the local invertebrate population and may starve if sufficient food is not available. As salmonid prey are sensitive to the expected exposures to each of the insecticides, as well as from mixtures containing the three a.i.s, we expect death and a variety of sublethal effects to salmonid prey. If the salmonid prey base is limited while fry are in this life stage, juvenile growth will be significantly hindered. Many of the invertebrate communities are already degraded due to poor habitat conditions and poor water quality. These conditions make it more difficult for the prey base to recover following an exposure event. Thus, juvenile survivorship will be low and may consequently lead to a decrease in lambda for the affected population.

Based on the NMFS growth models, a four-day exposure to expected concentrations of carbaryl, carbofuran, and methomyl will substantially reduce a population's growth rate due to prey base reduction. All four life history types modeled demonstrated this effect. As exposure duration increases, we expect more pronounced effects on salmonid prey abundance and a longer prey recovery period leading to further reduced salmonid growth and decreased survival.

We expect that all effects will be more pronounced in drainage basins that include high use areas, *i.e.,* major agricultural, urban, or residential centers. To determine which ESUs/DPSs will be affected by the action, we compare the range of each species to the locations of high use land classes. Species that occupy major agricultural basins, such as the Willamette basin or California Central Valley, have a much higher risk of exposure than species found in uninhabited, non-agricultural areas.

California Coastal Chinook Salmon

The CC Chinook salmon ESU consists of 10 historically functionally independent populations in California from Humboldt County in the north to Sonoma County in the south. Historic annual escapement was around 73,000 fish with most of these being produced in the Eel River. Today, annual returns to the Eel River system is estimated at 150 to 2,800 fish. Runs in the Russian River may be viable, though the short-term trend is negative. Lack of data precludes development of population growth rates or trends for all other populations.

The *Status of Listed Resources* and *Environmental Baseline* sections indicate that fisheries, timber harvest, vineyards and other agriculture, non-native fish species, and migration barriers negatively affect this ESU. Adverse effects on Chinook salmon habitat include a high percentage of fines in the streams' bottom substrate, lack of large instream woody debris, reduced riparian vegetation, elevated water temperatures, degraded water quality, increased predation, and barriers that limit access to tributaries. The combined impacts from these multiple threats continue to affect the CC Chinook salmon. Accumulation of fine sediment in the bottom substrate, contamination of waters, lack of riparian vegetation, and non-natives fish species are expected to impact invertebrate abundance and composition in streams within the ESU.

Most of the agriculture and urban developments are concentrated in the Russian River valley and on alluvial plains of coastal rivers. Vineyards and smaller centers are dispersed along coastal watersheds. Based on the crop types, we expect carbaryl and methomyl are commonly applied throughout the growing season in the Russian River basin. We also expect use of the a.i.s on the alluvial plain of the lower Eel River and its estuary, and to a lesser extent along the lower portions and estuaries of other coastal streams. Carbaryl is expected to be used the entire year within urban/residential areas. Existing stocks of carbofuran are also expected to be applied throughout the growing season. In California, there are 61 pesticides that inhibit AChE approved for use and we expect that application of other AChE inhibiting pesticides will co-occur with the a.i.s, exacerbating adverse effects from AChE inhibition. However, monitoring data for pesticides in streams within the CC Chinook salmon ESU is lacking. Adults within Willapa Bay during 24(c) carbaryl application to oyster beds are likely exposed to this compound and may experience additional mortalities.

CC Chinook spawning occurs on gravel beds in the mainstem of rivers and larger tributaries. Fry use the floodplain, stream margins, and side channels to rear after emergence from the redds in December through mid-April. Downstream migration of juveniles starts as early as February and most enter marine waters before mid-summer.

We expect the proposed uses of carbaryl and carbofuran pesticide products that contaminate aquatic habitats will lead to individual fitness level consequences and subsequent population-

level consequences. Land use and crop type data indicate that, while not a major agricultural center, the CC Chinook will be exposed to all three a.i.s. We expect that exposure to methomyl may lead to individual fitness consequences, but not to an extent that would affect population growth rates. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl and carbofuran, but low for methomyl.

Central Valley Spring-run Chinook Salmon

The CV Spring-run Chinook salmon ESU includes four populations of Spring-run populations in the upper Sacramento River and its tributaries. The distribution within the Sacramento River basin is now mostly restricted to accessible areas below dams in the mainstem river and in three of its tributaries: Deer, Mill, and Butte Creeks. Abundance remains far below the estimated 700,000 once entering the Sacramento-San Joaquin Rivers system. The number of Spring-run Chinook salmon spawning in the Sacramento River has averaged about 9,800 annually since 2000. While most populations within the ESU are at or above replacement, the Sacramento River population has been steadily decreasing.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include impaired or loss of habitat, predation, contamination, and water management. Reservoir dams in the Sacramento River have prevented the ESU from using its historic spawning locations. Physical channel habitat has been altered through sediment input from mining, levee construction, and removal of riparian vegetation for levee maintenance. Detected pesticides in the Sacramento River include thiobencarb, carbofuran, molinate, simazine, metolachlor, and dacthal, chlorpyrifos, carbaryl, and diazinon. State and federal water diversions in the south Sacramento-San Joaquin Delta (Delta) have resulted in increased mortality through prolonged migration and entrainment at the water diversion facilities. We also expect that application of other AChE inhibiting pesticides will co-occur with carbaryl, carbofuran, and methomyl in the waters within the ESU and exacerbate adverse effects from AChE inhibition.

With the high density of agriculture in the Sacramento River valley and the Sacramento-San Joaquin Delta (Delta), application of all three a.i.s is expected. Large urban centers occur along the Sacramento River and San Francisco Bay. Young and adult migrating Chinook salmon are

also exposed to poor water quality from agricultural runoff that enters the Delta from the San Joaquin River. Carbaryl and methomyl can be applied to several crops throughout the growing season in the Central Valley. Existing stocks of carbofuran are also expected to be applied throughout the growing season. Carbaryl is approved for use throughout the year within urban/residential areas

The CV Spring-run Chinook salmon is categorized as an ocean-type fish. The young salmon emerge from the gravel from November through May and outmigration starts within four months. While the majority emigrates soon after emergence, some juveniles emigrate as yearlings with the onset of fall storms. Juveniles' seaward migration follows the mainstem Sacramento River, through the Delta, and across San Francisco Bay. Off-channel habitats within the lower Sacramento River floodplains, especially the Yollo Bypass, are particularity important for CV Chinook salmon juveniles during rearing and migration (Sommer, Nobriga et al. 2001; Sommer, Harrell et al. 2005).

The widespread uses of these pesticides have substantial overlap with rearing and migratory habitat of the CV Spring-run Chinook salmon ESU. The CV Spring-run Chinook salmon exhibit high variation in abundance, have restricted distribution, and are exposed to pesticides and other pollutants during rearing and downstream migration. We expect the proposed uses of the three carbamates may contaminate aquatic habitats and lead to both individual fitness and subsequentr population-level consequesnces. Therefore, the risk to this species' survival and recovery from the stressors of the action is high from carbaryl, carbofuran, and methomyl.

Lower Columbia River Chinook salmon

The LCR Chinook salmon ESU includes 32 historical populations in tributaries from the ocean to the Big White Salmon River, Washington and Hood River, Oregon. The ESU also includes 17 artificial propagation programs. LCR Chinook salmon numbers began to decline by the early 1900s from habitat degradation and excessive harvest rates. Many of these populations have low abundance. The annual population growth rates for 14 independent populations range from 0.93 to 1.037.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include hydromorphological changes from hydropower development, loss of tidal marsh and swamp habitat, and reduced or eliminated access to subbasin headwaters from by the construction of non-federal dams. LCR Chinook salmon spawning and rearing habitats in tributary mainstems have been adversely affected by sedimentation, elevated water temperature, and reduced habitat diversity. The survival of yearlings in the ocean is also affected by habitat conditions in the estuary, such as changes in food availability and the presence of contaminants.

NAWQA sampling in surface waters within the ESU range detected more than 50 pesticides in streams. Concentrations of ten pesticides, including carbaryl and carbofuran, also exceeded EPA's chronic toxicity aquatic life criteria (Wentz, Bonn et al. 1998). The combined impacts from these multiple threats continue to affect this ESU.

Most of the highly developed land and agricultural areas in this ESU's range are adjacent to salmonid habitat. Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. Registered 24(c) uses in Oregon include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. Based on land use patterns, we expect the highest exposure to these chemicals to occur in the Lewis River basin, Clackamas River basin, and Hood River basin.

Mature LCR Fall-run Chinook salmon enter freshwater in August through October to spawn in large river mainstems. After emergence, fry typically select off-channel habitats associated with their natal rivers and streams. Juveniles eventually emigrate from freshwater, usually within six months of hatching. LCR Spring-run Chinook salmon enter freshwater in March through June to spawn in upstream tributaries. These fish generally emigrate from freshwater as yearlings. As juveniles overwinter in shallow, freshwater habitats, they are likely to experience higher exposure to pesticides, other contaminants, and elevated temperature. In northern rivers, juveniles may rear in freshwater for two years or more. Given their long residence time in shallow freshwater habitats, LCR Chinook salmon are vulnerable to high pesticide exposures. Also, if adults and juveniles are within Willapa Bay during 24(c) carbaryl application to oyster beds they are likely exposed to this compound and may likely experience additional mortalities.

Given the life history of LCR Chinook salmon, we expect the proposed uses of carbaryl, carbofuran, and methomyl pesticide products may contaminate aquatic habitats and lead to individual fitness and subsequent population-level consequences. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Upper Columbia River Spring-run Chinook salmon

The UCR Spring-run Chinook salmon ESU includes 11 populations and 7 artificial propagation programs in the state of Washington. The four known annual population growth rates range from 0.99 to 1.1. Based on 1980-2004 returns, the average annual population growth rate for this ESU is estimated at 0.93. One historical population is considered extinct.

The major threats to UCR Chinook salmon identified in the *Status of Listed Resources* and *Environmental Baseline* sections include reduced tributary stream flow and impaired fish passage from hydroelectric dams. Additionally, degradation of the tributary habitat and impaired water quality from development negatively affect this ESU. Pesticide detections in UCR Chinook salmon freshwater habitats are well documented. NAWQA sampling from 1992-1995 in the Central Columbia Plateau detected numerous pesticides in surface water (Williamson, Munn et al. 1998). Carbaryl was detected in 5% of samples, and carbofuran was detected in 6%. Methomyl was not detected. While detections of these three chemicals did not exceed water quality standards, concentrations of six other pesticides exceeded EPA criteria for the protection of aquatic life. Listed salmonids are commonly exposed to combinations of carbaryl, carbofuran, and methomyl, other compounds, and other mixtures of cholinesterase-inhibiting insecticides.

Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. Registered 24(c) uses in Washington State include carbofuran application to potatoes and spinach grown for seed. About 3% of the land has been developed and 3.5% has been cultivated for crops. Areas with the potential for high exposure in the Upper Columbia River basin are the Methow, Entiat, and Wenatchee River basins.

UCR Spring-run Chinook salmon begin returning from the ocean in the early spring. After migration, they hold in freshwater tributaries until spawning in mid- to late August. Fish spawn in the major tributaries leading to the Columbia River between Rock Island and Chief Joseph dams. UCR Spring-run Chinook salmon fry typically select off-channel habitats associated with their natal rivers and streams to rear. Juveniles spend a year in freshwater before migrating to the ocean in the spring of their second year of life. The duration of juvenile rearing in shallow freshwater habitats increases their susceptibility to higher exposures of pesticides, contaminants, and elevated temperature.

Given the life history of UCR Spring-run Chinook salmon, we expect the proposed uses of carbaryl, carbofuran, and methomyl pesticide products that contaminate aquatic habitats will lead to individual fitness and subsequent population-level consequences, *i.e.*, reductions in population viability. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Puget Sound Chinook Salmon

The Puget Sound ESU includes all runs of Chinook salmon in the Puget Sound region from the North Fork Nooksack River to the Elwha River on the Olympic Peninsula. This includes 31 historic quasi-independent populations and 26 artificial propagations programs. Of the historic populations, only 22 are considered extant. The estimated total run size for this ESU in the early 1990s was 240,000 fish. During a recent five-year period, the geometric mean of natural spawners in populations of this ESU ranged from 222 to just over 9,489 fish (Good, Waples et al. 2005). Recent five-year and long-term productivity trends remain below replacement for the majority of the 22 extant populations of Puget Sound Chinook salmon. The annual population growth rate known for these populations ranged from 0.75 to 1.17.

The major threats to the Puget Sound Chinook salmon identified in the *Status of Listed Resources* and *Environmental Baseline* sections include degraded freshwater and marine habitat from agricultural activities and urbanization. Poor forestry practices have also reduced water quality in the upper river tributaries for this ESU. Elevated temperature, water diversions, and poor water quality across land use categories pose significant threats to the status of Puget Sound

Chinook salmon. Furthermore, there has been extensive urbanization in this region. Well over two million people inhabit the area, with most development occurring along rivers and coastline.

Pesticide use and detections in the ESU's watershed are well documented. NAWQA sampling conducted in 2006 in the Puget Sound basin detected numerous pesticides and other synthetic organic chemicals in streams and rivers. However, mixtures of chemicals found in agricultural and urban settings differ. Urban streams sampled in Puget Sound showed the highest detections for carbaryl, diazinon, and malathion. Carbaryl was detected at 60% of urban sampling sites (Ebbert, Embrey et al. 2000). Diazinon was detected at all urban sites, frequently at concentrations that exceeded EPA guidelines for protecting aquatic life (Bortleson and Ebbert 2000).

Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. In addition, Washington has 24(c) registrations for carbofuran use on spinach grown for seed and potatoes. Land classes indicate high-use of the three a.i.s in the following drainage basins: Nooksack, Skagit River, Stillaguamish, Skykomish, Snoqualimie, Snohomish, Lake Washington, Duwamish, and Puyallup. Roughly 7% of the lowland areas (below 1,000 ft elevation) in the Puget Sound region are covered by impervious surfaces, which increase urban runoff containing pollutants and contaminants into streams. Pollutants carried into streams from urban runoff include pesticides, heavy metals, PCBs, PBDEs, PAHs, pharmaceuticals, nutrients, and sediments. As such, we expect salmonid populations within the ESU to be exposed to carbaryl, carbofuran, and methomyl. Further, monitoring data shows that we can expect concurrent exposure with other AChE inhibiting chemicals, which will exacerbate the severity of effects. Adults within Willapa Bay during 24(c) carbaryl application to oyster beds are likely exposed to this compound and may experience additional mortalities.

Puget Sound stream-type Chinook salmon fry typically rear in shallow off-channel habitats associated with their natal rivers and streams. Juveniles generally have long freshwater residences of one or more years before migrating to the ocean.

Given the life history of the Puget Sound Chinook salmon, we expect that the proposed uses of carbaryl, carbofuran, and methomyl pesticide products may lead to individual fitness consequences and subsequent population-level consequences, *i.e.*, reductions in population viability. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Sacramento River Winter-run Chinook salmon

The Sacramento River Winter-run Chinook salmon ESU includes only one population in Sacramento River, California. The current spawning distribution of Sacramento River Winter-run salmon is restricted to a short portion of the mainstem Sacramento River below Keswick Dam. Historic run estimates for the Sacramento River are as large as 200,000 fish (Brown et al. 1994). Estimated natural production has fluctuated greatly over the past two decades. In 2007, estimated natural production was 4,461 fish. The population's annual growth rate ranged from 0.870 to 1.090.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections indicate impaired or loss of habitat, predation, contamination, and water management negatively affect this ESU. Reservoir dams in the Sacramento River have eliminated the ESU from its historic spawning locations. Today, the ESU depends on the ability of the BOR to manage cold water through reservoir storage and releases to support adult holding, spawning, incubation, and rearing. The physical channel habitat has been altered through sediment input from mining, levee construction, and removal of riparian vegetation for levee maintenance. Pesticides are frequently detected in the Sacramento River including thiobencarb, carbofuran, molinate, simazine, metolachlor, dacthal, chlorpyrifos, carbaryl, and diazinon. Carbofuran is commonly detected in agricultural areas but less so in urban sites while carbaryl is commonly detected in all urban sites. Modification of hydrology has resulted in increased mortality through stranding, increased predation, prolonged migration, and entrainment at water diversion facilities.

About 10% of the land within this ESU is developed; large areas of urban centers occur along the Sacramento River and San Francisco Bay. As about 21% of land within the ESU is cultivated,

all three a.i.s are expected to be applied to several crops within the ESU. Agriculture activity is prominent in the lower Sacramento River and within the Delta. Chinook salmon are also exposed to poor water quality from agricultural runoff that enters the Delta from the San Joaquin River. The Mediterranean climate in California, with dry summers and fall storms, may result in high concentration of these contaminants in run-off during the onset of the rainy season. These high concentrations can overlap with juvenile presence in the river system and movement into floodplains for rearing.

Winter-run adults enter the Sacramento River in early spring with spawning peaking in May and June. Spawning occurs in the Sacramento River downstream of the Keswick Dam. Fry rear in the Sacramento River for a few weeks to months before starting outmigration in late July, peaking in November and December. During outmigration, the young salmon migrate down the Sacramento River, through the Delta and San Francisco Bay. Juvenile winter-run Chinook salmon appear in the Delta from October to early May where they may rear in the fresher upstream portions for up to two months.

We expect that the proposed uses of carbaryl, carbofuran, and methomyl pesticide products will lead to both individual fitness level and subsequent population-level consequences. Registered uses of these a.i.s indicate overlap with the spawning, rearing, and migratory habitat of the one extant population in this ESU. Thus, the risk to this species' survival and recovery from the stressors of the proposed action is high for carbaryl, carbofuran, and methomyl.

Snake River Fall-run Chinook salmon

The SR Fall-run Chinook salmon ESU is comprised of a single population that spawns and rears in the mainstem Snake River and its tributaries below Hells Canyon Dam. Only 10 to 15% of the historical range of this ESU remains. Estimated historical returns from 1938 to 1949 were 72,000 fish annually (Bjornn and Horner 1980). The average abundance (1,273) of SR Fall-run Chinook salmon over the most recent 10-year period is below the 3,000 natural spawner average abundance thresholds identified as a minimum for recovery. The annual population growth rate for this single population is 1.02. Two historical populations are considered extirpated.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include impaired stream flows and barriers to fish passage in tributaries from hydroelectric dams. During the 1960s and 1970s, approximately 80% of the ESU's historic habitat was eliminated or severely degraded by the construction of the Hells Canyon complex and the lower Snake River dams. Additionally, degraded freshwater habitats in the estuary, mainstem, and tributaries from development and land use activities negatively affect this ESU. Agricultural activities, urban communities, and industries are concentrated along the Snake River and near the mouths of major tributary valleys. Thus, stream water quality and biological communities in the downstream portion of the upper Snake River basin are degraded. The combined impacts from these multiple threats continue to affect SR Fall-run Chinook salmon.

Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. Registered 24(c) uses within this ESU include carbofuran application to potatoes and spinach grown for seed in Washington. The remaining spawning and rearing area of the SR Fall-run Chinook salmon is potentially a high-use area for these chemicals, as it is adjacent to agricultural and residential areas. About 14% of the land has been developed. Dryland agriculture occurs in the lower Clearwater Basin, with crops including wheat, peas, and lentils. Alfalfa, hay, and grasses are also grown in the lower Clearwater as well as the lower Salmon River basin. Thus, ESU exposure to these pesticides is likely. Adults within Willapa Bay during 24(c) carbaryl application to oyster beds are likely exposed to this compound and may experience additional mortalities.

Adult SR Fall-run Chinook salmon enter the Columbia River in July and August. Spawning occurs from October through November above Lower Granite Dam in the mainstem Snake River and in the lower reaches of the larger tributaries, such as the Salmon and Clearwater Rivers. Fry emerge from redds beginning in March or April, then rear for two months or more in the sandy littoral zone along the river margin. Juveniles begin migration in June along the edges of rivers, where they are at risk of exposure to higher concentrations of pesticides from drift and runoff. Their duration in shallow freshwater habitats increases their chances of higher exposure to pesticides, contaminants, and elevated temperature. Most fish exhibit an ocean-type life cycle,

completing migration to the Pacific during the first year of life, though some overwinter inlow-velocity pools created by the hydroelectric dams.

Given the life history of SR Fall-run Chinook salmon, we expect the proposed uses of carbaryl and carbofuran pesticide products may lead to individual fitness level consequences and subsequent population-level consequences. We expect that exposure to methomyl may lead to individual fitness consequences, but not to an extent that would affect population growth rates. Land class data indicate that exposure of the carbamates to SR Fall-run Chinook salmon is possible. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl and carbofuran, but low for methomyl.

Snake River Spring/Summer-run Chinook salmon

This ESU includes 32 historical populations in the Snake River basin which drains portions of southeastern Washington, northeastern Oregon, and north/central Idaho. Historically, the Salmon River system may have supported more than 40% of the total return of Spring/Summer-run Chinook salmon to the Columbia system (Fulton 1968). The long-term trends in productivity indicate a shrinking population. However, recent trends in productivity, buoyed by the last five years, are approaching replacement levels. The annual population growth known for 18 populations ranged from 0.97 to 1.1. Historical populations above Hells Canyon are considered extinct.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include degraded water quality in the freshwater estuary, tributaries, and coastal habitats from land use activities and hydroelectric dams. Significant threats to SR Spring/Summer-run Chinook salmon include elevated temperature, water diversions, and poor water quality.

Some spawning and rearing areas of the SR Spring/Summer Run Chinook are in forested areas, where carbaryl may be applied. The likelihood of exposure in forested areas is unknown. Registered 24(c) uses within this ESU include carbofuran application to potatoes and spinach grown for seed in Washington. Dryland agriculture occurs in lower Clearwater Basin, with crops

including wheat, peas, and lentils. Alfalfa, hay, and grasses are also grown in the lower Clearwater as well as the lower Salmon River basin. All three a.i.s are registered for use on alfalfa. Agricultural activities and urban communities, are concentrated along the Snake River and near the mouths of major tributary valleys, thus stream water quality and biological communities in the downstream portion of the upper Snake River basin are degraded.

SR Spring/Summer-run Chinook salmon spawn at high elevations in the headwater tributaries of the Clearwater, Grande, Ronde, Salmon, and Imnaha Rivers. Spawning is complete by the second week of September. Eggs incubate and hatch in late winter and early spring of the following year. The fry typically overwinter in shallow off-channel habitats associated with their natal rivers and streams. Juveniles become active seaward migrants during the following spring as yearlings (Connor, Sneva et al. 2005).

Given the life history of SR Spring/Summer-run Chinook salmon, we expect the proposed uses of carbaryl and carbofuran pesticide products that contaminate aquatic habitats will lead to individual fitness level consequences and subsequent population-level consequences. The uses of these materials along the migratory route of SR Spring/Summer-run Chinook salmon, may cause acute lethality or temporary AChE inhibition. We expect that exposure to methomyl may lead to individual fitness consequences, but not to an extent that would affect population growth rates. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl and carbofuran, but low for methomyl.

Upper Willamette River Chinook Salmon

The UWR Chinook salmon ESU includes all eight naturally spawned populations residing in the Clackamas River and the Upper Willamette River above Willamette Falls. It also includes seven artificial propagation programs. The population in the McKenzie River is the only population that is naturally producing, and current estimates indicate a negative growth rate. Historically, the Upper Willamette River supported large numbers (exceeding 275,000 fish) of UWR Chinook salmon. Current abundance of natural-origin fish is estimated at less than 10,000.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include habitat loss due to blockages from hydroelectric dams and irrigation diversions, and degraded water quality within the Willamette mainstem and the lower reaches of its tributaries. Elevated water temperature also poses a significant threat to the status of UWR Chinook salmon. Fifty pesticides were detected in streams that drain both agricultural and urban areas. Forty-nine pesticides were detected in streams draining agricultural land, while 25 were detected in streams draining urban areas. Ten of these pesticides, including carbaryl and carbofuran, exceeded EPA criteria for the protection of freshwater aquatic life from chronic toxicity (Wentz, Bonn et al. 1998). The combined impacts from these threats continue to affect UWR Chinook salmon.

Based on the crop types, we expect that carbaryl and methomyl are commonly applied in the Willamette Valley throughout the growing season. Existing stocks of carbofuran are also expected to be applied throughout the growing season. Registered 24(c) uses in Oregon include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. The Willamette Basin is the largest agricultural area in Oregon. In 1992 the Willamette Basin accounted for 51% of Oregon's total gross farm sales and 58% of Oregon's crop sales. About one-third of the agricultural land is irrigated and most of it is adjacent to the mainstem Willamette River. Urban developments are also located primarily in the valley along the mainstem Willamette River. We expect carbaryl to be used throughout the year in urban and residential areas. Given that major urban and agricultural areas are located adjacent to the mainstem Willamette, ESU exposure to these pesticides is likely. We also expect that other AChE inhibiting pesticides will co-occur with carbaryl, carbofuran, and methomyl in the waters of the Willamette Valley and exacerbate adverse effects from AChE inhibition.

Chinook salmon fry typically select shallow off-channel habitats associated with their natal rivers and streams. Juveniles generally rear in freshwater for several months to more than one year before migrating to the ocean. Their duration in shallow freshwater habitats increases their susceptibility to higher exposures of pesticides, contaminants, and elevated temperature. UWR Chinook salmon exhibit an earlier time of entry into the Columbia River and estuary than other spring Chinook salmon ESUs (Meyers, Kope et al. 1998). Although most juveniles from interior

spring Chinook salmon populations reach the mainstem migration corridor as yearlings, some juvenile Chinook salmon in the lower Willamette River are sub-yearlings (Friesen, Vile et al. 2004). Off-channel habitats within the Willamette Valley floodplain are particularity important for rearing fry and are actively being identified, reconnected and restored. We expect fry to be exposed to the three insecticides when applications overlap with fry occurrence and will further depress abundances of the available prey.

Based on land use and the life history of UWR Chinook salmon, we expect that this ESU will be compromised by reduced lambdas of affected populations. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Columbia River Chum Salmon

This ESU includes two remaining populations of 16 historical populations in the lower reaches (the Lower Gorge tributaries and Grays River) of the Columbia River. Thus, about 88% of the historic populations are extirpated or nearly so. In the early 1900s, the run numbered in the hundreds of thousands to a million returning adults. The size of the Lower Gorge population is estimated at 400-500 individuals, down from a historical level of greater than 8,900 (Good, Waples et al. 2005). Previous estimates of the Grays River population range from 331 to 812 individuals. However, the population increased in 2002 to as many as 10,000 individuals (Good, Waples et al. 2005). Overall, the lambda values indicate a long-term downward trend at 0.954 and 0.984, respectively.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections are hydromodification and habitat loss. Of the salmonids, chum salmon are most averse to negotiating obstacles in their migratory pathway. Thus, they are more highly impacted by the Columbia River hydropower system – specifically the Bonneville Dam (Johnson, Grant et al. 1997). The water quality in the lower Columbia River is poor. Recent USGS studies have demonstrated the presence of 25 pesticide compounds in surface waters, including carbaryl (Ebbert and Embry 2002). Although the habitat restoration project for the Grays River will likely provide some benefit to the population, we are unable to quantify the overall net effect for salmonids at this time.

Land use data indicate that the Columbia River chum salmon may be at risk of pesticide exposure. In addition to general uses, registered 24(c) uses in Oregon include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. The locations of high-pesticide use areas and the preferential use of river-edge habitat by chum salmon indicate that the species is at risk of pesticide exposure. The developed area surrounding the cities of Portland and Vancouver occurs along the migratory route of the Lower Gorge chum.

Columbia River chum salmon fry emerge between March and May and emigrate shortly thereafter to nearshore estuarine environments (Salo 1991). This is in sharp contrast to other salmonid behavior and indicates that chum salmon are less dependent on freshwater conditions for survival. After emergence, juvenile Columbia River chum salmon spend around 24 days feeding in the estuary. Adults return to spawn in the lower reaches of the Columbia River between the ages of two and five from mid-October through December. An average of ten days is spent in the freshwater by the spawning adults.

Given the life history of the Columbia River chum salmon, we expect that the proposed uses of carbaryl, carbofuran, and methomyl pesticide products may lead to individual fitness level consequences. We expect that exposure will occur, resulting in both acute lethality and sublethal olfactory-mediated effects. However, we do not expect these effects to occur at a scale that would have population-level effects. As chum fry are more precocious and quickly leave natal streams, they are less reliant on the local invertebrate population. Given the life history of Columbia River chum salmon, the risk to this species' survival and recovery from the proposed stressors of the action is low for carbaryl, carbofuran, and methomyl.

Hood Canal Summer-run Chum Salmon

This ESU includes 16 historical, naturally spawned populations of summer-run chum salmon in Olympic Peninsula Rivers between Hood Canal and Dungeness Bay, Washington, as well as eight artificial propagation programs. Of the historically existing populations, seven are believed to be extirpated. Most of the extirpated populations occurred on the eastern side of the canal. Only two of the remaining populations have long-term trends above replacement; long-term

lambda values of the nine existing populations range from 0.85 to 1.39 (Good, Waples et al. 2005). The Hood Canal Summer-run chum salmon populations are the subject of an intense hatchery program intended to bolster numbers. As much as 60% of the spawning populations are hatchery-raised fish.

The major threat to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections is habitat degradation. The combined effects of degraded floodplains, estuarine, and riparian habitats, along with reduced stream flow and sedimentation, have had a profound negative impact on this ESU.

The land use and environmental data indicate that the Hood Canal Summer-run chum may be exposed to carbaryl, carbofuran, and methomyl. There is no cultivated crop land and less than 6% of the ESU is developed. Washington's 24(c) registrations for carbofuran use are not expected to be employed in this region. We do expect some exposure due to residential uses.

The Hood Canal Summer-run chum spawn from mid-September through mid-October (Tynan 1997). Emergence generally occurs from early February through mid April. Upon emerging, fry immediately commence downstream migration to estuaries (Tynan 1997). Upon arrival in the estuary, salmon fry inhabit nearshore areas in shallow water. In Puget Sound, they have been observed to reside in the top 6 inches of surface water and extremely close to the shoreline (Tynan 1997). This behavior increases the likelihood of acute exposure to drift and runoff events.

Given the life history of the Hood Canal Summer-run chum, we expect the proposed uses of carbofuran, carbaryl, and methomyl pesticide products may contaminate aquatic habitats and lead to individual fitness level consequences. We expect that exposure will occur, resulting in lethality and sublethal olfactory-mediated effects. We do not, however, expect that these effects will have population-level consequences. As chum fry are more precocious and quickly leave natal streams, they are less reliant on the local invertebrate population. Therefore, risk to this species' survival and recovery from the stressors of the action is low for carbaryl, carbofuran, and methomyl.

Central California Coast Coho Salmon

The CCC coho salmon ESU includes 11 historical independent populations within counties from Mendocino to Santa Cruz in California. Coho populations in three larger watersheds, as well as some in smaller watersheds, have been extirpated or are nearly so. Historical escapement has been estimated between 200,000 and 500,000 fish. Current escapements are not known, though a minimum of 6,570 adult coho salmon are estimated to return to coastal streams within the ESU. Long-term population trends do not exist for any of the populations in this ESU. More fish enter northern streams but variation in abundance between cohorts can be large with one cohort often dominating. Southern streams produce few naturally spawned fish of all cohorts.

CCC coho salmon populations have been adversely affected by loss of riparian cover, elevated water temperatures, alteration of channel morphology, loss of winter habitat, and siltation. High water temperatures prevent coho salmon from inhabiting several streams within the ESU. Pesticides are expected to enter rivers as drift during application in agricultural areas. Highly contaminated runoff into the Russian River, San Francisco Bay, and into rivers south of the Golden Gate Bridge is expected during the first fall storms. We expect that application of other AChE inhibiting pesticides will co-occur with carbaryl, carbofuran, and methomyl in the waters within the ESU and exacerbate adverse effects from AChE inhibition.

The majority of agricultural land use is concentrated in the Russian River watershed and watersheds south of the Golden Gate Bridge. High density urban development and urban centers occur in the San Francisco Bay and in the Russian River basin. All three a.i.s are expected to be applied to several crops within the Russian River basin and the Santa Cruz stratum during the growing season. Carbaryl is expected to be used within urban/residential areas throughout the entire year.

The movements of mature adults are influenced by stream flow; entry often occurs during the first large winter storms. Similarly, CCC coho salmon adults must wait in the lower river for sufficient flow to be able to reach spawning grounds. Fry emerge in spring and remain in the stream for up to 18 months. Newly emerged fry use backwater, side channels, and shallow channel edges. During winter, juveniles inhabit side channels, sloughs, backwater, and other

protected channel features. The off-channel floodplain habitats provide feeding and growth opportunities that are important before smoltification and seaward migration in the spring. The presence of discrete brood years (BYs) makes coho salmon more vulnerable to environmental perturbations than other salmonids because a failed BY is unlikely to be replaced by other BYs.

Land use data indicate substantial overlap between high-use areas and fish runs in the Russian River, San Francisco Bay, and the Santa Cruz area. In several streams, one or more BYs are at the verge of extinction, and heavy pesticide exposure may result in the loss of a BY. We expect the proposed use of the three carbamates will lead to both individual fitness level consequences and subsequent population-level consequences. Therefore, the risk to this species' survival and recovery from the proposed action is high for carbaryl, carbofuran, and methomyl.

Lower Columbia River Coho Salmon

The LCR coho salmon ESU includes all naturally spawned coho salmon populations in streams and tributaries to the Columbia River in Washington and Oregon from the mouth of the Columbia up to and including the White Salmon and Hood rivers, and along the Willamette to Willamette Falls, Oregon. The ESU includes 26 historical populations and 25 artificial propagation programs. Over 90% of the historic populations of LCR coho salmon are considered extirpated. Most populations have very low numbers and have been replaced by hatchery production. Only two populations have a degree of natural spawning – the Sandy River and the Clackamas River. The annual population growth rates known for the Sandy River and Clackamas River are 1.102 and 1.028, respectively.

The major threats to LCR coho salmon identified in the *Status of Listed Resources* and *Environmental Baseline* sections include reduced water flow in the mainstem and estuary from irrigation diversions and hydroelectric dams. Additionally, degraded water quality in freshwater and tributary habitats negatively affects this ESU. Among the various types of habitat threats, elevated temperature, water diversions, and poor water quality have significant influence on the status of LCR coho salmon.

Pesticide use and detections in LCR coho salmon freshwater habitats are well documented. NAWQA sampling in surface waters within the ESU range detected more than 50 pesticides in streams within this ESU. Ten pesticides exceeded EPA's criteria for the protection of aquatic life from chronic toxicity, including carbaryl. The combined impacts from these multiple threats continue to affect this ESU.

Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. Registered 24(c) uses in Oregon include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. Agricultural and urban development occurs along the Columbia River and the basins of its major tributaries. Both the Sandy and Clackamas Rivers drain parts of the Willamette Basin – a major agricultural area. Thus, ESU exposure to these pesticides is likely.

LCR coho salmon enter freshwater from August through December. Coho salmon spawn in November and December: emergence from the redds occurs between March and July. Fry typically select off-channel habitats associated with their natal rivers and streams to rear. The juvenile coho salmon reside in shallow freshwater habitats for more than one year. The long residence in these habitats increases their likelihood of experiencing significant exposure to pesticides and other contaminants.

Given the life history of LCR coho salmon, we expect the proposed uses of carbaryl, carbofuran, and methomyl pesticide products may lead to both individual fitness level and subsequent population-level consequences. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

SONCC *coho salmon*

The SONCC coho salmon ESU includes coho salmon in streams between Cape Blanco, Oregon, and Punta Gorda, California, and three artificial propagation programs in the Klamath, Trinity, and Rogue Rivers. Little information on abundance trends exists for the streams within the ESU. However, available information indicates that Eel River and Southern populations are at high risk from critically low abundances. Northern populations may have larger runs. Recent

estimated escapement in the Klamath River is about 2,000 fish. The Rogue River spawner run ranged from 7,800 to 12,213 coho salmon from 1999 to 2001, though many are of hatchery origin.

The threats to this ESU include road crossings and other migration barriers, timber harvest and agricultural activities, and water management. Adverse effects on the SONCC coho salmon consist of barriers that limit access to tributaries, lack of large instream woody debris, reduced riparian vegetation, and elevated water temperature. The Klamath River, one of the largest rivers, is 303(d) listed because aquatic habitat has been degraded due to excessively high water temperatures and algae blooms associated with high nutrient loads, water impoundments, and agricultural water diversions (USEPA 1993). Pesticides used in land management activities are expected to enter stream mainstems and tributaries during application as drift and as runoff.

A large portion of the agricultural and municipal land uses within this ESU is concentrated in the upper Klamath and Rogue Rivers. A diverse array of crops is produced in these areas each year. Some agriculture and smaller urban centers are dispersed on the lower alluvial coastal plains and in rivers valleys of coastal rivers. Active forest management occurs throughout the watersheds within this ESU, and application of pesticide products is anticipated.

Spawning occurs from November through January, depending on the occurrence of fall and winter storms. Fry incubate for four to eight weeks before emergence in the spring. Newly emerged fry rear in backwater, side channels, and shallow channel edges for up to 18 months. During winter, juveniles inhabit side channels, sloughs, backwater, and other protected channel features. The off-channel and floodplain habitats provide feeding and growth opportunities that are important before smoltification and seaward migration in spring. The three-year life cycle of coho salmon, with limited exchange between cohorts, makes them more vulnerable to environmental perturbations than other salmonids.

Agricultural and urban land uses overlap substantially with this ESU, particularly in the Interior Rogue and Klamath rivers. Because of this overlap, we expect that the proposed uses of carbaryl, carbofuran, and methomyl will result in both individual fitness and population-level

effects. In several streams, one or more BYs are at the verge of extinction. Exposure to the three a.i.s can result in loss of weak BYs. Low population abundance levels and the discrete cohort life history of the coho salmon make the SONCC ESU more vulnerable to environmental stressors. Therefore the risk to the survival and recovery of the SONCC ESU from the stressors of the action is high.

Oregon Coast Coho Salmon

The OC coho salmon ESU includes 11 naturally spawned populations in Oregon coastal streams south of the Columbia River and north of Cape Blanco and one hatchery stock. While none of the populations have become extinct, the ESU's current abundance levels are less than 10% of historic populations. OC coho salmon abundance estimates from 2000 to 2007 ranged from a low of 51,875 to a high of 260,000 naturally produced spawners. Long-term trends in ESU productivity remain strongly negative.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections are habitat degradation from logging, road construction, urban development, mining, agriculture, and recreation. Within the various types of habitat, elevated temperature, water diversions, and poor water quality also affect the status of OC coho salmon. The combined impacts from these multiple threats continue to affect OC coho salmon.

Crop rotation patterns and crop types influence the distribution and frequency of pesticides within an area. Based on limited agricultural activities, we expect that carbaryl and existing stocks of carbofuran may be applied on a limited scale throughout the growing season. Registered 24(c) uses in Oregon include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. We also expect carbaryl use within urban and residential areas throughout the entire year. However, we expect no to very low applications of methomyl throughout the growing season. Although carbaryl and carbofuran may be applied to pine seedlings, we expect no to low applications in these forests. As runoff from urban and agricultural areas may drain into adjacent streams, ESU exposure to these pesticides is likely. However, given the above land uses and expected low application of the three carbamates, we

expect lower incidences of fish exposure to these compounds in surface waters following application.

OC coho salmon enter rivers in September or October; spawning occurs in December. Fry emerge between March and July, then move to shallow areas near the stream banks. Juvenile coho salmon are often found in small streams less than five ft wide, and may migrate considerable distances to rear in lakes and off-channel ponds. Generally, coho salmon spend 18 months rearing in freshwater before moving out into the ocean. Given this duration spent in shallow freshwater habitats, they are more likely to experience higher pesticide exposure and contaminants.

Given the limited applications of the three carbamates and low incidences within land uses that overlap with the range of OC coho, exposure is possible, although not likely to be extensive. We do not expect that exposure will have effects at the population level. Therefore, the risk to this species' survival and recovery from the stressors of the action is low for carbaryl, carbofuran, and methomyl.

Ozette Lake Sockeye Salmon

This ESU is made up of only one historic population. Natural spawning aggregations remain on two beaches of Ozette Lake. Two tributary spawning groups were initiated in1992 through hatchery programs. Peak run size in the 1940s has been estimated to be between 3,000 and 18,000 fish, and actual production (*i.e.*, including harvest) may have been as high as 50,000. Recent estimates put the population at 3,600 – 4,600 individuals (Haggerty, Ritchie et al. 2007). The supplemental hatchery program began with out-of-basin stocks and make up an average of 10% of the run. The proportion of beach spawners originating from the hatchery is unknown but likely low. Uncertainty in past population counts coupled with poorly documented historical abundance prevents calculation of population growth rates and trends.

Major threats to this population identified in the *Status of Listed Resources* and *Environmental Baseline* sections are siltation of spawning habitat from logging activities within the watershed and genetic effects from past interbreeding with kokanee. Almost 80% of the land cover for this

ESU is evergreen forest. Between 1940 and 1984, 85% of the basin was clear-cut logged (Blum 1988). Roughly 77% of the land in Ozette Basin is managed for timber production (Jacobs, Larson et al. 1996). The extent to which pesticide products are currently used by these companies is unknown.

Ozette Lake is in a sparsely populated area, with less than 1% of land developed. No crop land was identified in NLCD data (Table 32). The land use and environmental data indicate that the Ozette Lake sockeye salmon may be exposed to carbaryl or carbofuran if applied in the watershed. Carbaryl is registered for a number of non-agricultural applications which may take place in forested and residential areas. Additionally, the area has a small population, making residential use of carbaryl within the ESU a possibility. We do not expect 24(c) registrations of carbofuran will be used within this ESU, though it may be applied to pine seedlings. However, there are few data available on use and no monitoring data are currently available. We do not expect methomyl to be used within the boundaries of this ESU.

Ozette Lake sockeye salmon enter the lake between April and August, and spawning occurs late October through February. Fry emerge from gravel redds in the spring and emigrate to the open waters of the lake where they remain for a full year. They then smolt as 1-year olds and migrate to the open ocean. The majority of Ozette Lake sockeye salmon return to spawn as four-year old fish after spending two full years at sea.

Given the life history of the Ozette Lake sockeye, we expect that that the proposed uses of carbaryl and carbofuran pesticide products may contaminate aquatic habitats used by sockeye in a way that might lead to individual fitness level consequences. While the uses of these materials may lead to some overlap with the Ozette Lake sockeye, the existing and likely future land uses should limit the applications of pesticides containing the three carbamates. Consequently, the risk posed by the proposed action to Ozette Lake sockeye salmon's survival and recovery is low for carbaryl, carbofuran, and methomyl.

Snake River Sockeye Salmon

The SR sockeye salmon ESU historically includes populations in five Idaho lakes as well as artificially propagated sockeye salmon from the Redfish Lake Captive Broodstock Program. Only one hatchery-sustained population remains and is found in Redfish Lake. This population is listed as endangered and has an extremely high risk of extinction. Current smolt-to-adult survival of sockeye originating from the Stanley Basin lakes is rarely greater than 0.3% (Hebdon, Kline et al. 2004). No natural origin adults have returned to Redfish Lake to spawn since 1998; the population is maintained entirely by propagation efforts. Around 30 fish of hatchery origin return to spawn each year (FCRPS 2008).

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include impaired tributary flow and passage, migration barriers, degraded water quality, and hydromodification of the Columbia and Snake Rivers. Like the Ozette Lake ESU, the SR sockeye occupy a relatively undeveloped area with very little cropland (Table 37) However, the SR sockeye have the longest migration of any sockeye salmon, traveling 900 miles inland. These waters are contaminated by drift and runoff from both agricultural and urban areas. Exposure during migration likely adds to the low survivorship of smolts. The land use and environmental data indicate that the SR sockeye may be exposed to carbaryl, carbofuran, and methomyl during migration. Registered 24(c) uses within this ESU include carbofuran application to potatoes and spinach grown for seed in Washington.

Historically, sockeye salmon entered the Columbia River system in June and July, and arrived at Redfish Lake between August and September (FCRPS 2008). Spawning occurred in lakeshore gravel and generally peaked in October. Fry emerged in the spring (April and May) then migrated to open waters of the lake to feed. Juvenile sockeye remained in the lake for one to three years before migrating through the Snake and Columbia Rivers to the ocean. Adult sockeye spent two or three years in the open ocean before returning to Redfish Lake to spawn.

During adult and juvenile migrations the sockeye are at their greatest risk of exposure to the stressors of the action. Sockeye salmon making the 900 mile journey each way pass along many

miles where agricultural crops are at the river's edge. Drift and runoff occurring in conjunction with sockeye salmon migration is expected to cause adverse effect.

Given the life history of the SR sockeye, we expect the proposed uses of carbaryl, carbofuran, and methomyl pesticide products may lead to individual fitness level consequences. However, we do not expect fry to be exposed to the a.i.s, although some exposure may occur during adult migration and lead to acute lethality or temporary AChE inhibition. However, this exposure is not expected to occur at a frequency that would cause effects at the population level. Therefore, the risk to this species' survival and recovery from the stressors of the action is low for carbaryl, carbofuran, and methomyl.

Central California Coast steelhead

The CCC steelhead DPS includes all naturally spawned steelhead in streams from the Russian River south to Aptos Creek. This area includes streams entering the San Francisco Bay. The DPS consists of nine historic independent populations. There is limited information on the abundance of these populations, but all are in severe decline.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections are dams and other migration barriers, urbanization and channel modification, agricultural activities, predators, hatcheries, and water diversions. Throughout the species' range, habitat conditions and quality have been degraded by a lack of channel complexity, eroded banks, turbid and contaminated water, low summer flow and high water temperatures, an array of contaminants found at toxic levels, and restricted access to cooler head waters from migration barriers. There is limited monitoring data from streams within this DPS. The combined impacts of these threats continue to affect the CCC steelhead.

Crop farming is concentrated in low laying areas and floodplains along the estuaries and stream valleys of the Russian River and Santa Cruz drainage basins. Christmas trees production occurs in these areas in addition to a variety of food crops. Carbaryl and methomyl are registered for a variety crops grown in the Russian River valley and in the San Mateo and Santa Cruz counties. Registered 24(c) uses for carbaryl in California include application to fruits and nuts, prickly

pear cactus, ornamental plants, and non-food crops. Methomyl has 24(c) registrations for insect control on ornamentals, beans, soybeans, radishes, sweet potatoes, Chinese broccoli, broccoli raab, and pumpkins. The a.i.s are therefore expected to be used throughout the growing season. Existing stocks of carbofuran are also expected to be applied throughout the growing season. Further, 16% of the DPS' range consists of developed urban and residential land, mostly within the San Francisco Bay and Russian River basin. Carbaryl is expected to be used the entire year within the urban/residential areas.

The CCC steelhead populations are all of the winter-type. Fry emerge in spring and rear in smaller tributaries and off-channel habitats. During periods with high flows, they move into floodplain habitat. Juvenile steelhead remain in freshwater for one or more years before migrating downstream to smolt.

The registered uses of the three carbamates indicate substantial overlap with the CCC steelhead populations, especially in the San Francisco Bay, Russian River, and Santa Cruz area. We expect that the proposed uses of the three carbamates may contaminate spawning and rearing habitats and lead to both individual fitness level and population -level consequences. Thus, the risk to this species' survival and recovery from the stressors of the proposed action is high for carbaryl, carbofuran, and methomyl.

California Central Valley Steelhead

The CCV steelhead DPS includes all naturally spawned steelhead in the Sacramento River, San Joaquin River, and their tributaries. This area includes streams entering the Sacramento-San Joaquin Delta (Delta) east of Chipps Island. All populations rear and migrate through the Sacramento River, San Joaquin River, Delta, and San Francisco Bay. The current distribution is severely reduced and fragmented compared to historical distributions. About 6,000 river miles of river habitat have been reduced to 300 miles. Historical returns within the DPS may have approached two million adults annually. Current annual run size for the entire Sacramento-San Joaquin system today is estimated at less than 10,000 returning adults.

The *Status of Listed Resources* and *Environmental Baseline* sections indicate that dams and other migration barriers, urbanization and channel modification, agricultural activities, introduced non-native predators, hatcheries, and large scale water management and diversions negatively affect this DPS. Steelhead habitat has been highly degraded by reduced channel complexity, eroded banks, increased water temperature, migration barriers restricting access to cooler head waters, and decreased water quality from contaminants. Numerous NAWQA, CDPR, and other assessments found high concentration of contaminants in both the San Joaquin and Sacramento Rivers and their tributaries. In the San Joaquin Basin, seven pesticides exceeded EPA criteria for aquatic life. These pesticides include diuron, trifluralin, azinphos-methyl, carbaryl, chlorpyrifos, diazinon, and malathion. The combined impacts from these threats continue to affect the CCV steelhead.

Approximately 27% of the land within the DPS is developed for cultivation of crops (Table 38). High densities of crop farming occur throughout the San Joaquin Basin, in the Sacramento-San Joaquin Delta, and along lower Sacramento River. Further, 9.2% of the DPS consists of urban development. Based on the crop types, we expect carbaryl, carbofuran, and methomyl are commonly applied in the Central Valley throughout the growing season. In urban and residential areas, we expect carbaryl to be applied throughout the year. Monitoring in the San Joaquin basin found 48 of 83 pesticides tested for. Seven pesticides (diuron, trifluralin, azinphos-methyl, carbaryl, chlorpyrifos, diazinon, and malathion) exceeded criteria for the protection of aquatic life. Pesticides detected in the Sacramento River included thiobencarb, carbofuran, molinate, simazine, metolachlor, dacthal, chlorpyrifos, carbaryl, and diazinon. Carbofuran was most often detected in agricultural sites while carbaryl was also found in all urban sites tested.

All of the steelhead populations within this DPS exhibit the winter-type life history, though detailed information about the CCV steelhead life history is not available. Juvenile steelhead remain in freshwater for one or more years before migrating downstream to enter the ocean. The CCV steelhead use the lower Sacramento River and the Delta for rearing and as migration corridor. Some may utilize tidal marshes, non-tidal freshwater marshes, and other shallow areas in the Delta for rearing areas for short periods during outmigration to the ocean.

The registered uses of the three carbamates indicate substantial overlap with the CCV steelhead populations, especially in the lower Sacramento River and Delta. We expect that the proposed uses may contaminate spawning and rearing habitats and lead to both individual fitness and population-level consequences. Thus, the risk to this species' survival and recovery from the stressors of the proposed action is high for carbaryl, carbofuran, and methomyl.

Lower Columbia River Steelhead

The LCR Steelhead DPS includes 23 historical, naturally-spawned steelhead populations in Columbia River tributaries on the Washington side between the Cowlitz and Wind Rivers in Washington and on the Oregon side between the Willamette and Hood Rivers. Historical counts from the Cowlitz, Kalama, and Sandy Rivers suggest the ESU probably exceeded 20,000 fish. During the 1990s, fish abundance dropped to 1,000 to 2,000 fish. Many of the populations in this DPS are small, and the long- and short-term trends in abundance of all individual populations are negative. The annual population growth rate known for nine independent populations ranged from 0.945 to 1.06.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections include dams; water diversion; destruction or degradation of riparian habitat; and land use practices (logging, agriculture, and urbanization). Tributary hydropower development has created barriers and reduced fish access, ultimately affecting the spatial structure within the independent populations. Within the various types of habitat, water diversions, elevated temperature, and poor water quality also affect the status of LCR steelhead. Pesticides have also been detected in LCR steelhead habitats. NAWQA sampling from 1991-1995 in surface waters within the DPS range detected more than 50 pesticides in streams. Ten pesticides exceeded EPA's criteria for the protection of aquatic life from chronic toxicity. These pesticides include carbaryl, carbofuran, atrazine, chlorpyrifos, and malathion. The combined impacts from these multiple threats continue to affect this DPS.

Most of the highly developed land and agricultural areas in this DPS's range are adjacent to salmonid habitat. Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. Registered 24(c) uses in Oregon include

carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. Based on the crop types, we expect that carbaryl and methomyl are commonly applied in the Lewis River subbasin throughout the growing season and within urban and residential areas throughout the entire year for carbaryl. Existing stocks of carbofuran are also expected to be applied throughout the growing season. Thus, DPS exposure to these pesticides is likely.

This DPS includes winter- and summer-run types. Summer-run steelhead return to freshwater between May and November. They enter the Columbia River in a sexually immature condition and require several months in freshwater before spawning. Winter-run steelhead enter freshwater from November to April. These fish are close to sexual maturation and spawn shortly after arrival in their natal streams. Steelhead fry typically rear in off-channel habitats associated with their natal rivers and streams for more than a year. Given this duration, juveniles are likely to experience pesticide exposure.

Given the life history of LCR steelhead, we expect the proposed uses of carbaryl, carbofuran, and methomyl pesticide products may contaminate rearing habitats and lead to individual fitness and subsequent population-level consequences. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Middle Columbia River Steelhead

The MCR steelhead DPS includes 19 populations in Oregon and Washington subbasins upstream of the Hood and Wind River systems to and including the Yakima River. Historical run estimates for the Yakima River imply that annual species abundance may have exceeded 300,000 returning adults (Busby, Wainwright et al. 1996), whereas only 1,000 – 4,000 currently spawn. The most recent 10-year period indicated trends in abundance were positive for approximately half of the independent populations and negative for the remainder. Growth rates ranged from 0.97 to 1.02. Two historical populations are considered extinct.

Agricultural development is high within the range of MCR steelhead. Based on crop types and allowable uses, we expect that carbaryl and methomyl are commonly applied in the Yakima River basin, Walla Walla River basin, Deschutes River basin, and the John Day River basin

throughout the growing season. Existing stocks of carbofuran are also expected to be applied throughout the growing season. In urban and residential areas, carbaryl will likely be applied throughout the entire year. Registered 24(c) uses within this ESU include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons in Oregon and to potatoes and spinach grown for seed in Washington. Given the high amount of agriculture in these areas, we also expect other AChE inhibiting pesticides will co-occur with carbaryl, carbofuran, and methomyl and exacerbate adverse effects from AChE inhibition. Thus, DPS exposure to these pesticides is expected to be high

Mature adults (three to five years old) may enter rivers any month of the year and spawn in late winter or spring. Swim–up fry usually inhabit shallow water along banks of streams or aquatic habitats on stream margins. Steelhead rear in a variety of freshwater habitats and most remain in freshwater for two to three years. Some individuals, however, have stayed for as many as six to seven years. Most MCR steelhead smolt at two years and spend one to two years in the ocean prior to re-entering the freshwater to spawn.

Intense agricultural development has a high degree of overlap with the spawning and rearing areas of the MCR steelhead DPS. Given the long residency periods in freshwater, we expect that the proposed uses of of the three carbamates may lead to both individual fitness and population-level consequences. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Northern California Steelhead

The NC steelhead DPS includes all naturally spawned steelhead in California coastal river basins from Redwood Creek southward to, but not including, the Russian River, as well as two artificial propagation programs. Historical estimates of annual production for this DPS are upwards of 200,000 fish. Exact information on abundance is lacking for most of the streams within the DPS, though most populations are in decline. The DPS includes 15 historically independent populations of winter steelhead and 10 populations of summer steelhead. None of the winter steelhead populations are viable due to low abundance and production.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections are timber harvest, forest roads, vineyard developments, and road crossings and dams. Stressors to the NC steelhead include lack of large instream woody debris, reduced riparian vegetation, elevated water temperature, increased predation, and barriers that limit access to tributaries. The combined impacts from these multiple threats continue to affect the NC steelhead.

About 85% of the land use for this DPS consists of forests and chaparral (Table 26). Atlhough carbaryl may be applied in forested areas, the extent of exposure is unknown. There are areas of Mendocino County with a high density of vineyards, and there is some crop farming in low laying areas and floodplains along the estuaries and lower reaches of coastal streams. Coastal communities are located at the mouths of several streams within the NC steelhead DPS. Based on the crop types, we expect carbaryl, carbofuran, and methomyl to be commonly applied throughout the growing season in these areas. Carbaryl is expected to be used the entire year within urban and residential areas. However, because agricultural and urban development is not concentrated in any one basin, the risk of exposure to any given population is decreased. Additionally, the majority of steelhead juveniles rear at higher elevations in the watersheds with less agricultural influence. The fry, then, are less likely to be exposed during critical life stages.

The winter-type steelhead enters rivers as mature adults between November and April to spawn. The summer-type enters the stream in immature condition between May and October. Early arriving summer steelehead move high into the upper watersheds where they hold in deep pools throughout the summer before spawning in fall. In northern California, juvenile steelhead remain in freshwater for two or more years before migrating downstream to smolt. Juvenile steelheads spend a variable amount of time in the estuary before entering the open ocean.

We expect the proposed uses of carbaryl, carbofuran, and methomyl pesticides products within this DPS may lead to individual fitness effects, ranging from acute lethality to temporary AChE inhibition. However, exposure of NC steelhead populations to the three carbamates will be limited given the amount of overlap between agriculture, residential and urban development and spawning and rearing habitat. As such, we do not expect exposure to result in population-level

consequences. Therefore, the risk to the survival and recovery of NC steelhead from the proposed action is low for carbaryl, carbofuran, and methomyl.

Puget Sound Steelhead

The Puget Sound steelhead is comprised of 21 populations, some of which have both summer and winter runs. Steelhead occur in all major watersheds within the Sound and out to the Elwha River. Of the winter runs, 17 had declining and four had increasing population trends. Summer run abundance trends are not available. Estimated run size for Puget Sound steelhead in the early 1980s is approximately 100,000 winter-run steelhead and 20,000 summer-run steelhead.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections are habitat degradation from logging, road construction, urban development, mining, agriculture, and recreation; water diversions; and poor water quality. In particular, elevated temperature, water diversions, and poor water quality have the most significant influences on the status of Puget Sound steelhead. Furthermore, there has been extensive urbanization in this region. Well over two million people inhabit the area, with most development occurring along rivers and coastline.

Pesticide use and detections in the DPS's watershed are also well documented. 2006 NAWQA sampling in the Puget Sound basin detected 26 pesticides and 74 other synthetic organic chemicals in streams and rivers, with different mixtures of chemicals linked to agricultural and urban settings. Urban streams sampled in Puget Sound showed the highest detections for carbaryl, diazinon, and malathion. Diazinon was also frequently detected in urban streams at concentrations that exceeded EPA guidelines for protecting aquatic life (Bortleson and Ebbert 2000).

Registered uses of carbaryl, carbofuran, and methomyl include applications to crop agricultural sites, residential sites, and urban sites. In addition, Washington has 24(c) registrations for carbofuran use on spinach grown for seed and potatoes. Land classes indicate high use of the three a.i.s in the following drainage basins: Nooksack, Skagit River, Stillaguamish, Skykomish, Snoqualimie, Snohomish, Lake Washington, Duwamish, and Puyallup. Roughly 7% of the

lowland areas (below 1,000 ft elevation) in the Puget Sound region are covered by impervious surfaces, which increase urban runoff containing pollutants and contaminants into streams. Pollutants carried into streams from urban runoff include pesticides, heavy metals, PCBs, PBDEs, PAHs, pharmaceuticals, nutrients, and sediments. Thus, we expect salmonid populations within the ESU to be exposed to carbaryl, carbofuran, and methomyl. Further, monitoring data shows that we can expect concurrent exposure with other AChE inhibiting chemicals, leading to a pronounced severity of effects.

Summer steelhead enter freshwater between May and October, while winter steelhead enter between November and April. Spawning generally occurs in late winter or spring. Immediately after leaving the gravel, swim-up fry usually inhabit shallow water along banks of stream or aquatic habitats on stream margins. Steelhead rear in a wide variety of freshwater habitats, generally for two to three years. However, they may possibly reside up to six to seven years in freshwater environments. Following the rearing period, they smolt and migrate to sea in the spring.

We expect the proposed uses of carbaryl, carbofuran, and methomyl pesticide products that contaminate aquatic habitats may lead to both individual fitness level and subsequent population-level consequences. The risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Snake River Basin Steelhead

The SR steelhead DPS includes 23 naturally spawned populations below impassable natural and man-made barriers in streams in the Columbia River Basin upstream from the Yakima River, Washington, to the U.S.-Canada border. The Snake River supports about 63% of the natural-origin production of steelhead in the Columbia River Basin. The 10-year average for natural-origin steelhead passing Lower Granite Dam between 1996 and 2005 is 28,303 adults. Annual population growth rates show mixed long- and short-term trends in abundance and productivity. The annual population growth rate is known for eight independent populations and range 0.89 to 1.08. One historical population is likely extirpated.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections include hydrosystem mortality, water diversions, excessive sediment, and degraded water quality. Elevated temperature also impacts the status of SR steelhead. Pesticides have been detected in SR steelhead freshwater habitats. NAWQA sampling in 1992-1995 in the DPS's watersheds detected Eptam, atrazine, desethylatrazine, metolachlor, and alachlor. Carbaryl and carbofuran were detected in only 1% of samples. The combined impacts from these multiple threats continue to affect SR steelhead.

Some spawning and rearing habitat of the Snake River steelhead is in forested areas, where carbaryl may be applied. However, the likelihood of exposure in forested areas is unknown. Registered 24(c) uses within this ESU include carbofuran application to potatoes and spinach grown for seed in Washington. Dryland agriculture occurs in lower Clearwater Basin, with crops including wheat, peas, and lentils. Alfalfa, hay, and grasses are also grown in the lower Clearwater as well as the lower Salmon River basin. All three a.i.s are registered for use on alfalfa. Agricultural activities and urban communities are concentrated along the Snake River and near the mouths of major tributary valleys, thus stream water quality and biological communities in the downstream portion of the upper Snake River basin are degraded. Given that urban and agricultural areas are located adjacent to streams in the Lower Clearwater River drainage, DPS exposure to these pesticides is likely.

Sexually immature adult Snake River summer steelheads enter the Columbia River from late June to October. Adults migrate upriver until they reach Snake River tributaries where they spawn between March and May of the following year. Emergence occurs by early June in low elevation streams and as late mid-July at higher elevations. After hatching, juvenile SR steelhead typically select off-channel habitats associated with their natal rivers and streams for rearing. They spend two to three years in freshwater before they smolt and migrate to the ocean. Juvenile steelhead are more likely to be exposed to pesticides and other contaminants because of their long freshwater residency period.

Given the life history of SR steelhead, we expect the proposed uses of carbaryl and carbofuran pesticide products that contaminate aquatic habitats will lead to individual fitness level

consequences and subsequent population-level consequences. The uses of these materials in some natal areas and along migratory routes may cause acute lethality, temporary AChE inhibition, and reduced growth. We expect that exposure to methomyl may lead to individual fitness consequences, but not to an extent that would affect population growth rates. The risk to SR steelhead survival and recovery from the stressors of the action is high for carbaryl and carbofuran, but low for methomyl.

South-Central California Coast Steelhead

The S-CCC steelhead DPS includes all naturally spawned steelhead in streams from the Pajaro River to the Santa Maria River. The major basins in the S-CCC steelhead range are the Pajaro River system and the Salinas River system. Carmel River, a smaller basin, also supports a stable run of steelhead. Historic abundance estimates for the DPS imply an annual return may have been upwards of 20,000 fish. The estimated production in five of the major rivers indicates a return of less than 500 adults.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections are dams and other migration barriers, urbanization and channel modification, agricultural activities, and wildfires. These activities has resulted in reduced channel complexity, eroded banks, increased water temperature, migration barriers restricting access to cooler head waters, and decreased water quality from contaminants.

About 7% of the DPS is developed for cultivation of crops; a large portion of this land is in the Salinas River valley. Crops are concentrated in low laying areas and floodplains along the estuaries and lower reaches of streams. Based on the crop types, we expect carbaryl, carbofuran, and methomyl are commonly applied within the DPS throughout the growing season. Approximately 8% of the DPS has been developed for urban and residential purposes. Developed areas are located at the mouth of several streams within the S-CCC steelhead DPS. We expect carbaryl use in urban/residential areas throughout the entire year.

All S-CCC steelhead are a winter-run life history. Juvenile steelhead remain in freshwater for one or more years before migrating downstream to smolt. Steelhead in this area consists of two

life history groups: one where the juveniles rear for one or two years mainly in freshwater and another where the juveniles rear at the upper end of coastal lagoons for the first or second summer.

In conclusion, based on the long freshwater residence time of steelhead and the considerable overlap between S-CCC steelhead distribution and expected pesticide use, we expect that the S-CCC may experience high levels of exposure. We expect that proposed uses of the three carbamates that contaminate spawning and rearing habitats may lead to both individual fitness and population-level consequences. Therefore, the risk to the survival and recovery of S-CCC from the proposed action is high for carbaryl, carbofuran, and methomyl.

Southern California Steelhead

The SC steelhead DPS includes populations in five major and several small coastal river basins in California from the Santa Maria River to the U.S. – Mexican border. It is estimated that the species' current distribution constitutes about 1% of the historical distribution. Current abundance is considerably reduced with an estimated escapement of 500 fish for four of the larger rivers. Long-term estimates and population trends are lacking for the streams within the DPS.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections are dams and other migration barriers, urbanization and channel modification, agricultural activities, and wildfires. As a result of these activities, the stream substrate contains a high proportion of fines, stream channels lack complexity, banks are eroding, migration barriers restrict fish access to cooler head waters and tributaries, and the water is turbid and contaminated.

Agriculture is concentrated in low laying areas and floodplains along the estuaries and lower reaches of streams. Carbaryl, carbofuran, and methomyl are expected to be commonly used for several crops during the growing season. Large areas of dense development exist in the counties of Santa Barbra to San Diego. Carbaryl is expected to be used within urban/residential areas throughout the entire year. The NAWQA analysis detected more than 58 pesticides in ground

and surface waters within the heavily populated Santa Ana basin, including multiple AChE inhibitors. The invertebrate community in the basin is heavily altered by pesticide influence. Carbaryl was detected in 42% or urban samples but few detections exceeded standards for protection of aquatic life. Carbofuran was also detected but not in levels exceeding standards. The application of other AChE inhibiting pesticides is expect to co-occur with the a.i.s, and exacerbate adverse effects from AChE inhibition.

All steelhead populations in this DPS are winter-type. Juvenile steelheads remain in freshwater for one or more years before migrating downstream to smolt. SC steelhead consists of two life history groups: one where the juveniles rear for one or two years mainly in freshwater and another where the juveniles rear at the upper end of coastal lagoons for the first or second summer.

We expect the proposed uses of carbaryl, carbofuran, and methomyl pesticides products that contaminate aquatic habitat will lead to both individual fitness consequences and subsequent population-level consequences. There is substantial overlap between urban and agricultural areas and the spawning and rearing habitats of the SC steelhead populations. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Upper Columbia River Steelhead

The UCR steelhead DPS includes all naturally spawned populations below natural and man-made impassable barriers in the Columbia River basin upstream from the Yakima River, Washington, to the U.S.-Canada border. The DPS is comprised of four naturally-spawned populations and six artificial propagation programs in Washington State. The historical independent populations are located within the Wenatchee, Entiat, Methow, and Okanogan river systems. Abundance data indicate that all populations are below the minimum threshold for recovery. The annual population growth rates range between 1.067 and 1.086. Overall adult returns are dominated by hatchery fish.

The major threats to this DPS identified in the *Status of Listed Resources* and *Environmental Baseline* sections include dams that block fish migration and alter river hydrology; water diversions; destruction or degradation of riparian habitat; and land use practices (logging, agriculture, urbanization). Elevated water temperature and poor water quality also affect the status of UCR steelhead. Pesticides have also been detected in UCR steelhead freshwater habitats. NAWQA sampling from 1992-1995 in the Central Columbia Plateau detected numerous pesticides in surface water (Williamson et al. 1998). Carbaryl was detected in 5% of samples, and carbofuran was detected in 6%. Methomyl was not detected. While detections of these three chemicals did not exceed water quality standards, concentrations of six other pesticides exceeded EPA criteria for the protection of aquatic life. The co-occurrence of atrazine with carbaryl and other OPs in aquatic habitats increases the likelihood of adverse responses in salmonids and their aquatic prey. The combined impacts from these multiple threats continue to affect UCR steelhead.

Land uses within this DPS range include agricultural, urban and residential development. Based on the crop types, we expect that carbaryl and methomyl are commonly applied in the Wenatchee, Methow, and Entiat subbasins throughout the growing season. Existing stocks of carbofuran are also expected to be applied throughout the growing season. As runoff containing pesticides and other contaminants from the above land uses drain into the Wenatchee, Entiat, and Methow Rivers, DPS exposure to these pesticides is likely. We also expect other AChE inhibiting pesticides will co-occur with carbaryl, carbofuran, and methomyl in the waters of the Wenatchee, Entiat, Methow, and Lower Crab Creek subbasins and exacerbate adverse effects from AChE inhibition.

UCR adults return to the Columbia River in the late summer and early fall. UCR steelhead spawn and rear in the major tributaries to the Columbia River between Rock Island and Chief Joseph dams. Adults reach spawning areas in late spring of the calendar year following entry into the river. Newly emerged fry move about considerably and seek suitable rearing habitat, such as stream margins or cascades. Steelhead fry typically select off-channel habitats associated with their natal rivers and stream for extended periods of rearing. Fry move downstream in the fall in search of suitable overwintering habitat (Chapman, Hillman et al.

1994). Most juvenile steelhead spend two or three years in freshwater before migrating to the ocean. Some juvenile steelhead may spend up to seven years rearing in freshwater before migrating to sea. Given the long duration in shallow freshwater habitats, juveniles are more likely to experience higher pesticide exposure, contaminants, and elevated temperature.

We expect that the proposed uses of carbaryl, carbofuran, and methomyl may contaminate the rearing habitat of UCR steelhead and lead to individual fitness and population-level effects. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Upper Willamette River Steelhead

The UWR steelhead DPS includes all naturally spawned late-fall populations below natural and man-made impassable barriers in the Willamette River, Oregon, and its tributaries upstream from Willamette Falls to the Calapooia River. The DPS is comprised of four historical populations. Steelhead populations within this DPS have been declining, on average, since 1971 and have exhibited large fluctuations in abundance. Long-term trends in the annual population growth rate are less than one. The annual population growth rate of the four independent populations ranged from 0.97 to 1.023.

The major threats to this ESU identified in the *Status of Listed Resources* and *Environmental Baseline* sections include habitat loss due to blockages from hydroelectric dams and irrigation diversions, and degraded water quality within the Willamette mainstem and the lower reaches of its tributaries. Additionally, pesticide use and detections in UWR steelhead freshwater habitats are well documented. Fifty pesticides were detected in streams that drain both agricultural and urban areas. Forty-nine pesticides were detected in streams draining agricultural land, while 25 pesticides were detected in streams draining urban areas. Ten of these pesticides, including carbaryl and carbofuran, exceeded EPA criteria for the protection of freshwater aquatic life for chronic toxicity (Wentz, Bonn et al. 1998). The combined impacts from these multiple threats continue to affect UWR steelhead.

Based on the crop types, we expect that carbaryl and methomyl are commonly applied in the Willamette Valley throughout the growing season. Existing stocks of carbofuran are also expected to be applied throughout the growing season. Registered 24(c) uses in Oregon include carbofuran application to potatoes, nursery stock, sugar beets, and watermelons. The Willamette Basin is the largest agricultural area in Oregon. In 1992 the Willamette Basin accounted for 51% of Oregon's total gross farm sales and 58% of Oregon's crop sales. About one-third of the agricultural land is irrigated and most of it is adjacent to the mainstem Willamette River. Urban developments are also located primarily in the valley along the mainstem Willamette River. We expect carbaryl to be used throughout the year in urban and residential areas. Given that major urban and agricultural areas are located adjacent to the mainstem Willamette, DPS exposure to these pesticides is likely. We also expect that other AChE inhibiting pesticides will co-occur with carbaryl, carbofuran, and methomyl in the waters of the Willamette Valley and exacerbate adverse effects from AChE inhibition.

UWR steelhead enter the Willamette River in January and February and ascend to their spawning areas in late March or April. After emergence, steelhead fry typically rear in off-channel habitats associated with their natal rivers and streams for two to three years. Smolt migration past Willamette Falls begins in early April and extends through early June, with peak migration in early to mid-May. Most spend two years in the ocean before re-entering freshwater to spawn.

Much of the Willamette Valley has been converted to agricultural purposes. Based on the co-occurrence of high use land classes with spawning and rearing habitats, we expect that the proposed uses of the three carbamates may contaminate spawning and rearing habitats and lead to both individual fitness and population-level effects. Therefore, the risk to this species' survival and recovery from the stressors of the action is high for carbaryl, carbofuran, and methomyl.

Summary of Species-Level Effects

In the preceding section NMFS described expected population-level effects in terms of reductions in annual growth rate, productivity (reproduction), and abundance (numbers of salmonids). We concluded that all but Ozette Lake sockeye salmon, Snake River sockeye

salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, and Oregon Coast coho salmon populations will likely show reductions in viability due to the reregistration of carbaryl and carbofuran. We also concluded that all but Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, Oregon Coast coho salmon, Snake River fall-run Chinook salmon, Snake River spring-summer-run Chinook salmon, California Coastal Chinook salmon, and Snake River steelhead populations will likely show reductions in viability due to the reregistration of methomyl. The effects of EPA's proposed action are first manifested at the individual-level where reductions in individual fitness are expected. We showed that an individual's survival, migration, and growth are all significantly reduced by the proposed action. We also showed that these reductions are likely intensified by co-occurring stressors in the action area including the presence of other carbamates and OP insecticides in the action area.

Therefore, given the severity of expected changes in the annual population growth rate for affected populations, it is likely that California Coastal Chinook salmon, Central Valley spring-run Chinook salmon, LCR Chinook salmon, Puget Sound Chinook salmon, Sacramento River winter-run Chinook salmon, Snake River fall-run Chinook salmon, Snake River spring/summer-run Chinook salmon, UCR spring-run Chinook salmon, Upper Willamette River Chinook salmon, Central California Coast coho salmon, Southern Oregon and Northern Coastal California coho salmon, Central California Coast steelhead, California Central Valley steelhead, LCR steelhead, MCR steelhead, Snake River Basin steelhead, South-Central California Coast steelhead, Southern California steelhead, UCR steelhead, and Upper Willamette River steelhead will experience reductions in viability, which ultimately reduces the likelihood of survival and recovery of these species. The Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, and Oregon Coast coho salmon will not likely experience reductions in viability.

Effects of the Proposed Action to Designated Critical Habitat

NMFS' critical habitat analysis determines whether the proposed action will destroy or adversely modify critical habitat for ESA-listed species by examining any change in the conservation value

of the essential features of critical habitat. Our analysis does not rely on the regulatory definition of 'adverse modification or destruction' of critical habitat. Instead, this analysis focuses on statutory provisions of the ESA, including those in Section 3 that define "critical habitat" and "conservation," those in Section 4 that describe the designation process, and those in Section 7 setting forth the substantive protections and procedural aspects of consultation.

NMFS has designated critical habitat for all listed Pacific salmonids except for LCR coho salmon and Puget Sound steelhead. The action area encompasses all designated critical habitat areas considered in this Opinion. The PCEs for each listed species, where they have been designated, are described in the *Status of Listed Resources* section of this Opinion. The PCEs identify those physical or biological features that are essential to the conservation of the species that may require special management considerations or protections. As the species addressed in this Opinion have similar life history characteristics, they share many of the same PCEs. These PCEs include sites essential to support one or more life stages (sites for spawning, rearing, migration, and foraging) and contain physical or biological features essential to the conservation of the ESU/DPS, such as:

1. freshwater spawning sites with water quantity and quality conditions and substrate supporting spawning, incubation and larval development;
2. freshwater rearing sites with water quantity and floodplain connectivity to form and maintain physical habitat conditions and support juvenile growth and mobility; water quality and forage supporting juvenile development; and natural cover such as shade, submerged and overhanging large wood, log jams and beaver dams, aquatic vegetation, large rocks and boulders, side channels, and undercut banks;
3. freshwater migration corridors free of obstruction, along with water quantity and quality conditions and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, side channels, and undercut banks supporting juvenile and adult mobility and survival;
4. estuarine areas free of obstruction, along with water quality, water quantity, and salinity conditions supporting juvenile and adult physiological transitions between fresh and saltwater; natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels; and juvenile and adult forage, including aquatic invertebrates and fishes, supporting growth and maturation;
5. nearshore marine areas free of obstruction with water quality and quantity conditions and forage, including aquatic invertebrates and fishes, supporting growth and maturation; and

natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels; and

6. offshore marine areas with water quality conditions and forage, including aquatic invertebrates and fishes, supporting growth and maturation.

At the time that each habitat area was designated as critical habitat, that area contained one or more PCEs within the acceptable range of values required to support the biological processes for which the species use that habitat. We identified PCEs of prey availability and water quality in freshwater spawning sites, freshwater rearing sites, migratory corridors, and estuarine and nearshore marine areas as susceptible to the effects of the proposed action. We evaluated whether prey availability and water quality are likely affected by the proposed action and formulated risk hypotheses for these PCEs. We relied upon pesticide use information (see the *Description of the Action* section), surface water monitoring data, EPA modeling estimates, and NMFS modeling estimates (see *Exposure Analysis* section) to determine likely aquatic concentrations. Based on our analysis within the *Effects of the Proposed Action* section, the proposed action will reduce prey availability and degrade water quality within freshwater spawning habitat, freshwater rearing habitat, and migration corridors.

Direct exposure to carbaryl, carbofuran, and methomyl and the other chemical stressors of the action within freshwater will have an effect on Pacific salmonid critical habitat that overlaps with intense agricultural and residential/urban land uses. The *Environmental Baseline* discusses the extent of anthropogenic alteration of salmonid habitat within the action area. As established in *Effects of the Action to Listed Species* Section, agricultural, urban, and residential areas overlap with salmonids' geographic range to differing degrees between ESUs/DPSs. As noted in the *Effects of the Proposed Action* section, pesticides most often occur in the aquatic environment as mixtures. Carbaryl, carbofuran, and methomyl are found in environmental mixtures. Based on evidence of additive and synergistic effects of these compounds, we expect mortality of large numbers and types of aquatic insects, which are prey items for salmon. A reduction in salmonid prey abundance poses subsequent impacts on the overall growth of salmonid juveniles, especially during their first year of survival.

Reduction in Prey

Freshwater spawning, rearing, and migratory habitats must provide forage areas that support juvenile development. A reduction in the abundance of prey items will decrease the conservation value of these habitats, as they will support fewer individuals, especially during a salmonid's first year of survival. Given the environmental baseline conditions of the aquatic systems, the existing invertebrate community is already depauperate in many of these areas and requires longer periods for recovery following each pesticide application event. The a.i.s in surface runoff and pesticide drift entering freshwater rearing habitats will exacerbate reductions in insect communities that are salmonid prey items in these degraded systems. We expect that designated critical habitats that support juvenile feeding and growth will be contaminated by the proposed uses of carbaryl, carbofuran, and methomyl to the extent that the habitat is precluded from serving its intended role in the survival and recovery of listed salmonids. The overall conservation value of designated critical habitat, whether low, medium, or high, will not meet its intended role to support the survival and recovery of the species.

Reduction in Water Quality

Drift and runoff from areas of intensive urban and agricultural development will likely contain carbaryl, carbofuran, and methomyl in addition to other pesticides - particularly other AChE-inhibiting pesticides, chemical pollutants, and sediments that also degrade water quality. Depending on the available water flow, amount of shade from LWD and intact riparian zones, and water temperature in aquatic habitats, the toxicity of carbaryl, carbofuran, and methomyl in tributary and stream waters may become more pronounced. Reductions in water quality may reduce the conservation value of designated habitats used for spawning, rearing, and migration. Furthermore restoration actions promoted in many of the salmonid recovery plans focus on increasing flood plain connectivity and creating new off-channel habitats. These actions are proposed in agricultural and urban flood plains that overlap with uses of the three insecticides. Water quality (as well as prey availability) may be degraded in these newly constructed habitats from the stressors of the action- effectively precluding intended benefits to rearing juvenile salmonids. We expect that proposed uses may contaminate these areas, thereby precluding habitat from its intended purpose in supporting the survival and recovery of listed Pacific salmonids.

The precise change in the conservation value of critical habitat within the ESU/DPS from the proposed action cannot be quantified and will likely vary according to the specific designated critical habitat. However, based on the effects described above, it is reasonably likely that the proposed action will have a large, local, negative reduction in that conservation value of designated critical habitat within highly developed agricultural, residential, and urban areas. The duration, frequency, and severity of these reductions will vary according to overall numbers and volume of applications of carbaryl, carbofuran, and methomyl in areas of designated critical habitat, among other variables.

Therefore, we expect that the registration of carbaryl and carbofuran will adversely affect designated critical habitat of all listed Pacific salmonids except for that of Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, and Oregon Coast coho salmon. We also expect that the reregistration of methomyl will adversely affect designated critical habitat of all listed Pacific salmonids, except for that of Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, Oregon Coast coho salmon, Snake River fall-run Chinook salmon, Snake River spring-summer-run Chinook salmon, California Coastal Chinook salmon, and Snake River steelhead.

Conclusion

Carbaryl and Carbofuran

After reviewing the current status of California Coastal Chinook salmon, Central Valley spring-run Chinook salmon, LCR Chinook salmon, Puget Sound Chinook salmon, Sacramento River winter-run Chinook salmon, Snake River fall-run Chinook salmon, Snake River spring/summer-run Chinook salmon, UCR spring-run Chinook salmon, Upper Willamette River Chinook salmon, Central California Coast coho salmon, LCR coho salmon, Southern Oregon and Northern Coastal California coho salmon, California Central Valley steelhead, Central California Coast steelhead, LCR steelhead, MCR steelhead, Puget Sound steelhead, Snake River Basin steelhead, South Central California coast steelhead, Southern California steelhead, UCR steelhead, and Upper Willamette River steelhead, the environmental baseline for the action area,

the effects of the proposed action, and the cumulative effects, it is NMFS' Opinion that the registration of carbaryl and carbofuran is likely to jeopardize the continued existence of these endangered or threatened species (Table 81).

It is NMFS' Opinion that the registration of carbaryl and carbofuran is not likely to jeopardize the continued existence of Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, and Oregon Coast coho salmon (Table 81).

After reviewing the current status of designated critical habitat for California Coastal Chinook salmon, Central Valley spring-run Chinook salmon, LCR Chinook salmon, Puget Sound Chinook salmon, Sacramento River winter-run Chinook salmon, Snake River fall-run Chinook salmon, Snake River spring/summer-run Chinook salmon, UCR spring-run Chinook salmon, Upper Willamette River Chinook salmon, Columbia River chum salmon, Central California Coast coho salmon, Southern Oregon/Northern Coastal California coho salmon, California Central Valley steelhead, Central California Coast steelhead, LCR steelhead, MCR steelhead, Snake River Basin steelhead, South-Central California coast steelhead, Southern California steelhead, UCR steelhead, and Upper Willamette River steelhead, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is NMFS' Opinion that the registration of carbaryl and carbofuran, is likely to result in the destruction or adverse modification of critical habitat of these endangered and threatened species (Table 82).

It is NMFS' Opinion that the registration of carbaryl and carbofuran is not likely to result in the destruction or adverse modification of critical habitat of Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, and Oregon Coast coho salmon (Table 82).

Methomyl

After reviewing the current status of Central Valley spring-run Chinook salmon, LCR Chinook salmon, Puget Sound Chinook salmon, Sacramento River winter-run Chinook salmon, UCR spring-run Chinook salmon, Upper Willamette River Chinook salmon, Central California Coast

coho salmon, LCR coho salmon, Southern Oregon and Northern Coastal California coho salmon, California Central Valley steelhead, Central California Coast steelhead, LCR steelhead, MCR steelhead, Puget Sound steelhead, South Central California coast steelhead, Southern California steelhead, UCR steelhead, and Upper Willamette River steelhead, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is NMFS' Opinion that the registration of methomyl is likely to jeopardize the continued existence of these endangered or threatened species (Table 81).

It is NMFS' Opinion that the registration of methomyl is not likely to jeopardize the continued existence of California Coastal Chinook salmon, Snake River fall-run Chinook salmon, Snake River spring/summer-run Chinook salmon, Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum salmon, Hood Canal summer-run chum salmon, Oregon Coast coho salmon, and Snake River steelhead (Table 81).

After reviewing the current status of designated critical habitat for Central Valley spring-run Chinook salmon, LCR Chinook salmon, Puget Sound Chinook salmon, Sacramento River winter-run Chinook salmon, UCR spring-run Chinook salmon, Upper Willamette River Chinook salmon, Central California Coast coho salmon, LCR coho salmon, Southern Oregon and Northern Coastal California coho salmon, California Central Valley steelhead, Central California Coast steelhead, LCR steelhead, MCR steelhead, Puget Sound steelhead, South Central California coast steelhead, Southern California steelhead, UCR steelhead, and Upper Willamette River steelhead, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is NMFS' Opinion that the registration of methomyl is likely to result in the destruction or adverse modification of critical habitat of these endangered and threatened species (Table 82).

It is NMFS' Opinion that the registration of methomyl is not likely to result in the destruction or adverse modification of critical habitat of California Coastal Chinook salmon, Snake River fall-run Chinook salmon, Snake River spring/summer-run Chinook salmon, Ozette Lake sockeye salmon, Snake River sockeye salmon, Northern California steelhead, Columbia River chum

salmon, Hood Canal summer-run chum salmon, Oregon Coast coho salmon, and Snake River steelhead (Table 82).

Reasonable and Prudent Alternatives

This Opinion has concluded that EPA's proposed registration of pesticides containing carbaryl and carbofuran is likely to jeopardize the continued existence of 22 endangered and threatened Pacific salmonids and is likely to destroy or adversely modify designated critical habitat for 20 threatened and endangered salmonids. The Opinion further concluded that EPA's proposed registration of pesticides containing methomyl is likely to jeopardize the continued existence of 18 endangered and threatened Pacific salmonids and is likely to destroy or adversely modify designated critical habitat for 16 threatened and endangered salmonids. "Jeopardize the continued existence of" means "to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species" (50 CFR §402.02).

Regulations (50 CFR §402.02) implementing section 7 of the ESA define reasonable and prudent alternatives as alternative actions, identified during formal consultation, that: (1) can be implemented in a manner consistent with the intended purpose of the action; (2) can be implemented consistent with the scope of the action agency's legal authority and jurisdiction; (3) are economically and technologically feasible; and (4) NMFS believes would avoid the likelihood of jeopardizing the continued existence of listed species or resulting in the destruction or adverse modification of critical habitat.

NMFS reached this conclusion because measured and predicted concentrations of the three a.i.s in salmonid habitats, particularly in off-channel habitats[5], are likely to cause adverse effects to listed Pacific salmonids including significant reductions in growth and survival. For carbaryl and carbofuran, 22 ESUs/DPSs of listed Pacific salmonids are likely to suffer reductions in

---

[5] Off-channel habitat – water bodies and/or inundated areas that are connected (accessible to salmonid juveniles) seasonally or annually to the main channel of a stream including but not limited to features such as side channels, alcoves, ox bows, ditches, and floodplains.

Main channel –the stream channel that includes the thalweg (longitudinal continuous deepest portion of the channel.

viability given the severity of expected changes in abundance and productivity associated with the proposed action. Similarly for methomyl, 18 ESUs/DPSs of listed Pacific salmonids are likely to suffer reductions in viability. These adverse effects are expected to appreciably reduce the likelihood of both the survival and recovery of these listed Pacific salmonids. EPA's proposed registration of carbaryl and carbofuran is also likely to result in the destruction or adverse modification of critical habitat for 20 affected ESUs/DPSs because of adverse effects on salmonid prey and water quality in freshwater rearing, spawning, and foraging areas. EPA's proposed registration of methomyl is also likely to result in the destruction or adverse modification of critical habitat for 16 affected ESUs/DPSs because of adverse effects on salmonid prey and water quality in freshwater rearing, spawning, and foraging areas.

The Reasonable and Prudent Alternative (RPA) accounts for the following issues: (1) the action will result in exposure to other chemical stressors in addition to the a.i. that may increase the risk of the action to listed species, including unspecified inert ingredients, adjuvants, and tank mixes; (2) exposure to chemical mixtures containing carbaryl, carbofuran, and methomyl and other cholinesterase-inhibiting compounds result in additive and synergistic responses; and (3) exposure to other chemicals and physical stressors (*e.g.,* pH and temperature) in the baseline habitat will likely intensify response to carbaryl, carbofuran, and methomyl.

The action as implemented under the RPA will remove the likelihood of jeopardy and of destruction or adverse modification of critical habitat. In the proposed RPA, NMFS does not attempt to ensure there is no take of listed species. NMFS believes take will occur, and has provided an incidental take statement exempting that take from the take prohibitions, so long as the action is conducted according to the RPA and reasonable and prudent measures (RPM). Avoiding take altogether would most likely entail canceling registration, or prohibiting use in watersheds inhabited by salmonids. NMFS recognizes that carbofuran's registration is currently in the process of being cancelled. However, NMFS is uncertain when and if cancellation will occur. Furthermore, existing stocks under older labels would remain and are currently allowed to be applied. The RPA and RPMs therefore apply to carbofuran as well. The goal of the RPA is to reduce exposure to ensure that the action is not likely to jeopardize listed species or destroy or adversely modify critical habitat.

The RPA is comprised of six required elements that must be implemented in its entirety within one year of the receipt of EPA's Opinion to ensure the proposed registration of these pesticides is not likely to jeopardize endangered or threatened Pacific salmonids under the jurisdiction of NMFS or destroy or adversely modify critical habitat that has been designated for these species. All elements of the RPA apply only to those ESUs/DPSs where there is jeopardy or the destruction or adverse modification of critical habitat. These elements rely upon recognized practices for reducing drift and runoff of pesticide products into aquatic habitats.

Specific Elements of the Reasonable and Prudent Alternative

Elements 1-4 shall be specified on FIFRA labels of all pesticide products containing carbaryl, carbofuran, and methomyl used in California, Idaho, Oregon, and Washington. Alternatively, the label could direct pesticide users to the EPA's Endangered Species Protection Program (ESPP) bulletins that specify elements 1-4. For purposes of this RPA salmonid habitats are defined as freshwaters, estuarine habitats, and nearshore marine habitats including bays within the ESU/DPS ranges including migratory corridors. The freshwater habitats include intermittent streams and other temporally connected habitats to salmonid-bearing waters. Freshwater habitats also include all known types of off-channel habitats as well as drainages, ditches, and other man-made conveyances to salmonid habitats that lack salmonid exclusion devices (*e.g.*, screens).

Element 1.

Do not apply pesticide products[6] within specified buffers of salmonid habitats (Table 83). Buffers only apply to those salmonid habitats where NMFS concluded jeopardy or the destruction or adverse modification of designated critical habitat for listed Pacific salmonids. Buffers also only apply when water exists in the stream or habitat and shall be measured from the water's edge of salmonid habitat, including off-channel habitat, to the point of deposition (below spray nozzle).

Pesticide buffers are recognized tools to reduce pesticide loading into aquatic habitats from drift. EPA, USFWS, NMFS, courts, and state agencies routinely enlist buffers as pesticide load

[6] Use of the term "pesticide products" in the Reasonable and Prudent Alternative section of the Opinion refers to pesticide products containing carbaryl, carbofuran, and methomyl.

reduction measures. EPA requires the use of buffers on end-use product labels for ground and/or aerial applications for some products that pose risk to aquatic systems. For example, many methomyl containing end-use products have mandated buffers of 25, 100, and 450 ft for ground, aerial, and Ultra Low Volume applications, respectively. CDPR has pesticide use limitations of 120 and 600 ft buffers for carbaryl, carbofuran, and methomyl-containing pesticides when the wind is blowing toward sensitive areas. On June 14, 1989, USFWS issued a Biological Opinion for 165 listed species and 112 pesticide a.i.s. Prescribed buffers under species-specific RPAs ranged from 60 ft (ground applications) to one half mile (aerial applications). Many of EPA's historical county bulletins for endangered species referenced a 60 ft buffer for ground applications and a 300 ft buffer for aerial spraying. One court decision prescribed mandatory 60 ft (ground) and 300 ft (aerial) buffers for applications within the ranges of ESA-listed Pacific salmonids. NMFS has prescribed a range of buffers in ESA consultations for herbicide and insecticide application actions by agencies such as the U.S. Forest Service and Bureau of Land Management overlapping with ESA-listed salmonid habitats. Herbicide buffers ranged from 0 ft to 500 ft depending on application type, rate, and frequency. Insecticide buffers ranged from 0 ft to 200 ft depending on application type, rate, and frequency.

NMFS generated estimated environmental concentrations for the three *N*-methyl carbamates for off-channel habitats using the AgDrift model (set to EPA Tier 1 simulation defaults). NMFS generated values for a range of buffer sizes in 100 ft increments for ground applications (0 – 1,000 ft), and aerial applications (0 – 1,000 ft). The dimensions of the off-channel habitat modeled were 32.8 ft (10 m) wide and 0.328 ft (0.1 m) deep. Key model assumptions include:

- Drift as the only pathway of exposure;
- A single application of each a.i.; and
- The estimates represent instantaneous average concentrations across the entire habitat modeled.

Table 83. Mandatory pesticide no application buffers for ground and aerial applications

Rate	Carbaryl	Carbofuran	Methomyl
lbs/ acre	No Application Buffer (ft)		
Ground Applications			
0 -1	200	200	50
≥1-3	300	300	NA
≥3-5	400	400	NA
≥5-10	500	500	NA
≥10	600	600	NA
Aerial Applications			
All rates	1000	1000	600

NA – Not Applicable. Methomyl has no current registrations permitting maximum applications ≥ 1 lb ai/A

The estimated concentrations decline as buffer size increases **(**Table 84**).** We note the disparity between the concentrations predicted by the two models. For example, at 100 ft. the predicted concentrations are 4.4 µg/L from a ground application and 92.9 µg/L from an aerial application. The two results are not directly comparable because the models use different methods to predict amount of drift.

Table 84. Estimated environmental concentrations of carbaryl, carbofuran, and methomyl applied at the rate of 1 lb per acre for ground and aerial applications.

Ground application, low boom, ASAE very fine-fine droplet distribution, 50th percentile estimates EPA Tier 1 simulations	
Buffer (ft)	Off-Channel (10 m * 0.1 m) (µg/L)

700	16.035
800	14.692
900	13.719
997	12.983

Based on the population growth modeling exercises, a four-day exposure to expected concentrations of carbaryl, carbofuran, and methomyl will substantially reduce a population's growth rate due to prey base reduction. All four life history types modeled demonstrated this effect. As exposure duration and application rate increases, we expect more pronounced effects on salmonid prey abundance and recovery timing leading to further reduced salmonid growth. We expect that some juvenile salmonids are likely to experience reductions in growth. However, the prescribed buffers are intended to avoid population-level effects. We also expect that prey

items will die from these exposures. The likelihood of impacting salmonid prey availability, an identified PCE, is substantially reduced by these buffers.

The majority of buffers described earlier are smaller than the buffers prescribed in this element. Concentrations expected with smaller buffers would lead to a greater probability of affecting populations and PCEs especially in habitats that are compromised from a variety of stressors (described in the *Environmental Baseline* section).

The scenario we modeled with AgDrift in this RPA element is expected to occur when all of the modeled variables are present *e.g.*, specific wind speed, wind direction, release height, size of off-channel habitat, droplet size distribution, etc. The input variables are relevant to field conditions and the frequency of this exact scenario occurring remains unknown. We selected this scenario to represent off-channel habitats used by a sensitive salmonid life stage *i.e.*, juveniles. NMFS believes that these buffers will remove a substantial portion of risk attributed to pesticide drift.

Element 2. Do not apply when wind speeds are greater than or equal to 10 mph as measured using an anemometer immediately prior to application. Because wind conditions may change during application of pesticide products, commence applications on the side nearest the aquatic habitat and proceed away from the aquatic habitat.

Element 3. For all uses do not apply pesticide products when soil moisture is at field capacity, or when a storm event likely to produce runoff from the treated area is forecasted by NOAA/NWS (National Weather Service), to occur within 48 h following application.

Element 4. Report all incidents of fish mortality that occur within four days of application and within the vicinity of the treatment area to EPA OPP (703-305-7695).

Element 5. In addition to the labeling requirements above, EPA shall develop and implement a NMFS-approved effectiveness monitoring plan for off-channel habitats with annual reports. The plan shall identify representative off-channel habitats within agricultural areas prone to drift and

runoff of pesticides. The number and locations of off-channel habitat sampling sites shall include currently used off-channel habitats by threatened and endangered Pacific salmonids identified by NMFS biologists and will include at least two sites for each general species (ESU or DPS; *i.e.,* coho salmon, chum salmon, steelhead, sockeye salmon, and ocean-type Chinook and stream-type Chinook salmon). The plan shall collect daily surface water samples targeting at least three periods during the application season for seven days. Collected water samples will be analyzed for current-use OPs and carbamates following USGS schedule for analytical chemistry. The report shall be submitted to NMFS OPR and will summarize annual monitoring data and provide all raw data.

*Element 6***.** This element is specific to Washington State's 24(c) for carbaryl applications on estuarine mudflats. As this use is specific for application on mudflats within estuaries, elements 1, 3, and 4 are not applicable for this use. Elements 2 and 5 are required. A monitoring program approved by NMFS OPR shall be established in Willapa Bay and Grays Harbor to determine the presence, AChE activity, and genetic source populations of captured juvenile salmonids. For example, a monitoring program shall be implemented to determine salmonid health at five locations using beach seines with the first incoming tide after carbaryl application. Additionally, fyke nets placed in five channels proximate to sprayed mudflats shall be used to determine and health at first outgoing tide after carbaryl application. All dead or dying salmonids, if any, shall be collected and genetically analyzed to determine source population origin. Additionally, muscle and brain AChE activity shall be measured in collected dead or dying salmonids. A subset of the live salmonids captured in seines and nets shall be genetically analyzed to determine source population origin. Annual reports shall be submitted to NMFS and include the raw data and summaries of the raw data including number of fish caught, species of salmonids, genetic analysis results, AChE activity results of brain and muscle samples, and number of dead or dying salmonids collected. The sampling effort shall be conducted annually as long as carbaryl is allowed for use in Willapa Bay and Grays Harbor.

Although NMFS has concluded that EPA's action for carbaryl and carbofuran is likely to jeopardize 22 listed ESUs/DPSs and destroy or adversely modify 20 designated critical habitats during the 15-year duration of the proposed action, NMFS does not believe that the effects of the

action will attain this level in the year between issuance of this Opinion and EPA's implementation of the RPA. NMFS has further concluded that EPA's action for methomyl is likely to jeopardize 18 listed ESUs/DPSs and destroy or adversely modify designated critical habitats for 16 listed species during the 15-year duration of the proposed action. As with carbaryl and carbofuran, NMFS does not believe that the effects of the action for methomyl will attain this level in the year between issuance of this Opinion and EPA's implementation of the RPA. Products containing these three a.i.s have been in use for some time. NMFS believes that these products have contributed to ESU/DPS declines, but not to the extent that one year of additional use as now authorized would lead to likely jeopardy or adverse modification.

Based on the above conclusions on the effects of EPA's proposed registration of pesticide products containing carbaryl, carbofuran, and methomyl, the EPA is required to notify NMFS OPR of its final decision on implementation of the RPA.

Incidental Take Statement

Section 9 of the ESA and federal regulation pursuant to section 4(d) of the ESA prohibits the take of endangered and threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by NMFS to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this Incidental Take Statement.

Amount or Extent of Take Anticipated

As described earlier in this Opinion, this is a consultation on the EPA's registration of pesticide products containing carbaryl, carbofuran, and methomyl, and their formulations as they are used

in the Pacific Northwest and California and the impacts of these applications on listed ESUs/DPSs of Pacific salmonids. The EPA authorizes use of these pesticide products for pest control purposes across multiple landscapes. The goal of this Opinion is to evaluate the impacts to NMFS' listed resources from the EPA's broad authorization of applied pesticide products. This Opinion is a partial consultation because pursuant to the court's order, EPA sought consultation on only 26 listed Pacific salmonids under NMFS' jurisdiction. However, even though the court's order did not address the two more recently listed ESUs and DPSs, NMFS analyzed the impacts of EPA's actions to them because they belong to the same taxon and the analysis requires consideration of the same information. Consultation with NMFS will be completed when EPA makes effect determinations on all remaining species under NMFS' jurisdiction and consults with NMFS as necessary.

For this Opinion, NMFS anticipates the general direct and indirect effects that would occur from EPA's registration of pesticide products across the states of California, Idaho, Oregon, and Washington to 28 listed Pacific salmonids under NMFS' jurisdiction during the 15-year duration of the proposed action. Recent and historical surveys indicate that listed salmonids occur in the action area, in places where they will be exposed to the stressors of the action. The RPAs are designed to reduce this exposure but not eliminate it. Pesticide runoff and drift of carbaryl, carbofuran, and methomyl are most likely to reach streams and other aquatic sites when they are applied to crops and other land use settings located adjacent to wetlands, riparian areas, ditches, off-channel habitats, and intermittent streams. These inputs into aquatic habitats are especially high when rainfall immediately follows applications. The effects of pesticides and other contaminants found in urban runoff especially from areas with a high degree of impervious surfaces may also exacerbate degraded water quality conditions of receiving waters used by salmon. Urban runoff is also generally warmer in temperature and elevated water temperature pose negative effects on certain life history phases for salmon, increasing susceptibility to chemical stressors. The range of effects of the three a.i.s on salmonids include reductions in growth, prey capture, and swimming ability, impaired olfaction affecting homing and reproductive behaviors, and increased susceptibility to predation and disease. Thus, we expect some exposed fish will respond to these effects by changing normal behaviors. In some cases, fish may die, be injured, or suffer sublethal effects. These results are not the purpose of the

proposed action. Therefore, incidental take of listed salmonids is reasonably certain to occur over the 15-year duration of the proposed action.

Given the variability of real-life conditions, the broad nature and scope of the proposed action, and the migratory nature of salmon, the best scientific and commercial data available are not sufficient to enable NMFS to estimate a specific amount of incidental take associated with the proposed action. As explained in the *Description of the Proposed Action* and the *Effects of the Proposed Action* sections, NMFS identified multiple uncertainties associated with the proposed action. Areas of uncertainty include:

1. Incomplete information on the proposed action (*i.e.,* no master label summarizing all authorized uses of pesticide products containing carbaryl, carbofuran, and methomyl);
2. Limited use and exposure data on stressors of the action for non-agricultural uses of these pesticides;
3. Minimal information on exposure and toxicity for pesticide formulations, adjuvants, and other/inert ingredients within registered formulations;
4. No information on permitted tank mixtures and associated exposure estimates;
5. Limited data on toxicity of environmental mixtures;
6. No known method to predict synergistic responses from exposure to combinations of the three a.i.s;
7. Annual variable conditions regarding land use, crop cover, and pest pressure;
8. Variable temporal and spatial conditions within each ESU, especially at the population-level; and
9. Variable conditions of water bodies in which salmonids live.

NMFS therefore identifies as a surrogate for the allowable extent of take the ability of this action to proceed without any fish kills attributed to the use of carbaryl, carbofuran, or methomyl or any compounds, degradates, or mixtures in aquatic habitats containing individuals from any ESU/DPS. Because of the difficulty of detecting salmonid deaths, the fishes killed are not to be listed salmonids. Salmonids appear to be more sensitive to these compounds, so that if there are kills of other freshwater fishes attributed to use of these pesticides, it is likely that salmonids have also died, even if no dead salmonids can be located. In addition, if stream conditions due to pesticide use kill less sensitive fishes in certain areas, the potential for lethal and non-lethal takes in downstream areas increases. A fish kill is considered attributable to one of these three ingredients, its metabolites, or degradates, if measured concentrations in surface waters are at

levels expected to kill fish, if AChE measurements were taken of the fish carcass and correlate to fish death, if pesticides were applied in the general area, and if pesticide drift or runoff was witnessed or apparent.

NMFS notes that with increased monitoring and study of the impact of these pesticides on water quality, particularly water quality in off-channel habitats, NMFS will be able to refine this incidental take statement, and future incidental take statements, to allow other measures of the extent of take.

Reasonable and Prudent Measures

The measures described below are non-discretionary, and must be undertaken by the EPA so that they become binding conditions of any grant or permit issued to the applicant(s), as appropriate, for the exemption in section 7(o)(2) to apply. The EPA has a continuing duty to regulate the activity covered by this incidental take statement. If the EPA (1) fails to assume and implement the terms and conditions or (2) fails to require the applicant(s) to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. In order to monitor the impact of incidental take, the EPA must report the progress of the action and its impact on the species to NMFS OPR as specified in the incidental take statement. [50 CFR§402.14(i)(3)].

To satisfy its obligations pursuant to section 7(a)(2) of the ESA, the EPA must monitor (a) the direct, indirect, and cumulative impacts of its long-term registration of pesticide products containing carbaryl, carbofuran, and methomyl; (b) evaluate the direct, indirect, or cumulative impacts of pesticide misapplications in the aquatic habitats in which they occur; and (c) the consequences of those effects on listed Pacific salmonids under NMFS' jurisdiction. The purpose of the monitoring program is for the EPA to use the results of the monitoring data and modify the registration process in order to reduce exposure and minimize the effect of exposure where pesticides will occur in salmonid habitat.

The EPA shall:

1. Minimize the amount and extent of incidental take from use of pesticide products containing carbaryl, carbofuran, and methomyl by reducing the potential of chemicals reaching the water;
2. Monitor any incidental take or surrogate measure of take that occurs from the action; and
3. Report annually to NMFS OPR on the monitoring results from the previous season.

Terms and Conditions

To be exempt from the prohibitions of section 9 of the ESA, within one year following the date of issuance of this Opinion, the EPA must comply with the following terms and conditions. These terms and conditions implement the reasonable and prudent measure described above. These terms and conditions are non-discretionary.

1. a. EPA shall include the following instructions requiring reporting of fish kills either on the labels for all products containing carbaryl, carbofuran, and methomyl or in ESPP Bulletins:

   NOTICE: Incidents where salmon appear injured or killed as a result of pesticide applications shall be reported to NMFS OPR at 301-713-1401 and EPA at 703-305-7695. The finder should leave the fish alone, make note of any circumstances likely causing the death or injury, location and number of fish involved, and take photographs, if possible. Adult fish should generally not be disturbed unless circumstances arise where an adult fish is obviously injured or killed by pesticide exposure, or some unnatural cause. The finder may be asked to carry out instructions provided by NMFS OPR to collect specimens or take other measures to ensure that evidence intrinsic to the specimen is preserved.

   b. EPA shall report to NMFS OPR any incidences regarding carbaryl, carborfuran, or methomyl effects on aquatic ecosystems added to its incident database that it has classified as probable or highly probable.

   c. Do not apply pesticide products when wind speeds are greater than or equal to 10 mph as measured using an anemometer immediately prior to application. When applying pesticide products, commence applications on the side nearest the aquatic habitat and proceed away from the aquatic habitat.

2. For all uses do not apply pesticide products when soil moisture is at field capacity, or when a storm event likely to produce runoff from the treated area is forecasted by NOAA/NWS (National Weather Service), to occur within 48 h following application.

Conservation Recommendations

Section 7(a) (1) of the ESA directs federal agencies to use their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

The following conservation recommendations would provide information for future consultations involving future authorizations of pesticide a.i.s that may affect listed species:

1. Conduct mixture toxicity analysis in screening-level and endangered species biological evaluations;
2. Develop models to estimate pesticide concentrations in off-channel habitats; and
3. Develop models to estimate pesticide concentrations in aquatic habitats associated with non-agricultural applications, particularly in residential and industrial environments.

In order for NMFS to be kept informed of actions minimizing or avoiding adverse effects or benefiting listed species or their habitats, the EPA should notify NMFS OPR of any conservation recommendations it implements in the final action.

Reinitiation Notice

This concludes formal consultation on the EPA's proposed registration of pesticide products containing carbaryl, carbofuran, and methomyl and their formulations to ESA-listed Pacific salmonids under the jurisdiction of the NMFS. As provided in 50 CFR 402.16, reinitiation of formal consultation is required where discretionary federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the extent of take specified in the *Incidental Take Statement* is exceeded; (2) new information reveals effects of this action that may affect listed species or designated critical habitat in a manner or to an extent not previously considered in this biological opinion; (3) the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in this Opinion; or (4) a new species is listed or critical habitat designated that may be affected by the identified action. If reinitiation of consultation appears warranted due to one or more of the above circumstances, EPA must contact NMFS OPR. If none of these reinitiation triggers are

met within the next 15 years, then reinitiation will be required because the Opinion only covers the action for 15 years.

Appendix 1: Population Modeling

Introduction

To assess the potential for adverse impacts of the anticholinesterase insecticides on Pacific salmon populations, a model was developed that explicitly links impairments in the biochemistry, behavior, prey availability and somatic growth of individual salmon to the productivity of salmon populations. More specifically, the model connects known effects of the pesticides on salmon physiology and behavior with community-level effects on salmon prey to estimate population-level effects on salmon. The model used here is an extension of one developed for investigating the direct effects of pesticides on the biochemistry, behavior, and growth of ocean-type Chinook salmon (Baldwin et al., in press).

In the freshwater portion of their life, Pacific salmon may be exposed to insecticides that act by inhibiting acetylcholinesterase (AChE). AChEe is a crucial enzyme in the proper functioning of cholinergic synapses in the central and peripheral nervous systems of vertebrates and invertebrates. Of consequence to salmon, anticholinesterase insecticides have been shown to interfere with salmon swimming behavior (Beauvais et al. 2000, Brewer et al. 2001, Sandahl et al. 2005), feeding behavior (Sandahl et al. 2005), foraging behavior (Morgan and Kiceniuk 1990), homing behavior (Scholz et al. 2000), anti-predator behaviors (Scholz et al. 2000), and reproductive physiology (Moore and Waring 1996, Waring and Moore 1997, Scholz et al. 2000).

Anticholinesterase insecticides have also been found to reduce benthic densities of aquatic invertebrates and alter the composition of aquatic communities (Liess and Schulz 1999, Schulz and Liess 1999, Schulz et al. 2002, Fleeger et al. 2003, Schulz 2004, Chang et al. 2005, Relyea 2005). Spray drift and runoff from agricultural and urban areas can expose aquatic invertebrates to relatively low concentrations of insecticides for as little as minutes or hours, but populations of many taxa can take months or even years to recover to pre-exposure or reference densities (Wallace et al. 1991, Liess and Schulz 1999, Anderson et al. 2003, Stark et al. 2004). For example, when an aquatic macroinvertebrate community in a German stream was exposed to runoff containing parathion (an AChE inhibitor) and fenvalerate (another commonly used insecticide), eight of eleven abundant species disappeared and the remaining three were reduced in abundance (Liess and Schulz 1999). Long-term changes in invertebrate densities and community composition likely result in reductions in salmon prey availability. Therefore, in

addition to the direct impacts that AChE inhibitors have on salmon, there may also be, independently, significant indirect effects to salmon via their prey (Peterson et al. 2001a). Wild juvenile salmon feed primarily on invertebrates in the water column and those trapped on the water's surface, actively selecting the largest items available (Healey 1991, Quinn 2005). Salmon are often found to be food limited (Quinn 2005), suggesting that a reduction in prey number or size due to insecticide exposure may further stress salmon. For example, Davies and Cook (1993) found that several months following a spray drift event, benthic and drift densities were still reduced in exposed stream reaches. Consequently, brown trout in the exposed reaches fed less and grew at a slower rate compared to those in unexposed stream reaches (Davies and Cook 1993). Although the insecticide in their study was cypermethrin (a pyrethroid), similar reductions in macroinvertebrate density and recovery times have been found in studies with AChE inhibitors (Liess and Schulz 1999, Schulz et al. 2002), suggesting indirect effects to salmon via prey availability may be similar.

One likely biological consequence of reduced swimming, feeding, foraging, and prey availability is a reduction in food uptake and, subsequently, a reduction in somatic growth of exposed fish. Juvenile growth is a critical determinant of freshwater and marine survival for Chinook salmon (Higgs et al. 1995). Reductions in the somatic growth rate of salmon fry and smolts are believed to result in increased size-dependent mortality (Healey 1982, West and Larkin 1987, Zabel and Achord 2004). Zabel and Achord (2004) observed size-dependent survival for juvenile salmon during the freshwater phase of their outmigration. Mortality is also higher among smaller and slower growing salmon because they are more susceptible to predation during their first winter (Healey 1982, Holtby et al. 1990, Beamish and Mahnken 2001). These studies suggest that factors affecting the organism and reducing somatic growth, such as anticholinesterase insecticide exposure, could result in decreased first-year survival and, thus, reduce population productivity.

Changes to the size of juvenile salmon from exposure to carbaryl, carbofuran, and methomyl were linked to salmon population demographics. We used size-dependent survival of juveniles during a period of their first year of life. We did this by constructing and analyzing general life history matrix models for coho salmon (*Oncorhynchus kisutch*), sockeye salmon (*O. nerka*), and

ocean-type and stream-type Chinook salmon (*O. tshawytscha*). A steelhead (*O. mykiss*) life history model was not constructed due to the lack of demographic information relating to the proportions of resident and anadromous individuals, the freshwater residence time of steelhead, and rates of repeated spawning. The basic salmonid life history modeled consisted of hatching and rearing in freshwater, smoltification in estuaries, migration to the ocean, maturation at sea, and returning to the natal freshwater stream for spawning followed shortly by death. Differences between the modeled strategies are lifespan of the female, time to reproductive maturity, and the number and relative contribution of the reproductive age classes (Figure 1). The coho females we modeled reach reproductive maturity at age 3 and provide all of the reproductive contribution. Sockeye females reach maturity at age 4 or 5, but the majority of reproductive contributions are provided by age 4 females. Chinook salmon females can mature at age 3, 4, or 5, with the majority of the reproductive contribution from ages 4 and 5. The primary difference between the ocean-type and stream-type Chinook salmon is the juvenile freshwater residence with ocean-type juveniles migrating to the ocean as sub-yearlings and stream-type overwintering in freshwater and migrating to the ocean as yearlings. The models depicted general populations representing each life history strategy and were constructed based upon literature data described below. Specific populations were not modeled due to the difficulty in finding sufficient demographic and reproductive data for a single population.

A separate acute toxicity model was constructed that estimated the population-level impacts of juvenile mortality resulting from exposure to lethal concentrations of carbaryl, carbofuran, and methomyl. These models excluded sublethal and indirect effects of the pesticide exposures and focused on the population-level outcomes resulting from an annual exposure of juveniles to a pesticide. The lethal impact was implemented as a change in first year survival for each of the salmon life history strategies.

The overall model endpoint used to assess population-level impacts for both the growth and acute lethality models was the percent change in the intrinsic population growth rate (lambda, λ) resulting from the pesticide exposure. Change in λ is an accepted population parameter often used in evaluating population productivity, status, and viability. The National Marine Fisheries Service uses changes in λ when estimating the status of species, conducting risk and viability

assessments, developing endangered species recovery plans, composing biological opinions, and communicating with other federal, state and local agencies (McClure et al. 2003). While values of $\lambda<1.0$ indicate a declining population, negative changes in lambda greater than the natural variability for the population indicate a loss of productivity. This can be a cause for concern since the decline could make a population more susceptible to dropping below 1.0 due to impacts from multiple stressors.

The following models were developed to serve as a means to assess the potential effects on ESA-listed salmon populations from exposure to AChE inhibiting pesticides, including *N*-methyl carbamates and organophosphorus insecticides. The growth model focuses on the impacts to prey abundance and a salmon's ability to feed which are integrated into reductions in juvenile growth. Assessing the results from different pesticide exposure scenarios relative to a control (*i.e.*, unexposed) scenario can indicate the potential for sublethal pesticide exposures to lead to changes in the somatic growth and survival of individual sub-yearling salmon. Consequently, subsequent changes in salmon population dynamics as indicated by percent change in a population's intrinsic rate of increase assists us in forecasting the potential population-level impacts to listed populations. Also, the model helps us understand the potential influence of life history strategies that might explain differential results within the species modeled.

Methods

The model consists of two parts, an organismal portion and a population portion. The organismal portion of the model links AChE inhibition and reduced prey abundance from insecticide exposure to potential reductions in the growth of individual fish. The population portion of the model links the sizes of individual sub-yearling salmon to their survival and the subsequent growth of the population. Models were constructed using MATLAB 7.7.0 (R2008b) (The MathWorks, Inc. Natick, MA).

Organismal Model

For the organismal model a relationship between AChE activity and somatic growth of salmonid fingerlings was developed using a series of relationships between pesticide exposure, AChE activity, feeding behavior, food uptake, and somatic growth rate (Figures 2-4). The model

incorporates empirical data when available. Since growth and toxicity data are limited, extrapolation from one salmon species to the others was done with the assumption that the salmon stocks would exhibit similar physiological and toxicological responses. Sigmoidal dose-response relationships based upon the AChE inhibition EC50 values and their slopes are used to determine the level of AChE activity (Figure 2A, 2B, 2C) from the exposure concentration of each pesticide exposure or pulse.

A linear relationship based on empirical data related AChE activity to feeding behavior (Sandahl et al. 2005, Figure 2D). Feeding behavior was then assumed to be directly proportional to food uptake, defined as potential ration (Figure 2E). The potential ration expresses the amount of food the organism can consume when prey abundance is not limiting. Potential ration over time (Figure 2F) depicts how the food intake of individual fish changes in response to the behavioral effects of the pesticide exposure over the modeled growth period. Potential ration is equal to final ration if no effects on prey abundance are incorporated (Figure 4). If effects of pesticide exposure on prey abundance are incorporated, final ration is the product of potential ration (relating to the fish's ability to capture prey, Figure 2) and the relative abundance of prey available following exposure (Figure 3). Next, additional empirical data (*e.g.*, Weatherley and Gill 1995) defined the relationship between final ration and somatic growth rate (Figure 4C). While the empirical relationship is more complex (*e.g.*, somatic growth rate plateaus at rations above maximum feeding), a linear model was considered sufficient for the overall purpose of this model. Finally, the model combines these linear models relating AChE activity to feeding behavior, feeding behavior to potential ration, and final ration to somatic growth rate to produce a linear relationship between AChE activity and somatic growth rate (Figure 4D). One important assumption of the model is that the relationships are stable, *i.e.*, do not change with time. The relationships would need to be modified to incorporate time as a variable if, for example, fish are shown to compensate over time for reduced AChE activity to improve their feeding behavior and increase food uptake.

Juvenile salmonids are largely opportunistic, feeding on a diverse community of aquatic and terrestrial invertebrate taxa that are entrained in the water column or on the surface (Higgs et al. 1995). As a group, these invertebrates are among the more sensitive taxa for which there is

toxicity data, but within this group, there is a wide range of sensitivities. To determine a single effect concentration to use in the model analyses, a search was completed using the EPA's Ecotox database for each pesticide (http://cfpub.epa.gov/ecotox/). Several criteria were used to determine which reported effect concentrations were included in the final analysis. The data included were from studies on taxa that are known to be salmonid prey (or are functionally similar to salmonid prey); these include a diverse group of fresh and saltwater crustaceans, aquatic insects and worms. Studies with exposures of at least 24 hours (h) and not more than 96 h were included. Studies examining shorter and longer exposure times are known to affect invertebrates (*e.g.*, Peterson et al. 2001b), but these were excluded so that estimated EC50s would be comparable to previous analyses (NMFS 2008). Studies reporting invertebrate LC50s and EC50s in which mortality or immobilization of invertebrates was the recorded endpoint were included; the term "EC50" will be used in this report to describe all of these included data. Data derived for sublethal endpoints (*e.g.*, growth or reproduction) were not included. If specific data were represented more than once in the Ecotox output, duplicates were eliminated. Data from several recent peer-reviewed studies that are not yet included in the Ecotox data base, but report effect concentrations that caused mortality, were also included.

From the distributions of those data, a single effect concentration and slope were derived to best represent the diverse community of prey available in juvenile salmonid freshwater and estuarine habitats. The distributions of individual invertebrate EC50s and the geometric means of EC50s by taxa were analyzed to estimate the 50th, 10th, and 5th percentiles. Figure 43shows the distribution of geometric means of EC50s by taxa for the 10th percentile and Table 79shows the concentrations for the percentiles. Specifically, for each pesticide, a probability plot was used to graph the EC50 concentrations normalized to a normal probability distribution. For each plot, the X axis is scaled in probability (between zero and 100%) and shows the percentage of entire data whose value is less than the data point. The Y axis displays the range of the data on a log scale. The results of a linear regression of the log-transformed concentrations are shown and highlight the lognormal distribution of the data (Figure 43). In the regression equation, the normsinv() function returns the inverse of the standard normal cumulative distribution. The standard normal distribution has a mean of zero and a standard deviation of one. For example,

given a percentile value of 50 (*i.e.*, a probability of 0.5), normsinv(50) returns a value of zero. The plots and regressions were performed using KaleidaGraph 4.03 (Synergy Software).

The decision to use the 10th percentile rather than the 50th percentile is consistent with previous designations by EPA, and is reasonable because of the relative sensitivity of invertebrates that are most likely consumed by juveniles. In addition, the 10th percentile is a reasonable threshold because the data included in the meta-analysis were limited to concentrations that caused mortality or immobilization within a short period of time (1-4 days). A growing number of studies on a variety of insecticides have reported that concentrations well below LC50s can cause delayed mortality or sublethal effects that may scale up to affect populations, especially in scenarios with multiple exposures and/or other stressors. Evidence for ecologically significant sublethal or delayed effects includes reduced growth rates (Schulz and Liess 2001b, Forbes and Cold 2005), altered behavior (Johnson et al. 2008), reduced emergence (Schulz and Liess 2001a), reduced reproduction (Cold and Forbes 2004, Sakamoto et al. 2006), and reduced predator defenses (Sakamoto et al. 2006, Johnson et al. 2008). Finally, the available toxicity data – and therefore the data included for these analyzes – are from studies using taxa hearty enough to survive laboratory conditions. Studies specifically examining salmonid prey that are more difficult to rear in the laboratory have documented relatively low LC50 or EC50 values when exposed to current-use pesticides (*e.g.*, Peterson et al. 2001a, Johnson et al. 2008). It is noteworthy that the most relevant invertebrate study for carbaryl – a study using a diverse group of seven salmonid prey taxa collected from streams in the Pacific Northwest – reports LC50s for carbaryl with a geometric mean of 26.28 µg/L (range 11.1 – 61.0) (Peterson et al. 2001a).

The models allow exposures that can include multiple AChE-inhibiting pesticides over various time pulses. Sigmoidal dose-response relationships, at steady-state, between each single pesticide exposure and 1) AChE activity and 2) relative prey abundance are modeled using specific EC50s and EC50s and slopes (Figure 2B and 3B). The timecourse for each exposure was built into the model as a pulse with a defined start and end during which the exposure remained constant (Figure 2A and 3A). The timecourse for AChE activity, on the other hand, was modeled using two single-order exponential functions, one for the time required for the exposure to reach full effect and the other for time required for complete recovery following the

end of the exposure (time-to-effect$_{\text{AChE activity}}$ and time-to-recovery$_{\text{AChE activity}}$, respectively; Figure 2C). The apparent activity level was back-calculated to result in a relative concentration (concentration/ AChE inhibition EC50) for each day of the growth period for each pulse. The relative concentration for each day was summed across all the pulses to result in a total apparent concentration for each day. The sigmoid slope used in the calculation of AChE activity using the apparent concentration was the arithmetic mean of the sigmoid slopes for each pesticide present on each day. The timecourse for relative prey abundance was modeled incorporating a one day spike in prey drift relative to the toxicity and available prey base followed by a drop in abundance due to the toxic impacts (Figure 3C). Recovery is assumed to be due to a constant influx of invertebrates from connected habitats (aquatic and terrestrial) that are not exposed to the pesticide. Incoming organisms are subject to toxicity if pesticides are still present and this alters the rate of recovery during exposures. Incorporating dynamic effects and recovery variables allows the model to simulate differences in the pharmacokinetics (*e.g.*, the rates of uptake from the environment and of detoxification) of various pesticides and simulate differences in invertebrate community response and recovery rates (see below).

The relationship between final ration and somatic growth rate (Figure 4C) produces a relationship representing somatic growth rate over time (Figure 4D), which is then used to model individual growth rate and size over time. The growth models were run for 1,000 individual fish, with initial weight selected from a normal distribution with a mean of 1.0 g and standard deviation of 0.1 g. The size of 1.0 g was chosen to represent sub-yearling size in the spring prior to the onset of pesticide application. For each iteration of the model (one day for the organismal model), the somatic growth rate is calculated for each fish by selecting the parameter values from normal distributions with specified means and standard deviations (Table 1). The weight for each fish is then adjusted based on the calculated growth rate to generate a new weight for the next iteration. The length (days) to run the growth portion of the model was selected to represent the time from when the fish enter the linear portion of their growth trajectory in the mid to late spring until they change their growth pattern in the fall due to reductions in temperature and resources or until they migrate out of the system. The outputs of the organismal model that are handed to the population models consist of mean weights (with standard deviations) after the

species-appropriate growth period (Table 2). A sensitivity analysis was run to determine the influence of the parameter values on the output of the growth model.

The parameter values defining control conditions that are constant for all the modeled species are listed in Table 1. Model parameters such as the length of the growth period and control daily growth rate that are species specific are listed in Table 2. Each exposure scenario was defined by a concentration and exposure time for each pesticide. The duration of time until full effect for the pesticides was assumed to be within a few days (Ferrari et al. 2004), with a half-life of 0.5 days.

For prey, it is assumed there is a constant, independent influx of prey from upstream habitats that will eventually (depending on the rate selected) return prey abundance to 1. As mentioned above, however, these invertebrates are subject to exposure once added to the system, and therefore prey recovery rate is a product of the influx rate as well as the exposure scenario. While recovery rates reported in the literature vary, it is assumed a 1% recovery rate is ecologically realistic (Ward et al. 1995, Van den Brink et al. 1996, Colville et al. 2008). It was also assumed that regardless of the exposure scenario, relative prey abundance would not drop below a specific floor (Figure 3B). This assumption depends on a minimal yet constant terrestrial subsidy of prey and/or an aquatic community with tolerant individuals that would be available as prey, regardless of pesticide exposure and in addition to the constant recovery rate. No studies specify floors per se, but studies quantifying invertebrate densities following highly toxic exposures indicate a floor of 0.2 is ecologically realistic (*i.e.*, regardless of the exposure, 20% of a fish's ration will be available daily; *e.g.*, Cuffney et al. 1984). Finally, because prey availability has been found to increase dramatically albeit briefly following pesticide exposures (due to immediate mortality and/or emigration of benthic prey into the water column; Davies and Cook 1993, Schulz 2004), a one-day prey spike is included for the day following an exposure. The relative magnitude of the spike is calculated as the product of the standing prey availability the day prior to exposure (minus the floor), the toxicity of the exposure, and a constant of 20. This calculation therefore accounts for the potential prey that are available and the severity of the exposure. The spike will be greater when more prey are available and/or the toxicity of the

exposure is greater; alternatively, the spike will be small when few prey are available and/or the exposure toxicity is low.

Below are the mathematical equations used to derive Figures 2, 3, and 4.

Figures 2A and 3A use a step function:

time < start; exposure = 0

start ≤ time ≤ end; exposure = exposure concentration(s)

time > end; exposure = 0.

Figures 2B and 3B use a sigmoid function:

y = bottom + (top – bottom)/(1 + (exposure concentration/EC50)^slope).

For 2B, y = AChE activity, top = Ac, bottom = 0.

For Figure 3B, y = prey abundance, top = Pc (in this case 1), bottom = Pf.

Figures 2D, 2E, and 4C use a linear function (the point-slope form of a line):

y = m*(x – x1) + y1.

For 2D, m = Mfa, x1 = Ac, and y1 = Fc.

For 2E, m = Mrf (computed as Rc/Fc), x1 = Fc, and y1 = Rc.

For 4C, m = Mgr, x1 = Rc, and y1 = Gc.

Figure 2C uses a series of exponential functions:

time < start; y = c

start ≤ time ≤ end; y = c – (c – i)*(1 – exp(-ke*(time – start)))

time > end; ye = c – (c – i)*(1 – exp(-ke*(end – start)))

y = ye + (c – ye)*(1 – exp(-kr*(time – end))).

For Figure 2C, c = Ac, i = Ai, ke = ln(2)/AChE effect half-life, kr = ln(2)/AChE recovery half-life. For Figure 2C the value of ye is calculated to determine the amount of inhibition that is reached during the exposure time, which may not be long enough to reach the maximum level of inhibition.

For Figure 3C, an exposure pulse would result in a 1-day spike followed by a decline to the impacted level based upon the prey toxicity. During exposures resulting in low prey toxicity, toxicity-limited recovery can occur. After exposure ends a constant rate of recovery proceeds until control drift is reached or another exposure occurs

```
preyavail=preydrift(day-1)-floor;
preytox=1/(1+(concentration)^preyslope);
preyrecrate=0.01;
preydriftrec = preyrecrate*preytox.
time=start; spike=(-1+10^(1.654*preyavail))*(1-preytox)
        preydrift =preydrift+spike
start ≤ time ≤ end;  preydrift=(preyavail*preytox)+preyrdriftrec+floor;
time>end; preydrift = preydrift(day-1)+preydriftrec
```

Figure 2F is generated by using the output of Figure 2C for a given time as the input for 2D and using the resulting output of 2D as the input for 2E. The resulting output of 2E produces a single time point in the relationship in 2F. Performing this series of computations across multiple days produces the entire relationship in 2F. 4D is generated by taking the outputs of 4A and 4B for the same day. Note the relationship of 4A is equivalent to 2F. The resulting outputs of 4A and 4B are multiplied to produce a final ration for a given day. The prey abundance (4B) available for consumption during a prey spike is capped at a maximum of 1.5*control drift to provide a limited benefit to the individual fish. The final ration is used as input for 4C to generate 4D.

Population Model

The weight distributions from the organismal growth portion of the model are used to calculate size-dependent first-year survival for a life history matrix population model for each species and life history type. This incorporates the impact that reductions in size could have on population growth rate and abundance. The first-year survival element of the transition matrix incorporates a size-dependent survival rate for a three- or four-month interval (depending upon the species) which takes the juveniles up to 12 months of age. This time represents the 4-month early winter survival in freshwater for stream-type Chinook salmon, coho, and sockeye models. For ocean-

type Chinook salmon, it is the 3-month period the sub-yearling smolt spend in the estuary and nearshore habitats (*i.e.*, estuary survival). The weight distributions from the organismal model are converted to length distributions by applying condition factors from data for each modeled species (cf; 0.0095 for sockeye and 0.0115 for all others) as shown in Equation L.

Equation L: length(mm) = ((fish weight(g)/cf)^(1/3))*10

The relationship between length and early winter or estuary survival rate was adapted from Zabel and Achord (2004) to match the survival rate for each control model population (Howell et al. 1985, Kostow 1995, Myers et al. 2006). The relationship is based on the length of a sub-yearling salmon relative to the mean length of other competing sub-yearling salmon of the same species in the system, Equation D, and relates that relative difference to size-dependent survival based upon Equation S. The values for α and resulting size-dependent survival (survival ϕ) for control runs for each species are listed in Table 2. The constant α is a species-specific parameter defined such that it produces the correct control survival ϕ value when Δlength equals zero.

Equation D: Δlength = fish length(mm) – mean length(mm)

Equation S: Survival $\phi = (e^{(\alpha+(0.0329*\Delta length))}) / (1 + e^{(\alpha+(0.0329*\Delta length))})$

Randomly selecting length values from the normal distribution calculated from the organismal model output size and applying equations 1 and 2 generates a size-dependent survival probability for each fish. This process was replicated 1,000 times for each exposure scenario and simultaneously 1,000 times for the paired control scenario and results in a mean size-dependent survival rate for each population. The resulting size-dependent survival rates are inserted in the calculation of first-year survival in the respective control and pesticide-exposed transition matrices.

The investigation of population-level responses to pesticide exposures uses life history projection matrix models. Individuals within a population exhibit various growth, reproduction, and survivorship rates depending on their developmental or life history stage or age. These age specific characteristics are depicted in the life history graph (Figure 1A-D) in which transitions are depicted as arrows. The nonzero matrix elements represent transitions corresponding to reproductive contribution or survival, located in the top row and the subdiagonal of the matrix, respectively (Figure 1E). The survival transitions in the life history graph are incorporated into

the n x n square matrix (A) by assigning each age a number (1 through n) and each transition from age i to age j becomes the element a_{ij} of matrix A (i = row, j = column) and represent the proportion of the individuals in each age passing to the next age as a result of survival. The reproductive element (a_{1j}) gives the number of offspring that hatch per individual in the contributing age, j. The reproductive element value incorporates the proportion of females in each age, the proportion of females in the age that are sexually mature, fecundity, fertilization success, and hatch success.

In order to understand the relative impacts of a short-term exposure of a single pesticide on exposed vs. unexposed fish, we used parameters for an idealized control population that exhibits an increasing population growth rate. All characteristics exhibit density independent dynamics. The models assume closed systems, allowing no migration impact on population size. No stochastic impacts are included beyond natural variability as represented by selecting parameter values from a normal distribution about a mean each model iteration (year). Ocean conditions, freshwater habitat, fishing pressure, and marine resource availability were assumed constant and density independent.

In the model an individual fish experiences an exposure once as a sub-yearling (during its first spring) and never again. The pesticide exposure is assumed to occur annually. All sub-yearlings within a given population are assumed to be exposed to the pesticide. No other age classes experience the exposure. The model integrates this as every brood class being exposed as sub-yearlings and thus the vital demographic rates of the transition matrix are continually impacted in the same manner. Regardless of the level of AChE inhibition due to the direct exposure, only the sublethal effects are incorporated in the models at this time.

The model recalculates first-year survival for each run using a size-dependent survival value selected from a normal distribution with the mean and standard deviation produced by Equation S. Population model output consists of the percent change in lambda from the unexposed control populations derived from the mean of two thousand calculations of both the unexposed control population and the pesticide exposed population. Change in lambda, representing alterations to

the population productivity, was selected as the primary model output for reasons outlined previously.

A prospective analysis of the transition matrix, A, (Caswell 2001) explored the intrinsic population growth rate as a function of the vital rates. The intrinsic population growth rate, λ, equals the dominant eigenvalue of A and was calculated using matrix analysis software (MATLAB version 7.7.0 by The Math Works Inc., Natick, MA). Therefore, λ is calculated directly from the matrix and running projections of abundances over time is redundant and unnecessary. The stable age distribution, the proportional distribution of individuals among the ages when the population is at equilibrium, is calculated as the right normalized eigenvector corresponding to the dominant eigenvalue λ. Variability was integrated by repeating the calculation of λ 2,000 times selecting the values in the transition matrix from their normal distribution defined by the mean standard deviation. The influence of each matrix element, a_{ij}, on λ was assessed by calculating the sensitivity values for A. The sensitivity of matrix element a_{ij} equals the rate of change in λ with respect to a_{ij}, defined by $\delta\lambda/\ \delta a_{ij}$. Higher sensitivity values indicate greater influence on λ. The elasticity of matrix element a_{ij} is defined as the proportional change in λ relative to the proportional change in a_{ij}, and equals (a_{ij}/λ) times the sensitivity of a_{ij}. One characteristic of elasticity analysis is that the elasticity values for a transition matrix sum to unity (one). The unity characteristic also allows comparison of the influence of transition elements and comparison across matrices.

Due to differences in the life history strategies, specifically lifespan, age at reproduction and first year residence and migration habits, four life history models were constructed. This was done to encompass the different responses to freshwater pesticide exposures and assess potentially different population-level responses. Separate models were constructed for coho, sockeye, ocean-type and stream-type Chinook salmon. In all cases transition values were determined from literature data on survival and reproductive characteristics of each species.

A life history model was constructed for coho salmon (*O. kisutch*) with a maximum age of 3. Spawning occurs in late fall and early winter with emergence from March to May. Fry spend 14-18 months in freshwater, smolt and spend 16-20 months in the saltwater before returning to

spawn (Pess et al. 2002). Survival numbers were summarized in Knudsen et al. (2002) as follows. The average fecundity of each female is 4,500 with a standard deviation of 500. The observed number of males:females was 1:1. Survival from spawning to emergence is 0.3 (0.07). Survival from emergence to smolt is 0.0296 (0.00029) and marine survival is 0.05 (0.01). All parameters followed a normal distribution (Knudson et al. 2002). The calculated values used in the matrix are listed in Table 4. The growth period for first year coho was set at 180 days to represent the time from mid-spring to mid-fall when the temperatures and resources drop and somatic growth slows (Knudson et al. 2002).

Life history models for sockeye salmon (*O. nerka*) were based upon the lake wintering populations of Lake Washington, Washington, USA. These female sockeye salmon spend one winter in freshwater, then migrate to the ocean to spend three to four winters before returning to spawn at ages 4 or 5. Jacks return at age 2 after only one winter in the ocean. The age proportion of returning adults is 0.03, 0.82, and 0.15 for ages 3, 4 and 5, respectively (Gustafson et al.1997). All age 3 returning adults are males. Hatch rate and first-year survival were calculated from brood year data on escapement, resulting presmolts and returning adults (Pauley et al. 1989), and fecundity (McGurk 2000). Fecundity values for age 4 females were 3,374 (473) and for age 5 females were 4,058 (557) (McGurk 2000). First-year survival rates were 0.737/month (Gustafson et al. 1997). Ocean survival rates were calculated based upon brood data and the findings that 90% of ocean mortality occurs during the first 4 months of ocean residence (Pauley et al. 1989). Matrix values used in the sockeye baseline model are listed in Table 4. The 168 day growth period represents the time from lake entry to early fall when the temperature drops and somatic growth slows (Gustafson et al. 1997).

A life history model was constructed for ocean-type Chinook salmon (*O. tshawytscha*) with a maximum female age of 5 and reproductive maturity at ages 3, 4, or 5. Ocean-type Chinook salmon migrate from their natal stream within a couple months of hatching and spend several months rearing in estuary and nearshore habitats before continuing on to the open ocean. Transition values were determined from literature data on survival and reproductive characteristics from several ocean-type Chinook salmon populations in the Columbia River system (Healey and Heard 1984, Howell et al. 1985, Roni and Quinn 1995, Ratner et al. 1997,

PSCCTC 2002, Green and Beechie 2004). The sex ratio of spawners was approximately 1:1. Estimated size-based fecundity of 4,511(65), 5,184(89), and 5,812(102) was calculated based on data from Howell et al., 1985, using length-fecundity relationships from Healy and Heard (1984). Control matrix values for the Chinook model are listed in Table 4. The growth period of 140 days encompasses the time the fish rear in freshwater prior to entering the estuary and open ocean. The first three months of estuary/ocean survival are the size-dependent stage. Size data for determining sub-yearling Chinook salmon condition indices came from data collected in the lower Columbia River and estuary (Johnson et al. 2007).

An age-structured life history matrix model for stream-type Chinook salmon with a maximum age of 5 was defined based upon literature data on Yakima River spring Chinook from Knudsen et al. (2006) and Fast et al. (1988), with sex ratios of 0.035, 0.62 and 0.62 for females spawning at ages 3, 4, and 5, respectively. Length data from Fast et al. (1988) was used to calculate fecundity from the length-fecundity relationships in Healy and Heard (1984). The 184-day growth period produces control fish with a mean size of 96 mm, within the observed range documented in the fall prior to the first winter (Beckman et al. 2000). The size-dependent survival encompasses the 4 early winter months, up until the fish are 12 months old.

Acute Toxicity Model

In order to estimate the population-level responses of exposure to lethal pesticide concentrations, acute mortality models were constructed based upon the control life history matrices described above. The acute responses are modeled as direct reduction in the first-year survival rate (S1). All sub-yearling salmon are assumed to be exposed in each scenario. Exposures are assumed to result in a cumulative reduction in survival as defined by the concentration and the dose-response curve as defined by the LC50 and slope for each pesticide. A sigmoid dose-response relationship is used to accurately handle responses well away from LC50 and to be consistent with other does-response relationships. The model inputs for each scenario are the exposure concentration and acute fish LC50, as well as the sigmoid slope for the LC50. For a given concentration a pesticide survival rate (1-mortality) is calculated and is multiplied by the control first-year survival rate, producing an exposed scenario first-year survival for the life history matrix. Variability is incorporated as described above using mean and standard deviation of normally

distributed survival and reproductive rates and model output consists of the percent change in lambda from unexposed control populations derived from the mean of 1,000 calculations of both the unexposed control population and the pesticide exposed population. The percent change in lambda is considered different from control when the difference is greater than the percent of one standard deviation from the control lambda.

Results

Sensitivity Analysis

A sensitivity analysis conducted on the organismal model revealed that changes in the control somatic growth rate had the greatest influence on the final weights (Table 1). While this parameter value was experimentally derived for another species (sockeye salmon; Brett et al. 1969), this value was adapted for each model species and is within the variability reported in the literature for other salmonids (reviewed in Weatherley and Gill 1995). Other parameters related to the daily growth rate calculation, including the growth to ration slope (Mgr) and the control ration produced strong sensitivity values. Initial weight, the prey recovery rate and the prey floor also strongly influenced the final weight values (Table 1). Large changes (0.5 to 2X) in the other key parameters produced proportionate changes in final weight.

The sensitivity analysis of all four of the control population matrices predicted the greatest changes in population growth rate (λ) result from changes in first-year survival. Parameter values and their corresponding sensitivity values are listed in Table 4. The elasticity values for the transition matrices also corresponded to the driving influence of first-year survival, with contributions to lambda of 0.33 for coho, 0.29 for ocean-type Chinook salmon, 0.25 for stream-type Chinook salmon, and 0.24 for sockeye.

Model Output

Organismal and population model outputs for all scenarios are shown in Tables 74-78 and were summarized in Figures 44-47 in the main text of the Opinion. As expected, greater changes in population growth resulted from longer exposures to the pesticides. The factors driving the level of change in lambda were the Prey Drift and relative AChE Activity parameters determined by the toxicity values for each pesticide (Table 3). The low Prey Abundance EC_{50} values drive the

effects for all three compounds at most concentrations investigated since they have higher AChE EC50 values (Table 3). Output from the acute toxicity models was presented in the Risk Characterization section of the main text. Increases in direct mortality during the first year of life produced large impacts on the population growth rates for all the life history strategies.

While strong trends in effects were seen for each pesticide across all four life history strategies modeled, some slight differences were apparent. The similarity in patterns likely stems from using the same toxicity values for all four models, while the differences are consequences of distinctions between the life history matrices. The stream-type Chinook salmon and sockeye models produced very similar results as measured as the percent change in population growth rate. The ocean-type Chinook salmon and coho models output produced the greatest changes in lambda resulting from the pesticide exposures. When looking for similarities in parameters to explain the ranking, no single life history parameter or characteristic, such as lifespan, reproductive ages, age distribution, lambda and standard deviation, or first-year survival show a pattern that matches this consistent output. Combining these factors into the transition matrix for each life history and conducting the sensitivity and elasticity analyses revealed that changes in first-year survival produced the greatest changes in lambda. In addition, the elasticity analysis can be used to predict relative contribution to lambda from changes in first-year survival on a per unit basis. As detailed by the elasticity values reported above, the same change in first-year survival will produce a slightly greater change in the population growth rate for coho and ocean-type Chinook salmon than for stream-type Chinook salmon and sockeye. While some life history characteristics may lead a population to be more vulnerable to an impact, the culmination of age structure, survival and reproductive rates as a whole strongly influences the population-level response.

Figure 1: Life-History Graphs and Transition Matrix for coho (A), sockeye (B) and Chinook salmon (C). The life history graph for a population labeled by age, with each transition element labeled according to the matrix position, a_{ij}, i row and j column. Dashed lines represent reproductive contribution and solid lines represent survival transitions. D) The transition matrix for the life history graph depicted in C.

Figure 2: Relationships used to link anticholinesterase exposure to the organism's ability to acquire food (potential ration). See text for details. Relationships in B, C, and D use empirical data. Closed circles represent control conditions. Open circles represent the exposed (inhibited) condition. A) Representation of a constant level of anticholinesterase pesticide exposure (either a single compound or mixtures). B) Sigmoidal relationship between exposure concentration and steady-state AChE activity showing a dose-dependent reduction defined by control activity (horizontal line, Ac), sigmoidal (*i.e.*, hille) slope (AChE slope), and the concentration producing 50% inhibition (vertical line, EC50). C) Timecourse of AChE inhibition based on modeling the time-to-effect and time-to-recovery as single exponential curves with different time-constants. At the start of the exposure AChE activity will be at control and then decline toward the inhibited activity (Ai) based on Panel B. D) Linear model relating AChE activity to feeding behavior using a line that passes through the feeding (Fc) and activity (Ac) control conditions with a slope of Mfa. E) The relationship between feeding behavior and the potential ratio an organism could acquire (if not food limited) used a line passing through the control conditions (Fc as in Panel D and the control ration, Rc) and through the origin producing a slope (Mrf) equal to Rc/Fc. F) Timecourse for effect of exposure to anticholinesterase on potential ration produced by combining C and E.

Figure 3: Relationships used to link anticholinesterase exposure to the availability of prey. See text for details. Relationships in B and C utilize empirical data. Closed circles represent control conditions. Open circles represent the exposed (inhibited) condition. A) Representation of a constant level of anticholinesterase pesticide exposure (either single compound or mixtures). B) Sigmoidal relationship between exposure concentration and relative prey abundance showing a dose-dependent reduction defined by control abundance (horizontal line at 1, Pc), sigmoid (*i.e.*, hille) slope (prey slope), the concentration producing a 50% reduction in prey (vertical line,

EC_{50}), and a minimum abundance always present (horizontal line denoted as floor, Pf). C) Timecourse of prey abundance including a 1-day spike in prey drift relative to the available prey and the level of toxicity followed by a drop to the level of impact or the floor whichever is greater. During extended exposures at low toxicity recovery can begin at the constant prey influx rate multiplied by the current level of toxicity. After exposure recovery to control prey drift is at the constant rate of influx from upstream habitats.

Figure 4: Relationships used to link anticholinesterase exposure to growth rate relating to long-term weight gain of each fish. See text for details. Relationships in A, B, and C utilize empirical data. Closed circles represent control conditions. Open circles (*e.g.*, Ai) represent the exposed (inhibited) condition. A&B) Relationships describing the timecourse of the effects of anticholinesterase exposure on the organisms ability to capture food (Panel A, potential ration) and the availability of food to capture (Panel B, relative prey abundance). The figures are the same as those in Figures 2F and 3C, respectively. For a given exposure concentration and time, multiplying potential ration by relative prey abundance yields the final ration acquired by the organism. C) A linear model was used to relate final ration to growth rate using a line passing through the control conditions and through the maintenance condition with a slope denoted by Mgr. D) Timecourse for effect of exposure to anticholinesterase on growth rate produced by combining A, B, & C.

Table 1. List of values used for control parameters to model organismal growth and the model sensitivity to changes in the parameter.

Parameter	Value[1]	Error[2]	Sensitivity[3]
acetylcholinesterase activity (Ac)	1.0[4,5]	0.06[5]	-0.167

Table 4. Matrix transition element and sensitivity (S) and elasticity (E) values for each model species. These control values are listed by the transition element taken from the life history graphs as depicted in Figure 1 and the literature data described in the method text. Blank cells indicate elements that are not in the transition matrix for a particular species. The influence of each matrix element on λ was assessed by calculating the sensitivity (S) and elasticity (E) values for A. The sensitivity of matrix element a_{ij} equals the rate of change in λ with respect to the transition element, defined by $\delta\lambda / \delta a$. The elasticity of transition element a_{ij} is defined as the proportional change in λ relative to the proportional change in a_{ij}, and equals (a_{ij}/λ) times the sensitivity of a_{ij}. Elasticity values allow comparison of the influence of individual transition elements and comparison across matrices.

Appendix 4: Glossary

303(d) waters Section 303 of the federal Clean Water Act requires states to prepare a list of all surface waters in the state for which beneficial uses – such as drinking, recreation, aquatic habitat, and industrial use - are impaired by pollutants. These are water quality limited estuaries, lakes, and streams that do not meet the state's surface water quality standards and are not expected to improve within the next two years. After water bodies are put on the 303(d) list they enter into a Total Maximum Daily Load Clean Up Plan.

Active ingredient	The component(s) that kills or otherwise affects the pest. A.i.s are always listed on the label (FIFRA 2(a)).
Adulticide	A compound that kills the adult life stage of the pest insect.
Anadromous Fish	Species that are hatched in freshwater migrate to and mature in salt water and return to freshwater to spawn.
Adjuvant	A compound that aides the operation or improves the effectiveness of a pesticide.
Alevin	Life history stage of a salmonid immediately after hatching and before the yolk-sac is absorbed. Alevins usually remain buried in the gravel in or near the egg nest (redd) until their yolk sac is absorbed when they swim up and enter the water column.
Anadromy	The life history pattern that features egg incubation and early juvenile development in freshwater migration to sea water for adult development, and a return to freshwater for spawning.
Assessment Endpoint	Explicit expression of the actual ecological value that is to be protected (*e.g.*, growth of juvenile salmonids).

Bioaccumulation	Accumulation through the food chain (*i.e.*, consumption of food, water/sediment) or direct water and/or sediment exposure.
Bioconcentration	Uptake of a chemical across membranes, generally used in reference to waterborne exposures.
Biomagnification	Transfer of chemicals via the food chain through two or more trophic levels as a result of bioconcentration and bioaccumulation.
Degradates	New compounds formed by the transformation of a pesticide by chemical or biological reactions.
Distinct Population Segment	A listable entity under the ESA that meets tests of discreteness and significance according to USFWS and NMFS policy. A population is considered distinct (and hence a "species" for purposes of conservation under the ESA) if it is discrete fro an significant to the remainder of its species based n factors such as physical, behavioral, or genetic characteristics, it occupies an unusual or unique ecological setting, or its loss would represent a significant gap in the species' range.
Escapement	The number of fish that survive to reach the spawning grounds or hatcheries. The escapement plus the number of fish removed by harvest form the total run size.
Evolutionarily Significant Unit	A group of Pacific salmon or steelhead trout that is (1) substantially reproductively isolated from other conspecific units and (2) represent an important component of the evolutionary legacy of the species.
Fall Chinook	This salmon stock returns from the ocean in late summer and early

Salmon	fall to head upriver to its spawning grounds, distinguishing it from other stocks which migrate in different seasons.
Fate	Dispersal of a material in various environmental compartments (sediment, water air, biota) as a result of transport, transformation, and degradation.
Flowable	A pesticide formulation that can be mixed with water to form a suspension in a spray tank.
Fry	Stage in salmonid life history when the juvenile has absorbed its yolk sac and leaves the gravel of the redd to swim up into the water column. The fry stage follows the alevin stage and in most salmonid species is followed by the parr, fingerling, and smolt stages. However, chum salmon juveniles share characteristics of both the fry and smolt stages and can enter sea water almost immediately after becoming fry.
Half-pounder	A life history trait of steelhead exhibited in the Rogue, Klamath, Mad, and Eel Rivers of southern Oregon and northern California. Following smoltification, half-pounders spend only 2-4 months in the ocean, then return to fresh water. They overwinter in fresh water and emigrate to salt water again the following spring. This is often termed a false spawning migration, as few half-pounders are sexually mature.
Hatchery	Salmon hatcheries use artificial procedures to spawn adults and raise the resulting progeny in fresh water for release into the natural environment, either directly from the hatchery or by transfer into another area. In some cases, fertilized eggs are outplanted (usually in "hatch-boxes"), but it is more common to release fry or smolts.
Inert ingredients	"an ingredient which is not active" (FIFRA 2(m)). It may be toxic or enhance the toxicity of the active ingredient.

Iteroparous	Capable of spawning more than once before death
Jacks	Male salmon that return from the ocean to spawn one or more years before full-sized adults return. For coho salmon in California, Oregon, Washington, and southern British Columbia, jacks are 2 years old, having spent only 6 months in the ocean, in contrast to adults, which are 3 years old after spending 1 ½ years in the ocean.
Jills	Female salmon that return from the ocean to spawn one or more years before full-sized adult returns. For sockeye salmon in Oregon, Washington, and southern British Columbia, jills are 3 years old (age 1.1), having spent only one winter in the ocean in contrast to more typical sockeye salmon that are age 1.2, 1.32.2, or 2.3 on return.
Kokanee	The self-perpetuating, non-anadromous form of *O. nerka* that occurs in balanced sex ration populations and whose parents, for several generations back, have spent their whole lives in freshwater.
Lambda	Also known as Population growth rate, or the rate at which the abundance of fish in a population increases or decreases.
LRL	Laboratory Reporting Level (USGS NAWQA data)- Generally equal to twice the yearly determined LT-MDL. The LRL controls false negative error. The probability of falsely reporting a non-detection for a sample that contained an analyte at a concentration equal to or greater that the LRL is predicted to be less than or equal to 1 percent.
Major Population Group (MPG)	A group of salmonid populations that are geographically and genetically cohesive. The MPG is a level of organization between demographically independent populations and the ESU.

Main channel	The stream channel that includes the thalweg (longitudinal continuous deepest portion of the channel.
Metabolite	A transformation product resulting from metabolism.
Mode of Action	A series of key processes that begins with the interaction of a pesticide with a receptor site and proceeds through operational and anatomical changes in an organisms that result in sublethal or lethal effects.
Natural fish	A fish that is produced by parents spawning in a stream or lake bed, as opposed to a controlled environment such as a hatchery.
Nonylphenols	A type of APE and is an example of an adjuvant that may be present as an ingredient of a formulated product or added to a tank mix prior to application.
Off-channel habitat	Water bodies and/or inundated areas that are connected (accessible to salmonid juveniles) seasonally or annually to the main channel of a stream including but not limited to features such as side channels, alcoves, ox bows, ditches, and floodplains.
Parr	The stage in anadromous salmonid development between absorption of the yolk sac and transformation to smolt before migration seaward.
Persistence	The tendency of a compound to remain in its original chemical form in the environment.
Pesticide	Any substance or mixture of substances intended for preventing, destroying, repelling or mitigating any pest.

Reasonable and Prudent Alternative (RPA)	Recommended alternative actins identified during formal consultation that can be implemented in a manner consistent with the scope of the Federal agency's legal authority an jurisdiction, that are economically an technologically feasible, an that the Services believes would avoid the likelihood of jeopardizing the continued existence of the listed species or the destruction or adverse modification of designated critical habitat.
Redd	A nest constructed by female salmonids in streambed gravels where eggs are deposited and fertilization occurs.
Riparian area	Area with distinctive soils an vegetation between a stream or other body of water and the adjacent upland. It includes wetlands and those portions of flood plains an valley bottoms that support riparian vegetation.
Risk	The probability of harm from actual or predicted concentrations of a chemical in the aquatic environment – a scientific judgement.
Salmonid	Fish of the family *Salmonidae*, including salmon, trout, chars, grayling, and whitefish. In general usage, the term usually refers to salmon, trout, and chars.
SASSI	A cooperative program by WDFW and WWTIT to inventory and evaluate the status of Pacific salmonids in Washington State. The SASSI report is a series of publications from this program.
Semelparous	The condition in an individual organism of reproducing only once in a lifetime.

Smolt	A juvenile salmon or steelhead migrating to the ocean and undergoing physiological changes to adapt from freshwater to a saltwater environment.
Sublethal	Below the concentration that directly causes death. Exposure to sublethal concentrations of a material may produce less obvious effect on behavior, biochemical, and/or physiological function of the organism often leading to indirect death.
Surfactant	A substance that reduces the interfacial or surface tension of a system or a surface-active substance.
Synergism	A phenomenon in which the toxicity of a mixture of chemicals is greater than that which would be expected from a simple summation of the toxicities of the individual chemicals present in the mixture.
Technical Grade Active Ingredient (TGAI)	Pure or almost pure active ingredient. Available to formulators. Most toxicology data are developed with the TGAI. The percent AI is listed on all labels.
Technical Recovery Teams (TRT)	Teams convened by NOAA Fisheries to develop technical products related to recovery planning. TRTs are complemented by planning forums unique to specific states, tribes, or reigns, which use TRT and other technical products to identify recovery actions.
Teratogenic	Effects produced during gestation that evidence themselves as altered structural or functional processes in offspring.
Total Maximum	defines how much of a pollutant a water body can tolerate (absorb)

Daily Load (TMDL)	daily and remain compliant with applicable water quality standards. All pollutant sources in the watershed combined, including non-point sources, are limited to discharging no more than the TMDL.
Unique Mixture	A specific combination of 2 or more compounds, regardless of the presence of other compounds.
Viable Salmonid Population	An independent population of Pacific salmon or steelhead trout that has a negligible risk of extinction over a 100-year time frame. Viability at the independent population scale is evaluated based on the parameters of abundance, productivity, spatial structure, and diversity.
VSP Parameters	Abundance, productivity, spatial structure, and diversity. These describe characteristics of salmonid populations that are useful in evaluating population viability. See NOAA Technical Memorandum NMFS-NWFSC-, "Viable salmonid populations and the recovery of evolutionarily significant units," McElhany et al., June 2000.
WDFW	Washington Department of Fish and Wildlife is a co-manager of salmonids and salmonid fisheries in Washington State with WWTIT and other fisheries groups. The agency was formed in the early 1990s by the combination of the Washington Department of Fisheries and the Washington Department of Wildlife.
WWTIT	Western Washington Treaty Indian Tribes is an organization of Native American tribes with treaty fishing rights recognized by the U.S. government. WWTIT is a co-manager of salmonids and salmonid fisheries in western Washington in cooperation with the WDFW and other fisheries groups.

WQS	"A water quality standard defines the water quality goals of a waterbody, or portion thereof, by designating the use or uses to be made of the water and by setting criteria necessary to protect public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act." Each state is responsible for maintaining water quality standards.

EXECUTIVE SUMMARY

This Watershed Annual Report documents the area-wide and watershed-based Urban Runoff management programs and activities that were implemented by the Permittees during Fiscal Year 2008-2009 (July 1, 2008 through June 30, 2009) to reduce pollutants in Urban Runoff to the Maximum Extent Practicable (MEP). The regional programs reported upon herein are described in the Riverside County Drainage Area Management Plan (DAMP), which serves as the Permittees Watershed SWMP. These programs have been created and implemented in accordance with and to comply with the requirements of Provision K and the Monitoring and Reporting Program (MRP) of the Municipal Separate Storm Sewer System (MS4) Permit issued to the Riverside County Permittees by the San Diego Regional Water Quality Control Board (Regional Board) on July 14, 2004 (Board Order R9-2004-001). This is the third MS4 permit issued for the Santa Margarita Region of Riverside County (SMR) by the Regional Board and is referred to as the "Third-term SMR Permit".

This reporting period covers the fifth year and final year of the five-year duration of the Third Term MS4 Permit. In January 2009, 180 days before the expiration of the Third Term Permit, the Permittees submitted their Report of Waste Discharge (ROWD) to the Regional Board as their application for the Fourth-Term of the SMR Permit. This ROWD included a comprehensive analysis of the effectiveness of the Permittees' storm-water management programs and resulted in specific and included specific recommendations for enhancing these programs. This annual report continues the documentation.

Within this Watershed Annual Report the terms "Watershed SWMP" and "DAMP" are used interchangeably, and the term "Standard Urban Storm-water Management Plan (SUSMP)" referenced in the SMR Permit is hereinafter referred to as the "Water Quality Management Plan (WQMP)". Additional terms and acronyms used in this Watershed Annual Report are defined in the glossary included in the DAMP.

A copy of the Third-term SMR Permit is included as Appendix C of the DAMP.

APPENDIX E – TRAINING ATTENDANCE SHEETS

- NEW DEVELOPMENT TRAINING
- MUNICIPAL TRAINING
- INDUSTRIAL/COMMERCIAL TRAINING
- CONSTRUCTION TRAINING
- CAP Training

APPENDIX F – WATERSHED MS4 MAP

APPENDIX G – MONITORING ANNUAL REPORT

A. OVERVIEW OF THE UPPER SANTA MARGARITA WATERSHED

A.1. OVERVIEW OF THE SMR

The SMR is defined as the area delineated by the Riverside-San Diego County boundary line on the south and the Santa Margarita River watershed boundary line on the north, east, and west as shown in Figure A-1. The area includes portions of unincorporated County of Riverside and the Cities of Murrieta and Temecula. Portions of the newly incorporated cities of Menifee and Wildomar are also located within the SMR and have submitted their Notice of Intent to comply with the fourth-term permit as part of the ROWD. Further, the SMR is comprised entirely of the Murrieta Creek and Temecula Creek sub-watersheds.

It is important to recognize that the Clean Water Act exempts agricultural activities from regulation under NPDES. Further, under federal and state law, Permittees do not have legal jurisdiction over storm-water discharges into their respective MS4 from:

- State and Federal facilities,
- Utilities and special districts,
- Native American tribal lands.

Photo A-1: Santa Margarita River, just below confluence of Murrieta and Temecula Creeks

Although these areas may exist within Riverside County, they are not included in the SMR. However, the current Permit requires the Permittees to coordinate with these stakeholders to reduce discharges from their lands. In addition, other point and non-point source discharges otherwise permitted by or under the jurisdiction of the Regional Board may affect water quality in the Murrieta and Temecula Creek watersheds. Current land uses within the SMR are shown on the Watershed Facilities Map in Appendix F.

The area of Riverside County under the jurisdiction of the Regional Board is approximately 548 square miles, which is less than 8 percent of the 7,300 square miles within Riverside County. Not counting the two newly incorporated cities, only three of the 24 existing general-purpose municipalities within Riverside County are located within the SMR. Figure A-1 below shows the Permit area and the incorporated Cities.

Figure A-1

SANTA MARGARITA RIVER WATERSHED

RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT
GEOGRAPHIC INFORMATION SYSTEM
September 2009

The graphical and tabular information shown on this document may be derived from a variety of public agency and/or private commercial sources such as Riverside County Transportation and Land Management Agency, Thomas Brothers Mapping, the Stephen P. Teale Data Center, GIS Technology Center, State of California, the United States Geologic Survey and the United States National Atlas. These sources may possess varying levels of accuracy and precision and this product is meant only as a guide to the relative position and scale of the depicted features. This GIS document is in no case to be interpreted as fundamental or decisive for purposes of land surveying, field engineering, plan drafting, code enforcement, land boundary determination and/or land acquisition.

A.2. CHANGES IN POPULATION

The California Department of Finance estimates that as of January 1, 2009, the total population of the whole of Riverside County was approximately 2,107,653[1]. Of the 2.10 million people, roughly 256,194 persons[2] (12%) reside within the SMR. Approximately 31,163 persons reside in unincorporated county areas while approximately 225,031 persons reside within incorporated cities.

Figure A-2 2009 Population Distribution within SMR [3]

Table A-1 shows the population data for years 2004-2009 for the neighboring counties and for each of the Cities within the Permit area between years 2004 and 2009. Throughout the first four years of the Third-term of the SMR Permit (2004-2008), population growth in Riverside County was significantly higher than in neighboring counties and was also greater than the percent change in population in the entire State. However, this has not been the case for Fiscal year 2008-2009 wherein current estimates show a net reduction in population within the SMR. This limited growth and economic hardship is forecasted to continue well into the next permit term as described in the 2009 ROWD.

1 State of California, Department of Finance, E-1 population Estimates for Cities, Counties and the State with Annual Percent Change — January 1, 2008 and 2009. Sacramento, California, May 2009

2 Aerial image analysis based upon 2007 imagery and State identified trend of declined population in unincorporated Riverside County.

3 The recently incorporated cities of Menifee and Wildomar have submitted their notice of intent to participate in the upcoming 4th Term MS4 Permit as part of the 2009 ROWD.

(e) ND = No Data

A.3. CHANGES IN LAND USE

In 1956, only 0.3 percent of the SMR (less than two square miles) was urbanized.[4] Over half a century later, even with a significant rate of growth in population relative to the State and neighboring counties, approximately 87 percent of the SMR remains in non-urban land uses (rural residential, agriculture, preserves and open space, state lands, federal lands, and tribal lands). Further, almost thirty percent (30%) of the watershed within the county consists of federal, state, and tribal lands[5] that are not under the jurisdiction of the Permittees' MS4 programs.

Changes in zoned land uses from 2008 to 2009 are shown in on the next page in Table A-2. A Map of the various land uses in the SMR is included in Appendix F.

[4] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956.

A.4. CONSERVED LANDS

Approximately 136 square miles, or 25% of the Permit Area has been successfully conserved as part of the Permittee's implementation of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). Additionally, through the continued implementation of the MSHCP much of the remaining non-urbanized area will ultimately be conserved, totaling approximately 43% of the Permit Area.

Figure A-3: Conservation within the Santa Margarita Region of Riverside County

Additional information regarding the MSHCP can be found in Section G.3.3 and the current status of the MSHCP can be found in Section H.1.1.a) of this report.

Figure A-4 contains a map of the currently conserved lands within the Santa Margarita Watershed.

B. A DESCRIPTION OF EFFORTS TO COORDINATE WITH OTHER STAKEHOLDERS IN THE SANTA MARGARITA RIVER WATERSHED, INCLUDING SAN DIEGO COUNTY AND THE US MARINE CORPS BASE CAMP PENDLETON.

B.1. INTRODUCTION

The Permittees schedule at least one annual meeting with representatives from the San Diego County MS4 Permittees within the Santa Margarita River watershed, Camp Pendleton, U.S. Bureau of Reclamation (Bureau), and others. The purpose of these meetings is to:

- Exchange ideas of how to address sources of Focus Area Constituents of Concern and evaluate effectiveness of actions;
- Collaborate with water districts in an effort to reduce irrigation water runoff; and
- Consider grant applications to coordinate and prioritize water quality projects that address Focus Area Constituents of Concern.

And to Discuss:

- Land use planning;
- Monitoring data and potential management measures to target Focus Area Constituents of Concern;
- The proposed Santa Margarita Lagoon Total Maximum Daily Load (Lagoon TMDL);
- Watershed based planning issues and a watershed model for the Santa Margarita River;
- Implementation of the Integrated Regional Watershed Management Plan for the Upper Santa Margarita Watershed, and its coordination with the adjacent San Diego and Orange County Integrated Regional Watershed Management Plans
- Formation of a Watershed Council
- Coordination of regional monitoring programs within the Santa Margarita Watershed

These meetings may occur from within the context of another workgroup, such as the Santa Margarita River Executive Management Team, or as separately called meetings, as appropriate. Several of these efforts are inter-coordinated and have been administered, at stakeholder request, by the Bureau. The Bureau administered efforts are coordinated by the Santa Margarita River Executive Management Team (SMREMT). The IRWM and Watershed Council efforts are conducted outside the management of the Bureau and the SMREMT.

The District, in consultation with the Permittees, participates in several additional cooperative activities through formal or informal regional stakeholder workgroups. These efforts can broadly be categorized as management efforts to address general storm-water quality issues that also pertain to the Santa Margarita River watershed.

These efforts may be expanded, reduced or abandoned over time based on budget, changing regulations, program needs, program effectiveness consideration, or other factors.

B.2. SANTA MARGARITA RIVER EXECUTIVE MANAGEMENT TEAM (SMREMT)

During FY2008-2009, the District and the Permittees continued their participation in the SMREMT. The SMREMT's goal is to facilitate high-level communication and planning among stakeholders in the Santa Margarita watershed to aggressively identify and address the highest priority water quality concerns, including 303(d) listings.

Participants include:

- District,
- U.S. Bureau of Reclamation (Bureau)
- Western Municipal Water District
- Eastern Municipal Water District
- Fallbrook Public Utilities District,
- U.S. Marine Corps Camp Pendleton
- County of San Diego
- Mission Resource Conservation District (MRCD)
- Elsinore-Murrieta-Anza RCD,
- Regional Board
- San Diego State University.

The SMREMT oversees the Lagoon TMDL Workgroup and the Water Quality Monitoring Group (WQMG) described below. Two **(2)** meetings were held specifically for the SMREMT within the reporting period. The stakeholder representatives that attend the SMREMT meetings are typically the same as for the TMDL Workgroup. As such many SMREMT meetings are combined with Lagoon TMDL Workgroup meetings and are reported upon in section B.3 below.

Copies of meeting Agendas for the SMREMT (where available) are contained in Appendix A.

B.3. LAGOON TMDL WORKGROUP

On July 19, 2006 the Regional Board issued an investigative order (Order R9-2006-0076) to the stakeholders in the Santa Margarita River Watershed to gather monitoring data for the development of a nutrient TMDL for the Santa Margarita Lagoon.

In compliance with this Order, the Permittees have been working with the Regional Board and the other stakeholders through the SMREMT to fund and oversee the development of a comprehensive program to collect data that will in turn be used by Regional Board staff to model the various inputs to the lagoon and develop this TMDL.

Eleven (11) meetings were held for the Lagoon TMDL Workgroup within the reporting period.

The status of the Permittees' compliance with Order R9-2006-0076 is described in Appendix G, Section G-7.4. Copies of meeting Agendas for the Lagoon TMDL Workgroup (where available) are contained in Appendix A.

B.4. SANTA MARGARITA WATERSHED WATER QUALITY MONITORING GROUP (WQMG)

The WQMG is a subcommittee of the SMREMT (described in section B.2) and was established to coordinate the monitoring efforts of various stakeholders in the Santa Margarita watershed. Many of these stakeholders are also involved in the broader monitoring coordination effort for of the greater Southern California region through the SMC (described in section B.5). This group meets as needed to discuss monitoring issues specific to the Santa Margarita Watershed.

Parties involved in this group are:

- District
- United States Bureau of Reclamation (Bureau)
- San Diego County,
- California Department of Transportation (Caltrans),
- United States Marine Corps Base, Camp Pendleton,
- City of Temecula,
- City of Murrieta,
- Eastern Municipal Water District,
- Rancho California Water District,
- Fallbrook Public Utilities District

There were no meetings held for the WQMG within the reporting period.

B.5. SOUTHERN CALIFORNIA STORMWATER MONITORING COALITION (SMC)

The SMC was formed in 2001 by cooperative agreement of the Phase I municipal storm-water NPDES lead Permittees, the NPDES regulatory agencies in southern California and the Southern California Coastal Water Research Project (SCCWRP). The overall goal for the SMC is to establish a Southern California storm-water research and monitoring agenda that would focus on improving storm-water monitoring science coordinate data collection efforts, and evaluating the effects of storm-water discharges to receiving waters specific to Southern California.

The District participates in the Storm-water Monitoring Coalition (SMC) on behalf of the SMR Permittees. The SMC includes representatives from:

- SWRCB
- Los Angeles RWQCB,
- San Diego RWQCB,
- Santa Ana RWQCB,
- District,
- Los Angeles County,
- Orange County,
- San Bernardino County,
- San Diego County,
- Ventura County,
- Caltrans
- City of Los Angeles.
- SCCWRP
- United States Environmental Protection Agency, Region 9,
- United States Environmental Protection Agency, Office of Research and Development

The District, on behalf of the Permittees, is currently working with the SMC on several regional studies including:

- A Hydromodification Study (see Appendix G, Section G-7.2.1)
- A Low Impact Development Study. (see Appendix G, Section G-7.2.2)
- Laboratory Inter-calibration Study (See Appendix G, Section G-7.5)
- LID BMP Study (See Appendix G, Section G-7.2.2)
- Regional Bio-assessment Monitoring Program (See Appendix G, Section G-7.5)
- Standardization of Toxicity Testing Methods (See Appendix G, Section G-7.5)

Additionally, the District is also coordinating with the Southern California Coastal Water Research Project (SCCWRP), who facilitates the SMC, to collect data on natural loadings of various pollutants from watersheds throughout Southern California.

At least Nine (9) SMC Meetings were held within the Reporting Period and consisted of either general meetings of the SMC or meetings specific to the above regional studies. Copies of meeting agendas (where available) are contained in Appendix A.

The SMC Annual Report is included in Appendix D.

B.6. CALIFORNIA STORMWATER QUALITY ASSOCIATION (CASQA)

CASQA assists the State Water Resources Control Board (SWRCB) and MS4 Permittees throughout California in implementing the National Pollutant Discharge Elimination System (NPDES) storm-water mandates of the Federal Clean Water Act. In fulfilling this purpose, CASQA recommends objectives and procedures for storm-water discharge control programs which:

- Are technically and economically feasible;
- Provide significant environmental benefits and protect water resources;
- Promote the advancement of storm-water management technology; and
- Effect compliance with state and federal laws, regulations and policies.

CASQA also holds workshops on and develops methods and materials for important technical issues such as:

- Low Impact Development
- Water Quality BMP's
- Hydromodification
- Green Building
- Monitoring
- Program Effectiveness Assessment
- Pesticides
- Many Others

In September 2008, District staff attended CASQA's Annual Conference on behalf of the Permittees, where many of these issues were featured in focused workshops or the subject of technical presentations. Additionally Jason Uhley is the conference chair for the upcoming 2009 Conference in San Diego (November '09)

The Permittees have strongly supported CASQA's mission and use CASQA's resources to improve their respective compliance programs. Several Riverside County District NPDES section staff are active in various ongoing CASQA programs including:

- **Mark Wills,**
  - Board Member
  - Treasurer
- **Jason Uhley,**
  - Legislative Chair
  - Conference Chair
  - Pesticides Committee
- **Arlene Chun,**
  - Monitoring Committee
  - Pesticides Committee

District staff, on behalf of the Permittees, attended over thirty (30) CASQA meetings, not including the 2008 conference. Copies of agendas for these CASQA meetings (where available) are contained in Appendix A.

The CASQA Annual Report is included in Appendix D.

B.7. INTEGRATED REGIONAL WATER MANAGEMENT WORKGROUP (IRWM)

Because the upper Santa Margarita watershed was not included in the San Diego County Integrated Regional Water Management Plan (IRWMP), the IRWM has focused its efforts on the development of an IRWMP for the upper portion of the watershed. The intent of the IRWMP was to pave the way for greater watershed-wide coordination and management of water resources within the Santa Margarita watershed as a whole, as well as adjoining watershed and regional planning efforts.

The IRWMP for the upper Santa Margarita watershed was completed on July 31, 2007 and is currently being implemented. More information on the IRWMP can be found in Section G.3.1 of this report.

Participants in the IRWM include:

- The SMR Permittees,
- Rancho California Water District,
- Elsinore-Murrieta-Anza Resource Conservation District,
- Trout Unlimited,
- Riverside Lands Conservancy,
- San Diego State University/Santa Margarita Ecological Reserve,
- Southwestern Riverside County Multi-Species Reserve,
- US Bureau of Reclamation,
- Eastern Municipal Water District,
- Western Municipal Water District,
- The Nature Conservancy,
- California Department of Fish and Game,
- U.S. Army Corps of Engineers (USACE),
- Regional Board.

Eleven (11) meetings were held for the IRWM within the reporting period.

Copies of agendas for IRWM meetings (where available) are contained in Appendix A.

C. AN ASSESSMENT OF WATER QUALITY IN THE SANTA MARGARITA REGION, THIS ASSESSMENT SHALL INCLUDE DATA FROM THE PREVIOUS MONITORING REPORT.

This reporting requirement is addressed in the conclusion of the Monitoring Annual Report (Appendix G).

D. IDENTIFICATION OF WATER QUALITY IMPROVEMENT OR DEGRADATION IN THE SANTA MARGARITA REGION

This reporting requirement is addressed in the conclusion of the Monitoring Annual Report (Appendix G-6.3.6).

E. A PRIORITIZATION OF WATER QUALITY PROBLEMS AND POTENTIAL SOURCES IN THE SANTA MARGARITA REGION

This reporting requirement is addressed in the conclusion of the Monitoring Annual Report (Appendix G Section G-6.3.1)

F. A DESCRIPTION OF WATERSHED SPECIFIC EDUCATIONAL ACTIVITIES CONDUCTED DURING THE REPORTING PERIOD

F.1. INTRODUCTION

This section provides an overview of watershed specific public education activities conducted by the Permittees. Public education materials distributed during this reporting period have been included at the end of the Public Education section.

In addition to the Public Education program described in this section, the District, on behalf of the Permittees organizes and coordinates a Training program for municipal employees and inspectors. This training program is described in Section G.8.2 of this report.

F.1.1. PROGRAM OVERVIEW

The Riverside County NPDES Permittees have established an ongoing watershed based public education and outreach program known as the **Only Rain down the Storm Drain** pollution prevention program. The specific objectives of the public education program include:

- Fostering a broad public awareness of water pollution concerns;
- Increasing public acceptance of pollution prevention activities to curtail everyday human behaviors that contribute to water quality problems;
- Educating/informing the general public, regulators and key local government and state decision makers on Urban Runoff conditions in Riverside County; and
- Promoting stewardship of all local water resources.

The **Only Rain down the Storm Drain** program implements the public awareness objectives by focusing on three areas of pollutant reduction/prevention:

- Public Behavior;
- Proper Management of Pollutants,
- Business Specific Outreach.

In addition, when attempting to make use of the finite resources available to the Public Education Program, the Permittees use these management goals to ensure that resources are used effectively:

- Focusing on pollutants of concern specific to each watershed region;
- Coordinating public education efforts with adjacent storm-water management programs and other related education programs to share resources, coordinate outreach efforts and avoid unnecessary duplication;
- Adapt public education programs and objectives, based on effectiveness analysis, to address changing MS4 programs and goals, and

- Establish an outreach educational partnership with the staff at the San Diego Regional Water Quality Control Board on at least one event in the Santa Margarita Watershed.

F.1.2. PROGRAM HIGHLIGHTS

The public education program was significantly improved this year. Program highlights include:

- Incorporation of Television Outreach through KVCR and PBS on the "Greenworks" and "Curiosity Quest" programs.
- The public education program has updated the format of its public awareness survey and continues to be present and conduct surveys at various community events. The survey results are tallied to help determine and measure the public's awareness of urban runoff pollution. There is also an on-line survey on the NPDES website, to encourage people to challenge their knowledge of stormwater pollution problems and behaviors. It is our hope that the final analysis will be a reminder to people to refrain from engaging in some of their environmentally negative outdoor activities.
- The District NPDES website has gone through an overhaul to provide the public and businesses information on the **Only Rain down the Storm Drain** program.
- The program continues to update its brochures and develop outreach programs specific to the needs of Riverside County's unique watersheds. Revisions this year include link updates, and revamping existing brochures and the development of new brochures for:
  - *OUTDOOR CLEANING ACTIVITIES* (now includes information for Professional Mobile Service Providers)
  - *LANDSCAPING AND GARDENING*
  - *TIPS FOR HORSE CARE*; (Equestrian Care and Management)
  - *PET WASTE*,
  - *TIPS FOR MAINTAINING A SEPTIC TANK SYSTEM*,
  - *AUTOMOTIVE MAINTENANCE AND CAR CARE*, and
  - *STREAM BANK STABILIZATION*.
- Initiation of a billboard advertisement within the Santa Margarita Watershed.
- Development of a new 'Lenticular' magnet that promotes control of fertilizer, pesticides, oil & grease, pet waster and household chemicals.
- Provide outreach material for County and District new employee orientation sessions regarding appropriate storm-water stewardship practices, including clean water information and promotional items that link back to the County's "**Only Rain**

down the Storm Drain" message. In addition, attendees receive a carry bag containing After the Storm, *Outdoor Cleaning Activities, Pool and Spa Maintenance, Pet Care* and *Tips for Horse Care* brochures. Reinforcement of messages to curtail negative behaviors also come in the form of a vehicle air freshener, shop rag, dust pan and key chain ALL imprinted with the "**Only Rain Down the Storm Drain**" logo and the 1-800 Toll Free line for reporting illegal disposal.

F.2. Santa Margarita Pollutants of Concern

Based on a review of monitoring data collected and reported upon in the previous year's annual report (FY07-08), the Regional Board's 303(d) List and discussions among the Co-Permittees, the pollutants of concern identified in the following sub-sections have been targeted for this watershed, and specific outreach activities are identified to address each. More discussion on the identification of pollutants of concern can be found in Monitoring Annual Report (Appendix G).

In addition, the District has developed other outreach materials to focus on other pollutants and pollutant causing activities/businesses commonly associated with urban runoff. These additional outreach materials are described in Sections F.5 through F.7.

F.2.1. Pesticides Associated with Urban Pest Control

- Provided guidance to the Permittees (www.ecowise.com) for standard language on integrated pest management (IPM) for municipal pest management contracts.
- Partnered with the Agricultural Commissioner in the distribution of educational material as part of the Pesticide Applicator's License Renewal information package and training workshops.
- During this fiscal year, the Riverside County Agricultural Commissioner's Office reported the following:
  - Restricted Materials Permits = 701; Operator Identification Numbers = 556
  - Agricultural Pest Control = 326; Structural Pest Control = 476
  - In processing the Permits/Operator ID Numbers and registering pest control businesses, "After the Storm" and EPA's booklet, "Storm-Water Pollution and the Solutions" are distributed.
- Coordinating with nurseries to distribute material containing messages about the use of pesticides through the popular Southern California Heritage Gardening DVD guide and our *SAFE* spray bottles that provide non-toxic garden pesticides and household cleaning recipes.

- '*Home Garden Workshops'* at nurseries and garden shows to inform residents about less-toxic pesticide alternatives for the garden.
- The distribution of the *WATER WISE GARDENING FOR THE INLAND EMPIRE* and the *SOUTHERN CALIFORNIA HERITAGE GARDENING GUIDE* on water-wise landscape design, irrigation, IPM guidance, plant encyclopedia and helpful maintenance tips all in a handy CD.
- '*KEEP OUR WATER CLEAN'* Public Services Announcement video.
- The '**Only Rain Down the Storm Drain'** presentations conducted by Mission Resource Conservation District discusses the effects of pesticides can have on local waterways.
- Completed updates to the NPDES training presentations for Permittee staff involved in municipal facilities operation and maintenance, and inspectors of commercial and industrial facilities. These updates incorporated a more specific focus on the appropriate use, timing and application of pesticides, and encourage the use of Integrated Pest Management (IPM) as a substitute.
- Provided information during two (2) episodes of the television show '*GreenWorks*' on KVCR.
- Completed the new *LANDSCAPE MANAGEMENT* brochure.

F.2.2. NUTRIENTS ASSOCIATED WITH URBAN DEVELOPMENT AND LAND USES

- The Agricultural Commissioner and UC Riverside Cooperative Extension both assist in the distribution of **Only Rain down the Storm Drain** materials. In addition, local nurseries distribute these materials, along with the County's FREE Compost Workshop announcement flyer and "How To" Composting book;
- "*KEEP OUR WATER CLEAN*" a video that focuses on proper use of fertilizers and avoiding excess runoff from sprinklers;
- A section of the County's Household Hazardous Waste flyer is dedicated to informing residents about the problem of storm-water pollution and provide simple pollution prevention activities;
- The "*AFTER THE STORM*" brochure;
- *STORM-WATER POLLUTION AND THE SOLUTIONS*
- Construction Activities brochure and the construction poster.
- The **'Only Rain Down the Storm Drain'** presentations conducted by Mission Resource Conservation District discusses the effects fertilizers can have on local waterways.

- Newly completed *Landscape and Gardening* brochure
- Newly completed *Tips for Maintaining a Septic Tank System* brochure
- Newly completed *Pet Waste* Brochure
- Newly completed *Tips for Horse Care* brochure covering equestrian care and management.
- Provided information during two (2) episodes of the television show '*GreenWorks*' on KVCR.

F.2.3. Pathogens Associated with Urban Activities

- Construction, municipal, industrial/commercial and new development training focusing on the need to address pathogen sources within the watershed;
- Contracted with S. Groner and Associates (SGA) to distribute pet waste information in pet stores, veterinarian clinics, kennels and pet grooming facilities;
- Coordination with Riverside County Animal Control Department and private "no kill" pet shelters to distribute "*What's the Scoop*" and "*After the Storm*" brochures to families adopting pets at the shelters;
- Newly completed *Landscape and Gardening* brochure
- Newly completed *Tips for Maintaining a Septic Tank System* brochure
- Newly completed *Industrial/Commercial* brochure including information on 'nurdles' (Plastic pellets used in manufacturing).

F.2.4. Sedimentation associated with Urban Development and Land Uses

- Construction, municipal, industrial/commercial and new development training focusing on the need to address erosion control and sedimentation within the watershed.
- County Building Inspectors distribute both the construction brochure and poster during site visits.
- Newly completed *Stream bank Stabilization* Fact Sheet.
- Newly completed *Landscape and Gardening* brochure.
- Independent storm-water educators are provided with our construction activities materials for their regularly scheduled Riverside County training sessions.

- Distribution of dust pans featuring the "**Only Rain Down the Storm Drain**" message to promote the dry cleaning of drive ways and impervious surfaces;
- Distribution of sponges and shop cloths to promote clean-up of spills and not letting them discharge into the storm drain;
- *CONSTRUCTION POSTER*;
- Adult storm-water education presentations include instruction on controlling soil erosion;
- The "*AFTER THE STORM*" brochure;
- General *CONSTRUCTION ACTIVITIES* brochure.

IN DEVELOPMENT

- Revised Construction poster

F.2.5. METALS ASSOCIATED WITH AUTOMOTIVE SOURCES

The primary metallic pollutants within the region are copper from brake pad wear and lead from lost wheel weights. The Permittees are currently coordinating through CASQA (as further described in Section B.6) to educate and promote statewide and national change to these problems that are caused by the societal use of a currently accepted technology.

F.3. 24-HOUR WATERSHED-WIDE OUTREACH PORTALS

The Permittees maintain three 24-hour watershed wide portals to receive and distribute information regarding the **Only Rain down the Storm Drain** program. These portals include a *website*, a *1-800 number*, an *e-mail address* and links from the County's main page and other websites to the District main page for reporting illegal storm drain disposal and obtaining printed materials.

F.3.1. STORM-WATER PROTECTION PROGRAM WEBSITE

The District operates a website that provides information on how to report illegal dumping, clogged storm drains and lack of curb markers, as well as provide information opportunities for public participation in program development and general information about Urban Runoff pollution prevention techniques. The website is located at: www.rcflood.org and during the **08/09 Fiscal Year there were 145,553 hits reported.** There is also a link on the County's main page advocating reporting illegal storm drain disposal by clicking on the familiar **Only Rain down the Strom Drain** logo.

Most of the District's outreach materials have been scanned into an electronic .pdf file formats and are available for download. Online Order forms and phone numbers are also available to assist internet customers in obtaining brochures posters and promotional items that are not available for viewing on line.

The website contains pages specific to the following target audiences:

- General Public/ Residents
- Businesses
- Developers
- Contractors
- Schools and Teachers
- Kid's Page

In addition, the website contains links to:

- Locate your local watershed
- An online media library
- Material order forms
- 1-800 Toll Free Line to
- Report storm drain pollution
- On-line survey
- Other resources

F.3.2. STORM-WATER TOLL FREE 1-800 HOTLINE

On October, 1994, a Toll Free "800" telephone number (1-800-506-2555) for reporting suspected storm-water pollution and obtaining pollution prevention information was established. This call line links to County Environmental Health or County Waste Management to obtain grass re-cycling, composting, or household hazardous waste collection workshop dates and locations. The 24-hour hotline also allows callers to report clogged catch basin inlets, illegal dumping and other illicit discharge violations. Finally, the hotline allows people to order public education materials and/or request storm-water presentations for schools or community groups. The Toll Free Hotline number is widely publicized in all public education outreach materials, listed in telephone directories, and registered in Riverside County 911, a non-profit community help line.

The 1-800 line transfers callers to appropriate Permittee departments based on caller selections. Callers requesting information on pollution collection activities are transferred to either County Environmental Health or Waste Management depending on their specific selection. Callers reporting illicit discharges are directed to County Code Enforcement, who accepts the calls and then re-directs them to appropriate Permittee Code Enforcement Departments. Calls for public education materials or presentations are routed to the District's front desk, and then to the District's Public Education Staff. The specific text to the hotline is included in this report.

The provider of the Toll Free Hotline, Riverside County Information Technology, tracks the number of incoming calls. The number of Toll Free calls received and tracked from **June, 08 through May, 09 was 1,169, with 158 inquiries originating from the Santa Margarita Region.** County Communications promises to continue improving and working on its tracking program.

Figure F-1 shows the script implemented for the Toll Free 1-800 hotline.

Figure F-1: Toll Free 800 Line Dialogue

ONLY RAIN DOWN THE STORM DRAIN POLLUTION PREVENTION PROGRAM TOLL FREE 800 LINE DIALOGUE

Thank you for calling the Storm-water/Clean Water Protection Program. To better serve the needs of our County communities, please listen carefully to the following options:

If this is an emergency, or you wish to report a significant release or threatened releases of hazardous material into the storm drain or elsewhere in the environment, please hang up and immediately Dial 911

For water service connection, disconnection, or any other water utility information, call your local water service provider.

- To report illegal dumping at residential, commercial, industrial or construction sites, please call Environmental Health at 909 955-8982, or *PRESS #1* to be directly connected.
- For information regarding Household Hazardous Waste Collection Events, please *PRESS #2* (Drops to 951 358-5256)
- To report clogged storm drains, faded or missing storm drain ONLY RAIN IN THE STORM DRAIN markers, *PRESS #3* (District lobby line)
- For General or specific business types of Storm-water Pollution prevention information or to receive promotionals *PRESS #3* (District lobby line)
  - Thank you for your interest in obtaining information on storm drain pollution protection. Basic, construction, industrial, commercial and children's storm-water protection outreach packets are available. For a quick response to your request, please slowly and clearly leave your name, address, city and zip code. Also state the type and quantity of the materials you are interested in receiving. Should you need additional assistance, provide your area code and phone number and someone will contact you as soon as possible.
- To inquire about our FREE storm-water classroom presentations, workshops, youth group activities and other outreach programs, *PRESS #4*
  - The Storm-water/Clean Water Public education Program offers classroom presentations, workshops, youth group activities, special event opportunities and other programs.
  - For inquiries for the Temecula or Murrieta area, please *PRESS #1* (Drops to Mission Resource Conservation District at 760—728-1332)
  - For inquiries in all other Riverside County areas, *PRESS #2* (Drops to Riverside Resource Conservation District 951 683-7691)
- For Grass re-cycling and composting information or workshops, please *PRESS #5* (Drops to 951 486-3200)
- For additional assistance regarding our storm drain pollution protection program during regular business office hours, Monday through Friday from 7:30 a.m. to 5:30 p.m. *PRESS #6*

F.3.3. E-MAIL

The Permittees also maintain an e-mail address that can be used to report illicit discharges or request storm-water related public information. The email address is: fcnpdes@rcflood.org

In most cases, public information request e-mails received at this address are responded to within 2 business days.

F.4. COORDINATION WITH OTHER STAKEHOLDERS

The **Only Rain down the Storm Drain** Program collaborates extensively to leverage available resources. Partnerships have been established with local environmental groups, business organizations, cities, public and private entities. These partnerships help maximize the use of existing distribution outlets, events, programs and materials. Impressions, attendance, and other measures of effectiveness relative to these programs are included in the Measurable Goals portion of this Watershed Annual Report.

To facilitate statewide awareness of storm-water public education, educate local and state decision makers, and assist in the development of more effective public education outreach programs, the District participates in the following public education committees:

- Public Information Public Participation Committee (PIPP) – A subcommittee of the California Storm-water Quality Association, and
- Western Regional Pollution Prevention Network (WRPPN)
- Water Education and Conservation Committee (WEAC)

To leverage education outreach resources and coordinate public education activities with other environmental programs, the Permittees closely coordinate and/or have existing partnerships with the following entities/organizations:

- Household Hazardous Waste Information Exchange (HHWIE) copy included;
- Mission Resource Conservation District (MRCD);
- Partnership with Mission Resource Conservation District and Riverside-Corona Resource Conservation District to provide student education outreach in the Santa Ana and Santa Margarita Watersheds
- Partnership with Mission Resource Conservation District and Riverside Corona Resource Conservation District to provide adult education outreach activities in the Santa Ana and Santa Margarita Watersheds
- Partnership with Mission Resource Conservation District and Riverside-Corona Resource Conservation District to provide support services for public education outreach activities at community events

- California Regional Environmental Education Community Network (CREEC);
- Public Affairs Network (PAN)
- Western Riverside Council of Governments

In addition, the **Only Rain down the Storm Drain** program also coordinates with the following City/County departments to distribute appropriate storm-water education outreach materials:

- City/County/District Front Counters
- County Assessor and Recorder
- County Waste Management
- County Environmental Health Department
- Household Hazardous Waste
- County Agriculture Department
- County Code Enforcement
- County Economic Development Agency
- County Animal Control
- County Fleet Services
- County Housing
- County Human Resources
- County & City Library Systems
- County Safety
- County Parks
- Transportation and Land Management
- County Business License
- City of Temecula Library
- City of Murrieta Library

In general, brochures and promotional items are provided to make the storm-water pollution prevention materials visible and accessible to the public at all times in lobbies, training sessions, through customer interactions and new employee orientations.

Finally, the **Only Rain down the Storm Drain** program also coordinates with the following state and/or local government or business entities to distribute public education information:

- Western Riverside Council of Governments
- South Coast Air Quality Management District
- Santa Rosa Plateau
- State Bureau of Reclamation
- Metropolitan Water District
- Lake Elsinore/San Jacinto Watershed Authority
- City of Temecula
- City of Murrieta
- Rancho California Water District
- Department of Water Resources Southern District
- Western Municipal Water District
- City of Riverside Public Utilities
- Eastern Municipal Water District
- DVL Water Education Center (WEC)
- Habitat for Humanity
- SAWPA
- Temecula Museum

F.5. OUTREACH TOOLS TO CHANGE PUBLIC BEHAVIOR

The **Only Rain down the Storm Drain** Program conducts a wide range of outreach activities to residents, students, community groups, new home owners, public employees, businesses, and homeowner associations; informing them of how their "everyday activities" may contribute to the pollution of Receiving Waters, and encouraging them to adopt alternatives that will lessen or eliminate pollution-causing behaviors. *Program efforts include providing information on pollution prevention techniques and informing residents about the proper disposal of household hazardous wastes, used motor oil, pesticides, pet waste and litter.* Public education materials and media emphasizes that all citizens have a role in reducing and preventing the polluting of Receiving Waters. The goal is to present a clear and consistent message that explains the simple connections between people's everyday activities and their impacts upon Receiving Water quality.

As the public education and outreach program continues to be implemented and enhanced, the Permittees hope to broaden public awareness of Urban Runoff quality problems, promote proper disposal of household hazardous waste and motor oil, encourage illegal discharge reporting, foster good stewardship of Receiving Waters, and take personal responsibility for their actions in preventing pollution.

While public education outreach at events indicates that most people are willing to act in an environmentally responsible manner when given simple ways to avoid polluting our water bodies; most are unaware of the sources of pollution from everyday urban land use. The "**Only Rain down the Storm Drain**" pollution prevention program, using various media forms, educates county-wide to modify behaviors by preventing storm-water pollution by focusing on residents, general public, students, and home gardeners.

F.5.1. DIRECT OUTREACH METHODS

The **Only Rain down the Storm Drain** program interfaces directly with the public via program staff, or through contracts and partnerships at community events, home improvement stores, school education programs, and adult education programs and/or by providing classroom based training. Specific outreach activities, segregated by target audiences, are described below.

F.5.1.a) General Community Outreach

The **Only Rain down the Storm Drain** program participates in various community events to ensure that our message is delivered to the largest possible municipal audience. These community events also provide an opportunity to survey attendees and assess their public knowledge of storm-water pollution prevention.

In addition, the **Only Rain down the Storm Drain** Pollution Prevention program has partnered with *Riverside County Waste Management* to ensure that a minimum number of Household Hazardous Waste and Antifreeze, Batteries, Oil and Paint Collection Centers and/or Events are held within each of Riverside County's principal watersheds (Santa Margarita, Santa Ana, and Whitewater). These events provide free disposal sites for common pollutants that can impair Receiving Waters.

The program's urban runoff materials and promotional items are also distributed through Community Clean up partnerships with *Riverside County Code Enforcement Administration,* whose undertaking is to achieve voluntary compliance in all phases of community revitalization. Staff works closely with the Community Improvement Specialists, ensuring that residential storm-water pollution prevention material packets are on hand for distribution on inspection visits, complaint investigations and at neighborhood or community presentations.

When a complaint warranting an investigation is received, the information is entered into a database and then followed up with an NPDES staff inspection. Following the investigation, when appropriate the inspector then canvasses the area with storm drain pollution prevention brochures, household hazardous waste collection schedules, and/or door hangers.

Finally, the Permittees participated in the annual Santa Margarita Watershed Cleanup Day, with City, County and District staff participating to remove trash and debris from local watercourses. Following the cleanup activities, the **Only Rain down the Storm Drain** Program either provided outreach from their booth or provided informational items and promotional items to the volunteers at the post-event barbecue.

F.5.1.b) School Outreach

ELEMENTARY (K-6)

THE MISSION RESOURCE CONSERVATION DISTRICT (MRCD) continues to provide a variety of K-6 education programs for the Only Rain down the Storm Drain Program. The K-6 education program includes materials such as the Water Pollution Prevention Patrol workbook, the Fancy Fin hands-on classroom presentation and accompanying coloring book, various word match and crossword activity sheets and videos. A second story line featuring Fancy Fin and her friend Phinnious J. Green (a Pacific Tree Frog) educate students about point and non-point pollution and their effects on the environment and other creatures in the watershed. School materials are offered to all public and private schools in the Menifee, Murrieta, Temecula and Wildomar areas, as well as to youth groups such as the Boy and Girl Scouts, Boys and Girls Clubs and Community Recreation Facilities.

The upcoming *CURIOSITY QUEST* video will also be provided to educators as a tool for storm-water education.

SECONDARY SCHOOLS

A video entitled "*HOW TO CONDUCT AN ENVIRONMENTALLY FRIENDLY CAR WASH AND MAKE MONEY TOO*" was developed for the "*Car Wash Challenge*" fundraising program. Over time, the overall preparation necessary for sponsoring a *Car Wash Challenge* presented too many challenges and retail selling has since become a greener and more profitable school fundraiser.

Next fiscal year, secondary students will be provided presentations with the aid of an enhanced three-dimensional watershed area map displaying pollutants of concern (as per the 303(d) List), impaired waters, watershed boundaries and watershed stakeholders. The detailing and enhancing the map will help students appreciate the unique topography of their watershed and the negative impacts of non-point discharge into area receiving waters.

F.5.1.c) Adult Outreach

Adult presentations are given through community outreach efforts by County Community Code Enforcement Officers. The Community Officers are provided materials about storm-water impacts that could occur from improper application of paint, pesticides or fertilizers to share with residents of their focused community.

The adult packet includes residential specific information (*After the Storm*; *What's the Scoop*; and *HHW Schedule*). All of the **Only Rain down the Storm Drain** materials are imprinted with the 800 Toll Free number to call to report illegal disposal or to obtain additional information. The children receive a Fancy Finn coloring book and box of crayons made from soybeans.

The **Only Rain down the Storm Drain** program contracts with *Mission Resource Conservation District* and *Riverside-Corona Resource Conservation District (RCRCD)* to provide urban runoff educational presentations to community groups who call and request such services.

The program's "*Home Garden Care Guide*" – provided the inspiration for the development of a series of "*Home Garden Workshops*". The *Riverside-Corona Resource Conservation District (RCRCD)* has developed a home garden workshop that encourages the use of alternatives to chemical fertilizers and pesticides in the garden through techniques such as companion planting, incorporating plans that attract beneficial insects, composting, and mulching. These workshops are presented at various community events and at the request of local nurseries, home owners associations, or other entities.

S. Groner Associates has been retained to prepare and present workshops at major home improvement stores throughout Riverside County. These workshops include a handout that educates the store's employees about storm-water impacts that could occur from improper application of paint, pesticides or fertilizers. Attendees at the workshop also receive **Only Rain down the Storm Drain** information and promotional items to help re-enforce storm-water protection message. The employees are then able to share with customers the proper use and disposal of products that are potential storm drain pollutants. Point of purchase displays, tear sheets and counter displays have been installed at strategic locations to educate the public directly. **There were 4 Home Improvement Store workshops provided in the Santa Margarita Watershed region.**

Valley Greeters once was a door to door "Meet and Greet" organization to new residents or homeowners who, along with local business coupons gave newcomers to the Temecula and Murrieta area urban runoff information and promotionals. *Due to the economic downturn, Valley Greeters has since closed its doors.*

F.5.2. BROCHURES

F.5.2.a) Residential Outreach Materials:

- *AFTER THE STORM*;
- *LANDSCAPING AND GARDENING*;
- *TIPS FOR HORSE CARE*;
- *WHAT'S THE SCOOP* (Dogs, Cats and Equestrian Animal Waste);
- *TIPS FOR MAINTAINING A SEPTIC TANK SYSTEM*;
- *AUTOMOTIVE MAINTENANCE AND CAR CARE* (being revised);
- *STREAM BANK STABILIZATION* fact sheet;
- *HOUSEHOLD HAZARDOUS WASTE* Collection Schedules;
- *OUTDOOR CLEANING ACTIVITIES AND PROFESSIONAL MOBILE SERVICE PROVIDERS*
- *SWIMMING POOL, JACUZZI AND FOUNTAIN MAINTENANCE*;
- *EARTH DAY FLYER*; and
- *POLLUTION PREVENTION FLYER*.

F.5.2.b) Other Outreach Materials

In addition to the brochures mentioned above, the program utilizes other effective outreach materials such as, magnets, billboard ads, newspaper supplements, trade programs, flyers, calendars, promotional items, workbooks, curriculum, shop rags, dust pans, key chains, compressed sponges, shelf talkers, tear sheets, posters and print ads to foster interest in the program.

A door hanger is also being utilized to help address problem discharges that are commonly observed in residential settings. The door hanger notifies the recipient that a problem discharge was observed and asks help from recipients to prevent problem discharge by following recommended pollution prevention activities. The door hanger is provided to all cities and is used by various County departments and the NPDES staff, when conducting field or site activities/inspections.

F.5.3. MAILING INSERTS

The **Only Rain down the Storm Drain** Pollution Prevention Program publicizes the dates and locations of household hazardous waste collection events through the use of mail inserts. Inserts are included in various utility bills and special notices. An example insert is shown in Figure F-2 below.

Figure F-2: Example HHW Insert

HHW Collection Event Scheduled for (date here)

There will be a Household Hazardous Waste (HHW) collection event at the **NAME OF LOCATION** located at

_____ADDRESS_____

On _____DATE_____ , 200X from 9 a.m. to 2 p.m.

HHW collection events provide you the opportunity to properly dispose of HHW and it's FREE! HHW products are paints, motor oil, bleach, cleaners, furniture polish, aerosol cans, etc. Visit www.rivcoeh.org for more information.

Never throw these items in the trash, as they may injure sanitation workers and contaminate landfills and the surrounding area.

NEVER pour any HHW into the gutter or down a storm drain.

Storm drains connect directly to local rivers, lakes and streams and not treatment plants.

Here are some important guidelines to follow:

You may bring up to five (5) gallons of a hazardous liquid waste or a total of 50 pounds maximum per car per trip (State Law). Multiple trips are allowed. Containers shall be marked and secured to prevent leaks. Containers holding gasoline will not be returned.

HHW includes deodorizers, cleaners, bleaches, floor wash, spot remover, drain cleaner, furniture polish, aerosol cans, latex paint, weed killers, fertilizers, antifreeze, pesticides, oil-based paint, pool chlorine, household and auto batteries, garden chemicals and motor oil.

The following will not be accepted:

Business or Non-profit waste, Explosives/Ammunition; Medical waste; Waste in 55-gallon drums; Radio-active materials; appliances and tires

The event will be canceled if rained out or excessive winds.

For more information, call 951-358-5256

F.5.4. MEDIA OUTREACH

The **Only Rain down the Storm Drain** program continues to utilize various forms of print and electronic media to reach the public and promote the reduction of urban runoff. Media forms such as, supplement newspaper inserts, fliers, and advertisements help increase public awareness of storm-water pollution and environmental protection.

- Through a partnership between Riverside and San Bernardino Counties, the District is sponsoring a 1-hour episode of the PBS show for kids called *'CURIOSITY QUEST'*. The episode will *focus on many of the impacts that residential activities can have on storm-water* including:
  - Landscape Care
  - Pool Maintenance
  - Pet Waste
  - Automotive Care
  - Household Hazardous Waste
- This episode will be broadcast nationwide and will be available royalty free for the Permittees to use on local access television stations.
- The PBS show *"GREENWORKS" conducted two 30-minute interviews* of Program staff on the County's Storm-water Program.
- A colorful billboard graphic with a simple storm drain message was designed and posted on a 12' x 36' *illuminated billboard at the I-15 north of Winchester*. Within the advertisement contract period, this billboard generated over 3,373,530 impressions. Billboard availability in the Santa Margarita region has always been extremely limited due to the long term billboard advertising contracts held by the many area casino properties. Since last year, the economic forecast has taken a down turn making prime billboard advertising locations more available and will be considered for the 09/10 Year.
- A relatively new addition to the Public Outreach Program is the supply trailer, featuring brightly colored graphics that surround the trailer. The graphic is a brightly colored text and advertises the "**Only Rain down the Storm Drain**" message. This convenient trailer functions as a moving billboard, as it transports public education/outreach materials to special events and large venues throughout Riverside County.
- The E-Z up (portable shade) is imprinted with the **Only Rain down the Storm Drain** message.

- The **Only Rain down the Storm Drain** exhibitor's gazebo is imprinted with **Only Rain down the Storm Drain** messages and colorful graphics depicting the importance of clean water.

F.5.5. COOPERATIVE USED OIL PROGRAM

The *Western Riverside Council of Governments (WRCOG)* is responsible for administering the Used Oil Block Cycle Grant for ten cities within WRCOG's boundaries. These cities include: Banning, Beaumont, Canyon Lake, Lake Elsinore, Murrieta, Norco, Perris, Riverside, San Jacinto and Temecula. The target audience is the Do It Yourselfers (DIY'ers).

One of WRCOG's goals is to make it convenient for DIY'ers to recycle their used oil and to make it easy for them to find a Certified Center accepting used oil. In order for these centers to be certified, they need to apply for certification with the California Integrated Waste Management Board (CIWMB). WRCOG contacts the Non-Certified Centers in the jurisdictions to explain the program and hopefully interest them in becoming certified, the potential for decreasing the amount of illegally dumped motor oil increases with the addition of new Certified Centers within driving distance of the DIY'er.

WRCOG also provides secure oil containers on an as needed basis to the Certified Centers for distribution among DIY'ers at no cost, to minimize the chance of spillage and a hazardous situation. **During this fiscal year, 1,440 motor oil drain containers were distributed and 203,218 gallons of motor oil was collected (up 54,612 gallons from last year).**

WRCOG also conducts site visits at all certified centers in jurisdictions to ensure center compliance to state and local mandates. This one on one interaction provides the attention needed to answer questions the centers have. Materials are periodically provided to the centers such as: brochures, magnets, and state regulatory information. **3,638 used oil filters were collected during this period.**

WRCOG's program also includes public education. This includes hosting booths at large venue events, conducting surveys to see how informed the local community is regarding used oil recycling, distributing brochures in both English and Spanish with information regarding used oil drop-off locations, curbside programs and other local recycling programs. The program also maintains an English and Spanish 1-800 hotline that can be used to get answers to any recycling question a resident may have regarding, "where the nearest Certified Center is located?" and "where can I find a used oil container?". The phone number is printed on all distributed materials including the

oil containers. As mentioned, WRCOG provides brochures in Spanish, as Riverside County has a large Spanish-speaking population that needs to be reached. By educating this group with the right information concerning used oil recycling, WRCOG hopes an increase in used oil recycling will occur throughout our jurisdictions.

WRCOG provides equal services to all jurisdictions regardless of their grant contribution. The goal is the same with all the jurisdictions, an increase in used oil collections for recycling. WRCOG offers these services to make it more convenient for the DIY'ers to recycle and result in the increase of recycled used oil.

F.5.6. WESTERN RIVERSIDE COUNTY CLEAN CITIES PROGRAM

WRCOG also participates in large venue events to promote the use of alternative vehicle fuels. Car Care for Clean Air whose objective is to increase public awareness regarding the benefits of proper vehicle maintenance and repair. These events give staff an opportunity to assess how informed the local community is regarding recycling and also allows us to distribute brochures and informational flyers that will assist people in finding the nearest recycling center.

F.6. OUTREACH TOOLS TO A BUSINESS SPECIFIC AUDIENCE

The **Only Rain down the Storm Drain** program conducts a wide range of outreach activities to businesses; informing them of how their "everyday activities" may contribute to the pollution of Receiving Waters, and encouraging them to adopt alternatives that will lessen or eliminate polluting-causing activities. Program efforts include providing information on pollution prevention techniques and informing businesses about the proper disposal of wastes. Public education materials and media emphasize the theme that all businesses have a role to play in reducing and preventing the polluting of Receiving Waters. The goal is to present a clear and consistent message that explains the simple connections between a business' everyday activities and their impacts upon Receiving Water quality.

Originally, the business outreach program mainly consisted of the development and distribution of formal BMP guidance and to business associations thorough the Business Press, a trade publication. The program has now expanded to include direct outreach to businesses through Riverside County's Business Licensing Program. Discussion of the current Business Specific Outreach tools implemented by the Permittees is provided below.

F.6.1. DIRECT BUSINESS OUTREACH ACTIVITIES

Through the *Compliance Assistance Program (CAP),* a partnership with County Environmental Health, restaurants and businesses that handle hazardous wastes are inspected for potential storm-water impacts from their activities. Each business is provided with educational information specific to their typical business activities.

Within the 08/09 Fiscal Year, the Board of Supervisors passed legislation to require all businesses in Riverside County to obtain a business license. Billing inserts were developed for the County's Transportation and Land Management's, Business License Division and are included in all license renewal notices. New businesses receive their storm-water education that is affixed to their application.

Our partnership with the County's Business License Department established last year continues to be successful with providing direct outreach to business owners about behaviors that contribute to water quality problems. Direct outreach is made in the form of an insert that is issued to new business license applicants, and inserted into annual renewal reminders. The insert includes information on the "**Only Rain down the Storm Drain**" program and the Toll Free 800 number portal used for reporting illegal storm drain disposal.

The first year of the business license program distributed 979 storm-water pollution prevention informational items. The 07/08 Year resulted in the issuance of 7,503 awareness inserts. For the 08/09 Year new business license applications accounted for **1,700 new businesses and including license renewals, a total of 7,600 impressions were made.**

S. Groner Associates has been retained to prepare and present workshops at major home improvement stores throughout Riverside County. The workshops include a handout educating store employees about storm-water impacts that could occur from improper application of paint, pesticides or fertilizers. Attendees at the workshop also receive "**Only Rain down the Storm Drain**" information and promotionals to help reinforce the urban runoff message. Employees are then able to share with customers the proper use and disposal of products that can contaminate receiving waters. Point of purchase displays, tear sheets and counter displays have been installed at planned locations to provide a brief education to the public directly. *SGA's full report has been provided at the end of this section.*

F.6.2. BROCHURES

F.6.2.a) Commercial:

- *AFTER THE STORM*;
- *FOOD FACILITIES*;
- *OUTDOOR CLEANING ACTIVITIES AND PROFESSIONAL MOBILE SERVICE PROVIDERS*
- *AUTOMOTIVE MAINTENANCE & CAR CARE*
- *STORM-WATER POLLUTION AND THE SOLUTIONS*.

F.6.2.b) Industrial:

- *AFTER THE STORM*;
- *OUTDOOR CLEANING ACTIVITIES AND PROFESSIONAL MOBILE SERVICE PROVIDERS*;
- *STORM-WATER POLLUTION AND THE SOLUTIONS*;

IN DEVELOPMENT

- *YOUR FACILITY MAY NEED A STORM-WATER PERMIT* (this brochure will contain both industrial and commercial industries in 08/09 and released in FY 09/10.

F.6.2.c) Construction:

- *AFTER THE STORM*;
- *STORM-WATER POLLUTION AND THE SOLUTIONS*;
- *OUTDOOR CLEANING ACTIVITIES AND PROFESSIONAL MOBILE SERVICE PROVIDERS*;
- *GENERAL CONSTRUCTION & SITE SUPERVISION*.

PENDING

- Once the new Construction Permit has been approved, updates will begin on the *CONSTRUCTION BROCHURE* and *CONSTRUCTION POSTER*.

F.6.3. POSTERS

Best Management Practices (BMP) posters for automotive, food service establishments (available in both English and Spanish) and construction employees are available. The posters address activities associated with the automotive repair industry, and the food/restaurant industry that may pose a threat to water quality. The well

written and illustrated posters list recommended storm-water BMPs and are designed to serve as reminders for the employees.

F.6.4. MEDIA OUTREACH

No additional Media was used to target a business specific audience because education through the business license programs venue was determined to be the most effective method available to reach county businesses. The results of the outreach effort attracts the attention of general types of business activities that threaten water quality and reference the County Flood Control District and CASQA websites for BMPs that can be implemented to reduce stormwater pollution.

F.6.5. SUPPLEMENTAL ENVIRONMENTAL PROJECTS

County Environmental Health has established a *Supplemental Environmental Project (SEP)*. Funding for the SEP comes from monetary fines paid by violators found guilty of environmental crimes. These monetary revenues are then used to develop new environmental protection programs or enhance existing ones. The following are stormwater outreach efforts that utilized SEP funds:

- Conoco Phillips SEP resulted in the development of two posters for Fueling Stations and Service Bay Servicing
- Downs Energy SEP resulted in the development of a billboard advertisement.

To date, there have been no other SEP funds directed to the NPDES program for environmental projects.

F.7. OUTREACH TOOLS SPECIFIC TO POLLUTANTS

The **Only Rain down the Storm Drain** program conducts a wide range of outreach activities focusing on reduction of certain pollutants in the Receiving Waters. These outreach activities focus on sources of those pollutants whether it is residential, business, municipal or some other state or federal source. Education materials explain how "everyday activities" of potential sources may contribute to the pollution of Receiving Waters, and encourage the sources to adopt alternative approaches to pollutant management that will lessen or eliminate pollution causing activities. Program efforts include providing information on pollution prevention techniques and informing sources about the proper disposal of pollutants. Public education materials and media emphasize the theme that all citizens/businesses have a role to play in reducing and preventing the polluting of Receiving Waters. The goal is to present a clear and consistent message that explains the simple connections between a business' everyday activities and their impacts upon Receiving Water quality.

Each subsection that follows identifies how existing outreach materials previously described address specific potential pollutant sources in the watershed.

F.7.1. USE OF PESTICIDES, FERTILIZERS, AND HERBICIDES.

- Through a partnership between Riverside and San Bernardino Counties, the District is sponsoring a 1-hour episode of the PBS show for kids called *'CURIOSITY QUEST'*. The episode will *focus on many of the impacts that residential activities can have on storm-water* including Landscape Care. This episode will be broadcast nationwide and will be available royalty free for the Permittees to use on local access television stations.

- The Riverside County Agricultural Commissioner's Pesticide Applicator's License renewal information package includes materials on the proper use of pesticides and offers information on training workshops. The license renewal process requires continuing education of applicants and detailed record keeping of pesticide applications. Municipal employees that are responsible for the application of pesticides are encouraged to obtain and maintain credentials as Certified Applicators and/or licensed Pest Control Advisors.

- The Riverside County Agricultural Commissioner's Agency, provided registrants and permit recipients with the *AFTER THE STORM* and *OUTDOOR CLEANING ACTIVITIES* (now includes information for professional mobile service providers) brochures, and *HOME COMPOSTING MADE EASY* booklet. The continued success of this partnership has resulted in **2,259** pesticide professionals receiving the required MS4 materials during the 08/09 Fiscal Year. This year, outreach material has expanded to include the *HOME*

COMPOSTING MADE EASY BOOKLET; *SOUTHERN CALIFORNIA HERITAGE GARDENING GUIDE (DVD)*; and spray bottles with handy non-toxic garden and household recipes imprinted on the bottle and Compost Workshop locations and dates.

- The "*Home Garden Workshops*" conducted at nurseries and garden shows inform residents on less-toxic alternatives for the garden.
- The "*KEEP OUR WATER CLEAN*" film covers proper use of pesticides, fertilizers and herbicides, as well as, excess runoff from sprinklers.
- The **Only Rain down the Storm Drain** Annual National Pollution Prevention Week insert informs County residents about the problems of storm-water pollution and provides clear and simple pollution prevention activities in the garden.
- The **Only Rain down the Storm Drain** presentations conducted by MRCD discuss the effects of pesticides and fertilizers on local waterways.
- The *2009 ENVIRONMENTAL CALENDAR* included a wide array of storm-water protection information. It was designed specifically to attract the adult audience with information on listing best management practices, scheduled special events, household hazardous waste collection sites, used oil collection sites, home garden workshops and citywide clean ups. Each month has a featured water body and a bit of background on the water pictorial.
- S. Groner Associates has been retained to prepare and present *employee workshops at major home improvement stores* throughout Riverside County. The employee is then well prepared to discuss the proper use and disposal of chemicals. The workshops include information on BMPs that the public should be aware of for pesticide and fertilizer application, use and storage. HHW tear sheets dispensers are placed at or near herbicide and pesticide locations.

F.7.2. EDUCATE/INFORM ON IMPACTS FROM LITTERING AND IMPROPER WASTE DISPOSAL.

- Replacing the "*HOUSEHOLD HAZARDOUS WASTE - A GUIDE FOR PROPER DISPOSAL OF HHW AND THE USE OF ENVIRONMENTALLY FRIENDLY PRODUCTS*" guide is a spray bottle imprinted with non-toxic recipes on the side of the bottle for garden and/or household cleaning projects. The After the Storm brochure accompanies each spray bottle distributed.
- Through a partnership between Riverside and San Bernardino Counties, the District is sponsoring a 1-hour episode of the PBS show for kids called *'CURIOSITY QUEST'*. The episode will *focus on many of the impacts that residential activities can have on storm-water* including Household Hazardous Waste. This episode

will be broadcast nationwide and will be available royalty free for the Permittees to use on local access television stations.

- Through classroom activity books, work sheets, coloring books and presentations, children are taught to put trash in its proper place, to never throw any hazardous products in the trash, and to properly dispose of chemicals at a location near them.
- All **Only Rain down the Storm Drain** brochures and the 'lenticular' magnet encourage residents to report illegal dumping to the **Only Rain down the Storm Drain** toll-free phone number.
- The MRCD adult presentation discuss the various pollutants of concern that contribute to storm-water pollution – including trash and debris – residents are reminded to always pick-up waste and dispose of it properly. These days, requests for adult presentations are few, but overall outreach efforts at events at the larger venues might be sufficient for this age group.
- The door hanger *"A STORM DRAIN DUMPING VIOLATION HAS BEEN FOUND IN YOUR NEIGHBORHOOD"* is a friendly reminder to inform residents about the effects of improper waste disposal and encourages them to participate with simply pollution prevention suggestions.

F.7.3. EDUCATE/INFORM ON IMPACTS FROM DUMPING POLLUTANTS INTO STORM DRAINAGE SYSTEMS.

- The "*THE AFTER THE STORM*" brochures informs residents of the negative environmental impacts caused by pollutants allowed to enter storm drains.
- The "*KEEP OUR WATER CLEAN*" DVD and PSAs inform residents about the problem of storm-water pollution and describes pollution prevention activities.
- The school program stresses the message of never dumping anything into a storm drain. Both the Santa Margarita Classroom activity book and the *"FANCY FIN"* presentation specifically address this issue.
- *MRCD* works with organized volunteer groups for catch basin marking events throughout the Murrieta and Temecula Valleys. The durable, circular vibrant storm drain curb marker adheres to the inlet opening on the curb face with the clear message that reminds residents to NEVER POUR ANYTHING down a storm drain.
- The *"Only Rain in the Drain" song*, produced by the **Only Rain down the Storm Drain** program for the elementary school education program, also addresses the improper dumping issue.

- The MRCD adult presentation addresses the issue of improperly dumping pollutants into the storm drain and advises residents that storm drains connect directly – without treatment – to local waterways.
- The "*2009 Environmental Calendar*" contained various informative and visual water reminders as to why all of us should keep wastes out of the storm drain system, more specifically, **Only Rain down the Storm Drain**.
- The door hanger "*A Storm Drain Dumping Violation has been found in YOUR neighborhood*" informs residents about the effects of dumping pollutants into the storm drains, encourages them to follow simple pollution prevention activities and curtails illegal dumping behavior.
- S. Groner Associates has been retained to prepare and present *employee workshops at major home improvement stores* throughout Riverside County, so that employees can properly communicate this message to their customers. The workshops also discuss that paints or paint-related products should never be disposed of in a storm drain or gutter.

F.7.4. Educate on impacts from gasoline, fuel oil, and oil and grease.

- The *"Automotive Maintenance & Car Care"* BMP brochure specifically identifies recommended BMPs that address the problem of gasoline, oil and grease entering into storm drains.
- Through a partnership between Riverside and San Bernardino Counties, the District is sponsoring a 1-hour episode of the PBS show for kids called *'Curiosity Quest'*. The episode will *focus on many of the impacts that residential activities can have on storm-water* including Automotive Care. This episode will be broadcast nationwide and will be available royalty free for the Permittees to use on local access television stations.
- Nearly all **Only Rain down the Storm Drain** brochures, utility inserts, advertisements, the school program, and audio and video media provide information on the water quality impacts from improper disposal and spills from gasoline, oil and chemicals in a general context.
- The *"Keep Our Water Clean"* DVD specifically covers the topic of grease and oil from vehicles.
- The **Only Rain down the Storm Drain** program works cooperatively with the Permittees' motor oil recycling programs to distribute information on the "why" and "how to" of used motor oil disposal. The motor oil recycling programs actively distribute the **Only Rain down the Storm Drain** materials in conjunction

with their outreach efforts since both programs are working toward the same goal of environmental protection through pollution prevention.

- The new and improved *OUTDOOR CLEANING ACTIVITIES AND PROFESSIONAL MOBILE SERVICE PROVIDERS* brochure informs customers that vehicle fluids pose a threat to local waterways and groundwater resources and provides BMPs to keep these pollutants out of the storm drains.
- The *"2009 ENVIRONMENTAL CALENDAR"* provided a full page section on recycling motor oil. The calendar included information on the environmental problems spilled motor oil can cause.
- Environmental Health Household Hazardous Waste (HHW) Collection Schedule is provided with all of our storm-water related materials and promotionals. The schedule covers the times, dates and locations of both temporary and permanent facilities and is released in two sections:.July 1st through December 31st, and January 1st through June 30th.

F.7.5. EDUCATE/INFORM ON IMPACTS FROM AIRBORNE PARTICLES.

- The County of Riverside has an active Employee Rideshare Program, which encourages employees to carpool, vanpool, use transit, cycle or walk to work. Also, the County actively supports the use of zero/low emission vehicles. The County's Fleet Services includes a variety of alternative vehicles including CNG, propane, electric and methanol powered vehicles.
- Various County facilities are installing alternative fuel fueling stations to expand the use of alternative energy vehicles. This is a direct result of the County Board Policy to use alternative fuel vehicles as the "first choice" when purchasing or leasing vehicles.
- The County of Riverside is an active member of the Clean Cities Coalition and provides financial support for various clean air efforts/activities throughout the County.
- The District is involved in South Coast Air Quality Management District's Lawn Mower Exchange Program, whereby gas mowers are replaced with a new cordless electric mower.

F.7.6. EDUCATE ON THE NEED TO KEEP STORM-WATER FROM CONTACTING POTENTIAL CONTAMINANTS.

- The "*STORM-WATER POLLUTION….WHAT YOU SHOULD KNOW*" brochures informs residents about keeping storm-water from contacting potential contaminants and explains various pollution prevention activities. It also advises residents to keep common storm-water pollutants from entering our storm drains.
- The *AUTOMOTIVE MAINTENANCE & CAR CARE*, *the FOOD SERVICE INDUSTRY*, and the *GENERAL CONSTRUCTION & SITE SUPERVISION* BMP brochures all advise facility and site operators to properly manage pollutant sources and prevent polluted storm-water from entering storm drains. The brochures also inform owner/operators that local ordinances strictly prohibit the discharge of pollutants to the storm drain system or local waterways without a permit.

F.7.7. EDUCATE ON THE CLEAN-UP AND PROPER DISPOSAL OF PET WASTE.

- The "*WHAT'S THE SCOOP*" and "*AFTER THE STORM*" brochures addresses the need to pick-up animal waste and to dispose of it properly.
- Through a partnership between Riverside and San Bernardino Counties, the District is sponsoring a 1-hour episode of the PBS show for kids called *'CURIOSITY QUEST'*. The episode will *focus on many of the impacts that residential activities can have on storm-water* including Pet Waste. This episode will be broadcast nationwide and will be available royalty free for the Permittees to use on local access television stations.
- The school activity book and the "*FANCY FIN*" presentation discuss the proper disposal of pet waste.
- The "*KEEP OUR WATER CLEAN*" DVD also addresses the topic of the proper disposal of pet waste and the impacts to our waterways.
- The **Only Rain down the Storm Drain** adult storm-water presentation discusses proper disposal of pet waste and actually includes a DVD showing how bad this problem can be. The pictures from a distance depict small yellow flags marking pet waste deposits in what is obviously a very popular dog walking area.
- The Pollution Prevention Week is a recognized blue/green and white flyer informational and is released every September. Along with other useful BMP's, the flyer does have an article that specifically addresses pet waste under the article "*WHAT'S THE SCOOP . . . TIPS FOR A HEALTHY PET AND A HEALTHIER ENVIRONMENT*".

- The *EARTH DAY FLYERS* released every April, contains an article on the hazards of pet droppings.
- The *"2009 ENVIRONMENTAL CALENDAR"* reminds us to always "pick up animal waste". The accompanying message informs residents of the effects of pet waste on local waterways.
- The District does not allow the disposal of pet waste or other trash within its facilities. Signage has been installed at access gates and perimeters to discourage illegal dumping and encourage reporting thereof. At the start of the program, the District purchased "Dogipots," (containers that hold pet waste bags), and had them installed in County Parks. Upkeep and additional purchases of Dogipots are the responsibility of County Parks staff. The District has also purchased pet leash tags with the storm-water hotline number repeating the "**Only Rain down the Storm Drain**" message.

F.7.8. DEVELOP PROGRAMS FOR LANDOWNERS ON EROSION AND SEDIMENT CONTROL PRACTICES.

- The "*AFTER THE STORM*" brochure and the school program addresses the topic of controlling soil erosion.
- The "*STREAM BANK STABILIZATION*" fact sheet gives relevant information to land owners about managing stream courses.
- The **Only Rain down the Storm Drain** program continues to work cooperatively with both *MRCD* and *RCRCD* to offer various workshops on the topic and has conducted additional workshops for the needs of the storm-water program. These workshops have been offered to both Permittee staff and the general public.
- The **Only Rain down the Storm Drain** storm-water presentation was modified to specifically address soil erosion as it relates to the Santa Margarita Watershed and what homeowners and businesses can do to minimize soil erosion.

F.7.9. COVER CONTAMINANTS AND PREVENT RUNOFF THROUGH POLLUTED AREAS.

- The *OUTDOOR CLEANING ACTIVITIES AND PROFESSIONAL MOBILE SERVICE PROVIDERS*, *FOOD SERVICE INDUSTRY*, *AND AUTOMOTIVE MAINTENANCE AND CAR CARE* brochures all include specific BMPs to cover outside work areas; keep dumpster lids closed; prevent run-off at work and material storage areas; cover exposed stockpiles; avoid wash down of paved surfaces that drain to storm drains; and many other BMPs that help prevent pollutants from entering the storm drains.

- The *industrial/commercial training workshop* included specific segments on covering outside materials to prevent contaminated runoff. The target group for this workshop is staff that is responsible for conducting NPDES Urban Runoff inspections of industrial/commercial facilities.

F.7.10. EDUCATE MUNICIPALITIES/AGENCIES ON THE NEED FOR VEHICLE INSPECTIONS.

- As part of the municipal employee-training program, various departments have been instructed to inform employees about the need for vehicle inspections and have been provided with a complete training package to help in this area. Included in the training information are brochures, posters and vehicle air fresheners that Fleet Services personnel have distributed at their garage/work sites.
- Departments and agencies are also encouraged to use alternative fuel vehicles that not only help reduce vehicle emissions but also, in some cases (*e.g.*, electric vehicles), eliminate the use of motor oil and antifreeze. The County highly encourages its Departments to convert to these types of vehicles, whenever possible.
- The municipal employee training workshops are conducted by AEI-CASC and cover such topics as inspecting vehicles and equipment for fluid leakages.

F.8. PUBLIC EDUCATION MATERIAL

Examples of various the Public Education materials the Permittees distribute are included in Appendix B of this report.

G. A DESCRIPTION OF ALL AREA-WIDE AND WATERSHED-BASED ACTIVITIES CONDUCTED DURING THE REPORTING PERIOD.

G.1. INTRODUCTION

This section provides a summary of area-wide and watershed-based activities that were conducted during the reporting period, but not specifically described elsewhere in this report. This section also documents programs described within the DAMP that are implemented on a regional scale, rather than by each Permittee individually. Due to the small percentage of urbanization and small population within the SMR, the Permittees leverage resources by implementing several regional programs which makes these programs both cost effective and protective of water quality.

G.2. PROGRAM MANAGEMENT ACTIVITIES

The Permittees meet regularly to discuss the implementation of the MS4 compliance programs, to disseminate information regarding the current status of the various watershed-wide activities, and to discuss regional, state, and national issues related to storm-water quality. These discussions occur through various formal and informal means including the following established meetings:

G.2.1. MANAGEMENT STEERING COMMITTEE (MSC) MEETINGS

The Permittees established the MSC to address Urban Runoff management policies for the Santa Ana Region (SAR) and SMR and to review and approve revisions to the DAMP and the SAR and SMR Implementation Agreements. In addition, the MSC facilitates coordination with related water quality management programs and monitoring and establishes positions relative to legislative and regulatory initiatives. The MSC consists of city managers or equivalent representatives from each of the Co-Permittees and an executive-level representative from the County. The General Manager-Chief Engineer of the District participates on the MSC as Chair. The District provides staff support to the MSC. The MSC meets quarterly or as determined by the Chair. MSC meeting agendas and minutes are included in Appendix A.

G.2.2. SUMMARY OF TECHNICAL ADVISORY COMMITTEE (TAC) MEETINGS

A TAC has been established consisting of representatives formally appointed by the city manager or equivalent of each Permittee. The purpose of the TAC is to coordinate the implementation of the DAMP and overall MS4 Permit compliance program. The TAC members also provide technical assistance and support to facilitate coordination with related water quality management programs and monitoring and to respond to

legislative and regulatory initiatives. The District chairs and provides staff support to the TAC. TAC meeting agendas and minutes are included in Appendix A.

G.2.3. DEVELOPMENT OF REGIONAL AND STATEWIDE SCIENCE AND STUDIES

The Permittees are supporting the further development of Regional and Statewide science and studies to address issues relating to and impacting storm-water quality and to better manage the NPDES MS4 Storm-water Programs. Many of these efforts are coordinated through the SMC while others are undertaken independently by the Permittees. Additionally, the Permittees participate in CASQA, which helps coordinate and disseminate information about the science, methods and experiences of the various MS4 Programs and requirements throughout the state.

The studies and related activities that the Permittees are participating in address are summarized below and fully reported on in the indicated sections of this report:

- Participation in the *CALIFORNIA ASSOCIATION OF STORM-WATER QUALITY AGENCIES* (CASQA, Section B.6) – To follow, coordinate and disseminate information about the science, methods and experiences of the various MS4 Programs and requirements throughout the state.
- Participation in the *SOUTHERN CALIFORNIA STORM-WATER MONITORING COALITION* (SMC, Section B.5) – To develop the technical information necessary to better understand storm-water mechanisms and impacts, and then develop the tools that will effectively and efficiently improve storm-water decision-making.
- Involvement in the *SCCWRP HYDROMODIFICATION STUDY* (See Appendix G, Section G-7.2.1) – Developing tools to assess stream susceptibility to the Hydromodification effects of new development, and for the implementation of hydromodification management measures.
- Participation in the *SMC LOW IMPACT DEVELOPMENT STUDY* (See Appendix G, Section G-7.2.2) – To develop a comprehensive program to incorporate LID strategies and techniques into the planning and design of public and private sector projects.
- Development of a *LID BMP TESTING AND DEMONSTRATION FACILITY* (See Appendix G, Section G-7.2.2) – To develop technical guidance for, perform field training on, and to monitor the performance of LID features.
- Completion of a *TOXICITY REDUCTION EVALUATION* (TRE, see Section G.2.4) – to understand the sources of toxicity in our receiving waters and assess methodologies to mitigate the resulting water quality impairments.

- Participation in the *Development of Local Pesticide Regulatory Activities* (See Appendix G, Section G-7.5) – To develop activities that focus on providing input to the USEPA and the California Department of Pesticide Regulation to improve implementation of pesticide regulations to more fully protect water quality.
- Participation in efforts to *Standardize Toxicity Testing Methods* (See Appendix G, Section G-7.5) – To provide more comparable data between MS4 permit areas.
- Participation in a *Laboratory Inter-calibration Study* (See Appendix G, Section G-7.5) – To ensure quality and comparability among analytical laboratories.
- Involvement in *Regional Bio-assessment Protocol Studies* (See Appendix G, Section G-7.5) – To develop an Index of Biological Integrity (IBI) that is appropriate for low gradient streams.

G.2.4. Submittal of the Report of Waste Discharge

On January 15th, 2009 the Permittees submitted their Report of Waste Discharge (ROWD) to the Regional Board. In this report the Permittees performed a comprehensive review and analysis of their programs, and determined that their overall programs have been successful in protecting water quality, especially in light of the substantial (almost 300%) growth that has occurred within the region. Nevertheless, as part of their proactive and iterative management of their programs, the Permittees made recommendations for specific new and/or modified programs and activities that will further enhance their ability to effectively address the identified water quality problems.

These recommendations included:

- *Municipal Action Levels (MALs)* (Programmatically Based) to ensure that their programs continue to be effective at meeting their goals, and to identify areas that may need attention.
- *Enhanced Program Effectiveness Assessments*, to provide clear goals for the Permittees' programs and a clear and measurable system to determine the Permittees' effectiveness at working toward each goal. The proposed system of effectiveness assessments includes:
  - *Goals* for each program area,
  - *Measureable metrics* to determine progress toward each goal,
  - Assessments that quantify effectiveness at each level of the *CASQA effectiveness methodology*
  - *Timeframes* of assessment
  - *MALs* (described above).

- *Revised/Enhanced IC/ID Monitoring Program* to:
  - Distribute the monitoring sites throughout the Santa Margarita Region to detect Illicit Discharges closer to their source before they become excessively diluted.
  - Increase efficiency and consistency in sampling resulting in enhanced data quality.
  - Enhance response time to identify IC/IDs.
- *Post Construction BMP Tracking and Inspection program* to ensure the ongoing maintenance and effectiveness of Treatment Control BMPs.
- *Revisions to the Dry Weather Monitoring Program* to help develop a regional approach to watershed assessment. *
- Development of an *LID Manual and Design Guidance* to provide additional guidance for and to encourage use of Low Impact Development BMPs.*
- Construction of an *LID BMP testing facility*. To foster an increased knowledge and understanding of the implementation, effectiveness and maintenance of various types of LID BMP's. *
- *Addressing Pesticide Toxicity through the Plan of Action described in the Toxicity Reduction Evaluation* (TRE), which included a five-year plan (to coincide with the 5-year life of the 4th Term MS4 Permit) with specific actions for each year.*

As the Permittees had structured these enhancements in a manner that would best focus their resources to the benefit of water quality, the intent of the recommended activities summarized above is to have any new and/or revised requirements in the upcoming 4th Term MS4 Permit be based upon and supportive of these recommended actions.

* Although the Permittees are still operating under their 3rd term Permit, through the Permittees' ongoing iterative management of their programs, they have continued to move their programs forward by proactively implementing the asterisked items above.

The ROWD can be accessed in the *'Compliance Documents'* section of the following web site:

http://rcflood.org/NPDES/SantaMargaritaWS.aspx

G.2.5. TOXICITY REDUCTION EVALUATION FOR PYRETHROID PESTICIDES

In January 2009, the Permittees completed and submitted a Toxicity Reduction Evaluation (TRE) as part of the Report of Waste Discharge (ROWD). This evaluation identified that the primary source of toxicity within the SMR is likely Pyrethroid pesticides and included an extensive literature review of potentially applicable management measures. Many of the most appropriate actions to address Pyrethroid Pesticides had already been proactively implemented by the Permittees. Further the TRE established a five-year plan of action for addressing the toxicity that the Permittees are preparing to implement consistent with the pending fourth-term MS4 Permit.

Below is a summary of some of the actions that are already being implemented by the Permittees

- Distributed to the Permittees, *guidance published by Eco-Wise* on developing standard language for including IPM in municipal pest management contracts.
- *Produced educational materials* for use by each municipality that include messages about the proper use of pesticides and encouraging IPM. These educational materials are further discussed in Section F.7.1 of this report.
- Coordinating with Department of Pesticide Regulation (DPR) on an *upcoming Pyrethroid Pesticide evaluation*.
- Provide input and comments to DPR regarding proposed *Pesticide Working Group Studies.*
- Peer review of the *'2008 Summary of Pesticide Use Report'* prepared by the UP3 project.
- Presented on urban pesticide issues at the September 2008 *Western Regional Urban Pest Ant Workgroup* at UC Riverside.
- Coordinating meetings with the *Riverside County Agricultural Commission* to help coordinate activities related to pesticide management.
- *Updated NPDES Training* (Described in Section G.8.2) to include information on the impacts that improper application of pesticides has on the environment and to encourage the use of IPM.
- Proposing to establish an *agreement with the U.C. Extension's Master Gardener program* in fiscal year 2010-2011 to *support master gardener hotline staffing*, local presentation and other outreach by the U.C. Master Gardeners to provide residents with information on integrated pest management techniques that minimize pesticide application.

- Pursued a grant with UCR to *develop tools and guidance for pesticide application as part of the USEPA project "IMPLEMENTING IPM PROGRAMS TO CONTROL ANTS IN URBAN COMMUNITIES"*.

G.2.6. ENCOURAGING WATER CONSERVATION

The District and the County of Riverside are participating in the Riverside County Water Task Force which is a proactive regional forum for diverse stakeholders to discuss critical water-related issues and develop regional solutions. Their mission is to ensure the reliability, sustainability, and quality of the water resources within Riverside County through stakeholder communication and regional collaboration.

In 2008/09 the Task Force developed a Local Model Landscape Water Use Efficiency Ordinance intended to be a regional solution to the State mandated requirements of AB1881. Other activities of the Task Force include tracking and responding to state water supply legislation, actively participating in a Bay Delta solution, sponsoring a regional Water Symposium, promoting training in drought tolerant landscaping, engaging local decision makers, and developing new methods to incentivize water conservation efforts. More information on the Riverside County Water Task Force may be found at:

http://www.h2oriversidecounty.org/

G.3. WATERSHED PLANNING ACTIVITIES

The Permittees are active in pursuing watershed-based planning efforts, and within the reporting period have participated in the following efforts.

G.3.1. INTEGRATED REGIONAL WATERSHED MANAGEMENT PLAN (IRWMP)

An IRWMP has been developed and is being implemented for the Upper Santa Margarita Watershed through the coordinated efforts of agencies described in Section B.7 of this report. IRWMPs are the gold standard of watershed based planning. The IRWMP was initiated by Rancho California Water District, the County of Riverside and the District and established the following nine (9) planning objectives for the stakeholders:

- Develop a more reliable and diverse portfolio of water supplies;
- Promote economic, social and environmental sustainability;
- Improve water quality;
- Restore, enhance and maintain habitats and open spaces;
- Promote sustainable floodplain management;
- Promote appropriate recreational opportunities;
- Promote appropriate land use planning;
- Increase stakeholder involvement and stewardship; and
- Maximize implementation of water resources projects.

Projects were then selected that support various listed planning objectives with focus placed on projects that integrated multiple objectives. Based on the IRWMP, several stakeholders submitted an application for Prop 50 IRWM Implementation Grant projects, including the District, who requested the funds to complete the Murrieta Creek Flood Control, Environmental Restoration and Recreation Project. A copy of the IRWMP was included in the 2006-2007 Watershed Annual Report.

The Status of the implementation of the IRWMP is described in Section H.1.1.d)

G.3.2. SPECIAL AREA MANAGEMENT PLAN (SAMP)

Starting in 2001, the US Army Corps of Engineers (USACE) Los Angeles District, in conjunction with the Permittees, the Regional Board and other stakeholders, has pursued the development of a Special Area Management Plan (SAMP) within the San Jacinto and Upper Santa Margarita Watersheds. SAMPs are a regulatory tool that the Corps may utilize within a "geographic area of special sensitivity". Corps Districts are encouraged to develop and implement SAMPs to "reduce challenges associated with traditional case-by-case review" [404 permitting] but only where it is likely to "result in a definitive regulatory product". The objectives of the SAMP are to ensure that "development interests can plan with predictability and environmental interests are assured that individual and cumulative impacts are analyzed in the context of broad ecosystem needs"[6]

This collaborative and comprehensive watershed based planning effort will identify, prioritize and protect high priority "Waters of the U.S.", while also considering the needs of future growth and infrastructure development. The SAMP will be used to assist Federal, State and local agencies with their regulatory permit decision making processes to protect, restore and enhance aquatic resources, while accommodating various types of development activities and infrastructure projects. The Upper Santa Margarita and San Jacinto watersheds include such resources as woodlands, wetlands, freshwater marshes, vernal pools, streams, lakes and rivers that will be evaluated and protected under the project. The final product of the SAMP will be the establishment of an abbreviated or expedited regulatory permitting process by the Corps under Section 404 of the Clean Water Act. Additionally, the California Department of Fish and Game is preparing a Master Streambed Alteration Agreement in conjunction with the SAMP to provide an expedited permitting process under the State's Section 1600 of the Fish and Game Code.

The status of the SAMP effort is included in Section H.1.1.b) of this report.

[6] USACE Regulatory Guidance Letter No. 05-09; Special Area Management Plans, December 7, 2005

G.3.3. WESTERN RIVERSIDE COUNTY MULTIPLE SPECIES HABITAT CONSERVATION PLAN (MSHCP)

As part of their Watershed-Based Planning Activities, the Permittees continue to lead efforts to mitigate the impact of new development on water quality in the SMR through participation in the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The MSHCP is a joint effort of the Santa Margarita Region Permittees, and others stakeholders that was adopted in June of 2003. It is a comprehensive, multi-jurisdictional Habitat Conservation Plan focusing on conservation of species and their associated habitats in western Riverside County. The MSHCP is one of several large, multi-jurisdictional habitat planning efforts in southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP will allow Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts. Further, the MSHCP's special provisions for the protection of existing Riverine/Riparian communities will ensure protection and preservation of natural watercourses

Through the implementation of the MSHCP, much of the remaining non-urbanized lands within the SMR will ultimately be conserved.

A summary of the status of this effort is described in Section H.1.1.a) and the annual report for the MSHCP is included in Appendix D.

G.4. DEVELOPMENT PLANNING ACTIVITIES

The Permittees are supporting and developing a number of methodologies to advance their capabilities to avert storm-water pollution through creation and implementation of various development planning practices. The findings of these studies will provide the basis for future amendments to the Watershed and Individual SWMPs.

G.4.1. HYDROMODIFICATION STUDY

The Permittees have implemented numeric criteria to control runoff from new developments as described in the DAMP. Additionally, the Permittees are participating in a regional hydromodification study conducted by SCCWRP, to increase understanding of hydromodification problems and potential management measures, and provide a basis and the tools for developing revised criteria as needed.

A full description of these efforts is provided in the Special Studies section of the Monitoring Annual Report (Appendix G, Section G-7.1).

G.4.2. LOW IMPACT DEVELOPMENT (LID) STUDY

The Permittees are participating in a study coordinated by the Southern California Monitoring Coalition (SMC, Section B.5) to develop a LID BMP design manual.

This study is described in the Special Studies section of the Monitoring Annual Report (Appendix G, Section G-7.1).

G.4.3. LOW IMPACT DEVELOPMENT TESTING AND DEMONSTRATION FACILITY

In the interest of fostering an increased knowledge and understanding of the implementation, effectiveness and maintenance of various types of LID BMP's, the District will be reconstructing much of the grounds surrounding the District's headquarters at a cost of almost 1.2 million dollars, to incorporate a Low Impact Development Testing and Demonstration Facility. This project and its benefits are further described in the Special Studies section of the Monitoring Annual Report (Appendix G, Section G-7.1).

G.4.4. LID BMP DESIGN MANUAL

The District is currently coordinating with the SMC LID BMP grant project referenced in Section G.4.2 to develop a LID Supplement for the current BMP Design Manual contained in the WQMP. This project and its benefits are further described in the Special Studies section of the Monitoring Annual Report (Appendix G, Section G-7.1).

G.5. MUNICIPAL ACTIVITIES

Under the second-term SMR Permit, the Permittees developed a Municipal Facilities Strategy to identify BMPs for various activities that are typically conducted at municipal facilities. The municipal facilities of concern identified by the Permittees included maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, and parks and recreational facilities. In addition, the Permittees identified BMPs for street sweeping, catch basin cleaning, landscape and swimming pool maintenance activities, MS4 maintenance activities, and the application of pesticides. The Municipal Facilities Strategy was incorporated into Chapter 5 of the DAMP as part of the permit update process. The following table updates the Public Agency Facilities Matrix contained within the DAMP.

G.5.1. UPDATED PUBLIC AGENCIES FACILITIES MATRIX

Table G-1 lists the types and numbers of municipal facilities operated by the Permittees.

Table G-1: Permittee Facilities Matrix

	Corporate Yards	Parks & Recreation Facilities	Ware-houses	Fire Stations	Police Stations	Hazardous Materials Storage	Animal Shelters	Swimming Pools	Water Treatment Facilities
District [(a)]	--	--	--	--	--	--	--	--	--
County	3	3	--	11	--	1	--	--	--
Murrieta [(b)]	1	50 [(c)]	--	4	1	--	--	1	--
Temecula	1	43	--	3	2 [(d)]	--	--	3	--

(a) The District has no municipal facilities, other than MS4, in the Santa Margarita Region.

(b) Numbers of facilities within City Limits.

(c) There are forty-four (47) parks and three (3) recreational facilities within City of Murrieta limits.

(d) Although within city limits, these stations are operated by the Riverside County Sheriff's Department.

G.5.2. UPDATED DRAINAGE MAPS

An updated MS4 map is included in Appendix F of this report and Appendix D of the DAMP. As with the FY2007-2008 Watershed Annual Report, the map included in this year's report has been enhanced to better incorporate presentation of the entire drainage system including natural or unmaintained drainages, thus allowing viewers to trace watercourses from their point of initiation all the way to receiving waters.

Additionally, in accordance with the recommendations submitted in the ROWD, the Permittees are working to add additional information onto the MS4 Maps. While gathering the information needed to complete these map layers is an on-going process, the drainage maps included in Appendix F now includes the delineation of HUC Sub-Drainage areas.

A GIS database is also maintained by the District which identifies all receiving waters, all CWA section 303(d) impaired receiving waters, existing and planned land uses, MS4s, major highways, and jurisdictional boundaries. Work to improve the maps is ongoing. A GIS Web-Map with much of this information is available on the District's Website at:

http://rcflood.org/gis_npdes/home.htm

G.6. INDUSTRIAL AND COMMERCIAL ACTIVITIES

The regional Industrial and Commercial Activities program includes the implementation of the Compliance Assistance Program (CAP), which makes use of existing County Department of Environmental Health site inspections as described in Section 8 of the DAMP. As the responsible Certified Unified Program Agency (CUPA) in Riverside County, the County Department of Environmental Health is responsible for regularly inspecting all sites within the County that handle hazardous waste. The County Department of Environmental Health also inspects all food service restaurants within the SMR at least annually.

Revisions to the inspection program requirements contained within the Third-term SMR Permit expanded the scope of the overall commercial/industrial inspection program beyond the ability of the CAP to solely address. In addition, the Third-term SMR Permit required inventories/databases of facilities, prioritization of industrial and commercial sources relative to the potential to impact water quality, and specified inspection frequencies based upon facility priority. To address these expanded requirements, each municipal Permittee now implements a supplemental inspection program for Commercial and Industrial facilities not adequately covered by the CAP.

The revised industrial and commercial sources program continues to have both regional and local jurisdiction components. Although the overall industrial/commercial inspection program has grown beyond the CAP, the CAP still addresses most of the facilities identified in the Third-term SMR Permit. With its relatively low cost, the CAP remains a cost effective approach to mitigating the impacts of industrial and commercial facilities on the MS4 and Receiving Waters.

G.6.1. CAP SUMMARY REPORT

Under the CAP, County Department of Environmental Health inspectors added a storm-water compliance survey to their regular inspection process. *The CAP program performed **406** Facility inspections during this reporting period.* Completed surveys were forwarded to the appropriate Permittees for their records, review and further action, if necessary. Individual inspection results are contained in each of the Permittee's Annual Reports.

Appendix C contains a listing of the facilities inspected under the CAP program.

G.7. ILLICIT CONNECTION / ILLICIT DISCHARGE (IC/ID) ACTIVITIES

Each Permittee implements its own IC/ID monitoring program. In addition to and complementing these programs, the following watershed based IC/ID activities are conducted.

G.7.1. HAZMAT RESPONSE TEAMS

The Haz-Mat Emergency Response Team is a partnership program with combined efforts from the Riverside County Fire Department and the Hazardous Material Branch of Environmental Health. The Haz-Mat Response Team is staffed daily by firefighters/Haz-Mat specialists at two separate locations. Hazmat 34 is stationed at the Winchester Fire Station and Hazmat 81 is stationed at the Palm Desert Fire Station. The Hazmat Team oversees the NPDES program for the County Fire Department's fire stations and facilities and provides training to the employees of the Fire Department.

Appendix C contains a detailed report of the Haz-Mat Team Activities within the reporting period.

G.7.2. COMPLAINT CALL SUMMARY LOGS

In addition to each Permittee's individual programs to handle complaint calls and IC/ID reports, the District on behalf of the Permittees maintains a "800" telephone number and an e-mail address for anonymous public reporting of Illicit Discharges, and additionally, the District monitors CAL EMA (California Emergency Management Agency) spill reports. Through these, the District receives reports on and ensures proper response to Illicit Connections, Illicit Discharges and Spills throughout the county.

Following is a summary of the total number and nature of complaints fielded by the District within the reporting period.

Illicit Discharges (ID): **4**
Illicit Connections (IC): **0**
Spills (S): **41**
Total: 45

A key component of this public reporting program is the "1-800" number maintained by the District on behalf of the Permittees. As described in Section F.3.2, this "1-800" telephone number enables callers to report activities suspected of causing pollution. The total number of calls received on the 1-800 line during the reporting period was **1,169**. Please note that hang-ups or disconnects are not included in the total.

Additional Details are provided in the effectiveness assessments summarized in Section H.1.3.d), and copies of the reports are provided in Appendix C

G.7.3. WATERSHED CLEAN-UP EVENT SUMMARY

The Santa Margarita Watershed Clean Up event was held on November 1th, 2008. Over 120 people volunteered for this event, and about 12 tons of waste was removed. Since 1995, volunteers have collected more than 1,300 tons of trash during the annual cleanups. To encourage the public to keep their communities clean, the District always participates in watershed clean up events by providing manpower, equipment and storm-water related promotional items and brochures.

A Flyer and a Newspaper Article that promoted this event are included in Appendix C of this report.

G.7.4. HOUSEHOLD HAZARDOUS WASTE/ANTIFREEZE, BATTERY, OIL AND LATEX PAINT (HHW/ABOP)

One of the principal components of the Permittees' source control efforts are the HHW and ABOP collection programs conducted by the County's Environmental Health Department. The Permittees contribute funding to ensure that sufficient HHW and ABOP events are held each year. Within this reporting period, *54 HHW/ABOP events were held within the SMR involving 3,300 participants and collected over 100 tons of waste*. The goal of these programs is to provide convenient alternatives to illegally disposing of wastes into the MS4. Additional information regarding the quantities of materials collected during the reporting period is identified in Section H.1.4.a).

G.8. TRAINING & EDUCATIONAL ACTIVITIES

G.8.1. PUBLIC EDUCATION

On behalf of the Permittees, the District conducts a watershed wide Public Education Program. This program is fully described in Section F of this report.

G.8.2. NPDES TRAINING

The Permittees jointly fund NPDES stormwater training and education programs tailored for their Municipal staff. These training programs are designed to train Municipal employees on the proper use and implementation of BMP's appropriate for their field of work.

This year, the following new courses were added to the NPDES training program:

- CAP Storm-Water Survey Training
- Whitewater WQMP training (specific to portion of Riverside County within jurisdiction of Colorado Regional Board.)

Additionally, all of the existing training modules (WQMP, Construction, Municipal, and Industrial-Commercial) have been updated to include information on proper management of pesticides and to enhance focus on addressing the pollutants of concern within the County.

Of the six training courses the program now offers, five are applicable to the SMR and are described below:

CONSTRUCTION TRAINING

- Targets staff that conduct:
- Construction Site Inspections / Enforcement
- Public Works Construction Activities
- Grading/Building Permit Review Staff
- Any staff reviewing or preparing construction project SWPPP's

INDUSTRIAL – COMMERCIAL TRAINING

- Targets health, building and code enforcement staff that conduct:
- Industrial/Commercial Site Inspections / Enforcement for Water Quality Ordinances.

MUNICIPAL TRAINING

Targets Permittee maintenance Workers in:

- Building Services
- Parks Department
- Fleet Services
- Warehouse/Receiving Personnel
- Building and Grounds Maintenance

WQMP TRAINING

- Targets staff involved with:
  - Planning
  - Engineering
  - Plan Review and Plan Check
  - Grading/Building Permit Review
  - Post Construction BMP Inspection

CAP TRAINING

- County Environmental Health inspectors that are implementing the CAP program for inspections of Industrial and Commercial facilities. (These employees formerly attended the Industrial – Commercial Training)

Tables summarizing attendance to these trainings are provided in Section H.1.3.e) of this report. Copies of the training attendance sheet are included in Appendix E. AEI-CASC is contracted by the District to present the training.

G.9. PUBLIC INVOLVEMENT

All major permit compliance programs were developed during the FY 2004 -2005 period, therefore, there were no significant revisions to the DAMP or SMR programs warranting public involvement. Nevertheless the permittees facilitated the following opportunities for the public to become involved in protecting water quality.

G.9.1. OPEN MEETINGS

- *TAC meetings* are scheduled monthly and are open to the public. The TAC meetings are described in Section G.2.2.
- The Bureau of Reclamation, on behalf of the SMREMT has held several publicly noticed meetings to discuss SMR watershed issues and priorities.

G.9.2. OTHER ACTIVITIES INVOLVING THE PUBLIC

- The *Watershed Cleanup* described in section G.7.3 was sponsored by the Permittees and *included over 120 public volunteers and removed 12 tons of waste* from the Santa Margarita Watershed.
- *Fifty-four (54) Household Hazardous Waste collection events have been held* and involve the public in ensuring that wastes are disposed of properly. During this reporting period there were *3,300 participants* and, *over 100 tons of waste was collected*.

G.10. MONITORING ACTIVITIES

On behalf of the Permittees, the District implements a watershed based monitoring program which is fully reported upon in Appendix G of this report. This program includes direct sampling and analysis for wet and dry weather flows. The program also participates in a number of regional special studies that the Permittees participate in to address various water quality problems. These special studies are listed below, and additional information can be found in Appendix G - Section G-7.0.

- SCCWRP Hydromodification Study
- Toxicity Reduction Evaluation (TRE) for Pyrethroid pesticides in the SMR
- Lagoon Investigation Order No. R9-2006-0076
- Involvement in State Pesticide Regulatory and Reevaluation Activities
- Laboratory Inter-calibration Study
- Standardization of Toxicity Testing Methods
- Index of Biological Integrity for Low Gradient Streams
- Regional Watershed Monitoring Program

G.11. BUDGET

Expenditures identified below reflect costs incurred by the District for implementing its own NPDES program and to implement the regional watershed programs. The District does not track its direct implementation costs separately from the Regional Programs, nor does it track costs separately for many permit provisions.

Future compliance costs could increase significantly to address TMDL monitoring requirements in future fiscal years. In addition, the shown budget for FY2009-2010 only includes costs associated with compliance with the Order 2004-001. Undetermined additional costs may be incurred as part of the review and development of the fourth-term MS4 Permit and associated compliance programs.

Table G-2: Regional Program Costs

	Fiscal Year 2008-2009		Fiscal Year 2009-2010	
	Capital Expenditures	O&M/ Admin Expenditure	Capital Expenditures	O&M/ Admin Expenditure
Program Management [(a)]	N/A	$393,606	N/A	$582,590
Annual Fee for MS4 NPDES Permit	N/A	0	N/A	$4,000
Development Planning [(b)]	N/A	N/A	N/A	N/A
Industrial and Commercial Inspections (CAP Program)	N/A	$25,000	N/A	$19,830
Illicit Connections & Illegal Discharges Program (HAZMAT, HHW/ABOP Collections)	N/A	$66,500	N/A	$66,500
Municipal Facilities and Activities [(b)]	N/A	N/A	N/A	N/A
Training, Public Education & Outreach	N/A	$69,000	N/A	$74,910
Monitoring Program	N/A	$307,158	N/A	$200,200
Other	N/A	$0	N/A	$0
Contributions to Other Programs	N/A	$0	N/A	$0
Total	**N/A**	**$861,264**	**N/A**	**$948,030**

(a) Program Management includes all costs not directly tracked below, and includes staffing, administration & overhead, and consultant services.

(b) Costs for these regional program elements are not directly tracked but are included in the Program Management costs shown.

A description of the sources of funds that were utilized during the previous fiscal year and the sources of funds proposed to meet the necessary expenditures for the subsequent year, including legal restrictions on the use of such funds are as follows:

Table G-3: Source of Funds

	Amount Available	Percent of Total Program Funding	Restrictions on Use (if applicable)
Santa Margarita Watershed Benefit Assessment Fund	$444,830	50.71%	District NPDES compliance costs, excess funds used to fund regional NPDES activities.
Santa Margarita Watershed Permittee Implementation Agreement	$422,323	48.15%	Regional NPDES Compliance Programs.
Spending Against Reserves	$0	0%	District NPDES Compliance Costs
Miscellaneous Revenue	~$10,000	1.14%	Interest, Other Misc.
TOTAL	**$877,153**	**100%**	

ADDITIONAL COMMENTS/INFORMATION:

The Permittees are working with other stakeholder groups to leverage funds for regional planning objectives including the following: [NOTE many of the State's grant funding programs have been suspended]

Prop 13/40/50 Grant Funds – Working cooperatively with San Diego County, Bureau of Reclamation and other stakeholders to implement a Watershed Management Plan for the Santa Margarita River Watershed. (See Section B.7)

Storm-water Monitoring Coalition – The SMR Permittees are partnering with other participants in the SMC to fund monitoring projects to address high priority water quality issues as described in Section B.5.

Mission Resource Conservation District – Partnering with stakeholders in the SMR through the MRCD to implement watershed education, monitoring, and clean up programs.

Santa Ana Watershed Project Authority – Jointly fund a low impact development (LID) BMP testing and demonstration facility for southern California. The facility will be a retrofit of the District's compound in Riverside. Data collected from the facility will be used to update the BMP Design Manual, develop numeric criteria for hydromodification, and provide data for statewide efforts to better define the effectiveness of LID BMPs. The facility will also serve as a regional demonstration facility for southern California MS4 Permittees. Additional information regarding this project is available in the Appendix G (Section G-7.2.2).

Southern California Coastal Watershed Research Project – Jointly fund a regional study the impacts of hydromodification on southern California streams and assess possible mitigation measures. Additional information regarding this project is available in the Special Project's section of the Monitoring and Reporting Annual Report (Section G-7.1).

H. AN ASSESSMENT OF OVERALL PROGRAM EFFECTIVENESS BASED ON MEASURABLE GOALS ESTABLISHED IN THE DAMP

In the 4th year annual report and in the subsequent ROWD, the Permittees performed a comprehensive assessment of the effectiveness of their overall programs. Section 5.3 of the ROWD found that the Permittees' programs have been and continue to be effective at addressing the Focus Area Constituents of Concern. This section contains a continuance of these assessments based upon the short-term and a long term strategies described in Appendix S of the DAMP.

While program effectiveness assessment is a key step in the iterative process of program implementation, it should be realized that effectiveness assessment itself is a part of a management process that is also evolving. Assessing program effectiveness is recognized as a challenge for program managers across California, and the Riverside County Storm-water Program has supported the efforts of CASQA to develop guidance in this area at a statewide level. As such, the ROWD also includes recommendations for revised reporting formats and proposes a new method for effectiveness assessments based upon the CASQA methodology, which will provide a better and more transparent view into the Permittees compliance activities in the fourth term MS4 Permit.

H.1. SHORT TERM MEASURES OF EFFECTIVENESS

The short-term strategy for assessing the effectiveness of the DAMP (Watershed SWMP) requires the development of measurable goals and measures of effectiveness for programs proposed to mitigate the impacts of Focus Area Constituents of Concern. The measures of effectiveness track the year-to-year implementation of the regional programs. The measures of effectiveness also are used as part of the Long-Term Strategy to measure the effectiveness of the Watershed SWMP as described in Provision K.2.m of the Watershed SWMP. The Measures of Effectiveness for the regional programs are presented below.

H.1.1. ENCOURAGE WATERSHED BASED PLANNING EFFORTS

SUMMARY EFFECTIVENESS ANALYSIS:

During the Reporting Period and throughout the implementation of the 3rd Term Permit, the Permittees have been effective at encouraging Watershed-Based Planning Efforts. Section G.3 describes the efforts undertaken within the reporting period. A summary of these efforts is provided below and the current status of these efforts is described in the following sections.

- Participation in the *INTEGRATED REGIONAL WATERSHED MANAGEMENT PLAN* (IRWMP, Section G.3.1) for the Upper Santa Margarita Watershed. – Promoting watershed-wide coordination and management of water resources.
- Participation in the development of the *SPECIAL AREA MANAGEMENT PLAN* (SAMP, Section G.3.2) – Working with the Corps of Engineers and other regulatory agencies to assess Clean Water Act Section 404 permitting on a regional scale to protect, restore and enhance aquatic resources, while accommodating various types of development activities and infrastructure projects.
- Participation in the *WESTERN RIVERSIDE COUNTY MULTIPLE SPECIES HABITAT CONSERVATION PLAN* (MSHCP, Section G.3.3) – To conserve endangered species and sensitive habitat areas including Riparian/Riverine habitat.

The Permittees believe that the combined efforts not only meet but exceed the minimum requirements established by the Watershed SWMP and the measurable goals established for addressing the highest priority Water Quality Problems in the Santa Margarita watershed.

Specific measurable metrics are as follows:

H.1.1.a) Annual Summary Reports of Benefits of MSHCP Implementation

The MSCHP effort (described in Section G.3.3) continues to purchase critical habitat and stream-bank properties through grants and local MSHCP funding mechanisms to ensure preservation of the region's natural resources. As of the end of FY08-09, approximately 87,407 acres have been conserved, representing about 25% of the Santa Margarita Watershed region of Riverside County.

It is estimated that by roughly 2028 (25 years of MSHCP implementation), the plan will have conserved approximately 43% of the SMR through the creation of approximately 150,000 acres of permanent habitat reserve lands.

Figure H-1: Conservation within the SMR

Figure H-2: Conservation Area Acquired Through Implementation of MSHCP

Note: Due to discrepancies discovered in the methodologies used to generate the information in **Error! Reference source not found.**, the shown Yearly Acquisistions should be considered rough approximations. The total Conserved Land shown for 2009 (representing FY08-09) is considered accurate, and the methodology used to generate this number will be used consistently in future annual reports.

It is estimated that after 25 years of implementation, the planned acquisitions will be complete, however the number of acres acquired per year is dependent upon many factors that are largely dependent upon the economy during that year and as such the acquisitions can vary significantly from year to year. The continuing implementation of the MSHCP represented in Figure H-2 above demonstrates the Permittees' ongoing efforts to support watershed based planning and conservation within the watershed.

The MSHCP is described in Section G.3.3 of this report.

H.1.1.b) Annual Summary Report of SAMP Development

The $4.5 million in appropriations received since FY 2001 has allowed the Corps to complete a 'Landscape Level Aquatic Resource Delineation' and 'Functional Assessment' to determine the value of waters and wetlands within the San Jacinto and Upper Santa Margarita watersheds.

During the past two years the Corps did not receive any funding for the SAMP and all efforts were put on hold. The Corps has received new funding this fiscal year and the project is once again moving forward. Additionally, the District has partnered with the Riverside County Transportation and Land Management Agency, The Riverside County Resource Conservation Authority and The Riverside County Transportation Commission to assist the Corps with the final stages of the SAMP which include the development of the expedited regulatory products, the identification of the conservation/mitigation areas and completion of the necessary NEPA/CEQA documents. The goal is to have the SAMP completed by FY 2009-10.

The SAMP is further described in Section G.3.2 of this report.

H.1.1.c) Summary Report of Watershed Stakeholder meetings and agendas.

As part of the implementation of the various watershed-based planning efforts described in this report, the Permittees hold or attend meetings with the various watershed stakeholders. These meetings are described in Section B of this report and agendas for these meetings (as available) are provided in Appendix A.

H.1.1.d) Summary Report on the Status of IRWMP

IRWMP was finalized on July 31, 2007 and is currently being implemented. A grant application was submitted in August 2008. However, the application was not funded by DWR, in part due to concern that the IRWMP did not fully address the SMR watershed. As a result, The IRWM committee formed a tri-county committee with their IRWM counterparts in San Diego County and Orange County to discuss boundary coordination issues and determine how to allocate remaining Proposition 84 IRWM funds. A MOU was developed between the three IRWM plans within the San Diego Region in March 2009. The MOU established a permanent 3-county coordinating committee (Tri-County Facilitation and Coordination Committee) to ensure coordination of cross-boundary issues. In June 2009, the District, County and RCWD also participated in the DWR IRWMP Regional Acceptance Process (RAP). As a result, the IRWMP is proposed for approval by the state without condition on 9/1/2009.

The IRWMP is described in Section G.3.1 of this Report.

H.1.1.e) Summary Report of status of WQMP and BMP Guidance

District and County staff are continuing their efforts to develop guidance for the implementation of Low Impact Development (LID) BMPs and for addressing Hydromodification.

There are *four (4) active efforts ongoing*; these efforts are summarized in Section G.4 of this report and complete descriptions, and the status of these efforts can be found in Appendix G - Section G-7.2, Special Studies.

H.1.2. CONTINUE TO SUPPORT DEVELOPMENT OF REGIONAL SCIENCE AND OTHER STUDIES TO FURTHER UNDERSTAND AND MITIGATE WATER QUALITY IMPAIRMENTS

SUMMARY EFFECTIVENESS ANALYSIS:

During the Reporting Period and throughout the implementation of the 3rd Term Permit, the Permittees have extensively supported the development of regional science to further understand and mitigate water quality impairments and are working to meet the goals described in the Watershed SWMP section K.2.l. As such the Permittees have been effective in addressing this section.

H.1.2.a) Annual Status Reports of ongoing studies

Within this reporting period, *the Permittees have supported ten (10) separate regional studies* to further develop the science of managing storm-water. A summary of the specific efforts undertaken within the reporting period is provided in Section G.2.3 of this report.

H.1.3. PUBLIC EDUCATION AND OUTREACH

SUMMARY OF EFFECTIVENESS ANALYSIS:

A detailed and complete effectiveness analysis of this component was provided within the 2009 ROWD. Since that analysis, the Permittees have continued to collect the measureable metrics, and this year's data is presented below, indicating the continued and ongoing effectiveness of the Public Education Component. It should be noted that the Permittees implement a consistent public education program across the County, with modifications to focus on specific watershed issues as necessary. To this end, many of the metrics provided below are Countywide as it is consistent with the implementation of the Public Education Program. SMR specific metrics are provided where available.

Additionally, many of these metrics are not conducive to trend analysis as variables such as event venues change from year to year. The Public Education program is continually looking for better and more effective opportunities to present the message of 'Only Rain in the Storm Drain'.

H.1.3.a) Track materials distributed

This section includes an accounting of the attendance to outreach events and the number of materials distributed.

Table H-1: Countywide Educational Materials Outreach

Attendance and/or Outreach Materials Distributed	FY04-05	FY05-06	FY06-07	FY07-08	FY08-09

H.1.3.c) Track media impressions

This section includes an estimate of the media impressions made during the fiscal year. Many of these metrics are not conducive to trend analysis as variables such as the media outlets change from year to year. The Public Education program is continually looking for better and more effective opportunities to present the message of 'Only Rain in the Storm Drain'.

Table H-5: Estimated Media Impressions

H.1.3.d) The Number of Urban Runoff Complaints received through hotlines

During this reporting period, 45 Urban Runoff complaint reports were received by the District through the regional reporting portals, i.e., telephone calls, e-mail requests, and/or mail. Currently, the specific method of "receipt" of the complaints directed to the District is not tracked.

Additional complaints that may have been fielded directly by the other Permittees are reported within the respective Permittee's annual report.

Of the 45 reports received by the District, 41 (91%) were Spill reports that were received via copy of a Cal EMA (California Emergency Management Agency) report. Eight (8) of the spill reports involved sewage discharges. The remaining four (4) were reported illicit discharges, which generally consisted of illegal dumping.

Copies of these reports and any follow up investigations are provided in Appendix C. Additional information regarding these reports can be found in the District's Individual Annual Report.

Table H-6: Total Number of Calls to '800' Hotline

2004-05	2005-06	2006-07	2007-08	2008-09
100	2,015	1,648	1,317	1,169

Note: These numbers are for the entire County of Riverside. The number of inquiries originating from the Santa Margarita Region was *158*.

H.1.3.e) The Number of Permittee staff receiving Riverside County NPDES training for activities related to DAMP implementation

The training sessions accounted for in these tables are described in Section G.8.2 of this report, and consist of the regional training provided by the '**Only Rain down the Drain**" program. Additional training may have been attended by individual Permittee staff; such training is documented in the corresponding individual annual report.

Table H-7: Training Attendance - Municipal Facilities Operation and Maintenance

Municipal	11/4/08	11/6/08	11/18/08	5/5/09	5/26/09	Total

H.1.3.f) Provide summary report of on-going program modifications

In fiscal year 2007-2008 the Permittees initiated or completed the following program improvements to the **Only Rain down the Storm Drain** Program:

- Updated the *Outdoor Cleaning Activities* brochure to ensure that it adequately addresses issues related to mobile operators, power washers and carpet cleaners. Additional resource information and phone numbers, as well as legislative mandates will be added. (In Process)
- Update the Santa Margarita Watershed map from its basic layout to one that clearly characterizes the significant tributaries.
- Completed the following new brochures:
  - *Tips for Maintaining a Septic Tank System*
  - *Tips for Horse Care*
  - *Landscape Management*
  - *Pet Waste*
  - *Outdoor Cleaning Activities*
- Continued enhancement to the following brochure :
  - *Automotive Maintenance and Car Care*

H.1.4. WASTE COLLECTION AND WATERSHED CLEAN-UP EVENTS

SUMMARY OF EFFECTIVENESS ANALYSIS:

The Permittees continue to support and collect data on waste collection and watershed clean up events. The Watershed Clean Up event also continues to generate interest and press coverage. The Permittees have determined this to be an effective component of their program.

H.1.4.a) Annual summary report of materials removed/collected

During FY 2007-2008, ten (10) HHW collection events were held within the SMR. Also there were forty-four (44) ABOP events staged at the County's Transportation Maintenance Yard in Murrieta which serviced a total of 1,927 participants. A total of more than 200,000 pounds of waste were collected through these events. A detailed breakdown of the HHW and ABOP waste streams is included in Appendix C.

Table H-12: Waste Collection Event Summary

	FY04-05		FY05-06		FY06-07		FY07-08		FY08-09	
	Participants	Lbs collected	Participants	Lbs collected	Participants	Lbs collected	Participants	Lbs collected	Participants	Lbs collected

Totals	2,728	141,000	3,550	259,600	3,568	254,085	3,350	305,843	3,299	208,906

H.1.4.b) Santa Margarita Watershed Clean Up Event

The Santa Margarita Watershed Clean Up event was held on November 1st, 2008. Over *120 people volunteered* for this event, and about *12 tons of waste was removed*. Since 1995, volunteers have collected more than 1,300 tons of trash during the annual cleanups. To encourage the public to keep their communities clean, the District supports these watershed clean up events by providing manpower, equipment and storm-water related promotional items and brochures.

H.1.4.c) Annual summary report of public outreach conducted as part of collection/removal events

Outreach materials are provided to participants and event organizers at Watershed Clean Up events.The volunteers are made up of those who need to complete community service hours; part of their rehabilitation; Boy and Girl Scout Project; environmental organizations, families, and environmental enthusiasts; etc.

H.2. LONG TERM MEASURES OF EFFECTIVENESS

The objective of the Watershed SWMP is to maintain and/or improve the quality of Receiving Waters within the SMR by mitigating impacts of Constituents of Concern in urban runoff using regional programs, while considering economic, social and environmental resource limitations. The Permittees' long-term effectiveness analysis was incorporated in the ROWD submitted to the Regional Board on January 15th, 2009. As described therein, the Permittees programs have been shown to be effective overall as indicated by the lack of correlation between the monitoring data and the significant growth that has occurred in the region.

H.3. OTHER MEASURES OF EFFECTIVENESS

The Permittees continually review their programs for effectiveness. These reviews can use the measurable metrics and goals required by the Permit, however, the most effective program enhancements tend to occur as the result of diligent program implementation by program coordinators. The following items are additional activities that the Permittees have undertaken during the reporting period that further demonstrate the Permittee's commitment to the iterative management of their programs and ensuring their programs remain effective and efficient.

H.3.1. SUBMITTAL OF REPORT OF WASTE DISCHARGE

In January 2009 the Permittees submitted the Report of Waste Discharge (ROWD). As a demonstration of the Permittees' effectiveness in Program Management, this

document incorporated a comprehensive analysis of the Permittees programs and recommended a suite of programmatic revisions to the Regional and Individual Programs to further enhance their programs and ensure they continue to meet the MEP standard in the next permit term. The ROWD is described in section G.2.4.

H.3.2. WEB SITE UPGRADE

The Permittees continue to improve the efficiency and efficacy of their MS4 compliance programs. An integral facet of the NPDES program and education of the public has been the District's internet web site. The District's previous NPDES website contained only a single page listing various program compliance documents and a link to its Public Education web site.

An internal web site review was completed in January 2009, and a new NPDES web site became publically available in early June 2009. Whereas the old web site was not particularly user friendly and was burdensome to navigate and locate specific documents, these problems have been addressed via the new site. The redesigned web site can be accessed at http://www.rcflood.org/NPDES. Many improvements were made, including the following:

- The front page describes each of the three major watersheds in which the District is involved;
- Each of the watersheds has its own individual web page;
- Other web pages were added for Public Notices, Developers, Training, Public Education, Monitoring, Storm-water Facts, Links and Contact information;
- Allows online training registration for classes sponsored by the District;
- Provides watershed identification and map for specific locations;
- Enables easy access to a Public Education Calendar of Events; and
- Watershed compliance documents can be readily located.

Future improvements are planned to improve the Public Education webpage. The District hopes to complete additional improvements during the next fiscal year.

H.3.3. ONLINE POSTING OF ANNUAL REPORTS

In an effort to promote public awareness, the Permittees have posted the previous year's annual reports on-line for public access.

H.3.4. TRAINING PROGRAM UPDATES

In an effort to ensure that the NPDES Training programs for Municipal Employees are effective and providing appropriate training to all Municipal Staff that are involved in the Permittees' NPDES activities, several updates to the training program were made or initiated within the reporting period.

- Creation of a specialized training for Compliance Assistance Program (CAP) storm-water inspectors.
- Updated all training modules to include discussion on the water quality impacts of pesticides, and provided information on how each training group can use or encourage IPM in their duties.
- Updated all training modules to enhance focus on addressing the pollutants of concern.
- Acquisition of Form Scanning and Recognition Software to track and assess the effectiveness of the training sessions.

H.3.5. DATA TRACKING

In an effort to improve their ability to track and efficiently catalogue information from all aspects of their compliance activities, the District has acquired a software package that allows creation of scan-able forms that can be filled out by hand. Further this software will scan the filled-out forms and recognize the hand-filled information and transfer the results into a database for use and/or analysis.

This software can have applicability in many aspects of the Permittees compliance activities and is currently planned for use in the Public Education and Municipal Training programs.

In a time where permit requirements are exceeding fiscal constraints upon Permittees, one of the principal benefits of this software package will be to free up staff time to focus on responding to data collected, and on managing and enhancing other program areas.

I. RECOMMENDED ACTIVITIES TO BE CONDUCTED JOINTLY BY THE PERMITTEES TO ADDRESS THE IDENTIFIED WATER QUALITY PROBLEMS

Based on the water quality problems identified in Appendix G of this report and the effectiveness evaluations described in Section H herein, the Permittees recommend the following activities be implemented. The Permittees make adjustments to their compliance programs on an on-going basis as water quality problems are identified or as implementation issues warrant. As such many of the activities described or referenced herein have already been initiated and therefore are also described in Section G of this report.

Activities that have been recommended in past annual reports and have now been completed are described in Section G of this report.

I.1. IMPLEMENT RECOMMENDATIONS IN THE REPORT OF WASTE DISCHARGE

On January 15th 2009, the Permittees submitted their Report of Waste Discharge (ROWD) to the Regional Board. *Section G.2.4 of this report describes the ROWD* including highlights of the recommended activities that the Permittees' proposed to incorporate into their compliance programs as part of their anticipated 4th Term MS4 Permit.

Although still operating under their 3rd Term MS4 Permit, the Permittees have continued to move their programs forward by proactively implementing several of the activities recommended in the ROWD. These activities are summarized below.

- Revisions to the Dry Weather Monitoring Program
- Development of an LID Manual and Design Guidance
- Construction of an LID BMP testing facility.
- Addressing Pesticide Toxicity through implementing year 1 of the Plan of Action identified in the TRE.

The Permittees plan to continue their proactive implementation of these now existing activities within the next reporting period.

I.2. POLLUTANT TARGETED ACTIVITIES

The Permittees concluded in Section 5.3.1 of the 2009 ROWD that "…no significant program modifications are necessary to continue to protect and improve the quality of the Receiving Waters". Nevertheless, this section describes activities that the Permittees plan to implement as part of their ongoing and iterative management of their MS4 discharges to ensure that pollutant discharges are continually reduced to the MEP. Listed below are the

DRAFT

pollutant-targeted activities the Permittees are proposing to address the Water Quality Problems described in Appendix G. These Pollutant-Targeted activities are in addition to the general activities described in Section 6 of the DAMP that address a broad range of pollutants typically expected to be generated within Urban areas.

I.2.1. PESTICIDES

I.2.1.a) Implement Plan of Action Identified in the Toxicity Reduction Evaluation (TRE)

The Permittees completed and submitted their Toxicity Reduction Evaluation (TRE) as part of their Report of Waste Discharge (ROWD) in January 2009. This TRE identified a plan of action that the Permitees proposed to implement beginning with their 4th term permit. Although the 4th term Permit is not yet adopted, the Permittees have proactively begun implementing many of the 'Year 1' recommendations included therein; these activities are reported upon in Section G.2.5 of this report.

I.2.1.b) Participate in CASQA Pesticides Subcommittee

The Permittees recommend continuing participation in the Pesticides Subcommittee of CASQA (see section B.6). This committee provides a forum for the collection and dissemination of information regarding pesticide impacts, a uniform voice for commenting on state and federal regulations and legislation, a forum to identify and resolve monitoring issues, and a forum to comprehensively identify and/or develop methods of reducing the impact pesticides have on our environment.

I.2.1.c) Continue Existing Outreach and Education

The Permittees will continue dissemination of their existing public education and outreach materials that address Pesticides. These are described in Section F.2.1 of this report.

I.2.1.d) Pursue distribution of educational materials within Home Depot Stores regarding pesticide alternatives.

With recent support from Home Depot corporate offices for the *"Our Water Our World Program"*, the Permittees are looking into installing shelf displays that will inform customers about alternatives to the use of chemical pesticides.

I.2.1.e) Support proposed USEPA Project: "Implementing IPM Programs to Control Ants in Urban Communities"

The District with the support of the Permittees has committed to supporting this program proposed by USEPA to limit the use of pesticides to control ant populations. This project is scheduled for 2010 through 2012.

I.2.2. NUTRIENTS

I.2.2.a) Continue Education Programs

The Permittees will continue dissemination of their existing educational materials that address Nutrients. These are described in Section F.2.2 of this report, and *include the recently completed PET WASTE, TIPS FOR HORSE CARE and TIPS FOR MAINTAINING A SEPTIC TANK SYSTEM brochures.*

I.2.3. PATHOGENS

I.2.3.a) Continue Education Programs

The Permittees will continue dissemination of their existing educational materials that address Pathogens. These are described in Section F.2.3 and include the recently completed brochures on managing septic systems, pet waste, and equestrian management.

I.2.4. METALS

The primary urban source of copper and lead in the regions waters are from brake pad wear and lost automotive wheel weights, respectively. The Permittees are currently, and propose to continue coordinating through CASQA to reduce metallic pollutant loads in regional waters by promoting statewide and national change to these national problems that are caused by societal use of currently accepted technologies. To date, several automotive manufacturers have committed to evaluating reformulated brake pads and converting from lead to steel tire weights. Additional work needs to be done, however, as there are still several third-party manufacturers who are not participating in the process and who are distributing problematic components to automotive shops and automotive enthusiasts throughout the country.

I.2.4.a) Brake Pad Partnership

The Permittees recommend continued participation through CASQA in Sustainable Conservation's efforts to bring together government regulators, brake pad manufacturers; storm-water management agencies and environmentalists to research the impacts of brake wear debris on water quality. Through this effort, the brake pad manufacturers have agreed to bring new products to market within five years if brake pad wear is determined to have significant potential to impair water quality.

I.3. CONTINUE EXISTING REGIONAL PROGRAMS

As indicated in the introduction to Section H herein, the Permittees programs have been shown to be effective. As such, and notwithstanding the recommended activities described in Sections I.1 and I.2 above, the Permittees recommend continuing the overall breadth and scope of their other ongoing regional activities described in the DAMP and this Annual Report.

It should be noted that although the Permittees recommend continuing their existing programs, specific activities may be revised or ended depending upon the ongoing and iterative nature of these programs.

J. PROPOSED REVISIONS TO THE WATERSHED SWMP

The Permittees are continually revising their compliance programs to adjust to programmatic and water quality issues as they arise. Section I of this report identifies the activities that the Permittees propose to implement to ensure that any such issues are addressed. Those revisions that warrant amendment of the Watershed SWMP are identified below.

J.1. PROVISION K.2.D – CONSTITUENTS OF CONCERN

The Constituents of Concern, including Table K-4 in the Watershed SWMP (DAMP Appendix S) will be updated to reflect the current constituents of concern as described in Appendix G to this annual report. (Table G-38)

J.2. ADDITIONAL REVISIONS PENDING ADOPTION OF THE 4TH TERM MS4 PERMIT

Based upon a comprehensive review and analysis of their existing programs, the Permittees recommended several programmatic enhancements in their 2009 ROWD, that they recommended to be incorporated within the upcoming 4th Term MS4 Permit. To the extent that the 4th Term Permit incorporates those recommendations, the Permittee's compliance plans, including as appropriate the Watershed SWMP, will be updated accordingly.

Although still operating under their 3rd term MS4 Permit, as noted in section I.1, the Permittees have proactively implemented several of the enhancements recommended in the ROWD. The Permittees have determined that these proactively implemented programs do not necessitate a revision to the Watershed SWMP at this time.

J.3. OTHER REVISIONS

Sections I.2 and I.3 of this annual report identify other recommended activities to address water quality within the SMR that will be continued or initiated within the next reporting period. These recommended activities, while demonstrating the Permittee's iterative management of their programs, are within the existing framework of, and do not necessitate any revisions to the Watershed SWMP. As such, no further revisions to the Watershed SWMP are proposed at this time.

MEETING AGENDAS AND NOTES

MSC MEETINGS

RIVERSIDE COUNTY STORMWATER MANAGEMENT PROGRAM
MANAGEMENT STEERING COMMITTEE
SANTA ANA & SANTA MARGARITA REGIONS

MEETING AGENDA

(Lunch Served)
11:30 a.m.* – 12:30 p.m. October 16, 2008
Room C/D
Riverside County Administrative Office, Fourth Floor
4080 Lemon Street, Riverside, CA 92501

* meeting to begin at 11:30 a.m. or immediately following the WRCOG TAC meeting should it end later than 11:30

1. Welcome and Self Introduction – Jason Uhley, RCFC&WCD

2. Review October 16, 2008 Agenda and Approval of April 17, 2008 Meeting Minutes – Jason Uhley, RCFC&WCD

3. Santa Ana/Santa Margarita Program Status - Jason Uhley, RCFC&WCD
   - Legislative Update
   - Permit Renewal Update
     - Summary of Discussion with RWQCB staff

4. TMDL Development - Jason Uhley, RCFC&WCD
   - Lake Elsinore and Canyon Lake Nutrient TMDL
   - Middle Santa Ana River Watershed Bacteria Indicator TMDL
   - Canyon Lake Bacteria Indicator TMDL

5. New Agenda Items/Schedule Next MSC Meetings - Jason Uhley, RCFC&WCD
   - Schedule MSC Meetings for the upcoming year*

*Tentative meeting dates pending WRCOG 2008 schedule

P8/121480

RIVERSIDE COUNTY STORMWATER MANAGEMENT PROGRAM
MANAGEMENT STEERING COMMITTEE
SANTA ANA/SANTA MARGARITA REGIONS

MEETING MINUTES
for
October 16, 2008

Attendees:

Jason Uhley	RCFC&WCD
Albert Martinez	RCFC&WCD
Charlene Warren	RCFC&WCD
Mark Wills	RCFC&WCD
Alex Gann	County of Riverside
Mike Shetler	County of Riverside
Joe Aklufi	City of Beaumont
Alan Kapanicas	City of Beaumont
Ron Espalin	City of Calimesa
Lori Moss	City of Canyon Lake
Rudy Fandel	City of Corona
Kent Wegelin	City of Moreno Valley
George Wentz	City of Menifee
Bill Woolsey	City of Murrieta
Jeff Allred	City of Norco
Tom Boyd	City of Riverside
Barry McClellan	City of San Jacinto
Aldo Licitra	City of Temecula
Terry Fitzwater	City of Wildomar

1. Welcome and Self Introductions – Jason Uhley, RCFC&WCD

Jason introduced Mark Wills as the new Chief of the District's Regulatory Division and Albert Martinez as the Santa Ana NPDES MS4 Permit Coordinator. He then initiated self introductions of attendees and welcomed the new cities of Menifee and Wildomar.

2. Review October 16, 2008 Agenda and Approval of April 17, 2008 Meeting Minutes – Jason Uhley, RCFC&WCD

Item 2A (Announcements) was added to the agenda. The group reviewed the minutes of April 17, 2008. There were no changes to the minutes.

a. Announcements – Jason reminded the group that the MSC meeting is required by the Santa Ana Permit and City Managers or designated representatives are required to attend 3 out of 4 of the meetings per fiscal year. He added that the new MS4 Permit draft is expected to be issued sometime in December and negotiation of the Santa Margarita Permit is expected to begin in January

2009. For new members, a Santa Ana region program executive summary was provided to outline the program elements.

b. The State is going through budget issues and has raised fees for NPDES MS4 permits. The Construction Permit was incorporated into the MS4 Permit therefore only one permit fee will be raised. Please see fee schedule provided at the meeting for city fees. The money obtained from the cities is intended to pay for the State's cost to administer the NPDES MS4 Construction/Permit as well as to offset the cost for other programs such as monitoring and non-point programs. Comments on the fees were submitted to the State through CASQA.

Handouts Provided

- Agenda for October 16, 2008
- Minutes for April 17, 2008
- MS4 Permit Renewal: Tri-County Meeting October 2, 2008 Draft Agenda
- Santa Ana Region NPDES Program Executive Summary
- Water Quality Management Plan (WQMP) for Urban Runoff (For New Development/Significant Redevelopment)
- As Adopted by Resolution 2008-0073 California Code of Regulations, Title 23. Division 3. Chapter 9. Waste Discharge Reports and Requirements Article 1. Fees

3. Santa Ana/Santa Margarita Program Status- Jason Uhley, RCFC&WCD

Legislative Update – There are no new legislations adopted.

Permit Renewal Update

- **Summary of Discussion with RWQCB staff** - Jason focused on the Santa Ana Permit noting that EPA has gotten involved and wants consistency in the permits and would like to have 1 permit for all 3 counties (Orange, San Bernardino and Riverside). The Santa Ana Regional Board as well as Permittees has issues with this. The Regional Board is supportive of the 3 counties and their efforts in keeping the permits separate. The 3 counties regulated by the Regional Board are talking among their permit managers to discuss the permit renewal. Key topics include TMDL incorporation, new development and LID, program effectiveness, hydromodification and downstream erosion, inspections of BMPs, municipal measures to be incorporated to collect data, monitoring program and measureable goals. Also included was language on smart growth. Please see MS4 Permit Renewal Agenda handout for items of discussion.

4. ***TMDL Development – Jason Uhley, RCFC&WCD***

Lake Elsinore and Canyon Lake TMDL - Renegotiation of the Cooperative Agreement between cities and other agencies is expected to begin in January. Permittees will have to start looking at who will pay for implementation of in-lake control measures, axial flow pumps, aeration systems etc. that are reducing or controlling the pollutant loads to the lake. Each of the cities has an obligation to reduce nutrients to the lake. One way is to be very aggressive at implementing BMPs in the municipalities for both existing and new development and the other is to try and sequester the nutrients in the lake. Research has shown that it is most cost effective to try and sequester the nutrients. Discussion on regulatory compliance, water quality objectives, operation of the lakes, LESJWA, pursuing grants, load reductions, municipal performance measures, measureable goals and associated costs were further discussed among the group. Permittees will need to document how they are reducing loads. A group of experts will be brought on board to assist Permittees and it is important to attend future meetings.

Jason further talked about draft language that is being proposed by the Orange County MS4 Permit that will likely end up in the Santa Ana MS4 Permit for the new development section. Kent Wegelin will be taking the lead on this effort. Kent noted that Permittees will want to take a look at item 2(i) of the draft that addresses streets, roads, highways and freeways of 5,000 square feet of paved surface. Jason added that 3(a) is also an issue of concern. Comments on the draft language is due by Friday, October 24, 2008. Please see handout for more information.

Middle Santa Ana River TMDL - The first phase has been completed on this TMDL which was basically determining what storm drain systems were sources of human bacteria. Box Springs was determined to be one of those storm drains in Riverside County in which the source of the problem was addressed. The other 2 systems were in San Bernardino County. Cities will need to take quick action to control waste. Brown and Caldwell will be conducting testing for Permittees. Further discussion ensued on BMPs, water quality, Regional Board expectations, public education and Permittee plans of identifying and controlling human sources of bacteria in an effort to reduce costs endured by the cities.

Canyon Lake Bacteria Indicator TMDL - The monitoring program for the lake is expected to begin in 2008 in hopes to have it removed from the 303(d) list.

Other items discussed were, public education outreach, public education materials that are free to the cities, ACA13 which was cannibalized to support other measures and Prop. 218 stormwater fees. Please contact Florence Mowrer (FBMowrer@rcflood.org) of the District for public education and promotional materials.

5. ***New Agenda Items/Schedule Next Meeting***
   - Schedule MSC Meetings for the upcoming year*

NEXT MEETING IS SET FOR
January 15, 2009
AT
RIVESIDE COUNTY EXECUTIVE OFFICE, FOURTH FLOOR
4080 Lemon Street, Riverside, CA 92501

Visit the StormWater/Clean Water Protection Program website at:
http://www.rcflood.org/depts/flood/YouCanHelp.asp.
The Site contains a variety of useful stormwater program information including links to other stormwater management programs and related web sites.

Aldo Licitra	City of Temecula
Dan York	City of Temecula

1. ***Welcome and Self Introductions – Jason Uhley, RCFC&WCD***

Jason Uhley welcomed everyone to the meeting and initiated self introductions of attendees.

2. ***Review January 15, 2009 Agenda and Approval of October 16, 2008 Meeting Minutes – Jason Uhley, RCFC&WCD***

Mike Shetler requested that the recent AB885 workshop on septic tank systems be added to the agenda. Jason changed the order of agenda items 4 (TMDL Development) and 5 (Potential Proposition 84 Grant Opportunities).

Jason noted that cities are required to attend 3 of the 4 MSC meetings per fiscal year. Jason noted that the January 15, 2009 meeting was the 2nd meeting of the fiscal year. There were no changes to the meeting minutes. Minutes were approved.

Handouts Provided

- Agenda for January 15, 2009
- Minutes for October 16, 2008
- 2009-2010 NPDES Cooperative Agreement Cost Sharing Estimates

3. Santa Ana/Santa Margarita Program Status - Jason Uhley, RCFC&WCD

- **Permit Renewal Presentation** - Jason informed the group that the Ventura County Permit and the draft Orange County Permit were out for public review. He added that some of the language in the Orange County Permit may be incorporated into the Riverside County Permit. To bring the group up to speed on the Permit he has asked the District's Consultant, Bob Collacott, to give the group a presentation on the Orange County Permit. The presentation touched on:

    - Permit background information
    - Local Implementation Plans (LIP)
    - Receiving Water Limitations
    - Construction Program Impacts
    - Industrial/Commercial Inspection Impacts
    - Proposed Residential Program
    - Significant changes to the New Development programs, including new requirements for Low Impact Development and Hydromodification
    - Alternative / In Lieu Programs for New Development
    - Permittee Facilities/Activities Impacts
    - Additional Training Requirements
    - Watershed Action Plans
    - TMDL Compliance and Cost Sharing

  Per the request of Jeff Allred, a copy of the PowerPoint presentation was sent via email to the group of attendees following the meeting. Please refer to the PowerPoint presentation for more detailed information.

  Jason informed the group that the District, on behalf of Permittees is preparing a comment letter on the draft Orange County Permit. The comment letter will be provided to the TAC representatives for review and comments, then to City Managers. The group further engaged in a lengthy conversation on the following:

    - Benefit Assessments/Economic Concerns
    - Need for Riverside County representatives to be appointed to Regional Board
    - Low Impact Development (LID)
    - Inspection Program Requirements
    - Monitoring Program
    - Post Construction BMP Inspections (general support for self certification program)
    - GIS Tracking Systems
    - Glossary of terms and definitions for Orange County Permit

  Jason also noted that the Santa Margarita Report of Waste Discharge (ROWD) was being submitted to the San Diego Regional Board January 15, 2009 by the District. Jason thanked the cities of Murrieta, Temecula, Wildomar, and Menifee, Riverside County and District staff for their participation with the ROWD. Jason noted that

permit renewal discussions with the San Diego Regional Board would also be starting shortly.

- **CAP Program Summary**
  Mike reported that Riverside County has eliminated the Compliance Assistance Program (CAP) for the unincorporated areas of Riverside County due to expanded inspection requirements in the Santa Margarita Region NPDES MS4 Permit. The inspections in the unincorporated County will now be addressed through a business registration and licensing program which also includes a stormwater element. The new program is administered by the County's Building and Safety Department. Because the new permits may expand the scope of the business inspection programs beyond the capability of the Environmental Health CAP, he added that the option of contracting with the County's Building and Safety Department to conduct inspections can be made available to the cities should they have the need. However, it is likely that the new inspection program will not be as cost effective as the CAP because the CAP was able to leverage Environmental Health's existing inspection programs.

  Jason asked for confirmation from the group that the comment letter he will be putting together will state that Permittees wish to defend the CAP (due to its cost effectiveness and effectiveness as addressing pollutants of concern). Jason also asked if the City Managers supported comments recommending that post construction BMP inspection programs support self certification approaches. It was believed that if such inspections are required, that self-certifications were an economic approach to compliance that was appropriate for the current economic climate. There were no objections from the group.

- **BMP Consistency Summary**
  Jason stated that there were discrepancies between the development BMP approval processes for the various cities. He noted that the TAC had asked him to query the MSC about their interest in establishing a standardized policy for BMP acceptance. Jason noted:

  - Permit is vague regarding what BMPs are acceptable
  - Many city plan check staff do not have information readily available to challenge developer assumptions regarding BMP effectiveness
  - Regional Board identified in audit the inappropriate use of BMPs in some cities
  - Lack of consistency in BMP approval leads to developers questioning why some cities accept certain BMPs and others don't
  - Data is available on BMP effectiveness, however, it needs to be collected, analyzed and codified in a single document that can be used by the cities

  Discussion ensued. The MSC supported the concept of a BMP Consistency Policy and requested that the TAC develop such a policy and bring it before the MSC for approval.

- **Budget Estimates for 2009-10**
  Jason reviewed the 2009-2010 NPDES Cooperative Agreement Cost Sharing Estimates for both the Santa Ana and Santa Margarita NPDES Permit regions (handout).

He noted that for the cities in the Santa Margarita NPDES MS4 Permit area, the costs for Santa Margarita Lagoon TMDL are up in air at this point. A meeting is scheduled for February 18th with the San Diego Regional Board to further discuss costs associated with the Lagoon TMDL.

Lori Moss thanked Jason for his efforts.

4. ***Potential Proposition 84 Grant Opportunities***

There is a stormwater grant chapter defined in Prop 84 which is explicitly for municipal governments and can be used for MS4 compliance activities. The total available funds are approximately $100,000,000. 80% of the chapter's funds are targeted at public works projects that implement LID, the other 20% are targeted at projects that address TMDL compliance. Jason advised the cities to think of projects such as road projects and other upcoming public works projects that could possibly qualify for the grant funds. In order to qualify for the funds, the project must demonstrate that it can be completed by 2013. More information is available at:

http://www.swrcb.ca.gov/water_issues/programs/grants_loans/prop84/index.shtml

Jason also noted that pending federal legislation may provide additional grants and/or low interest loans for public works projects throught the Clean Water State Revolving Funds. More information is available at:

http://www.swrcb.ca.gov/water_issues/programs/grants_loans/srf/index.shtml

5. ***TMDL Development – Jason Uhley, RCFC&WCD***

- **Lake Elsinore and Canyon Lake TMDL** – The County of Riverside, Riverside County Flood Control, and cities of Hemet, Moreno Valley, and Perris received 13267 letters from the Regional Board notifying them that there are potential agricultural operations that are taking place on city lands and, as such, the cities are responsible for complying with the agricultural operator requirements in the TMDL. The letters indicated that the cities could independently address TMDL requirements or participate in, and fund, an existing agricultural cooperative that is addressing the TMDL (Western Riverside County of Agricultural Coalition). The Cities must declare their intent to participate with the Western Riverside County of Agricultural Coalition program by April 15th.

  The 13267 letters went out to several hundred land owners in the San Jacinto watershed. There is a process described in the letter to challenge improperly identified parcels. Jason recommended that the cities go through each of the parcels identified in the 13267 letter to make sure that there are actually agricultural activities occurring. Improperly identified parcels should be challenged. Jason specifically noted that in some cases private parcels with city easements were improperly identified as being city responsibility. Several MSC members noted concern regarding cities being identified in both MS4 and agricultural requirements for the TMDL. Jason explained how the TMDL and TMDL Task Force was developed and structured. Jason noted that the 13267 letters were consistent with the TMDL and TMDL Task Force. Jason also noted that if agricultural activities were occurring on city lands, that participating in the agricultural effort was the most cost effective solution. Jason also recommended that the cities attempt to recover costs from the actual agricultural operators.

Jason also noted that the existing TMDL Task Force Agreement expires in 2010 and will need to be re-negotiated later this year.

- **AB885 Workshop on Septic Tank Systems (subsequently added to agenda)**
  The Lake Elsinore and Canyon Lake TMDL also requires cities to develop a Sanitary Sewer Management Plan. Permittees have negotiated with the Regional Board to have the plan stayed pending the completion of AB885 legislation which will ultimately promulgate new statewide regulations for septic system management. A workshop regarding the draft regulations was held January 14, 2009. County staff attended the workshop and Mike Shetler provided the group with a summary of the workshop. He noted that AB855 was legislated in 2000 and the State Board was supposed to have promulgated regulations by 2004. The proposed regulations are highly contentious due to requirements for septic system inspections, mandatory clean out frequencies and requirements for failed septic system replacement with advanced treatment systems. There will be 12 workshops held on the matter. A Permit adoption hearing is set for February 9, 2009 in Sacramento on regulations (this adoption hearing has since been delayed).

- **Middle Santa Ana River TMDL**
  There was no news reported on the Middle Santa Ana River TMDL.

- **Canyon Lake Bacteria Indicator TMDL**
  LESJWA has agreed to use some of their left over Prop 13 grant money to implement a Bacteria Sampling Program on Canyon Lake. LESJWA expects that the data will show that Canyon Lake is not impaired for bacteria, thus providing data to support having it delisted from the 303(d) list.

6. New Agenda Items/Schedule Next Meeting

- Schedule MSC Meetings for the upcoming year* - Future meeting dates are scheduled for March 19th and April 16th (tentative) or June 18th.

NEXT MEETING IS SET FOR
March 19, 2009
AT
RIVESIDE COUNTY EXECUTIVE OFFICE, FIFTH FLOOR, ROOM C
4080 Lemon Street, Riverside, CA 92501

RIVERSIDE COUNTY STORMWATER MANAGEMENT PROGRAM
MANAGEMENT STEERING COMMITTEE
SANTA ANA & SANTA MARGARITA REGIONS

MEETING AGENDA

(Lunch Served)
11:30 a.m.* – 12:30 p.m. April 16, 2009
Riverside County Administrative Office, Fifth Floor Room C
4080 Lemon Street, Riverside, CA 92501

* meeting to begin at 11:30 a.m. or immediately following the WRCOG TAC meeting should it end later than 11:30

1. Welcome and Self Introduction – Jason Uhley, RCFC&WCD

2. Review April 16, 2009 Agenda and Approval of January 15, 2009 Meeting Minutes – Jason Uhley, RCFC&WCD

3. Santa Ana/Santa Margarita Program Status - Jason Uhley, RCFC&WCD
   - Permit Renewal Status
     1. South Orange County MS4 Permit
     2. North Orange County MS4 Permit

4. TMDL Development - Jason Uhley, RCFC&WCD
   - Lake Elsinore and Canyon Lake Nutrient TMDL
   - Middle Santa Ana River Watershed Bacteria Indicator TMDL
   - Santa Ana Region Draft 303(d) List

5. Presentation on Draft South Orange County MS4 Permit (San Diego Board) – URS

6. New Agenda Items/Schedule Next MSC Meetings - Jason Uhley, RCFC&WCD
   - Schedule next MSC Meeting*

*Tentative meeting dates pending WRCOG 2009 schedule

P8/124606

RIVERSIDE COUNTY STORMWATER MANAGEMENT PROGRAM
MANAGEMENT STEERING COMMITTEE
SANTA ANA/SANTA MARGARITA REGIONS

MEETING MINUTES
for
April 16, 2009

Attendees:

Jason Uhley	RCFC&WCD
Albert Martinez	RCFC&WCD
Claudio Padres	RCFC&WCD
Charlene Warren	RCFC&WCD
Mark Wills	RCFC&WCD
Bob Collacott	URS Corporation
Joe Aklufi	City of Beaumont
Randy Anstine	City of Calimesa
Bob Bohan	City of Canyon Lake
Rudy Fandel	City of Corona
Michele Hindersinn	City of Corona
Lyndy Lewis	City of Corona
Yolanda Macalalad	City of Corona
Len Wood	City of Hemet
Brad Kutzner	City of Menifee
Kent Wegelin	City of Moreno Valley
Bill Woolsey	City of Murrieta
Jeff Allred	City of Norco
Michael Morales	City of Perris
Tom Boyd	City of Riverside
Barry McClellan	City of San Jacinto
Aldo Licitra	City of Temecula
Ron Grider	City of Wildomar

1. ***Welcome and Self Introductions – Jason Uhley, RCFC&WCD***

Jason Uhley welcomed everyone to the meeting and initiated self introductions of attendees.

2. ***Review April 16, 2009 Agenda and Approval of January 15, 2009 Meeting Minutes – Jason Uhley, RCFC&WCD***

Item 4A (BMP Policy Status Update) was added to the agenda. There were no changes to the minutes. Minutes were approved.

The April 16, 2009 meeting was the 3rd of the 4 required meetings for the fiscal year. Those cities who have attended at least three are not required to attend the May 21, 2009 meeting. However, should the Santa Ana MS4 Permit be released by that time, it will be important for city representatives to attend. Attendees were advised to pay close attention to the May 21st agenda for this item.
NOTE: As of May 7, 2009 the Santa Ana MS4 Permit had not been released.

Handouts Provided

- Agenda for April 16, 2009
- Minutes for January 15, 2009

3. ***Santa Ana/Santa Margarita Program Status - Jason Uhley, RCFC&WCD***

- **Permit Renewal Status**
  1. **South Orange County MS4 Permit**
     This Permit is issued by the San Diego Regional Board and may end up being used in Riverside County as a model for the Santa Margarita Region MS4 Permit. The Permit drafted by San Diego Board staff is, in many ways, more prescriptive and onerous than the Ventura County MS4 Permit that has garnered statewide attention. It is significantly more prescriptive than the draft MS4 Permit issued for northern Orange County by the Santa Ana Board. Please see agenda item 5 for more information on the South Orange County MS4 Permit.

  2. **North Orange County MS4 Permit**
     This Permit is issued by the Santa Ana Regional Board to the Orange County Permittee group. This Permit is very likely to be a model for the Riverside County Santa Ana Watershed MS4 Permit. District staff has been following the north Orange County Permit very closely and has provided policy related comments to the Santa Ana Regional Board. Jason noted that Orange County has generally done a good job of working with Board staff and environmental special interests to negotiate a reasonable Permit, particularly in regards to the administration of new development provisions. However, several provisions of the Permit are very vague and are subject to interpretation. In as much as portions of the Orange County Permit are incorporated into our MS4 Permit, Jason intends to focus on clarifying the intent of Permit programs. Updates to follow.

4. ***TMDL Development – Jason Uhley, RCFC&WCD***

- **Lake Elsinore and Canyon Lake Nutrient TMDL** – The Lake Elsinore/Canyon Lake TMDL Task Force is currently studying treatment options for Canyon Lake. Jason recommended that City Managers remain abreast of the work of the Task Force. The Task Force is in the process of developing local and regional BMP programs to mitigate the current use impairments at the lakes. The cities will be expected to participate in these programs by Board staff. Though Permittees will be given options regarding how to comply with the TMDL, it is likely that the in-lake treatment systems will be more cost effective for most cities. Cities opting out of regional treatment systems will need to be developing alternative compliance programs. The Task Force is also updating a computer model of the entire watershed based on monitoring over the last five years. The output of the model will be used to reallocate liability and responsibility for each of the cities based on how much load the cities are estimated to be contributing to the lake. Because there are significant ramifications to the assumptions contained in the model regarding present and future land use and other factors, it is important for city representatives to play close attention to this item.

- **Middle Santa Ana River Watershed Bacteria Indicator TMDL**
  This TMDL is addressing bacteria in the Santa Ana River. Initial TMDL efforts were focused on identifying tributaries to the River that appeared to be significant sources of human fecal contamination. Initial data indicated that Box Springs Channel was a significant source of human-sourced bacteria input. Due to a fortuitous sewer relocation project, a sewer cross-connection to Box Springs Channel was detected by the City of Riverside. City and District staff worked to abate the cross-connection. Subsequent data collection indicates that the source of human fecal contamination has been controlled. The Task Force is now focusing on the next tier of potential sources of human contamination, which are Chino and Cucamonga Creeks in San Bernardino County. San Bernardino County will be required to develop a source assessment monitoring plan, and based on the results, deploy appropriate BMPs. San Bernardino County is in the process of developing the monitoring plan. It is expected that the plan, and subsequent BMP deployment, may cost several hundred thousand dollars. Next year, Riverside County cities will likely be required to initiate similar scale plans on other tributaries of the Santa Ana River. Mark Wills inquired as to how natural in-river sources will be addressed by the TMDL. Jason noted that the Stormwater Quality Standards Task Force, which is a separate, but related Task Force is re-evaluating current REC 1 Water Quality Standards for the Santa Ana River. They are expected to develop revised criteria to recognize and account for the impacts of natural sources of bacteria, exempt wet weather flows from REC 1 standards, and adjust the standards to reflect the current state of science. However, the proposed revisions will not relieve the cities of identifying and abating human sources of bacteria which are detected via DNA analyses of bacteria now required by the Regional Board.

- **Santa Ana Region Draft 303 (d) List**
  Section 303(d) of the federal Clean Water Act and 40 CFR §130.7 require states to develop a list of waterbodies that do not meet water quality standards and are not supporting designated beneficial uses. The 303(d) List identifies the pollutant or stressor causing impairment and establishes a schedule for developing a control plan to address the impairment. The Santa Ana Regional Board posted their draft of the 303(d) List about 2 months ago for the Santa Ana Region. The Permittees have worked closely with Board staff and many initial proposed listings have been eliminated due to additional data, corrections to the data, and other factors. The 303(d) List now only proposes the addition of a pH listing for Temescal, copper listing for Santa Ana River, Reach 3 (wet weather only) and a sediment toxicity listing for Lake Elsinore. Initially more than 20 new listings were proposed. The Regional Board does not intend to take any action on these listings/TMDLs until they are mandated by federal law, possibly 2020/2021.

4a - BMP Policy Committee

Previously the Santa Ana Technical Advisory Committee group asked the MSC for direction regarding the implementation of a BMP Uniformity Policy. The MSC supported such a policy. Kent Wegelin was designated to take the lead on the development of the policy for the SA/SM TAC. He reported that the BMP Policy Committee had a kick off meeting 2 weeks ago where there were a number of unanticipated questions, concerns and suggestions brought up. The Committee will begin evaluating these and will look at a number of published documents and

resources the group can use to develop the BMP Policy. The BMP Policy Committee will meet again in the next few weeks.

5. ***Presentation on Draft South Orange County MS4 Permit (San Diego Board) – URS***

Bob Collacott discussed the following key management issues for these cities with regard to the South Orange County MS4 Permit, which is likely to become a model for the Santa Margarita NPDES MS4 Permit (issued to Menifee, Wildomar, Temecula, Murrieta, the County of Riverside and RCFC&WCD):

- Asserts Permit not an "Unfunded State Mandate"
- Standards of compliance based on numeric standards
- Expansion of New Development requirements
- Requirements for retrofit
- Expansion of monitoring/special studies
- If applied in the Santa Margarita Region, would result in significant increase in compliance costs

6. ***New Agenda Items/Schedule Next Meeting***

- Schedule next MSC Meetings – The next meeting was set for May 21st.

NEXT MEETING IS SET FOR
May 21, 2009
AT
RIVESIDE COUNTY EXECUTIVE OFFICE, FIFTH FLOOR, ROOM C
4080 Lemon Street, Riverside, CA 92501

TAC MEETINGS

MEETING AGENDA

NPDES
SANTA ANA / SANTA MARGARITA
TECHNICAL ADVISORY COMMITTEE

10:00 a.m. – 12:00 p.m. Thursday, July 24, 2008
Riverside County Flood Control District
1995 Market Street
Riverside, CA 92501

I. Introductions

II. Agenda Changes

III. Review of Minutes: June 26, 2008

IV. Announcements
   A. Permit Renewal Update
   B. Notice of Violation

V. Public Education Program – Florence Mowrer

VI. TMDL Progress Report – Jason Uhley
   A. Middle Santa Ana River Bacteria Indicator TMDL Update
      - Next Meeting – Thursday, September 4, 2008 from 1:30 p.m. to 4:00 p.m.
   B. Lake Elsinore/Canyon Lake TMDL Update
      - Next Meeting – August 26, 2008 1:30 p.m. to 4:00 p.m.
   C. San Diego Lagoons TMDL/Investigation Order Update
      - Next Meeting – USBR, Wednesday, August 13, 2008, 1:30 p.m. to 3:30 p.m.

VII. Santa Ana/Santa Margarita Region Programs – Jason Uhley
   A. Stormwater Quality Standards Task Force Update
      - Next Meeting - Thursday, September 4, 2008 from 9:30 a.m. to 1:30 p.m.
      - General Construction Permit

VIII. Open Discussion
   A. Santa Ana RWQCB
   B. San Diego RWQCB
   C. U.S. EPA – Region IX
   D. Round Table

IX. New Agenda Items/Schedule Next Meeting – August 28, 2008

Michael Yasmer	City of Riverside
Mike Emberton	City of San Jacinto
Aldo Licitra	City of Temecula
Mike Kimberlain	Kristar
Bob Collacott	URS Corporation
Sean Motlagh	Tri Lake Consultants

I. *Introductions*

Albert Martinez welcomed everyone to the August 28, 2008 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees. Ann Iaali was introduced as the new Whitewater Permit Manager.

II. *Agenda Changes*

Agenda item IV B (Notice of Violation) was removed and replaced with LID Update. Item F (Pesticides) was added under agenda item IV.

III. *Review of Minutes: July 24, 2008*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- August 28, 2008 Agenda, July 24, 2008 Minutes, and Roster
- CASQA NewsFlash #s 2008-15 ~ 2008-17
- Public Education and Outreach Report – August 28, 2008
- Home Gardens Community Clean-Up Event (The Posting, Volume 2, Issue 8 by: TLMA)
- 2007-2008 Stormwater Education Program Presentations (MRCD)
- Education Program Report, August 2008 Santa Ana River Watershed
- Santa Ana Watershed Stormwater Classroom Presentation July 1st – September 30th 2008
- Stormwater Education Program Report , August 2008 Santa Margarita and Santa Ana River Watersheds
- Stormwater Education Program Presentation, August 2008
- EPA – Fact Sheet: Water Quality Improvement Initiative

IV. *Announcements*

A. *Permit Renewal Update* – Keith noted that there were no changes. A draft of the permit will be available to Permittees by the end of the year, prior to being released to the public.

B. *LID Update –* Jason announced that the District's LID project is moving forward. The District's parking compound will be reconstructed. Parallel effort is going on between CASQA and the Southern California Monitoring Coalition to develop a LID/BMP design manual. Drafts of the manual will be released in the upcoming weeks. Jason inquired as to those who would like to volunteer to sit on the committee that's reviewing the manual. Those interested were asked to contact Jason via email. Jason explained the construction process of the District's LID project, noting that the primary purpose of the project is to show developers and municipal staff the technology of what things will look like in the field so that municipal staff can get a sense of what they are approving and developers can see how it would fit into their sites. The following items were further discussed:

- Project fact sheets will be made available (before and after photos/comparisons)
- Re-Development/Retrofitting

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

- Flow and water quality data to be collected
- Preimposed effective pervious area
- Monitoring the maintenance effect of the BMPs
- District to develop a BMP design manual of its own

C. ***CASQA Conference September 23-24, 2008*** – District NPDES staff will be attending the CASQA Conference. Due to the conference there will be no TAC meeting in September.

D. ***RFQ Announcement*** – Albert announced that the District has received RFQ submittals from 14 firms and is currently working to obtain a pre-qualification list of consultants for regulatory compliance and ancillary professional services. Questions regarding the RFQ should be addressed to Albert.

E. ***Annual Report*** – Santa Ana Annual Report forms were sent out to Permittees on August 19, 2008. Training sign in sheets were sent August 21, 2008. James Grimm commented that he may not have received the information; Albert noted that he will be resending him the information via email. Berlinda McCadney requested that the sign-in sheets be sent to her electronically. Summaries of the Riverside County Environmental Health CAP/Food Facilities inspections performed for Permittees will be emailed soon.

F. ***Pesticides*** – Jason reported that there has been pyrethoid pesticides detected in the monitoring data within the Santa Margarita Region. Efforts are being made to find ways to get information out to the public on how to properly use pesticides. The District is working through CASQA who is working with the Department of Pesticide Regulation to get the labeling requirments changed. Jason further noted that UCR received a grant to look at Integrated Pest Management (IPM) methods for ant control in which he conducted a presentation to UCR staff who is coordinating with the District in an effort to develop IPM measures for pest control products. Permittees will be updated on the progress of development. Further discussion ensued among the group on pesticides and water quality.

V. ***Public Education Program – Florence Mowrer***

Flo gave an update on the efforts of the District's Public Education Program. The following items were discussed:

- Curb markers and facility signs available
- Pollution Prevention Week schedule
- TLMA has begun to insert the Only Rain Down the Storm Drain logo in their newsletter (see handout)
- Illuminated cross read billboard located just before the I-15/I-215 split in Murrieta
- Changes being made to the District's website; Permittee suggestions should be addressed to Ann Iaali of the District
- Flo working on Annual Report; orders will be on hold unless urgent
- Maps needed from Permittees for each watershed for the annual report

Please see handouts provided at meeting for more public education information.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

VI. TMDL Progress Report – Jason Uhley

A. Middle Santa Ana River Bacteria Indicator TMDL Update

- Next Meeting - Thursday, September 18, 2008 – 1:30 p.m. - 4:00 p.m.
  Albert reported that the cities of Pomona and Claremont will be joining the Task Force. Albert announced that the correct meeting date is September 18th

B. Lake Elsinore/Canyon Lake TMDL Update

- Next Meeting – Tuesday, October 28, 2008 - 1:30 p.m. – 4:00 p.m.
  - Presentation conducted by Western Riverside County Agriculture Coalition (WRCAC)
  - Ramifications for cities (cost share)
  - AG lands open shares
  - Task Force will go dark September – next meeting is October 28th
  - Contract has been approved with Brown and Caldwell to conduct the TMDL monitoring for the Task Force

C. San Diego Lagoons TMDL/Investigation Order Update

- Next Meeting – USBR, Wednesday, September 17, 2008 from 10:00 a.m.-12:00 p.m. ~ Claudio Padres reported on the August 19th meeting. The topic of the meeting was the outfall that had been dry but noticed flows in June in the channel from groundwater. He briefly discussed the following items:
  - Issues with lab results (dissolved nitrogen and dissolved solids)
  - Channel owned by North County Transportation may be removed
  - AG fields going away (rumor); needs additional data
  - Estimate for lidar survey ($6,000-$10,000); no decision on if it will actually be done

VII. Santa Ana/Santa Margarita Region Programs – Jason Uhley

A. Stormwater Quality Standards Task Force Update

- Next Meeting: Thursday, September 11, 2008 from 8:30 a.m. to 1:30 p.m.
  There will be a presentation on recreational uses to the Regional Board on September 5, 2008. Permittees were advised to attend the meeting and provide their input. The topic of a wet weather exemption on recreational uses will be discussed at the next meeting.

B. General Construction Permit

No news on the General Construction Permit.

VIII. Open Discussion

A. ***Santa Ana RWQCB –*** No comments

B. ***San Diego RWQCB*** – The executive officer sent a letter to the Permittees regarding their responsibilities and requirements for the upcoming wet season. Meeting scheduled with Regional Board and District staff September 8th to discuss the ROWD.

C. ***U.S. EPA – Region IX –*** Not present

D. ***Round Table –*** The City of Moreno Valley produced a video on hazardous material disposal. The city is also in the process of converting two of San Diego County's videos for use in Riverside County. Flo will have the videos available for Permittee use. Thanks went out to Kent Wegelin and the City of Moreno Valley.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

Training notification was sent via email requesting Permittees to submit the number of attendees they intend on sending to training. It is recommended that all construction inspectors attend the fall training due to the upcoming rainy season.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. September meeting is canceled due to the CASQA Conference. Next meeting will be held October 23, 2008.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

Please visit the "Only Rain Down the Storm Drain" Public Education Program website at: http://www.floodcontrol.co.riverside.ca.us. The site contains a variety of useful stormwater program information including links to other stormwater management programs and related websites.

I. *Introductions*

Albert Martinez welcomed everyone to the October 23, 2008 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Agenda item E (Regional Board Scoping Meeting) was added under Announcements.

III. *Review of Minutes: August 28, 2008*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- October 23, 2008 Agenda, August 28, 2008 Minutes, and Roster
- CASQA NewsFlash #s 2008-18 ~ 2008-21
- Hydrophix brochures

IV. *Announcements*

A. ***Permit Renewal Update*** – Albert reported that Jason Uhley, along with San Bernardino and Orange County, met with Michael Adackapara of the Santa Ana Regional Board regarding the Permit. A draft of the Permit will be available by the end of 2008 with the goal of having it adopted by early 2009.

B. ***CASQA Conference Summary*** – Claudio Padres reported on the CASQA Conference held September 22-24 in which there were over 500 people in attendance. Topics of the conference included:

- Research and Policy Planning
- Development of TMDLs
- Hydromodification and LID
- Stormwater Program Effectiveness

C. ***RFQ Pre-Qualification List Status*** – The District will be processing the Form 11 to the County Board of Supervisor's November 18th for the RFQ for On-Call NPDES Regulatory Compliance and Ancillary Professional Services.

D. ***Annual Report*** – Albert reported that most of the annual reporting forms had been received from the cities, yet there were a couple that still needed to be submitted. Claudio added that Santa Margarita's Annual Report is due October 31st. Watershed Report information for the Santa Margarita Region is still needed from the cities.

E. ***Regional Board Scoping Meeting*** – The SWRCB held a CEQA Scoping Meeting regarding proposed revisions to the REC Water Quality Standards. The revisions may include new water quality objectives, wet weather exemptions, monitoring requirements, etc. The SWQSTF members provided a coordinated presentation to the SWRCB regarding the work of the Task Force and the need to allow local RWQCB to develop their own standards. Jason spoke on behalf of the Riverside County Permittees for the Task Force. A letter was also developed and submitted ot the

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

SWRCB on behalf of the SWQSTF members. EPA has previously provided testimony recommending that the state adopt a single statewide standard for REC objectives.

V. Public Education Program – Florence Mowrer

The October Public Education Report was sent via email to Permittees on October 22nd by Florence Mowrer of the District.

VI. TMDL Progress Report – Jason Uhley

***A.* Middle Santa Ana River Bacteria Indicator TMDL Update –**

- Next Meeting - Thursday, October 23, 2008 – 1:30 p.m. - 4:00 p.m.
  Los Angeles County will be doing a presentation on how they are dealing with the Bacteria TMDL in the LA River which is similar to the Middle Santa Ana River Bacteria Indicator TMDL at the October 23rd meeting MSAR TMDL Meeting. The MSAR Task Force will also be discussing which MS4s need further monitoring based on the initial monitoring program.

***B.* Lake Elsinore/Canyon Lake TMDL Update**

- Next Meeting – Tuesday, October 28, 2008 - 1:30 p.m. – 4:00 p.m.
  There was no meeting in September. The next meeting is scheduled for October 28th.

***C.* San Diego Lagoons TMDL/Investigation Order Update**

- Next Meeting – USBR, Tuesday, November 18, 2008 from 10:00 a.m.-12:00 p.m.
  Claudio Padres reported that index sampling was conducted at the end of September and data should be available within 3-4 weeks. Also, data from the ocean inlet survey was submitted to CDM. There have been issues with the data readings and work is in progress to resolve those issues. Claudio added that the Regional Board is offering an opportunity to implement 3rd party TMDLs and will be holding a stakeholder meeting in December to discuss these issues.

VII. Santa Ana/Santa Margarita Region Programs – Jason Uhley

***A.* Stormwater Quality Standards Task Force Update**

- Next Meeting: Thursday, Ocotober 23, 2008 from 8:30 a.m. to 1:30 p.m.
  Albert announced that there was a meeting taking place October 23rd in which he and Jason would be in attendance.

***B.* General Construction Permit**

- Keith Elliott stated that the goal is to have the draft permit available by the end of the year.

VIII. Open Discussion

A. Santa Ana RWQCB – No comments

B. San Diego RWQCB – No comments

C. U.S. EPA – Region IX – Not present

D. Round Table – Michele Hindersinn inquired as to guidance regarding foreclosed homes with swimming pools issues. Albert stated to her that he would send the Permittees guidance information via email. Bob Collacott led a brief discussion on swimming pool issues and concerns.

P8122355

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held November 20, 2008 at the Riverside County Flood Control District.

X. ***Hydrophix Presentation – Brian Martello***

Hydrophix representatives gave a presentation on the Smart Sponge and Antimicrobial Smart Sponge Plus. Handouts and a CD were provided.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

Please visit the "Only Rain Down the Storm Drain" Public Education Program website at: http://www.floodcontrol.co.riverside.ca.us. The site contains a variety of useful stormwater program information including links to other stormwater management programs and related websites.

NEXT MEETING IS SET FOR:

THURSDAY, November 20, 2008 10:00 A.M.

Meeting Minutes
for
November 20, 2008

Attendees:

Arlene Chun	Riverside County Flood Control District
Ann Iaali	Riverside County Flood Control District
Albert Martinez	Riverside County Flood Control District
Claudio Padres	Riverside County Flood Control District
Charlene Warren	Riverside County Flood Control District
Mike Shetler	Riverside County Executive Office
Steve Horn	Riverside County Facilities Management
Glen Higa	Riverside County Transportation
Adriana Soares	Riverside County Transportation
Bob French	City of Calimesa
Mike McCabe	City of Calimesa
James Grimm	City of Canyon Lake
Michele Hindersinn	City of Corona
Jeff Potts	City of Corona
Linda Nixon	City of Hemet
Phuong Hunter	City of Moreno Valley
Kent Wegelin	City of Moreno Valley
Bill Woolsey	City of Murrieta
Lori Askew	City of Norco
Jessie Powell	City of Perris
Sandy Caldwell	City of Riverside
Jessica Chin	City of Riverside
Michael Yasmer	City of Riverside
Mike Emberton	City of San Jacinto
Aldo Licitra	City of Temecula
Mark Baker	CONTECH Stormwater
Mike Kimberlain	Kristar
Jerry Leopard	Kristar
Bob Collacott	URS Corporation
Sean Motlagh	Tri Lake Consultants
Eric Stein	SCCWRP
Jason Pereira	California Watershed Engineering

I. *Introductions*

Albert Martinez welcomed everyone to the November 20, 2008 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Agenda item F (Draft Guidelines for Prop. 84) was added under Announcements.

III. *Review of Minutes: October 23, 2008*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- November 20, 2008 Agenda, October 23, 20008 Minutes, and Roster
- CASQA NewsFlash #s 2008-22 ~ 2008-23

IV. *Announcements*

A. Permit Renewal Update – Draft Permit is expected to be released by the end of 2008.

B. NAS Report – The National Academy of Sciences (NAS) Report is designed to promote Municipal Action Levels, numeric impervious area and increased volume limitations and makes recommendations directly to EPA.

C. RFQ Pre-Qualification List Status – The list was approved Tuesday, November 18, 2008. Letters will be sent to selected consultants after Thanksgiving.

D. Annual Report – Albert announced that he is working to finalize the Santa Ana Annual Report and hopes to have it delivered to the Santa Ana Regional Board by November 26, 2008.

E. MSC Meeting Reminder – Albert announced that the next MSC meeting is scheduled for January 15, 2009 and advised Permittees to be sure to remind their City Managers of the meeting.

F. Prop. 84 Grant – The Prop. 84 Grant only applies to public agencies and can only be used for Permit compliance. The grant is desigend for public agencies to incorporate LID features into public works projects.

V. *Public Education Program – Albert Martinez*

- Outdoor Activities brochure was sent yesterday via email to Permittees
- The Outdoor Activities brochures are available for pick up November 20th at the District's front counter for Permittees who submitted orders
- There are 2 brochures due to be released: Tips for Landscaping and Gardening and one on Industrial/Commercial Facilities
- Aldo inquired as to whether or not Permittees can be provided a draft of the brochures prior to their production. Albert advised him to contact Flo with regards to his question

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

VI. ***TMDL Progress Report – Albert Martinez***

A. Middle Santa Ana River Bacteria Indicator TMDL Update –

- Next Meeting – January 15, 2009 from 1:30 p.m. - 4:00 p.m.
  Discussion of the January 15th meeting will be geared towards Source Assessment in the Santa Ana Region and the public education task of the grant.

B. Lake Elsinore/Canyon Lake TMDL Update -

- Next Meeting – TBD
  Albert announced that the next meeting is scheduled for January 27, 2009 at 1:30 p.m. and will focus on review of the budget. He also noted that the Task Force is running out of funds due to the Agricultural Stakeholders not being a part of funding the Task Force.

C. San Diego Lagoons TMDL/Investigation Order Update

- Next Meeting – USBR, Tuesday, December 9, 2008 (Conference Call Meeting)
  Arlene Chun reported on the San Diego Lagoons TMDL. Discussion included the following:

  - Waiting on the 3rd storm and keeping eye on weather
  - Meeting with Regional Board on December 18th to discuss questionable data concerns as well as TMDL funding
  - Conference call tentatively scheduled for December 9th. Formal meeting scheduled for January 15, 2009
  - Bob Collacott inquired as to what the water quality data issues were. Arlene noted that they were getting dissolved nutrients higher than total nutrients and some of the analysis were conducted outside of the holding times

VII. ***Santa Ana/Santa Margarita Region Programs – Albert Martinez***

A. Stormwater Quality Standards Task Force Update

- Next Meeting: Thursday, November 20, 2008 from 9:30 a.m. to 1:30 p.m.
  The Task Force is still defining REC use definitions. Tim Moore gave a presentation to the State Board and updated the Board on the work of the Task Force. In addition, the Task Force advocated for REC uses to be established at a regional basis although EPA would like statewide consistency.

B. General Construction Permit

- The State Board is hoping to adopt the Permit by Fall 2009 and prior to EPA's Federal Permit which will include Effluent Limitations Guidelines. Albert also noted that the Linear Permit will be incorporated into the General Construction Permit so that there are not 2 separate permits.

VIII. ***Open Discussion***

A. Santa Ana RWQCB – Not in attendance
B. San Diego RWQCB – Not in attendance
C. U.S. EPA – Region IX – Not in attendance

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

D. ***Round Table –*** Bob noted that they are currently working on the renewal of the ROWD for tha Santa Margarita Region that is due January 15, 2009. Claudio Padres added that he needs information regarding Permittee programs over the last 4 years as soon as possible to begin incorporating it into the ROWD. An excel spreadsheet was sent to Santa Margarita Region Permittees for them to use to input that information and forward back to him. A meeting will be setup to further discuss the ROWD. Claudio further noted that the new cities of Wildomar and Menifee will need to be involved in the ROWD process. As to date, there has been no feedback from the San Diego Regional Board regarding the 2008 Santa Margarita Annual Report.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held December 18, 2008 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

I. *Introductions*

Albert Martinez welcomed everyone to the November 20, 2008 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Under item IX, date of next meeting is January 22, 2009.

III. *Review of Minutes: November 20, 2008*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- December 18, 2008 Agenda, November 20, 2008 Minutes, and Roster
- CASQA NewsFlash #s 2008-24 ~ 2008-25

IV. *Announcements*

A. Permit Renewal Update – Keith announced that the goal is still to have the Draft Permit released by the end of 2008 but may not be until early January 2009.

B. CASQA Webcast – The District will be sponsoring the CASQA Meeting on January 9, 2009 via webcast at the District office Conference Room 1. The meeting is being held in San Diego, CA.

C. MSC Meeting Reminder – Meeting is scheduled for January 15, 2009. Presentations on BMP Effectiveness and CAP Program will be conducted at the meeting. Further details to be discussed among Permittees.

V. *Public Education Program – Albert Martinez*

Calendars are available for pick up at the front counter. Permittees are welcomed and encouraged to submit photos to be considered for inclusion in future calendar issues.

VI. *TMDL Progress Report – Albert Martinez*

***A.* Middle Santa Ana River Bacteria Indicator TMDL Update –**

- Next Meeting – Thursday, January 15, 2009 from 1:30 p.m. to 4:00 p.m.
  There was no update provided on the Middle Santa Ana River Bacteria TMDL. Albert announced that the next meeting is scheduled for January 15th.

***B.* Lake Elsinore/Canyon Lake TMDL Update -**

- Next Meeting – Tuesday, January 27, 2009 from 1:30 p.m. to 4:00 p.m.
  There was no update provided on the Lake Elsinore/Canyon Lake TMDL. Albert announced that the next meeting is scheduled for January 27th.

***C.* San Diego Lagoons TMDL/Investigation Order Update**

- Next Meeting – USBR, Tuesday, January 20, 2009, 10:00 a.m. to 12:00 p.m.
  Arlene reported that CDM had conducted the 3rd storm and data would be filtering in over the next few months. Final report is due to Regional Board

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

around June 2009. A meeting is scheduled for December 18th in Escondido to discuss funding situations and data received from the University labs.

VII. ***Santa Ana/Santa Margarita Region Programs – Albert Martinez***

A. **Stormwater Quality Standards Task Force Update**

- Next Meeting: Wednesday, January 7, 2009 from 9:30 a.m. to 1:30 p.m.
  Albert reported that during the last Task Force meeting the group was updated on the latest activity at various sites throughout Riverside and San Bernardino Counties. The Task Force will potentially be looking at new sites. Albert added that should Permittees know of any new sites that they would like the Task Force to look at, feel free to notify him. Also, the Task Force is looking to hold meetings every 3 weeks in 2009 in an effort to accomplish the goals of the Task Force.

B. **General Construction Permit**

Keith Elliott reported that the Regional Board is still working to get the draft Riverside County MS4 Permit released by the end of 2008. He added that the Orange County MS4 Permittees have asked for a 30-day extension for the comment period for their permit. Reasons for the extension are to get the major interested parties into a discussion with respect to hydrologic conditions of concern and the effective impervious area.

Keith added that the Regional Board has been guided by EPA to make sure that there are measureable goals in the MS4 Permit. He stated that the Regional Board is open to any ideas from Permittees on how to reach hydrologic conditions of concern but still have measureable goals. It is anticipated that Permittees will get an advanced draft of the permit but there will not be a lot of time for Permittees to review it prior to public release. It should be released to the public early February in which the 3 counties will have a combined workshop on March 6th.

Bob Collacott inquired as to if the draft Riverside County MS4 Permit was based on the current 2002 Riverside County Permit or was it based on the draft Orange County Permit. Keith informed him that it started out as being a modification of the existing permit and there is a lot of information that has not changed. Permittees will see a blend of all 3 county permits in their permit.

Maria Macario inquired as to if comments had yet been submitted by the District on the draft Orange County MS4 Permit. Albert informed her that they had not yet submitted comments but will be doing so soon.

VIII. ***Open Discussion***

- ***A. Santa Ana RWQCB –*** Regional Board staff had no further comments.
- ***B. San Diego RWQCB*** – Not in attendance
- ***C. U.S. EPA – Region IX –*** Not in attendance
- ***D. Round Table –*** There were no comments from group.

I. *Introductions*

Albert Martinez welcomed everyone to the January 22, 2009 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Agenda items C (Training) and D (De Minimus Discharge) were added under agenda item II (Announcements).

III. *Review of Minutes: December 18, 2008*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- January 22, 2009 Agenda, December 18, 2008 Minutes, and Roster
- CASQA NewsFlash #s 2009-01

IV. *Announcements*

A. ***Permit Renewal Update*** – Keith Elliott informed the group that Regional Board management staff has been focusing on the draft Orange County MS4 Permit. He noted that stakeholders are meeting to discuss the Permit and the 5% effective impervious area permit requirement and was uncertain as to when the draft Riverside County MS4 Permit would be released.

B. ***MSC Meeting Update –*** Albert provided a summary of the January 15th MSC meeting. Items of discussion included:

- Draft Orange County MS4 Permit presentation conducted by Bob Collacott to MSC attendees
- Presentation on CAP Program and effects that the draft Orange County MS4 Permit has on the CAP Program
- Discussion on BMP consistency (to be discussed more in closed session)

C. ***NPDES Training –*** Claudio Padres stated that the revised scanned training sign-in sheets were emailed to Permittees earlier in the week. He also noted that due to cumbersome issues when sending training notifications via email, that he would now be sending the email to NPDES Permittees only and asked that Permittees be sure to notify their staff directly of training information.

D. ***De Minimus Discharge*** – A draft of the De Minimus Discharge Permit was released a couple of weeks ago by the Regional Board. Albert stated that it appears from information he's received that construction dewatering for Permittee activities will be included as a non-stormwater discharge in the Riverside County MS4 Permit.

V. *Public Education Program – Albert Martinez*

Albert reported on the efforts of the District's Public Education Program. Items of his discussion included the following:

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

- There are only 5 boxes of the 2009 calendars available
- 2009 Household Hazardous Waste (HHW) schedules are available
- January 2009 Public Education Report emailed to Permittees January 20, 2009
- KVCR will be at the District to interview Jason and Florence January 22nd at 2:00 p.m. for a Greenworks segment and the District's Public Education Department that will air February 9, 2009; CDs of the show will be available for Permittess
- New billboard locations are being considered that will focus on BMP activities
- District's Public Education Department will be distributing outreach materials at the Temecula car show
- District's Public Education Department partnering with Santa Margarita Regional Board on a outreach event

VI. ***TMDL Progress Report – Albert Martinez***

A. Middle Santa Ana River Bacteria Indicator TMDL Update –

- Next Meeting – Thursday, February 11, 2009 from 9:30 a.m. to 12:30 p.m.
  Due to language in the contract stating that the budget can not exceed $300,000 the budget will need to be revised. Albert added that it has been reported that a lot of state grants have been frozen and it is uncertain as to when the Task Force will be receiving funds from their grants.

B. Lake Elsinore/Canyon Lake TMDL Update -

- Next Meeting – Tuesday, January 27, 2009 from 1:30 p.m. to 4:00 p.m.
  There was no meeting in the month of December. The next meeting is set for January 27th.

C. San Diego Lagoons TMDL/Investigation Order Update

- Next Meeting – USBR, Tuesday, January 20, 2009, 10:00 a.m. to 12:00 p.m.
  Claudio provided a brief update on the efforts of the San Diego Lagoons TMDL, reporting that a 4th data submission was provided to the Regional Board at the beginning of the month. He added that CDM is planning to have a cleaner draft of the Quality Assurance Report available by the next Task Force meeting scheduled for **February 17, 2009 from 10:00 a.m. – 12:00 p.m. at the Bureau of Reclamation** office in Temecula. There will also be a Executive Management Team meeting February 18, 2009 from 1:30 – 3:30 at the Bureau of Reclamation office in Temecula. District consultants will be meeting with SCCWRP to discuss discrepancies between total dissolved and total nutrient results where the results are coming in greater than total. The continuation of modeling development. Still pursuing Prop 84 grants.

VII. ***Santa Ana/Santa Margarita Region Programs – Albert Martinez***

A. Stormwater Quality Standards Task Force Update

- Next Meeting: Thursday, February 12, 2009 from 9:30 a.m. to 1:30 p.m.
  Albert announced that Jason was currently in attendance at the January 22, 2009 Task Force meeting at SAWPA to discuss and finalize REC use definitions and high flow language. The next meeting is set for February 12th.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

B. **General Construction Permit –** Keith Elliott noted that as Regional Board staff he anticipates one last review (within the next 10 days) of the Permit prior to it being available to the public. He added that Permittees can anticipate seeing it towards the end of the month.

VIII. ***Open Discussion***

A. ***Santa Ana RWQCB –*** Keith commented on the 2007/2008 Santa Ana Annual Report, noting that there were several Permittees whose construction, commercial and industrial databases were not submitted and none of the electronic versions were provided in a searchable format. He asked that this information be submitted to the Regional Board as soon as possible.

B. ***San Diego RWQCB*** – Not in attendance

C. ***U.S. EPA – Region IX –*** Not in attendance

D. ***Round Table –*** Aldo Licitra inquired as to any changes to the upcoming training. Claudio briefly discussed changes that are being looked at for future training classes. The next set of training classes will be provided in Fall 2009.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held February 26, 2009 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

Please visit the "Only Rain Down the Storm Drain" Public Education Program website at: http://www.floodcontrol.co.riverside.ca.us. The site contains a variety of useful stormwater program information including links to other stormwater management programs and related websites.

X. ***ORCO Block Co., Inc. Presentation – Veronica Muth***

ORCO Block Co., Inc. gave a presentation on their products and services.

Bob Collacott	URS Corporation

I. *Introductions*

Albert Martinez welcomed everyone to the February 26, 2009 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Albert added Item X (Permittee Closed Session) to the agenda.

III. *Review of Minutes: January 22, 2009*

Jessica Chin noted that she was in attendance at the January 22nd TAC meeting (meeting minutes did not reflect this). Subsequently, after review of the meeting recording and meeting sign-in sheet, there was no record of her attendance, however, the City of Riverside did receive credit for other Riverside representatives who attended the meeting. There are no changes to the meeting minutes. Minutes are approved.

Handouts and Materials Provided:

- February 26, 2009 Agenda, January 22, 2009 Minutes, and Roster
- CASQA NewsFlash #s 2009-02, 2009-03 and 2009-04
- Trident Curb Screen – Take Care of the Sea flyer
- Clean Water Act Org Chart

IV. *Announcements*

A. ***Permit Renewal Update*** – There is no new update from the Regional Board regarding the Riverside County Permittee comment letter on the draft Orange County MS4 Permit but they have received it and currently Jason Uhley and Matt Yeager (San Bernardino County) are working on scheduling a meeting within the next couple of weeks with Gerard Thibeault and Michael Adackapara to discuss the Riverside and San Bernardino Counties MS4 Permits. Albert inquired as to if Permittees had any comments on the comment letter sent to them via email. There were no comments from Permittees.

B. ***MSC Meeting Update*** **–** The next MSC meeting is set for March 19th at 11:30 a.m. at the County Administrative Center, 5th Floor, Room C. Subsequently, this meeting has been canceled. The next meeting is set for April 16th.

V. *Public Education Program – Albert Martinez*

There was no Public Education Report available for the month of February. The Public Education Department is waiting for the updated list on school presentations from the Resource Conservation Districts (RCDs).

VI. *TMDL Progress Report – Albert Martinez*

A. Middle Santa Ana River Bacteria Indicator TMDL Update

- Next Meeting – Thursday, March 25, 2009 from 9:30 a.m. to 12:30 p.m.
  The budget has been reduced slightly and it was mentioned that the cost share will be reduced for the stakeholders during fiscal year 2009-10 and will be reflected on the invoices.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

B. **Lake Elsinore/Canyon Lake TMDL Update**

- Next Meeting – Tuesday, February 24, 2009 from 1:30 p.m. to 4:00 p.m.
  Albert reported that attendance was low at the last meeting. He stated that future meetings will be held to discuss the budget noting that it would be beneficial for Permittees to attend. He also noted that the draft 303(d) list came out in which Lake Elsinore was listed for sediment toxicity. Bob Collacott and Arlene Chun are working on providing a draft comment letter to the Regional Board by April 17th and will also be coordinating with San Bernardino County on the matter. Bob added that there were 5 waterbodies in the Santa Ana Region that are listed for additional impairments. Those listed are the Santa Ana River, Hole Lake, Lake Elsinore, Cucamonga Creek, and Day Creek.

C. **San Diego Lagoons TMDL/Investigation Order Update**

- Next Meeting – USBR, TBD
  Claudio Padres reported that the Bureau of Reclamation is still looking into the possibility for the third party TMDL effort. The next meeting is scheduled for March 17th. The Bureau of Reclamation is scheduled to meet with the Regional Board on March 16th. There is an EMT meeting set for sometime in April.

VII. ***Santa Ana/Santa Margarita Region Programs – Albert Martinez***

A. **Stormwater Quality Standards Task Force Update**

- Next Meeting: Thursday, March 5, 2009 from 9:30 a.m. to 1:30 p.m.
  Albert announced that work is being done to finalize REC use definitions and the Temporary High Flow Suspension language. The next meeting is set for March 6th at SAWPA.

B. **General Construction Permit –** A draft of the Permit may be available March 6th. There will be one workshop and comments are due in April. Updates will be provided to Permittees. Keith added that the State Board is still shooting for a March release.

VIII. ***Open Discussion***

A. ***Santa Ana RWQCB –*** Keith informed the group that the General Industrial Permit would not be reviewed until the Construction Permit is available.

B. ***San Diego RWQCB*** – Not in attendance

C. ***U.S. EPA – Region IX –*** Not in attendance

D. ***Round Table –*** Michele Hindersinn inquired as to the status of Keith Elliot's request at the last TAC meeting regarding the Annual Report electronic information being submitted to the Regional Board. Albert advised the Permittees that the information had been given to the Regional Board on January 28, 2009.

Albert touched on previous discussion among Permittees regarding a BMP consistency policy due to be developed by the TAC members. He added that Kent

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

Wegelin will be taking charge on developing the policy and asked if any other cities were interested in assisting with the development of the policy. Several cities showed their interest. A meeting will be set up to further discuss the matter.

Bob made mention on why and how the economy is affecting cities financing, programs, budget etc. and asked if anyone would like to volunteer information on how their city has been affected. Further discussion took place amongst the Permittees.

IX. New Agenda Items / Schedule Next Meeting

There were no agenda item requests from the group. Next meeting will be held March 26, 2009 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

I. *Introductions*

Albert Martinez welcomed everyone to the March 26, 2009 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Item D (Santa Ana Regional Board 2nd draft of Orange County Permit) was added under Item IV (Announcements).

Item X (Closed Session) was added to the agenda.

III. *Review of Minutes: February 26, 2009*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- March 26, 2009 Agenda, February 26, 2009 Minutes, and Roster
- CASQA NewsFlash #s 2009-05 and 2009-04

IV. *Announcements*

A. *Permit Renewal Update* – Keith Elliott informed the group that the Santa Ana Regional Board's focus has been on the Orange County Permit. There has been no progress with the San Bernardino or Riverside County Permits since the last update.

B. *MSC Meeting Update* – The March 19th MSC meeting was cancelled. The next meeting is scheduled for April 16th.

C. *Draft Orange County MS4 Permit (San Diego Region)*

Claudio Padres stated that the San Diego Regional Board has issued a draft Permit to the Orange County Permittee group. A workshop is scheduled for the draft Permit April 3rd, a Board meeting April 8th, and a public hearing June 10th. Comments must be submitted by April 24th in order to be heard at the June 10th hearing. Ben Neil has informed Claudio that San Diego Regional Board staff is currently working on the Orange County Permit. Once that is complete (August/September), they will begin to work on the Santa Margarita Region Permit.

D. *Santa Ana Regional Board 2nd draft of Orange County Permit*

Albert announced that the 2nd draft Orange County MS4 Permit was released by the Santa Ana Regional board on March 25th and is available on the Regional Board's website. Comments on the draft Permit are due to the Regional Board by April 9th. A public hearing is set for April 24th. Keith added that there's a possibilitiy that the Permit will be adopted at the April 24th hearing.

V. *Public Education Program – Albert Martinez*

Albert discussed the following public education items:

- Runoff materials distributed at the Rock Run event in Temecula March 13th and 14th

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

- District staff is currently working on outlining improvements to the public education program
- Classroom presentations are not automatically conducted at each school; schools must request that the District conduct the presentations
- Letters are being sent to school districts informing them of the public education program
- District staff is working with San Bernardino County to help provide a more uniform public education program for 5th and 6th graders in the Inland Empire and are looking to partner with Curiosity Quest PBS to develop a program for stormwater (geared toward 5th and 6th graders). A meeting will be held the first week of April with San Bernardino County and PBS staff to further discuss the partnership.

VI. ***TMDL Progress Report – Albert Martinez***

A. Middle Santa Ana River Bacteria Indicator TMDL Update

- Next Meeting – Thursday, March 25, 2009 from 9:30 a.m. to 12:30 p.m.
  NOTE: Albert advised attendees that the next meeting is set for **May 20th at 1:30 p.m.** Key items to be discussed at the meeting are source assessment on various sites, alternative lab analysis for bacterial indicators, and reducing lab analysis costs.

B. Lake Elsinore/Canyon Lake TMDL Update

- Next Meeting – Tuesday, March 24, 2009 from 1:30 p.m. to 4:00 p.m.
  NOTE: Albert advised attendees that the next meeting is actually set for **Monday, April 27th at 2:00 p.m.**

C. San Diego Lagoons TMDL/Investigation Order Update

- Next Meeting – USBR, Tueday, March 24, 2009 from 10:00 a.m. to 12:00 p.m.
  Claudio informed attendees that the March 24th meeting has been postponed to April 1st from 10:00 a.m. - 12:00 p.m.

VII. ***Santa Ana/Santa Margarita Region Programs – Albert Martinez***

A. Stormwater Quality Standards Task Force Update

- Next Meeting: Thursday, March 26, 2009 from 9:30 a.m. to 1:30 p.m.
  NOTE: Albert advised attendees that the next meeting is actually set for **Thursday, April 16th at 9:30 a.m.** at SAWPA. Work continues in an effort to establish REC use definitions and high flow suspension language. Tim Moore and the Task Force is meeting today (March 26th) to discuss REC 2 uses. Jason will be meeting with Tim to further discuss REC 2 use. Work is expected to be finalized soon.

B. **General Construction Permit –** Keith noted that the there was a request to do a re-work of the Permit itself so that is reads better. A draft of the Permit is expected to be released by the end of March or April with adoption expected in October.

VIII. ***Open Discussion***

A. ***Santa Ana RWQCB*** **–** Keith advised Permittees that there are lots of permits (construction sites) being terminated due to suspension of activities. WDID #s can be checked on the State Board's web-site to see if the site is active. Bob Collacott

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

inquired as to the implications for the cities and county in terms of enforcing stormwater requirements for the terminated construction sites. Keith stated that a new WDID # is given when the site is not active and there is a new owner. Keith will provide Permittees with more detailed and confirmed information on termination of permits, Notice of Termination letters, and enforcing ordinances once the permit is terminated. Further discussion ensued among the group regarding expectations for MS4 Permittees.

B. ***San Diego RWQCB*** – Not in attendance

C. ***U.S. EPA – Region IX*** – Not in attendance

D. ***Round Table*** – Riverside County Water Task Force new web address is http://www.h2oriversidecounty.org/.

The 2009 CASQA conference will be held at Mission Bay Hilton Hotel in San Diego, CA November 2nd – 4th 2010. Next year's conference will be held in Riverside County.

District staff advised meeting attendees that due to the new carpeting in the conference room, there will be no drinks allowed that do not have caps/lids.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held April 23, 2009 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

IV. *Announcements*

A. *Permit Renewal Update*

- **Status of Santa Ana OC Permit**
  Jason Uhley announced that the OC Permit is scheduled to be adopted Friday, April 24, 2009. The hearing is a continuation of the April adoption hearing. Testimony will be limited to the LID provisions of the OC Permit. More discussion to follow in closed session.
- **Status of San Diego OC Permit**
  i. **Next public workshop** – Claudio will advise Permittees via email of the next workshop date. Claudio noted there was a staff workshop two weeks ago. Topics of discussion included:.
    - Numeric effluent limits
    - Municipal Action Levels
    - Definition of stormwater
    - Variation between Santa Ana and San Diego versions of the OC Permit.
    - Removal of the word urban from the term urbanrunoff
    - Scheduling of a meeting with Regional Board and OC staff the week of April 20th
    - EPA comments regarding the SA OC Permit

B. *MSC Meeting Update* –

MSC attendees were updated on the status on both the draft San Diego and Santa Ana RWQCB OC Permits. Kent Wegelin gave an update on the BMP Consistency Policy at the April 16, 2009 meeting. The next MSC meeting is set for May 21, 2009. Bob Collacott provided a presentation summarizing the key issues of the draft San Diego OC Permit.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

C. ***303 (d) List update)***

An email was sent to Permittees April 22, 2009 summarizing the status of the 303 (d) List. Jason stated that there were three waterbodies (Ph for Temescal, copper for the Santa Ana River, and sediment toxicity in Lake Elsinore) being added to the 303 (d) List.

V. ***Public Education Program – Florence Mowrer***

Albert reported on the following Public Education items:

- RCRCD Report emailed to Permittees on April 21st
- No slap braclets, mood pencils, shoe laces available at this time - no shop cloths available until next fiscal year
- Regional Board staff member attended Earth Night in support of the Public Education Program
- Florence will be at the Water Education Center Saturday April 25th and Penny Skog will be at the Riverside Flower Show
- Stream stabilization fact sheet is close to being published; per the request of Permittees, a draft of the stream stabilization fact sheet was previously emailed to Permittees for their review and comments

VI. ***TMDL Progress Report – Albert Martinez***

A. **Middle Santa Ana River Bacteria Indicator TMDL Update**

- Next Meeting – Wednesday, May 20, 2009 from 1:30 p.m. to 4:00 p.m.
  There was no meeting in the month of April 2009. Next meeting is set for May 20th.

B. **Lake Elsinore/Canyon Lake TMDL Update**

- Next Meeting – Tuesday, April 27, 2009 from 1:30 p.m. to 4:00 p.m.
  There was no update provided on the LE/CL TMDL. A meeting is scheduled for April 27th. Items to be discussed include a status update on the 303 (d) List and the Regional Board's release of a draft amendment to the Elsinore Valley Municipal Water District Effluent Discharge Permit in an effort to incorporate requirements into the TMDL. Jason noted the importance of the April 27th meeting and encouraged Permittees to attend.

C. **San Diego Lagoons TMDL/Investigation Order Update**

- Next Meeting – TBD
  There was no news reported on this item.

VII. ***Santa Ana/Santa Margarita Region Programs – Albert Martinez***

A. **Stormwater Quality Standards Task Force Update**

- Next Meeting: Thursday, April 30, 2009 from 9:30 a.m. to 1:30 p.m.
  A meeting was scheduled for the afternoon of April 23rd.
  NOTE: The April 30th meeting has been rescheduled to May 21st.

B. **General Construction Permit –** Keith reported that notices are being prepared and he expects that the Permit will be released to the public at any time. Bill Flores added

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

that he received an email from Sandy Matthews that the draft had in fact been released earlier that morning.

VIII. ***Open Discussion***

A. ***Santa Ana RWQCB –*** Jason inquired as to the status of the draft Santa Ana Permit. Keith advised him that it may be around June when the draft is released.

B. ***San Diego RWQCB*** – Not in attendance

C. ***U.S. EPA – Region IX –*** Not in attendance

D. ***Round Table –*** Jason thanked Sandy Caldwell for his work with the NPDES Program over the past several years and congratulated him on his retirement. Bill Flores inquired as to if the Permit would be implemented at the adoption hearing April 24th. Jason informed him that most permits are implemented about a year from their adoption. Keith added that there is a time schedule in the Permit to refer to. Jason informed the group that the CASQA Conference registration is open and if possible to budget this year for the 2010 conference.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held May 21, 2009 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

Please visit the "Only Rain Down the Storm Drain" Public Education Program website at: http://www.floodcontrol.co.riverside.ca.us/stormwater/. The site contains a variety of useful stormwater program information including links to other stormwater management programs and related websites.

X. ***Closed Session***

Permittees engaged in closed session discussion.

I. *Introductions*

Claudio Padres welcomed everyone to the May 23, 2009 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Items D (CASQA) and E (General Meeting Webcast) was added under agenda item IV (Announcements).

Item C (303(d)) List Update was removed from the agenda.

Agenda Item X (Closed Session) was added to the agenda.

III. *Review of Minutes: April 23, 2009*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- May 28, 2009 Agenda, April 23,2009 Minutes, and Roster
- CASQA NewsFlash #s 2009-09 and 2009-10
- General Construction Permit Update

IV. *Announcements*

A. *Permit Renewal Update*

- **Status of Santa Ana OC Permit** – The Permit was adopted last week. During the adoption hearing the Regional Board provided clarification on some of the intent of the documentation regarding infiltration.
- **Status of San Diego OC Permit** – There was a workshop held May 26th that focused on LID provisions within the draft Permit. Changes were proposed during the workshop in an effort to gain more continuity between the Santa Ana and San Diego Regional Boards. There will be a public workshop July 1st. Comments are due to the Regional Board by June 19th.
    - Next public workshop - TBD

B. ***MSC Meeting Update –*** Claudio announced that he was not in attendance of the May 21st meeting; no update was provided.

C. ***303(d) List Update –*** No discussion. This item was removed from the agenda.

D. ***CASQA –*** CASQA is now offering a registration discount on the upcoming CASQA Conference if purchased by June 30th. The discounted cost is $399 versus the standard rate of $525.

E. ***General Meeting Webcast –*** The District hosted a webcast of CASQAs May 2009 General Meeting and will continue to host future CASQA meetings via webcast at the District office. Aldo inquired about CASQA offering a free webcast for day one of the conference only. Claudio will check on this and get back to Permittees.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

Mike Roth inquired as to if there was any interesting new research discussed on infiltration at the conference. Bill Flores provided a general overview of the meeting and informed Mike that there was discussion on rain water harvesting issues/concerns and that all presentations for the conference are available on CASQAs website. Permittees must login as a member to view them.

V. ***Public Education Program – Claudio Padres***

Claudio provided a status update on efforts of the Public Education Department events, brochures and materials.

- The are new lenticular magnets available and ready for pickup at the front counter for Permittees who have ordered them. Magnets were also made available at the meeting.
- No shop cloths or sponges available at the time/ Low inventory on air freshners
- Spring training in the Desert area May 28th / New training for CAP inspectors June 2nd/1 more WQMP training June 9th
- Volunteers needed to man the public education booth at the Southern California Fair in Perris
- Water Symposium in Palm Springs May 28th / Home and Garden Show May 29th – 31st at the Riverside Convention Center / Events in Canyon Lake on the 30th and Beaumont from the 4th - 7th
- District staff attended a presentation on pesticides given by SGA at the Moreno Valley Home Depot
- Stream Stabilization flyer still in production
- HHW schedule available; new schedule will be available August 2009

VI. ***TMDL Progress Report – Claudio Padres***

A. **Middle Santa Ana River Bacteria Indicator TMDL Update**

- **Next Meeting – Wednesday, July 8, 2009 from 9:30 a.m. to 12:00 p.m.**
  CDM is reviewing the workplan for the next fiscal year in which they will focus efforts to identify human fecal sources and potential BMPs to abate sources from two storm drains in San Bernardino County. CDM will be sending out a draft revision to the plan and requesting comments from the MSAR Task Force. The MSAR Task Force received approval from the State to move forward with grant project tasks but it unsure if grant reimbursement will go through because of state budget issues.

B. **Lake Elsinore/Canyon Lake TMDL Update**

- **Next Meeting – Tuesday, August 3, 2009 from 1:30 p.m. to 4:00 p.m.**
  They are evaluating EVMWD proposed revisions to the Permit for discharge to the Lake. There will be a hearing in July on the matter, date and time TBD.

C. **San Diego Lagoons TMDL/Investigation Order Update**

- Next Meeting – TBD
  Due to funding issues there is still discussion on weather or not SCCWRP will do the model as a 3rd party TMDL effort. QA and QC reports for the monitoring data are still being reviewed.

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

VII. ***Santa Ana/Santa Margarita Region Programs – Claudio Padres***

A. **Stormwater Quality Standards Task Force Update**
Next Meeting: TBD – Claudio stated that he did not have the date for the next meeting. He added that REC II standards are still being reviewed and the first use attainability analyses (UAA) for the Santa Ana Delhi Channel is being done. This UAA will serve as the model for how future analyses will be done.

B. **General Construction Permit –** The Permit was released April 23rd. Albert Martinez, URS Corporation and Linda Nixon are working on a draft comment letter on the Permit. Comments will be out to Permittees the week of June 8th and due to State Board on June 17th. The Permit is tentatively scheduled for adoption in the Fall. A brief discussion of the grandfathering clause ensued briefly among the group, where under the current draft of the General Construction Permit, construction projects that are active upon adoption of the Permit will not be fully grandfathered and will have to meet some enhanced requirements of the new Permit. Claudio noted that it will be important to provide flexibility in municipal construction specifications to allow for compliance with the new Permit without requiring change-orders.

VIII. ***Open Discussion***

A. ***Santa Ana RWQCB –*** Mike informed the group that EPA has a new webpage for road BMPs in MS4s.

B. ***San Diego RWQCB*** – Not in attendance

C. ***U.S. EPA – Region IX –*** Not in attendance

D. ***Round Table –*** There was an inquiry as to if there was any update on the Riverside County MS4 Permit. Mike stated that the Permit is going up the Regional Board's chain of command and is similar to the Orange County Permit. Claudio added that to date there has been no release of the draft San Diego Permit. Bob Collacott noted that the existing Permit is still in effect until the new one is released.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held June 25, 2009 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

I. *Introductions*

Albert Martinez welcomed everyone to the July 24, 2008 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees. Claudio Padres was introduced as the new Santa Margarita Permit Manager for the District.

II. *Agenda Changes*

The following items were added to the agenda under IV- Announcements:

- Item C –CASQA Conference
- Item D – RFQ
- Item E – Water Quality Newsletter
- Item F – Annual Report

Agenda item X – Closed Session was added to the agenda.

III. *Review of Minutes: June 26, 2008*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- July 24, 2008 Agenda, June 26, 2008 Minutes, and Roster
- CASQA NewsFlash #s 2008-13 ~ 2008-14
- CASQA Conference (handout)

IV. *Announcements – Albert Martinez*

A. Permit Renewal Update – Keith Elliott announced that a draft of the Permit should be released by the end of 2008. The Permit is expected to be adopted early 2009.

B. Notice of Violation – The County of Riverside and the City of Temecula received NOVs from the San Diego Regional Board. Albert noted that the County has responded to the Regional Board regarding the NOV and Temecula was currently working on their response.

C. CASQA Conference – CASQA Conference is scheduled for September 22-24, 2008 at the Oakland Marriot Center. See handout provided at meeting for more information.

D. RFQ – Albert announced that the District released a Request for Qualifications (RFQ) for On-Call National Pollutant Discharge Elimination System (NPDES) Regulatory Compliance and Ancillary Professional Services July 7th and all Statement of Qualifications are required to be submitted to the District by August 21st.

E. Water Quality Newsletter – Anyone interested in the newsletter (Urban and Highway Stormwater Runoff) created by G. Fred Lee can see Albert Martinez for a copy.

F. Annual Report – Santa Ana Region annual reporting forms are due to go out to Permittees in the next several weeks.

V. *Public Education Program – Arlene Chun*

Florence Mowrer emailed Permittees the July 2008 Public Education Report for the Santa Ana Watershed and the July Santa Ana Watershed Stormwater Classroom Presentations summary on July 23rd. Please refer to these documents for public education information.

VI. *TMDL Progress Report – Arlene Chun*

***A.* Middle Santa Ana River Bacteria Indicator TMDL Update**

- Next Meeting - Thursday, September 4, 2008 – 1:30 p.m. to 4:00 p.m.
  Arlene reported that work is being done on the Box Springs Source Assessment and by luck a cross connection into a 18 inch strom drain was found on the grounds of Riverside Community College (RCC) that fed into the channel. That connection has since been severed, sanitized and 2 bacteriodes tests have been ran and have come back negative.

  Bob Collacott noted that RCC is a school district and is not under the jurisdiction of Permittees.

B. **Lake Elsinore/Canyon Lake TMDL Update**

- Next Meeting – Tuesday, August 26, 2008 - 1:30 p.m. to 4:00 p.m.
  There was nothing reported on this TMDL.

C. **San Diego Lagoons TMDL/Investigation Order Update**

- Next Meeting – USBR, Wednesday, August 13, 2008 - 1:30 p.m. to 3:30 p.m.
  The August 13th meeting is scheduled to be held via conference call. The following were briefly discussed:
- CDM will be speaking with Steve Carter (Tetra Tech) regarding bathymetry data
- Inlet survey on the 18th
- Problems with academic labs
- Invoices will be sent out around September [Note: as of 8/19 meeting there will be no additional invoices for this fiscal year]
- Transect sampling taking place July 24th
- Index 3 sampling taking place week of July 21st

VII. ***<u>Santa Ana/Santa Margarita Region Programs – Albert Martinez</u>***

A. **Stormwater Quality Standards Task Force Update**

- Next Meeting: Thursday, September 4, 2008 from 9:30 a.m. to 1:30 p.m.
  The discussion topic of the September 4th meeting will be wet weather exemption. Albert informed the Permittees that if they have opinions they should attend the meeting.

B. ***General Construction Permit***

- June 4, 2008 Hearing ~ Keith reported that comments are still being reviewed and he had no date as to when a draft will be released.

VIII. ***<u>Open Discussion</u>***

A. ***Santa Ana RWQCB –*** No comments

B. ***San Diego RWQCB*** – Ben Neill informed the group that the Writ of Mandate does not cover the San Diego Region and they will not be making any changes as to how their Board is working. He noted that the Board's lawyers will handle the Writ of Mandate. Ben added that the Board will go forward with the Orange County Permit and expects the Riverside County Permit to look like the Orange County Permit.

C. ***U.S. EPA – Region IX –*** Not present

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

D. ***Round Table –*** Inquiry was made as to how the Santa Ana Regional Board perceives the Writ of Mandate. Keith noted that management is still looking into the matter.

An announcement was made stating that SAWPA is sponsoring a Regional Watershed Planning meeting July 26th at 2:00 p.m. at the Sunkist Center in Riverside.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

Please visit the "Only Rain Down the Storm Drain" Public Education Program website at: http://www.rcflood.org. The site contains a variety of useful stormwater program information including links to other stormwater management programs and related websites.

I. *Introductions*

Jason Uhley welcomed everyone to the June 25, 2009 NPDES Santa Ana/Santa Margarita Technical Advisory Committee Meeting and initiated the self introductions of attendees.

II. *Agenda Changes*

Agenda item X (Closed Session) was added to the agenda.
Agenda item H (Santa Ana Bioassessment) was added under IV (Announcements).

III. *Review of Minutes: May 28, 2009*

There were no changes to the meeting minutes. Minutes were approved.

Handouts and Materials Provided:

- June 25, 2009 Agenda, May 25, 2009 Minutes, and Roster
- CASQA NewsFlash #s 2009-11 and 2009-12

IV. *Announcements*

A. *Status of San Diego OC Permit* – Claudio Padres announced that the draft amendment of the San Diego OC Permit had been released and was emailed to the Santa Margarita Permittees. There is a Board hearing (not adoption hearing) July 1st. Jason briefly discussed the Permit and Permittee request to the San Diego Regional Board that Riverside County's existing MS4 Permit be used as the basis for a new MS4 Permit. The Regional Board staff had previously indicated that the OC Permit would serve as the template. There has been no response from the Regional Board on the matter as of yet. High priority items of concern in the OC Permit are the landscape irrigation prohibition LID provisions, MALs, and NELs.

B. *Status of Santa Ana Permit* – Keith announced that the draft San Bernardino County MS4 Permit is moving forward and expected to be released prior to the draft Riverside County MS4 Permit. The following items were touched on.

- San Bernardino County adoption hearing in October
- July public hearing workshop for San Bernardino County and August public hearing workshop for Riverside County. Subsequently, the workshop for the San Bernardino County MS4 Permit has since been postponed to August 3rd and will now discuss both San Bernardino County and Riverside County MS4 Permits
- Status of Appeal of OC Permit
- Expect late July early August to be real busy
- Pre-review draft may possibily be available early/mid July
- San Bernardino Draft Permit expected be available on the Regional Board's website June 26th
- Jason to contact Michael Adakapara to get a more definitive schedule for the Permit.

C. *Whitewater NPDES MS4 Permit* – The Whitewater Permit was adopted May 2008. Permittees were required to have the SWMP Implemented by June 15, 2009. The Whitewater Region is now implementing WQMP requirements. Jason noted that the

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

Colorado River Regional Board will take action on the SWMP within the next few months.

D. ***MSC Meeting Update –*** The last MSC meeting was held May 21st. The meeting was very short as Permittees are awaiting the release of the Santa Ana MS4 Permit. The next meeting is set for October 15th; this meeting may be moved up to an earlier date pending the release of the Santa Ana MS4 Permit.

E. ***New Website –*** Ann Iaali gave a demonstration of the District's new NPDES website. Several Permittees suggested that NPDES Stormwater staff contact information for the cities be included on the webpage. Ann will follow up on comments and suggestions provided by Permittees.

F. ***Annual Reports –*** Albert informed Permittees that the Annual Reporting Forms will be going out in the next 2 weeks and is asking that the Annual Reports be submitted a little early this year. Santa Margarita reporting forms will be going out early as well.

G. ***NPDES Training Program Update –*** The District has completed its annual Spring training. Fall training will be offered in the next several months. Claudio Padres discussed changes to the training courses and the streamlining of the presentations. Permittees were advised to contact Claudio should they have any ideas, suggestions, or comments on bettering the training program. He briefly reported on some of the changes to training, noting that one of the biggest changes so far is the WQMP updates. Permittees who would like to be involved with the restructuring of the training program should coordinate with Claudio. Certificates were provided at the meeting for several city staff members who attended the Spring training.

H. ***Santa Ana Bioassessment Program – Santa Ana Bioassessment Program –*** Arlene explained that the District coordinates with the Stormwater Monitoring Coalition (SMC) and the program has been in development over the last 3-4 years. This bioassessment program is a regional effort from Ventura County south to San Diego County and east to San Bernardino and Riverside Counties, with SCCWRP as the lead/coordinating agency. This regional bioassessment program parallels the State Board's Perennial Stream Assessment that is taking place statewide under SWAMP. The SMC program requires that all stream reaches being assessed must be flowing *through* September so that SMC results will be comparable to SWAMP's results. This program is part of the Santa Ana MS4 Permit requirements.

In Riverside County, the 1st year of a 5-year sampling plan began Monday, June 22nd. There are 3 sites in the Middle Santa Ana Region – SAR downstream of Hamner and 2 sites on Cucamonga Creek. 2 sites in the San Jacinto Watershed, both in Perris Valley Channel and 1 site in the Santa Margarita Region – Temecula Creek under the I-15 bridge. Each site is assessed with SWAMP protocols (bioassessment – physical habitat, algae/periphyton, bugs), California Rapid Assessment Method (CRAM), water column toxicity, metals, conventional parameters, etc. There will be 6 new sites assessed each year of the program. Mike Roth inquired about dry stream analysis;

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

SCCWRP is conducting a separate study on these streams. Jason noted that ambient stream conditions will be compared.

V. *Public Education Program – Jason Uhley*

A. *Curiosity Quest* – Albert sent Permittees a request to provide information for possible homes in their city that exemplified xerascaping, artifical turf or water efficient landscaping. Three homes were chosen, one in each of the cities of Moreno Valley, Corona, and Rialto which will be highlighted in the show. Hosts of the show will be taking a look at proper carwash, pool, and pet management. The show will air on PBS and Permittees can use the 2-5 minute segments for their local public access channels. DVD copies of the episode will be provided to Permittess. Jason thanked Permittees for their contributions to the home findings.

VI. *TMDL Progress Report – Jason Uhley*

A. Middle Santa Ana River Bacteria Indicator TMDL Update

- **Next Meeting – Wednesday, July 8, 2009 from 9:30 a.m. to 12:00 p.m.**
  The Source Assessment Plan is being put together for the 2009/2010 fiscal year. Permittees who are a part of this TMDL and have not had a chance to take a look at the plan need to review the plan and be ready to provide comments at the July 8th meeting. It is important in that the plan establishes the procedures Permittees will be using from this year forward.

B. Lake Elsinore/Canyon Lake TMDL Update

- **Next Meeting – Monday, August 3, 2009 from 2:00 p.m. to 4:00 p.m.**
  The Bioassessment Program is being put together to conduct lake monitoring. The Regional Board is proposing to update the EVMWD discharge Permit that allows them to discharge reclaimed water into Lake Elsinore. This is something that needs to be watched carefully because the language incorporated into their Permit is likely to be incorporated into our Permit. More discussion during closed session.

C. San Diego Lagoons TMDL/Investigation Order Update

- Next Meeting – TBD
  Arlene stated that the final data use ability and assessment review has been put together. There were extensive comments provided by the Navy, Marines, and San Diego County and will be submitted to the Regional Board on the 30th.

VII. *Santa Ana/Santa Margarita Region Programs – Albert Martinez*

A. Stormwater Quality Standards Task Force Update

- **Next Meeting – Thursday, July 9, 2009 from 9:30 to 12:00 p.m.**
  The issue of how the Task Force is going to set a numeric standard has been a concern. The proposed solution is to not include a water quality objective number in the REC 2 objective however, the Task Force is going to put a numeric antidegregation number in the objective. Jason talked further of the possible directions in which this may be approached.

B. General Construction Permit

Riverside County Flood Control and Water Conservation District
1995 Market Street • Riverside, CA 92501 • (951) 955-1200 • FAX (951) 788-9965

Albert informed the group that a GCP comment letter was emailed to Permittees June 24, 2009 and thanked all who provided comments. The group discussed comments that were addressed in the letter.

VIII. ***Open Discussion***

A. ***Santa Ana RWQCB –*** Keith reiterated that the MS4 Permit is a high priority at this time.

B. ***San Diego RWQCB*** – Not in attendance

C. ***U.S. EPA – Region IX –*** Not in attendance

D. ***Round Table –*** Mark Grey of BIA thanked the District for their work efforts and comments submitted on the OC Permit. He briefly discussed BIA's position on the OC Permit.

Jason reported that the design of the District's LID compound is about 95% complete. The entire facility will be retrofitted to require LID BMPs prior to discharge from any of the discharge points.

IX. ***New Agenda Items / Schedule Next Meeting***

There were no agenda item requests from the group. Next meeting will be held July 23, 2009 at the Riverside County Flood Control District.

If there are any questions or items for the next meeting agenda, please contact the Flood Control District's NPDES Section at 951.955.4375. Suggestions are always welcome.

Please visit the "Only Rain Down the Storm Drain" Public Education Program website at: http://www.rcflood.org/stormwater/. The site contains a variety of useful stormwater program information including links to other stormwater management programs and related websites.

X. ***Closed Session***

Permittees engaged in closed session discussion.

NEXT MEETING IS SET FOR:

THURSDAY, July 23, 2009 10:00 A.M.
AT
RIVERSIDE COUNTY FLOOD CONTROL DISTRICT
1995 Market Street Conference Room 1
Riverside, CA 92501

P8126095

SMREMT MEETINGS

SANTA MARGARITA RIVER WATERSHED EXECUTIVE MANAGEMENT TEAM

AGENDA

February 18, 2009
1:30 – 3:30 PM

Location: Bureau of Reclamation, Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590
Phone: 951 – 695 – 5310

1:30	**Introductions**
1:35	**Review Meeting Objectives:** 1- Update group on Lagoon & Mainstem projects 2- RWQCB position for a SMR 3rd party TMDL 3- Clarify group's position on a watershed project relative to: a. WEF-USEPA discussion i. Sidebar 1 on page 7 ii. Sidebar 3 on page 9 iii. Sidebar 4 on page 10 b. SWRB's draft recycled water policy – salt-nutrient management plans c. Extent / Scope of watershed project d. Merging / Keep separate the lagoon study 4- Identify opportunities to move project forward in 2009-2010
1:45	**Discussion:** 1. Project Updates 2. Overview: 3rd Party TMDL Formation 3. SMR Watershed project – direction, scope, group position 4. Upcoming Opportunities 5. Next Steps
3:30	**Summary**

Meeting Agenda

SANTA MARGARITA RIVER WATERSHED
EXECUTIVE MANAGEMENT TEAM

August 20, 2008
10:00 – 12:00 PM

U.S. Bureau of Reclamation
Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590
(951) 695-5310

1. Introductions

2. General Update
   a. WQMG
   b. Stakeholder Meeting
   c. Studies – Lagoon & Mainstem
   d. Phase 4

3. MOA Review

4. Phase 4 Scope of Work

5. Next Steps / Meeting

LAGOON MEETINGS

Meeting Agenda

Santa Margarita River Watershed

Executive Order Lagoon TMDL Sampling

July 15, 2008
10:00 AM to 12:00 PM

U.S. Bureau of Reclamation
Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590
(951) 695-5310

1. Introductions

2. Contractor Update

   a. Index 3
   b. Inlet Survey
   c. Field & Lab data – QA
   d. Bathymetry: 2007 aerial v. 2002 work

3. MOA / Next invoices

4. Other

5. Next Meeting:

   August 19 2008 – 10:00 AM to 12:00 PM

Meeting Agenda
Santa Margarita River Watershed

Executive Order Lagoon TMDL Sampling

August 19, 2008

10:00 AM – 12:00 PM

U.S. Bureau of Reclamation
Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590

I. Introductions

II. Main Issue: Discuss storm channel discharge into the lagoon that Pendleton staff estimates at approx 6-7 GPM and it is high in nitrate/nitrites and how this may impact the current monitoring program and model.

III. LIDAR

IV. Cost-Sharing

V. Other business
   a. TDN/TN values
   b. 3rd Storm

VI. Next meeting

Meeting Agenda
Santa Margarita River Watershed

Executive Order Lagoon TMDL Sampling

September 17, 2008

10:00 AM – 12:00 PM

U.S. Bureau of Reclamation
Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590

I. Introductions

II. Monitoring Update

III. Lagoon outfall pipe

IV. Next steps (i.e., discharge has stopped & only 1 sampling event occurred…is/was this a significant nutrient loading)

V. Next meeting

Meeting Agenda
Santa Margarita River Watershed

Executive Order Lagoon TMDL Sampling

October 14, 2008

10:00 AM – 12:00 PM

U.S. Bureau of Reclamation
Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590

I. Introductions

II. Monitoring Update

III. Data Submittal

IV. Upcoming Wet Season

V. Next meeting

Meeting Agenda

Santa Margarita River Watershed

Executive Order Lagoon TMDL Sampling

November 18, 2008
10:00 AM to 12:00 PM

U.S. Bureau of Reclamation
Southern California Area Office
27708 Jefferson Avenue, Suite 202
Temecula, CA 92590
(951) 695-5310

1. Introductions

2. Contractor Update

   a. Lab data
   b. Weather forecast

3. Q & A

4. Next Meeting:

   December 16 2008 – 10:00 AM to 12:00 PM

MEETING AGENDA

California Regional Water Quality Control Board
San Diego Region

Lagoons Monitoring Data Reporting

Thursday, December 18, 2008
1:30 – 3:30 p.m.
City of Escondido, Training Room #1

I. Introductions/Meeting Overview (*Wayne Chiu*)

II. Recap of lagoons conceptual models and monitoring work plan development (*Martha Sutula*)

III. Update on SCCWRP studies and related projects (*Martha Sutula*)

IV. Data quality issues (*Martha Sutula/Wayne Chiu/Consultants*)
-Laboratory analytical data
-Field data

V. Data reporting elements and format (*All*)

VI. Current status and next steps of lagoons modeling and development of TMDLs (*Wayne Chiu/All*)

VII. Next steps

Escondido City Hall
201 North Broadway

020214

Directions:

From Interstate 15:

Take Valley Parkway (Downtown) exit and head east. When Valley Parkway crosses over Centre City Parkway it becomes Second Avenue. Turn left onto Escondido Blvd. Cross over Valley Parkway, turn right into the parking lot just after the CA Center for the Arts.

From Highway 78:

Continue east on Highway 78 into Escondido. When 78 ends at the light, turn right on Broadway. Just past Washington Ave, turn right on Woodward Ave. The parking lot is on the left, just on the other side of the Boys & Girls Club.

DISCLAIMER: Every reasonable effort has been made to ensure the accuracy of this map. However, by accepting this material, you agree that the City of Escondido assumes no liability of any kind arising from the use of this map. THIS MAP IS PROVIDED WITHOUT WARRANTY OF ANY KIND, either expressed or implied, including but not limited to time, money or goodwill arising from the use, operation or modification of the map.

SMC MEETINGS

Stormwater Monitoring Coalition Steering Committee
Meeting Agenda
September 9, 2008
10:00 a.m. – 12:30 p.m. (Pacific Time)
at
Riverside County Flood Control and Water Conservation District
1995 Market Street, Riverside, CA 92501

http://maps.yahoo.com/maps_result?addr=1995+Market+Street%2C&csz=Riverside%2CCA+92501&country=us&new=1&name=&qty=

Conference Call In: (913) 227-1219, Code 425157

1. Introductions, meetings and announcements

2. Update on SMC website - Chris Crompton (County of Orange)

3. SMC Annual Report – Ken Schiff (SCCWRP)

4. Agreements – Chris Crompton
    a. Distribution of SMC Master Agreement D06-049
    b. Distribution of Low Impact Development (LID) Agreement D06-051
    c. Distribution of SMC Research Agenda Agreement D07-025
    d. Implementation of regional bioassessment program D08-026
    e. Toxicity amendment to laboratory intercalibration study

5. Ongoing project updates (as necessary)
    a. LID project status – Matt Yeager (SB County Flood)
    b. Hydromodification project status – Eric Stein (SCCWRP)
    c. Post-fire monitoring – Eric Stein
    d. Other projects

6. Future projects
    a. Follow-up discussion on proposed projects for 2008-09
        i. Trash and debris monitoring approaches and protocols
        ii. New intercalibration constituents
        iii. Stormwater data compilation study
        iv. BMP effectiveness testing
    b. SMC members are invited to present future projects for consideration

7. Committee member items

8. Next Meeting

Southern California Stormwater Monitoring Coalition
Steering Committee Meeting Agenda
December 9, 2008
10:00 a.m. –2:00 p.m. (Pacific Time)
at
Southern California Coastal Water Research Project
3535 Harbor Blvd, Costa Mesa, CA 92626
Conference Call In: see separate attachment

1. Introductions, meetings and announcements
   Minutes – send comments to Ken if any.

2. Update on SMC website - Chris Crompton (County of Orange)
   LID manual section updated (12/8/08) – password protected (see email).
   Need links to organization pages. **Request from those who have not submitted.**

3. Agreements – Chris Crompton
   a. Approval status of Low Impact Development (LID) Agreement D06-051
      - Approved—San Diego, Ventura, Riverside, Orange, CASQA, SCCWRP, SMC, San Bernardino
      - County of LA – working on it.
      - City of LA (will not be able to contribute this time around)
      - City of Long Beach (still working on it)
      - Request signature pages from Regional Boards
   b. Final review of SMC Research Agenda Agreement D07-025
      - Small functional update; cost decreased slightly
      - City of LA is in!
      - **Email Chris confirmation that parties are onboard by 12/19/08**
      - Thought: perhaps add planner onto selection of panel members (Jimmy). Send Ken names of potential experts & he will contact them.
   c. Final review of Regional Bioassessment Agreement D08-026
      - 3rd draft. See email from this morning.
      - Title change;
      - Pages 2-3 – addition of language "to incorporate the BIOASSESSMENT PROGRAM in stormwater permits in place of current bioassessment programs" (Arne suggestion)
        - Perhaps add "municipal"? Dependent perhaps on Caltrans' participation

- Q: what is intent of language addition? A: Puts in writing the intent of REPLACING this bioassessment program with MS4 requirements.
- Add SWRCB? Mesh SWAMP with this program – additional funds (Ken). SWAMP/SWRCB participation/depth of intent seems weak in the agreement. **Talk to SWAMP/SWRCB to draft "Whereas" portion (Ken).** Great idea to have State as a signatory; however, execution in timely fashion may take a while. **Also, "whereas" for RB coordination.**
- Need to act on this agreement quickly (Spring 09); otherwise allocated RB funds may be spent elsewhere

- S 14. Reorganization.
- Ex. B: List of participating agencies. Commit today if possible. Xavier, Chris & Matt will get together w/ City of LA (Sharam) before Christmas to see where they are at. **City of LA.**
- **Long Beach** – answer next week (1/2 share)
- Co. LA – on board
- Caltrans – dep. on what's on permit. Perhaps next week.
- San Diego Co. – On board. Permittees voted to be on board; but awaiting formal Permit amendment (trade w/ other permit requirements).
- LA Sanitation – not in. Talk to San Gabriel WS Council. Let's not add them now, but if money comes in, then great.
- (Jimmy) Data made public? As long as data is available, then its ok w/ Jimmy. Regional program – 1st year report, annual progress reports, final report? Appendix A Table – it's flexible enough. Bioassessment WG will determine what should be in the reports.
- [ABC note: Jimmy asked if Riverside is on board. Told him yes.]
- **FAST-TRACK! GET CHRIS ANY COMMENTS IN NEXT 2 WEEKS.**

d. Toxicity amendment to Laboratory Intercalibration Agreement D-05-022
- Exhibits C&D (first draft).
- Billings for Year 2 going out today.
- Sent out as scope some time back.
- A similar toxicity calibration was done on sediment samples during the BIGHT program.
- 2 species: 1 marine, 1 freshwater.
- Recalibration (similar to chemistry labs)? Number of Toxicity labs small and do not have high turnover. Let's do one for now; of course, more is better.
- Can add members since we are doing an amendment (current list on 1st page of Ex. C)
- **Please review and give Ken feedback; discussion at next meeting.**

4. Ongoing project updates (as necessary)

a. LID project status – Matt Yeager (SB County Flood)
- Matt's LID powerpoint (see email)
  - i. Draft Manual (**comments due Jan. 9, 2009**); Chapter 9(?) takes a long time to load – give it time. Final draft target: July 2009.
- **Arlene: Pre-testing this winter for pre-bmp retrofit (TALK TO JASON/MIKE CAIRNS/MATT RICH).**
- LGC presentation (Ventura County): "Reviewing Codes – Now What?"

i. Draft is done, but waiting for feedback/comment from Ventura. Early 2009 – out with product hopefully. (Email: nisenson@gmail.com (sp?))
ii. Opportunity? Work with planning and zoning to insert LID even where less that 5000sf disturbance occurs.

- Thoughts: What could be a potential project? What do we need to do to implement (perhaps) the LGC findings to make LID work? Do we take the findings/draft codes to a City?
- (Xavier) Leave the permit aside. While the permit may be a catalyst, the SMC is interested in moving forward with LID now. (Matt/Chris) We need prioritization of the 130 LGC findings. (LGC) Perhaps start with local manuals? (Chris) Regional approaches that are common to all SMC members may be a good start for this SMC. Could LGC perhaps propose a scope for a future project w/ the SMC? (LGC) Need to talk to colleagues & see what happens in Ventura. Matt has a good point, though. (X) Need to include the other 5 counties as the SMC is a regional organization; need for most regional benefit. (M) Evaluate plans of each county (6). (C) Take findings of Ventura and work from there; there may be commonality among all 6 counties.

b. Hydromodification project status – Ken Schiff (SCCWRP)
- Add-on to original hydromod proj (identify which streams at greatest risk; what are effects of hydromodification (& develop modeling tools to identify risk factors); what are potential mgmt actions/screening tools for these at risk locations. Eric Stein is lead. Completed GIS tools. Perhaps present screening tool at March meeting. **Looking for volunteer counties for field validation in summer. Ask Jason & verify w/ Ken.**

c. Post-fire monitoring – Ken Schiff
- In collaboration w/ Co. San Diego. Workshop in August 2008. Eric has draft report and will be out for review soon. Haven't been able to take advantage of recent fires (LA County). We can go ahead and take advantage of these recent fires if we want to. Draft may be on website soon.
- Thoughts/suggestions: Address multi-county fires. Kit of minimum requirements of what to do.

d. Laboratory Intercalibration – Ken Schiff
- **Invoices out. RCFC—Invoice #1743**
- Moving forward to invite labs to participate in the intercalibration study. **Review and send comments to Ken**. Letter will be sent out
- SS, nutrients/metals, pyrethroids (water/sediment?), OP pesticides. How about PAHs & chlorinated pesticides? Agreement has OP/chlorinated pesticides. Would need to add/amend for pyrethroids.
- Going w/ OP & chlorinated.

e. Stormwater data compilation study – Ken Schiff
- Handout ("Bight '08 Offshore Water Quality Monitoring Storm Water Update")
- SCCWRP compiles now.
- Mass emissions for POTWs calculated (POTWs send SCCWRP samples monthly) & reported in SCCWRP's annual reports. Will be starting for stormwater (nutrients will be first test). However, not everyone measures the same thing. BIGHT '08 program: stormwater data was received (extra sample, SCCWRP-analyzed); good timing w/ this data compilation.

f. Other projects – none to discuss.

5. Future projects - Follow-up on proposed projects
    a. Trash and debris monitoring approaches and protocols – Arne Anselm & Ted von Bitner
        - There's a SWAMP standard, modified slightly by each implementing entity (usually for receiving waters).
        - Ted's presentation (OC monitoring project in Fullerton Creek).
        - (Chris) Could this be a BMP effectiveness project versus a Trash Characterization study? OC findings point towards more of a non-point source of trash (e.g., wind) since screens are helping trash keep out of the stormdrain.
        - (LA Co.) Currently working on a plan to address non-point sources of trash. Apparently, current plans in LA Co. & TMDL are not making a difference in the amount of trash collected (Malibu Creek Trash TMDL).
        - (J) More interested in actual effectiveness of the BMPs in place. What is the level of local enforcement/money spent/effort effectiveness? Which one is doing a better job?
        - (Arne) Sounds like 2 projects – method assessment/source id & BMP effectiveness. Portion of BMP effectiveness may be labor intensive however.
        - (Steve W) – OPC likely to fund SCCWRP to look at a trash study statewide. Time frame starts Summer 2009. Overall trash on beaches. Subset of drainage area to focus on looking at plastics. Not a lot of money. Just a survey of whether trash is getting better or worse on the beaches.
        - (Chris) Perhaps we need to see OPC's scope and hopefully refocus the SMC's thoughts.
        - (X) Jenny Malloy (federal level) – "What are municipalities doing to reduce marine debris?"
        - (J) Is there a rapid assessment method out there to focus on our limited resources? With our limited resources, can we just focus on determining what/where the hot spots are?
        - (C) We need to sit down and think this through offline (subset). Come back at next meeting. (Steve, Jimmy, Ted, Chris, Arne).
    b. BMP effectiveness testing – Mike Borst (EPA-ORD) – no update/presentation
    c. LID implementation constraints – Matt Yeager
        - (covered earlier in LGC presentation)
    d. Discussion of other potential projects for 2009-10
        - Martha Sutulu (SCCWRP) – nutrients, presentation. Characterization of nutrient sources from SoCal watersheds (proposal for submission to the prop 84 RFP)
            i. Need for nutrient source characterization. Data lacking on relative magnitude of wet and dry weather sources of nutrients from land cover types. Nutrient criteria in streams and estuaries (SD NNE project).
            ii. Prop 84 SW program RFP presents opportunity to address regional data gap. SCCWRP may not be eligible for this prop – may need to join forces.
            iii. Develop conceptual model; collect data; perhaps develop/propose mgmt tools.
            iv. Rough budget: $1M. 20-25% match (SMC?) paper, piggyback w/ current program.
            v. (C) Time frame for submitting pre-proposals? Approval w/ SB, submission rapid. Comments on RFP due Dec. 19. CASQA Jan meeting – talk on this prop 84 SW program.

vi. Looking for partnership w/ government agency. [ABC note: could this help in TMDL implementation? Check w/ LESJWA/SJR Council].
vii. Perhaps a concept proposal for next meeting. Effects-based modeling.

6. Committee member items

7. Next Meeting – Tuesday, March 3, 2008. SCCWRP. 10-12:30 p.m.

Southern California Stormwater Monitoring Coalition
Steering Committee Meeting Agenda
March 3, 2009
10:00 a.m. –12:30 p.m. (Pacific Time)
at
Southern California Coastal Water Research Project
3535 Harbor Blvd, Costa Mesa, CA 92626
Conference Call In: see separate attachment

1. Introductions, meetings and announcements

2. Agreements – Chris Crompton
    a. Approval status of Low Impact Development (LID) Agreement D06-051
    b. Final review of SMC Research Agenda Agreement D07-025
    c. Final review of Regional Bioassessment Agreement D08-026
    d. Toxicity amendment to Laboratory Intercalibration Agreement D05-022

3. Ongoing project updates (as necessary)
    a. LID project status – Matt Yeager (SB County Flood)
    b. Hydromodification project status – Eric Stein (SCCWRP)
    c. Post-fire monitoring – Eric Stein
    d. Laboratory intercalibration – Ken Schiff
    e. Stormwater data compilation study – Eric Stein and Shelly Moore
    f. Other projects

4. Future projects - Follow-up on proposed projects
    a. LID implementation constraints proposal from LGC – Matt Yeager
    b. Nutrient source characterization study – Martha Sutula
    c. Regional collaboration on new permit issues – Matt Yeager
    d. Discussion of other potential projects for 2009-10

    (Trash and debris follow-up deferred until June meeting)

5. Committee member items

6. Next Meeting

Southern California Stormwater Monitoring Coalition
Steering Committee Meeting Agenda
June 2, 2009
10:00 a.m. –12:30 p.m. (Pacific Time)
at
Southern California Coastal Water Research Project
3535 Harbor Blvd, Costa Mesa, CA 92626
Conference Call In: see separate attachment

1. Introductions, meetings and announcements

2. Ongoing project updates (as necessary)
    a. Post-fire monitoring – Eric Stein (SCCWRP)
    b. LID project status – Matt Yeager (SB County Flood)
    c. Stormwater data compilation study – Eric Stein and Shelly Moore (SCCWRP)
    d. Laboratory intercalibration – Ken Schiff (SCCWRP)
    e. Hydromodification project status – Eric Stein
    f. Other projects

3. Agreements – Chris Crompton (County of Orange)
    a. Approval status of Low Impact Development (LID) Agreement D06-051
    b. Status of SMC Research Agenda Agreement D07-025
    c. Status of Regional Bioassessment Agreement D08-026
    d. Toxicity amendment to Laboratory Intercalibration Agreement D05-022

4. Future projects - Follow-up on proposed projects (as necessary)
    a. LID implementation constraints updated proposal from LGC – Matt Yeager
    b. NOAA regional impervious data layer – Eric Stein
    c. Regional collaboration on new permit issues – Chris Crompton/Matt Yeager
    d. Southern California BMP effectiveness – Xavier Swamikannu (LARWQCB)
    e. Trash and debris monitoring – Arne Anselm (Ventura WPD)/Ted von Bitner (Orange County)
    f. Nutrient source characterization study – Martha Sutula (SCCWRP)
    g. Discussion of other potential projects for 2009-10

IRWM MEETINGS

Tri-County Funding Area Coordination Committee DWR Meeting

Wednesday February 4th 2009 2:00 PM

Bonderson Building at 901 P St. Sacramento, CA 95814
Large Conference Room on the Second Floor of West B wing a the far right end

Meet-up location: La Bou Bakery & Cafe: Downtown
1100 O St # 1 Sacramento, CA 95814 (916) 447-4281, Map Link here

Attending

DWR

- Paula Landis, acting DPLA chief
- Tracie Billington
- Ralph Svetich
- Norman Shopay
- Anna Aljabiry

San Diego Funding Region

- Matt Stone Rancho California Water District/Riverside
- Perry Louck, Rancho California Water District/Riverside
- Mary Anne Skorpanich, County of Orange
- Tom Rosales, South Orange County Wastewater Authority
- Toby Roy, San Diego Water Authority
- Marci Stirer, City of San Diego
- Tom West, RMC Water
- Daniel Cozad, Integrated Planning and Management

Goals of the meeting

- Help DWR understand the Tri-County FACC and our commitments to plan together
- Why we are not SOLELY county line separate
- What are their doubts or questions
- Why what we are doing works and should be supported in the RAP

Determinations/Discussions for the Conference Call

- Who will take which roles?
- Changes to the order or supporting points
- How much time to leave for questions (talking points are aimed at 20-30 min)
- Follow-up from the meeting
- What to do if we get immediate acceptance
- What to do if we get immediate rejection

Potential Questions

Who is doing more to cooperate among planning areas?
What is DWR's official view of what the right region size is?
What is the overriding benefit to larger region if it does not work locally?

Messages/Talking Points

1) Introductions – We are planning Together

a) Committed to planning together, where we were, are now and are going (graphic leave behind)
b) We have documented our commitment (Tri-County FACC MOU in legal review)
c) 7 reasons Water Supply, Wastewater, Groundwater, Land use, Flood protection, Stormwater and Environmental Resources (on leave behind sheet)

2) One Size Does Not Fit All in California

a) Funding area cooperation, regional integration and sub-regional planning is working
b) We cover the entire funding area, we are separated into planning subregions or communities of interest that work in our region (map on leave behind sheet)
c) Our overlay areas ensure integration of watershed areas that cross planning regions
d) In Southern California built water/wastewater systems carry more institutional weight than watersheds due to small groundwater basins and many small coastal watersheds
e) This size and layout fits the region, allows comfort for local elected officials and real engagement of DAC, federal, tribal, habitat, flood control, etc. on a sub-regional basis

3) How and why we chose this structure

a) Reviewed 5 alternatives for 15 factors and chose this structure, made changes to the plan
b) MOU documents terms allocating funding in a fair manner while preserving integration
c) Consistent with how we work together, eg, Regional Board TMDL, Stormwater, etc.
d) Allows independent IRWM funding (Measure M - OC, Tribal agreements - Riv Co.)
e) We will create common plan elements, regional description and others
f) Members of Each Regional Advisory Committee attend the other RAC meetings

4) Focused on the Planning and Cooperative Integration

a) We focused on engaging communities and planning not creating additional bureaucracies
b) Larger IRWM programs are not better at engagement or interaction with DAC, disengaged local non-profits, only region agency staff attend if too large.
c) Precedent for using county lines in Regional Board and the Legislatures division of the South Coast Region into San Diego, Santa Ana and LA subregions
d) Many regions faced this issue, consolidation now would distract planning, reduce trust

5) Future Cooperative efforts

a) We continue to build relationships and develop additional ways to work together
b) Common schedules and data management are possible
c) Additional common planning components and possibly grant will be reviewed
d) Evaluation of common strategies, objectives, and priorities
e) Search for not just collaboration but efficiency and ensuring the highest quality of multi-benefit projects are funded and completed

6) RAP submission and Interviews

a) Working together to prepare a common application
b) Would like to interview together

7) Recap, Questions and Closing

We are pleased to announce that a Watershed Panel will be convened at our August 25th RAC meeting!

Developing a better understandingof watershed issues was identified as a priority for the RAC, so we haveconvened a group to present current and future watershed planning activities throughout the Region. The purpose of the panel is to identify opportunities for the IRWM effort to bring watershed planning to a consistent level in the Region's hydrologic units. The group will also explore how thewatershed approach could reformulate the IRWM governance structure. We look forward to seeing you there!

Regional Advisory Committee Meeting #18
NAugust 25, 2008
9 a.m. – 11:30 p.m.
San Diego County Water Authority
4677 Overland Ave., San Diego CA 92123
(858) 522-6600

Thank you!
Rosalyn

CASQA MEETINGS

CASQA Pesticides Subcommittee members,

Our next meeting will be Monday August 11 at 1:30 p.m. The agenda is in preparation and will be out soon.

The call-in information is:

Phone: Phone: 1-866-495-8302 Code: 2563789

Please let me know if you won't be able to participate.

Kelly Moran
TDC Environmental
CASQA Pesticides Subcommittee Co-Chair

DRAFT AGENDA

Monday August 11 1:30 p.m.

1. Review/amend agenda (Dave, 5 mins.)

2. *Need* volunteer to take meeting notes for today's call

AND Develop plan for notetaking on future calls (Dave 5 mins)

3. Announcements and updates (All, 5 mins) --Any announcements from participants --CASQA Conference registration is open, need to encourage attendance

(Kelly)

--Pesticide monitoring data complete (Armand) --Outcome of request to EPC for Supplemental funding for subcommittee activities (Dave)

--UP3 Project pyrethroid use estimates report published--thanks to reviewers! (Kelly)

4. DPR Pyrethroid Reevaluation (Kelly & All, 30 mins)

—DPR responses to our comments (Kelly)

-continue planning for a meeting with DPR/PWG to share information about modeling, monitoring, and our regulatory context

5. Supplemental funding (Dave 5 mins.)

6. Overall strategy with DPR (Kelly, 15 minutes)

7. Next meeting (Dave, 5 mins)

--Set date & time for next subcommittee teleconference

--Make list of items for discussion

CASQA 2008 Conference Agenda – Draft Final

020235

Sept. 23 - Tuesday Morning				
Opening & Keynote 8:30 - 9:40	**Peter Gleick - "Storms and Water in the 21st Century"**			
Break 9:40 - 10:00				
Session 1	**Track A** **Construction General Permit**	**Track B** **Planning and Monitoring Assessment**	**Track C** **Bacteria Source Tracking**	**Track D** **Stormwater Management and Treatment**
10:00 - 10:30	Field Implementation of the New Construction Permit Sandy Mathews: LWA	Biological Health of Streams in the Highly Urbanized Los Angeles Basin: Status and Trends Bill Isham: Weston Solutions, Inc.	Evaluation of Environmental Toolkit for Fecal Microbial Source Tracking Alexander Schriewer: UC Davis	Design of Regional Urban Watershed Dry-weather Flow Treatment System-Talbert Lake Diversion Project Bruce M. Phillips: PACE
10:35 - 11:05	Inside the New Construction Permit Greg Gearheart: SWRCB	Assessing Stormwater Program Progress Through Dry Weather Monitoring Brock Bernstein	Bacteria Fate and Transport in the Infamous Los Angeles River Dustin Bambic: AMEC	Daly City Vision: Converting a Flood-Prone Area into a Multi-Benefit Site Celine Monget: RMC Water
11:10 - 11:40	Construction Industry Coalition on Water Quality Evaluation of Construction Site Erosion and Sediment Control BMPs to meet TMDL Waste Load Allocations Mark Grey: CICWQ	Planning for Productivity. NPDES Industrial and Commercial Inspections. Achieving Quality and Quantity Results Chandra Santiago: AEI-CASC	How Microbial Source Tracking can Help Define Sources, Abatement and Policy in a Bacterial TMDL: Tecolote Creek Gretel Roberts: Weston Solutions, Inc.	Neighborhood Watershed Stormwater Management: The Elmer Avenue Neighborhood Retrofit Project Edward Belden: LA & San Gabriel Rivers Watershed Council
Alternates		Design of Bio-Retention Cells: Integrated Volume and Flow Based Hydrologic Analysis Luis Parra-Rosales: Adams Engineering	Implementation and Prioritization of Bacterial Indicator TMDL Compliance Activities in the Middle Santa Ana River Watershed Don Schroeder: CDM	Stormwater Management on San Francisco's Cesar Chavez Street – a Conceptual Plan for Low Impact Design in an Ultra-urban Landscape Phoebe Grow: RMC Water
Exhibitor Break 11:40 - 12:00				
Lunch and Awards Program 12:00 - 1:30				

CASQA 2008 Conference Agenda – Draft Final

020236

Sept. 23 - Tuesday Afternoon				
Lunch and Awards Program 12:00 - 1:30				
Session 2	**Track A** **Research - Runoff Impacts and Treatment**	**Track B** **Monitoring and Treatment Assessment**	**Track C** **Water Quality Monitoring and Treatment**	**Track D** **LID Implementation**
1:30 - 2:00	Endocrine Disrupting Compounds in Urban Runoff: Is There A Problem Chris Campbell - Geosyntec	In situ Bioassays Using Rainbow Trout Embryos for Evaluation of Stormwater Receiving Environments Chessy Knight: Nautilus Environmental	The Bottom Line: Estimating the Cost of Monitoring Provisions in the New Bay Area Municipal Regional Permit Khalil Abu-Saba: Brown and Caldwell	Implementation of Low Impact Development at Various Scales – An Engineer Design Approach Hong Lin: CONTECH
2:05 - 2:35	Small-Scale Studies on Alternative Media for Stormwater Treatment Dipen Patel: CSU Sacramento	Optimizing Stormwater Sampling Using Watershed Model Output Drew Ackerman: SCCWRP	Coordinated Monitoring by SWAMP and Stormwater Agencies: Watershed Contaminant Trends and Pyrethroids in Urban Streams John Hunt: UC Davis	The Road to Low Impact Development - Green Streets and Parking Lots in San Mateo County Matt Fabry: SMCWPPP
2:40 - 3:10	Direct and Indirect Effects of So. Cal. Wildfires on Storm Water Runoff of Metals and PAHs Eric Stein: SCCWRP	Small Particle Removal Performance of Full-Scale Stormwater Filters John Johnston: CSU Sacramento	Sediment Chemistry and Toxicity in Urban Wetlands Jeff Brown: SCCWRP	Making Local Regulations "LID-Friendly" – A Case Study of One California Community Rebecca Winer-Skonovd: LWA
Alternates	Automated System Protects Napa River Matt Hromatka: Clear Water Compliance Services, Inc.	BayFilter – Testing and Verification of a Stormwater Treatment Technology Alex Weisz: BaySaver Technologies	Development of the Agua Hedionda Watershed Management Plan – Incorporating Quantitative Analyses Steve Carte: Tetra Tech, Inc.	Hydrologic and Water Quality Benefits of Low Impact Design: A Case Study Sarah McIlroy: Stantec Consulting, Inc.
Break 3:10 - 3:40				
Session 3	**Construction Training and Inspection**	**Program and Monitoring Assessment**	**Planning - Integrated Regional Management**	**BMP Design and Implementation**
3:45 - 4:15	Developing a Statewide Training Program for Construction General Permit Compliance Greg Gearheart: SWRCB Eric Bernsten: SWRCB Daniel Apt: RBF Consulting	The Next Step – Conducting Program Effectiveness Assessments for Annual Reports. Lessons From Around the State Karen Ashby: LWA	Integrated Water Management Chris Kloss: LID Center	Beyond BMP Design by Rules-Of-Thumb - A Simple Hydrograph Approach to Designing Bioretention and Filtration BMPs. Jeffrey Endicott: AEI-CASC
4:20 - 5:00	Sacramento County Post-Construction BMP Inspector Training Summer Christensen: Sac. Co.	Water Quality Monitoring & Stormwater BMP Treatment Effectiveness Lawrence Magura: Black & Veatch	A Regional Stormwater Treatment Approach: Regional Retrofitting Study Orange County, California Daniel Apt: RBF Consulting	A New Direction for Stormwater Filtration Joel Garbon Imbrium Systems
Alternates	Green Roofs and Their Multiple Environmental Benefits Daniel Apt: RBF Consulting	Techniques to Improve Storm Water Monitoring and Your Bottom Line! Peter Wilde: ADH Environmental	Conditional Waivers for Irrigated Lands-Current Regulation of Agricultural Discharges Amy Storm: LWA	Simple Structural Methods for Urban Stormwater Pollution Reduction Targeting Trash, Gross-Pollutants, Hydrocarbons, and Bacteria T.J. Mullen: BMP Products, Inc.
Exhibitor Sponsored Reception 5:30 - 7:30				

CASQA 2008 Conference Agenda – Draft Final

020237

Sept. 24 - Wednesday Morning				
Session 4	**Track A** **Hydromodification Planning and Management**	**Track B** **BMP Effectiveness**	**Track C** **LID - Planning**	**Track D** **Stormwater Management and TMDL Compliance**
8:30 - 9:00	Managing Hydromodification in Steep Terrain Jeff Haltiner: PWA	International Stormwater BMP Database Enhancements and Updates Eric Strecker: Geosyntec	Site Specific Considerations in LID Feasibility and Effectiveness Lisa Austin: Geosyntec	Climate Change and Stormwater Quality Management: Opportunities for Collaboration Regulatory Management and Revenue Generation John Bliss: SCI Consulting Group
9:05 - 9:35	A Stream Susceptibility Identification Tool for Use in Hydromodification Planning Chris Bowles: CBEC	A Robust Statistical Approach for Summarizing Stormwater Quality Data with Non-Detects and Unknown Distributions Marc Leisenring: Geosyntec	Implementing LID in Contra Costa: Review, Design, and Construction of New Developments and Redevelopments: Panel Discussion Dan Cloak: Dan Cloak Environmental Consulting	TMDLS and Watershed Management: What are the Options for Stormwater Treatment – LA Anna Lantin: RBF Consulting
9:40 - 10:10	Relationships Between Detention Basin Volume and Hydraulic Detention Time: A Modeling Study Dave Alderete: CSU Sacramento	BMP Effectiveness Evaluation Using the Triad Approach Mark Pumford and Scott Johnson City of Oxnard		Urban Runoff Management in the Los Angeles Area: Approach for Achieving TMDL Compliance Reza Iranpour: City of Los Angeles
Alternates		Santa Monica Bans Polystyrene Food Containers and Opens Corporate Doors Karl Bruskotter: City of Santa Monica	Low Impact Development in a Built Environment Catherine Tyrrell: Malcolm Pirnie	Water Quality Trading: Where is California? Persephene St. Charles: RMC
Break 10:10 - 10:40				
Session 5	**Bacteria Tracking and Treatment**	**Pollutant and Program Assessment**	**Public Education**	**Stormwater Management, Collaboration, and Regulation**
10:40 - 11:10	What Have We Learned From Bacterial Source Tracking Studies Joan Brackin: Weston Solutions	Spatial and Temporal Variability of Pollutant Loading in Ballona Creek Mike Anghera: Weston Solutions	Web Trappings: Enticing Web Visitors and Bringing Them Back Tiffany Jonick: S. Groner Associates	BASMAA - A Model for Collaboration and Innovation Geoff Brosseau: BASMAA
11:15 - 11:45	Bacterra™- Discussion of the Benefits, Mechanisms and Efficiencies for Bacteria Removal Mindy Ruby: Filterra	Assessment of Proposition O Projects in the City of Los Angeles, CA for Storm Water Clean-up Mi-Hyun Park: UCLA	10 Education Pieces That Work Tom Lawrence: Consultant	Using Numerics to Define MEP: The Legal and Technical Implications Tess Dunham: Somach, Simmons & Dunn
Alternates	Development of a Bacteria TMDL within a Stakeholder Process: Los Angeles River Jagjit Kaur: CH2M HILL	City of Los Angeles' Activities to Meet Stormwater Regulations Huub Cox: City of Los Angeles	Effective and Efficient Outreach and Education for the 21st century J. Michael Huls : Huls Env. Media	The Dynamics of Collaboration in an Enforcement Setting Andre Monette: Best & Krieger, LLP
Lunch 12:00 - 1:15				

CASQA 2008 Conference Agenda – Draft Final

020238

Sept. 24 - Wednesday Afternoon				
Lunch 12:00 - 1:15				
Session 6	Track A Pesticides	Track B BMP Assessment	Track C Smart Growth v. LID	Track D BMP Implementation
1:15 - 1:45	Five Decades After Silent Spring: : Now It's Your Problem Armand Ruby: Consultant	Assessing the Use of Turbidity as a Storm Water Runoff Quality Assessment Tool Sandy Mathews: LWA	Stormwater Management on Smart Growth Sites: New Ways of Thinking. Tom Richman: Consultant	Stormwater Treatment with Aluminum-Based Coagulants: Promises and Problems Jeff Curtis: ECO:LOGIC Engineering
1:50 - 2:20	Urban Runoff as a Source of Pyrethroid Pesticides from Residential Areas Donald Weston: University of California	Analysis of Legacy Organochlorine Concentration and Loads: Application of a New Sampling Method and Use of Regression Modeling to Assist in Source Identification and Load Estimation Stuart Goong: County of Orange	The Integration of Low Impact Development (LID), Green Highways, and Green Infrastructure with Smart Growth Principles and New Urbanism Principles Neil Weinstein: LID Center	Erosion Control Performance Studies on Ornamental Vegetation, Compost, and Jute Netting Misty Scharff: CSU Sacramento
2:25 - 2:55	Insecticide Wash-Off From Urban Hard Surfaces Brant Jorgenson: UC Davis	BMPs – Design, Monitoring and Efficiency Assessment Suraj Shankar: Weston Solutions, Inc.	Lessons Learned and Innovative Approaches for LID Techniques in an Urbanized Watershed to meet an Integrated TMDL and Watershed Strategy in Southern California David Pohl: Weston Solutions, Inc.	Simulating Stormwater Treatment Performance of Man-made Lake BMPs Ron J. Rovansek: PACE
3:00 - 3:30	Pesticide Detections in Dry and Wet Weather Surface Runoff from Single-Family Residences Darren Haver: University of California Cooperative Extension- Orange County	Post Construction BMP Maintenance – What Have We Learned from Our California Experience? Vaikko Allen: CONTECH	I-5 North Corridor Storm Water Quality Master Plan Wilfred Hsu: CH2M HILL	Voluntary Compliance By San Diego County Schools - A Non-Traditional Small MS4 Success Story Stephen Herrera: Owen Psomas
3:35 - 4:05	The Pesticide Reality Shock: How to Deal with Synthetic Pyrethroid Assessments in Urban Runoff Monitoring Programs Dave Renfrew: Weston Solutions, Inc	**ALTERNATE** The Use and Assessment of Natural Treatment Wetlands (WetTraq) Andrea Crumpacker: Weston Solutions, Inc.	**ALTERNATE** San Diego Hydromodification Management Plan: Setting the Standard for Southern California Municipal Storm Water Programs Nancy Gardiner: Brown and Caldwell	**ALTERNATE** Representing Stormwater BMP Influence at a Watershed Scale: A Case Study of the Lake Tahoe Clarity TMDL Implementation Plan for Urban Areas John Riverson: Tetra Tech, Inc.

020239

California Stormwater Quality Association™

Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation

Meeting Notice & Agenda

Friday, November 14, 2008, 9:00 a.m. to 3:00 p.m.
Hilton Hotel, Costa Mesa
3050 Bristol Street, Costa Mesa, California 92626 714-540-7000

Meeting Fee: Pre-register by November 7, $45 – Members / $45 – Regulators / $65 – Non-members
Meeting Fee: After November 7 and at door, $60 – Members / $60 – Regulators / $80 – Non-members
Registration online until 5:00 pm, November 13
LIVE Webcast now available – Purchase individual use or site use access online until Thursday November 13
Meeting fee payable at the door beginning at 8:00 a.m. – Check preferred, no credit cards at the door
Meeting fee includes lunch. CASQA is a 501(c)(3) non-profit corporation. CASQA Tax Identification Number: 55-0797265

Integrating Water Quality, Hydrograph Modification and Stormwater Permitting

I. Welcome / Introductions / Announcements (9:00 – 9:15)
Chris Crompton, Chair / Scott Taylor, Vice Chair / Geoff Brosseau, Executive Director

II. Integrating Water Quality, Hydrograph Modification and Stormwater Permitting – I: Introduction (9:15 – 9:30)
Richard Boon, County of Orange

Impervious Surface Coefficients: A Tool for Analysis and Management (9:30 – 10:00)
Barbara Washburn, PhD, OEHA

Deficiency of Watershed Sediment Yield and its Impact on Channel Hydromodification (10:00 – 10:30)
Hasan Nouri, PE, President, Rivertech

Development of Tools for Hydromodification Assessment and Management (10:30 – 11:00)
Eric Stein, PhD, SCCWRP

Q&A (11:00 – 11:45)

III. Statewide Permit Renewal Update (11:45 – 12:00)
Sandy Mathews & Mack Walker, LWA

Lunch (12:00 – 1:15)

IV. State and Federal Reports (1:15 – 1:30)
USEPA, SWRCB, and RWQCBs

V. Integrating Water Quality, Hydrograph Modification and Stormwater Permitting – II: A Methodology for Integrating Water Quality and Hydromodification (1:30 – 2:00)
Tom Cahill, P.E. Cahill Associates Inc.

Case Studies (Los Angeles) (2:00 – 2:20)
Catherine Tyrrell, Senior Associate-Water Resources, Malcom Pirnie

Case Studies (Orange and Ventura Counties) (2:20 – 2:40)
Aaron Poresky, Geosyntec

Q&A (2:40 – 2:55)

VI. Closing (2:55 – 3:00)
Chris Crompton, Chair

The content of presentations by individuals and organizations other than CASQA has not been officially reviewed, approved, or endorsed in any way by CASQA or any of its employees or agents.
Any opinions or conclusions expressed in the presentations are the opinions and conclusions of the speakers and are not necessarily the opinions or conclusions of CASQA or any of its employees or agents.

P.O. Box 2105 Menlo Park CA 94026-2105 650.366.1042 www.casqa.org info@casqa.org

Call-in details:

PHONE: 1-866-495-8302

CODE: 5554347896

Action items resulting from the 11/6/08 meeting:

- Provide update re: CA Water Quality Monitoring Council 11/18 meeting/draft recommendations (Armand)
- Forward SoCal ASBS monitoring plan to group (Geremew)
- Forward CASQA pyrethroid pesticides research compilation to group (Armand)
- Review/comment on CWP Monitoring Guidance document (Chris S./Chris C.)
- Prepare two requests for CASQA funding: 1) Monitoring/Research Agenda - Web Access; 2) Regulatory and Technical Assistance (Armand; for EPC meeting 11/13/08)

Issues to track/follow-up on:

- ASBS Special Provisions/monitoring - Central Coast, NorCal (group)
- Ask SCCWRP about SMC hydromod/monitoring study (Jay/Armand)
- Toxicity testing for episodic (storm-based) events; appropriate exposure times (group)
- Ventura County draft permit/Municipal Action Levels/sampling timing/period (group)

Please let me know if I've missed anything. Meeting notes to follow. Thanks - Armand

Armand Ruby Consulting

P.O. Box 945, Capitola, CA 95010

Tel.: 831-477-1214

Web Site: www.armandrubyconsulting.com

Guest: Li-Ming He, Scientist with DPR. Will be giving an update on the DPR Urban Monitoring Project.

The call-in information is:
Phone: Phone: 1-866-495-8302 Code: 2563789

DRAFT AGENDA

Wednesday, December 10 at 10 a.m.

1. Review/amend agenda (Dave, 2 mins.)

2. *Need* volunteer to take meeting notes for today's call

3. Announcements and updates (All, 5 mins)
--Any announcements from participants

4. DPR's Urban Monitoring Project (Li-Ming He, DPR, 30 mins)
--Lee will provide an update on DPR's monitoring of urban creeks
--Presentation slides will be send prior to teleconference

5. EPA Antimicrobials Data Rule - Swimming Pools (Kelly, 5 minutes)
--Update on schedule/confirm process for comment letter to EPA

6. Fundraising (Dave, 5 minutes)

7. DPR Pyrethroid Reevaluation (All, 20 minutes)
--Update on recent DPR activities (Kelly)
--Attorney consultation update (Dave)
--joint letter with Tri-TAC to Cal-EPA delayed
--Statewide agency meeting with DPR (Dave)
--Cost estimates memo (Armand)

8. Next meeting (Dave, 5 mins)
--Set date & time for next subcommittee teleconference
--Make list of items for discussion

California Stormwater Quality Association™

Dedicated to the Advancement of Stormwater Quality Management, Science and Regulation

Meeting Notice & Agenda

Friday, January 9, 2009, 9:00 a.m. to 3:00 p.m.
San Diego Marriott Mission Valley, San Diego
8757 Rio San Diego Drive, San Diego, California 92108; 619-692-3800

Meeting Fee: Pre-register by NOON, January 6, $45 – Members / $45 – Regulators / $65 – Non-members
Meeting Fee: After NOON, January 6 and at door, $60 – Members / $60 – Regulators / $80 – Non-members
Registration online until 5:00 pm, January 8
LIVE Webcast option available–Purchase individual use or site use access online until Thursday January 8
Meeting fee payable at the door beginning at 8:00 a.m. – Check preferred, no credit cards at the door
Meeting fee includes lunch. CASQA is a 501(c)(3) non-profit corporation. CASQA Tax Identification Number: 55-0797265

Annual Federal and State Stormwater Program Updates

I. Welcome / Introductions / Announcements (9:00 – 9:15)
Hosts: Chris Crompton, Chair / Scott Taylor, Vice Chair / Geoff Brosseau, Executive Director

II. Federal and State Update on Stormwater Management and Water Quality Issues (9:15 – 10:30)
John Kemmerer, Associate Director, Water Division, USEPA Region 9
Dorothy Rice, Executive Director, State Water Resources Control Board

III. NRC Report on Urban Stormwater Management in the United States (10:30 – 12:00)
Laura Ehlers, Senior Staff Officer, Water Science and Technology Board,
National Research Council, National Academy of Sciences
Greg Schaner, Attorney Adviser, Permits Division, USEPA Office of Wastewater Management

Lunch (12:00 – 1:15)

IV. State and Federal Reports (1:15 – 1:40)
USEPA, SWRCB, and RWQCBs

V. Preparing for the Proposition 84 Stormwater Grant Program (1:40 – 2:55)
Lessons Learned from the ASBS Grant Program
Julé Rizzardo, Senior Water Resources Control Engineer, State Water Resources Control Board

Guidance for Preparing Effective Stormwater Grant Applications
Jim Maughan, Asst. Deputy Director, Div of Financial Assistance, State Water Resources Control Board
Erin Ragazzi, Senior Environmental Scientist, State Water Resources Control Board

VI. Closing (2:55 – 3:00)
Chris Crompton, Chair

CASQA Pesticides Subcommittee members,

Our next teleconference meeting will be Monday January 26 at 10 a.m.

The agenda is below. The meeting will focus on prioritization and planning to accomplish key actions in light of the loss of support from the UP3 Project due to the statewide stop-work order for all grant-funded projects.

The call-in information is:

Phone: Phone: 1-866-495-8302 Code: 2563789

Please let us know if you won't be able to participate.

Dave Tamayo and Kelly Moran
CASQA Pesticides Subcommittee Co-Chairs

CASQA Pesticides Subcommittee

Agenda & Draft Notes
Monday, January 26, 2009 at 10 a.m.

DAVE's NOT PRESENT, Jamison

1. Review/amend agenda (Jamison, 2 mins.)

Jamison Crosby, Arlene Chun, Kelly Moran, Christine Couch, Armand Ruby
2. *Need* volunteer to take meeting notes for today's call
3. Announcements and updates (All, 5 mins)
--Any announcements from participants Meeting w/ DPR (Jamison)

4. Designate acting co-chair during Dave's absence (Dave, 3 mins)
--Jamison Crosby has volunteered to serve as acting Co-Chair during Dave's absence
--also, contract management duties (Jamison) -- approving invoices (eg Kelly & Armand)

--for Item 8 -- finance mgmt. needs to be worked out, esp in Dave's absence (end of Feb).

5. UP3 Project status (Kelly, 5 mins)
--statewide stop-work order issued 12/18; State Bond-funded projects.
--Work may be stopped until summer -- can't work on projects until State has CASH IN HAND.

Est. $10,000/month of work not being done. Athena website, etc.; Kelly tech work. CASQA supplying some funds over couple of months to keep on DPR radar.

--Overview of what's not being addressed. (See also item #8 below)

AQUATIC PESTICIDES APPLICATION PERMIT. There was a court decision that overturne EPA decision re. pesticides to water bodies whether or not to have NPDES permit. YOU NEED AN NPDES PERMIT TO APPLY PESTICIDES IN WATER BODIES. AFFECTS MOSQUITO ABATEMENT, ETC. NOW AT RISK OF LITIGATION. STATE REGULATIONS ARE STILL IN PLACE! EPA HAS NOT DEVELOPED GUIDANCE FOR THE STATE(S) YET. TALK TO THE STATE BOARD.

Microbial rule (biocides, algicides) -- EPA review letter: there will be no State Board letter to EPA on this (re: chemical analysis & data, endangered species handling, cooling towers, degradation, economic analysis) Data rule, comments due April 6th; however, things still in flux due to new administration (Lisa Jackson, EPA) so we may not know when the rule is finalled as new admin is reviewing everything from previous administration. Could this buy us some time?

Pesticides affecting salmon (west coast), endangered species act. Kelly has noticed label notice at OSH concerning this (not by carbaryl, etc., but by metal-based?). Application of pesticides/EPA process unclear. Was on January UP3 meeting agenda. Broad requirement, Bush Administration rule; EPA's risk assessment is "enough". Rule overturned; EPA changed risk assessment, however still broad. Ag & urban application of pesticides are included.

6. Fundraising (Dave, 5 minutes)--letter

Arlene & Christine: please review this letter. Meeting 2:30pm Wednesday. 1/15/09 draft is okay to review as well.
--update on long-term fundraising planning
--introduce emergency need for interim funding

7. DPR Pyrethroid Reevaluation (All, 10 minutes)
--Attorney consultation update (Dave). Alameda County counsel looked over. DPR is required to required to provide data w/in 2 years.
--Water Board actions (Kelly). Dorothy Rice met w/ Maryann Warmerdam before Christmas. Board involvement has been helping. However, meeting with DPR was suggested through CASQA and all are hopeful to keep moving forward.
--EPA label language (Kelly). EPA is close to issuing voluntary (?) label changes. Pre-construction termaticide treatments. Label-direction changes. February? CASQA had previously commented on this & EPA has implemented those comments.
--Statewide agency meeting with DPR (Dave). Jan 13. Jamison Crosby, Dave Tamayo, Jim Scanlin, Jason Uhley, Geoff Brosseau, Ron Manwill; Chris Riordan (DPR Chief Deputy Director), Chuck Andrews (Deputy Director for Registration). DPR will be proceeding differently in the future. Receptive, committing to being more directive during the reevaluation. DPR will be telling PWG how to proceed, esp. with testing, etc. DPR will continue to involve CASQA in future. Stewardship program that PWG is developing; DPR did not have specifics. Pre-issuance draft of directive from DPR to PWG (giving PWG specifics for studies; focus on bifenthrins?) may be available to review/comment end of February to CASQA. Previously, these drafts were made available to water boards for their comments; this is a new method. Kelly had been reviewing these drafts through the water boards, and have updated the committee. Shall meeting participatants send an email to DPR to remind DPR of the draft directive? Great idea!

Coming up Next (meeting) -- Dave's perspective, legal opinion. Perhaps include next steps w/ DPR. Joint letter w/ Tritac(?) -- including legal opinion. State Board: Future workshop? Do we want to agendize this? Public forum/work session. Invited speakers to speak on certain topics. Workshop could help move things along.

8. Planning for needed actions - prioritization, funding strategy (All, 30 mins)
--List of upcoming items requiring action (Kelly). DPR requests detailed review of PWG Grass Runoff study(Kelly emailed link). Are there scientific problems with these reports? DPR has sent this request to review. State Board may not be commenting as may not have staff and the work furlough. CASQA should write a comment letter--how to handle this? Note: takes a week to go through Board EPC (letter, etc.) review. We need to start drafting letter mid February to get through subcommittee reivew & Board EPC; start review now.

--PWG Grass Runoff study (comments due 3/13)

--PWG building material washoff study (due in May), still to be made available.

--EPA Antimicrobials data rule/swimming pools (due 4/6)
--No subsidy from UP3 Project for these comments: former plans to handle these comments are no longer feasible

--Other priority items (all)

--joint letter with Tri-TAC to Cal-EPA

--keeping pressure on DPR without UPC meetings

--Others?

--discuss priorities

--develop plan to accomplish needed actions

--who does what

--set internal review deadlines for grass runoff study

Armand & Kelly will get together to talk estimate on accomplishing the above comment letters.

9. Cost estimates memo (Armand, 5 mins)
--Status and schedule. Was not able to devote much time on this. Question: what is the next most immediate need? Armand would like to set an internal deadline. Would need this info to send to DPR & EPA to bolster our concerns. Would like to include in EPA Antimicrobials data rule comment letter. Have deadline our next meeting data, plus meeting to discuss above comment letters.

10. Next meeting (Jamison, 5 mins). Funding letter -- W 1/28/09 2:30pm; Subcommittee meeting -- W 2/25/09 10-12pm; Priority Task Fund meeting (funding for PWG/EPA comment letters) -- W 2/04/09 10 am.
--Make list of items for discussion: Kelly will develop agenda for subcommittee meeting.

Hello everyone,

We'll be using my conference line for our call tomorrow at 2:30. Call in is 877-336-1828 access code 9177212#

Jamison Crosby

Pesticides
ubcommittee fundin.

1. Agenda Review. On the call: Dave Tamayo, Jamison Crosby, Kelly Moran, Arlene Chun, Christine Couch, Athena Honore, Jim Scanlin.

2. Funding & letter discussion

(Jamison) BASMAA -- Geoff brought up CASQA letter. Immediate reaction -- Water Board should dip into their ACL monies. We could get shut down with only the municipalities involved. Perhaps send Water Board a similar letter. Athena had conversations w/ other staff to determine what other types of funding to move forward. Discussed small "leverages" for some monies, supplemental environmental projects, fines, etc. Some work is in progress. Note, not sufficient, temporary, but at least there may be some money. (Kelly) Note this may not be a potential monies source with the upcoming enforcement policies coming on line. There may be some communication issues surrounding the request that may need to be resolved.

(Dave) It's important to have the board to help fund this as it is a statewide problem; and it is a good idea to also involve them by sending them this letter. Are there also other alternatives, even in small amounts. How about private sources? (Armand) Our work is on the front line. How about national organizations as they may be promoting several issues regarding pesticides; but it is unknown how their economic status stands. (Kelly) Sad to say, there is no money. Funding ideas and discussion ensued. This is a good discussion and should continue.

Will we be developing a parallel letter to send to the Water Boards? It is recommended that we need to meet with the Regional Boards prior to sending the Water Board's letter. Include in muni letter that the water boards will be pursued.

Suggestion: separate from the actual letter, seek CASQA Board support to approach water boards. Athena says that this may be counterproductive as she feels that she has already done that within the water board (talked to Tom Mumley). Something along lines: CASQA is committed to working with the water boards to contribute to UP3 (with discussions conducted prior to making this statement). Between now & letter distribution, need to sit down and discuss this, internally within CASQA and internally within the water boards.

It seems that sending out this letter is not important as we may not receive the funds now. Let's work on funding the priority tasks from within our programs first and have the discussions with the water board prior to sending out the letter. Another suggestion -- how about we approach the individual agencies first to get their buy in/support before bringing the letter to the CASQA Board.

3. Wrap up funding request letter. We will pursue first approaching individual agencies before sending the letter to the CASQA Board.

4. Next steps. Let's state what we need; modify what we have right now (eg attachments) as we approach our agencies for support. Do we calculate out their fair share or leave it up to them? Seems more prudent to have the true fair share, give agencies a number. Armand will have cost estimates draft

before next subcommittee meeting (Feb. 25). Let's also shoot for the full amount of funding. When should we be ready to begin talking to people? Feb. 25th; would be beneficial to have Armand's cost estimate.

UP3 Scope/Costs -- are there activities missing that your agency currently participate in/coordinate? Also, need to have a separate activities list specific to CASQA.

5. CASQA Priority Actions (Kelly's list) -- deadlines fast approaching. Included, but not in writing -- ability to hold UPC meetings (Kelly/Athena's letter circa Christmas time). Funding until summer. Need to set date to discuss more in detail. Also, may need more documentation for funding request for immediate needs list and UPC.

Discussion on Feb. 4th teleconference.

The call-in information is:

Phone: 1-866-495-8302 Code: 2563789

1. Review/amend agenda (Dave, 2 mins.)

2. *Need* volunteer to take meeting notes for today's call (2 mins.). Jamison.

Present today: Ron Manuel, Arlene Chun, Kelly Moran, Dave Tamayo, Jamison Crosby, Athena Honore, Christine Couch, Armand Ruby, Dave Renfrew.

3. Funding plan for 4 near-term CASQA letters to DPR and EPA (All, 30-40 mins.)
--Draft scope of work and budget are attached (See "Priority Action Items Known As of 01-28-09.doc")

Riverside County--$7000 (Armand's review of PWG documents)

Sacramento County -- $3000 (Kelly's tasks)

Contra Costa County -- still exploring.

CASQA funding -- can we tap into the money? Supposedly, $10,000 is our budget. Don't know if there will be any adjustments, or if it is the final/adopted budget. Kelly says it sounded like a done deal. We'll need to be careful in balancing the CASQA money as once its gone, its gone for the rest of the year. We'll have to nurse these funds (Dave).
--Schedule: Some work items must be completed in February
--Budget: no UP3 Project subsidy possible
--Additional letters are likely in 2009 (but are not specifically known at this time)
--Discuss options for funding this immediate work
--Develop list of action items

4. Interim funding request from UP3 Project (All, 30-40 minutes) $26,250 over next 5 months to keep heat on DPR, hold UPC meetings.
--Draft scope of work and budget are attached (See "UP3 Gap Funding Request_020209.doc")
--Review scope/budget and answer questions
--Discuss options for assembling funding
--Discuss other possible funders (e.g., POTWs)
--Develop list of action items

5. Next meeting: Wednesday February 25 10 a.m.

Conference Participant:
1. At the specified time, dial the Access Number 1.800.786.1922
2. When prompted, enter your Participant Code followed by #
3. Your Participant Code is 87779856

Dear Subcommittee: this is a confirmation that the subcommittee will meet via teleconference as planned tomorrow Feb. 24 at 2:00 PM. Agenda and call-in info to follow.

Meanwhile I am forwarding information regarding a topic for tomorrow's agenda - the requirements for field filtration of dissolved metals samples. For those who have monitoring requirements that include dissolved metals, this may be an issue of some significance. I would like to hear from any members who have been doing this in the field already.

Here is the link to the March 2007 Federal Register EPA Methods notice, which I think is the most recent:
http://www.epa.gov/fedrgstr/EPA-WATER/2007/March/Day-12/w1073.htm

The holding time and preservation requirements are in Table II; most of the relevant stuff is in the footnotes to that table:

\7\ - metals filtration

\17\ - mercury filtration

\21\ - general

Filter w/in 15 minutes clearly is the law of the land for most metals (and ortho-P). For mercury, however, the lab has to filter w/in 24 hours of sampling, so that could be either a solution or an issue, as the alternative is to filter in the field "in a designated clean area", which is a bigger deal.

This guidance is written with point source dischargers (esp. WWTPs) in mind, where you typically set up a composite for a pre-determined (us. 24 hour) time period, and therefore know when the last aliquot will be collected. There will need to be some adjustments made in the typical stormwater sampling routine to conform to this requirement.

Armand Ruby Consulting

Web Site: www.armandrubyconsulting.com

CASQA Monitoring and Science Subcommittee
Teleconference: Tues., Feb. 24, 2009 - 2:00 PM.

MEETING NOTES

1) Introductions/Note-taker

Approximately 20 people participated in the conference call.

Pavitra Rammohan with PBS&J volunteered to provide the meeting notes.

2) Review/Amend Agenda

No changes

3) Updates:

CA Water Quality Monitoring Council [Armand]

As mentioned during the previous meeting, the Monitoring Council aims at improving implementation and tracking of water quality monitoring in order to enhance local, state, federal, tribal and private efforts in addressing point and nonpoint source pollution and protecting designated uses. The Council described a concept of theme-based portals that would provide ready access to a variety of assessment information. Armand briefed the group on the meeting conducted on February 2nd, 2009, at Costa Mesa. The first submittal of recommendations was provided to SWRCB on Dec 1, 2008, with the principal recommendation to proceed with improved access to water quality data statewide. This is an attempt to standardize web accessibility to existing information sources. The focus of the meeting was to set up the web portal to provide accessibility to different web resources of statewide water quality data. One category would address core assessment questions or concerns, such as: Is it safe to swim at the beach? Follow up work will involve the more difficult issues of standardizing data management and monitoring protocols.

SWAMP – upcoming stormwater guidance [Armand]

The Surface Water Ambient Monitoring Program (SWAMP) is a statewide monitoring effort designed to assess the conditions of surface waters throughout California. It was proposed to integrate existing water quality monitoring activities of the State Water Resources Control Board (SWRCB) and the Regional Water Quality Control Boards, as well as to coordinate these activities with other monitoring programs. The SWRCB, along with the US EPA, are responsible for reporting on the status of California's water quality in order to provide a scientific basis for management priorities and regulatory actions.

Armand mentioned the already-developed SWAMP monitoring protocols and the typical CA NPDES permit requirement to report water quality data as per SWAMP database protocols. The group discussed the SWAMP format; both Orange County and released Ventura County are required to report the data in a SWAMP compatible format. Some programs are required to report data in Storm Water Monitoring Coalition (SMC) compatible format. Ted von Bitner of Orange County indicated that having the database SWAMP compatible significantly increases (doubles or triples) the size of the database. SWAMP will produce storm water monitoring guidance to be released in 2009 and

Armand will be part of the review panel to provide comments on the guidance document. He will also solicit comments or feedback from the group.

CA Dept. of Pesticide Regulation urban runoff monitoring [Armand]

Armand described DPR's ongoing study to test for pyrethroid pesticides in the runoff generated from urban areas. Several sites are being monitored in northern California (Sacramento and Bay Area) and southern Cal. (San Diego). The draft study report is to be reviewed by the Pesticide Subcommittee and then forwarded to the DPR for review. Armand will forward the study report and CASQA letter, and encouraged the group to review the study report and offer input or comments.

ASBS Program [Steen Trump/Geremew Amenu]

The ASBS program is being carried out as a pilot study in Southern California under Bight '08. It will serve as a template or guidance for Northern and Central California. They will initiate a program similar to the one in Southern California. Key questions involve implementation of the program and potential funding form the state for the ASBS program.

SCCWRP/SMC hydromodification monitoring study

No meeting has been conducted since last summer (2008). The next meeting is scheduled to be held this summer. The goal of the storm water research program, led by Colorado State University Fort Collins and Storm water Monitoring Coalition (SMC), is to develop tools to assess the effects of hydromodification and increased runoff volumes, and develop watershed models that can be used to evaluate potential management scenarios. This is a long term project. One of the group members indicated that SCCWRP is looking for volunteer counties and sites to validate the study. They have completed the first round of studies and the next step is to validate assessments.

Ventura County draft permit/Municipal Action Levels

Arne Anselm and Mark Pumford, who work for agencies in Ventura County, laid out some of the highlights of the new permit:

1. Attachment F: Monitoring Program: The first storm event of the wet season that produces a 20% or greater increase in base stream flow, and 2 additional storm events; all storm events shall be separated by 7 days of dry weather (less than 0.1 inch of rainfall) from the previously measurable storm event (0.25 inches of rain). The 20% trigger is an improvement and was requested. The group discussed that since the Ventura County watershed is not fully developed (only one-third of the County is developed), 0.25 inches of rain may not generate measurable runoff. The group discussed about how the term mass emission station (an air pollution term) can be related in terms of storm water quality; this presumably will be similar to the Bight study element used to estimate the types and amounts of pollutants discharged into the ocean. The permit language is confused. The constituent list is extensive, but is about the same as in the previous draft.

2. The big additions are outfall monitoring and the MALs, which are the big issue. Armand noted that Ventura did perform outfall monitoring in its original permit term, but has not had to do so since the 1990's. If the Permittee's discharge exceeds a certain level (similar to Action levels in San Diego County), a follow up sampling, followed by the documentation of the iterative process is required.

3. The new permit also requires that the results of monitoring from each mass emission station conducted in accordance with the Standard Operating Procedure submitted under Standard Provision 14 of Attachment F shall be sent electronically to the Regional Water Board's Storm Water site, no later than 90 days from sample collection date, highlighting exceedances (Pollutants of Concern, POC) to the Basin Plan objectives for all test results, and the CTR for acute criteria with corresponding sampling dates per mass emission station.

4. Bioassessment monitoring must be performed through participation in the Southern California Municipal Storm Water Monitoring Coalition's (SMC's) regional program. Issues include difficulties in selecting reference streams, and those streams that become dry in the summer season.

5. Section 1.7 of the Permit involves compliance with water quality objectives. These objectives are set for receiving waters and cannot be used for discharges in MS4s. Armand provided his interpretation of the permit saying that the discharge in the MS4 could potentially cause exceedance when it reaches the receiving water body. The group agreed that it was not worded correctly.

The comment period to provide feedback is 45 days (Mid April 2009).

Construction General Permit monitoring requirements

Discussion deferred to next meeting.

4) **Toxicity testing for episodic (storm-based) events/exposure times – white paper presentation/discussion – follow-up actions [Group discuss]**

White paper on toxicity testing and exposure time issues specific to Calleguas Creek has been developed and is under review. Mark mentioned that EPA is considering revising the toxicity TMDL for Calleguas Creek; a meeting is being held on that issue. The idea is to incorporate TMDLs in NPDES permit.

Armand asked where the group might go with this issue on more of a statewide level; Mark suggested a meeting with Jon Bishop and Deb Smith; Chris recommended involving Ken Schiff. .

5) **Technical Issues:**
Field filtration for dissolved metals – stormwater experience?

Armand asked the group if any filter samples in the field. Ted indicated that it is problematic esp. during wet weather, as it could result in contamination of samples. How would filtration for composites be performed? Filtering each aliquot would be impractical. Bruce indicated that they do filtering of dissolved metals for dry weather sampling involving grab sample collection and performing follow-up investigations for IC/IDs.

Gretel Roberts mentioned that they do filter samples, both grab and composite. She cautioned the group on how some of the filters used could become a source of Zinc in the samples.

The County of San Diego indicated that they do not use filters for sampling for storm water. Most of the group members use test kits in the field to obtain measurements.

The group discussed the need for a study comparing the data obtained by filtering samples in the field versus filtering samples in the lab.

Field pH measurement – stormwater experience?

Group members report pH is typically measured in the field using pH meter and probe during grab sampling, even when composite sampling is ongoing.

6) 2009 activities/CASQA budget; EPC meeting summary [Armand]

Although the subcommittee did not receive CASQA funding in the adopted budget, the EPC expressed support for funding the transfer of the Monitoring and Research Agenda web portal to the new CASQA platform, and it is hoped that we still may receive funding for this important project. The funding from the state for other CASQA activities is still being reviewed and does not appear positive for 2009.

7) Schedule next telemeeting

Next Subcommittee meeting scheduled for March 31st (Tuesday), 2009, at 2:00 PM.

CASQA Monitoring and Science Subcommittee
Teleconference: Tues., Mar. 31, 2009 - 2:00 PM.

AGENDA

Call-in details:
Access Number 1.800.786.1922
Participant Code is 87779856#

1) Introductions
    Volunteer note-taker?

2) Review/Amend Agenda as needed

3) Updates:
    CA Water Quality Monitoring Council [Armand]
    SWAMP – upcoming stormwater guidance [Armand]
    CA Dept. of Pesticide Regulation urban runoff monitoring [Armand]
    ASBS Program [Steen Trump/Geremew Amenu]
    SCCWRP/SMC hydromodification monitoring study
    Other

4) New Permits/Monitoring Requirements
    Ventura County draft permit/Municipal Action Levels/sample req's.
    SF Bay Area Municipal Regional Permit (MRP)
    Construction General Permit monitoring requirements

5) Data Access/Display (re: statewide CA WQMC web portal effort)

6) Technical Issues/Follow-up:
    Field filtration for dissolved metals – stormwater
    Field pH measurement – stormwater
    Toxicity testing for episodic (storm-based) events/exposure times – white paper presentation/discussion – follow-up actions

7) 2009 activities/CASQA budget; EPC meeting summary [Armand]

8) Schedule next telemeeting
    Tues. 4/28 or Wed. 4/29?

CASQA Monitoring and Science Subcommittee

Teleconference: Tues., March 31, 2009 - 2:00 PM.

MEETING NOTES

1. Attendees: Armand Ruby (Subcommittee Chair), Chris Stransky, Arne Anselm, Steen Trump, Paul Randall, Arlene Chun, Peter Mangarella, Bruce Moore, Jody Edmunds, Adrienne Cibor (volunteer note-taker), Jay Shrake (Low attendance today due to Cesar Chavez state holiday)
2. Amendments to agenda: none
3. Topic Updates

California Water Quality Monitoring Council (Monitoring Council) [Armand Ruby (AR)]

- Info on the Council's activities is sent by e-mail from state's Listserv; subscribe through the on-line sign-up or let AR know if you need more info
- An alternate is needed to represent stormwater (CASQA) on the Council; call or email AR with ideas or to volunteer. Should be someone experienced in storm water quality monitoring, knows the issues, and is comfortable representing CASQA membership. Time commitment: meetings approx. every other month, rotates between SoCal (usually SCCWRP) and Sac., documents to review, conference meeting prep., etc.

SWAMP stormwater monitoring guidance – still no status update, should be some word this Thursday. Will need subcommittee review/input. [AR]

CA Dept. of Pesticide Regulation (DPR) Urban Runoff Monitoring [AR]

- DPR has Pyrethroid Working Group (PWG) conducting studies to determine impacts. AR to forward copy of study simulating rainfall on lawn after pesticide application.

ASBS Program [Steen Trump]

- Nothing new out yet but new special protection guidance expected soon.
- 3 Monitoring questions:
  1. What is the range of natural WQ at reference locatons?
  2. How does WQ at ASBS coastline compare to WQ at reference locations?
  3. How does the natural WQ compare at ASBS locations with and without discharges?

  SCCWRP currently working on #3, has sampled in S. Ca. and parts of N. and Central Ca., pre- and post-storm samples in receiving water.

- North coast ASBS stakeholders (Trinidad head, Kings Range, and Redwood National Park ASBS') submitted a request last week to form a N. coast regional monitoring group (as opposed to the Board's vision of one N. Ca. group from Marin to the Oregon border). Still awaiting a response from Dominic.

SCCWRP/SMC Hydromodification Monitoring Study

- Project on hold. Arne Anselm [AA] said the bonds are frozen. Once unfrozen, will take approx 18 months to complete. Possibly complete 2012. San Diego County is volunteering a few sites for validation; not sure about funding.

4. New Permits/Monitoring Requirements

Orange County Permit

Bruce Moore [BM]: tentative draft permit for San Diego region includes municipal action levels (MALs) for wet weather & enforceable numeric effluent limits (NELs) for dry weather. Runoff monitoring permit with the word "urban" removed, includes all runoff. Bruce to email to Armand who will forward to the group. The nationwide dataset was used to develop MALs – this is an issue b/c nationwide average levels tend to be higher; whereas CTR and Basin Plan were used for the NELs.

[BM] Potential problems w/MALs incl. high levels of Cd, Ni, Zn in approx. 25% of storm drains in S. Orange County due to seepage from groundwater affected by geological formations. Nothing new in OC permit re: pesticides, just continuing pyrethroid monitoring. TIE requirement from model monitoring program (metric table depending on results). Dry weather NEL requirements: total phosphorous, TDS, fecal coliform, Cd, Cu, Ni).

Ventura County Permit

Arne Anselm [AA]: Major outfall monitoring of pipes 36" or greater (wet weather), results compared to MAL's for just 5 or 6 constituents.
Dry weather monitoring (have to hunt for sites): includes aquatic toxicity; TIE requirement from model monitoring program (metric table depending on results). TIE clearly laid out same as for irrigated lands, 50% mortality triggers TIE. Discussion of which species to use for invertebrate testing, *Ceriodaphnia* or *Hyalella? Ceriodaphnia* more sensitive to TDS, *Hyalella* may be more sensitive to pesticides. All three species tested in first year (invertebrate, vertebrate, algae), then most sensitive only.

[AA] Pyrethroid insecticide study at two sites, twice during permit cycle. Once at beginning, once near 5 year end. Includes sediment toxicity, no water column toxicity. It used to be a wet weather event but difficult to get sediment safely during wet weather. [AR] suggested to check out an article written by Robert Holmes *et. al.* on SWAMP Pyrethroid study In "Environmental Science & Technology" 2008.

Bioassessment – cooperating w/regional study. Beach WQ monitoring – wet season, weekly at 10 sites.

Construction General Permit – still not issued.

5. Data Access/Display – item deferred to next meeting

6. Technical Issues
    - Next steps re: white paper on appropriate tox testing approaches - AR to check with Ken Schiff/SCCWRP re: SoCal study.
    - Geremew brought up a permit requirement to determine optimal sampling design for wet weather monitoring; AR to forward info and group follow up at next meeting.
    - Arne mentioned having toxaphene hits in receiving waters; group to have follow up discussion.

7. 2009 Activities/CASQA Budget; EPC Meeting Summary [AR]
    - Nothing new to report. Besides member dues, main portion of annual CASQA income is derived from annual conference – evaluation of any additional funding that may become available will be done after that happens in November.

8. Schedule Next Meeting
    - Group agreed on Tues. 4/28 at 2:00 PM for next meeting.

CASQA Pesticides Subcommittee members,
Our next meeting will be Tuesday, March 31, from 10 a.m. to noon. The agenda is below. We'll be planning our next steps for interactions with DPR.

The call-in information is:

Number: 1-800-786-1922
Code: 46864387#
Note: The phone system will prompt you for your name; please press "#" after you say it.

Please let us know if you won't be able to participate.

Jamison Crosby (acting) & Kelly Moran
CASQA Pesticides Subcommittee Co-Chairs

_____

CASQA Pesticides Subcommittee

DRAFT Agenda
Tuesday, March 31, from 10 a.m. to noon

1. Review/amend agenda (Jamison, 5 mins.)
2. *Need* volunteer to take meeting notes for today's call (Dave Tamayo)
3. Announcements and updates (All, 10 mins)
--Any announcements from participants
Kelly: PWG hired URS as their consultant for re-evaluation. Jody Edmunds is URS consultant; requested to join our conference call. Conflict of interest? CASQA has open meeting policy, however. Shall we apply "Executive Session" to our agendas? Looks like we will. Kelly will talk to Jody after call. Will talk about at next EPC meeting.

--Recent meetings (Dave)
Member National Pesticides Board (pretreatment) – how to better regulate pretreatment regarding termite control? Label changes, etc.
International IPM, Portland, OR. Armand & Dave made presentation on structural pest control.
PMAC – primarily focused on results of internal survey of membership, how to proceed w/ PMAC.
Discussion on how to deal with urban issues.

--Geoff's DPR interactions (Kelly)
Phone calls & meetings w/ Chuck Andrews (DPR). Building rapport.

--Antimicrobials Data Rule letter to EPA nearly done (Kelly) – off to EPC review. Sending final Monday (4/6)

--Slowdown on EPA pyrethroids label language changes (Kelly) –

--Any information from members on state/Federal pesticides activities (ALL - in lieu of usual UP3 update)

--UP3 funding/restart status (Kelly) – Palo Alto has contributed $2500 for Kelly to do UP3 duties.
$15k through CASQA; $10k for subcommittee. DPR considering $5k.
State has sold some bonds, but mostly for monies owed.

4. Permit updates (Jamison & Ron, 15 minutes)
--SF Bay Area Municipal Regional Permit (MRP) (Jamison)
Response to comments (previous draft) in 2 weeks ago. Comment period for current draft due 4/3 (Friday). Monitoring requirements were where most of the comments addressed. 100% increase in monitoring costs is projected (C.8 section of permit only); $1-3M (C8, 11, 12, 13, 14) price tag for entire monitoring program.

--Ventura Permit (Ron). Armand. Extensive monitoring section as well. Pyrethroids/toxicity study to establish baseline and/or trends through permit term (sediment & water column). Additional general pesticides monitoring. Ceriodaphnia changed to hyallela? Pyrethroids

--Others?

5. Riverside Toxicity Reduction Evaluation (TRE) (Arlene & Armand, 10
minutes). $0.90 per resident spent on monitoring (TIE/TRE). Does not include public ed, etc.

6. Herbicides (Dave R. and all, 10 minutes) TABLED.
--Are any of concern?
--Is there a monitoring list?

7. EPA OPP/OW "Harmonization" activities (Kelly and all, 10 mins)
--Past: Letter from EPA and CASQA response (last meeting). Reopening this task. Patty Tembrook (EPA 9) is on the workgroup. Too late for comments from CASQA. (Note, we did not have resources in January).
--Process/schedule information (Kelly). Workgroup (through Patty) will share with us their science workplan. Plan to execute this summer. Workshop in August (Washington, D.C.). How about meeting here or webcast – to be worked out.
--Plan of action (all). Review work plan; submit comments? PPDC next meeting is 4/22/09 (Pesticide Program Dialogue Committee; Dave sits on this); may be good to have work plan reviewed by that time. Dave will be flying to DC for this meeting; also, he will be meeting w/ Debbie Edwards (chair of PPDC and also is deputy director of an EPA division Of. Poll Prev. & Toxic Substances).

8. DPR Surface Water Regulations (Kelly and all, 10 mins)
--Notice (attached)
--What's happening (Kelly). General concept similar to another regulatory structure (groundwater protection, enacted by legislation previously to protect GW through measures – pesticides had been detected in GW). Waterboards are reviewing right now (due end of April); Kelly hopes to be able to guide Waterboards. We may see the plan in May; **HEADS UP!!!!**
--Plan of action (all). **Email contact on notice to be put on the email list!** (Done

3/31/09)

Make new list for tasks – discuss at next meeting.

9. DPR direction to PWG on Pyrethroid Reevaluation (Kelly and All, 10 minutes). **EXTREMELY IMPORTANT!**

--Discuss DPR approach (attached) (All). Schedule separate call to discuss this. Also, it is not clear where DPR is heading.
--Schedule/process for preparation of letter (all). Perhaps it would be better to wait and see.
Questions: is the approach good? Are these studies good; will it answer questions.

10. Cost estimates memo (Armand, 5 mins)
--Status and revised schedule. Now working on this. Proposed draft date: April 22, 2009.

11. Next meeting (Jamison, 5 mins)
--Set date & time for next subcommittee teleconference
--Make list of items for discussion.

CASQA Monitoring and Science Subcommittee
Teleconference: Tues., April 28, 2009 - 2:00 PM.

AGENDA

Call-in details:
Access Number 1.800.786.1922
Participant Code is 87779856#

1) Introductions

Volunteer note-taker (Bryn)?

2) Review/Amend Agenda as needed

3) Updates:

CA Water Quality Monitoring Council [Armand]. Met 4/2/09. Interesting presentations. Standardized access to data, monitoring protocols. Can get onto List Serve via State Board. Alternate for Armand (talk to Armand before next EPC)

SWAMP – upcoming stormwater guidance [Armand]. SCCWRP helping to develop w/ SWAMP folks. Armand will request that subcommittee to provide comment when guidance is available.

ASBS Program [Steen Trump/Geremew Amenu]. No real update. Few points made. Will try to talk/coordinate w/ Caltrans.

Construction General Permit monitoring requirements [Sandy M.]. Req. effluent monitoring from sites. 3 risk levels for projects, range from visual (Level 1) to grab samples (L2 & L3). Grab samples @ all discharge points w/in 1hr of flow plus 1 sample at beginning & end of work day. There are action levels (Turbidity=200 NTU, 6.5<pH<8.5) and numeric effluent limits (500 NTU, 6<ph<9).

L2: no receiving water monitoring.

L3: If exceed NEL, must monitor receiving water monitoring & monitor SSC (ASTM method)

NOI/etc/SWPPP electronic submittal to State.

Bioassessment (SWAMP) of receiving water before & after construction project. Monitoring personnel must qualify w/ SWAMP protocols.

SSC (variant of TSS). Sampling is USGS technique. Very difficult to comply w/ sampling protocol for SSC. Not sure how sampling protocol can be done w/ construction flows (sheet/gutter/pipe discharge). Perhaps talk to Roger James regarding sampling protocols (guy who works w/ Gary Minton).

Active Treatment Systems – separate effluent limits; now an option. Lower effluent limits.

Non-visual monitoring remains in permit.

Monitoring is everyday of every storm event.

Municipal member impacts – will need to comply w/ these monitoring program requirements! BIG QUESTION: to what degree will municipalities w/ CGP in their jurisdictions be reviewing monitoring results (eg., as part of their inspections)?

Owner of land (few exceptions) can only apply for the permit.

On-going projects up to 2 years will be grandfathered as L1.

This is a draft. Public comments due June 17th. June 3rd is public hearing, not an adoption hearing. No workshop scheduled. Construction subcommittee is working on comments. Hoping to get draft talking points out prior to June 3rd hearing.

Looking for comments on Monitoring aspects. Sandy will forward timeline to Armand.

Other (none)

4) CA Dept. of Pesticide Regulation pyrethroids re-evaluation [Armand]

MS4 Cost info needed! TODAY!

Grass Wash-off Study review; Building Wash-off study

5) Data Access/Display (re: statewide CA WQMC web portal effort) – deferred to future meeting.

6) Technical Issues/Follow-up:

Field filtration for dissolved metals – stormwater

Toxicity testing for episodic (storm-based) events/exposure times – white paper presentation/discussion – follow-up actions

Optimal sampling design for wet weather EMCs – forwarded this afternoon. Defer discussion for next meeting.

Notable/unexpected monitoring "hits" [Arne's note on seeing toxaphene in receiving water sampling]

7) 2009 activities/CASQA budget; EPC meeting summary [Armand]

8) Schedule next telemeeting

Tues. 5/26 2pm. or Wed. 5/27?

CASQA Pesticides Subcommittee members,
Next meeting Monday May 4, 10 a.m. to noon. Please let us know if you won't be able to participate.

Call-in: Number: 1-800-786-1922
Code: 87779856# (note: New code!)
Note: The phone system will prompt you for your name; please press "#" after you say it.
Dave Tamayo, Kelly Moran, Jamison Crosby
CASQA Pesticides Subcommittee Co-Chairs

_____

CASQA Pesticides Subcommittee
Agenda
Monday May 4, 10 a.m. to noon

1. Review/amend agenda (Dave, 5 mins.)
2. Recruit note taker.
3. Discuss co-chair changes
4. Announcements and updates (All, 10 mins)
   --Any announcements from participants
   -- updates on permits
   --Recent EPA meetings (Dave)
   --Information from members on state/Federal pesticides activities (ALL - in lieu of usual UP3 update)
   --UP3 funding/restart status (Kelly)
   --Next meeting Tues. May 19
5. Court Decision Reinstates Permit Requirements for Pesticide Applications to Surface Water (Mike Blankinship & Kelly, 15 mins)
   --Status of Court Decision overturning EPA rule defining pesticides as not being pollutants under Clean Water Act (Kelly)
   --Risks for CASQA members (Lawsuits against mosquito abatement districts) (Kelly)
   --California Aquatic Pesticide Application General Permits: Renewal of current permits, implementation (Mike)
6. DPR Draft Direction to PWG for Pyrethroid Reevaluation (Dave, Armand, Kelly and All, 30 minutes)
   --Discussions with DPR, URS, PWG(Dave, Armand Kelly)
   --Calls with PCOC (Kelly)
   --Next Steps/potential timeline
7. Plan for response to items from DPR (Dave, all, 15 mins)
   --Study plan for controlled urban runoff study (due 6/26)
   --Building material washoff study report (due 6/29)
   --Change in scope for review of DPR direction to PWG (due 5/15)
   --Discuss above items - scope/budget/funding/process to complete
8. Cost estimates memo (Armand, 5 mins)
   --Update
9. Next meeting (Dave, 5 mins)
   --Set date & time for next subcommittee teleconference
   --Make list of items for discussion

Subject: Don't Miss CASQA's May 15th General Membership Meeting and Webcast on "Stormwater Harvesting and Reuse – A New Component of Stormwater Permitting"

CALIFORNIA STORMWATER QUALITY ASSOCIATION
Dedicated to the Advancement of Stormwater Quality Management, Science, and Regulation

ANNOUNCEMENT:
May 1, 2009

Contact: info@CASQA.org

Don't Miss CASQA's May 15th General Membership Meeting on

"Stormwater Harvesting and Reuse - A New Component of Stormwater Permitting"

- LIVE WEBCAST AVAILABLE -

Friends of CASQA,

For the first time, CASQA will devote an entire quarterly meeting to exploring stormwater harvesting and reuse. The subject matter is extremely timely for those involved with both water supply and stormwater management given the ongoing drought conditions affecting much of the western U.S. It is also an important emerging issue in stormwater permits as current tentative orders are starting to prioritize stormwater harvesting and reuse, along with infiltration, as preferred strategies of Low Impact Development.

The agenda for the meeting brings together a diverse range of experts that will help shape our understanding this important topic including:

1. An overview of policy and integration issues from a water supply, sanitary sewer and stormwater perspective
2. An exploration of regulatory barriers and solutions - for example: Are there water rights issues? Can stormwater be used within buildings for non-potable uses? What are the public health issues?
3. A review of case studies where stormwater has been successfully harvested and reused at a facility and a regional scale.

The agenda is available by clicking here; registration to attend the meeting and watch the webcast is open - click here to register.

- **ATTEND IN PERSON:** Register online until 5:00 pm, May 14th. Meeting fee payable at the door beginning at 8:00 a.m. - Check preferred, no credit cards at the door.
- **LIVE WEBCAST:** Purchase individual use or site use access online until noon Thursday, May 14th.

- **THEME:** Stormwater Harvesting and Reuse: A New Component of Stormwater Permitting 920266
- **DATE:** Friday, May 15, 2009; 9 am - 3:15 pm
- **LOCATION:** Waterfront Hotel in Jack London Square, Oakland

The California Stormwater Quality Association (CASQA) has been a leader since 1989 when the field of stormwater management was in its infancy. CASQA's membership is composed of a diverse range of stormwater quality management organizations and individuals, including cities, counties, special districts, industries, and consulting firms throughout the state. A large part of our mission is to assist water quality programs in California to learn collectively from the individual experiences of its members, to learn from the mistakes and avoid the pitfalls.

County of Riverside Backyard Composting Program

REMEMBER FOLKS, COMPOSTING IS RECYCLING!

Presented by
Riverside County Waste Management Department
14310 Frederick Street
Moreno Valley, CA 92553
(951) 486-3200 or (800) 366-SAVE
www.rivcowm.org

Low cost bins available for purchase by Riverside County Residents.
CHECKS ONLY PLEASE!

COMPOST BINS
A compost bin will help to keep your compost pile neat and tidy, deter rodents from digging in your pile, and help your pile to retain heat and moisture. The compost bin should be approximately 3 feet wide x 3 feet deep x 3 feet tall. Take the time to consider your options and the style of composting that is most convenient for you. Compost bins can either be homemade or purchased.

Biostack Bin
This bin is manufactured by Smith & Hawken. It stacks for easy turning of material, has large air slots that offer good ventilation, and the lid keeps the material from drying out or getting too wet. (28" x 28" x 34"h)
Price: $50.00 (Price good thru 06/30/09)

GEOBIN
This bin is is easy to assemble, easy to fill and easy to maintain. It is made of rugged, lightweight plastic that you can start using in minutes. Due to the generous number of air holes and open top, the composting process takes place very quickly. (3' H and makes a bin that is 3' to 4' around)
Price: $12.00 (Price good thru 06/30/09)

Volunteer Master Composters Needed!

Become a volunteer Master Composter with the Riverside County Backyard Composting Program!

You will be part of an elite group of Volunteer Master Composters who will:
*Help with all aspects of the program
*Become a home Compost Expert through the extensive 6 Saturday training course.
*Teach your family, friends, neighbors and fellow County residents "How to Compost"

Classes forming now. To sign up for the class or for more information please call: (951) 486-3200 or (800) 366-SAVE or visit www.rivcowm.org

To purchase compost or mulch in bulk, or to recycle green or woody waste, visit www.rivcowm.org for a list of companies selling compost/mulch

Mission Resource Conservation District

Stormwater Education Program Report for the

Santa Margarita Watershed

Annual Report 2008/2009

The Storm water Program was presented to 193 classrooms in Fiscal Year08/09/2009. :

School District	Presentations	Students
Lake Elsinore	6	126
Menifee	40	755
Murrieta	63	739
Temecula	84	1,843
TOTAL	193	3,463

The goal of the Fancy Fin presentations and the Watershed model is to leave students at each grade level with a basic understanding of the concept of watershed, the definition of storm water, how water becomes polluted, and the difference between point and non-point source pollution. Presentations always end with an interactive conversation about what they can to help keep waterways clean. This conversation has an emphasis on recycling, reusing and reducing which help support the growing number of school recycling programs.

While achieving these storm water goals, we also tie the subject matter into the grade appropriate state science standards which address physical sciences, life science, earth science and investigation and experimentation. For example, we addressed the water cycle at a grade appropriate level which served as a basis for understanding how water on earth moves between the oceans and land through a process of evaporation and condensation. This is part of the physical science standard for California. At a kindergarten level, this concept is as basic as letting them know that water can be liquid or solid. In third and fourth grades the watershed presentations help students understand not only the water cycle but also the role of land forms in moving water between ocean and land.

Referencing: A.5.1

Mission Resource Conservation District provides the following educational presentations and services in the Santa Margarita Region:

- Student education outreach
- Adult education outreach
- Support services for public education outreach activities at community events

Mission Resource Conservation District

Stormwater Education Program Report for the

Santa Margarita Watershed

Annual Report 2008/2009

Page 2

Number of presentations by grade:

Kindergarten:	23
First grade:	32
Second grade:	69
Second/Third Combination:	1
Third grade:	27
Fourth grade:	8
Fifth grade:	15
Sixth, seventh	
Eight	4

The Storm Water presentations are appropriate for all grade levels and the use of the Fancy Fin series, graduating to the watershed model in 4th through 8th grade, makes them age and grade appropriate.

Distribution of materials:

Student bags are individually packed with a parent letter, household hazardous waste detective sheet and either a Fancy Fin coloring book (k-3) or a Storm water Pollution Patrol Book and age appropriate collaterals. The individual packing of take home bags relieves the teacher of this and insures that the material is taken home at the end of the day. Addition of the County's list of recycling and house hold hazardous waste events would be an excellent addition.

Outreach events:

Mission Resource Conservation District always responds to requests to do public events but this last year we did not receive any so we devoted the budget to school presentations.

Riverside County Stormwater Public Education Program

Summary of Activities for Fiscal Year 2008-2009

Referencing A.5.1

The following report is from SGA (Steve Groner and Associates). They have been retained to prepare and present workshops at major home improvement stores throughout Riverside County providing training and offering information to employees and customers the proper uses and disposals for paint, pesticides and fertilizers .

sga
S.GRONER ASSOCIATES, INC.

Riverside County "Only Rain Down the Storm Drain"
SGA's Summary of Activities

PURPOSE

According to the Environmental Protection Agency, storm water pollution is the leading cause of water contamination across the nation. To address this issue, the Riverside County Storm Water Public Education Program seeks to reduce the amount of pollutants – including pesticides, fertilizers, paint and pet waste– from being discharged into the storm drain system and ending up in our rivers, beaches and oceans. The program focuses on outreaching to target audiences associated with these specific pollutants with the pollution prevention message.

GOALS

The program has three (3) primary goals:

- Continue to increase awareness of storm water pollution and its impact on our environment;
- Continue to educate residents and businesses on how to change their behavior to minimize pollution; and
- Maintain compliance with the NPDES Municipal Storm Water Permit.

STRATEGY

To achieve the goals of the program and to maximize the program's available resources in order to yield the greatest amount of pollution reduction, the program executed a comprehensive set of pollutant-specific outreach activities. The strategy of the program focuses on directing Riverside County residents and businesses to available outreach materials to prevent storm water pollution. The program's educational materials each identified a pollutant and the simple pollution prevention behavior(s) associated with it. Whenever possible, messages were delivered in settings tied to these pollutants, such as placing paint tip cards in paint stores and placing posters reminding pet owners to pickup after their dog in pet facilities.

NON-MEDIA OUTREACH

To deliver the storm water pollution prevention message, the programexecuted an expansive set of outreach activities. This included formingpartnerships with garden centers/nurseries, paint stores, hardware stores, home improvement stores and pet facilities in order to place outreach materials. Outreach materials included fact sheets, tearsheets andshelftalkers. Fact sheets that explained storm water pollution prevention tipswere given to store staff. Tearsheets, promoting the program's phonenumbers, website and a list of common items accepted at the household hazardous waste collection centers, were placed on counters and checkoutstands. Shelftalkers, with tearsheets attached, provided pollution preventiontips and were placed in the appropriate aisles relating to the specific pollutant.

This allowed customers to tear off individual sheets and take the information with them. Additionally, the program utilized a pet poster placed in pet facilities to encourage pet owners to pick up after their pets in order to prevent pollution. Fact sheets, tearsheets, shelftalkers and posters promoted the (800) 506-2555 and (951) 358-5256 hotlines along with the www.rcflood.org website, as resources of more information for residents and businesses. In addition, owners, managers and employees were educated on storm water pollution. Once educated, the staff, seen as experts by the customers, served as catalysts to spread the storm water pollution prevention message to "do-it -yourselfers" who may be unintentionally engaged in various polluting activities during their home projects or pet owners who may not be picking up after their dog(s) resulting in pollution. By having staff deliver the storm water pollution prevention message, the program has the advantage of "the messenger" constantly being at the customers' disposal, thereby being able to effectively reach and educate a large group of potential polluters.

Partnership with Garden Centers/Nurseries, Paint Stores, Hardware Stores and Home Improvement Stores

Goals

- Continue to develop and maintain corporate and private partnerships with garden centers/nurseries, paint stores, hardware stores and home improvement stores throughout the County.
- Continue to place public educational materials in appropriate locations (paint tip cards on paint counter, etc.) in stores throughout the County.
- Promote the (800) 506-2555 and (951) 358-5256 hotlines along with the www.rcflood.org website. Encourage residents, businesses and store staff to refer to these resources when they want more information on storm water pollution prevention and proper household hazardous waste disposal.
- Continue to develop and maintain partnerships with home improvement stores in order to conduct tablings in front of the stores while providing outreach materials to residents in their community with the storm water pollution prevention message.

S SGA
Riverside County Storm Water Public Education Program
Annual Report for Fiscal Year 2008-2009

Results

• Maintained partnerships with 94 garden centers/nurseries, paint stores,hardware stores and home improvement stores.

Worked with stores to train 257 employees on Best Management Practices (BMP) and the proper disposal of pesticides, fertilizers and paint furthering their ability to pass on these pollution prevention messages to their customers.

•

Distributed approximately 17,681 public education materials at stores throughout the County; including fact sheets, tearsheets and shelftalkers).

Listed below is a summary of the materials placed at garden centers/nurseries, paint stores, hardware stores and home improvement stores:

- Partner Stores: 94
- Fact Sheets (pollution prevention tips): 105
- Tearsheets (hotline and website resource information): 17,450
- Shelftalkers (tips on pesticide, fertilizer and paint): 126

• Developed partnerships with major home improvement stores and held 5 tablings at Home Depot and/or Lowe's. Set up a table with the program information near the front of the store. Distributed public education materials and spoke one-on-one to residents regarding stormwater pollution prevention, educating 953 residents.

Listed below is a summary of the materials distributed at home improvement store tablings:

- Tablings: 5
- Tearsheets (hotline and website resource information): 903
- Fact Sheets (pollution prevention tips): 250
- Outdoor Cleaning Brochures: 154
- HHW Booklets: 353
- Stormwater Sponges: 170
- Air Fresheners: 207
- Pens: 392
- Key Chains 281
- Highlighters 116

Partnership with Pet Facilities

Goals

• Continue to develop and maintain corporate and private partnerships between the program and pet facilities, including pet stores, grooming facilities, animal hospitals and animal shelters.
• Continue to place public educational materials in pet facilities. Materials included posters which stressed the negative impact of pet waste to the storm drain system.

4.2.2 Results

• Partnered with 91 major pet store chains – such as PETCO and PetSmart – as well as smaller independent pet stores, veterinarian clinics, kennels and grooming facilities to outreach to pet owners.
Placed 83 pet posters.
Trained 134 employees.

Listed below is a summary of the materials placed at pet facilities:
 Partner Facilities: 91
 Posters: 83

MATERIAL DEVELOPMENT

The material development portion of the program included the reprinting of collateral materials including pet posters and tearsheets.

Goals

• Reprint and create new materials with storm water program information.

Results

• *Collateral items:* Collateral materials were reprinted, including pet posters and tearsheets.

To leverage education outreach resources, the "Only Rain Down the Storm Drain" Program coordinates and partnerships with Western Riverside Council of Governments (WRCOG). Their report is as follows:

Storm Water Pollution Prevention
ONLY RAIN DOWN THE STORM DRAIN
Call 1-800-506-2555 to report storm drain disposal or obtain more information. E-mail us at fcnpdes@rcflood.org or visit www.rcflood.org

ation (800) 304-2226 or www.rivcowm.org

BACK:

Businesses, DON'T LET YOUR PROFITS GO DOWN THE DRAIN!!!

are in business to make money, but might not realize that e of your daily outdoor business cleaning activities could be tributing pollutants into a waterway by way of the storm n system. Did you know that anyone found disposing or asing pollutants into a storm drain is in violation of the law subject to stiff fines? ***How, you say?*** Storm drains NOT connected to sanitary sewer systems or treatment nts, but their primary function is to prevent flooding by ying rainwater AWAY from developed areas to prevent ding. As water flows over the ground, it picks up a variety ollutants to the storm drain, then flows directly to a pond, k or lake. Contaminated waterways and/or clogged storm ins can cost you $$$$ for remediation and by steep fines osed for each violation.

nty of Riverside Ordinance 754.2 states, "It is a violation his ordinance to throw, deposit, leave, maintain, keep, or mit to be thrown, deposited, placed, left or maintained, any utant in or upon any street, alley, sidewalk, storm drain, t, catch basin, conduit or other drainage structures, business e, or upon any public or private plot of land in the County."

The "Only Rain Down the Storm Drain" Program, in partnership with the County of Riverside, offers the following tips:

- Don't use a hose or pressure washing system; try a dry clean up method.
- Don't overuse cleaning solutions and agents.
- Keep equipment and vehicles in good working condition; look for and repair leaks.
- Discuss and distribute information on storm drain pollution prevention to new employees.
- Write and keep a current spill response plan.
- Wash company vehicles at a commercial car wash, if possible.
- Place all trash inside dumpsters or containers and keep closed.
- Store liquids, hazardous waste and other chemicals in a designated area with secondary containment.
- Properly dispose of all leftover chemicals.

Don't let your profits go down the drain, call 1-800-506-2555 to obtain FREE storm drain pollution prevention information for businesses.

GET THE LOW DOWN ON HOW TO PROTECT WATER QUALITY.....

r quality is affected when storm water pollution (runoff water that flows into the storm drain) moves all kinds of debris pollutants from city streets, neighborhoods, farms, construction sites and parking lots down into a storm drain flowing ocal waterway.

e your home sewer system, (system that collects your waste water), which goes to treatment plants, urban runoff untreated through the storm drain system. ANYTHING thrown, swept or poured into the street or gutter can flow tly into our channels and creeks significantly reducing water quality. This includes pollutants like trash, pet waste, rette butts, motor oil, anti-freeze, runoff from pesticides and fertilizers, paint from brushes and containers rinsed in the r and toxic household chemicals.

ying some simple solutions such as using trash and recycling containers, using chemicals sparingly, taking leftover nicals to household hazardous waste events, properly servicing your vehicle and picking up after pets, can help ect the water quality in the County of Riverside.

tect water quality, please call 1-800-506-2555 to report illegal dumping or clogged storm ins and REMEMBER, only rain down the storm drain!

Over 100,000 copies of the HHW Collections Schedule are distributed throughout Riverside Co. twice annually. Note the "Only Rain Down the Storm Drain" message and toll free number at the bottom right corner.

Above is a utility insert sample prepared at the request of our co-permittees for a mass mailing project. The double-sided message lists HHW local schedules on one side and urban water discharge pollution prevention activities on the other. The average distribution of an insert is 40,000 copies.

HOME IMPROVEMENT STORE OUTREACH

Lowe's: 40390 Winchester Rd.
Temecula, CA 92591
Saturday, June 13, 2009

Approximately **103 residents** in the Santa Margarita Watershed area of Riverside County were educated on stormwater pollution. Public outreach consultant, SGA, distributed the following public education materials to residents:

- 103 HHW Tearsheets
- 50 Tabling Fact Sheets
- 2 Outdoor Cleaning Guide Brochure
- 50 HHW Booklets
- 100 Stormwater Pens

Top: The EZ-Up identifies the agency and the accompanying tablecloth the "Only Rain Down the Storm Drain" slogan and logo.

Left: The value of one on one community outreach and education can lead to others sharing the message with their friends and neighbors.

Above: The gazebo and "Only Rain Down the Storm Drain" logo is an easily recognizable exhibit that draws attendees at fairs and community events. The illustrations on the skirt cross language barriers and encourage DIY behaviors.

Missing: The "Only Rain Down the Storm Drain" trailer that is brightly text wrapped with the program logo, storm drain inlet as the gazebo above and "Only Rain Down the Storm Drain" message.

1.0 Summary

This report addresses the Riverside County Fire Department's Hazardous Materials Response Team activities for the period of July 1, 2008 to June 30, 2009. The report details program development, public outreach efforts, municipal staff training, runoff prevention measures, and call summary. Hazardous Material Response Team activities included in this report were actual hazardous material releases that potentially threatened the watersheds of the Santa Ana, Santa Margarita, and Whitewater Rivers overseen by the Riverside County Flood Control and Water Conservation District.

2.0 Introduction to the Hazardous Materials Response Team

The 2008/2009 Annual Report on Hazardous Materials Emergency Response Team Activities summarizes responses to environmental emergencies for the purpose of controlling the release of toxic materials and minimizing the impact on public safety and the environment. The Riverside County Fire Department Hazardous Materials Response Team, established in 1986, continues with its mission of providing service within Riverside County through a partnership program that combines the efforts from Cal Fire/Riverside County Fire Department and the Hazardous Material Branch of Riverside County Environmental Health.

The Hazardous Materials Response Team responds to environmental emergencies within the County of Riverside and proves mutual aid to Imperial County. An additional responsibility of the HMRT is oversight and coordination of the NPDES Storm Water Discharge Permit for Riverside County Fire Department facilities. The HMRT oversees maintenance and implementation of the Storm Water Pollution Prevention Program (SWPPP) for county fire stations and facilities which includes the implementation of Best Management Practices (BMPs) municipal employee training and Riverside County Fire Fighting Agencies BMPs.

Riverside County Fire Department is one of the largest fire departments within California in both geographic coverage and firefighting personnel, providing emergency service to Riverside County and the cities of Banning, Beaumont, Calimesa, Coachella, Desert Hot Springs, Indian Wells, Indio, La Quinta, Moreno Valley, Palm Desert, Perris, Rancho Mirage, San Jacinto, and Temecula. The Riverside County Fire Department operates 96 fire stations with over 1200 employees.

3.0 Program Management and Development

With the continued development and population growth of Riverside County, total numbers of emergency incidents are increasing. Riverside County Fire Department is committed to meeting the demand for public service and has developed plans and contingencies for continued expansion through placement of new facilities and additional personnel. With the increase in the total number of emergency incidents, there is a related increase in Hazardous Materials related incidents. The Hazardous Material Response Team is meeting this increase in service with the following program developments:

- FY 2001/2002, this year saw the development of two dedicated Hazardous Materials Response Teams, consisting of five Firefighter/Hazardous Material Technicians per team. Team One is located in Winchester, CA and Team two is located in Palm Desert, CA.

- FY 2002/2003, the purchase of three new hazardous materials response vehicles, consisting of two support trucks, and a tractor-trailer main unit. The main unit was assigned to Hazmat Team 1 and one support truck is assigned to each team. There have been additional purchases of equipment and monitors to ensure a full compliment of tools for both teams.

- FY 2003/2004, two Mass Decontamination Response Trailers, capable of treating 200 patients per hour, were purchased with grant money and placed in-service for both teams. A change in the designators for the Hazardous Materials Response Teams was made; “Hazmat 1” and “Hazmat 2” became “Hazmat 34” and “Hazmat 81”, to reflect the geographic locations of the Hazmat Response teams, improving communications and organization.

- FY 2004/2005, participating fire departments within Riverside County developed Best Management Practices (BMPs) that are intended to be used by fire fighting agencies for urban runoff management. These BMPs are a requirement of the Riverside County Municipal Stormwater permit (section XI.B) adopted by the Santa Ana Regional Water Quality Control Board (SARWQCB). Due to an operational need the two response teams were combined into one team and separated into three locations.

- FY 2005/2006, the Hazardous Materials Response Team was reorganized into two distinct teams, Hazmat 34 at Winchester Fire Station 34 and Hazmat 81 at North Bermuda Dunes Fire Station 81. Daily on duty staff is 10 Hazardous Materials Specialists providing service to the county.

- FY 2006/2007, approximately $25000.00 was expended on Vetter air bags to replace older complements and add to the capabilities of Hazmat 81. Vetter air bags are a significant tool that can be used to occlude accidental discharges from impacting the storm water system. Further developments, the installation of MDTs (mobile data terminals) in all front line fire equipment, and Riverside County environmental health officer vehicles. This allows for improvements in locating and responding to incidents, orthographic mapping of incidents and integrating technology which the ability to access the Health Department's Business Response Plans. A $400,000 purchase has been approved to replace the main Hazmat Response Team vehicle at Station 81 and it is scheduled to be placed in service in FY 2007/2008.

- FY 2007/2008, with the growing needs of Hazardous Materials Response, the Hazardous Materials Response Team was granted additional staffing at each station. Winchester Fire Station 34 and Bermuda Dunes Fire Station 81 each have a Paramedic Engine with Hazmat trained people on them. This increased the daily staffing to 16 Hazardous Materials Technicians and Specialist to provide service to the county.

- FY 2008/2009, unfortunately, due to the tough economical times, we have cut the staffing that we were granted last year. The minimum staffing at Winchester Fire Station 34 and Bermuda Dunes Fire Station 81 is 5 Hazardous Materials Technicians and Specialists. We will still be able to provide the same service that we have over the years, we will just have a longer response time. This is due to the fact that we are now cross staffing a fire engine and the Hazmat team.

4.0 Public Education

The Hazardous Materials Response Team is available for public education, and dedicates time to provide information and education regarding environmental safety and Storm Water Pollution Prevention. Both teams have participated in public relation and education events during FY 2008/2009 on an average of 1- 2 per month. Hazmat Response Team personnel are made available to provide information and education through direct public contact, and materials. These events have included:

- The Riverside County Fair held annually at Indio, CA.
- Educational presentations at public schools, grades K through 12.
- Safety fairs held at the cities of La Quinta, Hemet, Perris, Moreno Valley, and Temecula.
- Public events within Riverside County.

Public information and education is provided through materials that the Hazardous Materials Response Team hands out during the various events that are attended during the year and information that team members provide during equipment displays.

- "Household Hazardous Waste Collection Site Schedule" (schedule) Riverside County Environmental Health.
- "Household Hazardous Waste" (pamphlet), Stormwater Cleanwater Protection Program.
- "Stormwater Pollution, What You Should Know" (pamphlet) Stormwater Cleanwater Protection Program.
- "Stormwater Pollution, Outdoor Cleaning Activities" (pamphlet) Stormwater Cleanwater Protection Program.
- "Storm Drains Flow directly to our Waterways" (poster) Stormwater Cleanwater Protection Program.

5.0 Municipal Employee Training

Successful Storm Water Pollution Prevention is dependent upon a standard operation policy and effective education of department employees. Team members from the Hazardous Material Response Team are available to train and educate the approximately 1200 Riverside County Fire Department personnel on the Storm Water Pollution Prevention Program and the National Pollution Discharge Elimination System. In previous years, the training was conducted at individual fire stations, or during employee orientation at Clark Training Center.

To comply with NPDES permit requirements for municipal employee training, and to ensure a consistent training program, Riverside County Fire Department produced a video training program that is distributed to all 96 fire department facilities to compliment the SWPPP manuals that are available for reference at the facilities. Employees are encouraged to view the program on an annual basis. The training covers BMPs, (best management practices) that apply to municipal facilities.

Fire Station/Municipal Facility Activities

- Dispensing of Fuel.
- Vehicle and equipment parking and storage.
- Vehicle and equipment maintenance.
- Vehicle and equipment washing and cleaning.
- Leak and spill cleanup.
- Landscape, garden, and general maintenance and cleaning.
- Loading, handling, storage of chemicals, oil, trash, and debris.

6.0 Prevention Measures

Members of the Hazardous Materials Response Team were involved in the development of best management practices (BMPs) that are used by participating Riverside County fire fighting agencies for urban runoff management. These best management practices were a requirement of the Riverside County Municipal Storm Water Permit (section XI.B) adopted by the Santa Ana Regional Water Quality Control Board in 2004.

The Riverside County Fire Chief's Association adopted the fire department activities to provide guidance to firefighting personnel for management of urban runoff. The BMPs, when followed, minimize discharges of runoff to the municipal separate storm sewer system (MS4) associated with firefighting activities such as fire training, emergency scene spills, discharges and firefighting.

The following Emergency and Non-emergency Firefighting Activities were addressed:

- Discharges associated with fire training activities.
- Discharges associated with post-emergency fire fighting activities.
- Discharges associated with activities conducted at fire department facilities.
- Discharges associated with emergency fire fighting activities.
- Stormwater NPDES training of fire department employees.

7.0 Incident Summary

From July of 2008 through June of 2009 the Hazardous Materials Response Teams, Hazmat 34 and Hazmat 81, responded to a total of **571** hazardous materials related incidents. **234** of these incidents were a threat or potential threat to the stormwater system of Riverside County Flood Control and the Santa Ana, Santa Margarita and Whitewater watersheds.

• Santa Ana Watershed	103
• Whitewater Watershed	68
• Santa Margarita Watershed	63
• Total	234

The average length of time spent on a hazardous materials related incident is two hours. Based on **234** flood control related incidents, the Hazardous Materials Response Team provided **468** service hours to the Riverside County Flood Control District.

Received By	David Ortega
Complaint Adderess	41891 Kalmia Street, Suite A
Complaint City	Murrieta
Complaint Zip Code	92562
Location	Creative Hydroseed

Complaint Grass seed has been dumped in a 'washout' area on the complaint address; the residual hydroseed has migrated on to the access road of the Riverside County Flood Control (RCFC) District facility: "Murrieta Creek Master Drainage Plan - Line F".

Findings 4/30/09: David Ortega, of the NPDES Section at the RCFC, (951) 955-4390, received a call today from Mark Mandel, Riverside County Code Enforcement, about this complaint.

Action 5/1/09: Mr. Ortega went to the site today and took a few photos of the hydroseed that has been dumped on the ground of the business located at the complaint address. Mr. Ortega also noticed that some of the hydroseed from this 'washout' area had migrated onto the access road of the RCFC District facility. Mr. Ortega went to the office of the complaint address and spoke with Jana Rush. She escorted Mr. Ortega to the fenced in 'washout' area to take a better look at the hydroseed that was dumped. Mr. Ortega took a few more photos and then told Ms. Rush that he would find out how severe this matter is. Later that day, Mr. Ortega briefed J. Uhley, of the NPDES Section at the RCFC about this incident. Mr. Uhley stated to Mr. Ortega that hydroseed is a big factor of nutrient loads in that watershed. 5/4/09: Mr. Ortega spoke briefly with Cheryl Roberts of Creative Hydroseed today about the 'washout' area at her business. Mr. Ortega stated that he will have to get with the City of Murrieta's Code Enforcement to find out how they would like to proceed with this matter. Ms. Roberts did say that "she is willing to cooperate with getting things cleaned up and getting a better 'washout' area engineered and in place as soon as possible". 5/20/09: Mark Mandel of County of Code Enforcement called Mr. Ortega today to inform him that Jason Jones, Murrieta Code Enforcement, (951) 461-6331, will be handling this matter. Mr. Mandel sent an email to Mr. Ortega about this and also stating that the business owner will be taking steps to reduce the risk of hydroseed run-off into the RCFC District's facility as well as off of the business property. These steps include: 1. Installing a curb in the rear of the property where they conduct the washouts of their hydroseeding business at the end of each day. 2. Installing an NPDES compliant concrete washout box for the hydroseeding residue. 3. Hiring an engineer to design a permanent concrete vault or pit with pumps to capture the hyroseeding residue and recycle it on the property. 6/17/09: Mr. Ortega and P. Nanney of the NPDES Section met briefly today with the owners of Creative Hydroseed to view the improved BMP's to the hydroseed washout area. Mr. Ortega gave the owners a few pamphlets about the County's Stormwater/Cleanwater program. Mr. Ortega also took a few photos of the installed BMP on site.

Location Santa Gertrudis Creek Channel, just east of Winchester Road

Complaint A 100 gallon, metal tank, has been dumped in the Santa Gertrudis Creek Channel (a Riverside County Flood Control District facility), just east of Winchester Road. Not certain if there is any type of product in the tank that could be hazardous.

Findings 3/16/09: Avelino Valencia, of the Operations & Maintenance Section at the Riverside County Flood Control (RCFC) District, called David Ortega, in the NPDES Section at the RCFC, about this complaint. Mr. Valencia stated to Mr. Ortega that a guy from one of the field crews called this in today. Mr. Valencia told Mr. Ortega, at first, that the tank is located "downstream" of Winchester Road. And that the tank is in the creek bottom. 3/18/09: David Ortega spoke to Richard Garza today about this matter. Mr. Garza stated that he and others from one of the O & M field crews located this tank "about two months ago". Mr. Garza continued to say that "he notified Mark Luna about this who said that he would report it to others in the office". When the field crew members discovered this in the channel, they were hoping to mow the vegetation around it. They moved this tank slightly and noticed that some product was leaking from the bottom of the tank onto the soil. They quickly uprighted the tank and mowed around it. Mr. Valencia also stated that they (O & M) were hoping to remove it from the channel and bring the tank back here to the District because they "assumed" that there was "motor oil" in the tank because of the product that they saw leaking from it.

Action 3/16/09: Mr. Ortega called Kelly Winters, of Riverside County Haz.-Mat., (951) 453-5804, about this complaint. Mr. Winters stated that before he left for the day that he would go to this area to locate the tank and find out the status of it then he would call back to Mr. Ortega. Later in this day, Mr. Winters called back to Mr. Ortega and stated that he looked in Santa Gertrudis Creek Channel from Winchester Road to Margarita Road and could not locate the tank. Mr. Ortega told Mr. Winters that he will call him back tomorrow morning about this matter. 3/17/09, 1510 hours: Mr. Ortega arrived at the site and eventually located the tank in the Santa Gertrudis Creek Channel; upstream of Winchester Road near N. General Kearny Road. Mr. Ortega took a few photos while on site today. He noticed an information plate on the tank that stated it was a tank made "for butane gases only". Mr. Ortega called Mr. Winters back today to set up a time for tomorrow (3/18/09) to meet on site: 0830 hours. 3/18/09, 0830 hours: Mr. Ortega met with Mr. Winters and Jim Sappington of County Haz.-Mat. and with a crew from the Riverside County Fire Department, Emergency Response Unit. Mr. Winters used a "drum thief" to get some product out of the tank to perform a hazard categorization (haz.-cat.). The haz.-cat. of the product was a pH 7, combustible hydrocarbon. After the haz.-cat., Mr. Ortega was given permission by Mr. Winters to call a contractor to remove the tank and product from the site. Eventually, Filter Recycling came to the site today and removed 65 gallons of product from the tank. They also poured a bag of dry sorbent into the tank to inert any residue. They removed the tank off of the site today as well. Mr. Ortega took photos of the work performed by Filter Recycling today. The product went off site on Uniform Hazardous Waste Manifest# 003807833 JJK as 'Waste, Flammable Liquids, N.O.S. 3, UN1993' The tank went off site on Uniform Hazardous Waste Manifest# 004852776 JJK as 'on-RCRA Hazardous Waste Solid'.

Complaint Mobile detail businesses are operating in Temecula, Murrieta, Wildomar, and Lake Elsinore area. The following tip is from the US EPA National Tips Database: "recently, I noticed quite a bit of activity involving 'mobile detail' businesses that are engaged in the business of car washing, steam cleaning, waxing, polishing, etc. I believe the Clean Water Act clearly states that home owners are exempt washing their personal vehicle. However, when one engages as a business (for profit) it is considered industrial waste water. Therefore, what is occurring is industrial waste water being dumped intentionally in the drain systems. Who should supervise this? You tell me, you are the 'expert' folks. Who is responsible? Cities like Temecula, Murrieta, and Lake Elsinore who have granted these businesses licenses to operate.

Findings 12/23/08: David Ortega, of the NPDES Section of the Riverside County Flood Control (RCFC), called and spoke to Eileen Boken at the US EPA today about this matter. She stated that if I need more information about this complaint, that I should call Mr. Harry Paez, of Wildomar, at (951) 678-1682. He is the one who provided the complaint onto the US EPA National Tips Database.

Action 12/23/09: Mr. Ortega called and spoke to Mr. Paez today about this complaint. Mr. Paez was very concerned that this type of business practice, from 'mobile detailers' continue on a daily basis in the cities mentioned in his complaint. Mr. Ortega asked Mr. Paez if there is a specific name and/or phone number to any of these type of mobile detailers that are possibly in violation. Mr. Paez stated that he did not have any specific names of businesses, nor any specific dates of possible violations, nor any specific addresses that this has occurred. Mr. Paez stated that "Riverside County should have their employees drive around these cities to monitor this type of activity". Mr. Ortega stated to Mr. Paez that if and when he witnesses an active discharge happening, then he can call Mr. Ortega at his cell phone# (951) 961-9574, and either he will mobilize to the site and/or someone from County Code Enforcement will drive to the site. Mr. Ortega also stated to Mr. Paez that there is not much that can be done now for some incident that occurred sometime ago with no names of businesses, no phone numbers to the businesses, and no photos showing the possible infractions.

Location	Murrieta Valley I-215 Retention Basin

Complaint Illegal dumping of mattresses, palm fronds and trash in the Riverside County Flood Control (RCFC) District facility: "Murrieta Valley I-215 Retention Basin".

Findings 10/30/08, 1642 hours: Officer Jason Jones, City of Murrieta Code Enforcement, (951) 461-6331, called and left a voice mail message for David Ortega in the NPDES Section of the RCFC concerning the nature of the complaint. 10/31/08, 0715 hours: David Ortega of the RCFC forwarded the voice mail message to Mark Biloki of the RCFC; at his direct line. Mr. Ortega also forwarded the voice mail message to Jason Uhley of the RCFC. Mr. Ortega also called Mr. Jones and left him a voice mail message to give him the cell phone for Mark Biloki, (951) 288-5254, and to suggest that Mr. Jones call Mr. Biloki concerning this matter. Mr. Jones stated in his voice mail message that "he is hoping someone from the RCFC District will be coming out either today or tomorrow (11/1/08) to clean up the items from the I-215 basin so that he can close out his report".

Action 11/3/08: Mark Biloki of the RCFC, Operations & Maintenance Section, sent an email today to David Ortega at the RCFC stating that the illegally dumped materials were cleaned up on Saturday, 11/1/08.

Complaint City	Murrieta
Complaint Zip Code	92562
Location	Murrieta Creek ~200yd south of Ivy on West Side

Complaint 10/17/2008 - Tiffany Zimmer from City of Murrieta Code Enforcement called to ask if we owned a portion of Murrieta Creek between Hayes Ave and Newday. Stated that a person was caught dumping green waste in Murrieta Creek there. I told her that I would look into it and call back.

Findings 10/17/2008 - Found that the property is not owned by the District. It is under the jurisdiction of CDFG and District must obtain permits for maintenance in this area. Spoke with Murrieta Police Officer Bennett who stated that they caught the person in the act dumping Palm Fronds within the creek bed. The property owner (who employed the person caught dumping) came to the scene and told the officer that he owns the land. Officer Bennett told the person to stop the dumping and made them remove the debris. Murrieta Police issued incident number 082910103 regarding this matter.

Action Officer Bennett asked me when he should report such dumping. I informed Officer Bennett that any dumping within a waterway regardless of ownership is illegal and should be reported.

Complaint 9,000 gallons of raw sewage was released due to a lift station failure that caused the manhole to back up and spill out. River flows south from Riverside County into San Diego County.

Findings 6/25/09: EMWD called the California Emergency Management Agency (CEMA) to report this release. The CEMA issued a Hazardous Materials Spill Report, Control# 09-4582, concerning this incident. The CEMA report states that it is unknown if any drinking water was impacted from this release. The CEMA report also states that water was involved in the Santa Margarita River. The CEMA report states that the sewage was contained but was considered unrecoverable. The Riverside County Environmental Health Department and the San Diego RWQCB were notified about this incident. There are no Riverside County Flood Control District facilities in the area of the complaint address that could have been impacted from this release. NOTE: The complaint APN listed in this report is a reference APN only.

Action 6/25/09, 0805 hours: The CEMA received a situation update concerning this incident. RP provided an update to the quantity released, which is 4,000 gallons.

Complaint A combination of muriatic acid, chlorine and pH balancer (adding up to a total of about 20 gallons) was released due to a traffic accident involving a pool service vehicle; less than 20 gallons of pool cleaning chemicals were spilled on the roadway, mostly within the vehicle. The injuries due to chemical spill, only the collision.

Findings 6/23/09: CHP Temecula called the California Emergency Management Agency (CEMA) to report this release. The CEMA issued a Hazardous Materials Spill Report, Control# 09-4554, concerning this incident. The CEMA report states that no water was involved from this release. The CEMA report also states that the substances were contained and cleaned up by the Fire Department. CHP, County Health, and the Fire Department were on scene concerning this incident. The Riverside County Environmental Health Department were notified about this release. The nearest Riverside County Flood Control District facility is located about 1.1 miles to the southwest of the complaint location: "AD159 - Butterfield Stage Road Storm Drain".

Location	Northbound I-15 Freeway at the Rainbow Scale facility

Complaint 1 ounce of acetone was on the side of a 55 gallon drum.

Findings 11/6/08: CHP called the Governor's Office of Emergency Services (OES) to report this substance. The OES issued a Hazardous Materials Spill Report, Control# 08-8003, concerning this incident. The OES report states that this is a "historical" report; the incident occurred on 10/24/08. No water and no drinking water was involved and/or impacted from the substance. The OES report also states that the substance was contained. The Riverside County Environmental Health Department was notified about this incident. There are no Riverside County Flood Control District facilities in the area of the complaint location that could have been impacted from the substance. NOTE: The complaint APN listed in this report is a reference APN only.

Location On Via Montezuma, cross street of Del Rio Road

Complaint 5 gallons of a mixture of motor oil, transmission oil, and Gasoline was released due to a solo accident that resulted in the vehicle going over the side of the road and into a creek (Murrieta Creek).

Findings 9/1/08, 1150 hours: County Haz.-Mat. called the Governor's Office of Emergency Services (OES) to report this release. The OES issued a Hazardous Materials Spill Report, Control# 08-6384, concerning this incident. The OES report states that no drinking water was impacted from this release however, water was involved in Murrieta Creek. The OES report also states that the vehicle has been extracted but substance has been released to the creek bed. Absorbent pads have been placed to contain substance and Flood Control will be contacted regarding determining who will clean up. Police Dept., Cal Fire, and Temecula Public Works were on scene concerning this incident. The Riverside County Environmental Health Department was notified about this release.

Action 9/2/08: David Ortega spoke briefly to Christine Parsons today about this incident that occurred yesterday on Labor Day. Ms. Parsons said that she was on call this past weekend and left voice messages to Mark Biloki and Steve Thomas of the Riverside County Flood Control (RCFC) with no response from either since yesterday about this release into Murrieta Creek. Ms. Parsons referred Mr. Ortega to call Jim Sappington of County Haz.-Mat., (951) 377-8407, today about this incident. Mr. Ortega left a voice message for Aldo Licitra to call him back today. Mr. Ortega spoke briefly with Mr. Sappington today about this release near Murrieta Creek. Mr. Sappington stated that Cal Fire had set out some absorbent pads on the spilled material. Mr. Sappington also said that he traded voice messages today with Mr. Licitra of the City of Temecula about the impacted area. Mr. Sappington said that Mr. Licitra will have a City of Temecula crew pick up the pads tomorrow (9/3/08). 9/5/08: David Ortega, (951) 955-4390), of the RCFC District spoke briefly to Aldo Licitra, City of Temecula, about this incident. Mr. Licitra emailed an update about this release to Ben Neill of the RWQCB, to Mike Shetler at the Riverside County Executive Office, to J. Uhley, C. Padres and to David Ortega at the RCFC and to others. The email stated that, "Once the City (Temecula) was notified, immediate actions were implemented. Although Murrieta Creek does not fall under the City's maintenance jurisdiction, assistance was provided to the Haz Mat team to ensure their safety during their operations. The accident occurred on a low-flow crossing at Via Montezuma. The area affected by the accident was limited to a small section of shallow ponded water immediately adjacent to the crossing and did not move beyond the crossing. The vehicle was immediately removed from the crossing and an array of absorbent pads were placed by both the Hazmat team and the City maintenance crew on areas where sheen was observed. The City (Temecula) subsequently removed these pads once the sheen was absorbed. No further impacts were observed at the location of the incident. The City re-opened the low-flow access immediately afterward. The City appreciates the collective efforts between Haz Mat, Flood Control, and the County in resolving this issue".

SANTA MARGARITA RIVER

WATERSHED CLEAN UP

November 1, 2008, 8am-12pm

The 26.2 mile watershed of the Santa Margarita River provides habitat for plants and animals in San Diego and Riverside Counties. Since 1995, volunteers have prevented over 1400 tons of trash from polluting our creeks and entering the Pacific Ocean.

8:00 am Report to one of the staging areas below to pick up
your free Clean Up T-shirt, garbage bags,
and directions to your clean up area.

12:00 pm Free barbecue for volunteers
at Perrit Park in Lakeland Village

Murrieta Staging Areas:

Santa Rosa Plateau Ecological Reserve, 39400 Clinton Keith Road
Murrieta Police Station, 24701 Jefferson Avenue

For more information, contact Carole Bell at (951) 677-6951x223 or cbell@tnc.org
Community Service Hours are available

Sponsored by: Supervisor Bob Buster, CR&R, WM and EMARCD

PE.com Press Enterprise Article

Volunteers move mountains of debris from areas around Murrieta

10:00 PM PDT on Saturday, November 1, 2008

By JERRY SOIFER
Special to The Press-Enterprise

MURRIETA - Joe Bobak, a transplant from Chicago to Murrieta, searched the Web site of his new hometown for a place he could take his daughter trick-or-treating on Halloween.

Instead, he found an announcement of the cleanup of the watershed of the Santa Margarita River west of Murrieta. Bobak and his wife, Lauren, were two of 125 people who attempted to purge trash and all forms of pollution Saturday from the Santa Rosa Plateau Reserve, the Lakeland Village area, Lake Elsinore and the environs of Murrieta.

The group picked up about 25 tons of waste such as a hot tub, enough discarded parts to build an auto and the skeletal remains of animals, including what may have been a horse.

Carole Anne Bell, manager of the reserve who started the event in 1994, said, "The (De Luz) Canyon looks free of trash as of this moment. What makes this a success is all these people joining together."

People came from as far as Norco, Woodcrest and Bonsall in San Diego County. "This is the good half of humanity," Bryce Miller, of Bonsall, said of his colleagues working in DeLuz Canyon.

"That's the bad half," Miller said, pointing at the rubble they had pushed up the side of a hill.

Bobak said he joined the cleanup effort to get out of the house and to exercise.

Riverside County code workers hooked up a chain to the hot tub to haul it up from the side of the canyon before it was loaded on a truck.

"Once we got it attached (to the chain), it wasn't too hard," said Mike Slaick, county flood control operator.

The Bobaks, Miller and Murrieta residents Zach and Beth Principe needed mountaineering skills to inch their way down the side of the canyon to retrieve trash. Zach Principe found a wallet filled with credit cards. Beth found a pillow which she flung

like a Frisbee. They found a child's bicycle with its training wheels, and legal documents that might have been divorce papers.

Kim Hull, 16, a Murrieta Valley High School junior, found desks, plastic piping and lockers while working off Jackson Avenue in Murrieta. "We filled a whole Dumpster," Kim said. "I was sweating. It wasn't that hot."

Vance Usui, a teacher at Norco High School, brought five students to give them "a first-hand look at what we do to the environment and to also get some community service hours."

Bell said the cleanup was scheduled in mid-fall to avoid the heat. Large satellite dishes were a common find at previous cleanups because smaller ones were coming into vogue, Bell said.

At noon, the volunteers joined county workers and Cal Fire firefighters for a picnic at Perret Park in Lakeland Village. Cal Fire Capt. John Crater said, "This is an example of leadership in the community and getting to know their neighbors. The more of these events they have, the closer the community becomes."

Samantha Dempster, of Woodcrest, collects shirts with the cleanup insignia the way runners amass shirts from races.

She wore the shirt from the 2004 cleanup Saturday.

Erin Snyder, of Riverside, worked at her third cleanup in the space of a month.

"This is such a pretty county site," said Snyder who was wearing a shirt from the 2006 cleanup. "It's a great excuse to get out here."

RIVERSIDE COUNTY FLOOD CONTROL
AND WATER CONSERVATION DISTRICT

January 15, 2009

Mr. John Robertus, Executive Officer
California Regional Water Quality
Control Board – San Diego Region
9174 Sky Park Court, Suite 100
San Diego, California 92123

Dear Mr. Robertus:

Re: Report of Waste Discharge for the Santa Margarita River Region of Riverside County Order No. R9-2004-001, NPDES No. CAS0108766

This letter and the enclosures comprise the Report of Waste Discharge (ROWD) for the area-wide municipal separate storm sewer system (MS4) National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108766, San Diego Regional Water Quality Control Board Order No. R9-2004-001. This ROWD is an application for renewal of the area-wide MS4 NPDES Permit for Riverside County Flood Control and Water Conservation District (RCFC&WCD), the County of Riverside (County), and the incorporated cities of Riverside County within the upper Santa Margarita River watershed (Menifee, Murrieta, Temecula, and Wildomar) collectively referred to herein as "Permittees."

Order No R9-2004-001 does not specify the requirements of the ROWD. However, the attached ROWD includes the following information:

- Applicant information, including Permittee contacts, legal authorities, description of the Permit Area, and funding sources;
- Overview of the upper Santa Margarita River watershed, including population, land use, Receiving Waters, and the MS4;
- Changes in land use and/or population over the 2004 MS4 Permit term and projections for changes over the next MS4 Permit term;
- Highlights of the Permittee compliance programs over the 2004 MS4 Permit term;
- Evaluations of the Permittees existing compliance programs based on water quality data collected to date; and

- Activities the Permittees propose to undertake during the next MS4 Permit term, including implementation of Low Impact Development (LID) requirements and compliance assessments and targets.

In addition, the ROWD includes an assessment of the economic conditions and the projected impact of these conditions on sources of compliance program funding. Based on this assessment, it appears that the major challenge facing the Permittees over the next MS4 Permit term will be maintaining existing compliance programs. In 2004 both the Permittees and the San Diego Regional Water Quality Control Board (Regional Board) staff invested significant time and resources in the development of the current MS4 NPDES Permit (hereinafter referred to as the 2004 MS4 Permit) which define the current compliance program. The Permittees believe, with exceptions outlined in the ROWD, that the existing Permit is protective of water quality and should be reissued as is.

Permittee representatives met with Regional Board staff on September 8, 2008 to obtain guidance for preparation of the ROWD. In that meeting, Regional Board staff provided their expectations regarding the ROWD. Based on the Permittee internal discussions and discussions with Regional Board staff, the Permittees propose to maintain the provisions of the 2004 MS4 Permit and DAMP with limited modifications to reflect:

- Updated references to related orders by the San Diego Regional Board and State Water Resources Control Board (State Board);
- Identification of impairments to Receiving Waters in the Santa Margarita Region;
- Evolution of compliance programs;
- Further standardization and definition of terms;
- Deletion of requirements in the 2004 MS4 Permit that described the development of compliance program elements which were incorporated into the 2005 DAMP;
- Implementation of LID/Hydromodification requirements for New Development projects;
- Implementation of compliance assessments and action levels;
- Necessary modifications to the Watershed SWMP and Individual SWMPs for the 2004 - 2009 MS4 Permit term; and
- Regional Board staff comments made during the term of the 2004 MS4 Permit, including comments received during the September 8th ROWD coordination meeting.

Especially given the existing and projected economic conditions, the Permittees goal is to work with the Regional Board staff to further refine the provisions of the 2004 MS4 Permit to enhance the effectiveness of existing compliance programs within available funding. In addition, the Permittees will work with the Regional Board staff to ensure that the requirements and expectations of the fourth term MS4 NPDES Permit are clear and unambiguous and that the focus is on addressing identified water quality problems in the Receiving Waters

We look forward to working with the Regional Board staff in the renewal of the area-wide MS4 NPDES Permit. If you have any questions, please call Jason Uhley at 951.955.1273 or Claudio Padres at 951.955.8602.

Very truly yours,

WARREN D. WILLIAMS
General Manager-Chief Engineer

1.0 Executive Summary

On July 14, 2004 the San Diego Regional Water Quality Control Board (Regional Board) adopted Order No. R9-2004-001, an area-wide National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit (2004 MS4 Permit); this permit expires on July 14, 2009. A Report of Waste Discharge (ROWD) for renewal of the 2004 MS4 Permit must be submitted no later than 180 days in advance of the expiration date (i.e., by January 15, 2009).

This ROWD is an application for renewal of the 2004 MS4 Permit (NPDES No. CAS0108766) for the MS4 owned and operated by the Riverside County Flood Control and Water Conservation District (District), the County of Riverside (County), and the incorporated cities of Riverside County within the upper Santa Margarita River watershed (collectively, the Permittees). The newly incorporated cities of Menifee and Wildomar are included in this application as a Notice of Intent to participate in the updated MS4 Permit.

The content of this document is structured to identify:

- Information about the applicants (Section 3.0),
- Information on the area to be covered under the MS4 Permit (Section 4.0),
- An overall evaluation of the Permittees' existing programs based on water quality trends (Section 5.0),
- Accomplishments and recommendations for the Permittees' regionally implemented programs (Section 6.0) and
- Accomplishments and recommendations for the programs implemented as part of the Individual Stormwater Management Plans (SWMPs) (Section 7.0).

The Riverside County Drainage Area Management Plan (DAMP) documents the model implementation plan from which each of the existing Permittees has developed their respective Individual SWMP to implement the DAMP. In addition a Watershed SWMP has been developed to describe the programs that will be implemented regionally. The Annual Reports submitted to date describe the implementation of these SWMPs and document how they have evolved over time.

This ROWD builds on these Annual Reports by highlighting the major accomplishments of these programs, evaluating the long-term effectiveness of the programs and recommending revisions to the programs to enhance the efficiency and effectiveness of the programs to manage Urban Runoff to protect Receiving Water quality. To promote clarity of intent, terms defined in the 2004 MS4 Permit are capitalized in this ROWD.

Due to the impacts of the current economic recession on Permittee budgets and the effectiveness of existing Urban Runoff management programs, the Permittees' primary focus during the next MS4 Permit term will be on maintaining existing compliance programs in the face of significant cuts in basic municipal programs and services. Riverside County is one of the areas most affected by the mortgage crisis and the Santa Margarita Region is one of the most impacted areas of Riverside County. This crisis is having significant impacts on Permittee resources and projections for a deepening recession promises to exacerbate these impacts. Further, monitoring data indicates that the existing compliance programs have been effective in maintaining water quality. This ROWD focuses on maintaining the fundamental

structure and content of the Riverside County DAMP and the Individual SWMPs. However, the Permittees have identified several enhancements and/or alterations to their programs that can be implemented to continue to increase the effectiveness of these programs, without increasing costs.

1.1 Highlights of Program Implementation

Sections 6 and 7 of this ROWD describe the numerous accomplishments of the Permittees programs during the 2004 MS4 Permit term. Some highlights of the major accomplishments for the Permittees include:

- Development and implementation of a Water Quality Management Plan (WQMP) that addresses post-construction Urban Runoff management for New and Significant Re-Development.
- Development and implementation of the Watershed SWMP and the Permittee's Individual SWMPs.
- Development of handbook to standardize post-construction Best Management Practice (BMP) selection and design in Riverside County. Ongoing updates to the handbook include a plan to incorporate and promote low impact development design concepts.
- Development and enhancements to the design template for developing project-specific WQMPs
- Development of a Frequently Asked Question (FAQ) document to assist developers and plan review staff in understanding WQMP requirements and expectations.
- Development of coordinated BMP manual for firefighting agencies.
- Development, implementation and maintenance of Permittee databases to track construction sites 1-acre or larger. In addition, the Permittees have standardized a construction reporting spreadsheet used for Annual Reports, updated inspection forms, and enhanced the construction outreach program.
- Creation of Permittee databases to track industrial and commercial facilities.
- Creation and maintenance of the Storm Water Protection website that offers educational resources and free brochures targeting residents, businesses, developers, contractors, and elementary school children.
- Partnership with the Mission Resource Conservation District to provide an educational outreach programs targeting both schools and adults.
- Continued participation in the Consolidated Program for Water Quality Monitoring (Consolidated Monitoring Program) that includes collection of water quality samples at MS4 outfalls and Receiving Waters.
- Participation in regional and statewide monitoring efforts such as the Southern California Monitoring Committee (SMC), Southern California Coastal Water Commission and National Water Resources Institute.
- Participation in the California Stormwater Quality Association (CASQA), including the leadership roles of Officer, Director, and Legislative Chair.
- Development of the Upper Santa Margarita Region Integrated Regional Watershed Management Plan

- Continued partnership and coordination with the Bureau of Reclamation on a watershed plan and water quality model for the Santa Margarita watershed
- Continued participation in the Santa Margarita Lagoon nutrient Total Maximum Daily Load (TMDL) development process
- Participated in a stakeholder workgroup process led by Regional Board staff to revise REC 1 Basin Plan requirements for TMDLs

1.2 Summary Evaluation of Program Implementation

The trend analysis presented in Section G-8.2 of the FY 2007/2008 Watershed Annual Report and reviewed in Section 5.3 of this ROWD indicates that after almost 14 years of active Permittee involvement in MS4 Permit related Urban Runoff management programs, the significant increase in population (over 300 percent) and associated rapid urbanization that the area has experienced has not resulted in any statistically significant increases in Pollutant concentrations in Receiving Waters in the Santa Margarita Region. This indicates that the Permittees MS4 programs are and have been protective of Receiving Water quality. Pyrethroid pesticides, the one Pollutant that does appear to be linked to urbanization, has been addressed through a Toxicity Reduction Evaluation process, outreach programs, and Permittee participation to address pyrethroid pesticides and other pesticide sources at the state and federal level.

To enhance the effectiveness of the MS4 Permit compliance programs, the Permittees have agreed to implement compliance program revisions as described in sections 6 and 7 of this ROWD.

1.3 Summary of Major Recommendations for Program Revision

As described in section 3.4 of this ROWD, the Permittees are facing unprecedented fiscal impacts resulting from the national and state economic crises. The impacts on the Permittees are especially severe due to the disproportionate impact of home foreclosures in the Santa Margarita Region coupled with plummeting sales tax revenue. Unfortunately, it is anticipated that the economic conditions will persist for a significant portion of the term of the next MS4 Permit. During this period, the Permittee's MS4 compliance programs will increasingly compete with more fundamental public services for finite and dwindling resources. The challenge and priority for the Permittees will be to maintain the existing compliance programs in the face of cuts in basic programs and services.

Nevertheless, and although the various programs implemented as part of the Watershed SWMP and the Riverside County DAMP have been determined to be effective overall, Sections 6 and 7 of this ROWD identify certain areas wherein the Permittees are proposing changes to improve the effectiveness, efficiency, and transparency of these programs.

The program revisions recommended in this ROWD reconfigure existing programs in a manner that will increase the Permittees' overall ability to protect Urban Runoff quality, while limiting additional costs that would make these revisions cost-prohibitive in light of the current and foreseeable economy. Some of the major recommendations include:

Enhance Program Effectiveness Assessments and Incorporate Action Levels (Section 6.1.2.1)

The Permittees have carefully evaluated their MS4 Permit compliance programs and annual reporting forms. Based on this review the Permittees determined that:

- The overarching goal of the program is to ensure that Urban Runoff does not cause or contribute to non-attainment of Beneficial Uses in the upper Santa Margarita River watershed;
- Permittee compliance programs are process based and, consistent with the Maximum Extent Practical (MEP) approach, are incrementally adjusted as part of the annual reports and comprehensively reevaluated and if necessary, revamped as part of each ROWD;
- Monitoring data should be used to drive long term program assessments and assess goal attainment as part of the ROWD; and
- Process based Municipal Action Levels (MALs) should be used to evaluate annual program implementation to ensure that programs are implemented to the MEP and identify the needs for incremental adjustments.

The Permittees have proposed revised Effectiveness Assessment metrics and MALs for use in Permittee Annual Reports consistent with the aforementioned findings and as described further in Section 6.1.2.1. The MALs are intended to function as triggers, or minimum bars that if breached, would require the Permittees to evaluate the appropriate program elements to determine if adjustments are necessary to attain the MEP standard. The Permittee proposal will not only add transparency to the Permittees compliance programs but assist Permittees in evaluating and adjusting their Permit compliance programs to assist in attaining Water Quality Standards. Further, the proposed effectiveness assessment metrics can be implemented without significantly increasing the Permittees' program costs.

Revisions to the IC/ID Program (Section 7.8.2)

During the 2007/2008 MS4 Program audits conducted by PG Environmental and Regional Board staff, several questions were raised regarding the Permittees existing Illicit Connection/Illegal Discharge(IC/ID) field monitoring programs. The Permittees have evaluated the Regional Board and PG Environmental staff's comments and proposed a revised IC/ID Program based on the following:

- Random selection of MS4 outfalls throughout the Santa Margarita Region;
- Rotating MS4 outfall sites annually to maximize coverage of the MS4;
- Partnering one District staff person with one city/county code enforcement officer for data collection to ensure consistency in sampling procedure/collection and quick response to detected IC/ID events.

Implementation of a Post-Construction Treatment Control BMP Inspection Program (Section 7.2.2.6)

Consistent with Regional Board staff's request to consider development of a post-construction Treatment Control BMP inspection program, the Permittees have developed a proposal that they plan to implement when economic conditions allow. This proposal would enhance the existing business and Permittee facility inspection programs described in the Riverside County DAMP by incorporating inspections and maintenance verification of Treatment Control BMPs. Treatment Control BMPs constructed as part of residential developments, or other developments not captured by the Permittees' existing business inspections would be addressed through an annual self-certification program.

Revisions to the Dry Weather Monitoring Program (Section 6.4.4.1)

The Permittees have committed to participating in the Regional Watershed Monitoring Program developed in conjunction with the Southern California Coastal Water Research Project (SCCWRP). Six annual monitoring events were scheduled for the upper Santa Margarita River watershed. Consistent with the agreement reached by SCCWRP, Permittee, and Regional Board staff, three of these sites would be collected by the Permittees and three through the Surface Water Ambient Monitoring Program (SWAMP). The costs for implementing the three sites to be implemented by the Permittees would be offset by reducing the Permittees existing dry weather triad monitoring events (three stations) from twice a year to annually.

Development of a LID Manual (Section 7.2.2.1)

The Permittees have committed to develop a Low Impact Development (LID) Implementation Manual based on the LID Manual currently being developed by the SMC and CASQA.

Hydromodification Management Plan (Section 7.2.2.2)

The Permittees have committed to develop a revised hydromodification management plan based on the findings of the final SCCWRP Hydromodification Management report currently under development.

Participate in a Watershed Based TMDL for the Santa Margarita Lagoon (Section 6.4.4.7)

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon watershed-based TMDL has been withdrawn. As described in Section 3.4, economic conditions are also impacting the Permittees' funding sources and the Permittees are struggling to maintain sufficient resources to fund their existing compliance programs. Therefore, the Permittees cannot currently support committing additional funds toward a third party TMDL effort. The Permittees are, however, agreeable to discussing with the Regional Board a elimination or reduction of various required compliance activities that are not measurably enhancing the their ability to attain Water Quality Standards, which in turn could allow the Permittees to redirect some of their existing resources into the third party TMDL effort. Some program elements that could be considered for discussion are described in Section 6.4.4.7.

Pyrethroid Pesticide BMP Implementation

The Permittees have committed to implementing several BMPs to address possible urban sources of pyrethroid pesticides. In addition the Permittees have committed to working through CASQA to facilitate regulatory change in pyrethroid pesticide use to curtail potential causes of receiving water impairment.

Adjustments to the Monitoring Program

The Permittees have proposed additional revisions to the monitoring program to streamline implementation and increase its utility.

2.0 Introduction

The Regional Board adopted Order No. R9-2004-001 (NPDES No. CAS0108766), an area-wide NPDES MS4 permit (2004 MS4 Permit) on July 14, 2004. This ROWD is a required component for renewal of the 2004 MS4 Permit. The 2004 MS4 Permit authorizes discharges of Urban Runoff from the MS4 owned and operated by the Permittees.

Capitalized terms used in this ROWD are defined in the glossary of the Riverside County DAMP. The Riverside County DAMP serves as the model compliance document used by the Permittees to develop the Watershed and Individual SWMPs. To save costs and increase the effectiveness of the MS4 Permit compliance programs, the Permittees will maintain the Riverside County DAMP as the primary document that describes Permittee compliance programs. The Permittees individual and regional compliance programs are then described in more detail in the Individual and Watershed SWMPs.

This ROWD has been written and formatted to address the requirements outlined in United States Environmental Protection Agency (USEPA) *Interpretative Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems* contained in the Federal Register, Volume 61, page 41698 (61 FR 41698), and to include commitments made in the various compliance documents, annual reports and in meetings with the Regional Board.

Additionally, as discussed in the meeting with Regional Board staff on September 9, 2008 and as supported by the above mentioned USEPA guidance, this ROWD relies on the fourth year Annual Reports to document the programs implemented by the Permittees. The fourth year Annual Report also includes a comprehensive evaluation of Permittee monitoring data to date and includes preliminary recommendations for Permittee compliance programs based on that data. As part of the ROWD process, the Permittees have reassessed their existing programs that are described in the Annual Reports, the monitoring conclusions and program recommendations contained in the fourth year Annual Reports, and in this ROWD, are making additional recommendations for revisions to improve the efficiency and effectiveness of these programs at improving and protecting the quality of our Receiving Waters.

The following sections of the ROWD are summarized as follows:

Section 3.0 - Information about the Permittees, their legal authority to implement the existing and proposed programs, the Permit Area, and the Permittee's funding sources and economic outlook relative to continued funding of the MS4 Permit compliance programs.

Section 4.0 – Information about the upper Santa Margarita River watershed, including physiography and geology, hydrology, climate, population, land use, surface water bodies and their Beneficial Uses and Impairments, and the MS4. This information provides context for the MS4 Permit compliance program in the Santa Margarita Region.

Section 5.0 – An overall evaluation of the Permittees existing programs based on water quality data collected to date and proposed compliance program modifications.

Section 6.0 – Evaluation of regional compliance programs, including a summary of accomplishments and proposed program revisions.

Section 7.0 – Evaluation of compliance programs individually implemented by the Permittees, including a summary of accomplishments and proposed program revisions.

3.0 Applicant Information

3.1 Permittee Contact Information

Table 1 provides the contact information for each of the Permittees in the Santa Margarita Region.

3.2 Statement of Legal Authority

The Co-Permittees have adopted ordinances regarding the management of Urban Runoff. The ordinances provide the Permittees with the legal authority to implement the requirements of the 2004 MS4 Permit and 40 CFR Section 122.26(d)(2)(i)(A-F). The Permittees also provided certification of adequate legal authority to comply with the 2004 MS4 Permit and to implement the Riverside County DAMP to the

[1] As the Cities of Menifee and Wildomar are recently incorporated, the County of Riverside is currently handling their stormwater and MS4 permitting issues. Once these cities are fully established and staffed, updated contact information will be provided to the Board. The cities will assume responsibility for their programs on October 1, 2009.

Regional Board. However, it is noted that the newly incorporated cities of Menifee and Wildomar will submit their certifications following adoption of the updated MS4 Permit.

However, there are limitations to the authority the Permittees have for enforcement actions. The Permittees do not have legal authority over discharges into their respective MS4 facilities that originate from agricultural activities, state and federal facilities, utilities and special districts, Native American tribal lands, wastewater management agencies and other point and non-point source discharges otherwise permitted by, or under the jurisdiction of, the Regional Board or USEPA. Examples of non-point sources of Pollutants not under the control of the Permittees include materials from operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

Also, the Permittees do not have the authority to enforce the provisions of California's General Permit for Storm Water Discharges Associated with Industrial Activities (General Permit-Industrial) or California's General Permit for Storm Water Discharges Associated with Construction Activity (General Permit-Construction). The State Water Resources Control Board (State Board) issues these NPDES permits, and neither the State Board nor the Regional Board has the authority under the Clean Water Act to delegate responsibility for administering these NPDES permit programs to the Permittees. However, the Permittees' local storm water and erosion control ordinances may address items similar to those identified in these statewide NPDES permits.

3.3 Permit Area

The Permit Area is defined as the urbanized area serviced by the Permittee's MS4 facilities. The Permit Area is located within the area delineated by the County boundary line on the south and the limits of the jurisdiction of the San Diego Regional Board on the north, east, and west. It is important to recognize that the Clean Water Act exempts agricultural activities from regulation under NPDES and the Permittees do not have legal jurisdiction over storm water discharges into their MS4 facilities from:

- California and federal facilities,
- Areas under the jurisdiction of San Diego County,
- Utilities and special districts, and
- Native American tribal lands.

These areas are not included in the Permit Area. In addition, other point and non-point source discharges otherwise permitted by or under the jurisdiction of the Regional Board or USEPA may affect water quality in the Murrieta and Temecula Creek watersheds.

The area of Riverside County under the jurisdiction of the Regional Board is less than 8 percent of the 7,300 square miles within Riverside County. Of the 27 municipalities within the whole of Riverside County, only five include areas under the jurisdiction of the Regional Board.

3.4 Funding Sources and Economic Projections

3.4.1 Funding Sources

The costs incurred by the Permittees in implementing the SWMPs fall into two broad categories:

- **Shared Costs**. These are costs that fund activities performed mostly by the District under the Implementation Agreements. These activities include coordinating the overall storm water program, coordinating other interagency cooperative efforts such as the Compliance Assistance Program (CAP), participating in CASQA activities, representing Permittees at meetings of the Regional Board or State Board and other public forums; preparing and submitting compliance reports and other reports required under the MS4 Permit, conducting Urban Runoff monitoring and public education outreach programs, responding to Water Code Section 13267 requests, providing other program documentation, and coordinating consultant studies, Permittee meetings, and training seminars.
- **Individual Permittee Costs for Individual SWMP Implementation**. These are costs incurred by each Permittee for implementing within its jurisdiction the BMPs (drainage facility inspections for illicit connections, drainage facility maintenance, drain inlet/catch basin stenciling, emergency spill response, street sweeping, litter control, public education, construction activity inspection, development of implementation plans, etc.) comprising the Individual SWMPs.

Historically, the Permittees have employed several funding methods to finance their MS4 Permit compliance activities. Unfortunately, the mortgage crisis, collapse of the housing market, and the economic recession has resulted in the cessation of virtually all development activity and has significantly reduced property and sales tax revenue. Property tax revenues have been reduced by the high level of foreclosure activity, reduced property values and a significant decline in assessed valuations. Property tax revenues have been further reduced by homeowner requests for reassessments to reflect the reduced property values. The impact of these economic conditions on the Permittees in the Santa Margarita Region has been particularly severe. As a result, the aggregate funding available to the Permittees has been severely reduced, and it is anticipated that this condition will continue well into and possibly throughout the next Permit term. The funding methods historically used and the effects of the economic situation on the availability of funds through these sources are summarized as follows:

- **Santa Margarita Watershed Benefit Assessment Area**. In 1991, the District established the Santa Margarita Watershed Benefit Assessment Area to fund its MS4 Permit compliance activities. Currently, the Benefit Assessment revenues fund the District's share of the area-wide MS4 Permit program activities and the District's individual compliance activities as a Permittee. Under the Benefit Assessment each parcel is taxed based on the impervious area of each parcel at a set rate established by District Ordinance 14. This rate has not been increased since 1991 due to Proposition 218. In 2007/08 the Santa Margarita Benefit Assessment generated approximately $410,000 dollars in revenue.

  Outlook: The District expects at best to maintain, if not see temporary reductions in Benefit Assessment revenues due to the significant number of homes that are not paying property tax due to foreclosure. Pursuant to Article 13.D of the California Constitution, an increase in the established Benefit Assessment rate to compensate for these reductions requires approval of 2/3

of the voters or 50 percent of the property owners and is highly unlikely given the current economic climate. Revenues will not increase until the development industry recovers.

- **General Fund /Other Revenues**. The County and the cities utilize general fund revenue to finance most of their MS4 Permit compliance activities. General fund revenue is generated by property tax, sales tax, and auto license taxes.

  Outlook: The Permittees expect a continued reduction in th**e funds** available through General Fund / Other Revenues through at least FY 2009 /2010. Although optimistic that conditions will begin to stabilize toward the end of 2009, the Permittees cannot speculate as to when revenues will recover to previous levels.

- **Fees**. Several Permittees charge fees for services such as inspections, plan check, and other recoverable costs related to compliance with the 2004 MS4 Permit. These fees cover both the direct and indirect costs associated with conducting these inspections/reviews including associated compliance tracking and reporting.

  Outlook: It is notable that, with the virtual collapse of the development industry in the Santa Margarita Region, the fees received by the Permittees have been significantly reduced. With this reduced level of fee-based income, maintenance of the existing inspection and plan review programs will place an increased burden on overall funding of the compliance programs. The Permittees do not expect revenues from fees to recover until the development industry recovers. Even with recovery of the development industry, it is anticipated that over the long-term, revenues from fees will be reduced for the City of Temecula and the County due to the reduced area remaining for development within their jurisdictions.

- **Grants.** The Permittees have actively pursued and, as available, used Grants to fund compliance programs.

  Outlook: In December the state's budget crisis resulted in a directive to state agencies from the Department of Finance to halt projects that rely on bond funds, including those funded by Prop 40, Prop 50, or Prop 84. The State of California is the primary source of grant funding for water quality projects. Future availability of funds to resume grant-funded projects is uncertain.

It is clear that the current economic climate and that of the foreseeable future is creating a significant burden upon the Permittees that will make the continuance of all existing MS4 Permit compliance programs increasingly difficult. New funding sources or alternative combinations of funding sources will likely be required to ensure continued funding of even the current MS4 Permit compliance programs.

3.4.2 Economic Projections

According to Chicago Title, Southwest Riverside County has experienced a very significant increase in supply of single-family residential units on the market. As a result, housing price indicators are very negative. In the majority of the Southwest Riverside submarket, the pending price is less than the closing price indicating general price weakness. The October, 2008 count of bank owned (REO) properties for Riverside County as a whole was 12,078. The number of home in foreclosure was 23,480. The presence of high levels of REO properties will continue to negatively affect home prices. In addition, the level of foreclosures is increasing.

With regard to other sectors of the economy, Riverside County has taken a serious turn for the worst in 2008, with projections indicating that the severe downturn will continue through 2009 at the very least.

The economic difficulties being faced in the Southwest Riverside submarket is the result of the dramatic downturn in the housing market in this area, the national financial turmoil, the worldwide credit crisis, and the increasing consumer debt crisis. According to Beacon Economics, a respected economics consulting firm in Los Angeles, Inland Southern California is clearly at the epicenter of this economic turmoil, with extremely high rates of unemployment at present. Unemployment rates in Inland Southern California are expected to reach 12.4 percent before this deep recession is over. Housing prices are expected to continue their precipitous decline from their peak levels in the two Inland Southern California counties through at least 2011. According to Dataquick, median home prices in Riverside County peaked at $415,000 in January 2007. At the end of this cycle, the median home price in Riverside County is expected to be $198,000. Figure 1 depicts the median housing price in Riverside County over the period 1990 to August 2008.

Figure 1. Riverside County Median Housing Price (1990 – August 2008)

Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 14.

Local Government sales tax revenues remained fairly stagnant through 2006 and began to decline in early 2007, according to Beacon. By the second quarter of 2008, taxable sales in Riverside County declined by 7.7 percent. The decline is expected to continue with taxable sales possibly bottoming out by 2010. Recovery of these reduced revenue streams will likely not occur within the next permit term.

As a direct outcome of the current economy and the economic outlook into the next MS4 Permit term, the number of New Developments proposals has plummeted and any significant rebound is not forecast. New and redevelopment projects will likely remain minimal. As shown in Figure 2, the number of housing units being added each year has dropped below the levels seen at any point in time during the 2004 MS4 Permit. These numbers will likely continue to decrease for a significant portion of the new MS4 Permit term.

Figure 2. Riverside County Housing Units Added (1990 – 2008)

Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 12.

These economic issues and projections directly affect and limit both:

1. The need for including enhanced new and re-development requirements in the new MS4 Permit, and
2. The Permittees ability to fund, and even seek new funding sources for additional MS4 Permit requirements for new and re-development projects.

Therefore, as described in Section 7.2, the Permittees are not recommending and cannot financially support any significant increases to their Development Planning activities. Permittee specific projections are as follows:

3.4.2.1 County of Riverside

The County is operating with a structural deficit of $12 million and plans a 25 percent budget reduction from FY 2008/2009 through FY 2011/2012. The County's current budget of $4.7 billion represents a 5 percent reduction from the previous year and next year's budget is expected to be cut by 10 percent. These cuts are directly associated with the overall decline in property values and the high number of foreclosures. There are concerns about having to use discretionary funds to meet State mental health and social service mandates. In addition, the County is dependent on funds from federal and state sources. If during this time of economic crisis federal and state funding sources are reduced or eliminated, any unfunded State and Federal programs will be terminated. Only core County programs will continue.

The primary source of general fund revenue is from property taxes and sales tax. With the unprecedented number of foreclosures, reduced property values, and declining sales tax revenue, general fund revenue is in a downward spiral. Another source of funding is through the Solid Waste Tipping Fees paid at the County landfills. Volume is down 15 percent since 2006 with anticipated downward trend to 40 percent reduction in solid waste through 2014. Programs that are partially funded through tipping fee allotments will be impacted. Due to the declining economy the recycling market has collapsed. Virtually no recyclable materials are being shipped for reprocessing. This loss of revenue and increased disposal costs is further impacting the general fund.

Cuts of 25 percent for all Net County Cost general fund programs will translate into reduction of County services and elimination of unfunded state and federal programs. Only core value programs will be provided (including public safety and fee programs)

The County has instituted a hiring freeze and required each department to create a report outlining the projected effects of the budget cuts. The County currently employs over 20,000 people, and layoffs are expected to result from the findings of these departmental reports. It is anticipated that this will impact program delivery for stormwater related activities. No County department will be able to sustain current staffing levels as they try to meet the 25 percent budget reduction strategy.[2] [3]

3.4.2.2 City of Menifee

The newly incorporated City of Menifee FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements during the first year of incorporation which expires October 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

3.4.2.3 City of Murrieta

The City of Murrieta's FY 2008/2009 budget did not increase compared to FY 2007/2008. Adjustments were made to reflect less revenue and to absorb any operating costs. However, budget cuts are anticipated for FY 2009/2010 because the immediate economic outlook is not good. There have been approximately 2,000 home foreclosures within the City. Sales tax revenue is estimated to drop 12.5 percent, property tax revenue will drop, and the State took approximately $525,000 out of redevelopment funds. Murrieta did not receive any vehicle licensing fees from the State and it appears likely that the State will take more revenue from the Cities to solve its budget problems. New NPDES requirements that increase compliance costs will create a financial hardship for the City.

3.4.2.4 City of Temecula

Various ongoing tax and investment revenues adopted in the City of Temecula's FY 2008-09 general fund revenues are projected to decrease from FY 2007-08. Sales and use tax revenues are expected to decrease in FY 2008-09 compared to FY 2007-08. This decrease is primarily the result of the decline in general consumer goods, electronic retail, and auto sales. Property tax revenue is also expected to decrease due to decreases in supplemental tax receipts attributed to the impact of the housing crisis. Investment interest revenue is also anticipated to decrease due to a decline in interest rates.

As a result of the 2008/2009 State budget, Temecula's redevelopment agency will have to shift existing funds from property taxes to the State's Education Revenue Augmentation Fund coffer for schools and

[2] "The Realities of Recession in California: A Statewide Report by U.S. Senator Barbara Boxer, December, 2008, p. 18.

[3] Riverside County Executive Office, January, 2008.

colleges. As such, the amount due from the Temecula Redevelopment Agency is expected to be $898,685. As the State of California continues to address its budget deficit, the City of Temecula faces the possibility of additional revenue shifts to State coffers, further losing future revenue streams and threatening existing service levels.

In addition, a Press-Enterprise article dated December 9, 2008, reported that "Between 25 and 30 part-time Temecula employees will be without work in the new year as City officials deal with a lack of revenue and less work to go around." Furthermore, "the city is not immune to the economic slowdown, which has forced its neighbors to lay off workers and slash spending to counter drops in sales tax receipts and building permit fees. In May, the City's Finance Director reported that revenues were down $3 million compared to two years ago."

With these current and projected reductions in revenue and staff, additional requirements in the MS4 Permit or upcoming TMDL-related requirements, without any corresponding cost-equivalent offsets, will exceed the City's ability to effectively implement these new requirements and will begin to compromise the City's existing efforts to manage the existing MS4 Permit requirements.

3.4.2.5 City of Wildomar

The newly incorporated City of Wildomar FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements the first year of incorporation that expires July 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

4.0 Overview of the Upper Santa Margarita River Watershed

4.1 Physiography and Geology

The upper Santa Margarita River watershed is defined as that portion of the Santa Margarita River watershed above the confluence of Murrieta and Temecula Creeks and includes the City of Temecula and portions of the Cities of Menifee, Murrieta, Wildomar, unincorporated County areas, portions of the Cleveland and San Bernardino National Forests, the Cahuilla, Ramona, Pauma, and Pechanga Indian Reservations and properties under the jurisdiction of Caltrans and a variety of special districts. The watershed is bounded by several mountain ranges, including the Santa Ana and Santa Margarita mountains to the North and the Palomar Mountains to the South. The upper Santa Margarita watershed includes areas in Riverside and San Diego Counties and encompasses approximately 588 square miles.

The upper Santa Margarita watershed includes two major sub-basins, drained by Temecula and Murrieta Creeks. Temecula Creek has a drainage area of 366 square miles, with steep rugged topography in the Palomar and Thomas Mountain areas and rolling hills below. The upper 316 square miles of this basin is controlled by Vail Lake (completed in 1949). Murrieta Creek has a drainage area of 222 square miles, with over 50 square miles controlled by Skinner Reservoir (completed in 1974). Although the watershed area is somewhat smaller and less rugged than the Temecula Basin, flood flows have the potential to create greater damage as they flow through the Cities of Temecula and Murrieta.

Temecula and Murrieta Creeks join along the Elsinore fault zone at the head of Temecula Canyon to form the Santa Margarita River. The Temecula Canyon is approximately five miles long, and is a steep, narrow, and rocky canyon. The San Diego-Riverside county line crosses through the Temecula Canyon. From here, the river traverses 27 miles to the Pacific Ocean.[4]

4.1.1 Watershed Characteristics

Over 50 percent of the Santa Margarita watershed has been controlled by the construction of Vail Dam in 1949 and Skinner Reservoir in 1974, which created a significant storage capacity in the upper watershed.[5] [6] 52 percent of the upper Santa Margarita River watershed is controlled by the dams. Due to this storage capacity, peak flow rates during major flow events for both existing and future land use conditions will be lower than under natural conditions.[7] [8]

[4] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 1.

[5] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 14.

[6] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 14.

[7] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 20.

[8] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 20.

4.1.2 Stream Flow Characteristics

Murrieta and Temecula Creeks are perennial interrupted streams, i.e., they include reaches in which the flow is continuous and others where flow is ephemeral. The areas of perennial flow are located in mountain area tributaries outside of the urbanized areas serviced by the MS4s. The perennial flows disappear by seepage into the sands and gravels and resurface upstream of the confluence of Murrieta and Temecula Creeks. The creeks in the urbanized areas of the watershed, located primarily in the valley, are ephemeral and flows are only observed during and immediately after significant storm events. During major storms, after initial wetting, periods of intense rainfall result in rapid increases in stream flow in steep foothill and mountain areas.[9] "Runoff in streams in the watershed is derived primarily from rainfall, and as a result, stream flows exhibit monthly and seasonal variations similar to those shown by the precipitation records. Absence of snow pack in the tributary watershed results in a rapid decrease in flow of streams at the conclusion of the winter precipitation season. Following severe storms, discharge in the larger streams often increases in a few hours time from practically no flow to a rate of thousands of cubic feet per second. Stream flows vary greatly from month to month and from season to season."[10]

Rising groundwater is currently observed in Murrieta Creek below its confluence with the Santa Gertrudis Channel. This is consistent with the observations with the rising groundwater conditions observed by the State of California in 1956.[11] Rising groundwater is also observed in Temecula Creek approximately one quarter mile upstream of the Interstate 15 bridge. In 1956, the State of California observed more extensive rising groundwater conditions occurring as far upstream as the Highway 79 bridge. Based on the virtual absence of non-storm water flows and the rising groundwater conditions in lower Murrieta and Temecula Creeks observed prior to development of the watershed, there is no evidence that the rising groundwater is due to Urban Runoff nor that Urban Runoff has affected the quality of rising groundwater. However, use and disposal of reclaimed water and agricultural and landscape irrigation in the watershed may affect groundwater quality. Until October 2002, the Rancho California Water District augmented the flow of the Santa Margarita River with reclaimed water at a point about five miles upstream from the Temecula gauging station. Since that time, the Rancho California Water District has diverted reclaimed water to the Santa Ana watershed and instead discharged imported water at a location downstream of the confluence of Murrieta and Temecula Creeks in order to meet water supply obligations to Camp Pendleton.

For the average annual event, it is estimated that approximately 89 percent of the volume of runoff in the Santa Margarita Region is due to non-urban land uses not regulated under the federal storm water program. For the 100-year 24-hour event, 93 percent of the volume of runoff will be due to non-urban land uses. These estimates are based on the assumption that precipitation is constant across the watershed. However, precipitation (and resultant runoff volumes) in the non-urbanized upland areas is as much as four times greater than that from the urbanized valley areas.[12]

[11] State of California Department of Public Works Division of Water Resources, Bulletin No. 57, "Santa Margarita River Investigation," Volume I, June 1956, p. 48.

[12] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11

4.2 Climate

"The climate of the Santa Margarita River watershed is typically Mediterranean, being characterized by warm dry summers and cool rainy winters. About 75 percent of the precipitation occurs during the four-month period from December through March. Mean annual depth of precipitation ranges from less than 10 inches near Vail Reservoir to over 40 inches west of Palomar Observatory, varying with elevation and topographic influences."[13] Precipitation increases with increases in elevation to the summit of the Coastal range. Shading effects of the Coastal range lead to a marked decrease of precipitation throughout the lower portions of the Inland area. Precipitation increases again farther away from the Coastal range in the northeastern area of the Inland area.[14] The significant and varied orographic features also make rainfall prediction particularly challenging in the urbanized portion of the watershed.

4.3 Population and Land Use

4.3.1 Population

The California Department of Finance estimates that as of January 1, 2008, the total population of Riverside County was about 2,088,322. Of the 2.1 million people, approximately 272,621 persons (or 13 percent) reside within the portion of Riverside County under the jurisdiction of the San Diego Regional Board. As shown in Figure 3, approximately 51,314 persons[15] reside in the unincorporated area while approximately 221,307 persons reside within the cities of Menifee, Murrieta, Temecula and Wildomar.

Figure 3. Santa Margarita Region Population by Permittee (2008)

[13] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11.

[14] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 38.

[15] Population estimate for the portion of unincorporated Riverside County within the Santa Margarita River watershed developed by the County TLMA GIS Demographics Unit based on the 2000 Census.

Although the second term and 2004 MS4 Permits covered a period of time that saw a significant amount of growth, due to the current and foreseeable economic conditions described in Section 3.4.2 of this report and decreasing areas available for development, growth during the next MS4 Permit term will be quite limited. In fact, the projected growth rate through 2015 will be significantly less than has been seen since the early 1990s. Figure 4 shows the combined populations of the Cities of Murrieta and Temecula since 1997 and projected through 2015. Similar trends are expected for the unincorporated areas and the portions of the cities of Wildomar and Menifee within the watershed.

Figure 4. Cities of Murrieta and Temecula Combined Population (1997 – 2015)

Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pgs 92 & 124.

Figure 4 clearly demonstrates the dramatic reduction in growth that is expected for the term of the next MS4 Permit when compared to previous permit terms.[16] Establishing trend lines for the population in these cities further demonstrates that the growth rate (population added per year) will be lower than the previous growth rate by approximately 86 percent.

[16] 2008 Riverside County Progress Report

Table 2 shows population projections for the all of the Permittees into the year 2015.

Table 2. Population of Santa Margarita Region Co-Permittees

Co-Permittee	Year			Change (2009 to 2015)
	Estimate 2008 (a)	Estimate 2009 (b)	Projected 2015 (b)	
City of Menifee	906[c]	927[c]	5,232[c]	464%
City of Murrieta	100,173	102,277	109,715	7.3%
City of Temecula	101,057	101,356[d]	103,150	1.8%
City of Wildomar	19,171[c]	19,589[c]	20,127[c]	2.7%
Unincorporated County of Riverside	51,314[c]	52,436[c]	53,793[c]	2.6%
Total	272,621	276,585	292,017	5.6%

Notes:

(a) Unless otherwise noted, populations were obtained from the State of California, Department of Finance, E-4 Population Estimates for Cities, Counties and the State, May 2008.

(b) Unless otherwise noted, projected populations were obtained from Riverside County Center for Demographic Research. Riverside County Progress Report, 2008

(c) Data provided by County of Riverside, Executive Office.

(d) Data provided by City of Temecula.

Since the District is not a general purpose government, it is not included in this listing. Although the current population of the City of Menifee in the Permit Area is small, it is anticipated that the population will increase as it annexes unincorporated areas. Similarly, it is anticipated that the cities of Murrieta and Temecula will gain population as they annex unincorporated areas. It is not anticipated that Wildomar will see significant population increases as it is bounded on all sides by other cities and lands reserved under the MSHCP.

4.3.2 Land Use

Land uses in Riverside County within the Santa Margarita Region include open space, residential, commercial, light industrial, heavy industrial, and agriculture. The agricultural land uses include row crops, nurseries, citrus groves and vineyards, dairies, ranches, poultry and hog farms, and other agricultural related uses with one single-family residence allowed per 10 acres (County of Riverside General Plan, Land Use Element 2003). The conversion of agricultural lands and open space to other "developed" land uses has been ongoing and will continue, although at a much lower rate than previously experienced. Land uses in the Santa Margarita Region are shown in Table 3. These land uses are based on the County of Riverside Assessor Parcel Data, current as of February 2006. It should be noted that the land uses below represent ***zoned*** land uses rather than ***actual*** land uses. This overstates the actual area of urban land use in the Santa Margarita Region. Also, changes in zoning designations can cause odd fluctuations in year-to-year date.

A map of the zoned land uses is provided in Appendix A.

In 1956, only 0.3 percent of the Santa Margarita River watershed (less than two square miles) was urbanized.[17] Although there has been a significant rate of growth in population relative to the State and

[17] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956.

neighboring counties, half a century later, approximately 88 percent of the Santa Margarita River watershed remains as non-urban land uses (rural residential, agriculture, preserves and open space, state lands, federal lands, and tribal lands). Further, almost one-third of the upper Santa Margarita River watershed consists of federal, state, and tribal lands that are not under the jurisdiction of the Permittees' MS4 programs. It is projected that the population of Riverside County will increase approximately 5.6 percent by 2015. If the urbanized area increases proportional to population, 87 percent of the upper Santa Margarita River watershed would remain in non-urban land uses in 2015.

Table 3. 2009 Santa Margarita Region Land Uses

Urban Land Use	Acreage[(a)]	% of Land Use Subtotal	% of Total Land Use
Commercial	8,339	20.0%	2.5%
Industrial	963	2.3%	0.3%
Urban Residential (< 1 acre)	12,656	30.4%	3.7%
Parks & Recreation Facilities	4,291	10.3%	1.3%
Streets & Roads	15,439	37.0%	4.6%
Subtotal – Urban Land Use	41,688		12.3%
Non Urban Land Uses			
Preserves & Open Space	54,141	18.2%	16.0%
Rural Residential (> 1 acre)	106,773	35.9%	31.5%
Agriculture	36,389	12.2%	10.7%
Federal/State/Tribal Lands/Non-County Jurisdiction	100,076	33.7%	29.5%
Subtotal Non Urban Land Use	297,379		87.7%
Total Urban & Non Urban Land Use	339,067		100%

(a) As reported in the FY 2007/2008 Watershed Annual Report.

4.3.3 Conserved Lands

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) was adopted in June of 2003. It is a comprehensive, multi-jurisdictional Habitat Conservation Plan focusing on conservation of species and their associated habitats in western Riverside County. The MSHCP is one of several large, multi-jurisdictional habitat planning efforts in southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP will allow Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts. Further, as floodplains and streams tend to support critical habitat, the MSHCP will preserve many of the remaining natural streams and establish significant buffer areas between those systems and urban land uses.

Much of the remaining non-urbanized lands in the Santa Margarita Region will ultimately be incorporated into the MSHCP. The MSHCP will result in a conserved area in excess of 500,000 acres and focuses on conservation of 146 species. The MSHCP Conservation Area includes approximately 347,000 acres on

existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. A large portion of the conserved lands are in the upper Santa Margarita watershed (at least 145,000 acres). There are approximately 72,318 acres of existing public or quasi-public lands preserved within the upper Santa Margarita River watershed area located in Riverside County.

4.3.4 Anticipated Development 2009-2015

Proposed development during the next MS4 Permit term is an important indicator of potential new Urban Runoff sources. To the extent possible, the Permittees have identified significant New Development projects that, if constructed, will result in the conversion of primarily undeveloped land to developed land. This section describes the expected development within Permittee cities. Consistent with the current and forecasted economic conditions and population estimates, and as supported by the population information and forecasts presented in Section 4.3.1, the Permittees anticipate that the term of the upcoming MS4 Permit will be a time of little development. Following are summaries of anticipated development during the upcoming MS4 Permit.

4.3.4.1 County of Riverside

Projected trends for the County of Riverside's land use can be referenced in the Riverside County General Plan. Maps depicting the areas of future development and type of land use can be found in the General Plan maps that are accessible at http://www.rctlma.org/generalplan/area_maps.html.

- With the incorporation of the cities of Wildomar and Menifee the remaining unincorporated County area to be built out in the Santa Margarita Region during the upcoming MS4 Permit term is going to be considerably smaller.
- It is anticipated that, over the next five years, additional annexations will occur in each of the four city areas (Temecula, Murrieta, Wildomar and Menifee) that will further reduce the unincorporated County area in the Santa Margarita Region.
- The unincorporated County area in the upper Santa Margarita River watershed (east of Temecula, Menifee and Murrieta) will remain in rural, open space and additional MSHCP land uses. In addition, due to drought conditions and depletion of aquifers the prospects of New Development is unlikely. Water districts in the region cannot offer "will serve" letters to provide for water resources they do not have. Infrastructure for water supply and municipal water treatment, MS4 and flood control facilities are virtually non-existent in this area.
- Due to downturn in economy, Development Impact Fees (DIF) and Transportation Uniform Mitigation Fees (TUMF) are and will continue to be significantly under funded. This reduction in transportation funding will result in fewer road and infrastructure projects during the term of the upcoming MS4 Permit. The Transportation Department has projected limited projects for the Santa Margarita Region. The Clinton Keith Road widening project is still in the planning stages. Due to budgetary constraints, unless projects are fully funded through County finance mechanisms (TUMF, DIF, state and federal pass through from bonds and grants) most projects will be put on hold through 2012.

4.3.4.2 City of Menifee

Projected development trends for the City of Menifee are unknown, sphere of influence and annexation opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.3.4.3 City of Murrieta

The area north of Clinton Keith Road along the east side of the I-215 freeway should see some construction towards the end of the next MS4 Permit term. Grading for the construction of a hospital has started along the freeway and it is anticipated that supporting development will follow once the hospital is open. Overall the Planning Department is receiving few applications for New Development projects. For example, a Planning Commission meeting scheduled for January 2009 has been cancelled because there are no New Development items to discuss. In light of the current and foreseeable economic conditions, the City does not anticipate any substantial New Development activity for the next few years, with limited growth possibly resuming toward the end of the next MS4 Permit term.

4.3.4.4 City of Temecula

The City of Temecula is currently experiencing a significant leveling trend in development. Throughout 2008, fewer applications were being processed than in previous years. As such, Temecula does not anticipate processing any substantial number of New Development applications within the next MS4 Permit term. It is anticipated that applications from hereon will be limited to smaller in-fill and redevelopment projects. In addition, proposed annexation areas will be limited to areas that will be set aside mostly for conservation. As Temecula is on the verge of build-out, approximately 1 percent of developable land remains available throughout the City for New Development.

4.3.4.5 City of Wildomar

Projected trends for the City of Wildomar are unknown, sphere of influence opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.4 Surface Water Bodies, Beneficial Uses, and Impairments

Approximately eight percent of Riverside County drains into surface water bodies within the jurisdiction of the Regional Board. Those surface water bodies (or portions thereof) are listed in Sections 4.4.1 and 4.4.2.

Rivers and Streams

- Santa Margarita River (Hydrologic Unit Basin Number 2.22)
  - Murrieta Creek
    - Slaughterhouse Canyon
  - Cole Canyon
    - Warm Springs Creek
      - Diamond Valley Reservoir
  - Santa Gertrudis Creek
    - Tucalota Creek
    - Lake Skinner
  - Temecula Creek (Hydrologic Unit Basin Number 2.92)
    - Iron Spring Canyon
  - Temecula Creek (Hydrologic Unit Basin Number 2.84)
    - Tule Creek
      - Million Dollar Canyon
    - Cottonwood Creek
  - Vail Lake
    - Wilson Creek
      - Cahuilla Creek (Hydrologic Unit Basin Number 2.73)
        - Hamilton Creek
      - Cahuilla Creek (Hydrologic Unit Basin Number 2.71)
        - Elder Creek
    - Arroyo Seco Creek
    - Kolb Creek
  - Temecula Creek (Hydrologic Unit Basin Number 2.52)
    - Pechanga Creek
- Santa Margarita River (Hydrologic Unit Basin Number 2.21)
  - DeLuz Creek

4.4.1 Beneficial Uses

The upper Santa Margarita River watershed supports a variety of ecosystems and provides many Beneficial Uses (Table 4)[18]. The ultimate goal of the Riverside County DAMP and the Watershed and Individual SWMPs is to manage Urban Runoff in a manner protective of the Beneficial Uses of these Receiving Waters.

Table 4. Beneficial Uses of Receiving Waters
Upper Santa Margarita River Watershed

Beneficial Use	Murrieta Creek	Cole Canyon	Warm Springs Creek	Santa Gertrudis Creek	Long Valley	Temecula Creek	Santa Margarita River
Municipal and Domestic Supply	X	X	X	X	X	X	X
Agricultural Supply	X	X	X	X	X	X	X

Warm Freshwater Habitat	X	X	X	X	X	X	X
Cold Freshwater Habitat							X
Wildlife Habitat	X	X	X	X	X	X	X
Rare, Threatened or Endangered Species							X

4.4.2 Current Water Quality Concerns and Issues

Urban Runoff discharged to MS4s in Riverside County ultimately flows to various surface water bodies (inland streams, lakes, and reservoirs) and typically carries Pollutants that originate from numerous dispersed and uncontrolled sources. Examples of Pollutants that may be present in Urban Runoff are fertilizer, heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals, and litter.

Because the upper Santa Margarita River watershed is large and has many land uses, the water quality concerns in sub-watersheds vary. However, each land use can potentially contribute Pollutants to nearby streams, rivers, and lakes. The infrastructure that supports people's activities (e.g., roads, parks, MS4, and wastewater collection and treatment facilities) may contribute to water quality concerns if not properly managed. Other sources of stormwater runoff, including agricultural areas, are exempt from the requirements of the NPDES permitting program established under the Clean Water Act. In addition, some Pollutants, such as total suspended solids, may be found at elevated levels in runoff from non-urban land uses. Further, certain activities that generate Pollutants present in Urban Runoff are beyond the ability of the Permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

[18] www.waterboards.ca.gov/rwqcb9/programs/

As required by Section 303(d) of the Clean Water Act, the State Board maintains a list all waters in the State that do not meet the Water Quality Standards established in the Basin Plans prepared by the Regional Boards for protection of Beneficial Uses. This list, referred to as the "303(d) List," details the Pollutant or stressor on each named water body, the potential source of Pollution, estimated affected area, as well as a priority for development of the associated TMDL. A TMDL is a plan that identifies how much Pollutant load a specific Impaired Waterbody can sustain without impacts to its Beneficial Uses. In addition to identifying the maximum Pollutant load, a TMDL is used to develop implementation plans to meet Water Quality Standards for a designated water body. Table 5 summarizes the 2006 303(d) List of Impaired Waterbodies within the upper Santa Margarita River watershed, as well as the year in which a TMDL is proposed for approval. No TMDLs have been established for Receiving Waters in the upper Santa Margarita River watershed.

Table 5. 2006 303(d) Listings for the Santa Margarita Region

Water Body	Pollutant	Potential Sources	Area Affected	Proposed TMDL Completion
Santa Margarita River (Upper)	Phosphorus	Urban runoff/storm sewers Unknown nonpoint source Unknown point source	18 miles	2019
Murrieta Creek	Iron Manganese Nitrogen Phosphorous	Source unknown Source unknown Source unknown Urban runoff/storm sewers Unknown nonpoint source Unknown point source	12 miles 12 miles 12 miles 12 miles	2019 2019 2019 2019
Temecula Creek	Nitrogen Phosphorus Total dissolved solids	Source unknown Source unknown	44 miles 44 miles	2019 2019

Table G-35 of Appendix G to the Annual Report 2007-2008 additionally identifies pyrethroid pesticides (bifenthrin and permethrin), bacteria (E. coli and fecal coliform), lead, and sediment (turbidity) as Pollutants of Concern in the upper Santa Margarita River watershed that warrant focused attention by Permittee implementation programs. These constituents have been detected intermittently or persistently at Triad and Tributary monitoring stations.

4.5 Municipal Separate Storm Sewer System

A map depicting the MS4 facilities owned and operated by the Permittees is provided in Appendix B.

5.0 Program Evaluation Based on Water Quality Trends

The overall effectiveness of the Permittees programs is assessed based on the analysis of water quality data obtained as part of the Consolidated Monitoring Program. Approximately 14 years of data have been collected through this program and have been cumulatively analyzed in the fourth-year monitoring Annual Report.

5.1 Inherent Limitations to Analyzing Water Quality Data

There are inherent limitations to analyzing water quality data from storm water. Storm water runoff is very different from mechanical wastewater or water treatment processes that usually incorporate water quality monitoring. Discharges from mechanical processes such as treated wastewater effluent and industrial discharges usually:

- Come from a single or a few readily identifiable sources;
- Are generally consistent in flow rate and chemical character from day to day; and
- Can be easily instrumented.

Conversely, Urban Runoff non-point source flows, such as those collected and analyzed as part of the MS4 Permit monitoring programs usually:

- Come from multitudes of unidentifiable or hidden sources, many of which are non-Urban in nature:
  - State, federal or tribal lands
  - Natural leaching of soils
  - Wildlife
  - Aerial deposition
  - Wildfires
- Vary widely in flow rate in response to precipitation events
- Vary widely in chemical character at any given moment due to:
  - Unidentified episodic issues related to natural phenomena
  - Magnitude of rainfall and extent of contributing area
  - Potential one-time illicit discharges that were not identified at the time of sampling
  - Unforeseen or unidentified consequences of changes in numerous land use policies (fire management, development, etc)
- Are subject to significant natural random variation; and
- Cannot be easily instrumented due to the wide variation in depth and velocity and associated impacts of natural or unnatural aggradation and degredation of natural stream beds.

Because ephemeral storm water flows are, by their very nature, particularly random in character, it may take many years before monitoring data trends can be detected or to determine the effectiveness of an

Urban Runoff control measure. Power analyses were conducted for fecal coliform, metals, and nutrients at the stations monitored in the Santa Ana Region during the 2005/06 reporting period. Power analysis is used to determine how many years of monitoring would be required to detect a given trend in the data. This tool was developed by the SCCWRP. Based on the results, for biennial monitoring, and having an 80 percent chance of detecting a change in concentration, it would take about 5-10 years of data collection to detect a change of 50 percent in concentration, 10-15 years of data to detect a 25 percent change, and 15-30+ years of data to detect a 10 percent change. It is expected that results would be similar for other parameters measured in the monitoring program in the Santa Margarita Region.

5.2 Focus Area Constituents of Concern

During the 2004 MS4 Permit term, monitoring data indicated that one or more receiving water samples have been found to contain the following constituents at levels that exceeded Basin Plan Objectives (BPO). As such they have been identified as constituents of concern.

- Nutrients (Ammonia as N, Phosphorus
- Pyrethroid Pesticides (Permethrin, Bifenthrin)
- Pathogen Indicators (E.coli, Fecal Coliform)
- Lead
- Turbidity (lab)

5.3 Analysis of Water Quality Trends

As discussed in the 2008 Santa Margarita Region Annual Monitoring Report, the results of the trend analysis and regression calculations indicate that there are no statistically significant trends in the water quality monitoring data. The lack of trends in the data presented in the Annual Monitoring Report contrasts with the rapid population growth over the same time frame. As discussed in the Annual Monitoring Report, population growth from 1990 to 2008 was approximately 300 percent for the Santa Margarita Region. This significant growth in population and resulting urban land use area contrasts sharply with the lack of statistically significant increases in concentrations of constituents of concern that would otherwise be expected in stormwater runoff from urbanized areas.

These results demonstrate and can be attributed to the effectiveness of the Permittees' programs at addressing the Focus Area Constituents of Concern, which are targeted and designed to prevent the discharge of these constituents into the Receiving Waters.

5.3.1 Recommended Compliance Program Modifications to Address Focus Area Constituents of Concern

Based on the analysis described above and in Appendix G of the 2008 Watershed Annual Report, no significant program modifications are necessary to continue to protect and improve the quality of the Receiving Waters.

Although the Permittees programs have been shown to be protective of Receiving Water quality, through continual evaluation of the programs being implemented and on-going water quality monitoring, additional measures are being proposed as part of this ROWD to address changing conditions and ensure

the ongoing effectiveness of the programs. Recommended changes to ensure the ongoing effectiveness of the Permittees programs are described in Sections 6 and 7 of this report.

6.0 Evaluation and Recommendations for Regionally Implemented Programs

6.1 Program Management

The District is the Principal Permittee for each of the three MS4 permits issued by the three Regional Boards that have jurisdiction in Riverside County. As Principal Permittee, the District performs management functions including coordination with the Regional Boards, preparation of compliance documents and Annual Reports, participation in studies and external cooperative efforts and dissemination of information to the Permittees. The Permittees implement some compliance programs that are common to all of the Permittees and which are implemented on a Countywide or regional basis to increase cost effectiveness and efficiency. Typically, the District also manages Countywide and regional programs.

6.1.1 Program Management Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit the following accomplishments were achieved.

- Updated the Implementation Agreement that sets forth the responsibilities of the Principal Permittee and the Co-Permittees.
- Revised the Riverside County DAMP to reflect requirements in the 2004 MS4 Permit, which served as a model document for the Permittees Watershed and Individual SWMPs.
- Developed Santa Margarita Region Watershed SWMP
- Participated in the Santa Margarita River Executive Management Team (SMREMT) to identify and address the highest priority water quality concerns in the Santa Margarita watershed, including development of a watershed model to assist with land use planning and TMDL development, coordinating watershed monitoring, and developing formal agreements between interested stakeholders for the purposes of evaluating impairment listing and data gaps in the watershed.
- Continued progress with the SMREMT on a uniform watershed plan and model for the Santa Margarita Watershed through the Santa Margarita Watershed Supply Augmentation, Water Quality Protection, and Environmental Enhancement Program.
- Participated in the Santa Margarita Lagoon TMDL workgroup in funding and overseeing the development of a comprehensive program to collect data and model the various inputs to the lagoon to be used to develop a TMDL to address nutrients.
- Participated in the Santa Margarita Watershed Water Quality Monitoring Group to coordinate the monitoring efforts of various stakeholders in the Santa Margarita watershed.
- Participated in the SMC to improve stormwater monitoring science, coordinate data collection efforts, and evaluate the effects of stormwater discharges to receiving waters specific to Southern California.
- Participated actively in various efforts of CASQA.

- Participated in the completion of an Integrated Regional Water Management Plan for the upper Santa Margarita Watershed to help pave the way for greater watershed-wide coordination and management of water resources within the upper watershed as a whole, as well as adjoining watershed and regional planning efforts.
- Participated in the development and implementation of the MSHCP for Western Riverside County which contains a comprehensive land use plan that ultimately conserves the environmental resources and habitat of approximately half of the Santa Margarita Region.
- Participated in the development of a Special Area Management Plan (SAMP) to further manage receiving waters at a watershed scale for the upper Santa Margarita Watershed by identifying, prioritizing and protecting the highest priority Waters of the U.S., while considering the broader needs of growth and transportation improvements.
- Developed and updated methods to track program effectiveness such as resident surveys, tracking hotline inquiries, and web counters.
- Enhanced Public Education program through development of new outreach materials and programs.

6.1.2 Proposed Revisions to Regional Program Management

6.1.2.1 Enhanced Program Effectiveness Assessments and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the effects of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP as part of their implementation of the new MS4 Permit. An assessment strategy based on the CASQA Municipal Stormwater Program Effectiveness Assessment Guidance has been established including the establishment of:

- Measurable goals for each component,
- Measurable metrics to assess progress toward those goals,
- CASQA Effectiveness Levels for each metric; to indicate the level at which each metric can demonstrate the effectiveness of the Permittee's programs at addressing each goal.
- Timeframes in which the Permittees expect to be able to assess effectiveness using each metric.
- Municipal Action Levels (MALs) for appropriate metrics to ensure a minimum level of program implementation and identify shortcomings that could affect the Permittee's progress toward the established goals. The MALs would not be permit compliance measures, but triggers for further Permittee evaluation of the affected compliance program.

If a MAL for a metric is exceeded, the Permittees will review implementation of that program component to identify the cause of the exceedance and identify needed adjustments to avoid future exceedances. The findings of these reviews and any recommended adjustments to the Permittees programs will be reported in the corresponding section of the Annual Report submitted the following year. Further research is particularly needed to establish appropriate Municipal Action Levels for the various program areas.

After a review of the stormwater program, the Permittees have established an initial Assessment Methodology for each component including preliminary goals, measurable metrics, effectiveness levels,

timeframes and MALs for each. These initial assessment methodologies are included in tabular format in Appendix C. Although the Permittees believe the basic proposal is viable, The Permittees will review and finalize these Assessment Methodologies and associated metrics within one year following adoption of the new MS4 Permit as additional data and analysis is necessary to support specific action levels.

6.1.2.2 Revised Reporting Format

The Permittees recommend substantial revisions to the MS4 Permit requirements for the layout of the Annual Report. The Permit requires substantial duplication of reporting, which either increases the volume of the Annual Report, or requires substantial cross-referencing. In either case, it is confusing to write, and most likely, confusing to read. The Permittees recommend a meeting with Regional Board staff in the development of the new MS4 Permit to discuss methods to streamline and clarify reporting requirements.

6.1.2.3 Maintain Enhanced Watershed / MS4 Map

The Permittees are in the process of collecting data to support an enhanced MS4 facilities map. Updates completed to date are provided in the map in Appendix B. This enhanced map demonstrates initial efforts to identify the locations of:

- Receiving Waters
- MS4 facilities
- Areas of historical perennial flows
- Known blow off locations
- Wastewater storage ponds
- Sub-drainage areas
- Known non-Permittee facilities
- 36-inch diameter and larger outfalls

This map will be used to help in the tracking of IC/ID events and issues and continued updates will be submitted with the Annual Reports. The Permittees will continue to enhance this map over the next MS4 Permit term. As described in the Annual Report, the District is in the process of upgrading their web page that offers public access the District's various NPDES activities. Along with these web site upgrades, additional layers will be added to the Web-based GIS map.

6.1.2.4 Elimination of the Watershed SWMP as a separate compliance document from the Riverside County DAMP

The Santa Margarita Region is comprised of only a single watershed. Further, the Permittees' regional compliance programs are described in the Riverside County DAMP. Maintenance of a separate and duplicative Watershed SWMP is confusing, cumbersome, and does not contribute to protection of Receiving Water quality. The Permittees request that the next MS4 Permit be drafted in a fashion that allows the Permittees to maintain the Riverside County DAMP as the primary document describing regional compliance programs for western Riverside County including the Santa Margarita Region. Any

necessary changes for requirements included in the new MS4 Permit will be updated /added to the Riverside County DAMP.

6.2 Permittee Training Programs

6.2.1 Summary

The Permittees jointly fund comprehensive training and education programs for Permittee staff. These training programs are designed to train Permittee employees on the proper use and implementation of BMPs appropriate for their field of work. There are four distinct training courses currently offered including Construction Inspection, Municipal Maintenance, Industrial-Commercial Facility Inspection, and New Development Planning.

6.2.2 NPDES Training Program Accomplishments and Programmatic Improvements

- Evaluated and tested various knowledge retention methods.
- Performed Training Enhancement Analysis study (2005-2006)
- Created an on-line training registration web page where attendees can also obtain training materials.
- Annually updated training materials to address Pollutants of Concern (2005-2007)
- Added component to training to address proper use, application and timing of application of Pesticides (2007-2008)
- Began developing a formalized testing and effectiveness analysis approach (2008)

Highlights
Municipal Training: **14** Training Sessions; **900** Attendees
Construction Training: **22** Training Sessions; **626** Attendees
Industrial-Commercial Training: **11** Training Sessions; 426 Attendees
New Development Training: **13** Training Sessions; **345** Attendees

6.2.3 Long-Term Effectiveness Assessment

Throughout the term of the 2004 MS4 Permit the Permittees have evaluated and implemented various quizzes as part of the NPDES training courses. These efforts were intended to assess the retention of knowledge of the attendees and, as described in Provision K.2.m of the Watershed SWMP, serve as a component of the assessment of the long term effectiveness of the Watershed SWMP.

The quizzes used to assess employees' retention of knowledge have evolved over time as the Permittees found what worked and what did not. Quiz questions that were found to be confusing or misleading were refined or eliminated. Thus, a question-by-question analysis of the results is not possible. Instead, results from a number of the training courses with reasonably comparable quizzes were aggregated and an average score (percent correct) was established for each of these training sessions. The results of this analysis are presented in Figure 5.

Figure 5. Training Pre-Test and Post-Test Analysis

Although the required random-sample nature of this analysis is not conducive to the analysis of trends across time, two findings become evident from this analysis:

1. Permittee inspection, maintenance and planning staff generally have a high level of understanding of issues related to stormwater Pollution in their field of work.
2. Average scores on quizzes administered after the training sessions were always higher than scores on quizzes administered before the training session.

Finding 1 above can be attributed to the Permittee's proactive efforts to ensure that their employees are aware of the issues in their field of work that could contribute to stormwater Pollution. This includes annual attendance at the NPDES training courses, and on-the-job training, reminders and meetings. This fact alone is a strong indicator of the effectiveness of the Permittees training programs.

Finding 2 above demonstrates that after attending the NPDES training courses, the attendees have a higher level of understanding of the issues in their field of work related to stormwater Pollution. This indicates that the training materials, delivery and content were effective.

Based on these analyses, general feedback from the training programs, and the overall effectiveness of the Permittees' programs (as described in Section 5.3 herein) the Permittees believe their training programs to be effective. Nevertheless, the following revisions to the training programs have been identified and are proposed for implementation with the new permit to ensure ongoing effectiveness.

6.2.4 Proposed Revisions

6.2.4.1 Continued focus on Focus Area Pollutants of Concern

The Permittees commit to continue to revise the Permittee training programs to focus on Pollutants of Concern.

6.2.4.2 Standardized Effectiveness Quizzes

Over the course of the 2004 MS4 Permit, the Permittees have evaluated various methods of assessing the retention of knowledge and are now recommending a standardized approach to assessing the effectiveness of the training program.

The Permittees plan to create standardized quizzes to assess the retention of knowledge and increased understanding as a result of the Permittees' training sessions. This includes establishing core messages that the Permittees want to impart upon the attendees and, creating clear and understandable quiz questions for each core message.

This approach will help the Permittees identify if any core training messages are not being retained by attendees and to subsequently modify the training. The Permittees also hope that this approach will yield results that will, over time, demonstrate that the knowledge among Permittee staff of issues related to storm water Pollution is increasing, thus clearly demonstrating that the NPDES Training program is effective.

As a necessary part of this effort, a database to track responses will also be created.

6.2.4.3 Attendance Tracking Mechanism

At each training session a sign-in sheet is provided to track attendance to the session. Included in the sign-in sheet is an indication of the Permittee that each attendee is representing. After each training session, these sign-in sheets are scanned to PDF files and sent to each Permittee for their records. This approach requires that each Permittee manually review the sign-in sheets to determine who and how many of their staff attended the training.

The District, on behalf of the Permittees, is currently investigating various form scanning and recognition software packages to determine the feasibility of creating a sign-in sheet that, when scanned, will automatically transfer the attendance list into a database. This would facilitate tracking of staff attendance by each Permittee. At this time the District has not determined if a feasible and cost efficient program is available that will accomplish their needs.

6.3 Public Education

6.3.1 Summary

To leverage finite resources, the Permittees jointly fund a public education program. The District implements this program to disseminate information about Urban Runoff issues and to provide education on how activities may impact Receiving Waters.

The Permittees have established an ongoing watershed-based public education and outreach program known as the **Only Rain Down the Storm Drain** Pollution Prevention Program. The specific objectives of this program include:

- Fostering a broad public awareness of water Pollution concerns;
- Increasing public acceptance of Pollution Prevention activities to curtail everyday human behaviors that contribute to water quality problems;
- Educating/informing the general public, regulators and key local government and state decision makers on Urban Runoff conditions in Riverside County; and
- Promoting stewardship of local water resources.

The **Only Rain Down the Storm Drain** Program implements the public awareness objectives by focusing on three areas of Pollutant reduction/prevention:

- Public behavior;
- Proper management of Pollutants; and
- Business specific education outreach.

In addition, when attempting to make use of the finite resources available to the Public Education Program, the Permittees use these management goals to ensure that resources are used effectively:

- Focusing on Pollutants of Concern specific to each watershed region;
- Coordinating public education efforts with adjacent storm water management programs and other related education programs to share resources, coordinate outreach efforts, and avoid duplication of effort; and
- Adapt public education programs and objectives, based on effectiveness analysis, to address changing MS4 program requirements and objectives.

6.3.2 Public Education Program Accomplishments and Programmatic Improvements

The Public Education Program has developed and distributed the following educational materials during the 2004 MS4 Permit term:

- *After the Storm* – a citizen's guide to understanding MS4 Pollution in your neighborhood or when performing daily activities.
- *Automotive Maintenance & Car Care* – guidelines for keeping your auto shop or retail fuel facility in environmental shape.

- *Outdoor Cleaning Activities* – guideline for outdoor cleaning activities and wastewater disposal.
- *Pools, Spas and Fountains* –Environmental maintenance suggestions for pool, spa, and fountain owners.
- *What's the Scoop* – tips for a healthy pet and a healthier environment.
- *Household Hazardous Waste* – A schedule of collection locations for proper disposal of HHW.
- *Stormwater Pollution Found in Your Neighborhood* – door hanger.
- *Equestrian Management* – Recommendations for BMPs related to equestrian activities.
- *Spray Bottles* – Including directions to make environmental friendly recipes for pest control and household cleaning

The Permittees also initiated development of the following outreach materials

- *Landscaping and Gardening Brochure* – Initiated development a new brochure to address outdoor residential landscaping and gardening activities.
- *Septic System Management Brochure* – initiated development of a brochure to assist with septic system management.

In addition to the information provided on the Storm Water Protection website, the Public Education and Outreach Program has:

- Updated the Public Education and Outreach Program web page.
- Tested and/or implemented several new Public Education and Outreach Program effectiveness tracking mechanisms including call tracking, web counters, testing, and bilingual surveys.
- Enhanced the toll free storm water Pollution reporting hot line to include public education information and support for the public and other interested stakeholders.
- Obtained a trailer with "**Only Rain Down the Storm Drain**" graphics specifically designed for transporting materials to outreach events. It is also used as part of the booth at outreach events.
- Initiated billboard advertising within the Santa Margarita Region.
- Worked with the Mission Resource Conservation District to implement presentations to elementary and middle schools and staff to raise public awareness of Urban Runoff management issues and source control methods and to encourage volunteers, partners, and groups to gather annually for a trash and debris clean-up day in the Santa Margarita Region.
- Developed special newspaper and billing inserts, fliers and advertisements to raise public awareness of Urban Runoff management issues and source control methods. A radio advertising campaign was also developed and implemented for a time.
- Developed and presented workshops regarding household hazardous waste use and proper disposal at major home improvement stores throughout Riverside County.
- Placed advertisements in the Penny Saver and Bargain Bulletin to raise public awareness of Urban Runoff management.

- In cooperation with certain County Service Areas or other programs, pet waste signs with bag dispensers have been installed at various parks to help encourage the proper disposal of animal waste.
- Cooperated with the Western Riverside Council of Government in the Used Oil Block Cycle Grant that decreases the amount of illegally dumped motor oil by promoting the addition of new Certified Oil Collection Centers.
- Established a partnership with County Environmental Health whereby businesses cited by Environmental Health for violations of ordinances related to stormwater issues may be allowed to implement a Supplemental Environmental Project in conjunction with the **Only Rain Down the Storm Drain** program.

6.3.3 Long-Term Effectiveness Assessment

Effectiveness metrics of the Public Education and Outreach Program during the 2004 MS4 Permit term are presented in Section J.1.3 of the FY 2007/2008 Watershed Annual Report. The data indicates that overall impressions have continually exceeded the number of residents in the watershed, HHW/ABOP pounds of waste collected and pounds of waste collected per person have steadily increased over the term of the 2004 MS4 Permit.

In 2005, the **Only Rain Down the Storm Drain** program developed and implemented a survey to be distributed at Public Outreach events to assess the public's level of knowledge related to stormwater Pollution. This original "long" survey contained 13 questions in both English and Spanish as shown in Figure 6.

This survey was used for fiscal years 2005-06 and 2006-07. Through this period of implementation it was found that the survey took too much time to complete and reduced the level of response from event attendees. Therefore, the survey was subsequently revised to a shorter version with revised questions for the 2007-08 fiscal year. The revised "Short" survey that is currently used is shown in Figure 7.

Figure 6. Original "Long" Survey Utilized at Public Outreach Events

Zip Code_____ Age_____ Sex F__ M__ Date:_____

THINK YOU KNOW ABOUT STORM DRAIN POLLUTION PREVENTION?

1. Where do you think **storm drain** contents go or flow to? __Treatment Plant __Streams, rivers & lakes

2. Where do you think **sewer pipes** contents go or flow to? __Treatment Plant __Streams, rivers & lakes

3. Are storm drains and sewers part of the same or separate systems? __Same __Separate __Don't know

4. Have you ever been to a Household Hazardous Waste **(HHW)** Collection Event? __Yes __No

5. Did you know that **A.B.O.P.** Antifreeze, Batteries, Oil, and Latex Paint locations and mobile **HHW** Collection Events provide safe havens for the disposal of pollutants? __Yes __No

6. If you have a lawn or garden, where do you (or your gardener) dispose of the green waste (grass, clippings or other)? **(Check all that apply)**

   ☐Trash/garbage ☐Compost/Mulch pile ☐Take to compost facility
   ☐Leave on lawn ☐Removed by gardener ☐Other:_____

7. Where is the best location to wash your vehicles?
   (Check only one)

   ☐Pavement (driveway, street) ☐Dirt Area
   ☐Lawn or Grass ☐Other_____

8. Do you change the motor oil in your vehicle yourself? __Yes __No

   If **Yes**, where do you dispose of it? **(Check all that apply)**

   __in the garbage __at a curbside collection program
   __down the storm drain __collection center (Jiffy Lube, Kragen, etc.)
   __pour it on the ground __Other_____

9. If you have a pet, how often do you pick up after your pet?
   9. a) in your yard? **9. b)** when you walk the pet?

   ☐Always ☐Sometimes ☐Never ☐Always ☐Sometimes ☐Never

10. Do you think, anything ,other than rainwater, that flows into the storm drains (i.e., trash, chemicals, pet waste, etc.) considered a pollutant? __Yes __No

11. Have you seen or heard the slogans "Only Rain Down the Drain" or "Only Rain Down the Storm Drain"?
    __Yes __No If yes, where? __Radio __Newspaper __ Flier __Billboard __Street Fair, Festival, etc.

12. Are there State laws and local ordinances which STRICTLY PROHIBIT the dumping of pollutants **(EVERYTHING, EXCEPT RAIN WATER)** into the storm drain systems or waterways? ___Yes ___No

13. After this booth visit, have you increased your understanding of storm drain pollution prevention? __Yes __No

Thank you for your time and input... Remember, YOU can do your part by calling our Toll Free Line (1-800-506-2555) to report illegal storm drain pollutant disposal anywhere in Riverside County, or to get more information about storm drain pollution protection to help promote "ONLY RAIN DOWN THE STORM DRAIN".

Figure 7. Revised "Short" Survey Utilized at Public Outreach Events

DO YOU KNOW HOW TO PROTECT OUR STREAMS, RIVERS and LAKES?

City_____ Zip Code_____ Age_____ Sex □ F □ M Date: _____

1) Water that leaves your lawn from **Irrigation (water sprinklers), Car washing** and **Rain** flows down streets and/or storm drains and then directly to…

☐ Sewage Treatment Plants ☐ Streams, rivers & lakes

2) Which of the following can LEGALLY be disposed into the storm drain? (*Circle all that apply*)

- **Useable Household Chemicals**
- **Yard waste/clippings/leaves**
- **Paint**
- **Cigarette butts**
- **Empty Household Chemicals containers**
- **Pet Waste**
- **Motor Oil / antifreeze**
- **None of these**

3) Do you feel you are well informed and aware of illegal dumping into the storm drain and its impact in your community or streams, rivers and lakes?

☐ Yes ☐ No

HOW DID YOU DO?

1) Water that leaves your lawn from irrigation, washing your car, or rainwater runoff can pickup motor oil and grease from vehicles, excess fertilizer from your lawn, bacteria from pet waste, and excess pesticides from your yard. These pollutants can be carried down streets and storm drains directly to our streams, lakes, and rivers without treatment! That is why we must take care to properly dispose of waste, maintain our vehicles, and use fertilizers, pesticides and other chemicals only as specified on their labels.

2) It is illegal to dispose of any chemical, constituent or waste into a storm drain! Report illegal disposal of chemicals, constituents, or waste to storm drains at **1(800) 506-2555.** You may properly dispose of many of the wastes listed above by doing the following things:

- **Usable and empty household chemicals, paint, motor oil** – Properly dispose these at Household Hazardous Waste and/or Antifreeze, Batteries, Oil and Paint disposal facilities and events. Call **1 (800) 506-2555** for information on disposal locations and special drop off events near you.
- **Pet waste** – Carefully pick up and dispose in the nearest trash receptacle.
- **Grass, clippings, leaves and yard waste** – Collect and dispose in green waste bins or composting areas that are designed to prevent the compost from mixing with excess irrigation water and/or rainwater runoff.

3) Would you like to learn more about protecting our streams, rivers and lakes or wish to report on a illegal storm drain disposal in your area or request a classroom or group demonstration……

Visit www.rcflood.org or call 1 (800) 506-2555.

ONLY RAIN DOWN THE STORM DRAIN

Remember…Only Rain Down the Storm Drain!

Results have been tabulated for all of the "Long" surveys received and they have been analyzed to determine trends in public awareness. The "Short" survey has been used at two events to date, one of which was quite recent and its results have not yet been tabulated. Using the "Long" survey results, nine questions were used to assess any trends in public awareness. The remaining questions were determined to be either confusing or not applicable to the intent of the assessment. The results of this assessment of survey results are shown in Figure 8.

Figure 8. Assessment of Survey Results (2005-06 vs. 2006-07)

The results shown in the chart in Figure 8 are percent of survey takers that responded as described below:

- Assessment 1: Percent of respondents that understood that storm drains do not go to treatment plants.
- Assessment 2: Percent of respondents that understood that sewer lines go to treatment plants.
- Assessment 3: Percent of respondents that understood that sanitary sewers and storm drains are separate systems.
- Assessment 4: Percent of respondents that had attended a Household Hazardous Waste collection event.
- Assessment 5: Percent of respondents that understood that the best place to wash a car is on the lawn or grass.
- Assessment 6: Percent of respondents that change their own oil that reported that they properly dispose of it.
- Assessment 7: Percent of respondents that have heard of the "Only Rain Down the Storm Drain" program.
- Assessment 8: Percent of respondents that dumping of anything except storm water is a violation of laws and ordinances.
- Assessment 9: Percent of respondents that felt that visiting the Outreach Booth at the event increased their understanding of storm drain Pollution Prevention.

Although implementation of the "Long" survey was limited before it was modified to its current form, the results available do indicate an increase in understanding of these basic principles and can be attributed to the effectiveness of the Permittee's Public Education program. As additional survey results are collected and tabulated, further analysis will be performed to ensure the ongoing effectiveness of the program.

6.3.4 Proposed Revisions

To better address residential sources of pesticides, the Permittees are proposing to coordinate with the University of California Extension Program to enhance the implementation of the U.C. Extension's Master Gardener program in the Santa Margarita Region. Along with information regarding use of drought tolerant landscaping techniques and appropriate methods of fertilizer and irrigation application, the U.C. Master Gardeners also provide residents with information on integrated pest management techniques that minimize pesticide application. The Permittees are proposing to establish an agreement with the U.C. Extension's Master Gardener program in fiscal year 2010-2011 to support master gardener hotline staffing, local presentation and other outreach by the U.C. Master Gardeners.

In addition, through the Permittee's ongoing efforts to internally assess the efficiency and efficacy of their MS4 compliance programs, it was determined that an overhaul of the District's web site was needed. The District's web site contains the public education web site and a technical resource site with the various compliance documents for the program. It was found that information available through the site was often difficult to find and was not user friendly and sometimes was out of date. The Permittees are now reviewing this site to identify and implement needed changes

6.4 Receiving Water Monitoring Program

6.4.1 Summary

A Summary of the Monitoring Program is contained in Appendix G of the Watershed Monitoring Report.

6.4.2 Monitoring Program Accomplishments and Programmatic Improvements

The Monitoring Program accomplished the following goals during the term of the 2004 MS4 Permit:

- Subcontracted monitoring data collection and analysis to MACTEC, Inc. to enhance data collection and reporting capabilities.
- Developed and implemented a Triad Monitoring Program (bioassessment, Toxicity and chemical monitoring) consistent with the goals of the SMC Model Monitoring Program
- Developed watershed boundaries and land use information for all monitoring stations
- Updated the format and technical content of the monitoring Annual Report
- Added fire map information to assist with assessing potential Pollutant sources
- Enhanced monitoring data databases to be compatible with SCCWRP/SMC standard reporting protocols.
- Enhanced monitoring methods to incorporate use of automatic sampling equipment where appropriate

- Conducted several Toxicity Identification Evaluations that led to the identification of pyrethroid pesticides as a cause of wet weather Toxicity in Murrieta and Temecula Creeks and a Toxicity Reduction Evaluation that identified additional BMPs necessary to control sources of pyrethroid pesticides.
- Coordination with the CASQA Pesticide Committee on comments and presentations to California Department of Pesticide Regulation, UC Riverside and others regarding the impacts of pyrethroid pesticides and the need to change regulatory requirements regarding the use of pyrethroid pesticides.
- Participation in or coordination of several BMP studies, including coordination of new development BMP treatment studies (as required by conditions of approval) and the District's LID BMP Demonstration and Testing Facility.
- Continued to update and enhance the Consolidated Monitoring Program to incorporate new monitoring collection methods and data analysis protocols.

6.4.2.1 Participation in Regional Monitoring Efforts

- Participation in the monitoring programs to support development of the Santa Margarita Lagoon TMDL.
- Continued participation in regional and statewide Monitoring and Science efforts such as the Southern California Monitoring Committee to develop:
  - Lab inter-calibration of chemical, bioassessment and Toxicity testing methods
  - Testing methods for bioassessment and Toxicity in Southern California streams
  - Bacterial Reference Watershed Study
  - A storm water research needs report for southern California
- Partnered with SCCWRP on developing hydromodification guidance for Southern California including participation in a series of hydromodification workshops for a CASQA conference.
- Coordination with SCCWRP on the development of the Regional Watershed Monitoring Program for Southern California.

6.4.3 Effectiveness Assessment

The Watershed Monitoring Program was evaluated as part of the Regional Board audits in 2007-2008. As a result of those audits several enhancements were made to the monitoring program, including update of constituent lists, subcontracting of data collection to a monitoring consultant with automatic sampling capabilities, and updates to the Consolidated Monitoring Program and Monitoring Annual Report formats. The Permittees believe that as a result of these changes, the overall monitoring program is effective. However, the revisions presented in section 6.4.4 are recommended to increase monitoring data utility or overall program effectiveness.

6.4.4 Proposed Revisions to Monitoring Program

In updating the Monitoring and Reporting Program, the Permittees request that Regional Board staff meet with them to discuss the following proposed modifications to the monitoring program:

6.4.4.1 Revise Dry Weather Monitoring Program

As noted in Section G.7 (Special Studies) of Appendix G of the FY 2007-2008 Watershed Monitoring Annual Report, the Permittees participated in a SMC Study to develop a regional approach to watershed assessment. The Permittees, in conjunction with Regional Board staff, committed to participating in the resulting watershed monitoring program. The Permittees agreed to monitor three rotating dry weather stations identified for the Santa Margarita Region. Additionally, three stations are to be collected by Regional Board (or SCCWRP staff) using SWAMP funds, and the remaining three will be located in the Santa Ana Watershed region of Riverside County. In exchange for the commitment to participate in the program, the Regional Board staff agreed to reduce the current dry weather monitoring requirements in the new MS4 Permit from two (2) events annually to (1) event annually for each Triad monitoring stations. This would effectively eliminate three existing dry weather samples. The Permittees recommend a meeting with Regional Board staff to discuss these options prior to the release of the draft Permit.

6.4.4.2 Clarify Analyte List

As described in Section G-8.1.5 of the 2008 Monitoring Report (Appendix G of the FY 2007/2008 Watershed Annual Report), 168 analytes have never been detected in samples collected under the current program. The Permittees request that requirements to analyze for these constituents be eliminated unless or until a reason to believe they may be present in stormwater arises.

Basin Plan Objectives are expressed in terms of total metals, while California Toxics Rule (CTR) criteria are expressed in terms of dissolved metals. Although the Permittees do not support comparison of stormwater data to CTR values, the Permit requires it. The Permittees recommend deletion of this requirement. However, if this language is to remain, in order to properly compare results for metals to both sets of objectives, both total and dissolved fractions will be analyzed by the laboratory for the following metals: arsenic, cadmium, chromium (III), chromium (VI), copper, lead, mercury, nickel, selenium, silver, and zinc.

6.4.4.3 Clarify Mobilization Criteria

The District is proposing the following amendment to the monitoring mobilization criteria based on experience and the difficulties faced collecting the first storm and the analysis of the USEPA criteria specific to the Temecula National Weather Service weather station (Consolidated Monitoring Program, Section 4.C.2):

> "Note: If the QPF indicates that more than 0.3-inch is predicted for any 6-hour period, mobilization for sampling will occur."

The District's experience over the past three years indicates that intensities greater than 0.3" in six hours are likely to produce runoff and would warrant mobilization, even on a dry watershed. Further, these mobilization criteria are consistent with EPA-833-B-92-001 guidance regarding minimum depths/durations for storm sampling.

The Permittees recommend that the Regional Board amend the MS4 Permit to reflect these Mobilization Criteria. Due to issues with stream gauges operated by the United States Geological Survey (USGS), the Permittees have concluded that preparing post-storm forensics based on USGS data is not of significant value. A simple test of comparing Quantitative Precipitation Forecast (QPF) reports with actual rainfall and the mobilization criteria should be sufficient to determine compliance with the MS4 Permit.

Mobilization criteria should also reflect practical limitations to storm water monitoring by excluding national holiday periods (Thanksgiving, Christmas, and New Year's Day in particular) and quantifying the probability and the lead time between the forecast and actual rainfall that must be met in order to mobilize.

6.4.4.4 Reduce Wet Weather Events

As was noted in the audits, the Permittees have experienced consistent difficulty collecting three storm events in the upper Santa Margarita River watershed. The Permittees also noted that the San Diego County MS4 Permit only requires the collection of samples from two wet weather events. The Permittees request that the monitoring program for Riverside County be revised to require collection of two storm events. This would not only reduce opportunities for unavoidable non-compliance, it would also be a prudent cost saving measure that would not alter the overall effectiveness of the Permittees monitoring programs.

6.4.4.5 Clarify Triad Method and Follow-up Actions

The MS4 Permit included an early draft of the Triad method envisioned by the Model Monitoring Program (MMP) developed by the SMC. The result was a misapplication of the final Triad approach envisioned by the MMP. Toxicity is currently required to be sampled for at the Triad stations during wet weather events, but not during dry weather when the bioassessments occur. According to the SMC MMP, the three components of the Triad approach (chemistry, Toxicity, and bioassessment) should be conducted at the same time. Bioassessments cannot be conducted during wet weather due to safety concerns and the planning necessary. For this reason the MMP recommends the full triad for dry weather and only chemistry and Toxicity for wet weather.

In an effort to be proactive and supportive of good science, the Permittees have taken the following actions to ensure proper application of the Triad approach:

- Beginning with the 2007-2008 season, Toxicity sampling will be conducted during dry weather, at the same time as the bioassessments and dry weather chemistry sampling events are conducted. Thus, the full Triad approach will be conducted during dry weather. Wet weather monitoring will focus on Toxicity and chemistry. This action will modify the current program to be consistent with the MMP approach.
- The 2006-2007 Annual Report established the framework for proper application of the Triad method (full triad for dry weather, chemistry and Toxicity only for wet weather) by adding new tables (G-21 through G-27), in anticipation of properly applying the Triad method in the 2007-2008 Annual Report.

The Permittees further recommend clarifying the definitions of "persistent", "consistent", and "magnitude" as used in the MS4 Permit to be consistent with the intent of the MMP. In addition, the MS4 Permit inappropriately limits Triad analysis by defining a "fair" Index of Biological Integrity scores as automatically indicative of benthic alteration. This limitation needs to be corrected to prevent Permittee

resources from being inappropriately diverted to expensive source assessment studies. The MMP (and the SMC) envision that watersheds will be prioritized for follow up action based on their relative quality to one another. The envisioned analysis would compare watersheds from throughout southern California. The Permittees support this coordinated and comprehensive approach to addressing water quality.

6.4.4.6 Recognize Limitations of Laboratory Analysis of Bacteria

Babcock Labs prefers to accept bacteria samples between the hours of 7:00 a.m. and 4:00 p.m. during normal business days, and 9:00 a.m. and 12:00 p.m. on weekends. Although Babcock will accept bacteria samples outside those hours, acceptance is contingent upon payment of substantial overtime rates to ensure laboratory staff availability to receive and analyze the samples.

The timing of bacteria sample collection, particularly within the context of automatic sampling, will require consideration of the sample's four-hour holding time and available laboratory receiving hours. The Permittees request that the Permit be modified to only require collection of bacteria samples such that they can be delivered during the regular working hours of the lab to avoid excessive laboratory costs.

6.4.4.7 Participate in a Watershed Based TMDL for the Santa Margarita Lagoon

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon Watershed-Based TMDL has been withdrawn. As described in section 3.4, these economic conditions are also impacting the Permittee's funding sources and they are struggling to maintain resources to fund existing compliance programs. The Permittees currently cannot support additional expenditures associated with assisting in funding a watershed-based TMDL effort. However, the Permittees are agreeable to discussing a re-prioritization of compliance activities in order to reallocate existing Permittee resources for this purpose. For example, where current MS4 Permit compliance programs elements are not measurably enhancing attainment of Water Quality Standards, the Permittees would consider reduction or elimination of those requirements to support reallocation of the associated funding to the development of the watershed based TMDL. Program elements that may be considered for discussion include:

- Toxicity/Pyrethroid Monitoring – Under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) local regulation of pesticides, including pyrethroid pesticides is pre-empted. The Permittees are expending significant resources at the State and Federal level to facilitate regulatory changes in the allowable uses of pyrethroid pesticides, which have been implicated in causing toxicity in receiving waters throughout California. The Permittees have also recognized pyrethroid pesticides as a Pollutant of Concern for the upper Santa Margarita River watershed. The Permittees believe that public education and outreach regarding use and more stringent regulation/management of pesticides, including pyrethroid pesticides, represents the most effective means of controlling pesticides in Urban Runoff. However, continued Toxicity tests, Toxicity Identification Evaluations, and direct monitoring for pyrethroid pesticides are not likely to enhance the Permittee's ability to reduce/eliminate pyrethroid pesticides in Receiving Waters. Greater Receiving Water quality benefits may be realized by reallocating the resources currently allocated to these activities to the development of the watershed-based TMDL.
- Reduction in General Monitoring Requirements – The Permittees continue to expend significant resources on Receiving Water and outfall monitoring and the benefits of these monitoring activities are limited. Further, these costs have more than doubled over the term of the 2004 MS4

Permit due to audit findings recommending the implementation of automatic sampling equipment. Revised MS4 Permit requirements that provide for a simplified monitoring program may allow cost savings to be reallocated from data collection and processing to development of the watershed-based TMDL.

- Watershed/Individual Annual Reporting – The current Annual Reporting requirements are time, labor and cost-intensive exercises. Revised MS4 Permit requirements that provide for a simplified Annual Report requirements would not necessarily produce substantial cost savings (because is the reports are typically produced in-house); however, they would free up staff resources to assist with TMDL development.
- IC/ID Monitoring – Although the Permittees support regular visual inspection of MS4 facilities to identify IC/IDs, field measurements and sampling has not proven to be effective for this purpose. Although sampling of identified IC/IDs for later enforcement purposes may be appropriate, IC/IDs that have been identified and eliminated in the Santa Margarita Region typically result from visual observations and subsequent follow-up efforts by Permittee staff, not field measurements and water quality samples. Revised MS4 Permit requirements that provide for visual inspections of MS4 facilities to identify IC/IDs may yield cost savings that could be reallocated to development of the watershed-based TMDL.

There may be additional opportunities for modification of MS4 Permit requirements to focus the expenditure of Permittee funds on those activities that are most effective at protecting Receiving Water quality. Although the resources available for Permittee compliance activities are finite, the Permittees are supportive of modifications to the MS4 Permit that, while working within available funding limitations, enhance their ability to protect and enhance the quality of Receiving Waters.

7.0 Evaluation and Recommendations for Individual SWMP Programs

The Riverside County DAMP is a programmatic document developed by the Permittees in the Santa Ana and Santa Margarita Regions. It outlines the major programs and policies that the Permittees individually and/or collectively implement to manage Urban Runoff for the protection of Receiving Waters in Western Riverside County, including the Santa Margarita Region. The Riverside County DAMP provides a model for the development of a Permittees' Individual SWMPs in the Santa Margarita Region.

The Permittees continue to support a uniform approach to the implementation of MS4 Permit compliance programs in order to facilitate increased transparency and understanding for residents, regulated entities, and Permittee staff. For this reason, the discussions below focus on programmatic changes to the compliance programs that are necessary to maintain the effectiveness of the model compliance programs described in the Riverside County DAMP. Upon adoption of the new MS4 Permit, the Riverside County DAMP and Individual SWMPs will be revised accordingly.

7.1 Program Management

There are typically multiple Permittee departments that are responsible for implementing the elements of the Individual SWMPs. Each Permittee has designated an NPDES Coordinator who coordinates the overall Permittee compliance programs, collects and analyzes compliance program data, develops and maintains the Individual SWMPs, compiles and submits necessary reports, coordinates with other Permittees, stakeholders and Regional Board staff, and conducts other necessary duties as assigned.

To facilitate inter-Permittee coordination and funding of regional compliance activities such as the Public Education and Monitoring programs, the Permittees have entered into an Implementation Agreement that defines the roles and responsibilities of each Permittee and assigns cost shares for regional programs defined in the agreement. The Implementation Agreement also requires each Permittee to designate an NPDES Coordinator who is also responsible for representing the Permittee's interest at Permittee coordination meetings such as the monthly Santa Ana/Santa Margarita Technical Advisory Committee.

The Permittees in the Santa Margarita and Santa Ana Regions participate in a Management Steering Committee made up of the City Managers, County Executive Officer, and the District's Chief Engineer; or their assigned alternate. Participation in the Management Steering Committee is not mandatory; however, it provides a management-level forum to address Urban Runoff management policies for the Permit Area and coordination of the review, and necessary revisions to the Riverside County DAMP and Implementation Agreement. In addition, the Management Steering Committee promotes a higher level of awareness of the MS4 Permit compliance program by each Permittee's senior management staff.

7.1.1 Accomplishments and Programmatic Improvements

Collectively, the Permittees Program Management activities have achieved:

- Development of the Riverside County DAMP, WQMP and Individual SWMPs following adoption of the 2004 MS4 Permit.
- Revised the Implementation Agreement to account for necessary program enhancements resulting from the new MS4 Permit.

- Established and held monthly meetings of a Technical Advisory Committee comprising of each Permittee's NPDES coordinator, to discuss and coordinate response to issues that arise through the ongoing implementation of the Riverside County DAMP-based programs.
- Voluntarily participate in a Management Steering Committee comprised of Permittee upper management (City Manager or equivalent) to provide a forum to discuss major policy issues related to MS4 Permit compliance program implementation. This also helps the major decision makers within each organization to stay abreast of the status of the implementation of the Riverside County DAMP and aware of upcoming issues and approaches taken by other Permittees.
- Enhanced enforcement and compliance elements of the Riverside County DAMP.
- Developed the Integrated Regional Watershed Management Plan (IRWMP) for the Upper Santa Margarita Watershed.
- Continued progress with the Bureau of Reclamation, San Diego County and other stakeholders on a uniform watershed plan and model for the Santa Margarita River watershed.

7.1.2 Recommended Revisions and Enhancements to Program Management Efforts

7.1.2.1 Assessment Metrics and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the impact of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP following adoption of the new MS4 Permit. These planned changes are further described in Section 6.1.2.1 of this ROWD. The Permittees also recommend streamlining of the reporting forms to focus on the revised Program Effectiveness Assessments.

7.1.2.2 Revised Reporting Format

As a result of continued program effectiveness assessment, following adoption of the new MS4 Permit, the Permittees will update annual reporting forms to incorporate specific reporting requirements for the effectiveness assessment metrics and to remove inappropriate, outdated, or ineffective reporting requirements.

7.2 Development Planning

This program element links each Permittee's General Plan, environmental review process, and development approval and permitting processes to the later phases of detailed design, construction and operation. The development approval and permitting processes carries forth project-specific requirements in the form of conditions of approval, project plans, and design specifications that support tracking, inspection, and enforcement actions.

7.2.1 Development Planning Program Element Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit, the development planning program accomplishments and programmatic improvements included:

- Developed the WQMP to address post construction stormwater runoff quality for New and Significant Re-Development Projects.
- Development of a FAQ for WQMP projects to assist with implementing the WQMP program.
- Developed and subsequently enhanced a BMP design guidance manual to standardize the construction of post construction BMPs.
- Participation in the SMC efforts to develop a LID manual.
- Participation in SCCWRP's hydromodification studies to develop scientifically based hydromodification design guidance for Southern California.
- Enhanced online watershed maps to assist developers and the public with identifying areas tributary to Impaired Waterbodies.
- Adopted and implemented a MSHCP to ensure the regional-scale protection of habitat and natural resources in the approval process for New Developments.

7.2.2 Proposed Revisions to the Development Planning Program Element

7.2.2.1 Low Impact Development

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to (1) better incorporate LID design concepts, and (2) incorporate guidance to describe how developments can offset Treatment Control and hydromodification impacts with LID concepts including infiltration, evapo-transpiration, reuse, and onsite stormwater management. These revisions will follow the completion of the SMC LID BMP Manual and SCCWRPs Hydromodification Study. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.2 Hydromodification

As committed to in the 2004 WQMP (now Appendix O to the Riverside County DAMP), the Permittees have developed numeric guidance for hydromodification and are now working with SCCWRP to develop enhanced hydromodification guidance for Southern California. The Permittees will use the completed guidance to update the WQMP, BMP Design Handbook and other guidance as necessary to effectively mitigate hydromodification impacts. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.3 BMP Design Criteria

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to incorporate additional design guidance to clarify those Treatment Control BMPs that are effective at removing sediment-bound pesticides such as pyrethroid pesticides (consistent with the recommendations of the Toxicity Reduction Evaluation contained in Appendix D.

7.2.2.4 TMDLs

The Permittees will revise the DAMP to identify and include BMPs that are necessary to mitigate the impacts of Urban Runoff on Impaired Waterbodies.

7.2.2.5 Roads

The Permittees believe that standard WQMP requirements for public works road projects create potential avenues for unavoidable non-compliance. The Permittees would like to review this priority development category with Regional Board Staff to develop a better system to manage public works road projects.

7.2.2.6 Inspect and Verify Maintenance of Post Construction Treatment Control BMPs to Ensure Ongoing Effectiveness

As economic conditions allow, the Permittees propose to implement the following approach to inspect and/or verify maintenance of Treatment Control BMPs implemented on Priority Development Projects to ensure their ongoing effectiveness. The development of the program described below will require the Permittee resources that are unavailable in the current economic climate, particularly considering that it would likely require the Permittees to abandon the CAP in lieu of a local Permittee inspection program. The resources that will be required to ramp up new inspection programs are unavailable and may not become available during the term of the new MS4 Permit; however when the economy recovers sufficiently the Permittees propose to implement the program described below.

Integrated Management Practice (IMP) Exemption:

For the purposes of this program, IMPs include BMPs that are landscape based or otherwise serve an additional purpose other than Treatment Control. IMPs will be exempted from Inspection and Maintenance Tracking / Certification requirements if solely through the regular maintenance of the feature's secondary (non-treatment) functions and with Permittee concurrence, it can reasonably be expected that the treatment efficacy of the IMP will be ensured in perpetuity. An example that may satisfy this exemption would be a grassy swale that is mowed as part of regular landscape maintenance, whereas a BMP with a media filter which requires periodic resetting or replacement to maintain treatment effectiveness would not be exempted.

Priority Development projects will be exempted from all Treatment Control BMP Inspection and Maintenance Tracking / Certification requirements if they completely meet their Treatment Control requirements by implementing only IMPs that meet these criteria.

Priority Industrial and Commercial

The following requirements will apply to new priority Commercial and Industrial developments subject to the Permit's Commercial and Industrial business inspection requirements.

- Inspection

  Sites will be inspected per the Individual SWMPs current inspection frequency requirements that are based on the potential of the site to contribute to water quality impairments. At these inspections, in addition to the normal inspection requirements, all Treatment Control BMPs at the site will be inspected. In other words, all Treatment Control BMPs at high-priority facilities will be inspected annually; Treatment Control BMPs at medium-priority facilities will inspected biennially and Treatment Control BMPs at low-priority facilities will be inspected once during the term of the MS4 Permit. Improperly maintained BMPs may subject the maintenance entity to license suspension or administrative citations.

- Proof of Maintenance

  Maintenance records demonstrating compliance with the O&M procedures in the WQMP must be available for review at the time of the inspection. Failure to demonstrate that the BMPs have been maintained appropriately may result in license suspension or other enforcement actions.

Other Priority Developments

The following requirements will apply to new priority residential developments and businesses not otherwise subject to the Permit's Commercial and Industrial business inspection requirements.

- Proof of Maintenance and Self Certification

  The maintenance entity identified in the WQMP will be required to submit maintenance records including a signed certification to the Co-Permittee. The frequency of these submittals will be based on the relative maintenance requirements of the Treatment Control BMPs implemented on that site. BMPs will be categorized into groups as having High, Medium or Low maintenance requirements. If a WQMP project utilizes high-maintenance Treatment Control BMPs it will be categorized as a High-priority residential development, etc. High-Priority residential developments will be required to submit records annually, Medium – biennially, and Low – once every five years. Failure to report will result in administrative citations against the maintenance entity.

Permittee Projects and Permittee Maintained Treatment Control BMPs

This requirement will be included as part of the existing Permittee facility inspection program and inspected per the frequency requirements specified in the Riverside County DAMP.

7.3 Private Development Construction Activities

The Permittees have reviewed their ordinances to ensure that they are adequate to control discharges to the MS4 from construction sites to the MEP. For construction projects that will disturb one acre or more, the Permittees require proof of compliance with the General Permit-Construction prior to issuance of building/grading permits (a copy of the Notice of Intent filed with the State Board). Each of the Co-Permittees provides training for their construction inspectors regarding the proper installation and

maintenance of erosion and sediment control BMPs. Education and outreach to the building industry (developers, construction contractors, engineering firms, etc.) regarding managing discharges from construction sites is also incorporated into the "**Only Rain Down the Storm Drain** Pollution Prevention Program," the Permittees' area-wide public education and outreach program.

7.3.1 Private Development Construction Activities Program Element Accomplishments and Programmatic Improvements

- The Permittees annually distribute construction activities posters to construction sites as part of construction outreach program.
- A standardized construction activity reporting spreadsheet was developed for the Annual Reports.
- The construction inspection forms were updated.
- The Co-Permittees developed and maintained inventory databases of construction sites 1-acre or larger for which they have issued a building or grading permit.
- Prioritized inspections to help target construction activities that present the highest risk to water quality.

Highlights
Conducted over **17,000** construction site inspections
Initiated over **3,800** enforcement actions to gain compliance
626 attendees to NPDES Construction training

7.3.2 Proposed Revisions to the Private Development Construction Activities Program Element

The Permittees are not proposing revisions to their existing construction inspection programs at this time. As previously described, the Permittees expect that development activity will be greatly reduced during the term of the new MS4 Permit. Regional Board staff has however raised the issue of abandoned construction sites. Regulation of abandoned construction sites has proven challenging due to bankruptcy of project proponents, non-responsiveness or inability to locate underlying investment banks that actually own the developments, and the practical limitations encountered by the Permittees in calling bonds. As the Regional Board has enforcement capabilities that often surpass those of the Permittees, to ensure that this issue is effectively addressed the Permittees ask for the close cooperation and support of the Regional Board. Nonetheless, the Permittees are committed to continuing the use of their IC/ID programs, code enforcement tools, and other ordinance authorities to control, to the extent allowable under law, abandoned parcels that are not properly stabilized.

7.4 Existing Development – Permittee Facilities and Activities

The Municipal Facilities Strategy which has been consolidated into Section 5 of the Riverside County DAMP provides guidance for identifying potential storm water Pollutant sources and for selecting appropriate BMPs for implementation at identified facilities of concern owned and operated by the Permittees. The Permittees are implementing the provisions of the Municipal Facilities Strategy within their respective jurisdictions via processes described in their Individual SWMPs. To assist the Permittees in implementing this program, training focused on storm water regulatory requirements and BMPs related

to Permittee maintenance facilities and roadway maintenance activities were conducted twice annually during the 2004 MS4 Permit term.

7.4.1 Permittee Facilities and Activities Program Element Accomplishments and Programmatic Improvements

- The District coordinated preparation of GIS-based maps for Permittee MS4 facilities. The MS4 maps are updated annually with new information provided by the Permittees as part of the Annual Reporting process.
- Development of a GIS Browser that allows interested parties to view MS4 Facilities from the District's website.
- Updated Model Facilities Pollution Prevention Plan for Permittee facilities not requiring coverage under the Industrial General Permit.

Highlights
900 attendees to Municipal NPDES training

7.4.2 Proposed Revisions to Permittee Facilities and Activities Program Element

7.4.2.1 FPPP Guidance

The Permittees commit to developing a revised WQMP template for Permittee projects that better facilitates translation of WQMP BMP requirements into Facility Pollution Prevention Plans, where appropriate.

7.4.2.2 Integrated Pest Management

The Permittees commit to including Ecowise's standardized language for contracted pesticide management services in Permittee pesticide management contracts.

7.5 Commercial and Industrial Sources

The Principal Permittee and the County have implemented the CAP through which the County Department of Environmental Health makes use of existing inspection programs to address storm water compliance survey/inspections of restaurants and facilities that must secure a hazardous materials permit for either storing, handling or generating hazardous materials. As the responsible Certified Unified Program Agency in Riverside County, the County Department of Environmental Health is responsible for regularly inspecting all sites within the County that handle hazardous waste. The CAP is implemented in those cities and unincorporated areas that do not maintain an individual industrial/commercial inspection program through other mechanisms such as POTW waste pre-treatment programs or business license inspection programs.

Revisions to the inspection program requirements contained within the 2004 MS4 Permit expanded the scope of the overall commercial/industrial inspection program beyond the ability of the CAP to address. Each Co-Permittee now implements a supplemental inspection program for facilities not covered by the CAP. In addition, the 2004 MS4 Permit required inventories/databases of facilities, prioritization of

industrial and commercial sources relative to the potential to impact water quality, and specified inspection frequencies based upon facility priority.

The revised industrial and commercial sources program continues to have both regional and local jurisdiction components. Although the overall industrial/commercial inspection program has grown beyond the CAP, the CAP still addresses most of the facilities identified in the 2004 MS4 Permit. With its low overhead cost, it remains a cost effective approach to mitigating the impacts of industrial and commercial facilities on the MS4 and Receiving Waters.

7.5.1 Commercial and Industrial Program Element Accomplishments and Programmatic Improvements

- Reviewed and updated several educational brochures for distribution to inspected facilities.
- Developed outreach posters for gas and automotive service stations.
- Developed standardized inspection reporting forms for Annual Reports.
- Updated food service surveys.
- Extended the agreement with the County's Department of Environmental Health executed in 1999 for the area-wide CAP for the inspection of commercial and industrial facilities through June 30, 2009.
- Created Permittee databases for the inspected commercial and industrial facilities.
- Revised the Riverside County DAMP to reflect development of the industrial and commercial facility database that contains the following information: facility name, address, city, zip code, and Standard Industrial Classification (SIC) codes.
- Provided public education information regarding NPDES storm water permits to any new businesses listed in the Press Enterprise.

Highlights
3,974 inspections of Industrial and Commercial facilities
Over **1000** enforcement actions taken
426 attendees to Municipal NPDES training

7.5.2 Proposed Revisions to Commercial and Industrial Sources Program Element

The expected future expansion of the Commercial and Industrial Inspection Program to address Treatment Control BMPs as described in Section 7.2.2.6 would likely result in an expansion of the CAP that is beyond the ability of Environmental Health staff to accommodate and still achieve their own mandated inspection requirements. The Permittees are therefore proposing to amend the Riverside County DAMP and Individual SWMPs to recognize not only the CAP inspection program but also Permittee specific alternative programs that may develop during the term of the next MS4 Permit.

7.6 Residential Sources

The residential program focuses on educating residents about activities that can potentially contribute to beneficial use impairment. The residential program outreach is focused on Pollutants of Concern. The residential program is primarily implemented through the Regional Public Education Program; however, each Permittee typically conducts additional outreach. In those cases where residential Illegal Discharges are identified, appropriate code enforcement actions are also taken.

7.6.1 Accomplishments and Programmatic Improvements

The residential program achieved the following accomplishments during the term of the 2004 MS4 Permit:

- Developed several new outreach brochures and tools to promote changes in knowledge and behavior regarding activities that potentially generated Pollutants of Concern including landscape and gardening brochure, spray bottles with non-toxic pest control or cleaner recipes, septic system management brochure, updated outdoor activities brochure, and pet waste brochure.
- Implemented billboard advertising promoting "**Only Rain Down the Storm Drain**" message
- Purchased a new trailer to transport public education materials. The trailer is wrapped in graphics supporting the "**Only Rain Down the Storm Drain**" message.
- Point of Sale Outreach Programs to customers of hardware stores regarding paint, pesticides and fertilizers.
- Partnership with Valley Greeters to deliver "**Only Rain Down the Storm Drain**" information to new residents in the Santa Margarita Region.
- Promotion and participation in the annual Santa Margarita Watershed Clean Up Day.
- Continued supplemental support of the HHW/ABOP waste collection programs
- Continued update and revision of the public education information page
- Continued implementation and enhancement of school outreach programs conducted by Mission Resource Conservation District
- Reproduction and distribution of the After the Storm poster

7.6.2 Recommended Revisions

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.7 Public Education and Outreach

Although the bulk of public education and outreach activities are conducted by the District on behalf of the Permittees, the Permittees also conduct outreach activities. These activities include providing informational pamphlets at counters, conducting presentations for local businesses or developers, maintaining a stormwater page or appropriate stormwater links on their individual websites, conducting employee training programs, and attending various public events.

7.7.1 Public Education and Outreach Program Element Accomplishments and Programmatic Improvements

The Public Education and Outreach Program Element had the following accomplishments and improvements over the term of the 2004 Permit (not including those identified in Section 7.6.1):

- Use of a CEQA-style public participation process to develop the Riverside County DAMP, SWMPs, and WQMP
- Duplication and use of the USEPA construction site poster to educate construction site operators
- Distribution of stormwater outreach information to various businesses and construction sites through code enforcement, and building and grading inspectors
- Development and distribution of a automotive shop BMP poster
- Advertisements in the Business Press
- Update of the outdoor activities brochure for mobile operators

7.7.2 Recommended Changes

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.8 Elimination of Illicit Connections and Illegal Discharges

The Riverside County DAMP describes the discharge limitations and prohibitions applicable to the Permittee's MS4 (Section 4.1), procedures to be implemented when persistent exceedances of Water Quality Standards are identified (Section 4.2), responding to and reporting Illegal Discharges (Section 4.4), enforcement measures for IC/IDs (Section 4.5), measures to control litter (Section 4.6), measures to manage sanitary wastes (Section 4.7), and programs to promote collection and proper disposal of hazardous waste (Section 4.8).

7.8.1 IC/ID Program Element Accomplishments and Programmatic Improvements

- Developed Sanitary Sewer Overflow Procedures in coordination with the sanitary sewer operators in the Santa Ana and Santa Margarita Regions and implemented annual updates to Sanitary Sewer Overflow Procedures to ensure proper contact information for outside agencies.
- Established an electronic tracking system for NPDES complaints received through the toll free "Report Storm Water Pollution" hotline, OES or otherwise reported to the District.
- Enhanced public outreach regarding illegal dumping including brochures for: Outdoor Activities, Fountains & Swimming Pools, and Pet Waste, establishment of a Santa Margarita watershed Clean-Up Day and coordination with the County of Riverside Trash Task Force.

- Initiated a cooperative program with the County Environmental Health Department to promote Environmental Enhancement Projects in lieu of fines for environmental crime cases. This initiative resulted in a billboard advertising campaign and BMP posters addressing appropriate BMPs for gas stations and garages.
- Established IC/ID Monitoring Program

Highlights
1,263 potential IC/ID reports received and responded to
Over **5,500** calls received on stormwater pollution hotlines
94 IC/ID Monitoring events
5 monitoring events where field screening exceeding criteria

7.8.2 Proposed Revisions to IC/ID Program Element

The Permittees re-evaluated their existing IC/ID monitoring programs as part of this ROWD. The Permittees believe that the overall monitoring program is effective. However, the Permittees plan to revise their approach to the implementation of the Illicit Discharge monitoring program to increase monitoring data utility or overall program effectiveness.

7.8.2.1 Revise IC/ID Monitoring Program

The Permittees plan to revise their approach to the implementation of the IC/ID monitoring program. The goals of the recommended revisions are to:

- Relocate the IC/ID monitoring sites at MS4 outfalls.
- Distribute the monitoring sites throughout the Santa Margarita Region to detect Illicit Discharges closer to their source before they become excessively diluted.
- Increase efficiency and consistency in sampling resulting in enhanced data quality.
- Enhance response time to identify IC/IDs.

A model Illicit Discharge monitoring plan that accomplishes these goals is described below; a final plan will be incorporated into updated compliance documents with the new MS4 Permit.

7.8.2.2 Model Illicit Discharge Monitoring Plan

The Municipal Permittees will identify MS4 outfalls that could be used for monitoring sites based on maps of the MS4 facilities. This list of preliminary sites will be then field checked to determine the accessibility of the sites and feasibility for inclusion in the IC/ID monitoring program. Inaccessible sites or sites determined to be otherwise infeasible will be removed from the list.

Each Municipal Permittee except Menifee will then divide the list of the viable sites within their jurisdiction into groups of four. As Menifee only has one MS4, it will only monitor that one site. Each group of four sites will be monitored for a period of one year, twice during the dry season. Once all sites have been monitored for a year, sites will be repeated.

A monitoring team will be formed including one District and one Municipal Permittee staff member. The District staff will perform all monitoring/screening activities. The Municipal Permittee staff will be available to assist and will be responsible for initiating any necessary follow-up actions. This approach will provide consistency in screening and monitoring data collection and will allow the Municipal Permittee with jurisdiction over the tributary land use to be immediately aware of exceedances and initiate appropriate follow-up actions.

1.0 Executive Summary

On July 14, 2004 the San Diego Regional Water Quality Control Board (Regional Board) adopted Order No. R9-2004-001, an area-wide National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit (2004 MS4 Permit); this permit expires on July 14, 2009. A Report of Waste Discharge (ROWD) for renewal of the 2004 MS4 Permit must be submitted no later than 180 days in advance of the expiration date (i.e., by January 15, 2009).

This ROWD is an application for renewal of the 2004 MS4 Permit (NPDES No. CAS0108766) for the MS4 owned and operated by the Riverside County Flood Control and Water Conservation District (District), the County of Riverside (County), and the incorporated cities of Riverside County within the upper Santa Margarita River watershed (collectively, the Permittees). The newly incorporated cities of Menifee and Wildomar are included in this application as a Notice of Intent to participate in the updated MS4 Permit.

The content of this document is structured to identify:

- Information about the applicants (Section 3.0),
- Information on the area to be covered under the MS4 Permit (Section 4.0),
- An overall evaluation of the Permittees' existing programs based on water quality trends (Section 5.0),
- Accomplishments and recommendations for the Permittees' regionally implemented programs (Section 6.0) and
- Accomplishments and recommendations for the programs implemented as part of the Individual Stormwater Management Plans (SWMPs) (Section 7.0).

The Riverside County Drainage Area Management Plan (DAMP) documents the model implementation plan from which each of the existing Permittees has developed their respective Individual SWMP to implement the DAMP. In addition a Watershed SWMP has been developed to describe the programs that will be implemented regionally. The Annual Reports submitted to date describe the implementation of these SWMPs and document how they have evolved over time.

This ROWD builds on these Annual Reports by highlighting the major accomplishments of these programs, evaluating the long-term effectiveness of the programs and recommending revisions to the programs to enhance the efficiency and effectiveness of the programs to manage Urban Runoff to protect Receiving Water quality. To promote clarity of intent, terms defined in the 2004 MS4 Permit are capitalized in this ROWD.

Due to the impacts of the current economic recession on Permittee budgets and the effectiveness of existing Urban Runoff management programs, the Permittees' primary focus during the next MS4 Permit term will be on maintaining existing compliance programs in the face of significant cuts in basic municipal programs and services. Riverside County is one of the areas most affected by the mortgage crisis and the Santa Margarita Region is one of the most impacted areas of Riverside County. This crisis is having significant impacts on Permittee resources and projections for a deepening recession promises to exacerbate these impacts. Further, monitoring data indicates that the existing compliance programs have been effective in maintaining water quality. This ROWD focuses on maintaining the fundamental

structure and content of the Riverside County DAMP and the Individual SWMPs. However, the Permittees have identified several enhancements and/or alterations to their programs that can be implemented to continue to increase the effectiveness of these programs, without increasing costs.

1.1 Highlights of Program Implementation

Sections 6 and 7 of this ROWD describe the numerous accomplishments of the Permittees programs during the 2004 MS4 Permit term. Some highlights of the major accomplishments for the Permittees include:

- Development and implementation of a Water Quality Management Plan (WQMP) that addresses post-construction Urban Runoff management for New and Significant Re-Development.
- Development and implementation of the Watershed SWMP and the Permittee's Individual SWMPs.
- Development of handbook to standardize post-construction Best Management Practice (BMP) selection and design in Riverside County. Ongoing updates to the handbook include a plan to incorporate and promote low impact development design concepts.
- Development and enhancements to the design template for developing project-specific WQMPs
- Development of a Frequently Asked Question (FAQ) document to assist developers and plan review staff in understanding WQMP requirements and expectations.
- Development of coordinated BMP manual for firefighting agencies.
- Development, implementation and maintenance of Permittee databases to track construction sites 1-acre or larger. In addition, the Permittees have standardized a construction reporting spreadsheet used for Annual Reports, updated inspection forms, and enhanced the construction outreach program.
- Creation of Permittee databases to track industrial and commercial facilities.
- Creation and maintenance of the Storm Water Protection website that offers educational resources and free brochures targeting residents, businesses, developers, contractors, and elementary school children.
- Partnership with the Mission Resource Conservation District to provide an educational outreach programs targeting both schools and adults.
- Continued participation in the Consolidated Program for Water Quality Monitoring (Consolidated Monitoring Program) that includes collection of water quality samples at MS4 outfalls and Receiving Waters.
- Participation in regional and statewide monitoring efforts such as the Southern California Monitoring Committee (SMC), Southern California Coastal Water Commission and National Water Resources Institute.
- Participation in the California Stormwater Quality Association (CASQA), including the leadership roles of Officer, Director, and Legislative Chair.
- Development of the Upper Santa Margarita Region Integrated Regional Watershed Management Plan

- Continued partnership and coordination with the Bureau of Reclamation on a watershed plan and water quality model for the Santa Margarita watershed
- Continued participation in the Santa Margarita Lagoon nutrient Total Maximum Daily Load (TMDL) development process
- Participated in a stakeholder workgroup process led by Regional Board staff to revise REC 1 Basin Plan requirements for TMDLs

1.2 Summary Evaluation of Program Implementation

The trend analysis presented in Section G-8.2 of the FY 2007/2008 Watershed Annual Report and reviewed in Section 5.3 of this ROWD indicates that after almost 14 years of active Permittee involvement in MS4 Permit related Urban Runoff management programs, the significant increase in population (over 300 percent) and associated rapid urbanization that the area has experienced has not resulted in any statistically significant increases in Pollutant concentrations in Receiving Waters in the Santa Margarita Region. This indicates that the Permittees MS4 programs are and have been protective of Receiving Water quality. Pyrethroid pesticides, the one Pollutant that does appear to be linked to urbanization, has been addressed through a Toxicity Reduction Evaluation process, outreach programs, and Permittee participation to address pyrethroid pesticides and other pesticide sources at the state and federal level.

To enhance the effectiveness of the MS4 Permit compliance programs, the Permittees have agreed to implement compliance program revisions as described in sections 6 and 7 of this ROWD.

1.3 Summary of Major Recommendations for Program Revision

As described in section 3.4 of this ROWD, the Permittees are facing unprecedented fiscal impacts resulting from the national and state economic crises. The impacts on the Permittees are especially severe due to the disproportionate impact of home foreclosures in the Santa Margarita Region coupled with plummeting sales tax revenue. Unfortunately, it is anticipated that the economic conditions will persist for a significant portion of the term of the next MS4 Permit. During this period, the Permittee's MS4 compliance programs will increasingly compete with more fundamental public services for finite and dwindling resources. The challenge and priority for the Permittees will be to maintain the existing compliance programs in the face of cuts in basic programs and services.

Nevertheless, and although the various programs implemented as part of the Watershed SWMP and the Riverside County DAMP have been determined to be effective overall, Sections 6 and 7 of this ROWD identify certain areas wherein the Permittees are proposing changes to improve the effectiveness, efficiency, and transparency of these programs.

The program revisions recommended in this ROWD reconfigure existing programs in a manner that will increase the Permittees' overall ability to protect Urban Runoff quality, while limiting additional costs that would make these revisions cost-prohibitive in light of the current and foreseeable economy. Some of the major recommendations include:

Enhance Program Effectiveness Assessments and Incorporate Action Levels (Section 6.1.2.1)

The Permittees have carefully evaluated their MS4 Permit compliance programs and annual reporting forms. Based on this review the Permittees determined that:

- The overarching goal of the program is to ensure that Urban Runoff does not cause or contribute to non-attainment of Beneficial Uses in the upper Santa Margarita River watershed;
- Permittee compliance programs are process based and, consistent with the Maximum Extent Practical (MEP) approach, are incrementally adjusted as part of the annual reports and comprehensively reevaluated and if necessary, revamped as part of each ROWD;
- Monitoring data should be used to drive long term program assessments and assess goal attainment as part of the ROWD; and
- Process based Municipal Action Levels (MALs) should be used to evaluate annual program implementation to ensure that programs are implemented to the MEP and identify the needs for incremental adjustments.

The Permittees have proposed revised Effectiveness Assessment metrics and MALs for use in Permittee Annual Reports consistent with the aforementioned findings and as described further in Section 6.1.2.1. The MALs are intended to function as triggers, or minimum bars that if breached, would require the Permittees to evaluate the appropriate program elements to determine if adjustments are necessary to attain the MEP standard. The Permittee proposal will not only add transparency to the Permittees compliance programs but assist Permittees in evaluating and adjusting their Permit compliance programs to assist in attaining Water Quality Standards. Further, the proposed effectiveness assessment metrics can be implemented without significantly increasing the Permittees' program costs.

Revisions to the IC/ID Program (Section 7.8.2)

During the 2007/2008 MS4 Program audits conducted by PG Environmental and Regional Board staff, several questions were raised regarding the Permittees existing Illicit Connection/Illegal Discharge(IC/ID) field monitoring programs. The Permittees have evaluated the Regional Board and PG Environmental staff's comments and proposed a revised IC/ID Program based on the following:

- Random selection of MS4 outfalls throughout the Santa Margarita Region;
- Rotating MS4 outfall sites annually to maximize coverage of the MS4;
- Partnering one District staff person with one city/county code enforcement officer for data collection to ensure consistency in sampling procedure/collection and quick response to detected IC/ID events.

Implementation of a Post-Construction Treatment Control BMP Inspection Program (Section 7.2.2.6)

Consistent with Regional Board staff's request to consider development of a post-construction Treatment Control BMP inspection program, the Permittees have developed a proposal that they plan to implement when economic conditions allow. This proposal would enhance the existing business and Permittee facility inspection programs described in the Riverside County DAMP by incorporating inspections and maintenance verification of Treatment Control BMPs. Treatment Control BMPs constructed as part of residential developments, or other developments not captured by the Permittees' existing business inspections would be addressed through an annual self-certification program.

Revisions to the Dry Weather Monitoring Program (Section 6.4.4.1)

The Permittees have committed to participating in the Regional Watershed Monitoring Program developed in conjunction with the Southern California Coastal Water Research Project (SCCWRP). Six annual monitoring events were scheduled for the upper Santa Margarita River watershed. Consistent with the agreement reached by SCCWRP, Permittee, and Regional Board staff, three of these sites would be collected by the Permittees and three through the Surface Water Ambient Monitoring Program (SWAMP). The costs for implementing the three sites to be implemented by the Permittees would be offset by reducing the Permittees existing dry weather triad monitoring events (three stations) from twice a year to annually.

Development of a LID Manual (Section 7.2.2.1)

The Permittees have committed to develop a Low Impact Development (LID) Implementation Manual based on the LID Manual currently being developed by the SMC and CASQA.

Hydromodification Management Plan (Section 7.2.2.2)

The Permittees have committed to develop a revised hydromodification management plan based on the findings of the final SCCWRP Hydromodification Management report currently under development.

Participate in a Watershed Based TMDL for the Santa Margarita Lagoon (Section 6.4.4.7)

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon watershed-based TMDL has been withdrawn. As described in Section 3.4, economic conditions are also impacting the Permittees' funding sources and the Permittees are struggling to maintain sufficient resources to fund their existing compliance programs. Therefore, the Permittees cannot currently support committing additional funds toward a third party TMDL effort. The Permittees are, however, agreeable to discussing with the Regional Board a elimination or reduction of various required compliance activities that are not measurably enhancing the their ability to attain Water Quality Standards, which in turn could allow the Permittees to redirect some of their existing resources into the third party TMDL effort. Some program elements that could be considered for discussion are described in Section 6.4.4.7.

Pyrethroid Pesticide BMP Implementation

The Permittees have committed to implementing several BMPs to address possible urban sources of pyrethroid pesticides. In addition the Permittees have committed to working through CASQA to facilitate regulatory change in pyrethroid pesticide use to curtail potential causes of receiving water impairment.

Adjustments to the Monitoring Program

The Permittees have proposed additional revisions to the monitoring program to streamline implementation and increase its utility.

2.0 Introduction

The Regional Board adopted Order No. R9-2004-001 (NPDES No. CAS0108766), an area-wide NPDES MS4 permit (2004 MS4 Permit) on July 14, 2004. This ROWD is a required component for renewal of the 2004 MS4 Permit. The 2004 MS4 Permit authorizes discharges of Urban Runoff from the MS4 owned and operated by the Permittees.

Capitalized terms used in this ROWD are defined in the glossary of the Riverside County DAMP. The Riverside County DAMP serves as the model compliance document used by the Permittees to develop the Watershed and Individual SWMPs. To save costs and increase the effectiveness of the MS4 Permit compliance programs, the Permittees will maintain the Riverside County DAMP as the primary document that describes Permittee compliance programs. The Permittees individual and regional compliance programs are then described in more detail in the Individual and Watershed SWMPs.

This ROWD has been written and formatted to address the requirements outlined in United States Environmental Protection Agency (USEPA) *Interpretative Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems* contained in the Federal Register, Volume 61, page 41698 (61 FR 41698), and to include commitments made in the various compliance documents, annual reports and in meetings with the Regional Board.

Additionally, as discussed in the meeting with Regional Board staff on September 9, 2008 and as supported by the above mentioned USEPA guidance, this ROWD relies on the fourth year Annual Reports to document the programs implemented by the Permittees. The fourth year Annual Report also includes a comprehensive evaluation of Permittee monitoring data to date and includes preliminary recommendations for Permittee compliance programs based on that data. As part of the ROWD process, the Permittees have reassessed their existing programs that are described in the Annual Reports, the monitoring conclusions and program recommendations contained in the fourth year Annual Reports, and in this ROWD, are making additional recommendations for revisions to improve the efficiency and effectiveness of these programs at improving and protecting the quality of our Receiving Waters.

The following sections of the ROWD are summarized as follows:

Section 3.0 - Information about the Permittees, their legal authority to implement the existing and proposed programs, the Permit Area, and the Permittee's funding sources and economic outlook relative to continued funding of the MS4 Permit compliance programs.

Section 4.0 – Information about the upper Santa Margarita River watershed, including physiography and geology, hydrology, climate, population, land use, surface water bodies and their Beneficial Uses and Impairments, and the MS4. This information provides context for the MS4 Permit compliance program in the Santa Margarita Region.

Section 5.0 – An overall evaluation of the Permittees existing programs based on water quality data collected to date and proposed compliance program modifications.

Section 6.0 – Evaluation of regional compliance programs, including a summary of accomplishments and proposed program revisions.

Section 7.0 – Evaluation of compliance programs individually implemented by the Permittees, including a summary of accomplishments and proposed program revisions.

3.0 Applicant Information

3.1 Permittee Contact Information

Table 1 provides the contact information for each of the Permittees in the Santa Margarita Region.

3.2 Statement of Legal Authority

The Co-Permittees have adopted ordinances regarding the management of Urban Runoff. The ordinances provide the Permittees with the legal authority to implement the requirements of the 2004 MS4 Permit and 40 CFR Section 122.26(d)(2)(i)(A-F). The Permittees also provided certification of adequate legal authority to comply with the 2004 MS4 Permit and to implement the Riverside County DAMP to the

[1] As the Cities of Menifee and Wildomar are recently incorporated, the County of Riverside is currently handling their stormwater and MS4 permitting issues. Once these cities are fully established and staffed, updated contact information will be provided to the Board. The cities will assume responsibility for their programs on October 1, 2009.

Regional Board. However, it is noted that the newly incorporated cities of Menifee and Wildomar will submit their certifications following adoption of the updated MS4 Permit.

However, there are limitations to the authority the Permittees have for enforcement actions. The Permittees do not have legal authority over discharges into their respective MS4 facilities that originate from agricultural activities, state and federal facilities, utilities and special districts, Native American tribal lands, wastewater management agencies and other point and non-point source discharges otherwise permitted by, or under the jurisdiction of, the Regional Board or USEPA. Examples of non-point sources of Pollutants not under the control of the Permittees include materials from operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

Also, the Permittees do not have the authority to enforce the provisions of California's General Permit for Storm Water Discharges Associated with Industrial Activities (General Permit-Industrial) or California's General Permit for Storm Water Discharges Associated with Construction Activity (General Permit-Construction). The State Water Resources Control Board (State Board) issues these NPDES permits, and neither the State Board nor the Regional Board has the authority under the Clean Water Act to delegate responsibility for administering these NPDES permit programs to the Permittees. However, the Permittees' local storm water and erosion control ordinances may address items similar to those identified in these statewide NPDES permits.

3.3 Permit Area

The Permit Area is defined as the urbanized area serviced by the Permittee's MS4 facilities. The Permit Area is located within the area delineated by the County boundary line on the south and the limits of the jurisdiction of the San Diego Regional Board on the north, east, and west. It is important to recognize that the Clean Water Act exempts agricultural activities from regulation under NPDES and the Permittees do not have legal jurisdiction over storm water discharges into their MS4 facilities from:

- California and federal facilities,
- Areas under the jurisdiction of San Diego County,
- Utilities and special districts, and
- Native American tribal lands.

These areas are not included in the Permit Area. In addition, other point and non-point source discharges otherwise permitted by or under the jurisdiction of the Regional Board or USEPA may affect water quality in the Murrieta and Temecula Creek watersheds.

The area of Riverside County under the jurisdiction of the Regional Board is less than 8 percent of the 7,300 square miles within Riverside County. Of the 27 municipalities within the whole of Riverside County, only five include areas under the jurisdiction of the Regional Board.

3.4 Funding Sources and Economic Projections

3.4.1 Funding Sources

The costs incurred by the Permittees in implementing the SWMPs fall into two broad categories:

- **Shared Costs**. These are costs that fund activities performed mostly by the District under the Implementation Agreements. These activities include coordinating the overall storm water program, coordinating other interagency cooperative efforts such as the Compliance Assistance Program (CAP), participating in CASQA activities, representing Permittees at meetings of the Regional Board or State Board and other public forums; preparing and submitting compliance reports and other reports required under the MS4 Permit, conducting Urban Runoff monitoring and public education outreach programs, responding to Water Code Section 13267 requests, providing other program documentation, and coordinating consultant studies, Permittee meetings, and training seminars.
- **Individual Permittee Costs for Individual SWMP Implementation**. These are costs incurred by each Permittee for implementing within its jurisdiction the BMPs (drainage facility inspections for illicit connections, drainage facility maintenance, drain inlet/catch basin stenciling, emergency spill response, street sweeping, litter control, public education, construction activity inspection, development of implementation plans, etc.) comprising the Individual SWMPs.

Historically, the Permittees have employed several funding methods to finance their MS4 Permit compliance activities. Unfortunately, the mortgage crisis, collapse of the housing market, and the economic recession has resulted in the cessation of virtually all development activity and has significantly reduced property and sales tax revenue. Property tax revenues have been reduced by the high level of foreclosure activity, reduced property values and a significant decline in assessed valuations. Property tax revenues have been further reduced by homeowner requests for reassessments to reflect the reduced property values. The impact of these economic conditions on the Permittees in the Santa Margarita Region has been particularly severe. As a result, the aggregate funding available to the Permittees has been severely reduced, and it is anticipated that this condition will continue well into and possibly throughout the next Permit term. The funding methods historically used and the effects of the economic situation on the availability of funds through these sources are summarized as follows:

- **Santa Margarita Watershed Benefit Assessment Area**. In 1991, the District established the Santa Margarita Watershed Benefit Assessment Area to fund its MS4 Permit compliance activities. Currently, the Benefit Assessment revenues fund the District's share of the area-wide MS4 Permit program activities and the District's individual compliance activities as a Permittee. Under the Benefit Assessment each parcel is taxed based on the impervious area of each parcel at a set rate established by District Ordinance 14. This rate has not been increased since 1991 due to Proposition 218. In 2007/08 the Santa Margarita Benefit Assessment generated approximately $410,000 dollars in revenue.

  Outlook: The District expects at best to maintain, if not see temporary reductions in Benefit Assessment revenues due to the significant number of homes that are not paying property tax due to foreclosure. Pursuant to Article 13.D of the California Constitution, an increase in the established Benefit Assessment rate to compensate for these reductions requires approval of 2/3

of the voters or 50 percent of the property owners and is highly unlikely given the current economic climate. Revenues will not increase until the development industry recovers.

- **General Fund /Other Revenues**. The County and the cities utilize general fund revenue to finance most of their MS4 Permit compliance activities. General fund revenue is generated by property tax, sales tax, and auto license taxes.

  Outlook: The Permittees expect a continued reduction in th**e funds** available through General Fund / Other Revenues through at least FY 2009 /2010. Although optimistic that conditions will begin to stabilize toward the end of 2009, the Permittees cannot speculate as to when revenues will recover to previous levels.

- **Fees**. Several Permittees charge fees for services such as inspections, plan check, and other recoverable costs related to compliance with the 2004 MS4 Permit. These fees cover both the direct and indirect costs associated with conducting these inspections/reviews including associated compliance tracking and reporting.

  Outlook: It is notable that, with the virtual collapse of the development industry in the Santa Margarita Region, the fees received by the Permittees have been significantly reduced. With this reduced level of fee-based income, maintenance of the existing inspection and plan review programs will place an increased burden on overall funding of the compliance programs. The Permittees do not expect revenues from fees to recover until the development industry recovers. Even with recovery of the development industry, it is anticipated that over the long-term, revenues from fees will be reduced for the City of Temecula and the County due to the reduced area remaining for development within their jurisdictions.

- **Grants.** The Permittees have actively pursued and, as available, used Grants to fund compliance programs.

  Outlook: In December the state's budget crisis resulted in a directive to state agencies from the Department of Finance to halt projects that rely on bond funds, including those funded by Prop 40, Prop 50, or Prop 84. The State of California is the primary source of grant funding for water quality projects. Future availability of funds to resume grant-funded projects is uncertain.

It is clear that the current economic climate and that of the foreseeable future is creating a significant burden upon the Permittees that will make the continuance of all existing MS4 Permit compliance programs increasingly difficult. New funding sources or alternative combinations of funding sources will likely be required to ensure continued funding of even the current MS4 Permit compliance programs.

3.4.2 Economic Projections

According to Chicago Title, Southwest Riverside County has experienced a very significant increase in supply of single-family residential units on the market. As a result, housing price indicators are very negative. In the majority of the Southwest Riverside submarket, the pending price is less than the closing price indicating general price weakness. The October, 2008 count of bank owned (REO) properties for Riverside County as a whole was 12,078. The number of home in foreclosure was 23,480. The presence of high levels of REO properties will continue to negatively affect home prices. In addition, the level of foreclosures is increasing.

With regard to other sectors of the economy, Riverside County has taken a serious turn for the worst in 2008, with projections indicating that the severe downturn will continue through 2009 at the very least.

The economic difficulties being faced in the Southwest Riverside submarket is the result of the dramatic downturn in the housing market in this area, the national financial turmoil, the worldwide credit crisis, and the increasing consumer debt crisis. According to Beacon Economics, a respected economics consulting firm in Los Angeles, Inland Southern California is clearly at the epicenter of this economic turmoil, with extremely high rates of unemployment at present. Unemployment rates in Inland Southern California are expected to reach 12.4 percent before this deep recession is over. Housing prices are expected to continue their precipitous decline from their peak levels in the two Inland Southern California counties through at least 2011. According to Dataquick, median home prices in Riverside County peaked at $415,000 in January 2007. At the end of this cycle, the median home price in Riverside County is expected to be $198,000. Figure 1 depicts the median housing price in Riverside County over the period 1990 to August 2008.

Figure 1. Riverside County Median Housing Price (1990 – August 2008)

Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 14.

Local Government sales tax revenues remained fairly stagnant through 2006 and began to decline in early 2007, according to Beacon. By the second quarter of 2008, taxable sales in Riverside County declined by 7.7 percent. The decline is expected to continue with taxable sales possibly bottoming out by 2010. Recovery of these reduced revenue streams will likely not occur within the next permit term.

As a direct outcome of the current economy and the economic outlook into the next MS4 Permit term, the number of New Developments proposals has plummeted and any significant rebound is not forecast. New and redevelopment projects will likely remain minimal. As shown in Figure 2, the number of housing units being added each year has dropped below the levels seen at any point in time during the 2004 MS4 Permit. These numbers will likely continue to decrease for a significant portion of the new MS4 Permit term.

Figure 2. Riverside County Housing Units Added (1990 – 2008)

Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 12.

These economic issues and projections directly affect and limit both:

1. The need for including enhanced new and re-development requirements in the new MS4 Permit, and
2. The Permittees ability to fund, and even seek new funding sources for additional MS4 Permit requirements for new and re-development projects.

Therefore, as described in Section 7.2, the Permittees are not recommending and cannot financially support any significant increases to their Development Planning activities. Permittee specific projections are as follows:

3.4.2.1 County of Riverside

The County is operating with a structural deficit of $12 million and plans a 25 percent budget reduction from FY 2008/2009 through FY 2011/2012. The County's current budget of $4.7 billion represents a 5 percent reduction from the previous year and next year's budget is expected to be cut by 10 percent. These cuts are directly associated with the overall decline in property values and the high number of foreclosures. There are concerns about having to use discretionary funds to meet State mental health and social service mandates. In addition, the County is dependent on funds from federal and state sources. If during this time of economic crisis federal and state funding sources are reduced or eliminated, any unfunded State and Federal programs will be terminated. Only core County programs will continue.

The primary source of general fund revenue is from property taxes and sales tax. With the unprecedented number of foreclosures, reduced property values, and declining sales tax revenue, general fund revenue is in a downward spiral. Another source of funding is through the Solid Waste Tipping Fees paid at the County landfills. Volume is down 15 percent since 2006 with anticipated downward trend to 40 percent reduction in solid waste through 2014. Programs that are partially funded through tipping fee allotments will be impacted. Due to the declining economy the recycling market has collapsed. Virtually no recyclable materials are being shipped for reprocessing. This loss of revenue and increased disposal costs is further impacting the general fund.

Cuts of 25 percent for all Net County Cost general fund programs will translate into reduction of County services and elimination of unfunded state and federal programs. Only core value programs will be provided (including public safety and fee programs)

The County has instituted a hiring freeze and required each department to create a report outlining the projected effects of the budget cuts. The County currently employs over 20,000 people, and layoffs are expected to result from the findings of these departmental reports. It is anticipated that this will impact program delivery for stormwater related activities. No County department will be able to sustain current staffing levels as they try to meet the 25 percent budget reduction strategy.[2] [3]

3.4.2.2 City of Menifee

The newly incorporated City of Menifee FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements during the first year of incorporation which expires October 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

3.4.2.3 City of Murrieta

The City of Murrieta's FY 2008/2009 budget did not increase compared to FY 2007/2008. Adjustments were made to reflect less revenue and to absorb any operating costs. However, budget cuts are anticipated for FY 2009/2010 because the immediate economic outlook is not good. There have been approximately 2,000 home foreclosures within the City. Sales tax revenue is estimated to drop 12.5 percent, property tax revenue will drop, and the State took approximately $525,000 out of redevelopment funds. Murrieta did not receive any vehicle licensing fees from the State and it appears likely that the State will take more revenue from the Cities to solve its budget problems. New NPDES requirements that increase compliance costs will create a financial hardship for the City.

3.4.2.4 City of Temecula

Various ongoing tax and investment revenues adopted in the City of Temecula's FY 2008-09 general fund revenues are projected to decrease from FY 2007-08. Sales and use tax revenues are expected to decrease in FY 2008-09 compared to FY 2007-08. This decrease is primarily the result of the decline in general consumer goods, electronic retail, and auto sales. Property tax revenue is also expected to decrease due to decreases in supplemental tax receipts attributed to the impact of the housing crisis. Investment interest revenue is also anticipated to decrease due to a decline in interest rates.

As a result of the 2008/2009 State budget, Temecula's redevelopment agency will have to shift existing funds from property taxes to the State's Education Revenue Augmentation Fund coffer for schools and

[2] "The Realities of Recession in California: A Statewide Report by U.S. Senator Barbara Boxer, December, 2008, p. 18.

[3] Riverside County Executive Office, January, 2008.

colleges. As such, the amount due from the Temecula Redevelopment Agency is expected to be $898,685. As the State of California continues to address its budget deficit, the City of Temecula faces the possibility of additional revenue shifts to State coffers, further losing future revenue streams and threatening existing service levels.

In addition, a Press-Enterprise article dated December 9, 2008, reported that "Between 25 and 30 part-time Temecula employees will be without work in the new year as City officials deal with a lack of revenue and less work to go around." Furthermore, "the city is not immune to the economic slowdown, which has forced its neighbors to lay off workers and slash spending to counter drops in sales tax receipts and building permit fees. In May, the City's Finance Director reported that revenues were down $3 million compared to two years ago."

With these current and projected reductions in revenue and staff, additional requirements in the MS4 Permit or upcoming TMDL-related requirements, without any corresponding cost-equivalent offsets, will exceed the City's ability to effectively implement these new requirements and will begin to compromise the City's existing efforts to manage the existing MS4 Permit requirements.

3.4.2.5 City of Wildomar

The newly incorporated City of Wildomar FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements the first year of incorporation that expires July 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

4.0 Overview of the Upper Santa Margarita River Watershed

4.1 Physiography and Geology

The upper Santa Margarita River watershed is defined as that portion of the Santa Margarita River watershed above the confluence of Murrieta and Temecula Creeks and includes the City of Temecula and portions of the Cities of Menifee, Murrieta, Wildomar, unincorporated County areas, portions of the Cleveland and San Bernardino National Forests, the Cahuilla, Ramona, Pauma, and Pechanga Indian Reservations and properties under the jurisdiction of Caltrans and a variety of special districts. The watershed is bounded by several mountain ranges, including the Santa Ana and Santa Margarita mountains to the North and the Palomar Mountains to the South. The upper Santa Margarita watershed includes areas in Riverside and San Diego Counties and encompasses approximately 588 square miles.

The upper Santa Margarita watershed includes two major sub-basins, drained by Temecula and Murrieta Creeks. Temecula Creek has a drainage area of 366 square miles, with steep rugged topography in the Palomar and Thomas Mountain areas and rolling hills below. The upper 316 square miles of this basin is controlled by Vail Lake (completed in 1949). Murrieta Creek has a drainage area of 222 square miles, with over 50 square miles controlled by Skinner Reservoir (completed in 1974). Although the watershed area is somewhat smaller and less rugged than the Temecula Basin, flood flows have the potential to create greater damage as they flow through the Cities of Temecula and Murrieta.

Temecula and Murrieta Creeks join along the Elsinore fault zone at the head of Temecula Canyon to form the Santa Margarita River. The Temecula Canyon is approximately five miles long, and is a steep, narrow, and rocky canyon. The San Diego-Riverside county line crosses through the Temecula Canyon. From here, the river traverses 27 miles to the Pacific Ocean.[4]

4.1.1 Watershed Characteristics

Over 50 percent of the Santa Margarita watershed has been controlled by the construction of Vail Dam in 1949 and Skinner Reservoir in 1974, which created a significant storage capacity in the upper watershed.[5] [6] 52 percent of the upper Santa Margarita River watershed is controlled by the dams. Due to this storage capacity, peak flow rates during major flow events for both existing and future land use conditions will be lower than under natural conditions.[7] [8]

[4] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 1.

[5] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 14.

[6] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 14.

[7] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 20.

[8] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 20.

4.1.2 Stream Flow Characteristics

Murrieta and Temecula Creeks are perennial interrupted streams, i.e., they include reaches in which the flow is continuous and others where flow is ephemeral. The areas of perennial flow are located in mountain area tributaries outside of the urbanized areas serviced by the MS4s. The perennial flows disappear by seepage into the sands and gravels and resurface upstream of the confluence of Murrieta and Temecula Creeks. The creeks in the urbanized areas of the watershed, located primarily in the valley, are ephemeral and flows are only observed during and immediately after significant storm events. During major storms, after initial wetting, periods of intense rainfall result in rapid increases in stream flow in steep foothill and mountain areas.[9] "Runoff in streams in the watershed is derived primarily from rainfall, and as a result, stream flows exhibit monthly and seasonal variations similar to those shown by the precipitation records. Absence of snow pack in the tributary watershed results in a rapid decrease in flow of streams at the conclusion of the winter precipitation season. Following severe storms, discharge in the larger streams often increases in a few hours time from practically no flow to a rate of thousands of cubic feet per second. Stream flows vary greatly from month to month and from season to season."[10]

Rising groundwater is currently observed in Murrieta Creek below its confluence with the Santa Gertrudis Channel. This is consistent with the observations with the rising groundwater conditions observed by the State of California in 1956.[11] Rising groundwater is also observed in Temecula Creek approximately one quarter mile upstream of the Interstate 15 bridge. In 1956, the State of California observed more extensive rising groundwater conditions occurring as far upstream as the Highway 79 bridge. Based on the virtual absence of non-storm water flows and the rising groundwater conditions in lower Murrieta and Temecula Creeks observed prior to development of the watershed, there is no evidence that the rising groundwater is due to Urban Runoff nor that Urban Runoff has affected the quality of rising groundwater. However, use and disposal of reclaimed water and agricultural and landscape irrigation in the watershed may affect groundwater quality. Until October 2002, the Rancho California Water District augmented the flow of the Santa Margarita River with reclaimed water at a point about five miles upstream from the Temecula gauging station. Since that time, the Rancho California Water District has diverted reclaimed water to the Santa Ana watershed and instead discharged imported water at a location downstream of the confluence of Murrieta and Temecula Creeks in order to meet water supply obligations to Camp Pendleton.

For the average annual event, it is estimated that approximately 89 percent of the volume of runoff in the Santa Margarita Region is due to non-urban land uses not regulated under the federal storm water program. For the 100-year 24-hour event, 93 percent of the volume of runoff will be due to non-urban land uses. These estimates are based on the assumption that precipitation is constant across the watershed. However, precipitation (and resultant runoff volumes) in the non-urbanized upland areas is as much as four times greater than that from the urbanized valley areas.[12]

---

[10] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 48.

[11] State of California Department of Public Works Division of Water Resources, Bulletin No. 57, "Santa Margarita River Investigation," Volume I, June 1956, p. 48.

[12] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11

4.2 Climate

"The climate of the Santa Margarita River watershed is typically Mediterranean, being characterized by warm dry summers and cool rainy winters. About 75 percent of the precipitation occurs during the four-month period from December through March. Mean annual depth of precipitation ranges from less than 10 inches near Vail Reservoir to over 40 inches west of Palomar Observatory, varying with elevation and topographic influences."[13] Precipitation increases with increases in elevation to the summit of the Coastal range. Shading effects of the Coastal range lead to a marked decrease of precipitation throughout the lower portions of the Inland area. Precipitation increases again farther away from the Coastal range in the northeastern area of the Inland area.[14] The significant and varied orographic features also make rainfall prediction particularly challenging in the urbanized portion of the watershed.

4.3 Population and Land Use

4.3.1 Population

The California Department of Finance estimates that as of January 1, 2008, the total population of Riverside County was about 2,088,322. Of the 2.1 million people, approximately 272,621 persons (or 13 percent) reside within the portion of Riverside County under the jurisdiction of the San Diego Regional Board. As shown in Figure 3, approximately 51,314 persons[15] reside in the unincorporated area while approximately 221,307 persons reside within the cities of Menifee, Murrieta, Temecula and Wildomar.

Figure 3. Santa Margarita Region Population by Permittee (2008)

[13] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11.

[14] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 38.

[15] Population estimate for the portion of unincorporated Riverside County within the Santa Margarita River watershed developed by the County TLMA GIS Demographics Unit based on the 2000 Census.

Although the second term and 2004 MS4 Permits covered a period of time that saw a significant amount of growth, due to the current and foreseeable economic conditions described in Section 3.4.2 of this report and decreasing areas available for development, growth during the next MS4 Permit term will be quite limited. In fact, the projected growth rate through 2015 will be significantly less than has been seen since the early 1990s. Figure 4 shows the combined populations of the Cities of Murrieta and Temecula since 1997 and projected through 2015. Similar trends are expected for the unincorporated areas and the portions of the cities of Wildomar and Menifee within the watershed.

Figure 4. Cities of Murrieta and Temecula Combined Population (1997 – 2015)

Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pgs 92 & 124.

Figure 4 clearly demonstrates the dramatic reduction in growth that is expected for the term of the next MS4 Permit when compared to previous permit terms.[16] Establishing trend lines for the population in these cities further demonstrates that the growth rate (population added per year) will be lower than the previous growth rate by approximately 86 percent.

[16] 2008 Riverside County Progress Report

Table 2 shows population projections for the all of the Permittees into the year 2015.

Table 2. Population of Santa Margarita Region Co-Permittees

Co-Permittee	Year			Change (2009 to 2015)
	Estimate 2008 (a)	Estimate 2009 (b)	Projected 2015 (b)	
City of Menifee	906[c]	927[c]	5,232[c]	464%
City of Murrieta	100,173	102,277	109,715	7.3%
City of Temecula	101,057	101,356[d]	103,150	1.8%
City of Wildomar	19,171[c]	19,589[c]	20,127[c]	2.7%
Unincorporated County of Riverside	51,314[c]	52,436[c]	53,793[c]	2.6%
Total	272,621	276,585	292,017	5.6%

Notes:

(a) Unless otherwise noted, populations were obtained from the State of California, Department of Finance, E-4 Population Estimates for Cities, Counties and the State, May 2008.

(b) Unless otherwise noted, projected populations were obtained from Riverside County Center for Demographic Research. Riverside County Progress Report, 2008

(c) Data provided by County of Riverside, Executive Office.

(d) Data provided by City of Temecula.

Since the District is not a general purpose government, it is not included in this listing. Although the current population of the City of Menifee in the Permit Area is small, it is anticipated that the population will increase as it annexes unincorporated areas. Similarly, it is anticipated that the cities of Murrieta and Temecula will gain population as they annex unincorporated areas. It is not anticipated that Wildomar will see significant population increases as it is bounded on all sides by other cities and lands reserved under the MSHCP.

4.3.2 Land Use

Land uses in Riverside County within the Santa Margarita Region include open space, residential, commercial, light industrial, heavy industrial, and agriculture. The agricultural land uses include row crops, nurseries, citrus groves and vineyards, dairies, ranches, poultry and hog farms, and other agricultural related uses with one single-family residence allowed per 10 acres (County of Riverside General Plan, Land Use Element 2003). The conversion of agricultural lands and open space to other "developed" land uses has been ongoing and will continue, although at a much lower rate than previously experienced. Land uses in the Santa Margarita Region are shown in Table 3. These land uses are based on the County of Riverside Assessor Parcel Data, current as of February 2006. It should be noted that the land uses below represent ***zoned*** land uses rather than ***actual*** land uses. This overstates the actual area of urban land use in the Santa Margarita Region. Also, changes in zoning designations can cause odd fluctuations in year-to-year date.

A map of the zoned land uses is provided in Appendix A.

In 1956, only 0.3 percent of the Santa Margarita River watershed (less than two square miles) was urbanized.[17] Although there has been a significant rate of growth in population relative to the State and

[17] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956.

neighboring counties, half a century later, approximately 88 percent of the Santa Margarita River watershed remains as non-urban land uses (rural residential, agriculture, preserves and open space, state lands, federal lands, and tribal lands). Further, almost one-third of the upper Santa Margarita River watershed consists of federal, state, and tribal lands that are not under the jurisdiction of the Permittees' MS4 programs. It is projected that the population of Riverside County will increase approximately 5.6 percent by 2015. If the urbanized area increases proportional to population, 87 percent of the upper Santa Margarita River watershed would remain in non-urban land uses in 2015.

Table 3. 2009 Santa Margarita Region Land Uses

Urban Land Use	Acreage[(a)]	% of Land Use Subtotal	% of Total Land Use
Commercial	8,339	20.0%	2.5%
Industrial	963	2.3%	0.3%
Urban Residential (< 1 acre)	12,656	30.4%	3.7%
Parks & Recreation Facilities	4,291	10.3%	1.3%
Streets & Roads	15,439	37.0%	4.6%
Subtotal – Urban Land Use	41,688		12.3%
Non Urban Land Uses			
Preserves & Open Space	54,141	18.2%	16.0%
Rural Residential (> 1 acre)	106,773	35.9%	31.5%
Agriculture	36,389	12.2%	10.7%
Federal/State/Tribal Lands/Non-County Jurisdiction	100,076	33.7%	29.5%
Subtotal Non Urban Land Use	297,379		87.7%
Total Urban & Non Urban Land Use	339,067		100%

(a) As reported in the FY 2007/2008 Watershed Annual Report.

4.3.3 Conserved Lands

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) was adopted in June of 2003. It is a comprehensive, multi-jurisdictional Habitat Conservation Plan focusing on conservation of species and their associated habitats in western Riverside County. The MSHCP is one of several large, multi-jurisdictional habitat planning efforts in southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP will allow Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts. Further, as floodplains and streams tend to support critical habitat, the MSHCP will preserve many of the remaining natural streams and establish significant buffer areas between those systems and urban land uses.

Much of the remaining non-urbanized lands in the Santa Margarita Region will ultimately be incorporated into the MSHCP. The MSHCP will result in a conserved area in excess of 500,000 acres and focuses on conservation of 146 species. The MSHCP Conservation Area includes approximately 347,000 acres on

existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. A large portion of the conserved lands are in the upper Santa Margarita watershed (at least 145,000 acres). There are approximately 72,318 acres of existing public or quasi-public lands preserved within the upper Santa Margarita River watershed area located in Riverside County.

4.3.4 Anticipated Development 2009-2015

Proposed development during the next MS4 Permit term is an important indicator of potential new Urban Runoff sources. To the extent possible, the Permittees have identified significant New Development projects that, if constructed, will result in the conversion of primarily undeveloped land to developed land. This section describes the expected development within Permittee cities. Consistent with the current and forecasted economic conditions and population estimates, and as supported by the population information and forecasts presented in Section 4.3.1, the Permittees anticipate that the term of the upcoming MS4 Permit will be a time of little development. Following are summaries of anticipated development during the upcoming MS4 Permit.

4.3.4.1 County of Riverside

Projected trends for the County of Riverside's land use can be referenced in the Riverside County General Plan. Maps depicting the areas of future development and type of land use can be found in the General Plan maps that are accessible at http://www.rctlma.org/generalplan/area_maps.html.

- With the incorporation of the cities of Wildomar and Menifee the remaining unincorporated County area to be built out in the Santa Margarita Region during the upcoming MS4 Permit term is going to be considerably smaller.
- It is anticipated that, over the next five years, additional annexations will occur in each of the four city areas (Temecula, Murrieta, Wildomar and Menifee) that will further reduce the unincorporated County area in the Santa Margarita Region.
- The unincorporated County area in the upper Santa Margarita River watershed (east of Temecula, Menifee and Murrieta) will remain in rural, open space and additional MSHCP land uses. In addition, due to drought conditions and depletion of aquifers the prospects of New Development is unlikely. Water districts in the region cannot offer "will serve" letters to provide for water resources they do not have. Infrastructure for water supply and municipal water treatment, MS4 and flood control facilities are virtually non-existent in this area.
- Due to downturn in economy, Development Impact Fees (DIF) and Transportation Uniform Mitigation Fees (TUMF) are and will continue to be significantly under funded. This reduction in transportation funding will result in fewer road and infrastructure projects during the term of the upcoming MS4 Permit. The Transportation Department has projected limited projects for the Santa Margarita Region. The Clinton Keith Road widening project is still in the planning stages. Due to budgetary constraints, unless projects are fully funded through County finance mechanisms (TUMF, DIF, state and federal pass through from bonds and grants) most projects will be put on hold through 2012.

4.3.4.2 City of Menifee

Projected development trends for the City of Menifee are unknown, sphere of influence and annexation opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.3.4.3 City of Murrieta

The area north of Clinton Keith Road along the east side of the I-215 freeway should see some construction towards the end of the next MS4 Permit term. Grading for the construction of a hospital has started along the freeway and it is anticipated that supporting development will follow once the hospital is open. Overall the Planning Department is receiving few applications for New Development projects. For example, a Planning Commission meeting scheduled for January 2009 has been cancelled because there are no New Development items to discuss. In light of the current and foreseeable economic conditions, the City does not anticipate any substantial New Development activity for the next few years, with limited growth possibly resuming toward the end of the next MS4 Permit term.

4.3.4.4 City of Temecula

The City of Temecula is currently experiencing a significant leveling trend in development. Throughout 2008, fewer applications were being processed than in previous years. As such, Temecula does not anticipate processing any substantial number of New Development applications within the next MS4 Permit term. It is anticipated that applications from hereon will be limited to smaller in-fill and redevelopment projects. In addition, proposed annexation areas will be limited to areas that will be set aside mostly for conservation. As Temecula is on the verge of build-out, approximately 1 percent of developable land remains available throughout the City for New Development.

4.3.4.5 City of Wildomar

Projected trends for the City of Wildomar are unknown, sphere of influence opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.4 Surface Water Bodies, Beneficial Uses, and Impairments

Approximately eight percent of Riverside County drains into surface water bodies within the jurisdiction of the Regional Board. Those surface water bodies (or portions thereof) are listed in Sections 4.4.1 and 4.4.2.

Rivers and Streams

- Santa Margarita River (Hydrologic Unit Basin Number 2.22)
  - Murrieta Creek
    - Slaughterhouse Canyon
  - Cole Canyon
    - Warm Springs Creek
      - Diamond Valley Reservoir
  - Santa Gertrudis Creek
    - Tucalota Creek
    - Lake Skinner
  - Temecula Creek (Hydrologic Unit Basin Number 2.92)
    - Iron Spring Canyon
  - Temecula Creek (Hydrologic Unit Basin Number 2.84)
    - Tule Creek
      - Million Dollar Canyon
    - Cottonwood Creek
  - Vail Lake
    - Wilson Creek
      - Cahuilla Creek (Hydrologic Unit Basin Number 2.73)
        - Hamilton Creek
      - Cahuilla Creek (Hydrologic Unit Basin Number 2.71)
        - Elder Creek
    - Arroyo Seco Creek
    - Kolb Creek
  - Temecula Creek (Hydrologic Unit Basin Number 2.52)
    - Pechanga Creek
- Santa Margarita River (Hydrologic Unit Basin Number 2.21)
  - DeLuz Creek

4.4.1 Beneficial Uses

The upper Santa Margarita River watershed supports a variety of ecosystems and provides many Beneficial Uses (Table 4)[18]. The ultimate goal of the Riverside County DAMP and the Watershed and Individual SWMPs is to manage Urban Runoff in a manner protective of the Beneficial Uses of these Receiving Waters.

Table 4. Beneficial Uses of Receiving Waters
Upper Santa Margarita River Watershed

Beneficial Use	Murrieta Creek	Cole Canyon	Warm Springs Creek	Santa Gertrudis Creek	Long Valley	Temecula Creek	Santa Margarita River
Municipal and Domestic Supply	X	X	X	X	X	X	X
Agricultural Supply	X	X	X	X	X	X	X

4.4.2 Current Water Quality Concerns and Issues

Urban Runoff discharged to MS4s in Riverside County ultimately flows to various surface water bodies (inland streams, lakes, and reservoirs) and typically carries Pollutants that originate from numerous dispersed and uncontrolled sources. Examples of Pollutants that may be present in Urban Runoff are fertilizer, heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals, and litter.

Because the upper Santa Margarita River watershed is large and has many land uses, the water quality concerns in sub-watersheds vary. However, each land use can potentially contribute Pollutants to nearby streams, rivers, and lakes. The infrastructure that supports people's activities (e.g., roads, parks, MS4, and wastewater collection and treatment facilities) may contribute to water quality concerns if not properly managed. Other sources of stormwater runoff, including agricultural areas, are exempt from the requirements of the NPDES permitting program established under the Clean Water Act. In addition, some Pollutants, such as total suspended solids, may be found at elevated levels in runoff from non-urban land uses. Further, certain activities that generate Pollutants present in Urban Runoff are beyond the ability of the Permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

[18] www.waterboards.ca.gov/rwqcb9/programs/

As required by Section 303(d) of the Clean Water Act, the State Board maintains a list all waters in the State that do not meet the Water Quality Standards established in the Basin Plans prepared by the Regional Boards for protection of Beneficial Uses. This list, referred to as the "303(d) List," details the Pollutant or stressor on each named water body, the potential source of Pollution, estimated affected area, as well as a priority for development of the associated TMDL. A TMDL is a plan that identifies how much Pollutant load a specific Impaired Waterbody can sustain without impacts to its Beneficial Uses. In addition to identifying the maximum Pollutant load, a TMDL is used to develop implementation plans to meet Water Quality Standards for a designated water body. Table 5 summarizes the 2006 303(d) List of Impaired Waterbodies within the upper Santa Margarita River watershed, as well as the year in which a TMDL is proposed for approval. No TMDLs have been established for Receiving Waters in the upper Santa Margarita River watershed.

Table 5. 2006 303(d) Listings for the Santa Margarita Region

Water Body	Pollutant	Potential Sources	Area Affected	Proposed TMDL Completion
Santa Margarita River (Upper)	Phosphorus	Urban runoff/storm sewers Unknown nonpoint source Unknown point source	18 miles	2019
Murrieta Creek	Iron Manganese Nitrogen Phosphorous	Source unknown Source unknown Source unknown Urban runoff/storm sewers Unknown nonpoint source Unknown point source	12 miles 12 miles 12 miles 12 miles	2019 2019 2019 2019
Temecula Creek	Nitrogen Phosphorus Total dissolved solids	Source unknown Source unknown	44 miles 44 miles	2019 2019

Table G-35 of Appendix G to the Annual Report 2007-2008 additionally identifies pyrethroid pesticides (bifenthrin and permethrin), bacteria (E. coli and fecal coliform), lead, and sediment (turbidity) as Pollutants of Concern in the upper Santa Margarita River watershed that warrant focused attention by Permittee implementation programs. These constituents have been detected intermittently or persistently at Triad and Tributary monitoring stations.

4.5 Municipal Separate Storm Sewer System

A map depicting the MS4 facilities owned and operated by the Permittees is provided in Appendix B.

5.0 Program Evaluation Based on Water Quality Trends

The overall effectiveness of the Permittees programs is assessed based on the analysis of water quality data obtained as part of the Consolidated Monitoring Program. Approximately 14 years of data have been collected through this program and have been cumulatively analyzed in the fourth-year monitoring Annual Report.

5.1 Inherent Limitations to Analyzing Water Quality Data

There are inherent limitations to analyzing water quality data from storm water. Storm water runoff is very different from mechanical wastewater or water treatment processes that usually incorporate water quality monitoring. Discharges from mechanical processes such as treated wastewater effluent and industrial discharges usually:

- Come from a single or a few readily identifiable sources;
- Are generally consistent in flow rate and chemical character from day to day; and
- Can be easily instrumented.

Conversely, Urban Runoff non-point source flows, such as those collected and analyzed as part of the MS4 Permit monitoring programs usually:

- Come from multitudes of unidentifiable or hidden sources, many of which are non-Urban in nature:
  - State, federal or tribal lands
  - Natural leaching of soils
  - Wildlife
  - Aerial deposition
  - Wildfires
- Vary widely in flow rate in response to precipitation events
- Vary widely in chemical character at any given moment due to:
  - Unidentified episodic issues related to natural phenomena
  - Magnitude of rainfall and extent of contributing area
  - Potential one-time illicit discharges that were not identified at the time of sampling
  - Unforeseen or unidentified consequences of changes in numerous land use policies (fire management, development, etc)
- Are subject to significant natural random variation; and
- Cannot be easily instrumented due to the wide variation in depth and velocity and associated impacts of natural or unnatural aggradation and degredation of natural stream beds.

Because ephemeral storm water flows are, by their very nature, particularly random in character, it may take many years before monitoring data trends can be detected or to determine the effectiveness of an

Urban Runoff control measure. Power analyses were conducted for fecal coliform, metals, and nutrients at the stations monitored in the Santa Ana Region during the 2005/06 reporting period. Power analysis is used to determine how many years of monitoring would be required to detect a given trend in the data. This tool was developed by the SCCWRP. Based on the results, for biennial monitoring, and having an 80 percent chance of detecting a change in concentration, it would take about 5-10 years of data collection to detect a change of 50 percent in concentration, 10-15 years of data to detect a 25 percent change, and 15-30+ years of data to detect a 10 percent change. It is expected that results would be similar for other parameters measured in the monitoring program in the Santa Margarita Region.

5.2 Focus Area Constituents of Concern

During the 2004 MS4 Permit term, monitoring data indicated that one or more receiving water samples have been found to contain the following constituents at levels that exceeded Basin Plan Objectives (BPO). As such they have been identified as constituents of concern.

- Nutrients (Ammonia as N, Phosphorus
- Pyrethroid Pesticides (Permethrin, Bifenthrin)
- Pathogen Indicators (E.coli, Fecal Coliform)
- Lead
- Turbidity (lab)

5.3 Analysis of Water Quality Trends

As discussed in the 2008 Santa Margarita Region Annual Monitoring Report, the results of the trend analysis and regression calculations indicate that there are no statistically significant trends in the water quality monitoring data. The lack of trends in the data presented in the Annual Monitoring Report contrasts with the rapid population growth over the same time frame. As discussed in the Annual Monitoring Report, population growth from 1990 to 2008 was approximately 300 percent for the Santa Margarita Region. This significant growth in population and resulting urban land use area contrasts sharply with the lack of statistically significant increases in concentrations of constituents of concern that would otherwise be expected in stormwater runoff from urbanized areas.

These results demonstrate and can be attributed to the effectiveness of the Permittees' programs at addressing the Focus Area Constituents of Concern, which are targeted and designed to prevent the discharge of these constituents into the Receiving Waters.

5.3.1 Recommended Compliance Program Modifications to Address Focus Area Constituents of Concern

Based on the analysis described above and in Appendix G of the 2008 Watershed Annual Report, no significant program modifications are necessary to continue to protect and improve the quality of the Receiving Waters.

Although the Permittees programs have been shown to be protective of Receiving Water quality, through continual evaluation of the programs being implemented and on-going water quality monitoring, additional measures are being proposed as part of this ROWD to address changing conditions and ensure

the ongoing effectiveness of the programs. Recommended changes to ensure the ongoing effectiveness of the Permittees programs are described in Sections 6 and 7 of this report.

6.0 Evaluation and Recommendations for Regionally Implemented Programs

6.1 Program Management

The District is the Principal Permittee for each of the three MS4 permits issued by the three Regional Boards that have jurisdiction in Riverside County. As Principal Permittee, the District performs management functions including coordination with the Regional Boards, preparation of compliance documents and Annual Reports, participation in studies and external cooperative efforts and dissemination of information to the Permittees. The Permittees implement some compliance programs that are common to all of the Permittees and which are implemented on a Countywide or regional basis to increase cost effectiveness and efficiency. Typically, the District also manages Countywide and regional programs.

6.1.1 Program Management Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit the following accomplishments were achieved.

- Updated the Implementation Agreement that sets forth the responsibilities of the Principal Permittee and the Co-Permittees.
- Revised the Riverside County DAMP to reflect requirements in the 2004 MS4 Permit, which served as a model document for the Permittees Watershed and Individual SWMPs.
- Developed Santa Margarita Region Watershed SWMP
- Participated in the Santa Margarita River Executive Management Team (SMREMT) to identify and address the highest priority water quality concerns in the Santa Margarita watershed, including development of a watershed model to assist with land use planning and TMDL development, coordinating watershed monitoring, and developing formal agreements between interested stakeholders for the purposes of evaluating impairment listing and data gaps in the watershed.
- Continued progress with the SMREMT on a uniform watershed plan and model for the Santa Margarita Watershed through the Santa Margarita Watershed Supply Augmentation, Water Quality Protection, and Environmental Enhancement Program.
- Participated in the Santa Margarita Lagoon TMDL workgroup in funding and overseeing the development of a comprehensive program to collect data and model the various inputs to the lagoon to be used to develop a TMDL to address nutrients.
- Participated in the Santa Margarita Watershed Water Quality Monitoring Group to coordinate the monitoring efforts of various stakeholders in the Santa Margarita watershed.
- Participated in the SMC to improve stormwater monitoring science, coordinate data collection efforts, and evaluate the effects of stormwater discharges to receiving waters specific to Southern California.
- Participated actively in various efforts of CASQA.

- Participated in the completion of an Integrated Regional Water Management Plan for the upper Santa Margarita Watershed to help pave the way for greater watershed-wide coordination and management of water resources within the upper watershed as a whole, as well as adjoining watershed and regional planning efforts.
- Participated in the development and implementation of the MSHCP for Western Riverside County which contains a comprehensive land use plan that ultimately conserves the environmental resources and habitat of approximately half of the Santa Margarita Region.
- Participated in the development of a Special Area Management Plan (SAMP) to further manage receiving waters at a watershed scale for the upper Santa Margarita Watershed by identifying, prioritizing and protecting the highest priority Waters of the U.S., while considering the broader needs of growth and transportation improvements.
- Developed and updated methods to track program effectiveness such as resident surveys, tracking hotline inquiries, and web counters.
- Enhanced Public Education program through development of new outreach materials and programs.

6.1.2 Proposed Revisions to Regional Program Management

6.1.2.1 Enhanced Program Effectiveness Assessments and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the effects of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP as part of their implementation of the new MS4 Permit. An assessment strategy based on the CASQA Municipal Stormwater Program Effectiveness Assessment Guidance has been established including the establishment of:

- Measurable goals for each component,
- Measurable metrics to assess progress toward those goals,
- CASQA Effectiveness Levels for each metric; to indicate the level at which each metric can demonstrate the effectiveness of the Permittee's programs at addressing each goal.
- Timeframes in which the Permittees expect to be able to assess effectiveness using each metric.
- Municipal Action Levels (MALs) for appropriate metrics to ensure a minimum level of program implementation and identify shortcomings that could affect the Permittee's progress toward the established goals. The MALs would not be permit compliance measures, but triggers for further Permittee evaluation of the affected compliance program.

If a MAL for a metric is exceeded, the Permittees will review implementation of that program component to identify the cause of the exceedance and identify needed adjustments to avoid future exceedances. The findings of these reviews and any recommended adjustments to the Permittees programs will be reported in the corresponding section of the Annual Report submitted the following year. Further research is particularly needed to establish appropriate Municipal Action Levels for the various program areas.

After a review of the stormwater program, the Permittees have established an initial Assessment Methodology for each component including preliminary goals, measurable metrics, effectiveness levels,

timeframes and MALs for each. These initial assessment methodologies are included in tabular format in Appendix C. Although the Permittees believe the basic proposal is viable, The Permittees will review and finalize these Assessment Methodologies and associated metrics within one year following adoption of the new MS4 Permit as additional data and analysis is necessary to support specific action levels.

6.1.2.2 Revised Reporting Format

The Permittees recommend substantial revisions to the MS4 Permit requirements for the layout of the Annual Report. The Permit requires substantial duplication of reporting, which either increases the volume of the Annual Report, or requires substantial cross-referencing. In either case, it is confusing to write, and most likely, confusing to read. The Permittees recommend a meeting with Regional Board staff in the development of the new MS4 Permit to discuss methods to streamline and clarify reporting requirements.

6.1.2.3 Maintain Enhanced Watershed / MS4 Map

The Permittees are in the process of collecting data to support an enhanced MS4 facilities map. Updates completed to date are provided in the map in Appendix B. This enhanced map demonstrates initial efforts to identify the locations of:

- Receiving Waters
- MS4 facilities
- Areas of historical perennial flows
- Known blow off locations
- Wastewater storage ponds
- Sub-drainage areas
- Known non-Permittee facilities
- 36-inch diameter and larger outfalls

This map will be used to help in the tracking of IC/ID events and issues and continued updates will be submitted with the Annual Reports. The Permittees will continue to enhance this map over the next MS4 Permit term. As described in the Annual Report, the District is in the process of upgrading their web page that offers public access the District's various NPDES activities. Along with these web site upgrades, additional layers will be added to the Web-based GIS map.

6.1.2.4 Elimination of the Watershed SWMP as a separate compliance document from the Riverside County DAMP

The Santa Margarita Region is comprised of only a single watershed. Further, the Permittees' regional compliance programs are described in the Riverside County DAMP. Maintenance of a separate and duplicative Watershed SWMP is confusing, cumbersome, and does not contribute to protection of Receiving Water quality. The Permittees request that the next MS4 Permit be drafted in a fashion that allows the Permittees to maintain the Riverside County DAMP as the primary document describing regional compliance programs for western Riverside County including the Santa Margarita Region. Any

necessary changes for requirements included in the new MS4 Permit will be updated /added to the Riverside County DAMP.

6.2 Permittee Training Programs

6.2.1 Summary

The Permittees jointly fund comprehensive training and education programs for Permittee staff. These training programs are designed to train Permittee employees on the proper use and implementation of BMPs appropriate for their field of work. There are four distinct training courses currently offered including Construction Inspection, Municipal Maintenance, Industrial-Commercial Facility Inspection, and New Development Planning.

6.2.2 NPDES Training Program Accomplishments and Programmatic Improvements

- Evaluated and tested various knowledge retention methods.
- Performed Training Enhancement Analysis study (2005-2006)
- Created an on-line training registration web page where attendees can also obtain training materials.
- Annually updated training materials to address Pollutants of Concern (2005-2007)
- Added component to training to address proper use, application and timing of application of Pesticides (2007-2008)
- Began developing a formalized testing and effectiveness analysis approach (2008)

Highlights
Municipal Training: **14** Training Sessions; **900** Attendees
Construction Training: **22** Training Sessions; **626** Attendees
Industrial-Commercial Training: **11** Training Sessions; 426 Attendees
New Development Training: **13** Training Sessions; **345** Attendees

6.2.3 Long-Term Effectiveness Assessment

Throughout the term of the 2004 MS4 Permit the Permittees have evaluated and implemented various quizzes as part of the NPDES training courses. These efforts were intended to assess the retention of knowledge of the attendees and, as described in Provision K.2.m of the Watershed SWMP, serve as a component of the assessment of the long term effectiveness of the Watershed SWMP.

The quizzes used to assess employees' retention of knowledge have evolved over time as the Permittees found what worked and what did not. Quiz questions that were found to be confusing or misleading were refined or eliminated. Thus, a question-by-question analysis of the results is not possible. Instead, results from a number of the training courses with reasonably comparable quizzes were aggregated and an average score (percent correct) was established for each of these training sessions. The results of this analysis are presented in Figure 5.

Figure 5. Training Pre-Test and Post-Test Analysis

Although the required random-sample nature of this analysis is not conducive to the analysis of trends across time, two findings become evident from this analysis:

1. Permittee inspection, maintenance and planning staff generally have a high level of understanding of issues related to stormwater Pollution in their field of work.
2. Average scores on quizzes administered after the training sessions were always higher than scores on quizzes administered before the training session.

Finding 1 above can be attributed to the Permittee's proactive efforts to ensure that their employees are aware of the issues in their field of work that could contribute to stormwater Pollution. This includes annual attendance at the NPDES training courses, and on-the-job training, reminders and meetings. This fact alone is a strong indicator of the effectiveness of the Permittees training programs.

Finding 2 above demonstrates that after attending the NPDES training courses, the attendees have a higher level of understanding of the issues in their field of work related to stormwater Pollution. This indicates that the training materials, delivery and content were effective.

Based on these analyses, general feedback from the training programs, and the overall effectiveness of the Permittees' programs (as described in Section 5.3 herein) the Permittees believe their training programs to be effective. Nevertheless, the following revisions to the training programs have been identified and are proposed for implementation with the new permit to ensure ongoing effectiveness.

6.2.4 Proposed Revisions

6.2.4.1 Continued focus on Focus Area Pollutants of Concern

The Permittees commit to continue to revise the Permittee training programs to focus on Pollutants of Concern.

6.2.4.2 Standardized Effectiveness Quizzes

Over the course of the 2004 MS4 Permit, the Permittees have evaluated various methods of assessing the retention of knowledge and are now recommending a standardized approach to assessing the effectiveness of the training program.

The Permittees plan to create standardized quizzes to assess the retention of knowledge and increased understanding as a result of the Permittees' training sessions. This includes establishing core messages that the Permittees want to impart upon the attendees and, creating clear and understandable quiz questions for each core message.

This approach will help the Permittees identify if any core training messages are not being retained by attendees and to subsequently modify the training. The Permittees also hope that this approach will yield results that will, over time, demonstrate that the knowledge among Permittee staff of issues related to storm water Pollution is increasing, thus clearly demonstrating that the NPDES Training program is effective.

As a necessary part of this effort, a database to track responses will also be created.

6.2.4.3 Attendance Tracking Mechanism

At each training session a sign-in sheet is provided to track attendance to the session. Included in the sign-in sheet is an indication of the Permittee that each attendee is representing. After each training session, these sign-in sheets are scanned to PDF files and sent to each Permittee for their records. This approach requires that each Permittee manually review the sign-in sheets to determine who and how many of their staff attended the training.

The District, on behalf of the Permittees, is currently investigating various form scanning and recognition software packages to determine the feasibility of creating a sign-in sheet that, when scanned, will automatically transfer the attendance list into a database. This would facilitate tracking of staff attendance by each Permittee. At this time the District has not determined if a feasible and cost efficient program is available that will accomplish their needs.

6.3 Public Education

6.3.1 Summary

To leverage finite resources, the Permittees jointly fund a public education program. The District implements this program to disseminate information about Urban Runoff issues and to provide education on how activities may impact Receiving Waters.

The Permittees have established an ongoing watershed-based public education and outreach program known as the **Only Rain Down the Storm Drain** Pollution Prevention Program. The specific objectives of this program include:

- Fostering a broad public awareness of water Pollution concerns;
- Increasing public acceptance of Pollution Prevention activities to curtail everyday human behaviors that contribute to water quality problems;
- Educating/informing the general public, regulators and key local government and state decision makers on Urban Runoff conditions in Riverside County; and
- Promoting stewardship of local water resources.

The **Only Rain Down the Storm Drain** Program implements the public awareness objectives by focusing on three areas of Pollutant reduction/prevention:

- Public behavior;
- Proper management of Pollutants; and
- Business specific education outreach.

In addition, when attempting to make use of the finite resources available to the Public Education Program, the Permittees use these management goals to ensure that resources are used effectively:

- Focusing on Pollutants of Concern specific to each watershed region;
- Coordinating public education efforts with adjacent storm water management programs and other related education programs to share resources, coordinate outreach efforts, and avoid duplication of effort; and
- Adapt public education programs and objectives, based on effectiveness analysis, to address changing MS4 program requirements and objectives.

6.3.2 Public Education Program Accomplishments and Programmatic Improvements

The Public Education Program has developed and distributed the following educational materials during the 2004 MS4 Permit term:

- *After the Storm* – a citizen's guide to understanding MS4 Pollution in your neighborhood or when performing daily activities.
- *Automotive Maintenance & Car Care* – guidelines for keeping your auto shop or retail fuel facility in environmental shape.

- *Outdoor Cleaning Activities* – guideline for outdoor cleaning activities and wastewater disposal.
- *Pools, Spas and Fountains* –Environmental maintenance suggestions for pool, spa, and fountain owners.
- *What's the Scoop* – tips for a healthy pet and a healthier environment.
- *Household Hazardous Waste* – A schedule of collection locations for proper disposal of HHW.
- *Stormwater Pollution Found in Your Neighborhood* – door hanger.
- *Equestrian Management* – Recommendations for BMPs related to equestrian activities.
- *Spray Bottles* – Including directions to make environmental friendly recipes for pest control and household cleaning

The Permittees also initiated development of the following outreach materials

- *Landscaping and Gardening Brochure* – Initiated development a new brochure to address outdoor residential landscaping and gardening activities.
- *Septic System Management Brochure* – initiated development of a brochure to assist with septic system management.

In addition to the information provided on the Storm Water Protection website, the Public Education and Outreach Program has:

- Updated the Public Education and Outreach Program web page.
- Tested and/or implemented several new Public Education and Outreach Program effectiveness tracking mechanisms including call tracking, web counters, testing, and bilingual surveys.
- Enhanced the toll free storm water Pollution reporting hot line to include public education information and support for the public and other interested stakeholders.
- Obtained a trailer with "**Only Rain Down the Storm Drain**" graphics specifically designed for transporting materials to outreach events. It is also used as part of the booth at outreach events.
- Initiated billboard advertising within the Santa Margarita Region.
- Worked with the Mission Resource Conservation District to implement presentations to elementary and middle schools and staff to raise public awareness of Urban Runoff management issues and source control methods and to encourage volunteers, partners, and groups to gather annually for a trash and debris clean-up day in the Santa Margarita Region.
- Developed special newspaper and billing inserts, fliers and advertisements to raise public awareness of Urban Runoff management issues and source control methods. A radio advertising campaign was also developed and implemented for a time.
- Developed and presented workshops regarding household hazardous waste use and proper disposal at major home improvement stores throughout Riverside County.
- Placed advertisements in the Penny Saver and Bargain Bulletin to raise public awareness of Urban Runoff management.

- In cooperation with certain County Service Areas or other programs, pet waste signs with bag dispensers have been installed at various parks to help encourage the proper disposal of animal waste.
- Cooperated with the Western Riverside Council of Government in the Used Oil Block Cycle Grant that decreases the amount of illegally dumped motor oil by promoting the addition of new Certified Oil Collection Centers.
- Established a partnership with County Environmental Health whereby businesses cited by Environmental Health for violations of ordinances related to stormwater issues may be allowed to implement a Supplemental Environmental Project in conjunction with the **Only Rain Down the Storm Drain** program.

6.3.3 Long-Term Effectiveness Assessment

Effectiveness metrics of the Public Education and Outreach Program during the 2004 MS4 Permit term are presented in Section J.1.3 of the FY 2007/2008 Watershed Annual Report. The data indicates that overall impressions have continually exceeded the number of residents in the watershed, HHW/ABOP pounds of waste collected and pounds of waste collected per person have steadily increased over the term of the 2004 MS4 Permit.

In 2005, the **Only Rain Down the Storm Drain** program developed and implemented a survey to be distributed at Public Outreach events to assess the public's level of knowledge related to stormwater Pollution. This original "long" survey contained 13 questions in both English and Spanish as shown in Figure 6.

This survey was used for fiscal years 2005-06 and 2006-07. Through this period of implementation it was found that the survey took too much time to complete and reduced the level of response from event attendees. Therefore, the survey was subsequently revised to a shorter version with revised questions for the 2007-08 fiscal year. The revised "Short" survey that is currently used is shown in Figure 7.

Figure 6. Original "Long" Survey Utilized at Public Outreach Events

Zip Code_____ Age_____ Sex F__ M__ Date:_____

THINK YOU KNOW ABOUT STORM DRAIN POLLUTION PREVENTION?

1. Where do you think **storm drain** contents go or flow to? __Treatment Plant __Streams, rivers & lakes

2. Where do you think **sewer pipes** contents go or flow to? __Treatment Plant __Streams, rivers & lakes

3. Are storm drains and sewers part of the same or separate systems? __Same __Separate __Don't know

4. Have you ever been to a Household Hazardous Waste **(HHW)** Collection Event? __Yes __No

5. Did you know that **A.B.O.P.** Antifreeze, Batteries, Oil, and Latex Paint locations and mobile **HHW** Collection Events provide safe havens for the disposal of pollutants? __Yes __No

6. If you have a lawn or garden, where do you (or your gardener) dispose of the green waste (grass, clippings or other)? **(Check all that apply)**

   ☐Trash/garbage ☐Compost/Mulch pile ☐Take to compost facility
   ☐Leave on lawn ☐Removed by gardener ☐Other:_____

7. Where is the best location to wash your vehicles?
   (Check only one)

   ☐Pavement (driveway, street) ☐Dirt Area
   ☐Lawn or Grass ☐Other_____

8. Do you change the motor oil in your vehicle yourself? __Yes __No

   If **Yes**, where do you dispose of it? **(Check all that apply)**

   __in the garbage __at a curbside collection program
   __down the storm drain __collection center (Jiffy Lube, Kragen, etc.)
   __pour it on the ground __Other_____

9. If you have a pet, how often do you pick up after your pet?
   9. a) in your yard? 9. b) when you walk the pet?

   ☐Always ☐Sometimes ☐Never ☐Always ☐Sometimes ☐Never

10. Do you think, anything ,other than rainwater, that flows into the storm drains (i.e., trash, chemicals, pet waste, etc.) considered a pollutant? __Yes __No

11. Have you seen or heard the slogans "Only Rain Down the Drain" or "Only Rain Down the Storm Drain"?
    __Yes __No If yes, where? __Radio __Newspaper __ Flier __Billboard __Street Fair, Festival, etc.

12. Are there State laws and local ordinances which STRICTLY PROHIBIT the dumping of pollutants **(EVERYTHING, EXCEPT RAIN WATER)** into the storm drain systems or waterways? ___Yes ___No

13. After this booth visit, have you increased your understanding of storm drain pollution prevention? __Yes __No

Thank you for your time and input... Remember, YOU can do your part by calling our Toll Free Line (1-800-506-2555) to report illegal storm drain pollutant disposal anywhere in Riverside County, or to get more information about storm drain pollution protection to help promote "ONLY RAIN DOWN THE STORM DRAIN".

Figure 7. Revised "Short" Survey Utilized at Public Outreach Events

DO YOU KNOW HOW TO PROTECT OUR STREAMS, RIVERS and LAKES?

City_____ Zip Code_____ Age_____ Sex □ F □ M Date: _____

1) Water that leaves your lawn from **Irrigation (water sprinklers), Car washing** and **Rain** flows down streets and/or storm drains and then directly to…

☐ Sewage Treatment Plants ☐ Streams, rivers & lakes

2) Which of the following can LEGALLY be disposed into the storm drain? (*Circle all that apply*)

- **Useable Household Chemicals**
- **Yard waste/clippings/leaves**
- **Paint**
- **Cigarette butts**
- **Empty Household Chemicals containers**
- **Pet Waste**
- **Motor Oil / antifreeze**
- **None of these**

3) Do you feel you are well informed and aware of illegal dumping into the storm drain and its impact in your community or streams, rivers and lakes?

☐ Yes ☐ No

HOW DID YOU DO?

1) Water that leaves your lawn from irrigation, washing your car, or rainwater runoff can pickup motor oil and grease from vehicles, excess fertilizer from your lawn, bacteria from pet waste, and excess pesticides from your yard. These pollutants can be carried down streets and storm drains directly to our streams, lakes, and rivers without treatment! That is why we must take care to properly dispose of waste, maintain our vehicles, and use fertilizers, pesticides and other chemicals only as specified on their labels.

2) It is illegal to dispose of any chemical, constituent or waste into a storm drain! Report illegal disposal of chemicals, constituents, or waste to storm drains at **1(800) 506-2555.** You may properly dispose of many of the wastes listed above by doing the following things:

- **Usable and empty household chemicals, paint, motor oil** – Properly dispose these at Household Hazardous Waste and/or Antifreeze, Batteries, Oil and Paint disposal facilities and events. Call **1 (800) 506-2555** for information on disposal locations and special drop off events near you.
- **Pet waste** – Carefully pick up and dispose in the nearest trash receptacle.
- **Grass, clippings, leaves and yard waste** – Collect and dispose in green waste bins or composting areas that are designed to prevent the compost from mixing with excess irrigation water and/or rainwater runoff.

3) Would you like to learn more about protecting our streams, rivers and lakes or wish to report on a illegal storm drain disposal in your area or request a classroom or group demonstration……

Visit www.rcflood.org or call 1 (800) 506-2555.

ONLY RAIN DOWN THE STORM DRAIN

Remember…Only Rain Down the Storm Drain!

Results have been tabulated for all of the "Long" surveys received and they have been analyzed to determine trends in public awareness. The "Short" survey has been used at two events to date, one of which was quite recent and its results have not yet been tabulated. Using the "Long" survey results, nine questions were used to assess any trends in public awareness. The remaining questions were determined to be either confusing or not applicable to the intent of the assessment. The results of this assessment of survey results are shown in Figure 8.

Figure 8. Assessment of Survey Results (2005-06 vs. 2006-07)

The results shown in the chart in Figure 8 are percent of survey takers that responded as described below:

- Assessment 1: Percent of respondents that understood that storm drains do not go to treatment plants.
- Assessment 2: Percent of respondents that understood that sewer lines go to treatment plants.
- Assessment 3: Percent of respondents that understood that sanitary sewers and storm drains are separate systems.
- Assessment 4: Percent of respondents that had attended a Household Hazardous Waste collection event.
- Assessment 5: Percent of respondents that understood that the best place to wash a car is on the lawn or grass.
- Assessment 6: Percent of respondents that change their own oil that reported that they properly dispose of it.
- Assessment 7: Percent of respondents that have heard of the "Only Rain Down the Storm Drain" program.
- Assessment 8: Percent of respondents that dumping of anything except storm water is a violation of laws and ordinances.
- Assessment 9: Percent of respondents that felt that visiting the Outreach Booth at the event increased their understanding of storm drain Pollution Prevention.

Although implementation of the "Long" survey was limited before it was modified to its current form, the results available do indicate an increase in understanding of these basic principles and can be attributed to the effectiveness of the Permittee's Public Education program. As additional survey results are collected and tabulated, further analysis will be performed to ensure the ongoing effectiveness of the program.

6.3.4 Proposed Revisions

To better address residential sources of pesticides, the Permittees are proposing to coordinate with the University of California Extension Program to enhance the implementation of the U.C. Extension's Master Gardener program in the Santa Margarita Region. Along with information regarding use of drought tolerant landscaping techniques and appropriate methods of fertilizer and irrigation application, the U.C. Master Gardeners also provide residents with information on integrated pest management techniques that minimize pesticide application. The Permittees are proposing to establish an agreement with the U.C. Extension's Master Gardener program in fiscal year 2010-2011 to support master gardener hotline staffing, local presentation and other outreach by the U.C. Master Gardeners.

In addition, through the Permittee's ongoing efforts to internally assess the efficiency and efficacy of their MS4 compliance programs, it was determined that an overhaul of the District's web site was needed. The District's web site contains the public education web site and a technical resource site with the various compliance documents for the program. It was found that information available through the site was often difficult to find and was not user friendly and sometimes was out of date. The Permittees are now reviewing this site to identify and implement needed changes

6.4 Receiving Water Monitoring Program

6.4.1 Summary

A Summary of the Monitoring Program is contained in Appendix G of the Watershed Monitoring Report.

6.4.2 Monitoring Program Accomplishments and Programmatic Improvements

The Monitoring Program accomplished the following goals during the term of the 2004 MS4 Permit:

- Subcontracted monitoring data collection and analysis to MACTEC, Inc. to enhance data collection and reporting capabilities.
- Developed and implemented a Triad Monitoring Program (bioassessment, Toxicity and chemical monitoring) consistent with the goals of the SMC Model Monitoring Program
- Developed watershed boundaries and land use information for all monitoring stations
- Updated the format and technical content of the monitoring Annual Report
- Added fire map information to assist with assessing potential Pollutant sources
- Enhanced monitoring data databases to be compatible with SCCWRP/SMC standard reporting protocols.
- Enhanced monitoring methods to incorporate use of automatic sampling equipment where appropriate

- Conducted several Toxicity Identification Evaluations that led to the identification of pyrethroid pesticides as a cause of wet weather Toxicity in Murrieta and Temecula Creeks and a Toxicity Reduction Evaluation that identified additional BMPs necessary to control sources of pyrethroid pesticides.
- Coordination with the CASQA Pesticide Committee on comments and presentations to California Department of Pesticide Regulation, UC Riverside and others regarding the impacts of pyrethroid pesticides and the need to change regulatory requirements regarding the use of pyrethroid pesticides.
- Participation in or coordination of several BMP studies, including coordination of new development BMP treatment studies (as required by conditions of approval) and the District's LID BMP Demonstration and Testing Facility.
- Continued to update and enhance the Consolidated Monitoring Program to incorporate new monitoring collection methods and data analysis protocols.

6.4.2.1 Participation in Regional Monitoring Efforts

- Participation in the monitoring programs to support development of the Santa Margarita Lagoon TMDL.
- Continued participation in regional and statewide Monitoring and Science efforts such as the Southern California Monitoring Committee to develop:
  - Lab inter-calibration of chemical, bioassessment and Toxicity testing methods
  - Testing methods for bioassessment and Toxicity in Southern California streams
  - Bacterial Reference Watershed Study
  - A storm water research needs report for southern California
- Partnered with SCCWRP on developing hydromodification guidance for Southern California including participation in a series of hydromodification workshops for a CASQA conference.
- Coordination with SCCWRP on the development of the Regional Watershed Monitoring Program for Southern California.

6.4.3 Effectiveness Assessment

The Watershed Monitoring Program was evaluated as part of the Regional Board audits in 2007-2008. As a result of those audits several enhancements were made to the monitoring program, including update of constituent lists, subcontracting of data collection to a monitoring consultant with automatic sampling capabilities, and updates to the Consolidated Monitoring Program and Monitoring Annual Report formats. The Permittees believe that as a result of these changes, the overall monitoring program is effective. However, the revisions presented in section 6.4.4 are recommended to increase monitoring data utility or overall program effectiveness.

6.4.4 Proposed Revisions to Monitoring Program

In updating the Monitoring and Reporting Program, the Permittees request that Regional Board staff meet with them to discuss the following proposed modifications to the monitoring program:

6.4.4.1 Revise Dry Weather Monitoring Program

As noted in Section G.7 (Special Studies) of Appendix G of the FY 2007-2008 Watershed Monitoring Annual Report, the Permittees participated in a SMC Study to develop a regional approach to watershed assessment. The Permittees, in conjunction with Regional Board staff, committed to participating in the resulting watershed monitoring program. The Permittees agreed to monitor three rotating dry weather stations identified for the Santa Margarita Region. Additionally, three stations are to be collected by Regional Board (or SCCWRP staff) using SWAMP funds, and the remaining three will be located in the Santa Ana Watershed region of Riverside County. In exchange for the commitment to participate in the program, the Regional Board staff agreed to reduce the current dry weather monitoring requirements in the new MS4 Permit from two (2) events annually to (1) event annually for each Triad monitoring stations. This would effectively eliminate three existing dry weather samples. The Permittees recommend a meeting with Regional Board staff to discuss these options prior to the release of the draft Permit.

6.4.4.2 Clarify Analyte List

As described in Section G-8.1.5 of the 2008 Monitoring Report (Appendix G of the FY 2007/2008 Watershed Annual Report), 168 analytes have never been detected in samples collected under the current program. The Permittees request that requirements to analyze for these constituents be eliminated unless or until a reason to believe they may be present in stormwater arises.

Basin Plan Objectives are expressed in terms of total metals, while California Toxics Rule (CTR) criteria are expressed in terms of dissolved metals. Although the Permittees do not support comparison of stormwater data to CTR values, the Permit requires it. The Permittees recommend deletion of this requirement. However, if this language is to remain, in order to properly compare results for metals to both sets of objectives, both total and dissolved fractions will be analyzed by the laboratory for the following metals: arsenic, cadmium, chromium (III), chromium (VI), copper, lead, mercury, nickel, selenium, silver, and zinc.

6.4.4.3 Clarify Mobilization Criteria

The District is proposing the following amendment to the monitoring mobilization criteria based on experience and the difficulties faced collecting the first storm and the analysis of the USEPA criteria specific to the Temecula National Weather Service weather station (Consolidated Monitoring Program, Section 4.C.2):

> "Note: If the QPF indicates that more than 0.3-inch is predicted for any 6-hour period, mobilization for sampling will occur."

The District's experience over the past three years indicates that intensities greater than 0.3" in six hours are likely to produce runoff and would warrant mobilization, even on a dry watershed. Further, these mobilization criteria are consistent with EPA-833-B-92-001 guidance regarding minimum depths/durations for storm sampling.

The Permittees recommend that the Regional Board amend the MS4 Permit to reflect these Mobilization Criteria. Due to issues with stream gauges operated by the United States Geological Survey (USGS), the Permittees have concluded that preparing post-storm forensics based on USGS data is not of significant value. A simple test of comparing Quantitative Precipitation Forecast (QPF) reports with actual rainfall and the mobilization criteria should be sufficient to determine compliance with the MS4 Permit.

Mobilization criteria should also reflect practical limitations to storm water monitoring by excluding national holiday periods (Thanksgiving, Christmas, and New Year's Day in particular) and quantifying the probability and the lead time between the forecast and actual rainfall that must be met in order to mobilize.

6.4.4.4 Reduce Wet Weather Events

As was noted in the audits, the Permittees have experienced consistent difficulty collecting three storm events in the upper Santa Margarita River watershed. The Permittees also noted that the San Diego County MS4 Permit only requires the collection of samples from two wet weather events. The Permittees request that the monitoring program for Riverside County be revised to require collection of two storm events. This would not only reduce opportunities for unavoidable non-compliance, it would also be a prudent cost saving measure that would not alter the overall effectiveness of the Permittees monitoring programs.

6.4.4.5 Clarify Triad Method and Follow-up Actions

The MS4 Permit included an early draft of the Triad method envisioned by the Model Monitoring Program (MMP) developed by the SMC. The result was a misapplication of the final Triad approach envisioned by the MMP. Toxicity is currently required to be sampled for at the Triad stations during wet weather events, but not during dry weather when the bioassessments occur. According to the SMC MMP, the three components of the Triad approach (chemistry, Toxicity, and bioassessment) should be conducted at the same time. Bioassessments cannot be conducted during wet weather due to safety concerns and the planning necessary. For this reason the MMP recommends the full triad for dry weather and only chemistry and Toxicity for wet weather.

In an effort to be proactive and supportive of good science, the Permittees have taken the following actions to ensure proper application of the Triad approach:

- Beginning with the 2007-2008 season, Toxicity sampling will be conducted during dry weather, at the same time as the bioassessments and dry weather chemistry sampling events are conducted. Thus, the full Triad approach will be conducted during dry weather. Wet weather monitoring will focus on Toxicity and chemistry. This action will modify the current program to be consistent with the MMP approach.
- The 2006-2007 Annual Report established the framework for proper application of the Triad method (full triad for dry weather, chemistry and Toxicity only for wet weather) by adding new tables (G-21 through G-27), in anticipation of properly applying the Triad method in the 2007-2008 Annual Report.

The Permittees further recommend clarifying the definitions of "persistent", "consistent", and "magnitude" as used in the MS4 Permit to be consistent with the intent of the MMP. In addition, the MS4 Permit inappropriately limits Triad analysis by defining a "fair" Index of Biological Integrity scores as automatically indicative of benthic alteration. This limitation needs to be corrected to prevent Permittee

resources from being inappropriately diverted to expensive source assessment studies. The MMP (and the SMC) envision that watersheds will be prioritized for follow up action based on their relative quality to one another. The envisioned analysis would compare watersheds from throughout southern California. The Permittees support this coordinated and comprehensive approach to addressing water quality.

6.4.4.6 Recognize Limitations of Laboratory Analysis of Bacteria

Babcock Labs prefers to accept bacteria samples between the hours of 7:00 a.m. and 4:00 p.m. during normal business days, and 9:00 a.m. and 12:00 p.m. on weekends. Although Babcock will accept bacteria samples outside those hours, acceptance is contingent upon payment of substantial overtime rates to ensure laboratory staff availability to receive and analyze the samples.

The timing of bacteria sample collection, particularly within the context of automatic sampling, will require consideration of the sample's four-hour holding time and available laboratory receiving hours. The Permittees request that the Permit be modified to only require collection of bacteria samples such that they can be delivered during the regular working hours of the lab to avoid excessive laboratory costs.

6.4.4.7 Participate in a Watershed Based TMDL for the Santa Margarita Lagoon

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon Watershed-Based TMDL has been withdrawn. As described in section 3.4, these economic conditions are also impacting the Permittee's funding sources and they are struggling to maintain resources to fund existing compliance programs. The Permittees currently cannot support additional expenditures associated with assisting in funding a watershed-based TMDL effort. However, the Permittees are agreeable to discussing a re-prioritization of compliance activities in order to reallocate existing Permittee resources for this purpose. For example, where current MS4 Permit compliance programs elements are not measurably enhancing attainment of Water Quality Standards, the Permittees would consider reduction or elimination of those requirements to support reallocation of the associated funding to the development of the watershed based TMDL. Program elements that may be considered for discussion include:

- Toxicity/Pyrethroid Monitoring – Under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) local regulation of pesticides, including pyrethroid pesticides is pre-empted. The Permittees are expending significant resources at the State and Federal level to facilitate regulatory changes in the allowable uses of pyrethroid pesticides, which have been implicated in causing toxicity in receiving waters throughout California. The Permittees have also recognized pyrethroid pesticides as a Pollutant of Concern for the upper Santa Margarita River watershed. The Permittees believe that public education and outreach regarding use and more stringent regulation/management of pesticides, including pyrethroid pesticides, represents the most effective means of controlling pesticides in Urban Runoff. However, continued Toxicity tests, Toxicity Identification Evaluations, and direct monitoring for pyrethroid pesticides are not likely to enhance the Permittee's ability to reduce/eliminate pyrethroid pesticides in Receiving Waters. Greater Receiving Water quality benefits may be realized by reallocating the resources currently allocated to these activities to the development of the watershed-based TMDL.
- Reduction in General Monitoring Requirements – The Permittees continue to expend significant resources on Receiving Water and outfall monitoring and the benefits of these monitoring activities are limited. Further, these costs have more than doubled over the term of the 2004 MS4

Permit due to audit findings recommending the implementation of automatic sampling equipment. Revised MS4 Permit requirements that provide for a simplified monitoring program may allow cost savings to be reallocated from data collection and processing to development of the watershed-based TMDL.

- Watershed/Individual Annual Reporting – The current Annual Reporting requirements are time, labor and cost-intensive exercises. Revised MS4 Permit requirements that provide for a simplified Annual Report requirements would not necessarily produce substantial cost savings (because is the reports are typically produced in-house); however, they would free up staff resources to assist with TMDL development.
- IC/ID Monitoring – Although the Permittees support regular visual inspection of MS4 facilities to identify IC/IDs, field measurements and sampling has not proven to be effective for this purpose. Although sampling of identified IC/IDs for later enforcement purposes may be appropriate, IC/IDs that have been identified and eliminated in the Santa Margarita Region typically result from visual observations and subsequent follow-up efforts by Permittee staff, not field measurements and water quality samples. Revised MS4 Permit requirements that provide for visual inspections of MS4 facilities to identify IC/IDs may yield cost savings that could be reallocated to development of the watershed-based TMDL.

There may be additional opportunities for modification of MS4 Permit requirements to focus the expenditure of Permittee funds on those activities that are most effective at protecting Receiving Water quality. Although the resources available for Permittee compliance activities are finite, the Permittees are supportive of modifications to the MS4 Permit that, while working within available funding limitations, enhance their ability to protect and enhance the quality of Receiving Waters.

7.0 Evaluation and Recommendations for Individual SWMP Programs

The Riverside County DAMP is a programmatic document developed by the Permittees in the Santa Ana and Santa Margarita Regions. It outlines the major programs and policies that the Permittees individually and/or collectively implement to manage Urban Runoff for the protection of Receiving Waters in Western Riverside County, including the Santa Margarita Region. The Riverside County DAMP provides a model for the development of a Permittees' Individual SWMPs in the Santa Margarita Region.

The Permittees continue to support a uniform approach to the implementation of MS4 Permit compliance programs in order to facilitate increased transparency and understanding for residents, regulated entities, and Permittee staff. For this reason, the discussions below focus on programmatic changes to the compliance programs that are necessary to maintain the effectiveness of the model compliance programs described in the Riverside County DAMP. Upon adoption of the new MS4 Permit, the Riverside County DAMP and Individual SWMPs will be revised accordingly.

7.1 Program Management

There are typically multiple Permittee departments that are responsible for implementing the elements of the Individual SWMPs. Each Permittee has designated an NPDES Coordinator who coordinates the overall Permittee compliance programs, collects and analyzes compliance program data, develops and maintains the Individual SWMPs, compiles and submits necessary reports, coordinates with other Permittees, stakeholders and Regional Board staff, and conducts other necessary duties as assigned.

To facilitate inter-Permittee coordination and funding of regional compliance activities such as the Public Education and Monitoring programs, the Permittees have entered into an Implementation Agreement that defines the roles and responsibilities of each Permittee and assigns cost shares for regional programs defined in the agreement. The Implementation Agreement also requires each Permittee to designate an NPDES Coordinator who is also responsible for representing the Permittee's interest at Permittee coordination meetings such as the monthly Santa Ana/Santa Margarita Technical Advisory Committee.

The Permittees in the Santa Margarita and Santa Ana Regions participate in a Management Steering Committee made up of the City Managers, County Executive Officer, and the District's Chief Engineer; or their assigned alternate. Participation in the Management Steering Committee is not mandatory; however, it provides a management-level forum to address Urban Runoff management policies for the Permit Area and coordination of the review, and necessary revisions to the Riverside County DAMP and Implementation Agreement. In addition, the Management Steering Committee promotes a higher level of awareness of the MS4 Permit compliance program by each Permittee's senior management staff.

7.1.1 Accomplishments and Programmatic Improvements

Collectively, the Permittees Program Management activities have achieved:

- Development of the Riverside County DAMP, WQMP and Individual SWMPs following adoption of the 2004 MS4 Permit.
- Revised the Implementation Agreement to account for necessary program enhancements resulting from the new MS4 Permit.

- Established and held monthly meetings of a Technical Advisory Committee comprising of each Permittee's NPDES coordinator, to discuss and coordinate response to issues that arise through the ongoing implementation of the Riverside County DAMP-based programs.
- Voluntarily participate in a Management Steering Committee comprised of Permittee upper management (City Manager or equivalent) to provide a forum to discuss major policy issues related to MS4 Permit compliance program implementation. This also helps the major decision makers within each organization to stay abreast of the status of the implementation of the Riverside County DAMP and aware of upcoming issues and approaches taken by other Permittees.
- Enhanced enforcement and compliance elements of the Riverside County DAMP.
- Developed the Integrated Regional Watershed Management Plan (IRWMP) for the Upper Santa Margarita Watershed.
- Continued progress with the Bureau of Reclamation, San Diego County and other stakeholders on a uniform watershed plan and model for the Santa Margarita River watershed.

7.1.2 Recommended Revisions and Enhancements to Program Management Efforts

7.1.2.1 Assessment Metrics and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the impact of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP following adoption of the new MS4 Permit. These planned changes are further described in Section 6.1.2.1 of this ROWD. The Permittees also recommend streamlining of the reporting forms to focus on the revised Program Effectiveness Assessments.

7.1.2.2 Revised Reporting Format

As a result of continued program effectiveness assessment, following adoption of the new MS4 Permit, the Permittees will update annual reporting forms to incorporate specific reporting requirements for the effectiveness assessment metrics and to remove inappropriate, outdated, or ineffective reporting requirements.

7.2 Development Planning

This program element links each Permittee's General Plan, environmental review process, and development approval and permitting processes to the later phases of detailed design, construction and operation. The development approval and permitting processes carries forth project-specific requirements in the form of conditions of approval, project plans, and design specifications that support tracking, inspection, and enforcement actions.

7.2.1 Development Planning Program Element Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit, the development planning program accomplishments and programmatic improvements included:

- Developed the WQMP to address post construction stormwater runoff quality for New and Significant Re-Development Projects.
- Development of a FAQ for WQMP projects to assist with implementing the WQMP program.
- Developed and subsequently enhanced a BMP design guidance manual to standardize the construction of post construction BMPs.
- Participation in the SMC efforts to develop a LID manual.
- Participation in SCCWRP's hydromodification studies to develop scientifically based hydromodification design guidance for Southern California.
- Enhanced online watershed maps to assist developers and the public with identifying areas tributary to Impaired Waterbodies.
- Adopted and implemented a MSHCP to ensure the regional-scale protection of habitat and natural resources in the approval process for New Developments.

7.2.2 Proposed Revisions to the Development Planning Program Element

7.2.2.1 Low Impact Development

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to (1) better incorporate LID design concepts, and (2) incorporate guidance to describe how developments can offset Treatment Control and hydromodification impacts with LID concepts including infiltration, evapo-transpiration, reuse, and onsite stormwater management. These revisions will follow the completion of the SMC LID BMP Manual and SCCWRPs Hydromodification Study. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.2 Hydromodification

As committed to in the 2004 WQMP (now Appendix O to the Riverside County DAMP), the Permittees have developed numeric guidance for hydromodification and are now working with SCCWRP to develop enhanced hydromodification guidance for Southern California. The Permittees will use the completed guidance to update the WQMP, BMP Design Handbook and other guidance as necessary to effectively mitigate hydromodification impacts. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.3 BMP Design Criteria

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to incorporate additional design guidance to clarify those Treatment Control BMPs that are effective at removing sediment-bound pesticides such as pyrethroid pesticides (consistent with the recommendations of the Toxicity Reduction Evaluation contained in Appendix D.

7.2.2.4 TMDLs

The Permittees will revise the DAMP to identify and include BMPs that are necessary to mitigate the impacts of Urban Runoff on Impaired Waterbodies.

7.2.2.5 Roads

The Permittees believe that standard WQMP requirements for public works road projects create potential avenues for unavoidable non-compliance. The Permittees would like to review this priority development category with Regional Board Staff to develop a better system to manage public works road projects.

7.2.2.6 Inspect and Verify Maintenance of Post Construction Treatment Control BMPs to Ensure Ongoing Effectiveness

As economic conditions allow, the Permittees propose to implement the following approach to inspect and/or verify maintenance of Treatment Control BMPs implemented on Priority Development Projects to ensure their ongoing effectiveness. The development of the program described below will require the Permittee resources that are unavailable in the current economic climate, particularly considering that it would likely require the Permittees to abandon the CAP in lieu of a local Permittee inspection program. The resources that will be required to ramp up new inspection programs are unavailable and may not become available during the term of the new MS4 Permit; however when the economy recovers sufficiently the Permittees propose to implement the program described below.

Integrated Management Practice (IMP) Exemption:

For the purposes of this program, IMPs include BMPs that are landscape based or otherwise serve an additional purpose other than Treatment Control. IMPs will be exempted from Inspection and Maintenance Tracking / Certification requirements if solely through the regular maintenance of the feature's secondary (non-treatment) functions and with Permittee concurrence, it can reasonably be expected that the treatment efficacy of the IMP will be ensured in perpetuity. An example that may satisfy this exemption would be a grassy swale that is mowed as part of regular landscape maintenance, whereas a BMP with a media filter which requires periodic resetting or replacement to maintain treatment effectiveness would not be exempted.

Priority Development projects will be exempted from all Treatment Control BMP Inspection and Maintenance Tracking / Certification requirements if they completely meet their Treatment Control requirements by implementing only IMPs that meet these criteria.

Priority Industrial and Commercial

The following requirements will apply to new priority Commercial and Industrial developments subject to the Permit's Commercial and Industrial business inspection requirements.

- Inspection

  Sites will be inspected per the Individual SWMPs current inspection frequency requirements that are based on the potential of the site to contribute to water quality impairments. At these inspections, in addition to the normal inspection requirements, all Treatment Control BMPs at the site will be inspected. In other words, all Treatment Control BMPs at high-priority facilities will be inspected annually; Treatment Control BMPs at medium-priority facilities will inspected biennially and Treatment Control BMPs at low-priority facilities will be inspected once during the term of the MS4 Permit. Improperly maintained BMPs may subject the maintenance entity to license suspension or administrative citations.

- Proof of Maintenance

  Maintenance records demonstrating compliance with the O&M procedures in the WQMP must be available for review at the time of the inspection. Failure to demonstrate that the BMPs have been maintained appropriately may result in license suspension or other enforcement actions.

Other Priority Developments

The following requirements will apply to new priority residential developments and businesses not otherwise subject to the Permit's Commercial and Industrial business inspection requirements.

- Proof of Maintenance and Self Certification

  The maintenance entity identified in the WQMP will be required to submit maintenance records including a signed certification to the Co-Permittee. The frequency of these submittals will be based on the relative maintenance requirements of the Treatment Control BMPs implemented on that site. BMPs will be categorized into groups as having High, Medium or Low maintenance requirements. If a WQMP project utilizes high-maintenance Treatment Control BMPs it will be categorized as a High-priority residential development, etc. High-Priority residential developments will be required to submit records annually, Medium – biennially, and Low – once every five years. Failure to report will result in administrative citations against the maintenance entity.

Permittee Projects and Permittee Maintained Treatment Control BMPs

This requirement will be included as part of the existing Permittee facility inspection program and inspected per the frequency requirements specified in the Riverside County DAMP.

7.3 Private Development Construction Activities

The Permittees have reviewed their ordinances to ensure that they are adequate to control discharges to the MS4 from construction sites to the MEP. For construction projects that will disturb one acre or more, the Permittees require proof of compliance with the General Permit-Construction prior to issuance of building/grading permits (a copy of the Notice of Intent filed with the State Board). Each of the Co-Permittees provides training for their construction inspectors regarding the proper installation and

maintenance of erosion and sediment control BMPs. Education and outreach to the building industry (developers, construction contractors, engineering firms, etc.) regarding managing discharges from construction sites is also incorporated into the "**Only Rain Down the Storm Drain** Pollution Prevention Program," the Permittees' area-wide public education and outreach program.

7.3.1 Private Development Construction Activities Program Element Accomplishments and Programmatic Improvements

- The Permittees annually distribute construction activities posters to construction sites as part of construction outreach program.
- A standardized construction activity reporting spreadsheet was developed for the Annual Reports.
- The construction inspection forms were updated.
- The Co-Permittees developed and maintained inventory databases of construction sites 1-acre or larger for which they have issued a building or grading permit.
- Prioritized inspections to help target construction activities that present the highest risk to water quality.

Highlights
Conducted over **17,000** construction site inspections
Initiated over **3,800** enforcement actions to gain compliance
626 attendees to NPDES Construction training

7.3.2 Proposed Revisions to the Private Development Construction Activities Program Element

The Permittees are not proposing revisions to their existing construction inspection programs at this time. As previously described, the Permittees expect that development activity will be greatly reduced during the term of the new MS4 Permit. Regional Board staff has however raised the issue of abandoned construction sites. Regulation of abandoned construction sites has proven challenging due to bankruptcy of project proponents, non-responsiveness or inability to locate underlying investment banks that actually own the developments, and the practical limitations encountered by the Permittees in calling bonds. As the Regional Board has enforcement capabilities that often surpass those of the Permittees, to ensure that this issue is effectively addressed the Permittees ask for the close cooperation and support of the Regional Board. Nonetheless, the Permittees are committed to continuing the use of their IC/ID programs, code enforcement tools, and other ordinance authorities to control, to the extent allowable under law, abandoned parcels that are not properly stabilized.

7.4 Existing Development – Permittee Facilities and Activities

The Municipal Facilities Strategy which has been consolidated into Section 5 of the Riverside County DAMP provides guidance for identifying potential storm water Pollutant sources and for selecting appropriate BMPs for implementation at identified facilities of concern owned and operated by the Permittees. The Permittees are implementing the provisions of the Municipal Facilities Strategy within their respective jurisdictions via processes described in their Individual SWMPs. To assist the Permittees in implementing this program, training focused on storm water regulatory requirements and BMPs related

to Permittee maintenance facilities and roadway maintenance activities were conducted twice annually during the 2004 MS4 Permit term.

7.4.1 Permittee Facilities and Activities Program Element Accomplishments and Programmatic Improvements

- The District coordinated preparation of GIS-based maps for Permittee MS4 facilities. The MS4 maps are updated annually with new information provided by the Permittees as part of the Annual Reporting process.
- Development of a GIS Browser that allows interested parties to view MS4 Facilities from the District's website.
- Updated Model Facilities Pollution Prevention Plan for Permittee facilities not requiring coverage under the Industrial General Permit.

Highlights
900 attendees to Municipal NPDES training

7.4.2 Proposed Revisions to Permittee Facilities and Activities Program Element

7.4.2.1 FPPP Guidance

The Permittees commit to developing a revised WQMP template for Permittee projects that better facilitates translation of WQMP BMP requirements into Facility Pollution Prevention Plans, where appropriate.

7.4.2.2 Integrated Pest Management

The Permittees commit to including Ecowise's standardized language for contracted pesticide management services in Permittee pesticide management contracts.

7.5 Commercial and Industrial Sources

The Principal Permittee and the County have implemented the CAP through which the County Department of Environmental Health makes use of existing inspection programs to address storm water compliance survey/inspections of restaurants and facilities that must secure a hazardous materials permit for either storing, handling or generating hazardous materials. As the responsible Certified Unified Program Agency in Riverside County, the County Department of Environmental Health is responsible for regularly inspecting all sites within the County that handle hazardous waste. The CAP is implemented in those cities and unincorporated areas that do not maintain an individual industrial/commercial inspection program through other mechanisms such as POTW waste pre-treatment programs or business license inspection programs.

Revisions to the inspection program requirements contained within the 2004 MS4 Permit expanded the scope of the overall commercial/industrial inspection program beyond the ability of the CAP to address. Each Co-Permittee now implements a supplemental inspection program for facilities not covered by the CAP. In addition, the 2004 MS4 Permit required inventories/databases of facilities, prioritization of

industrial and commercial sources relative to the potential to impact water quality, and specified inspection frequencies based upon facility priority.

The revised industrial and commercial sources program continues to have both regional and local jurisdiction components. Although the overall industrial/commercial inspection program has grown beyond the CAP, the CAP still addresses most of the facilities identified in the 2004 MS4 Permit. With its low overhead cost, it remains a cost effective approach to mitigating the impacts of industrial and commercial facilities on the MS4 and Receiving Waters.

7.5.1 Commercial and Industrial Program Element Accomplishments and Programmatic Improvements

- Reviewed and updated several educational brochures for distribution to inspected facilities.
- Developed outreach posters for gas and automotive service stations.
- Developed standardized inspection reporting forms for Annual Reports.
- Updated food service surveys.
- Extended the agreement with the County's Department of Environmental Health executed in 1999 for the area-wide CAP for the inspection of commercial and industrial facilities through June 30, 2009.
- Created Permittee databases for the inspected commercial and industrial facilities.
- Revised the Riverside County DAMP to reflect development of the industrial and commercial facility database that contains the following information: facility name, address, city, zip code, and Standard Industrial Classification (SIC) codes.
- Provided public education information regarding NPDES storm water permits to any new businesses listed in the Press Enterprise.

Highlights
3,974 inspections of Industrial and Commercial facilities
Over **1000** enforcement actions taken
426 attendees to Municipal NPDES training

7.5.2 Proposed Revisions to Commercial and Industrial Sources Program Element

The expected future expansion of the Commercial and Industrial Inspection Program to address Treatment Control BMPs as described in Section 7.2.2.6 would likely result in an expansion of the CAP that is beyond the ability of Environmental Health staff to accommodate and still achieve their own mandated inspection requirements. The Permittees are therefore proposing to amend the Riverside County DAMP and Individual SWMPs to recognize not only the CAP inspection program but also Permittee specific alternative programs that may develop during the term of the next MS4 Permit.

7.6 Residential Sources

The residential program focuses on educating residents about activities that can potentially contribute to beneficial use impairment. The residential program outreach is focused on Pollutants of Concern. The residential program is primarily implemented through the Regional Public Education Program; however, each Permittee typically conducts additional outreach. In those cases where residential Illegal Discharges are identified, appropriate code enforcement actions are also taken.

7.6.1 Accomplishments and Programmatic Improvements

The residential program achieved the following accomplishments during the term of the 2004 MS4 Permit:

- Developed several new outreach brochures and tools to promote changes in knowledge and behavior regarding activities that potentially generated Pollutants of Concern including landscape and gardening brochure, spray bottles with non-toxic pest control or cleaner recipes, septic system management brochure, updated outdoor activities brochure, and pet waste brochure.
- Implemented billboard advertising promoting "**Only Rain Down the Storm Drain**" message
- Purchased a new trailer to transport public education materials. The trailer is wrapped in graphics supporting the "**Only Rain Down the Storm Drain**" message.
- Point of Sale Outreach Programs to customers of hardware stores regarding paint, pesticides and fertilizers.
- Partnership with Valley Greeters to deliver "**Only Rain Down the Storm Drain**" information to new residents in the Santa Margarita Region.
- Promotion and participation in the annual Santa Margarita Watershed Clean Up Day.
- Continued supplemental support of the HHW/ABOP waste collection programs
- Continued update and revision of the public education information page
- Continued implementation and enhancement of school outreach programs conducted by Mission Resource Conservation District
- Reproduction and distribution of the After the Storm poster

7.6.2 Recommended Revisions

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.7 Public Education and Outreach

Although the bulk of public education and outreach activities are conducted by the District on behalf of the Permittees, the Permittees also conduct outreach activities. These activities include providing informational pamphlets at counters, conducting presentations for local businesses or developers, maintaining a stormwater page or appropriate stormwater links on their individual websites, conducting employee training programs, and attending various public events.

7.7.1 Public Education and Outreach Program Element Accomplishments and Programmatic Improvements

The Public Education and Outreach Program Element had the following accomplishments and improvements over the term of the 2004 Permit (not including those identified in Section 7.6.1):

- Use of a CEQA-style public participation process to develop the Riverside County DAMP, SWMPs, and WQMP
- Duplication and use of the USEPA construction site poster to educate construction site operators
- Distribution of stormwater outreach information to various businesses and construction sites through code enforcement, and building and grading inspectors
- Development and distribution of a automotive shop BMP poster
- Advertisements in the Business Press
- Update of the outdoor activities brochure for mobile operators

7.7.2 Recommended Changes

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.8 Elimination of Illicit Connections and Illegal Discharges

The Riverside County DAMP describes the discharge limitations and prohibitions applicable to the Permittee's MS4 (Section 4.1), procedures to be implemented when persistent exceedances of Water Quality Standards are identified (Section 4.2), responding to and reporting Illegal Discharges (Section 4.4), enforcement measures for IC/IDs (Section 4.5), measures to control litter (Section 4.6), measures to manage sanitary wastes (Section 4.7), and programs to promote collection and proper disposal of hazardous waste (Section 4.8).

7.8.1 IC/ID Program Element Accomplishments and Programmatic Improvements

- Developed Sanitary Sewer Overflow Procedures in coordination with the sanitary sewer operators in the Santa Ana and Santa Margarita Regions and implemented annual updates to Sanitary Sewer Overflow Procedures to ensure proper contact information for outside agencies.
- Established an electronic tracking system for NPDES complaints received through the toll free "Report Storm Water Pollution" hotline, OES or otherwise reported to the District.
- Enhanced public outreach regarding illegal dumping including brochures for: Outdoor Activities, Fountains & Swimming Pools, and Pet Waste, establishment of a Santa Margarita watershed Clean-Up Day and coordination with the County of Riverside Trash Task Force.

- Initiated a cooperative program with the County Environmental Health Department to promote Environmental Enhancement Projects in lieu of fines for environmental crime cases. This initiative resulted in a billboard advertising campaign and BMP posters addressing appropriate BMPs for gas stations and garages.
- Established IC/ID Monitoring Program

Highlights
1,263 potential IC/ID reports received and responded to
Over **5,500** calls received on stormwater pollution hotlines
94 IC/ID Monitoring events
5 monitoring events where field screening exceeding criteria

7.8.2 Proposed Revisions to IC/ID Program Element

The Permittees re-evaluated their existing IC/ID monitoring programs as part of this ROWD. The Permittees believe that the overall monitoring program is effective. However, the Permittees plan to revise their approach to the implementation of the Illicit Discharge monitoring program to increase monitoring data utility or overall program effectiveness.

7.8.2.1 Revise IC/ID Monitoring Program

The Permittees plan to revise their approach to the implementation of the IC/ID monitoring program. The goals of the recommended revisions are to:

- Relocate the IC/ID monitoring sites at MS4 outfalls.
- Distribute the monitoring sites throughout the Santa Margarita Region to detect Illicit Discharges closer to their source before they become excessively diluted.
- Increase efficiency and consistency in sampling resulting in enhanced data quality.
- Enhance response time to identify IC/IDs.

A model Illicit Discharge monitoring plan that accomplishes these goals is described below; a final plan will be incorporated into updated compliance documents with the new MS4 Permit.

7.8.2.2 Model Illicit Discharge Monitoring Plan

The Municipal Permittees will identify MS4 outfalls that could be used for monitoring sites based on maps of the MS4 facilities. This list of preliminary sites will be then field checked to determine the accessibility of the sites and feasibility for inclusion in the IC/ID monitoring program. Inaccessible sites or sites determined to be otherwise infeasible will be removed from the list.

Each Municipal Permittee except Menifee will then divide the list of the viable sites within their jurisdiction into groups of four. As Menifee only has one MS4, it will only monitor that one site. Each group of four sites will be monitored for a period of one year, twice during the dry season. Once all sites have been monitored for a year, sites will be repeated.

A monitoring team will be formed including one District and one Municipal Permittee staff member. The District staff will perform all monitoring/screening activities. The Municipal Permittee staff will be available to assist and will be responsible for initiating any necessary follow-up actions. This approach will provide consistency in screening and monitoring data collection and will allow the Municipal Permittee with jurisdiction over the tributary land use to be immediately aware of exceedances and initiate appropriate follow-up actions.

Appendix C
Initial Assessment Methodologies based on CASQA approach

Construction Component Effectiveness Assessments

Goals

I Ensure that all Construction Sites have applicable permits from the Permittee.

II Increase the percentage of Construction Sites that are in compliance with Permittee building and grading permits

III Place additional focus on Construction Sites during Wet Season

IV Ensure that construction inspection staff are properly trained and informed of the issues related to stormwater quality

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of active construction sites that are discovered without building/grading permits	2	Permit Term	Decreasing Trend or minimal %	Y
II	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or minimal %	N
II, III	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings **during wet season**	3	Permit Term	Decreasing Trend or minimal %	N
II	% of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower levels	N
III	% of active permitted construction sites provided wet weather reminders	2	Annually	N/A	Y
IV	% of construction inspectors receiving annual training	1	Annually	N/A	Y

020617

Development Planning Component Effectiveness Assessments

Goals

I Develop Design Guidance for Low Impact Development (LID) BMPs

III Encourage the use of LID-Based Treatment Control BMPs

IV Ensure that appropriate planning staff are trained in WQMP requirements

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Status of SMC LID BMP Design Manual	1	Within Permit Term	Completion	Y
II	% of WQMP projects that met the exemption requirements for inspection and maintenance reporting by implementing only LID-Based Treatment Control BMPs	3	Permit Term	Increasing Trend	N
III	% of applicable planning staff that attended WQMP training.	1	Annually	N/A	Y

020618

Permittee Facilities and Activities Program Effectiveness Assessments

Goals

I Ensure that Permittee Facilities have adequate BMPs implemented and that they are properly maintained
II Ensure that Channels and Inlets are kept free from trash and debris
III Encourage the use of Integrated Pest Management (IPM) on Permittee Facilities
IV Maintain an updated GIS map of the MS4 system
V Ensure the Permittee facility operators and maintenance workers are properly trained in issues related to water quality.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of facilities with appropriate BMPs identified	1	Annually	N/A	Y
I	% of Facilities provided reminders of appropriate BMPs	2	Annually	N/A	Y
I	% of annual facility inspections finding deficiencies in BMP implementation that require follow-up actions	3	Permit Term	Decreasing Trend or minimal %	Y
I	Average % of deficiencies identified in the previous year's inspections that were addressed.	3	Permit Term	Increasing Trend or high %	Y
II	Estimated Tons of Waste removed from Streets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Inlets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Open Channels	5	Annually	N/A	N
III	% of Pest Control Contracts that include language promoting or requiring IPM	1	Annually	N/A	N
IV	% of new Permittee-maintained MS4 facilities added to GIS Map	1	Annually	N/A	Y
V	% of Permittee Facility and MS4 operators and maintenance staff that attended training.	1	Annually	N/A	Y

Industrial-Commercial Facilities Program Effectiveness Assessments

Goals

I Maintain an updated and prioritized list of Industrial and Commercial Facilities

II Ensure the each Industrial and Commercial Facility has implemented BMPs that are appropriate for the activities and features at that facility

III Ensure that implemented BMPs are properly maintained to ensure their effective operation

IV Implement enforcement measures as necessary to reduce the occurance and recurrance of violations

V Ensure that inspectors are appropriately trained to identify problem areas and BMPs maintenance issues.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of new facilities added to database and prioritized	1	Annually	N/A	Y
II	% of inspected facilities with adequate Minimum BMPs in place at time of inspection	3	Permit Term	Increasing Trend or High %	N
III	% of inspected WQMP facilities subject to Post Construction Treatment Control BMP Inspection, with adequately maintained Treatment Control BMP	3	Permit Term	Increasing Trend or High %	N
IV	% of inspected High/Medium priority facilities that were subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or Low %	N
IV	% of enforced sites that are repeat offenders	3	Permit Term	Decreasing Trend or Low %	N
IV	% / Number of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower enforcement	N
V	Percent of applicable inspectors that attended training	1	Annually	N/A	Y

020620

Residential Program Effectiveness Assessments

Goals

I Raise awareness among residents of activities that may be contributing to stormwater pollution
II Increase public awareness of BMPs for residential activities
III Increase public participation in hazardous material collection events
IV Increase public involvement in keeping the watershed clean
V Encourage the use of Alternative Pest Control Methods

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Number of outreach events to Schools	1	Annually	N/A	N
II	Number and type of educational materials distributed that target residential activities	1	Annually	N/A	Y
I, II	Results of Public Ed Surveys	2	Permit Term	Increasing or high level of Knowledge	Y
III	Gallons of Used Oil Collected through Used Oil Block Cycle Grant	4	Annually	N/A	Y
III	Total Pounds collected at HHW/ABOP events	4	Annually	N/A	Y
III	Total Number of participants at HHW/ABOP events	3	Annually	Increasing Trend	Y
IV	Pounds of trash removed through Watershed Cleanup Events	4	Annually (as events occur)	NA	N
V	Number of Home Improvement stores provided outreach and customer educational information for pesticide use	2	Annually	Increasing Trend	Y

020621

Detection and Elimination of Illicit Discharges and Connections Effectiveness Assessments

I Revise and enhance IC/ID Monitoring Program
II Reduce the occurance of Illicit Connections and Discharges
III Increase public reporting of improper disposal into MS4
IV Ensure the IC/ID reports are reviewed and responded to in a timely manner
V Ensure the confirmed IC/ID events are eliminated as quickly as possible
VI Ensure the IC/ID response staff are trained to identify potential sources of Illicit Discharges and recommend BMPs to prevent such discharges

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Revise IC/ID Monitoring Program to screen random MS4 outfalls	1	N/A	N/A	N
II	% of IC/ID Monitoring events with sampleable flow	1	Permit Term	N/A	N
II	% of IC/ID Monitoring events that exceeded criteria and required follow-up	5	Permit Term	Decreasing Trend or low %	N
III	Number of IC/ID reports received	2	Annually	Increasing Trend	N
IV	% of IC/ID reports responded to within 1 business day of receipt	1	Annually	N/A	Y
V	% of confirmed and source-identified IC/ID incidents that required enforcement beyond verbal or written wardnings to eliminate	3	Permit Term	Decreasing Trend or minimal %	N
V	% of each type / level of enforcement	3	Permit Term	Trend toward lower levels	N
VI	% of IC/ID response staff receiving training	1	Annually	N/A	Y

Toxicity Reduction Evaluation for Pyrethroid Pesticides

Riverside County Flood Control and Water Conservation District

Riverside County – Santa Margarita Region Pyrethroid Source Identification Toxicity Reduction Evaluation

Final Phase II Report
January 2009

MACTEC
9177 Sky Park Court
San Diego, California 92123
858-278-3600 FAX 858-278-5300

Executive Summary

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the SMR Permittees to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. This report documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff.

Data gathered under this TRE was compared to data from neighboring counties. Based on available data, problems with pyrethroid-induced toxicity in urban runoff are common among municipalities in Southern California, and methods for addressing the problems are comparable.

A literature review was conducted to determine appropriate source control and treatment control BMPs for reducing the concentration and load of pyrethroids in storm water runoff. The literature source, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are summarized.

Based on the results of the literature review, BMPs are evaluated for applicability and potential effectiveness in the SMR watershed. Many of the most effective and appropriate BMPs are currently being implemented by the Permittees.

A search for pending legislation did not identify any pending legislation pertaining to pyrethroid pesticides.

The most effective strategy to prevent water quality impacts from legal pesticide uses was identified as state or federal regulatory change involving effective labeling and use restrictions. The Permittees propose a five year plan to continue, review, and enhance current activities to reduce pyrethroid-induced toxicity.

1.0 Introduction

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the County of Riverside, the City of Murrieta, the City of Temecula, and the Riverside County Flood Control and Water Conservation District (District, collectively Permittees). The Phase I Status Report (RCFCWCD, 2008) contains the work plan for Phase II and an outline of the topics in this report, as well as additional background information. This Phase II report is divided into six sections.

Section 1 describes the purpose of the TRE and provides an overview of the approach taken by the Permittees. Section 1 also contains a discussion of the regulatory framework of the TRE, a brief project background, a description of the Santa Margarita watershed, pyrethroid pesticide background and usage, and management questions and objectives.

Section 2 describes available pyrethroid and toxicity data from other counties in Southern California, and compares the data to data from Riverside County. The data and comparisons are included to demonstrate that the problems and solutions relating to pyrethroid pesticides facing the Permittees are similar to those of neighboring counties in the region.

Section 3 presents the results of the literature review conducted for this study of pesticide reduction Best Management Practices (BMPs).

Section 4 discusses potential pesticide reduction BMPs, the status of the Permittees implementation of the BMPs, and, when applicable, examples of the implementation of the BMPs in other municipalities. Section 4 also contains a table summarizing the potential BMPs, their advantages and disadvantages, and relative cost.

Section 5 discusses pending legislation relating to pyrethroid pesticides.

Section 6 presents the five-year course of action the Permittees propose to follow to reduce pyrethroid-induced toxicity in the SMR.

1.1 Purpose and Overview of Approach

The purpose of the TRE is to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. The results of Phase I of the TRE are contained in the TRE Status Report (Riverside, 2008). This Phase II report for the TRE study documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff. The goal of Phase II is to establish a course of action and develop modifications to the Permittee's Storm Water Management Plans (SWMPs) to more effectively control the sources of toxicity that were identified in Phase I of the TRE. The Permittees will incorporate the course of action and SWMP modifications into the Report of Waste Discharge (ROWD) that will be submitted to the RWQCB in January 2009.

Phase II activities included:

- A comparison of toxicity and chemistry results to data from adjacent Phase I municipal separate storm sewer system (MS4) permit areas, including San Diego County and Orange County.
- A literature review of current studies and a survey of pesticide reduction BMPs.
- A search for pending legislation regarding pyrethroid pesticides.
- Development of a proposed course of action for the Permittees.

A literature review was conducted of BMP information available from the Urban Pesticide Pollution Prevention (UP3) Project and other pesticide management programs and documents. Information on relevant BMPs was compiled and evaluated to identify potential BMPs that are available to mitigate urban sources of pyrethroids. Existing Permittee programs, such as outreach, regulation, and BMP implementation, were then evaluated for improvement opportunities.

The proposed course of action was determined with consideration of the adequacy of data collection (sufficient precipitation and runoff to collect adequate data) and pending

regulatory actions by California Department of Pesticide Regulation (DPR), and the United States Environmental Protection Agency (EPA).

Land uses in Riverside County are comparable to those in neighboring Orange County and San Diego County, and pyrethroid pesticide-induced toxicity has been observed in those counties. The Permittees are committed to identifying and addressing water quality issues with methods consistent with those used by other stakeholders in Southern California. To this end, data gathered under this TRE was compared to data from neighboring counties, and current pesticide reduction programs used by municipalities throughout California were reviewed.

Source control and treatment control BMPs were researched and evaluated for potential effectiveness in reducing pyrethroid pesticide-induced toxicity in the Santa Margarita watershed. Many of the most effective BMPs are currently implemented by the Permittees, and several have been implemented within the previous Permit term (2004-2008). A proposed five-year course of action for the Permittees was developed by combining the results of the research with the existing programs.

1.2 Regulatory Framework

At the federal level, the authority to regulate pesticide manufacture and use is assigned to the United States Environmental Protection Agency (EPA) under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). In California, pesticide use is regulated at the state level by the DPR. In the SMR, the Permittees are required under the Clean Water Act to control discharges of pollutants, including pesticides that produce water toxicity, to and from their MS4 under the National Pollutant Discharge Elimination System (NPDES).

This TRE was performed as required by Monitoring and Reporting Program (MRP) R9-2004-001.

The MRP, Section II. A. I. 4, states:

> *"When results from the chemistry, toxicity, and bioassessment monitoring…indicate urban runoff-induced degradation, Permittees shall evaluate the extent and causes of urban runoff pollution in receiving waters and prioritize management actions to eliminate or reduce sources. Toxicity Identification Evaluations (TIEs) shall be used to determine the cause of the toxicity, and Toxicity Reduction Evaluations (TREs) shall be used to identify sources and implement management actions to reduce pollutants in urban runoff causing toxicity."*

As local regulation of pesticide use is generally preempted by federal and state law, the Permitttees' authorities are limited to addressing illegal disposal of pesticides, promoting public education, setting the example for minimum pesticide use, and coordinating with the federal and state agencies to facilitate regulatory changes at the state and federal level.

1.3 Project Background

Phase I of the TRE consisted of the toxicity monitoring begun in 2004 and the Toxicity Identification Evaluations (TIE) was initiated in the spring of 2007. The Phase I Status Report (RCFCWCD, 2008) provides a full project background. Toxicity monitoring at Temecula Creek and Murrieta Creek was initiated in 2004 using EPA protocol with the following indicator species: *Ceriodaphnia dubia*, *Selenastrum capricornutum*, and *Hyalella azteca*. Toxicity testing during the 2004-2008 reporting period indicated persistent wet weather toxicity to *Hyalella* in both Temecula Creek and Murrieta Creek. Toxicity was not observed to either *Ceriodaphnia* or *Selenastrum* in any of the samples collected over the four annual reporting periods beginning in the fall of 2004.

Toxicity Identification Evaluations (TIEs) were conducted on the wet weather samples collected from Temecula Creek and Murrieta Creek beginning in April 2007, in accordance with Table 2 of the MRP. The TIEs indicated that pyrethroids were the primary source of toxicity and biological degradation in both Murrieta Creek and Temecula Creek.

As a result of the toxicity and TIEs, storm water monitoring for pyrethroids was initiated in 2007-2008. Results indicate that the pyrethroids permethrin and/or bifenthrin are present in wet weather water samples taken at Murrieta Creek and Temecula Creek.

To further assess the impacts of pyrethroid pesticides the Permittees instituted Dry Weather Toxicity Testing and direct measurement of pyrethroid pesticide concentrations in dry weather water samples during the 2007-2008 reporting period. Toxicity and pyrethroid pesticides were not detected in dry weather water samples at either Murrieta Creek or Temecula Creek.

Phase I of the TRE concluded with the Phase I Status Report. The Phase I Status Report included studies to better characterize patterns and sources of toxicity and to evaluate the hypothesis that the *Hyalella* toxicity is due to pyrethroids.

Bifenthrin and permethrin appear to be the primary toxic elements in Temecula Creek and Murrieta Creek. While bifenthrin and permethrin were applied to both agricultural and non-agricultural land uses, the major sources of pyrethroid toxicity in the SMR are non-agricultural activities. Permethrin was applied more than any other pyrethroid pesticide in the urban landscape. Bifenthrin and permethrin application rates were one and three orders of magnitude higher for structural control applications than agricultural applications in Riverside County. Structural control appears to represent 93% of the total pyrethroids use for Riverside County.

The Status Report outlined the plan for Phase II of the TRE, and this report presents the results of Phase II.

1.4 Watershed Description

The SMR encompasses approximately 750 square miles in southwestern Riverside and northern San Diego Counties (see Figure 1-1). The upper (northeast) portion of the SMR is in Riverside County with the remainder in San Diego County. The SMR is subdivided into the Temecula Creek and Murrieta Creek sub-watersheds and has an arid Mediterranean climate. Creeks in the SMR are ephemeral. Flow in Temecula Creek and in Murrieta Creek results almost exclusively from groundwater during the dry season. It is rare to find flow during dry weather at the tributary stations, and usually this flow infiltrates before reaching Temecula Creek or Murrieta Creek (2006-2007 Monitoring Annual Report). While the ephemeral streams in the SMR are technically receiving waters, the term "Receiving Waters" as used in this TRE Status Report refers exclusively to Murrieta Creek and Temecula Creek.

The Santa Margarita River is formed by the confluence of Murrieta Creek and Temecula Creek. The confluence is located in Riverside County, approximately five miles northeast of San Diego County. The Santa Margarita River flows from Riverside County into San Diego County through the community of Fallbrook and Marine Corps Base Camp Pendleton. The lower estuary and river are protected by Camp Pendleton and are much less developed than surrounding areas in Southern California. The Santa Margarita River is able to support a relative abundance of wildlife and habitats in part because of its undeveloped state.

Figure 1-1

Riverside County Santa Margarita Watershed

020633

As presented in Table 1-1, the total population in the SMR of Riverside County is significantly less than adjacent watersheds covered under similar Phase I MS4 NPDES permits.

Table 1-1

San Diego Region Populations

Jurisdiction	Population
Orange County	3,002,048
San Diego County	2,941,454
SMR/Riverside County	250,483
Unincorporated	55,291
Murrieta	97,257
Temecula	97,935

1.5 Pyrethroid Pesticide Background and Usage

A statewide compilation of the presence and effects of pyrethroid pesticides in urban surface waters, prepared in July 2008 and presented at the 2008 California Association of Stormwater Quality Agencies (CASQA) Conference, outlined the rise in pyrethroid use and its increased presence in urban waterways (Ruby, 2008). A comprehensive survey of pesticide use in Sacramento, San Diego, and Orange Counties also concluded that, as the older pesticides chlorpyrifos and diazinon have been phased out, pyrethroid pesticides have seen increased usage (Wilen, 2005). The Urban Pesticide Pollution Prevention (UP3) Project confirms that pyrethroids are the cause of toxicity in numerous California waterways, particularly in urban waterways. The UP3 Project (www.up3project.org) publishes an annual review of new scientific findings on pesticides in urban surface water (TDC, 2007). Since 2005, the reviews have consistently indicated that pyrethroid use continues to increase and that pyrethroids are found to be the cause of toxicity in urban waterways. The pyrethroid use information is confirmed by data published by the DPR.

Pyrethrins are natural insecticides that are derived from an extract of chrysanthemum flowers. Pyrethroids are synthetic versions of pyrethrins. These chemicals act on the nervous system of insects. Commercial pyrethroid pesticides often contain a synergist that works by restricting the enzymes insects use to detoxify pyrethroids. While pyrethroids have been shown to be one of the least poisonous insecticides to mammals, the effects depend on the level of exposure, the health of the animal, and the environmental circumstances.

Pyrethroids applied in urban areas enter the storm drainage system of the MS4 by surface runoff and are transported directly to receiving waters. Other potential urban sources are runoff from irrigation with reclaimed water, application overspray, and atmospheric deposition. Pyrethroids transported via the MS4, from whatever source, are considered to be non-point discharges. Agriculture, nursery, and urban/suburban uses are the main categories of sources of pyrethroids in the receiving waters of the SMR.

Outdoor structural pest control is the predominant urban use of pyrethroids in most watersheds. However, in the SMR, the acreage dedicated to agricultural land use exceeds the urban land use area by approximately 2:1. Pyrethroid insecticides are applied to a variety of crops in the SMR and California throughout the year. According to the DPR, pyrethroids are commonly used on fruit and nut trees, row crops, and in nurseries. Six of the primary pyrethroids used in California agriculture, in order of decreasing amount applied in 2003, are permethrin, esfenvalerate, lambda-cyhalothrin, cyfluthrin, bifenthrin, and cypermethrin. Therefore, agricultural sources of pyrethroids were considered.

TIE methods for pyrethroids are still being developed. Effective methods require the ability to measure low concentrations of pyrethroids, and this remains a challenge. Fortunately, the development of TIE methods for pyrethroids is progressing and moving towards standardization (San Francisco Estuary Project, 2007). TIEs are planned for storm water samples collected during 2008-2009 when toxicity is evident.

1.6 Management Questions and Objectives

This TRE is designed to confirm the toxic element observed in the samples collected in the Santa Margarita Region, identify likely sources of the toxic element, and propose mitigation measures for those sources. TIEs identified pyrethroids pesticides as the likely toxic element. As the MRP specifies that a TRE must be conducted following toxicant identification through a TIE, Phase I of the TRE focused on the pyrethroids identified as the source of toxicity in the 2007 TIEs. To support this TRE, the Permittees commissioned additional wet and dry weather toxicity testing, water column pyrethroid testing, additional TIEs to verify the persistence of pyrethroids as the toxicant. Based on the resulting information, the TRE evaluates the specific sources of toxicity and likely mitigation.

This TRE study assumes that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in neighboring counties, in particular San Diego and Orange Counties. Under this assumption, the Permittees hypothesized that pyrethroids would be detected in samples at most if not all monitoring locations, that the samples would exhibit toxicity to *Hyalella,* and that TIEs would indicate pyrethroids as the cause of the toxicity. Unlike other regions, dry weather toxicity is not expected in the SMR, as dry weather flows are supported primarily by groundwater.

Based on this assumption, this TRE was designed to provide information to help answer the following five management questions related to the toxicity:

1) Is the pyrethroid toxicity persistent in Temecula Creek and Murrieta Creek?
2) Does the toxicity occur during dry weather?
3) Are there any obvious sources of illicit discharge of pyrethroids that can be abated?
4) What are the likely sources of pyrethroid toxicity in the SMR?
5) What potential management measures are available to the Permittees to mitigate the impacts of pyrethroid pesticide application?

Answers to the first four questions are detailed in the Phase I Status Report. Briefly, toxicity is persistent in the creeks during wet weather, but is not evident in dry weather samples. No

obvious sources of illicit discharge were found. The likely primary source of pyrethroids is structural control performed by pest control operators (PCOs). The final question is addressed during Phase II and is the focus of this report.

2.0 Data Comparison

An assumption of this TRE study is that pyrethroid sources and resultant toxicity patterns in the SMR are analogous to those in similar counties, in particular neighboring San Diego and Orange Counties. To verify this assumption, it was necessary to compare data collected in SMR to data collected in other locations. As part of the 2008 CASQA pyrethroids data compilation, monitoring results were summarized from studies that investigated the presence and effects of pyrethroid pesticides in urban areas of California (Ruby, 2008). The CASQA summary listed the frequency of detection of various pyrethroid pesticides and results of toxicity testing for different indicator species. Results from various northern and Southern California locations were detailed, including results of water column studies from Orange, San Diego and Sacramento Counties.

Pyrethroids, as a class of chemicals, have an affinity for particles and they are considered to be relatively hydrophobic; they are therefore commonly found in sediments of waterways downstream of their application sites. The initial toxicity studies leading to the identification of pyrethroids as pervasive environmental contaminants in California were performed on sediment samples by Don Weston and his colleagues at the University of California, Berkeley (Weston et al., 2005; Amweg et al., 2006). Recently, improvements in analytical methods for pyrethroids in water, and modification of toxicity studies to more effectively test for pyrethroid-based toxicity in water, have lead to increasing evidence of the presence of pyrethroids in water column samples, and toxic effects in the water matrix (see citations for Orange and San Diego County in Ruby, 2008).

Extensive work has been performed on the environmental presence and effects of pyrethroids in urban areas of the neighboring Orange and San Diego counties; however, much of this work has been performed on sediment samples. Although the sediment monitoring results do not correspond directly with the SMR water column test results, sediments are considered to be effective integrators of contaminants from the contributing storm water flows. The deposited sediments are produced as particles settle out from the passing water over some

period of time, and tend to accumulate until they are washed away by higher-velocity flows. Summaries of the relevant sediment study results are therefore included in the discussion that follows.

In Orange County, an ongoing study being performed by UC Davis, in conjunction with UC Riverside and the Orange County UC Cooperative Extension, has consistently found bifenthrin and permethrin in water column runoff samples from residential areas (Haver et al., 2007; Oki, personal communication). In samples from four residential sites they have detected bifenthrin in 100% of samples, with the number of samples varying from 48 to 57 per site (Oki, personal communication). In sediment samples collected in recent years from the Santa Ana Region of Orange County, bifenthrin is commonly detected (32 of 56 samples) and permethrin less frequently so (4 of 56 samples), with sediment toxicity to *Hyalella* common (39 of 54 samples tested were moderately or highly toxic; see summary in Ruby, 2008).

In a 2005 study of six Orange County residential storm drainages and seven tributary streams draining commercial/residential land uses, bifenthrin was detected in 95% of dry weather samples and 100% of wet weather samples (Budd et al., 2007). Because treatment of nursery products is mandatory to control Red Imported Fire Ants, an older DPR study, conducted in 1999-2002, found occasional detects of bifenthrin in urban runoff samples, along with frequent detects in nursery runoff from several Orange County sites.

In San Diego County, under NPDES Permit monitoring conducted since 2004, pyrethroids have been commonly detected in water samples from several receiving waters, and toxicity to *Hyalella* has been increasingly observed in water samples (see summary in Ruby, 2008). Bifenthrin was detected in 12 of 15 samples collected from 2005-2006 and 2006-2007; detection frequency was 100% in samples from Chollas Creek, Agua Hedionda, and Tecolote Creek. Toxicity to *Hyalella* was observed in 22 of 57 samples tested over the three year period, 2004-2007. In a TIE study performed on Chollas Creek samples during 2005-2006,

67% of samples were acutely toxic to *Hyalella*, and the toxicity was found to be likely due to pyrethroids.

In a 2004-2005 study performed by UC Davis and others, sediments from Switzer Creek at its outlet to San Diego Harbor were found to be highly toxic; bifenthrin and permethrin were detected at high concentrations, and a sediment TIE identified pyrethroids as the likely cause of the observed toxicity (Anderson et al., in press). As part of a statewide survey of urban waterways, sediments were tested from several receiving waters in San Diego County. All were found to be highly toxic to *Hyalella* (Holmes et al., in press).

To further compare the pyrethroid sources and toxicity patterns in the SMR to other counties, the CASQA data summary was analyzed to select the studies which reported results for the same constituents and effects identified in the SMR, specifically permethrin, bifenthrin, and toxicity to *Hyalella*. The total number of detections for the different monitoring locations was divided by the total number of samples taken at the sites to calculate the percentage of samples with detectable concentrations of pyrethroids. This normalized metric allowed for comparison of the various datasets.

While permethrin is among the more commonly-used pyrethroids, it is much less toxic to aquatic life than bifenthrin (TDC, 2007). For the purposes of this assessment, bifenthrin detection frequency and frequency of toxic effects were used as the metrics for comparison.

Comparative results for bifenthrin are summarized in Figure 2-1. Data were available for two creeks in Sacramento County and three locations in San Diego County, in addition to the data collected for SMR. Two samples were taken at the Sacramento County sampling locations. For San Diego County, each creek was sampled three times except for Chollas Creek, which was sampled six times. The SMR was sampled a total of eight times. In most cases, bifenthrin was detected in over 80% of samples. Only at Elk Grove Creek in Sacramento County was bifenthrin detected at a notably lower percentage.

Figure 2-1

Percentage of Samples with Bifenthrin Detections

Toxicity to *Hyalella* was documented in water samples from San Diego County, along with the SMR. Toxicity testing was performed on samples from seven San Diego County water bodies. The sample sets ranged from three to nine toxicity tests (Aqua Hedionda, San Dieguito River, Tijuana River, and Chollas Creek). In the SMR, a total of eight toxicity tests were performed on samples from Murrieta Creek and Temecula Creek. The results for frequency of acute toxicity from the SMR were within the range of the results for similar sites in San Diego County (see Figure 2-2).

After comparing the results from different locations, the assumption that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in similar counties appears to be valid.

Figure 2-2

Percentage of Samples with Acute Toxicity to *Hyalella*

3.0 Literature Review

A literature review was conducted during December, 2008 to determine appropriate BMPs for reducing the concentration and load of pyrethroids in storm water runoff. An initial search was made of the Urban Pollution Prevention Program (UP3) website (www.up3program.org) for potential examples of BMP strategies implemented specifically for pyrethroids. The United States Environmental Protection Agency website and the CASQA website were also reviewed for pyrethroid specific BMPs. Widespread use of pyrethroids is relatively recent, and there has been little direct evaluation of BMPs for pyrethroids. Further research was conducted on general storm water BMPs, and their potential for pyrethroid reduction was evaluated based on the design of the BMP and the chemical behavior of pyrethroids.

To identify pending legislation that may be related to pyrethroid pesticides, web searches were conducted on the websites for DPR, the California legislature, the EPA, and the Library of Congress. However, no pending legislation was identified as relevant to pyrethroid pesticides.

Table 3-1 below presents the findings of the literature review. BMPs are categorized as either source control or treatment control, and within each category they are sorted by type. The literature source, a summary of the BMP, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are provided. See Section 4 for further information about each type of BMP.

Table 3-1
Literature Review Matrix

Type of BMP	Literature Source	Summary	Ability to Reduce Toxicity Caused by Pyrethroids	Storm Water Concerns
Source Control				
Regulatory	Pesticides of Interest for Urban Surface Water Quality. Urban Pesticides Use Trends Annual Report. July 2008.	Suggests regulatory changes as a result of increased toxicity due to pyrethroid use	Potentially High	Supplementary to other BMPs, Will take years to show results
Regulatory	Improving Urban Pesticide Regulatory Activities to Protect Water Quality – Annual Update 2007. November 2007.	Discusses recent state and federal regulatory pesticide activities on an annual basis	Potentially High	Supplementary to other BMPs, Will take years to show results
Regulatory	California Department of Pesticide Regulation. http://www.cdpr.ca.gov/docs/registration/reevaluation/chemicals/pyrethroids.htm. 2007.	The reevaluation of the widespread presence of synthetic pyrethroid residues in the sediment of both agricultural and urban dominated California waterways at levels toxic to Hyalella azteca (H. azteca).	Potentially High	Supplementary to other BMPs, Will take years to show results
Integrated Pest Management (IPM)	Building Maintenance - Structural Integrated Pest Management. June 2008.	Promotes reduction in pesticide use through use of municipality IPM and hiring of PCO's trained in IPM	Potentially High	Does not eliminate all uses of pyrethroids
IPM	California Stormwater BMP Handbook. January 2003.	Promotes prevention of pesticide use through use hiring of PCOs that use IPM as an alternative	Potentially High	Does not eliminate all uses of pyrethroids
IPM	City of Santa Monica Toxics Use Reduction Program Integrated Pest Management. June 1997.	Overview of IPM program initiated by the City of Santa Monica	Potentially High	Does not eliminate all uses of pyrethroids
IPM	National Management Measures to Control Nonpoint Source Pollution from Urban Areas. November 2005.	EPA document discussing management practices to help reduce pesticide use	Potentially High	Does not eliminate all uses of pyrethroids
IPM	National Pollutant Discharge Elimination System (NPDES) Phase II BMP & Measureable Goal Examples. February 2008.	Provides examples and goals of good housekeeping BMPs	Potentially High	Does not eliminate all uses of pyrethroids
IPM	The Monterey Bay Green Gardener Program "sample curriculum". www.green-gardener.org/about. Accessed December 2008.	Informs the public and landscapers about the green gardener program and how to get involved	Potentially High	Does not eliminate all uses of pyrethroids

4.0 BMP Analysis

Based on the literature review and the findings of Phase I of the TRE, BMPs were evaluated for their applicability to the SMR. Because the toxicity appears to be principally a wet weather phenomenon, and because the Permittees' jurisdiction includes the urbanized area of the watershed, the analysis focused on BMPs designed to reduce the amount of storm water pollution caused by urban runoff.

The potentially applicable BMPs are divided into Source Control and Treatment Control BMPs and are discussed in detail below. Through the Permittee's proactive efforts to protect the quality of the receiving waters and their beneficial uses, many programs addressing these broad categories are either already in place or are actively being developed. The implementation status for each specific BMP is discussed. Examples of BMP implementation by other municipalities in the region are included as a tool for evaluating the consistency of the Permittees' program with other programs in the region.

4.1 Source Control BMPs

Source control BMPs are designed to curtail pollution at the source before it has the opportunity to enter the storm drain system and pollute waterways. They are generally the preferred type of BMP because reduction of pollution occurs at the source, before runoff has become contaminated (CASQA, 2003). The types of broad categories of source control BMPs that identified as most appropriate for the Santa Margarita watershed are: pursuing regulatory change, implementing IPM strategies including LID, and public outreach and education.

4.1.1 Regulatory Action

Status: Currently being implemented by the Permittees.

Pesticide manufacturers are required to receive approval by USEPA and California DPR for specific pesticide uses, and both agencies can impose use restrictions to prevent unwanted impacts on the environment and public health. At the federal level, a fundamental regulatory disconnect exists between pesticide approval (registration) under FIFRA and water pollution control programs under the Clean Water Act. This has resulted in a repeating pattern, in which a) pesticides are approved for use without sufficient consideration of potential environmental effects, b) water quality and other ecological impacts accrue, c) use restrictions are applied to the offending products (sometimes involving widespread bans on use), and d) new pesticides are approved for use, with subsequent environmental impacts.

In 1962 Rachel Carson published *Silent Spring*, documenting the widespread ecological consequences of pesticide applications. The federal government responded by banning the use of DDT and other organochlorine pesticides, based on extensive evidence of environmental impacts through the process of bioaccumulation. The ban has lead to dramatic recoveries in affected populations of bald eagles and other species; however, the legacy of these long-lasting pesticides near-shore dumping areas in Los Angeles County and elsewhere remains (IWS, 2007).

Eventually the organochlorine pesticides were replaced principally by organophosphate pesticides, especially in urban uses. In the mid-1990s municipal storm water monitoring programs began to document that commonly-used organophosphate pesticides, especially diazinon and chlorpyrifos, were present at toxic levels and causing toxicity to aquatic organisms, principally the common water flea, *Ceriodaphnia*. Although not bioaccumulative, diazinon and chlorpyrifos were discovered to cause widespread toxicity in urban runoff and local receiving waters (TDC, 2001). USEPA subsequently banned most urban uses of diazinon and chlorpyrifos, although EPA's main motivation involved human health effects

on the pesticide applicators, and water quality was not an important factor in those decisions. Again, the ban was also immediately effective, reflected in reduced concentrations of diazinon and chlorpyrifos in urban water samples, and fewer occurrences of organophosphate-based water column toxicity (c.f., references in Ruby, 2008 for San Diego County Municipal Copermittees Annual Urban Runoff Monitoring Reports). But pesticide manufacturers simply replaced the OP pesticides in their products with other active ingredients, principally pyrethroids. Shortly thereafter, researchers and municipal storm water programs began documenting toxic effects from the new pyrethroid products. The pyrethroid impacts were first documented in sediments, and the affected test organism shifted from *Ceriodaphnia* to the sediment-dwelling *Hyalella*.

In the cases of both organochlorine (DDT) and organophosphate (diazinon, chlorpyrifos) pesticides, federal limitations or bans on uses were effective in ameliorating the associated environmental impacts. In both cases, however, new pesticide products were approved for use that then caused related but different impacts to the environment. Therefore it is clear that the most effective strategy for preventing environmental impacts from pesticide use involves implementing an effective process of pesticide approval and registration that comprehensively accounts for and mitigates against such impacts.

For more than ten years CASQA and various other California state and local agencies have promoted better regulation of pesticides at the federal level, encouraging use restrictions as the most effective means of source control. California water quality agencies have sent comment letters to USEPA and DPR on guidance pertaining to the application of pesticides to surface waters and on recommended environmental hazard statements for residential outdoor pesticides (TDC, 2007). These efforts are beginning to show some modest signs of success. In a recent letter to stakeholders, EPA outlined an approach to provide better cooperation between the Office of Pesticide Programs (OPP) and the Office of Water (OW), to allow for “environmentally protective and scientifically defensible effects assessment judgments about contaminants that are or may be found in ambient water”. The Riverside County Permittees plan to continue their support of these efforts through ongoing

participation in the CASQA Pesticides Subcommittee, the Urban Pesticide Pollution Prevention (UP3) Project, and the Urban Pesticide Committee. The Permittees also plan to request that the RWQCB become involved in advocating for more effective pesticide regulation at the state and federal levels.

The Permittees are members of a CASQA subcommittee that addresses pesticide uses impacting stormwater discharges. Effort focuses on providing input to the USEPA and the California Department of Pesticide Regulation (DPR) to improve pesticides regulations so that they more fully protect water quality and are better aligned with the Clean Water Act and California Water Code. (RCFCWCD, 2008). CASQA has also been active in supporting DPR's ongoing reevaluation of allowable pyrethroid pesticide uses (TDC, 2007).

Increasingly, the regulatory response to the water quality impacts resulting from *legal uses of approved pesticides* has been for regional water boards to impose limitations on the allowable loadings of pesticides to impaired waters through the TMDL process. Local agencies have little or no jurisdiction over sales or use of these pesticide products, and therefore do not have the full authority needed to perform loading reductions in resulting TMDLs. An effective regulatory solution must occur at the state and federal levels, to regulate allowable pesticide uses to effectively prevent such water quality impacts.

Current legislation requires users of certain pesticides to be trained, often certified, in the use of those pesticides and to report the amounts applied (State of California, 2008). A similar regulatory approach could be used to promote pesticide alternatives, such as for PCOs to train and certify their technicians in the use of IPM methods (Quarles, 2002). The Permittees are considering supporting regulatory action by the state to include IPM training for PCOs in the requirements for certification and training on the use of pesticides.

Environmentally sensitive and flexible zoning ordinances may be adopted to facilitate the use of LID principles, thereby encouraging private developers to use LID principles (Prince Georges County, 1999). Additional land use restrictions or alternatives to present zoning

laws may help reduce urban storm water runoff, potentially reducing pyrethroid loadings in receiving waters. The Permittees plan to continue promoting LID implementation through interagency communications and cooperation.

4.1.2 Integrated Pest Management

Status: Currently being implemented by the Permittees.

IPM is "a decision-making process for managing pests that uses monitoring to determine pest injury levels, and combines biological, cultural, mechanical, physical, and chemical tools and other management practices to control pests in a safe, cost effective, and environmentally sound manner that contributes to the protection of public health" (Carlsen, 2008). IPM can further be described as an approach to solving pest problems by using information about the pest and landscape to eradicate the pest's habitat in a manner that poses the least risk to humans (Ecology Action, 2007). IPM has many different aspects that help to reduce pests and in turn cause a reduction in pesticide use, including green gardening and structurally integrated pest management (SIPM). BMPs that are typically used as part of an IPM strategy are described in the following sub-sections.

4.1.2.1 Green Gardening

Status: Not currently being implemented by the Permittees, program under consideration and will be enacted in the near future.

The Green Gardener program, implemented through landscapers, promotes environmentally responsible landscaping to reduce the use and need for pesticides. In general, education of gardening and landscape maintenance staff is beneficial for pest reduction as part of an IPM program. It provides alternative methods to landscapers, such as reducing outdoor sources of ants by elimination of their food and water sources through management of honeydew producing insects and plants associated with them (UC Davis, 2007). The Green Gardener

program encourages businesses to participate in environmentally sound landscape maintenance. Healthy landscapes are more resistant to pests (Ecology Action, 2007). Pests that do not have a suitable habitat will leave to find a more hospitable environment. When the pests leave, then there is a lessened need for pesticide applications and lower risk of pyrethroids entering storm water.

The County of Santa Barbara implemented a Green Gardener Program, in which landscapers are encouraged to take a class at the local city college, covering subjects such as IPM strategies and environmentally beneficial landscaping to obtain a "Green Gardener" card. They are then placed on the Green Gardener list, which is then promoted to the public by the County (County of Santa Barbara, 2008). The program benefits both parties; gardeners receive education and advertising at a nominal cost, and the County receives the benefit of more environmentally-friendly landscaping and a reduction in the use of pesticides. Municipalities may promote this type of program by contracting with landscaping companies that have their employees trained in green gardening practices.

Encouraged by the success of the Santa Barbara Green Gardener Program, the Monterey Bay area instituted a similar program. "The goal of the program was to educate and certify local gardeners in resource efficient and pollution prevention landscape management practices" (Ecology Action, 2007). With the support of the State of California Water Resources Control Board, more municipalities are likely to follow (Ecology Action, 2007).

4.1.2.2 Pest Control Contracting

Status: Currently partially implemented by the Permittees.

Many municipalities contract pesticide applications to professional PCOs. Contracting only with PCOs that have IPM training and certification can help realize IPM models and goals. The recently completed EcoWise Certified IPM Contracting Tool Kit (www.EcoWiseCertified.org), provides resources for municipal agencies to use in developing such a program. The EcoWise IPM Tool Kit includes:

- Elements to consider when developing an IPM policy
- Roles and responsibilities of the agency or business in an IPM program
- How to hire and work with a professional IPM service provider

The Took Kit also includes the EcoWise IPM Process along with a number of other helpful resources and sample documents.

Because PCOs are responsible for the majority of pesticides applied in urban areas, distribution of information regarding less-toxic alternatives, lower-use application techniques, and proper disposal, practices to professional applicators is an essential component of the Permitee's pesticide control effort. The Permittees currently distribute information to PCOs through the Public Outreach and Education Program (see Section 4.1.3).

The City of Palo Alto's Regional Water Quality Control Plant includes IPM requirements in their contracts with PCOs (City of Palo Alto, 2008). The City of Santa Monica, as a part of their SIPM program, specified IPM requirements in their PCO contracts (Raphael, 1997). Use of PCOs with IPM training and certification by municipalities encourages local PCOs to invest in IPM training and certification, which in turn, allows their expertise in IPM to expand beyond just the municipality itself (Quarles, 2002). Education of PCOs, hiring only PCOs that have IPM training, and contracting specifically for IPM by local agencies may

create more public awareness and reduce the use of pyrethroids in the Santa Margarita watershed.

4.1.2.3 Structurally Integrated Pest Management Program

Status: Currently being implemented by the Permittees, with additional programs under consideration.

SIPM is a program that controls the access of pests to buildings and the potential food sources within them by protecting the structure itself from pests, with minimal use of pesticides. The Permittees intend to lead by example, sharing success through public outreach programs and encouraging individuals and businesses to do the same. SIPM is a long term solution offering positive potential impacts on budget, reduction of pests and, reduction of pyrethroid pesticide use. Note that SIPM should not be confused with category of pesticide use referred to as structural pest control. SIPM is a BMP designed to reduce the use of pesticides in a structural pest control program.

The City of Santa Monica implemented an SIPM program and experienced a reduction in pests and in the use of pesticides. In addition, Santa Monica reduced pest management costs by 30% (State of California, 2008). California law requires a SIPM strategy for all state-owned buildings and schools (State of California, 2008). The three main aspects of a SIPM strategy are facility design and LID, monitoring, and facility maintenance.

<u>Facility Design</u>

Status: Currently being implemented by the Permittees.

Facility design can play a large role in the exclusion of potential pests. "A facility's planning, design, and construction provides an opportunity to incorporate features that help to exclude pests, minimize pest habitat, and promote proper sanitation" (NIH, 1999). It can also reduce

storm water runoff (NAHB, 2008). Exclusion of pests helps reduce pest infestations and in turn the need for pyrethroid pesticide use. For example, ensuring that the design holds plants and mulch several inches away from the foundation of a building may assist the reduction of ant populations immediately adjacent to the building (UC Davis, 2007). A reduction in storm water runoff may also reduce the amount of pyrethroids that enter receiving waters. Facility designs can incorporate aspects of LID, as discussed below. New development and redevelopment may incorporate designs that aid in the exclusion of pests and the reduction of urban runoff, which may contribute to a reduction of pollutant loads, including pyrethroids.

Pest Monitoring

Status: Currently in not use by the Permittees, program under consideration.

Monitoring structures and adjacent areas may help prevent pest infestations and quickly identify potential problems. Traps, visual inspections, and staff interviews assist in the identification of areas and conditions that may foster pest activity (NIH, 1999). Monitoring for ants, for example, may consist of simple inspections of facilities such as looking under sinks and along pipes and electrical wires (UC Davis, 2007). The City of Santa Monica, as a part of their SIPM, provided training to all general staff, purchasing, carpenters and custodial staff. Specific presentations were given to groups, such as the custodial staff, who learned about products used in control of ant and cockroach populations and general sanitation. The staff is trained in the identification of potential pest infestations and habitat conditions that may foster pest activity (Raphael, 1997). Early identification of pest infestations can increase the effectiveness of specific treatments and reduce the overall need for pesticide use.

Sanitation and Facility Maintenance

Status: Currently not being implemented by the Permittees, program under consideration.

Proper sanitation includes reducing clutter and pest habitat and incorporating proper facility and waste management practices. Records of maintenance and housekeeping conditions may help track pest problems and assist in the determination of whether corrective action is needed or has been taken in a timely manner (NIH, 1999). Sanitation and facility maintenance involves the housekeeping staff, the building maintenance staff, and the landscaping staff.

Improper storage of waste may affect urban runoff, and it may create a hospitable environment for pests, particularly ants. Initial, low-cost steps that municipalities may take to improve waste handling are: controlling litter, keeping waste collection areas clean, and insuring proper disposal of pyrethroid pesticide products, if used, and educating employees and the public. Simple solutions such as rinsing out soda bottles and emptying trash daily prove effective to reduce insect infestations, particularly ants (UC Davis, 2007). An important component of an SIPM monitoring program is regular inspections of solid waste containers for structural damage or leaks (CASQA, 2004).

Educating custodial staff, such as was done in the City of Santa Monica, can reduce the amount of improperly disposed pesticides (Raphael, 1997). Designating staff members to perform a daily checklist of areas around the structure to ensure cleanliness and proper storage of waste can assist the efforts to reduce potential pest infestations and leakage of hazardous waste (CASQA, 2004).

Building maintenance staff also benefit from education and acceptance of responsibility for pest management. Maintenance crews can contribute to an SIPM strategy by securing the structure, such as caulking holes and cracks, assisting in the removal of clutter, and installing

door sweeps (State of California, 2008). Caulking holes in structures can prove effective in keeping ants out of facilities (UC Davis, 2007). Upkeep on building maintenance helps reduce potential pest habitat, and thus may reduce the need for application of pyrethroid pesticides.

Reduction of pest habitat around structures may reduce pest populations in and around structures. Marin County, as part of its integrated pest management program, has reduced rat habitat around the local Civic Center and in turn has seen suppression of the rat population (Carlsen, 2008). Programs similarly tailored to ants may result in a positive effect of pest reduction within the SMR. For example, banding tree trunks with tanglefoot or similar sticky substances can keep ants away from trees (UC Davis, 2007). Education and training may be provided to Permittee landscaping crews to assist in proper vegetation removal and, when necessary, pesticide use. Landscaping crews may be informed that pyrethroid pesticides or any less toxic pesticides are to be used only when a pest problem arises to an intolerable level, that they are not administered when a wet weather event is expected and only when low wind speeds are present (CASQA, 2004). Education of landscaping crews to remove pest habitat may reduce the need for pyrethroid use thus reducing the potential risk of pyrethroids entering storm water runoff.

Also, utilizing low water using vegetation and alternative landscaping techniques such as xeriscaping or naturescaping are efforts that landscape crews can take to reduce pyrethroids in urban runoff. Landscaping crews may also help preserve the water efficiency of the landscape through properly timed fertilizing, weeding, pruning, and pest control. For example, proper collection and disposal of yard clippings can prevent loose vegetation that has possibly been treated with pyrethroid pesticides from entering waterways or storm water drainage systems such as MS4s (CASQA, 2004). Reduction in pest habitat and proper landscaping maintenance may help reduce pest problems, and thus the need for pyrethroid pesticides.

4.1.3 Public Outreach and Education

Status: Currently being implemented by the Permittees.

Public Outreach and Education programs inform the public about storm water issues, proper use and disposal of publically available chemicals, and alternatives to pyrethroid pesticides. Reaching out to the public and providing information about the dangers of pyrethroids pesticides encourages citizens to make educated decisions about pesticide use. It also may accelerate state and federal regulatory changes regarding pyrethroid use through public promotion of such changes. According to the EPA, public education and awareness can be a "key component" in any BMP program for storm water management (EPA, 2008).

The District has enacted a public outreach program to help reduce the potential for pyrethroid pesticides to contaminate receiving waters. This program has initiated: distribution of educational materials to hardware store employees, active participation and distribution of outreach for HHW/ABOP facilities to provide for free venues to dispose of excess pesticides, and distribution of EPA and CalEPA materials to the public. The District also promotes the use of less toxic pesticides, provides education on storm water issues in public schools, and has enacted a multimedia campaign to control urban sources of pyrethroid pesticides (RCFCWCD, 2005).

<u>Education and Outreach to Businesses</u>

Status: Currently being implemented by the Permittees.

Distribution of information regarding pesticides to businesses, particularly hardware stores, is crucial for reducing pyrethroid use and misuse at its source. Education on pyrethroid runoff to local hardware stores may assist local hardware store employees to educate their customers on alternative methods of pest control. An Orange County survey from 2001 found that 55% of pest control products were purchased at hardware stores (Wilen, 2001). In

2006, Riverside County had 177,562 pounds of reported non-agricultural usage of pyrethroid pesticides (RCFCWCD, 2008). Reduction in usage may lead to a reduction of pyrethroids in urban storm water runoff. Educating hardware store employees about urban water quality impacts of pyrethroid pesticides may help reduce the usage and thus the toxicity of runoff in the Santa Margarita Watershed resulting from pyrethroid use, as employees have the ability to recommend alternative methods of pest management to their customers.

Education of nursery employees about pyrethroid management and IPM techniques may also yield significant source control benefits. In general, nursery employees tend to be more knowledgeable about pesticides than employees at hardware stores (Wilen, 2001). Nurseries that use and sell pyrethroids offer the highest return on outreach resources, while those nurseries that have chosen alternate pest management methods serve as examples of IPM in practice. In a recent Riverside County survey, one nursery stated that they do not use pesticides and if their nursery does experience a pest infestation, it is treated naturally (RCFCWCD, 2008). Such nurseries are likely to encourage their clients and customers to use the same methods. Education and outreach can lead to cooperation and sharing of successful and unsuccessful methods of IPM and ultimately reduce pyrethroid pesticide use and toxicity of storm water runoff.

Businesses not in the industry of pesticide sales may also benefit from outreach. The District directs outreach efforts to all businesses; those in the business of selling or using pesticides, and those that are not. The District has coordinated with the County's Business License Department to include an educational insert of the "Only Rain Down the Storm Drain" program to new business license applicants and annual renewal reminders (CRWQCBSD, 2008). Informing companies on proper disposal of hazardous materials such as pesticides is crucial to prevent pyrethroid containers from being improperly disposed of, leaking, and then contributing to storm water pollution.

Several Southern California cities conduct general business outreach as well. Cities such as Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water

pollution relating to landscaping and gardening practices to general businesses (DCWMAC, 2007). Such information informs businesses of alternate methods of pest control beyond pesticide use and imparts knowledge about storm water quality issues. Thus, dissemination of educational materials to local businesses is intended to help reduce pyrethroid runoff by ensuring proper disposal of pesticides and encouraging alternate methods of pest control.

Educational and Outreach to the General Public

Status: Currently being implemented by the Permittees.

The District distributes educational materials within the Santa Margarita Region such as EPA sponsored pamphlets in order to promote reduced use of pyrethroid pesticides and educate the public about alternate practices of pest management. The public purchases retail pesticides and uses them, presumably, according to the manufacturer's instructions and in compliance with regulations listed on the packaging, including proper disposal of empty containers in the municipal waste stream. However, even when used properly, retail pesticides have the potential to contaminate urban runoff, and homeowners may be unaware of the downstream consequences of pesticide use. Depending on the landscaping practices in a neighborhood, promoting alternative pest management strategies and educating the public on storm water quality and pesticide use may be the most beneficial way to reduce the source of pyrethroids in urban runoff (Wilen, 2005).

The District distributes educational materials within other public outreach programs and maintains pest management information on the internet. The District also distributes brochures to educate the public on lawn and garden maintenance, fertilization, and pesticide and household chemical use (RCFCWCD, 2005). These educational materials provide public education on alternative pest control methods, limiting individual use of pyrethroids, and proper disposal of pesticide containers.

Many municipalities perform storm water outreach at festivals and public events by participating in the events and by distributing brochures. The Cities of Lawndale and Torrance plan and attend public festivals and rent booth space to educate the public about storm water quality and the use of pyrethroids (DCWMAC, 2007). Cities including Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water pollution relating to household activities and landscaping and gardening practices to the general public (DCWMAC, 2007). The District participates in events such as the Children's Groundwater Festival, the Southern California Fair, the Community Water Festival, and the Santa Margarita Watershed Clean Up (RCFCWCD, 2005). The Permittees, as well as other municipalities within California, participate in public events and distribute informative materials as a portion of their current public outreach programs.

Education on proper disposal of pesticides

Status: Currently being implemented by the Permittees.

Improper disposal of pesticides is a potential contributor to storm water contamination. Empty containers be disposed of in the municipal waste stream are not likely to contribute to storm water pollution, however, unused pesticides may enter the MS4 by leaking in transit. In Orange County in 2001, 54.5% of people surveyed claimed to have disposed of unwanted pesticides in the municipal waste stream, and 78.6% did not know the location of a household waste disposal site (Wilen, 2001). The District has created a partnership with Riverside County Waste Management to provide educational programs and materials on proper disposal of unwanted waste, including pesticide containers (RCFCWCD, 2005).

Multimedia Outreach

Status: *Currently being implemented by the Permittees.*

The EPA suggests using multiple media sources to promote and educate on storm water impacts, particularly through public service messages (EPA, 2007). Mass media has proven to be a key source of pollution prevention information for the general public (LADPW, 2002). The District currently participates in a multimedia advertising campaign including: maintaining a website that provides information, distributing mailing inserts regarding water quality issues through various county entities, and billboard advertising campaigns. Many other municipalities, such as the Cities of Palo Alto and Lawndale, also use the world wide web to provide information to the public (City of Palo Alto, 2008) (DCWMAC, 2007).

Public School Programs

Status: *Currently being implemented by the Permittees.*

A storm water education program for public schools is a concept supported by the EPA (EPA, 2007). The County of Los Angeles has incorporated public school educational programs into its outreach program (LADPW, 2002). The District focuses storm water education efforts on elementary school students (RCFCWCD, 2005). For example, sixth-grade students at Warm Springs Middle School were given an interactive presentation regarding storm water pollution with an enviroscape model that excited and engaged the students; a presentation that has been given over 150 times during the 2003-2004 school year (Jamescourie, 2004). Educational programs in public schools are intended to produce long-term benefits to storm water runoff quality.

Education on Lower Risk Alternative Pesticides

Status: Currently being implemented by the Permittees.

Part of Public outreach includes suggesting less toxic alternatives to pyrethroid pesticides, such as those listed on the Our Water Our World website (www.ourwaterourworld.org). Lower risk pesticides have reduced impacts on human health, lessened toxicity to non-target organisms, decreased potential for water contamination, and lower pest resistance potential (Matteson et al., 2007). The District distributes materials associated with the "Our Water Our World" organization (RCFCWCD, 2008).

However, some of the lower risk pesticides are toxic to beneficial arthropods and still have the potential to pollute surface and ground water (Matteson et al., 2007). Pyrethroids were developed as a less toxic alternative from organophosphate pesticides (Quarles, 2002). In the Santa Margarita Watershed, there was a decrease in water toxicity to *Ceriodaphnia* and an increase in toxicity to *Hyalella* as organophosphate pesticides such as chlorpyrifos and diazinon and were replaced by pyrethroids (RCFCWCD, 2008). The effects on storm water runoff of lower risk pesticides must be carefully evaluated before they are promoted as effective solutions to urban storm water runoff pollution.

4.1.4 Low Impact Development (LID)

Status: Currently being implemented by the Permittees.

LID involves environmentally-friendly building and development designs that mitigate impacts to land and water. LID functions by managing storm water at its source, incorporating a variety of runoff control techniques, using natural features as design features, and protecting natural resources (NAHB, 2008). Municipalities that promote LID have the potential to reduce municipal infrastructure and maintenance costs while balancing growth needs with environmental protection (NAHB, 2008). LID practices include "small scale,

decentralized treatment practices" that include conservation of open space, a reduction of impervious surfaces, and the incorporation of water controls (NAHB, 2008). Reduction of urban runoff volumes may reduce the loadings of pyrethroids to receiving waters in urban areas.

In 2007, EPA implemented a retrofit of the agency headquarters in Washington, D.C., incorporating LID designs to assist with storm water retention (EPA, 2007). Retention of storm water on the land helps prevent pollutants from entering streams and rivers (EPA, 2007). One of the main goals of the EPA LID retrofit was to demonstrate several LID techniques and encourage government agencies and developers to use them (EPA, 2007). LID may be used in conjunction with IPM programs, which would reduce the amount of pesticides used and minimize the urban storm water runoff of pyrethroids. The County of San Diego's most recent MS4 permit requires implementation of LID techniques (County of San Diego, 2007); this appears likely to continue as a trend with other permits in the region as they are renewed. The incorporation of LID principles into development regulations in the Santa Margarita watershed provides a potential solution to runoff of pyrethroids into receiving waters.

4.2 Treatment Control BMPs

Treatment Control BMPs are typically structural devices engineered with the intent to remove pollutants from storm water. Treatment BMPs require construction and long term maintenance, but can be extremely effective (CASQA, 2003). Although treatment BMP's have not been thoroughly investigated specifically for reduction of pyrethroids, some methods may be useful. Pyrethroids bind tightly to soil particles so there is a high probability that pyrethroids would be removed with suspended solids when they pass through treatment BMPs. In addition, pyrethroids degrade over time; permethrin, for example, has a half life in soil of about 30 days and about 10 days on certain plant life. Because pyrethroids have low mobility in soil, infiltration-based treatment BMPs have a low probability of contributing to groundwater contamination (NPTN, 1997).

From the list of available treatment BMP's identified in Table 3-1, the types of treatment BMPs feasible for pyrethroid treatment in the Santa Margarita Watershed, considering the climate, local vegetation, and soil types present are: pervious pavement, media filters, extended detention basins, infiltration basins, and infiltration trenches.

These BMPs and their potential to remove pyrethroids from storm water runoff are described below.

4.2.1 Pervious Pavement

Status: Currently being implemented by Permittees under LID program.

Pervious or porous pavement is "a system comprising a load-bearing, durable surface together with an underlying layered structure that temporarily stores water prior to infiltration or drainage to a controlled outlet" (CASQA, 2003). Pervious surfaces include grass, gravel, and porous concrete and asphalt (CASQA, 2003). The multi layer system assists in preventing pyrethroid pollution by providing a stable structure for pyrethroids to bind to and degrade, thus helping to prevent their transport in to receiving waters. Silts that are deposited within the pavement may need infrequent controlled waste disposal (CASQA, 2003).

The advantage of porous pavement is that urban runoff is reduced while treatment is provided and it is an effective drainage solution in confined urban areas. However, porous pavement is not a viable option on high traffic or high speed roads due to safety issues. There is a small chance that it may contaminate groundwater. It is fairly easy to replace, should there be a clog or damaged area, as small areas can individually be paved (CASQA, 2003). The use of pervious pavement appears to be a growing trend.

4.2.2 Media Filter

Status: Currently being implemented by Permittees via sand filters.

Storm water media filters are usually two-chambered including a pretreatment settling basin and a filter bed filled with sand or other absorptive filtering media. As storm water flows into the first chamber, large particles settle out, and then finer particles and other pollutants are removed as storm water flows through the filtering media in the second chamber. Media filters are highly effective at removing sediment from storm water flows (CASQA, 2003). They are appropriate in low flow areas, particularly with sandy soil. Washington D.C. and Austin, TX have both successfully implemented media filters to treat storm water (VCSQMP, 2002). They "are well suited to Southern California because they do not require vegetation and require less space than other treatment control measures with similar removal efficiencies when a partial treatment sedimentation basin is used" (VCSQMP, 2002).

However, media filters clog easily when exposed to high sediment loads and may decrease in effectiveness after being in use for a few years (CASQA, 2003). A media filter is not appropriate for areas with erosive soil upstream from the treatment filter (VCSQMP, 2002). The lack of abundant native vegetation in the Santa Margarita watershed contributes to a high potential for erosion, so media filters may not be effective in the long term due to clogging. When clogging does occur, media filters may become a nuisance due to mosquito or midge breeding in pooled waters (CASQA, 2003).

4.2.3 Extended Detention Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An extended detention basin (EDB) is a permanent basin "formed by excavation and/or construction of embankments to temporarily detain the Stormwater Quality Design Volume

(SQDV) of storm water runoff to allow sedimentation of particulates to occur before the runoff is discharged"(VCSQMP, 2002). EDBs are constructed with an outlet at the bottom that allows for a slow, time-controlled release. The ultimate goal of EDBs is to level off peak storm water runoff rates (VCSQMP, 2002). Santa Clara Valley and the City of Palo Alto have noted that their detention basins have helped with the reduction of pollutants (EOA, 2004) (City of Palo Alto, 2008). Pyrethroids could be removed in the basin through settling of particulates.

Extended detention basins can serve multiple purposes as they provide for significant trash removal as well (CASQA, 2003). Maintenance is needed to ensure that the pond fully drains after large wet weather events, to avoid creation of standing pools causing mosquito or other vector habitats (CASQA, 2003). Extended detention basins are most effective when used in conjunction with other control measures, and are only moderately successful at removal of sediment. EDBs require relatively large amounts of land and therefore may not be feasible in urban areas of the Santa Margarita watershed (VCSQMP, 2002). There are no available examples of test results from municipalities using an extended detention basin for reduction of pyrethroid pesticides.

4.2.4 Infiltration Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration basin is a shallow impoundment that is designed to infiltrate storm water and utilize the natural ability of soil to remove pollutants in storm water runoff (CASQA, 2003). Infiltration basins store runoff until it eventually enters the soil and infiltrates into the water table (CASQA, 2003). The soil present in the Santa Margarita Region is extremely pervious and may work well with an infiltration basin treatment structure.

Since pyrethroids adsorb onto soil, pyrethroids are likely to be removed from the storm water into the soil. However, there is a slight possibility that they may be resuspended into the

groundwater. Monitoring of pilot sites would be required to determine if there is transport of pyrethroids to the water table.

As with detention basins, maintenance is needed to ensure that the basin fully drains after large wet weather events to avoid creation of standing pools causing mosquito or other vector habitats. Infiltration basins may fail if the storm water volume is greater than the design volume (VCSQMP, 2002). Since infiltration basins require a large amount of open space, installation in urban areas is problematic. There are no available examples of test results from municipalities using infiltration basins for reduction of pyrethroid pesticides.

4.2.5 Infiltration Trench

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration trench is a long and narrow ditch that collects storm water runoff by storing it in the voids in a rock bed and allowing it to infiltrate to the soil matrix (CASQA, 2003). Infiltration trenches are extremely effective at removing fine sediment particles and associated pollutants (CASQA, 2003). Naturally pervious soils are required (VCSQMP, 2002). The Santa Margarita watershed has naturally pervious soils, which would allow for the removal of pyrethroids from the water and into the sandy soil.

Infiltration trenches are typically used in conjunction with grass lined channels or grass filter areas located upstream for maximum removal of sediment and larger particles (VCSQMP, 2002). Due to the arid environment in the Santa Margarita Region, grass lined channels, or even vegetated strips, would require irrigation to maintain the vegetation. If the infiltration trench clogs, it can become a source for mosquito breeding. There are no available examples of test results from municipalities using infiltration trenches for reduction of pyrethroid pesticides.

4.3 BMP Evaluation

A summary of the relative advantages, disadvantages and costs of the various BMPs identified in Sections 4.1 and 4.2 above is presented in Table 6.1 below. The table includes advantages, disadvantages, and the relative cost of implementing the BMPs.

Table 6.1
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Source Control			
Regulatory Change	Reduces the availability of pyrethroids on the market	May take years to achieve full effect	$
Integrated Pest Management	Engages businesses and the public in environmentally sound gardening practices	Need to ensure that employees are following protocols	$
	Has been implemented in various locations throughout CA and the US	Could have some resistance from employees who are use to standard practices	
	SIPM can be put in place directly by the Permittees	Some may find the organic methods of gardening to be too time consuming	
	SIPM can be incorporated directly into current maintenance activities		
	Includes LID aspects		
Public Outreach and Education	EPA states that Public Outreach is key for any BMP program	Cannot control the direct actions of public but only educate	$
	Copermittees have already implemented a public outreach program	Hard to measure the direct impact of pollutant reduction	
	Employees of business have direct impact on the buying choices of the general public		
	Programs have been implemented by many municipalities		

Table 6.1 (continued)
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Treatment Control			
Porous Pavement	Reduces runoff volume while reducing pollutant load as well	Requires ongoing minimal maintenance	$ to $$ depending on size
	Can be easily replaced depending on the size and location of design	No known measured reduction of pyrethroids.	
Media Filter	Do not require vegetation	No known measured reduction of pyrethroids.	$$$
	Highly effective in removal of sediments	Clogging is an issue because of the erosion potential in the watershed.	
	Requires less space than other treatment controls for sediment removal		
Extended Detention Basin	Known for significant trash	Large footprint Moderately successful at removing sediment	$$$
	Standard BMP with many years of maintenance and operational information available	Create an area with vector breeding potential	
		No known measured reduction of pyrethroids.	
Infiltration Basin and Trench	Uses natural ability of soil to remove pollutants.	Unknown if pyrethroids would be transported to the groundwater table.	$ to $$$
	Local soils would allow infiltration	Would require a pilot study to determine transport.	
		No known measured reduction of pyrethroids.	
		Clogging of outlet structure	
		Accumulation of metals in soil	

*Relative Cost: $ = $0 to $50,000, $$ = $50,001 to $100,000, $$$>100,000

5.0 Pending Legislation

There is no relevant pending state legislation relating to pyrethroid pesticides from the California Department of Pesticide Regulation or, in general, the State of California as of December, 2008 (State of California, 2008) (CDPR, 2008). In August 2006, the DPR put rules in place to control insecticide sprays during the dormant season. During winter, pesticides are applied to dormant tree and vine crops to kill overwintering pests and diseases. The new rules restrict the use of most dormant insecticides when residuals can run off into water (DPR 2007-08 Progress Report). However, there are no additional updates relating to pending pyrethroid legislation at this time.

There is no relevant pending federal legislation relating to pyrethroid pesticides from the United States Congress as of December, 2008 (Library of Congress, 2008). Although the EPA is working on proposed mitigation labeling for non-agricultural pyrethroids, there is no indication as to when this legislation may be enacted (TDC, 2007).

6.0 Proposed Course of Action

The Permittees intend to use a phased approach to address the identified sources of pyrethroid pesticides causing toxicity in surface waters of the SMR watershed. As described in Section 4, various source control BMPs and treatment control BMPs are available to address these sources. However, the use of pyrethroid pesticides can not be directly regulated by local governments. The most effective control strategy involves effective labeling and use restrictions via state or federal regulatory action, to prevent water quality impacts from legal pesticide uses. The proposed course of action involves an adaptive management approach with the following broad elements:

- Pursue state and federal regulatory change through CASQA
- Implement a set of source controls targeted specifically at urban pesticide use,
- Through the annual reporting process, monitor the implementation of those controls, assess effectiveness, and identify sources or areas where additional effort is needed,
- Evaluate whether additional controls, including treatment controls, may be needed to further reduce pyrethroid pollution,
- Implement additional controls as needed,
- Continue to monitor implementation, as well as conditions within the target receiving waters, assess effectiveness, and re-evaluate control program

The Permittees will continue to support CASQA and/or other agencies pursuing regulatory change in labeling or use limitations for pyrethroid pesticides. This support will include participation in the CASQA Pesticides Subcommittee and the Urban Pesticide Committee, and supporting the implementation of the Urban Pesticide Pollution Prevention (UP3) Project. Permittee staff will continue to provide staff time and resources necessary for the CASQA Pesticides Subcommittee to complete its negotiations with the California Department of Pesticide Regulation and USEPA regarding labeling and use limitations for pyrethroids.

Source control is generally a more cost-effective approach to pollution abatement than treatment control, as source controls do not involve the costly capital investments of treatment controls. As discussed previously, CASQA, EPA, and other agencies and experts

recommend a source control program as an essential component of a successful pollution reduction strategy.

The basis of source control involves preventing the entrance of the subject pollutant into the discharge stream. For pyrethroid pesticides, this means preventing the pesticide from entering the municipal storm drain system through urban runoff. This can take place by intervention at the various steps in the pest control process:

- Point of sale: reducing the purchase of pyrethroid products through education of PCOs and the public in consequences of pesticide use and alternative means of pest control, including integrated pest management (IPM)
- Application: reducing use of pyrethroids on site through education of PCOs and the public into the importance of proper application methods and the potential consequences of pesticide use, as well as pest control alternatives (IPM techniques)
- Off-site Transport: reducing movement of pyrethroids into municipal storm drain system via use of Green Gardener approaches, IPM, and LID building techniques to reduce irrigation water use, retain storm water runoff on-site, and provide on-site mitigation for runoff pollutants (via grassy swales, infiltration, etc.)

A five-year pyrethroid pollutant reduction program is proposed by the Permittees.

<u>Year 1</u>

- Continue to support state and federal efforts to improve pyrethroid pesticide regulation
- Continue to publicize/promote the services of IPM-certified PCOs, to encourage businesses and homeowners to choose their services
- Continue to implement local agency contracting rules to require contracting of IPM-certified PCOs for municipal pest control (through EcoWise Certified IPM Contracting Tool Kit, e.g.)
- Continue point-of-sale education effort providing instruction in pesticide alternatives and proper use/application (using materials available through Our Water Our World, UP3 Project, CASQA members, e.g.)
- Continue efforts to develop and implement LID guidance for planning and development

Year 2

- Coordinate with the University of California (UC) Extension Master Gardener Program to extend its services to the Temecula/Murrieta area to further promote and support the use of IPM by local residents
- Re-evaluate, enhance as needed, and continue measures implemented in Year 1

Year 3

- Conduct programmatic assessment as part of third-year annual report, evaluate successes and areas where additional efforts are needed and adjust program accordingly
- Re-evaluate, enhance as needed, and continue measures implemented in Years 1 and 2

Year 4

- Evaluate effectiveness of BMPs using water quality monitoring data as part of fourth year annual report
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Year 5

- Conduct programmatic assessment, evaluate successes and areas where additional efforts are needed as part of ROWD process
- Identify additional program elements, including source and/or treatment controls, as needed to effect required pollutant reductions; revise program accordingly
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Many of the source control materials and programs needed are readily available through existing programs such as EcoWise Certified, Green Gardener, Our Water Our World, the UP3 Project, and the Western IPM Center. The following websites provide further information on these and other programs:

Urban Pesticide Pollution Prevention (UP3) Project: www.up3project.org
Green Gardener Program: www.green-gardener.org/about
Western Integrated Pest Management Center: www.wripmc.org
EcoWise Certified Integrated Pest Management: www.ecowisecertified.com
Our Water Our World: www.ourwaterourworld.org
Green California: www.green.ca.gov/EPP/building/structipm.htm

City of San Francisco: http://www.sfenvironment.org/our_programs/topics.html?ti=1
DPR: http://www.cdpr.ca.gov/docs/registration/reevaluation/chemicals/pyrethroids.htm

As a practical measure, it will be necessary to evaluate individual Permittee capabilities and resources, and develop a specific work plan for implementation of the pyrethroid pollutant reduction program.

It is also essential to develop and implement the pyrethroid pollutant reduction program in coordination with other regulatory requirements, especially other pollutant reduction programs mandated under the storm water NPDES Permit and/or load allocations required by TMDLs within the SMR watershed.

020689

Construction Component Effectiveness Assessments

Goals

I Ensure that all Construction Sites have applicable permits from the Permittee.

II Increase the percentage of Construction Sites that are in compliance with Permittee building and grading permits

III Place additional focus on Construction Sites during Wet Season

IV Ensure that construction inspection staff are properly trained and informed of the issues related to stormwater quality

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of active construction sites that are discovered without building/grading permits	2	Permit Term	Decreasing Trend or minimal %	Y
II	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or minimal %	N
II, III	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings **during wet season**	3	Permit Term	Decreasing Trend or minimal %	N
II	% of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower levels	N
III	% of active permitted construction sites provided wet weather reminders	2	Annually	N/A	Y
IV	% of construction inspectors receiving annual training	1	Annually	N/A	Y

Development Planning Component Effectiveness Assessments

Goals

I Develop Design Guidance for Low Impact Development (LID) BMPs

III Encourage the use of LID-Based Treatment Control BMPs

IV Ensure that appropriate planning staff are trained in WQMP requirements

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Status of SMC LID BMP Design Manual	1	Within Permit Term	Completion	Y
II	% of WQMP projects that met the exemption requirements for inspection and maintenance reporting by implementing only LID-Based Treatment Control BMPs	3	Permit Term	Increasing Trend	N
III	% of applicable planning staff that attended WQMP training.	1	Annually	N/A	Y

Permittee Facilities and Activities Program Effectiveness Assessments

Goals

I Ensure that Permittee Facilities have adequate BMPs implemented and that they are properly maintained
II Ensure that Channels and Inlets are kept free from trash and debris
III Encourage the use of Integrated Pest Management (IPM) on Permittee Facilities
IV Maintain an updated GIS map of the MS4 system
V Ensure the Permittee facility operators and maintenance workers are properly trained in issues related to water quality.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of facilities with appropriate BMPs identified	1	Annually	N/A	Y
I	% of Facilities provided reminders of appropriate BMPs	2	Annually	N/A	Y
I	% of annual facility inspections finding deficiencies in BMP implementation that require follow-up actions	3	Permit Term	Decreasing Trend or minimal %	Y
I	Average % of deficiencies identified in the previous year's inspections that were addressed.	3	Permit Term	Increasing Trend or high %	Y
II	Estimated Tons of Waste removed from Streets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Inlets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Open Channels	5	Annually	N/A	N
III	% of Pest Control Contracts that include language promoting or requiring IPM	1	Annually	N/A	N
IV	% of new Permittee-maintained MS4 facilities added to GIS Map	1	Annually	N/A	Y
V	% of Permittee Facility and MS4 operators and maintenance staff that attended training.	1	Annually	N/A	Y

Industrial-Commercial Facilities Program Effectiveness Assessments

Goals

I Maintain an updated and prioritized list of Industrial and Commercial Facilities

II Ensure the each Industrial and Commercial Facility has implemented BMPs that are appropriate for the activities and features at that facility

III Ensure that implemented BMPs are properly maintained to ensure their effective operation

IV Implement enforcement measures as necessary to reduce the occurance and recurrance of violations

V Ensure that inspectors are appropriately trained to identify problem areas and BMPs maintenance issues.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of new facilities added to database and prioritized	1	Annually	N/A	Y
II	% of inspected facilities with adequate Minimum BMPs in place at time of inspection	3	Permit Term	Increasing Trend or High %	N
III	% of inspected WQMP facilities subject to Post Construction Treatment Control BMP Inspection, with adequately maintained Treatment Control BMP	3	Permit Term	Increasing Trend or High %	N
IV	% of inspected High/Medium priority facilities that were subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or Low %	N
IV	% of enforced sites that are repeat offenders	3	Permit Term	Decreasing Trend or Low %	N
IV	% / Number of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower enforcement	N
V	Percent of applicable inspectors that attended training	1	Annually	N/A	Y

Residential Program Effectiveness Assessments

Goals

I Raise awareness among residents of activities that may be contributing to stormwater pollution
II Increase public awareness of BMPs for residential activities
III Increase public participation in hazardous material collection events
IV Increase public involvement in keeping the watershed clean
V Encourage the use of Alternative Pest Control Methods

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Number of outreach events to Schools	1	Annually	N/A	N
II	Number and type of educational materials distributed that target residential activities	1	Annually	N/A	Y
I, II	Results of Public Ed Surveys	2	Permit Term	Increasing or high level of Knowledge	Y
III	Gallons of Used Oil Collected through Used Oil Block Cycle Grant	4	Annually	N/A	Y
III	Total Pounds collected at HHW/ABOP events	4	Annually	N/A	Y
III	Total Number of participants at HHW/ABOP events	3	Annually	Increasing Trend	Y
IV	Pounds of trash removed through Watershed Cleanup Events	4	Annually (as events occur)	NA	N
V	Number of Home Improvement stores provided outreach and customer educational information for pesticide use	2	Annually	Increasing Trend	Y

Detection and Elimination of Illicit Discharges and Connections Effectiveness Assessments

I Revise and enhance IC/ID Monitoring Program
II Reduce the occurance of Illicit Connections and Discharges
III Increase public reporting of improper disposal into MS4
IV Ensure the IC/ID reports are reviewed and responded to in a timely manner
V Ensure the confirmed IC/ID events are eliminated as quickly as possible
VI Ensure the IC/ID response staff are trained to identify potential sources of Illicit Discharges and recommend BMPs to prevent such discharges

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Revise IC/ID Monitoring Program to screen random MS4 outfalls	1	N/A	N/A	N
II	% of IC/ID Monitoring events with sampleable flow	1	Permit Term	N/A	N
II	% of IC/ID Monitoring events that exceeded criteria and required follow-up	5	Permit Term	Decreasing Trend or low %	N
III	Number of IC/ID reports received	2	Annually	Increasing Trend	N
IV	% of IC/ID reports responded to within 1 business day of receipt	1	Annually	N/A	Y
V	% of confirmed and source-identified IC/ID incidents that required enforcement beyond verbal or written wardnings to eliminate	3	Permit Term	Decreasing Trend or minimal %	N
V	% of each type / level of enforcement	3	Permit Term	Trend toward lower levels	N
VI	% of IC/ID response staff receiving training	1	Annually	N/A	Y

Riverside County Flood Control and Water Conservation District

Riverside County – Santa Margarita Region Pyrethroid Source Identification Toxicity Reduction Evaluation

Final Phase II Report
January 2009

MACTEC
9177 Sky Park Court
San Diego, California 92123
858-278-3600 FAX 858-278-5300

Executive Summary

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the SMR Permittees to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. This report documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff.

Data gathered under this TRE was compared to data from neighboring counties. Based on available data, problems with pyrethroid-induced toxicity in urban runoff are common among municipalities in Southern California, and methods for addressing the problems are comparable.

A literature review was conducted to determine appropriate source control and treatment control BMPs for reducing the concentration and load of pyrethroids in storm water runoff. The literature source, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are summarized.

Based on the results of the literature review, BMPs are evaluated for applicability and potential effectiveness in the SMR watershed. Many of the most effective and appropriate BMPs are currently being implemented by the Permittees.

A search for pending legislation did not identify any pending legislation pertaining to pyrethroid pesticides.

The most effective strategy to prevent water quality impacts from legal pesticide uses was identified as state or federal regulatory change involving effective labeling and use restrictions. The Permittees propose a five year plan to continue, review, and enhance current activities to reduce pyrethroid-induced toxicity.

1.0 Introduction

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the County of Riverside, the City of Murrieta, the City of Temecula, and the Riverside County Flood Control and Water Conservation District (District, collectively Permittees). The Phase I Status Report (RCFCWCD, 2008) contains the work plan for Phase II and an outline of the topics in this report, as well as additional background information. This Phase II report is divided into six sections.

Section 1 describes the purpose of the TRE and provides an overview of the approach taken by the Permittees. Section 1 also contains a discussion of the regulatory framework of the TRE, a brief project background, a description of the Santa Margarita watershed, pyrethroid pesticide background and usage, and management questions and objectives.

Section 2 describes available pyrethroid and toxicity data from other counties in Southern California, and compares the data to data from Riverside County. The data and comparisons are included to demonstrate that the problems and solutions relating to pyrethroid pesticides facing the Permittees are similar to those of neighboring counties in the region.

Section 3 presents the results of the literature review conducted for this study of pesticide reduction Best Management Practices (BMPs).

Section 4 discusses potential pesticide reduction BMPs, the status of the Permittees implementation of the BMPs, and, when applicable, examples of the implementation of the BMPs in other municipalities. Section 4 also contains a table summarizing the potential BMPs, their advantages and disadvantages, and relative cost.

Section 5 discusses pending legislation relating to pyrethroid pesticides.

Section 6 presents the five-year course of action the Permittees propose to follow to reduce pyrethroid-induced toxicity in the SMR.

1.1 Purpose and Overview of Approach

The purpose of the TRE is to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. The results of Phase I of the TRE are contained in the TRE Status Report (Riverside, 2008). This Phase II report for the TRE study documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff. The goal of Phase II is to establish a course of action and develop modifications to the Permittee's Storm Water Management Plans (SWMPs) to more effectively control the sources of toxicity that were identified in Phase I of the TRE. The Permittees will incorporate the course of action and SWMP modifications into the Report of Waste Discharge (ROWD) that will be submitted to the RWQCB in January 2009.

Phase II activities included:

- A comparison of toxicity and chemistry results to data from adjacent Phase I municipal separate storm sewer system (MS4) permit areas, including San Diego County and Orange County.
- A literature review of current studies and a survey of pesticide reduction BMPs.
- A search for pending legislation regarding pyrethroid pesticides.
- Development of a proposed course of action for the Permittees.

A literature review was conducted of BMP information available from the Urban Pesticide Pollution Prevention (UP3) Project and other pesticide management programs and documents. Information on relevant BMPs was compiled and evaluated to identify potential BMPs that are available to mitigate urban sources of pyrethroids. Existing Permittee programs, such as outreach, regulation, and BMP implementation, were then evaluated for improvement opportunities.

The proposed course of action was determined with consideration of the adequacy of data collection (sufficient precipitation and runoff to collect adequate data) and pending

regulatory actions by California Department of Pesticide Regulation (DPR), and the United States Environmental Protection Agency (EPA).

Land uses in Riverside County are comparable to those in neighboring Orange County and San Diego County, and pyrethroid pesticide-induced toxicity has been observed in those counties. The Permittees are committed to identifying and addressing water quality issues with methods consistent with those used by other stakeholders in Southern California. To this end, data gathered under this TRE was compared to data from neighboring counties, and current pesticide reduction programs used by municipalities throughout California were reviewed.

Source control and treatment control BMPs were researched and evaluated for potential effectiveness in reducing pyrethroid pesticide-induced toxicity in the Santa Margarita watershed. Many of the most effective BMPs are currently implemented by the Permittees, and several have been implemented within the previous Permit term (2004-2008). A proposed five-year course of action for the Permittees was developed by combining the results of the research with the existing programs.

1.2 Regulatory Framework

At the federal level, the authority to regulate pesticide manufacture and use is assigned to the United States Environmental Protection Agency (EPA) under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). In California, pesticide use is regulated at the state level by the DPR. In the SMR, the Permittees are required under the Clean Water Act to control discharges of pollutants, including pesticides that produce water toxicity, to and from their MS4 under the National Pollutant Discharge Elimination System (NPDES).

This TRE was performed as required by Monitoring and Reporting Program (MRP) R9-2004-001.

The MRP, Section II. A. I. 4, states:

> *"When results from the chemistry, toxicity, and bioassessment monitoring…indicate urban runoff-induced degradation, Permittees shall evaluate the extent and causes of urban runoff pollution in receiving waters and prioritize management actions to eliminate or reduce sources. Toxicity Identification Evaluations (TIEs) shall be used to determine the cause of the toxicity, and Toxicity Reduction Evaluations (TREs) shall be used to identify sources and implement management actions to reduce pollutants in urban runoff causing toxicity."*

As local regulation of pesticide use is generally preempted by federal and state law, the Permitttees' authorities are limited to addressing illegal disposal of pesticides, promoting public education, setting the example for minimum pesticide use, and coordinating with the federal and state agencies to facilitate regulatory changes at the state and federal level.

1.3 Project Background

Phase I of the TRE consisted of the toxicity monitoring begun in 2004 and the Toxicity Identification Evaluations (TIE) was initiated in the spring of 2007. The Phase I Status Report (RCFCWCD, 2008) provides a full project background. Toxicity monitoring at Temecula Creek and Murrieta Creek was initiated in 2004 using EPA protocol with the following indicator species: *Ceriodaphnia dubia*, *Selenastrum capricornutum*, and *Hyalella azteca*. Toxicity testing during the 2004-2008 reporting period indicated persistent wet weather toxicity to *Hyalella* in both Temecula Creek and Murrieta Creek. Toxicity was not observed to either *Ceriodaphnia* or *Selenastrum* in any of the samples collected over the four annual reporting periods beginning in the fall of 2004.

Toxicity Identification Evaluations (TIEs) were conducted on the wet weather samples collected from Temecula Creek and Murrieta Creek beginning in April 2007, in accordance with Table 2 of the MRP. The TIEs indicated that pyrethroids were the primary source of toxicity and biological degradation in both Murrieta Creek and Temecula Creek.

As a result of the toxicity and TIEs, storm water monitoring for pyrethroids was initiated in 2007-2008. Results indicate that the pyrethroids permethrin and/or bifenthrin are present in wet weather water samples taken at Murrieta Creek and Temecula Creek.

To further assess the impacts of pyrethroid pesticides the Permittees instituted Dry Weather Toxicity Testing and direct measurement of pyrethroid pesticide concentrations in dry weather water samples during the 2007-2008 reporting period. Toxicity and pyrethroid pesticides were not detected in dry weather water samples at either Murrieta Creek or Temecula Creek.

Phase I of the TRE concluded with the Phase I Status Report. The Phase I Status Report included studies to better characterize patterns and sources of toxicity and to evaluate the hypothesis that the *Hyalella* toxicity is due to pyrethroids.

Bifenthrin and permethrin appear to be the primary toxic elements in Temecula Creek and Murrieta Creek. While bifenthrin and permethrin were applied to both agricultural and non-agricultural land uses, the major sources of pyrethroid toxicity in the SMR are non-agricultural activities. Permethrin was applied more than any other pyrethroid pesticide in the urban landscape. Bifenthrin and permethrin application rates were one and three orders of magnitude higher for structural control applications than agricultural applications in Riverside County. Structural control appears to represent 93% of the total pyrethroids use for Riverside County.

The Status Report outlined the plan for Phase II of the TRE, and this report presents the results of Phase II.

1.4 Watershed Description

The SMR encompasses approximately 750 square miles in southwestern Riverside and northern San Diego Counties (see Figure 1-1). The upper (northeast) portion of the SMR is in Riverside County with the remainder in San Diego County. The SMR is subdivided into the Temecula Creek and Murrieta Creek sub-watersheds and has an arid Mediterranean climate. Creeks in the SMR are ephemeral. Flow in Temecula Creek and in Murrieta Creek results almost exclusively from groundwater during the dry season. It is rare to find flow during dry weather at the tributary stations, and usually this flow infiltrates before reaching Temecula Creek or Murrieta Creek (2006-2007 Monitoring Annual Report). While the ephemeral streams in the SMR are technically receiving waters, the term "Receiving Waters" as used in this TRE Status Report refers exclusively to Murrieta Creek and Temecula Creek.

The Santa Margarita River is formed by the confluence of Murrieta Creek and Temecula Creek. The confluence is located in Riverside County, approximately five miles northeast of San Diego County. The Santa Margarita River flows from Riverside County into San Diego County through the community of Fallbrook and Marine Corps Base Camp Pendleton. The lower estuary and river are protected by Camp Pendleton and are much less developed than surrounding areas in Southern California. The Santa Margarita River is able to support a relative abundance of wildlife and habitats in part because of its undeveloped state.

Figure 1-1

Riverside County Santa Margarita Watershed

020705

As presented in Table 1-1, the total population in the SMR of Riverside County is significantly less than adjacent watersheds covered under similar Phase I MS4 NPDES permits.

Table 1-1

San Diego Region Populations

Jurisdiction	Population
Orange County	3,002,048
San Diego County	2,941,454
SMR/Riverside County	250,483
Unincorporated	55,291
Murrieta	97,257
Temecula	97,935

1.5 Pyrethroid Pesticide Background and Usage

A statewide compilation of the presence and effects of pyrethroid pesticides in urban surface waters, prepared in July 2008 and presented at the 2008 California Association of Stormwater Quality Agencies (CASQA) Conference, outlined the rise in pyrethroid use and its increased presence in urban waterways (Ruby, 2008). A comprehensive survey of pesticide use in Sacramento, San Diego, and Orange Counties also concluded that, as the older pesticides chlorpyrifos and diazinon have been phased out, pyrethroid pesticides have seen increased usage (Wilen, 2005). The Urban Pesticide Pollution Prevention (UP3) Project confirms that pyrethroids are the cause of toxicity in numerous California waterways, particularly in urban waterways. The UP3 Project (www.up3project.org) publishes an annual review of new scientific findings on pesticides in urban surface water (TDC, 2007). Since 2005, the reviews have consistently indicated that pyrethroid use continues to increase and that pyrethroids are found to be the cause of toxicity in urban waterways. The pyrethroid use information is confirmed by data published by the DPR.

Pyrethrins are natural insecticides that are derived from an extract of chrysanthemum flowers. Pyrethroids are synthetic versions of pyrethrins. These chemicals act on the nervous system of insects. Commercial pyrethroid pesticides often contain a synergist that works by restricting the enzymes insects use to detoxify pyrethroids. While pyrethroids have been shown to be one of the least poisonous insecticides to mammals, the effects depend on the level of exposure, the health of the animal, and the environmental circumstances.

Pyrethroids applied in urban areas enter the storm drainage system of the MS4 by surface runoff and are transported directly to receiving waters. Other potential urban sources are runoff from irrigation with reclaimed water, application overspray, and atmospheric deposition. Pyrethroids transported via the MS4, from whatever source, are considered to be non-point discharges. Agriculture, nursery, and urban/suburban uses are the main categories of sources of pyrethroids in the receiving waters of the SMR.

Outdoor structural pest control is the predominant urban use of pyrethroids in most watersheds. However, in the SMR, the acreage dedicated to agricultural land use exceeds the urban land use area by approximately 2:1. Pyrethroid insecticides are applied to a variety of crops in the SMR and California throughout the year. According to the DPR, pyrethroids are commonly used on fruit and nut trees, row crops, and in nurseries. Six of the primary pyrethroids used in California agriculture, in order of decreasing amount applied in 2003, are permethrin, esfenvalerate, lambda-cyhalothrin, cyfluthrin, bifenthrin, and cypermethrin. Therefore, agricultural sources of pyrethroids were considered.

TIE methods for pyrethroids are still being developed. Effective methods require the ability to measure low concentrations of pyrethroids, and this remains a challenge. Fortunately, the development of TIE methods for pyrethroids is progressing and moving towards standardization (San Francisco Estuary Project, 2007). TIEs are planned for storm water samples collected during 2008-2009 when toxicity is evident.

1.6 Management Questions and Objectives

This TRE is designed to confirm the toxic element observed in the samples collected in the Santa Margarita Region, identify likely sources of the toxic element, and propose mitigation measures for those sources. TIEs identified pyrethroids pesticides as the likely toxic element. As the MRP specifies that a TRE must be conducted following toxicant identification through a TIE, Phase I of the TRE focused on the pyrethroids identified as the source of toxicity in the 2007 TIEs. To support this TRE, the Permittees commissioned additional wet and dry weather toxicity testing, water column pyrethroid testing, additional TIEs to verify the persistence of pyrethroids as the toxicant. Based on the resulting information, the TRE evaluates the specific sources of toxicity and likely mitigation.

This TRE study assumes that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in neighboring counties, in particular San Diego and Orange Counties. Under this assumption, the Permittees hypothesized that pyrethroids would be detected in samples at most if not all monitoring locations, that the samples would exhibit toxicity to *Hyalella,* and that TIEs would indicate pyrethroids as the cause of the toxicity. Unlike other regions, dry weather toxicity is not expected in the SMR, as dry weather flows are supported primarily by groundwater.

Based on this assumption, this TRE was designed to provide information to help answer the following five management questions related to the toxicity:

1) Is the pyrethroid toxicity persistent in Temecula Creek and Murrieta Creek?
2) Does the toxicity occur during dry weather?
3) Are there any obvious sources of illicit discharge of pyrethroids that can be abated?
4) What are the likely sources of pyrethroid toxicity in the SMR?
5) What potential management measures are available to the Permittees to mitigate the impacts of pyrethroid pesticide application?

Answers to the first four questions are detailed in the Phase I Status Report. Briefly, toxicity is persistent in the creeks during wet weather, but is not evident in dry weather samples. No

obvious sources of illicit discharge were found. The likely primary source of pyrethroids is structural control performed by pest control operators (PCOs). The final question is addressed during Phase II and is the focus of this report.

2.0 Data Comparison

An assumption of this TRE study is that pyrethroid sources and resultant toxicity patterns in the SMR are analogous to those in similar counties, in particular neighboring San Diego and Orange Counties. To verify this assumption, it was necessary to compare data collected in SMR to data collected in other locations. As part of the 2008 CASQA pyrethroids data compilation, monitoring results were summarized from studies that investigated the presence and effects of pyrethroid pesticides in urban areas of California (Ruby, 2008). The CASQA summary listed the frequency of detection of various pyrethroid pesticides and results of toxicity testing for different indicator species. Results from various northern and Southern California locations were detailed, including results of water column studies from Orange, San Diego and Sacramento Counties.

Pyrethroids, as a class of chemicals, have an affinity for particles and they are considered to be relatively hydrophobic; they are therefore commonly found in sediments of waterways downstream of their application sites. The initial toxicity studies leading to the identification of pyrethroids as pervasive environmental contaminants in California were performed on sediment samples by Don Weston and his colleagues at the University of California, Berkeley (Weston et al., 2005; Amweg et al., 2006). Recently, improvements in analytical methods for pyrethroids in water, and modification of toxicity studies to more effectively test for pyrethroid-based toxicity in water, have lead to increasing evidence of the presence of pyrethroids in water column samples, and toxic effects in the water matrix (see citations for Orange and San Diego County in Ruby, 2008).

Extensive work has been performed on the environmental presence and effects of pyrethroids in urban areas of the neighboring Orange and San Diego counties; however, much of this work has been performed on sediment samples. Although the sediment monitoring results do not correspond directly with the SMR water column test results, sediments are considered to be effective integrators of contaminants from the contributing storm water flows. The deposited sediments are produced as particles settle out from the passing water over some

period of time, and tend to accumulate until they are washed away by higher-velocity flows. Summaries of the relevant sediment study results are therefore included in the discussion that follows.

In Orange County, an ongoing study being performed by UC Davis, in conjunction with UC Riverside and the Orange County UC Cooperative Extension, has consistently found bifenthrin and permethrin in water column runoff samples from residential areas (Haver et al., 2007; Oki, personal communication). In samples from four residential sites they have detected bifenthrin in 100% of samples, with the number of samples varying from 48 to 57 per site (Oki, personal communication). In sediment samples collected in recent years from the Santa Ana Region of Orange County, bifenthrin is commonly detected (32 of 56 samples) and permethrin less frequently so (4 of 56 samples), with sediment toxicity to *Hyalella* common (39 of 54 samples tested were moderately or highly toxic; see summary in Ruby, 2008).

In a 2005 study of six Orange County residential storm drainages and seven tributary streams draining commercial/residential land uses, bifenthrin was detected in 95% of dry weather samples and 100% of wet weather samples (Budd et al., 2007). Because treatment of nursery products is mandatory to control Red Imported Fire Ants, an older DPR study, conducted in 1999-2002, found occasional detects of bifenthrin in urban runoff samples, along with frequent detects in nursery runoff from several Orange County sites.

In San Diego County, under NPDES Permit monitoring conducted since 2004, pyrethroids have been commonly detected in water samples from several receiving waters, and toxicity to *Hyalella* has been increasingly observed in water samples (see summary in Ruby, 2008). Bifenthrin was detected in 12 of 15 samples collected from 2005-2006 and 2006-2007; detection frequency was 100% in samples from Chollas Creek, Agua Hedionda, and Tecolote Creek. Toxicity to *Hyalella* was observed in 22 of 57 samples tested over the three year period, 2004-2007. In a TIE study performed on Chollas Creek samples during 2005-2006,

67% of samples were acutely toxic to *Hyalella*, and the toxicity was found to be likely due to pyrethroids.

In a 2004-2005 study performed by UC Davis and others, sediments from Switzer Creek at its outlet to San Diego Harbor were found to be highly toxic; bifenthrin and permethrin were detected at high concentrations, and a sediment TIE identified pyrethroids as the likely cause of the observed toxicity (Anderson et al., in press). As part of a statewide survey of urban waterways, sediments were tested from several receiving waters in San Diego County. All were found to be highly toxic to *Hyalella* (Holmes et al., in press).

To further compare the pyrethroid sources and toxicity patterns in the SMR to other counties, the CASQA data summary was analyzed to select the studies which reported results for the same constituents and effects identified in the SMR, specifically permethrin, bifenthrin, and toxicity to *Hyalella*. The total number of detections for the different monitoring locations was divided by the total number of samples taken at the sites to calculate the percentage of samples with detectable concentrations of pyrethroids. This normalized metric allowed for comparison of the various datasets.

While permethrin is among the more commonly-used pyrethroids, it is much less toxic to aquatic life than bifenthrin (TDC, 2007). For the purposes of this assessment, bifenthrin detection frequency and frequency of toxic effects were used as the metrics for comparison.

Comparative results for bifenthrin are summarized in Figure 2-1. Data were available for two creeks in Sacramento County and three locations in San Diego County, in addition to the data collected for SMR. Two samples were taken at the Sacramento County sampling locations. For San Diego County, each creek was sampled three times except for Chollas Creek, which was sampled six times. The SMR was sampled a total of eight times. In most cases, bifenthrin was detected in over 80% of samples. Only at Elk Grove Creek in Sacramento County was bifenthrin detected at a notably lower percentage.

Figure 2-1

Percentage of Samples with Bifenthrin Detections

Toxicity to *Hyalella* was documented in water samples from San Diego County, along with the SMR. Toxicity testing was performed on samples from seven San Diego County water bodies. The sample sets ranged from three to nine toxicity tests (Aqua Hedionda, San Dieguito River, Tijuana River, and Chollas Creek). In the SMR, a total of eight toxicity tests were performed on samples from Murrieta Creek and Temecula Creek. The results for frequency of acute toxicity from the SMR were within the range of the results for similar sites in San Diego County (see Figure 2-2).

After comparing the results from different locations, the assumption that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in similar counties appears to be valid.

Figure 2-2

Percentage of Samples with Acute Toxicity to *Hyalella*

3.0 Literature Review

A literature review was conducted during December, 2008 to determine appropriate BMPs for reducing the concentration and load of pyrethroids in storm water runoff. An initial search was made of the Urban Pollution Prevention Program (UP3) website (www.up3program.org) for potential examples of BMP strategies implemented specifically for pyrethroids. The United States Environmental Protection Agency website and the CASQA website were also reviewed for pyrethroid specific BMPs. Widespread use of pyrethroids is relatively recent, and there has been little direct evaluation of BMPs for pyrethroids. Further research was conducted on general storm water BMPs, and their potential for pyrethroid reduction was evaluated based on the design of the BMP and the chemical behavior of pyrethroids.

To identify pending legislation that may be related to pyrethroid pesticides, web searches were conducted on the websites for DPR, the California legislature, the EPA, and the Library of Congress. However, no pending legislation was identified as relevant to pyrethroid pesticides.

Table 3-1 below presents the findings of the literature review. BMPs are categorized as either source control or treatment control, and within each category they are sorted by type. The literature source, a summary of the BMP, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are provided. See Section 4 for further information about each type of BMP.

4.0 BMP Analysis

Based on the literature review and the findings of Phase I of the TRE, BMPs were evaluated for their applicability to the SMR. Because the toxicity appears to be principally a wet weather phenomenon, and because the Permittees' jurisdiction includes the urbanized area of the watershed, the analysis focused on BMPs designed to reduce the amount of storm water pollution caused by urban runoff.

The potentially applicable BMPs are divided into Source Control and Treatment Control BMPs and are discussed in detail below. Through the Permittee's proactive efforts to protect the quality of the receiving waters and their beneficial uses, many programs addressing these broad categories are either already in place or are actively being developed. The implementation status for each specific BMP is discussed. Examples of BMP implementation by other municipalities in the region are included as a tool for evaluating the consistency of the Permittees' program with other programs in the region.

4.1 Source Control BMPs

Source control BMPs are designed to curtail pollution at the source before it has the opportunity to enter the storm drain system and pollute waterways. They are generally the preferred type of BMP because reduction of pollution occurs at the source, before runoff has become contaminated (CASQA, 2003). The types of broad categories of source control BMPs that identified as most appropriate for the Santa Margarita watershed are: pursuing regulatory change, implementing IPM strategies including LID, and public outreach and education.

4.1.1 Regulatory Action

Status: Currently being implemented by the Permittees.

Pesticide manufacturers are required to receive approval by USEPA and California DPR for specific pesticide uses, and both agencies can impose use restrictions to prevent unwanted impacts on the environment and public health. At the federal level, a fundamental regulatory disconnect exists between pesticide approval (registration) under FIFRA and water pollution control programs under the Clean Water Act. This has resulted in a repeating pattern, in which a) pesticides are approved for use without sufficient consideration of potential environmental effects, b) water quality and other ecological impacts accrue, c) use restrictions are applied to the offending products (sometimes involving widespread bans on use), and d) new pesticides are approved for use, with subsequent environmental impacts.

In 1962 Rachel Carson published *Silent Spring*, documenting the widespread ecological consequences of pesticide applications. The federal government responded by banning the use of DDT and other organochlorine pesticides, based on extensive evidence of environmental impacts through the process of bioaccumulation. The ban has lead to dramatic recoveries in affected populations of bald eagles and other species; however, the legacy of these long-lasting pesticides near-shore dumping areas in Los Angeles County and elsewhere remains (IWS, 2007).

Eventually the organochlorine pesticides were replaced principally by organophosphate pesticides, especially in urban uses. In the mid-1990s municipal storm water monitoring programs began to document that commonly-used organophosphate pesticides, especially diazinon and chlorpyrifos, were present at toxic levels and causing toxicity to aquatic organisms, principally the common water flea, *Ceriodaphnia*. Although not bioaccumulative, diazinon and chlorpyrifos were discovered to cause widespread toxicity in urban runoff and local receiving waters (TDC, 2001). USEPA subsequently banned most urban uses of diazinon and chlorpyrifos, although EPA's main motivation involved human health effects

on the pesticide applicators, and water quality was not an important factor in those decisions. Again, the ban was also immediately effective, reflected in reduced concentrations of diazinon and chlorpyrifos in urban water samples, and fewer occurrences of organophosphate-based water column toxicity (c.f., references in Ruby, 2008 for San Diego County Municipal Copermittees Annual Urban Runoff Monitoring Reports). But pesticide manufacturers simply replaced the OP pesticides in their products with other active ingredients, principally pyrethroids. Shortly thereafter, researchers and municipal storm water programs began documenting toxic effects from the new pyrethroid products. The pyrethroid impacts were first documented in sediments, and the affected test organism shifted from *Ceriodaphnia* to the sediment-dwelling *Hyalella*.

In the cases of both organochlorine (DDT) and organophosphate (diazinon, chlorpyrifos) pesticides, federal limitations or bans on uses were effective in ameliorating the associated environmental impacts. In both cases, however, new pesticide products were approved for use that then caused related but different impacts to the environment. Therefore it is clear that the most effective strategy for preventing environmental impacts from pesticide use involves implementing an effective process of pesticide approval and registration that comprehensively accounts for and mitigates against such impacts.

For more than ten years CASQA and various other California state and local agencies have promoted better regulation of pesticides at the federal level, encouraging use restrictions as the most effective means of source control. California water quality agencies have sent comment letters to USEPA and DPR on guidance pertaining to the application of pesticides to surface waters and on recommended environmental hazard statements for residential outdoor pesticides (TDC, 2007). These efforts are beginning to show some modest signs of success. In a recent letter to stakeholders, EPA outlined an approach to provide better cooperation between the Office of Pesticide Programs (OPP) and the Office of Water (OW), to allow for “environmentally protective and scientifically defensible effects assessment judgments about contaminants that are or may be found in ambient water”. The Riverside County Permittees plan to continue their support of these efforts through ongoing

participation in the CASQA Pesticides Subcommittee, the Urban Pesticide Pollution Prevention (UP3) Project, and the Urban Pesticide Committee. The Permittees also plan to request that the RWQCB become involved in advocating for more effective pesticide regulation at the state and federal levels.

The Permittees are members of a CASQA subcommittee that addresses pesticide uses impacting stormwater discharges. Effort focuses on providing input to the USEPA and the California Department of Pesticide Regulation (DPR) to improve pesticides regulations so that they more fully protect water quality and are better aligned with the Clean Water Act and California Water Code. (RCFCWCD, 2008). CASQA has also been active in supporting DPR's ongoing reevaluation of allowable pyrethroid pesticide uses (TDC, 2007).

Increasingly, the regulatory response to the water quality impacts resulting from *legal uses of approved pesticides* has been for regional water boards to impose limitations on the allowable loadings of pesticides to impaired waters through the TMDL process. Local agencies have little or no jurisdiction over sales or use of these pesticide products, and therefore do not have the full authority needed to perform loading reductions in resulting TMDLs. An effective regulatory solution must occur at the state and federal levels, to regulate allowable pesticide uses to effectively prevent such water quality impacts.

Current legislation requires users of certain pesticides to be trained, often certified, in the use of those pesticides and to report the amounts applied (State of California, 2008). A similar regulatory approach could be used to promote pesticide alternatives, such as for PCOs to train and certify their technicians in the use of IPM methods (Quarles, 2002). The Permittees are considering supporting regulatory action by the state to include IPM training for PCOs in the requirements for certification and training on the use of pesticides.

Environmentally sensitive and flexible zoning ordinances may be adopted to facilitate the use of LID principles, thereby encouraging private developers to use LID principles (Prince Georges County, 1999). Additional land use restrictions or alternatives to present zoning

laws may help reduce urban storm water runoff, potentially reducing pyrethroid loadings in receiving waters. The Permittees plan to continue promoting LID implementation through interagency communications and cooperation.

4.1.2 Integrated Pest Management

Status: Currently being implemented by the Permittees.

IPM is "a decision-making process for managing pests that uses monitoring to determine pest injury levels, and combines biological, cultural, mechanical, physical, and chemical tools and other management practices to control pests in a safe, cost effective, and environmentally sound manner that contributes to the protection of public health" (Carlsen, 2008). IPM can further be described as an approach to solving pest problems by using information about the pest and landscape to eradicate the pest's habitat in a manner that poses the least risk to humans (Ecology Action, 2007). IPM has many different aspects that help to reduce pests and in turn cause a reduction in pesticide use, including green gardening and structurally integrated pest management (SIPM). BMPs that are typically used as part of an IPM strategy are described in the following sub-sections.

4.1.2.1 Green Gardening

Status: Not currently being implemented by the Permittees, program under consideration and will be enacted in the near future.

The Green Gardener program, implemented through landscapers, promotes environmentally responsible landscaping to reduce the use and need for pesticides. In general, education of gardening and landscape maintenance staff is beneficial for pest reduction as part of an IPM program. It provides alternative methods to landscapers, such as reducing outdoor sources of ants by elimination of their food and water sources through management of honeydew producing insects and plants associated with them (UC Davis, 2007). The Green Gardener

program encourages businesses to participate in environmentally sound landscape maintenance. Healthy landscapes are more resistant to pests (Ecology Action, 2007). Pests that do not have a suitable habitat will leave to find a more hospitable environment. When the pests leave, then there is a lessened need for pesticide applications and lower risk of pyrethroids entering storm water.

The County of Santa Barbara implemented a Green Gardener Program, in which landscapers are encouraged to take a class at the local city college, covering subjects such as IPM strategies and environmentally beneficial landscaping to obtain a "Green Gardener" card. They are then placed on the Green Gardener list, which is then promoted to the public by the County (County of Santa Barbara, 2008). The program benefits both parties; gardeners receive education and advertising at a nominal cost, and the County receives the benefit of more environmentally-friendly landscaping and a reduction in the use of pesticides. Municipalities may promote this type of program by contracting with landscaping companies that have their employees trained in green gardening practices.

Encouraged by the success of the Santa Barbara Green Gardener Program, the Monterey Bay area instituted a similar program. "The goal of the program was to educate and certify local gardeners in resource efficient and pollution prevention landscape management practices" (Ecology Action, 2007). With the support of the State of California Water Resources Control Board, more municipalities are likely to follow (Ecology Action, 2007).

4.1.2.2 Pest Control Contracting

Status: Currently partially implemented by the Permittees.

Many municipalities contract pesticide applications to professional PCOs. Contracting only with PCOs that have IPM training and certification can help realize IPM models and goals. The recently completed EcoWise Certified IPM Contracting Tool Kit (www.EcoWiseCertified.org), provides resources for municipal agencies to use in developing such a program. The EcoWise IPM Tool Kit includes:

- Elements to consider when developing an IPM policy
- Roles and responsibilities of the agency or business in an IPM program
- How to hire and work with a professional IPM service provider

The Took Kit also includes the EcoWise IPM Process along with a number of other helpful resources and sample documents.

Because PCOs are responsible for the majority of pesticides applied in urban areas, distribution of information regarding less-toxic alternatives, lower-use application techniques, and proper disposal, practices to professional applicators is an essential component of the Permitee's pesticide control effort. The Permittees currently distribute information to PCOs through the Public Outreach and Education Program (see Section 4.1.3).

The City of Palo Alto's Regional Water Quality Control Plant includes IPM requirements in their contracts with PCOs (City of Palo Alto, 2008). The City of Santa Monica, as a part of their SIPM program, specified IPM requirements in their PCO contracts (Raphael, 1997). Use of PCOs with IPM training and certification by municipalities encourages local PCOs to invest in IPM training and certification, which in turn, allows their expertise in IPM to expand beyond just the municipality itself (Quarles, 2002). Education of PCOs, hiring only PCOs that have IPM training, and contracting specifically for IPM by local agencies may

create more public awareness and reduce the use of pyrethroids in the Santa Margarita watershed.

4.1.2.3 Structurally Integrated Pest Management Program

Status: Currently being implemented by the Permittees, with additional programs under consideration.

SIPM is a program that controls the access of pests to buildings and the potential food sources within them by protecting the structure itself from pests, with minimal use of pesticides. The Permittees intend to lead by example, sharing success through public outreach programs and encouraging individuals and businesses to do the same. SIPM is a long term solution offering positive potential impacts on budget, reduction of pests and, reduction of pyrethroid pesticide use. Note that SIPM should not be confused with category of pesticide use referred to as structural pest control. SIPM is a BMP designed to reduce the use of pesticides in a structural pest control program.

The City of Santa Monica implemented an SIPM program and experienced a reduction in pests and in the use of pesticides. In addition, Santa Monica reduced pest management costs by 30% (State of California, 2008). California law requires a SIPM strategy for all state-owned buildings and schools (State of California, 2008). The three main aspects of a SIPM strategy are facility design and LID, monitoring, and facility maintenance.

<u>Facility Design</u>

Status: Currently being implemented by the Permittees.

Facility design can play a large role in the exclusion of potential pests. "A facility's planning, design, and construction provides an opportunity to incorporate features that help to exclude pests, minimize pest habitat, and promote proper sanitation" (NIH, 1999). It can also reduce

storm water runoff (NAHB, 2008). Exclusion of pests helps reduce pest infestations and in turn the need for pyrethroid pesticide use. For example, ensuring that the design holds plants and mulch several inches away from the foundation of a building may assist the reduction of ant populations immediately adjacent to the building (UC Davis, 2007). A reduction in storm water runoff may also reduce the amount of pyrethroids that enter receiving waters. Facility designs can incorporate aspects of LID, as discussed below. New development and redevelopment may incorporate designs that aid in the exclusion of pests and the reduction of urban runoff, which may contribute to a reduction of pollutant loads, including pyrethroids.

Pest Monitoring

Status: Currently in not use by the Permittees, program under consideration.

Monitoring structures and adjacent areas may help prevent pest infestations and quickly identify potential problems. Traps, visual inspections, and staff interviews assist in the identification of areas and conditions that may foster pest activity (NIH, 1999). Monitoring for ants, for example, may consist of simple inspections of facilities such as looking under sinks and along pipes and electrical wires (UC Davis, 2007). The City of Santa Monica, as a part of their SIPM, provided training to all general staff, purchasing, carpenters and custodial staff. Specific presentations were given to groups, such as the custodial staff, who learned about products used in control of ant and cockroach populations and general sanitation. The staff is trained in the identification of potential pest infestations and habitat conditions that may foster pest activity (Raphael, 1997). Early identification of pest infestations can increase the effectiveness of specific treatments and reduce the overall need for pesticide use.

Sanitation and Facility Maintenance

Status: Currently not being implemented by the Permittees, program under consideration.

Proper sanitation includes reducing clutter and pest habitat and incorporating proper facility and waste management practices. Records of maintenance and housekeeping conditions may help track pest problems and assist in the determination of whether corrective action is needed or has been taken in a timely manner (NIH, 1999). Sanitation and facility maintenance involves the housekeeping staff, the building maintenance staff, and the landscaping staff.

Improper storage of waste may affect urban runoff, and it may create a hospitable environment for pests, particularly ants. Initial, low-cost steps that municipalities may take to improve waste handling are: controlling litter, keeping waste collection areas clean, and insuring proper disposal of pyrethroid pesticide products, if used, and educating employees and the public. Simple solutions such as rinsing out soda bottles and emptying trash daily prove effective to reduce insect infestations, particularly ants (UC Davis, 2007). An important component of an SIPM monitoring program is regular inspections of solid waste containers for structural damage or leaks (CASQA, 2004).

Educating custodial staff, such as was done in the City of Santa Monica, can reduce the amount of improperly disposed pesticides (Raphael, 1997). Designating staff members to perform a daily checklist of areas around the structure to ensure cleanliness and proper storage of waste can assist the efforts to reduce potential pest infestations and leakage of hazardous waste (CASQA, 2004).

Building maintenance staff also benefit from education and acceptance of responsibility for pest management. Maintenance crews can contribute to an SIPM strategy by securing the structure, such as caulking holes and cracks, assisting in the removal of clutter, and installing

door sweeps (State of California, 2008). Caulking holes in structures can prove effective in keeping ants out of facilities (UC Davis, 2007). Upkeep on building maintenance helps reduce potential pest habitat, and thus may reduce the need for application of pyrethroid pesticides.

Reduction of pest habitat around structures may reduce pest populations in and around structures. Marin County, as part of its integrated pest management program, has reduced rat habitat around the local Civic Center and in turn has seen suppression of the rat population (Carlsen, 2008). Programs similarly tailored to ants may result in a positive effect of pest reduction within the SMR. For example, banding tree trunks with tanglefoot or similar sticky substances can keep ants away from trees (UC Davis, 2007). Education and training may be provided to Permittee landscaping crews to assist in proper vegetation removal and, when necessary, pesticide use. Landscaping crews may be informed that pyrethroid pesticides or any less toxic pesticides are to be used only when a pest problem arises to an intolerable level, that they are not administered when a wet weather event is expected and only when low wind speeds are present (CASQA, 2004). Education of landscaping crews to remove pest habitat may reduce the need for pyrethroid use thus reducing the potential risk of pyrethroids entering storm water runoff.

Also, utilizing low water using vegetation and alternative landscaping techniques such as xeriscaping or naturescaping are efforts that landscape crews can take to reduce pyrethroids in urban runoff. Landscaping crews may also help preserve the water efficiency of the landscape through properly timed fertilizing, weeding, pruning, and pest control. For example, proper collection and disposal of yard clippings can prevent loose vegetation that has possibly been treated with pyrethroid pesticides from entering waterways or storm water drainage systems such as MS4s (CASQA, 2004). Reduction in pest habitat and proper landscaping maintenance may help reduce pest problems, and thus the need for pyrethroid pesticides.

4.1.3 Public Outreach and Education

Status: Currently being implemented by the Permittees.

Public Outreach and Education programs inform the public about storm water issues, proper use and disposal of publically available chemicals, and alternatives to pyrethroid pesticides. Reaching out to the public and providing information about the dangers of pyrethroids pesticides encourages citizens to make educated decisions about pesticide use. It also may accelerate state and federal regulatory changes regarding pyrethroid use through public promotion of such changes. According to the EPA, public education and awareness can be a "key component" in any BMP program for storm water management (EPA, 2008).

The District has enacted a public outreach program to help reduce the potential for pyrethroid pesticides to contaminate receiving waters. This program has initiated: distribution of educational materials to hardware store employees, active participation and distribution of outreach for HHW/ABOP facilities to provide for free venues to dispose of excess pesticides, and distribution of EPA and CalEPA materials to the public. The District also promotes the use of less toxic pesticides, provides education on storm water issues in public schools, and has enacted a multimedia campaign to control urban sources of pyrethroid pesticides (RCFCWCD, 2005).

<u>Education and Outreach to Businesses</u>

Status: Currently being implemented by the Permittees.

Distribution of information regarding pesticides to businesses, particularly hardware stores, is crucial for reducing pyrethroid use and misuse at its source. Education on pyrethroid runoff to local hardware stores may assist local hardware store employees to educate their customers on alternative methods of pest control. An Orange County survey from 2001 found that 55% of pest control products were purchased at hardware stores (Wilen, 2001). In

2006, Riverside County had 177,562 pounds of reported non-agricultural usage of pyrethroid pesticides (RCFCWCD, 2008). Reduction in usage may lead to a reduction of pyrethroids in urban storm water runoff. Educating hardware store employees about urban water quality impacts of pyrethroid pesticides may help reduce the usage and thus the toxicity of runoff in the Santa Margarita Watershed resulting from pyrethroid use, as employees have the ability to recommend alternative methods of pest management to their customers.

Education of nursery employees about pyrethroid management and IPM techniques may also yield significant source control benefits. In general, nursery employees tend to be more knowledgeable about pesticides than employees at hardware stores (Wilen, 2001). Nurseries that use and sell pyrethroids offer the highest return on outreach resources, while those nurseries that have chosen alternate pest management methods serve as examples of IPM in practice. In a recent Riverside County survey, one nursery stated that they do not use pesticides and if their nursery does experience a pest infestation, it is treated naturally (RCFCWCD, 2008). Such nurseries are likely to encourage their clients and customers to use the same methods. Education and outreach can lead to cooperation and sharing of successful and unsuccessful methods of IPM and ultimately reduce pyrethroid pesticide use and toxicity of storm water runoff.

Businesses not in the industry of pesticide sales may also benefit from outreach. The District directs outreach efforts to all businesses; those in the business of selling or using pesticides, and those that are not. The District has coordinated with the County's Business License Department to include an educational insert of the "Only Rain Down the Storm Drain" program to new business license applicants and annual renewal reminders (CRWQCBSD, 2008). Informing companies on proper disposal of hazardous materials such as pesticides is crucial to prevent pyrethroid containers from being improperly disposed of, leaking, and then contributing to storm water pollution.

Several Southern California cities conduct general business outreach as well. Cities such as Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water

pollution relating to landscaping and gardening practices to general businesses (DCWMAC, 2007). Such information informs businesses of alternate methods of pest control beyond pesticide use and imparts knowledge about storm water quality issues. Thus, dissemination of educational materials to local businesses is intended to help reduce pyrethroid runoff by ensuring proper disposal of pesticides and encouraging alternate methods of pest control.

Educational and Outreach to the General Public

Status: Currently being implemented by the Permittees.

The District distributes educational materials within the Santa Margarita Region such as EPA sponsored pamphlets in order to promote reduced use of pyrethroid pesticides and educate the public about alternate practices of pest management. The public purchases retail pesticides and uses them, presumably, according to the manufacturer's instructions and in compliance with regulations listed on the packaging, including proper disposal of empty containers in the municipal waste stream. However, even when used properly, retail pesticides have the potential to contaminate urban runoff, and homeowners may be unaware of the downstream consequences of pesticide use. Depending on the landscaping practices in a neighborhood, promoting alternative pest management strategies and educating the public on storm water quality and pesticide use may be the most beneficial way to reduce the source of pyrethroids in urban runoff (Wilen, 2005).

The District distributes educational materials within other public outreach programs and maintains pest management information on the internet. The District also distributes brochures to educate the public on lawn and garden maintenance, fertilization, and pesticide and household chemical use (RCFCWCD, 2005). These educational materials provide public education on alternative pest control methods, limiting individual use of pyrethroids, and proper disposal of pesticide containers.

Many municipalities perform storm water outreach at festivals and public events by participating in the events and by distributing brochures. The Cities of Lawndale and Torrance plan and attend public festivals and rent booth space to educate the public about storm water quality and the use of pyrethroids (DCWMAC, 2007). Cities including Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water pollution relating to household activities and landscaping and gardening practices to the general public (DCWMAC, 2007). The District participates in events such as the Children's Groundwater Festival, the Southern California Fair, the Community Water Festival, and the Santa Margarita Watershed Clean Up (RCFCWCD, 2005). The Permittees, as well as other municipalities within California, participate in public events and distribute informative materials as a portion of their current public outreach programs.

Education on proper disposal of pesticides

Status: Currently being implemented by the Permittees.

Improper disposal of pesticides is a potential contributor to storm water contamination. Empty containers be disposed of in the municipal waste stream are not likely to contribute to storm water pollution, however, unused pesticides may enter the MS4 by leaking in transit. In Orange County in 2001, 54.5% of people surveyed claimed to have disposed of unwanted pesticides in the municipal waste stream, and 78.6% did not know the location of a household waste disposal site (Wilen, 2001). The District has created a partnership with Riverside County Waste Management to provide educational programs and materials on proper disposal of unwanted waste, including pesticide containers (RCFCWCD, 2005).

Multimedia Outreach

Status: Currently being implemented by the Permittees.

The EPA suggests using multiple media sources to promote and educate on storm water impacts, particularly through public service messages (EPA, 2007). Mass media has proven to be a key source of pollution prevention information for the general public (LADPW, 2002). The District currently participates in a multimedia advertising campaign including: maintaining a website that provides information, distributing mailing inserts regarding water quality issues through various county entities, and billboard advertising campaigns. Many other municipalities, such as the Cities of Palo Alto and Lawndale, also use the world wide web to provide information to the public (City of Palo Alto, 2008) (DCWMAC, 2007).

Public School Programs

Status: Currently being implemented by the Permittees.

A storm water education program for public schools is a concept supported by the EPA (EPA, 2007). The County of Los Angeles has incorporated public school educational programs into its outreach program (LADPW, 2002). The District focuses storm water education efforts on elementary school students (RCFCWCD, 2005). For example, sixth-grade students at Warm Springs Middle School were given an interactive presentation regarding storm water pollution with an enviroscape model that excited and engaged the students; a presentation that has been given over 150 times during the 2003-2004 school year (Jamescourie, 2004). Educational programs in public schools are intended to produce long-term benefits to storm water runoff quality.

Education on Lower Risk Alternative Pesticides

Status: Currently being implemented by the Permittees.

Part of Public outreach includes suggesting less toxic alternatives to pyrethroid pesticides, such as those listed on the Our Water Our World website (www.ourwaterourworld.org). Lower risk pesticides have reduced impacts on human health, lessened toxicity to non-target organisms, decreased potential for water contamination, and lower pest resistance potential (Matteson et al., 2007). The District distributes materials associated with the "Our Water Our World" organization (RCFCWCD, 2008).

However, some of the lower risk pesticides are toxic to beneficial arthropods and still have the potential to pollute surface and ground water (Matteson et al., 2007). Pyrethroids were developed as a less toxic alternative from organophosphate pesticides (Quarles, 2002). In the Santa Margarita Watershed, there was a decrease in water toxicity to *Ceriodaphnia* and an increase in toxicity to *Hyalella* as organophosphate pesticides such as chlorpyrifos and diazinon and were replaced by pyrethroids (RCFCWCD, 2008). The effects on storm water runoff of lower risk pesticides must be carefully evaluated before they are promoted as effective solutions to urban storm water runoff pollution.

4.1.4 Low Impact Development (LID)

Status: Currently being implemented by the Permittees.

LID involves environmentally-friendly building and development designs that mitigate impacts to land and water. LID functions by managing storm water at its source, incorporating a variety of runoff control techniques, using natural features as design features, and protecting natural resources (NAHB, 2008). Municipalities that promote LID have the potential to reduce municipal infrastructure and maintenance costs while balancing growth needs with environmental protection (NAHB, 2008). LID practices include "small scale,

decentralized treatment practices" that include conservation of open space, a reduction of impervious surfaces, and the incorporation of water controls (NAHB, 2008). Reduction of urban runoff volumes may reduce the loadings of pyrethroids to receiving waters in urban areas.

In 2007, EPA implemented a retrofit of the agency headquarters in Washington, D.C., incorporating LID designs to assist with storm water retention (EPA, 2007). Retention of storm water on the land helps prevent pollutants from entering streams and rivers (EPA, 2007). One of the main goals of the EPA LID retrofit was to demonstrate several LID techniques and encourage government agencies and developers to use them (EPA, 2007). LID may be used in conjunction with IPM programs, which would reduce the amount of pesticides used and minimize the urban storm water runoff of pyrethroids. The County of San Diego's most recent MS4 permit requires implementation of LID techniques (County of San Diego, 2007); this appears likely to continue as a trend with other permits in the region as they are renewed. The incorporation of LID principles into development regulations in the Santa Margarita watershed provides a potential solution to runoff of pyrethroids into receiving waters.

4.2 Treatment Control BMPs

Treatment Control BMPs are typically structural devices engineered with the intent to remove pollutants from storm water. Treatment BMPs require construction and long term maintenance, but can be extremely effective (CASQA, 2003). Although treatment BMP's have not been thoroughly investigated specifically for reduction of pyrethroids, some methods may be useful. Pyrethroids bind tightly to soil particles so there is a high probability that pyrethroids would be removed with suspended solids when they pass through treatment BMPs. In addition, pyrethroids degrade over time; permethrin, for example, has a half life in soil of about 30 days and about 10 days on certain plant life. Because pyrethroids have low mobility in soil, infiltration-based treatment BMPs have a low probability of contributing to groundwater contamination (NPTN, 1997).

From the list of available treatment BMP's identified in Table 3-1, the types of treatment BMPs feasible for pyrethroid treatment in the Santa Margarita Watershed, considering the climate, local vegetation, and soil types present are: pervious pavement, media filters, extended detention basins, infiltration basins, and infiltration trenches.

These BMPs and their potential to remove pyrethroids from storm water runoff are described below.

4.2.1 Pervious Pavement

Status: Currently being implemented by Permittees under LID program.

Pervious or porous pavement is "a system comprising a load-bearing, durable surface together with an underlying layered structure that temporarily stores water prior to infiltration or drainage to a controlled outlet" (CASQA, 2003). Pervious surfaces include grass, gravel, and porous concrete and asphalt (CASQA, 2003). The multi layer system assists in preventing pyrethroid pollution by providing a stable structure for pyrethroids to bind to and degrade, thus helping to prevent their transport in to receiving waters. Silts that are deposited within the pavement may need infrequent controlled waste disposal (CASQA, 2003).

The advantage of porous pavement is that urban runoff is reduced while treatment is provided and it is an effective drainage solution in confined urban areas. However, porous pavement is not a viable option on high traffic or high speed roads due to safety issues. There is a small chance that it may contaminate groundwater. It is fairly easy to replace, should there be a clog or damaged area, as small areas can individually be paved (CASQA, 2003). The use of pervious pavement appears to be a growing trend.

4.2.2 Media Filter

Status: Currently being implemented by Permittees via sand filters.

Storm water media filters are usually two-chambered including a pretreatment settling basin and a filter bed filled with sand or other absorptive filtering media. As storm water flows into the first chamber, large particles settle out, and then finer particles and other pollutants are removed as storm water flows through the filtering media in the second chamber. Media filters are highly effective at removing sediment from storm water flows (CASQA, 2003). They are appropriate in low flow areas, particularly with sandy soil. Washington D.C. and Austin, TX have both successfully implemented media filters to treat storm water (VCSQMP, 2002). They "are well suited to Southern California because they do not require vegetation and require less space than other treatment control measures with similar removal efficiencies when a partial treatment sedimentation basin is used" (VCSQMP, 2002).

However, media filters clog easily when exposed to high sediment loads and may decrease in effectiveness after being in use for a few years (CASQA, 2003). A media filter is not appropriate for areas with erosive soil upstream from the treatment filter (VCSQMP, 2002). The lack of abundant native vegetation in the Santa Margarita watershed contributes to a high potential for erosion, so media filters may not be effective in the long term due to clogging. When clogging does occur, media filters may become a nuisance due to mosquito or midge breeding in pooled waters (CASQA, 2003).

4.2.3 Extended Detention Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An extended detention basin (EDB) is a permanent basin "formed by excavation and/or construction of embankments to temporarily detain the Stormwater Quality Design Volume

(SQDV) of storm water runoff to allow sedimentation of particulates to occur before the runoff is discharged"(VCSQMP, 2002). EDBs are constructed with an outlet at the bottom that allows for a slow, time-controlled release. The ultimate goal of EDBs is to level off peak storm water runoff rates (VCSQMP, 2002). Santa Clara Valley and the City of Palo Alto have noted that their detention basins have helped with the reduction of pollutants (EOA, 2004) (City of Palo Alto, 2008). Pyrethroids could be removed in the basin through settling of particulates.

Extended detention basins can serve multiple purposes as they provide for significant trash removal as well (CASQA, 2003). Maintenance is needed to ensure that the pond fully drains after large wet weather events, to avoid creation of standing pools causing mosquito or other vector habitats (CASQA, 2003). Extended detention basins are most effective when used in conjunction with other control measures, and are only moderately successful at removal of sediment. EDBs require relatively large amounts of land and therefore may not be feasible in urban areas of the Santa Margarita watershed (VCSQMP, 2002). There are no available examples of test results from municipalities using an extended detention basin for reduction of pyrethroid pesticides.

4.2.4 Infiltration Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration basin is a shallow impoundment that is designed to infiltrate storm water and utilize the natural ability of soil to remove pollutants in storm water runoff (CASQA, 2003). Infiltration basins store runoff until it eventually enters the soil and infiltrates into the water table (CASQA, 2003). The soil present in the Santa Margarita Region is extremely pervious and may work well with an infiltration basin treatment structure.

Since pyrethroids adsorb onto soil, pyrethroids are likely to be removed from the storm water into the soil. However, there is a slight possibility that they may be resuspended into the

groundwater. Monitoring of pilot sites would be required to determine if there is transport of pyrethroids to the water table.

As with detention basins, maintenance is needed to ensure that the basin fully drains after large wet weather events to avoid creation of standing pools causing mosquito or other vector habitats. Infiltration basins may fail if the storm water volume is greater than the design volume (VCSQMP, 2002). Since infiltration basins require a large amount of open space, installation in urban areas is problematic. There are no available examples of test results from municipalities using infiltration basins for reduction of pyrethroid pesticides.

4.2.5 Infiltration Trench

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration trench is a long and narrow ditch that collects storm water runoff by storing it in the voids in a rock bed and allowing it to infiltrate to the soil matrix (CASQA, 2003). Infiltration trenches are extremely effective at removing fine sediment particles and associated pollutants (CASQA, 2003). Naturally pervious soils are required (VCSQMP, 2002). The Santa Margarita watershed has naturally pervious soils, which would allow for the removal of pyrethroids from the water and into the sandy soil.

Infiltration trenches are typically used in conjunction with grass lined channels or grass filter areas located upstream for maximum removal of sediment and larger particles (VCSQMP, 2002). Due to the arid environment in the Santa Margarita Region, grass lined channels, or even vegetated strips, would require irrigation to maintain the vegetation. If the infiltration trench clogs, it can become a source for mosquito breeding. There are no available examples of test results from municipalities using infiltration trenches for reduction of pyrethroid pesticides.

4.3 BMP Evaluation

A summary of the relative advantages, disadvantages and costs of the various BMPs identified in Sections 4.1 and 4.2 above is presented in Table 6.1 below. The table includes advantages, disadvantages, and the relative cost of implementing the BMPs.

Table 6.1
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Source Control			
Regulatory Change	Reduces the availability of pyrethroids on the market	May take years to achieve full effect	$
Integrated Pest Management	Engages businesses and the public in environmentally sound gardening practices	Need to ensure that employees are following protocols	$
	Has been implemented in various locations throughout CA and the US	Could have some resistance from employees who are use to standard practices	
	SIPM can be put in place directly by the Permittees	Some may find the organic methods of gardening to be too time consuming	
	SIPM can be incorporated directly into current maintenance activities		
	Includes LID aspects		
Public Outreach and Education	EPA states that Public Outreach is key for any BMP program	Cannot control the direct actions of public but only educate	$
	Copermittees have already implemented a public outreach program	Hard to measure the direct impact of pollutant reduction	
	Employees of business have direct impact on the buying choices of the general public		
	Programs have been implemented by many municipalities		

Table 6.1 (continued)
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Treatment Control			
Porous Pavement	Reduces runoff volume while reducing pollutant load as well	Requires ongoing minimal maintenance	$ to $$ depending on size
	Can be easily replaced depending on the size and location of design	No known measured reduction of pyrethroids.	
Media Filter	Do not require vegetation	No known measured reduction of pyrethroids.	$$$
	Highly effective in removal of sediments	Clogging is an issue because of the erosion potential in the watershed.	
	Requires less space than other treatment controls for sediment removal		
Extended Detention Basin	Known for significant trash	Large footprint Moderately successful at removing sediment	$$$
	Standard BMP with many years of maintenance and operational information available	Create an area with vector breeding potential	
		No known measured reduction of pyrethroids.	
Infiltration Basin and Trench	Uses natural ability of soil to remove pollutants.	Unknown if pyrethroids would be transported to the groundwater table.	$ to $$$
	Local soils would allow infiltration	Would require a pilot study to determine transport.	
		No known measured reduction of pyrethroids.	
		Clogging of outlet structure	
		Accumulation of metals in soil	

*Relative Cost: $ = $0 to $50,000, $$ = $50,001 to $100,000, $$$>100,000

5.0 Pending Legislation

There is no relevant pending state legislation relating to pyrethroid pesticides from the California Department of Pesticide Regulation or, in general, the State of California as of December, 2008 (State of California, 2008) (CDPR, 2008). In August 2006, the DPR put rules in place to control insecticide sprays during the dormant season. During winter, pesticides are applied to dormant tree and vine crops to kill overwintering pests and diseases. The new rules restrict the use of most dormant insecticides when residuals can run off into water (DPR 2007-08 Progress Report). However, there are no additional updates relating to pending pyrethroid legislation at this time.

There is no relevant pending federal legislation relating to pyrethroid pesticides from the United States Congress as of December, 2008 (Library of Congress, 2008). Although the EPA is working on proposed mitigation labeling for non-agricultural pyrethroids, there is no indication as to when this legislation may be enacted (TDC, 2007).

6.0 Proposed Course of Action

The Permittees intend to use a phased approach to address the identified sources of pyrethroid pesticides causing toxicity in surface waters of the SMR watershed. As described in Section 4, various source control BMPs and treatment control BMPs are available to address these sources. However, the use of pyrethroid pesticides can not be directly regulated by local governments. The most effective control strategy involves effective labeling and use restrictions via state or federal regulatory action, to prevent water quality impacts from legal pesticide uses. The proposed course of action involves an adaptive management approach with the following broad elements:

- Pursue state and federal regulatory change through CASQA
- Implement a set of source controls targeted specifically at urban pesticide use,
- Through the annual reporting process, monitor the implementation of those controls, assess effectiveness, and identify sources or areas where additional effort is needed,
- Evaluate whether additional controls, including treatment controls, may be needed to further reduce pyrethroid pollution,
- Implement additional controls as needed,
- Continue to monitor implementation, as well as conditions within the target receiving waters, assess effectiveness, and re-evaluate control program

The Permittees will continue to support CASQA and/or other agencies pursuing regulatory change in labeling or use limitations for pyrethroid pesticides. This support will include participation in the CASQA Pesticides Subcommittee and the Urban Pesticide Committee, and supporting the implementation of the Urban Pesticide Pollution Prevention (UP3) Project. Permittee staff will continue to provide staff time and resources necessary for the CASQA Pesticides Subcommittee to complete its negotiations with the California Department of Pesticide Regulation and USEPA regarding labeling and use limitations for pyrethroids.

Source control is generally a more cost-effective approach to pollution abatement than treatment control, as source controls do not involve the costly capital investments of treatment controls. As discussed previously, CASQA, EPA, and other agencies and experts

recommend a source control program as an essential component of a successful pollution reduction strategy.

The basis of source control involves preventing the entrance of the subject pollutant into the discharge stream. For pyrethroid pesticides, this means preventing the pesticide from entering the municipal storm drain system through urban runoff. This can take place by intervention at the various steps in the pest control process:

- Point of sale: reducing the purchase of pyrethroid products through education of PCOs and the public in consequences of pesticide use and alternative means of pest control, including integrated pest management (IPM)
- Application: reducing use of pyrethroids on site through education of PCOs and the public into the importance of proper application methods and the potential consequences of pesticide use, as well as pest control alternatives (IPM techniques)
- Off-site Transport: reducing movement of pyrethroids into municipal storm drain system via use of Green Gardener approaches, IPM, and LID building techniques to reduce irrigation water use, retain storm water runoff on-site, and provide on-site mitigation for runoff pollutants (via grassy swales, infiltration, etc.)

A five-year pyrethroid pollutant reduction program is proposed by the Permittees.

<u>Year 1</u>

- Continue to support state and federal efforts to improve pyrethroid pesticide regulation
- Continue to publicize/promote the services of IPM-certified PCOs, to encourage businesses and homeowners to choose their services
- Continue to implement local agency contracting rules to require contracting of IPM-certified PCOs for municipal pest control (through EcoWise Certified IPM Contracting Tool Kit, e.g.)
- Continue point-of-sale education effort providing instruction in pesticide alternatives and proper use/application (using materials available through Our Water Our World, UP3 Project, CASQA members, e.g.)
- Continue efforts to develop and implement LID guidance for planning and development

Year 2

- Coordinate with the University of California (UC) Extension Master Gardener Program to extend its services to the Temecula/Murrieta area to further promote and support the use of IPM by local residents
- Re-evaluate, enhance as needed, and continue measures implemented in Year 1

Year 3

- Conduct programmatic assessment as part of third-year annual report, evaluate successes and areas where additional efforts are needed and adjust program accordingly
- Re-evaluate, enhance as needed, and continue measures implemented in Years 1 and 2

Year 4

- Evaluate effectiveness of BMPs using water quality monitoring data as part of fourth year annual report
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Year 5

- Conduct programmatic assessment, evaluate successes and areas where additional efforts are needed as part of ROWD process
- Identify additional program elements, including source and/or treatment controls, as needed to effect required pollutant reductions; revise program accordingly
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Many of the source control materials and programs needed are readily available through existing programs such as EcoWise Certified, Green Gardener, Our Water Our World, the UP3 Project, and the Western IPM Center. The following websites provide further information on these and other programs:

City of San Francisco: http://www.sfenvironment.org/our_programs/topics.html?ti=1
DPR: http://www.cdpr.ca.gov/docs/registration/reevaluation/chemicals/pyrethroids.htm

As a practical measure, it will be necessary to evaluate individual Permittee capabilities and resources, and develop a specific work plan for implementation of the pyrethroid pollutant reduction program.

It is also essential to develop and implement the pyrethroid pollutant reduction program in coordination with other regulatory requirements, especially other pollutant reduction programs mandated under the storm water NPDES Permit and/or load allocations required by TMDLs within the SMR watershed.
