The development planning component of the City's JURMP aims to improve overall storm water quality by reducing the discharge of pollutants from development projects to the MEP and managing increases in runoff from development projects that have the potential to negatively affect downstream water bodies. During the 2008/2009 fiscal year, the City accomplished these goals through implementation of its JURMP document.

### 2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- Collaborated with the Copermittee Land Development workgroup to discuss key Model SUSMP and Hydromodification Management Plan (HMP) development issues.
- Continued to utilize the City's SUSMP database to track information about site design, source control, and treatment control BMPs within the City's jurisdiction, and the parties responsible for BMP maintenance.
- Used the City's treatment control BMP database to track completed Priority Development Projects.
- Mailed annual maintenance verification forms to completed private Priority Development Projects on the City's treatment control BMP inventory.
- Conducted maintenance inspections of site design, source control, and treatment control BMPs at 10 completed development projects in the City.
- Distributed educational materials for the development community regarding Municipal Permit requirements related to development projects.

A list of development projects subject to SUSMP requirements in 2008/2009 is available in Table 2-1. A comparison of the number of inspections performed and the requirements of the Municipal Permit can be found in Table 2-2. SUSMP projects that were completed after inspection and maintenance verification actions had been performed for the 2008/2009 inventory are listed in Table 2-3. Details of treatment control BMP inspections and related follow-up actions are provided in Table 2-4.

## 2.2 LAND USE PLANNING

### 2.2.1 BACKGROUND

The City's General Plan was adopted in 1996 and contains water quality and watershed protection principles in its Natural Settings Element. The comprehensive principles established in 1996 provide an ample framework for implementing the requirements of the current Municipal Permit, and no changes to these policies were necessary during the reporting period.

### 2.2.2 SOURCE CHARACTERIZATION

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to development restrictions in the City's General Plan for storm water purposes were implemented during the reporting period.

### 2.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

Please refer to the City's updated JURMP document for a list of the water protection policies included in the City's General Plan. These policies remained the same throughout the reporting period.

### 2.2.4 PROGRAM IMPLEMENTATION

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code which was last updated during the 2007-2008 reporting period. No changes were made to the City's Municipal Code sections related to storm water during the current reporting period.

Details on how the City implemented its established water protection policies through its environmental review process and its development project approval and verification processes during the reporting period are provided in Sections 2.3 and 2.4 of this JURMP Annual Report document.

## 2.3 ENVIRONMENTAL REVIEW PROCESS

The City's current environmental review process is detailed in the City's updated JURMP. The overall structure of the review process remains the same as in previous reporting years. No changes to the City's environmental review process have been made since the submittal of the updated JURMP.

## 2.4 Development Project Approval and Verification Process

### 2.4.1 Background

The approval and verification process implemented during 2008/2009 followed the process described in the City's updated JURMP. Details on the different aspects of the process are described in the sections below.

### 2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's SUSMP Ordinance. No changes to the City's SUSMP Ordinance were made during the 2008/2009 reporting period. However, the City will be updating this document to incorporate the recently approved Model SUSMP by the March 2010 deadline.

### 2.4.3 Best Management Practice Requirements

No changes were made to the development BMP requirements presented in the City's current JURMP during the 2008/2009 reporting period.

### 2.4.4 Program Implementation

During the 2008/2009 fiscal year, the City required implementation of its BMP requirements for all development projects through education, a comprehensive development project approval process, and a new treatment control BMP inspection and maintenance verification program.

#### 2.4.4.1 Outreach and Staff Training

The City continually trains staff involved in the planning and review of development projects within the City and works closely with the development community to communicate its development requirements throughout the entire approval process. Details on trainings conducted and educational materials developed and distributed related to new development during the reporting period can be found in Section 8 of this JURMP Annual Report document. Also, based on initial results from the first year of the program, distribution of maintenance verification letters to parties responsible for maintenance of treatment control BMPs at completed projects seems to be increasing the level of knowledge of regulated parties.

#### 2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Forms completed by

project applicants are kept with the project's file at the City for future reference. As discussed in the City's JURMP, the City required all developers applying for construction and building permits to complete a "National Pollutant Discharge Elimination System (NPDES) Project Applicability Form" (SUSMP Checklist) that guides project applicants to submit proper documents to the City for review. The checklist was updated during the 2008/2009 reporting period due to changes in assignments to TTWQ priority during construction, but no changes to the post-construction BMP aspects of the form were made. The updated SUSMP Checklist is included with this report as Attachment 2.1. Additional details on changes to the construction requirements portion of the SUSMP Checklist are included in Section 3 of this JURMP document.

Non-priority development projects were required to complete a Standard Permanent Storm Water BMPs form, which was included as an attachment to the City's updated JURMP document. This form includes a list of all standard permanent storm water BMPs required by the City's SUSMP and requires project proponents to identify which site and source control BMPs will be implemented at the development. If any BMP is not selected, the project proponent must provide an explanation why the BMP is not applicable or feasible for the project. These completed forms are kept with the project's file at the City.

All development projects determined to be Priority Projects after completing the SUSMP Checklist were required to prepare a Storm Water Management Plan (SWMP) to meet the City's SUSMP requirements. As part of the JURMP update, the City also developed a SWMP self checklist to be used by the SWMP preparer, which was included as an attachment to the updated JURMP. In the past, the majority of deficiencies found in document reviews were missing information or sections not having enough detail about proposed BMPs. Table 2-1 lists the development projects subject to the City's SUSMP requirements during the 2008/2009 reporting period, the number of document reviews for each project, and the current approval status of each. Public Priority Projects are marked as Capital Improvement Projects (CIP) in the table.

**Table 2-1**
**Development Projects Subject to SUSMP Requirements During 2008/2009**

| # | Project Name | Location | Project Type | Number of Reviews during 08/09 | Approved during 08/09 |
|---|---|---|---|---|---|
| 1 | Paradise Medical Center | 7th and 8th Street | Priority | 2 | No |
| 2 | Marina Gateway Streetscape (CIP) | Harrison Avenue and 23rd Street | Priority | 2 | No |
| 3 | Bay Marina Drive Widening (CIP) | Bay Marina Drive and I-5 | Priority | 1 | Yes |
| 4 | Carolino Hillside Homes Public Improvements | Portion of "M" Avenue North of 16th Street | Priority | 1 | Yes |

Note that two of the Priority Projects reviewed during the reporting period, both road projects, were approved during their first review. While these projects were relatively simple compared to more complicated residential and commercial developments, the reports included all required components and proposed treatment control BMPs with medium or high pollutant removal efficiencies for the project's most significant pollutants of concern. The Carolino Hillside Homes Public Improvements project is a small project with limited space, therefore a Filterra high rate bio-filtration unit was proposed for the project to provide treatment for metals and oil and grease associated with vehicle traffic.

No Priority Projects were allowed to implement treatment control BMPs with low removal efficiency rankings during the reporting period. The City makes every effort to encourage development projects to select treatment controls with high and medium pollutant removal efficiencies and does not expect to approve many projects with low removal efficiency BMPs. However, if projects proposing a low removal efficiency treatment control BMP with a defensible infeasibility analysis are approved, details of those projects and their feasibility analyses will be reported as required in future JURMP annual reports. No projects were granted waivers from SUSMP requirements, and the City does not anticipate granting waivers in the future.

**Model SUSMP and Hydromodification Management Plan**

The Copermittee Land Development Workgroup met regularly to discuss key Model SUSMP and HMP development issues and provide updates on the status of consultant work products. The City of National City regularly participated in the Land Development Workgroup during 2008/2009.

During the reporting period, the Copermittees submitted the Model SUSMP and HMP to the Regional Board for approval in January 2009. The Model SUSMP was approved by the Regional Board in March 2009, and the City will update its local SUSMP accordingly by the March 2010 deadline. The Land development Workgroup did not receive approval or comments from the Regional Board regarding the submitted HMP during the reporting period. The City's current SUSMP Ordinance contains detailed Interim Hydromodification Criteria (IHC) which the City will continue to implement until the HMP is finalized. None of the development projects undergoing the City's review process during the reporting period were subject to the IHC since all of these projects are less than 17 acres. Once the HMP is approved, the City will also incorporate these requirements into its local SUSMP.

**BMP Installation Verification**

During the course of 2008/2009, after maintenance verification letters had been sent out during the summer of 2008, the City identified recently completed Priority Projects within the City's jurisdiction to be added to the treatment control BMP inventory. When a project is completed, the City checks for BMPs prior to occupancy, records the site information, assigns it a TTWQ priority, and then adds it to the inventory of projects subject to the City's inspection and annual maintenance verification program the following fiscal year. This process helps the City focus its inspection resources on sites

more likely to have maintenance deficiencies, as maintenance deficiencies are generally less likely at sites with recently installed BMPs. A table of the projects identified after distribution of verification letters is presented in Table 2-3 at the end of this JURMP Section. These projects will be added to the City's treatment control BMP inventory in 2009/2010.

#### 2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

**2008-2009 Annual Maintenance Verification Program**

The Municipal Permit requires annual verification of operation and maintenance of treatment control BMPs installed within the City's jurisdiction. Annual verification must be provided by the party responsible for treatment control BMP maintenance and must be returned to the City prior to the start of the wet season (October 1st). While most of the implementation materials used for this program were developed during the 2007/2008 reporting period, 2008/2009 was the City's first year implementing the program.

Using the property owner names and addresses recorded in the City's BMP database, BMP maintenance verification forms were mailed to all the private projects included in the City's BMP database in early 2008/2009. Maintenance verification forms were also completed for all CIP projects on the City's inventory. The template letter, BMP maintenance verification form, and FAQ sheet were included as an attachment to the 2007/2008 JURMP Annual Report. Through this process, the City found that some of its contact information was no longer accurate due to sales of property or foreclosures, and it also found that some management companies needed additional guidance on how to properly maintain BMPs. The City completed research to update contact information and worked with management companies to educate them on the requirements. Through the City's maintenance verification efforts, responses were received from 15 projects. The City sent out six NOVs during this process and during 2009/2010 will continue to work with the few projects for which it did not receive a response, taking escalating enforcement steps as necessary.

**Operation and Maintenance Inspections**

During the 2008/2009 fiscal year, the City conducted inspections of projects with treatment control BMPs in accordance with the inspection frequencies outlined in the Municipal Permit. Table 2-2 provides a summary of the number of inspections performed and how these met the requirements of the Municipal Permit.

**Table 2-2**
**2008/2009 Inspection Numbers versus Municipal Permit Requirements**

| Site Class | Number of Sites | Full BMP Assessments | Percent Inspected | Permit Requirement | Requirement Met |
|---|---|---|---|---|---|
| All Inventoried Sites | 19 | 10 | 53% | 20% | **Yes** |
| Sites with Drainage Inserts | 14 | 7 | 50% | 50% | **Yes** |
| High TTWQ sites | 6 | 6 | 100% | 100% | **Yes** |

Details on the City's site-specific inspection forms and treatment control BMP tracking database were provided in the 2007/2008 JURMP annual report. During the reporting period, GPS coordinates were also collected for the BMPs inspected, and this location information was added to the electronic database. Table 2-4 at the end of this section lists the 10 development projects inspected during the reporting period, a brief description of inspection findings, and, if applicable, any follow-up actions taken. The BMP types proposed at these sites and the sites' TTWQ priorities are included in the City's treatment control BMP inventory, which is included in Appendix A.1 of this JURMP Annual Report.

During the 2008/2009 reporting period no sites were observed to present a significant threat to human health or the environment during inspections, so none were reported to the RWQCB.

## 2.5 Development Planning Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 2.6 Program Review and Modification

The inspection frequency for treatment control BMPs has been revised to match the Municipal Permit language more closely. Table 4-2 of the JURMP has been revised to read as follows:

**Table 4-2**
**Treatment Control BMP Inspection Frequencies**

| Site Type | Inspection Frequency |
|---|---|
| High Priority | Annual, Completed Prior to Wet Season |
| Contains Drainage Inserts | 50 Percent of All Sites with Drainage Inserts Per Year |
| All Other Sites | As Needed |

**Table 2-3**
**SUSMP Projects Completed After Establishment of 2008/2009 Inventory**

| # | Project Name | Project Address | Development Type | BMPs | HSA | Year Completed | TTWQ |
|---|---|---|---|---|---|---|---|
| **1** | 940 W 19th Street | 940 W 19th Street | Industrial | Biofilter | 908.32 | 2008 | Low |
| **2** | Bay Marina Drive Widening (CIP) | I-5 and Bay Marina Drive | Municipal | Filtration | 908.32 | 2009 | Medium |
| **3** | Marina Gateway | Marina Way, south of Bay Marina Dr | Commercial | Biofilters, Hydrodynamic Separator | 908.32 | 2009 | High |
| **5** | West Air Gases | 2300 Haffley Avenue | Commercial | Biofilter, Drainage Insert, Bioretention | 908.32 | 2009 | Medium |

**Table 2-4**
**2008/2009 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 1 | Plaza Bonita Mall Expansion | 6/18/2009 | Some BMPs observed missing, and one hydrodynamic separator was observed in need of maintenance. | Site was sent a maintenance deficiency letter and a request for maintenance verification in September 2009. Site is currently working to install missing BMPs. City will verify proper installation and maintenance in 2009/2010. | In progress |
| 2 | Paradise Ridge | 6/18/2009 | 35 swales observed in adequate condition, and two swales observed in need of repair. | Site was sent a maintenance deficiency letter and a request for maintenance verification in September 2009. | In progress |
| 3 | Paradise Creek Park (CIP) | 9/30/2008 | Drainage insert not observed in catch basin. | City is working to purchase drainage insert to install. | In progress |
| 4 | National City Library (CIP) | 6/18/2009 | All drainage inserts observed in adequate condition | NA | NA |
| 5 | Advanced Plastics | 6/25/2009 | All BMPs observed in adequate condition. | NA | NA |
| 6 | Penske Truck Leasing | 9/30/2008 | All BMPs observed in adequate conditions | NA | NA |
| 7 | Plaza City Apartments | 9/30/2008 | Hydrodynamic separator observed in working condition. | NA | NA |
| 8 | Sweetwater Town & Country Mall | 9/30/2008 | All drainage inserts observed in adequate condition | NA | NA |

**Table 2-4 (Continued)**
**2008/2009 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 9 | Walgreens | 9/30/2008 | All five drainage inserts were observed in need of maintenance | Site was issued an NOV for improper BMP maintenance and failure to return a maintenance verification form prior to October 1, 2008. Project reported to the City that maintenance would be performed. City will verify proper maintenance during routine inspection in 2009/2010. | In progress |
| 10 | Wal-Mart | 9/30/2008 | Hydrodynamic Separator observed in good condition. | NA | NA |

# 3.0 CONSTRUCTION

## 3.1 INTRODUCTION

During 2008/2009, the City continued to implement a program to prevent storm water pollution related to construction activities within the City. Modifications to the City's construction program were last made in late March 2008 as part of its JURMP update. All changes made at that time have been implemented for the entire 2008/2009 reporting period.

### 3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- Distributed storm water requirements applicability checklists to all development projects in the City's jurisdiction.
- Conducted plan checks of erosion control plans and SWPPPs to ensure construction projects planned to comply with the City's minimum BMP requirements.
- Distributed copies of the Construction BMP Fact Sheet with all approved grading permits.
- Conducted 111 construction inspections at 66 sites per the frequency in the updated JURMP. During the wet season, high TTWQ sites were inspected bi-weekly, medium TTWQ sites monthly, and as needed for low TTWQ sites.
- Issued two verbal warnings, one administrative citation, and four Notices of Violation to construction sites in response to violations of the City's minimum BMP requirements.
- Conducted pre-construction meetings with all large project developers.

## 3.2 SOURCE CHARACTERIZATION

An inventory of active construction projects during the reporting period is presented in Appendix A.2 of this JURMP Annual Report document. The City's inventory was maintained throughout the reporting period by entering permit application forms into the City's inventory spreadsheet on a continuous basis. New construction projects were added to the inventory at the start of construction, and projects were removed from the inventory after construction was completed. Since construction projects were continually being added and removed throughout the fiscal year, inventory updates were usually performed more frequently than the minimum once per month.

## 3.3 Updates to Ordinances and Approval Processes

The City has not updated its Grading Ordinance or its Storm Water Management and Discharge Control Ordinance since the City's JURMP update during the previous reporting period. Details on any changes to the City's approval process during the reporting period are discussed in Section 3.5 of this document.

## 3.4 Best Management Practice Requirements

The City's construction and grading requirements have not changes since the recent update to the City's JURMP document. A complete list of required construction BMPs is included in the City's BMP Manual, which is an attachment to the City's JURMP. The City continued to assess the implementation and effectiveness of required BMPs at construction sites in 2008/2009.

## 3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below.

### 3.5.1 Education and Staff Training

Education and staff training implemented during the 2008/2009 fiscal year focused on reinforcing the changes made to the City's construction requirements at the time of the City's recent JURMP update to both City staff and the construction community. Construction project proponents were educated in BMP requirements during the approval process described below. Please see Section 8 of this JURMP Annual Report document for details on training and educational materials related to construction and grading activities.

### 3.5.2 Construction and Grading Approval Process

During the reporting period, City personnel verified that all construction projects planned to implement the City's minimum BMP requirements prior to issuing any building or grading permits. The City conducted its grading approval process as described thoroughly in Section 5 of the City's updated JURMP. The City requires grading construction projects to submit erosion control plans that indicate what BMPs are to be used at the site. These erosion control plans are reviewed by the City to ensure the site plans to meet the City's minimum construction BMP requirements. The City also reviews Storm Water Pollution Prevention Plans (SWPPPs) for sites greater than one acre that are required to obtain coverage under the General Construction Permit. Additionally, the City arranged pre-construction meetings with all developers of large projects to ensure an understanding of construction BMP requirements. Approved

forms and documents completed by project proponents are kept with each project's file at the City for reference. A Construction BMP fact sheet, known as the "Blue Sheet" within the City because the copies distributed are on blue paper, was also distributed with all construction permits issued (Attachment 3.1). Proper implementation of the minimum BMPs listed on the fact sheet was a condition of approval for all permits issued by the City during the 2008/2009 fiscal year.

During the reporting period, none of the City's active construction sites were larger than 17 acres, and the maximum disturbed area limitation did not apply. However, all construction sites were still required to limit exposed cleared or graded areas to the amount of area that could be protected prior to a rain event, as prescribed in the City's seasonal BMP requirements. Note that toward the of the reporting period the City's TTWQ prioritization criteria for high TTWQ sites was modified to change the size threshold from 50 acres to 17 acres. This change was also incorporated in the applicability checklists projects complete when going through the approval process. See subsection 3.7 later in this section for additional details. The City did not have any sites larger than 17 acres during the reporting period, so this change did not affect the TTWQ prioritization of any of the inventoried sites.

Criteria for determining when advanced treatment is required are detailed in the City's JURMP. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites within the City's jurisdiction, and advanced treatment methods were not required at any construction sites.

### 3.5.3 Inspection of Construction Sites

Appendix A.2 of this JURMP Annual Report contains a list of construction projects that were active during the reporting period, along with their assigned TTWQ priorities, the number of weeks the site was active within the rainy season, the numbers of inspections conducted during the wet and dry seasons, the number of follow-up inspections and complaint investigations, and the total number of inspections for each site. In total, 111 construction inspections were performed for 66 construction sites, not including the building inspections at low priority sites, which also include a storm water component.

Construction inspections conducted during the reporting period were performed as described in the City's updated JURMP. Key components of the inspections include checks for coverage under the General Construction Permit during the initial inspection and assessments of compliance with the City's BMP and discharge requirements during all inspections. Responsible parties at the sites are educated as needed during inspections. Copies of the inspection forms are kept on file at the City. The City conducted inspections at high TTWQ construction sites bi-weekly during the wet season and monthly for medium TTWQ sites. Low TTWQ sites were inspected on an as needed basis. Typically, storm water only inspections were not conducted at low TTWQ sites unless a complaint was called into the City's storm water hotline. Construction inspectors have been trained in the City's minimum construction BMP requirements,

and they check BMP implementation at low TTWQ construction sites during their inspections. Any sites found to have problems with BMP implementation are forwarded to the City's Storm Water Compliance Inspector. During the reporting period, two inspections of low TTWQ construction sites were conducted as complaint investigations. These sites are indicated on the City's inventory in Appendix A.2.

When any violations were noted during routine, follow-up, or complaint investigation inspections, these violations were noted on the project's inspection form, and the sites were given a list of corrective actions necessary to fix the observed violation. During 25 of the inspections a construction site was observed to not be incompliance with the City's BMP requirements. In some cases, these issues were resolved while the inspector was still on site. When necessary, appropriate enforcement actions were taken, and City staff followed up with the site until compliance was achieved. Details on the enforcement actions taken for construction sites during the implementation period are described below.

### 3.5.4 Enforcement Measures

Table 3-1 includes the number of violations and enforcement actions taken during the reporting period in response to violations of the City's minimum construction BMP requirements. Enforcement actions are administered in an escalating manner as described in the City's updated JURMP.

**Table 3-1**
**Summary of Construction Enforcement Actions Taken**

| Verbal Warnings | Notices of Violation | Administrative Citations | Stop Work Orders |
|---|---|---|---|
| 2 | 4 | 1 | 0 |

Two low TTWQ construction sites received verbal warnings when they failed to implement the City's minimum construction BMP requirements and the inspector remained onsite until appropriate changes were made. No Stop Work Orders were issued in 2008/2009, but the City's JURMP notes that if a Stop Work Order is issued the Regional Board will be notified within five working days. During the reporting period, two complaints were received regarding construction site activities. Further details regarding complaint investigations and all enforcement actions taken during the reporting period can be found in Section 4 of this document.

None of the violations observed at construction sites during the reporting period were found to endanger human health or the environment. The City was able to address these violations through the City's established enforcement process, and it was not necessary to report any of these sites to the RWQCB.

## 3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 3.7 Program Review and Modification

The City's JURMP was last updated in March 2008. Since that time, RWQCB staff suggested during a meeting with the City by that the high TTWQ criterion for construction sites be 17 acres, the same as the maximum disturbed area for construction. The City agreed that the change would be feasible and updated the Water Quality Threat Prioritization Flow Chart for Construction Projects in the City's JURMP to consider any project 17 acres or larger to be high priority. The updated flow chart is available as Attachment 3.2 of this JURMP Annual Report and has been updated in the City's JURMP. This change is also visible in the updated NPDES Project Applicability Form or "SUSMP Checklist" in Attachment 2.1.

# 4.0 MUNICIPAL COMPONENT

## 4.1 INTRODUCTION

Throughout 2008/2009, the City of National City continued to manage municipal areas and activities to reduce discharges of pollutants to the MS4 to the MEP. As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. Public parks and recreation facilities, administrative buildings, fire stations, and public works facilities make up the bulk of the municipal areas in the City. Municipal activities conducted by the City include but are not limited to graffiti abatement, building maintenance, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2.

### 4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City inspected all high TTWQ fixed municipal facilities.
- The City removed a total of 1,004 tons of sediment and debris from street sweeping activities.
- The City removed a total of 42.2 tons of sediment and debris from standard MS4 cleaning activities, not including drainage insert maintenance.
- The City spent 3,007 man-hours maintaining 442,150 linear feet of sanitary sewer line.
- The City inspected all special events that occurred in the City during 2008/2009 to ensure appropriate BMP implementation and clean up. The City also developed a new special event inspection form to aid in special event inspection documentation.
- The City received and addressed 27 complaints through the Storm Water Hotline, City website, and other City departments. Enforcement actions resulting from complaint investigations are noted in Table 4-3.

## 4.2 FIXED FACILITIES

### 4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category, fixed facilities. This is because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar.

### 4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included on the City's municipal inventory, which is included as Appendix A.3.

### 4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs at all fixed municipal facilities. As mentioned in the City's JURMP, the City uses the CASQA Municipal BMP Handbook to establish appropriate BMPs for fixed municipal facilities. Table 6-2 in the City's JURMP describes the CASQA fact sheets that are used for specific facility types.

The City continues to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. The BMP requirements have not been changed since the City's JURMP was updated in March 2008.

City public works employees, fire station employees, and employees at other fixed facilities in the City continue to implement BMPs appropriate to the facility type, as described in the City's JURMP. City fire response personnel continue to be trained in implementing BMPs for non-emergency fire fighting activities as described in Section 3 of the City's JURMP. There were no changes in BMP requirements for any fixed facilities during 2008/2009.

### 4.2.4 PROGRAM IMPLEMENTATION

As mentioned above, the City's BMP requirements for fixed facilities have not changed since the development of the revised JURMP. Some notable examples of implementation of those BMPs are provided below.

**Parks and Recreational Facilities**

During 2008/2009, the City used a similar amount of granular fertilizer as in the past, but reduced liquid herbicide use from 88 gallons to only one gallon. Included in the fertilizer total is a small amount (5 pounds) of rose fertilizer, which contains a pesticide component and is stored in limited quantities.

**Public Works Facilities, Fire Stations, Other Fixed Facilities**
As previously mentioned, City personnel continued to implement appropriate BMPs for municipal fixed facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance activities at fixed facilities (i.e., landscaping, building maintenance, etc.) as necessary. Parking facilities associated with fixed municipal facilities were swept quarterly during 2008/2009, and the large paved areas at the City's Public Works Yard were swept weekly. Public Works employees continued to implement a SWPPP at the Public Works Yard. Public Works employees also continued to maintain the BioClean filter inserts on the property as needed.

**Municipal Inspections**
All 10 high TTWQ fixed municipal facilities received an annual routine inspection in 2008/2009. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2008/2009. The City's municipal inspection form, updated in 2008/2009, is included as Attachment 4.1. All inspections conducted at municipal facilities are tracked using a Microsoft Access database, which was created in 2008/2009. Table 4-4 at the end of this section lists all high TTWQ municipal fixed facilities requiring inspection in 2008/2009, the date the inspection was performed, and recommended corrective actions from the inspection. Since the inspections were conducted near the end of the reporting period, follow up inspections will take place in 2009/2010 to ensure that the corrective actions are implemented.

In addition to one annual inspection by other City personnel, public works personnel self inspect both the Public Works Yard East and Public Works Yard West weekly; street crew personnel inspect the Public Works Yard West and equipment maintenance crew inspect the Public Works Yard East. Inspection forms are completed and submitted to the City's Storm Water Compliance Inspector.

## 4.3 Roads, Streets, Highways, and Parking Facilities

### 4.3.1 Background

The City conducts regular maintenance of roads, streets, and parking facilities in the City to control pollutants such as sediment, metals, and litter and debris. Note that there are no highways within the City's jurisdiction.

### 4.3.2 Source Characterization

Roads and streets are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

### 4.3.3 Best Management Practices

The City's primary BMP for roads, streets, and parking facilities is street sweeping. Other BMPs are chosen as needed based on the CASQA Municipal Handbook. The

City's sweeping frequency is outlined in the JURMP and described in the following subsection. There were no changes to the BMPs implemented for roads, streets, and parking facilities in 2008/2009.

### 4.3.4 PROGRAM IMPLEMENTATION

During 2008/2009, the City swept a total of 15,212 curb miles, removing approximately 1,004 tons of debris. High priority streets in the City are swept at least every two weeks, and medium priority streets in the City are swept at least monthly. The City has not designated any streets in the City as low priority. The City does not maintain any stand-alone parking facilities that are not associated with municipal facilities. Seventeen parking facilities that are associated with municipal facilities are maintained and swept during regular maintenance activities at the respective municipal facility, and are considered part of the municipal facility on the inventory. Table 4-1, below, describes the areas assigned high and medium priorities, and the associated sweeping frequency. The table also includes the sweeping frequency for areas of fixed municipal facilities and the associated parking lots.

As a means to address priority pollutants in the San Diego Bay Watershed, the City continued conducting additional sweepings of the all streets in the City. High priority streets were swept daily during 2008/2009; medium priority streets were swept every two weeks during 2008/2009.

**Table 4-1**
**Street Sweeping Prioritization and Frequency**

| Category | Description | Approximate Mileage of Route | Sweeping Frequency |
|---|---|---|---|
| High | 8th Street, National City Boulevard, Highland Avenue, Plaza Boulevard | 11.8 miles | At least every two weeks |
| Medium | All other streets in the City | 98.2 miles | At least once per month |
| Fixed Facilities | Parking lots associated with municipal fixed facilities | N/A* | Quarterly |
| Fixed Facilities – Parks | Parking lots associated with parks | N/A* | Every two weeks |
| Fixed Facilities – PW Yard | Public Works Operation Center | N/A* | Weekly |
| **Total Amount of Debris Collected from Street Sweeping Activities: 1,004 tons** | | | |

* Mileage data is not available for the swept area of 17 parking facilities associated with municipal facilities, and the PW Yard. Mileage accrued while sweeping these facilities is included in the total mileage.

**Inspections**

Trash, debris, and sediment that has accumulated on City streets is identified and cleaned up via street sweeping, so additional inspections beyond this effort are not necessary.

## 4.4 MS4

### 4.4.1 Background

The City's extensive storm water conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during a rain event. The City's MS4 consists of approximately 19 miles of inlets, pipes of varying materials, natural channels, concrete channels, culverts, and 751 catch basins and inlets.

### 4.4.2 Source Characterization

The City's MS4 as one complete entity is included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.4.3 Best Management Practices

The City maintains a strict MS4 maintenance and cleaning schedule. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. As described in the City's JURMP, BMPs for MS4 maintenance activities are chosen based on the CASQA Municipal Handbook and have not changed during 2008/2009.

### 4.4.4 Program Implementation

The City implemented a rigorous MS4 inspection and cleaning schedule during 2008/2009, requiring 605 man-hours to maintain. The City continues to track municipal activities, such as MS4 channel cleaning, in a Microsoft Access database. During 2008/2009, the MS4 maintenance logs were updated to enable the City to record more detailed information regarding the different types of debris removed; implementation of these new logs is anticipated starting at the beginning of the 2009/2010 reporting period. The updated Storm Drain Box Cleaning Log and Storm Drain Channel Cleaning Log are available in Attachment 4.2 and Attachment 4.3, respectively. The City inspected and cleaned all MS4 cleanout locations and open channel segments in 2008/2009, as described in Table 4-2, below.

**Table 4-2**
**MS4 Maintenance Data**

| MS4 Structure | Percent inspected and/or cleaned* | Percent of open channels found with anthropogenic litter | Amount of debris removed from cleaning activities |
|---|---|---|---|
| Catch Basins / Self-Cleaning MS4 Facilities | 100% | N/A | 30,466 pounds |
| Open Channels | 100% | 100% | 135.01 cubic yards (54,004 pounds) |
| Drainage Inserts | 100% | N/A | 10 pounds |
| **Total Debris Removed From MS4 Maintenance Activities: 42.2 tons**** | | | |

* No structures were observed at least 33% of capacity during the reporting period. However, the City cleans out any structures, including self-cleaning structures, in which trash and debris is observed at the time of inspection.
** The weight of the material removed during channel maintenance activities was not recorded. Since trash the most common item removed, a conversion factor of 400 pounds per cubic yard was used to estimate the total weight of the material removed.

The City's cleanout locations are access points to various sections in the City's MS4, so no additional pipe beyond the cleanout location is typically cleaned. The City will use the vactor truck to clean the MS4 line in the event of a spill. During 2008/2009, there were three spills for which some additional cleaning of the MS4 had to be conducted. More information about the spills that occurred in the City during 2008/2009 is included in Table 4-5 at the end of this section.

During 2008/2009, the City continued to inspect the open channels in the City and remove trash and debris as necessary by hand. If litter or debris is observed during the routine inspections, it is removed immediately. The total length of the channel segments inspected and cleaned by City staff is approximately 25,950 linear feet. Additionally, as part of WURMP efforts that are beyond minimum required maintenance, the City hired a contractor in 2008/2009 to do biweekly inspections and remove any observed trash from Paradise Creek.

## 4.5 SANITARY SEWER SYSTEM

### 4.5.1 BACKGROUND

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. Routine inspection and maintenance of the sanitary sewer system works to reduce the potential for a spill or SSO and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

### 4.5.2 SOURCE CHARACTERIZATION

The City maintains a system of public sanitary sewer pipes to convey wastewater from the City to be treated. The sanitary sewer system, as one complete entity, is included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.5.3 BEST MANAGEMENT PRACTICES

The City implements BMPs from the CASQA Municipal Handbook, as described in the City's JURMP, during sanitary sewer maintenance. There have been no changes to these BMPs during 2008/2009. The City inspects and maintains the sanitary sewer system as part of regular wastewater activities. The City clears blockages and repairs leaks as needed.

### 4.5.4 PROGRAM IMPLEMENTATION

The City seeks to eliminate seepage from the sanitary sewer system to the MS4 by routine preventative maintenance of both systems. Routine maintenance of both systems allows the City to find areas that are likely to become problems in the future and make the necessary repairs/replacements before any larger issues arise. The City also continued to conduct flow metering throughout its sanitary sewer system to monitor for evidence of potential problems. A total of 3,007 man-hours were spent maintaining a total of 442,150 linear feet of sanitary sewer line during 2008/2009. Silt and grease were listed as the most common items removed from sanitary sewer lines during maintenance activities. A total of 2,800 linear feet of sanitary sewer line was televised during 2008/2009 to determine if areas of the sanitary sewer were in need of maintenance or repair.

The City has also developed a Fats, Oils, and Grease (FOG) program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs.

The City maintains a Sanitary Sewer Management Plan (SSMP) which establishes procedures for responding to an SSO. Detailed information about the City's SSO spill response plan is included in the City's JURMP. There were no SSOs during 2008/2009.

## 4.6 MOBILE MUNICIPAL ACTIVITIES, INCLUDING POWER WASHING

### 4.6.1 BACKGROUND

The City conducts a variety of different mobile municipal activities, typically involving infrastructure maintenance, landscape maintenance, and graffiti removal.

### 4.6.2 SOURCE CHARACTERIZATION

Both power washing and graffiti removal had previously been listed on the City's high TTWQ municipal inventory. However, it was determined that power washing is only used by the Graffiti Removal sector of Neighborhood Services and is therefore only conducted during graffiti removal activities. Since graffiti removal itself is already an inventoried activity, power washing was removed from the inventory (Appendix A.3). Infrastructure maintenance and landscape maintenance are listed on the City's medium TTWQ municipal inventory.

### 4.6.3 BEST MANAGEMENT PRACTICES

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel are trained to implement BMPs for the specific activity in which they are involved. For example, City personnel conducting graffiti removal are trained to store and handle any chemicals properly and to collect all waste water from power washing. A more detailed discussion of BMPs for specific mobile activities is included in the City's JURMP; there were no updates to the BMPs implemented during mobile activities during 2008/2009.

### 4.6.4 PROGRAM IMPLEMENTATION

During 2008/2009, City personnel continued to implement BMPs during mobile municipal activities such as graffiti removal and landscape maintenance. Most importantly, City personnel collect any water generated by activities such as power washing during graffiti removal activities and dispose of it properly. City personnel are provided with a handout that gives a summary of appropriate BMPs for power washing activities and reminds personnel that water generated by such activities must always be collected and disposed of properly.

One annual routine inspection of graffiti removal activities was conducted during the 2008/2009 reporting period. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2008/2009, including the inspection of graffiti removal activities. There were no instances of non-compliance relating to mobile municipal activities, and no corrective actions were required based on the inspection of graffiti removal activities during 2008/2009 (see Table 4-4).

## 4.7 SPECIAL EVENTS

### 4.7.1 BACKGROUND

As detailed in the City's JURMP, a variety of different special events are hosted within the City. Notably, the City's largest special event is an annual July 4th celebration.

### 4.7.2 SOURCE CHARACTERIZATION

As required by the Municipal Permit, special events are included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.7.3 BEST MANAGEMENT PRACTICES

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter/debris from the event, and raise storm water awareness among the vendors and patrons of the event, as applicable. BMPs for special events did not change during 2008/2009.

### 4.7.4 PROGRAM IMPLEMENTATION

The City hosted several special events during 2008/2009, including various one-time celebrations and recurring events. For each special event, the City inspected the site to ensure the proper implementation of required BMPs, as detailed in the City's JURMP. Special events that had not finished clean up at the time of the inspection were required to resolve remaining housekeeping issues within a timely manner. The special event inspection form, developed in 2008/2009, is available as Attachment 4.4. All inspections conducted at special events are tracked using a Microsoft Access database, which was created in 2008/2009. A full list of special events in the City is below:

**Special Events in 2008/2009**

- Fourth of July Celebration
- Bayfront Concert & Movie (National City Week)
- Health and Fitness Fair (National City Week)
- Family Entertainment at Plaza Bonita (National City Week)
- El Grito at Kimball Park and Open House at City Hall (National City Week)
- City Birthday Celebration (National City Week)
- State of the City Address and Taste of NC (National City Week)
- National City Fire Department "Tower of Terror"
- Christmas at Morgan Square
- Westfield Plaza Bonita Carnival
- Circus Vargas
- Feria de Salud—Por Tu Familia
- Cinco de Mayo
- Farmer's Market
- Taste of National City
- 23rd Annual Chili & Salsa Cook-off & Literacy Day
- Philippine Fair
- SD Movies in the Park at Las Palmas Park

There were no notable instances of non-compliance requiring enforcement beyond following up to ensure appropriate housekeeping was completed.

## 4.8 Public Reporting of Illicit Discharges and Connections

**Reporting and Response**

Public and municipal involvement are crucial to preventing and eliminating illicit connections and illegal discharges (IC/ID) from the storm water conveyance system. The Storm Water Hotline provides an effective means for individuals in the City to report suspected IC/IDs. The hotline number is provided on the City's website and in distributed storm water educational material. Storm water complaints may also be reported through the City's website. All complaints received through the hotline and website are logged into a spreadsheet for documentation and tracking. Each logged complaint is investigated by City personnel to determine if an IC/ID is present. Responsible parties for any confirmed IC/ID are sought out and educated and/or cited as necessary and required to stop any and all illegal discharges.

Complaints received by the City during the 2008/2009 reporting period and the City's response to each are listed in Table 4-5 at the end of this section. A total of 27 complaints were documented this year, a decrease from the 48 that were recorded last year. The extensive distribution of educational materials with the hotline number, particularly in residential areas, in 2008/2009 could have resulted in an increase in the number of complaints; however this was not the case. The observed decrease in complaint number may indicate that as individuals in the City become more aware of appropriate BMPs to prevent pollutants from reaching the City's MS4, fewer reportable incidents are observed by the public. For example, in residential areas of the City there were seven recorded complaints, but only three problems were identified during those seven field investigations. Most were related to excessive running water, which is less serious than an observed intentional discharge of pollutants.

**Enforcement**

As previously stated, complaints received via the Storm Water Hotline or City website, are included in Table 4-5 at the end of this section. The table also includes a description of how each complaint was resolved during the reporting period. Resolutions to investigated complaints included issuing warnings, corrective actions, and/or citations. Table 4-3, below, summarizes the enforcement actions taken in response to complaints received.

**Table 4-3**
**Enforcement Actions Resulting from Complaints Received by the Storm Water Hotline**

| Type | Verbal Warning | Stop Work Order | Administrative Citation | NOV |
|---|---|---|---|---|
| Commercial | 7 | 1 | 1 | 1 |
| Industrial | 0 | 0 | 0 | 0 |
| Mobile | 1 | 0 | 1 | 1 |
| Municipal | 0 | 0 | 0 | 0 |
| Residential | 1 | 0 | 0 | 0 |
| Construction | 2 | 0 | 0 | 0 |

## 4.9 Spill Reporting, Response, and Prevention

The City has documented procedures for preventing and responding to sanitary sewer overflows. As discussed earlier in this section, preventative maintenance is regularly conducted on the City's sanitary sewer system. Additionally video inspections and sewer surveys are regularly conducted to monitor the condition of the public sanitary sewer lines and to determine the necessity of maintenance. Private lateral lines do not receive preventative maintenance, but the City assists in the containment and cleanup of sewer spills if the spill could potentially reach the City's MS4.

Individuals in the City are encouraged to report any SSOs to the City's Storm Water Hotline. As previously mentioned, there were no SSOs during 2008/2009; however four other spills occurred during the reporting period and were reported to the RWQCB within 24 hours of the spill. All spills have been included in Table 4-5 at the end of this section with the other public complaints, however the following list also outlines the spills reported and investigated by the City:

- On 8/17/2008 a fire hydrant was reported broken, spilling water at 2606 Highland Avenue. Sweetwater Authority repaired the hydrant.
- On 12/10/2008 a fire hydrant was reported broken, spilling water on 21st Street and Highland Avenue. Sweetwater Authority repaired the hydrant.
- On 4/27/2009 a fire hydrant was reported broken, spilling water on Bay Marina Drive and Cleveland Avenue. Sweetwater Authority repaired the hydrant.
- On 6/16/2009 a discharge of sediment to an open channel was discovered at the National City Golf Course. American Golf received a Stop Work Order, a Notice of Violation, and a citation.

## 4.10 Education and Outreach

During 2008/2009, the City continued to educate municipal personnel regarding proper BMP implementation and other storm water and watershed concepts. The City also posted winning entries from the storm water calendar art contest on a bulletin board in

City Hall, which provided storm water information. A photo of the bulletin board is included as Attachment 4.5. Information regarding the education and outreach conducted for City personnel is described in Section 8 of this Annual Report.

## 4.11 Municipal Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 4.12 Program Modification and Review

The following modifications were made to the municipal component of the City's JURMP during 2008/2009:

**Municipal Inspections (Section 6.2.4.3 in the City's JURMP)**
The City made some minor changes to its municipal inspection form to clarify the meaning of some questions and streamline data management. The updated inspection form is included as Attachment 4.1.

**MS4 (Section 6.4 in the City's JURMP)**
The City made some minor changes to its MS4 maintenance logs to enable better documentation and tracking of the types and amounts of debris removed from the City's MS4 during routine maintenance activities. The updated storm drain box cleaning log and storm drain channel cleaning log are included as Attachment 4.2 and Attachment 4.3, respectively.

**Special Events (Section 6.7 in the City's JURMP)**
The City developed a special event storm water inspection form to enable better documentation and tracking of the inspections and enforcement of BMP requirements at special events. The special event inspection form is included as Attachment 4.4.

**Table 4-4**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Inspection Date | Corrective Actions Needed |
|---|---|---|---|---|---|
| 1 | Butterfly Park | East 22nd Street and Palm Avenue | High | 5/26/2009 | • No significant corrective actions |
| 2 | El Toyon Park | 2005 East 4th Street | High | 5/20/2009 | • No significant corrective actions |
| 3 | Graffiti Removal (Mobile Activity) | Kimball Skate Park, 16th Street | High | 6/18/2009 | • No corrective actions |
| 4 | Kimball Park | 12th Street & D Avenue | High | 5/20/2009 | • Keep drains and discharge locations free of sediment, trash, and debris, especially catch basin on north end of A Street.<br>• Keep parking lot next to skate park and sidewalk along A Street free of sediment.<br>• Provide soil stabilization to minimize erosion, especially along E. 12th Street planters and southeast dirt slope along channel.<br>• Cover stockpile by Boys and Girls Club.<br>• Cover roll-off dumpster by Boys and Girls Club and keep the surrounding area free of trash and debris. |
| 5 | Las Palmas Municipal Pool | 1800 East 22nd Street | High | 5/20/2009 | • No significant corrective actions |
| 6 | Las Palmas Park | 1800 Newell Street | High | 5/20/2009 | • Keep discharge locations free of sediment and debris, especially inlet on east end of pool below playground.<br>• Provide soil stabilization along slope around inlet on east end of pool below playground.<br>• Keep dumpster lids closed and keep dumpster areas free of trash and debris. |
| 7 | National City Municipal Golf Course | 1439 Sweetwater Road | High | 5/26/2009 | • No significant corrective actions |
| 8 | Paradise Creek Educational Park | West 19th Street and Coolidge Avenue | High | 5/26/2009 | • No significant corrective actions |

**Table 4-4 (Continued)**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Inspection Date | Corrective Actions Needed |
|---|---|---|---|---|---|
| 9 | Public Works East Yard | 2100 Hoover Avenue | High | 5/27/2009 | • Keep discharge points along west fence free of sediment and debris.<br>• Keep street sweeping vehicle storage area free of oil leaks.<br>• Ensure good housekeeping BMPs are in place to eliminate material transport from stockpiles beyond bermed area.<br>• Ensure liquid drums in hazmat storage area behind repair shop are kept in secondary containment, covered, and properly labeled. Keep secondary containment free of spills.<br>• Regularly inspect equipment and vehicles to prevent leaks.<br>• Raise materials stored outdoors (hazmat drums, used tires) off the ground and cover whenever possible. |
| 10 | Public Works West Yard | 2100 Hoover Avenue | High | 5/27/2009 | • No significant corrective actions |
| 11 | Sweetwater Heights Park | Cagle Street and Stockman Street | High | 5/26/2009 | • No significant corrective actions |

**Note:** Roads, streets, highways, and parking lots; the MS4; and the sanitary sewer system were inspected via the maintenance effort described earlier in this section.

**Table 4-5**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 1 | 7/7/2008 | Commercial | Public Works | 3142 Plaza Boulevard | Sewer clog caused overflow from sink to reach the storm drain | A clogged sewer line downstream of a kitchen sink caused an overflow of sewage to flow out of the kitchen to a private storm drain line. Inspector gave a verbal warning and discharge was stopped. The business was required to immediately repair the clog and clean out the private storm drain line. There was no discharge to the City's MS4. |
| 2 | 7/9/2008 | Construction | Development Services | 8th Street & Harbison Avenue, by Church's Chicken | Water was discharging to street | Water used for dust control at a vacant lot was flowing off of the property to the gutter. Inspector gave a verbal warning, and the discharge was immediately stopped. |
| 3 | 8/5/2008 | Municipal | Development Services | Grove Street & Sweetwater Rd | Landscape debris in gutter | Grass clippings were observed in the middle of Grove Street and at the cross-gutter, where water had pooled. The street sweeper was notified and cleaned up the debris. The cross-gutter was marked for later public improvements. |
| 4 | 8/17/2008 | Municipal | Police Dept | 2606 Highland Avenue | Fire hydrant leak | RWQCB (Dat Quach) was notified by voicemail on 8/17/08 and in writing on 8/19/08. Sweetwater Authority repaired the hydrant. |
| 5 | 8/19/2008 | Construction | Public Works | 1502 Highland Ave | Water being used to wash off driveway & sidewalk | Inspector gave a verbal warning to construction site personnel that had washed sidewalk and driveway toward the gutter, where gravel bags had been placed. Site was told to use dry methods and keep all materials and let nothing leave the job site. Worker on site observed to check all BMPs. |
| 6 | 9/23/2008 | Residential | Hotline Caller | 9th Street between M Avenue and N Avenue | Liquid dumped in the gutter | Oil appeared to have been washed into the gutter. No source was identified. Public Works was dispatched to clean the area. |

**Table 4-5 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 7 | 10/2/2008 | Residential | Hotline Caller | 300 Block of D Avenue | Discharge from single family residence that smells strongly of urine. | No discharge was observed during the inspection. Field investigation did not identify any threat to storm water quality. |
| 8 | 12/10/2008 | Commercial | County of San Diego | 1339 Hoover Avenue | Coolant in the gutter | A coolant spill had reached an outside surface to curb drain. The drain was 80% clogged and a minimal amount of coolant actually reached the gutter. Inspector gave a verbal warning with corrective actions. Business was required to clean the gutter at the curb outlet, clean the surface drain, conduct auto repairs inside if possible and use additional BMPs if working outside. Crown Transmission Center was scheduled for full inspection later in 2008/2009. |
| 9 | 12/10/2008 | Municipal | Police Dept | 21st Street & Highland Avenue | Fire hydrant leak | RWQCB (Dat Quach) was notified by voicemail and in writing on 12/11/08. Sweetwater Authority repaired the hydrant. |
| 10 | 12/17/2008 | Municipal | Public Works | Valley Road & Calle Abajo | Sediment and water flooding street during rain event | Public Works crew discovered that an empty barrel and shopping cart (on private property in City of San Diego) was blocking a natural drainage ditch. Property owner gave the crew permission to remove these items. |
| 11 | 12/17/2008 | Commercial | Hotline Caller | 3100 E 8th Street | Private property being flooded by water from adjacent business | A stream of water was observed coming from the business property, flowing down the bank and retaining wall, flooding private home property. Water was discovered coming from a broken hose bib, where copper pipe was missing from exterior walls, where the hose bib and water heaters were. A plumber on site shut off the water at the meter. Marbro Construction Company later reported having fixed the pipe. |

**Table 4-5 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 12 | 12/29/2008 | Commercial | Hotline Caller | 1411 Harding Avenue | Private party reported to PW that company was putting hazardous material in dumpster. | Dumpsters were inspected, but no hazardous material was noted. Spoke with manager regarding complaint. Manager will monitor dumpsters. |
| 13 | 1/5/2009 | Mobile | Sweetwater Authority | 30th Street & Highland Avenue | Concrete cutting activity discharging to gutter. CA plate 9B59755, contractor license #180853 | Contractor crew was removing concrete cap from the top of underground tanks. Inspector observed that concrete residue and water from the site was draining into a storm drain inlet west of I Ave on the north side of 30th St. The crew was stopped and instructed to sweep remaining material in street and gutter and dispose of it. Public Works crew was dispatched with a flusher truck to 30th and J Ave to clean the inlet and finished cleaning by noon. |
| 14 | 1/5/2009 | Mobile | Hotline Caller | 1300 Block of A Avenue | Water truck with open valve was discharging water to street and storm drain inlet | Driver parked vehicle up hill from inlet and opened valve releasing water. Driver acknowledged that he knew this practice was against City ordinance and that the water was not de-chlorinated. NOV and citation issued to Miller Paving with copy to RWQCB. Citation #2719 issued on 1/6/09 for the amount of $200. Mobile business was added to the City's inventory and required to obtain a business license. |
| 15 | 2/12/2009 | Commercial | Police Dept | 101 N. Highland Avenue | Water discharge | Inspector went to the site and found a wet driveway. The sprinkler box was opened and found to be full of water. The broken irrigation system was shut off by the owner. |
| 16 | 3/16/2009 | Commercial | Hotline Caller | 108 B 8th Street | Water from washing the meat department floor reported to run down back alley in the evening | Inspector did not observe a discharge but contacted owner, who stated that it was not the current practice. Owner let staff know this would be a violation and not acceptable. |

**Table 4-5 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 17 | 4/6/2009 | Commercial | Hotline Caller | 2220 Plaza Boulevard, Suite D | Bad, greasy smell coming from BBQ restaurant | Inspector talked to the owner at Hawaiian BBQ and told him to clean up outdoor area. Owner was verbally warned that if not kept clean it would be a violation. A full storm water inspection conducted later in the month found the business in compliance. |
| 18 | 4/20/2009 | Residential | Hotline Caller | 1906 E 16th Street | Running water down the sidewalk into the gutter | No discharge was observed during the inspection. Field investigation did not identify any threat to storm water quality. |
| 19 | 4/27/2009 | Municipal | Hotline Caller | Bay Marina Drive & Cleveland Avenue | Fire hydrant leak | RWQCB (Dat Quach) was notified by voicemail and in writing on 4/28/09. Sweetwater Authority repaired the hydrant. |
| 20 | 4/29/2009 | Residential | Hotline Caller | 1st Street & Valva Avenue | Car in driveway leaking oil | Inspector noted a Dodge truck parked in a driveway leaking oil to the gutter. Public Works crew found no oil in the nearest storm drain inlet, but cleaned a small amount of debris from inlet and soaked up oil from the gutter with absorbent. City traffic division was notified to mark the vehicle. |
| 21 | 4/29/2009 | Commercial | Hotline Caller | 1940 Highland Avenue | Kitchen wash water allowed to discharge to parking lot and surface drains | No discharge was observed during the inspection. Field investigation did not identify any threat to storm water quality. Manager was verbally warned not to allow any discharge of water to the parking lot or surface drains. Manager was to notify other shift managers. |
| 22 | 4/30/2009 | Residential | Hotline Caller | 801 National City Blvd | Water was flowing from Bayview Towers along A Avenue | Inspector observed that a pump near the swimming pool had a problem, and water kept pumping until it flowed onto the street. The Bayview Towers staff were notified and stopped the pumping. |

**Table 4-5 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 23 | 5/5/2009 | Commercial | Hotline Caller | 424 Mile of Cars Way | Kitchen floor and mat wash water flowing to parking lot | No discharge was observed. Manager was verbally warned not to allow any discharge of water to the parking lot. Manager was to notify other shift managers. |
| 24 | 5/6/2009 | Residential | Hotline Caller | 600 Block of Rachael Avenue | Water running down the sidewalk at Rachael Avenue and creating a consistent puddle. | No discharge was observed during the inspection. Field investigation did not identify any threat to storm water quality. |
| 25 | 5/20/2009 | Commercial | Development Services | 524 Highland Avenue | Sewage or grease in the back of a restaurant | A sewer cleanout was observed, but no sewage or grease issues were observed in the back area of the restaurant. |
| 26 | 6/11/2009 | Residential | Hotline Caller | Alley behind K Avenue between 22nd Street & 23rd Street | Water running for over 24 hours | At 12:25 pm an area at the bottom of the hill was damp, but no flowing water was observed in the alley. No further action was needed. |
| 27 | 6/16/2009 | Commercial | Development Services | 1439 Sweetwater Rd | Discharge of sediment and debris into a channel of a watercourse | Sediment had been discharged to the open channel running through the golf course. RWQCB (Dat Quach) was notified by voicemail and in writing on 6/17/09. Stop order, NOV, and Citation #2720 were issued to American Golf. |

# 5.0 INDUSTRIAL AND COMMERCIAL

## 5.1 INTRODUCTION

During 2008/2009, the City continued to implement a program to mitigate urban runoff pollution from the areas and activities of industrial and commercial businesses. Through various aspects of the industrial and commercial program, the City aims to reduce the amount of pollutants discharged from these facilities.

### 5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the industrial and commercial component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City met the Municipal Permit requirement of inspecting at least 25 percent of its stationary industrial and commercial inventory.
- The City met the Municipal Permit requirement of inspecting 100 percent of its inventoried high TTWQ industrial and commercial facilities.
- The City completed pollutant discharge potential assessment (PDPA) forms at inspections to aid in source identification efforts.
- The City issued 247 notices of correction with inspection results to industrial and commercial business based on inspection results.
- Based on inspection findings and complaints made to the hotline, the City issued seven NOVs and four administrative citations to industrial and commercial businesses.
- The City responded to two complaints regarding potential non-compliance of mobile businesses and resolved each issue of non-compliance appropriately.

## 5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES / SOURCES ELEMENT

### 5.2.1 BACKGROUND

The City's industrial and commercial inventories, which can be found in Appendix A, include all stationary and mobile businesses known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, auto repair shops, restaurants, wholesalers, and contractors. As discussed in the following subsections, the City requires industrial and commercial businesses to implement pollution prevention

measures and designated minimum BMPs to mitigate the impacts of business' activities on water quality.

### 5.2.2 Source Characterization

The City's industrial and commercial inventories are included as Appendix A.4 and A.5, respectively. The inventories include both stationary and mobile businesses, as required by the Municipal Permit. The inventories were updated in 2008/2009 using applicable data from the City's business license registry, the 2007/2008 inventory and inspection records, and the State's list of industrial sites covered under the State of California Industrial General Permit (Industrial Permit).

Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP. The City considers factors including those listed below when prioritizing the inventories:

- Results from previous inspections and institutional knowledge
- Presence of significant exposed outdoor storage or activities
- Consideration of downstream water body and whether the business is likely to discharge pollutants for which the water body is impaired
- Proximity to the receiving water body
- Facility size
- Industrial Permit subjectivity

The City's updated inventories include a total of 835 stationary industrial and commercial facilities.

### 5.2.3 Best Management Practice Requirements

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other BMPs to reduce or potentially eliminate the generation of pollutants from business areas/activities. The City has established a set of minimum BMPs based on the CASQA Industrial and Commercial Handbook. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. The City's BMP requirements are described in more detail in the City of National City Best Management Practice Manual, which is an attachment to the City's JURMP. The City's BMP requirements for industrial and commercial businesses did not change during 2008/2009.

### 5.2.4 Program Implementation

**Industrial and Commercial Inspections**

During 2008/2009, the City conducted storm water compliance inspections at selected stationary industrial and commercial facilities; Table 5-1 provides a summary of the industrial and commercial site visits. The purpose of the inspections is to confirm that the City's minimum BMPs are being implemented at stationary industrial and commercial facilities.

This was the second year of implementation of the updated JURMP program since requirements of the new Municipal Permit went into effect March 2008. The industrial and commercial component of the City's storm water program was conducted under the new Municipal Permit requirements for the entire 2008/2009 fiscal year. The City inspected 100 percent of the inventoried high TTWQ industrial and commercial facilities, which met the Municipal Permit's requirements for the second year of program implementation.

Table 5-1, below, provides a summary of the industrial and commercial site visits. All of the high TTWQ sites were selected for inspection, and additional medium TTWQ industrial facilities were also selected for routine inspection. Additional medium TTWQ sites selected for inspection were facilities that had not been inspected within the last few years.

**Table 5-1**
**Summary of Industrial and Commercial Inspections**

| Facility Category | Equivalent Full Inspections Conducted* | Percentage of Total Inventory |
|---|---|---|
| High TTWQ Sites | 121 | 14%<br>(100% of high TTWQ sites) |
| Additional Sites | 152 | 18% |
| **All Stationary Inventoried Sites** | **835** | **32%** |

* "Equivalent Full Inspections Conducted" includes full inspections and also counts at 50 percent value the site visits where a full inspection could not be conducted but where effort was taken to document the visit and update the inventory. It does not include any businesses that were duplicate listings of other inspected facilities or facilities replaced by other businesses inspected during the reporting period.

Facility inspections were conducted in accordance with the protocol set forth in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. BMP deficiencies and corrective actions were discussed with facility personnel present during the inspection and recorded on the City's industrial and commercial inspection form, updated in 2008/2009 and included in Attachment 5.1. The City also completed PDPA forms during the inspections as part of an additional data collection effort. The PDPA form is included with the City's inspection form in Attachment 5.1. More information about the results of this process is presented in Section 12 of this JURMP Annual Report.

During the inspection process, the City also checked Industrial Permit compliance status when applicable. Businesses observed to be in violation of the Industrial Permit are included in Table 5-2. Table 5-3, at the end of the section, summarizes the results of the 351 site visits conducted during 2008/2009. A total of 249 full inspections were completed as part of the City's 2008/2009 routine industrial and commercial inspection

program. The remainder of the sites were visited, but during the visit were found to have moved, be duplicates of other businesses, or not to be conducting activities for which inclusion on the City's inventory is necessary.

Facilities that were recommended for follow-up are noted in the table. The City visited some of these sites in 2008/2009, but anticipates conducting follow-up inspections at most of the facilities in 2009/2010, results of which will be reported in the 2009/2010 JURMP Annual Report. The City provided copies of inspection results to each facility that received a full inspection in 2008/2009. The inspection report included the findings of the inspection, including all required corrective actions recorded by the inspector.

The City did not rely on third party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third party inspection program.

**General Industrial Permit**

Industrial Permit compliance status was evaluated during the industrial and commercial inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business's standard industrial classification (SIC) code(s). The inspector then determined Industrial Permit subjectivity based on SIC code. Violations of any aspect of Industrial Permit requirements were recorded on the standard industrial and commercial inspection form and are presented in Table 5-2. The table includes businesses directed to file a Notice of Intent (NOI) and develop a Storm Water Pollution Prevention Plan (SWPPP) and monitoring program, as well as businesses that had filed an NOI but had failed to develop a SWPPP and monitoring program. The table also includes facilities that could potentially gain exemption from Industrial Permit requirements by completing notice of non-applicability/no exposure certification (NONA/NEC) paperwork. Each business was notified of any Industrial Permit-related non-compliance by the inspector.

Note that the business "GV Industries" was initially found to be in violation of the General Industrial Permit and was recommended to file a NOI. Based on a later follow-up inspection and correspondence with RWQCB staff, it is our understanding that they have since qualified for exemption by eliminating outdoor exposure and completing NONA/NEC paperwork.

**Education and Outreach**

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to provide site-specific one-on-one education regarding storm water concepts and BMPs. Educational materials were provided as applicable; nearly all inspected businesses received a copy of the City's 2009 Storm Water Calendar, which can be found in Attachment 5.2.

**Enforcement**

Several industrial and commercial facilities were observed to be out of compliance with the City's municipal storm water ordinance and/or the Industrial Permit during inspections conducted in 2008/2009. Additionally, the City received a number of complaints through the City's storm water hotline. Details of the industrial and commercial complaint investigations are included in the Summary of Documented Public Complaints in Section 4 of this Annual Report. The City issued the following enforcement actions in response to BMP deficiencies during inspections and other complaints:

- Seven verbal warnings
- 247 Notices of Correction (sent with inspection results)
- Eight NOVs
- Five administrative citations
- One Stop Work Order

There were no instances of noncompliance found to present a significant threat to human health or the environment observed at stationary businesses during 2008/2009, so none were reported to the RWQCB.

## 5.3 Mobile Sources

### 5.3.1 Background

Due to the nature of activities of most mobile businesses, a major area of concern tends to be illegal discharges. In general, mobile businesses can be hard to identify, as many may not have City business licenses. Additionally, because the activities of mobile businesses do not occur in one fixed location, inspections of such businesses are impractical.

### 5.3.2 Source Characterization

The industrial and commercial inventories were updated in 2008/2009 using applicable data from the City's business license registry and the 2007/2008 inventory. Known mobile industrial and commercial businesses, as described in the City's JURMP, are included on the City's inventory and are marked as mobile. Toward the end of the fiscal year, the Regional Industrial and Commercial Workgroup also developed a web-based mobile business database for use by all Copermittees. The goal of developing this database is to allow Copermittees to share information about mobile businesses, which may be active in more than one jurisdiction. The City contributed its mobile business inventory for upload to the regional database.

### 5.3.3 Best Management Practice Requirements

BMPs for stationary industrial and commercial facilities, as discussed earlier in this section, are required to be implemented for mobile activities, as applicable. BMPs for

mobile businesses, including key principles such as proper collection and disposal of any discharge, are discussed in the City's JURMP.

During 2008/2009, the Regional Industrial and Commercial Workgroup, in which the City was an active participant, developed regional mobile business BMP standards. These standards were devised to create a uniform set of minimum BMPs for mobile businesses operating within the region. The regional mobile business BMP standards were adopted at the end of June 2009.

### 5.3.4 PROGRAM IMPLEMENTATION

While mobile businesses are not as straightforward to inspect as fixed industrial and commercial facilities, the City has in place a program of education and enforcement to regulate mobile activities.

**Education and Outreach**

All businesses conducting mobile activities within the City's jurisdiction are required to apply for and maintain a business license with the City of National City, regardless of where the business may be based. The Industrial and Commercial "Preventing Urban Runoff Pollution" Trifold is provided to each person applying for a business license in the City, including mobile businesses. The trifold brochure, included in Attachment 5.3 of this Annual Report, clearly prohibits the discharge of wash water and provides a list of required BMPs applicable to industrial and commercial businesses. Mobile businesses maintaining a City business license are included on the Commercial Inventory in Appendix A.5. No known mobile businesses conduct industrial activities in the City at this point in time. To aid in tracking mobile businesses that may conduct activities within its jurisdiction in the future, the City also collaborates with other jurisdictions in the County of San Diego in maintaining a county-wide list of mobile businesses.

**Reporting and Enforcement**

In addition to regulation through business licenses, City staff are trained to report inappropriate mobile business activities to the City's storm water hotline. The City responds to all calls to the City's storm water hotline regarding mobile businesses. There were two complaints made to the City's storm water hotline regarding mobile businesses during 2008/2009. In the first complaint a paving contractor had unknowingly allowed concrete slurry to flow away from the work site and upon inspector arrival was made to immediately stop the discharge and clean up the gutter. In the second complaint, a water truck had knowingly been opened to discharge to the street, and the company received an NOV and citation for $200. More details of these complaint investigations are available in the summary of recorded public complaints in Section 4 of this report. In addition to the two complaints addressed, City staff immediately dealt with an observed case of inappropriate pool water discharge by issuing a citation. In all cases the business and/or a Public Works crew was tasked with clean up to prevent discharge to the MS4 and receiving water body.

There were no instances of noncompliance of mobile businesses that were believed to present potential threats to human health or the environment observed during 2008/2009, so none were reported to the RWQCB.

## 5.4 Industrial and Commercial Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 5.5 Program Review and Modification

During 2008/2009, the City made some minor changes to its industrial and commercial inspection form to clarify the meaning of some questions and streamline data management. The updated inspection form is included as Attachment 5.1. No other changes to the City's industrial and commercial component have been made since that time.

**Table 5-2**
**Violations of the Industrial Permit**

| # | Business Name | Street Address | Inspection Date | Industrial Permit Subjectivity | SIC Code(s) | Notes | Action to Correct Violation | | | |

# 6.0 RESIDENTIAL

## 6.1 INTRODUCTION

Land use in the City of National City is largely residential. Due to the large residential area, activities that take place in residential areas have the potential to impact the quality of receiving waters. Residential activities such as vehicle washing, over-irrigation, and home maintenance can potentially contribute pollutants to the City's MS4 if BMPs are not implemented. Additionally, household hazardous waste (HHW) can contribute pollutants to the City's MS4 if not disposed of properly. Pollutants of concern include sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals. The City has worked to implement a range of programs to address these residential activities with the goal of reducing pollutant loads associated with such activities. The City recognizes the need for educational efforts and opportunities designed specifically for residents and residential activities.

The following sections present activities conducted during this reporting period. These activities are associated with the residential component of the JURMP and include conducting ongoing HHW collection events, distributing educational materials, and participating in community events.

### 6.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the residential component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City developed a 2009 Calendar through a storm water art contest at local schools. The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways.
- The City developed a new door-to-door High TTWQ Residential Education Program. The goal of the program was to determine potential sources of residential pollution, assess residential knowledge, and educate residents.
- The City collaborated with the cities of Chula Vista and Imperial Beach to make HHW disposal events available to residents. The total amount of HHW collected from residents of all three cities was 252,494 pounds. Door-to-door pick up service was available for the disabled and senior communities.
- The City hosted two large item disposal events. The event allowed residents to dispose of large household items (not including HHW), such as unwanted furniture and large appliances.

## 6.2 SOURCE CHARACTERIZATION

The City has identified high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities. To reduce pollutant discharges from these high TTWQ areas and activities, the City designated specific BMPs in the 2008 JURMP. These BMPs did not change during 2008/2009.

During 2008/2009, the City conducted a significant door-to-door effort in all designated high TTWQ residential areas to look for evidence of high TTWQ activities and educate residents. The report from the "High TTWQ Residential Education Program" is included as Attachment 6.1. A summary of the program is provided below.

### 6.2.1 HIGH TTWQ ACTIVITIES

During the 2008/2009 reporting period, as outlined in the City's JURMP, the City continued to identify the following activities as high TTWQ:

- Automobile repair and maintenance, washing, and parking
- Home and garden care activities and product use, including disposal
- Disposal of trash and pet waste

During the door-to-door effort mentioned above, staff members looked for evidence of these high TTWQ activities. A summary of observations made during these visits is in Table 6-1, below.

**Table 6-1**
**High TTWQ Activities Observed During the Door-to-Door Residential Survey**

| High TTWQ Activities and Materials | | Total Observed Incidences |
|---|---|---|
| Activities | Auto repair and oil change | 5 |
| | Car washing | 2 |
| | Other outdoor washing | 3 |
| | Fertilizer application | 1 |
| | Pesticide application | 0 |
| | Poor waste disposal | 0 |
| Material and waste storage | Exposed rusty metal | 8 |
| | Old tires | 6 |
| | Oil leaks or significant stains | 8 |
| | Antifreeze and transmission fluid | 0 |
| | Loose trash | 2 |
| | Pet waste | 1 |
| | Exposed fertilizers and pesticides | 0 |
| | Cooking oil and grease | 0 |
| | Soapy water or residues | 1 |

Note: These observations are from a total of 1,389 residential visits.

### 6.2.2 HIGH THREAT TO WATER QUALITY AREAS

In addition to these activity-based priorities, the City has noted several residential areas that pose higher threats to water quality. High priority residential areas are designated by considering complaint investigations, institutional knowledge, Dry Weather Monitoring data, and criteria as defined in the Municipal Permit. The list of high priority residential areas is subject to re-evaluation based on new observations and data collected during the reporting period.

The following 10 residential areas were designated high TTWQ in the City's JURMP in 2008.

- Division Avenue Area
- West 18th Street Area
- Paradise Creek Area, between F and L Avenues
- East 8th Street Area
- Grove Avenue Area
- Arcadia Place Area
- Harbison Avenue Area
- A Avenue Area

- B Avenue Area
- 2nd Avenue Area

Visits to these areas during April and May of 2009 provided sufficient information to re-evaluate their TTWQ. For example, the West 18th Street and 2nd Avenue areas were determined to lack significant residential sources; most of these areas consist of commercial and industrial land use. In addition, where no evidence of high TTWQ residential activities was noted in an area, that area was removed from the high TTWQ list. Residential areas where some high TTWQ residential activities were observed will remain listed as high TTWQ. If future residential complaints, Dry Weather Monitoring Program results, or observations made by City staff indicate evidence of high TTWQ activities in these or other areas of the City, they will be designated as high TTWQ. No new residential areas have been added at this time; changes to the previous list of high TTWQ residential areas made in 2008/2009 are summarized in Table 6-2, below.

**Table 6-2**
**High TTWQ Residential Area List Updates**

| Residential Area | High TTWQ Status in 2008/2009 | Explanation |
|---|---|---|
| Division Avenue | **Listed**; streets outside of City jurisdiction removed from description. | Some high TTWQ activities were observed in this area. |
| West 18th Street | Removed from list | No residential sources were noted during site visit. |
| Paradise Creek, between F and L Avenues | **Listed** | Some high TTWQ activities were observed in this area. |
| East 8th Street | **Listed** | Oil observed at the 9th Street gutter during complaint investigation. See Section 4 of this Annual Report for details. |
| Grove Avenue | **Listed** | Some high TTWQ activities were observed in this area. |
| Arcadia Place | **Listed** | Some high TTWQ activities were observed in this area. |
| Harbison Avenue | Removed from list | No evidence of high priority activities noted during residential visits. |
| A Avenue | Removed from list | No evidence of high priority activities noted during residential visits. |
| B Avenue | Removed from list | Observed instance of loose trash associated with construction activity, not residential source. |
| 2nd Avenue | Removed from list | No residential sources were noted during site visit. |

The City's updated list of high TTWQ residential areas is as follows:

**Division Avenue Area**
The residential area located near Division Street, east of Highland Avenue, including residences located on East 2nd Street, Melrose Street, Eta Street, Fig Court, and Scott Drive. See Figure 6-1.

**Paradise Creek Area, between F and L Avenues**
The residential area that runs along the Southern side of Paradise Creek between F and L Avenues, including residences located along East 12th Street, East 13th Street, and East 14th Street. See Figure 6-2.

**East 8th Street Area**
The residential area along East 8th Street, including residences on East 8th Street and East 9th Street, between L Avenue and N Avenue. See Figure 6-3.

**Grove Avenue Area**
The residential area surrounding Grove Avenue, including residences along East 14th Street, Grove Avenue, Stancrest Lane, and Orange Street. See Figure 6-4.

**Arcadia Place Area**
The residential area surrounding Arcadia Place, including residences west of Harbison Avenue along East 11th Street, East 10th Street, and East Plaza Boulevard. See Figure 6-4.

## 6.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City has continued to provide information regarding the implementation of pollution prevention measures, such as good housekeeping practices, for residential areas and activities. Section 5 of the City's BMP Manual includes lists of general residential BMP requirements and BMP requirements for specific residential activities. The manual is included in Appendix C of the City's JURMP. General residential BMPs include erosion control; non-storm water discharge management, including elimination of IC/IDs; and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Specific BMPs for the high priority activities outlined above are also included in the City's BMP Manual Section 5.

## 6.4 PROGRAM IMPLEMENTATION

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting is conducted in residential areas. This ensures that pollutants associated with residential activities and areas are minimized. Additionally, the residential program implements an education component so that residents are made aware of appropriate BMPs, including pollution prevention methods that should be used during certain activities. During 2008/2009 the City also continued to participate in the Regional Residential Education Program.

### 6.4.1 TRAINING, EDUCATION, AND OUTREACH

The City has continued to conduct training, education, and outreach activities for residents, which are described below. For additional information on the City's educational efforts and the educational materials distributed to its residents please refer to Section 8 of this Annual Report.

**2009 Calendar**

The City developed a 2009 Storm Water Calendar through a local art contest at elementary schools within the City (Attachment 5.2). The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways. It described that pollutants such as fertilizers, pesticides, metals, paints, oil and grease and other debris can be transported from residential areas to the ocean. A list of BMPs, trash cleanup days, and HHW disposal events were included within the calendar. The theme for the calendar was "By Keeping our Community Clean, We Can Keep the Ocean Clean" and each month displayed a child's winning entry from the art contest.

**Distribution of Educational Material**

As part of the High TTWQ Residential Education Program, over 1,300 homes were provided with educational materials, including the 2009 Storm Water Calendar, the Storm Water Hotline Card (Attachment 6.2), the "Everything that flows down into a storm drain" brochure (Attachment 6.3), and the "Put Toxic Waste In Its Place" brochure (Attachment 6.4). This door-to-door distribution of educational materials also included the areas recommended to receive education based on the recommendations of the 2008 Dry Weather Report. In taking time to personally distribute the materials to residents at home, the City has tried to emphasize the importance of the educational message.

**Website**

Additional information regarding the City's storm water program, pollution prevention measures, and BMPs is posted and continually updated on the City of National City's website (http://www.ci.national-city.ca.us/). Storm water-related pages can be found under the Development Services Department tab in the Engineering Division section. The direct link to the City's storm water page is http://www.ci.national-city.ca.us/index.aspx?page=164/.

**Household Hazardous Waste Disposal Program**

The City continues to work with the City of Chula Vista to allow City residents to drop off HHW at Chula Vista's Household Hazardous Waste Collection Facility. The Household Hazardous Waste Collection Facility is the primary location for hazardous waste collection in the South Bay, receiving HHW from the City of National City, the City of Imperial Beach, and the City of Chula Vista. Curbside pickup was made available to the disabled and elderly communities. The amount of waste collected by City residents of National City alone is not available; however, the total amount of HHW collected from residents of all three cities is 252,494 pounds from 3,151

participants. The availability of a City subsidized HHW collection service was advertised in the 2009 Storm Water Calendar.

Additionally, the High TTWQ Residential Education Program distributed "Put Toxic Waste in Its Place" brochures during door-to-door residential visits to remind residents to dispose of HHW properly.

**Other Waste Disposal Programs/Activities**

In addition to proper HHW disposal, the City encourages residents to recycle used oil. The City maintains several Certified Used Oil Recycling Centers for residential oil disposal. The volume of used oil dropped off at the collection centers was not immediately available.

The City's Public Works Department held two trash collection events (June and November) during this reporting period in conjunction with EDCO Disposal Company. Information about the trash collection events was sent out to all residents with their trash bills. During these events, residents were encouraged to dispose of any unwanted large items from their homes, such as furniture and appliances.

### 6.4.2 Compliance and Enforcement

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the Storm Water Hotline, and observations made by the City's municipal personnel. If a potential threat to water quality is present, the City provides a verbal warning, written warning, notice of correction, and/or NOV as applicable. The City received and addressed seven residential-related complaints during this reporting period; however only three problems were identified during those seven field investigations. Complaints were submitted through the Storm Water Hotline or internally through the City's Development Services or Public Works departments.

In the 2008/2009 reporting period, verified complaints included a broken swimming pool pump, a parked vehicle leaking oil, and motor oil found at a gutter. In the case of the swimming pool pump, a verbal warning resulted in immediate shut off and repair. City personnel cleaned oil leaked into the public right of way to resolve the motor oil complaints and marked the parked vehicle for towing. All residential complaints were promptly resolved as noted in the Summary of Documented Public Complaints in Section 4 of this Annual Report.

## 6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 6.6 Program Review and Modification

The City's JURMP was last updated in March 2008. No changes to the City's residential component have been made since that time.

**Figure 6-1**

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

In accordance with the September 10, 2008 RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the 2008/2009 illicit discharge detection and elimination section and attachments to the RWQCB no later than December 15, 2009.

# 8.0 EDUCATION COMPONENT

## 8.1 INTRODUCTION

During 2008/2009, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, residents, and underserved communities. The City aims to reduce storm water pollution by increasing awareness about storm water and promoting the implementation of pollution prevention measures and BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community.

### 8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- Verbal education regarding storm water issues and site-specific BMPs was provided to several municipal employees during routine facility inspections.
- The "Construction Site Best Management Practices" handout was distributed with all construction-related permits issued, including building permits, during the 2008/2009 reporting year.
- San Diego County's Negocio Verde Environmental Justice Task Force held an Automotive Body and Repair Free Bilingual Compliance Workshop in the City. All code enforcement personnel, including the storm water compliance inspector, were on hand to explain the City ordinances, including storm water regulations.
- All businesses, including mobile businesses, applying for a new business license during the 2008/2009 reporting year received the "Preventing Urban Runoff Pollution" BMP Trifold.
- The City distributed approximately 5,740 storm water calendars to industrial and commercial businesses, residential households, school-aged children, and municipal staff.
- The City distributed storm water educational materials in both English and Spanish to 1,341 households during door-to-door surveys for the City's High TTWQ Residential Education Program.
- The City made an estimated 34,339 impressions through educational outreach material and activities.

## 8.2 STAFF TRAINING ELEMENT

During 2008/2009, the City provided training and educational outreach to its municipal personnel. Many municipal personnel are out in the field on a daily basis, so it is important that they understand the importance of implementing BMPs. Additionally, municipal personnel are encouraged to report any IC/IDs observed to the appropriate City staff and to educate other municipal personnel and the general public about storm water pollution prevention.

The City's Storm Water Compliance Inspector previously completed the California Environmental Protection Agency Basic Inspector Training Course, and used those skills to coordinate compliance within the various components of the City's storm water program during 2008/2009. During routine municipal inspections, the City's Consultant provided site-specific verbal education to several Parks Division, Public Works, and Graffiti Abatement staff. The City's municipal pool operator was provided with the 2009 Storm Water Program Calendar, which highlighted various storm water issues in both English and Spanish. Aspects of this calendar were also displayed on the storm water bulletin board located at the City's Engineering Department, a photo of which is included as Attachment 4.5. This display reinforced the importance of storm water pollution prevention to City staff and project proponents that visited the Engineering Department during 2008/2009.

## 8.3 EDUCATIONAL OUTREACH ELEMENT

In addition to municipal staff, the City has continued to provide education and outreach to industrial and commercial businesses, construction site owners and developers, residential areas, and underserved audiences. These efforts promote storm water awareness and BMP implementation.

### 8.3.1 INDUSTRIAL AND COMMERCIAL BUSINESSES

As required by the Municipal Permit, the City inspects its inventoried businesses to evaluate compliance with the City's BMP requirements and provides site-specific education outreach to business owners and operators. Violations of the City's BMP requirements are corrected through enforcement actions as necessary. Site-specific information relating to the facility's activities was discussed with businesses personnel during inspections. Approximately 237 industrial and commercial businesses received the City's 2009 Storm Water Program Calendar, during routine inspections. This calendar is included as Attachment 5.2. The "Everything that flows down into a storm drain" brochure (Attachment 6.3) was also included with the notices of correction and inspection result reports mailed to each inspected industrial and commercial business.

In addition to industrial and commercial businesses currently on the City's inventory, all businesses that applied for a business license in the City received the Industrial and Commercial "Preventing Urban Runoff Pollution" Trifold, as seen in Attachment 5.3. In

this way, even businesses that are not on the inspection inventory will receive storm water education.

The City of National City worked with the County of San Diego and other members of the Negocio Verde Environmental Justice Task Force to host two Automotive Body and Repair Free Bilingual Compliance Workshops during the 2008/2009 reporting year. At the National City Casa de Salud Recreation Center on November 17, 2008 and the National City Martin Luther King, Jr. Community Center on February 25, 2009, the workshops presented ways to be in compliance with air pollution, hazardous material, and storm water regulations. All code enforcement personnel, including the storm water compliance inspector, were on hand to explain the City ordinances. Bilingual announcement flyers for these workshops are provided as Attachment 8.1.

#### 8.3.1.1 Mobile Businesses

Mobile businesses, specifically mobile car detailers or power washers, are considered a high TTWQ due to the nature of the business activities and the likelihood of prohibited non-storm water discharges. Mobile businesses are not confined to a single area and many do not have City business licenses, making them difficult to identify. The City continues to respond to complaints regarding mobile businesses and provides one-on-one verbal BMP education and literature during the complaint investigation as applicable. All businesses, including mobile businesses, applying for a new business license during the 2008/2009 reporting year received the "Preventing Urban Runoff Pollution" Trifold. This pamphlet includes minimum BMPs for three commonly mobile professions: power washing, car washing, and landscaping services. Information about the storm drain conveyance system and BMPs applicable to mobile business activities were also made available during 2008/2009 on the City's website, http://www.ci.national-city.ca.us/index.aspx?page=164.

### 8.3.2 Construction Site Owners and Developers

Due to the nature of their activities, construction sites have the potential to discharge many types of pollutants to receiving waters if not managed properly. Many construction site owners, contractors, and developers visit the City's Engineering Division to apply for necessary permits. Through this interaction with City staff, owners and developers are able to gain insight on watershed concepts, potential pollutants, and required BMPs.

The City provided various construction site-specific educational materials targeting storm water concepts during the 2008/2009 reporting year. The distributed educational materials are described below.

- The Construction Site BMP Fact Sheet or "Blue Sheet" (Attachment 3.1) describes specific BMPs for construction activities including soil stabilization and erosion prevention, sediment containment, materials and equipment management, non-storm water discharge control, and drainage control. This sheet was distributed

with all permits issued, including building permits; implementing the BMPs listed on the sheet is a condition of the permits.

- The National Pollutant Discharge Elimination System (NPDES) Project Applicability Form or "SUSMP Checklist" (Attachment 2.1) was completed by all projects applying for construction and building permits. Once submitted, the City reviewed the checklist and prioritized the projects. Requirements to ensure compliance with the Municipal Permit and General Construction Permit were presented to the applicant and further discussed to ensure the applicant was educated on the process.
- A copy of JURMP Appendix C, which contains a list of required construction BMPs, is made available upon request for proponents of construction activities within the City.

### 8.3.3 Residential Areas

Since the City is mainly composed of residential areas, it is important to reach this particular audience through educational outreach programs. The City continued to make a variety of flyers, brochures, website postings, and other educational material available to its residents.

**Storm Water Calendar**

The City developed a 2009 Storm Water Calendar (Attachment 5.2) that was distributed to schools and residents within high TTWQ residential areas. The calendar, which presented information in both English and Spanish, informed residents about pollutants found in San Diego Bay and neighboring waterways, and described that pollutants such as trash, HHW, and bacteria from pet waste can be transported from residential areas to the ocean. The calendar also provided the date of the 7th Annual Creek to Bay Cleanup event and informed residents about regular opportunities to properly dispose of HHW and large trash items. See Section 9 of this Annual Report for a more detailed description of these events.

During 2008/2009, the City also began developing the 2010 Storm Water Calendar. Another art contest was arranged for 3rd graders in the City, which will again provide images for the calendar. Contest announcement flyers for teachers (Attachment 8.2) and for 3rd grade students and their families (Attachment 8.3) were distributed to provide information about the contest as well as the City's storm water program. More information about the development of the 2010 calendar is included in the Public Participation Component Section 9 of this Annual Report.

**High TTWQ Residential Education**

During the 2008/2009 reporting period, the City initiated a High TTWQ Residential Education Program. The program report is included as Attachment 6.1. The purpose of this education and outreach effort was to assess the level of storm water knowledge in high TTWQ areas, provide bilingual education to remedy important gaps in knowledge, and to make observations of the potential presence of high TTWQ activities. City staff

went door-to-door with a five question survey regarding the storm water conveyance system, pet waste disposal methods, car washing activities, and household substances that are potential pollutants. The knowledge assessment survey was concluded by obtaining the residents' opinions about what can be done to keep the City clean. Notably, 50 percent of the 318 residents surveyed had not known that all water going to the storm drain flows to receiving water bodies without treatment, and they were then personally informed of this fact. All results of the knowledge assessment survey are provided in Attachment 6.1.

During door-to-door visits within the City's designated high TTWQ residential areas educational material was distributed to 1,341 households. These bilingual educational materials included the 2009 Storm Water Program Calendar (Attachment 5.2) and the "Everything that flows down into a storm drain" brochure (Attachment 6.3). Approximately 895 residents were provided with a copy of the City's Storm Water Hotline Card (Attachment 6.2); however this hotline number was present on the calendar as well. About 340 households in the Division Street area were also left with the HHW brochure, "Put Toxic Waste In Its Place," included as Attachment 6.4.

**School Education and Outreach**

The City collaborated with other jurisdictions within the San Diego Bay Watershed during the 2008/2009 reporting year to target school-aged children. One of these collaborations included four watershed presentations by I Love a Clean San Diego (ILACSD) that were co-sponsored by National City and the Port Authority of San Diego (Port). More information about these education and outreach presentations is included in the Public Participation Component Section 9.3 and the 2008/2009 WURMP Annual Report.

**City Website**

The City's website, http://www.ci.national-city.ca.us/, is another way in which City residents can become familiar with the design and intended use of the storm drain system, HHW, alternatives to hazardous household products, find information regarding volunteer opportunities, applicable City contact information, and IPM cards.

### 8.3.4 UNDERSERVED COMMUNITIES

The City is a growing community that is diverse in culture. According to the April and May 2009 High TTWQ Residential Education Program data, of the 373 residents encountered, the City's outreach personnel identified about a third who preferred to speak in Spanish. A small fraction spoke Tagalog as their preferred language. To address the unique demographics of the City, the City's Storm Water Hotline accepts all reports of illegal discharges, regardless of language.

The City further provides educational materials both in English and Spanish to better serve Spanish speaking community members. These bilingual brochures may be found at various locations throughout the City, such as the Chamber of Commerce, the public library, public recreational centers, and the storm water display area at the City's

Engineering Department. The bilingual educational handout entitled "Everything that flows down into a storm drains goes untreated directly to our creeks, lagoons, and San Diego Bay" is also included in all mail-based correspondence (i.e. NOV, notice of corrective action, etc.) to residents and industrial and commercial businesses in the City.

### 8.3.5 Complaint Investigations

To further aid the process of identifying illicit discharges, the City encourages the public and City staff to report IC/IDs. The City's Storm Water Compliance Inspector follows up on all complaints made to the hotline. If a representative for the targeted business, residential area, or construction site is present, the inspector will provide site-specific information regarding storm water issues including applicable educational materials.

## 8.4 Outreach Component Effectiveness Assessment

The estimated number of impressions made by the City's education and outreach efforts during 2008/2009 is presented and described below. Please refer to Section 11 of this JURMP Annual Report for the remainder the effectiveness assessment for this program component.

**Impressions Made**

The City has continued to provide residents and businesses with storm water-related education through inspections, distribution, and mailing of educational materials, and various events throughout the year. The City calculates an estimate of impressions based on the number and type of educational materials distributed. Estimates of the numbers of impressions generated by the City's efforts allow for a more realistic evaluation of the effectiveness of the NPDES storm water program.

The estimated number of impressions was generated by multiplying each effort by the number of impressions thought to be generated by that particular effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections. Municipal inspections generally involve more people and are assumed to generate five impressions. Training sessions and cleanup events have been assumed to generate a number of impressions equal to four times the number of attendees, because it is likely that the attendees will discuss the content with others after the training session. Printed educational materials distributed in mass numbers are assumed to generate three impressions each. Impressions generated by the 2010 calendar contest are likely to generate five impressions because multiple people (teachers, students, and parents) were involved in the contest and were likely to share information about the contest with others. Table 8-1 details the number of impressions made by the City during this reporting year.

**Table 8-1**
**Impressions Made by the City**

| Impression Type | Estimated Count | Unit | Estimated Impressions Generated |
|---|---|---|---|
| Municipal Inspections | 12 | Inspection | 60 |
| Industrial Inspections | 35 | Inspection | 105 |
| Commercial Inspections | 214 | Inspection | 642 |
| Complaints Investigated | 24 | Investigation | 72 |
| Activity/Event Attendees | 221 | Events | 884 |
| "Preventing Urban Runoff Pollution" Trifold | 205 | Brochure | 615 |
| Residential Door-to-door Knowledge Assessment Surveys and Education | 318 | Survey | 1,272 |
| Everything that flows down the storm drain…. | 1,588 | Handout | 4,764 |
| 2009 Storm Water Program Calendar | 5,740 | Calendar | 17,220 |
| 2010 Storm Water Program Calendar Art Contest Handouts | 860 | Handout | 4,300 |
| Storm Water School Presentation Materials for Classrooms | 43 | Slideshow | 172 |
| Put Toxic Waste in its Place | 390 | Handout | 1,170 |
| Storm Water Hotline Card | 995 | Card | 2,985 |
| NONA/NEC Paperwork | 8 | Brochure | 24 |
| NOI Paperwork | 13 | Brochure | 39 |
| Construction BMP "Blue Sheet" | 5 | Handout | 15 |
| **Total** | | | **34,339** |

## 8.5 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was updated in March 2008. No changes to the City's education component have been made since that time.

# 9.0 PUBLIC PARTICIPATION COMPONENT

## 9.1 INTRODUCTION

The City encourages public participation in the City's JURMP as a means to foster storm water awareness and improve water quality. Public participation includes, but is not limited to, cleanup events, special community projects, reporting observed IC/IDs, and participating in City-hosted waste disposal events. Collaboration between the City and the community helps to encourage a sense of shared responsibility in protecting water quality both locally and regionally. The City has encouraged public participation through the programs discussed in this section.

### 9.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the public participation component during the 2008/2009 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City collaborated with ILACSD to host three sites for the Creek to Bay Cleanup event on 4/25/2009. A total of 118 volunteers participated to collect over 4,598 pounds of trash and debris.
- The City held a contest during 2008/2009 for the 2010 storm water calendar. A total of forty-three 3rd grade classrooms participated in this contest and were provided with storm water educational handouts and presentation materials.
- The City continued to collaborate with the cities of Chula Vista and Imperial Beach to provide HHW disposal for residents of the City of National City. Approximately 103 residents of National City participated.
- The City held large-item disposal events during the months of November and June, which allowed residents to dispose of large items (not including HHW).
- The City continued to operate its Storm Water Hotline to receive complaints from businesses and residents in the City.
- A large scale education and outreach effort was made by the City through its High TTWQ Residential Education Program. A total of 1,341 households received storm water educational materials.
- The City co-sponsored four ILACSD watershed presentations for fifth graders within the City.

## 9.2 PUBLIC PARTICIPATION ACTIVITIES

**Cleanup Events and Programs**

During 2008/2009, the City hosted cleanup events at various locations in the City. Cleanup events provide a direct benefit to water quality and provide an opportunity for the City to inform event volunteers of storm water issues. The City continued to collaborate with ILACSD for the Creek to Bay Cleanup event on 4/25/2009. Cleanup sites in the City were located at Sweetwater River and Paradise Creek Educational Park. At the Sweetwater River location, 43 volunteers collected 3,473 pounds of trash and three pounds of recyclables. Seventy-five volunteers gathered 1,125 pounds of trash and debris at Paradise Creek Educational Park (Figure 9-1). ILACSD reusable water bottles were distributed to volunteers during the event as a gift and to promote water bottle reuse.

**Figure 9-1. Paradise Creek Educational Park Cleanup Event**

**2010 Calendar Development**

As previously mentioned, during 2008/2009, the City began to develop the 2010 storm water program calendar. Similar to last year's calendar, the City worked to involve the public in the development of the 2010 edition. An art contest in June was held for the 3rd grade students of all 10 public elementary schools within the City. The 12 winning images will be included for each month of the upcoming calendar.

The theme of the contest was "By keeping our community clean, we can keep the ocean clean." Each of the 43 participating classrooms were provided with educational presentation material (Attachment 9.1) by the school district representative, and teachers

were given contest guidelines to share with their students (Attachment 8.2). This presentation addressed watershed concepts, the storm water conveyance system, pollutants of concern, and how to eliminate pollutants in urban runoff. The provided presentation also included past examples of submitted student work. An informational flyer was given to about 860 students that outlined the rules of the contest and presented some storm water concepts (Attachment 8.3). All students that submitted an entry received a certificate of participation signed by the mayor (Attachment 9.2). Winners will be selected in the 2009/2010 reporting period. The contest, which was sponsored by EDCO, will provide prizes, such as gift cards, to the contest winners. Unlike last year's contest, the 2008/2009 calendar contest applicants were encouraged to place more of an emphasis on community by including images of known landmarks or elements specific to their neighborhoods.

**Hazardous Waste Collection and Used Oil Recycling Program**

The City's Hazardous Waste Collection and Used Oil Recycling Program encourage City residents and business owners to properly dispose of HHW. Residents have access to proper disposal facilities for HHW at the Chula Vista Household Hazardous Waste Collection Facility. This facility is open on Saturdays from 9:00 a.m. to 1:00 p.m. and accepts up to 15 gallons or 125 lbs of waste per household for a small co-payment. An informational ad for this program is included as Attachment 9.3. This service is also available to residents in the cities of Chula Vista, Coronado, and Imperial Beach. During the 2008/2009 reporting year, 3,151 participants contributed over 252,494 pounds of waste. Of that total, 103 people were residents of National City. Door-to-door pick up was available for disabled or elderly communities for a small fee. Four certified used oil recycling centers located throughout the City were also advertised in the "2009 Storm Water Program Calendar" (Attachment 5.2).

The "Put Toxic Waste In Its Place" brochure continues to be used by the City to inform residents of how and where to dispose of HHW; the brochure directs people to www.1800cleanup.com, which provides further information about identification and disposal of HHW. As previously mentioned in Section 8 of this Annual Report, this brochure was distributed to approximately 340 households during the High TTWQ Residential Education Program.

**Other Waste Disposal**

The City also continued to hold household trash collection events for large items such as furniture and appliances at the EDCO Recovery and Transfer Facility from 7a.m. to 2p.m. The City coordinated with EDCO to host both fall and spring collection events. These events are routinely held in November and June of each year. The City encouraged the public to bring their debris (not including HHW) for proper disposal. Door-to-door pick up was provided for disabled or senior residents.

**Public Reporting**

As discussed in Section 4, complaints are received through the City's Storm Water Hotline and online website reporting system. The residential, industrial and commercial, construction, and municipal communities are encouraged to use the hotline

to report IC/IDs. The City investigates each complaint and tracks the complaint and follow-up actions, as applicable. Through use of the reporting system, residents of the City participate in holding their neighbors accountable for their actions. The hotline number is available on the Storm Water Hotline Card (Attachment 6.2), which was provided to residents during education and outreach activities. The hotline number is also available on the Storm Water Calendar and other brochures distributed by the City, as well as on the City's website. This reporting period there were 24 complaints received by the City. All complaints reported during 2008/2009 were investigated immediately and resolved appropriately by City staff.

## 9.3 OUTREACH EVENTS

The City has continued to provide educational outreach programs for variety of different communities in the City.

**Public Workshops**

Workshops, information, and training sessions are necessary to provide the public with the tools and knowledge to participate effectively in the City's storm water program. This reporting period, San Diego County's Negocio Verde Environmental Justice Task Force, provided an Automotive Body and Repair Free Compliance Workshop in National City, which targeted automotive shop owners and employees of National City and Chula Vista. This workshop discussed environmental and storm water regulation compliance and is discussed in further detail in Section 8 of this Annual Report.

**High TTWQ Residential Education Program**

As mentioned previously in Section 8, during 2008/2009, the City initiated a High TTWQ Residential Education Program. The report is included as Attachment 6.1. The purpose of this education and outreach effort was to assess the level of storm water knowledge in high TTWQ areas, provide bilingual education to remedy important gaps of knowledge, and to make observations of the potential presence of high TTWQ activities. A total of 1,389 sites were visited and educational material was distributed to 1,341 households. During these door-to-door visits, the bilingual "2009 Storm Water Program Calendar" and "Everything that runs into the storm drain goes untreated directly into our creeks, lagoons, and San Diego Bay" brochures (Attachment 5.2 and 6.3, respectively), were left at each residence along with other HHW and Storm Water Hotline educational materials.

**ILACSD Watershed Presentations**

The City collaborated with other jurisdictions within the San Diego Bay Watershed during the 2008/2009 reporting year. One of these collaborations included four watershed presentations by ILACSD for the City's elementary schools that were co-sponsored by the City of National City and the Port. These presentations included information about watersheds and ways to eliminate pollution in storm water runoff. Each student was given a post–presentation knowledge survey to assess what the students learned during the presentation. Two of the presentations were held at

Kimball Park Elementary on 5/13/2009 and were attended by more than 50 students in the 5th grade. More information about this event and the results of the post survey are included in the 2008/2009 WURMP Annual Report.

## 9.4 Public Participation Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 9.5 Program Review and Modification

The City's JURMP was updated in March 2008. No changes to the City's public participation component have been made since that time.

# 10.0 FISCAL ANALYSIS

The sources of funding for this program listed in the City's update JURMP have not been changed during this reporting period. The budgeted cost of the 2008/2009 program was $1,317,000. The proposed estimated budget for the 2009/2010 program is $1,172,257. Table 10-1, below, presents an itemized breakdown of the program budgets.

**Table 10-1**
**Itemized Budgets For Fiscal Years 2008/2009 and 2009/2010**

| Storm Water Program Fiscal Analysis | Budget FY 08/09 | Budget FY 09/10 |
|---|---|---|
| ***Staff*** | | |
| Public Works | 350,000 | 350,000 |
| City Attorney | 10,000 | 10,000 |
| Development Services (Engineering, Planning, Building) | * | 100,000 |
| Planning | 40,000 | * |
| Building | 20,000 | * |
| Engineering | 90,000 | * |
| Fire | 10,000 | 10,000 |
| Community Development Department (CDD) | 30,000 | 30,000 |
| *Sub-total* | ***$550,000*** | ***$500,000*** |
| ***Operation Expenditures*** | | |
| NPDES Fees | 40,000 | 40,000 |
| Consultant Fees for NPDES Program | 200,000 | 200,000 |
| Purchase Equipment | 1,000 | 1,000 |
| Miscellaneous Operations | 5,000 | 5,000 |
| *Sub-total* | ***$246,000*** | ***$246,000*** |
| ***CIP Appropriations*** | | |
| Drainage Improvements (Curb & Gutter, Alley Apron, X-Gutter) | ** | 426,257 |
| Curb and Gutter | 68,500 | *** |
| Alley Apron | 6,000 | *** |
| X-Gutter | 46,500 | *** |
| *Sub-total* | ***$121,000*** | ***$426,257*** |
| ***Special Projects*** | | |
| Storm Drain Improvements | 400,000 | -- |
| **Grand Total** | **$1,317,000** | **$1,172,257** |

* The Engineering, Planning, and Building departments were consolidated into one new department in 2008/2009, Development Services.
** Drainage improvement costs are broken out into specific categories for 2008/2009.
*** Included in drainage improvements

# 11.0 EFFECTIVENESS ASSESSMENT

## 11.1 INTRODUCTION

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

Based on participation in regional efforts and its experience implementing its JURMP, the City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics were provided in Section 13 of the City's 2008 JURMP.

The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge/Awareness
Level 3: Behavioral Change/BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

## 11.2 EFFECTIVENESS ASSESSMENT RESULTS

The Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Level 1, Level 5, and Level 6 outcomes are

discussed in the text below. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in the CASQA effectiveness assessment guidance document, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 OUTCOME LEVEL ASSESSMENTS

**Level 1**

Level 1 outcomes essentially are measures of permit compliance. The component-specific sections in this JURMP Annual Report provide details of programmatic actions taken to comply with the applicable Municipal Permit requirements. Appendix B of this JURMP Annual Report also includes a checklist that matches the Municipal Permit's annual reporting requirements with the section(s) or appendix of this report that addresses each requirement.

**Levels 2 and 3**

See the tables 11-1 through 11-8 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Please note that the number of hotline calls and Dry Weather Monitoring Program results are used in the assessments for other program components besides illicit discharge detection and elimination. Those numbers are taken from the work done within the period from July 1, 2008 through June 30, 2009 to be comparable with previous years' assessments and data. Also note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included.

**Level 4**

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs reliable load estimation methods have not yet been developed.

**Level 5**

The Dry Weather Monitoring Program is the City's primary mechanism of measuring the quality of discharges. The City began collecting MS4 monitoring data in 2008/2009; however, the data gathered at this time is insufficient to provide substantive information about discharge quality.

Graphs demonstrating historical Dry Weather Monitoring results are provided at the end of this section as figures 11-3 through 11-5. Ammonia, one of the constituents with the longest historical data record, has shown a decreasing trend over time. Also, since they have been analyzed, the exceedance frequencies of oil and grease and fecal indicator bacteria have decreased with time.

**Level 6**

No Regional Monitoring Program water quality monitoring stations are located within the City of National City. The Sweetwater Mass Loading Station is located just outside

the southeastern border of the City, but only a very minimal portion of the City would drain to that site. Some sediment sampling has been completed in the Sweetwater River flood control channel along southern side of the City as part of the regional Ambient Bay and Lagoon Monitoring Program. The results of that program have been relatively inconclusive to date. The RWQCB contracted Southern California Coastal Waters Research Project (SCCWRP) to conduct some wet weather monitoring in Paleta Creek (Seventh Street Channel) in support of a pending TMDL. At this point, the amount of data collected at these sites is not sufficient to determine any positive or negative trends for water quality at the site. Typically several years of data are needed before any trends become apparent. The City will continue to work with the San Diego Bay WURMP workgroup and TMDL stakeholder workgroups to improve the quality of water bodies in and around the City of National City.

### 11.2.2 OVERALL COMPONENT ASSESSMENTS

**Development Planning**

The City's review process for development projects is effectively requiring higher removal efficiency BMPs. Based on the results of the treatment control inspections and some interaction with responsible parties during the reporting period, it appears that there was a low level of awareness of the need for regular treatment control BMP maintenance at the start of the reporting period. The City worked with the parties responsible for maintenance of treatment control BMPs during the reporting period to address this issue and was able to improve maintenance rates during 2008/2009 compared to the 2007/2008 fiscal year.

**Construction**

The available data indicate that on the whole the City's construction program effectively requires BMP implementation. The City conducted dry season inspections for all high and medium priority construction sites to require continued implementation of required BMPs in preparation for the wet season. Any BMP deficiencies noted are typically remedied promptly. The City's approval process continues to notify all construction projects that will disturb soil of the City's BMP requirements before a permit is issued. This process has helped bring about better BMP implementation at small projects that otherwise might not be aware of the BMP requirements.

**Municipal**

The City's municipal staff are regularly trained on storm water issues, and the City's MS4 cleaning and street sweeping programs meet or exceed minimum Municipal Permit frequency requirements. In particular, the City sweeps its streets more often than the permit requirements to aid in WURMP efforts. As another part of WURMP efforts, the City hired a contractor in 2008/2009 to do biweekly inspections and remove any observed trash from Paradise Creek. Additionally, the City has developed new MS4 maintenance logs to facilitate the collection of more detailed information about the types and amounts of debris removed from the MS4 (included in attachments 4.2 and 4.3).

Currently not enough data exists to draw any conclusions for the 2008/2009 reporting period; however the new logs will be used for all of 2009/2010.

**Industrial and Commercial**

The City has a comprehensive inspection program that utilizes experienced consultant inspectors. Results are tracked using a database. Since a comparatively high number of noncompliant sites were identified in the previous reporting period, the City followed up with these sites in 2008/2009 to ensure that they comply with the City's regulations. Many of the businesses inspected had a low level of knowledge about storm water requirements. Approximately half of all businesses had the lowest possible storm water knowledge assessment score (1). The City worked with the County of San Diego to host two Negocio Verde workshops that addressed storm water regulations for local businesses. The City has also initiated some conversations with property management companies for businesses in multi-suite complexes to see if the landlords can provide some additional assistance in bringing about compliance with storm water requirements. The City is still investigating methods to educate businesses like restaurants that tend to have high staff turnover.

**Residential**

The City's residential component mainly achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. However, a significant door-to-door effort was made to screen for high priority residential activities in all of the City's high TTWQ residential areas. At least 1,389 homes were visited; observations made during these visits were an important factor in evaluating and updating the list of high TTWQ residential areas in the City. Another important factor was the record of complaints to the Storm Water Hotline. All residential complaints were investigated in the field and resolved promptly.

**IDDE**

The RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001 has extended the reporting period for the IDDE component of the City's program, so a full assessment of the program's effectiveness cannot be provided at this time. Some initial metrics are presented in Table 11-6.

**Education**

The City has expanded its education program over each of the last several years. In 2008/2009 the City specifically focused educational efforts on high TTWQ residential areas. At least 1,341 residents in eight different neighborhoods received educational materials. Over 300 residents were also surveyed to gauge their knowledge about storm water concepts and residential BMPs before staff delivered site-specific verbal education about appropriate BMPs. Additionally, through back and forth communication from treatment control BMP maintenance verification, many responsible parties were educated about storm water concepts and their BMP maintenance responsibilities. Educational efforts in 2009/2010 will focus on development of outreach material for staff at food establishments in the City.

**Public Participation**

For the Creek to Bay clean-up event with ILACSD, more clean-up sites were located within the City this year. Approximately three times as many volunteers participated in clean-up events within the City during 2008/2009, and the City will continue looking for new opportunities for public involvement. The City also held another third grade art contest for the 2010 Storm Water Calendar, involving more classrooms than in the previous year. While public education regarding use of the Storm Water Hotline has increased in this reporting period, the number of hotline calls unexpectedly decreased in 2008/2009. Since the complaints of many hotline calls in this year were made regarding less direct threats to storm water quality, such as over irrigation, it may be that fewer reportable activities took place in the City during 2008/2009. The City will assess data from 2009/2010 to see if current patterns continue or if hotline calls increase again. The City continues to ensure its own staff and the public are aware of the hotline and when to call it.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of that document.

**Table 11-1**
**Development Planning Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Review and approve project plans | External<br>A relatively small number of projects submitted reports during 2008/2009. Based on meetings with applicants and BMPs proposed, it appears that the level of knowledge is increasing.<br>Internal<br>The City's storm water consultant and the City's Storm Water Program Manager worked with engineers in the City to improve their level of understanding of the SUSMP program. City personnel also attended training sessions—see Section 8. The City's consultant reviews SWMPs submitted to the City. | Overall SWMP approval rate during reporting period | 33% | Percent of projects proposing BMPs besides filter inserts | 100% |
| | | Number of projects requiring three or more reviews prior to SWMP approval | 0 | Percent of approved projects implementing BMPs with high or medium removal efficiencies for key pollutants of concern | 100% |
| Verify proposed BMPs are implemented | External<br>N/A, knowledge is evaluated by appropriate implementation of BMPs as shown in Level 3<br>Internal<br>The City's NPDES Storm Water Compliance Inspector provided training to the inspector responsible for verifying BMPs prior to occupancy. | Percent of projects implementing all proposed BMPs | 100% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 2 | | |
| Verify BMPs are properly maintained | External<br>Annual maintenance verification letters were sent out in 2008/2009 and NOVs were issued to non-responders<br>Internal<br>The City contracts with a qualified consultant to perform treatment control BMP inspections. | Percent of sites properly maintaining all BMPs | 60% | Proper BMP maintenance is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 2 | | |
| | | Percent of sites responding to verification letters | 79% | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-2**
**Construction Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Review proposed plans and BMPs | External<br>Projects submit plans for construction BMP implementation for their projects; the level of awareness of construction BMP requirements is fairly high.<br>Internal<br>Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs. | BMPs proposed for construction projects generally meet requirements; no significant problems have been noted. | | Proper pre-project planning is likely to have reduced pollutant loading. |
| Verify proposed BMPs are implemented | External<br>Grading projects implement BMPs as required by their permits, and contractors are familiar with the City's requirements.<br>Internal<br>Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs, and the City's consultant conducts routine inspections of high and medium TTWQ construction sites. | Percent of projects implementing required BMPs at first inspection of wet season | 90% | Proper BMP implementation is likely to have reduced pollutant loading. |
| | | Percent of projects in compliance with BMP requirements during all inspections | 80% | |
| | | Resolution status of enforcement actions | See Section 3 | |
| | | Number of dry weather monitoring exceedances traced to construction sources | 0 | |
| | | It was noted that BMP implementation declined at some sites in June 2009, after the wet season. These sites were considered out of compliance and are receiving dry season inspections to ensure compliance for the coming wet season. | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-3**
**Municipal Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Verify proposed BMPs are implemented at facilities | City staff are regularly trained on BMP implementation; see sections 4 and 8. | Percent of inspected facilities/activities requiring a follow-up visit | 27% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of sites requiring follow-up inspections | See Section 4 | | |
| | | Number of dry weather monitoring exceedances traced to municipal sites | 0 | | |
| Sweep streets and parking facilities | | N/A, streets and parking facilities are swept as often as directed by management. | | Amount of sediment and debris removed (weight or volume) | 1,004 tons |
| | | | | Amount of sediment and debris removed per length of street swept (weight or volume per curb mile) | 0.066 tons/ curb mile |
| Maintain and clean out MS4 | | N/A, MS4 structures are maintained as often as directed by management. | | Amount of sediment and debris removed (weight or volume) | 42.2 tons |
| Maintain sanitary sewer system | | N/A, the sanitary sewer system is maintained as often as directed by management. | | Total volume of SSO discharge to MS4 (gallons) | 0 |
| Maintain municipal treatment control BMPs | | N/A, treatment control BMPs are maintained as often as directed by management. | | Amount of sediment and debris removed from treatment control BMPs | 10 pounds |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-4**
**Industrial and Commercial Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Require BMP implementation | External<br>Knowledge assessment scores indicated approximately half of the personnel present during inspections lacked any understanding of relevant storm water concepts. See Figure 11-1 on the following page for a score distribution. See Section 8 for more detail on educational materials and other outreach efforts.<br>Internal<br>The City contracts with a qualified consultant to perform industrial and commercial inspections. | Percent of inspected sites requiring a follow-up visit | 33% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 5 | | |
| | | Number of dry weather monitoring exceedances traced to industrial or commercial sources | 1 | Number of IC/IDs eliminated (inspections and complaint investigations) | 6 |
| | | Consistent with the intentional selection of sites with the highest TTWQ potential, many sites had a lower BMP score. However, the most common score was three. See Figure 11-2 on the following page for a score distribution. | | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Figure 11-1**
**Industrial/Commercial Knowledge Assessment Scores**

**Figure 11-2**
**Industrial/Commercial BMP Implementation Scores**

**Table 11-5: Residential Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Require BMP implementation | External<br>Door-to door visits to 1,389 homes in high TTWQ areas Residents in 2008/2009 screened for evidence of high priority residential activities and educated residents; see sections 6 and 8 for details of this and other education.<br>Internal<br>The City's Storm Water Program Manager and other City staff involved in the program have a good understanding of the goals of the storm water program. | Number of residential incidents reported to storm water hotline | 7 reported* | Resolution of residential incidents reported to the hotline likely resulted in a decrease in pollutant loading through improved BMP implementation. |
| | | Resolution of enforcement actions | See Section 6 | |
| | | Number of dry weather monitoring exceedances traced to residential sources | 3 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
* All seven reported complaints were investigated, but no storm water related issues were found at four of them.

**Table 11-6: Illicit Discharge Detection and Elimination Component Assessment Measures***

| Significant Activity | Level 2 | Level 3 | Level 4 |
|---|---|---|---|
| Conduct Dry Weather Monitoring Program | The City contracts with a qualified consultant to perform its Dry Weather Monitoring Program. | N/A, personnel conduct monitoring as directed by management. | No significant, long term IC/IDs were identified for elimination, so a reliable estimate of load reduction cannot be made. |
| Respond to incidents reported to storm water hotline | The City's Storm Water Program Manager trains City staff as needed. See sections 4 and 8. City staff were responsible for many of the reports made to the hotline, as shown in Section 4. | N/A, personnel respond to incidents as directed by management. | Resolution of the incidents reported to the hotline and listed in Section 4 are likely to have resulted in a pollutant loading reduction. |
| Respond to and clean up SSOs | City staff are thoroughly trained on how to respond to SSOs. | See Section 4 for details. | There were no SSOs during the reporting period, resulting in decrease in pollutant loading. |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
*Although the overall IDDE component is to be submitted in December 2009, a preliminary assessment of the component's effectiveness is provided here.

**Table 11-7: Education Component Assessment Measures**

| Significant Activity | Level 2 | | Level 3 | Level 4 |
|---|---|---|---|---|
| Provide storm water education to the public | External<br>The City actively educates the various audiences in its jurisdiction. In particular, the City made a door-to-door effort to educate all residents living within its high TTWQ residential areas. See Section 8 for details. | | See Level 3 outcomes for other program components for information about behavior change. | Sufficient data to estimate load reductions due to educational efforts is not available for 2008/2009. |
| | Estimated number of impressions made | 34,339 | | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-8: Public Participation Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Involve the public in activities that relate to storm water protection | External<br>The City and City partners put on a number of opportunities for the public to participate, including operation of the Storm Water Hotline. See Section 9 for details. | Number of attendees at events (ILACSD clean-up volunteers and HHW disposal participants) | 221 | Amount of trash and debris collected at cleanup events | 4,598 pounds |
| | | Number of calls received to the storm water hotline | 27 | Amount of HHW collected | 252,494 pounds between three cities* |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
* The cities of National City, Chula Vista, and Imperial Beach share a HHW disposal program located within the City of Chula Vista.

**Figure 11-3**
**Historical Dry Weather Monitoring Data: Action Level Exceedance Rates**

**City of National City, Detergents, 1996-2008**

# 12.0 SPECIAL INVESTIGATIONS

During the reporting period the City undertook two additional programs: the Clean Community Program and a pollutant discharge potential assessment component during industrial and commercial inspections.

## 12.1 CLEAN COMMUNITY PROGRAM

Results from trash assessments in previous years have indicated that litter and illegally dumped items tend to consist of household trash and large household items, likely from residents in the City. During 2008/2009, the City continued to implement its Clean Community Program. This program is designed to foster a sense of shared responsibility in keeping the community of National City clean and free of pollutants that may otherwise be carried to local receiving water bodies.

The theme of the 2009 Storm Water Calendar (Attachment 5.2) was "By Keeping our Community Clean, We can Keep the Ocean Clean!" This slogan was printed in both English and Spanish on every month of the calendar. Each month of the 2009 calendar featured artwork by local third grade students illustrating the theme. Through integrating public participation into the development of the 2009 calendar, the City increased attention to the "By Keeping our Community Clean, We Can Keep the Ocean Clean" message. Storm water facts were also presented throughout the calendar in both English and Spanish; such facts included "All water that enters National City storm drains flows to San Diego Bay without being treated," "Trash can harbor bacteria and cause beach closures when washed into the storm drain and out to the ocean," and "You can dispose of large items (mattresses, appliances, etc.) twice per year during the National City Clean-Up days. Watch for event details in your trash bill." The back of the calendar provides numerous City resources for residents who choose to take action in the City's program.

As discussed in detail in Section 9 of this Annual Report, during 2008/2009, the City worked to continue implementing part of the Clean Community Program though the development of a 2010 calendar.

Additionally, as part of WURMP efforts that are beyond minimum required MS4 maintenance, the City hired a contractor in 2008/2009 to do biweekly inspections and remove any observed trash from Paradise Creek.

## 12.2 POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

During 2008/2009, the City conducted pollutant discharge potential assessments (PDPA) at industrial and commercial facilities that received full inspection; the purpose of the assessment is to assist in source identification. The assessment is intended to be a semi-quantitative tool to identify which sites are major sources of the principal pollutants of concern for storm water. For each of several main categories of pollutants, a numeric

pollutant discharge potential (PDP) on a scale from 0 (not present) to 5 (severe) is assigned. A copy of the PDPA form is included with the standard inspection form in Attachment 5.1.

Table 12-1 shows the overall average PDP scores for each pollutant for all of the industrial and commercial facilities visited in 2008/2009. Note that pH indicates substances likely to cause either an abnormally low (acidic) or abnormally high (basic) pH.

**Table 12-1**
**Pollutant Discharge Potential Score Averages, By Category**

| Pollutant Category | Average PDP Score |
|---|---|
| Sediment | 2.5 |
| Nutrients | 1.4 |
| Aluminum | 1.1 |
| Iron | 1.3 |
| Heavy Metals | 1.8 |
| Organics | 1.5 |
| Trash | 2.4 |
| Oxygen Demanding | 1.7 |
| Oil and Grease | 2.4 |
| Bacteria | 1.7 |
| Pesticides | 1.0 |
| Acid/Base | 1.1 |

Sediment, trash, and oil and grease were observed to be the largest issues during the industrial and commercial inspections conducted during 2008/2009. The City uses this information to help target businesses for inspection. Figure 12-1, on the following page, shows the distribution of PDP scores for each pollutant on the PDPA table.

**Figure 12-1**
**PDPA Score Distribution for Facilities Inspected in 2008/2009**

# 13.0 NON-EMERGENCY FIRE FIGHTING

Please reference Section 3 of the City's most recent JURMP for information about BMPs and procedures associated with non-emergency fire fighting activities.

# 14.0 JURMP REVISIONS

The City's JURMP was rewritten in the spring of 2008 in response to new Municipal Permit requirements. Section 14 of the updated JURMP document includes a list of the changes made to the JURMP at that time. Any other changes to the JURMP made since the overall JURMP update in the spring of 2008 are discussed in the individual "Program Review and Modification" subsections in the preceding sections in this JURMP Annual Report, with the below exception.

Updated City organizational charts are provided in Attachment 14.1. These organizational charts have been updated since the Engineering, Planning, and Building departments have now become divisions within the new Development Services Department of the City of National City.

# 15.0 CONCLUSIONS AND RECOMMENDATIONS

During the 2008/2009 reporting period the City of National City continued to implement the new and revised programs in its JURMP, updated in March 2008. Based on feedback from RWQCB staff regarding the submitted JURMP, the City has improved the documentation of various components of its program and made revisions to the JURMP as necessary. The City continues to work with other Copermittees to facilitate sharing of information about how best to run these programs and to provide regional guidance on standardized implementation where applicable. The City of National City will work collaboratively as a member of the various regional workgroups in this process and continue to refine its program implementation as needed to improve its ability to reduce or eliminate pollutant discharges and meet regulatory requirements. The City will also continue its efforts related to the pending TMDL for Seventh Street Channel.

* The two high priority construction sites received inspections the last week of the dry season to ensure proper BMP implementation for the wet season. Therefore, biweekly wet season inspections began in the second week of the wet season, which resulted in 15 wet season inspections each.
** Low priority construction sites received at least one inspection from City building inspectors during the 2008/2009 reporting period. These inspections include a check for proper construction BMP implementation and maintenance.

**Notes**
TTWQ – Threat to Water Quality
SIC –Standard Industrial Classification Code
Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water

# APPENDIX B

**Appendix B**
**JURMP Annual Report Requirements Checklist**

## Development Planning Component

| Permit Annual Reporting Requirement—Section J.3.a.(3).(a) | Location in Report |
|---|---|
| i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements. | 2.2, 2.3 |
| ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked. | 2.4.3, 2.4.4.2 |
| iii. A listing of the development projects to which SUSMP requirements were applied. | Table 2-1 |
| iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked. | 2.4.4.2 |
| v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs. | 2.4.4.2 |
| vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible. | 2.4.4.2 |
| vii. An updated treatment control BMP inventory. | Appendix A (inventory) |
| viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings. | 2.4.4.3, Table 2-3 and Table 2-4 |
| ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings. | 2.4.4.3 |
| x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked. | 2.4.4.2, Table 2-2 |
| xi. A listing of any projects which received a SUSMP waiver. | 2.4.4.2 |
| xii. A description of implementation of any SUSMP waiver mitigation program. | 2.4.4.2 |
| xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation. | 2.4.4.2 |
| xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented. | 2.4.4.2 |
| xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements. | 2.4.4.2 |

## Development Planning Component

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(a)** | **Location in Report** |
|---|---|
| xvi. A listing of development projects disturbing 17 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project. | 2.4.4.2 |
| xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 2.4.4.3, Table 2-4 |
| xviii. A description of notable activities conducted to manage urban runoff from development projects. | 2.1 |

## Construction

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(b)** | **Location in Report** |
|---|---|
| i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked. | 3.5 |
| ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed. | 3.2 |
| iii. A description of modifications made to the construction and grading ordinances and approval processes. | 3.3 |
| iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites. | 3.5 |
| v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites. | 3.5 |
| vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites. | 3.5 |
| vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites. | 3.5, Appendix A.2 (inventory) |
| viii. A description of the general results of the inspections. | 3.5 |
| ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 3.5 |
| x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 3.5.3, 3.5.4 |
| xi. A description of notable activities conducted to manage urban runoff from construction sites. | 3.1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| i. Any updates to the municipal inventory and prioritization. | Appendix A.3 (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events. | 4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4 |
| iii. A description of inspections and maintenance conducted for municipal treatment controls. | 2.4.4.3, Table 2-4 |
| iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned. | 4.4.4 Table 4-2 |
| v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned. | 4.4.1, 4.4.4, Table 4-2 |
| vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned. | 4.4.1, 4.4.4, Table 4-2 |
| vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category. | 4.4.4, Table 4-2 |
| viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding. | (N/A for 2008/2009) |
| ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities. | 4.2.3, 4.2.4 |
| x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| xiii. Identification of the total distance of curb-miles swept. | 4.3.4 |
| xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping. | 4.3.4, Table 4-1 |
| xv. Amount of material (tons) collected from street and parking lot sweeping. | 4.3.4, Table 4-1 |
| xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4. | 4.5.4 |
| xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections. | 4.2.4, 4.6.4, 4.7.4, Table 4-3 |
| xviii. A description of the general results of the inspections. | Table 4-3 |
| xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 4.2.4, 4.6.4, 4.7.4 |
| xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 4.2.4, 4.6.4, 4.7.4 |
| xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities. | 4.1.1 and throughout Section |

## Industrial and Commercial

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(d)** | **Location in Report** |
|---|---|
| i. Any updates to the industrial and commercial inventory. | 5.2.2 (stationary), 5.3.2 (mobile), appendices A.4 and A.5 (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources. | 5.2.4, 5.3.4 |
| iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses. | 5.2.4, 5.3.4 |
| iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected. | 5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1 |
| v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection. | 5.2.4 |
| vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance. | 5.2.4 |
| vii. Identification of the number of third party inspections conducted. | 5.2.4 (will be N/A) |
| viii. Identification of efforts conducted to verify third party inspection effectiveness. | 5.2.4 (will be N/A) |
| ix. A description of efforts implemented to address mobile businesses. | 5.3.4 |
| x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 5.2.4, 5.3.4 |
| xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees. | 5.2.4, Table 5-2 |
| xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources. | 5.1.1 and throughout section |

## Residential

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(e)** | **Location in Report** |
|---|---|
| i. Identification of the high threat to water quality residential areas and activities that were focused on. | 6.2 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities. | 6.4 |
| iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials. | 6.4.1 |
| iv. Types and amounts of household hazardous wastes collected, if applicable. | 6.4.1 |
| v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation. | 6.4 (see discussion in JURMP) |
| vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 6.4.2 |
| vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program. | 6.4 |
| viii. A description of notable activities conducted to manage urban runoff from residential areas and activities. | 6.1.1 and throughout section |

## IDDE*

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| i. Correction of any inaccuracies in either the MS4 map or the Dry Weather Field Screening and Analytical Stations Map. | 7.4 |
| ii. Reporting of all dry weather field screening and analytical monitoring results. The data should be presented in tabular and graphical form. The reporting shall include station locations, all dry weather field screening and analytical monitoring results, identification of sites where results exceeded action levels, follow-up and elimination activities for potential illicit discharges and connections, the rationale for why follow-up investigations were not conducted at sites where action levels were exceeded, any Copermittee or consultant program recommendations/changes resulting from the monitoring, and documentation that these recommendations/changes have been implemented. Dry weather field screening and analytical monitoring reporting shall comply with all monitoring and standard reporting requirements in Attachment B of Order No. R9-2007-0001 and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001. | 7.4, Table 7-2, 7-3, and 7-4 |
| iii. Any dry weather field screening and analytical monitoring consultant reports generated, to be provided as an attachment to the annual report. | 7.4, Attachment 7.1 |
| iv. A brief description of any other investigations and follow-up activities for illicit discharges and connections. | 7.5 |
| v. The number and brief description of illicit discharges and connections identified. | 7.5, Table 7-5 |
| vi. The number of illicit discharges and connections eliminated. | 7.5, Table 7-5 |
| vii. Identification and description of all spills to the MS4 and response to the spills. | 7.3, Table 7-5 |
| viii. A description of activities implemented to prevent sewage and other spills from entering the MS4. | 7.3 |
| ix. A description of the mechanism whereby notification of sewage spills from private laterals and septic systems is received. | 7.3 |
| x. Number of times the hotline was called, as compared to previous reporting periods, and a summary of the calls. | 7.2, Table 7-5 |
| xi. A description of efforts to publicize and facilitate public reporting of illicit discharges. | 7.2 |
| xii. The number of violations and enforcement actions (including types) taken for illicit discharges and connections, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 7.5, Table 7-1 and 7-5 |

## IDDE*

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| xiii. A description of notable activities conducted to manage illicit discharges and connections. | 7.5, Table 7-1 |

## IDDE—Additional Dry Weather Monitoring Program Requirements*

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| Meets applicable standard monitoring and reporting requirements listed in Municipal Permit Attachment B. | 7.4 |
| c. (1) Determining Sampling Frequency: Dry weather field screening and analytical monitoring shall be conducted at each identified station at least once between May 1st and September 30th of each year or as often as the Copermittee determines is necessary to comply with the requirements of section D.4 of Order No. R9-2007-0001. | 7.4 |
| c. (2) If flow or ponded runoff is observed at a dry weather field screening or analytical monitoring station and there has been at least seventy-two (72) hours of dry weather, make observations and collect at least one (1) grab sample. Record general information such as time since last rain, quantity of last rain, site descriptions (i.e., conveyance type, dominant watershed land uses), flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate), and visual observations (i.e., odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biology). | 7.4 |
| c. (3) At a minimum, collect samples for analytical laboratory analysis of the following constituents for at least twenty five percent (25%) of the dry weather monitoring stations where water is present: (a) Total Hardness, (b) Oil and Grease, (c) Diazinon and Chlorpyrifos, (d) Cadmium (Dissolved), (e) Lead (Dissolved), (f) Zinc (Dissolved), (g) Copper (Dissolved), (h) Enterococcus bacteria, (i) Total Coliform bacteria, (j) Fecal Coliform bacteria | 7.4 |
| c.(4) At a minimum, conduct field screening analysis of the following constituents at all dry weather monitoring stations where water is present: | 7.4 |
| c. (a) Specific conductance (calculate estimated Total Dissolved Solids), (b) Turbidity, (c) pH, (d) Reactive Phosphorus, (e) Nitrate Nitrogen, (f) Ammonia Nitrogen, (g) Surfactants (MBAS) | 7.4 |
| c. (5) If the station is dry (no flowing or ponded runoff), make and record all applicable observations and select another station from the list of alternate stations for monitoring. | 7.4 |

## IDDE—Additional Dry Weather Monitoring Program Requirements*

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| c. (6) Develop and/or update criteria for dry weather field screening and analytical monitoring results whereby exceedance of the criteria will require follow-up investigations to be conducted to identify and eliminate the source causing the exceedance of the criteria. | 7.4 |
| c. (7) Assess the presence of trash in receiving waters and urban runoff at each dry weather field screening or analytical monitoring station. Assessments of trash shall provide information on the spatial extent and amount of trash present, as well as the nature of the types of trash present. | 7.4 |
| c. (8) Dry weather field screening and analytical monitoring stations identified to exceed dry weather monitoring criteria for any constituents shall continue to be screened in subsequent years. | 7.4 |
| c. (9) Develop and/or update procedures for source identification follow up investigations in the event of exceedance of dry weather field screening and analytical monitoring result criteria. These procedures shall be consistent with procedures required in section D.4.d of Order No. R9-2007-0001. | 7.4 |
| c. (10) Develop and/or update procedures to eliminate detected illicit discharges and connections. These procedures shall be consistent with each Copermittees Illicit Discharge and Elimination component of its Jurisdictional Urban Runoff Management Plan as discussed in section D.4 of Order No. R9-2007-0001. | 7.4 |
| d. The Copermittees shall commence implementation of dry weather field screening and analytical monitoring under the requirements of this Order by May 1, 2008. Each Copermittee shall conduct dry weather analytical and field screening monitoring in accordance with its storm water conveyance system map and dry weather analytical and field screening monitoring procedures as described in section II.B.3 above. If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and sections D.4.d and D.4.e of Order No. R9-2007-0001. Until the dry weather field screening and analytical monitoring program is implemented under the requirements of this Order, each Copermittee shall continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2001-01. | 7.4 |

* The IDDE Section of the 2008/2009 JURMP Annual Report will be submitted no later than December 15, 2009.

## Education

| Permit Annual Reporting Requirement—Section J.3.a.(3).(g) | Location in Report |
|---|---|
| i. A description of education efforts conducted for each target community. | 8.3 |
| ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges. | 8.3 |
| iii. A description of education efforts conducted for municipal departments and personnel. | 8.2 |
| iv. A description of education efforts conducted for the new development and construction communities. | 8.3.2 |
| v. A description of jurisdictional education efforts conducted for residents, the general public, and school children. | 8.3.3 |

## Public Participation

| Permit Annual Reporting Requirement—Section J.3.a.(3).(h) | Location in Report |
|---|---|
| i. A description of public participation efforts conducted. | 9.2 and 9.3 |

## Effectiveness Assessment

| Permit Annual Reporting Requirement—Section J.3.a.(3).(i) | Location in Report |
|---|---|
| i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order. | 11 |

## Fiscal Analysis

| Permit Annual Reporting Requirement—Section J.3.a.(3).(j) | Location in Report |
|---|---|
| i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. | 10 |

## Special Investigations

| Permit Annual Reporting Requirement—Section J.3.a.(3).(k) | Location in Report |
|---|---|
| i. A description of any special investigations conducted. | 12 |

## Non-Emergency Firefighting

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(l)** | **Location in Report** |
|---|---|
| i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows. | 4.2.3, 13 |

## JURMP Revisions

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(m)** | **Location in Report** |
|---|---|
| i. A description of any proposed revisions to the JURMP. | 14 and each program component section |

# RESPONSE TO RWQCB COMMENTS

**To:** Mr. David Barker, P.E., CRWQCB - San Diego Region

**Date:** September 30, 2009

**Re: Follow Up to JURMP Annual Report Meeting, City of National City (CIWQS PL ID# 243907; Reg Measure ID# 214417; SWU: DQUACH)**

---

This memo is in response to San Diego Regional Water Quality Control Board (RWQCB) review comments dated February 27, 2009 on the City of National City's (City) 2008 Jurisdictional Urban Runoff Management Plan (JURMP) and JURMP fiscal year 2007/2008 Annual Report (Annual Report) submittal. The comments in the letter were generated based on RWQCB staff review of the City's JURMP and Annual Report and a subsequent meeting with City staff to discuss the comments on January 13, 2009. Note that a response letter was sent on April 13, 2009 to address review comments 4, 5, 7, and 8, which the letter had indicated required an earlier response. This memo addresses the remaining review comments, which were required to be addressed with the submittal of the 2008/2009 JURMP Annual Report. Each RWQCB comment is provided first (*italicized*) followed by the City's response.

*1. Include the mechanism to regulate industrial and commercial mobile services in the City into the Annual report.*

This comment was made with respect to Section 5 of the City's 2007/2008 Annual Report. While the City does not conduct routine inspections of mobile businesses, regulation of these businesses occurs through the enforcement of business license laws and response to complaint investigations. All mobile businesses are required to maintain a City of National City business license to conduct activities within the City; based on these records mobile businesses are added to the City's inventory and tracked. To aid in tracking mobile businesses that may conduct activities within its jurisdiction in the future, the City also collaborates with other jurisdictions in the County of San Diego in maintaining a county-wide list of mobile businesses. Please see Section 5.3 of the 2008/2009 Annual Report for a full explanation of the City's mechanism to regulate the activities of mobile industrial and commercial businesses.

*2. Provide rationale for the selection of 50% High TTWQ industrial sites to be inspected during the first year.*

This comment was made with respect to Section 5 of the City's 2007/2008 Annual Report. Section D.3.b.(3)(b) of the Municipal Permit required that 50 percent of all sites determined to pose a high threat to water quality be inspected in the first year of implementation of the updated JURMP. Since the City updated its JURMP in March of 2008, the 2007/2008 reporting period was considered to be the first year of implementation, and at least 50 percent of the high TTWQ sites were chosen for inspection. In the 2008/2009 reporting period, the City inspected 100 percent of the high TTWQ sites, as is required for the second year of JURMP implementation and annually thereafter.

*3. Section J.3.c.VII of the Permit requires the City to report the amount of waste and litter removed from catch basins, inlets, the MS4, and open channels, by category. Please provide more detailed categories of debris removed from the City's MS4.*

This comment was made with respect to Section 4 of the City's 2007/2008 Annual Report. In the 2007/2008 Annual Report a total of 39.6 tons of debris was reported to have been removed from the City's MS4. The previous field reporting mechanism had recorded qualitative observations of the amounts of categories of debris within the overall quantity of debris removed. In response to this comment from RWQCB staff, Engineering Division Storm Water staff, Public Works Department staff, and the City's consultant engaged in a discussion to develop a more detailed way of recording debris category information in the field. As a result of this process, the City developed new MS4 and open channel maintenance log sheets to help quantify each category of debris. The revised maintenance log sheets are provided with the 2008/2009 JURMP Annual Report as attachments 4.2 and 4.3. These maintenance log sheets have been provided to Public Works Department staff, and data collected using these forms will be reported as part of the 2009/2010 reporting period.

*6. Create a data base of municipal facilities to track the inspections and enforcement.*

This comment was made with respect to the City's updated 2008 JURMP. The City already uses databases to track large numbers of inspections at industrial and commercial facilities, as well as at construction sites within the City. Since the meeting with RWQCB staff, a similar Microsoft Access database has been created to more easily track inspections and follow up actions for municipal fixed facilities and mobile activities. This database will also be used to track inspections and enforcement conducted at special events within the City.

## National Pollutant Discharge Elimination System (NPDES) Project Applicability Form

***No project will be accepted by the City without this form completed in its entirety***

Project Name: _____ Project Area: _____ acres/sq ft

Project Address: _____

APN: _____ Proposed Impervious Area:_____ acres/sq ft

Description of Project: _____

Description of Location: _____

## *Section 1 – Permanent Storm Water BMP Requirements:*

**PART A: Determine Subjectivity to SUSMP Requirements**

*Is the project new development?* □ *Yes* □ *No*

*Is the project redevelopment that adds/replaces/creates 5,000 ft$^2$ of impervious surface[1]?* □ *Yes* □ *No*

If both of the above answers are "no", go to Part B. If either of the above answers is "yes," answer the questions below (check all that apply).

Is the Project…

1. *Detached or attached residential development of 10 or more units?* □ *Yes* □ *No*
2. *Commercial development greater than one acre?* □ *Yes* □ *No*
3. *Industrial development greater than one acre?* □ *Yes* □ *No*
4. *Automotive repair shop?* □ *Yes* □ *No*
5. *Restaurant?* □ *Yes* □ *No*
6. *Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface?* □ *Yes* □ *No*
7. *Project located within or directly adjacent to (within 200 feet) or directly discharges to Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition?* □ *Yes* □ *No*
8. *Parking lot greater than or equal to 5,000 square feet of impervious surface OR with at least 15 parking spaces and potentially exposed to urban runoff?* □ *Yes* □ *No*
9. *Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater?* □ *Yes* □ *No*
10. *Retail gasoline outlets 5,000 square feet or more or with a project Average Daily Traffic (ADT of 100 or more vehicles per day* □ *Yes* □ *No*

[1] See the City's SUSMP Ordinance for more detail on the definition of "significant redevelopment."
[2] Limited exclusion: trenching and resurfacing work associated with utility projects are not considered Priority Projects. Parking lots, buildings and other structures associated with utility projects are Priority Projects if one or more of the criteria in Part A is met.

If any of the answers to Part A is "Yes", your project is a "Priority Project" and must meet the requirements of the City's Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance.[2]

**Is this a PRIORITY PROJECT that requires a SUSMP report?** □ **Yes** □ **No**

If all answers to Part A are "No", continue to PART B.
If any of the answers to Part A is "Yes", skip PART B and go to Section 2.

**PART B: Determine Non-SUSMP Standard Permanent Storm Water BMP Requirements**

*Does the project require any of the following permits or approvals?* □ ***Yes*** □ ***No***

- *Discretionary: Conditional use permit (including modification or extension); Coastal development permit; Parcel map (and modifications); Reclamation plan; Planned development permits; Planned unit development permits; Planning commission approval of plans; Site plan review; Tentative map (and amendments to conditions of approval or time extension); Tentative parcel map; or Variance OR*
- *Ministerial: Administrative clearing permit; Lot line adjustment; Final map modification; Grading plan (including modification or renewal); Improvement plan (including modification); Landscape plan; Building permit; Construction right-of-way permit; Encroachment permit; Excavation permit; On-site wastewater system permit; Underground tank permit; or Well permit*

*Will the project include exterior construction beyond signs, façade work, or other incidental construction to an existing structure?* □ ***Yes*** □ ***No***

If all answers to Part A are "No" and any answer to Part B is "Yes", your project is subject to the City's Standard Permanent Storm Water Best Management Practice (BMP) requirements.

If every question in both Parts A and B is answered "No", your project is exempt from permanent storm water requirements.

**Is this project subject to the Standard Permanent Storm Water BMP requirements?** □ **Yes** □ **No**

## *Section 2 – Construction Requirements*

General Construction Permit
*If your project disturbs at least one acre of land, you are subject to the State General Construction Permit.* A Notice of Intent (NOI) must be filed with the State Water Resources Control Board (SWRCB) and a Storm Water Pollution Prevention Plan (SWPPP) must be prepared for your project.

**Is this project subject to the General Construction Permit?** □ **Yes** □ **No**

Construction Threat to Water Quality Prioritization
*See the attached flow chart for guidance on determining the construction prioritization.*

**This project is** □ **HIGH** □ **MEDIUM** □ **LOW** **priority threat to water quality.**

## *Section 3 – Operating Requirements*

After your project is complete, certain water quality protection requirements may apply to the facility. The facility owner and operator should be made aware of these requirements.

All municipal, industrial, commercial, and residential sites in the City of National City are required to implement storm water BMPs to reduce the amount of pollution discharged to the Maximum Extent Practicable (MEP). See Appendix C of the City's Jurisdictional Urban Runoff Management Plan (JURMP) for further details.

Some industrial facilities are also subject to the State General Industrial Permit for Storm Water Discharges (Industrial Permit). To find out if your project may be required to obtain coverage under the Industrial Permit after it begins operations, visit the State Water Resources Control Board web sites at http://www.waterboards.ca.gov/stormwtr/industrial.html.

## *Section 4 – Certification*

## SUSMP REVIEW FLOW CHART

## CONSTRUCTION THREAT TO WATER QUALITY PRIORITIZATION FLOW CHART

*Sites with a low or medium TTWQ can be given a higher threat prioritization based on additional factors, such as project type, non-storm water discharge potential, or if there is a history of non-compliance with storm water regulations at the site.

303(d) Water bodies - 7th St Channel (La Paleta Creek) and 24th St Marine Terminal
ESA Water bodies - Paradise Marsh & Creek and Sweetwater Marsh National Wildlife Refuge

# ATTACHMENT 3.1

# CONSTRUCTION BMP FACT SHEET (BLUE SHEET)

# Construction Site Best Management Practices

As a condition of your permit, you are required to prevent construction generated or related pollutants from discharging from your project site. All construction projects within the City of National City are required to implement at least one of the Best Management Practices (BMPs) from each category and subcategory listed below, where applicable. Property owners and/or permit holders will be responsible for the selection, installation and maintenance of proper BMPs in accordance with industry recommended standards such as the Caltrans or California Storm Water BMP handbooks or in accordance with the California General Permit for Construction. Depending on site-specific information such as project scope and potential associated discharges. Additional BMPs may be required where appropriate. Project proponents will need approval from the City prior to installation of any alternate BMPs not listed below.

**Minimum BMPs for Construction Activities:**

1. **Planning and Scheduling**
   Planning and scheduling BMPs such as minimizing grading are required where feasible to help reduce the amount and duration of soil exposure.
   a. Preservation of natural hydrologic features
   b. Preservation of riparian buffers and corridors
   c. Minimization of areas that are cleared and graded to only the portion of the site necessary for construction
   d. Minimization of exposure time of disturbed soil areas
   e. Minimization of grading during the wet season and correlation of grading with seasonal dry weather periods
   f. Temporary stabilization and reseeding of disturbed soil areas as rapidly as feasible
   g. Employee and Subcontractor Training

2. **Soil Stabilization and Erosion Prevention**
   Physical Stabilization BMPs such as vegetation, landscaping or structural methods are required to prevent erosion from exposed slopes.
   a. Planning and Scheduling
   b. Preservation of Existing Vegetation
   c. Physical Stabilization
      - Hydraulic Mulch
      - Hydro-seeding
      - Soil Binders
      - Straw Mulch
      - Geo-textiles, Plastic Covers, and Erosion Control Blankets/Mats
      - Wood Mulching
      - Earth Dikes/Drainage Swales and Lined Ditches
   d. Site Drainage
      - Outlet Protection/Velocity Dissipation
      - Slope Drains
   e. Permanent re-vegetation or landscaping as early as feasible

See reverse side

3. **Sediment Containment**

Sediment containment controls should be used to supplement erosion prevention methods not as a substitute for erosion control. Sediment controls act to contain sediment that has been previously eroded and may get carried on-site and/or discharged from the site in sheet flow or from tracking by equipment and vehicles.

a. Perimeter Protection
   - Silt Fencing
   - Gravel Bag Berm
   - Fiber Rolls

b. Sediment Capture
   - Storm Drain Inlet Protection
   - Sediment Trap
   - De-silting Basins designed in accordance with industry standards such as Caltrans, California Storm Water BMP manual. If the project is five acres or greater the de-silting basin must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.
   - Gravel bag Barrier

c. Sediment Tracking
   - Stabilize Construction Entrances and Exits
   - Construction Road Stabilization
   - Entrance/ Outlet Tire Wash
   - Street Sweeping

4. **Materials and Equipment Management**

Pollution Prevention measures are required were applicable to prevent the contamination of storm water from waste materials, construction materials, vehicles, and equipment stored on-site. Each site must evaluate the potential pollutants on-site, which may be discharged during construction activities.

a. Materials Management
   - Material Delivery and Storage
   - Material Use
   - Stockpile Management
   - Spill Prevention and Control

b. Vehicle and Equipment Operations
   - Vehicle and Equipment Cleaning
   - Vehicle and Equipment Fueling
   - Vehicle and Equipment Maintenance

c. Waste Management
   - Solid
   - Liquid
   - Sanitary
   - Concrete
   - Hazardous
   - Contaminated Soil

5. **Non-Storm Water Discharge and Drainage Control**

Management of non-storm water discharges involves pollution prevention methods as well as drainage control. Project managers must implement appropriate drainage control methods to divert, contain and properly discharge drainage generated by construction activities.

a. General
   - Paving and Grinding Operations

b. Non-storm water discharges
   - Water Conservation Practices
   - Dewatering Operations
   - Potable Water/Irrigation and Flushing

**For additional information, call Barbara Tipton, Storm Water Compliance Inspector at (619) 336-4583 or Btipton@ci.national-city.ca.us**

## D. BMP ASSESSMENT

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| **D.1 General** | | | | |
| Is the site free of excessive litter and debris? | | | | |
| Are discharge locations free of excessive sediment and debris? | | | | |
| Are parking lots, sidewalks and streets free of excessive sediment and debris? | | | | |
| Are roof downspouts directed away from areas of potential pollutants? | | | | |
| Is wash water from pressure washing / hosing managed appropriately? | | | | |
| Are employees trained in storm water management? | | | | |
| Does the facility have a current log of employees who have participated in training? | | | | |
| **D.2 Landscaping** | | | | |
| Are adequate erosion prevention measures employed? (vegetation or physical stabilization) | | | | |
| Are irrigation systems programmed to minimize over-watering and runoff? | | | | |
| If reclaimed water is used for irrigation, is the site free of evidence of irrigation water entering the storm drain? | | | | |
| Are stockpiles of soil or landscape waste covered when feasible and equipped to prevent runoff transport? | | | | |
| Are pesticides, herbicides, and fertilizers managed in accordance with the JURMP BMPs? | | | | |
| **D.3 Materials and Wastes** | | | | |
| Are adequate trash containers provided? | | | | |
| Are adequate recycling containers provided? | | | | |
| Is the trash/recycling area adequately covered (closed lids or permanent overhead cover)? | | | | |
| Is the trash/recycling area free of litter and debris? | | | | |
| Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing? | | | | |
| Are outdoor materials that pose a threat to water quality stored appropriately (covered or in sealed containers)? | | | | |
| Are outdoor storage containers properly labeled? | | | | |
| Is there an accessible, appropriate spill response kit? | | | | |
| Is there a written spill response plan? If so, please provide to inspector. (NA if no significant materials to spill) | | | | |
| Are liquid storage containers/tanks equipped with secondary containment? | | | | |
| Is secondary containment free of spills and rainwater? | | | | |
| Are loading and unloading areas free of spills and debris? | | | | |
| Is water from pools and/or fountains disposed of properly? | | | | |
| **D.4 Equipment and Vehicles** | | | | |
| Are exposed parking areas free of significant spills and leaks? | | | | |

# City of National City

## Storm Water Quality Inspection for Municipal Facilities

Inspected by D-MAX Engineering, Inc.

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Are vehicle maintenance activities conducted within contained areas when feasible (garage, canopy, work shop)? | | | | |
| Are equipment and vehicles inspected daily for leaks and repaired as necessary? | | | | |
| Are storm drain inlets near vehicle-fueling areas protected from spills and leaks? | | | | |
| Is vehicle washing preformed in a designated area where runoff does not enter the MS4? | | | | |
| Are biodegradable soaps used when appropriate? | | | | |
| **D.5 Building Repair/Construction** | | | | |
| Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization) | | | | |
| Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters) | | | | |
| Are impervious areas free of debris and spills from painting, scraping, and/or sandblasting activities? | | | | |
| **D.6 Structural BMPs** | | | | |
| Are structural BMPs adequately maintained? (NA if no structural BMPs at facility) | | | | |
| **D.7 Non-Storm Water Management** | | | | |
| Is the site free of evidence of illicit connections and illegal discharges? | | | | |
| Is the site free of evidence of unauthorized releases to storm drains? | | | | |
| If not, have the appropriate authorities been notified? | | | | |
| **D.8 Other** | | | | |
| Are appropriate signs/stenciling present at the facility? | | | | |
| Are there any other potential storm water pollution issues or concerns? If yes, explain below. | | | | |

**E. ADDITIONAL COMMENTS**

(describe any additional deficiencies not represented above and/or notable BMP improvements)

# City of National City
## Storm Water Quality Inspection for Municipal Facilities
Inspected by D-MAX Engineering, Inc.

### F. CORRECTIVE ACTION

Is corrective action needed? ☐ Yes ☐ No (If **BMP-related** corrective action is required, describe below.)

Operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax ☐ E-Mail

### G. VIOLATIONS

☐ No violations have been noted at this time

☐ No violations have been noted, but recommend taking corrective action described in Section F.

☐ Violation of City Ordinance(s):

- ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
  Description_____
- ☐ Illegal connection(s) to the storm drain system
  Location_____
- ☐ Littering
- ☐ Failure to properly implement required BMPs

☐ Other Violation_____

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:**

☐ Implement the recommended corrective actions listed in Section F.

Additional actions required:

### H. ADDITIONAL RECOMMENDED CITY ACTIONS*

*Recommended City Actions listed at the time of inspection are subject to change based on later review by office staff

**Does this facility require a follow-up inspection?** ☐ **Yes** ☐ **No**

**ASSESSMENT**

| | | | | | |

| | | Trash Area | Material Storage | Prkng Lot | Load/ Unload | Land-scape | Veh/Eqp Maint | Exposed Work Area | Emp. Training | House-keeping | Minor Struct. | Major Struct. |
| Sediments | | | | | | | | | | | | |
| Nutrients | | | | | | | | | | | | |
| Aluminum | | | | | | | | | | | | |
| Iron | | | | | | | | | | | | |
| Heavy Metals | | | | | | | | | | | | |
| Check if evidence indicates specific metals may have significant PDPs: ☐ Copper ☐ Cadmium ☐ Lead ☐ Zinc ☐ Mercury | | | | | | | | | | | | |
| Organic Compounds | | | | | | | | | | | | |
| Check if evidence indicates there may be historical soil contamination associated with any of the following: ☐ PCBs ☐ PAHs ☐ Chlordane ☐ DDT | | | | | | | | | | | | |
| Trash & Debris | | | | | | | | | | | | |
| Oxygen Demanding | | | | | | | | | | | | |
| Oil & Grease | | | | | | | | | | | | |
| Bacteria & Viruses | | | | | | | | | | | | |
| Pesticides | | | | | | | | | | | | |
| Check if evidence indicates the following are used on site: ☐ Diazinon ☐ Chlorpyrifos | | | | | | | | | | | | |
| Acid/Base (pH effects) | | | | | | | | | | | | |
| Others (list): | | | | | | | | | | | | |

"RW 303(d)" = Receiving water impairments, as listed in the most recent 303(d) list
"WS COC" = High priority watershed constituents of concern (COC), as listed in the most recent WURMP Annual Report
"PDP" = pollutant discharge potential.
"Emp. Training" = employee training activities focused on storm water pollution prevention
"Housekeeping" = standard good housekeeping BMPs, such as sweeping, regular trash pickup, etc.
"Minor Struct." = minor structural BMPs that do not require building permits, such as covering with tarps or building berms
"Major Struct." = major structural BMPs that require a building permit or are especially expensive, such as detention basins, oil/water separators, grease interceptors, overhead coverage for storage areas, etc.

Criteria

0 - no appreciable quantity observed on site
1 - very small potential for pollutant discharge; monitoring results* are well below the EPA benchmark
2 - Small potential for pollutant discharge; monitoring results* are close to the EPA benchmark but still below it
3 - Moderate potential for pollutant discharge; monitoring results* are at or slightly above the EPA benchmark
4 - Large potential for pollutant discharge; monitoring results* above the EPA benchmark but are within an order of magnitude
5 - Severe potential for pollutant discharge; monitoring results* exceed the EPA benchmark by an order of magnitude or more

Home Based? ☐ Yes ☐ No Mobile Business? ☐ Yes ☐ No **APN**:_____

Is this facility located in a multi-suite complex? ☐ Yes ☐ No **E-Mail:**_____

Does facility have a current business certificate? ☐ Yes ☐ No #_____ Exp._____

Facility personnel present:_____

## B. FACILITY/SITE INFORMATION

Principal activity:_____

Assigned SIC Code(s): _____ _____ _____

Does SIC Code best represent principal activity: ☐ Yes ☐ No

Recommended change of SIC Code(s)? _____ _____ _____

**Existing SIC Code(s)** _____ _____ _____ ☐ Food Attachment ☐ Industrial Attachment

**Status Update** (if no longer active in City or does not need an inspection): ☐ Moved/Out of Business ☐ Duplicate ☐ Not Inventoried ☐ Out of Jurisdiction

Is facility subject to CA Statewide General Industrial Permit? ☐ Mandatory ☐ Conditional ☐ No

Does facility have a Notice of Non-Applicability (NONA/NEC)? ☐ Yes ☐ No

Has facility filed a Notice of Intent (NOI) to obtain coverage? ☐ Yes ☐ No WDID: 9 37I0_____

Does facility maintain SWPPP or BMP Plan? ☐ Yes ☐ No

Does facility have a storm water monitoring program? ☐ Yes ☐ No

## C. INITIAL OBSERVATIONS

Discharge points: _____

_____

Approximate area covered by industrial or commercial activities:_____square feet

Approximate % impervious surface of this area_____%

Exposed areas of significant outdoor activity or storage? ☐ Permanent ☐ Occasional ☐ No

## D. BMP ASSESSMENT

| BMPs | No Corrections Required | | Corrections Required | | Comments |
|---|---|---|---|---|---|
| | N/A | Fully Implemented | Partially Implemented | Not Implemented | |
| **D.1 General** | | | | | |
| Keep site free of litter, debris, and sediment using dry methods | | | | | |
| Keep drains on site free of litter and debris | | | | | |
| Keep outdoor areas free of spills and leaks | | | | | |
| Collect water from pressure washing or hosing and dispose of appropriately | | | | | ☐ Unknown<br>Performed by: |
| Collect and dispose of cleaning water appropriately | | | | | |
| Direct roof downspouts away from areas of potential pollutants | | | | | |
| **D.2 Landscaping** | | | | | |
| Properly manage pesticides/fertilizer; use IPM when feasible | | | | | ☐ Unknown<br>Landscaping Co: |
| Employ adequate erosion prevention measures (vegetation or physical stabilization) | | | | | |
| Reduce over watering/over-irrigation | | | | | |
| Properly store stockpiles to prevent material transport | | | | | |
| Properly store and dispose of green waste | | | | | ☐ Unknown |
| **D.3 Materials and Wastes** | | | | | |
| Protect trash area from contact with storm water | | | | | |
| Keep trash area free of litter and debris, liquids, powders, sediment | | | | | |
| Adequately cover materials stored outside | | | | | |
| Prevent run-on from contacting materials stored outdoors | | | | | |
| Provide an accessible, functional spill response kit | | | | | |
| Properly label outdoor storage containers | | | | | |
| Equip liquid storage containers with secondary containment | | | | | |
| Keep secondary containment free of spills and rainwater | | | | | |
| Properly store and dispose of hazardous materials | | | | | |
| Keep loading and unloading areas, including drains, free of debris | | | | | |
| Dispose of water generated by processing activities appropriately | | | | | |
| Dispose of pool, spa, fountain, and filter backwash water properly | | | | | ☐ Unknown<br>Performed by: |
| Clean floor mats in locations that do not drain to storm drain system | | | | | |

| BMPs | No Corrections Required | | Corrections Required | | Comments |
|---|---|---|---|---|---|
| | N/A | Fully Implemented | Partially Implemented | Not Implemented | |
| **D.4 Equipment, Vehicles, and Outdoor Activities** | | | | | |
| Conduct outdoor activities within contained areas (garage, under canopy, work shop) | | | | | |
| Use drip pans to collect leaks/spills | | | | | |
| Perform vehicle/equipment washing in a contained area where runoff does not enter the MS4 | | | | | |
| **D.5 Other** | | | | | |
| Manage animals and animal waste in a manner that prevents animal waste from being transported in runoff | | | | | |
| Identify and eliminate illicit connections and illegal discharges | | | | | |
| Provide storm water training for appropriate employees | | | | | |

| D.6 Additional Questions | Comments/Results |
|---|---|
| Are there any potential air sources that could contribute to atmospheric deposition of pollutants? | ☐ Painting ☐ Sandblasting ☐ Fuel Distribution ☐ Dust dispersion or mineral processing ☐ Metal smelting ☐ Metal plating or anodizing ☐ Chemical production or mixing ☐ Large fuel burning device ☐ Incinerator |
| Are there any treatment control BMPs on site? | ☐ Filter insert ☐ Hydrodynamic separator ☐ Debris screen ☐ Sewer diversion ☐ Vegetated swale ☐ Vegetated filter strip ☐ Biofiltration ☐ Detention/ sedimentation basin ☐ Containment and evaporation or reuse ☐ Filtration |
| Are treatment control BMPs regularly maintained? | ☐ Yes ☐ No ☐ Unknown ☐ N/A |
| What is the approximate percentage of the site that drains to the treatment control BMPs? | ☐ N/A |
| Do major potential pollutant sources drain to treatment BMP(s)? | ☐ All ☐ Some ☐ None ☐ N/A |
| If any illicit connections and/or illegal discharges were identified have the appropriate authorities been notified? | ☐ Yes ☐ No ☐ N/A |
| If any illicit connections and/or illegal discharges were identified, were they eliminated during the site visit? | ☐ Yes ☐ No ☐ N/A |
| Were any non IC/ID related corrective actions implemented during the site visit? | ☐ Yes ☐ No ☐ N/A |
| Were any educational materials distributed? | NOI NONA/NEC Calendar |

**D.7 Additional Required Actions**

## E. STATE GENERAL INDUSTRIAL PERMIT COMPLIANCE*

☐ Non-compliance with the State Industrial Storm Water General Permit noted.

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE*:**

☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit—see Attachment 3 of the Industrial Permit (www.waterboards.ca.gov/stormwtr/industrial.html).

- ☐ For "Conditional" facilities only: this site presently has outdoor exposure that requires filing for coverage under the Industrial Permit. If you implement all the recommended BMPs and eliminate outdoor exposure, you may be able to qualify for exemption from obtaining Industrial Permit coverage. Please contact the RWQCB for details.

☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP)—see Section A of the Industrial Permit.

☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.

☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

*Additional notes and/or actions required*: _____

_____

_____

## F. CORRECTIVE ACTION SUMMARY

☐ **Corrective Actions Required.** Please refer to sections D.1-D.6 and E of this form and, if applicable, the Food Establishment Storm Water BMP Assessment form (if applicable, it is attached).

☐ No Corrective Actions Required at this Time.

## G. RECOMMENDED CITY ACTIONS**

_____

_____

_____

_____

☐ poor management of shared waste disposal area(s), but responsible party could not be indentified

**ASSESSMENT**

| | | | | | |
|---|---|---|---|---|---|
| Level of knowledge regarding stormwater issues: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |
| Level of cleanliness, BMP implementation, orderliness of site: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |

*Please note that the Regional Water Quality Control Board (RWQCB) is the final arbiter of Industrial Permit compliance; please contact the RWQCB at (858) 467-2952 for details of what is necessary to comply with the Industrial Permit.

**Recommended City actions listed at the time of inspection are subject to change based on later review by office staff.

**Follow Up Inspection Priority:** ☐ **Priority 1** ☐ **Priority 2** ☐ **Priority 3** ☐ **None**

☐ Potential Hazmat issue

Re-inspect on or after: ____/_____/_____
Date

**RESOLUTION**

☐ NOV Issued: _____/_____/_____
Date

☐ Corrective Action Letter Issued: _____/_____/_____
Date

☐ Citation Issued: _____ _____/_____/_____
Number Date

☐ Verbal Warning

☐ Stop Work Order

## POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

Site Name:_____

| Pollutant | PDP | Sources Needing More BMPs | | | | | | | Recommended BMPs (check if applicable) | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Trash Area | Material Storage | Prkng Lot | Load/ Unload | Land-scape | Veh/Eqp Maint | Exposed Work Area | Emp. Training | House-keeping | Minor Struct. | Major Struct. |
| Sediments | | | | | | | | | | | | |
| Nutrients | | | | | | | | | | | | |
| Aluminum | | | | | | | | | | | | |
| Iron | | | | | | | | | | | | |
| Heavy Metals | | | | | | | | | | | | |
| Check if evidence indicates specific metals may have significant PDPs: ☐ Copper ☐ Cadmium ☐ Lead ☐ Zinc ☐ Mercury | | | | | | | | | | | | |
| Organic Compounds | | | | | | | | | | | | |
| Check if evidence indicates there may be historical soil contamination associated with any of the following: ☐ PCBs ☐ PAHs ☐ Chlordane ☐ DDT | | | | | | | | | | | | |
| Trash & Debris | | | | | | | | | | | | |
| Oxygen Demanding | | | | | | | | | | | | |
| Oil & Grease | | | | | | | | | | | | |
| Bacteria & Viruses | | | | | | | | | | | | |
| Pesticides | | | | | | | | | | | | |
| Check if evidence indicates the following are used on site: ☐ Diazinon ☐ Chlorpyrifos | | | | | | | | | | | | |
| Acid/Base (pH effects) | | | | | | | | | | | | |
| Others (list): | | | | | | | | | | | | |

"RW 303(d)" = Receiving water impairments, as listed in the most recent 303(d) list
"WS COC" = High priority watershed constituents of concern (COC), as listed in the most recent WURMP Annual Report
"PDP" = pollutant discharge potential.
"Emp. Training" = employee training activities focused on storm water pollution prevention
"Housekeeping" = standard good housekeeping BMPs, such as sweeping, regular trash pickup, etc.
"Minor Struct." = minor structural BMPs that do not require building permits, such as covering with tarps or building berms
"Major Struct." = major structural BMPs that require a building permit or are especially expensive, such as detention basins, oil/water separators, grease interceptors, overhead coverage for storage areas, etc.

Criteria

0 - no appreciable quantity observed on site
1 - very small potential for pollutant discharge; monitoring results* are well below the EPA benchmark
2 - Small potential for pollutant discharge; monitoring results* are close to the EPA benchmark but still below it
3 - Moderate potential for pollutant discharge; monitoring results* are at or slightly above the EPA benchmark
4 - Large potential for pollutant discharge; monitoring results* above the EPA benchmark but are within an order of magnitude
5 - Severe potential for pollutant discharge; monitoring results* exceed the EPA benchmark by an order of magnitude or more

**By Keeping our Community Clean,
We Can Keep the Ocean Clean!**

**¡Manteniendo a nuestra comunidad limpia
podemos mantener el océano limpio!**

VOL. 5 - Page 1854

**Do you go to the beach when it is raining?**

Probably not, but pollution does! When it rains, pollutants like litter and oil are carried from our streets and sidewalks through the storm drain system and to our local creeks and ocean. Pollution can hurt plants and animals and can also make water unhealthy for humans.

## 2009 Storm Water Program Calendar Art Contest

Winner Display at City Hall

The City of National City sponsored an art contest asking local third grade students to create original drawings showing how they and all members of their community can help prevent pollution in local creeks, rivers, and the ocean. This contest was open to third graders, who are taught responsible citizenship and the importance of caring for natural resources as part of the standard third grade curriculum. The theme of this year's contest was "by keeping our community clean, we can keep the ocean clean." The winners of the contest are featured within this calendar. Contest winners were also honored at a National City Council meeting where they received an award certificate signed by the National City Mayor, Ron Morrison. Prizes for the 12 winners were sponsored by Edco, National City's waste disposal service.

Special thanks to the City of National City's Storm Water Program, National City's City Council, National City Mayor Ron Morrison, Stephanie Maxin, Edco Disposal Services, Westfield Plaza Bonita, Central School, El Toyon School, Harbison School, Kimball School, Las Palmas School, Lincoln Acres School, Olivewood School, John A. Otis School, Palmer Way School, Rancho Del La Nacion School, and all of this year's participants for supporting and participating in the 2009 Storm Water Program Calendar Art Contest.

### Local Events

*You can do your part to keep National City and its local creeks, rivers, and oceans clean by participating in the following community events:*

NATIONAL CITY CLEAN UP DAY: The City of National City has National City Clean Up Day, twice a year, once in the spring and again in the fall. Residents can dispose of items such as garbage, appliances, furniture, etc. Hazardous materials are not permitted in the disposal dumpsters at this event. Information regarding this event will be enclosed with your Edco Disposal Service trash bill.

CREEK TO BAY CLEAN UP: The City of National City is a sponsor of the annual Creek to Bay Clean Up. This year's event is on April 25, 2009. Please visit the event's website at www.creektobay.org for more information and to register at a local clean up site.

HAZARDOUS WASTE DISPOSAL: The City of National City contracts with the City of Chula Vista to provide hazardous waste disposal for the residents of National City. The Chula Vista Household Hazardous Waste Collection Facility (1800 Maxwell Road, Chula Vista) is open on Saturdays from 9 a.m. - 1 p.m. For a $5.00 fee, up to 15 gallons or 125 pounds of hazardous waste is accepted. AutoZone, Kragen, Napa, and Firestone accept used oil and other automotive fluids at no charge. Please call the individual stores for details.

## ¿Va usted a la playa cuando está lloviendo?

Probablemente no, pero la contaminación sí va al mar. Cuando llueve, los contaminantes como la basura y el petróleo se llevan desde nuestras calles y aceras por el sistema de drenaje hasta nuestros arroyos locales y el mar. La contaminación puede dañar a las plantas y a los animales y también puede hacer la agua insalubre para los seres humanos.

## Concurso de arte para el calendario 2009 del programa de aguas pluviales

El Municipio de National City patrocinó un concurso de arte local, pidiendo a los estudiantes de tercer grado que creen dibujos originales que muestran cómo ellos y todos los miembros de su comunidad pueden ayudar a prevenir la contaminación en arroyos locales, ríos y el mar. Este concurso estaba abierto a los estudiantes del tercer grado, a quiénes se enseña la ciudadanía responsable y la importancia de cuidar a los recursos naturales como parte del plan de estudios del tercer grado. El tema del concurso de este año fue "manteniendo a nuestra comunidad limpia, podemos mantener el océano limpio." Los ganadores del concurso se presentan dentro de este calendario. Ganadores del concurso también fueron honrados en una reunión del Consejo Municipal de National City donde recibieron como premio una certificación firmado por el alcalde de National City, Ron Morrison. Los premios para los 12 ganadores fueron patrocinados por Edco, el servicio de recolección de basura en National City.

Un agradecimiento especial al Programa de Aguas Pluviales de El Municipio de National City, el Consejo Municipal de National City, Ron Morrison el alcalde de National City, Stephanie Maxin, Edco Disposal Services, Westfield Plaza Bonita, Central School, El Toyon School, Harbison School, Kimball School, Las Palmas School, Lincoln Acres School, Olivewood School, John A. Otis School, Palmer Way School, Rancho Del La Nación School, y todos los participantes de este año por apoyar y participar en el concurso de arte para el calendario 2009 del programa de aguas pluviales.

## Eventos Locales

Usted puede hacer su parte en mantener National City y sus arroyos locales, ríos y mar limpios mediante la participación en los eventos de la comunidad siguientes:

DÍA DE LIMPIEZA EN NATIONAL CITY: El Municipio de National City tiene un evento de limpieza dos veces por año en la primavera y en el otoño. Los residentes pueden deshacerse de basura, aparatos de hogar, muebles, etc. Los materiales peligrosos no son aceptados en los contenedores en el día del evento. Para más información sobre este evento, usted la podrá encontrar en su recibo de recolección de basura de Edco.

DÍA DE LIMPIEZA "CREEK TO BAY": El Municipio de National City es un patrocinador del evento anual "Creek to Bay Clean Up." El evento de este año es el 25 de abril, 2009. Por favor, visite el sitio Web del evento en www.creektobay.org para obtener más información y para registrarse para un sitio local de la limpieza.

DESECHOS PELIGROSOS: El Municipio de National City tiene contrato con el Municipio de Chula Vista para poder deshacerse de desechos peligrosos de los residentes de National City. Chula Vista Household Hazardous Waste Collection Facility está localizado en el 1800 Maxwell Road en Chula Vista, CA. Está abierto los sábados de 9:00 AM – 1:00 PM. Con un pago de $5.00 dólares son permitidos 15 galones o 125 libras de desechos peligrosos. AutoZone, Kragen, Napa y Firestone aceptan aceite usado y otros líquidos de coches de forma gratuita. Llame a cada una de estas compañías para más detalles.

# INDUSTRIAL AND COMMERCIAL "PREVENTING URBAN RUNOFF POLLUTION" TRIFOLD

## What's the difference?

### Sanitary Sewer vs. Storm Drain System

The water that drains down a sink or toilet in a home or business flows to the sanitary sewer and is treated by the City of San Diego at a wastewater treatment plant.

The storm drain system, on the other hand, is designed to carry rainwater from City streets and driveways to prevent flooding. This water does not receive any treatment. It flows directly to creeks and rivers – and eventually to San Diego Bay!

Unfortunately, as rainfall flows over the ground it picks up debris and pollutants and deposits them into our water bodies.

**Certain industrial businesses require coverage under the General Industrial Permit. For more information go to the State of California's Stormwater website at:**

http://www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.shtml

## Preventing Urban Runoff Pollution

### A Guide for Commercial and Industrial Businesses

**Urban storm water runoff is the largest contributor to water pollution in San Diego County.**

**Your business is required to prevent urban runoff pollution by implementing Best Management Practices (BMPs).**

**The City will be conducting inspections to ensure that BMPs are being used and water quality is protected.**

CALIFORNIA
NATIONAL CITY
1887
INCORPORATED

## Pollutants of Concern

Water that enters the City of National City storm drain system eventually flows into San Diego Bay. The following lists several main pollutants of concern for San Diego Bay.

- Sediments
- Metals (copper, zinc)
- Pesticides (diazinon)
- Bacteria and Viruses

**B**est **M**anagement **P**ractices (**BMPs**) are required to be used at all industrial and commercial businesses, where applicable, to reduce urban runoff pollution in our streams and waterways.

## Maintenance & Good Housekeeping

- Major cleaning of exterior surfaces (such as power washing) must include capturing all wash water and disposing of it into the sanitary sewer in compliance with local regulations. Wash water is not allowed to enter the street gutter or storm drains.
- Regularly sweep exterior paved areas. **Do Not use a hose!** Place debris in the dumpsters.
- If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer (sink or toilet).
- Regularly inspect and maintain storm drain inlets and surface drains on your property.

## Landscaping

- Time sprinklers to avoid over watering and aim them to avoid causing runoff.
- Minimize use of pesticides, herbicides, and fertilizers, which are harmful to animals downstream.
- Hand pull weeds instead of using herbicides
- Do not use pesticides that eliminate beneficial insects
- Only irrigate during early morning or late evening to avoid evaporation.

## Outdoor Material Storage

- Store all material indoors or under a covered area not exposed to rain. Include secondary containment for liquid materials.
- Have a spill response kit (dry absorbent, rags, and/or hydrophobic mops are useful) available to clean up potential spills.
- Keep lids closed on all outdoor storage containers and ensure containers are labeled.

**Unacceptable**

**Acceptable**

## Waste Management

- Keep all outdoor garbage and dumpster areas free of trash, sediment and debris.
- Keep lids closed on dumpsters and trash cans and never wash down dumpsters.
- Fix any leaks in garbage cans or dumpsters.
- Schedule extra pick-ups when regular waste collection does not meet demand.

## Vehicle & Equipment Washing and Maintenance

- Wash vehicles at a commercial car wash when possible. (Commercial car washes drain to the sanitary sewer and not to the storm drain).
- Wash vehicles over a pervious (absorbent) surface such as dirt, gravel or grass to prevent runoff.
- Minimize the use of soap and water.
- Car wash water is not allowed to enter storm drains. Wash water must be collected and disposed of to a pervious area (such as landscaping) or to the sanitary sewer system if allowed by local sewer agency.
- Perform all vehicle maintenance indoors when possible.
- Use drip pans to collect fluids from leaky vehicles
- Clean up spills with a spill kit and properly dispose of the used kit contents.

**Unacceptable**

**Acceptable**

## Loading Areas & Operations

- Load and unload in designated areas.
- Regularly sweep loading and unloading areas; do not hose them down.
- If possible, cover loading areas.
- Divert rain water away from all loading and unloading areas.
- Check shipments and trucks for leaks and spills.
- Clean up spills/leaks immediately and dispose of them properly.

# City of National City High Threat to Water Quality (TTWQ) Residential Education Program

## INTRODUCTION

In accordance with Section D.3.c.(1) of San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit), each of the Copermittees, including the City of National City (City), is required to identify high threat to water quality residential areas and activities. As part of the City of National City's 2007 Jurisdictional Urban Runoff Management Program (JURMP), the City has identified 10 high TTWQ residential areas and designated high residential TTWQ activities, as specified by the Municipal Permit. These 10 areas were considered high TTWQ due to observed incidences of high TTWQ activities, dry weather field screening and analytical monitoring exceedances, reported storm water violations, or proximity to Environmentally Sensitive Areas (ESA).

## PURPOSE AND OBJECTIVE

In order to reduce the threat to water quality in these residential areas, the purpose of this residential education program was two-fold: to assess storm water knowledge through a door-to-door survey and to provide educational materials to remedy important gaps in storm water awareness. Further, a secondary objective of this program was to take note of any high TTWQ activities or significant exposed storage observed within these residential areas.

Below is the report of the residential knowledge assessment survey and education outreach program. This document includes a summary of the City's High TTWQ Residential Education Program and presents the collected data, observation notes, analytical findings, and recommendations for the education and outreach for the high TTWQ residential areas.

## METHODS

The following 10 residential areas were designated as high TTWQ residential areas in the City's 2007 JURMP (See Attachment 1 of this report for aerial maps of each location):

- 2nd Avenue Area
- A Avenue Area
- Arcadia Place Area
- B Avenue Area
- Division Street Area
- East 8th Street Area
- Grove Avenue Area
- Paradise Creek Area, between F and L Avenues
- Harbison Avenue Area
- West 18th Street Area

Two of the 10 designated high TTWQ residential areas, West 18th and 2nd Avenue areas, were not included in the assessment surveys and site observations. Upon further field investigation, the sites were determined to lack significant high TTWQ residential activities. Instead, any high TTWQ activities appeared more likely to be due to industrial or commercial sources in these two excluded areas.

D-MAX staff went to the remaining eight high TTWQ residential areas during April and May of 2009 to conduct a survey of storm water knowledge, educate residents within these high threat zones, and visually screen for potential pollutant sources. Staff members went door-to-door within the designated residential areas during working hours (8 am to 5 pm) to conduct the knowledge assessment survey and provide residents with educational materials. When a resident was available, the survey was conducted and storm water concepts were verbally explained. Whether or not residents were home, any evidence of high TTWQ activities was noted from the public right-of-way and educational materials were left at each visited residence unless refused. All survey responses and observations from each residential area were recorded on a datasheet which was later converted into electronic format for data analysis.

The survey was comprised of five questions, aimed to assess awareness of storm water drainage without treatment, potential residential sources of pollutants, and perception of responsibility for the City's cleanliness. The survey is included in Attachment 2 of this report. Question Number 4 was supplemented with visual representations of potential pollutants and allowable discharges, on which the respondents were prompted to indicate which should not be discharged to the storm drain. The survey was concluded by confirming and/or explaining correct answers to the survey respondent. Of the 1389 sites visited, 318 were surveyed and a total of 1343 sites received educational material.

Educational materials provided to each resident consisted of the National City's Storm Water Program Calendar, a storm water fact sheet, brochures on proper hazardous household material (HHM) disposal, and the Storm Water Hotline number. The text of the educational materials was in both English and Spanish

## OBSERVATIONS

### Language Constraints

During the door-to-door surveys it became apparent that a percentage of residents at home during the day would not be able to participate due to a language barrier. While educational materials were bilingual in English and Spanish, instances where communication was not possible only in English were recorded. The inspections show that about one third of the residents could only communicate in Spanish, and that a small fraction of the surveyed individuals could only communicate in Tagalog. This is reflected in Figure 1 below. While the majority of the respondents spoke English as a first or second language, it is important to note other commonly spoken languages in these residential areas for future educational efforts. In some cases translation was provided by children, other residents, or by staff, but in all cases residents were provided with bilingual educational material.

**Figure 1.** Language constraints noted for each available resident (n = 373)

**Residents Surveyed**

As seen in Table 1 and Figure 2 below, almost 50 percent of the homes visited were in the Division Street Area. Of the 689 sites, a total of 134 residents were surveyed. B Avenue was the area with the second greatest number of homes visited at 15 percent. A Avenue and B Avenue had the highest percent of residents surveyed at 27 and 28 percent, respectively.

Educational materials were distributed to nearly all residential sites visited. Some households were not left with educational materials, as is indicated in the fourth column of Table 1. For these cases, several residents stated that they had already received the City's Storm Water Program Calendar or the tenant was not home and materials were not left. Notably, many school children were home for Spring Break during the early part of the program and sometimes were more knowledgeable than their parents about storm water topics. In these cases their answers were included for the household.

**Table 1.** Summary of visits, surveys, and educational material distribution by area.

| Residential areas | Number of homes visited | Number of completed surveys (and partial surveys) | Number of homes receiving educational material |
|---|---|---|---|
| A Avenue | 22 | 30 (1) | 22 |
| Arcadia Place | 85 | 19 (1) | 84 |
| B Avenue | 203 | 14 | 195 |
| Division Street | 689 | 152 (6) | 675 |
| East 8th Street | 47 | 24 | 47 |
| Grove Avenue | 91 | 18 | 90 |
| Harbison Avenue | 72 | 14 | 70 |
| Paradise Creek Area | 180 | 36 (2) | 158 |
| TOTAL | 1389 | 307 (10) | 1341 |

Note: The numbers in parenthesis are partial surveys that provided incomplete but useful data.

**Figure 2.** Residential area of the homes visited

**Residential Observations**

As stated above, observations of any significant activities or material storage were taken in the high TTWQ residential areas. Evidence of high TTWQ activities or storage was linked to individual addresses where possible. There were situations, such as apartment complexes, where no responsible party members could be identified for overall property issues. In these cases, a note about where the activities or materials were observed was made.

The majority of cases where significant exposed materials were noted consisted of rusty metal, used tires, or significant oil stains and leaks, which is expressed in Table 2 and Figure 3 below. Automotive repair and oil changes was the most common type of high TTWQ activity noted, followed by car washing activities. Photographs of some problematic cases are included in Attachment 3.

**Table 2.** Observed incidences of high TTWQ activities and material storage

| | High TTWQ Activities and Materials | Total Observed Incidences |
|---|---|---|
| Activities | Auto repair and oil change | 5 |
| | Car washing | 2 |
| | Other outdoor washing | 3 |
| | Fertilizer application | 1 |
| | Pesticide application | 0 |
| | Poor waste disposal | 0 |
| Materials | Exposed rusty metal | 8 |
| | Old tires | 6 |
| | Oil leaks or significant stains | 8 |
| | Antifreeze and transmission fluid | 0 |
| | Loose trash | 2 |
| | Pet waste | 1 |
| | Exposed fertilizers and pesticides | 0 |
| | Cooking oil and grease | 0 |
| | Soapy water or residues | 1 |

**Figure 3.** Observed incidences of high TTWQ activities and material storage

Table 3 displays the percentage of homes visited where a potential pollutant source was observed, broken down by residential area. These observations may suggest that some high TTWQ residential areas pose greater potential TTWQ than others, for the purpose of focused education and outreach.

**Table 3.** Percentage of homes with observed high TTWQ activities and material storage by residential area.

| Residential Area | Percent of homes with observed high TTWQ activities or materials |
|---|---|
| A Avenue | 0 % |
| Arcadia Place | 8 % |
| B Avenue | 1 % |
| Division Street | 3 % |
| East 8th Street | 0 % |
| Grove Avenue | 4 % |
| Harbison Avenue | 0 % |
| Paradise Creek Area | 3 % |

## SURVEY RESULTS

The following section summarizes the questions and corresponding answers for the residential knowledge assessment survey. Each of the five questions is listed below in the order they were presented to residents. The purpose of each question and a summary of common responses are explained below.

**Question 1:** "Do you know where water goes after it flows off of your property?"

a. Street/drain/sewer
b. Storm drain
c. River/creek/bay/ocean/etc.
d. Treatment plant
e. Don't know (if treated)

This question was designed to determine the number of residents that are aware that water runoff from their property is not treated before it enters receiving water bodies. The question was posed in an open-ended manner, without giving answer choices, to encourage respondents to relay any level of understanding. Any mentioned category was checked. The question did not mention the "storm drain" in order to decrease the number of responses that may be confused due to unfamiliarity with the terminology. If a resident's initial response to the question did not address treatment, they were asked if the water was treated after going to the drain (if mentioned) or before reaching a receiving water body (if mentioned). Staff did not check option "d" or "e" if residents did not think storm water received treatment before flowing to a receiving water body.

About 56 percent of the respondents were aware that water flowing off of their property eventually ends up in local receiving water bodies, however six percent still believed or were unsure whether the water would be treated first. Therefore, about 50 percent of all survey respondents did not know that water running off of their property goes to creeks, the bay, and the ocean without treatment.

**Figure 4.** Number of selected answer categories for Question 1 for all areas (n = 317 residents).

The responses recorded for this question serve as an indicator of basic storm water awareness. Residents that do not have a fundamental understanding that the storm drain system is connected directly to receiving water bodies may be less likely to implement BMPs for high TTWQ activities. Note that the percentages of responses in Table 4 below add up to over 100 percent because more than one answer may have been marked to indicate the resident's level of understanding.

**Table 4.** Percentage of responses for each category for all surveys (n = 317 residents).

| Response Categories | Percent of All Surveys |
|---|---|
| Street, drain or sewer | 32 % |
| Storm drain | 20 % |
| River, creek, bay or ocean | 56 % |
| Treatment plant | 6 % |
| Unknown (if treated) | 44 % |

**Table 5.** Percentage of residents aware of storm water in each area.

| Residential Area | Percent of residents knowing storm water is not treated before discharge to creeks, bay, and ocean | Number of residents answering in each area |
|---|---|---|
| A Avenue | 58 % | 31 |
| Arcadia Place | 80 % | 20 |
| B Avenue | 43 % | 14 |
| Division Street | 44 % | 158 |
| East 8th Street | 33 % | 24 |
| Grove Avenue | 67 % | 18 |
| Harbison Avenue | 57 % | 14 |
| Paradise Creek Area | 57 % | 38 |

Note: Residents "aware of storm water" are those who had response "c" but not "d" or "e" for Question 1.

**Question 2:** "Where do you wash your car, if you have one?"

a. Here at home, on driveway
b. Here at home, on the street
c. Here at home, on unpaved area
d. At workplace
e. At professional car wash
f. Never wash car or don't have car

The purpose of this question was to obtain data about vehicle washing habits in these high TTWQ residential areas. If the resident did not own a car, or did not wash a vehicle, in some instances a family member or friend was reported to conduct vehicle washing on the property. Residents were encouraged to report what actually takes place with no answer choices provided. Staff members also refrained from telling residents about car washing best management practices (BMPs) until the end of Question 4.

There were 10 reports of friends or family members who washed vehicles in the street; these residents were informed that it is prohibited to wash cars in the street but permitted to wash cars on a private driveway in the City of National City. The low percentage of residents washing vehicles over unpaved areas may be attributed to the City ordinance text prohibiting vehicle parking on lawns. As seen in Figure 5 below, a majority (61 percent) of the residents take their vehicles to be cleaned at a professional car wash, but 15 percent of this 61 percent also wash their vehicles at home in their driveways. For the purposes of analysis, residents reporting that they washed their vehicle at a professional car wash or over an unpaved area were considered to be implementing good car washing BMPs. All other types of washing would likely generate significant wash water runoff. Differences in percent of residents implementing good car washing BMPs between residential areas can be noted in Table 6.

**Figure 5.** Number of responses for each category of car washing behavior (n = 315 residents).

**Table 6.** Percentage of residents implementing car washing BMPs in each area (including only residents that do wash a vehicle).

| Residential Area | Percent of residents preventing wash water runoff | Number of residents that do wash a vehicle |
|---|---|---|
| A Avenue | 74 % | 27 |
| Arcadia Place | 67 % | 42 |
| B Avenue | 58 % | 12 |
| Division Street | 71 % | 148 |
| East 8th Street | 82 % | 22 |
| Grove Avenue | 58 % | 19 |
| Harbison Avenue | 57 % | 14 |
| Paradise Creek Area | 60 % | 30 |

**Question 3:** "What do people do in this neighborhood to clean up after their dogs?"

a. Leave waste where it is
b. Pick up pet waste and put in landscaping
c. Pick up pet waste and put in trash or toilet
d. Dump waste in drains
e. Other unacceptable disposal method
f. No dogs observed / don't know

This question was intended to assess the residents' perceptions about pet waste disposal in their neighborhood as a whole. In many cases, responses were based on observations of pet waste on the street or the behavior of a few neighbors, but where applicable residents would volunteer their own practices. All applicable responses from each resident were checked on the survey for "a" through "e." If the resident could not provide any observations then "f" only was checked.

Pet waste disposal methods considered to be appropriate included flushing pet waste down the toilet or using a plastic bag to dispose of the waste to the trash. All other observed practices were considered inappropriate. Generally speaking, residents were aware which behaviors would be inappropriate but readily offered information about the improper behaviors of their neighbors. Education about good pet waste disposal practices, where necessary, was provided at the end of Question 4.

The highest reported disposal method (50 percent) was simply leaving dog waste on the ground (Figure 6). Of residents that stated pet waste was not picked up, seven people reported other unacceptable disposal methods including dumping waste in the storm drain. These practices were not observed by staff during the residential surveys but were strongly discouraged at the end of each survey when reported. Forty-two percent of residents reported disposal to the trash or toilet, including many who owned pets themselves. Differences in pet waste disposal reports by residential area are shown below in Table 7. A large number of residents were unable to provide information about disposal practices in their neighborhood. This may indicate that fewer pets are present or owners are more conscientious in these residential areas (Figure 7).

**Figure 6.** Number responses for each category of pet waste disposal behavior (n = 311 residents).

**Table 7.** Percentage of reports indicating proper neighborhood pet waste disposal in each area (including only residents who had observed pets).

| Residential Area | Percent of residents reporting proper disposal | Number of residents who had observed pets |
|---|---|---|
| A Avenue | 29 % | 7 |
| Arcadia Place | 67 % | 18 |
| B Avenue | 27 % | 11 |
| Division Street | 45 % | 154 |
| East 8th Street | 33 % | 15 |
| Grove Avenue | 57 % | 7 |
| Harbison Avenue | 20 % | 10 |
| Paradise Creek Area | 32 % | 25 |

**Figure 7.** Percentage of residents in each residential area who had not observed pet waste disposal.

**Question 4:** "Which of these is a problem if it goes into the storm drain system?"

a. trash
b. motor oil
c. pet waste
d. fertilizer or pesticide
e. used cooking oil
f. soapy water from washing
g. sprinkler water from landscaping
h. rainwater

This question was created to determine what materials residents view as harmful to let enter the storm drain and what materials they feel are acceptable to discharge to the storm drain. Residents were provided with eight choices, presented as text in English and Spanish with visual representations (see Attachment 2). Residents were encouraged to consider each item separately, rather than choosing all of the options at once. Once all choices were made, staff members educated each resident regarding illegal discharges and best management practices. Note that trash, motor oil, pet waste, fertilizer and pesticide, and used cooking oil were considered to be unacceptable and illegal discharges in all cases. Car wash water (from private property) is currently an allowed discharge, but was described to residents as a source of pollution and an avoidable discharge. Irrigation runoff was also presented as an allowed discharge, but one that could waste water or potentially convey pollutants such as fertilizers or pesticides.

As is seen in Table 8, most people could identify several items as threats to storm water. Motor oil, at 89 percent, was the most often recognized threat to storm water. Fewer residents indicated that soapy water should not go into the storm drain than all other potential pollutants (Table 8). Some residents stated that soapy water was not hazardous; therefore it would not be harmful to let enter the storm drain. Yet other residents selected irrigation runoff for water conservation reasons. The results are summarized in Table 8 and Figure 8 below.

**Table 8.** Number and percent of responses for each category (n = 308 residents).

| Categories of Materials | Number of Residents Selecting | Percent of Residents Selecting |
|---|---|---|
| 4a.Trash | 265 | 86 % |
| 4b. Motor oil | 275 | 89 % |
| 4c. Pet waste | 254 | 82 % |
| 4d. Fertilizer or pesticides | 258 | 84 % |
| 4e. Used cooking oil | 259 | 84 % |
| 4f. Soapy water from washing | 221 | 72 % |
| 4g. Sprinkler water from landscaping | 82 | 27 % |
| 4h. Rainwater | 46 | 15 % |

**Figure 8.** Number of selected item categories for Question 4 for all areas (n = 308 residents).

**Question 5:** "What can we all do to help make National City a cleaner place?"

At the end of each survey, each resident was asked the above open-ended question. This final question was intended to provide residents an opportunity to share their ideas with the City. Additionally, responses from residents may reveal their attitudes about the cleanliness of the City and where responsibility lies for keeping the City clean.

Trash disposal (including recycling), mentioned in one third of all comments, was by far the largest topic of residential concern (Figure 9). The next most common type of suggestion was education and awareness. Some notable suggestions were as follows:

- Make it easier for people to recycle.
- Provide public trash containers so people don't litter.
- Provide dog waste bags at parks.
- Have residents form neighborhood clean-up crews.
- Educate school children who litter.
- Provide stricter enforcement of littering, excessive water use, and car washing.
- Provide more signs in Spanish.
- Educate residents about pollution.

**Figure 9.** Categories of residential survey comments on what is needed to keep the City clean (n = 137 suggestions from 126 residents).

The responses indicated that some residents considered the City to be responsible, while others pointed to individual responsibility within the neighborhood. A few residents thought that the property manager of the complex had an important role in promoting a clean neighborhood. One resident complained about trash coming from a nearby commercial area. Residents that do not feel that it is their responsibility to keep the

community clean may be less inclined to manage their own waste or be proactive about picking up trash in their neighborhood. These results are expressed in Figure 10 below.

**Figure 10.** Party most responsible for keeping the City clean (n = 126 residents).

## DATA ANALYSIS

Since the residential survey consisted of both knowledge assessment questions and residential behavior questions, comparisons of behavior could be made for residents with different levels of storm water knowledge.

### Knowledge vs. BMP Implementation by Residential Area

The first set of comparisons looked for differences in car washing habits and pet waste disposal behavior by residential area as opposed to the percent of residents aware that storm water is not treated. The findings are summarized in Table 9 below.

Notably the Arcadia Place Area had the most residents aware that storm water is not treated and also had the most reports of proper pet waste disposal. Proper pet waste disposal (i.e., to the trash or toilet) seems slightly more common where residents have a higher level of awareness of storm water (Figure 11). Since residents were reporting on the neighborhood as a whole, most residents were less likely to just pick the "correct" answer when they knew it. This would likely counteract a confounding effect of knowledge on the pet waste survey question. Good car washing practices (i.e., washing at a professional car wash or on an unpaved surface), on the other hand, do not seem related to knowledge by residential area.

**Table 9.** Comparison of knowledge with car washing and pet waste BMP implementation by residential area

| Residential Area | Percent of residents knowing storm water is not treated before discharge to creeks, bay, and ocean | Percent of residents preventing wash water runoff | Percent of residents reporting proper disposal of pet waste |
|---|---|---|---|
| A Avenue | 58 % | 74 % | 29 % |
| Arcadia Place | 80 % | 67 % | 67 % |
| B Avenue | 43 % | 58 % | 27 % |
| Division Street | 44 % | 71 % | 45 % |
| East 8th Street | 33 % | 82 % | 33 % |
| Grove Avenue | 67 % | 58 % | 57 % |
| Harbison Avenue | 57 % | 57 % | 20 % |
| Paradise Creek Area | 57 % | 60 % | 32 % |

Note: See also tables 5, 6, and 7 in this report for the initial presentation and explanation of the percentages.

**Figure 11.** Comparison of knowledge with car washing and pet waste BMP implementation by residential area.

### Knowledge vs. Car Washing Habits by Individual Resident

Since the first comparison found no association of car washing behavior and knowledge by residential area, these survey answers were compared within individuals. The second

comparison looked for differences in car washing behavior of individual residents who knew storm water is not treated as opposed to those that were unaware. It seems clear in Figure 12 that individual car washing behavior is not different for residents that are aware of storm water and those that are not aware.

Since car wash practices may be influenced heavily by convenience, cost, habit, and driveway availability, individuals may be unlikely to change their practices regardless of education unless car wash runoff is actually prohibited. It is unknown however, whether education might still influence car washing methods within those that wash vehicles at home.

**Figure 12.** Individual residents aware that storm water is not treated do not wash their cars differently than those who are unaware (n = 315 residents).

## SUMMARY AND CONCLUSIONS

- Surveys, education, and observations were conducted in eight high TTWQ residential areas, resulting in a total of 1341 homes receiving educational materials and survey data collected from 317 residents. Nearly half of these were within the Division Street Area.
- The three main languages used by residents within the City's high TTWQ areas are English, Spanish, and Tagalog. While many residents are bilingual, at least thirty-two percent of residents in these areas will have difficulty understanding

future educational efforts in English unless materials and presentations are also available in their language.

- High TTWQ activities were observed at 11 residences, and materials that might pose a TTWQ were noted at 26 residences. Photos of those that may require additional education or enforcement have been provided in Attachment 3.
- Fifty percent of all survey respondents did not know that storm water flows to the creeks, bay, and ocean without treatment. The least knowledgeable neighborhoods were the East 8th Street Area, B Avenue Area, and Division Street Area.
- Sixty-one percent of survey respondents wash their vehicle at a professional car wash most of the time.
- Of residents that had observed pet waste disposal practices in their neighborhood, only 42 percent said that pet owners tend to clean it up appropriately.
- When prompted, most residents identified many of the potential pollutants from Question 4 as not acceptable to be discharged to the storm drain. Soapy water was less frequently identified as a problematic discharge than other potential pollutants.
- Residents made many suggestions regarding what is needed to keep the City clean, the most common concerning encouraging proper trash disposal and increasing public awareness through education. Some residents had already received the storm water calendar or had heard of storm water through their children.
- Most suggestions for City cleanliness indicated attitudes of both City and individual responsibility. A few also indicated the important role of property managers.
- When compared by residential area, a higher percent of people aware that storm water is not treated appeared loosely associated with a higher reporting rate of proper pet waste disposal, but car wash behavior was not associated.
- Individuals who are aware that storm water is not treated are just as likely to wash their vehicles at home as those individuals who are unaware.

## RECOMMENDATIONS

- Consider developing some storm water educational materials in Tagalog to better serve and educate the residents of National City. Also ensure that any new materials will always be available in both English and Spanish.
- Address the high TTWQ activities and materials noted at some of the residences (Attachment 3) with education and/or enforcement where not in accordance with City ordinances.

- Compare the level of knowledge revealed through these residential surveys with regional storm water awareness data where it addresses similar topics when available.
- Consider providing or increasing the amount of signage and dog waste bag dispensers in parks and common walkways to encourage owners to properly dispose of pet waste.
- Continue storm water education efforts in local schools, especially encouraging school children to take time to share their new knowledge with their families and neighbors.
- Consider coordinating meetings with property managers in high TTWQ residential areas to discuss storm water quality issues and potential sources of pollutants as a proactive step for addressing observed overall property issues. Discussing storm water BMPs with property managers and landlords is an additional system for keeping residents aware of and accountable for their practices.

# Attachment 2

# Storm Water Residential Knowledge Assessment Survey

**Survey Questions:**

1. Do you know where water goes after it flows off of your property?
(Don't show list, but mark all mentioned.)

a. Street/drain/sewer — Ask "Where does it go after that?"
b. Storm drain — Ask "Where does it go after that?"
c. River/creek/bay/ocean/etc. — Ask "Does the water get treated or cleaned before it goes there?"
d. Treatment plant
e. Don't know (even after encouraged to guess)

In any case, after they answer remind that all water used outside enters the storm drain and is not treated in any way before it goes to the creeks, bay, and ocean.

2. Where do you wash your car, if you do?
(Don't show list, but mark all mentioned.)

a. Here at home, on driveway
b. Here at home, on the street
c. Here at home, on unpaved area
d. At workplace
e. At professional car wash
f. Never wash car or don't have car

3. Are there many dogs living in this neighborhood? What do people do in this neighborhood to clean up after their dog, if you know?
(Don't show list, but mark all mentioned.)

a. Leave waste where it is
b. Pick up pet waste and put in landscaping
c. Pick up pet waste and put in trash or toilet
d. Dump waste in drains
e. Other unacceptable disposal method
f. No dogs observed / don't know

4. Which of these is a problem if it goes into the storm drain system?
(Provide photos as multiple choice, and mark all mentioned.)

a. trash
b. motor oil
c. pet waste
d. fertilizer or pesticide
e. used cooking oil
f. soapy water from washing
g. sprinkler water from landscaping
h. rainwater

5. What can we all do to help make National City a cleaner place?
(Try to gauge what they think)

- Is there a trash (or other) problem?
- Who is responsible for causing the problem?
- Who should clean it up?
- Any potential suggestions / solutions?

## Which of these should NOT go in the storm drain?

## ¿Quáles NO deben ir a la coladera para aguas pluviales (afuera de la casa)?

**TRASH (BASURA)**

**MOTOR OIL (ACEITE DE CARRO)**

**PET WASTE (DESECHOS DE MASCOTA)**

**PESTICIDE/FERTILIZER (PESTICIDA/FERTILIZANTE)**

**COOKING OIL (ACEITE DE COCINA)**

**SOAPY WATER (AGUA JABONOSA)**

**SPRINKLER WATER (AGUA DE ROCIADERA)**

**RAIN WATER (AGUA PLUVIAL)**

**Everything that flows down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay.** When it rains o when water flows out of yards, it flows directly into storm drains. Many people think that everything that flows into a storm drain gets treated at the Point Loma Sewage Treatment Plant, just like wastewater in the sewer system, but these two systems are not connected.

The sources of pollution that must be controlled and eliminated result from urbanization and the choices that are made every day by residents, businesses and industry alike. For example, detergents, oil, grease, and other pollutants have been shown to be toxic to wildlife in local streams and San Diego Bay. **Recycling** of oil, antifreeze, glass, plastic, and other materials can prevent their improper disposal into the stormwater drainage system. **Proper landscaping practices** include minimization of the use of herbicides, pesticides and fertilizers together with conservation of water to minimize runoff of pollutants from landscaped areas, lawns, golf courses, etc.

**The City of National City's Stormwater Management & Discharge Control of the National City Municipal Code Chapter 14.22, prohibits non-stormwater discharges, such as car washwater, pesticides, fertilizers, pet waste, litter, oil, and other automobile fluids, to run into the City's storm drain system.** This ordinance is based on regulations set forth by the State Regional Water Quality Control Board and the U.S. Environmental Protection Agency in connection with the State and Federal Clean Water Acts.

Your help is needed, and by doing your part, by changing your washwater and trash disposal practices, you will help reduce the pollution problems in the community where you and your family live, work and play. Please call **Storm Drain Hotline** at **(619) 336-4389** if you have **any questions** regarding this matter and **to report any illegal discharges and /or dumping.**

# City of National City

Office of the Public Works/Engineering Director
1243 National City Blvd. National City, CA 91950-4397
619) 336-4580, Fax (619) 336-4397 www.ci.national-city.ca.us

**Todo lo que desemboca en las alcantarillas no esta tratado y va a parar directamente a nuestras lagunas, esteros y Bahia de San Diego.** Cuando llueve o cuando escurre agua de algun patio, desemboca directamente a las alcantarillas. Mucha gente piensa que todo lo que desemboja en una alcantarilla es tratado en la planta de Tratamiento de Agua Negras en Point Loma, como las aguas negras del sistema de drenaje, pero estos dos sistemas **no** estan conectados.

Las causas de contaminacion que tienen que ser controladas y eliminadas resultan de la urbanizacion y las elecciones que hacen todos los dias los residentes, negocios y la industria. Por ejemplo, detergentes, aceite, grasa, ya otros contaminantes se ha visto que son toxicos para la vida silvestre en nuestros arroyos locales y Bahia de San Diego. **Reciclando** el aceite, antifreeze, vidrio, plastico y otros productos que sean desechados de un modo inadecuado llegen a parar al sistema de alcantarillado de la ciudad. **Los metodos de mantener el jardin**, como usar menos los herbicidas, pesticidas y fertilisantes.Tambien como conservar el agua para que esa agua con contaminantes de los jardines, pastos, canchas de golf, etc.

**El Codigo Municipal No. 14.22 de las aguas pluviales de la Ciudad de National City, prohibe aguas que no sean pluviales como las aguas negras, pesticidas, fertilisantes, basura, aceite y otros liquidos de carros que sean depositadas en el sistema de alcantarillado de la ciudad.** Esta regla esta basada en las regulaciones puesta por "State Regional Water Quality Control Board" y "U.S. Environmental Protection Agency" en conneccion con "State and Federal Clean Water Acts."

Su ayuda es necesaria, y haciendo su parte como cambiar el modo de tirar su basura, usted ayudara a reducir la contaminacion en la comunidad donde usted y su familia viven, trabajan y juegan.

Por favor llame a la linea de **"Storm Drain Hotline"** al **(619) 336-4389**, si tiene **alguna pregunta** si quiere **reportar un desague ilegal**.

# Put Toxic Waste In Its Place!

## Introduction

Did you know that the average home contains 60 household hazardous products that can harm you, your family, pets and the environment if they are not used, stored or disposed of properly? Hazardous materials are contained in many common household products such as cleaners, paint, automotive products and pesticides. These products can harm trash collection personnel, contribute to fire hazards, enter storm drains and pollute creeks, rivers, lakes and beaches that include some of our most cherished recreational locations. These water sources are also critical to local water supplies and wildlife habitat.

Seventeen cities and the County of San Diego have come together to form the San Diego Regional Household Hazardous Waste Partnership. This guide contains a wide variety of information including identifying what household hazardous waste is; safety when using these materials; alternative products available to you; reducing your waste and much more.

Most importantly, this booklet provides residents with information about how to reuse, recycle and properly dispose of household hazardous waste.

Residents can bring their household hazardous waste, free of charge or for a small co-payment, to a nearby collection facility. There are a variety of programs offered throughout the region. Visit www.1800CLEANUP.org or call 1(800) CLEANUP / 1(800) 253-2687 for information about your community's household hazardous waste collection program.

The San Diego Regional Household Hazardous Waste Partnership is striving to create a cleaner and safer environment. So… read on to learn more about how to… Put Toxic Waste In Its Place!

## Defining Household Hazardous Waste

Household Hazardous Waste is any material (gas, liquid or solid) discarded from the home that may, due to its chemical nature, pose a health threat to people, animals and the environment if handled or disposed of improperly. You will know if a product is hazardous if it is labeled with signal words. These include:

**Toxic** – poisonous or causes long-term illness
**Flammable** – burns easily
**Corrosive** – eats through materials (e.g., acid)
**Reactive** – can explode when exposed to heat, water, air or strong impact

How dangerous is a hazardous product? Here are the signal words, please note they are in order based on how hazardous the product is:

**DANGER or POISON** means extremely hazardous. The product could poison you, cause serious damage to skin or eyes, or easily cause a fire.
**WARNING or CAUTION** means moderately hazardous.
**NO SIGNAL WORD** means least hazardous.

Hazardous product labels may also say: "harmful or fatal if swallowed," "keep out of reach of children," "causes severe burns on contact," "do not use near heat or flame" or "use only in well ventilated area." Avoid household products marked DANGER or POISON. Take care when you use, store or dispose of any hazardous product. Best of all, choose safer, less-toxic and often cheaper products that do not need warnings.

# Examples of…
# Household Hazardous Waste

The following are examples of household hazardous waste items that may be found around your home.

*For explosives or radioactive products, contact your local law enforcement agency.*

## Kitchen

- Bleach
- Bug sprays
- Drain cleaners / openers
- Floor care products
- Furniture polish
- Household cleaners
- Metal polishes
- Spot removers

## Bathroom

- Bathroom cleaners
- Disinfectant
- Expired medicine
- Hair chemicals
- Hair removers
- Isopropyl alcohol
- Mercury thermometers
- Nail polish & remover

## Automotive

- Antifreeze
- Auto batteries
- Auto body repair products
- Brake fluid
- Car wax
- Gas & Diesel fuel
- Used motor oil / oil filters
- Transmission fluid
- Solvents
- Windshield washer solution

## Storage

Latex / water-based paint

Oil-based paint

Paint remover / thinner

Rust remover

Solvents

Turpentine

Varnish / stains

Wood preservatives

Kerosene

## Yard / Garden

Fertilizers

Fungicides

Insecticides

Pesticides

Rat poison

Weed killer

## Misc

Computer monitors and televisions

Other electronic items

Dry cleaning solvents

Fluorescent lights

Glue / Adhesives / Epoxies

Gun cleaning solvents

Hobby chemicals

Household Batteries

Mercury thermostats

Mothballs

Photographic chemicals

Pool Chemicals

Shoe polish

# Protect Your Family!

## How chemicals enter your body:

**Ingestion**

Drinking or swallowing harmful chemicals may lead to poisoning. Contact the California Poison Control Center at 1 (800) 876-4766 as soon as possible when toxic or hazardous materials are ingested. Whenever possible, have the labeled container available for poison control and medical staff.

**Absorption**

If chemicals get on your skin they may be absorbed into your body and your blood stream. The effects can be as serious as ingestion.

**Inhalation**

Inhaling vapors or fumes through your mouth or nose may lead to poisoning. Vapors pass directly through the lungs into the blood stream. This is the quickest way that chemicals can affect your brain.

**Eye/skin contact**

This can cause blindness, irritation, burning and tissue damage.

The effects of exposure to hazardous chemicals may vary depending on the type of chemical, the length and amount of exposure and on your general health. Some of the more common immediate symptoms include: headaches, dizziness, nausea, sweating, difficulty breathing and irritation of the eyes, nose and throat. Long-term effects are more severe. Used motor oil and some pesticides and solvents, for example, can increase your risk of developing cancer. If you feel you may have been exposed to a hazardous chemical or begin to experience unusual symptoms, call your poison control center or doctor immediately.

*Did you know that 1 out of 10 children is injured at home from household chemicals?*

## In the event of a spill or accident:

- Keep children and pets out of the area.
- Wear protective gloves and clothing, if required.
- Extinguish any open flame or heat source.
- Keep the area well ventilated.
- Read the label for safety instructions.
- Contain the spill and cover it with kitty litter, sand or soil. Use rags for very small spills.
- Sweep or scoop the materials up and put into a strong plastic bag. Use double bags to be extra safe.
- Scrub the area with water and be careful not to wash toxic materials into storm drains or sewers.
- Cleanup materials cannot be thrown in the trash. They too must be taken to a household hazardous waste collection facility.

# Be Safe, Not Sorry
# Remember—Safety First

**Purchase:**

- Look for products that are less hazardous or nontoxic. This helps to prevent household accidents such as fire or poisoning.
- Read labels prior to purchase. Know what you are buying and what special safety precautions need to be followed when using, storing or disposing of the product.
- Buy only the amount you need for your project. Share leftovers with friends or neighbors.
- Buy recycled products. Ask your retailers for recycled products including paint, motor oil and antifreeze.

**Use / Storage:**

- Children and expectant mothers should restrict or eliminate their exposure to hazardous products.
- Follow directions when using a hazardous household product.
- Do not smoke, eat or drink when handling hazardous household products.
- Never mix any hazardous household products. Mixing products can produce dangerous reactions and make products unrecyclable.
- Do not allow hazardous products to be washed into the gutter or storm drain in front of your home or business. Storm drains lead directly to creeks, lakes, rivers and the ocean without being treated.
- Keep combustible and flammable products away from pilot lights.
- Keep containers standing upright with lids on tight.
- Make sure containers are not leaking.
- Store hazardous household products in their original containers with the label intact.
- Keep material out of the reach of children and pets.
- Store material in a cool, dry place away from excessive heat or cold.
- Do not store corrosives, flammables, and poisons together. Separate these containers.

**Disposal:**

- Offer your quality leftover products to neighbors, community groups, family and friends.
- Transport containers to a household hazardous waste facility or event in the trunk or back of vehicle away from passengers and animals.
- Do not transport more than 15 gallons or 125 pounds at any one time.
- Products should not be transported in containers larger than 5 gallons.
- Empty containers may be thrown in your trash or recycling bin.

# Reduce household hazardous waste at home!

## What can I do to reduce the amount of chemicals and hazardous products in my home?

**Reduce:**

- Use safer substitutes or alternatives to toxic products *(see household hazardous waste alternative charts, pages 9-12).*
- Buy less hazardous or non-toxic products.
- Buy only as much as you need for your current project. If you have leftovers, you will be responsible for their proper disposal.
- Select water-based products over solvent-based products when available *(e.g. paint, glue, shoe polish).*
- Avoid aerosol sprays. Choose non-aerosol pump sprays or other alternatives.

**Reuse:**

- Buy only as much as you need for your current project. Ask a friend, relative or neighbor if they can use your quality leftover.
- Certain civic and community groups may accept leftover paint for use at their facilities. Please call first.

# Less Toxic Products and Their Uses

**Ammonia:**

Cleans carpets, copper, dishes, enamel, floors, formica, garbage cans, glass, grout, jewelry, linoleum, ovens, porcelain, refrigerators, showers, stainless steel, stoves, tubs, windows and painted woodwork. Removes stains. Do not mix ammonia with bleach; it produces a toxic gas.

**Baking soda:**

Cleans and deodorizes carpets, counters, drains, refrigerators, upholstery, and vinyl. Extinguishes grease fires. Freshens fabrics. Removes stains. Scours and polishes aluminum, chrome, grout, jewelry, plastic, porcelain, silver, stainless steel and tin. Softens fabrics.

**Cornstarch:**

Cleans windows. Polishes furniture. Removes stains. Shampoos carpets and rugs. Starches clothes.

**Lemon juice:**

Deodorizes. Cleans windows and other glass. Removes stains from aluminum, clothes and porcelain.

**Soap and water:**

Cleans cars, clothes, dishes, doors, floors, glass, jewelry, people, pets, sporting goods, tools, walls, windows and woodwork.

**Steel wool:**

Removes rust, rust stains and stubborn film. Scours barbecue grills and broiler pans.

**Vinegar:**

Cleans bricks, carpets, coffee pots, dishes, fireplaces, glass, grout, paintbrushes, walls and windows. Polishes metal. Removes mildew, spots, stains and wax buildup. Softens fabric. Removes paint.

**Washing soda:**

Cleans and cuts grease on barbecue grills, broiler pans, concrete, drains, fireplaces, floors, ovens and walls. Improves detergent power. Removes stains. Softens water.

**Disclaimer:** The San Diego Regional Household Hazardous Waste Partnership, the California Integrated Waste Management Board and all participating jurisdictions, do not warrant and shall have no liability for information provided in this booklet or from the San Diego Regional Household Hazardous Waste Partnership and the California Integrated Waste Management Board. Each individual person, fabric or material may react differently to a particular suggested use. It is recommended that before you begin to use any formula, you read the directions carefully and test it first. Should you have any health care-related questions or concerns, please call or see your physician or other health care provider.

# Household Hazardous Waste

## Reference and Alternative Product Chart

**PEST / GARDEN / YARD PRODUCTS**

| Product | Alternative |
|---|---|
| Rodent bait | • Remove food supply and close all entry points.<br>• Some cats and dogs are good at catching rodents.<br>• Use traps (remember humane traps are available.) |
| Ant pesticides | • Remove all sources of food and water. Locate entry point and seal with caulk.<br>• Pour a line of tartar, red chili powder, paprika or dried peppermint at point of entry.<br>• Kill visible ants with soapy water or vacuum. Baits or traps are preferable over sprays. |
| Roach pesticides | • Remove all sources of food and water. Remove hiding places such as old newspapers, garbage bags and other clutter.<br>• Place bay leaves around cracks in room.<br>• Set out a dish of equal parts baking soda & powdered sugar.<br>• Carefully apply boric acid powder into cracks where roaches hide (keep away from children and pets.) |
| Flea collars & sprays | • Add small amounts of brewers yeast or vitamin B in pet's food.<br>• Use an herbal collar or ointment (eucalyptus or rosemary.)<br>• Place eucalyptus leaves near pet's bed.<br>• Give your pet herbal baths.<br>• Wash pet bedding and treat with flea soap or citrus oil product.<br>• Sprinkle carpet with borax, vacuum twice a week & dispose of vacuum bags in the trash. |
| Plant insecticides | • Remove pests by hand.<br>• Spray affected leaves with strong stream of water.<br>• Mist or spray with soapy water. |
| Snail/slug killers | • Remove tall grass & debris from vicinity of garden.<br>• Overturn clay pots or lay board between rows of planted vegetables.<br>• Remove pests by hand.<br>• Fill a shallow pan with stale beer and place in infested area. |
| Chemical fertilizers | • Use compost. Buy or make your own.<br>• Use natural soil enhancers such as greensand, bone meal or fish meal. |

## Disposal Options:

Use the entire product. Empty containers may be thrown in regular trash or recycled. Where possible, empty containers should be rinsed with water prior to discarding in the trash. If possible, rinse the container in a sink or indoors. If rinsed outdoors, rinse over a large bucket to collect the "dirty" water. The "dirty" water must also be properly disposed of at your local household hazardous waste collection facility. Never dump the dirty water into a storm drain or on the ground.

# Household Hazardous Waste

## Reference and Alternative Product Chart

### PEST / GARDEN / YARD PRODUCTS CONTINUED

| Product | Alternative |
|---|---|
| Fungicides | • Avoid over watering and keep garden growing area clean and dry. |
| Herbicides and weed killers | • Pull or hoe weeds regularly.<br>• Use mulch as ground cover.<br>• Keep grass short.<br>• Cover garden with opaque plastic to prevent weed germination. |

***Read and look at all product labels before purchase.***

### PAINT PRODUCTS

| Product | Alternative |
|---|---|
| Enamel or oil based paint | • Use latex or water-based paint. |
| Latex or water based paint | • Use limestone-based whitewash.<br>• Use casein-based paint, which is an opaque watercolor in which “casein” or milk glue, is its binder. |
| Furniture and paint strippers | • Rub with sandpaper or use a power sander.<br>• Use a heat gun.<br>• Scrub surface with steel wool or an emery cloth. |
| Stains and varnishes | • Look for water-based stains or natural earth-pigment finishes. |
| Thinners, solvents, turpentine | • Hold used solvent or turpentine in a tightly closed jar until paint settles out. Pour off clear solvent and reuse.<br>• Latex and water-based paint does not require thinners. |
| Wood preservatives | • Avoid products containing pentachlorophenol.<br>• Use water-based wood preservatives.<br>• Minimize wood contact with soil or high moisture. |
| Solvent based glue | • Use non-toxic glues. |

# Household Hazardous Waste

## Reference and Alternative Product Chart

### HOUSEHOLD PRODUCTS

| Product | Alternative |
|---|---|
| Abrasive cleaners and scouring powders | • Use baking soda or borax.<br>• Use ½ lemon dipped in borax rinse.<br>• Scrub with toothpaste for light stains. |
| *Ammonia-based cleaners | • Use white vinegar diluted in water.<br>• Scrub with baking soda. |
| *Bleach-based cleaners and chlorine bleach | • Use either baking soda or borax. |
| Disinfectant cleaners | • Use white vinegar diluted in water.<br>• Mix one teaspoon of essential oil (lavender, clove or tea tree oil) to 2 cups of water in a spray bottle. |
| Drain openers or drain cleaners | • Avoid putting grease in the drain.<br>• Use a plunger or “snake”. Follow with boiling water.<br>• Unclogged drains only: 1 cup baking soda followed by ½ cup vinegar. Follow with a kettle of boiling water. |
| Toilet bowl cleaners | • Mix ½ cup vinegar with ½ cup baking soda. Let stand for a few minutes, and then apply to toilet bowl with a brush.<br>• Soak for 2 hours in apple cider vinegar (drain toilet before adding vinegar.) After soaking, gently rub off any remaining residue. |
| Glass and window cleaners | • Mix 1 quart warm water with ¼ cup vinegar, add a splash of lemon juice. Apply to glass. Rub dry with newspaper. |
| Oven cleaners | • Sprinkle baking soda on the bottom of the oven, spray with water. Wipe down. Wipe 2nd time to remove any residue.<br>• Clean your oven as you use it. Use oven liners to catch drips.<br>• When purchasing a new oven, consider buying one that is self-cleaning. |
| Rug and upholstery cleaners | • Sprinkle baking soda on rug and vacuum.<br>• Mix 1 part borax with 2 parts cornmeal. Sprinkle on liberally. Vacuum after 1 hour. |
| Pet Odor Remover | • Rinse the area with water. Soak up as much pet urine as possible. Place baking soda on area to absorb. Rinse the "accident zone" thoroughly with clean, cool water. After rinsing, remove as much of the water as possible by blotting or by using a "wet-vac," "shop-vac" or "extractor."<br>• Make the "accident zone" unattractive, the appropriate "bathroom" area attractive, and teach your pet where you want him to eliminate instead. Contact your local humane society for suggestions in positive reinforcement and housetraining techniques. |

** Never mix a product containing chlorine bleach with anything containing ammonia.*

# Household Hazardous Waste

## Reference and Alternative Product Chart

### HOUSEHOLD PRODUCTS CONTINUED

| Product | Alternative |
|---|---|
| Spot remover | • (Spot check first) Sprinkle baking soda on stain, spray with vinegar. Apply pressure with clean absorbent cloth. Repeat as needed. |
| Furniture polish | • Mix mineral oil or vegetable oil with small amount of lemon juice or white vinegar to polish. |
| Floor cleaner | • Mix 1 cup vinegar with 2 gallons of warm water. |
| Mothballs | • Place cedar wood chips in dresser drawers or place cedar planks in the back of your closet.<br>• Place dried lavender flowers in your dresser drawers. |
| Silver and copper polishes | • Soak silver in 1 quart of warm water with 1 tsp. baking soda and 1 tsp. salt mixture and a small piece of aluminum foil.<br>• Pour vinegar and salt over copper and rub.<br>• Mix lemon juice with salt. Scrub and rinse. |
| Aerosol spray can products *(including hair spray, deodorants, etc.)* | • Buy non-toxic products with non-aerosol propellants.<br>• Use the product so the container is completely empty, with no propellant or product remaining. Recycle the empty container in your curbside recycling program. |
| Air fresheners | • Prepare an herbal sachet.<br>• Stud an orange with cloves and set in dish.<br>• Simmer cinnamon and cloves.<br>• Use scented candles.<br>• Place open baking soda boxes where needed.<br>• Set out hot vinegar in an open dish.<br>• Ventilate with outside air. |
| Laundry Whitener | • Add ½ cup borax to each load. |

### AUTOMOBILE PRODUCTS

| Product | Alternative |
|---|---|
| Gasoline/diesel fuel | • No known alternative; however when purchasing your next car, look for either natural gas, hybrid vehicles, biodiesel, hydrogen fuel cells or electric cars. Consider using public transportation or ride sharing. Reduce or eliminate idling to improve air quality. |
| Transmission fluid | • No known alternative, but recyclable. |
| Motor oil | • No known alternative, but recyclable.<br>• Ask your retailer for re-refined motor oil. |
| Antifreeze | • Use products containing propylene glycol instead of ethylene glycol. |
| Auto batteries | • No known alternative, but recyclable. |
| Engine cleaners and degreasers | • No known alternative, however regular maintenance and preventing or eliminating lead can produce great environmental benefits.<br>• Ask your mechanic about steam cleaning. |
| Car Wash | • Bring your vehicle to a car wash. Car washes are required to catch the detergents, lead, copper, asbestos, oils and dirt that are washed off your car and dispose of it properly. Most also recycle the water they use. |

# Dispose of Household Hazardous Waste Properly:

- Properly and legally dispose of your household hazardous waste by bringing it to a collection facility or event. For information, visit www.1800CLEANUP.org or call 1(800) CLEANUP / 1(800) 253-2687. Vehicle loads are legally limited to 15 gallons or 125 pounds.
- Recycle used motor oil, oil filters, auto batteries and antifreeze at collection centers such as gas/service stations or auto parts stores.

## What happens when household hazardous waste is not disposed of properly?

- When household hazardous waste is illegally dumped into gutters, sewers, storm drains or the ground, it contaminates nearby lakes, streams and the ocean. This is all part of our watershed and provides recreational opportunities, wildlife habitat and drinking water… all of which is so important to our region and quality of life.
- When mixed with the regular trash, household hazardous waste can harm trash collection personnel or spill onto the ground, endangering children and animals. These products eventually end up in our storm drains and in our waterways.
- When flushed down a toilet, sink or drain, household hazardous waste goes through the sewage system to water treatment plants. At water treatment plants, hazardous waste interferes with the biological treatment process by killing helpful bacteria and can contaminate the treated water, which runs into the ocean. Additionally, like other communities throughout Southern California, our communities are looking to reclaim water from these sources for irrigation and other important water uses.

# What Happens to the Household Hazardous Waste that is Collected?

- Latex/water-based paint can be recycled and reused.
- Oil-based paint is reused as supplemental fuel in the manufacture of cement.
- Motor oil is recycled as re-refined motor oil, lubricants, marine diesel fuel, supplemental fuel and tar by-products such as asphalt cover.
- Household hazardous waste that cannot be recycled or reused is lab packed into special drums for disposal at specially designed landfills or incineration facilities.
- Electronic components are disassembled and are either recycled or processed according to state and federal specifications.

# Paint

The majority of household hazardous waste collected in San Diego County consists of paint and paint-related products. Chances are residents may currently have some paint which is leftover from an old job. A beautiful paint job and helping our environment can be accomplished just by knowing a few important facts about buying and disposing of paint.

**Buy Smart**

- Look for low Volitale Organic Componds (VOC) which are less harmful to air quality.
- Household paints fall into two categories: latex (water-based) and oil-based. Latex products can be easily cleaned up with soap and water. Oil-based products require cleaning products such as paint thinner. Whenever possible, buy latex products.
- Avoid using spray paint. Aerosols contain chemicals which are flammable under pressure.
- Determine the amount of paint needed and use all that is purchased. Ask the retailer for assistance.

**Put Your Leftover Paint to Use**

- Return unopened cans. Many retailers will give a refund.
- Use leftover paint as a sealant or undercoat on another project.
- Be a good neighbor! Donate unopened cans to a community group or other local organization. Remember to call first. Ask family and friends if they could use the paint.

**Proper Disposal**

- Whether you are using latex, oil-based or paint from an aerosol can, any remaining liquid paint must be disposed of properly. These items cannot be thrown in the trash or poured down a storm drain.
- Empty and dried paint cans may be disposed of in your regular trash or recycling bin.

# E-Waste: Electronic Waste

**Electronic Waste (E-Waste)** includes a growing range of electronic devices from cellular phones to computer monitors and televisions. Many electronic devices contain toxic materials such as lead, mercury, and cadmium that can harm human and environmental health. There are an increasing number of safe and legal options for both disposal and recycling of E-waste.

**Computer Monitors and Televisions**

Computer monitors and televisions are of particular concern. Computer monitors, televisions, and even video cameras may have a cathode ray tube (CRT) or “picture tube”. CRT’s are banned from landfills because each one contains an average of 4 to 8 pounds of lead. Although there are no health hazards associated with handling intact, unbroken CRT’s, it is important to keep them out of our landfills where they can potentially contaminate soil and groundwater.

# Less-Toxic Yard & Garden Care

Maintaining a healthy lawn and garden is a high priority and a source of great pride for many residents. However, overuse and misuse of chemicals in yard care is common and can be harmful to your family's health and the environment. Pesticides and fertilizers can be especially harmful to children, pets, birds, fish and beneficial insects such as bees and ladybugs. Pesticides tracked into the house lodge in carpet and pose a special risk to toddlers who play on the floor and put their fingers in their mouth.

**In Your Yard & Garden**

The most effective pest control starts with prevention. Building healthy soil with compost grows healthier plants. Selecting appropriate plants, watering efficiently and using mulches contributes to an environmentally sensitive garden. An ounce of prevention is better than a pound of pesticide.

- Select native or pest-resistant plants that are suited to the soil and climate. Healthy plants resist harmful insects and weeds.
- Monitor pest populations. Learn how to identify the useful insects that eat other pests, aerate the soil and benefit the garden.
- Look for less-toxic solutions, such as beneficial insects which reduce or eliminate the need for pesticides.
- Utilize nontoxic control methods when pests first become a problem: for example, handpicking, a strong water jet, barriers and traps. Grow plants such as marigolds and "society" garlic to help repel harmful insects.
- Use the least toxic chemicals available when all other methods fail and confine the treatment to affected areas only.
- Attend local workshops on less-toxic pest control and home composting.
- Do not over water the garden. Over watering can transport excess pesticides and fertilizers into the storm drains.

**Put Electronic Waste in Its Place!**

Safe, proper and legal disposal of E-waste is important.

- Explore reuse options. Consider repairing or selling your working monitors or televisions. If you donate to a community group, please call first.
- Gather obsolete or non-working electronics and make use of your local recycling or disposal options. Fees may apply.
- For information about electronic waste disposal options, visit www.1800CLEANUP.org or call 1(800) CLEANUP / 1(800) 253-2687.

**Shop Smart**

The next time you purchase electronics, look ahead to tomorrow. Purchase items that will fit your needs well into the future. Research product manufacturers to find out if they have take-back or recycling programs.

# Recycle Used Motor Oil and Oil Filters

Only clean, uncontaminated used motor oil can be recycled. Never mix your used oil with antifreeze or any other automotive fluid. Drain used oil into a clean container with a tight fitting cap. Many communities offer free used oil collection containers.

**Oil Filters**
A single oil filter can hold anywhere from a pint to a quart of residual oil. If thrown in the trash or dumped in a neighborhood, that filter can leak residual oil into our environment, contaminating our storm drains, creeks, lagoons and the beach. Each filter contains approximately 1lb. of steel, which can also be recycled into all sorts of new items including cars, appliances and rebar for construction.

## Where can I take used motor oil and oil filters for recycling?

**State Certified Oil Collection Centers**
Bring clean, uncontaminated used motor oil to an oil-collection center such as an automotive service center or auto parts store. Oil collection centers are located throughout the region. Certified centers will not accept used motor oil brought in containers larger than 5 gallons. However, they may accept up to 20 gallons of used motor oil per individual per day. Many certified centers collect oil filters too; however, some do not. For information on the oil collection centers near you, details regarding the quantities they accept, whether they accept oil filters, location and hours of operation, please visit www.1800cleanup.org or call 1(800) CLEANUP / 1(800) 253-2687.

**Curbside Used Oil Collection**
Some communities provide curbside used motor oil collection services. Check with your local City or County to see if this service is available in your area.

**Household Hazardous Waste Facility or Event**
You can also recycle used motor oil and oil filters by bringing it to a household hazardous waste collection facility or event.

**How Can I Keep Used Motor Oil Clean?**

- When changing your oil, pour the used oil into a clean, empty, plastic container with a tight lid.
- Do not mix the used motor oil with other substances such as gasoline, paint removers or other contaminants.
- Contaminated motor oil cannot be recycled and must be brought to a household hazardous waste collection facility or event for processing.

**Auto Batteries And Antifreeze**

- Many service stations and auto parts stores accept used auto batteries and antifreeze. Many actually pay for waste auto batteries. Some service stations and auto parts stores may charge a fee for taking automotive waste. For more information, call the service station or auto parts store near you.

# NEGOCIO VERDE WORKSHOP ANNOUNCEMENT FLYERS

# Environmental Justice Achievement Award

*State or Local Government*

# Negocio Verde Environmental Justice Task Force

*Susan Hahn at the Negocio Verde Environmental Justice Task Force-sponsored UST workshop for owners/operators.*

**EPA is pleased to present a 2008 Environmental Justice Achievement Award to the County of San Diego, a member of the Negocio Verde Environmental Justice Task Force for its efforts to address environmental justice in the Barrio Logan community of San Diego and the cities of National City and Chula Vista.**

The Task Force is composed of members of San Diego County government departments, local businesses, community representatives, and community colleagues. It meets bi-monthly. Since 2003, the Task Force has provided environmental compliance and pollution prevention assistance training to over 6,500 people, the majority in communities with environmental justice concerns. The Task Force has provided 11 bilingual (English/Spanish) training workgroups. Spanish translation of the informational materials and onsite instantaneous translation proved crucial to many of the community members and minority-owned businesses.

The County of San Diego led the Task Force's participation in workshops that were multi-media, multi-cultural, and multi-dimensional. The Task Force's biggest success has been the non-enforcement interaction between regulators, small businesses, and the community. The majority of the small businesses located in communities challenged with environmental justice concerns are fearful of government agencies. The workshops were provided in English and Spanish, via dual PowerPoint presentations projected onto side-by-side screens and audio translation using radio devices. The inclusion of community college students, many of whom live in the affected communities, also proved an asset to the workshops. The success of the Task Force has been shared at several San Diego area and state conferences.

# Negocio Verde (Green Business) Task Force

By Ellen Schulte,
Pollution Prevention Specialist

The Negocio Verde Task Force utilizes a multi-organization, multi-faceted, and multi-media approach to promoting pollution prevention in the environmental justice communities of San Diego County. In order to bridge the gap between small business and regulatory agencies, task force members make contact with small businesses outside of the compliance inspection arena. The task force focuses on the needs of the small minority-owned business and provides training materials in Spanish and English. The task force has representatives from a number of local organizations, including large businesses, community colleges, and non-enforcement agency representatives.

Task Force members are: Angela Baranco, USEPA, Region 9; Vivian Bogue, Cuyamaca College; Kacey Christie – Task Force Chair, General Dynamics NASSCO; Kevin Heiss, San Diego County Air Pollution Control District ; James Justus, Inner City Business Association; Alicia Ortiz, BAE Systems, San Diego Ship Repair; Ellen Schulte, County of San Diego, Department of Environmental Health, Hazardous Materials Division; Veronica Serrano, City of National City; and Marie Vicario, Southwestern Community College.

In 2005, through an extensive review, the task force determined that the automotive business sector, including mechanical repair, auto body repair and dismantling businesses, would benefit from assistance, especially those shops where English is spoken as a second language. To meet this need, the task force conducted free bilingual multimedia automotive P2 & compliance assistance workshops. Workshop materials were provided in English & Spanish via dual PowerPoint presentations projected on side-by-side screens. Onsite simultaneous translation was also made available to all in attendance.

The Task Force utilizes the A, B, and C's of Pollution Prevention (P2) to promote P2 in the Environmental Justice (EJ) communities of San Diego County:

A Is for Academia where students from Environmental Technology programs at local junior colleges participate in a "Green Business" outreach to local automotive businesses in concert with non-enforcement personnel and large business representatives.

**The Task Force implements the A, B, C's of Pollution Prevention to provide outreach for small automotive businesses.**

B Is for Businesses located in EJ communities and pro vides for P2 education by promoting cost savings, economic vitality, and their environmental stewardship role in the community.

C Is for the EJ Community challenged with environmental and public health impacts. This outreach empowers community members to participate in improving conditions within their community.

In 2005, the Task Force provided free pollution prevention & compliance assistance to 229 individuals in the automotive small business sector. On April 28, 2005 the Task Force conducted the First Regional Environmental Symposium in San Diego County at Southwestern Community College. This event had an attendance of more than 400. The Negocio Verde Task Force was awarded the 2005 Environmental Responsibility Award from the Industrial Environmental Association for these successful educational efforts.

In 2006, the Task Force continues its multi-media pollution prevention and compliance assistance workshops for the automotive industry; in the fall, training will be expanded to include Underground Storage Tanks workshops.

# 2010 CALENDAR ART CONTEST ANNOUNCEMENT

City of National City

# Second Annual Storm Water Program Calendar Art Contest

## Guidelines for Teachers

The City of National City invites all third grade students attending public schools in the City to participate in this fun and educational art contest. We are asking students to provide original art pieces for the upcoming 2010 National City Storm Water Program Calendar. The theme of this year's contest is **"By Keeping Our Community Clean, We Can Keep The Ocean Clean"**.

Similar to last year's contest, the City plans to select 12 original art pieces to feature in the 2010 National City Calendar. The first place winner will also be featured on the cover of the calendar. The goal of the contest is to promote understanding of the local natural environment in National City and to educate students on ways they can help protect local waterways. The contest provides a way for children to share their ideas on ways to protect our creeks and oceans with the entire National City community.

We encourage teachers to relate this contest to various aspects of the third grade curriculum. Please encourage students to include National City landmarks in their drawings, such as Paradise Creek, the Sweetwater River, their school, favorite park, etc. Students can also incorporate native plants and animals. Ideally, a contest entry will show how to protect water quality AND how National City benefits from having a clean community.

Contest Rules

**Guidelines:**

- **Media:** Paint, color pencils, marker, or crayon.
- **Paper:** White paper, 8 1/2 inches by 11 inches in landscape format.
- **Text:** Drawings can include text and original slogans, however, names will not be allowed on front of the drawing. The artist's first name and school will be printed below the drawing in the calendar. All words must be spelled correctly. If preferred, text can be typed on a computer, printed, and then pasted to the drawings.

**Submittals:**

- All participants must submit a release form with their name, school, room number, teacher's name, and parent or guardian signature.
- The student's name, school, and teacher must also be taped to the back of the artwork on a piece of paper or index card.

(Continued on Back)

**Deadline:**

- The deadline for students will be **June 5, 2009**. Please note that this is a Friday, and the City offices will not be open. Teachers should submit their students' artwork to City Hall no later than **June 8, 2009.** If you cannot submit entries directly to City Hall, you can contact Barby Tipton (see bottom of page) to arrange for a pick up. Note that for teachers with Combination classes (2nd and 3rd grades), we encourage 2nd graders to participate, but only 3rd grade work should be submitted to the City for entry into the contest.

**Judging:**

- Drawings will be judged by various City officials and representatives involved in the City's Storm Water Pollution Prevention Program. 12 winners will be chosen based on originality and representation of the contest's theme. At least one winner will be chosen from each participating school.

**Prizes:**

- Teachers can hand out personalized participation certificates (to be filled out by the teacher) to all participating students when artwork is submitted in class.
- Winning art pieces will be featured in the 2010 National City Storm Water Program Calendar. Winners will be honored at a National City Council Meeting in the fall and will receive additional prizes.

**Contact Information:**

- If you have additional questions about how you can integrate this contest into your 3rd grade curriculum, please contact:
  Stephanie Maxin Phone: (619) 336-8306
  Email: stephanieb@national.k12.ca.us
- If you would like to contact a representative at the City, please contact:
  Barbra Tipton, National City Storm Water Compliance Inspector

# 2010 CALENDAR ART CONTEST TAKE-HOME FLYER

# 3rd Grade Art Contest!!

## Theme: By Keeping Our Community Clean, We Can keep the ocean clean!!!

Deadline: June 5, 2009

**Winning drawings will be featured in National City's 2010 Storm Water Program Calendar!**

*Do you go to the beach when its raining?*

Probably not, but pollution does! When it rains, pollutants like litter and oil are carried from our streets and sidewalks to our local creeks and ocean. Pollution can hurt plants and animals and can also make water unhealthy for humans. **By keeping our community clean, we can keep the ocean clean!**

## Rules:

- **Drawings should show how you and your friends, family, and neighbors can help prevent pollution in creeks, rivers, and oceans. We encourage you to include locations within National City in your drawing, such as your school, Paradise Creek, or your favorite park!**
- **Drawings must be on white 8 1/2 inch by 11 inch paper, in landscape format.**
- **Only color drawings made with markers, colored pencils, crayons, or paint will be accepted. Bright colors are best.**
- **Do NOT write your first or last name on the front of your drawing.**
- **Use original artwork only. Slogans and messages are ok, but all words must be spelled correctly. Text can be typed on the computer and pasted onto the drawing.**
- **Drawings must be submitted to your teacher by June 5, 2009 with a completed entry form (on the back of this flyer) signed by a parent or guardian.**
- **Your name, teacher, and school must be on a piece of paper or card taped to the back of the artwork**
- **Winners will be notified in the Fall. All winners will be featured in the 2010 National City Storm Water Program Calendar. Winners will also receive a prize and be honored at a future City Council Meeting!**

YOU CAN BE A CLEAN WATER SUPERSTAR!

☆ Don't litter

☆ Never pour anything into the storm drain

☆ Pick up after your pets

# Sweetwater Outlet to San Diego Bay

Great Egret

Great Blue Heron

Godwit

Duck

Fish and other animals that live in the water rely on us to keep their ocean community clean.

Trash can harbor bacteria and cause beach closures when washed into the storm drain and out to the ocean.

Water from rain, car washing, and sprinklers can carry trash and other pollutants into storm drains and San Diego Bay without being treated.

Trash in the ocean can cause damage to boats and fishing equipment. This damage is hazardous and costly in terms of repair and lost fishing time.

Fixing car leaks, picking up after your pet, properly disposing of trash, and using a commercial car wash can prevent storm water pollution.

Birds, fish and mammals often mistake trash for food.

With trash filling their stomachs, animals have a false feeling of being full and may die of starvation.

Your cleaning efforts help make National City enjoyable for everyone.

# INTRODUCTION AND CONTENTS

**Introduction**

Section 7 of the Annual Report discusses the implementation of the illicit discharge detection and elimination (IDDE) component of the City's storm water program. This program consists of dry weather monitoring activities and other activities intended to prevent and respond to illicit connection and illicit discharges, such as operating a storm water hotline. The reporting period for the portions of this section that discuss dry weather monitoring activities have been extended through September 30, 2009, but the reporting period for other activities described in the section was not changed and thus extends through June 30, 2009, consistent with rest of the JURMP Annual Report. Because field work for the dry weather monitoring program is not required to be completed until September 30, the same day that the JURMP Annual Report is to be submitted, the RWQCB extended the submittal deadline for all of Section 7 of the JURMP Annual Report until December 15 of each year.

**Contents**

This submittal includes a certification statement, the text of Section 7 of the 2008/2009 JURMP Annual Report, and the attachments associated with that section. For clarity, the items included in this submittal are listed below.

- Certification Statement for Section 7 Submittal
- Introduction and Contents
- Section 7 (IDDE Component) of the 2008/2009 JURMP Annual Report
- JURMP Annual Report Requirements Checklist (for Section 7 only)
- Attachment 7.1, City of National City Dry Weather Field Screening and Analytical Monitoring Program 2009

Please note that the complaint log, referenced as Appendix B in Section 7, was already provided with the main JURMP Annual Report submittal in September 2009 and is not included again with this December submittal.

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

The City maintains several programs to prevent and to seek out and eliminate illicit connections and illicit discharges (IC/IDs), which can be significant sources of pollutants to the City's MS4. Illicit discharges may result from activities such as vehicle washing or equipment cleaning without the use of proper BMPs. Illicit connections include improper links to the MS4, typically of conveyances that should be plumbed to the sanitary sewer system, such as car wash facility drains. City storm water personnel work with residents, businesses, and staff to make them aware of BMPs to prevent IC/IDs and to encourage reporting of IC/IDs. The following activities are the primary components of the City's program to combat IC/IDs:

- Inspecting local businesses, construction sites, and municipal facilities
- Conducting the Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program)
- Operating a public complaint hotline

These activities enable the City to provide a comprehensive system to improve the quality of storm water and urban runoff throughout the City through detection and elimination of IC/IDs.

### 7.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the illicit discharge detection and elimination component during the 2008/2009 reporting period are presented in the following bulleted list. Please note that per Addendum No. 2 to the Municipal Permit, the reporting period for the Dry Weather Monitoring Program was extended through September 30, 2009. The reporting period for all other components of the City's illicit discharge detection and elimination (IDDE) program ended on June 30, 2009.

- Seven IC/IDs were discovered and reported during the 2008/2009 reporting period. All were followed up on by City personnel, and enforcement measures were applied as necessary.
- The City recorded and investigated 27 Storm Water Hotline complaints.
- The City performed all of the recommended corrective actions proposed in the 2008 Dry Weather Field Screening and Analytical Monitoring Program Report to prevent possible pollutants from entering the storm drain system.
- The City conducted the 2009 Dry Weather Field Screening and Analytical Monitoring Program.

## 7.2 Public Reporting of Illicit Discharges and Connections

See Section 4.8 of this JURMP Annual Report, which was submitted in September 2009.

## 7.3 Spill Reporting, Response, and Prevention

See Section 4.9 of this JURMP Annual Report, which was submitted in September 2009.

## 7.4 Urban Runoff Monitoring

The City has continued to conduct a Dry Weather Monitoring Program, as required by the Municipal Permit. This program assists the City in detecting and eliminating IC/IDs to the storm drain system. There are three major components to the Dry Weather Monitoring Program:

- Field observations, which include site descriptions and qualitative observations
- Field screening, which includes flow estimation and sample testing using meters and test kits at the site
- Analytical monitoring, which involves submittal of collected samples from selected sites, constituting 25 percent of all flowing or ponded sites, to an analytical laboratory for additional testing

The City visits all designated primary monitoring stations each year between May 1 and September 30 to collect dry weather monitoring data. When a primary monitoring station is found to be dry, the City visits designated alternate monitoring stations.

Numeric action levels are used as the primary approach for the interpretation of most constituent concentrations measured in the field and laboratory. Action levels for dissolved metals follow the California Toxics Rule (CTR) Criteria Maximum Concentration (CMC). Temperature, turbidity, and conductivity parameters are evaluated using best professional judgment to determine if further investigation is needed. The action levels for pH, surfactants, ammonia-nitrogen, nitrate-nitrogen, orthophosphate-phosphorus, oil and grease, diazinon, and chlorpyrifos were adopted in 2003 and were based on statistical analyses of previous Dry Weather Monitoring Program data, established water quality benchmarks from the Basin Plan, and the United States Environmental Protection Agency Multi-Sector General Permit.

The Regional Monitoring Workgroup in November 2008 requested the Dry Weather Monitoring Sub-workgroup to evaluate dry weather action levels that were submitted in April 2003 by the County of San Diego on behalf of the Copermittees. The Dry Weather Monitoring Sub-workgroup determined that the bacterial indicators action levels required additional analysis. All other action levels were deemed appropriate and will not change. The Dry Weather Monitoring Sub-workgroup contracted the services of D-Max Engineering (D-Max) to conduct the evaluation of historical bacterial data

collected from dry weather monitoring from 2002 through 2007. Details of their evaluation are posted on the Project Clean Water Website at http://www.projectcleanwater.org/pdf/science_mon/dry_weather_2009bacteria_action_level_report_draft.pdf. The Regional Monitoring Workgroup on May 19, 2009 evaluated the recommendations of the Dry Weather Monitoring Sub-workgroup and selected the 80th percentile values to be proposed as the dry weather action levels for bacterial indicators beginning on May 1, 2010. The current levels and the levels proposed for use beginning May 1, 2010 are presented in Table 7-1.

**TABLE 7-1**
**Bacterial Indicators Action Levels for Dry Weather Monitoring Program**

| | **Total Coliform (MPN/100 mL)** | **Fecal Coliform (MPN/100 mL)** | ***Enterococcus* (MPN/100 mL)** |
|---|---|---|---|
| 2003-2009 Action Levels | 50,000 | 20,000 | 10,000 |
| Proposed 2010 -2012 Action Levels | 130,000 | 13,000 | 7,000 |

### 7.4.1 2008 Dry Weather Monitoring Program

The City's 2008 Dry Weather Monitoring Program was conducted during the 2008 dry season. For information about how the City addressed issues discovered during the 2008 Dry Weather Monitoring Program and responded to the resulting recommendations, see Section 7.5.1 of this report.

### 7.4.2 2009 Dry Weather Monitoring Program

The City's 2009 Dry Weather Monitoring Program was conducted during the 2009 dry season. Nineteen routine site visits to the monitoring stations were performed.

If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. Upstream investigations are performed when exceedances are verified during confirmation visits. See the City's JURMP for a complete discussion of upstream investigation procedures.

Table 7-2 presents a summary of the action level exceedances observed in 2009; Table 7-3 presents the follow-up investigations conducted in response to all action level exceedances. All of the monitoring stations visited are listed in Table 7-4. At the end of this section tables 7-5 and 7-6 provide the complete field analytical results and laboratory analytical results, respectively, from the 2009 Dry Weather Monitoring Program.

**Table 7-2**
**Summary of Action Level Exceedances**

| Field Screening (15 samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| **pH** | 0 | 0 | --- |
| **Conductivity** | 0 | 0 | --- |
| **Turbidity** | 0 | 0 | --- |
| **Surfactants** | 3 | 20 | 1A, 48, 49 |
| **Ammonia-N** | 3 | 20 | 43A, 48, 49 |
| **Nitrate-N** | 0 | 0 | --- |
| **Orthophosphate-P** | 2 | 13 | 48, 49 |
| **Laboratory Analyses (4 samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| **Oil & Grease** | 0 | 0 | --- |
| **Cadmium** | 0 | 0 | --- |
| **Copper** | 0 | 0 | --- |
| **Lead** | 0 | 0 | --- |
| **Zinc** | 0 | 0 | --- |
| **Diazinon** | 0 | 0 | --- |
| **Chlorpyrifos** | 0 | 0 | --- |
| **Total Coliforms** | 1 | 25 | 1A |
| **Fecal Coliforms** | 0 | 0 | --- |
| **Enterococci** | 2 | 50 | 1A, 46 |

**Note:** Table includes data from initial site visits only; confirmation and follow-up investigations are not included.

Follow-up investigations conducted in response to action level exceedances are summarized in Section 7.5.2 of this report.

A formal trash assessment was performed in 2009 in accordance with the Municipal Permit requirements. A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form's five categories are

primarily qualitative descriptions of the amount and extent of trash although a number of trash pieces is also included in each category as a rough guideline. The five categories are defined as follows.

- Optimal: On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
- Suboptimal: On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
- Marginal: Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
- Submarginal: Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (~100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
- Poor: Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is also assessed at each site. Prior to the beginning of the 2009 dry weather season, the Dry Weather Monitoring Sub-workgroup added additional detail to the definitions of these categories to help achieve a greater level or inter-jurisdictional consistency. The definitions are as follows:

- *Threat to Human Health* – Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment.
- *Threat to Aquatic Health* – Large amount (50 pieces or more) of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amounts of settleable, degradable, and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries, or spray cans; any evidence of large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment.

Nineteen sites, including four dry sites, received trash assessments. Twelve were scored as "optimal" or "suboptimal," having little or no trash. Five sites had "marginal" levels of trash. One site was considered "submarginal," and one site was considered "poor" due to significant amounts or types of trash consistent with human inhabitation and illegal dumping.

The 2009 Dry Weather Monitoring Program Report, which includes results of field screening and analytical monitoring, can be found as Attachment 7.1.

## 7.5 FOLLOW-UP AND ENFORCEMENT

### 7.5.1 ACTIONS TAKEN IN RESPONSE TO THE 2008 DRY WEATHER MONITORING PROGRAM FINDINGS

#### EDUCATION

Based on the 2008 Dry Weather Monitoring Program results, several recommendations were made. In response to these recommendations, educational materials were distributed and the City's Public Works Department employees performed all necessary maintenance and inspections listed below.

- Educational materials regarding BMPs for outdoor washing activities were distributed to the following areas of the City:
    - All residences on Melrose Street,
    - All residences on Scott Drive,
    - Integrity Charter School on Palm Avenue,
    - Rachael Avenue residences between East 20th Street and East 24th Street,
    - 1414 Stancrest Lane, and
    - 2436 Seawind Drive.
- The City of San Diego was notified of the importance of providing educational materials regarding BMPs for outdoor washing activities to the residential complex at 4616 Delta Street, which is outside of the jurisdiction of the City of National City but upstream of Site 45 and Site 1A.

#### INSPECTION AND MAINTENANCE

- Follow up visits were made to Frank Toyota on National City Boulevard and Mile-of-Cars Way, where vehicle washing discharges were found to be fully contained.
- An additional study was performed to investigate the businesses upstream of Site 46 and determine the source of bacteria to the site. As a result of this investigation, business received storm water compliance inspections, educational material, and citations as necessary. The property manager of the business complex was contacted and notified that the dumpster enclosure and grease bin areas must be kept free of loose trash and food waste.

- Trash and debris at Site 1A and in the upstream catch basins on Scott Street were removed in order to discourage bacterial growth. The City of San Diego was notified that discharges and trash generation in areas outside the City of National City but tributary to Site 1A (e.g., portions of Delta Street) were in their jurisdiction and would need to be addressed.
- Decomposing trash and human waste were removed from Site 32. Trash was also removed from the manhole at the northwest corner of the Sweetwater Road and Prospect Street intersection, upstream of Site 32. This area should also be monitored as feasible to discourage human inhabitation.
- Trash was removed from all sites in the City where trash was noted (i.e., every site except Site 47). Sites 1A, 6, 13A, 32, and 40 were scheduled for more frequent cleaning, as they were scored as submarginal or poor by the trash assessment during routine site visits, and two were considered a potential threat to aquatic and/or human health. Additionally, sites 4, 31A, 42, 44, 3, 38, 41, 43A, 45, 46, 48, 49.and 44A, were added to the City's existing clean up schedule as appropriate.

### 7.5.2 2009 Dry Weather Monitoring Follow-Up Investigations

If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. Upstream investigations are performed when exceedances are verified during confirmation visits. See the City's JURMP for a complete discussion of upstream investigation procedures.

Table 7-3 presents conclusions based on the results of confirmation visits and, where necessary, upstream investigations conducted at three sites during the 2009 Dry Weather Monitoring Program.

**Table 7-3**
**Summary of Follow-Up Investigations**

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 1A | Surfactants | Total Coliforms, Enterococci | Surfactants: transient flow<br>Bacteria: decomposing organic matter at the site and in upstream areas |
| 43A | Ammonia-N | --- | Transient flow, potentially generated by organic material decomposition at site and increased concentration of pollutants as ponded water evaporated |
| 46 | --- | Enterococci | Transient flow, possibly caused by food waste in the upstream shopping center |
| 48 | Ammonia-N, Orthophosphate-P, Surfactants | --- | Transient flow; dog washing by a resident upstream |
| 49 | Ammonia-N, Orthophosphate-P, Surfactants | --- | Transient flow and an increasing concentration of pollutants as ponded water evaporated |

The City is in the process of responding to the 2009 Dry Weather Monitoring Program findings. These actions and any other actions taken with respect to the City's Dry Weather Monitoring Program during the remainder of 2009/2010 will be described in the 2009/2010 JURMP Annual Report.

### 7.5.3 IC/IDs Identified

Seven IC/IDs were discovered and reported during the 2008/2009 reporting period. All were followed up on by City personnel, and enforcement measures were applied as necessary. The IC/IDs identified in 2008/2009 are discussed in Section 4 of this JURMP Annual Report, which was submitted in September 2009.

## 7.6 Illicit Discharge Detection and Elimination Component Effectiveness Assessment

The assessment of the effectiveness of this program component is provided in Section 11 of this JURMP Annual Report, which was submitted in September 2009.

## 7.7 Program Review and Modification

Changes to the definitions of threat to human health and threat to aquatic health used during the trash assessment component of the Dry Weather Monitoring Program and

proposed bacteria action levels to be used in the 2010 dry weather season are discussed earlier in this section. No other changes to the City's illicit discharge detection and elimination component were made during the reporting period.

**Table 7-4**
**2009 Dry Weather Monitoring Locations**

| Site | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908.31 | 32.68575 | -117.10166 |
| 3 | East 7th Street and R Avenue | Manhole | Residential | Commercial | 908.32 | 32.68183 | -117.08894 |
| 4* | East 1st Street and U Avenue | Manhole | Parks | Residential | 908.31 | 32.68726 | -117.08749 |
| 6* | North bank of Sweetwater River, approximately 500 feet east of Highland Avenue, access from North 2nd Avenue | Outlet | Industrial | Commercial | 909.12 | 32.65668 | -117.08844 |
| 13A | Northeast of 16th Street and National City Boulevard, inside Kimball Park | Outlet | Commercial | Residential | 908.32 | 32.66942 | -117.10326 |
| 31A* | North of Sweetwater Road, across from 2nd Avenue at the corner of the golf course | Earthen Channel | Parks | Commercial | 909.12 | 32.66121 | -117.08453 |
| 32 | East of 2nd Avenue, north of Freeway 54 and the Sweetwater River | Outlet | Commercial | Open | 909.12 | 32.65887 | -117.08274 |
| 38* | Dirt road, west of Harbison Avenue, between 20th Street and 24th Street, at the end of fence line | Earthen Channel | Residential | None | 909.12 | 32.67265 | -117.07057 |
| 40 | Southwest corner of Sweetwater Road and Plaza Bonita/Stockman Street, down in channel | Outlet | Commercial | Residential | 909.12 | 32.65961 | -117.06677 |
| 41 | Northeast of San Miguel Court and Valley Road, inside Park Bonita Apartment complex | Earthen Channel | Residential | None | 909.12 | 32.66588 | -117.05083 |
| 42* | Southwest of Euclid Avenue and 24th Street, south of Southern Community Church | Outlet | Residential | Commercial | 909.12 | 32.66785 | -117.07691 |

**Table 7-4 (Continued)**
**2009 Dry Weather Monitoring Locations**

| Site | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 43A | F Avenue between East 24th Street and East 28th Street, west of Olivewood Elementary School | Catch Basin | Residential | Commercial | 909.12 | 32.66134 | -117.09447 |
| 44* | Northeast of 16th Street and National City Boulevard, under the Kimball Park bridge | Concrete Channel | Commercial | Residential | 908.32 | 32.66982 | -117.10247 |
| 44A | D Avenue behind Boys and Girls Club in Kimball Park | Outlet | Commercial | Residential | 908.32 | 32.67151 | -117.10123 |
| 45 | In front of 1243-1305 Fig Court, in the middle of street | Manhole | Residential | Parks | 908.31 | 32.68739 | -117.09690 |
| 46 | South of South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop | Manhole | Commercial | Residential | 908.32 | 32.67584 | -117.09539 |
| 47 | Southeast corner of the Mile of Cars Way and Transportation Avenue | Manhole | Commercial | Residential | 908.32 | 32.66163 | -117.10275 |
| 48* | Northwest of East 14th Street and Grove Street | Catch Basin | Residential | None | 908.32 | 32.67673 | -117.08321 |
| 49* | South end of Arcadia Place (through Harbison Avenue and 11th Street) | Concrete Channel | Residential | Commercial | 908.32 | 32.68095 | -117.07770 |

**Note:** * Alternate sites 6, 44, 48, and 49 were selected to substitute for dry primary monitoring sites 4, 31A, 38, and 42.

Notes:
nd = not detected
na = not analyzed
Red values are at or above the measured constituent's action level
[yellow box] denotes a confirmation visit
* = Number of fecal coliforms for confirmation samples is derived from *E. coli* count. Number of fecal coliforms = (Number of *E. coli*) / 0.85
** = Confirmation samples are analyzed using the Colilert and Enterolert methods, which have a reporting limit of 10 MPN/100 mL.
*** = Total hardness is not considered a pollutant, and thus has no established action level for the purposes of dry weather monitoring. Total hardness is measured because the CTR action levels for metals are dependent on the total hardness value of the water sample.

## IDDE

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| i. Correction of any inaccuracies in either the MS4 map or the Dry Weather Field Screening and Analytical Stations Map. | 7.4 |
| ii. Reporting of all dry weather field screening and analytical monitoring results. The data should be presented in tabular and graphical form. The reporting shall include station locations, all dry weather field screening and analytical monitoring results, identification of sites where results exceeded action levels, follow-up and elimination activities for potential illicit discharges and connections, the rationale for why follow-up investigations were not conducted at sites where action levels were exceeded, any Copermittee or consultant program recommendations/changes resulting from the monitoring, and documentation that these recommendations/changes have been implemented. Dry weather field screening and analytical monitoring reporting shall comply with all monitoring and standard reporting requirements in Attachment B of Order No. R9-2007-0001 and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001. | 7.4, 7.5; Tables 7-2 through 7-6; Attachment 7.1 |
| iii. Any dry weather field screening and analytical monitoring consultant reports generated, to be provided as an attachment to the annual report. | Attachment 7.1 |
| iv. A brief description of any other investigations and follow-up activities for illicit discharges and connections. | 7.5; Appendix B |
| v. The number and brief description of illicit discharges and connections identified. | 7.5; Appendix B |
| vi. The number of illicit discharges and connections eliminated. | 7.5; Appendix B |
| vii. Identification and description of all spills to the MS4 and response to the spills. | 4.9, 7.3; Appendix B |
| viii. A description of activities implemented to prevent sewage and other spills from entering the MS4. | 4.9, 7.3 |
| ix. A description of the mechanism whereby notification of sewage spills from private laterals and septic systems is received. | 4.9, 7.3 |
| x. Number of times the hotline was called, as compared to previous reporting periods, and a summary of the calls. | 4.8, 7.2, Appendix B |
| xi. A description of efforts to publicize and facilitate public reporting of illicit discharges. | 4.8, 7.2 |
| xii. The number of violations and enforcement actions (including types) taken for illicit discharges and connections, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 7.5, Table 7-1, Appendix B |
| xiii. A description of notable activities conducted to manage illicit discharges and connections. | 7.1, 7.5 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| Meets applicable standard monitoring and reporting requirements listed in Municipal Permit Attachment B. | Attachment 7.1 |
| c. (1) Determining Sampling Frequency: Dry weather field screening and analytical monitoring shall be conducted at each identified station at least once between May 1st and September 30th of each year or as often as the Copermittee determines is necessary to comply with the requirements of section D.4 of Order No. R9-2007-0001. | 7.4; Attachment 7.1 |
| c. (2) If flow or ponded runoff is observed at a dry weather field screening or analytical monitoring station and there has been at least seventy-two (72) hours of dry weather, make observations and collect at least one (1) grab sample. Record general information such as time since last rain, quantity of last rain, site descriptions (i.e., conveyance type, dominant watershed land uses), flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate), and visual observations (i.e., odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biology). | 7.4; Attachment 7.1 |
| c. (3) At a minimum, collect samples for analytical laboratory analysis of the following constituents for at least twenty five percent (25%) of the dry weather monitoring stations where water is present: (a) Total Hardness, (b) Oil and Grease, (c) Diazinon and Chlorpyrifos, (d) Cadmium (Dissolved), (e) Lead (Dissolved), (f) Zinc (Dissolved), (g) Copper (Dissolved), (h) Enterococcus bacteria, (i) Total Coliform bacteria, (j) Fecal Coliform bacteria | 7.4; Table 7-6; Attachment 7.1 |
| c.(4) At a minimum, conduct field screening analysis of the following constituents at all dry weather monitoring stations where water is present: | (n/a) |
| c. (a) Specific conductance (calculate estimated Total Dissolved Solids), (b) Turbidity, (c) pH, (d) Reactive Phosphorus, (e) Nitrate Nitrogen, (f) Ammonia Nitrogen, (g) Surfactants (MBAS) | 7.4; Table 7-5, Attachment 7.1 |
| c. (5) If the station is dry (no flowing or ponded runoff), make and record all applicable observations and select another station from the list of alternate stations for monitoring. | 7.4; Attachment 7.1 |
| c. (6) Develop and/or update criteria for dry weather field screening and analytical monitoring results whereby exceedance of the criteria will require follow-up investigations to be conducted to identify and eliminate the source causing the exceedance of the criteria. | 7.4; Attachment 7.1 |
| c. (7) Assess the presence of trash in receiving waters and urban runoff at each dry weather field screening or analytical monitoring station. Assessments of trash shall provide information on the spatial extent and amount of trash present, as well as the nature of the types of trash present. | 7.4; Attachment 7.1 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| c. (8) Dry weather field screening and analytical monitoring stations identified to exceed dry weather monitoring criteria for any constituents shall continue to be screened in subsequent years. | 7.4; Attachment 7.1 |
| c. (9) Develop and/or update procedures for source identification follow up investigations in the event of exceedance of dry weather field screening and analytical monitoring result criteria. These procedures shall be consistent with procedures required in section D.4.d of Order No. R9-2007-0001. | 7.5; Attachment 7.1 |
| c. (10) Develop and/or update procedures to eliminate detected illicit discharges and connections. These procedures shall be consistent with each Copermittees Illicit Discharge and Elimination component of its Jurisdictional Urban Runoff Management Plan as discussed in section D.4 of Order No. R9-2007-0001. | 7.5; Attachment 7.1 |
| d. The Copermittees shall commence implementation of dry weather field screening and analytical monitoring under the requirements of this Order by May 1, 2008. Each Copermittee shall conduct dry weather analytical and field screening monitoring in accordance with its storm water conveyance system map and dry weather analytical and field screening monitoring procedures as described in section II.B.3 above. If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and sections D.4.d and D.4.e of Order No. R9-2007-0001. Until the dry weather field screening and analytical monitoring program is implemented under the requirements of this Order, each Copermittee shall continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2001-01. | 7.4, 7.5; Attachment 7.1 |

**Re: 2009 Dry Weather Field Screening and Analytical Monitoring Program City of National City, California**

Dear Mr. Daneshfar:

Enclosed please find our final report for the City of National City 2009 Dry Weather Field Screening and Analytical Monitoring Program. This report presents the results of the monitoring program conducted in the City of National City during the 2009 dry weather season. The contents include field screening results, trash assessment data, analytical laboratory test results, analyses of the collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations conducted to identify the sources of pollutants detected during the field screening program and our recommendations for additional actions.

Review comments from the draft report submitted to the City have been incorporated into this final report. It has been our pleasure working with the City of National City on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.

# 1 INTRODUCTION

## 1.1 Program Overview

The purpose of the Dry Weather Field Screening and Analytical Monitoring Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm water conveyance system, minimizing the negative impact of human activities on receiving water bodies. The Dry Weather Monitoring Program consists of the following components:

- Field screening observations
- Field screening analytical monitoring
- Trash assessments
- Laboratory analytical monitoring

The data gathered from dry weather monitoring is used to characterize discharges to the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations are conducted as needed to detect and eliminate the sources of these pollutants. The results from the current year's Dry Weather Monitoring Program conducted by D-MAX Engineering, Inc., (D-MAX) are presented herein.

## 1.2 Hydrologic Setting

The City of National City (City) lies entirely within the San Diego Bay Watershed Management Area. The City is one of the most densely populated regions of the San Diego Bay Watershed Management Area, but makes up only 1.6% of the total area. The City encompasses hydrologic areas 909.1 and 908.3, of the Lower Sweetwater and Pueblo watersheds, respectively. The major receiving water body in the City is the San Diego Bay. Runoff from the southern part of the City initially drains to the Sweetwater River, which ultimately conveys it into the bay. The Sweetwater River and the Sweetwater Marsh are identified by the City as Environmentally Sensitive Areas (ESA). The Sweetwater River flows along the southern border of the City through the Sweetwater Marsh and into the San Diego Bay. Paradise Creek is a small salt marsh creek that receives runoff from the northern areas of the City and discharges into the Sweetwater River. Paradise Creek and Paradise Marsh have also been identified as ESAs. La Paleta Creek traces the northern border of the City, and is 303(d) listed for benthic community effects and sediment toxicity as Seventh Street Channel. The 2008 San Diego Bay Watershed Urban Runoff Management Program (WURMP) Document identified bacteria, sediment, and trash as high priority water quality problems in hydrologic area 908.3 of the Pueblo San Diego Watershed. The San Diego Bay WURMP also identified bacteria as a high priority pollutant category in hydrologic area 909.1 of the Sweetwater Watershed.

## 1.3 Regulatory Requirements

In accordance with San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit), each of the Copermittees, including the City of National City, is required to annually perform dry weather monitoring of discharges into its storm water conveyance system. During the dry weather season, May 1 through September 30, selected locations along the storm drain conveyance system are evaluated. This procedure includes recording field observations, estimating observed flow rates, and conducting field testing.

The Municipal Permit also necessitates that Copermittees conduct laboratory analyses for at least 25 percent of the visited sites with flowing or ponded water. If a sampling location is dry, meaning there is no flowing or ponded water, an alternate sampling station is selected. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days.

## 1.4 Previous Work

The City of National City has conducted dry weather field screening programs since 1996 at several locations within the City's storm water conveyance system. A summary of the number of sites sampled for each year is presented in Table 1-1.

**TABLE 1-1**
**SUMMARY OF HISTORICAL DRY WEATHER SITES**

| Year | Number of Sites Screened [1] | Number of Flowing Sites | Number of Ponded Sites | Number of Dry Sites | Number of Lab Analysis Sites [2] |
|---|---|---|---|---|---|
| 1996 | 20 | Data not available [3] | | 13 | --- |
| 1997 | 7 | | | 0 | --- |
| 1998 | 7 | | | 3 | --- |
| 1999 | 7 | | | 1 | --- |
| 2000 | 7 | | | 2 | --- |
| 2001 | 10 | | | 1 | --- |
| 2002 | 15 | 12 | 3 | 2 | 4 |
| 2003 | 15 | 13 | 2 | 2 | 4 |
| 2004 | 15 | 11 | 4 | 2 | 4 |
| 2005 | 15 | 14 | 1 | 2 | 4 |
| 2006 | 15 | 14 | 1 | 2 | 4 |
| 2007 | 15 | 13 | 2 | 1 | 4 |
| 2008 | 15 | 12 | 3 | 4 | 4 |

**Notes:**
[1] Number of Sites Screened = Number Flowing + Number Ponded. Field screening cannot be conducted at sites found to be dry. Dry sites are replaced by either a flowing or ponded site.
[2] Laboratory analyses commenced in 2002 as required by RWQCB Order 2001-001.
[3] Available information does not distinguish between flowing and ponded sites during this period.

## 1.5 Report Outline

This report is presented in the following order:

**Section 1, Introduction,** includes a program overview, a discussion of the City s hydrologic setting, regulatory background, a summary of previous dry weather monitoring, and the report outline.

**Section 2**, **Sampling Locations,** describes the field screening sampling locations and site selection criteria.

**Section 3, Field and Laboratory Analytical Methods,** includes field screening and laboratory analytical procedures, quality assurance protocols, and follow-up action levels.

**Section 4, Field Screening Results,** presents qualitative observations of the sampling locations and quantitative results of the field screening analyses.

**Section 5, Trash Assessment,** discusses the procedure and results of the trash assessment.

**Section 6, Laboratory Analytical Results,** presents results of the laboratory analyses.

**Section 7, Data Analysis,** provides an analysis of this year s field and laboratory data, as well as a comparison of past results.

**Section 8, Follow-up Investigations,** details the results of follow-up investigations undertaken to isolate the sources of action level exceedances measured during the monitoring program.

**Section 9, Summary and Recommendations,** provides a summary of the program results and recommendations for follow-up actions.

**Appendix A** Historical Dry Weather Monitoring Data

**Appendix B** Photographs of Sampling Locations

**Appendix C** Laboratory Analytical Reports

**Appendix D** Field Data and Trash Assessment Sheets

# 2 SAMPLING LOCATIONS

In 2009, the City of National City had 15 designated primary monitoring stations, as well as six alternate stations to replace any primary sites that did not have ponded or flowing water. All sampling sites are located in San Diego Hydrologic Units 908 and 909. These sites are also presented in the City's Jurisdictional Urban Runoff Management Program (JURMP), updated in 2007.

All 15 primary monitoring stations were visited in 2009. Primary sites 4, 31A, 38, and 42 were dry and alternate sites 6, 44, 48, and 49 were sampled in their place.

Table 2-1 provides the location, conveyance configuration, primary and secondary land uses, hydrologic subarea (HSA), and GPS coordinates of the primary and alternate monitoring stations that were visited. Photographs of sampling locations are included as Appendix B. A complete map of the MS4 system, including sampling locations, is included as Figure A. A map of the watersheds in and around National City, broken down into HSAs, is included as Figure B.

**TABLE 2-1**
**2009 DRY WEATHER MONITORING STATIONS**

| Site | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908.31 | 32.68575 | -117.10166 |

**TABLE 2-1**
**2009 DRY WEATHER MONITORING STATIONS (CONTINUED)**

| Site | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 46 | South of South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop | Manhole | Commercial | Residential | 908.32 | 32.67584 | -117.09539 |
| 47 | Southeast corner of the Mile of Cars Way and Transportation Avenue | Manhole | Commercial | Residential | 908.32 | 32.66163 | -117.10275 |
| 48 | Northwest of East 14th Street and Grove Street | Catch Basin | Residential | None | 908.32 | 32.67673 | -117.08321 |
| 49 | South end of Arcadia Place (through Harbison Avenue and 11th Street) | Concrete Channel | Residential | Commercial | 908.32 | 32.68095 | -117.07770 |

**Note:** Alternate sites 6, 44, 48, and 49 were selected to substitute for dry primary monitoring sites 4, 31A, 38, and 42.

# 3 FIELD AND LABORATORY ANALYTICAL METHODS

## 3.1 Field Screening Procedures and Methods

Field screening techniques consist of qualitative field observations, flow measurement, and quantitative field analyses of selected water quality parameters. Weather conditions, time since last rainfall, and the type of storm water conveyance are recorded as well. Specific observations and results of the field water quality analyses are documented on field datasheets, which also serve as a record of the field visit. Datasheets are completed for every site visit regardless of whether or not samples were collected. Check boxes on the datasheets indicate if the visit is for routine field screening, confirmation of an exceedance, or an IC/ID follow-up visit. A confirmation visit is a revisit of the original site, whereas an IC/ID follow-up is an upstream investigation. Datasheets from the 2009 Dry Weather Monitoring Program are included as Appendix D. Field screening and analyses were conducted according to the following procedures and methods:

Qualitative Observations

Qualitative field observations are made during each site visit. These observations include a general site assessment and record water odor, clarity, the presence of floatable materials, visible deposits or stains, and organisms. Evidence of present or past illicit connections and illegal discharges to the storm drain system can also be discovered through careful field observations. Each field screening location is photographed to document site conditions. Photographs are included in Appendix B.

Flow Measurement

Flow measurements can help estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may be indicative of an illegal discharge. Various field methods are used in formulas to estimate the flow rate. These include measuring the velocity, depth, and width of the flowing water; recording the amount of time required to fill a bottle of known volume with sample water; or, if measuring flow within a cylindrical pipe, measuring the pipe diameter as well as the depth and velocity of the flow. Low levels of flow may also be assessed visually.

Field Water Quality Analyses

At each site with ponded or flowing water, water samples were collected and analyzed in the field for the following constituents:

- Specific Conductance
- Temperature
- pH
- Turbidity
- Surfactants, measured as methylene blue active substances (MBAS)
- Nitrate-Nitrogen (Nitrate-N)
- Ammonia-Nitrogen (Ammonia-N)
- Orthophosphate-Phosphorus (Orthophosphate-P)

Surfactants are also referred to as detergents.

The methods used to perform the above field analyses, along with the reporting limit, range, and accuracy of each method, are listed in Table 3-1.

## TABLE 3-1
## FIELD ANALYTICAL METHODS

| Parameter | Method | Reporting Limit | Range | Accuracy |
|---|---|---|---|---|
| Specific Conductance | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter□□□ | 0.01 mS/cm | 0 □20 mS/cm | ± 2□ of functional sensitivity[1] |

**Notes:**

EC □electrical conductivity

mS/cm □millisiemens per centimeter

□C □Degrees Celsius

NTU □nephelometric turbidity unit

mg/L □milligrams per liter

LED □light-emitting diode

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20□. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L $NO_3$. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the $NO_3$ molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14g/mol) to $NO_3$ (62 g/mol). The practical detection limit for nitrate is 5.0 mg/L; however, the practical detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30□ at PDL, ±20□ for 25□ of full range, ±10□ for 75□ of full range, ±10□ for 120□ of full range.

[6] This method determines the concentration of orthophosphate in mg/L $PO_4$. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the $PO_4$ molecule. Oxygen is 67.4□ of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31g/mol) to $PO_4$ (95 g/mol). The practical detection limit for orthophosphate is 0.3 mg/L; however, the practical detection limit for orthophosphate-phosphorus is lower due to the conversion.

□Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

□□Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

□□□Test method information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com.

## 3.2 Laboratory Analytical Methods

In accordance with the Municipal Permit, laboratory samples were collected at four sites, representing 25 percent of the sites where ponded or flowing water was observed. Samples were submitted to EnviroMatrix Analytical, Inc, a laboratory certified by the California Department of Health Services, for analysis of the following constituents:

- Total hardness
- Oil and grease
- Diazinon
- Chlorpyrifos
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- Total Coliform bacteria
- Fecal Coliform bacteria
- *Enterococcus* bacteria

The methods used to perform each of the above analyses along with method reporting limits and holding times are listed in Table 3-2.

## 3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project includes the United States Environmental Protection Agency (USEPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

### 3.3.1 Field Sampling and Analysis QA/QC

The pH meters, turbidity meter and conductivity meter are tested daily before field screening begins. The pH meters are calibrated as needed with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube is kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter and conductivity meter are calibrated as needed using standard solutions.

Field sample collection containers are rinsed first with distilled water and then with the sample water prior to sample collection. Upon completion of sampling and testing at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water and dried.

The accuracy of field analytical techniques and equipment is assessed at the beginning of each sampling week by analyzing solutions of known concentrations for ammonia-nitrogen, surfactants, nitrate, and orthophosphate. The results of the assessment are shown in Table 3-3.

**TABLE 3-2**
**LABORATORY ANALYTICAL METHODS**

| Analyte | Analytical Method | Method Reporting Limit | Maximum Holding Time [1] |
|---|---|---|---|
| Oil and Grease | USEPA 1664 | 5 mg/L | 28 days |
| Total Hardness | USEPA 200.7 | 10 mg/L | 14 days |
| Dissolved Cadmium | USEPA 200.8 | 0.001 mg/L | 24 hours |
| Dissolved Copper | USEPA 200.8 | 0.001 mg/L | 24 hours |
| Dissolved Lead | USEPA 200.8 | 0.001 mg/L | 24 hours |
| Dissolved Zinc | USEPA 200.8 | 0.020 mg/L | 24 hours |
| Diazinon | USEPA 8141A | 0.05 g/L | 7 days |
| Chlorpyrifos | USEPA 8141A | 0.05 g/L | 7 days |
| Total Coliforms[2] | SM 9221 | 20 1,600,000 MPN/100 mL | 6 hours |
| Fecal Coliforms[2] | SM 9221 | 20 160,000 MPN/100 mL | 6 hours |
| Enterococci[2] | SM 9230 | 20 160,000 MPN/100 mL | 6 hours |
| Total Coliforms | SM 9223 (IDEXX Colilert)[3] | 10 2,419,600 MPN/100 mL | 6 hours |
| *Escherichia coli* (*E. coli*) [4] | SM 9223 (IDEXX Colilert)[3] | 10 2,419,600 MPN/100 mL | 6 hours |
| Enterococci | IDEXX Enterolert[4] | 10 241,960 MPN/100 mL | 6 hours |

**Notes:**

g/L micrograms per liter

MPN/100 mL most probable number (of colony-forming units) per 100 milliliters

[1] Maximum Holding Time values listed here apply to samples collected and preserved in accordance with the quality assurance and quality control procedures listed in Section 3.3.2.

[2] For D-MAX's Dry Weather Monitoring Program, EnviroMatrix Analytical, Inc. (EMA) performs standard dilutions for total coliforms to quantify from 20-1,600,000 most probable number per 100 milliliters (MPN/100 mL). For fecal coliforms and Enterococci, EMA performs standard dilutions to quantify from 20-160,000 MPN/100 mL. During the analysis and interpretation of the results, the number of tubes used to quantify the sample must fit the MPN index table from Standard Method 9221. The dilution set used will determine the detection limit. A standard dilution analysis is set up with 15 tubes at different concentrations. The reporting limit will always be adjusted depending on the dilution factor used for quantifying the actual results based on the MPN table. If the result for the analysis was less than 16,000 MPN/100 mL, the reporting limit will always be 20, and the dilution factor will be 10. As the dilution factor goes up, the reporting limit listed in the results from EMA will also go up based on the calculation made with EMA's data system. However, the lowest quantifiable number or reporting limit would still be 20 based on how the standard tubes for the sample is set up.

[3] IDEXX Colilert and Enterolert tests are used during upstream investigations only.

[4] Number of fecal coliforms is derived from number of *E. coli* through the following formula:
Fecal Coliforms *E. coli* / 0.85. The converted fecal coliform count, not the number of *E. coli*, is reported in this report's data tables.

**TABLE 3-3**
**FIELD ANALYSIS QA/QC RESULTS**

| Date | Analyte | Known Concentration (mg/L) | Acceptable Range* (mg/L) | Field Test Kit Results (mg/L) |
|---|---|---|---|---|
| 07/29/09 | Ammonia-Nitrogen | 0.82 | 0.66 – 0.98 | 0.749 |
| 07/29/09 | Surfactants | 1.00 | 0.75 – 1.25 | 1.00 |
| 07/29/09 | Nitrate ** | 44.3 | 31.0 – 57.6 | 43.54 |
| 07/29/09 | Orthophosphate ** | 3.07 | 2.45 – 3.68 | 3.164 |
| | | | | |
| 08/03/09 | Ammonia-Nitrogen | 0.82 | 0.66 – 0.98 | 0.669 |
| 08/03/09 | Surfactants | 1.00 | 0.75 – 1.25 | 1.00 |
| 08/03/09 | Nitrate ** | 44.3 | 31.0 – 57.6 | 41.60 |
| 08/03/09 | Orthophosphate ** | 3.07 | 2.45 – 3.68 | 2.713 |

**Notes:**
*Acceptable range is calculated based on the error associated with the methods as listed in Table 3-1.
**Nitrate and orthophosphate are converted to nitrate-nitrogen and orthophosphate-phosphorus, respectively, when conducting standard field screening. This is accomplished by multiplying the results by 0.226 for nitrate and 0.326 for orthophosphate. To simplify the calibration process, the unconverted numbers are used when calibrating the instruments.

### 3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis are collected concurrently with field samples and utilize the same sampling procedures. Pre-sterilized sample bottles are obtained from the laboratory and thus do not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples are kept in a cooler on ice until picked up by the lab. Strict chain of custody procedures are followed, and samples are delivered and analyzed within the appropriate holding times listed in Table 3-2. Completed chain of custody forms are included in Appendix C.

## 3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation is necessary, numeric action levels and best professional judgment are used to interpret the field screening results. If visual and/or analytical evidence of gross contamination are present at a site (e.g., substantial petroleum sheen, extremely high ammonia concentration, evidence of a sewage release, etc.), then an immediate source identification investigation is initiated. For sites that exceed numeric action levels but are not perceived as an immediate threat to water quality, a confirmation visit is conducted within two business days. An upstream pollutant source investigation is conducted thereafter if elevated concentrations persist and no sources can be identified in the immediate vicinity of the monitoring station. If elevated levels of pollutants are detected by the laboratory analyses, a comprehensive follow-up pollutant source investigation is conducted within two business days of receiving the laboratory results. A discussion of follow-up investigations is included in Section 8 of this report. Recommendations based on the results of the investigations are included in Section 9.

The following three methods are employed to determine whether immediate or comprehensive follow-up investigations are necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment. All three approaches are described in detail below and presented in Table 3-4.

**Numeric Action Levels**

Numeric action levels are used as the primary approach for interpreting pH, orthophosphate-P, nitrate-N, ammonia-N, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (see Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels based on county-wide sampling data. These action levels have been used by all San Diego County Copermittees since the 2003 dry weather season.

**California Toxics Rule**

The CTR criterion maximum concentration (CMC) is a short term concentration limit in which aquatic life can be sustained. The CMC is used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in USEPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total hardness of the sampled water, with the action levels increasing as hardness increases. More information on the CTR is available at http://www.epa.gov/region09/water/ctr.

**Best Professional Judgment**

Best professional judgment is utilized as the primary approach for interpreting turbidity, water temperature, and conductivity and as a secondary approach for interpreting the results of all other field and laboratory analyses. Under best professional judgment, the need for a follow-up investigation is left to the discretion of the D-MAX field crew. Best professional judgment may indicate that results which either exceed certain action levels or are statistical outliers may be the result of natural or background factors.

## TABLE 3-4
## ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

| Field Screening Analytes | Action Levels[1] | Source□Notes |
|---|---|---|
| pH | □6.5 or 9.0 | Basin Plan[2], with allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia. |
| Orthophosphate-P (mg/L) | 2.0 | USEPA Multi-sector General Permit |
| Nitrate-N (mg/L) | 10.0 | Basin Plan and drinking water standards |
| Ammonia-N (mg/L) | 1.0 | Based on Workgroup experience. May also consider unionized ammonia fraction. |
| Turbidity (NTU) | Best Professional Judgment | WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity) and unusual odors. |
| Temperature (□C) | Best Professional Judgment | Base judgment on season, air temperature, channel type, shading, etc. |
| Conductivity (mS/cm) | Best Professional Judgment | Conductivity may be highly elevated in some regions due to high TDS, groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values □0.75 may indicate excessive potable water discharge or flushing. |
| **Laboratory Analytes** | **Action Levels** | **Source□Notes** |
| Oil and Grease (mg/L) | 15 | USEPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation. |
| Diazinon (□g/L) | 0.5 | Response to diazinon and chlorpyrifos levels above 0.5 □g/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs. |
| Chlorpyrifos (□g/L) | 0.5 | |
| Dissolved Cadmium (□g/L) | California Toxics Rule | Use California Toxics Rule, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd □ 14 ppb; Cu □ 38 ppb; Pb □209 ppb; and Zn □297 ppb. |
| Dissolved Copper (□g/L) | California Toxics Rule | |
| Dissolved Lead (□g/L) | California Toxics Rule | |
| Dissolved Zinc (□g/L) | California Toxics Rule | |
| Total Coliforms (MPN/100 mL) | 50,000 | Bacteria levels in many storm drains are likely to exceed public health guidance criteria. Use confidence interval test and best professional judgment to identify conveyances for source ID. |
| Fecal Coliforms (MPN/100 mL) | 20,000 | |
| Enterococci (MPN/100 mL) | 10,000 | |

**Notes:**
[1] The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry weather monitoring data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.
[2] Basin Plan □ Water Quality Control Plan for the San Diego Basin
WQO □Water Quality Objective
ppb □parts per billion

# 4 FIELD SCREENING RESULTS

The Dry Weather Monitoring Program field screening was conducted during July and August of 2009. Since four primary sites were found to be dry, four alternate sites were visited. Field screening was conducted at the 15 sites where ponded or flowing water was observed. Of these sites, 12 had a measurable flow, and three had ponded water. Six confirmation visits were performed at sites where one or more constituents were found to exceed specified action levels, and two upstream locations were sampled during follow-up investigations.

## 4.1 Qualitative Observations

Qualitative observations for all routine field screening visits are summarized below. Routine field screening and confirmation visit observations are presented in Table 4-1:

***Light Conditions***

Light conditions were primarily sunny, with occasional partly cloudy or overcast weather.

***Tide***

One site visited during dry weather monitoring was subject to tidal influence. This site was sampled during low tide with a height of approximately 2.8 feet.

***Odor***

The sample from one site had an odor of sewage. All other samples lacked any discernable odor.

***Color***

Water from one site was yellow in color, and water from two of the sites appeared brown. All other samples were colorless.

***Clarity***

The majority of water samples collected were clear, with negligible amounts of suspended particles observed. The water samples at three sites were slightly cloudy.

***Floatable Materials***

Trash was noted floating on the surface of the water at eight sites. No other types of floating materials were noted. Section 5 of this report includes the complete results of the Trash Assessment.

***Deposits***

Sediment, gravel, and/or fine particulates were observed at nearly all sites. No other types of deposits were noted.

***Vegetation***

Most sites supported either normal or no vegetation, appropriate for the availability of sunlight and soil. One site had limited vegetation, and flow was not restricted at any sites as a result of excessive vegetation.

### *Biology*

The presence of organisms can be an indication of healthy waters. The presence of algae often indicates that water flow is persistent. An overabundance of algae often implies high levels of nutrients in the water and can have negative effects on aquatic life. No sites had excessive algal growth this year. Insects and algae were prevalent at most sites that had sun exposure. Two sites were host to snails, and fish were observed at one site.

**TABLE 4-1**
**DRY WEATHER FIELD OBSERVATIONS**

| Site | Date | Time | Light Conditions | Odor | Color | Clarity | Floatables | Deposits | Vegetation | Biology |

## 4.2 Field Analytical Results

Field analyses are conducted at all sites with flowing or ponded water. The measured constituents are described below.

**Flow rate** quantifies the volume of fluid passing across a given surface per unit time. Flow rate measurements are needed to calculate the load or particular amount of a pollutant discharged.

**Water temperature** is needed to assess the significance of other parameters, such as pH and conductivity. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. In the field, water temperature is measured immediately upon sample collection at each site.

The **pH** is an expression of acidity or alkalinity of a water sample. The pH of an aquatic system will affect a variety of chemical reactions, including the availability of nutrients and the solubility of chemical substances, particularly heavy metals.

**Turbidity** describes the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation, thus reducing photosynthetic capacity, but excessive suspended particles can also absorb heat and increase water temperatures.

**Specific conductance (conductivity)** measurements indicate the total concentration of ions in an aquatic system and the ability of the water to conduct electricity. This parameter can be used to assess the mineral content of water and potentially help indicate the presence of dissolved pollutants.

**Surfactant** concentrations in water samples often reflect illegal discharges from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms.

**Ammonia-nitrogen** (ammonia-N) is an indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment; however, in higher quantities it can become toxic to fish and other organisms.

**Nitrate-nitrogen** (nitrate-N) is a common sign of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, resulting in oxygen depletion as algae decomposes and may eventually suffocate other aquatic life. During the field analysis, nitrate is measured and converted into nitrate-N using a conversion factor of 0.226. This process is explained in Note 3 of Table 3-1.

**Orthophosphate-phosphorus** (orthophosphate-P) is also an indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate-N, orthophosphate-P pollution can cause nutrient enrichment, stimulate algal growth, and thus deplete oxygen in the water to levels that are dangerous for aquatic life. Even low levels of orthophosphate-P can cause significant algal growth, as it is commonly the limiting nutrient in plant growth. During the field analysis, orthophosphate is measured and converted into orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 6 of Table 3-1.

A statistical summary of the routine field analytical results is presented in Table 4-2. Table 4-3 shows the results of all field analyses conducted at the sampled sites. Graphs of the

various parameters and appropriate action levels for follow-up investigations are included at the end of this Section.

**TABLE 4-2**
**FIELD ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum | Average | Median | Standard Deviation | Number of Exceedances | Graph No. |
|---|---|---|---|---|---|---|---|
| Flow Rate (gpm) | 3 | 0 | 0.8 | 0.5 | 0.8 | --- | 4-1 |

# 5 TRASH ASSESSMENT

## 5.1 Regulatory Requirements

Section II.B.3.C.(7) of the Municipal Permit's Receiving Waters and Urban Runoff Monitoring and Reporting Program requires Copermittees to assess the presence of trash in receiving waters and urban runoff at each dry weather monitoring site. This trash assessment program is designed to provide information on the spatial extent and relative amount of trash present, as well as the nature and origin of the trash at the site.

## 5.2 Procedure and Definitions

The San Diego Copermittee Dry Weather Monitoring Workgroup developed a Trash Assessment Form to document the amount and extent of trash at each evaluated site. The form categorizes the site into one of five trash categories: optimal, suboptimal, marginal, submarginal, or poor. The form also addresses any potential threats that the trash may pose to human or aquatic health. For sites rating submarginal or poor, the form includes a section to record types, prevalence, potential routes, and sources of trash.

A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form's five categories are primarily qualitative descriptions of the amount and extent of trash although a number of trash pieces is also included in each category as a rough guideline. The five categories are defined as follows.

- *Optimal:* On first glance, no trash is visible. Little or no trash (10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (10-50 pieces) are evident in the evaluated area.
- *Marginal:* Trash is evident in low to medium levels (51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris ( 100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris ( 400 pieces).

The threat to human health and threat to aquatic health is assessed at each site using the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long

distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category.

In the event that a site is noted as potentially posing a threat to human or aquatic health, additional descriptive comments are recorded in the Comments section of the Trash Assessment Form.

If a site is labeled as submarginal or poor, it is then assessed for types of trash present (e.g., automotive, biohazard, food waste), which are ranked based on the prevalence and potential threat to water quality of the items. Lastly, the potential mechanism through which trash reached the site (e.g., dumping, littering, upstream sources) and the potential source of the trash (e.g., construction, commercial, transient) are identified.

## 5.3 Trash Assessment Results

Trash assessments were conducted at 19 sites, including four dry sites. The most frequent trash assessment scores in the City of National City for 2009 were optimal and suboptimal trash ratings, with six sites in each category. Five sites were rated marginal, one site rated submarginal, and one site rated poor. No sites were determined to pose a threat to human or aquatic health. Table 5-1 and Graph 5-1 summarize the trash assessment results. Table 5-2 presents a breakdown of the types and potential sources of trash present at submarginal or poor sites. Figure 5-1 provides a map of sampling sites and their corresponding trash assessment.

**GRAPH 5-1**
**TRASH ASSESSMENT SUMMARY**

### 5.3.1 Submarginal or Poor Sites

**Site 1A** is located in a concrete channel southwest of 43rd Street and Nordica Avenue, and received a submarginal trash rating. Food packaging was the most prevalent type of trash. Most of the trash was likely due to littering and dumping at the site, with some likely to be transported to the site from an upstream source. The surrounding area showed evidence of being used by people.

**Site 6** is located at an outlet on the north bank of the Sweetwater River, approximately 500 feet east of Highland Avenue. This site received a poor trash rating. A very large amount of trash was observed protruding from the outlet's flapper gate and piled within the concrete conveyance. This waste included miscellaneous plastic debris, clothing, used tires, a shopping cart, and various household items. Tidal influence at the site may assist in debris deposition, although most debris was likely to have been carried down from upstream sources or left by transients. Upstream commercial areas are a probable source for much of the smaller debris.

**TABLE 5-2**
**BREAKDOWN OF SUBMARGINAL AND POOR SITES**

| Site | Ranking | Types of Trash | Potential Route 1 | Potential Route 2 | Potential Source 1 | Potential Source 2 |
|---|---|---|---|---|---|---|
| 1A | 1 | Food Packaging | Littering | Upstream | Household | Transient |
| | 2 | Household | Dumping | Littering | Household | Construction |
| | 3 | Food Waste | Littering | Upstream | Household | Transient |
| | 4 | Fabric/Clothing | Dumping | Littering | Household | Transient |
| | 5 | Cigarette Butts | Littering | --- | Household | Transient |
| 6 | 1 | Fabric/Clothing | Upstream | --- | Household | Transient |
| | 2 | Household | Upstream | --- | Household | --- |
| | 3 | Shopping Carts | Dumping | Upstream | Commercial | Transient |
| | 4 | Automotive | Upstream | --- | Household | Commercial |
| | 5 | Food Packaging | Upstream | --- | Household | Commercial |
| | 6 | Food Waste | Upstream | --- | Household | Commercial |

**Note**: Only the types of trash that are present in the evaluated area are ranked. Ranking order refers to the prevalence of each type of trash, with 1 being most prevalent and 12 being least prevalent.

**FIGURE 5-1**
**TRASH ASSESSMENT GIS MAP**

# 6 LABORATORY ANALYTICAL RESULTS

## 6.1 Summary

Laboratory analyses were conducted at four sites, representing over 25 percent of all sites with ponded or flowing water. The laboratory constituents measured are defined below.

**Oil and grease** analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities.

**Total hardness** measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Hardness itself is not considered a pollutant, but is measured to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions.

**Diazinon** and **chlorpyrifos** are organophosphate pesticides that are highly toxic to insects, birds, and mammals, freshwater fish, and invertebrates. In 2005, the Environmental Protection Agency banned the sale of diazinon in the United States and tightened restrictions on chlorpyrifos use.

**Coliform bacteria** are relatively harmless to humans and are present in mammalian digestive tracts, most surface waters, and soils. Testing water samples for total coliform bacteria is a standard practice in public health. Total coliform is measured as an indicator of other more harmful pathogens, since these pathogens are generally present in much smaller quantities and are difficult to detect.

**Fecal coliform**, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastrointestinal tracts of humans and animals and are commonly used as indicators of water contamination by fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material is human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain.

**Metal** contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms.

The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness. As hardness increases, so does the Criterion Maximum Concentration (CMC), a concentration limit in which aquatic life can be sustained. CMC values differ for various metals. Dry weather monitoring laboratory samples are analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Table 6-1 shows the sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

Table 6-2 presents a statistical summary of the laboratory results from all samples. Table 6-3 presents the laboratory results from all samples. Laboratory reports are included in Appendix C.

**TABLE 6-1**

**Notes:**

nd not detected

na not analyzed

**Red** values were at or above the measured constituent s action level

denotes a confirmation visit

Number of fecal coliforms for confirmation samples are derived from *E. coli* count. Number of fecal coliforms (Number of *E. coli*) / 0.85

Confirmation samples are analyzed using the Colilert and Enterolert methods described in Table 3-2, which have a reporting limit of 10 MPN/100 mL.

Total hardness is not considered a pollutant (see Section 3.4), and thus has no established action level for the purposes of dry weather monitoring. Total hardness is measured because the CTR action levels for metals are dependent on the total hardness value of the water sample.

# 7 DATA ANALYSIS

This section provides an overall evaluation of test results of the 2009 Dry Weather Monitoring Program, as well as a discussion of historical trends for various constituent exceedances. In 2009, only two of the 15 sites sampled had a flow rate greater than 1 gpm during the initial visit. The generally low levels of dry weather flow observed indicate that only a relatively small amount of discharge is being generated within the City. Lower levels of flow reduce the likelihood that pollutants in the water will reach receiving water bodies.

## 7.1 2009 Results

Of the 15 sites sampled, ammonia-nitrogen exceedances and surfactants exceedances were the most common, occurring at three sites each. All exceedances except those in bacteria at Site 1A were transient, with three of the five investigated sites being dry at the confirmation visit. A summary of 2009 exceedances is presented in Table 7-1.

**TABLE 7-1**
**2009 EXCEEDANCES SUMMARY**

| Site No. | Surfactants | Ammonia-N | Orthophosphate-P | Total Coliforms | Enterococci |
|---|---|---|---|---|---|
| 1A | ✓ | | | ✓ | ✓ |
| 43A | | ✓ | | | |
| 46 | | | | | ✓ |
| 48 | ✓ | ✓ | ✓ | | |
| 49 | ✓ | ✓ | ✓ | | |

**Note:** Table reflects exceedances occurring during routine visits only, not confirmation or follow-up visits.

## 7.2 Previous Results

Historical exceedance results are presented in Table 7-2, Graph 7-1, and Graph 7-2. Table 7-2 shows the percentage of sampled sites that have had exceedances each year of the Dry Weather Monitoring Program. Graph 7-1 illustrates the percentage of exceedances by year for field screening, and Graph 7-2 presents the percentage exceedances by year for laboratory analyses.

No exceedances have been measured in nitrate-nitrogen, lead, diazinon, or chlorpyrifos since testing of these constituents began in accordance with Order 2001-01. Thus, these constituents have not been included in the following graphs. Ammonia-nitrogen exceedances appeared to be decreasing throughout the course of the program; however three exceedances were noted this year. The number of orthophosphate-phosphorus exceedences have increased in the past two years, and surfactant exceedences appear to

be persistent. No exceedances have been noted in conductivity since 2004, and pH exceedances have not been observed in the past two years.

As shown in Graph 7-2, the frequency of total and fecal coliform bacteria exceedances appear to be decreasing in recent years. Oil and grease, cadmium, copper, and zinc exceedances have been detected only once in the history of the program. Since only eight years of data are available, trends cannot be drawn with a high degree of certainty.

**TABLE 7-2**

Results based on complete routine visits only. Confirmation visits, follow-up visits, and dry sites not included.

□By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgment in order to account for sites in which salt water and groundwater increase conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

**GRAPH 7-1**
**PERCENT OF SITES WITH FIELD SCREENING EXCEEDANCES BY YEAR**

The action level for conductivity was numeric in the past but was later changed to best professional judgment. See footnote in Table 7-2.

**GRAPH 7-2**
**PERCENT OF SITES WITH LABORATORY ANALYSIS EXCEEDANCES BY YEAR**

# 8 FOLLOW-UP INVESTIGATIONS

One of the primary purposes of the Dry Weather Monitoring Program is to identify IC/IDs. Both field screening and laboratory analytical results are compared to regionally developed action levels (Table 3-4). When a parameter is measured at or above its action level, it is possible that an IC/ID is present and further investigation is performed. Procedures for such investigations are described below, followed by a discussion of the 2009 follow-up investigations.

## 8.1 Investigation Procedures

Follow-up investigations are conducted in two rounds. The first follow-up investigations are for the sites at which action level exceedances are indicated by field testing. These investigations are in the form of additional field testing and are conducted within two business days of the initial findings. The second round of follow-up investigations are carried out for the sites at which laboratory testing shows elevated constituent levels. These investigations are conducted within two business days of receiving the laboratory test results.

During the follow-up investigations, flow rates are measured, visual observations are performed, and field testing is conducted. Visual observations, such as water color, clarity, odor, floatable materials, vegetation, and biology are recorded on field data sheets at each site. Field data sheets are included in Appendix D.

Source identification investigations begin by testing the water at the site again. This is referred to as a confirmation visit, as its purpose is to confirm the initial findings. If follow-up testing at a site results in constituent concentrations below specified action levels, the exceedance found during the initial sampling may have been due to a transient flow. If follow-up testing at a site finds constituent concentrations again above the specified action levels, an upstream investigation will be conducted. The field crew will progress upstream to isolate and identify potential pollutant sources.

Upstream investigations are also referred to as IC/ID follow-up visits, as the purpose is to identify illicit connections and illegal discharges. They are conducted by checking a number of upstream branches for any potential sources of the constituent of concern. The estimated flow rate in each branch and any relevant observations are recorded. Depending upon the constituent under investigation, laboratory samples may be collected for analysis.

The laboratory test for investigating upstream bacteria sources differs from routine bacteria testing by using the IDEXX Colilert and IDEXX Enterolert tests. Information about these methods is provided in Table 3-2. Results for the Colilert and Enterolert tests are typically available within 24 hours, as opposed to the five business days needed for routine testing. The quicker turnaround time allows for additional upstream investigations as needed.

## 8.2 Investigated Sites

During the 2009 Dry Weather Monitoring Program, five sites required upstream investigations for identifying potential IC/IDs. Amongst the five sites, there were a total of three exceedances in surfactants, three in ammonia-nitrogen, two in orthophosphate-phosphorus, two in *Enterococcus* bacteria, and one in total coliform bacteria. A brief description of each site, analytical results, photographs of selected upstream locations, and the results of the investigations are discussed in this section. Table 9-2 in Section 9 of this report provides a summary of the investigation results.

## Site 1A

Site 1A is in a concrete channel that flows westward near 43rd Street, just south of Nordica Avenue. During the initial visit, the water was flowing at a rate of less than 1 gpm and the surrounding area had a significant amount of trash, receiving a submarginal trash rating. There was also a faint odor of sewage during the initial visit, with a notably musty odor during the confirmation visit.

At the initial visit, the surfactant level was measured at 3.00 mg/L, above the action level of 1.00 mg/L. The area upstream of the site was inspected for potential sources, however no active washing was observed. It was reported by a resident that some apartment complexes upstream of the site allow vehicle washing in their parking lots, which is a potential source of surfactants. During the confirmation visit the following day, the surfactant level was measured at 0.50 mg/L, indicating that the initial exceedance was the result of a transient flow.

Site 1A was also sampled for laboratory analyses. At the time of the initial visit, total coliform bacteria were measured at 300,000 MPN/100 mL, above the action level of 50,000 MPN/100 mL, and *Enterococcus* bacteria levels were measured at 160,000 MPN/100 mL, above the action level of 10,000 MPN/100 mL. During the confirmation visit, the concentration of total coliform bacteria at the site was measured above the action level at 77,010 MPN/100 mL, while the level of *Enterococcus* bacteria was measured below the action level at 4,352 MPN/100 mL.

Site 1A is located at the convergence of three lines. The line from the north, which receives water from the City of San Diego, was dry. Areas upstream on this line showed no evidence of recent flow or potential bacteria sources. The line from the south was also dry; however the nearest upstream storm drain inlets contained organic debris and trash and were damp, indicating recent flow through the area. Damp conditions and decomposing material within the conveyance create an environment conducive to bacteria growth. Intermittent increases in flow could carry high levels of bacteria and its sources downstream to Site 1A.

The line from the east flows through several areas that contain probable sources of bacteria to the site. In the rear of a small shopping complex, across 43rd Street from Site 1A, is a small alley with large amounts of trash and a leaking dumpster (Photo 8-1). Leakage from the dumpster may contain bacteria and is likely to flow to the storm drain located several feet away.

**Photo 8-1**: Evidence of recent flow from beneath a dumpster upstream of Site 1A.

Just east of the shopping center is an apartment complex where a large amount of trash was observed around several dumpsters. As illustrated by Photo 8-2, discarded food and food packaging were present including raw chicken packaging within 10 feet of a storm drain. Further upstream of this area is a trailer park where a storm drain inlet contained evidence of past cooking grease disposal. All of these situations are likely to add bacteria to the storm water conveyance system.

A sample was taken further east of the trailer park at location 1A-1, which is a manhole in the middle of the street in front of 1243-1305 Fig Court. This sample location is also known as primary Site 45. *Enterococcus* bacteria levels measured at this site were below the action level at 3,448 MPN/100 mL, but the total coliform bacteria level was in exceedance at 98,040 MPN/100 mL. Upstream of this area, a residential neighborhood along Scott Drive contained numerous catch basins with a large amount of decomposing organic material.

The high bacteria levels at Site 1A were attributed to several factors. Debris and trash from the southern line may contribute bacteria to Site 1A when there is sufficient flow. The eastern line likely contributes bacteria from the commercial and residential areas containing significant amounts of trash and decomposing organic matter in and around the storm water conveyance. The conditions at the site itself were also a likely source of bacteria; a low flow rate and dense vegetation trapping large amounts of decomposing trash are conducive to bacterial growth. Table 8-1 provides upstream investigation results and Figure 8-1 is a map of sampling locations for Site 1A.

**Photo 8-2:** Food packaging and waste upstream of Site 1A.

**FIGURE 8-1**
**SITE 1A BACTERIA UPSTREAM INVESTIGATION MAP**

## Site 43A

Site 43A is located at a catch basin on F Avenue between East 24th Street and East 28th Street, west of Olivewood Elementary School. During the initial site visit, the flow was less than 1 gpm and the site had accumulated organic debris and trash resulting in the assignment of a submarginal trash rating. The concentration of ammonia-nitrogen for the sample measured 1.150 mg/L, above the action level of 1.00 mg/L. During the confirmation visit, the catch basin was dry and could not be sampled. No evidence of runoff was found in the surrounding area. The initial exceedance of ammonia-nitrogen was concluded to be due to a transient flow, and was potentially the result of a low flow through decomposing organic material and trash in the catch basin. As the ponded water evaporated, it is likely that ammonia-nitrogen levels become more concentrated.

## Site 46

Site 46 located at a manhole in the parking lot south of the South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop. During the initial site visit, a flow of 1 gpm was noted. Laboratory analysis indicated that *Enterococcus* bacteria levels were over the action level, measuring 22,000 MPN/100 mL. The sample collected from Site 46 during the confirmation visit had an *Enterococcus* measurement of 5,172 MPN/100 mL.

The site receives flow from two lines, one from the east and one from the north. The eastern line runs behind a shopping center that has several storm drain inlets throughout the parking lot. Food waste was observed throughout the parking lot. The northern line drains primarily residential neighborhoods. The storm drains in these neighborhoods were generally clean. Location 46-1 at the corner of East 7th Street and R Avenue (which is also primary Site 3) was sampled, and the *Enterococcus* count was measured at 246 MPN/100mL.

*Enterococcus* bacteria measured below the action level in follow-up samples collected at Site 46 and the upstream location 46-1. This suggests that the initial exceedance was the result of a transient flow. Table 8-2 provides upstream investigation results and Figure 8-2 provides a map of sampling locations. Recommendations regarding this site are provided in Section 9 of this report.

**Note:** **Red Bold Type** value exceeds action level

**FIGURE 8-2**
**SITE 46 BACTERIA UPSTREAM INVESTIGATION MAP**

## Site 48

Site 48 is located in a catch basin at the northwest corner of the East 14th Street and Grove Street intersection. In the catch basin, trash levels were categorized as marginal and a large amount of organic debris was also noted. The flow was less than 1 gpm during the initial site visit. The ammonia-nitrogen concentration was measured at 1.517 mg/L; orthophosphate-phosphorus was measured at 3.684 mg/L; and the surfactants level was greater than 3.00 mg/L.

Directly upstream, a resident was bathing several dogs in her driveway on East 14th Street. Runoff at a rate of 1 gpm traveled several hundred feet from the driveway along the curbside before entering the storm drain. Pet shampoo and particulates washed off from the pets are likely sources of the exceedances measured downstream at Site 48. The resident was informed that it is illegal to allow polluted water to enter the MS4 system, and the washing activities were discontinued.

At the confirmation visit the following day, the site was dry and no overland flow was observed. The exceedances of ammonia-nitrogen, orthophosphate-phosphorus, and surfactants were transient.

## Site 49

Site 49 is located in a concrete channel at the south end of Arcadia Place. During the initial visit, the water was ponded, slightly cloudy, and brown in color. The ammonia-nitrogen concentration of the sample was 1.187 mg/L; the orthophosphate-phosphorus concentration was measured at 2.191 mg/L; and the surfactants concentration was measured at 3.00 mg/L. During the confirmation visit the following day, the site was dry.

On the day of the initial visit, an immediate upstream investigation was performed. The maintenance supervisor of an upstream apartment complex reported that although residents are not allowed to wash cars in the parking lot, washing does take place occasionally. The supervisor also noted that the landscapers had applied fertilizer within the past six weeks. The storm drain inlets within the complex contained trash and small amounts of grass clippings, which are materials that may produce ammonia as they decompose.

The exceedances noted at the initial visit may potentially have been influenced by activities in the apartment complex upstream; however this could not be verified. The pollutants present in the ponded water had likely been concentrated as water evaporated. Since the site was dry at the confirmation visit, the exceedances were attributed to a transient flow.

# 9 SUMMARY AND RECOMMENDATIONS

## 9.1 Field Screening & Laboratory Analysis Summary

Fifteen primary monitoring sites and four alternate sites were visited in the 2009 Dry Weather Monitoring Program. Laboratory analyses were performed on water samples from four of the primary sites, representing over 25 of sites with flowing or ponded water. Table 9-1 provides a summary of action level exceedances.

**TABLE 9-1**
**SUMMARY OF ACTION LEVEL EXCEEDANCES**

| Field Screening (15 samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| pH | 0 | 0 | --- |
| Conductivity | 0 | 0 | --- |
| Turbidity | 0 | 0 | --- |
| Surfactants | 3 | 20 | 1A, 48, 49 |
| Ammonia-N | 3 | 20 | 43A, 48, 49 |
| Nitrate-N | 0 | 0 | --- |
| Orthophosphate-P | 2 | 13 | 48, 49 |
| **Laboratory Analyses (4 samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| Oil & Grease | 0 | 0 | --- |
| Cadmium | 0 | 0 | --- |
| Copper | 0 | 0 | --- |
| Lead | 0 | 0 | --- |
| Zinc | 0 | 0 | --- |
| Diazinon | 0 | 0 | --- |
| Chlorpyrifos | 0 | 0 | --- |
| Total Coliforms | 1 | 25 | 1A |
| Fecal Coliforms | 0 | 0 | --- |
| Enterococci | 2 | 50 | 1A, 46 |

**Note:** Table includes data from initial site visits only; confirmation and follow-up investigations are not included.

In general, the City of National City s storm water conveyances had low flows this year. Only two of the 19 visited primary sites had a flow greater than 1 gpm during the initial visit. Four of these sites were dry and two were ponded. The low level of dry weather flows in the City

may be a result of less irrigation runoff. These conditions decrease the likelihood that pollutants will reach receiving water bodies.

In the trash assessment, nineteen sites were assessed, including four that were dry. Twelve were assigned optimal or suboptimal trash ratings; five were marginal; one was submarginal; and one site was considered poor.

## 9.2 Follow-Up Investigation Summary

Table 9-2 presents the conclusions based on the results of confirmation visits and upstream investigations conducted at five sites in the 2009 Dry Weather Monitoring Program.

**TABLE 9-2**
**SUMMARY OF FOLLOW-UP INVESTIGATIONS**

| Site | Follow-Up Investigation Target Constituent(s) | | Results Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 1A | Surfactants | Total Coliforms, Enterococci | Surfactants: transient flow<br>Bacteria: decomposing organic matter at the site and in upstream areas |
| 43A | Ammonia-N | --- | Transient flow, potentially generated by organic material decomposition at site and increased concentration of pollutants as ponded water evaporated |
| 46 | --- | Enterococci | Transient flow, possibly caused by food waste in the upstream shopping center |
| 48 | Ammonia-N, Orthophosphate-P, Surfactants | --- | Transient flow; dog washing by a resident upstream |
| 49 | Ammonia-N, Orthophosphate-P, Surfactants | --- | Transient flow and an increasing concentration of pollutants as ponded water evaporated |

## 9.3 Recommendations

Based on the results of the 2009 Dry Weather Monitoring Program for the City of National City, the following actions are recommended for consideration.

### 9.3.1 Education

- Provide educational materials regarding dumpster area best management practices (BMPs) to the property manager and residents of the Highland View Apartments and to the business owner of the Siete Dias Market, where a leaking dumpster was observed. Provide educational materials to the residents of the Happy Hollow Trailer Park regarding proper oil and grease disposal. These locations are upstream of Site 1A, where bacteria exceedances were noted.

- Provide educational materials regarding outdoor washing activities to the residents of the Summer Crest Living Complex, upstream of Site 49, and to the residents of East 14th Street, upstream of Site 48. Both sites experienced surfactants and orthophosphate-phosphorus exceedances that were likely the result of to washing activities.
- Provide educational materials regarding BMPs for fertilizer application, and landscaping waste disposal to the maintenance department of the Summer Crest Living complex, upstream of Site 49 where an ammonia-nitrogen and orthophosphate-phosphorus exceedance was measured.

### 9.3.2 Inspection and Maintenance

- Remove trash and debris from submarginal Site 1A to eliminate potential sources of bacteria. Remove organic debris from the catch basins on Scott Drive, upstream of Site 1A. Increase the inspection frequency of these areas to determine if additional maintenance is necessary to prevent debris accumulation.
- Establish and maintain a regular schedule for the removal of trash from Site 6, which received a poor trash rating. Ensure that trash at Site 6 is regularly assessed, and implement preventative measures where possible to decrease the introduction of debris to the storm water conveyance system. This may include the installation or improvement of barriers and signage at the sites to discourage illegal dumping and use of the areas by transients.
- Although the confirmation visit indicated bacteria counts below the action level at Site 46, this site has had a history of high bacteria levels. Contact the property management of the South Bay Plaza Center to ensure the trash areas and storm drains are kept free of trash and food waste.

# Laboratory Analytical Reports

**EnviroMatrix Analytical, Inc.**

07 August 2009

D-Max Engineering
Attn: Arsalan Dadkhah
7220 Trade Street, Suite 119
San Diego, California 92121

**EMA Log #: 0907804**

**Project Name: National City Dry Weather Monitoring**
**Project Desc./#:200938W-5**

Enclosed are the results of analyses for samples received by the laboratory on 07/30/09 16:02. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that this data is in compliance both technically and for completeness.

**Dan Verdon**
**Laboratory Director**

CA ELAP Certification #: 2564

## Notes and Definitions

| | |
|---|---|
| QM-06 | Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values. |
| GC-05 | Results confirmed by GCMS. |
| ND | Analyte NOT DETECTED at or above the reporting limit |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

## Notes and Definitions

| | |
|---|---|
| QM-06 | Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values. |
| GC-05 | Results confirmed by GCMS. |
| ND | Analyte NOT DETECTED at or above the reporting limit |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis |
| RPD | Relative Percent Difference |

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

# 2009 Trash Assessment Form

SITE ID: 1A DATE: 7/30/09

OBSERVER: JL/MD TIME: 14:25

LOCATION: Southwest of 43rd Street and Nordica Avenue

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Submarginal

ESTIMATED AREA OF ASSESSMENT L X W (FT): 20 x 25

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☑ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

SITE ID: 1A

*** Complete the following section for Submarginal, and Poor Evaluations ONLY ***

| TYPE | Ranking or Count by Type * | POTENTIAL ROUTE (CHECK UP TO 2) | | | | POTENTIAL SOURCE (CHECK UP TO 2) | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Dumping | Littering | Upstream | Unable to determine | Household | Construction | Commercial | Industrial | School | Transient | Unable to determine |
| Automotive | | | | | | | | | | | | |
| Biohazard Waste | | | | | | | | | | | | |
| Business Related | | | | | | | | | | | | |
| Cigarette Butts | 5 | | ✓ | | | ✓ | | | | | ✓ | |
| Construction | | | | | | | | | | | | |
| Fabric/Clothing | 4 | ✓ | ✓ | | | ✓ | | | | | ✓ | |
| Food Packaging | 1 | | ✓ | ✓ | | ✓ | | | | | ✓ | |
| Food Waste | 3 | | ✓ | ✓ | | ✓ | | | | | ✓ | |
| Household | 2 | ✓ | ✓ | | | ✓ | ✓ | | | | | |
| Shopping Carts | | | | | | | | | | | | |
| Toxic | | | | | | | | | | | | |
| Yard Waste | | | | | | | | | | | | |

* Only rank the types of trash PRESENT in evaluated area from 1 through 12 (1 is most prevalent – 12 is least prevalent). DO NOT rank types of trash that are not present in evaluated area.

# 2009 Trash Assessment Form

SITE ID: 3 DATE: 7/30/09

OBSERVER: JL/MD TIME: 11:45

LOCATION: East 7th Street and R Avenue

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Suboptimal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 6x6

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2009 Trash Assessment Form

SITE ID: 32 DATE: 7/30/09

OBSERVER: JL/MD TIME: 13:30

LOCATION: East of 2nd Avenue, north of Freeway 54 and Sweetwater Riv

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Submarginal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 20 x 10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☑ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). # 2009 Trash Assessment Form

SITE ID: 42 DATE: 7/31/09

OBSERVER: JL/MD TIME: 10:10

LOCATION: Southwest of Euclid Ave and 24th Street, south of Southern Community Church

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Marginal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 20x20

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☑ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2009 Trash Assessment Form

SITE ID: 45 DATE: 7/30/09

OBSERVER: JL/MD TIME: 10:15

LOCATION: In front of 1243-1305 Fig Court, in the middle of the street

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Suboptimal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 6x8

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☑ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☑ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2009 Trash Assessment Form

SITE ID: 49 DATE: 7/31/09

OBSERVER: JL / MD TIME: 10:40

LOCATION: South end of Arcadia Place (through Harbison Ave and 11th Street)

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Suboptimal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 20 x 20

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☑ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

## CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki, P.E.
Director of Development Services / City Engineer

Date: 9/27/10

Telephone Number: (619) 336-4380

# EXECUTIVE SUMMARY

The City of National City (City) has been actively developing and implementing storm water pollution prevention measures since 1990. The City's current Jurisdictional Urban Runoff Management Program (JURMP) was prepared in March 2008 in response to San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit). The Municipal Permit was jointly issued to 18 municipalities in San Diego County, including the City, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees").

At the end of each fiscal year, the City is required to report a summary of its JURMP implementation activities to the RWQCB. This JURMP Annual Report presents the City's activities during the 2009/2010 fiscal year, which began on July 1, 2009 and ended on June 30, 2010. Each section of this JURMP Annual Report discusses how the City's efforts during 2009/2010 met the requirements of the Municipal Permit. Key actions taken for the major components of the City's storm water program are summarized below.

**Development Planning Component**

During 2009/2010, the City continued to oversee development activities occurring in the City to mitigate potential threats to water quality due to such activities. The City updated its Standard Urban Storm Water Mitigation Plan (SUSMP) requirements in February 2010. The City continued to require all development projects to submit applicability checklists to determine subjectivity to the City's SUSMP requirements. The City implemented its treatment control BMP operation and maintenance verification program, which included the utilization of a Microsoft Access treatment control BMP database to track information and prepare the maintenance verification letters distributed to responsible parties. The City also conducted inspections at sites with approved treatment control BMPs and exceeded Municipal Permit inspection frequencies.

**Construction Component**

During 2009/2010, a total of 76 construction storm water compliance inspections were completed at 11 construction sites, not including inspections for building permits, which also include a brief check for storm water BMPs. The City checked all construction projects for applicability to the maximum disturbed area limitation and guidelines for advanced treatment. The City's plan check process provided construction BMP fact sheets, and the inspection program required projects to comply with the City's minimum BMP requirements.

**Municipal Component**

The City inspected all high TTWQ municipal fixed facilities and continued its rigorous street sweeping and MS4 maintenance programs. A total of 975 tons of trash and debris were removed from street sweeping activities, and 33.7 tons of debris were removed

from standard MS4 maintenance. The City continued to maintain and repair or replace sanitary sewer lines, as needed, to decrease the potential for a sanitary sewer overflow (SSO). One SSO was reported, stopped, and effectively cleaned up in 2009/2010. The City received and appropriately addressed all complaints received by the City's Storm Water Hotline, the City website, and other City departments.

**Industrial and Commercial Component**

During 2009/2010 the City met the Municipal Permit requirement to inspect at least 25 percent of the City's industrial and commercial inventory, including 100 percent of its high threat to water quality (TTWQ) sites. During the inspections conducted in 2009/2010, the City notified industrial and commercial businesses of the City's BMP requirements through the City's inspection program. Inspectors also assessed each facility's compliance with the General Industrial Permit (Industrial Permit). The City updated the standard industrial and commercial inspection form to improve inspection result notification and also continued to collect additional data to assess the pollutant discharge potential at each site.

**Residential Component**

The City worked to educate its residents through a variety of means. During 2009/2010, the City continued to collaborate with the cities of Chula Vista and Imperial Beach to encourage residents to dispose of household hazardous waste (HHW) appropriately at a facility available to the public. The City also continued to host large item waste disposal events in fall and spring, as well as respond to calls made to the City storm water hotline regarding residential areas.

**Illicit Discharge Detection and Elimination Component**

As required by RWQCB Addendum No. 2 to the Municipal Permit, adopted on September 10, 2008, the reporting period for this component of the JURMP has been extended to September 30, 2010. The City will submit the details of how it implemented the illicit discharge detection and elimination component of its JURMP to the RWQCB no later than December 15, 2010.

**Education Component**

As a means to raise storm water awareness in various communities in the City, the City continued to conduct various education and outreach activities throughout 2009/2010. The City's efforts resulted in an estimated 18,637 impressions. The City developed a bilingual 2010 Storm Water Program Calendar, which presented storm water concepts as well as storm water related artwork created by local third grade students. Approximately 3,800 calendars were distributed to municipal staff, industrial and commercial business representatives, school-aged children, and residents. To better serve the City's diverse population, a variety of educational materials were distributed in Spanish as well as English.

**Public Participation Component**

During 2009/2010, the City provided a variety of opportunities for individuals in the City to participate in the City's storm water program. Activities included cleanup

events, which have a direct effect on water quality, as well as outreach activities, through which the City works to increase general knowledge and awareness regarding storm water issues. The City selected and honored the 2010 Storm Water Calendar art contest winners. In addition, 255 volunteers participated in the Coastal Cleanup Day and Creek to Bay Cleanup at two different sites in the City. Also, City residents continued to participate in routine large item and HHW waste disposal events.

**Fiscal Analysis Component**

The City continued to fund its storm water program as discussed in the City's JURMP. As required by the Municipal Permit, the Copermittees collectively developed new fiscal analysis reporting standards, which were implemented for the first time in 2009/2010.

**Effectiveness Assessment Component**

The City continued to evaluate the effectiveness of its storm water program based on the approach presented in the City's March 2008 JURMP update. The City has identified significant activities within each program component and metrics to assess each one. Standard tables to report this information have been created and included in Section 11 of this JURMP Annual Report.

**Special Investigations**

The City continued its Clean Community Program which promotes shared responsibility within communities to keep National City and local receiving waterbodies clean and free of pollution. The City also assessed pollutant discharge potential of industrial and commercial businesses; sediment, trash, and oil and grease had the highest average pollutant discharge potential scores.

**Conclusions and Recommendations**

The City will continue to implement the new and updated programs in its JURMP during 2009/2010; it is anticipated that some program refinements will be made as implementation progresses. The City will also continue to collaborate with the other Copermittees to improve the efficiency of its program.

# 1.0 INTRODUCTION

## 1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Program (JURMP) Annual Report presents an activity summary for the City of National City (City) during the 2009/2010 fiscal year. The JURMP Annual Report preparation and submission are required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

### 1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act, also known as the Clean Water Act (CWA), established a framework for regulating Municipal Separate Storm Sewer System (MS4) discharges under the National Pollutant Discharge Elimination System (NPDES). In 1990, the RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region, followed by a revised permit in 2001. RWQCB Order No. 2001-01 was replaced by the current Municipal Permit in 2007.

In 2002, the City, like all regulated municipalities in the San Diego region (collectively referred to as Copermittees), developed and submitted a JURMP to the RWQCB. The City then submitted an updated JURMP, as required by the Municipal Permit, in March 2008. The JURMP explains management measures for different sectors, including municipal, industrial, commercial, construction, and significant development and re-development activities.

Annual reports documenting the implementation of the JURMP are required to be submitted to the RWQCB by September 30. This JURMP Annual Report presents data from the 2009/2010 fiscal year, which extended from July 1, 2009, to June 30, 2010.

### 1.1.2 CITY SETTING

The City of National City is located in southwest San Diego County, surrounded by the City of San Diego, Chula Vista, and unincorporated portions of San Diego County. The City itself covers approximately nine square miles and has an estimated population size of approximately 61,000 residents. Land use within the City is primarily residential, although a large industrial area can be found along the San Diego Bay. Commercial development is restricted to businesses and shopping centers along the main roadways. Land use is broken down by area and percentage of total in Table 1-1 and illustrated in Figure 1-1.

**Table 1-1**
**City of National City Land Use Breakdown**

| Land Use | Total Area (Acres) | Percentage |
|---|---|---|
| Single Family Residential | 1,216 | 30% |
| Transportation | 1,149 | 29% |
| Commercial | 490 | 12% |
| Industrial | 251 | 6% |
| Multi-Family Residential | 215 | 5% |
| Open | 202 | 5% |
| Public Facilities and Utilities | 174 | 4% |
| Vacant | 115 | 3% |
| Parks | 114 | 3% |
| Other Residential | 41 | 1% |
| Office | 22 | 1% |
| Water | 20 | <1% |
| Construction | 6 | <1% |
| Recreation | 2 | <1% |
| **Total** | **4,016** | **100%** |

Source: 2007 SANDAG land-use data

The City of National City lies entirely within the San Diego Bay Watershed and constitutes approximately 1.6 percent of its total area. More specifically, the City is located within two sub-watersheds: Sweetwater and Pueblo San Diego. The majority of the southern part of National City drains to the Sweetwater River and ultimately discharges into San Diego Bay. La Paleta Creek (also known as 7th Street Channel) drains the northern part of the City and also discharges into San Diego Bay, while a very small western portion of the City drains directly to the San Diego Bay shoreline. Nearly all areas of the City that drain directly to San Diego Bay are within the San Diego Unified Port District. Lastly, the central portion of the City drains to Paradise Creek, a small salt marsh creek, which then discharges into the Sweetwater River. Watersheds in the City are shown in Figure 1-2.

San Diego Bay is listed in the 2006 CWA Section 303(d) for polychlorinated biphenyls (PCB) based on recent fish tissue analyses. The shorelines at 7th Street Channel and at the 24th Street Marine Terminal are also listed in the 2006 CWA Section 303(d) for benthic community effects and sediment toxicity. Currently, the TMDL for the mouth of 7th Street Channel has not been adopted. Sweetwater Marsh, which is part of a national wildlife refuge, is considered an ESA. In addition, Paradise Creek is considered an ESA by the City.

**Figure 1-1**
**City of National City Land Use**

**Figure 1-2**
**City of National City Watersheds**

Note: Marsh boundaries based on land use data from SANDAG. The portion of the marsh west of I-5 and south of the Sweetwater River is not in the City's Jurisdiction. Base Data Sources: City of National City, SANDAG, SanGIS, Port of San Diego

## 1.2 PURPOSE AND OBJECTIVES

The City's JURMP presents strategies to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The JURMP describes various programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the implementation of the City of National City's JURMP during the 2009/2010 reporting period.

## 1.3 REPORT ORGANIZATION

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

| | |
|---|---|
| **Section 1** | **Introduction** |
| **Section 2** | **Development Planning Component** |
| **Section 3** | **Construction Component** |
| **Section 4** | **Municipal Component** |
| **Section 5** | **Industrial and Commercial Component** |
| **Section 6** | **Residential Component** |
| **Section 7** | **Illicit Discharge Detection and Elimination Component** |
| **Section 8** | **Education Component** |
| **Section 9** | **Public Participation Component** |
| **Section 10** | **Fiscal Analysis Component** |
| **Section 11** | **Effectiveness Assessment Component** |
| **Section 12** | **Special Investigations** |
| **Section 13** | **Non-Emergency Fire Fighting** |
| **Section 14** | **JURMP Revisions** |
| **Section 15** | **Conclusions and Recommendations** |
| **Section 16** | **References** |

Each section includes all components required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a more detailed explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Background, subsection 1.1, has been divided into Regulatory Background, subsection 1.1.1, and City Setting, subsection 1.1.2, for clarity.

# 2.0 DEVELOPMENT PLANNING COMPONENT

## 2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall storm water quality by reducing the discharge of pollutants from development projects to the MEP and by managing the increases in runoff from development projects that have the potential to negatively affect downstream water bodies. During the 2009/2010 fiscal year, the City accomplished these goals through implementation of its JURMP document.

### 2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2009/2010 reporting period are presented in the following bulleted list. The remainder of this section provides more detail about the City's implementation of this component of its storm water program.

- Distributed the City's development requirements checklist to projects applying for permits.
- Worked with other Copermittees to develop a final Hydromodification Management Plan, which was approved by the RWQCB just after the end of the 2009/2010 reporting period.
- Updated the Standard Urban Stormwater Mitigation Plan (SUSMP) requirements in February 2010, in advance of the March 24, 2010 deadline.
- Continued to utilize the City's SUSMP database to track Priority Development Projects within the City's jurisdiction and the parties responsible for BMP maintenance.
- Obtained verification of BMP maintenance from completed Priority Development Projects on the City's treatment control BMP inventory.
- Conducted maintenance inspections of treatment control BMPs at 18 completed development projects in the City.

A list of development projects subjected to SUSMP requirements in 2009/2010 is available in Table 2-1. A comparison of the number of inspections performed and the requirements of the Municipal Permit can be found in Table 2-2. SUSMP projects that were completed after inspection and maintenance verification actions had been performed for the 2009/2010 inventory are listed in Table 2-3. Details of treatment control BMP inspections and related follow-up actions are provided in Table 2-4.

## 2.2 Land Use Planning

### 2.2.1 Background

The City's General Plan was adopted in 1996 and contains water quality and watershed protection principles in its Natural Settings Element. The comprehensive principles established in 1996 provide an ample framework for implementing the requirements of the current Municipal Permit, and no changes to these policies were necessary during the reporting period.

### 2.2.2 Source Characterization

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to development restrictions in the City's General Plan for storm water purposes were implemented during the reporting period.

### 2.2.3 Best Management Practice Requirements

Please refer to the City's updated JURMP document for a list of the water protection policies included in the City's General Plan. These policies remained the same throughout the reporting period.

### 2.2.4 Program Implementation

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code. The City updated its SUSMP requirements by adopting two ordinances regarding storm water management and discharge control. Ordinance 2010-2329 updated the SUSMP requirements in Chapter 14.22 of its Municipal Code on February 16, 2010. Ordinance 2010-2328 adopted the SUSMP Manual, a formatted guidance manual, also updated in February 2010. The updates made at this time were consistent with the regional Model SUSMP document prepared by the Copermittees and adopted by the RWQCB on March 25, 2009. These ordinances that updated the City's SUSMP requirements are included as Attachment 2.1 of this JURMP Annual Report. The updated City of National City's SUSMP Manual is available on the City's website (http://www.ci.national-city.ca.us/) on the Engineering Division webpage, within Development Services.

Details on how the City implemented its established water protection policies through its environmental review process and its development project approval and verification processes during the reporting period are provided in Sections 2.3 and 2.4 of this JURMP Annual Report document.

## 2.3 Environmental Review Process

The City's current environmental review process is detailed in the City's updated JURMP. The overall structure of the review process remains the same as in previous reporting years. No changes to the City's environmental review process have been made since the submittal of the updated JURMP.

## 2.4 Development Project Approval and Verification Process

### 2.4.1 Background

The approval and verification process implemented during 2009/2010 followed the process described in the City's updated JURMP. Details on the different aspects of the process are described in the sections below.

### 2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's SUSMP Manual, which contains the City's SUSMP regulations. The City's SUSMP regulations are included in Municipal Code Chapter 14.22. Projects subject to SUSMP regulations are identified by completion of applicability checklists. More detail about this process is provided in Section 2.4.4.2.

### 2.4.3 Best Management Practice Requirements

The City updated its SUSMP requirements for development projects in February 2010, as described in Section 2.2.4 above.

### 2.4.4 Program Implementation

During the 2009/2010 fiscal year, the City required implementation of its BMP requirements for all development projects through education, a comprehensive development project approval process, and the treatment control BMP inspection and maintenance verification program.

#### 2.4.4.1 Outreach and Staff Training

The City continually trains staff involved in the planning and review of development projects within the City and works closely with the development community to communicate its development requirements throughout the entire approval process. Details on trainings conducted and educational materials developed and distributed related to new development during the reporting period can be found in Section 8 of this JURMP Annual Report document. Also, based on results from the first years of the program, distribution of maintenance verification letters to parties responsible for

maintenance of treatment control BMPs at completed projects seems to be increasing the level of knowledge of regulated parties.

#### 2.4.4.2 URBAN RUNOFF APPROVAL PROCESS FOR DEVELOPMENT PROJECTS

All development projects that required City permits were required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Forms completed by project applicants are kept with the project's file at the City for future reference. As discussed in the City's JURMP, the City required all developers applying for construction and building permits to complete a "National Pollutant Discharge Elimination System (NPDES) Project Applicability Form" (SUSMP Checklist) that guides project applicants to submit proper documents to the City for review. The checklist was updated during the 2009/2010 reporting period at the same time as the BMP Manual. The updated SUSMP Checklist is included with this report as Attachment 2.2.

Non-priority development projects were required to complete a Standard Permanent Storm Water BMPs form, which was included as an attachment to the City's updated JURMP document. This form includes a list of all standard permanent storm water BMPs required by the City's SUSMP and requires project proponents to identify which BMPs will be implemented at the development. If any BMP is not selected, the project proponent must provide an explanation why the BMP is not applicable or feasible for the project. These completed forms are kept with the project's file at the City.

All development projects determined to be Priority Projects after completing the SUSMP Checklist were required to prepare a Storm Water Management Plan (SWMP) or Water Quality Technical Report (WQTR) to meet the City's SUSMP requirements. As part of the JURMP update, the City also developed a SWMP self checklist to be used by the SWMP preparer, which was included as an attachment to the updated JURMP. In the past, the majority of deficiencies found in document reviews were missing information or sections not having enough detail about proposed BMPs. Table 2-1 lists the development projects subject to the City's SUSMP requirements during the 2009/2010 reporting period, the number of document reviews for each project, and the current approval status of each. Public Priority Projects are marked as Capital Improvement Projects (CIP) in the table.

**Table 2-1**
**Development Projects Subject to SUSMP Requirements During 2009/2010**

| # | Project Name | Location | Project Type | Number of Reviews during 09/10 | Approved during 09/10 |
|---|---|---|---|---|---|
| 1 | 2504-12 Highland Avenue | 2504-12 Highland Avenue | Priority | 1 | No |
| 2 | AutoZone | Highland Avenue & East 21st Street | Priority | 2 | No |

| # | Project Name | Location | Project Type | Number of Reviews during 09/10 | Approved during 09/10 |
|---|---|---|---|---|---|
| 3 | Bible Baptist Church | 2432 East 18th Street | Priority | 2 | No |
| 4 | Fraser Boiler | 3101 Hoover Avenue | Priority | 3 | Yes |
| 5 | Harbor View Condos | 8th Street & D Avenue | Priority | 4 | Yes |
| 6 | Marina Gateway Streetscape (CIP) | Harrison Avenue & W. 23rd Street | Priority | 2 | Yes |
| 7 | Paradise Medical Center | Between 7th & 8th Streets, west of South V Street and east of I-805 | Priority | 3 | Yes |
| 8 | Riverview Gateway | South of Sweetwater Road & north of Route 54, between N 2nd Avenue & I-805 | Priority | 1 | No |
| 9 | The Gateway | National City Boulevard & F Avenue, between 31st Street & Route 54 | Priority | 2 | No |

No projects were granted waivers from SUSMP requirements, and the City does not anticipate granting waivers in the future. The City makes every effort to encourage development projects to select treatment controls with high and medium pollutant removal efficiencies and does not expect to approve many projects with low removal efficiency BMPs. However, if projects proposing a low removal efficiency treatment control BMP with a defensible infeasibility analysis are approved, details of those projects and their feasibility analyses will be reported as required in future JURMP annual reports. Only one approved project was allowed to propose a low removal efficiency BMP, as described below.

The Fraser Boiler project is a proposed redevelopment of a 23,000 square-foot property with an existing industrial builidng and parking lot. Due to site size and grading constraints, the project proponent initially did not propose to treat the entire site and proposed only drainage insert BMPs. However, after three review cycles, the City was able to require the project to treat the entire site, primarily using a planter box and a high-rate media filter, which are more effective treatment control BMPs. For a very small portion of the site, approximately 500 square feet, a trench drain filter was considered to be the only feasible BMP. Since it was a very small area, the City allowed that it was not feasible to install any other BMP due to very small elevation differences and due to the need to include a trench drain in the project design.

**Hydromodification Management Plan**

During the reporting period the Copermittee Land Development Workgroup met regularly to discuss key Hydromodification Management Plan (HMP) development issues and provide updates on the status of consultant work products. The City of

National City regularly participated in the workgroup meetings. The final regional HMP was adopted by the RWQCB just after the end of the 2009/2010 reporting period on July 14, 2010. The City will be incorporating the HMP requirements into its local development requirements prior to the January 14, 2011 deadline.

The City's SUSMP requirements were updated to contain the detailed Interim Hydromodification Criteria (IHC) which the City implemented in 2009/2010 and will continue to implement until the recently adopted regional HMP requirements are incorporated into local requirements. None of the projects approved during 2009/2010 were subject to IHC requirements. Some projects currently under review may be subject to the new hydromodification requirements if they do not have prior lawful approval before the new requirements are incorporated in 2010/2011.

**BMP Installation Verification**

During the course of 2009/2010, after maintenance verification letters had been sent out during the summer of 2009, the City identified recently completed Priority Projects within the City's jurisdiction to be added to the treatment control BMP inventory. When a project is completed, the City checks for BMPs prior to occupancy, records the site information, assigns it a TTWQ priority, and then adds it to the inventory of projects subject to the City's inspection and annual maintenance verification program the following fiscal year. This process helps the City focus its inspection resources on sites more likely to have maintenance deficiencies, as maintenance deficiencies are generally less likely at sites with recently installed BMPs. A table of the projects identified after distribution of verification letters is presented in Table 2-3 at the end of this JURMP Section. These projects will be added to the City's treatment control BMP inventory in 2010/2011.

#### 2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

**2009/2010 Annual Maintenance Verification Program**

The Municipal Permit requires annual verification of operation and maintenance of treatment control BMPs installed within the City's jurisdiction. Annual verification must be provided by the party responsible for treatment control BMP maintenance and must be returned to the City prior to the start of the wet season (October 1st).

Using the property owner names and addresses recorded in the City's BMP database, BMP maintenance verification forms were mailed to all the private projects included in the City's BMP database in early 2009/2010. Maintenance verification forms were also completed for all CIP projects on the City's inventory. Through this process, the City updated contact information was no longer accurate due to property sales or foreclosures and provided additional guidance on how to properly maintain BMPs, as needed. The City completed research to update contact information and worked with management companies to educate them on the requirements. Through the City's maintenance verification efforts, responses were received from all except one project.

This project is being referred to the City Attorney for legal action. The City sent out 11 NOVs and 11 citations during this process and took other escalating enforcement steps as necessary to achieve compliance.

**Operation and Maintenance Inspections**

During the 2009/2010 fiscal year, the City conducted inspections of projects with treatment control BMPs in accordance with the inspection frequencies outlined in the Municipal Permit. Table 2-2 provides a summary of the number of inspections performed and how these met the requirements of the Municipal Permit.

**Table 2-2**
**2009/2010 Inspection Numbers versus Municipal Permit Requirements**

| Site Class | Number of Sites | Full BMP Assessments | Percent Inspected | Permit Requirement | Requirement Met |
|---|---|---|---|---|---|
| All Inventoried Sites | 31 | 18 | 58% | 20% | **Yes** |
| Sites with Drainage Inserts | 20 | 14 | 70% | 50% | **Yes** |
| High TTWQ sites | 9 | 9 | 100% | 100% | **Yes** |

The City continued to use site-specific inspection forms and the treatment control BMP tracking database. During the reporting period, GPS coordinates were also collected for the BMPs inspected, and this location information was added to the electronic database. Table 2-4 at the end of this section lists the development projects inspected during the reporting period, a brief description of inspection findings, and, if applicable, any follow-up actions taken. The BMP types proposed at these sites and the sites' TTWQ priorities are included in the City's treatment control BMP inventory, which is included in Appendix A.1 of this JURMP Annual Report.

During the 2009/2010 reporting period no sites were observed to present a significant threat to human health or the environment during inspections, so none were reported to the RWQCB.

## 2.5 Development Planning Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 2.6 Program Review and Modification

The City's SUSMP requirements have been updated as described above in Section 2.2.4.

**Table 2-3**
**SUSMP Projects Completed After Establishment of 2009/2010 Inventory**

| # | Project Name | Project Address | Development Type | BMPs | HSA | Year Completed | TTWQ |
|---|---|---|---|---|---|---|---|
| 1 | Pacific View Estates | E. Division Street between Highland and Laurel Ave | Residential | Hydrodynamic separator | 908.31 | 2009/2010 | Medium |
| 2 | Mirabelle (Cypress Glen Condos) | 3229, 3359, 3391 Cypress St | Residential | Drainage inserts | 909.11 | 2009/2010 | Medium |
| 3 | Paradise Village | Between 4th & 8th Street, Arcadia Ave & Bowron St. | Residential | Hydrodynamic separator | 908.32 | 2009/2010 | Medium |
| 4 | Kalesa Walk | 1830 - 1884 E. 12th Street | Residential | Drainage inserts | 908.32 | 2009/2010 | Medium |
| 5 | Harley Davidson | 3201 Hoover Ave | Commercial | Drainage inserts | 908.32 | 2009/2010 | High |
| 6 | Discount Tire | 1309 E Plaza Blvd | Commercial | Drainage inserts | 908.32 | 2009/2010 | Medium |

**Table 2-4**
**2009/2010 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 1 | Paradise Creek Park (CIP) | 9/23/2009 | No drainage insert was observed. | The City installed the drainage insert. | Resolved |
| 2 | Walgreens | 9/23/2009 | Two drainage inserts were missing from catch basins. Additional drainage inserts were observed in need of maintenance. | An NOV and citation were issued. Inspection findings were the same during follow-up inspection on 3/26/10. This project has been referred to the City Attorney for escalating enforcement. | In progress |
| 3 | Wal-Mart | 9/23/2009 | Hydrodynamic separator was observed in adequate condition. | NA | NA |
| 4 | Paradise Walk | 9/23/2009 | No drainage inserts were observed. | Site was issued an NOV for installation deficiencies. City worked with the developer still conducting construction activities, who did install all missing BMPs. | Resolved |
| 5 | Penske Truck Leasing | 9/24/2009 | Drainage inserts were observed in adequate condition. | NA | NA |
| 6 | Sweetwater Town & Country Mall | 9/24/2009 | Drainage inserts were observed in adequate condition. | NA | NA |
| 7 | Plaza City Apartments | 9/25/2009 | Hydrodynamic separator was observed in adequate condition. | NA | NA |
| 8 | Marina Gateway (Hotel) | 9/25/2009 | Hydrodynamic separator was observed in adequate condition. Vegetated swale was missing in one area. | The developer landscaped the vegetated swale. | Resolved |

**Table 2-4 (Continued)**
**2009/2010 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 9 | Jack In The Box | 3/26/2010 | Drainage inserts were observed in need of maintenance. | Site was issued an NOV in March 2010. The City subsequently received a maintenance verification form. | Resolved |
| 10 | Kalesa Walk | 3/26/2010 | No flume filter drainage inserts were observed in the concrete conveyances. | Site was issued a notice of correction for installation deficiencies. | In progress |
| 11 | West Air Gases | 3/26/2010 | Bioretention area and vegetated swale were observed in adequate condition. Drainage insert was missing from the catch basin. | Site was issued a notice of correction for installation deficiencies. | In progress |
| 12 | Harley Davidson | 3/26/2010 | Drainage inserts and flume filter were observed in need of maintenance. | Site was issued a notice of correction for maintenance deficiencies. A request for maintenance verification has been sent. | In progress |
| 13 | Mirabelle (Cypress Glen Condos) | 4/5/2010 | Two drainage inserts were observed in need of maintenance. Hydrodynamic separator was also observed in need of maintenance. Vegetated swale was observed in adequate condition. | Site was issued a notice of correction for maintenance deficiencies. Subsequently, a request for maintenance verification was sent. | In progress |
| 14 | Discount Tire | 4/5/2010 | Drainage insert was not observed in the catch basin. | Site was issued a notice of correction for installation deficiencies. | In progress |
| 15 | Mariposa Walk | 6/28/2010 | One of six drainage inserts was missing. The other five were observed both in need of repair and maintenance. | Site was issued a notice of correction for installation deficiencies. | In progress |
| 16 | National City Library (CIP) | 6/28/2010 | Two of the drainage inserts were observed to require minor repair of rubber gaskets. | Repair order was referred to the appropriate City department. | In progress |

**Table 2-4 (Continued)**
**2009/2010 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 17 | Plaza Village | 6/28/2010 | One drainage insert was observed in need of repair, and both were in need of maintenance. | Site was issued a notice of correction for maintenance deficiencies. Subsequently, a request for maintenance verification was sent. | In progress |
| 18 | Canyon Ridge | 6/28/2010 | Media filter was observed in adequate condition. The hydrodynamic separator was not accessible at the time of inspection. | Property manager was contacted to ensure future accessibility of the hydrodynamic separator. | Resolved |

# 3.0 CONSTRUCTION

## 3.1 INTRODUCTION

During 2009/2010, the City continued to implement a program to prevent storm water pollution related to construction activities within the City. Modifications to the City's construction program were last made in late March 2008 as part of its JURMP update. All changes made at that time were implemented for the entire 2009/2010 reporting period.

### 3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2009/2010 reporting period are presented below. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- Distributed storm water requirements applicability checklists to all development projects in the City's jurisdiction.
- Conducted plan checks of erosion control plans and SWPPPs to ensure construction projects planned to comply with the City's minimum BMP requirements.
- Distributed copies of the Construction BMP Fact Sheet with all approved grading permits.
- Conducted 76 construction inspections at 11 sites in 2009/2010 per the frequency in the updated JURMP.
- Issued 13 verbal warnings and one NOV to construction sites in response to violations of the City's minimum BMP requirements.
- Conducted pre-construction meetings with all large project developers.

## 3.2 SOURCE CHARACTERIZATION

An inventory of active construction projects during the reporting period is presented in Appendix A.2 of this JURMP Annual Report document. The City's inventory was maintained throughout the reporting period by entering permit application forms into the City's inventory spreadsheet on a continuous basis. New construction projects were added to the inventory at the start of construction, and projects were removed from the inventory after construction was completed. Since construction projects were continually being added and removed throughout the fiscal year, inventory updates were usually performed more frequently than the minimum once per month.

## 3.3 Updates to Ordinances and Approval Processes

The City has not updated its Grading Ordinance or its Storm Water Management and Discharge Control Ordinance since the City's JURMP update during the previous reporting period. Details on any changes to the City's approval process during the reporting period are discussed in Section 3.5 of this document.

## 3.4 Best Management Practice Requirements

The City's construction and grading requirements have not changed since the recent update to the City's JURMP document. A complete list of required construction BMPs is included in the City's BMP Manual, which is an attachment to the City's JURMP. The City continued to assess the implementation and effectiveness of required BMPs at construction sites in 2009/2010.

## 3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below.

### 3.5.1 Education and Staff Training

Education and staff training implemented during the 2009/2010 fiscal year focused on reinforcing the changes made to the City's construction requirements at the time of the City's recent JURMP update to both City staff and to the construction community. In addition, construction site supervisors and City staff were educated on the new General Construction Permit (effective July 1, 2010) and provided a fact sheet for review. Construction project proponents were educated in BMP requirements during the approval process described below. Please see Section 8 of this JURMP Annual Report document for details on training and educational materials related to construction and grading activities.

### 3.5.2 Construction and Grading Approval Process

During the reporting period, City personnel verified that all construction projects planned to implement the City's minimum BMP requirements prior to issuing any building or grading permits. The City conducted its grading approval process as described thoroughly in Section 5 of the City's updated JURMP. The City requires grading construction projects to submit erosion control plans that indicate what BMPs are to be used at the site. These erosion control plans are reviewed by the City to ensure the site plans to meet the City's minimum construction BMP requirements. The City also reviews Storm Water Pollution Prevention Plans (SWPPPs) for sites greater than one acre that are required to obtain coverage under the General Construction Permit.

Additionally, the City arranged pre-construction meetings with all developers of large projects to ensure an understanding of construction BMP requirements. Approved forms and documents completed by project proponents are kept with each project's file at the City for reference. A Construction BMP fact sheet, known as the "Blue Sheet" within the City because the copies distributed are on blue paper, was also distributed with all construction permits issued (Attachment 3.1). Proper implementation of the minimum BMPs listed on the fact sheet was a condition of approval for all permits issued by the City during the 2009/2010 fiscal year.

During the reporting period, none of the City's active construction sites were larger than 17 acres; therefore the maximum disturbed area limitation did not apply. However, all construction sites were still required to limit exposed cleared or graded areas to the amount of area that could be protected prior to a rain event, as prescribed in the City's seasonal BMP requirements.

Criteria for determining when advanced treatment is required are detailed in the City's JURMP. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites within the City's jurisdiction, and advanced treatment methods were not required at any construction sites.

### 3.5.3 Inspection of Construction Sites

Appendix A.2 of this JURMP Annual Report contains a list of construction projects that were active during the reporting period, along with their assigned TTWQ priorities, the number of weeks the site was active within the rainy season, the numbers of inspections conducted during the wet and dry seasons, the number of follow-up inspections and complaint investigations, and the total number of inspections for each site. In total, 76 construction inspections were performed at 11 construction sites during 2009/2010.

Construction inspections conducted during the reporting period were performed as described in the City's updated JURMP. Key components of the inspections include checks for coverage under the General Construction Permit during the initial inspection and assessments of compliance with the City's BMP and discharge requirements during all inspections. Responsible parties at the sites are educated as needed during inspections. Copies of the inspection forms are kept on file at the City. The City conducted inspections at high TTWQ construction sites bi-weekly during the wet season and monthly for medium TTWQ sites. Low TTWQ sites were inspected on an as needed basis. Typically, storm water only inspections were not conducted at low TTWQ sites unless a complaint was called into the City's storm water hotline. Construction inspectors have been trained in the City's minimum construction BMP requirements, and they check BMP implementation at low TTWQ construction sites during their inspections. Any sites found to have problems with BMP implementation are forwarded to the City's Storm Water Compliance Inspector. During the reporting period, two inspections of low TTWQ construction sites were conducted at the request of the City. These sites are indicated on the City's inventory in Appendix A.2.

When any violations were noted during routine, follow-up, or complaint investigation inspections, these violations were noted on the project's inspection form, and the sites were given a list of corrective actions necessary to fix the observed violation. During 2009/2010 there were 22 instances of non-compliance observed where enforcement action needed to be taken. In some cases, these issues were resolved while the inspector was still on site. When necessary, appropriate enforcement actions were taken, and City staff followed up with the site until compliance was achieved. Details on the enforcement actions taken for construction sites during the implementation period are described below.

### 3.5.4 Enforcement Measures

Table 3-1 includes the number of violations and enforcement actions taken during the reporting period in response to violations of the City's minimum construction BMP requirements. Enforcement actions are administered in an escalating manner as described in the City's updated JURMP.

**Table 3-1**
**Summary of Construction Enforcement Actions Taken**

| Verbal Warnings | Notices of Violation | Administrative Citations | Stop Work Orders |
|---|---|---|---|
| 13 | 1 | 0 | 0 |

No Stop Work Orders were issued in 2009/2010, but the City's JURMP notes that if a Stop Work Order is issued the Regional Board will be notified within five working days. During the reporting period, two complaints were received to the City's storm water hotline regarding construction site activities. Further details regarding complaint investigations and all enforcement actions taken during the reporting period can be found in Section 4 of this document.

None of the violations observed at construction sites during the reporting period were found to endanger human health or the environment. The City was able to address these violations through the City's established enforcement process, and it was not necessary to report any of these sites to the RWQCB.

## 3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 3.7 Program Review and Modification

No modifications were made to the City's construction component during 2009/2010.

# 4.0 MUNICIPAL COMPONENT

## 4.1 INTRODUCTION

Throughout 2009/2010, the City of National City continued to manage municipal areas and activities to reduce discharges of pollutants to the MS4 to the MEP. As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. The majority of municipal areas in the City comprise of administrative buildings, fire stations, public parks, recreation and public works facilities. Municipal activities conducted by the City include but are not limited to graffiti abatement, building maintenance, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2.

### 4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the 2009/2010 reporting period are presented below. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City inspected all high TTWQ fixed municipal facilities.
- The City removed a total of 975 tons of sediment and debris from street sweeping activities.
- The City removed a total of 33.7 tons of trash, sediment, and other debris from standard MS4 cleaning activities, not including drainage insert maintenance.
- The City spent 1,998 man-hours maintaining 442,150 linear feet of sanitary sewer line.
- The City inspected several special events that occurred in the City during 2009/2010 to ensure appropriate BMP implementation and clean up.
- The City received and addressed 13 complaints through the Storm Water Hotline, City website, and other City departments. Enforcement actions resulting from complaint investigations are noted in Table 4-3.

## 4.2 FIXED FACILITIES

### 4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category, fixed

facilities. This is because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar.

### 4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included on the City's municipal inventory, which is included as Appendix A.3.

### 4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs at all fixed municipal facilities. As mentioned in the City's JURMP, the City uses the CASQA Municipal BMP Handbook to establish appropriate BMPs for fixed municipal facilities. Table 6-2 in the City's JURMP describes the CASQA fact sheets that are used for specific facility types.

The City continues to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. The BMP requirements have not been changed since the City's JURMP was updated in March 2008.

As described in the City's JURMP, City public works employees, fire station employees, and employees at other fixed facilities in the City continue to implement BMPs appropriate to the facility type. City fire response personnel continue to be trained in implementing BMPs for non-emergency fire fighting activities as described in Section 3 of the City's JURMP. There were no changes in BMP requirements for any fixed facilities during 2009/2010.

### 4.2.4 PROGRAM IMPLEMENTATION

As mentioned above, the City's BMP requirements for fixed facilities have not changed since the development of the revised JURMP. Some notable examples of implementation of those BMPs are provided below.

**Parks and Recreational Facilities**
During 2009/2010, the City used fertilizers, herbicides, and pesticides sparingly at parks and other City-owned landscaped areas. All chemicals are used and stored in accordance with the City's JURMP BMPs. The City routinely cleans parks each Monday after weekend use.

**Public Works Facilities, Fire Stations, Other Fixed Facilities**
As previously mentioned, City personnel continued to implement appropriate BMPs for municipal fixed facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance activities at fixed facilities (i.e., landscaping, building maintenance, etc.) as necessary. Parking facilities associated with fixed municipal facilities were swept quarterly during 2009/2010, and the large paved areas at the City's Public Works Yard were swept weekly. Public Works employees continued to

proactively implement a SWPPP at the Public Works Yard, though it is not a requirement. Public Works employees also continued to maintain the BioClean filter inserts on the property as needed.

**Municipal Inspections**

All high TTWQ fixed municipal facilities received an annual routine inspection in 2009/2010. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2009/2010. The City's municipal inspection form is included as Attachment 4.1. All inspections conducted at municipal facilities are tracked using a Microsoft Access database, which was created in 2008/2009. Table 4-4 at the end of this section lists all high TTWQ municipal fixed facilities requiring inspection in 2009/2010, the date the inspection was performed, and recommended corrective actions from the inspection. For minor corrective actions, resolution is documented by City staff and no follow-up inspection is necessary. Since the inspections were conducted near the end of the reporting period, any necessary follow up inspections will take place in 2010/2011 to ensure that the corrective actions are implemented.

In addition to one annual inspection by other City personnel, public works personnel inspect both the Public Works Yard East and Public Works Yard West weekly; street crew personnel inspect the Public Works Yard West and the equipment maintenance crew inspects the Public Works Yard East. Inspection forms are completed and submitted to the City's Storm Water Compliance Inspector.

## 4.3 Roads, Streets, Highways, and Parking Facilities

### 4.3.1 Background

The City conducts regular maintenance of roads, streets, and parking facilities in the City to control pollutants such as sediment, metals, litter, and debris. Note that there are no highways within the City's jurisdiction.

### 4.3.2 Source Characterization

Roads and streets are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

### 4.3.3 Best Management Practices

Street sweeping is the City's primary BMP for roads, streets, and parking facilities. Other BMPs are chosen as needed based on the CASQA Municipal Handbook. The City's sweeping frequency is outlined in the JURMP and described in the following subsection. There were no changes to the BMPs implemented for roads, streets, and parking facilities in 2009/2010.

### 4.3.4 PROGRAM IMPLEMENTATION

During 2009/2010, the City swept a total of 14,855 curb miles, removing approximately 975 tons of debris. High priority streets in the City are swept at least every two weeks, and medium priority streets in the City are swept at least monthly. The City has not designated any streets in the City as low priority. The City does not maintain any stand-alone parking facilities that are not associated with municipal facilities. Seventeen parking facilities that are associated with municipal facilities are maintained and swept during regular maintenance activities at the respective municipal facility, and are considered part of the municipal facility on the inventory. Table 4-1, below, describes the areas assigned high and medium priorities, and the associated sweeping frequency. The table also includes the sweeping frequency for areas of fixed municipal facilities and the associated parking lots.

As a means to address priority pollutants in the San Diego Bay Watershed, the City continued conducting additional sweepings of the all streets in the City. High priority streets were swept daily during 2009/2010; medium priority streets were swept every two weeks during 2009/2010.

**Table 4-1**
**Street Sweeping Prioritization and Frequency**

| Category | Description | Approximate Mileage of Route | Sweeping Frequency |
|---|---|---|---|
| High | 8th Street, National City Boulevard, Highland Avenue, Plaza Boulevard | 11.8 miles | At least every two weeks |
| Medium | All other streets in the City | 98.2 miles | At least once per month |
| Fixed Facilities | Parking lots associated with municipal fixed facilities | N/A* | Quarterly |
| Fixed Facilities – Parks | Parking lots associated with parks | N/A* | Every two weeks |
| Fixed Facilities – PW Yard | Public Works Operation Center | N/A* | Weekly |
| **Total Amount of Debris Collected from Street Sweeping Activities: 975 tons** | | | |

* Mileage data is not available for the swept area of 17 parking facilities associated with municipal facilities, and the PW Yard. Mileage accrued while sweeping these facilities is included in the total mileage.

**Inspections**

Because trash, debris, and sediment that have accumulated on City streets are identified and cleaned up via street sweeping, additional inspections beyond this effort are not necessary.

## 4.4 MS4

### 4.4.1 Background

The City's extensive storm water conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during a rain event. The City's MS4 consists of approximately 19 miles of inlets, pipes of varying materials, natural channels, concrete channels, culverts, and 751 catch basins and inlets.

### 4.4.2 Source Characterization

The City's MS4 as one complete entity is included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.4.3 Best Management Practices

The City maintains a strict MS4 maintenance and cleaning schedule. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. As described in the City's JURMP, BMPs for MS4 maintenance activities are chosen based on the CASQA Municipal Handbook and have not changed during 2009/2010.

### 4.4.4 Program Implementation

Throughout 2009/2010 the City has implemented a thorough MS4 inspection and cleaning schedule that required 173.5 man-hours to complete. The City continues to follow municipal activities, such as MS4 channel cleaning, in a Microsoft Access database. During 2008/2009, the MS4 maintenance logs were updated to allow for the recording of more detailed information regarding the various types of debris removed. Use of these new logs was implemented during the 2009/2010 reporting period. The City inspected and cleaned all MS4 cleanout locations and open channel segments in 2009/2010, as described in Table 4-2, on the following page.

**Table 4-2**
**MS4 Maintenance Data**

| MS4 Structure | Percent inspected and/or cleaned* | Percent of open channels found with anthropogenic litter | Amount of debris removed from cleaning activities |
|---|---|---|---|
| Catch Basins / Self-Cleaning MS4 Facilities | 100% | N/A | 27,474 pounds |
| Open Channels | 100% | 100% | 99.13 cubic yards (39,652 pounds) |
| Drainage Inserts | 100% | N/A | 192 pounds |
| **Total Debris Removed From MS4 Maintenance Activities: 33.7 tons**** | | | |

* No structures were observed at least 33% of capacity during the reporting period. However, the City cleans out any structures, including self-cleaning structures, in which trash and debris is observed at the time of inspection.
** The weight of the material removed during channel maintenance activities was not recorded. Since trash was the most common item removed, a conversion factor of 400 pounds per cubic yard was used to estimate the total weight of the material removed.

The City's cleanout locations are access points to various sections in the City's MS4, so no additional pipe beyond the cleanout location is normally cleaned. The City uses a vactor truck to clean the MS4 line in the event of a spill. For example, during 2009/2010, one sewage spill occurred, which was successfully intercepted before reaching the receiving water and entirely cleaned up within the City's MS4.

During 2009/2010, the City continued to inspect the open channels in the City and remove trash and debris as necessary by hand. If litter or debris is observed during the routine inspections, it is removed immediately. Of debris removed from open channels, 78.2 cubic yards of trash, 9 cubic yards of sediment, and 11.9 cubic yards of organic matter were removed over the course of the fiscal year. The only significant sediment removal occurred in the City's concrete channels. The total length of the channel segments inspected and cleaned by City staff is approximately 25,950 linear feet. Additionally, as part of WURMP efforts that are beyond minimum required maintenance, the City continued to hire a contractor to do biweekly inspections and remove any observed trash from Paradise Creek.

## 4.5 SANITARY SEWER SYSTEM

### 4.5.1 BACKGROUND

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. Routine inspection and maintenance of the sanitary sewer system works to reduce the

potential for a spill or sanitary sewer overflows (SSOs) and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

### 4.5.2 SOURCE CHARACTERIZATION

The City maintains a system of public sanitary sewer pipes to convey wastewater from the City to be treated. The sanitary sewer system, as one complete entity, is included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.5.3 BEST MANAGEMENT PRACTICES

The City implements BMPs from the CASQA Municipal Handbook, as described in the City's JURMP, during sanitary sewer maintenance. There have been no changes to these BMPs during 2009/2010. The City inspects and maintains the sanitary sewer system as part of regular wastewater activities. The City clears blockages and repairs leaks as needed.

### 4.5.4 PROGRAM IMPLEMENTATION

The City seeks to eliminate seepage from the sanitary sewer system to the MS4 by routine preventative maintenance of both systems. Routine maintenance of both systems allows the City to find areas that are likely to become problems in the future and make the necessary repairs/replacements before any larger issues arise. Approximately 300 linear feet of pipe were repaired or replaced during the reporting year. The City also continued to conduct flow metering throughout its sanitary sewer system to monitor for evidence of potential problems. A total of 1,998 man-hours were spent maintaining a total of 442,150 linear feet of sanitary sewer line during 2009/2010. Silt and grease were listed as the most common items removed from sanitary sewer lines during maintenance activities. A total of 2,300 linear feet of sanitary sewer line was televised during 2009/2010 to determine if areas of the sanitary sewer were in need of maintenance or repair.

The City has also developed a Fats, Oils, and Grease (FOG) program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs.

The City maintains a Sanitary Sewer Management Plan (SSMP) which establishes procedures for responding to an SSO. Detailed information about the City's SSO spill response plan is included in the City's JURMP. One SSO was discovered during 2009/2010. The spill was stopped, cleaned up, and reported to the RWQCB. Details on the SSO can be found in Table 4-5.

## 4.6 Mobile Municipal Activities, Including Power Washing

### 4.6.1 Background

The City conducts a variety of different mobile municipal activities, typically involving infrastructure maintenance, landscape maintenance, and graffiti removal.

### 4.6.2 Source Characterization

Power washing is only used by the Graffiti Removal sector of Neighborhood Services during graffiti removal activities. Graffiti removal is the only high priority municipal activity on the inventory (Appendix A.3). Infrastructure maintenance and landscape maintenance are listed on the City's medium TTWQ municipal inventory.

### 4.6.3 Best Management Practices

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel are trained to implement BMPs for the specific activity in which they are involved. For example, City personnel conducting graffiti removal are trained to store and handle any chemicals properly and to collect all waste water from power washing. A more detailed discussion of BMPs for specific mobile activities is included in the City's JURMP; there were no updates to the BMPs implemented during mobile activities during 2009/2010.

### 4.6.4 Program Implementation

During 2009/2010, City personnel continued to implement BMPs during mobile municipal activities such as graffiti removal and landscape maintenance. During 2009/2010 the City decided to paint instead of using power washing methods for graffiti removal, reducing the threat to water quality. If power washing is conducted in the future, City personnel will collect any water generated by activities such as power washing during graffiti removal activities and dispose of it properly. City personnel are provided with a handout that gives a summary of appropriate BMPs for power washing activities and reminds personnel that water generated by such activities must always be collected and disposed of properly.

One annual routine inspection of graffiti removal activities was conducted during the 2009/2010 reporting period. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2009/2010, including the inspection of graffiti removal activities. There were no instances of non-compliance relating to mobile municipal activities, and no corrective actions were required based on the inspection of graffiti removal activities during 2009/2010 (see Table 4-4).

## 4.7 Special Events

### 4.7.1 Background

As detailed in the City's JURMP, a variety of different special events are hosted within the City. Notably, the City's largest special event is an annual July 4th celebration.

### 4.7.2 Source Characterization

As required by the Municipal Permit, special events are included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.7.3 Best Management Practices

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter/debris from the event, and raise storm water awareness among the vendors and patrons of the event, as applicable. In Kimball Park, for example, the City always requires and charges the event holder for the use of a litter fence to prevent debris from entering the nearby channel. BMPs for special events did not change during 2009/2010.

### 4.7.4 Program Implementation

The City hosted several special events during 2009/2010, including various one-time celebrations and recurring events. Several special events were inspected the site to ensure the proper implementation of required BMPs, as detailed in the City's JURMP. If any special events had not finished clean up at the time of the inspection, staff would have been required to resolve remaining housekeeping issues within a timely manner. All inspections conducted at special events are tracked using the Microsoft Access database.

There were no notable instances of non-compliance at inspected events that requiring enforcement beyond following up to ensure appropriate housekeeping BMPs were implemented.

## 4.8 Public Reporting of Illicit Discharges and Connections

**Reporting and Response**

Public and municipal reporting is crucial to preventing and eliminating illicit connections and illegal discharges (IC/IDs) from the storm water conveyance system. The Storm Water Hotline provides an effective means for individuals in the City to report suspected IC/IDs. The hotline number is also listed on the City's website and in distributed storm water educational material. Storm water complaints may also be reported through the City's website. All complaints received through the hotline and

website are logged into a spreadsheet for documentation and tracking. Each logged complaint is investigated by City personnel to determine if an IC/ID is present. Responsible parties for any confirmed IC/ID are sought out and educated and/or cited as necessary and required to stop any and all illegal discharges.

Complaints received by the City during the 2009/2010 reporting period and the City's response to each are listed in Table 4-5 at the end of this section. A total of 13 complaints were documented this year.

**Enforcement**

As previously stated, complaints received via the Storm Water Hotline or City website, are included in Table 4-5 at the end of this section. The table also includes a description of how each complaint was resolved during the reporting period. Resolutions to investigated complaints included issuing warnings, corrective actions, and/or citations. Table 4-3, below, summarizes the enforcement actions taken in response to complaints received.

**Table 4-3**
**Enforcement Actions Resulting from Documented Complaints**

| Type | Verbal Warning | Stop Work Order | Administrative Citation | NOV |
|---|---|---|---|---|
| Commercial | 2 | 0 | 2 | 1 |
| Industrial | 0 | 0 | 0 | 0 |
| Mobile | 0 | 0 | 0 | 0 |
| Municipal | 0 | 0 | 0 | 0 |
| Residential | 0 | 0 | 2 | 1 |
| Construction | 0 | 0 | 1 | 1 |

## 4.9 Spill Reporting, Response, and Prevention

The City has documented procedures for preventing and responding to sanitary sewer overflows. As discussed earlier in this section, preventative maintenance is regularly conducted on the City's sanitary sewer system. Additionally, video inspections and sewer surveys are regularly conducted to monitor the condition of the public sanitary sewer lines and to determine the necessity of maintenance. Private lateral lines do not receive preventative maintenance, but the City assists in the containment and cleanup of sewer spills if the spill could potentially reach the City's MS4.

Individuals in the City are encouraged to report any SSOs to the City's Storm Water Hotline. As previously mentioned, there was one SSO during 2009/2010 that was reported to the RWQCB within 24 hours of the spill, and no other spills occurred during the reporting period.

## 4.10 EDUCATION AND OUTREACH

During 2009/2010, the City continued to educate municipal personnel regarding proper BMP implementation and other storm water and watershed concepts. For example, a training session regarding SUSMP requirements and the development approval process was conducted in August 2009 for employees in development services. Information regarding the education and outreach conducted for City personnel is described in Section 8 of this Annual Report.

## 4.11 MUNICIPAL COMPONENT EFFECTIVENESS ASSESSMENT

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 4.12 PROGRAM MODIFICATION AND REVIEW

The City's JURMP was updated in March 2008. No changes to the City's municipal component were made during 2009/2010.

**Table 4-4**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Inspection Date | Corrective Actions Needed |
|---|---|---|---|---|---|
| 1 | Butterfly Park | East 22nd Street and Palm Avenue | High | 4/28/2010 | • Keep the site free of excessive litter and debris using dry methods, especially along fence bordering golf course.<br>• Keep the trash/recycling area adequately covered. |
| 2 | El Toyon Park | 2005 East 4th Street | High | 4/28/2010 | • Keep parking lots, sidewalks, and streets free of excessive sediment and debris.<br>• Employ adequate erosion prevention measures (e.g., vegetation or physical stabilization).<br>• Properly store material and waste stockpiles to prevent transport in runoff.<br>• Keep the trash/recycling area adequately covered.<br>• Keep exposed parking areas free of significant spills and leaks.<br>• Adequately maintain structural BMPs. |
| 3 | Graffiti Removal (Mobile Activity) | Kimball Skate Park, 16th Street | High | 5/11/2010 | • No corrective actions |
| 4 | Kimball Park | 12th Street & D Avenue | High | 4/28/2010 | • Keep discharge locations free of excessive sediment and debris.<br>• Keep parking lots, sidewalks, and streets free of excessive sediment and debris.<br>• Employ adequate erosion prevention measures (e.g., vegetation or physical stabilization).<br>• Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover).<br>• Keep the trash/recycling area free of litter and debris. |
| 5 | Las Palmas Municipal Pool | 1800 East 22nd Street | High | 4/28/2010 | • Keep parking lots, sidewalks, and streets free of excessive sediment and debris.<br>• Provide storm water training for appropriate employees.<br>• Maintain a current log of employees who have participated in storm water training.<br>• Employ adequate erosion prevention measures (e.g., vegetation or physical stabilization).<br>• Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover).<br>• Keep the trash/recycling area free of litter and debris.<br>• Keep exposed parking areas free of significant spills and leaks. |

**Table 4-4 (Continued)**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Inspection Date | Corrective Actions Needed |
|---|---|---|---|---|---|
| 6 | Las Palmas Park | 1800 Newell Street | High | 4/28/2010 | • Keep discharge locations free of excessive sediment and debris.<br>• Employ adequate erosion prevention measures (e.g., vegetation or physical stabilization).<br>• Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover).<br>• Provide appropriate signs/stenciling. |
| 7 | National City Municipal Golf Course | 1439 Sweetwater Road | High | 6/28/2010 | • Keep discharge locations free of excessive sediment and debris.<br>• Provide storm water training for appropriate employees.<br>• Maintain a current log of employees who have participated in storm water training.<br>• Program and adjust irrigation systems to minimize over-watering and runoff.<br>• Properly store material and waste stockpiles to prevent transport in runoff.<br>• Provide adequate recycling containers.<br>• Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover).<br>• Keep the trash/recycling area free of litter and debris.<br>• Store outdoor materials that pose a threat to water quality appropriately (covered and/or in closed containers).<br>• Properly label outdoor storage containers.<br>• Maintain a written spill response plan.<br>• Keep secondary containment free of spills and rainwater especially in maintenance area.<br>• Inspect equipment/vehicles daily for leaks and repair as necessary.<br>• Use biodegradable soaps when appropriate. |
| 8 | Paradise Creek Educational Facility | West 19th Street and Coolidge Avenue | High | 4/28/2010 | • Keep the site free of excessive litter and debris using dry methods?<br>• Keep parking lots, sidewalks, and streets free of excessive sediment and debris.<br>• Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover). |

**Table 4-4 (Continued)**
**Municipal Inspection Results**

| # | Facility Name | Facility Address | TTWQ | Inspection Date | Corrective Actions Needed |
|---|---|---|---|---|---|
| 9 | Public Works East Yard | 2100 Hoover Ave | High | 4/20/2010 | • Keep the site free of excessive litter and debris using dry methods.<br>• Store outdoor materials that pose a threat to water quality appropriately (covered and/or in closed containers).<br>• Keep exposed parking areas free of significant spills and leaks. |
| 10 | Public Works West Yard | 2100 Hoover Ave | High | 4/20/2010 | • Properly store material and waste stockpiles to prevent transport in runoff.<br>• Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover). |
| 11 | Sweetwater Heights Park | Cagle Street and Stockman Street | High | 4/28/2010 | • Keep the trash/recycling area adequately covered (closed lids or permanent overhead cover). |

**Note:** Roads, streets, highways, and parking lots; the MS4; and the sanitary sewer system were inspected via the maintenance effort described earlier in this section.

**Table 4-5**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 1 | 9/16/09 | Commercial | Hotline Caller | 33rd and Hoover Avenue | Oil spill in street, gutter, bike path and on private property. | Observed dried oil on street and on bike path. Verbal warning issued to responsible party (a contractor of the City of San Diego) who agreed to properly clean up oil |
| 2 | 9/21/09 | Commercial | Hotline Caller | 450 E 8th Street and E Avenue | Irrigation sprinkler discharging water at Plaza Josha. | Observed water flowing from E Avenue along 9th Street up to C Avenue. Gemmae Bake Shop will contact owner to report the broken sprinkler. |
| 3 | 9/24/09 | Municipal | Hotline Caller | 16 ½ Street and N Avenue | Trash and debris in storm drain. No fence to prevent access to conveyance. | Public Works investigated and observed no trash or debris. |
| 4 | 9/24/09 | Commercial | Hotline Caller | 2501 Cleveland Avenue | Cleaning pavement/asphalt with soapy water. Overwatering. | Verbal warning issued to hotel general manager. Manager agreed to explain to all employees that cleaning in such a way is unacceptable. Contacted owner about overwatering. Water valve reportedly stuck in "open" position was repaired. |
| 5 | 12/21/09 | Commercial | Hotline Caller | Seafood City 1420 E Plaza Boulevard | Dumping fish parts in storm drain. | Leaky trash bins in poor condition had been put over storm drain grates behind Seafood City. Instructed manager to move bins away from drains. Public Works contacted and cleaned the drains. |
| 6 | 1/6/10 | Construction | Construction Inspector | Paradise Village 600 block of Arcadia Avenue | Raw sewage seeping from manhole. | Observed seepage from three manholes, but only one reached storm drain conveyance. Passed through vegetation detention basin at Paradise Village, then across pavement behind hospital and entered storm drain inlet at Euclid Avenue. Public Works cleaned and removed blockage. Although an estimated 1500 gallons were discharged, Public Works was able to stop the spill downstream and then vacuum up all of the discharge before it reached a receiving water body. SSO reported to RWQCB. |

**Table 4-5 (Continued)**
**Summary of Documented Public Complaints**

| # | Date | Complaint Type | Origin of Complaint | Location | Nature of Complaint | Investigation Results |
|---|---|---|---|---|---|---|
| 7 | 2/2/10 | Commercial | Public Works Dept | 110 W Plaza Boulevard | Oil running into gutter. | Observed motor oil spill entering on-site drainage inlet and exiting into south gutter on W Plaza Blvd then traveling west up to cross gutter of W Plaza Blvd/Hoover Ave intersection. Public works impeded the flow and absorbed the oil with addition of sand. Owner cleaned oil from gutter and was issued an administrative citation (#2366). |
| 8 | 2/27/10 | Construction | Fire Dept | Harborview Condos 8th and D Avenue | Discharge of white substance from property. | Public Works crew vacuumed white milky runoff while owner cleaned remaining residue from the roof. An administrative citation (#4201) and a NOV were issued. |
| 9 | 4/5/10 | Commercial | Hotline Caller | 3039 Hoover Avenue | Water discharge at Restaurant Equipment Warehouse. | Equipment stored outside had filled with rainwater. Grease residue was discharged when equipment was dumped out. Full inspection conducted on site. A NOV and an administrative citation (#4202) were issued. |
| 10 | 4/15/10 | Residential | Building Dept | 2318 Prospect Street | Carpet cleaner discharging dirty water. | Public Works called to clean inlet and downstream. Some runoff flowed to sandy channel at golf course and could not be cleaned. An administrative citation (#4233) was issued. |
| 11 | 5/12/10 | Commercial | Engineering Dept | McDinni's 105 E 8th Street | Water flowing in gutter at intersection of E 8th Street and A Avenue. | Contacted owner who called plumber to repair leaky air conditioning unit condenser. |
| 12 | 6/7/10 | Residential | Engineering Dept | Bay View Towers 801 National City Boulevard | Crew power washing parking lot at Bay View Towers. | Observed two men power washing parking area, gutter, and street. Contractor (Brinks Services) stated they were cleaning up an enzyme mixture that had been spilled. Public Works vacuumed water out of drains at Plaza Boulevard and A Avenue. An administrative citation (#4235) and a NOV were issued. |
| 13 | 6/28/10 | Residential | Development Dept | 2702 Southport Way | RV disposed of sewage in storm drain grate on west side of building's parking lot. | Eyewitness observed large RV dumping its reservoirs of solid and liquid waste into the storm drain grate. Consistent with site observation. License plate number is currently being used to trace owners and issue a citation. |

# 5.0 INDUSTRIAL AND COMMERCIAL

## 5.1 INTRODUCTION

During 2009/2010, the City continued to implement a program to mitigate urban runoff pollution from the areas and activities of industrial and commercial businesses. Through various aspects of the industrial and commercial program, the City aims to reduce the amount of pollutants discharged from these facilities.

### 5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the industrial and commercial component during the 2009/2010 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City met the Municipal Permit requirement of inspecting at least 25 percent of its stationary industrial and commercial inventory.
- The City met the Municipal Permit requirement of inspecting 100 percent of its inventoried high TTWQ industrial and commercial facilities.
- The City completed pollutant discharge potential assessment (PDPA) forms at inspections to aid in source identification efforts.
- The City issued 54 notices of correction with inspection results to industrial and commercial business based on inspection results.
- The City responded to seven complaints regarding potential non-compliance of mobile businesses and resolved each issue of non-compliance appropriately.

## 5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES / SOURCES ELEMENT

### 5.2.1 BACKGROUND

The City's industrial and commercial inventories, which can be found in Appendix A, include all stationary and mobile businesses known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, auto repair shops, restaurants, wholesalers, and contractors. As discussed in the following subsections, the City requires industrial and commercial businesses to implement pollution prevention measures and designated minimum BMPs to mitigate the impacts of business' activities on water quality.

### 5.2.2 SOURCE CHARACTERIZATION

The City's industrial and commercial inventories are included as Appendix A.4 and A.5, respectively. The inventories include both stationary and mobile businesses, as required by the Municipal Permit. The inventories were updated in 2009/2010.

Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP. The City considers factors including those listed below when prioritizing the inventories:

- Results from previous inspections and institutional knowledge
- Presence of significant exposed outdoor storage or activities
- Consideration of downstream water body and whether the business is likely to discharge pollutants for which the water body is impaired
- Proximity to the receiving water body
- Facility size
- Industrial Permit subjectivity

The City's updated inventories include a total of 752 stationary industrial and commercial facilities.

### 5.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other BMPs to reduce or potentially eliminate the generation of pollutants from business areas/activities. The City has established a set of minimum BMPs based on the CASQA Industrial and Commercial Handbook. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. The City's BMP requirements are described in more detail in the City of National City Best Management Practice Manual, which is an attachment to the City's JURMP. The City's BMP requirements for industrial and commercial businesses did not change during 2008/2009.

### 5.2.4 PROGRAM IMPLEMENTATION

**Industrial and Commercial Inspections**

During 2009/2010, the City conducted storm water compliance inspections at selected stationary industrial and commercial facilities; Table 5-1 provides a summary of the industrial and commercial site visits. The purpose of the inspections is to confirm that the City's minimum BMPs are being implemented at stationary industrial and commercial facilities.

Table 5-1, below, provides a summary of the industrial and commercial site visits. All of the high TTWQ sites were selected for inspection, and additional medium TTWQ industrial facilities were also selected for routine inspection. Additional medium TTWQ sites selected for inspection were facilities that had not been inspected within the last few years.

**Table 5-1**
**Summary of Industrial and Commercial Inspections**

| Facility Category | Full Inspections Conducted | Percentage of Total Inventory |
|---|---|---|
| High TTWQ Sites | 126* | 17%<br>(100% of high TTWQ sites) |
| Additional Sites | 67 | 9% |
| **All Stationary Inventoried Sites** | **752** | **26%** |

* All high TTWQ sites were visited during 2009/2010; however four high TTWQ facilities could not be contacted and did not receive full inspections. One facility was undergoing renovations and was not active during 2009/2010. Multiple attempts were made to contact facility representatives at the three other facilities, but these attempts were unsuccessful. These facilities remain on the high TTWQ inventory and efforts to contact and inspect these businesses will continue in 2010/2011.

Facility inspections were conducted in accordance with the protocol set forth in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. BMP deficiencies and corrective actions were discussed with facility personnel present during the inspection and recorded on the City's industrial and commercial inspection form (Attachment 5.1).

During 2009/2010, the City updated the standard inspection form and associated inspection reports. Facility personnel at inspected businesses reported that many of the corrective actions on the inspection report were related to shared areas or areas maintained by the property owner or property management company, the inspection form was updated to collect information regarding areas where responsibility for BMP implementation may be shared. Check boxes indicating "shared responsibility" were added to the form for each BMP assessment item on the form. These boxes were checked whenever the facility personnel present during the inspection reported that the BMP was a shared responsibility between the individual business, other tenants in a multi-suite complex, and/or the property management company/property owner. Note that the information collected is whether or not the responsibility is reportedly shared, not a determination of whether or not legally the responsibility is shared. In some cases the business may report that the responsibility is shared, but other parties, such as the property owner, may not agree.

The inspection reports were also updated to group the types of corrective actions listed on the inspection report into the following categories, which were described in a cover letter accompanying the inspection report:

- **Business Corrective Actions**, which included corrective actions specific to business activities.

- **Specific Action(s) Required by the Business to Comply with the Requirements of the General Industrial Permit**, which included corrective actions relating to the State of California General Industrial Permit (State Water Resources Control Board Order No. 97-03-DWQ).
- **Shared or Communal Area Corrective Actions**, which included corrective actions that are related to shared or communal areas and may not be solely the responsibility of the individual business.

When any corrective actions regarding a shared or communal area are included on the inspection report, a copy of the same inspection report was also provided to the property owner. A slightly different cover letter that explains why the property owner or manager is receiving the report is included with these letters. The property owner/manager cover letter explains the different types of corrective actions, described above, and explains that deficiencies listed under the "Shared or Communal Area Corrective Actions" heading are deficiencies that may not be the responsibility of the individual business and are being provided to both the property owner and the business to ensure that action is taken by the appropriate party. This updated method of inspection result notification is more straightforward and easier for the business representatives to understand, which increases the chance that the corrective actions will be implemented in a timely manner. Additionally, notifying property owners of corrective actions observed in communal areas should also contribute to BMPs being implemented in a timely manner.

The City also completed PDPA forms during the inspections as part of an additional data collection effort. The PDPA form is included with the City's inspection form in Attachment 5.1. More information about the results of this process is presented in Section 12 of this JURMP Annual Report.

During the inspection process, the City also checked Industrial Permit compliance status when applicable. Businesses observed to be in violation of the Industrial Permit are included in Table 5-2. Table 5-3, at the end of the section, summarizes the results of the 270 site visits conducted during 2009/2010. A total of 193 full inspections were completed as part of the City's 2008/2009 routine industrial and commercial inspection program. The remainder of the sites were visited, but during the visit were found to have moved, be duplicates of other businesses, or not to be conducting activities for which inclusion on the City's inventory is necessary.

Facilities that were recommended for follow-up are noted in the table. The City conducted follow-up inspections in August 2010, and the resolution status of these follow-ups is included with the routine inspection results in Table 5-3. The City provided copies of inspection results to each facility that received a full inspection in 2008/2009. The inspection report included the findings of the inspection, including all required corrective actions recorded by the inspector.

The City did not rely on third party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third party inspection program.

**General Industrial Permit**

Industrial Permit compliance status was evaluated during the industrial and commercial inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business's standard industrial classification (SIC) code(s). The inspector then determined Industrial Permit subjectivity based on SIC code. Violations of any aspect of Industrial Permit requirements were recorded on the standard industrial and commercial inspection form and are presented in Table 5-2. The table includes businesses directed to file a Notice of Intent (NOI) and develop a Storm Water Pollution Prevention Plan (SWPPP) and monitoring program, as well as businesses that had filed an NOI but had failed to develop a SWPPP and monitoring program. The table also includes facilities that could potentially gain exemption from Industrial Permit requirements by completing notice of non-applicability/no exposure certification (NONA/NEC) paperwork. Each business was notified of any Industrial Permit-related non-compliance by the inspector.

**Education and Outreach**

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to provide site-specific one-on-one education regarding storm water concepts and BMPs. Educational materials were provided as applicable; nearly all inspected businesses received a copy of the City's 2010 Storm Water Calendar, which can be found in Attachment 5.2. During 2009/2010 the City identified a need for a restaurant-focused BMP handout. The City developed a BMP handout for eating establishments, which can be found in Attachment 5.2.

**Enforcement**

Several industrial and commercial facilities were observed to be out of compliance with the City's municipal storm water ordinance and/or the Industrial Permit during inspections conducted in 2009/2010. Additionally, the City received a number of complaints through the City's storm water hotline. Details of the industrial and commercial complaint investigations are included in the Summary of Documented Public Complaints in Section 4 of this Annual Report. The City issued the following enforcement actions in response to BMP deficiencies during inspections and other complaints:

- 54 Notices of Correction (sent with inspection results)
- 43 NOVs
- 43 administrative citations

There were no instances of noncompliance found to present a significant threat to human health or the environment observed at stationary businesses during 2009/2010, so none were reported to the RWQCB.

## 5.3 MOBILE SOURCES

### 5.3.1 BACKGROUND

Due to the nature of activities of most mobile businesses, a major area of concern tends to be illegal discharges. In general, mobile businesses can be hard to identify, as many may not have City business licenses. Additionally, because the activities of mobile businesses do not occur in one fixed location, inspections of such businesses are impractical.

### 5.3.2 SOURCE CHARACTERIZATION

Known mobile industrial and commercial businesses, as described in the City's JURMP, are included on the City's inventory and are marked as mobile. During 2008/2009, the Regional Industrial and Commercial Workgroup also developed a web-based mobile business database for use by all Copermittees. The goal of developing this database is to allow Copermittees to share information about mobile businesses, which may be active in more than one jurisdiction. The City contributed its mobile business inventory for upload to the regional database.

### 5.3.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

BMPs for stationary industrial and commercial facilities, as discussed earlier in this section, are required to be implemented for mobile activities, as applicable. BMPs for mobile businesses, including key principles such as proper collection and disposal of any discharge, are discussed in the City's JURMP.

During 2009/2010, the Regional Industrial and Commercial Workgroup, in which the City was an active participant, adopted regional mobile business BMP standards. These standards were devised to create a uniform set of minimum BMPs for mobile businesses operating within the region. The Workgroup is currently developing a mobile business BMP notification template that Copermittees may choose to use to notify mobile businesses operating their jurisdiction.

### 5.3.4 PROGRAM IMPLEMENTATION

While mobile businesses are not as straightforward to inspect as fixed industrial and commercial facilities, the City has in place a program of education and enforcement to regulate mobile activities.

**Education and Outreach**

All businesses conducting mobile activities within the City's jurisdiction are required to apply for and maintain a business license with the City of National City, regardless of where the business may be based. The Industrial and Commercial "Preventing Urban

Runoff Pollution" Trifold is provided to each person applying for a business license in the City, including mobile businesses. The trifold brochure, included in Attachment 5.3 of this Annual Report, clearly prohibits the discharge of wash water and provides a list of required BMPs applicable to industrial and commercial businesses. Mobile businesses maintaining a City business license are included on the Commercial Inventory in Appendix A.5. No known mobile businesses conduct industrial activities in the City at this point in time. To aid in tracking mobile businesses that may conduct activities within its jurisdiction in the future, the City also collaborates with other jurisdictions in the County of San Diego in maintaining a county-wide list of mobile businesses.

**Reporting and Enforcement**

In addition to regulation through business licenses, City staff are trained to report inappropriate mobile business activities to the City's storm water hotline. The City responds to all calls to the City's storm water hotline regarding mobile businesses. There were seven complaints made to the City's storm water hotline regarding mobile businesses during 2009/2010. Details of these complaint investigations are available in the summary of recorded public complaints in Section 4 of this report.

There were no instances of noncompliance of mobile businesses that were believed to present potential threats to human health or the environment observed during 2009/2010, so none were reported to the RWQCB.

## 5.4 Industrial and Commercial Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 5.5 Program Review and Modification

As previously discussed, the City made some changes to its industrial and commercial inspection form to collect information about shared areas and clarify the inspection reports that are mailed to businesses. The updated inspection form is included as Attachment 5.1. No other changes to the City's industrial and commercial component have been made since that time.

# 6.0 RESIDENTIAL

## 6.1 INTRODUCTION

Land use in the City of National City is largely residential. Due to the large residential area, activities that take place, these areas have the potential to impact the quality of receiving waters. Residential activities such as vehicle washing, over-irrigation, and home maintenance can potentially contribute pollutants to the City's MS4 if BMPs are not implemented. Additionally, household hazardous waste (HHW) can contribute pollutants to the City's MS4 if not disposed of properly. Pollutants of concern include sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals. The City has worked to implement a range of programs to address these residential activities with the goal of reducing pollutant loads associated with such activities. The City recognizes the need for educational efforts and opportunities designed specifically for residents and residential activities.

The following sections present activities conducted during this reporting period. These activities are associated with the residential component of the JURMP and include conducting ongoing HHW collection events, distributing educational materials, and participating in community events.

### 6.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the residential component during the 2009/2010 reporting period are presented in the following bulleted list. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City developed a 2010 Calendar through a storm water art contest at local schools. The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways.
- The City collaborated with the cities of Chula Vista and Imperial Beach to make HHW disposal events available to residents. The total amount of HHW collected from residents of all three cities was 294,217 pounds. Door-to-door pick up service was available for the disabled and senior communities.
- The City hosted three large item disposal events. The event allowed residents to dispose of large household items (not including HHW), such as unwanted furniture and large appliances.
- At least 88 code violations related to storm water quality were noted in residential areas and corrected by the City's Code Enforcement staff.

## 6.2 SOURCE CHARACTERIZATION

The City has identified high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities. To reduce pollutant discharges from these high TTWQ areas and activities, the City designated specific BMPs in the 2008 JURMP. These BMPs did not change during 2009/2010.

### 6.2.1 HIGH TTWQ ACTIVITIES

During the 2009/2010 reporting period, as outlined in the City's JURMP, the City continued to identify the following activities as high TTWQ:

- Automobile repair and maintenance
- Automobile washing
- Automobile parking
- Home and garden care activities and product use, including disposal
- Disposal of trash and pet waste

### 6.2.2 HIGH THREAT TO WATER QUALITY AREAS

In addition to these activity-based priorities, the City has noted several residential areas that pose higher threats to water quality. High priority residential areas are designated by considering complaint investigations, institutional knowledge, Dry Weather Monitoring data, and criteria as defined in the Municipal Permit. The list of high priority residential areas is subject to re-evaluation based on new observations and data collected during the reporting period.

The following five residential areas have been designated as high TTWQ:

**Division Avenue Area**
The residential area located near Division Street, east of Highland Avenue, including residences located on East 2nd Street, Melrose Street, Eta Street, Fig Court, and Scott Drive. See Figure 6-1. Past dry weather monitoring programs have detected elevated levels of ammonia and detergents just downstream of these residential areas.

**Paradise Creek Area, between F and L Avenues**
The residential area that runs along the Southern side of Paradise Creek between F and L Avenues, including residences located along East 12th Street, East 13th Street, and East 14th Street. See Figure 6-2. Past dry weather monitoring programs have detected elevated bacteria, ammonia, and oil and grease levels.

**East 8th Street Area**
The residential area along East 8th Street, including residences on East 8th Street and East 9th Street, between L Avenue and N Avenue. See Figure 6-3. This area borders Paradise Creek and has been found to have the same elevated constituents as the areas between F and L Avenues.

**Grove Avenue Area**
The residential area surrounding Grove Avenue, including residences along East 14th Street, Grove Avenue, Stancrest Lane, and Orange Street. See Figure 6-4. This area has been identified during previous dry weather monitoring programs as a source of trash, ammonia, and detergents.

**Arcadia Place Area**
The residential area surrounding Arcadia Place, including residences west of Harbison Avenue along East 11th Street, East 10th Street, and East Plaza Boulevard. See Figure 6-4. This area has been identified during previous dry weather monitoring programs as a source of ammonia and detergents. No new residential areas were added during 2009/2010. However, if future residential complaints, Dry Weather Monitoring Program results, or observations made by City staff indicate evidence of high TTWQ activities in these or other areas of the City, they will be designated as high TTWQ.

## 6.3 Best Management Practice Requirements

The City has continued to provide information regarding the implementation of pollution prevention measures, such as good housekeeping practices, for residential areas and activities. Section 5 of the City's BMP Manual includes lists of general residential BMP requirements and BMP requirements for specific residential activities. The manual is included in Appendix C of the City's JURMP. General residential BMPs include erosion control; non-storm water discharge management, including elimination of IC/IDs; and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Specific BMPs for the high priority activities outlined above are also included in the City's BMP Manual Section 5.

## 6.4 Program Implementation

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting is conducted in residential areas. This ensures that pollutants associated with residential activities and areas are minimized. Additionally, the residential program implements an education component so that residents are made aware of appropriate BMPs, including pollution prevention methods that should be used during certain activities. During 2009/2010 the City also continued to participate in the Regional Residential Education Program.

### 6.4.1 Training, Education, and Outreach

The City has continued to conduct training, education, and outreach activities for residents, which are described below. For additional information on the City's educational efforts and the educational materials distributed to its residents please refer to Section 8 of this Annual Report.

**Distribution of Educational Material**

The City developed a 2010 Storm Water Calendar after selecting the winners of a local art contest at elementary schools within the City (Attachment 5.2). The calendar was printed in both English and Spanish and informed residents about pollutants found in San Diego Bay and neighboring waterways. It described that pollutants such as fertilizers, pesticides, metals, paints, oil and grease and other debris can be transported from residential areas to the ocean. The theme for the calendar was "By Keeping our Community Clean, We Can Keep the Ocean Clean" and each month displayed a child's winning entry from the art contest.

**Website**

Additional information regarding the City's storm water program, pollution prevention measures, and BMPs is posted and continually updated on the City of National City's website (http://www.ci.national-city.ca.us/). Storm water-related pages can be found under the Development Services Department tab in the Engineering Division section. The direct link to the City's storm water page is http://www.ci.national-city.ca.us/index.aspx?page=164.

**Household Hazardous Waste Disposal Program**

The City continues to work with the City of Chula Vista to allow City residents to drop off HHW at Chula Vista's Household Hazardous Waste Collection Facility. The Household Hazardous Waste Collection Facility is the primary location for hazardous waste collection in the South Bay, receiving HHW from the City of National City, the City of Imperial Beach, and the City of Chula Vista. Curbside pickup was made available to the disabled and elderly communities. The amount of waste collected by City residents of National City alone is not available; however, the total amount of HHW collected from residents of all three cities is 294,217 pounds from 2,818 participants. The availability of a City subsidized HHW collection service was advertised in the 2010 Storm Water Calendar.

**Other Waste Disposal Programs/Activities**

In addition to proper HHW disposal, the City encourages residents to recycle used oil. The City maintains several Certified Used Oil Recycling Centers for residential oil disposal. The volume of used oil dropped off at the collection centers was not immediately available.

The City's Public Works Department held three trash collection events (one in November and two in June) during this reporting period in conjunction with EDCO Disposal Company. Information about the trash collection events was sent out to all residents with their trash bills. During these events, residents were encouraged to dispose of any unwanted large items from their homes, such as furniture and appliances. In total, 1,579 vehicles dropped off over 696 tons of waste during these events.

In addition, Recycle San Diego hosted a free electronics waste event at the Kimball Senior Center on July 19, 2009. Residents were encouraged to bring a variety of electronics waste for proper disposal.

### 6.4.2 Compliance and Enforcement

**Public Complaints**

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the Storm Water Hotline, and observations made by the City's municipal personnel. If a potential threat to water quality is present, the City provides a verbal warning, written warning, notice of correction, and/or NOV as applicable. Two residential sites with elevated bacterial levels measured during dry weather monitoring were sent acknowledgement letters which provided simple guidelines to reduce these storm water pollutants. The City received and addressed four residential-related complaints during this reporting period. Complaints were submitted through the Storm Water Hotline or internally through the City's Development Services or Public Works departments. All residential complaints were promptly resolved as detailed in the Summary of Documented Public Complaints in Section 4 of this Annual Report.

**Code Enforcement**

In addition to complaints to the storm water hotline, the general code enforcement staff spends time in residential areas, checking for compliance with the City's Municipal Code. The correction of at least 88 residential code violations in 2009/2010 had potential direct or indirect benefits for storm water quality. Violations corrected included three cases of abandoned materials, two cases of dumping, 17 cases of trash accumulation deemed a public nuisance, 58 cases of prohibited junk storage, four cases of littering, and four cases of illegal auto repair.

## 6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 6.6 Program Review and Modification

The City's JURMP was last updated in March 2008. No changes to the City's residential component have been made since that time.

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

In accordance with the September 10, 2008 RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the 2009/2010 Illicit Discharge Detection and Elimination section and attachments to the RWQCB no later than December 15, 2010.

# 8.0 EDUCATION COMPONENT

## 8.1 INTRODUCTION

During 2009/2010, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, residents, and underserved communities. The City aims to reduce storm water pollution by increasing awareness about storm water and promoting the implementation of pollution prevention measures and BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community.

### 8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the 2009/2010 reporting period are presented below. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- On-site education regarding storm water issues and site-specific BMPs was provided to several municipal employees during routine facility inspections.
- The "Construction Site Best Management Practices" handout was distributed with all construction-related permits issued, including building permits, during the 2009/2010 reporting year.
- Restaurant and food industry personnel were educated on proper site-specific BMPs and provided a BMP handout on storm water issues common to food-related facilities.
- All businesses, including mobile businesses, applying for a new business license during the 2009/2010 reporting year received the "Preventing Urban Runoff Pollution" BMP Trifold.
- The City distributed approximately 3,800 storm water calendars to industrial and commercial businesses, residential households, school-aged children, and municipal staff.
- The City made an estimated 18,637 impressions through educational outreach material and activities.

## 8.2 STAFF TRAINING ELEMENT

During 2009/2010, the City provided training and educational outreach to its municipal personnel. Many municipal personnel are out in the field on a daily basis, so it is necessary that they understand the importance of implementing BMPs. In August 2009, a training session was attended by at least five development services employees who

participate in the City's SUSMP program. The training emphasized SUSMP compliance and reviewed the processes to verify proper BMP installation and to follow-up on violations. Additionally, municipal personnel are encouraged to report any IC/IDs observed to the appropriate City staff and to educate other municipal personnel and the general public about storm water pollution prevention.

The City's Storm Water Compliance Inspector previously completed the California Environmental Protection Agency Basic Inspector Training Course and used those skills to coordinate compliance within the various components of the City's storm water program during 2009/2010. During routine municipal inspections, the City's Consultant provided site-specific education to several Parks Division, Public Works, and Graffiti Abatement staff.

## 8.3 EDUCATIONAL OUTREACH ELEMENT

In addition to municipal staff, the City has continued to provide education and outreach to industrial and commercial businesses, construction site owners and developers, residential areas, and underserved audiences. These efforts promote storm water awareness and BMP implementation.

### 8.3.1 INDUSTRIAL AND COMMERCIAL BUSINESSES

As required by the Municipal Permit, the City inspects its inventoried businesses to evaluate compliance with the City's BMP requirements and provides site-specific education outreach to business owners and operators. Violations of the City's BMP requirements are corrected through enforcement actions as necessary. Site-specific information relating to the facility's activities was discussed with businesses personnel during inspections. Approximately 187 industrial and commercial businesses received the City's 2010 Storm Water Program Calendar, during routine inspections. This calendar is included as Attachment 5.2. The "Everything that flows down into a storm drain" brochure (Attachment 8.1) was also included with the notices of correction and inspection result reports mailed to each inspected industrial and commercial business.

All businesses that applied for a business license in the City received the Industrial and Commercial "Preventing Urban Runoff Pollution" Trifold, as seen in Attachment 5.3. In this way, even businesses that were not slated for inspection during 2009/2010 received storm water education.

This year, the City took measures to educate restaurant and food industry personnel on proper BMPs. A double-sided flyer was distributed to all food-related businesses and highlighted the six most common issues at food-related facilities (Attachment 8.2). In addition, long-term solutions to prevent costly and ineffective cleanup of grease spills was presented. Contact information for the City's compliance inspector and for the Storm Water Hotline was also included.

#### 8.3.1.1 Mobile Businesses

Mobile businesses, specifically mobile car detailers or power washers, are considered a high TTWQ due to the nature of the business activities and the likelihood of prohibited non-storm water discharges. Mobile businesses are not confined to a single area and many do not have City business licenses, making them difficult to identify. The City continues to respond to complaints regarding mobile businesses and provides one-on-one verbal BMP education and literature during the complaint investigation as applicable. All businesses, including mobile businesses, applying for a new business license during the 2009/2010 reporting year received the "Preventing Urban Runoff Pollution" Trifold. This pamphlet includes minimum BMPs for three commonly mobile professions: power washing, car washing, and landscaping services. Information about the storm drain conveyance system and BMPs applicable to mobile business activities were also made available during 2009/2010 on the City's website.

### 8.3.2 Construction Site Owners and Developers

Due to the nature of their activities, construction sites have the potential to discharge many types of pollutants to receiving waters if not managed properly. Many construction site owners, contractors, and developers visit the City's Engineering Division to apply for necessary permits. Through this interaction with City staff, owners and developers are able to gain insight on watershed concepts, potential pollutants, and required BMPs.

The City provided various construction site-specific educational materials targeting storm water concepts during the 2009/2010 reporting year. The distributed educational materials are described below.

- The Construction Site BMP Fact Sheet or "Blue Sheet" (Attachment 3.1) describes specific BMPs for construction activities including soil stabilization and erosion prevention, sediment containment, materials and equipment management, non-storm water discharge control, and drainage control. This sheet was distributed with all permits issued, including building permits; implementing the BMPs listed on the sheet is a condition of the permits.
- The National Pollutant Discharge Elimination System (NPDES) Project Applicability Form or "SUSMP Checklist" (Attachment 2.2) was completed by all projects applying for construction and building permits. Once submitted, the City reviewed the checklist and prioritized the projects. Requirements to ensure compliance with the Municipal Permit and General Construction Permit were presented to the applicant and further discussed to ensure the applicant was educated on the process.
- A copy of JURMP Appendix C, which contains a list of required construction BMPs, is made available upon request for proponents of construction activities within the City.

### 8.3.3 RESIDENTIAL AREAS

Since the City is mainly composed of residential areas, it is important to reach this particular audience through educational outreach programs. The City continued to make a variety of flyers, brochures, website postings, and other educational material available to its residents.

**Storm Water Calendar**

The City developed a 2010 Storm Water Calendar (Attachment 5.2) that was distributed to schools and residents. The calendar, which presented information in both English and Spanish, informed residents about pollutants found in San Diego Bay and neighboring waterways, and described that pollutants such as trash, HHW, and bacteria from pet waste can be transported from residential areas to the ocean. The calendar also provided the date of the 8th Annual Creek to Bay Cleanup event as well as the date of the Coastal Cleanup Day. See Section 9 of this Annual Report for a more detailed description of these events.

During 2009/2010, the City selected the winners of a pollution prevention art contest for display in the 2010 Storm Water Calendar. More information about the development of the 2010 calendar is included in the Public Participation Component Section 9 of this Annual Report.

**School Education and Outreach**

The 2010 Storm Water Calendar was distributed to elementary school students. The calendar provides year round education on the connection between our communities' activities and the health of the oceans.

**City Website**

The City's website, http://www.ci.national-city.ca.us/, is another way in which City residents can become familiar with the design and intended use of the storm drain system, HHW, alternatives to hazardous household products, find information regarding volunteer opportunities, applicable City contact information, and IPM cards.

### 8.3.4 UNDERSERVED COMMUNITIES

The City is a growing community that is diverse in culture. According to the April and May 2009 High TTWQ Residential Education Program data, of the 373 residents encountered, the City's outreach personnel identified about a third who preferred to speak in Spanish. A small fraction spoke Tagalog as their preferred language. To address the unique demographics of the City, the City's Storm Water Hotline accepts all reports of illegal discharges, regardless of language.

The City further provides educational materials both in English and Spanish to better serve Spanish speaking community members. These bilingual brochures may be found at various locations throughout the City, such as the Chamber of Commerce, the public library, public recreational centers, and the storm water display area at the City's Engineering Department. The bilingual educational handout entitled "Everything that

flows down into a storm drains goes untreated directly to our creeks, lagoons, and San Diego Bay" is also included in all mail-based correspondence (i.e. NOV, notice of corrective action, etc.) to residents and industrial and commercial businesses in the City.

### 8.3.5 Complaint Investigations

To further aid the process of identifying illicit discharges, the City encourages the public and City staff to report IC/IDs. The City's Storm Water Compliance Inspector follows up on all complaints made to the hotline. If a representative for the targeted business, residential area, or construction site is present, the inspector will provide site-specific information regarding storm water issues including applicable educational materials.

## 8.4 Outreach Component Effectiveness Assessment

The estimated number of impressions made by the City's education and outreach efforts during 2009/2010 is presented and described below. Please refer to Section 11 of this JURMP Annual Report for the remainder the effectiveness assessment for this program component.

**Impressions Made**

The City continues to provide residents and businesses with storm water-related education through inspections, distribution, and mailing of educational materials, and various events throughout the year. The City calculates an estimate of impressions based on the number and type of educational materials distributed. Estimates of the numbers of impressions generated by the City's efforts allow for a more realistic evaluation of the effectiveness of the NPDES storm water program.

The estimated number of impressions was generated by multiplying each effort by the number of impressions thought to be generated by that particular effort. For example, inspections have been presumed to generate three impressions, with the exception of municipal inspections. Municipal inspections generally involve more people and are assumed to generate five impressions. Training sessions and cleanup events have been assumed to generate a number of impressions equal to four times the number of attendees, because it is likely that the attendees will discuss the content with others after the training session or cleanup event. Printed educational materials distributed in mass numbers are assumed to generate three impressions each. Table 8-1 details the number of impressions made by the City during this reporting year.

**Table 8-1**
**Impressions Made by the City**

| Impression Type | Estimated Count | Unit | Estimated Impressions Generated |
|---|---|---|---|
| Municipal Inspections | 11 | Inspection | 55 |
| Industrial/Commercial Inspections | 193 | Inspection | 579 |
| Complaints Investigated | 11 | Investigation | 33 |
| Activity/Event Attendees | 366 | Events | 1,464 |
| "Preventing Urban Runoff Pollution" Trifold | 434 | Brochure | 1,302 |
| Everything that flows down the storm drain…. | 96 | Handout | 288 |
| 2010 Storm Water Program Calendar | 3,800 | Calendar | 11,400 |
| Put Toxic Waste in its Place | 40 | Handout | 120 |
| NONA/NEC Paperwork | 15 | Brochure | 45 |
| NOI Paperwork | 12 | Brochure | 36 |
| Storm Water Ordinance 14.22 | 46 | Handout | 138 |
| Construction BMP "Blue Sheet" | 986 | Handout | 2,958 |
| New Construction Permit Flyer | 10 | Handout | 30 |
| Restaurant/Food Industry BMP Fact Sheet | 63 | Handout | 189 |
| **Total** | | | **18,637** |

## 8.5 PROGRAM REVIEW AND MODIFICATION

The City's JURMP was updated in March 2008. No changes to the City's education component have been made since that time.

# 9.0 PUBLIC PARTICIPATION COMPONENT

## 9.1 INTRODUCTION

The City encourages public participation in the City's JURMP as a means to foster storm water awareness and improve water quality. Public participation includes, but is not limited to, cleanup events, special community projects, reporting observed IC/IDs, and participating in City-hosted waste disposal events. Collaboration between the City and the community helps to encourage a sense of shared responsibility in protecting water quality both locally and regionally. The City has encouraged public participation through the programs discussed in this section.

### 9.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the public participation component during the 2009/2010 reporting period are presented below. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City collaborated with the California Coastal commission to host two sites for the Coastal Cleanup Day in September 2009. A total of 210 volunteers collected 3,060 pounds of trash and recyclables at the Paradise Creek Education Park and Sweetwater River sites.
- The City collaborated with ILACSD to sponsor the Paradise Creek Education Park site for the Creek to Bay Cleanup event in April 2010. A total of 45 volunteers participated to collect over 510 pounds of trash and recyclables.
- The City selected and honored the 12 winners of the 2008/2009 art contest for the 2010 Storm Water Calendar.
- The City continued to collaborate with the cities of Chula Vista and Imperial Beach to provide HHW disposal for residents of the City of National City. Approximately 111 residents of National City participated.
- The City held three large-item disposal events during the months of November and June, which allowed residents to dispose of large items (not including HHW). Over 696 tons of large-item waste was collected from 1,596 vehicle loads during these events.
- The City continued to operate its Storm Water Hotline to receive complaints from businesses and residents in the City.

## 9.2 PUBLIC PARTICIPATION ACTIVITIES

**Cleanup Events and Programs**

During 2009/2010, the City hosted cleanup events at various locations in the City. These events provide a direct benefit to water quality and provide an opportunity for the City to inform event volunteers of storm water issues. The City participated in the California Coastal Commission sponsored Coastal Cleanup Day on September 19, 2009 (Figure 9-1). Ninety volunteers cleaned two miles of Sweetwater River and collected 2,240 pounds of trash and 20 pounds of recyclables. In addition, 120 volunteers at Paradise Creek Education Park collected 100 pounds of trash and 700 pounds of recyclables during the mile cleanup. In total, Coastal Cleanup Day volunteers collected 3,060 pounds of trash and recyclables and cleaned three miles of park.

**Figure 9-1. Coastal Cleanup Day Event**

The City continued to collaborate with ILACSD and sponsored the Paradise Creek Education Park site for the Creek to Bay Cleanup event on April 24, 2010. Forty-five volunteers collected 200 pounds of trash and debris and an additional 310 pounds of recycling (Figure 9-2). In total, Creek to Bay Cleanup volunteers collected 510 pounds of trash and recyclables and cleaned over 0.5 mile of park.

**Figure 9-2. Creek to Bay Cleanup Event**

**2010 Calendar Development**

During 2008/2009, the City developed the 2010 Storm Water Program Calendar through an art contest sponsored in part by EDCO Recycling and Waste Collection Services at local public elementary schools. In 2009/2010, those 12 contest winners whose submissions were selected for the 2010 Storm Water Calendar were invited to a National City Council meeting. Each winner was honored during the recognition ceremony for their dedication to keeping their neighborhoods and communities clean, and in turn, keeping our oceans clean. They also received an award certificate signed by the National City Mayor, Ron Morrison, and members of the City Council. The presentation shown at the award ceremony is available as Attachment 9.1.

**Hazardous Waste Collection and Used Oil Recycling Program**

The City's Hazardous Waste Collection and Used Oil Recycling Program encourage City residents and business owners to properly dispose of HHW. Residents have access to proper disposal facilities for HHW at the Chula Vista Household Hazardous Waste Collection Facility. This facility is open on Saturdays from 9:00 a.m. to 1:00 p.m. and accepts up to 15 gallons or 125 lbs of waste per household for a small co-payment. An informational ad for this program is included as Attachment 9.2. This service is also available to residents in the cities of Chula Vista, Coronado, and Imperial Beach. During the 2009/2010 reporting year, 2,818 participants brought over 294,217 pounds of hazardous waste. Of that total, 111 people were residents of National City. Door-to-door pick up was available for disabled or elderly communities for a small fee. Residents were directed to an online resource on how to properly dispose of used motor oil and other automotive fluids in the 2010 Storm Water Program Calendar (Attachment 5.2).

The City's website also informs residents of what is considered HHW and how and where to properly dispose of it.

**Other Waste Disposal**

The City continued to hold large item trash collection events for bulky items such as furniture and appliances at the EDCO Recovery and Transfer Facility. The City coordinated with EDCO Recycling and Waste Collection Services to host one event in November and two events in June. Over 303 tons of waste was collected from 723 vehicle loads on November 14, 2009. On June 5, 2010, the facility collected 211 tons of waste from 445 vehicles and then an additional 182 tons from 411 vehicles the following Saturday, June 12, 2010. The City encouraged the public to bring their debris (not including HHW) for proper disposal. Door-to-door pick up was provided for disabled or senior residents.

In addition, Recycle San Diego hosted a free electronics waste event at the Kimball Senior Center on July 19, 2009. Residents and businesses were encouraged to bring a variety of electronics waste for proper disposal.

**Public Reporting**

As discussed in Section 4, complaints are received through the City's Storm Water Hotline and online website reporting system. The residential, industrial and commercial, construction, and municipal communities are encouraged to use the hotline to report IC/IDs. The City investigates each complaint and tracks the complaint and follow-up actions, as applicable. The hotline number is available on the Storm Water Calendar, on various brochures distributed by the City, on printed Storm Water Hotline business cards, as well as on the City's website. This reporting period there were 11 complaints received by the City. All complaints reported during 2009/2010 were investigated immediately and resolved appropriately by City staff. See Table 4-5 for details on documented public complaints.

## 9.3 Public Participation Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 9.4 Program Review and Modification

The City's JURMP was updated in March 2008. No changes to the City's public participation component have been made since that time.

# 10.0 FISCAL ANALYSIS

The sources of funding for this program listed in the City's JURMP have not been changed during this reporting period. During 2009/2010, a fiscal analysis reporting template was developed collectively by the Copermittees. The City has used this template to report the 2009/2010 expenditures in this JURMP Annual Report.

**San Diego County Copermittees Fiscal Analysis Report for Urban Runoff Management Programs**

**EXPENDITURE SUMMARY**

| JURISDICTIONAL COMPONENTS | |
|---|---|
| Administration | $19,096 |
| Development Planning | $61,306 |
| Construction | $58,705 |
| Municipal | $225,192 |
| Industrial and Commercial | $59,706 |
| Residential | $26,595 |
| IDDE | $35,943 |
| Education | $27,482 |
| Public Participation | $10,786 |
| Special Investigations | $13,327 |
| Non-Emergency Firefighting | $0 |
| | |
| **Jurisdictional Total** | **$538,139** |

| WATERSHED | |
|---|---|
| Watershed 1 – San Diego Bay | $468,887 |
| | |
| **Watershed Total** | **$468,887** |

| REGIONAL | |
|---|---|
| Annual Permit Fee to Regional Board | $13,499.00 |
| Copermittee Cost Share of Regional Budget | $55,170 |
| | |
| **Regional Total** | **$68,669** |

| TOTAL COSTS | $1,075,695 |
|---|---|

**Watershed Urban Runoff Management Program (WURMP)**

| | Watershed 1 | Watershed 2 | Watershed 3 | Watershed 4 |
|---|---|---|---|---|
| Administration (1) | $5,456 | | | |
| Cost Share Contribution | $0 | | | |
| Watershed Activities | $463,431 | | | |
| Other | $0 | | | |
| ***TOTAL*** | **$468,887** | | | |

(1) Administration – includes Watershed strategic planning, management, mapping, assessment, and reporting.

**Regional Urban Runoff Management Program (RURMP)**

| Regional Programs | Jurisdictional Cost Share Amount |
|---|---|
| Administration (1) | $2,728 |
| Cost Share Contribution | $52,442 |
| Other (2) | $0 |
| ***TOTAL*** | **$55,170** |

(2) Administration – includes assessment, reporting, management, etc.
(3) Other – examples include regional and special studies.

# 11.0 EFFECTIVENESS ASSESSMENT

## 11.1 INTRODUCTION

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

Based on participation in regional efforts and its experience implementing its JURMP, the City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics were provided in Section 13 of the City's 2008 JURMP.

The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge/Awareness
Level 3: Behavioral Change/BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

## 11.2 EFFECTIVENESS ASSESSMENT RESULTS

The Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Level 1, Level 5, and Level 6 outcomes are

discussed in the text below. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in the CASQA effectiveness assessment guidance document, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 OUTCOME LEVEL ASSESSMENTS

**Level 1**

Level 1 outcomes essentially are measures of permit compliance. The component-specific sections in this JURMP Annual Report provide details of programmatic actions taken to comply with the applicable Municipal Permit requirements. Appendix B of this JURMP Annual Report also includes a checklist that matches the Municipal Permit's annual reporting requirements with the section(s) or appendix of this report that addresses each requirement.

**Levels 2 and 3**

See the tables 11-1 through 11-8 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Please note that the number of hotline calls and Dry Weather Monitoring Program results are used in the assessments for other program components besides illicit discharge detection and elimination. Those numbers are taken from the work done within the period from July 1, 2009 through June 30, 2010 to be comparable with previous years' assessments and data. Also note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included.

**Level 4**

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs reliable load estimation methods have not yet been developed.

**Level 5**

The Dry Weather Monitoring Program is the City's primary mechanism of measuring the quality of discharges. The City began collecting MS4 monitoring data in 2008/2009; however, the data gathered at this time is insufficient to provide substantive information about discharge quality.

Graphs demonstrating historical Dry Weather Monitoring results are provided at the end of this section as Figures 11-3 through 11-5. Ammonia, one of the constituents with the longest historical data record, has shown a decreasing trend over time. Also, since they have been analyzed, the exceedance frequencies of oil and grease and fecal indicator bacteria have decreased with time.

**Level 6**

No Regional Monitoring Program water quality monitoring stations are located within the City of National City. The Sweetwater Mass Loading Station is located just outside

the southeastern border of the City, but only a very minimal portion of the City would drain to that site. Some sediment sampling has been completed in the Sweetwater River flood control channel along southern side of the City as part of the regional Ambient Bay and Lagoon Monitoring Program. The results of that program have been relatively inconclusive to date. The RWQCB contracted Southern California Coastal Waters Research Project (SCCWRP) to conduct some wet weather monitoring in Paleta Creek (Seventh Street Channel) in support of a pending TMDL. At this point, the amount of data collected at these sites is not sufficient to determine any positive or negative trends for water quality at the site. Typically several years of data are needed before any trends become apparent. The City will continue to work with the San Diego Bay WURMP workgroup and TMDL stakeholder workgroups to improve the quality of water bodies in and around the City of National City.

### 11.2.2 OVERALL COMPONENT ASSESSMENTS

**Development Planning**

The City's review process for development projects has effectively required higher removal efficiency BMPs for all projects approved in 2009/2010. The City continued to work with parties responsible for maintenance of treatment control BMPs, achieving compliance through cooperation or using escalating enforcement. City enforcement resulted in the installation of missing BMPs at multiple projects during the reporting period. A slight improvement in maintenance rates from the 2008/2009 to the 2009/2010 reporting period may be attributed to generally increasing awareness of the need for regular treatment control BMP maintenance despite some ongoing changes in project ownership.

**Construction**

The available data indicate that on the whole the City's construction program effectively requires BMP implementation. The City conducted dry season inspections for all high and medium priority construction sites to require continued implementation of required BMPs in preparation for the wet season. Any BMP deficiencies noted are typically remedied promptly. The City's approval process continues to notify all construction projects that will disturb soil of the City's BMP requirements before a permit is issued. This process has helped bring about better BMP implementation at small projects that otherwise might not be aware of the BMP requirements.

**Municipal**

The City's municipal staff are regularly trained on storm water issues, and the City's MS4 cleaning and street sweeping programs meet or exceed minimum Municipal Permit frequency requirements. In particular, the City sweeps its streets more often than the permit requirements to aid in WURMP efforts. As another part of WURMP efforts, the City continued to hire a contractor in 2009/2010 to do biweekly inspections and remove any observed trash from Paradise Creek.

**Industrial and Commercial**

The City continued to implement a comprehensive inspection program. During 2009/2010 the City updated its inspection notification methods to better communicate corrective actions to inspected businesses. The City anticipates that this new method of inspection result notification will yield increased rates of implementation. Additionally, the City worked to educate restaurant and food industry personnel about food-related BMPs by developing industry specific handouts.

**Residential**

The City's residential component mainly achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. Complaints received about residential areas and/or activities by the Storm Water Hotline are documented, investigated, and appropriate actions are taken to resolve the reported issue.

**IDDE**

The RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001 has extended the reporting period for the IDDE component of the City's program, so a full assessment of the program's effectiveness cannot be provided at this time. Some initial metrics are presented in Table 11-6.

**Education**

During 2009/2010, the City provided educational outreach to various communities in the City. Most notably the City identified a need for specific materials for eating establishments and other food-related facilities. The City developed a 2 page handout for food-industry facilities that details proper techniques for waste grease handling and other food-related BMPs. The City also developed a 2010 calendar that presented various storm water concepts. This calendar was distributed during industrial and commercial inspections, and during various public events.

**Public Participation**

The City continued to host clean-up events in the City. Approximately twice as many volunteers participated in clean-up events within the City during 2009/2010 compared to 2008/2009. While public education regarding use of the Storm Water Hotline has increased in this reporting period, the number of hotline calls decreased in 2009/2010. The City continues to ensure its own staff and the public are aware of the hotline and when to call it.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of that document.

**Table 11-1**
**Development Planning Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Review and approve project plans | External<br>A relatively small number of projects submitted reports during 2009/2010. Based on meetings with applicants and BMPs proposed, it appears that the level of knowledge is increasing.<br>Internal<br>The City's storm water consultant and the City's Storm Water Program Manager worked with engineers in the City to improve their level of understanding of the SUSMP program. City personnel also attended training sessions—see Section 8. The City's consultant reviews SWMPs submitted to the City. | Overall project submittal approval rate during reporting period | 44% | Percent of projects proposing BMPs besides filter inserts | 100% |
| | | Number of projects requiring three or more reviews prior to SWMP approval | 3 | Percent of approved projects implementing BMPs with high or medium removal efficiencies for key pollutants of concern | 100% |
| Verify proposed BMPs are implemented | External<br>N/A, knowledge is evaluated by appropriate implementation of BMPs as shown in Level 3<br>Internal<br>The City's NPDES Storm Water Compliance Inspector provided training to the inspector responsible for verifying BMPs prior to occupancy. | Percent of projects completed in 2009/2010 implementing all proposed BMPs | 67% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 2 | | |
| Verify BMPs are properly maintained | External<br>Annual maintenance verification letters were sent out in 2009/2010 and NOVs were issued to non-responders<br>Internal<br>The City contracts with a qualified consultant to perform treatment control BMP inspections. | Percent of sites properly maintaining all BMPs | 66% | Proper BMP maintenance is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 2 | | |
| | | Percent of sites responding to verification letters | 95.8% | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-2**
**Construction Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Review proposed plans and BMPs | External<br>Projects submit plans for construction BMP implementation for their projects; the level of awareness of construction BMP requirements is fairly high.<br>Internal<br>Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs. | BMPs proposed for construction projects generally meet requirements; no significant problems have been noted. | | Proper pre-project planning is likely to have reduced pollutant loading. |
| Verify proposed BMPs are implemented | External<br>Grading projects implement BMPs as required by their permits, and contractors are familiar with the City's requirements.<br>Internal<br>Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs, and the City's consultant conducts routine inspections of high and medium TTWQ construction sites. | Percent of projects in compliance with BMP requirements during all inspections | 71% | Proper BMP implementation is likely to have reduced pollutant loading. |
| | | Resolution status of enforcement actions | See Section 3 | |
| | | Number of dry weather monitoring exceedances traced to construction sources | 0 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-3**
**Municipal Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Verify proposed BMPs are implemented at facilities | City staff are regularly trained on BMP implementation; see sections 4 and 8. | Percent of inspected facilities/activities requiring a follow-up visit | 9% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of sites requiring follow-up inspections | See Section 4 | | |
| | | Number of dry weather monitoring exceedances traced to municipal sites | 0 | | |
| Sweep streets and parking facilities | | N/A, streets and parking facilities are swept as often as directed by management. | | Amount of sediment and debris removed (weight or volume) | 975 tons |
| | | | | Amount of sediment and debris removed per length of street swept (weight or volume per curb mile) | 0.066 tons/ curb mile |
| Maintain and clean out MS4 | | N/A, MS4 structures are maintained as often as directed by management. | | Amount of sediment and debris removed (weight or volume) | 33.7 tons |
| Maintain sanitary sewer system | | N/A, the sanitary sewer system is maintained as often as directed by management. | | Total volume of SSO discharge to MS4 (gallons) | 0 |
| Maintain municipal treatment control BMPs | | N/A, treatment control BMPs are maintained as often as directed by management. | | Amount of sediment and debris removed from treatment control BMPs | 192 pounds |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-4**
**Industrial and Commercial Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Require BMP implementation | External<br>Knowledge assessment scores indicated approximately half of the personnel present during inspections lacked any understanding of relevant storm water concepts. See Figure 11-1 on the following page for a score distribution. See Section 8 for more detail on educational materials and other outreach efforts.<br>Internal<br>The City contracts with a qualified consultant to perform industrial and commercial inspections. | Percent of inspected sites requiring a follow-up visit | 28% | Proper BMP implementation is likely to have reduced pollutant loading. | |
| | | Resolution status of enforcement actions | See Section 5 | | |
| | | Number of dry weather monitoring exceedances traced to industrial or commercial sources | 1 | Number of IC/IDs eliminated (inspections and complaint investigations) | 9 |
| | | Consistent with the intentional selection of sites with the highest TTWQ potential, many sites had a lower BMP score. However, the most common score was three. See Figure 11-2 on the following page for a score distribution. | | | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Figure 11-1**
**Industrial/Commercial Knowledge Assessment Scores**

**Figure 11-2**
**Industrial/Commercial BMP Implementation Scores**

**Table 11-5: Residential Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 |
|---|---|---|---|---|
| Require BMP implementation | External<br>See sections 6 and 8 for details of this and other education.<br>Internal<br>The City's Storm Water Program Manager and other City staff involved in the program have a good understanding of the goals of the storm water program. | Number of residential incidents reported to storm water hotline | 4 | Resolution of residential incidents reported to the hotline likely resulted in a decrease in pollutant loading through improved BMP implementation. |
| | | Resolution of enforcement actions | See Sections 4 and 6 | |
| | | Number of dry weather monitoring exceedances traced to residential sources | 1 | |
| Maintain an accurate inventory | N/A, data management only | N/A, data management only | | N/A, data management only |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-6: Illicit Discharge Detection and Elimination Component Assessment Measures***

| Significant Activity | Level 2 | Level 3 | Level 4 |
|---|---|---|---|
| Conduct Dry Weather Monitoring Program | The City contracts with a qualified consultant to perform its Dry Weather Monitoring Program. | N/A, personnel conduct monitoring as directed by management. | No significant, long term IC/IDs were identified for elimination, so a reliable estimate of load reduction cannot be made. |
| Respond to incidents reported to storm water hotline | The City's Storm Water Program Manager trains City staff as needed. See sections 4 and 8. City staff were responsible for many of the reports made to the hotline, as shown in Section 4. | N/A, personnel respond to incidents as directed by management. | Resolution of the incidents reported to the hotline and listed in Section 4 are likely to have resulted in a pollutant loading reduction. |
| Respond to and clean up SSOs | City staff are thoroughly trained on how to respond to SSOs. | See Section 4 for details. | There was one SSO during the reporting period but effective clean-up prevented any discharge from reaching receiving waterbody. |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
*Although the overall IDDE component is to be submitted in December 2010, a preliminary assessment of the component's effectiveness is provided here.

**Table 11-7: Education Component Assessment Measures**

| Significant Activity | Level 2 | | Level 3 | Level 4 |
|---|---|---|---|---|
| Provide storm water education to the public | External<br>The City actively educates the various audiences in its jurisdiction. See Section 8 for details. | | See Level 3 outcomes for other program components for information about behavior change. | Sufficient data to estimate load reductions due to educational efforts is not available for 2009/2010. |
| | Estimated number of impressions made | 18,637 | | |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

**Table 11-8: Public Participation Component Assessment Measures**

| Significant Activity | Level 2 | Level 3 | | Level 4 | |
|---|---|---|---|---|---|
| Involve the public in activities that relate to storm water protection | External<br>The City and City partners put on a number of opportunities for the public to participate, including operation of the Storm Water Hotline. See Section 9 for details. | Number of attendees at events (ILACSD clean-up volunteers and HHW disposal participants) | 366 | Amount of trash, debris, and recyclables collected at cleanup events | 3,570 pounds |
| | | Number of calls received to the storm water hotline | 13 | Amount of HHW collected | 294,217 pounds between three cities* |

**Notes:** Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable
* The cities of National City, Chula Vista, and Imperial Beach share a HHW disposal program located within the City of Chula Vista.

# 12.0 SPECIAL INVESTIGATIONS

During the reporting period the City undertook two additional programs: the Clean Community Program and a pollutant discharge potential assessment component during industrial and commercial inspections.

## 12.1 CLEAN COMMUNITY PROGRAM

Results from trash assessments in previous years have indicated that litter and illegally dumped items tend to consist of household trash and large household items, likely from residents in the City. During 2009/2010, the City continued to implement its Clean Community Program. This program is designed to foster a sense of shared responsibility in keeping the community of National City clean and free of pollutants that may otherwise be carried to local receiving water bodies.

The theme of the 2010 Storm Water Calendar (Attachment 5.2) was "By Keeping our Community Clean, We can Keep the Ocean Clean!" This slogan was printed in both English and Spanish on every month of the calendar. Each month of the 2010 calendar featured artwork by local third grade students illustrating the theme. By integrating public participation into the development of the 2010 calendar, the City increased attention to the "By Keeping our Community Clean, We Can Keep the Ocean Clean" message. Storm water facts were also presented throughout the calendar in both English and Spanish; such facts included "All water that enters National City storm drains flows to San Diego Bay without being treated," "High levels of bacteria can be harmful to your health and the environment. One way to keep bacteria from entering storm drains is to be a responsible pet owner" and "The City of National City has National City Clean Up Day, twice a year, once in the spring and again in the fall. Residents can dispose of items such as garbage, appliances, furniture, etc." The back of the calendar provides numerous City resources for residents who choose to take action in the City's program.

Additionally, as part of WURMP efforts that are beyond minimum required MS4 maintenance, the City hired a contractor in 2008/2009 to do biweekly inspections and remove any observed trash from Paradise Creek. These cleanups continued in 2009/2010.

## 12.2 POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

During 2009/2010, the City conducted pollutant discharge potential assessments (PDPA) at industrial and commercial facilities that received full inspection; the purpose of the assessment is to assist in source identification. The assessment is intended to be a semi-quantitative tool to identify which sites are major sources of the principal pollutants of concern for storm water. For each of several main categories of pollutants, a numeric pollutant discharge potential (PDP) on a scale from 0 (not present) to 5 (severe) is

assigned. A copy of the PDPA form is included with the standard inspection form in Attachment 5.1.

Table 12-1 shows the overall average PDP scores for each pollutant for all of the industrial and commercial facilities visited in 2009/2010. Note that pH indicates substances likely to cause either an abnormally low (acidic) or abnormally high (basic) pH.

**Table 12-1**
**Pollutant Discharge Potential Score Averages, By Category**

| Pollutant Category | Average PDP Score |
|---|---|
| Sediment | 2.6 |
| Nutrients | 1.5 |
| Aluminum | 1.1 |
| Iron | 1.3 |
| Heavy Metals | 2.1 |
| Organics | 1.7 |
| Trash | 2.1 |
| Oxygen Demanding | 1.7 |
| Oil and Grease | 2.7 |
| Bacteria | 1.7 |
| Pesticides | 1.2 |
| Acid/Base | 1.0 |

Sediment, heavy metals, trash, and oil and grease were observed to be the largest issues during the industrial and commercial inspections conducted during 2009/2010. The City uses this information to help target businesses for inspection. Figure 12-1, on the following page, shows the distribution of PDP scores for each pollutant on the PDPA table.

**Figure 12-1**
**PDPA Score Distribution for Facilities Inspected in 2009/2010**

# 13.0 NON-EMERGENCY FIRE FIGHTING

Please reference Section 3 of the City's most recent JURMP for information about BMPs and procedures associated with non-emergency fire fighting activities.

# 14.0 JURMP REVISIONS

The City's JURMP was rewritten in the spring of 2008 in response to new Municipal Permit requirements. Section 14 of the updated JURMP document includes a list of the changes made to the JURMP at that time. Any other changes to the JURMP made since the overall JURMP update in the spring of 2008 are discussed in the individual "Program Review and Modification" subsections in the preceding sections in this JURMP Annual Report.

# 15.0 CONCLUSIONS AND RECOMMENDATIONS

During the 2009/2010 reporting period the City of National City continued to implement the programs in its JURMP, updated in March 2008. The City continues to work with other Copermittees to facilitate sharing of information about how best to run these programs and to provide regional guidance on standardized implementation where applicable. The City of National City will work collaboratively as a member of the various regional workgroups in this process and continue to refine its program implementation as needed to improve its ability to reduce or eliminate pollutant discharges and meet regulatory requirements. The City will also continue its efforts related to the pending TMDL for Seventh Street Channel.

* The two high priority construction sites received inspections the last week of the dry season to ensure proper BMP implementation for the wet season. Therefore, biweekly wet season inspections began in the second week of the wet season, which resulted in 15 wet season inspections each.

** Low priority construction sites received at least one inspection from City building inspectors during the 2009/2010 reporting period. These inspections include a check for proper construction BMP implementation and maintenance.

TTWQ – Threat to Water Quality
SIC –Standard Industrial Classification Code
Likely Source – Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water

# APPENDIX B

# JURMP ANNUAL REPORT REQUIREMENTS CHECKLIST

**Appendix B**
**JURMP Annual Report Requirements Checklist**

## Development Planning Component

| Permit Annual Reporting Requirement—Section J.3.a.(3).(a) | Location in Report |
|---|---|
| i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements. | 2.2, 2.3 |
| ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked. | 2.4.3, 2.4.4.2 |
| iii. A listing of the development projects to which SUSMP requirements were applied. | Table 2-1 |
| iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked. | 2.4.4.2 |
| v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs. | 2.4.4.2 |
| vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible. | 2.4.4.2 |
| vii. An updated treatment control BMP inventory. | Appendix A.1 (inventory) |
| viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings. | 2.4.4.3, Table 2-3 and Table 2-4 |
| ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings. | 2.4.4.3 |
| x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked. | 2.4.4.2, Table 2-2 |
| xi. A listing of any projects which received a SUSMP waiver. | 2.4.4.2 |
| xii. A description of implementation of any SUSMP waiver mitigation program. | 2.4.4.2 |
| xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation. | 2.4.4.2 |
| xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented. | 2.4.4.2 |
| xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements. | 2.4.4.2 |

## Development Planning Component

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(a)** | **Location in Report** |
|---|---|
| xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project. | 2.4.4.2 |
| xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 2.4.4.3, Table 2-4 |
| xviii. A description of notable activities conducted to manage urban runoff from development projects. | 2.1 |

## Construction

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(b)** | **Location in Report** |
|---|---|
| i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked. | 3.5 |
| ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed. | 3.2 |
| iii. A description of modifications made to the construction and grading ordinances and approval processes. | 3.3 |
| iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites. | 3.5 |
| v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites. | 3.5 |
| vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites. | 3.5 |
| vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites. | 3.5, Appendix A.2 (inventory) |
| viii. A description of the general results of the inspections. | 3.5 |
| ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 3.5 |
| x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 3.5.3, 3.5.4 |
| xi. A description of notable activities conducted to manage urban runoff from construction sites. | 3.1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| i. Any updates to the municipal inventory and prioritization. | Appendix A.3 (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events. | 4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4 |
| iii. A description of inspections and maintenance conducted for municipal treatment controls. | 2.4.4.3, Table 2-4 |
| iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned. | 4.4.4 Table 4-2 |
| v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned. | 4.4.1, 4.4.4, Table 4-2 |
| vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned. | 4.4.1, 4.4.4, Table 4-2 |
| vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category. | 4.4.4, Table 4-2 |
| viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding. | N/A for 2009/2010 |
| ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities. | 4.2.3, 4.2.4 |
| x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4, Table 4-1 |
| xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| xiii. Identification of the total distance of curb-miles swept. | 4.3.4 |
| xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping. | 4.3.4, Table 4-1 |
| xv. Amount of material (tons) collected from street and parking lot sweeping. | 4.3.4, Table 4-1 |
| xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4. | 4.5.4 |
| xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections. | 4.2.4, 4.6.4, 4.7.4, Table 4-3 |
| xviii. A description of the general results of the inspections. | Table 4-3 |
| xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 4.2.4, 4.6.4, 4.7.4 |
| xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 4.2.4, 4.6.4, 4.7.4 |
| xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities. | 4.1.1 and throughout Section |

## Industrial and Commercial

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(d)** | **Location in Report** |
|---|---|
| i. Any updates to the industrial and commercial inventory. | 5.2.2 (stationary), 5.3.2 (mobile), appendices A.4 and A.5 (inventory) |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources. | 5.2.4, 5.3.4 |
| iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses. | 5.2.4, 5.3.4 |
| iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected. | 5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1 |
| v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection. | 5.2.4 |
| vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance. | 5.2.4 |
| vii. Identification of the number of third party inspections conducted. | 5.2.4 |
| viii. Identification of efforts conducted to verify third party inspection effectiveness. | 5.2.4 |
| ix. A description of efforts implemented to address mobile businesses. | 5.3.4 |
| x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 5.2.4, 5.3.4 |
| xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees. | 5.2.4, Table 5-2 |
| xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources. | 5.1.1 and throughout section |

## Residential

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(e)** | **Location in Report** |
|---|---|
| i. Identification of the high threat to water quality residential areas and activities that were focused on. | 6.2 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities. | 6.4 |
| iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials. | 6.4.1 |
| iv. Types and amounts of household hazardous wastes collected, if applicable. | 6.4.1 |
| v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation. | 6.4 (see discussion in JURMP) |
| vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 6.4.2 |
| vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program. | 6.4 |
| viii. A description of notable activities conducted to manage urban runoff from residential areas and activities. | 6.1.1 and throughout section |

## IDDE*

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| * Section 7, the Illicit Discharge Detection and Elimination component, of the 2009/2010 Annual Report, will be submitted to the RWQCB no later than December 15, 2010. | |

## IDDE—Additional Dry Weather Monitoring Program Requirements*

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| * Section 7, the Illicit Discharge Detection and Elimination component, of the 2009/2010 Annual Report, will be submitted to the RWQCB no later than December 15, 2010. | |

## Education

| Permit Annual Reporting Requirement—Section J.3.a.(3).(g) | Location in Report |
|---|---|
| i. A description of education efforts conducted for each target community. | 8.3 |
| ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges. | 8.3 |
| iii. A description of education efforts conducted for municipal departments and personnel. | 8.2 |
| iv. A description of education efforts conducted for the new development and construction communities. | 8.3 |
| v. A description of jurisdictional education efforts conducted for residents, the general public, and school children. | 8.3 |

## Public Participation

| Permit Annual Reporting Requirement—Section J.3.a.(3).(h) | Location in Report |
|---|---|
| i. A description of public participation efforts conducted. | 9.2 |

## Effectiveness Assessment

| Permit Annual Reporting Requirement—Section J.3.a.(3).(i) | Location in Report |
|---|---|
| i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order. | 11 |

## Fiscal Analysis

| Permit Annual Reporting Requirement—Section J.3.a.(3).(j) | Location in Report |
|---|---|
| i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. | 10 |

## Special Investigations

| Permit Annual Reporting Requirement—Section J.3.a.(3).(k) | Location in Report |
|---|---|
| i. A description of any special investigations conducted. | 12 |

## Non-Emergency Firefighting

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(l)** | **Location in Report** |
|---|---|
| i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows. | 4.2.3, 13 |

## JURMP Revisions

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(m)** | **Location in Report** |
|---|---|
| i. A description of any proposed revisions to the JURMP. | 14 and each program component section |

# SUSMP ORDINANCE

ORDINANCE NO. 2010 – 2328

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF NATIONAL CITY ADOPTING THE STANDARD URBAN STORMWATER MITIGATION PLAN (SUSMP) MANUAL, AND REPEALING ORDINANCE NO. 2008-2307

WHEREAS, on January 24, 2007, the San Diego Regional Water Quality Control Board issued the National Pollutant Discharge Elimination System (NPDES) permit No. CAS0108758, Order No. R9-2007-001, requiring changes to the City's Standard Urban Stormwater Mitigation Plan (SUSMP) Manual.

NOW, THEREFORE, the City Council of the City of National City does hereby ordain as follows:

Section 1. Introduction of the Standard Urban Stormwater Mitigation Plan (SUSMP) Manual. The City Council of the City of National City introduces the Standard Urban Stormwater Mitigation Plan (SUSMP) Manual, attached hereto as Appendix "A", hereafter abbreviated as "SUSMP Manual", as the City of National City's program for management of stormwater runoff. A copy of Appendix "A" shall be kept on file in the Office of the City Engineer.

Section 2. Implementation and administration. All City departments, under the direction of the City Manager, shall implement, administer, and enforce the provisions of the SUSMP Manual, and shall modify their administrative procedure for permit issuance and plan approval accordingly. In case of a conflict between a provision of the Municipal Code and the SUSMP Manual, the SUSMP Manual, shall take precedence, unless the City Manager determines that compliance is impossible, impractical or is not in the public's best interest. In this event, the City Manager shall immediately advise the City Council and recommend appropriate measures for resolution.

Section 3. Department review. To the extent not already provided for, City department directors, under the direction of the City Manager, will review and propose amendments to the Municipal Code that are or may become necessary for the further implementation of the SUSMP Manual.

Section 4. Criminal and administrative enforcement. The mandatory provisions and prohibitions of the SUSMP Manual shall be enforceable as misdemeanors pursuant to Section 1.20.010 of the National City Municipal Code, and administrative penalties may be imposed in accordance with Chapters 1.44 or 1.48 of the National City Municipal Code, as appropriate.

Section 5. Repeal of previous ordinance. Ordinance No. 2008-2307 is hereby repealed.

PASSED and ADOPTED this 16th day of February, 2010.

Ron Morrison, Mayor

ATTEST:

Michael R. Dalla, City Clerk

APPROVED AS TO FORM:

George H. Eiser, III, City Attorney

Passed and adopted by the Council of the City of National City, California, on February 16, 2010, by the following vote, to-wit:

Ayes: Councilmembers Morrison, Parra, Sotelo-Solis, Van Deventer, Zarate.

Nays: None.

Absent: None.

Abstain: None.

AUTHENTICATED BY: RON MORRISON
Mayor of the City of National City, California

MICHAEL R. DALLA
City Clerk of the City of National City, California

By: _____
Deputy

I HEREBY CERTIFY that the foregoing ordinance was not finally adopted until seven calendar days had elapsed between the day of its introduction and the day of its final passage, to wit, on February 2, 2010 and on February 16, 2010.

I FURTHER CERTIFY THAT said ordinance was read in full prior to its final passage or that the reading of said ordinance in full was dispensed with by a vote of not less than a majority of the members elected to the Council and that there was available for the consideration of each member of the Council and the public prior to the day of its passage a written or printed copy of said ordinance.

I FURTHER CERTIFY that the above and foregoing is a full, true and correct copy of ORDINANCE NO. 2010-2328 of the City Council of the City of National City, passed and adopted by the Council of said City on February 16, 2010.

City Clerk of the City of National City, California

By: _____
Deputy

ORDINANCE NO. 2010 – 2329

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF NATIONAL CITY AMENDING SECTIONS 14.22.020, 14.22.030, 14.22.040, 14.22.090, 14.22.110, 14.22.120, 14.22.130, 14.22.140, 14.22.150, 14.22.160, and14.22.170 OF THE NATIONAL CITY MUNICIPAL CODE REGARDING NATIONAL CITY STORM WATER MANAGEMENT AND DISCHARGE CONTROL

BE IT ORDAINED by the City Council of the City of National City that Title 14, Chapter 14.22, of the National City Municipal Code is hereby amended by amending the Table of Contents to read as follows:

Sections:

| | |
|---|---|
| 14.22.010 | Title. |
| 14.22.020 | Purpose and intent. |
| 14.22.030 | Definitions. |
| 14.22.040 | General provisions. |
| 14.22.050 | Reduction of pollutants in storm water--Minimum requirements. |
| 14.22.060 | Watercourse protection. |
| 14.22.070 | Illicit connection and illegal discharge of pollutants--Prohibited. |
| 14.22.080 | Exceptions to discharge prohibition. |
| 14.22.090 | Best management practice requirements and general requirements applicable to all discharges. |
| 14.22.100 | Additional minimum best management practice requirements for residential activities and facilities. |
| 14.22.110 | Additional minimum best management practice requirements for commercial activities and facilities. |
| 14.22.120 | Additional minimum best management practice requirements for industrial activities and facilities. |
| 14.22.130 | Additional minimum best management practice requirements for municipal activities and facilities. |
| 14.22.140 | Manuals. |
| 14.22.150 | Additional requirements for land disturbance activity. |
| 14.22.160 | Additional planning, design, and post-construction requirements for Development Projects. |
| 14.22.170 | Maintenance of BMPs. |
| 14.22.180 | Inspection and sampling. |
| 14.22.190 | Enforcement. |
| 14.22.200 | Enforcement authority. |
| 14.22.210 | Other acts and omissions that are violations. |
| 14.22.220 | Penalties. |
| 14.22.230 | Restrictions and conditions on issuance of ministerial and discretionary development permits. |

BE IT FURTHER ORDAINED by the City Council of the City of National City that Title 14, Chapter 14.22, of the National City Municipal Code is hereby amended by amending Sections 14.22.020, 14.22.030, 14.22.040, 14.22.090, 14.22.110, 14.22.120, 14.22.130, 14.22.140, 14.22.150, 14.22.160, and 14.22.170 to read as follows:

14.22.020 Purpose and intent.

A. The purpose of this Chapter is to ensure the future health, safety, and general welfare of the citizens; to protect water resources and to improve water quality; to cause the use of management practices by the city and its citizens that will reduce the adverse effects of polluted runoff discharges on waters of the State; to secure benefits from the use of storm water as a resource; and to ensure that the city is compliant with San Diego Regional Water Quality Control Board ("RWQCB") Order No. 2001-01 and renewed by 2007-0001 National Pollutant Discharge Elimination System ("NPDES") Permit Number CAS0108758, and with applicable State and federal law. The city seeks to promote these purposes by:

1. Controlling nonstorm water discharges to the storm water conveyance system;

2. Eliminating discharges to the storm water conveyance system from spills, dumping, or disposal of materials other than storm water or permitted or exempted discharges;

3. Reducing pollutants in storm water discharges, including those pollutants taken up by storm water as it flows over urban areas, to the maximum extent practicable (MEP);

4. Reducing pollutants in storm water discharges in order to achieve applicable water quality objectives for surface waters in San Diego County;

5. Establishing minimum requirements for storm water management, including source control requirements, to prevent and reduce pollution;

6. Establishing requirements for development project site design, to reduce storm water pollution and erosion;

7. Establishing requirements for the management of storm water flows from development projects, both to prevent erosion, and to protect and to enhance existing water-dependent habitats; and

8. Establishing notice procedures and standards for adjusting storm water and nonstorm water management requirements where necessary.

B. The intent of this Chapter is to protect and enhance the water quality of the watercourse, water bodies, and wetlands in a manner pursuant to and consistent with the Clean Water Act and the San Diego RWQCB Order No. 2001-01, and renewed by 2007-0001, NPDES Permit Number CAS0108758, and any subsequent amendments, revisions, or reissuance of the permit and the Standard Urban Storm Water Mitigation Plan (SUSMP) adopted by Ordinance No. 2213 on November 19, 2002, and any subsequent adopted amendments, revisions, or modifications.

14.22.030 Definitions.

When used in this Chapter, the following terms shall have the meanings ascribed to them in this Section:

"Authorized enforcement official" means the city manager of the City of National City or any designee of the city manager of the City of National City who is responsible for enforcing the provisions of this Chapter, including but not limited to, the directors, their management staff, and designees.

"Basin plan" means the comprehensive water quality control plan for the San Diego Basin, adopted by the Regional Water Quality Control Board, San Diego Region (July 1975), and approved by the State Water Resources Control Board, together with subsequent amendments.

"Best management practices (BMPs)" means schedules of activities, prohibitions of practices, general good housekeeping practices, pollution prevention and educational practices, maintenance procedures, and other management practices to prevent or reduce to the MEP the discharge of pollutants directly or indirectly to waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage or leaks, sludge or waste disposal or drainage from raw materials storage.

"BMP Manual" means the city's Best Management Practices Manual described in Section 14.22.140 of this Chapter, adopted by resolution and hereinafter referred to as "BMP Manual".

"BMPs" means best management practices.

"California ocean plan" means the California Ocean Plan: Water Quality Control Plan for Ocean Waters of California, adopted by the State Water Resources Control Board, September 1991, and any subsequent amendments.

"Channel" means a natural or improved watercourse with a definite bed and banks that conducts continuously or intermittently flowing water.

"Commercial discharger" means discharger who operates a regulated commercial facility.

"City" means the City of National City.

"Development project" means new development or redevelopment with land disturbing activities, construction, or installation of a structure, the creation of impervious surface or land subdivision.

"Developer" means a person who seeks or receives permits for or who undertakes land development activity.

"Development project proponent" means developer.

"Directors" means the Director of Development Services.

"Discharge" when used as a verb, means to allow pollutants to directly or indirectly enter storm water or to allow storm water or nonstorm water to directly or indirectly enter the storm water conveyance system or receiving waters, from an activity or operations which one owns or operates. When used as a noun, "discharge" means the pollutants, storm water and/or nonstorm water that is discharged.

"Discharger" means any person or entity engaged in activities or operations or owning facilities, which will or may result in pollutants entering storm water, the storm water conveyance system or receiving waters; and the owners of real property on which such activities, operations or facilities are located; provided however that a local government or public authority is not a discharger as to activities conducted by others in public rights-of-way.

"Discharges directly to" means that storm water or nonstorm water enters receiving waters from a facility or activity without mixing with any storm water or nonstorm water from another facility or activity prior to entering such receiving waters.

"Drainage easement" means a legal right granted by a land owner to a grantee allowing the use of private land for storm water management purposes.

"Employee training program" means a documented employee training program for all persons responsible for implementing a storm water pollution prevention plan. The employee training program shall include, but is not limited to, the following topics:

1. Laws, regulations, and local ordinances associated with storm water pollution prevention, and an overview of the potential impacts of polluted storm water on the receiving waters of the San Diego region.
2. Proper handling of all materials and wastes to prevent spillage.
3. Mitigation of spills including spill response, containment, and cleanup procedures.
4. Visual monitoring of all effluent streams to ensure that no illicit discharges enter the storm water conveyance system.
5. Discussion of the difference between the storm water conveyance system and the sanitary sewer system.
6. Identification of all on-site connections to the storm water conveyance system.
7. Preventive maintenance and good housekeeping procedures.

8. Material management practices employed by the facility to reduce or eliminate pollutant contact with storm water discharge.

9. A documented employee training program prepared pursuant to any NPDES storm water permit shall meet the definition of an employee training program for the purposes of this Chapter.

"Enclosed bays and estuaries plan" means the California Enclosed Bays and Estuaries Plan: Water Quality Control Plan for Enclosed Bays and Estuaries of California, adopted by the State Water Resources Control Board, April 11, 1991, and any subsequent amendments.

"Environmentally sensitive area" means impaired water bodies, areas designated as areas of special biological significance or with the RARE beneficial use by the SWRCB in the water quality control plan for the San Diego Basin (1994 and amendments), national wildlife refuges, areas designated as preserves for species protection purposes by the State of California or a local government, and pre-approved mitigation areas identified in agreements between the city and State or federal natural resources agencies.

"ESA" means environmentally sensitive area.

"Household hazardous waste" means a household hazardous material that no longer has a use and is discarded or intended to be discarded. The term includes, but is not limited to paint and paint-related materials; yard and garden products; household cleaners; used oil, motor vehicle fluids, batteries, and oil filters; and household batteries.

"Illegal connection" means a pipe, facility, or other device connected to the storm water conveyance system or receiving waters, which has not been reviewed and authorized by the city; or a permitted/authorized pipe, facility, or other device, which conveys illegal discharges.

"Illegal discharge" means any nonpermitted or nonexempt discharge to the storm water conveyance system that is not composed entirely of storm water or is expressly prohibited by federal, State, or local regulations, laws, codes, or ordinances, or degrades the quality of receiving waters in violation of the basin plan, the enclosed bays and estuaries plan, the inland surface water plan, and the California Ocean Plan Standards.

"Illicit connection" means any nonpermitted or undocumented physical connection to the storm water conveyance system which has not been approved by the city or which drains illegal discharges either directly or indirectly into a storm water conveyance system.

"Impaired water body" means a water body that is listed by the SWRCB as impaired by a particular pollutant or pollutants, pursuant to Section 303(d) of the Federal Clean Water Act. "303(d)-listed water body" has the same meaning.

"Impervious cover or impervious surface" means constructed or modified surfaces that cannot effectively infiltrate rainfall. The term includes, but is not limited to, building rooftops, pavement, sidewalks, and driveways.

"Impervious surface area" means ground area covered or sheltered by an impervious surface measured in plan view (i.e., as if from directly above). For example, the "impervious surface area" for a pitched roof is equal to the ground area it shelters, rather than the surface area of the roof itself.

"Industrial activity" means manufacturing, processing, or raw materials storage at a commercial, industrial, or municipal facility. The term includes, but is not limited to, such manufacturing, processing, or storage in or upon industrial plant yards or immediate access roads used or traveled by carriers of raw materials; manufacture of products, waste material, or by-product creation or storage; material handling; refuse storage or disposal; the application or disposal of processed wastewaters; storage and maintenance of material handling equipment; treatment, storage, or disposal of residuals; outdoor shipping and receiving; activities in manufacturing buildings; storage of raw materials and intermediate and finished products; and the ownership, use, or control of areas where significant industrial activity has taken place in the past and significant materials remain and are exposed to storm water. Material handling

activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product, or waste product.

"Industrial discharger" means a discharger who operates a regulated industrial facility.

"Industrial storm water permit" means the State general industrial storm water permit.

"Infiltration" means the process of percolating storm water or nonstorm water into the soil.

"Infiltration BMPs or infiltration facility" means any structural treatment BMP designed primarily to percolate water into the subsurface, such as an infiltration trench or infiltration basin. An infiltration facility may include filtering prior to or during infiltration. BMPs that infiltrate some water, but are designed primarily to retain water or to treat water such as retention basins, constructed wetlands, or filtering swales, are not infiltration facilities.

"JURMP" is an acronym for jurisdictional urban runoff management program. This document presents the city's storm water program in compliance with the municipal permit.

"Land development activity" means any activity or proposed activity that requires any of the permits or approvals listed in Section 14.22.040(F) of this Chapter.

"Land disturbance activity" means any activity that moves soils or substantially alters the pre-existing vegetated or man-made cover of any land. This includes, but is not limited to, grading, digging, cutting, scraping, stockpiling, or excavating of soil; placement of fill materials; paving, pavement removal, exterior construction; substantial removal of vegetation where soils are disturbed including, but not limited to, removal by clearing or grubbing; or any activity which bares soil or rock or involves streambed alterations or the diversion or piping of any watercourse. Land disturbance activity does not include routine maintenance to maintain original line and grade, hydraulic capacity or the original purpose of the facility, nor does it include emergency construction activities or maintenance activities required to protect public health and safety.

"Land owner" means the holder of legal title to the land and other persons or entities who exercise control over a land development project pursuant to rights granted in a purchase agreement, joint venture agreement, development agreement, or long-term lease.

"Low impact development (LID)" means a storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic features.

"Maintenance (of a BMP)" means periodic action taken to maintain the as designed performance of a BMP and includes, but is not limited to, repairs to the BMP as necessary and replacement of the BMP by an equally effective or more effective BMP at the end of its useful life.

"Maximum extent practicable" is an acceptability standard for best management practices (BMPs). When BMPs are required to meet this standard, the BMPs must be the most effective set of BMPs that is still practicable. A BMP is effective if it prevents, reduces, or removes the pollutants that would otherwise be present in runoff due to human activity. A BMP is practicable if it complies with other regulations as well as storm water regulations; is compatible with the area's land use, character, facilities, and activities; is technically feasible (considering area soil, geography, water resources, and other resources available); is economically feasible; and provides benefits that are reasonable in relation to costs.

"MEP" means maximum extent practicable.

"Motor vehicle" means any automobile, car, truck, bus, motor home, or other self-propelled vehicle used or suited to use for on-road transportation; and any similar vehicle modified for off-road use.

"Municipal facility" means a facility owned or operated by the City of National City that is used for a governmental purpose. Facilities on municipally-owned land that are leased or rented to others to generate municipal revenues are not municipal facilities. (The commercial or

industrial lessees of such facilities may, however, be subject to this Chapter as commercial dischargers or industrial dischargers).

"National Pollution Discharge Elimination System (NPDES) permit" means a national pollutant discharge elimination system permit issued by the Regional Water Quality Control Board or the State Water Resources Control Board and/or the Regional Water Quality Control Board.

"NPDES Permit No. CAS0108758" means RWQCB Order No. 2007-0001, NPDES Permit No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff From the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the County of San Diego, the incorporated cities of San Diego County, the San Diego Unified Port District, and the San Diego County Regional Airport Authority.

"Nonstorm water discharge" means any discharge to the storm water conveyance system that is not entirely composed of storm water.

"Plan standard" means any or all applicable requirements of the basin plan, the enclosed bays and estuaries plan, the inland surface water plan, and the California Ocean Plan.

"Pollutant" means and includes, but is not limited to solid waste, sewage, garbage, medical waste, wrecked or discarded equipment, radioactive materials, dredged spoil, rock, sand, sediment, industrial waste, and any organic or inorganic contaminant whose presence degrades the quality of the receiving waters in violation of the basin plan, the enclosed bays and estuaries plan, the inland surface water plan, and the California Ocean Plan standards, such as fecal coliform, fecal streptococcus, enterococcus, volatile organic carbon (VOC), surfactants, oil and grease, petroleum hydrocarbons, total organic carbon (TOC), total suspended and settleable solids, nutrients, metals, cyanides, phenols, and biocides. A pollutant also includes any substance defined as a pollutant under 40 CFR Section 122.2, and any contaminant which degrades the quality of the receiving waters in violation of the basin plan, the enclosed bays and estuaries plan, the inland surface water plan, and the California Ocean Plan standards by altering any of the following parameters: pH, biochemical oxygen demand (BOD), chemical oxygen demand (COD), and temperature.

"Premises" means any building, lot, parcel, real estate, land, or portion of land whether improved or unimproved.

"Priority development projects" are any development projects falling into at least one of the following categories.

1. Housing subdivisions resulting in the disturbance of one acre or more of land, or comprised of 10 or more dwelling units. This category includes single-family homes, multi-family homes, condominiums, and apartments.

2. Commercial developments resulting in the disturbance of one acre or more of land. This category is defined as any development on private land that is not for industrial or residential use where the land area for development is greater than one acre. The category includes, but is not limited to, hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, municipal facilities, commercial nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses, automotive dealerships, commercial airfields, and other light industrial facilities.

3. Development of industry resulting in the disturbance of one acre or more of land. This category includes, but is not limited to, manufacturing plants, food processing plants, metal working facilities, printing plants, and fleet storage areas (bus, trucks, etc.).

4. Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539. The SIC codes are available on OSHA's website (http://www.osha.gov/pls/mis/sicsearch.html).

5. Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812), where the land

area for development is greater than 5,000 square feet. Restaurants where land development is less than 5,000 square feet shall meet all Standard Urban Storm Water Mitigation Plan (SUSMP) requirements except for structural treatment BMP and numeric sizing criteria requirement and hydromodification requirement.

6. All hillside development greater than 5,000 square feet. This category is defined as any development which creates 5,000 square feet of impervious surface that is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.

7. Environmentally Sensitive Areas: All development and redevelopment located within or directly adjacent to or discharging directly to an environmentally sensitive area (where discharges from the development or redevelopment will enter receiving waters within the environmentally sensitive area), which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. "Directly adjacent" means situated within 200 feet of the Environmentally Sensitive Area (ESA). "Discharging directly to" means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or redevelopment site, and not commingled with flows from adjacent lands.

8. Parking lots 5,000 square feet or more or with 15 or more parking spaces and potentially exposed to urban runoff. Parking lot is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce.

9. Street, roads, highways, and freeways. This category includes any paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles. Natural BMPs such as constructed wetlands, grassed swales, biofilters, wet ponds, and vegetated filter strips shall be utilized whenever practicable for all new development and significant redevelopment.

10. Retail Gasoline Outlets (RGOs). This category includes RGOs and retail places of business engaged in the sales of motor fuels that meet the following criteria: (a) 5,000 square feet or more, or (b) a projected average daily traffic (ADT) of 100 or more vehicles per day.

11. All other pollutant generating development projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces.

"Rainy season" means the period from October 1st through April 30th.

"Receiving water" means surface bodies of water, as described in Order No. 90-42 of the Regional Water Quality Control Board, San Diego Region, that serve as discharge points for the storm water conveyance system, including San Diego Bay, Paradise Creek and the Paradise Creek Marsh, the Sweetwater River and the Sweetwater River Flood Control Channel, the 7th Street Channel, and La Paleta Creek.

"Redevelopment" means any construction, alteration, or improvement of an already developed site that will increase the total impervious surface area of that site or that involves activities that could expose pollutants to rainfall. Redevelopment can include, but is not limited to, the expansion of building footprints, the addition or replacement of a structure, exterior construction and remodeling, replacement of existing impervious surfaces that are not part of a routine maintenance activity, and other activities that create additional impervious surfaces.

"Regulated commercial facility" means all nonresidential facilities engaged in business or commerce, whether for profit or not-for-profit or publicly or privately owned, except for regulated industrial facilities and municipal facilities; plus residences used for commercial repair, maintenance, cleaning, manufacturing, food preparation or painting activity if that activity has

the potential to result in the discharge of nonstorm water or the discharge of pollutants to storm water.

"Regulated industrial facility" means any facility subject to the State general industrial storm water permit; any other facility primarily engaged in manufacturing, processing, storage, or handling of raw materials, processed bulk materials or refuse; and any other facility with a total outdoor uncovered area of more than two acres that is used for an industrial activity. Municipal facilities are not regulated industrial facilities, unless they are subject to the State general industrial storm water permit.

"Residential discharger" means, for an occupied residence, the occupants; and for a vacant residence, the owner and the manager of the residence.

"RWQCB" means the Regional Water Quality Control Board for the San Diego region.

"Significant redevelopment" means development in the city that would create, add, or replace at least five thousand square feet of impervious surfaces on an already developed site that falls under one or more priority development project categories. Significant redevelopment includes, but is not limited to: the expansion of a building footprint; addition to or replacement of a structure; replacement of an impervious surface that is not part of a routine maintenance activity; and land disturbing areas related with structural or impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Significant redevelopment does not include trenching and resurfacing associated with utility work; resurfacing and reconfiguring surface parking lots; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and replacement of damaged pavement.

"Standard Urban Storm Water Mitigation Plan (SUSMP)" means the plan designed to reduce pollutants and runoff flows from new development and significant redevelopment, adopted by Ordinance No. 2213 of November 12, 2002, and any subsequently adopted amendments, revisions, or modifications.

"State General Construction Storm Water Permit" means NPDES Permit No. CAS000002, Waste Discharge Requirements for Discharges of Storm Water Associated with Construction Activities, and any amendments thereto.

"State General Industrial Storm Water Permit" means NPDES Permit No. CAS000001, Waste Discharge Requirements for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities, and any amendments thereto.

"Stop work order" means an order issued which requires that specifically identified activity or all activity on a site be stopped.

"Storm water" means surface runoff and drainage associated with storm events and snow melt.

"Storm water conveyance system" means and includes, but is not limited to those municipal facilities within the city by which storm water may be conveyed to waters of the United States, including any roads with drainage systems, municipal streets, catch basins, natural and artificial channels, aqueducts, canyons, stream beds, gullies, curbs, gutters, ditches, natural and artificial channels, or storm drains.

"Storm water management" means the use of structural or nonstructural BMPs that are designed to reduce urban run-off pollutant loads, discharge volumes, and/or peak discharge flow rates or velocities. When applied to the city or another municipality, storm water management also includes planning and programmatic measures.

"Storm water management plan" means a plan, submitted on a City form or in a City-specific format in connection with an application for a City permit or other City approval, identifying the measures that will be used for storm water and nonstorm water management during the permitted activity.

"Storm Water Pollution Prevention Plan (SWPPP)" means a document which describes the on-site program activities to eliminate or reduce to the MEP, pollutant discharges to the

storm water conveyance system. This plan shall include, but not be limited to, the following site information:

1. An inventory of all of materials/wastes that are handled on a premise and have a reasonable potential to impact storm water quality;

2. A description of measures taken which will reduce the possibility or likelihood of accidental spillage resulting from equipment failure or employee error;

3. A description of on-site spill control/response equipment and procedures to prevent contaminants from entering the storm water conveyance system;

4. A site map indicating all building structures, materials and waste storage areas, paved areas, areas of existing and potential erosion, storm drain inlets, and point(s) of discharge to a municipal storm water conveyance system or receiving waters. The site map shall include an estimate of the size of the facility and the facility's impervious area;

5. An employee training program, as defined in Subsection D of this Section, including training outlines and training records;

6. A description of any storm water monitoring program that is conducted on the site.

A storm water pollution prevention plan prepared and implemented pursuant to any NPDES storm water permit shall meet the definition of a storm water pollution prevention plan for the purposes of this Chapter.

"Structural BMP" means a BMP that relies on either a physical condition (other than an entirely natural and undisturbed condition) or on a constructed or installed device to reduce or prevent pollutants in storm water discharges and authorized nonstorm water discharges.

"Structural post-construction BMP" means a structural BMP (other than a temporary construction-related BMP) put in place in connection with a land development or redevelopment project to prevent or reduce contamination in storm water or receiving waters or to prevent or reduce erosion downstream from the project. All treatment control BMPs are structural post-construction BMPs.

"SUSMP Manual" means the city's Standard Urban Stormwater Mitigation Plan manual and described in Section 14.22.140 of this Chapter.

"SWRCB" means the State Water Resources Control Board.

"Surface waters plan" means the "California Inland Surface Waters Plan: Water Quality Control Plan for Inland Surface Waters of California" adopted by the State Water Resources Control Board, April 11, 1991, or the most current amendments thereto.

"Treatment control BMP" means any engineered system designed and constructed to remove pollutants from urban runoff. Pollutant removal is achieved by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption, or any other physical, biological, or chemical process. "Treatment control" has the same meaning.

"Tributary to an impaired water body" means a facility or activity is tributary to an impaired water body if urban runoff from that facility or activity enters:

1. The storm water conveyance system at a place and in a manner that will carry pollutants for which that water body is impaired in that discharge to the impaired water;

2. A flowing stream that will carry pollutants for which that water body is impaired in that discharge to the impaired water; or

3. An ephemeral stream that reaches the impaired water during storm events and that will carry pollutants for which that water body is impaired from the facility or activity to the impaired water body during such storm events.

"Urban run-off" means all flows in a storm water conveyance system in the city other than point source discharges in violation of a site-specific NPDES permit. Urban run-off includes, but is not limited to, storm water, exempt nonstorm water discharges, and illicit discharges.

"Water main" means a potable or recycled water delivery line greater than or equal to four inches in diameter.

"Watercourse" means any natural or artificial stream, river, creek, ditch, channel, canal, conduit, culvert, drain, waterway, gully, ravine, arroyo, or wash in which waters flow in a definite direction or course, either continuously or intermittently, and which has a definite channel and a bed or banks. A channel is not limited to land covered by minimal or ordinary flow but also includes land covered during times of high water. Watercourse does not include any surface drainage prior to its collection in a stream, river, creek, ditch, channel, canal, conduit, culvert, drain, waterway, gully, ravine, arroyo, or wash.

"Water quality standards" are defined as the beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.) of water and the water quality objectives adopted by the State or United States Environmental Protection Agency to protect those uses.

"Waters of the United States" means water subject to the regulatory jurisdiction of the United States under the Federal Clean Water Act and applicable case law. (In general, this includes "navigable" waters, waters tributary to "navigable" waters, and adjacent wetlands).

14.22.040 General provisions.

A. Responsibility for Administration. This Chapter shall be administered for the City by its authorized enforcement officials.

B. Construction and Application. This Chapter shall be interpreted to assure consistency with the requirements of the Federal Clean Water Act and acts amendatory thereof or supplementary thereto, applicable implementing regulations and NPDES Permit No. CAS108758 and any amendments, revision, or reissuance thereof, and SUSMP. This Chapter is not intended to interfere with, abrogate or annul any other chapter, rule or regulation, statute, or other provision of law. The requirements of this Chapter should be considered minimum requirements, and where any provision of this Chapter imposes restrictions different from those imposed by any other chapter, rule, or regulation, or other provision of law, whichever provisions are more restrictive or impose higher protective standards for human health or the environment shall take precedence. Storm water and nonstorm water discharges regulated under a valid facility-specific NPDES permit or facility-specific RWQCB waste discharge requirements permit are not subject to this Chapter, but shall instead be regulated exclusively by the RWQCB.

C. Recycled Water. This Chapter is not intended to prohibit or prevent the use of recycled water or the discharge of recycled water after use. This Chapter is intended to require the use of BMPs for such uses and discharges as necessary to protect human health and the environment.

D. Severability and Validity. If any section of this Chapter is declared invalid by a court of law, the remaining sections shall remain valid.

E. City Permits and Approvals.

1. An application for any of the following discretionary permits or approvals shall be accompanied by plans demonstrating how the requirements of this Chapter will be met, and the permit or approval shall not be approved unless the decision maker determines that the application complies with the requirements of this Chapter:

a. Conditional use permit (including modification or time extension).
b. Coastal development permit.
c. Parcel map (and modifications).
d. Reclamation plan.
e. Planned development permits.
f. Planned unit development permits.
g. Planning commission approval of plans.
h. Site plan review.

i. Tentative map (and amendments to conditions of approval or time extension).

j. Tentative parcel map.

k. Variance.

2. An application for any of the following ministerial permits or approvals shall be accompanied by plans demonstrating how the specifically applicable requirements, if any, set out in corresponding sections of the SUSMP Manual and the BMP Manual will be met, and the permit or approval shall not be approved unless the decision maker determines that the application complies with those requirements:

a. Administrative clearing permit.

b. Lot line adjustment.

c. Final map modification.

d. Grading plan (including modification or renewal).

e. Improvement plan (including modification).

f. Landscape plan.

g. Building permit.

h. Construction right-of-way permit.

i. Encroachment permit.

j. Excavation permit.

k. On-site wastewater system permit.

l. Underground tank permit.

m. Well permit.

F. Guidance Documents. Any authorized enforcement official may prepare, disseminate, and maintain guidance documents addressing the use of pollution prevention practices and BMPs for specific activities or facilities, illicit connections, and illegal disposal.

These guidance documents may set out additional compliance alternatives that, in specified circumstances, can provide the same environmental protection that is afforded by the BMPs required by this Chapter.

These guidance documents may also identify practices that have been determined by the authorized enforcement official to be additional BMPs that may be implemented for land disturbance activity and land development activity to prevent or control pollution to the MEP.

Authorized enforcement officials may also take these guidance documents into account when determining whether any practices used by a discharger or proposed in a grading plan, a storm water pollution prevention plan (SWPPP), an enforcement settlement offer, or any other submittal to the city, are BMPs that will prevent or control pollution to the MEP. These case-specific discretionary decisions may involve circumstances that were not anticipated when general guidance documents were prepared. Therefore, these guidance documents do not confer rights on dischargers in these circumstances, and do not constrain the discretion of authorized enforcement officials. Where appropriate, and provided the same protection is provided to the environment, authorized enforcement officials may depart from these guidance documents when making case-specific decisions authorized by this Chapter.

14.22.090 Best management practice requirements and general requirements applicable to all discharges.

A. Applicable Requirements. All dischargers in the city must comply with the generally applicable prohibitions and requirements in Sections 14.22.010 through 14.22.080 of this Chapter, and must also comply with any other parts of this Chapter (including relevant parts of the BMP Manual and the SUSMP Manual) that are applicable to the type of facility or activity owned or operated by that discharger.

B. Minimum BMPs for All Dischargers. All dischargers in the city must install, implement, and maintain at least the following minimum BMPs:

1. Eroded Soils. Prior to the rainy season, dischargers must remove or secure any significant accumulations of eroded soils from slopes previously disturbed by clearing or grading, if those eroded soils could otherwise enter the storm water conveyance system or receiving waters during the rainy season.

2. Pollution Prevention. Dischargers employing ten or more persons on a full-time basis shall implement those storm water pollution prevention practices that are generally recognized in that discharger's industry or business as being effective and economically advantageous.

3. Prevention of Illegal Discharges. Illicit connections must be eliminated (even if the connection was established pursuant to a valid permit and was legal at the time it was constructed) and illegal discharge practices eliminated.

4. Slopes. Completed slopes that are more than five feet in height, more than two hundred fifty square feet in total area, and more than a three-to-one run-to-rise ratio in grade that have been disturbed at any time by clearing, grading, or landscaping shall be protected from erosion prior to the first rainy season following completion of the slope and continuously thereafter.

5. Storage of Materials and Wastes. All materials and wastes with the potential to pollute urban runoff shall be stored in a manner that either prevents contact with rainfall and storm water or contains contaminated runoff for treatment and disposal.

6. Use of Materials. All materials with the potential to pollute urban runoff (including, but not limited to, cleaning and maintenance products used outdoors, fertilizers, pesticides, and herbicides, etc.) shall be used in accordance with label directions. No such product may be disposed of or rinsed into receiving waters or the storm water conveyance system.

C. Inspection, Maintenance, Repair, and Upgrading of BMPs. BMPs at manned facilities must be inspected by the discharger before and following predicted rain events. BMPs at unmanned facilities must be inspected by the discharger at least once during the rainy season, and at least once between each rainy season. These BMPs must be maintained so that they continue to function as designed. BMPs that fail must be repaired as soon as it is safe to do so. If the failure of a BMP indicates that the BMPs in use are inappropriate or inadequate to the circumstances, the BMPs must be modified or upgraded to prevent any further failure in the same or similar circumstances.

D. Storm Water Pollution Prevention Plan. An authorized enforcement official may require a commercial, industrial, or land disturbance activity discharger to prepare and submit an SWPPP for approval by that official if:

1. The discharger does not come into compliance with this Chapter after one or more warnings (or other enforcement action) that BMPs are inadequate or are not being adequately maintained; or

2. The facility or activity at issue is a significant source of contaminants to receiving waters despite compliance with this Chapter. Any discharger required to submit and to obtain approval of an SWPPP shall install, implement, and maintain the BMPs specified in the approved SWPPP.

The SWPPP shall identify the BMPs that will be used by the discharger to prevent or control pollution of storm water to the MEP. If the facility is an industrial facility, the SWPPP submitted to the city shall at a minimum meet the requirements of the State NPDES general industrial storm water permit. If the activity at issue is a construction or land disturbance activity, the SWPPP submitted to the city shall at a minimum meet the requirements of the State NPDES General Construction Storm Water Permit. If a facility required to submit an SWPPP to the city discharges nonstorm water to groundwater, the facility shall obtain a RWQCB permit as required by the State Water Code and shall describe the requirements of that permit in the SWPPP.

Whenever submission of an SWPPP is required pursuant to this Chapter, an authorized enforcement official may take existing city BMPs into account when determining whether the practices proposed in the SWPPP are BMPs that will prevent or control pollution to the required level of MEP.

E. Notification of Spills, Releases and Illegal Discharges. Spills, releases, and illegal discharges of pollutants to receiving waters or to the storm water conveyance system shall be reported by the discharger as required by all applicable State and federal laws. In addition, any such spills, releases, and illegal discharges with the potential to endanger health, safety, or the environment shall be reported to the directors within twenty-four hours of discovery of the spill, release, or discharge. If safe to do so, necessary actions shall be taken to contain and minimize the spill, release, or illegal discharge.

F. Sampling, Testing, Monitoring, and Reporting. Commercial, industrial, or land disturbance activity dischargers shall perform the sampling, testing, monitoring, and reporting required by this Chapter. In addition, an authorized enforcement official may order a discharger to conduct testing or monitoring, and to report the results to the city if: (1) the authorized enforcement official determines that testing or monitoring is needed to determine whether BMPs are effectively preventing or reducing pollution in storm water to the MEP or to determine whether the facility is a significant source of contaminants to receiving waters; or (2) the authorized enforcement official determines that testing or monitoring is needed to assess the impacts of an illegal discharge on health, safety, or the environment; or (3) an illegal discharge has not been eliminated after written notice by an authorized enforcement official; or (4) repeated violations have been documented by written notices from authorized enforcement officials; or (5) the RWQCB requires the city to provide any information related to the discharger's activities.

Testing and monitoring ordered pursuant to this Subsection may include the following:

1. Visual monitoring of dry weather flows, wet weather erosion, and/or BMPs;
2. Visual monitoring of premises for spills or discharges;
3. Laboratory analyses of storm water or nonstorm water discharges for pollutants;
4. Background or baseline monitoring or analysis; and
5. Monitoring of receiving waters or sediments that may be affected by pollutant discharges by the discharger (or by a group of dischargers including the discharger).

The authorized enforcement official may direct the manner in which the results of required testing and monitoring are reported and may determine when required sampling, testing, or monitoring may be discontinued.

G. Mitigation. All illegal discharges must be mitigated within a reasonable period of time to correct or compensate for all damage to the environment caused by the illegal discharge. The authorized enforcement official shall determine whether mitigation measures proposed or completed by the discharger meet this standard. The authorized enforcement official shall require the discharger to submit a mitigation plan and schedule by a specified date prior to taking action, and to submit a summary of completed mitigation by a specified date.

14.22.110 Additional minimum best management practice requirements for commercial activities and facilities.

A. Application of Requirements. All regulated commercial dischargers must install, implement, and maintain at least the additional minimum BMPs, if any, specified in this Section or in the BMP Manual for the category of activity or facility owned or operated by that discharger, as applicable. All regulated commercial dischargers shall review their facilities, activities, operations, and procedures at least annually to detect and eliminate illicit connections

and illegal discharges. Corrective training shall be provided as needed (and documented in training records) whenever an illegal disposal practice is discovered.

B. Regulated Commercial Dischargers Identified. As required by NPDES Permit No. CAS0108758, facilities in the city having one or more of the following characteristics are regulated commercial facilities:

1. The facility is a regulated commercial discharger if it is engaged in one or more of the following commercial activities:

a. Airplane mechanical repair, maintenance, fueling, or cleaning;
b. Motor vehicle (or other vehicle) parking lots and storage facilities;
c. Motor vehicle and other vehicle body repair or painting;
d. Motor vehicle mechanical repair, maintenance, fueling, or cleaning;
e. Boat mechanical repair, maintenance, fueling, or cleaning;
f. Botanical or zoological gardens and exhibits;
g. Cement mixing or cutting;
h. Cemeteries;
i. Eating or drinking establishments, including food markets;
j. Equipment repair, maintenance, fueling, or cleaning;
k. Golf courses, parks and other recreational areas/facilities;
l. Landscaping;
m. Marinas;
n. Masonry;
o. Mobile motor vehicle or other vehicle washing;
p. Mobile carpet, drape, or furniture cleaning;
q. Nurseries and greenhouses;
r. Painting and coating;
s. Pest control services;
t. Pool and fountain cleaning;
u. Portable sanitary services;
v. Retail or wholesale fueling;
w. Building material retailers and storage;
x. Animal facilities;
y. Power washing services.

2. All other commercial dischargers not mentioned in Section 14.22.110(B)(1), tributary to a CWA Section 303(d) impaired water body segment for which the city has determined the facility or activity generates pollutants for which the water body segment is impaired.

3. Commercial dischargers discharging directly to receiving waters within ESAs.

4. All other commercial dischargers that the city determines may contribute a significant pollutant load to the storm water conveyance system.

C. Additional Minimum BMPs for All Regulated Commercial Dischargers. All regulated commercial dischargers shall install, implement, and maintain the BMPs specified in the BMP Manual the following areas, as applicable:

1. Employee training;
2. Storm drain tileage and signing;
3. Annual review of facilities and activities;
4. Pollution prevention; and
5. Good housekeeping.

D. Additional Minimum BMPs for Specific Activities Conducted by Regulated Commercial Dischargers. Regulated commercial dischargers shall install, implement, and maintain the BMPs specified in the BMP Manual for all locations, if any, where any of the following activities are conducted:

1. Vehicle and equipment operations;
2. Materials and waste management (including tanks); and
3. Outdoor work and storage functions.

E. Additional Minimum BMPs for Specific Types of Regulated Commercial Facilities and Activities. Regulated commercial dischargers, including but not limited to the types of facilities and activities listed below, shall install, implement, and maintain the BMPs specified in the BMP Manual for each such type of facility or activity. BMPs must be installed, implemented, and maintained for all applicable specific facility or activity types regardless of whether that activity is the primary activity of the regulated commercial discharger.

1. Automobile, other vehicle, or equipment repair, maintenance, fueling, or cleaning;
2. Boat repair, maintenance, fueling, or cleaning, including marinas;
3. Automobile or other vehicle body repair or painting;
4. Automobile or other vehicle parking and storage;
5. Painting and coating;
6. Eating and drinking establishments, including food markets;
7. Parking lots and storage facilities;
8. Cement mixing and cutting and masonry;
9. Mobile carpet, drape, and furniture cleaning;
10. Pool and fountain cleaning;
11. Portable sanitary servicing;
12. Mobile vehicle washing;
13. Pest control;
14. Landscaping, including cemeteries, botanical gardens, golf courses, and parks;
15. Nurseries and greenhouses;
16. Building materials retailers and storage;
17. Animal facilities, including zoological gardens; and
18. Power washing.

F. Additional Controls. Where necessary to prevent discharges from causing or contributing to violations of water quality standards, the city may require the implementation of additional controls for commercial dischargers tributary to CWA Section 303(d) listed water body segments where the facility or activity generates pollutants for which the water body segment is impaired or for commercial dischargers within or directly adjacent to or discharging directly to receiving waters within ESAs. Additional controls may include, but are not limited to implementation of BMPs more stringent than the applicable minimum BMPs in this Chapter and preparing an SWPPP or conducting monitoring as provided in Section 14.22.090 of this Code.

14.22.120 Additional minimum best management practice requirements for industrial activities and facilities.

A. Application of Requirements. All regulated industrial dischargers must install, implement, and maintain at least the applicable additional minimum BMPs, if any, specified in this Section or in the BMP Manual for the category of activity or facility owned or operated by that discharger. All regulated industrial dischargers shall review their facilities, activities, operations, and procedures at least annually to detect and eliminate illicit connections and

illegal discharges. Corrective training shall be provided as needed (and documented in training records) whenever an illegal disposal practice is discovered.

B. Regulated Industrial Dischargers Identified. Dischargers that meet one or more of the criteria listed below are regulated industrial dischargers:

1. The facility is an industrial discharger, as defined in 40 CFR Section 122.26(b)(14), including those subject to the State industrial general storm water permit or other individual NPDES permit.

2. The facility is an operating and/or closed landfill.

3. The facility is subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA).

4. The facility is a hazardous waste treatment, disposal, storage, and/or recovery facility.

5. The facility is an industrial discharger tributary to a CWA Section 303(d) listed water body, and the facility generates a pollutant for which that water body is impaired.

6. The facility is a regulated industrial facility, and is located within or directly adjacent to (i.e., within two hundred feet) or discharges directly to a coastal lagoon or a receiving water body within an ESA.

C. Regulated industrial facilities must meet the applicable requirements set out in Sections 14.22.040 through 14.22.090 for all discharges, the applicable requirements set out in Section 14.22.110 for regulated commercial facilities, any applicable requirements in Section 14.22.140, and the following practices:

1. Pollution Prevention Practices. Regulated industrial facilities shall consider and, where determined to be appropriate by the facility, shall implement the following measures to prevent the pollution of storm water and runoff:

a. The use of smaller quantities of toxic materials or substitution of less toxic materials;

b. Changes to production processes to reduce waste;

c. Decreases in waste water flows;

d. Recycling of wastes as part of the production process;

e. Segregation of wastes; and

f. Treatment of wastes on site to decrease volume and/or toxicity.

2. Nonstructural BMPs. Regulated industrial facilities shall incorporate into the SWPPP, and install, implement and maintain the following nonstructural BMPs. The implementation of these practices shall be consistent with specifications, if any, contained in the BMP Manual.

a. BMPs for material handling and storage of significant materials;

b. BMPs for nonhazardous waste handling and recycling;

c. Preventive maintenance practices;

d. Self-inspection and quality assurance practices; and

e. Spill response planning.

3. BMPs for Specific Activities. Regulated industrial facilities shall install, implement and maintain BMPs as specified in the BMP Manual for any commercial activities conducted at the facility (as identified in Section 14.22.110) and for areas at the facility where industrial activities are conducted. Industrial activities include, but are not limited to the following:

a. Raw or processed materials bulk storage;

b. Mixing, where there is the potential for release of a pollutant;

c. Cutting, trimming, or grinding in connection with a production process;

d Casting, forging, or forming;

e. Hazardous materials storage (including tanks);

f. Pesticide or other chemical products formulation or packaging;
g. Process water pre-treatment;
h. Solid waste storage;
i. Waste water treatment;
j. Welding;
k. Blasting;
l. Chemical treatment; and
m. Loading and unloading significant materials.

4. Additional Structural BMPs. Regulated industrial facilities shall install, implement, and maintain one or more of the additional structural BMPs listed below where practicable, if use of such BMPs would significantly reduce pollution in run-off from the facility. The discharger shall determine in the first instance which of these BMPs to implement. However, an authorized enforcement official can order that additional BMPs be used at a particular facility.

a. Overhead coverage of outdoor work areas or chemical storage;
b. Retention ponds, basins, or other impoundments that confine storm water to the site;
c. Berms and concrete swales or channels that divert run-on and runoff away from contact with pollutant sources; and
d. Treatment controls to reduce pollutants in storm water or authorized nonstorm water discharges. The design of proposed treatment controls must be approved by the city engineer prior to implementation. Maintenance of treatment controls shall be the responsibility of the property owner.

D. Additional Requirements for Regulated Industrial Dischargers Subject to the State Industrial General Storm Water Permit.

1. Notice of Intent. Industrial dischargers required to comply with the State Industrial General Storm Water Permit shall maintain on site, and make available for inspection on request by the city, the state-issued waste discharge identification number (WDID) for the facility, and a copy of the notice of intent (NOI) filed with the SWRCB pursuant to that permit. The discharger shall submit the WDID and a copy of that NOI to the city by mail if directed to do so by an authorized enforcement official. Regulated industrial dischargers which are potentially subject to the State Industrial General Storm Water Permit that have determined they do not require coverage under that permit must prepare and retain on site, and make available for inspection, a written report documenting and explaining that determination.

2. Storm Water Pollution Prevention Plan. Dischargers required to prepare an SWPPP under the State General Industrial Storm Water Permit must prepare the plan, implement the plan, and maintain it at the site readily available for review. Failure to comply with an applicable State-required SWPPP is a violation of this Chapter.

E. Additional Controls. Where necessary to prevent discharges from causing or contributing to violations of water quality standards, the city may require the implementation of additional controls for industrial dischargers tributary to CWA Section 303(d) listed water body segments where the facility or activity generates pollutants for which the water body segment is impaired or for commercial dischargers within or directly adjacent to or discharging directly to receiving waters within ESAs. Additional controls may include, but are not limited to implementation of BMPs more stringent than the applicable minimum BMPs in this Chapter, and preparing an SWPPP or conducting monitoring as provided in Section 14.22.090 of this Code.

<u>14.22.130 Additional minimum best management practice requirements for municipal activities and facilities</u>. Municipal facilities must meet the requirements set out in Sections 14.22.010 through 14.22.090 and, where applicable, Sections 14.22.150 and 14.22.160 of this Chapter. In addition, these facilities and activities must install, implement, and maintain at least

the additional minimum BMPs, if any, specified in Section 14.22.120 or in the BMP Manual, for industrial areas and activities at the municipal facility.

14.22.140 Manuals.

A. Effect of Manuals. All dischargers who are required by this Chapter to install, implement, and maintain BMPs shall ensure that their selection of BMPs is consistent with the applicable specifications, if any, contained in the BMP Manual and the SUSMP Manual, for the category and priority of activity or facility owned or operated by that discharger. All BMPs installed, implemented, or maintained to meet the requirements of this Chapter must conform to the applicable specifications, if any, set out in these manuals.

B. Existing Facilities. The BMP Manual sets out minimum BMPs and other objective specifications for specific types and categories of existing facilities and activities. Where minimum BMPs and objective specification are specified, they are mandatory. Where no minimum BMPs have been specified in the BMP Manual for a type and category of facility or activity, only the requirements set out in this Chapter are applicable.

C. Land Development Projects. The BMP Manual sets out minimum BMPs and other objective specifications for all construction phase activities. The SUSMP Manual sets out minimum BMPs, design criteria, and other objective specifications for project design and planning with respect to the post-development condition of priority development projects.

D. Conflicting or More Detailed Requirements. In case of any conflict between any applicable minimum BMPs specified in this Chapter, and any applicable requirements described in more detail for a particular type of facility or activity in the BMP Manual or the SUSMP Manual, the requirement in the BMP Manual or the SUSMP Manual shall prevail.

14.22.150 Additional requirements for land disturbance activity.

A. Permit Issuance. No land owner or development project proponent shall receive any city grading, clearing, building, or other land development permit required for land disturbance activity without first meeting the requirements of this Chapter with respect to the portion of the development project and the land disturbance activity to which the permit at issue would apply.

B. Owners and Operators Both Responsible and Liable. Persons or entities performing land disturbance activity (including but not limited to construction activities) in the city, and the owners of land on which land disturbance activity is performed, are dischargers for purposes of this Chapter, provided however, that a local government or public authority is not a discharger as to activities conducted by others in public rights-of-way.

C. Storm Water Management Plan. All applications to the city for a permit or approval associated with a land disturbance activity must be accompanied by a storm water management plan on a form or in a format specified by the city. The storm water management plan shall specify the manner in which the discharger/applicant will implement the BMPs required by this Chapter for the activity at issue, including but not limited to the applicable BMPs required by Subsection D below.

D. Additional Minimum BMPs for Land Disturbance Activity. Whether a city permit or approval is required or not, and whether a storm water management plan is required to be submitted or not, all dischargers engaged in land disturbance activity shall implement BMPs as detailed in the BMP Manual in the following additional areas, if applicable to the project:

1. Erosion control on slopes;
2. Erosion control on flat areas; or BMPs to desilt runoff from flat areas;
3. Runoff velocity reduction;
4. Sediment control;
5. Off-site sediment tracking control;
6. Materials management;

7. Waste management;
8 Vehicle and equipment management;
9. Water conservation;
10. Structure construction and painting;
11. Paving operations;
12. Dewatering operations;
13. Planned construction operations;
14. Downstream erosion control;
15. Prevention of nonstorm water discharges;
16. Protection of ground water.

E. Control to the MEP. All dischargers engaged in land disturbance activity must install, implement, and maintain those additional BMPs, if any, that are needed to prevent or reduce pollutant discharges in storm water from land disturbance to the MEP.

F. Notice of Intent. Dischargers required to comply with the State Construction General Storm Water Permit shall maintain on site, and make available for inspection on request by the city, any State-issued waste discharge identification number (WDID) for the site and a copy of the notice of intent (NOI) filed with the SWRCB pursuant to that permit.

G. Storm Water Pollution Prevention Plan. Dischargers required to prepare an SWPPP under the State General Construction Storm Water Permit must prepare the plan, implement the plan, and maintain it at the site readily available for review. Failure to comply with an applicable State-required SWPPP is a violation of this Chapter.

H. Facility Monitoring. Dischargers required to conduct monitoring under the State Construction General Storm Water Permit must conduct such monitoring in conformance with requirements specified by the State, retain records of such monitoring on site, and make such records available for inspection by an authorized enforcement official.

I. Additional Controls. Where necessary to prevent discharges from causing or contributing to violations of water quality standards, the city may require the implementation of additional controls for dischargers engaged in land disturbance activity tributary to CWA Section 303(d) listed water body segments where the land disturbance area or activity generates pollutants for which the water body segment is impaired or for dischargers engaged in land disturbance activity within or directly adjacent to or discharging directly to receiving waters within ESAs. Additional controls may include, but are not limited to implementation of BMPs more stringent than the applicable minimum BMPs listed in this Chapter.

14.22.160 Additional planning, design, and post-construction requirements for Development Projects.

A. Application to Development Projects. No land owner or development project proponent in the city shall receive any city permit or approval listed in Section 14.22.040(F) of this Chapter for land development activity or redevelopment activity unless the project meets or will meet the requirements of this Chapter. Post-construction BMP requirements imposed by this Section and by the SUSMP Manual shall not apply to those physical aspects of the project that have been completed or substantially completed pursuant to and as required by a valid city permit or approval at the time a complete application for a subsequent permit or approval is submitted.

B. Owners and Developers Responsible and Liable. Developers, development project proponents, and land owners for land on which land development activity is performed are dischargers for purposes of this Chapter; provided, however that a local government or public authority is not a discharger as to activities conducted by others in public rights-of-way.

C. Post-Construction BMPs Required. Development projects with the potential to add pollutants to storm water or to affect the flow rate or velocity of storm water runoff after construction is completed, shall be designed to include and shall implement all of the following

post-construction BMPs to ensure that pollutants and runoff from the development will be reduced to the MEP, and will not significantly degrade receiving water quality.

1. Source control BMPs. Source control BMPs include storm drain system stenciling and posting of signs; posting of signs or other form of notification at storm drain inlets and access points to creeks and channels discouraging illegal dumping and stating the receiving water by name; properly designed outdoor material storage areas; properly designed trash storage areas; and implementation of efficient irrigation systems.

2. Low Impact Development (LID) BMPs. LID BMPs shall maximize infiltration, provide retention, slow run-off, minimize impervious footprint and constructed widths, and direct run-off from impervious areas into landscaping.

3. Buffer zones. A project shall be designed to include a buffer zone for natural water bodies. Where buffer zones are not feasible, other equally serving methods may be implemented, such as trees or access restrictions.

4. Construction BMPs. Implement land disturbance BMPs described in this Chapter.

5. Submittal of proof of a mechanism under which ongoing long-term maintenance of all structural post-construction BMPs will be conducted.

6. Additional BMPs as necessary to ensure that pollutants and runoff from the development project do not cause or contribute to an exceedance of a receiving water quality objective.

D. Additional Post-Construction BMP Requirements for Priority Development Projects. Priority development projects are subject to additional requirements as described in SUSMP Manual.

E. Post-Construction Storm Water Management Plan. All applications to the city for a permit or approval associated with a land development or redevelopment activity must be accompanied by a post-construction storm water management plan on a form or in a format specified by the city. The plan shall specify the manner in which the discharger/applicant will implement the post-construction BMPs required by this Chapter. The plan must address those aspects of the project that, at the time a complete application is submitted, are subject to further environmental review pursuant to Section 15162 of the California Environmental Quality Act. Post-construction BMPs for other aspects of the project need not be addressed in this plan.

F. Storm Water Management Plan Review Fee and Deposit. Fees for storm water management plan review and deposit thereof shall be adopted by resolution.

14.22.170 Maintenance of BMPs.

A. Existing Development. Residential, commercial, industrial, agricultural, and municipal dischargers shall maintain the BMPs they rely upon to achieve and maintain compliance with this Chapter.

B. New Development and Redevelopment. The owners and occupants of lands on which structural post-construction BMPs have been installed to meet the requirements of this Chapter shall ensure the maintenance of those BMPs, and shall maintain those BMPs by contract or covenant or pursuant to this Chapter. The owners of lands on which BMPs have been installed to meet the requirements of this Chapter and applicable SUSMP requirements are responsible for maintenance of those BMPs, shall enter into a BMP maintenance agreement contract or equivalent agreement with the city, and shall provide annual verification that appropriate maintenance is conducted for all treatment control BMPs.

C. Maintenance Obligations. Primary responsibility to maintain a BMP may be transferred through a contract or other agreement. If that contract provides that it will be submitted to the city pursuant to this Chapter as part of a development permit application, and if that contract is so submitted, the person or entity accepting a maintenance obligation in such a contract or agreement will also be legally obliged to maintain that BMP pursuant to this Chapter.

D. Obligation to Maintain BMPs Not Avoided by Contracts or Other Agreements. For purposes of city enforcement, no contract or other agreement imposing an obligation to maintain a BMP can relieve a person or entity of any obligation to maintain a BMP imposed by this Chapter.

E. Disclosure of Maintenance Obligations. Any developer who transfers ownership of land on which a BMP is located or will be located or who otherwise transfers ownership of a BMP or responsibility for the maintenance of a BMP to another person or entity, shall provide clear written notice of the maintenance obligations associated with that BMP to the new or additional responsible party prior to that transfer, and shall record that obligation so that the BMP will run with the land.

F. Maintenance Plans for Development Projects. The proponents of any land development project or significant redevelopment project that requires a discretionary city permit shall provide to the city for review and approval prior to issuance of such permit, a plan for maintenance of all post-construction structural BMPs associated with the project. The plan shall specify the persons or entities responsible for maintenance activity, the persons or entities responsible for funding, schedules and procedures for inspection and maintenance of the BMPs, worker training requirements, and any other activities necessary to ensure BMP maintenance. The plan shall provide for servicing of all post-construction structural BMPs at least annually, and for the retention of inspection and maintenance records for at least three years.

G. Access Easement/Agreement. The proponents of any land development project or significant redevelopment project that requires a discretionary city permit shall agree to a condition of approval that provides the city access for inspection and maintenance of BMPs or, at the discretion of the city, shall provide to the city for review and approval prior to issuance of such permit an executed, permanent easement onto the land on which post-construction structural BMPs will be located (and across other lands as necessary for access), to allow inspection and/or maintenance of those BMPs.

H. Security for Maintenance for Land Development Projects. If it is determined by the authorized enforcement official that the public interest requires the posting of bond or other security to assure the maintenance of a BMP, such bond or security may be required by the authorized enforcement official.

PASSED and ADOPTED this 16th day of February, 2010.

Ron Morrison, Mayor

ATTEST:

Michael R. Dalla, City Clerk

APPROVED AS TO FORM:

George H. Eiser, III
City Attorney

Passed and adopted by the Council of the City of National City, California, on February 16, 2010, by the following vote, to-wit:

Ayes: Councilmembers Morrison, Parra, Sotelo-Solis, Van Deventer, Zarate.

Nays: None.

Absent: None.

Abstain: None.

AUTHENTICATED BY: RON MORRISON
Mayor of the City of National City, California

MICHAEL R. DALLA
City Clerk of the City of National City, California

By: _____
Deputy

I HEREBY CERTIFY that the foregoing ordinance was not finally adopted until seven calendar days had elapsed between the day of its introduction and the day of its final passage, to wit, on February 2, 2010 and on February 16, 2010.

I FURTHER CERTIFY THAT said ordinance was read in full prior to its final passage or that the reading of said ordinance in full was dispensed with by a vote of not less than a majority of the members elected to the Council and that there was available for the consideration of each member of the Council and the public prior to the day of its passage a written or printed copy of said ordinance.

I FURTHER CERTIFY that the above and foregoing is a full, true and correct copy of ORDINANCE NO. 2010-2329 of the City Council of the City of National City, passed and adopted by the Council of said City on February 16, 2010.

City Clerk of the City of National City, California

## National Pollutant Discharge Elimination System (NPDES) Project Applicability Form

***No project will be accepted by the City without this form completed in its entirety***

Project Name: _____ Project Area: _____ acres/sq ft

Project Address: _____

APN: _____ Proposed Impervious Area:_____ acres/sq ft

Description of Project: _____

Description of Location: _____

## *Section 1 – Permanent Storm Water BMP Requirements:*

**PART A: Determine Subjectivity to SUSMP Requirements**

*Is the project new development?* □ *Yes* □ *No*

*Is the project redevelopment that adds/replaces/creates 5,000 ft$^2$ of impervious surface[1]?* □ *Yes* □ *No*

If both of the above answers are "no", go to Part B. If either of the above answers is "yes," answer the questions below (check all that apply).

Is the Project…

1. *Detached or attached residential development of 10 or more units?* □ *Yes* □ *No*
2. *Commercial development greater than one acre?* □ *Yes* □ *No*
3. *Industrial development greater than one acre?* □ *Yes* □ *No*
4. *Automotive repair shop?* □ *Yes* □ *No*
5. *Restaurant?* □ *Yes* □ *No*
6. *Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface?* □ *Yes* □ *No*
7. *Project located within or directly adjacent to (within 200 feet) or directly discharges to Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition?* □ *Yes* □ *No*
8. *Parking lot greater than or equal to 5,000 square feet of impervious surface OR with at least 15 parking spaces and potentially exposed to urban runoff?* □ *Yes* □ *No*
9. *Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater?* □ *Yes* □ *No*
10. *Retail gasoline outlets 5,000 square feet or more or with a project Average Daily Traffic (ADT of 100 or more vehicles per day* □ *Yes* □ *No*

[1] See the City's SUSMP Ordinance for more detail on the definition of "significant redevelopment."
[2] Limited exclusion: trenching and resurfacing work associated with utility projects are not considered Priority Projects. Parking lots, buildings and other structures associated with utility projects are Priority Projects if one or more of the criteria in Part A is met.

If any of the answers to Part A is "Yes", your project is a "Priority Project" and must meet the requirements of the City's Standard Urban Storm Water Mitigation Plan (SUSMP) Ordinance.[2]

**Is this a PRIORITY PROJECT that requires a SUSMP report?** □ **Yes** □ **No**

If all answers to Part A are "No", continue to PART B.
If any of the answers to Part A is "Yes", skip PART B and go to Section 2.

**PART B: Determine Non-SUSMP Standard Permanent Storm Water BMP Requirements**

*Does the project require any of the following permits or approvals?* □ ***Yes*** □ ***No***

- *Discretionary: Conditional use permit (including modification or extension); Coastal development permit; Parcel map (and modifications); Reclamation plan; Planned development permits; Planned unit development permits; Planning commission approval of plans; Site plan review; Tentative map (and amendments to conditions of approval or time extension); Tentative parcel map; or Variance OR*
- *Ministerial: Administrative clearing permit; Lot line adjustment; Final map modification; Grading plan (including modification or renewal); Improvement plan (including modification); Landscape plan; Building permit; Construction right-of-way permit; Encroachment permit; Excavation permit; On-site wastewater system permit; Underground tank permit; or Well permit*

*Will the project include exterior construction beyond signs, façade work, or other incidental construction to an existing structure?* □ ***Yes*** □ ***No***

If all answers to Part A are "No" and any answer to Part B is "Yes", your project is subject to the City's Standard Permanent Storm Water Best Management Practice (BMP) requirements.

If every question in both Parts A and B is answered "No", your project is exempt from permanent storm water requirements.

**Is this project subject to the Standard Permanent Storm Water BMP requirements?** □ **Yes** □ **No**

## *Section 2 – Construction Requirements*

General Construction Permit
*If your project disturbs at least one acre of land, you are subject to the State General Construction Permit.* A Notice of Intent (NOI) must be filed with the State Water Resources Control Board (SWRCB) and a Storm Water Pollution Prevention Plan (SWPPP) must be prepared for your project.

**Is this project subject to the General Construction Permit?** □ **Yes** □ **No**

Construction Threat to Water Quality Prioritization
*See the attached flow chart for guidance on determining the construction prioritization.*

**This project is** □ **HIGH** □ **MEDIUM** □ **LOW** **priority threat to water quality.**

## *Section 3 – Operating Requirements*

After your project is complete, certain water quality protection requirements may apply to the facility. The facility owner and operator should be made aware of these requirements.

All municipal, industrial, commercial, and residential sites in the City of National City are required to implement storm water BMPs to reduce the amount of pollution discharged to the Maximum Extent Practicable (MEP). See Appendix C of the City's Jurisdictional Urban Runoff Management Plan (JURMP) for further details.

Some industrial facilities are also subject to the State General Industrial Permit for Storm Water Discharges (Industrial Permit). To find out if your project may be required to obtain coverage under the Industrial Permit after it begins operations, visit the State Water Resources Control Board web sites at http://www.waterboards.ca.gov/stormwtr/industrial.html.

## *Section 4 – Certification*

## SUSMP REVIEW FLOW CHART

## CONSTRUCTION THREAT TO WATER QUALITY PRIORITIZATION FLOW CHART

*Sites with a low or medium TTWQ can be given a higher threat prioritization based on additional factors, such as project type, non-storm water discharge potential, or if there is a history of non-compliance with storm water regulations at the site.

303(d) Water bodies - 7th St Channel (La Paleta Creek) and 24th St Marine Terminal
ESA Water bodies - Paradise Marsh & Creek and Sweetwater Marsh National Wildlife Refuge

# ATTACHMENT 3.1

# CONSTRUCTION BMP FACT SHEET (BLUE SHEET)

# Construction Site Best Management Practices

As a condition of your permit, you are required to prevent construction generated or related pollutants from discharging from your project site. All construction projects within the City of National City are required to implement at least one of the Best Management Practices (BMPs) from each category and subcategory listed below, where applicable. Property owners and/or permit holders will be responsible for the selection, installation and maintenance of proper BMPs in accordance with industry recommended standards such as the Caltrans or California Storm Water BMP handbooks or in accordance with the California General Permit for Construction. Depending on site-specific information such as project scope and potential associated discharges. Additional BMPs may be required where appropriate. Project proponents will need approval from the City prior to installation of any alternate BMPs not listed below.

**Minimum BMPs for Construction Activities:**

1. **Planning and Scheduling**
   Planning and scheduling BMPs such as minimizing grading are required where feasible to help reduce the amount and duration of soil exposure.
   a. Preservation of natural hydrologic features
   b. Preservation of riparian buffers and corridors
   c. Minimization of areas that are cleared and graded to only the portion of the site necessary for construction
   d. Minimization of exposure time of disturbed soil areas
   e. Minimization of grading during the wet season and correlation of grading with seasonal dry weather periods
   f. Temporary stabilization and reseeding of disturbed soil areas as rapidly as feasible
   g. Employee and Subcontractor Training

2. **Soil Stabilization and Erosion Prevention**
   Physical Stabilization BMPs such as vegetation, landscaping or structural methods are required to prevent erosion from exposed slopes.
   a. Planning and Scheduling
   b. Preservation of Existing Vegetation
   c. Physical Stabilization
      - Hydraulic Mulch
      - Hydro-seeding
      - Soil Binders
      - Straw Mulch
      - Geo-textiles, Plastic Covers, and Erosion Control Blankets/Mats
      - Wood Mulching
      - Earth Dikes/Drainage Swales and Lined Ditches
   d. Site Drainage
      - Outlet Protection/Velocity Dissipation
      - Slope Drains
   e. Permanent re-vegetation or landscaping as early as feasible

See reverse side

3. **Sediment Containment**

Sediment containment controls should be used to supplement erosion prevention methods not as a substitute for erosion control. Sediment controls act to contain sediment that has been previously eroded and may get carried on-site and/or discharged from the site in sheet flow or from tracking by equipment and vehicles.

a. Perimeter Protection
   - Silt Fencing
   - Gravel Bag Berm
   - Fiber Rolls

b. Sediment Capture
   - Storm Drain Inlet Protection
   - Sediment Trap
   - De-silting Basins designed in accordance with industry standards such as Caltrans, California Storm Water BMP manual. If the project is five acres or greater the de-silting basin must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.
   - Gravel bag Barrier

c. Sediment Tracking
   - Stabilize Construction Entrances and Exits
   - Construction Road Stabilization
   - Entrance/ Outlet Tire Wash
   - Street Sweeping

4. **Materials and Equipment Management**

Pollution Prevention measures are required were applicable to prevent the contamination of storm water from waste materials, construction materials, vehicles, and equipment stored on-site. Each site must evaluate the potential pollutants on-site, which may be discharged during construction activities.

a. Materials Management
   - Material Delivery and Storage
   - Material Use
   - Stockpile Management
   - Spill Prevention and Control

b. Vehicle and Equipment Operations
   - Vehicle and Equipment Cleaning
   - Vehicle and Equipment Fueling
   - Vehicle and Equipment Maintenance

c. Waste Management
   - Solid
   - Liquid
   - Sanitary
   - Concrete
   - Hazardous
   - Contaminated Soil

5. **Non-Storm Water Discharge and Drainage Control**

Management of non-storm water discharges involves pollution prevention methods as well as drainage control. Project managers must implement appropriate drainage control methods to divert, contain and properly discharge drainage generated by construction activities.

a. General
   - Paving and Grinding Operations

b. Non-storm water discharges
   - Water Conservation Practices
   - Dewatering Operations
   - Potable Water/Irrigation and Flushing

**For additional information, call Barbara Tipton, Storm Water Compliance Inspector at (619) 336-4583 or Btipton@ci.national-city.ca.us**

# MUNICIPAL INSPECTION FORM

# City of National City

## Storm Water Quality Inspection for Municipal Facilities

Inspected by D-MAX Engineering, Inc.

Inspector Name _____

Date____/____/_____Time_____AM / PM Type of Inspection: ☐ Routine ☐ Follow-up ☐ Complaint Investigation

## A. CONTACT INFORMATION

Facility Name_____

Street Address_____ Mailing Address_____

_____ _____

Manager/Operator(s)_____

Telephone # (_____) _____ - _____ ext._____ Fax # (_____) _____ - _____

Manager/Operator(s) Email:_____

Facility Personnel Present_____

## B. FACILITY/SITE INFORMATION

Principal activity:_____

JURMP Classification_____

New JURMP Classification?_____

Does facility maintain SWPPP/BMP Plan? ☐ Yes ☐ No

If yes, what is the date of last SWPPP/BMP Plan revision?_____

If yes, does the SWPPP/BMP Plan include applicable minimum BMPs from the JURMP? (if no, describe in Section E) ☐ Yes ☐ No

If yes, does the SWPPP/BMP Plan include a current list of individuals Responsible for implementing BMPs at the site? ☐ Yes ☐ No

Does facility have a map/sketch of the site with flow lines and storm drains? ☐ Yes ☐ No

## C. INITIAL OBSERVATIONS

Nearest conveyances or water bodies: _____ Hydrologic Area: _____

Approximate distance to water bodies: ☐ < 200 ft. ☐ 200 – 1000 ft. ☐ > 1000 ft.

Sensitivity of receiving waters: ☐ Sensitive (ESA, 303(d), or other) ☐ Non-sensitive

Discharge points along perimeter: _____

_____

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by industrial or commercial activities:_____ square feet

Approximate % impervious surface of this area_____ %

Exposed areas of intensive outdoor activity: _____

# City of National City

## Storm Water Quality Inspection for Municipal Facilities

Inspected by D-MAX Engineering, Inc.

## D. BMP ASSESSMENT

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| **D.1 General** | | | | |
| Is the site free of excessive litter and debris? | | | | |
| Are discharge locations free of excessive sediment and debris? | | | | |
| Are parking lots, sidewalks and streets free of excessive sediment and debris? | | | | |
| Are roof downspouts directed away from areas of potential pollutants? | | | | |
| Is wash water from pressure washing / hosing managed appropriately? | | | | |
| Are employees trained in storm water management? | | | | |
| Does the facility have a current log of employees who have participated in training? | | | | |
| **D.2 Landscaping** | | | | |
| Are adequate erosion prevention measures employed? (vegetation or physical stabilization) | | | | |
| Are irrigation systems programmed to minimize over-watering and runoff? | | | | |
| If reclaimed water is used for irrigation, is the site free of evidence of irrigation water entering the storm drain? | | | | |
| Are stockpiles of soil or landscape waste covered when feasible and equipped to prevent runoff transport? | | | | |
| Are pesticides, herbicides, and fertilizers managed in accordance with the JURMP BMPs? | | | | |
| **D.3 Materials and Wastes** | | | | |
| Are adequate trash containers provided? | | | | |
| Are adequate recycling containers provided? | | | | |
| Is the trash/recycling area adequately covered (closed lids or permanent overhead cover)? | | | | |
| Is the trash/recycling area free of litter and debris? | | | | |
| Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing? | | | | |
| Are outdoor materials that pose a threat to water quality stored appropriately (covered or in sealed containers)? | | | | |
| Are outdoor storage containers properly labeled? | | | | |
| Is there an accessible, appropriate spill response kit? | | | | |
| Is there a written spill response plan? If so, please provide to inspector. (NA if no significant materials to spill) | | | | |
| Are liquid storage containers/tanks equipped with secondary containment? | | | | |
| Is secondary containment free of spills and rainwater? | | | | |
| Are loading and unloading areas free of spills and debris? | | | | |
| Is water from pools and/or fountains disposed of properly? | | | | |
| **D.4 Equipment and Vehicles** | | | | |
| Are exposed parking areas free of significant spills and leaks? | | | | |

# City of National City

## Storm Water Quality Inspection for Municipal Facilities

Inspected by D-MAX Engineering, Inc.

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Are vehicle maintenance activities conducted within contained areas when feasible (garage, canopy, work shop)? | | | | |
| Are equipment and vehicles inspected daily for leaks and repaired as necessary? | | | | |
| Are storm drain inlets near vehicle-fueling areas protected from spills and leaks? | | | | |
| Is vehicle washing preformed in a designated area where runoff does not enter the MS4? | | | | |
| Are biodegradable soaps used when appropriate? | | | | |
| **D.5 Building Repair/Construction** | | | | |
| Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization) | | | | |
| Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters) | | | | |
| Are impervious areas free of debris and spills from painting, scraping, and/or sandblasting activities? | | | | |
| **D.6 Structural BMPs** | | | | |
| Are structural BMPs adequately maintained? (NA if no structural BMPs at facility) | | | | |
| **D.7 Non-Storm Water Management** | | | | |
| Is the site free of evidence of illicit connections and illegal discharges? | | | | |
| Is the site free of evidence of unauthorized releases to storm drains? | | | | |
| If not, have the appropriate authorities been notified? | | | | |
| **D.8 Other** | | | | |
| Are appropriate signs/stenciling present at the facility? | | | | |
| Are there any other potential storm water pollution issues or concerns? If yes, explain below. | | | | |

**E. ADDITIONAL COMMENTS**
(describe any additional deficiencies not represented above and/or notable BMP improvements)

# City of National City
## Storm Water Quality Inspection for Municipal Facilities
Inspected by D-MAX Engineering, Inc.

### F. CORRECTIVE ACTION

Is corrective action needed? ☐ Yes ☐ No (If **BMP-related** corrective action is required, describe below.)

Operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax ☐ E-Mail

### G. VIOLATIONS

☐ No violations have been noted at this time

☐ No violations have been noted, but recommend taking corrective action described in Section F.

☐ Violation of City Ordinance(s):

- ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
  Description_____
- ☐ Illegal connection(s) to the storm drain system
  Location_____
- ☐ Littering
- ☐ Failure to properly implement required BMPs

☐ Other Violation_____

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:**

☐ Implement the recommended corrective actions listed in Section F.

Additional actions required:

### H. ADDITIONAL RECOMMENDED CITY ACTIONS*

*Recommended City Actions listed at the time of inspection are subject to change based on later review by office staff

**Does this facility require a follow-up inspection?** ☐ **Yes** ☐ **No**

**ASSESSMENT**

| | | | | | |
|---|---|---|---|---|---|
| Level of knowledge regarding storm water issues: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |
| Level of cleanliness, BMP implementation, orderliness of site: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |

## POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

Site Name:_____

| Pollutant | PDP | Sources Needing More BMPs | | | | | | | Recommended BMPs (check if applicable) | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Trash Area | Material Storage | Prkng Lot | Load/ Unload | Land-scape | Veh/Eqp Maint | Exposed Work Area | Emp. Training | House-keeping | Minor Struct. | Major Struct. |
| Sediments | | | | | | | | | | | | |
| Nutrients | | | | | | | | | | | | |
| Aluminum | | | | | | | | | | | | |
| Iron | | | | | | | | | | | | |
| Heavy Metals | | | | | | | | | | | | |
| Check if evidence indicates specific metals may have significant PDPs: ☐ Copper ☐ Cadmium ☐ Lead ☐ Zinc ☐ Mercury | | | | | | | | | | | | |
| Organic Compounds | | | | | | | | | | | | |
| Check if evidence indicates there may be historical soil contamination associated with any of the following: ☐ PCBs ☐ PAHs ☐ Chlordane ☐ DDT | | | | | | | | | | | | |
| Trash & Debris | | | | | | | | | | | | |
| Oxygen Demanding | | | | | | | | | | | | |
| Oil & Grease | | | | | | | | | | | | |
| Bacteria & Viruses | | | | | | | | | | | | |
| Pesticides | | | | | | | | | | | | |
| Check if evidence indicates the following are used on site: ☐ Diazinon ☐ Chlorpyrifos | | | | | | | | | | | | |
| Acid/Base (pH effects) | | | | | | | | | | | | |
| Others (list): | | | | | | | | | | | | |

"RW 303(d)" = Receiving water impairments, as listed in the most recent 303(d) list
"WS COC" = High priority watershed constituents of concern (COC), as listed in the most recent WURMP Annual Report
"PDP" = pollutant discharge potential.
"Emp. Training" = employee training activities focused on storm water pollution prevention
"Housekeeping" = standard good housekeeping BMPs, such as sweeping, regular trash pickup, etc.
"Minor Struct." = minor structural BMPs that do not require building permits, such as covering with tarps or building berms
"Major Struct." = major structural BMPs that require a building permit or are especially expensive, such as detention basins, oil/water separators, grease interceptors, overhead coverage for storage areas, etc.

Criteria

0 - no appreciable quantity observed on site
1 - very small potential for pollutant discharge; monitoring results* are well below the EPA benchmark
2 - Small potential for pollutant discharge; monitoring results* are close to the EPA benchmark but still below it
3 - Moderate potential for pollutant discharge; monitoring results* are at or slightly above the EPA benchmark
4 - Large potential for pollutant discharge; monitoring results* above the EPA benchmark but are within an order of magnitude
5 - Severe potential for pollutant discharge; monitoring results* exceed the EPA benchmark by an order of magnitude or more

Responsible Person(s)_____

Business Telephone # (____) _____ -_____ext._____

Business Fax # (_____) _____ - _____

Home Based? ☐ Yes ☐ No Mobile Business? ☐ Yes ☐ No **APN**:_____

Is this facility located in a multi-suite complex? ☐ Yes ☐ No **E-Mail:**_____

Does facility have a current business certificate? ☐ Yes ☐ No #_____ Exp._____

Facility personnel present:_____

## B. FACILITY/SITE INFORMATION

Principal activity:_____

Assigned SIC Code(s): _____ _____ _____

Does SIC Code best represent principal activity: ☐ Yes ☐ No

Recommended change of SIC Code(s)? _____ _____ _____

**Existing SIC Code(s)** _____ _____ _____ ☐ Food Attachment ☐ Industrial Attachment

**Status Update** (if no longer active in City or does not need an inspection): ☐ Moved/Out of Business ☐ Duplicate ☐ Not Inventoried ☐ Out of Jurisdiction

Is facility subject to CA Statewide General Industrial Permit? ☐ Mandatory ☐ Conditional ☐ No

Does facility have a Notice of Non-Applicability (NONA/NEC)? ☐ Yes ☐ No

Has facility filed a Notice of Intent (NOI) to obtain coverage? ☐ Yes ☐ No WDID: 9 37I0_____

Does facility maintain SWPPP or BMP Plan? ☐ Yes ☐ No

Does facility have a storm water monitoring program? ☐ Yes ☐ No

## C. INITIAL OBSERVATIONS

Discharge points: _____

_____

Approximate area covered by industrial or commercial activities:_____square feet

Approximate % impervious surface of this area_____%

Exposed areas of significant outdoor activity or storage? ☐ Permanent ☐ Occasional ☐ No

## D. BMP ASSESSMENT

| BMPs | No Corrections Required | | Corrections Required | | Comments |
|---|---|---|---|---|---|
| | N/A | Fully Implemented | Partially Implemented | Not Implemented | |
| **D.1 General** | | | | | |
| Keep site free of litter, debris, and sediment using dry methods | | | | | |
| Keep drains on site free of litter and debris | | | | | |
| Keep outdoor areas free of spills and leaks | | | | | |
| Collect water from pressure washing or hosing and dispose of appropriately | | | | | ☐ Unknown<br>Performed by: |
| Collect and dispose of cleaning water appropriately | | | | | |
| Direct roof downspouts away from areas of potential pollutants | | | | | |
| **D.2 Landscaping** | | | | | |
| Properly manage pesticides/fertilizer; use IPM when feasible | | | | | ☐ Unknown<br>Landscaping Co: |
| Employ adequate erosion prevention measures (vegetation or physical stabilization) | | | | | |
| Reduce over watering/over-irrigation | | | | | |
| Properly store stockpiles to prevent material transport | | | | | |
| Properly store and dispose of green waste | | | | | ☐ Unknown |
| **D.3 Materials and Wastes** | | | | | |
| Protect trash area from contact with storm water | | | | | |
| Keep trash area free of litter and debris, liquids, powders, sediment | | | | | |
| Adequately cover materials stored outside | | | | | |
| Prevent run-on from contacting materials stored outdoors | | | | | |
| Provide an accessible, functional spill response kit | | | | | |
| Properly label outdoor storage containers | | | | | |
| Equip liquid storage containers with secondary containment | | | | | |
| Keep secondary containment free of spills and rainwater | | | | | |
| Properly store and dispose of hazardous materials | | | | | |
| Keep loading and unloading areas, including drains, free of debris | | | | | |
| Dispose of water generated by processing activities appropriately | | | | | |
| Dispose of pool, spa, fountain, and filter backwash water properly | | | | | ☐ Unknown<br>Performed by: |
| Clean floor mats in locations that do not drain to storm drain system | | | | | |

| BMPs | No Corrections Required | | Corrections Required | | Comments |
|---|---|---|---|---|---|
| | N/A | Fully Implemented | Partially Implemented | Not Implemented | |
| **D.4 Equipment, Vehicles, and Outdoor Activities** | | | | | |
| Conduct outdoor activities within contained areas (garage, under canopy, work shop) | | | | | |
| Use drip pans to collect leaks/spills | | | | | |
| Perform vehicle/equipment washing in a contained area where runoff does not enter the MS4 | | | | | |
| **D.5 Other** | | | | | |
| Manage animals and animal waste in a manner that prevents animal waste from being transported in runoff | | | | | |
| Identify and eliminate illicit connections and illegal discharges | | | | | |
| Provide storm water training for appropriate employees | | | | | |

| D.6 Additional Questions | Comments/Results |
|---|---|
| Are there any potential air sources that could contribute to atmospheric deposition of pollutants? | ☐ Painting ☐ Sandblasting ☐ Fuel Distribution ☐ Dust dispersion or mineral processing ☐ Metal smelting ☐ Metal plating or anodizing ☐ Chemical production or mixing ☐ Large fuel burning device ☐ Incinerator |
| Are there any treatment control BMPs on site? | ☐ Filter insert ☐ Hydrodynamic separator ☐ Debris screen ☐ Sewer diversion ☐ Vegetated swale ☐ Vegetated filter strip ☐ Biofiltration ☐ Detention/ sedimentation basin ☐ Containment and evaporation or reuse ☐ Filtration |
| Are treatment control BMPs regularly maintained? | ☐ Yes ☐ No ☐ Unknown ☐ N/A |
| What is the approximate percentage of the site that drains to the treatment control BMPs? | ☐ N/A |
| Do major potential pollutant sources drain to treatment BMP(s)? | ☐ All ☐ Some ☐ None ☐ N/A |
| If any illicit connections and/or illegal discharges were identified have the appropriate authorities been notified? | ☐ Yes ☐ No ☐ N/A |
| If any illicit connections and/or illegal discharges were identified, were they eliminated during the site visit? | ☐ Yes ☐ No ☐ N/A |
| Were any non IC/ID related corrective actions implemented during the site visit? | ☐ Yes ☐ No ☐ N/A |
| Were any educational materials distributed? | NOI NONA/NEC Calendar |

**D.7 Additional Required Actions**

## E. STATE GENERAL INDUSTRIAL PERMIT COMPLIANCE*

☐ Non-compliance with the State Industrial Storm Water General Permit noted.

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE*:**

☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit—see Attachment 3 of the Industrial Permit (www.waterboards.ca.gov/stormwtr/industrial.html).

- ☐ For "Conditional" facilities only: this site presently has outdoor exposure that requires filing for coverage under the Industrial Permit. If you implement all the recommended BMPs and eliminate outdoor exposure, you may be able to qualify for exemption from obtaining Industrial Permit coverage. Please contact the RWQCB for details.

☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP)—see Section A of the Industrial Permit.

☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.

☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

*Additional notes and/or actions required*: _____

_____

_____

## F. CORRECTIVE ACTION SUMMARY

☐ **Corrective Actions Required.** Please refer to sections D.1-D.6 and E of this form and, if applicable, the Food Establishment Storm Water BMP Assessment form (if applicable, it is attached).

☐ No Corrective Actions Required at this Time.

## G. RECOMMENDED CITY ACTIONS**

_____

_____

_____

_____

☐ poor management of shared waste disposal area(s), but responsible party could not be indentified

**ASSESSMENT**

| | | | | | |
|---|---|---|---|---|---|
| Level of knowledge regarding stormwater issues: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |
| Level of cleanliness, BMP implementation, orderliness of site: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |

*Please note that the Regional Water Quality Control Board (RWQCB) is the final arbiter of Industrial Permit compliance; please contact the RWQCB at (858) 467-2952 for details of what is necessary to comply with the Industrial Permit.

**Recommended City actions listed at the time of inspection are subject to change based on later review by office staff.

**Follow Up Inspection Priority:** ☐ **Priority 1** ☐ **Priority 2** ☐ **Priority 3** ☐ **None**

☐ Potential Hazmat issue

Re-inspect on or after: ____/_____/_____
Date

**RESOLUTION**

☐ NOV Issued: _____/_____/_____
Date

☐ Corrective Action Letter Issued: _____/_____/_____
Date

### Do you Know?

All water that enters National City storm drains flows to San Diego Bay without being treated. Fish and other animals that live in the water rely on us to keep their ocean community clean. Birds, fish, and mammals often mistake trash for food. With trash filling their stomachs, animals have a false feeling of being full and may die of starvation. This is one reason why it is so important to keep our community clean.

NO DUMPING • DRAINS TO OCEAN • NO TIRE DESECHO • CORRE AL MAR

### ¿Sabe Usted Que?

Toda la agua que entra por las alcantarillas de National City van a dar a la Bahía de San Diego sin ser tratadas. Los peces y otros animales que viven en el agua dependen de nosotros para mantener limpia su comunidad oceánica. Las aves, los peces y los mamíferos pueden equivocar la basura con el alimento. Con los estómagos llenos de basura, los animales tienen una sensación falsa de satisfacción y pueden morir de hambre. Esto es una razón por qué es tan importante mantener las alcantarillas de aguas pluviales limpia.

By Keeping our Community Clean We Can Keep the Ocean Clean!
¡Manteniendo a nuestra comunidad limpia, podemos mantener el océano limpio!

## What's In Your House?
## ¿Qué está en su casa?

There are a lot of everyday products that are toxic to our health and the environment. Unlike regular waste, these household hazardous waste (HHW) products can not be thrown away with regular trash. For more information about HHW and electronic waste disposal sites view the inside cover of this calendar or visit www.ilacsd.org/recycle/index.php.

Hay muchos productos diarios que son tóxico a nuestra salud y al ambiente. A diferencia de desecho regular, estos productos peligrosos no pueden ser tirados con basura regular. Para mas información sobre sitios de eliminación para los desechos de productos peligrosos y electrónicos ve adentro de la pasta del calendario o visita la pagina de internet www.ilacsd.org/recycle/index.php.

Can you guess which of these are HHW or electronic waste?

¿Puede adivinar usted qual de éstos son productos peligrosos o desechos electrónicos?

1) Oil-based paint/ Pintura de aceite
2)Motor oil/ Aceite de Carro
3)Metal cans/ Latas de metal
4)Batteries/ Baterías
5)Glass bottles/ Botellas de vidrio
6)Pesticides/ Pesticidas

¿Que 'tipo' es esto y para que sirve?

## Proper Pet Waste Disposal

High levels of bacteria can be harmful to your health and the environment. One way to keep bacteria from entering storm drains is to be a responsible pet owner. Cleaning up your animal's waste and flushing it down the toilet or placing it in a bag before throwing it in the trash are two great ways to keep bacteria out of our City's waters.

## Eliminación de desechos apropiada de mascotas

Los niveles altos de bacterias pueden ser perjudiciales a su salud así como al ambiente. Una manera de mantener las bacterias que no entren a las alcantarillas es ser un dueño de mascotas responsable. Limpiando el desecho de su mascota y por ende o en la tasa del baño o poniéndolo en una bolsa antes de tirarlo en la basura, estas son dos gran maneras de mantener las bacterias fuera de la Bahía de San Diego.

# What's the difference?

## Sanitary Sewer vs. Storm Drain System

The water that drains down a sink or toilet in a home or business flows to the sanitary sewer and is treated by the City of San Diego at a wastewater treatment plant.

The storm drain system, on the other hand, is designed to carry rainwater from City streets and driveways to prevent flooding. This water does not receive any treatment. It flows directly to creeks and rivers – and eventually to San Diego Bay!

Unfortunately, as rainfall flows over the ground it picks up debris and pollutants and deposits them into our water bodies.

**Certain industrial businesses require coverage under the General Industrial Permit. For more information go to the State of California's Stormwater website at:**

# Preventing Urban Runoff Pollution

## A Guide for Commercial and Industrial Businesses

**Urban storm water runoff is the largest contributor to water pollution in San Diego County.**

**Your business is required to prevent urban runoff pollution by implementing Best Management Practices (BMPs).**

**The City will be conducting inspections to ensure that BMPs are being used and water quality is protected.**

CALIFORNIA
NATIONAL CITY
1887
INCORPORATED

## Pollutants of Concern

Water that enters the City of National City storm drain system eventually flows into San Diego Bay. The following lists several main pollutants of concern for San Diego Bay.

- Sediments
- Metals (copper, zinc)
- Pesticides (diazinon)
- Bacteria and Viruses

**B**est **M**anagement **P**ractices (**BMPs**) are required to be used at all industrial and commercial businesses, where applicable, to reduce urban runoff pollution in our streams and waterways.

## Maintenance & Good Housekeeping

- Major cleaning of exterior surfaces (such as power washing) must include capturing all wash water and disposing of it into the sanitary sewer in compliance with local regulations. Wash water is not allowed to enter the street gutter or storm drains.
- Regularly sweep exterior paved areas. **Do Not use a hose!** Place debris in the dumpsters.
- If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer (sink or toilet).
- Regularly inspect and maintain storm drain inlets and surface drains on your property.

## Landscaping

- Time sprinklers to avoid over watering and aim them to avoid causing runoff.
- Minimize use of pesticides, herbicides, and fertilizers, which are harmful to animals downstream.
- Hand pull weeds instead of using herbicides
- Do not use pesticides that eliminate beneficial insects
- Only irrigate during early morning or late evening to avoid evaporation.

## Outdoor Material Storage

- Store all material indoors or under a covered area not exposed to rain. Include secondary containment for liquid materials.
- Have a spill response kit (dry absorbent, rags, and/or hydrophobic mops are useful) available to clean up potential spills.
- Keep lids closed on all outdoor storage containers and ensure containers are labeled.

**Unacceptable**

**Acceptable**

## Waste Management

- Keep all outdoor garbage and dumpster areas free of trash, sediment and debris.
- Keep lids closed on dumpsters and trash cans and never wash down dumpsters.
- Fix any leaks in garbage cans or dumpsters.
- Schedule extra pick-ups when regular waste collection does not meet demand.

## Vehicle & Equipment Washing and Maintenance

- Wash vehicles at a commercial car wash when possible. (Commercial car washes drain to the sanitary sewer and not to the storm drain).
- Wash vehicles over a pervious (absorbent) surface such as dirt, gravel or grass to prevent runoff.
- Minimize the use of soap and water.
- Car wash water is not allowed to enter storm drains. Wash water must be collected and disposed of to a pervious area (such as landscaping) or to the sanitary sewer system if allowed by local sewer agency.
- Perform all vehicle maintenance indoors when possible.
- Use drip pans to collect fluids from leaky vehicles
- Clean up spills with a spill kit and properly dispose of the used kit contents.

**Unacceptable**

**Acceptable**

## Loading Areas & Operations

- Load and unload in designated areas.
- Regularly sweep loading and unloading areas; do not hose them down.
- If possible, cover loading areas.
- Divert rain water away from all loading and unloading areas.
- Check shipments and trucks for leaks and spills.
- Clean up spills/leaks immediately and dispose of them properly.

# ATTACHMENT 8.1

# ”EVERYTHING THAT FLOWS DOWN INTO A STORM DRAIN” BROCHURE

# City of National City

Office of the Public Works/Engineering Director
1243 National City Blvd. National City, CA 91950-4397
(619) 336-4580, Fax (619) 336-4397 www.ci.national-city.ca.us

**Everything that flows down into a storm drain goes *untreated* directly into our creeks, lagoons, and San Diego Bay.** When it rains or when water flows out of yards, it flows directly into storm drains. Many people think that everything that flows into a storm drain gets treated at the Point Loma Sewage Treatment Plant, just like wastewater in the sewer system, but these two systems are not connected.

The sources of pollution that must be controlled and eliminated result from urbanization and the choices that are made every day by residents, businesses and industry alike. For example, detergents, oil, grease, and other pollutants have been shown to be toxic to wildlife in local streams and San Diego Bay. **Recycling** of oil, antifreeze, glass, plastic, and other materials can prevent their improper disposal into the stormwater drainage system. **Proper landscaping practices** include minimization of the use of herbicides, pesticides and fertilizers together with conservation of water to minimize runoff of pollutants from landscaped areas, lawns, golf courses, etc.

**The City of National City's Stormwater Management & Discharge Control of the National City Municipal Code Chapter 14.22, prohibits non-stormwater discharges, such as car washwater, pesticides, fertilizers, pet waste, litter, oil, and other automobile fluids, to run into the City's storm drain system.** This ordinance is based on regulations set forth by the State Regional Water Quality Control Board and the U.S. Environmental Protection Agency in connection with the State and Federal Clean Water Acts.

Your help is needed, and by doing your part, by changing your washwater and trash disposal practices, you will help reduce the pollution problems in the community where you and your family live, work and play. Please call **Storm Drain Hotline** at **(619) 336-4389** if you have **any questions** regarding this matter and **to report any illegal discharges and /or dumping.**

# City of National City

Office of the Public Works/Engineering Director
1243 National City Blvd. National City, CA 91950-4397
619) 336-4580, Fax (619) 336-4397 www.ci.national-city.ca.us

**Todo lo que desemboca en las alcantarillas no esta tratado y va a parar directamente a nuestras lagunas, esteros y Bahia de San Diego.** Cuando llueve o cuando escurre agua de algun patio, desemboca directamente a las alcantarillas. Mucha gente piensa que todo lo que desemboja en una alcantarilla es tratado en la planta de Tratamiento de Agua Negras en Point Loma, como las aguas negras del sistema de drenaje, pero estos dos sistemas **no** estan conectados.

Las causas de contaminacion que tienen que ser controladas y eliminadas resultan de la urbanizacion y las elecciones que hacen todos los dias los residentes, negocios y la industria. Por ejemplo, detergentes, aceite, grasa, ya otros contaminantes se ha visto que son toxicos para la vida silvestre en nuestros arroyos locales y Bahia de San Diego. **Reciclando** el aceite, antifreeze, vidrio, plastico y otros productos que sean desechados de un modo inadecuado llegen a parar al sistema de alcantarillado de la ciudad. **Los metodos de mantener el jardin**, como usar menos los herbicidas, pesticidas y fertilisantes.Tambien como conservar el agua para que esa agua con contaminantes de los jardines, pastos, canchas de golf, etc.

**El Codigo Municipal No. 14.22 de las aguas pluviales de la Ciudad de National City, prohibe aguas que no sean pluviales como las aguas negras, pesticidas, fertilisantes, basura, aceite y otros liquidos de carros que sean depositadas en el sistema de alcantarillado de la ciudad.** Esta regla esta basada en las regulaciones puesta por "State Regional Water Quality Control Board" y "U.S. Environmental Protection Agency" en conneccion con "State and Federal Clean Water Acts."

Su ayuda es necesaria, y haciendo su parte como cambiar el modo de tirar su basura, usted ayudara a reducir la contaminacion en la comunidad donde usted y su familia viven, trabajan y juegan.

Por favor llame a la linea de **"Storm Drain Hotline"** al **(619) 336-4389**, si tiene **alguna pregunta** si quiere **reportar un desague ilegal**.

# ATTACHMENT 8.2

# RESTAURANT AND FOOD INDUSTRY BMP FACT SHEET

CITY OF NATIONAL CITY – DEVELOPMENT SERVICES DEPARTMENT
1243 NATIONAL CITY BLVD., NATIONAL CITY, CA 91950

# City of National City Storm Water Program

## Restaurant and Food Industry

**Your facility can help protect our water quality**

### Long-Term Compliance Solutions

Several properties and businesses in National City have already taken initiative to ensure long-term compliance with the minimum requirements of City's storm water program. In doing so they minimize the need for costly and ineffective cleanup of grease spills by employees. Three proactive solutions[1] include:

1. Storing waste grease in securely sealed indoor containers[2] until pickup

2. Permanent cover and containment of outdoor grease disposal areas[3], such as a roof and berm

3. Installation of an indoor oil management system[2] that changes oil and collects waste

[1] These solutions are not required by the City of National City, but they would likely facilitate staying in compliance with minimum storm water requirements. See the other side of this sheet for requirements commonly applicable to the restaurant and food industry.
[2] The City of National City does not require or endorse the use of any specific brand or product.
[3] Note that installation of outdoor structures should follow National City building codes and permitting requirements.

For more information about staying in compliance with the City's Storm Water Program requirements, call the City's compliance inspection contractor, D-Max Engineering, Inc.: (858) 586-6600 ext. 23.

# Restaurant and Food Industry

## Best Management Practices

### Your facility can help protect our water quality

**The following are six requirements commonly applicable to businesses that produce and/or sell food products, such as bakeries, food producers/distributors, grocery stores, and restaurants.**

| | | | |
|---|---|---|---|
| 1. Keep outdoor waste oil containers and surrounding areas free of grease stains and spills. | | 4. Pour wash water into a indoor janitorial or mop sink. Don't pour it outside into a storm drain or onto a parking lot, alley, sidewalk, or street. | |
| 2. Use dry sweeping or absorbent material for oil and grease spill cleanup instead of hosing. If wet cleanup methods are used, collect all water and take it indoors for disposal. | | 5. Clean floor mats, filters, and garbage cans in a mop sink, over an indoor floor drain, or on landscaping where water will not run off. Don't wash them in a parking lot, alley, sidewalk, or street. |  |
| 3. Keep dumpster area clean and lid closed. Don't fill it with liquid waste or hose it out. Repair or replace leaky dumpsters. | | 6. Recycle grease and oil. Don't pour it into sinks, floor drains, or onto a parking lot or street. Pouring grease and food scraps down drains can clog pipes and back up sewers. | |

## Laws and Enforcement

See National City Municipal Code Section 14.22, Storm Water Management and Discharge Control, for a full list of all storm water requirements applicable to businesses. Direct or indirect discharge of pollutants to the storm water conveyance system, even in rain water, is against the law.

**Violations can result in civil penalties up to $10,000 or fines up to $25,000 per violation, per day.**

To help report a spill or discharge to the storm drain, call the City of National City Storm Water Hotline: (619) 336-4389

Telephone Number: (619) 336-4380

# INTRODUCTION AND CONTENTS

**Introduction**

Section 7 of the Annual Report discusses the implementation of the illicit discharge detection and elimination (IDDE) component of the City's storm water program. This program consists of dry weather monitoring activities and other activities intended to prevent and respond to illicit connections and illegal discharges, such as operating a storm water hotline. The reporting period for the portions of this section that discuss dry weather monitoring activities extends through September 30, 2010, but the reporting period for other activities described in the section extends through June 30, 2010, consistent with the rest of the JURMP Annual Report. Because field work for the dry weather monitoring program is not required to be completed until September 30, the same day that the JURMP Annual Report is to be submitted, the RWQCB extended the submittal deadline for all of Section 7 of the JURMP Annual Report until December 15 of each year.

**Contents**

This submittal includes a certification statement, the text of Section 7 of the 2009/2010 JURMP Annual Report, and the attachments associated with that section. For clarity, the items included in this submittal are listed below.

- Certification Statement for Section 7 Submittal
- Introduction and Contents
- Section 7 (IDDE Component) of the 2009/2010 JURMP Annual Report
- JURMP Annual Report Requirements Checklist (for Section 7 only)
- Attachment 7.1, City of National City Dry Weather Field Screening and Analytical Monitoring Program 2010

Please note that the summary of documented public complaints was already provided with the main JURMP Annual Report submittal in September 2010 and is not included again with this December submittal.

# 7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

## 7.1 INTRODUCTION

The City maintains several programs to prevent and to seek out and eliminate illicit connections and illegal discharges (IC/IDs), which can be significant sources of pollutants to the City's MS4. Illicit connections include improper links to the MS4, typically of conveyances that should be plumbed to the sanitary sewer system, such as car wash facility drains. Illegal discharges may result from activities such as vehicle washing or equipment cleaning without the use of proper BMPs. City storm water personnel work with residents, businesses, and staff to make them aware of BMPs to prevent IC/IDs and to encourage reporting of IC/IDs. The following activities are the primary components of the City's program to combat IC/IDs:

- Inspecting local businesses, construction sites, and municipal facilities
- Conducting the Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program)
- Operating a public complaint hotline

These activities enable the City to provide a comprehensive system to improve the quality of storm water and urban runoff throughout the City through detection and elimination of IC/IDs.

### 7.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the illicit discharge detection and elimination component during the 2009/2010 reporting period are presented in the following bulleted list. Please note that per Addendum No. 2 to the Municipal Permit, the reporting period for the Dry Weather Monitoring Program extends through September 30, 2010. The reporting period for all other components of the City's illicit discharge detection and elimination (IDDE) program ended on June 30, 2010.

- Nine IC/IDs were discovered and reported during the 2009/2010 reporting period. All were followed up on by City personnel, and enforcement measures were applied as necessary.
- The City recorded and investigated all Storm Water Hotline complaints.
- The City performed all of the recommended corrective actions proposed in the 2009 Dry Weather Monitoring Program Report to prevent possible pollutants from entering the storm drain system.
- The City conducted the 2010 Dry Weather Monitoring Program.

## 7.2 Public Reporting of Illicit Discharges and Connections

See Section 4.8 of this JURMP Annual Report, which was submitted in September 2010.

## 7.3 Spill Reporting, Response, and Prevention

See Section 4.9 of this JURMP Annual Report, which was submitted in September 2010.

## 7.4 Urban Runoff Monitoring

The City has continued to conduct a Dry Weather Monitoring Program, as required by the Municipal Permit. This program assists the City in detecting and eliminating IC/IDs to the storm drain system. There are three major components to the Dry Weather Monitoring Program:

- Field observations, which include site descriptions and qualitative observations
- Field screening, which includes flow estimation and sample testing using meters and test kits at the site
- Analytical monitoring, which involves submittal of collected samples from selected sites, constituting 25 percent of all flowing or ponded sites, to an analytical laboratory for additional testing

The City visits all designated primary monitoring stations each year between May 1 and September 30 to collect dry weather monitoring data. When a primary monitoring station is found to be dry, the City visits designated alternate monitoring stations.

Numeric action levels are used as the primary approach for the interpretation of most constituent concentrations measured in the field and laboratory. Action levels for dissolved metals follow the California Toxics Rule (CTR) Criteria Maximum Concentration (CMC). Temperature, turbidity, and conductivity parameters are evaluated using best professional judgment to determine if further investigation is needed. The action levels for pH, surfactants, ammonia-nitrogen, nitrate-nitrogen, orthophosphate-phosphorus, oil and grease, diazinon, and chlorpyrifos were adopted in 2003 and were based on statistical analyses of previous Dry Weather Monitoring Program data, established water quality benchmarks from the Basin Plan, and the United States Environmental Protection Agency Multi-Sector General Permit.

The Regional Monitoring Workgroup in November 2008 requested the Dry Weather Monitoring Sub-workgroup to evaluate dry weather action levels that were submitted in April 2003 by the County of San Diego on behalf of the Copermittees. The Dry Weather Monitoring Sub-workgroup determined that the bacterial indicators action levels required additional analysis. The Dry Weather Monitoring Sub-workgroup contracted D-MAX Engineering (D-MAX) to evaluate historical bacterial data collected from dry weather monitoring from 2002 through 2007. Details of their evaluation are posted on the Project Clean Water Website at

http://www.projectcleanwater.org/pdf/science_mon/dry_weather_2009bacteria_action_level_report_draft.pdf. The Regional Monitoring Workgroup on May 19, 2009 evaluated the recommendations of the Dry Weather Monitoring Sub-workgroup and selected the 80th percentile values to be the dry weather action levels for bacterial indicators beginning on May 1, 2010. The previous and current action levels (effective May 1, 2010) are presented in Table 7-1.

**Table 7-1**
**Bacterial Indicators Action Levels for Dry Weather Monitoring Program**

| | **Total Coliform (MPN/100 mL)** | **Fecal Coliform (MPN/100 mL)** | ***Enterococcus* (MPN/100 mL)** |
|---|---|---|---|
| 2003-2009 Action Levels | 50,000 | 20,000 | 10,000 |
| 2010 -2012 Action Levels | 130,000 | 13,000 | 7,000 |

### 7.4.1 2009 Dry Weather Monitoring Program

The City's 2009 Dry Weather Monitoring Program was conducted during the 2009 dry season. For information about how the City addressed issues discovered during the 2009 Dry Weather Monitoring Program and responded to the resulting recommendations, see Section 7.5.1 of this report.

### 7.4.2 2010 Dry Weather Monitoring Program

The City's 2010 Dry Weather Monitoring Program was conducted during the 2010 dry season. Nineteen routine site visits to the monitoring stations were performed.

If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. Upstream investigations are performed when exceedances are verified during confirmation visits. See the City's JURMP for a complete discussion of upstream investigation procedures.

Table 7-2 presents a summary of the action level exceedances observed in 2010; Table 7-3 presents the follow-up investigations conducted in response to all action level exceedances. All of the monitoring stations visited are listed in Table 7-4. At the end of this section, tables 7-5 and 7-6 provide the complete field analytical results and laboratory analytical results, respectively, from the 2010 Dry Weather Monitoring Program.

**Table 7-2**
**Summary of Action Level Exceedances**

| Field Screening (15 samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| **pH** | 0 | 0 | --- |
| **Conductivity** | 0 | 0 | --- |
| **Turbidity** | 1 | 7 | 45 |
| **Surfactants** | 2 | 13 | 45, 47 |
| **Ammonia-N** | 1 | 7 | 38 |
| **Nitrate-N** | 0 | 0 | --- |
| **Orthophosphate-P** | 0 | 0 | --- |
| **Laboratory Analyses (4 samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| **Oil & Grease** | 0 | 0 | --- |
| **Cadmium** | 0 | 0 | --- |
| **Copper** | 1 | 25 | 32 |
| **Lead** | 0 | 0 | --- |
| **Zinc** | 0 | 0 | --- |
| **Diazinon** | 0 | 0 | --- |
| **Chlorpyrifos** | 0 | 0 | --- |
| **Total Coliforms** | 2 | 50 | 32, 46 |
| **Fecal Coliforms** | 1 | 25 | 46 |
| **Enterococci** | 2 | 50 | 32, 46 |

**Note:** Table includes data from initial site visits only; confirmation and follow-up investigations are not included.

Follow-up investigations conducted in response to action level exceedances are summarized in Section 7.5.2 of this report.

A formal trash assessment was performed in 2010 in accordance with the Municipal Permit requirements. A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form's five categories are

primarily qualitative descriptions of the amount and extent of trash although a number of trash pieces is also included in each category as a rough guideline. The five categories are defined as follows.

- Optimal: On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
- Suboptimal: On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
- Marginal: Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
- Submarginal: Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (~100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
- Poor: Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is also assessed at each site using the following definitions:

- *Threat to Human Health* – Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment.
- *Threat to Aquatic Health* – Large amount (50 pieces or more) of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amounts of settleable, degradable, and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries, or spray cans; any evidence of large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment.

Nineteen sites, including four dry sites, received trash assessments. Ten were ranked as "optimal" or "suboptimal," having little or no trash. Seven sites were ranked as "marginal". One site was ranked "submarginal," and one site was ranked "poor" due to significant amounts or types of trash consistent with human inhabitation and illegal dumping. Following this "poor" observation, the trash was removed from the site by the responsible public agency.

The 2010 Dry Weather Monitoring Program Report, which includes results of field screening and analytical monitoring, can be found as Attachment 7.1.

## 7.5 FOLLOW-UP AND ENFORCEMENT

### 7.5.1 ACTIONS TAKEN IN RESPONSE TO THE 2009 DRY WEATHER MONITORING PROGRAM FINDINGS

Based on the 2009 Dry Weather Monitoring Program results, several recommendations were made. In response to these recommendations, educational materials were distributed and the City's Public Works Department employees performed all necessary maintenance and inspections listed below.

**Education**

- In response to bacteria exceedances downstream at Site 1A, educational materials regarding dumpster area best management practices (BMPs) were provided to the property manager and residents of the Highland View Apartments and to the business owner of the Siete Dias Market, where a leaking dumpster was observed. Educational materials were also provided to the residents of the Happy Hollow Trailer Park regarding proper oil and grease disposal.
- In response to exceedances of surfactants and orthophosphate-phosphorus action levels, educational materials were provided regarding outdoor washing activities to the residents of the Summer Crest Living Complex, upstream of Site 49, and to the residents of East 14th Street, upstream of Site 48.
- Educational materials regarding BMPs for fertilizer application, and landscaping waste disposal were provided to the maintenance department of the Summer Crest Living complex, upstream of Site 49 where an ammonia-nitrogen and orthophosphate-phosphorus exceedance was measured.

**Inspection and Maintenance**

- Trash and debris was removed from Site 1A to eliminate potential sources of bacteria. Organic debris was removed from the catch basins on Scott Drive, upstream of Site 1A. Inspection frequency of these areas has increased to determine if additional maintenance is necessary to prevent debris accumulation.
- A regular schedule for the removal of trash from Site 6, which received a poor trash rating, has been established and maintained. Trash at Site 6 is regularly assessed, and preventative measures have been implemented where possible to decrease the introduction of debris to the storm water conveyance system.

- Although the confirmation visit indicated bacteria counts below the action level at Site 46, this site has had a history of high bacteria levels. The property management of the South Bay Plaza Center has been contacted to ensure the trash areas and storm drains are kept free of trash and food waste.

### 7.5.2 2010 Dry Weather Monitoring Follow-Up Investigations

If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. Upstream investigations are performed when exceedances are verified during confirmation visits. See the City's JURMP for a complete discussion of upstream investigation procedures.

Table 7-3 presents conclusions based on the results of confirmation visits and, where necessary, upstream investigations conducted during the 2010 Dry Weather Monitoring Program.

**Table 7-3**
**Summary of Follow-Up Investigations**

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 32 | --- | Total Coliforms, Enterococci, Dissolved Copper | Bacteria: decomposing leaves, grease spills upstream, and trash located at site. Dissolved copper: automobile brake pad dust and emissions, from vehicle traffic or vehicle wash water. |
| 38 | Ammonia-N | --- | Exceedance not confirmed |
| 45* | Surfactants, Turbidity | Total Coliforms, Fecal Coliforms, Enterococci | Surfactants and turbidity exceedances not confirmed. Bacteria possibly caused by decomposing trash inside manhole; decomposing leaves, food, and trash in storm water conveyance upstream. |
| 46 | --- | Total Coliforms, Fecal Coliforms, Enterococci | Low flow at site and decomposing trash upstream |
| 47 | Surfactants | --- | Possibly due to car washing from multiple car dealerships around site |

Notes: Table includes data from initial site visits only; confirmation and follow-up investigations are not included.
*Exceedances in bacterial indicators at Site 45 were part of the MS4 sampling program and not part of the Dry Weather Monitoring Program.

The City is in the process of responding to the 2010 Dry Weather Monitoring Program findings. These actions and any other actions taken with respect to the City's Dry Weather Monitoring Program during the remainder of 2010/2011 will be described in the 2010/2011 JURMP Annual Report.

### 7.5.3 IC/IDs Identified

Nine IC/IDs were discovered and reported during the 2009/2010 reporting period. All were followed up on by City personnel, and enforcement measures were applied as necessary. The IC/IDs identified in 2009/2010 are discussed in Section 4 of this JURMP Annual Report, which was submitted in September 2010.

## 7.6 Illicit Discharge Detection and Elimination Component Effectiveness Assessment

The assessment of the effectiveness of this program component is provided in Section 11 of this JURMP Annual Report, which was submitted in September 2010.

## 7.7 Program Review and Modification

No changes to the City's illicit discharge detection and elimination component were made during the reporting period.

**Table 7-4**
**2010 Dry Weather Monitoring Locations**

| Site | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| 1A | Southwest of 43rd Street and Nordica Avenue | Concrete Channel | Residential | Commercial | 908.31 | 32.68575 | -117.10166 |

| xi. A description of efforts to publicize and facilitate public reporting of illicit discharges. | 4.8, 7.2 |
| xii. The number of violations and enforcement actions (including types) taken for illicit discharges and connections, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 7.5, Table 7-1, Table 4-5 |
| xiii. A description of notable activities conducted to manage illicit discharges and connections. | 7.1, 7.5 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| Meets applicable standard monitoring and reporting requirements listed in Municipal Permit Attachment B. | Attachment 7.1 |
| c. (1) Determining Sampling Frequency: Dry weather field screening and analytical monitoring shall be conducted at each identified station at least once between May 1st and September 30th of each year or as often as the Copermittee determines is necessary to comply with the requirements of section D.4 of Order No. R9-2007-0001. | 7.4; Attachment 7.1 |
| c. (2) If flow or ponded runoff is observed at a dry weather field screening or analytical monitoring station and there has been at least seventy-two (72) hours of dry weather, make observations and collect at least one (1) grab sample. Record general information such as time since last rain, quantity of last rain, site descriptions (i.e., conveyance type, dominant watershed land uses), flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate), and visual observations (i.e., odor, color, clarity, floatables, deposits/stains, vegetation condition, structural condition, and biology). | 7.4; Attachment 7.1 |
| c. (3) At a minimum, collect samples for analytical laboratory analysis of the following constituents for at least twenty five percent (25%) of the dry weather monitoring stations where water is present: (a) Total Hardness, (b) Oil and Grease, (c) Diazinon and Chlorpyrifos, (d) Cadmium (Dissolved), (e) Lead (Dissolved), (f) Zinc (Dissolved), (g) Copper (Dissolved), (h) Enterococcus bacteria, (i) Total Coliform bacteria, (j) Fecal Coliform bacteria | 7.4; Table 7-6; Attachment 7.1 |
| c.(4) At a minimum, conduct field screening analysis of the following constituents at all dry weather monitoring stations where water is present: | See following |
| c. (a) Specific conductance (calculate estimated Total Dissolved Solids), (b) Turbidity, (c) pH, (d) Reactive Phosphorus, (e) Nitrate Nitrogen, (f) Ammonia Nitrogen, (g) Surfactants (MBAS) | 7.4; Table 7-5, Attachment 7.1 |
| c. (5) If the station is dry (no flowing or ponded runoff), make and record all applicable observations and select another station from the list of alternate stations for monitoring. | 7.4; Attachment 7.1 |
| c. (6) Develop and/or update criteria for dry weather field screening and analytical monitoring results whereby exceedance of the criteria will require follow-up investigations to be conducted to identify and eliminate the source causing the exceedance of the criteria. | 7.4; Attachment 7.1 |
| c. (7) Assess the presence of trash in receiving waters and urban runoff at each dry weather field screening or analytical monitoring station. Assessments of trash shall provide information on the spatial extent and amount of trash present, as well as the nature of the types of trash present. | 7.4; Attachment 7.1 |

## IDDE—Additional Dry Weather Monitoring Program Requirements

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| c. (8) Dry weather field screening and analytical monitoring stations identified to exceed dry weather monitoring criteria for any constituents shall continue to be screened in subsequent years. | 7.4; Attachment 7.1 |
| c. (9) Develop and/or update procedures for source identification follow up investigations in the event of exceedance of dry weather field screening and analytical monitoring result criteria. These procedures shall be consistent with procedures required in section D.4.d of Order No. R9-2007-0001. | 7.5; Attachment 7.1 |
| c. (10) Develop and/or update procedures to eliminate detected illicit discharges and connections. These procedures shall be consistent with each Copermittees Illicit Discharge and Elimination component of its Jurisdictional Urban Runoff Management Plan as discussed in section D.4 of Order No. R9-2007-0001. | 7.5; Attachment 7.1 |
| d. The Copermittees shall commence implementation of dry weather field screening and analytical monitoring under the requirements of this Order by May 1, 2008. Each Copermittee shall conduct dry weather analytical and field screening monitoring in accordance with its storm water conveyance system map and dry weather analytical and field screening monitoring procedures as described in section II.B.3 above. If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and sections D.4.d and D.4.e of Order No. R9-2007-0001. Until the dry weather field screening and analytical monitoring program is implemented under the requirements of this Order, each Copermittee shall continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2001-01. | 7.4, 7.5; Attachment 7.1 |

**Re: 2010 Dry Weather Field Screening and Analytical Monitoring Program**
**City of National City, California**

Dear Mr. Daneshfar:

Enclosed please find our final report for the City of National City 2010 Dry Weather Field Screening and Analytical Monitoring Program. This report presents the results of the monitoring program conducted in the City of National City during the 2010 dry weather season. The contents include field screening results, trash assessment data, analytical laboratory test results, analyses of the collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations conducted to identify the sources of pollutants detected during the field screening program and our recommendations for additional actions.

Review comments from the draft report submitted to the City have been incorporated into this final report. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.
Project Manager

# 1 INTRODUCTION

## 1.1 Regulatory Requirements

In accordance with the San Diego County Municipal Storm Water Permit Order R9-2007-01 (Municipal Permit), each of the Copermittees is required to annually perform dry weather monitoring of discharges into its storm water conveyance system. During the dry weather season, May 1 through September 30, selected locations along the storm drain conveyance system are evaluated. This procedure includes recording field observations, estimating observed flow rates, and conducting field testing. The Municipal Permit also requires laboratory analyses for at least 25 percent of the visited sites with flowing or ponded water. If a sampling location is dry, meaning there is no flowing or ponded water, an alternate sampling station is selected. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days.

## 1.2 Program Overview

The purpose of the Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program) is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm water conveyance system, minimizing the negative impact of human activities on receiving water bodies. The Dry Weather Monitoring Program consists of the following components:

- Field screening visual observations
- Field screening analytical monitoring
- Trash assessments
- Laboratory analytical monitoring

The data gathered from dry weather monitoring is used to characterize discharges to the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations are conducted as needed to detect and eliminate the sources of these pollutants.

## 1.3 Hydrologic Setting

The City of National City (City) is located entirely within the San Diego Bay Watershed Management Area. The City is one of the most densely populated regions of the San Diego Bay Watershed Management Area, but makes up only 1.6% of the watershed's total area. The City includes portions of hydrologic areas 909.1 and 908.3, of the Lower Sweetwater and Pueblo watersheds, respectively. The major receiving water body in the City is the San Diego Bay. Runoff from the southern part of the City initially drains to the Sweetwater River, which ultimately conveys flow to the bay. The Sweetwater River and the Sweetwater Marsh are identified as Environmentally Sensitive Areas (ESA). The Sweetwater River flows along the southern border of the City through the Sweetwater Marsh and into the San Diego Bay. Paradise Creek is a small salt marsh creek that receives runoff from the northern areas of the City and discharges into the Sweetwater River. Paradise Creek and Paradise Marsh have also been identified as ESAs. La Paleta Creek traces the northern border of the City, and is 303(d) listed for benthic community effects and sediment toxicity as Seventh Street Channel. The 2008/2009 San Diego Bay Watershed Urban Runoff Management Program (WURMP) Annual Report identified bacteria, sediment, and trash as high priority water quality problems in

hydrologic area 908.3 of the Pueblo San Diego Watershed. The San Diego Bay WURMP also identified bacteria as a high priority pollutant category in hydrologic area 909.1 of the Sweetwater Watershed.

## 1.4 Previous Work

The City of National City has conducted dry weather field screening programs since 1996 at several locations within the City's storm water conveyance system. A summary of the number of sites sampled for each year is presented in Table 1-1.

**TABLE 1-1**
**SUMMARY OF HISTORICAL DRY WEATHER SITES**

| Year | Number of Sites Screened [1] | Number of Flowing Sites | Number of Ponded Sites | Number of Dry Sites | Number of Lab Analysis Sites [2] |
|---|---|---|---|---|---|
| 1996 | 20 | Data not available [3] | | 13 | --- |
| 1997 | 7 | | | 0 | --- |
| 1998 | 7 | | | 3 | --- |
| 1999 | 7 | | | 1 | --- |
| 2000 | 7 | | | 2 | --- |
| 2001 | 10 | | | 1 | --- |
| 2002 | 15 | 12 | 3 | 2 | 4 |
| 2003 | 15 | 13 | 2 | 2 | 4 |
| 2004 | 15 | 11 | 4 | 2 | 4 |
| 2005 | 15 | 14 | 1 | 2 | 4 |
| 2006 | 15 | 14 | 1 | 2 | 4 |
| 2007 | 15 | 13 | 2 | 1 | 4 |
| 2008 | 15 | 12 | 3 | 4 | 4 |
| 2009 | 15 | 12 | 3 | 4 | 4 |

**Notes:**
[1] Number of Sites Screened = Number Flowing + Number Ponded. Field screening cannot be conducted at sites found to be dry. Dry sites are replaced by either a flowing or ponded site.
[2] Laboratory analyses commenced in 2002 as required by RWQCB Order 2001-001.
[3] Available information does not distinguish between flowing and ponded sites during this period.

## 1.5 Report Outline

This report is presented in the following order:

**Section 1, Introduction,** includes a regulatory background, a program overview, a discussion of the City's hydrologic setting, a summary of previous dry weather monitoring, and the report outline.

**Section 2**, **Sampling Locations,** describes sampling locations and site selection criteria.

**Section 3, Field and Laboratory Analytical Methods,** includes field screening and laboratory analytical procedures, quality assurance protocols, and follow-up action levels.

**Section 4, Field Screening Results,** presents qualitative observations of the sampling locations and quantitative results of the field screening analyses.

**Section 5, Trash Assessment,** discusses the procedure and results of the trash assessment.

**Section 6, Laboratory Analytical Results,** presents results of the laboratory analyses.

**Section 7, Data Analysis,** provides an analysis of this year's field and laboratory data, as well as a comparison of past results.

**Section 8, Follow-up Investigations,** details the results of follow-up investigations undertaken to identify the sources of action level exceedances measured during the monitoring program.

**Section 9, Summary and Recommendations,** provides a summary of the program results and recommendations for follow-up actions.

**Appendix A** Historical Dry Weather Monitoring Data

**Appendix B** Photographs of Sampling Locations

**Appendix C** Laboratory Analytical Reports

**Appendix D** Field Data and Trash Assessment Forms

# 2 SAMPLING LOCATIONS

The City of National City's most recent Jurisdictional Urban Runoff Management Plan identified 15 primary monitoring stations, as well as three alternate stations to replace any primary sites that did not have ponded or flowing water. All sampling sites are located in hydrologic units 908 and 909.

Fifteen primary monitoring stations were visited in 2010. Primary sites 4, 42, and 43A were dry and alternate sites 6, 44, and 49 were sampled in their place.

Table 2-1 provides the location, conveyance configuration, primary and secondary land uses, Hydrologic Subarea (HSA), and Global Positioning System (GPS) coordinates of the primary and alternate monitoring stations that were visited. Photographs of sampling locations are included as Appendix B. A complete map of the Municipal Separate Storm Sewer System (MS4) including sampling location is included as Figure A. A map of the watersheds in and around National City, broken down into HSAs, is included as Figure B.

**TABLE 2-1**

**Note:** * Alternate sites 6, 44, and 49 were selected to substitute for dry primary monitoring sites 4, 42, and 43A.

# 3 FIELD AND LABORATORY ANALYTICAL METHODS

## 3.1 Field Screening Procedures and Methods

Field screening techniques consist of flow measurements, qualitative field observations, and quantitative field analyses of selected water quality parameters. Weather conditions, time since last rainfall, and the type of storm water conveyance are recorded as well. Specific observations and results of the field water quality analyses are documented on field data sheets, which also serve as a record of the field visit. Data sheets are completed for every site visit regardless of whether or not samples were collected. Check boxes on the data sheets indicate if the visit is for routine field screening, confirmation of an exceedance, or an IC/ID follow-up visit. A confirmation visit is a revisit of the original site, whereas an IC/ID follow-up is an upstream investigation. Data sheets from the 2010 Dry Weather Monitoring Program are included as Appendix D.

Field screening and analyses were conducted according to the following procedures and methods:

### Qualitative Observations

Qualitative field observations are made during each site visit. These observations include a general site assessment and description of water odor, clarity, the presence of floatable materials, visible deposits or stains, and organisms. Evidence of present or past illicit connections and illegal discharges to the storm drain system can also be discovered through careful field observations. Each field screening location is photographed to document site conditions. Photographs of each site visited are included in Appendix B.

### Flow Measurement

Flow measurements can help estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may be indicative of an illegal discharge. Various field methods are used in formulas to estimate the flow rate. These include measuring the velocity, depth, and width of the flowing water; recording the amount of time required to fill a bottle of known volume with sample water; or, if measuring flow within a cylindrical pipe, measuring the pipe diameter as well as the depth and velocity of the flow. Low levels of flow may also be assessed visually.

### Field Water Quality Analyses

At each site with ponded or flowing water, water samples were collected and analyzed in the field for the following constituents:

- Specific Conductance
- Temperature
- pH
- Turbidity
- Nitrate-Nitrogen (Nitrate-N)
- Ammonia-Nitrogen (Ammonia-N)
- Orthophosphate-Phosphorus (Orthophosphate-P)
- Surfactants, measured as methylene blue active substances (MBAS)

The methods used to perform the above field analyses, along with the reporting limit, range, and accuracy of each method, are listed in Table 3-1.

## TABLE 3-1
## FIELD ANALYTICAL METHODS

| Parameter | Method | Method Reporting Limit | Range | Accuracy |
|---|---|---|---|---|
| Specific Conductance | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter* | 0.01 mS/cm | 0 – 20 mS/cm | ± 2% of functional sensitivity[1] |
| Temperature | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter* | 0.1 °C | 0.0 °C – 60.0 °C | ± 0.5 °C |
| pH | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter* | 0.01 | 0.00 – 14.00 | ± 0.01 pH |
| Turbidity | Hanna Instruments HI 93703 Portable Turbidity Meter* | 0.00 NTU | 0.00 – 50.00 NTU and 50 – 1000 NTU | ± 0.5 NTU or 5% of reading (whichever is greater) |
| Ammonia-N | CHEMetrics V-2000 Multi-Analyte LED Photometer – Ammonia 3 Vacu-vials® (K-1403) Salicylate* | 0.20 mg/L** | 0.20 mg/L – 3.00 mg/L** | Varies with measured concentration[2,3] |
| Nitrate-N | CHEMetrics V-2000 Multi-Analyte LED Photometer – Nitrate 3 Vacu-vials® (K-6933) Cadmium reduction[4]* | 1.13 mg/L** | 1.13 mg/L – 113 mg/L** | ± 30%of practical detection limit[2] |
| Ortho-phosphate-P | CHEMetrics V-2000 Multi-Analyte LED Photometer – Phosphate 2 Vacu-vials® (K-8513) Stannous chloride chemistry[4]* | 0.098 mg/L** | 0.10 mg/L – 2.61 mg/L** | Varies with measured concentration[2,3] |
| Surfactants | CHEMetrics CHEMets Kit (K-9400) methylene blue active substances | 0.13 mg/L | 0.00 mg/L – 3.00 mg/L*** | ± 0.13 & ± 0.5 mg/L[5] |

**Notes:**

EC = electrical conductivity
mS/cm = millisiemens per centimeter
°C = degrees Celsius
NTU = nephelometric turbidity unit
mg/L = milligrams per liter
LED = light-emitting diode

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20%. CV is the standard deviation divided by the mean.

[2] PDL is defined as the lower limit of the stated test range.
Percent error adjusts as follows: ±30% at PDL, ±20% for 25% of full range, ±10% for 75% of full range, ±10% for 120% of full range.

[3] This method determines the concentration of nitrate in mg/L $NO_3$. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the $NO_3$ molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14g/mol) to $NO_3$ (62 g/mol). The practical detection limit (PDL) for nitrate is 5.0 mg/L; however, the PDL for nitrate-nitrogen is lower due to the conversion.

[4] This method determines the concentration of orthophosphate in mg/L $PO_4$. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the $PO_4$ molecule. Oxygen is 67.4% of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31g/mol) to $PO_4$ (95 g/mol). The practical detection limit for orthophosphate is 0.3 mg/L; however, the practical detection limit for orthophosphate-phosphorus is lower due to the conversion.

[5] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

*Test method information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com.

** Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

***Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

## 3.2 Laboratory Analytical Methods

In accordance with the Municipal Permit, laboratory samples were collected at four sites, representing 25 percent of the sites where ponded or flowing water was observed. Samples were submitted to EnviroMatrix Analytical, Inc, a laboratory certified by the California Department of Health Services, for analysis of the following constituents:

- Total hardness
- Oil and grease
- Diazinon
- Chlorpyrifos
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- Total Coliform bacteria
- Fecal Coliform bacteria
- *Enterococcus* bacteria

The methods used to perform each of the above analyses along with method reporting limits and holding times are listed in Table 3-2.

## 3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project includes the United States Environmental Protection Agency (USEPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

### 3.3.1 Field Sampling and Analysis QA/QC

The pH meters, turbidity meter and conductivity meter are tested daily before field screening begins. The pH meters are calibrated as needed with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube is kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter and conductivity meter are calibrated as needed using standard solutions.

Field sample collection containers are rinsed first with distilled water and then with the sample water prior to sample collection. Upon completion of sampling and testing at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water and dried.

Field test kit accuracy is assessed prior to commencing sampling. Each lot, or batch, of Chemetrics ampoules is analyzed against standard solutions of known concentrations of ammonia-N, nitrate, orthophosphate, and surfactants. The results of these tests are shown in Table 3-3.

**TABLE 3-2**
**LABORATORY ANALYTICAL METHODS**

| Analyte | Analytical Method | Method Reporting Limit | Method Detection Limit | Maximum Holding Time [1] |
|---|---|---|---|---|
| Oil and Grease | EPA 1664 | 5 mg/L | 5 mg/L | 28 days |
| Total Hardness | EPA 200.7 | 10 mg/L | 10 mg/L | 14 days |
| Dissolved Cadmium | EPA 200.8 | 1 µg/L | 0.2 µg/L | 24 hours |
| Dissolved Copper | EPA 200.8 | 10 µg/L | 1 µg/L | 24 hours |
| Dissolved Lead | EPA 200.8 | 5 µg/L | 1 µg/L | 24 hours |
| Dissolved Zinc | EPA 200.8 | 20 µg/L | 0.3 µg/L | 24 hours |
| Diazinon | EPA 8141A | 0.05 µg/L | 0.04 µg/L | 7 days |
| Chlorpyrifos | EPA 8141A | 0.05 µg/L | 0.04 µg/L | 7 days |
| Total Coliforms[2] | SM 9221 | 20 – 1,600,000 MPN/100 mL | 20 MPN/100 mL | 6 hours |
| Fecal Coliforms[2] | SM 9221 | 20 – 160,000 MPN/100 mL | 20 MPN/100 mL | 6 hours |
| Enterococci[2] | SM 9230 | 20 – 160,000 MPN/100 mL | 20 MPN/100 mL | 6 hours |
| Total Coliforms | SM 9223 (IDEXX Colilert)[3] | 10 – 2,419,600 MPN/100 mL | 10 MPN/100 mL | 6 hours |
| *Escherichia coli (E. coli)* [4] | SM 9223 (IDEXX Colilert)[3] | 10 – 2,419,600 MPN/100 mL | 10 MPN/100 mL | 6 hours |
| Enterococci | IDEXX Enterolert[3] | 10 – 241,960 MPN/100 mL | 10 MPN/100 mL | 6 hours |

**Notes:**
µg/L = micrograms per liter
MPN/100 mL = most probable number (of colony-forming units) per 100 milliliters
[1] Maximum Holding Time values listed apply to samples collected and preserved in accordance with the quality assurance and quality control procedures listed in Section 3.3.2.
[2] For D-MAX's Dry Weather Monitoring Program, EMA performs standard dilutions for total coliforms to quantify from 20-1,600,000 most probable number per 100 milliliters (MPN/100 mL). For fecal coliforms and Enterococci, EMA performs standard dilutions to quantify from 20-160,000 MPN/100 mL. During the analysis and interpretation of the results, the number of tubes used to quantify the sample must fit the MPN index table from Standard Method 9221. The dilution set used will determine the detection limit. A standard dilution analysis is set up with 15 tubes at different concentrations. The reporting limit will always be adjusted depending on the dilution factor used for quantifying the actual results based on the MPN table. If the result for the analysis was less than 16,000 MPN/100 mL, the reporting limit will always be 20, and the dilution factor will be 10. As the dilution factor goes up, the reporting limit listed in the results from EMA will also go up based on the calculation made with EMA's data system. However, the lowest quantifiable number or reporting limit would still be 20 based on how the standard tubes for the sample is set up.
[3] IDEXX Colilert and Enterolert tests are performed by EMA. This test is used during upstream investigations only.
[4] Number of fecal coliforms is derived from number of *E. coli* through the following formula:
Fecal Coliforms = *E. coli* / 0.85. The converted fecal coliform count, not the number of *E. coli*, is reported in this report's data tables.

**TABLE 3-3**
**FIELD ANALYSIS QA/QC RESULTS**

| Analyte | Known Concentration (mg/L) | Acceptable Range* (mg/L) | Lot Number | Date | Field Test Kit Results (mg/L) |
|---|---|---|---|---|---|
| Ammonia-N | 0.85 | 0.68 - 1.02 | 73707/2 | 5/17/2010 | 0.811 |
| | | | 74559/8 | 5/27/2010 | 0.821 |
| | | | 75425/13 | 6/30/2010 | 0.811 |
| | | | 75608/7 | 8/27/2010 | 0.691 |
| | | | | | |
| Nitrate* | 44.3 | 31.0 - 57.6 | 75362/2 | 5/17/2010 | 42.77 |
| | | | 73960/4 | 5/17/2010 | 41.02 |
| | | | 75655/6 | 6/30/2010 | 38.56 |
| | | | 75655/8 | 6/30/2010 | 36.49 |
| | | | 75998/8 | 8/6/2010 | 46.63 |
| | | | | | |
| Orthophosphate* | 6.13 | 4.29 - 7.97 | 75263/4 | 5/17/2010 | 6.023 |
| | | | 73677/4 | 5/17/2010 | 5.265 |
| | | | 75756/4 | 6/30/2010 | 5.015 |
| | | | | | |
| Surfactants | 1.0 | 0.75 - 1.25 | 75440/75293/12 | 5/17/2010 | 1.0 |
| | | | 74268/74253/2 | 5/17/2010 | 1.0 |
| | | | 75638/75460/12 | 6/30/2010 | 1.0 |
| | | | 75638/75631/2 | 6/30/2010 | 1.0 |
| | | | 75928/75791/6 | 7/28/2010 | 1.0 |
| | | | 75928/75937/2 | 8/27/2010 | 1.0 |
| | | | | | |

**Notes:**
Acceptable range is calculated based on the error associated with the methods as listed in Table 3-1.
* Nitrate and orthophosphate are converted to nitrate-nitrogen and orthophosphate-phosphorus, respectively, when conducting standard field screening. This is accomplished by multiplying the results by 0.226 for nitrate and 0.326 for orthophosphate. To simplify the calibration process, the unconverted numbers are used when calibrating the instruments.

### 3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis are collected concurrently with field samples and utilize the same sampling procedures. Pre-sterilized sample bottles are obtained from the laboratory and thus do not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples are kept in a cooler on ice until picked up by the lab. Strict chain of custody procedures are followed, and samples are delivered and analyzed within the appropriate holding times listed in Table 3-2. Completed chain of custody forms are included in Appendix C.

## 3. 4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation is necessary, numeric action levels and best professional judgment are used to interpret the field screening results. If visual and/or analytical evidence of

gross contamination are present at a site (e.g., substantial petroleum sheen, extremely high ammonia-N concentration, evidence of a sewage release, etc.), then an immediate source identification investigation is initiated. For sites that exceed numeric action levels but are not perceived as an immediate threat to water quality, a confirmation visit is conducted within two business days. An upstream pollutant source investigation is conducted thereafter if elevated concentrations persist and no sources can be identified in the immediate vicinity of the monitoring station. If elevated levels of pollutants are detected by the laboratory analyses, a comprehensive follow-up pollutant source investigation is conducted within two business days of receiving the laboratory results. A discussion of follow-up investigations is included in Section 8 of this report. Recommendations based on the results of the investigations are included in Section 9.

The following three methods are employed to determine whether immediate or comprehensive follow-up investigations are necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment (BPJ). All three approaches are described in detail below and presented in Table 3-4.

**Numeric Action Levels**

Numeric action levels are used as the primary approach for interpreting pH, orthophosphate-P, nitrate-N, ammonia-N, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (see Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels based on county-wide sampling data. These action levels have been used by all San Diego County Copermittees since the 2003 dry weather season.

**California Toxics Rule**

The CTR criterion maximum concentration (CMC) is a short term concentration limit in which aquatic life can be sustained. The CMC is used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in USEPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total hardness of the sampled water, with the action levels increasing as hardness increases. More information on the CTR is available at http://www.epa.gov/region09/water/ctr.

**Best Professional Judgment**

Best professional judgment is utilized as the primary approach for interpreting turbidity, water temperature, and conductivity and as a secondary approach for interpreting the results of all other field and laboratory analyses. Under BPJ, the need for a follow-up investigation is left to the discretion of the D-MAX field crew. Best professional judgment may indicate that results which either exceed certain action levels or are statistical outliers may be the result of natural or background factors.

**TABLE 3-4**
**ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS**

| Field Screening Analytes | Action Levels[1] | Source/ Notes |
|---|---|---|
| Conductivity (mS/cm) | BPJ | Conductivity may be highly elevated in some regions due to high TDS, groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values <0.75 may indicate excessive potable water discharge or flushing. |
| Temperature (°C) | BPJ | Base judgment on season, air temperature, channel type, shading, etc. |
| pH | <6.5 or >9.0 | Basin Plan[2], with allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia. |
| Turbidity (NTU) | BPJ | WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity) and unusual odors. |
| Ammonia-N (mg/L) | 1.0 | Based on Workgroup experience. May also consider unionized ammonia fraction. |
| Nitrate-N (mg/L) | 10.0 | Basin Plan and drinking water standards |
| Orthophosphate-P (mg/L) | 2.0 | EPA Multi-sector General Permit |
| Surfactants (MBAS) (mg/L) | 1.0 | Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences. |
| **Laboratory Analytes** | **Action Levels** | **Source/ Notes** |
| Oil and Grease (mg/L) | 15 | EPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation. |
| Diazinon (µg/L) | 0.5 | Response to diazinon and chlorpyrifos levels above 0.5 µg/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs. |
| Chlorpyrifos (µg/L) | 0.5 | |
| Dissolved Cadmium (µg/L) | CTR | Use California Toxics Rule, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd – 14 ppb; Cu – 38 ppb; Pb – 209 ppb; and Zn – 297 ppb. |
| Dissolved Copper (µg/L) | | |
| Dissolved Lead (µg/L) | | |
| Dissolved Zinc (µg/L) | | |
| Total Coliforms (MPN/100 mL) | 130,000 | Bacteria action levels were updated for implementation in 2010 by the Dry Weather Monitoring Sub-workgroup. Bacteria levels in many storm drains are likely to exceed public health guidance criteria. Use confidence interval test and best professional judgment to identify conveyances for source ID. |
| Fecal Coliforms (MPN/100 mL) | 13,000 | |
| Enterococci (MPN/100 mL) | 7,000 | |

**Notes:**
[1] The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry weather monitoring data should be interpreted using a variety of available information, including within-site and between-site sample variability.
[2] Basin Plan = Water Quality Control Plan for the San Diego Basin
BPJ=Best Professional Judgment
WQO = Water Quality Objective
ppb = parts per billion

# 4 FIELD SCREENING RESULTS

Dry Weather field screening was conducted at the 15 sites where ponded or flowing water was observed. Of these sites, 11 had a measurable flow, and four had ponded water. Eight confirmation visits were performed at sites where one or more constituents were found to exceed specified action levels, and three upstream locations were sampled during follow-up investigations.

## 4.1 Qualitative Observations

Qualitative observations for all routine field screening visits are summarized below. Routine field screening and confirmation visit observations are presented in Table 4-1:

***Light Conditions***
Light conditions were primarily overcast, with occasional sunny or partly cloudy weather.

***Tide***
Two sites visited during dry weather monitoring were subject to tidal influence. Both sites were sampled during an incoming tide.

***Odor***
One site smelled musty and one site had a combination of a musty and sewage smell. All other samples lacked any discernable odor.

***Color***
Water from four sites was yellow in color, and water from two of the sites appeared brown. All other samples were colorless.

***Clarity***
The majority of water samples collected was clear, with negligible amounts of suspended particles observed. One water sample was slightly cloudy.

***Floatable Materials***
Trash was noted floating on the surface of the water at eight sites. Bubbles and foam were on the surface of one site. No other types of floating materials were noted. Section 5 of this report includes the complete results of the Trash Assessment.

***Deposits***
Sediment, gravel, and/or fine particulates were observed at nearly all sites. No other types of deposits were noted.

***Vegetation***
Most sites supported either normal or no vegetation, appropriate for the availability of sunlight and soil. Two sites had limited vegetation, and flow was restricted at one site as a result of excessive vegetation due to thick reed growth.

***Biology***
The presence of organisms can be an indication of healthy waters. The presence of algae often indicates that water flow is persistent. An overabundance of algae often implies high levels of nutrients in the water and can have negative effects on aquatic life. No sites had excessive algal growth this year. Insects and algae were prevalent at most sites that had sun exposure. One site was host to snails.

**TABLE 4-1**
**DRY WEATHER FIELD OBSERVATIONS**

| Site | Date | Time | Light Conditions | Odor | Color | Clarity | Floatables | Deposits | Vegetation | Biology |
|---|---|---|---|---|---|---|---|---|---|---|
| 1A | 7/8/10 | 15:50 | Overcast | None | None | Clear | Trash | Sediment/Gravel, Fine Particulates | Excessive | Insects, Snails, Larvae, Worms, Slugs |

## 4.2 Field Analytical Results

Field analyses are conducted at all sites with flowing or ponded water. The measured constituents are described below.

**Flow rate** quantifies the volume of fluid passing across a given surface per unit time. Flow rate measurements are needed to calculate the load or particular amount of a pollutant discharged.

**Water temperature** is needed to assess the significance of other parameters, such as pH and conductivity. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life.

The **pH** is an expression of acidity or alkalinity of a water sample. The pH of an aquatic system will affect a variety of chemical reactions, including the availability of nutrients and the solubility of chemical substances, particularly heavy metals.

**Turbidity** describes the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation, thus reducing photosynthetic capacity, but excessive suspended particles can also absorb heat and increase water temperatures.

**Specific conductance (conductivity)** measurements indicate the total concentration of ions in an aquatic system and the ability of the water to conduct electricity. This parameter can be used to assess the mineral content of water and potentially help indicate the presence of dissolved pollutants.

**Surfactant** concentrations in water samples often reflect illegal discharges from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms.

**Ammonia-N** is an indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment; however, in higher quantities it can become toxic to fish and other organisms.

**Nitrate-N** is a common sign of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, resulting in oxygen depletion as algae decomposes and may eventually suffocate other aquatic life. During the field analysis, nitrate is measured and converted into nitrate-N using a conversion factor of 0.226. This process is explained in Note 3 of Table 3-1.

**Orthophosphate-P** is also an indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate-N, orthophosphate-P pollution can cause nutrient enrichment, stimulate algal growth, and thus deplete oxygen in the water to levels that are dangerous for aquatic life. Even low levels of orthophosphate-P can cause significant algal growth, as it is commonly the limiting nutrient in plant growth. During the field analysis, orthophosphate is measured and converted into orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 4 of Table 3-1.

A statistical summary of the routine field analytical results is presented in Table 4-2. Table 4-3 shows the results of all field analyses conducted at the sampled sites. Graphs of the various parameters and appropriate action levels for follow-up investigations are included at the end of this Section.

# 5 TRASH ASSESSMENT

## 5.1 Regulatory Requirements

Section II.B.3.C.(7) of the Municipal Permit's Receiving Waters and Urban Runoff Monitoring and Reporting Program requires Copermittees to assess the presence of trash in receiving waters and urban runoff at each dry weather monitoring site. This trash assessment program is designed to provide information on the spatial extent and relative amount of trash present, as well as the nature and origin of the trash at the site.

## 5.2 Procedure and Definitions

The San Diego Copermittee Dry Weather Monitoring Workgroup developed a Trash Assessment Form to document the amount and extent of trash at each evaluated site. The form categorizes the site into one of five trash categories: optimal, suboptimal, marginal, submarginal, or poor. The form also addresses any potential threats that the trash may pose to human or aquatic health. For sites rating submarginal or poor, the form includes a section to record types, prevalence, potential routes, and sources of trash.

A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form's five categories are primarily qualitative descriptions of the amount and extent of trash although a number of trash pieces is also included in each category as a rough guideline. The five categories are defined as follows.

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.
- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is assessed at each site using the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* – Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other

material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category.

In the event that a site is noted as potentially posing a threat to human or aquatic health, additional descriptive comments are recorded in the "Comments" section of the Trash Assessment Form.

If a site is labeled as submarginal or poor, it is then assessed for types of trash present (e.g., automotive, biohazard, food waste), which are ranked based on the prevalence and potential threat to water quality of the items. Lastly, the potential mechanism through which trash reached the site (e.g., dumping, littering, upstream sources) and the potential source of the trash (e.g., construction, commercial, transient) are identified.

## 5.3 Trash Assessment Results

Trash assessments were conducted at 19 sites, including four dry sites. The most frequent trash assessment scores in the City of National City for 2010 were optimal and marginal trash ratings, with eight sites receiving an optimal score and seven sites receiving marginal scores. Two sites were rated suboptimal, one site rated submarginal, and one site rated poor. Site 31A was noted as potentially posing a threat to aquatic health because of spray paint cans in the area. Site 32 was considered a potential threat to human health because a diaper was observed near the flow of water at the site. Table 5-1 and Graph 5-1 summarize the trash assessment results. Table 5-2 shows a breakdown of the types and potential sources of trash present at submarginal or poor sites. Figure 5-1 provides a map of sampling sites and their corresponding trash assessment.

**GRAPH 5-1**
**TRASH ASSESSMENT SUMMARY**

### 5.3.1 Submarginal or Poor Sites

**Site 6**, located at an outlet at the north bank of the Sweetwater River, received a submarginal trash rating. A large amount of trash was observed protruding from the outlet's flap gate and piled within the concrete conveyance. This waste included clothing, household items, construction debris, and used tires. Most debris was likely to have been carried down from upstream sources or left by transients. Upstream commercial and residential areas are a probable source for much of the smaller debris.

**Site 32** is located at an outlet east of 2nd Ave and north of Freeway 54 and Sweetwater River. This site received a poor trash rating. Trash was within and around the concrete conveyance. This waste included clothing, food packaging, and household waste. A diaper was found next to water on side of channel. Most debris was likely to have been left by transients.

**TABLE 5-2**
**BREAKDOWN OF SUBMARGINAL AND POOR SITES**

| Site | Ranking | Types of Trash | Potential Route 1 | Potential Route 2 | Potential Source 1 | Potential Source 2 |
|---|---|---|---|---|---|---|
| 6 | 1 | Fabric/Clothing | Littering | Upstream | Household | Transient |
| | 2 | Household | Littering | Upstream | Household | Commercial |
| | 3 | Construction | Littering | Upstream | Household | Construction |
| | 4 | Automotive | Dumping | --- | Household | Commercial |
| 32 | 1 | Fabric/Clothing | Dumping | Littering | Transient | --- |
| | 2 | Food Packaging | Dumping | Littering | Transient | --- |
| | 3 | Household | Dumping | Upstream | Transient | --- |

**Note**: Only the types of trash that are present in the evaluated area are ranked. Ranking order refers to the prevalence of each type of trash, with 1 being most prevalent and 12 being least prevalent.

**FIGURE 5-1**
**TRASH ASSESSMENT GIS MAP**

# 6 LABORATORY ANALYTICAL RESULTS

## 6.1 Summary

Laboratory analyses were conducted at four sites, representing over 25 percent of all sites with ponded or flowing water. The laboratory constituents measured are defined below.

**Oil and grease** analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities.

**Total hardness** measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Hardness itself is not considered a pollutant, but is measured to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions.

**Diazinon** and **chlorpyrifos** are organophosphate pesticides that are highly toxic to insects, birds, and mammals, freshwater fish, and invertebrates. In 2005, the Environmental Protection Agency banned the sale of diazinon in the United States and tightened restrictions on chlorpyrifos use.

**Coliform bacteria** are relatively harmless to humans and are present in mammalian digestive tracts, most surface waters, and soils. Testing water samples for total coliform bacteria is a standard practice in public health. Total coliform is measured as an indicator of other more harmful pathogens, since these pathogens are generally present in much smaller quantities and are difficult to detect.

**Fecal coliform**, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastrointestinal tracts of humans and animals and are commonly used as indicators of water contamination by fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material is human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain.

**Metal** contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms.

The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness. As hardness increases, so does the CMC, a concentration limit in which aquatic life can be sustained. CMC values differ for various metals. Dry weather monitoring laboratory samples are analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Table 6-1 shows the sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

Table 6-2 presents a statistical summary of the laboratory results from all samples. Table 6-3 presents the laboratory results from all samples. Laboratory reports are included in Appendix C.

**TABLE 6-1**
**CTR – CMC FOR DISSOLVED METALS***

**Notes:** nd = not detected; na = not analyzed
J = Detected but below the reporting limit; therefore, result is an estimated concentration.
**Red** values were at or above the measured constituent's action level
[yellow box] denotes a confirmation visit
*Bacterial indicators were in exceedance at Site 45 during the MS4 sampling program and not as part of the Dry Weather Monitoring Program. These exceedances were investigated per the City's request.
**Number of fecal coliforms for confirmation samples are derived from *E. coli* count. Number of fecal coliforms = (Number of *E. coli*) / 0.85. Confirmation samples are analyzed using the Colilert and Enterolert methods described in Table 3-2, which have a reporting limit of 10 MPN/100 mL.
***Reporting limit is 10 MPN/100 mL for IDEXX tests used during confirmation and upstream testing.
****Total hardness is not considered a pollutant (see Section 3.4), and thus has no established action level for the purposes of dry weather monitoring. Total hardness is measured because the CTR action levels for metals are dependent on the total hardness value of the water sample.

# 7 DATA ANALYSIS

This section provides an overall evaluation of test results of the 2010 Dry Weather Monitoring Program, as well as a discussion of historical trends for various constituent exceedances. In 2010, only two of the 15 sites sampled had a flow rate greater than 1 gpm during the initial visit. The generally low levels of dry weather flow observed indicate that only a relatively small amount of discharge is being generated within the City. Lower levels of flow reduce the likelihood that pollutants in the water will reach receiving water bodies.

## 7.1 2010 Results

Of the 15 field screening visits performed in 2010, 10 exceedances were measured. A summary of 2010 exceedances in presented in Table 7-1.

**TABLE 7-1**
**2010 EXCEEDANCES SUMMARY**

| Site No. | Turbidity | Surfactants | Ammonia-N | Dissolved Copper | Total Coliforms | Fecal Coliforms | Enterococci |
|---|---|---|---|---|---|---|---|
| 32 | | | | ✓ | ✓ | | ✓ |
| 38 | | | ✓ | | | | |
| 45* | ✓ | ✓ | | | | | |
| 46 | | | | | ✓ | ✓ | ✓ |
| 47 | | ✓ | | | | | |

**Note:** Table reflects exceedances occurring during routine visits only, not confirmation or follow-up visits.
*Total Coliforms, Enterococci, and Fecal Coliforms bacteria were in exceedance during MS4 sampling but not as part of the Dry Weather Monitoring Program.

## 7.2 Previous Results

Historical exceedance results are presented in Table 7-2, Graph 7-1, and Graph 7-2. Table 7-2 shows the percentage of sampled sites that have had exceedances each year of the Dry Weather Monitoring Program. Graph 7-1 illustrates the percentage of exceedances by year for field screening, and Graph 7-2 presents the percentage exceedances by year for laboratory analyses.

No exceedances have been measured in nitrate-N, dissolved lead, diazinon, or chlorpyrifos since testing of these constituents began in accordance with Order 2001-01. Thus, these constituents have not been included in the following graphs.

This was the first year a turbidity exceedance was noted. Surfactant and ammonia-N exceedances appear to be decreasing throughout the course of the program. No exceedances

have been noted in conductivity since 2004, and pH exceedances have not been observed in the past three years.

As shown in Graph 7-2, the percent of total coliform and fecal coliform bacteria exceedances shows a slight downward trend over time. Note that dry weather action levels for bacterial indicators were revised in 2010. Constituents have been compared to action levels in effect at the time of sampling to identify exceedances. Oil and grease, dissolved cadmium, and dissolved zinc exceedances have been detected only once in the history of the program.

**TABLE 7-2**
**PERCENT OF SITES WITH EXCEEDANCES BY YEAR**

| Year | Field Screening | | | | | | | | | Laboratory Analysis | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | **Number of Field Screening Sites** | Temperature | pH | Conductivity * | Turbidity | Surfactants | Ammonia-N | Nitrate-N | Orthophosphate-P | **Number of Laboratory Sampling Sites** | Oil & Grease | Dissolved Cadmium | Dissolved Copper | Dissolved Lead | Dissolved Zinc | Diazinon | Chlorpyrifos | Total Coliforms ** | Fecal Coliforms ** | Enterococci ** |
| **2002** | 15 | 0 | 7 | 0 | 0 | 27 | 53 | 0 | 0 | 4 | 50 | 0 | 0 | 0 | 25 | 0 | 0 | 50 | 50 | 25 |

**Notes**: Results based on complete routine visits only. Confirmation visits, follow-up visits, and dry sites not included.

* By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgment in order to account for sites in which salt water and groundwater increase conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

** Note that dry weather action levels for bacterial indicators were revised in 2010. Constituents have been compared to action levels in effect at the time of sampling to identify exceedances.

**GRAPH 7-1**
**PERCENT OF SITES WITH FIELD SCREENING EXCEEDANCES BY YEAR**

**Note**: * The action level for conductivity was numeric in the past but was later changed to best professional judgment. See footnote in Table 7-2.

## GRAPH 7-2
## PERCENT OF SITES WITH LABORATORY ANALYSIS EXCEEDANCES BY YEAR

**Note**: * Dry weather action levels for bacterial indicators were revised in 2010. Constituents have been compared to action levels in effect at the time of sampling to identify exceedances.

# 8 FOLLOW-UP INVESTIGATIONS

One of the primary purposes of the Dry Weather Monitoring Program is to identify IC/IDs. When a parameter is measured at or above the regionally accepted action level, it is possible that an IC/ID is present and further investigation is performed. Procedures for such investigations are described below, followed by a discussion of the 2010 investigations.

## 8.1 Investigation Procedures

Follow-up investigations are conducted in two rounds. The first follow-up investigations are for the sites at which field tests indicate action level exceedances. These investigations are in the form of additional field testing and are conducted within one business day of the initial findings. The second round of follow-up investigations are carried out for the sites at which laboratory testing shows elevated constituent levels. These investigations are conducted within two business days of receiving the laboratory test results.

During the follow-up investigations, flow rates are measured, visual observations are performed, and field testing is conducted. Visual observations, such as water color, clarity, odor, floatable materials, deposits, vegetation, and biology are recorded on field data sheets at each site. Field data sheets are included in Appendix D.

Source identification investigations begin by testing the water at the site again. This is referred to as a “confirmation” visit, as its purpose is to confirm the initial findings. If confirmation testing results in constituent concentrations below specified action levels, the exceedance found during the initial sampling may have been due to a transient flow. If confirmation testing at a site finds constituent concentrations again above the specified action levels, an upstream investigation will be conducted. The field crew will progress upstream to isolate and identify potential pollutant sources.

Upstream investigations are also referred to as “IC/ID follow-up” visits, as the purpose is to identify illicit connections and illegal discharges. They are conducted by examining a number of upstream branches for any potential sources of the constituent of concern. The estimated flow rate in each branch and any relevant observations are recorded. Depending upon the constituent(s) under investigation, laboratory samples may be collected for analysis.

The laboratory test for investigating upstream bacteria sources differs from routine bacteria testing by using the IDEXX Colilert and IDEXX Enterolert tests. Information about these methods is provided in Table 3-2. Results for the Colilert and Enterolert tests are typically available within 24 hours, as opposed to the five business days needed for routine testing. The quicker turnaround time allows for additional upstream investigations as needed.

## 8.2 Investigated Sites

During the 2010 Dry Weather Monitoring Program, five sites required upstream investigations. Among the five sites, there were a total of two exceedances in surfactants, one in turbidity, one in ammonia-N, three in *Enterococcus* bacteria, two in fecal coliform bacteria, one in total coliform bacteria, and one dissolved copper. Each investigation is discussed in this section. Table 9-2 in Section 9 of this report provides a summary of the investigation results.

## Site 32

Site 32 is located at an outlet east of 2nd Ave, north of the 54 freeway and the Sweetwater River. The site received a poor trash assessment rating, and was flagged as a potential threat to human health due to the presence of human waste. Substantial amounts of litter surrounded the site. The items present, such as clothing, indicated frequent use of the area by people. Levels of *Enterococcus* and total coliform bacteria were measured above their respective action levels at both the routine and confirmation visits to the site. Water at the site was ponded during both visits.

**PHOTO 8-1:** Evidence of litter and human inhabitants at Site 32

Site 32 is located at the confluence of two main lines. During the confirmation visit, the line from the east was dry, and a small amount of water was observed coming from the northern line. This conveyance receives flow from within the Sweetwater Plaza Shopping Center and the western half of Sweetwater Town and Country Shopping Center. Poor waste disposal practices in this area, as well as conditions at the site are the most likely causes of the bacteria exceedances at Site 32 based on the following:

- Decomposing leaves, human waste, food packaging and other trash were observed in contact with the water in upstream conveyances and at Site 32 (Photo 8-1). These materials are likely to introduce bacteria as they decompose.
- A catch basin was located just downstream of the shopping areas, had a flow of less than 1 gpm, and contained high *Enterococcus* and total coliform bacteria levels.
- Used cooking oil creates conditions favorable to bacteria growth. Used cooking oil spills observed in the upstream shopping area, and an upstream inlet smelled of used cooking oil (Photo 8-2).
- Low flows upstream and ponded water at Site 32 provide conditions for bacteria to proliferate.

Upon the second confirmation visit to Site 32 a city crew was observed cleaning the area. The results of this investigation are presented in Table 8-1, and a map of sampling locations is provided in Figure 8-1.

**PHOTO 8-2**: Evidence of grease stains and spills upstream of site

**TABLE 8-1**
**SITE 32 BACTERIA UPSTREAM INVESTIGATION**

| Site | Date | Location | Flow (gpm) | Total Coliforms (MPN/100 mL) | *Enterococcus* (MPN/100 mL) |
|---|---|---|---|---|---|
| 32 | 7/8/10 | East of 2nd Ave, North of the 54 freeway and Sweetwater River | Ponded | **1,600,000** | **8,000** |
| 32 *(Confirmation)* | 7/26/10 | *Same as above* | Ponded | **173,000** | **26,130** |
| 32-2 | 7/26/10 | Catch basin at end of northern line at the southwest corner of Sweetwater Town and Country Shopping Center | <1 | **285,000** | **19,863** |

**Note:** **Red Bold Type** = value exceeds action level

**FIGURE 8-1**
**SITE 32 BACTERIA UPSTREAM INVESTIGATION**

In addition, the concentration of dissolved copper in a water sample from Site 32 exceeded the CMC-based action level during the routine visit. Although the exceedance was not confirmed during the follow-up visit, an upstream investigation to determine the potential sources of copper to Site 32 was done. Three water samples and eight sediment samples were collected from upstream locations and analyzed for copper concentrations. Dissolved copper in a water sample exceeded the CMC-based action level at upstream location 32-2 at the first visit but not at the second visit. None of the sediment samples exceeded the Environmental Health screening level of 225 mg/kg for residential and industrial soils.[1]

**PHOTO 8-3**: Inlet at location 32-9

The highest concentrations of total copper were measured at locations 32-9 (Photo 8-3) and 32-10 (Photo 8-4). These locations are along Sweetwater Road and at the entrance to the parking lot for the Sweetwater Crossing shopping center. The majority of runoff from the road and from the large parking lot is carried to locations 32-9 and 32-10.

Higher copper concentrations measured in sediment samples from locations 32-9 and 32-10 are likely due to automobile brake pad wear dust and emissions. Copper dust from vehicles tends to attach to particulates, which settle out on roadways and on parking lots and then may be transported with runoff into storm drains. Locations sampled along the channel to the south of the Sweetwater Crossing shopping center had much lower copper concentrations, which may have resulted from being located farther from heavy vehicle traffic. Conversation with City staff also indicated a potential source of vehicle wash water, which could also contain brake pad wear dust, east of the City's jurisdictional boundary immediately upstream of this area.

**PHOTO 8-4**: Culvert at location 32-10

The results of this investigation are presented in Table 8-2, and a map of sampling locations is provided in Figure 8-2.

[1] Environmental screening levels as listed *in Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater* (February 2005).

**TABLE 8-2**
**SITE 32 COPPER UPSTREAM INVESTIGATION**

| Site | Date | Location | CMC (µg/L) | Dissolved Copper (µg/L) | Total Copper (mg/kg) |
|---|---|---|---|---|---|
| 32 | 7/8/10 | East of 2nd Ave, north of the 54 freeway and Sweetwater River | 25 | **28** | na |
| 32 *(Confirmation)* | 9/14/10 | *Same as above* | 48 | 23 | na |

| 32-8 | 10/1/10 | West end of channel (south side) parking lot | -- | na | 54.8 |
| 32-9 | 10/1/10 | Inlet at southeast corner of Sweetwater Road and Town and Country Road intersection | -- | na | 151 |
| 32-10 | 10/1/10 | Inlet at northeast corner of Sweetwater Crossing parking lot | -- | na | 175 |

**Note:**
**Red Bold Type** = value exceeds action level (based on CMC value)
J = Detected but below the reporting limit; therefore, result is an estimated concentration.
na = not analyzed for this constituent
* EPA method 200.7 was used. All other dissolved copper measurements were generated using EPA method 200.8.

**FIGURE 8-2**
**SITE 32 COPPER UPSTREAM INVESTIGATION**

## Site 38

Site 38 is located within an earthen channel west of Harbison Avenue, between 20th and 24th Street. During the initial site visit, the water was ponded, and the ammonia-N concentration was measured at 1.97 mg/L, above the action level of 1 mg/L. During the confirmation visit, the earthen channel was dry and could not be sampled. The initial exceedance of ammonia-N was concluded to be due to a transient flow. This may have been the result of decomposing leaves and trash observed in storm drain inlets upstream of the sampling site. As organic material decomposes, ammonia is produced as a byproduct.

## Site 45

Site 45 is located in a manhole in front of 1243-1305 Fig Court, near the middle of the street. During the initial visit to the site, water was flowing at a rate of 1 gpm, had a musty odor, and was brown in color. Surfactants were measured above 3.0 mg/L, above the action level of 1 mg/L, and turbidity was also considered an exceedance by best professional judgment, at 262 NTU.

During the confirmation visit, all constituents were measured below their respective action levels and turbidity was measured at 4.81 NTU. Site 45 was also sampled for MS4 laboratory analyses. At the time of the initial visit, *Enterococcus*, total coliform, and fecal coliform bacteria

all measured above their respective action levels. Total coliform was measured at 1,600,000 MPN/100 mL, over the action level of 130,000 MPN/100 mL. Fecal coliform and *Enterococcus* bacteria were both measured at 160,000 MPN/100 mL, above action levels of 13,000 MPN/100 mL and 7,000 MPN/100 mL, respectively.

Decomposing trash and leaves were observed in contact with the flow at the site, and in the gutters of the upstream residential area (Photo 8-5). These conditions are likely to introduce bacteria into the storm drain system, which may be transported downstream to Site 45 during intermittent flows.

During the confirmation visit, the manhole was dry and could not be sampled. Bacteria are likely to be transported through the site during intermittent transient flows. The bacterial exceedances at Site 45 were part of MS4 sampling and not part of the Dry Weather Monitoring Program, but a follow up was conducted per the City's request.

**PHOTO 8-5**: Decomposing leaves and trash in a curb gutter upstream of Site 45

## Site 46

Site 46 is located within a manhole in the parking lot south of the South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop. During the initial visit, a flow of 1 gpm and a musty/sewage odor was noted. Laboratory analysis indicated that total coliform, fecal coliform, and *Enterococcus* bacteria measured above the action levels, at 500,000 MPN/100 mL, 17,000 MPN/100 mL, and 11,000 MPN/100 mL, respectively.

At the time of the confirmation visit, *Enterococcus* and fecal coliform bacteria were measured below their respective action levels. Total coliform was above the action level at 1,200,000 MPN/100 mL. These factors likely contribute elevated bacteria levels at Site 46:

- Significant amounts of decomposing trash in the northern storm water conveyance
- Consistent level of low flow at the site is conducive to bacterial growth

The results of this investigation are presented in Table 8-3, and a map of sampling locations is provided in Figure 8-3.

**TABLE 8-3**
**SITE 46 BACTERIA UPSTREAM INVESTIGATION RESULTS**

| Site | Date | Location | Flow (gpm) | *Enterococcus* (MPN/100 mL) | Total Coliforms (MPN/100 mL) | Fecal Coliforms (MPN/100 mL) |
|---|---|---|---|---|---|---|
| 46 | 7/8/10 | South of South Bay Plaza Center, between Fashion Plaza and Fiesta Pet Shop | 1 | **11,000** | **500,000** | **17,000** |
| 46 *(Confirmation)* | 7/26/10 | *Same as above* | <1 | 676 | **1,200,000** | 9,059* |
| 46-1 | 7/26/10 | Primary Site 3, East 7th Street and R Avenue | 3 | 882 | 5,480 | 74* |

**Note:** **Red Bold Type** = value exceeds action level
* Number of fecal coliforms is derived from number of *E. coli* through the formula: Fecal Coliforms = *E. coli* / 0.85.

**FIGURE 8-3**
**SITE 46 BACTERIA UPSTREAM INVESTIGATION**

## Site 47

Site 47 is located in a manhole at the southeast corner of Mile of Cars Way and Transportation Avenue. At the routine site visit, the measurement for surfactants was 1.50 mg/L. At the confirmation site visit, the value for surfactants had decreased to 1.00 mg/L, measuring at the action level. A sample was collected upstream from a ponded source at the corner of 2441 National City Boulevard and 25th Street (Photo 8-6). The water appeared to be left over from car washing activities from multiple car dealerships on National City Boulevard. The reported value for surfactants at this location was 2.50 mg/L.

**PHOTO 8-6**: Runoff at upstream location 47-1

**TABLE 8-4**
**SITE 47 SURFACTANTS UPSTREAM INVESTIGATION**

| Site | Date | Location | Flow (gpm) | Surfactants (mg/L) |
|---|---|---|---|---|
| 47 | 7/8/10 | Southeast corner of the Mile of Cars Way and Transportation Avenue | Ponded | **1.50** |
| 47 *(Confirmation)* | 7/26/10 | *Same as above* | Ponded | **1.00** |

# 9 SUMMARY AND RECOMMENDATIONS

## 9.1 Field Screening & Laboratory Analysis Summary

Fifteen primary monitoring sites and four alternate sites were visited in the 2010 Dry Weather Monitoring Program. Laboratory analyses were performed on water samples from four of the primary sites, representing over 25% of sites with flowing or ponded water. Table 9-1 provides a summary of action level exceedances.

**TABLE 9-1**
**SUMMARY OF ACTION LEVEL EXCEEDANCES**

| Field Screening (15 samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| pH | 0 | 0 | --- |
| Conductivity | 0 | 0 | --- |
| Turbidity | 1 | 7 | 45 |
| Surfactants | 2 | 13 | 45, 47 |
| Ammonia-N | 1 | 7 | 38 |
| Nitrate-N | 0 | 0 | --- |
| Orthophosphate-P | 0 | 0 | --- |
| **Laboratory Analyses (4 samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Sites with Exceedance** | **Sites Exceeding Action Level** |
| Oil & Grease | 0 | 0 | --- |
| Dissolved Cadmium | 0 | 0 | --- |
| Dissolved Copper | 1 | 25 | 32 |
| Dissolved Lead | 0 | 0 | --- |
| Dissolved Zinc | 0 | 0 | --- |
| Diazinon | 0 | 0 | --- |
| Chlorpyrifos | 0 | 0 | --- |
| Total Coliforms | 3* | 50* | 32, 45*, 46 |
| Fecal Coliforms | 2*- | 25* | 45*, 46 |
| Enterococci | 3* | 50* | 32, 45*, 46 |

**Note:** Table includes data from initial site visits only; confirmation and follow-up investigations are not included.
*Exceedances in bacterial indicators at Site 45 were part of the MS4 sampling program and not part of the Dry Weather Monitoring Program. The exceedances are not included in percentage of sites with exceedances.

Like the previous year, the City of National City's storm water conveyances had low flows this year; two of the 19 primary sites visited had a flow greater than 1 gpm during the routine visit. The low level of dry weather flows in the City may be a result of less irrigation runoff and drought conditions. Associated water conservation activities and the mandatory water restrictions implemented in San Diego County during 2009 and 2010, likely reduced flow and

indicate relatively small discharges in the City. These conditions decrease the likelihood that pollutants will reach receiving water bodies.

In the trash assessment, eight sites were assigned optimal trash ratings; two were suboptimal; seven were marginal; one was submarginal; and one site was rated poor.

## 9.2 Follow-Up Investigation Summary

Table 9-2 presents the conclusions based on the results of confirmation visits and upstream investigations conducted at five sites in the 2010 Dry Weather Monitoring Program.

**TABLE 9-2**
**SUMMARY OF FOLLOW-UP INVESTIGATIONS**

| Site | Follow-Up Investigation Target Constituent(s) | | Results / Probable Sources |
|---|---|---|---|
| | Field | Laboratory | |
| 32 | --- | Total Coliforms, Enterococci, Dissolved Copper | Bacteria: decomposing leaves, grease spills upstream, and trash located at site. Dissolved copper: automobile brake pad dust and emissions, from vehicle traffic or vehicle wash water. |
| 38 | Ammonia-N | --- | Exceedance not confirmed |
| 45* | Surfactants, Turbidity | Total Coliforms, Fecal Coliforms, Enterococci* | Surfactants and turbidity exceedances not confirmed. Bacteria possibly caused by decomposing trash inside manhole; decomposing leaves, food, and trash in storm water conveyance upstream.* |
| 46 | --- | Total Coliforms, Fecal Coliforms, Enterococci, | Low flow at site and decomposing trash upstream |
| 47 | Surfactants | --- | Possibly due to car washing from multiple car dealerships around site |

*These exceedances for total coliform, fecal coliform, and *Enterococcus* bacteria were observed during MS4 sampling; proactive follow up was conducted per the City's request.

## 9.3 Recommendations

Based on the results of the 2010 Dry Weather Monitoring Program for the City of National City, the following actions have been recommended. Follow-up actions already taken by the City are also described.

### 9.3.1 Education, Inspection, and Maintenance

- Visit the Sweetwater Plaza Shopping Center, upstream of Site 32, where a leaking dumpster and grease spills were observed, and conduct inspections of businesses with deficiencies in their trash grease disposal practices.
    - The City has conducted eight follow-up inspections and distributed educational materials at restaurants in this shopping center since the Dry

Weather Monitoring Program, resolving issues at all except one site, which faces ongoing enforcement.

- Conduct storm water compliance inspections at 2115 National City Boulevard and at 2601 National City Boulevard, upstream of Site 47. Ponded water outside each property had elevated levels surfactants that were likely the result of runoff from vehicle washing activities.
- Maintain a regular schedule for the removal of trash at the following sites that received marginal trash ratings. Ensure that trash at these sites is regularly assessed, and implement preventative measures where possible to decrease the introduction of debris to the storm water conveyance system.
    - Site 31A
    - Site 40
    - Site 42
    - Site 44
    - Site 44A
    - Site 48
    - Site 49
- Maintain a regular schedule for the removal of trash from Site 6 and 32, which received a submarginal and poor trash rating, respectively. Implement preventative measures where possible to decrease the introduction of debris to the storm water conveyance system. This may include the installation or improvement of barriers and signage at the site to discourage illegal dumping and use of the areas by transients.
    - Note that during a confirmation visit to Site 32 County of San Diego staff were observed cleaning the area. Staff also posted a notice to vacate the illegal encampment at the site.
- Contact the property management for the shopping centers near the intersection of Sweetwater Road and Town and Country Road to maintain their parking lots and remove particulates associated with elevated levels of copper.
- Contact the County of San Diego regarding the Sweetwater Chevron commercial car wash at Sweetwater Road as a potential source of copper particulate upstream of the City's dry weather Site 32.
- Remove trash and debris from storm drains along the 2200 block of Rachael Avenue, which may have contributed to the ammonia-N exceedance at Site 38.
- Remove trash from manhole at 1243 Fig Court, near the middle of the street at Site 45. Also consider cleaning MS4 conveyance along East 1st St and Laurel Avenue, upstream of Site 45, to prevent bacteria growth.
- Remove trash from MS4 conveyance along East 8th Street between R and M Avenue, upstream of Site 46, to prevent the growth of bacteria.

# Laboratory Analytical Reports

EnviroMatrix Analytical, Inc.

27 July 2010

D-Max Engineering
Attn: Arsalan Dadkhah
7220 Trade Street, Suite 119
San Diego, California 92121

**EMA Log #: 10G0179**

**Project Name: National City Dry Weather Monitoring**
**Project Desc./#: 201029W-07**

Enclosed are the results of analyses for samples received by the laboratory on 07/08/10 13:26. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that this data is in compliance both technically and for completeness.

**Dan Verdon**
**Laboratory Director**

CA ELAP Certification #: 2564

Client Name: D-Max Engineering
Project Name: National City Dry Weather Monitoring

**EMA Log #: 10G0179**

## ANALYTICAL REPORT FOR SAMPLES

| Sample ID | Laboratory ID | Matrix | Date Sampled | Date Received |
|---|---|---|---|---|
| Site 32 | 10G0179-02 | Stormwater | 07/08/10 11:00 | 07/08/10 13:26 |
| Site 46 | 10G0179-03 | Stormwater | 07/08/10 11:50 | 07/08/10 13:26 |

NOTE: The TOC analyses were cancelled by the client.

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

Client Name: D-Max Engineering
Project Name: National City Dry Weather Monitoring

## Notes and Definitions

| | |
|---|---|
| J | Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). |
| A-01 | MPN > 1,600,000 |
| ND | Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified) |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis (if indicated in units column) |
| RPD | Relative Percent Difference |
| MDL | Method detection limit (indicated per client's request) |

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

## Notes and Definitions

| | |
|---|---|
| S-04 | The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect. |
| S-02 | The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract. |
| J | Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). |
| ND | Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified) |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis (if indicated in units column) |
| RPD | Relative Percent Difference |
| MDL | Method detection limit (indicated per client's request) |

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

## Notes and Definitions

| | |
|---|---|
| QR-02 | The RPD result exceeded the QC limits due to non-homogeneity of sample. |
| J | Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). |
| ND | Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified) |
| NR | Not Reported |
| dry | Sample results reported on a dry weight basis (if indicated in units column) |
| RPD | Relative Percent Difference |
| MDL | Method detection limit (indicated per client's request) |

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

Revised 4/20/2004. 4/15/2005. 4/19/2006, 3/13/2008

# 2010 Trash Assessment Form

SITE ID: Site 1A DATE: 7/8/10

OBSERVER: MD/BM TIME: 15:50

LOCATION: SW of 43rd and Nordica Ave.

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Submarginal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 15x15

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☑ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ Potential Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2010 Trash Assessment Form

SITE ID: 13 A DATE: 7/22/10

OBSERVER: MD/TT TIME: 9:10

LOCATION: NE of 16th St & National City Blvd, inside Kimball Park

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Optimal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10x10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☐ MS4 ☐ RECEIVING WATER ☑ BOTH | |
| ☑ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ **Potential Threat to Human Health** | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ **Potential Threat to Aquatic Health** | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2010 Trash Assessment Form

SITE ID: 38 DATE: 7/21/10

OBSERVER: MD/IT TIME: 9:50

LOCATION: Dirt road, W of Harbison Ave., between 20th & 24th St., at end of fence line

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Optimal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10x10

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☑ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ **Potential Threat to Human Health** | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ **Potential Threat to Aquatic Health** | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☑ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ **Potential Threat to Human Health** | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ **Potential Threat to Aquatic Health** | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2010 Trash Assessment Form

SITE ID: 44A DATE: 7/21/10

OBSERVER: MD/IT TIME: 12:05

LOCATION: D Ave. behind Boys & Girls Club in Kimball Park

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): Marginal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 20x15

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☑ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☐ **Potential Threat to Human Health** | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ **Potential Threat to Aquatic Health** | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

# 2010 Trash Assessment Form

SITE ID: Site 97 DATE: 7/8/10

OBSERVER: MD / BM TIME: 13:50

LOCATION: SE corner of Mile of Cars Way & Transportation Ave.

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): optimal

ESTIMATED AREA OF ASSESSMENT L x W (FT): 4x4

| Amount and Extent of Trash | |
|---|---|
| EVALUATION OF TRASH INCLUDES*: ☑ MS4 ☐ RECEIVING WATER ☐ BOTH | |
| ☑ Optimal | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ Suboptimal | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ Marginal | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Submarginal | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ Poor | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Potential Threat to Human Health and/or Aquatic Health (applies to area of assessment) | |
|---|---|
| ☑ ~~Potential~~ Threat to Human Health | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ Potential Threat to Aquatic Health | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

|---|---|
| ☐ **Potential Threat to Human Health** | Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form. |
| ☐ **Potential Threat to Aquatic Health** | Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more. |

## CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Maryam Babaki, P.E.
Director of Development Services / City Engineer

Date: 9-28-2011

Telephone Number: (619) 336-4380

# EXECUTIVE SUMMARY

The City of National City (City) has been actively developing and implementing storm water pollution prevention measures since 1990. The City's current Jurisdictional Urban Runoff Management Program (JURMP) was prepared in March 2008 in response to San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit). The Municipal Permit was jointly issued to 18 municipalities in San Diego County, including the City, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees").

At the end of each fiscal year, the City is required to report a summary of its JURMP implementation activities to the RWQCB. This JURMP Annual Report presents the City's activities during the 2010/2011 fiscal year, which began on July 1, 2010 and ended on June 30, 2011. Each section of this JURMP Annual Report discusses how the City's efforts during 2010/2011 met the requirements of the Municipal Permit. Key actions taken for the major components of the City's storm water program are summarized below.

**Development Planning Component**

During 2010/2011, the City continued to oversee development activities occurring in the City to mitigate potential threats to water quality due to such activities. The City's development requirements were updated to incorporate the requirements of the regionally developed final Hydromodification Management Plan in January 2011, as required by the Municipal Permit. City staff attended a training session on the new requirements and worked with project applicants to ensure appropriate requirements were applied to submitted designs. The City continued to require all development projects to submit applicability checklists to determine subjectivity to the City's SUSMP requirements. The City implemented its treatment control BMP operation and maintenance verification program, which included the utilization of a Microsoft Access treatment control BMP database to track information and prepare the maintenance verification letters distributed to responsible parties. The City also conducted 18 inspections at sites with approved treatment control BMPs and exceeded Municipal Permit inspection frequencies.

**Construction Component**

During 2010/2011, a total of 71 construction storm water compliance inspections were completed at 10 construction sites, not including inspections for building permits, which also include a brief check for storm water BMPs. The City checked all construction projects for applicability to the maximum disturbed area limitation and guidelines for advanced treatment. The City's plan check process provided construction BMP fact sheets, and the inspection program required projects to comply with the City's minimum BMP requirements.

**Municipal Component**

The City inspected all high TTWQ municipal fixed facilities and continued its rigorous street sweeping and MS4 maintenance programs. A total of 980 tons of sediment and debris were removed from street sweeping activities, and 21.5 tons of debris were removed from standard MS4 maintenance. The City continued to maintain and repair or replace sanitary sewer lines, as needed, to decrease the potential for a sanitary sewer overflow (SSO). No public SSOs occurred during 2010/2011. The City received and appropriately addressed all complaints received by the City's Storm Water Hotline, the City website, and other City departments.

**Industrial and Commercial Component**

During 2010/2011 the City met the Municipal Permit requirement to inspect at least 25 percent of the City's industrial and commercial inventory, including 100 percent of its high threat to water quality (TTWQ) sites. During the inspections conducted in 2010/2011, the City notified industrial and commercial businesses of the City's BMP requirements through the City's inspection program. Additionally, the City notified businesses not recently inspected of the City's JURMP BMP requirements in March 2011. Inspectors also assessed each facility's compliance with the General Industrial Permit (Industrial Permit). The City also continued to collect additional data to assess the pollutant discharge potential at each site.

**Residential Component**

The City used various methods to provide storm water education to its residents. During 2010/2011, the City continued to collaborate with the cities of Chula Vista and Imperial Beach to encourage residents to dispose of household hazardous waste (HHW) appropriately at a facility available to the public. The City also continued to host large item waste disposal events in fall and spring, as well as respond to calls made to the City storm water hotline regarding residential areas.

**Illicit Discharge Detection and Elimination Component**

On September 10, 2008, the RWQCB adopted Addendum No. 2 to the Municipal Permit. This addendum requires the City to wait to submit the illicit discharge detection and elimination (IDDE) section of its JURMP Annual Report until the report for the 2011 Dry Weather Field Screening and Analytical Monitoring Program is finalized. The 2010/2011 section must be submitted to the RWQCB no later than December 15, 2011.

**Education Component**

As a means to raise storm water awareness in various communities in the City, the City continued to conduct various education and outreach activities throughout 2010/2011. The City's efforts resulted in an estimated 10,370 impressions. The City also began development of a bilingual 2012 Storm Water Program Calendar, which will present storm water concepts as well as storm water related artwork created by local third grade students in June 2011. To better serve the City's diverse population, a variety of its educational materials are distributed in Spanish as well as English.

**Public Participation Component**

During 2010/2011, the City provided a variety of opportunities for individuals in the City to participate in the City's storm water program. Activities included cleanup events, which have a direct effect on water quality, as well as outreach activities, through which the City works to increase general knowledge and awareness regarding storm water issues. The City organized the Storm Water Calendar Third Grade Art Contest with help from the local school district, which will provide art for a 2012 calendar in development. In addition, 361 volunteers participated in the Coastal Cleanup Day and Creek to Bay cleanups at two different sites in the City. Also, City residents continued to participate in routine large item and HHW waste disposal events.

**Fiscal Analysis Component**

The City continued to fund its storm water program as discussed in the City's JURMP. During 2009/2010, a fiscal analysis reporting template was developed collectively by the Copermittees. The City used this template to report the 2010/2011 program budget in this JURMP Annual Report.

**Effectiveness Assessment Component**

The City continued to evaluate the effectiveness of its storm water program based on the approach presented in the City's JURMP. The City has identified significant activities within each program component and metrics to assess each one. Standard tables to report this information have been created and included in Section 11 of this JURMP Annual Report. The City has seen some encouraging signs of the effect of its program, such as decreasing median concentrations of pollutants in runoff during its Dry Weather Monitoring Program in recent years.

**Special Investigations**

The City continued its Clean Community Program which promotes shared responsibility within communities to keep National City and local receiving water bodies clean and free of pollution. The City also assessed pollutant discharge potential of industrial and commercial businesses; sediment, trash, and oil and grease had the highest average pollutant discharge potential scores.

**Conclusions and Recommendations**

The City will continue to implement the new and updated programs in its JURMP during 2010/2011; it is anticipated that some program refinements will be made as implementation progresses. The City will also continue to collaborate with the other Copermittees to improve the efficiency of its program.

# 1.0 INTRODUCTION

## 1.1 BACKGROUND

This Jurisdictional Urban Runoff Management Program (JURMP) Annual Report presents an activity summary for the City of National City (City) during the 2010/2011 fiscal year. The JURMP Annual Report preparation and submission are required by San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit).

### 1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act, also known as the Clean Water Act (CWA), established a framework for regulating Municipal Separate Storm Sewer System (MS4) discharges under the National Pollutant Discharge Elimination System (NPDES). In 1990, the RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region, followed by a revised permit in 2001. RWQCB Order No. 2001-01 was replaced by the current Municipal Permit in 2007.

In 2002, the City, like all regulated municipalities in the San Diego region (collectively referred to as Copermittees), developed and submitted a JURMP to the RWQCB. The City then submitted an updated JURMP, as required by the Municipal Permit, in March 2008. The JURMP explains management measures for different sectors, including municipal, industrial, commercial, construction, and significant development and re-development activities.

Annual reports documenting the implementation of the JURMP are required to be submitted to the RWQCB by September 30. This JURMP Annual Report presents data from the 2010/2011 fiscal year, which extended from July 1, 2010, to June 30, 2011.

No TMDLs have been adopted for water bodies within or downstream of the City of National City at this time.

### 1.1.2 CITY SETTING

The City of National City is located in southwest San Diego County, surrounded by the City of San Diego, Chula Vista, and unincorporated portions of San Diego County. The City itself covers approximately nine square miles and has an estimated population size of approximately 61,000 residents. Land use within the City is primarily residential, although a large industrial area can be found along the San Diego Bay. Commercial development is restricted to businesses and shopping centers along the main roadways. Land use is broken down by area and percentage of total in Table 1-1 and illustrated in Figure 1-1.

**Table 1-1**
**City of National City Land Use Breakdown**

| Land Use | Total Area (Acres) | Percentage |
|---|---|---|
| Single Family Residential | 1,216 | 30% |
| Transportation | 1,149 | 29% |
| Commercial | 490 | 12% |
| Industrial | 251 | 6% |
| Multi-Family Residential | 215 | 5% |
| Open | 202 | 5% |
| Public Facilities and Utilities | 174 | 4% |
| Vacant | 115 | 3% |
| Parks | 114 | 3% |
| Other Residential | 41 | 1% |
| Office | 22 | 1% |
| Water | 20 | <1% |
| Construction | 6 | <1% |
| Recreation | 2 | <1% |
| **Total** | **4,016** | **100%** |

Source: 2007 SANDAG land-use data

The City of National City lies entirely within the San Diego Bay Watershed and constitutes approximately 1.6 percent of its total area. More specifically, the City is located within two sub-watersheds: Sweetwater and Pueblo San Diego. The majority of the southern part of National City drains to the Sweetwater River and ultimately discharges into San Diego Bay. La Paleta Creek (also known as 7th Street Channel) drains the northern part of the City and also discharges into San Diego Bay, while a very small western portion of the City drains directly to the San Diego Bay shoreline. Nearly all areas of the City that drain directly to San Diego Bay are within the San Diego Unified Port District. Lastly, the central portion of the City drains to Paradise Creek, a small salt marsh creek, which then discharges into the Sweetwater River. Watersheds in the City are shown in Figure 1-2.

San Diego Bay is listed in the 2008 CWA Section 303(d) for polychlorinated biphenyls (PCB) based on fish tissue analyses. The shorelines at 7th Street Channel and at the 24th Street Marine Terminal are listed in the 2008 CWA Section 303(d) for benthic community effects and sediment toxicity. La Paleta Creek is listed in the 2008 CWA Section 303(d) for copper and lead. Finally, Sweetwater River is listed in the 2008 CWA Section 303(d) for *Enterococcus,* fecal coliform, phosphorus, selenium, total dissolved solids, total nitrogen as N, and toxicity. Sweetwater Marsh, which is part of a national wildlife refuge, and Paradise Creek are considered to be ESAs by the City.

**Figure 1-2**
**City of National City Watersheds**

Note: Marsh boundaries based on land use data from SANDAG. The portion of the marsh west of I-5 and south of the Sweetwater River is not in the City's Jurisdiction. Base Data Sources: City of National City, SANDAG, SanGIS, Port of San Diego

## 1.2 PURPOSE AND OBJECTIVES

The City's JURMP presents strategies to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The JURMP describes various programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the implementation of the City of National City's JURMP during the 2010/2011 reporting period.

## 1.3 REPORT ORGANIZATION

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

| | |
|---|---|
| **Section 1** | **Introduction** |
| **Section 2** | **Development Planning Component** |
| **Section 3** | **Construction Component** |
| **Section 4** | **Municipal Component** |
| **Section 5** | **Industrial and Commercial Component** |
| **Section 6** | **Residential Component** |
| **Section 7** | **Illicit Discharge Detection and Elimination Component** |
| **Section 8** | **Education Component** |
| **Section 9** | **Public Participation Component** |
| **Section 10** | **Fiscal Analysis Component** |
| **Section 11** | **Effectiveness Assessment Component** |
| **Section 12** | **Special Investigations** |
| **Section 13** | **Non-Emergency Fire Fighting** |
| **Section 14** | **JURMP Revisions** |
| **Section 15** | **Conclusions and Recommendations** |
| **Section 16** | **References** |

Each section includes all components required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a more detailed explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Background, subsection 1.1, has been divided into Regulatory Background, subsection 1.1.1, and City Setting, subsection 1.1.2, for clarity.

# 2.0 DEVELOPMENT PLANNING COMPONENT

## 2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall storm water quality by reducing the discharge of pollutants from development projects to the MEP and by managing the increases in runoff from development projects that have the potential to negatively affect downstream water bodies. During the 2010/2011 fiscal year, the City accomplished these goals through implementation of its JURMP document.

### 2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2010/2011 reporting period are presented in the following bulleted list. The remainder of this section provides more detail about the City's implementation of this component of its storm water program.

- Distributed the City's development requirements checklist to projects applying for permits.
- Updated the Standard Urban Stormwater Mitigation Plan (SUSMP) requirements to include the final Hydromodification Management Plan (HMP) requirements in advance of the January 2011 deadline.
- Continued to utilize the City's SUSMP database to track Priority Development Projects within the City's jurisdiction and the parties responsible for BMP maintenance.
- Obtained verification of BMP maintenance from completed Priority Development Projects on the City's treatment control BMP inventory.
- Conducted maintenance inspections of treatment control BMPs at 18 completed development projects in the City.

A list of development projects subjected to SUSMP requirements in 2010/2011 is available in Table 2-1. A comparison of the number of inspections performed and the requirements of the Municipal Permit can be found in Table 2-2. SUSMP projects that were completed after inspection and maintenance verification actions had been performed for the 2010/2011 inventory are listed in Table 2-3. Details of treatment control BMP inspections and related follow-up actions are provided in Table 2-4.

## 2.2 LAND USE PLANNING

### 2.2.1 BACKGROUND

The City's General Plan was adopted in 1996 and contains water quality and watershed protection principles in its Natural Settings Element. The comprehensive principles established in 1996 provide an ample framework for implementing the requirements of the current Municipal Permit, and no changes to these policies were necessary during the reporting period.

A new General Plan, which will take effect in the 2011/2012 reporting period, was adopted in June 2011 and contains water quality and watershed protection principles in its Conservation and Sustainability Element. The comprehensive principles established in the new General Plan will also provide a good framework for implementing the requirements of the current Municipal Permit.

### 2.2.2 SOURCE CHARACTERIZATION

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts to the surrounding environment. No changes to development restrictions in the City's General Plan for storm water purposes were implemented during the reporting period.

### 2.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

Please refer to the City's updated JURMP document for a list of the water protection policies included in the City's General Plan. These policies remained the same throughout the reporting period.

### 2.2.4 PROGRAM IMPLEMENTATION

The City implemented its water protection-related land use policies during the reporting period mainly through the City's Municipal Code. The City updated its SUSMP Manual, a formatted guidance manual based on the regional Model SUSMP document, in January 2011. The City's SUSMP Manual is an uncodified appendix to Chapter 14.22 of its Municipal Code. The updates made at this time were consistent with the regional HMP document, prepared by the Copermittees and adopted by the RWQCB in July 2010, and the updated Model SUSMP. The regional HMP document was also added as an appendix to the City's SUSMP Manual. The updated City of National City SUSMP Manual is available on the City's website (http://www.nationalcityca.gov/) on the Storm Water section of the Engineering Division webpage.

Details on how the City implemented its established water protection policies through its environmental review process and its development project approval and verification

processes during the reporting period are provided in Sections 2.3 and 2.4 of this JURMP Annual Report document.

## 2.3 Environmental Review Process

The City's current environmental review process is detailed in the City's updated JURMP. The overall structure of the review process remains the same as in previous reporting years. No changes to the City's environmental review process have been made since the submittal of the updated JURMP.

## 2.4 Development Project Approval and Verification Process

### 2.4.1 Background

The approval and verification process implemented during 2010/2011 followed the process described in the City's updated JURMP. Details on the different aspects of the process are described in the sections below.

### 2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's SUSMP Manual, which contains the City's SUSMP regulations. The City's SUSMP Manual derives its authority from Municipal Code Chapter 14.22. Projects subject to SUSMP regulations are identified by completion of applicability checklists. More detail about this process is provided in Section 2.4.4.2.

### 2.4.3 Best Management Practice Requirements

The City updated its SUSMP requirements for development projects in January 2011, as described in Section 2.2.4 above.

### 2.4.4 Program Implementation

During the 2010/2011 fiscal year, the City required implementation of its BMP requirements for all development projects through education, a comprehensive development project approval process, and the treatment control BMP inspection and maintenance verification program.

#### 2.4.4.1 Outreach and Staff Training

The City trains staff involved in the planning and review of development projects within the City and works closely with the development community to communicate its development requirements throughout the entire approval process. Details on trainings conducted and educational materials developed and distributed related to new

development during the reporting period can be found in Section 8 of this JURMP Annual Report document. Also, based on results from the first years of the program, distribution of maintenance verification letters to parties responsible for maintenance of treatment control BMPs at completed projects seems to be increasing the level of knowledge of regulated parties.

#### 2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were required to undergo the City's urban runoff approval process as detailed in the City's JURMP. Forms completed by project applicants are kept with the project's file at the City for future reference. As discussed in the City's JURMP, the City required all developers applying for construction and building permits to complete a "National Pollutant Discharge Elimination System (NPDES) Project Applicability Form" (NPDES Checklist) that guides project applicants to submit proper documents to the City for review. The checklist was updated during the 2010/2011 reporting period at the same time as the BMP Manual. The updated NPDES Checklist is included with this report as Attachment 2.1.

All development projects determined to be Priority Projects after completing the SUSMP Checklist were required to prepare a Storm Water Management Plan (SWMP) or Water Quality Technical Report (WQTR) to meet the City's SUSMP requirements. As part of the JURMP update, the City also developed a SWMP self checklist to be used by the SWMP preparer, which was included as an attachment to the updated JURMP. In the past, the majority of deficiencies found in document reviews were missing information or sections not having enough detail about proposed BMPs. Table 2-1 lists the development projects subject to the City's SUSMP requirements during the 2010/2011 reporting period, the number of document reviews for each project, and the current approval status of each. Public Priority Projects are marked as Capital Improvement Projects (CIP) in the table.

**Table 2-1**
**Development Projects Subject to SUSMP Requirements During 2010/2011**

| # | Project Name | Location | Project Type | Number of Reviews during 10/11 | Approved during 10/11 |
|---|---|---|---|---|---|
| 1 | 8th Street Smart Growth Revitalization Project (CIP) | 8th Street, between Harbor Drive and Highland Avenue | Priority | 1 | No |
| 2 | AutoZone | Highland Avenue & East 21st Street | Priority | 2 | Yes |
| 3 | Bible Baptist Church | 2432 East 18th Street | Priority | 2 | Yes |
| 4 | Blendstar Renewable Fuel | Between Bay Marina Drive and 19th Street, east of Haffley Avenue (APN 559-040-54) | Priority | 1 | No |
| 5 | Plaza Boulevard Center | Intersection of Plaza Boulevard and Palm Avenue | Priority | 3 | No |
| 6 | SANDAG Blue Line Trolley Stations | 8th Street Trolley Station and 24th Street Trolley Station | Priority | 1 | No |
| 7 | The Gateway | National City Boulevard & F Avenue, between 31st Street & Route 54 | Priority | 2 | No |

No projects were granted waivers from SUSMP requirements, and the City does not anticipate granting waivers in the future. The City makes every effort to encourage development projects to select treatment controls with high and medium pollutant removal efficiencies and does not expect to approve many projects with low removal efficiency BMPs. However, if projects proposing a low removal efficiency treatment control BMP with a defensible infeasibility analysis are approved, details of those projects and their feasibility analyses will be reported as required in future JURMP annual reports. None of the approved projects were allowed to propose a low removal efficiency BMP.

The Multi-Purpose Building at Bible Baptist Church is one example of a priority development project that was conditioned to meet SUSMP requirements in 2010/2011. The project proponent had originally proposed a high-rate media filter for one discharge point and had otherwise failed to delineate drainage management areas and identify other discharge points. Through the City's rigorous review process, and over the course of four submittals, the project finally proposed infiltration facilities, bioretention areas, and pervious block pavers to prevent pollution in runoff from five discharge points.

**Hydromodification Management Plan**

During the reporting period the Copermittee Land Development Workgroup met regularly to discuss key Hydromodification Management Plan (HMP) implementation issues and provide updates on the status of consultant work products. The City of National City regularly participated in the workgroup meetings. The final regional HMP was adopted by the RWQCB at the beginning of the 2010/2011 reporting period on July 14, 2010. The City incorporated the HMP requirements into its local development requirements in January 2011. The City has posted information about the new HMP requirements on its website to educate project proponents.

The City's SUSMP Manual was updated to contain the regional HMP requirements in January 2011, but also implemented the detailed Interim Hydromodification Criteria (IHC) prior to that time in 2010/2011. Both of the projects approved during 2010/2011 were approved in 2010 and were smaller than 50 acres; therefore they were not subject to IHC or HMP requirements. All projects currently under review will be subject to the new hydromodification requirements unless they qualify for one of the exemption categories. This will be evaluated during review and reported in the applicable reporting period.

**BMP Installation Verification**

During the course of 2010/2011, after maintenance verification letters had been sent out during the summer of 2010, the City identified recently completed Priority Projects within the City's jurisdiction to be added to the treatment control BMP inventory. When a project is completed, the City checks for BMPs prior to occupancy using the site's plans and a BMP inspection form generated after the WQTR is approved, assigns the project a TTWQ priority, and then adds it to the inventory of projects subject to the City's inspection and annual maintenance verification program the following fiscal year. This process helps the City focus its inspection resources on sites more likely to have maintenance deficiencies, as maintenance deficiencies are generally less likely at sites with recently installed BMPs. A table of the projects identified after distribution of verification letters is presented in Table 2-3 at the end of this JURMP Section. These projects will be added to the City's treatment control BMP inventory in 2011/2012.

### 2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

**2010/2011 Annual Maintenance Verification Program**

The Municipal Permit requires annual verification of operation and maintenance of treatment control BMPs installed within the City's jurisdiction.

Using the property owner names and addresses recorded in the City's BMP database, BMP maintenance verification forms were mailed to all the private projects included in the City's BMP database in early 2010/2011, prior to the start of the wet season. Maintenance verification forms were also completed for all municipal treatment controls at CIP projects on the City's inventory. Through this process, the City updated contact

information that was no longer accurate due to transfer of ownership and provided additional guidance on how to properly maintain BMPs, as needed. The City completed research to update contact information and worked with management companies to educate them on the requirements. Because not all project responsible parties responded promptly, the City sent out 10 NOVs and nine citations during this process and took other escalating enforcement steps as necessary to achieve compliance. Through the City's maintenance verification efforts, responses were received from all projects.

**Operation and Maintenance Inspections**

During the 2010/2011 fiscal year, the City conducted inspections of projects with treatment control BMPs in accordance with the inspection frequencies outlined in the Municipal Permit. Table 2-2 provides a summary of the number of inspections performed and how these met the requirements of the Municipal Permit; also note that all high TTWQ sites were inspected prior to October 1, 2010.

**Table 2-2**
**2010/2011 Inspection Numbers versus Municipal Permit Requirements**

| Site Class | Number of Sites | Full BMP Assessments | Percent Inspected | Permit Requirement | Requirement Met |
|---|---|---|---|---|---|
| All Inventoried Sites | 34 | 18 | 53% | 20% | **Yes** |
| Sites with Drainage Inserts | 21 | 12 | 57% | 50% | **Yes** |
| High TTWQ sites | 9 | 9 | 100% | 100% | **Yes** |

The City continued to use site-specific inspection forms and the treatment control BMP tracking database. During the reporting period, GPS coordinates were also collected for the BMPs inspected, and this location information was added to the electronic database. Table 2-4 at the end of this section lists the development projects inspected during the reporting period, a brief description of inspection findings, and, if applicable, any follow-up actions taken. During 2010/2011, the City issued 10 NOVs and nine administrative citations to development projects and worked with responsible parties as necessary to achieve compliance. The BMP types proposed at these sites and the sites' TTWQ priorities are included in the City's treatment control BMP inventory, which is included in Appendix A.1 of this JURMP Annual Report.

During the 2010/2011 reporting period no sites were observed to present a significant threat to human health or the environment during inspections, so none were reported to the RWQCB.

## 2.5 Development Planning Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 2.6 Program Review and Modification

The City's SUSMP requirements have been updated as described above in Section 2.2.4.

**Table 2-3**
**SUSMP Projects Completed After Establishment of 2010/2011 Inventory**

| # | Project Name | Project Address | Development Type | BMPs | HSA | Year Completed | TTWQ |
|---|---|---|---|---|---|---|---|
| 1 | AutoZone | Highland Ave and East 21st Street | Commercial | Infiltration facilities and high-rate media filter | 909.12 | 2010/2011 | Medium |
| 2 | Harbor View Condominiums | 8th Street and D Avenue | Residential & Commercial | Media filters, infiltration facility, filter insert | 908.32 | 2010/2011 | Medium |
| 3 | Marina Gateway Streetscape (Harrison and 23rd St) (CIP) | Harrison Ave. between Bay Marina Dr. and 23rd St. | Public Roads | Infiltration facilities | 908.32 | 2010/2011 | Low |

**Table 2-4**
**2010/2011 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 1 | Jack In The Box | 9/23/2010 | Drainage inserts were observed to need maintenance. | NOVs were sent to the responsible party in November 2010 and July 2011. Subsequently a letter reporting maintenance was received by the City, but a re-inspection is scheduled to be completed in 2011/2012 before the wet season. | In Progress |
| 2 | Pacific View Estates | 9/23/2010 | The condition of the hydrodynamic separator was adequate. | NA | NA |
| 3 | Paradise Village | 9/23/2010 | Hydrodynamic separator was observed to need maintenance. | The responsible party reported maintenance, but a re-inspection is scheduled to be completed in 2011/2012 before the wet season. | In Progress |
| 4 | Paradise Walk Townhomes | 9/23/2010 | Some drainage inserts were observed to need maintenance. | NOV was sent in November 2010. Subsequently a letter was received indicating that maintenance was performed. | Resolved |
| 5 | Walgreens | 9/23/2010 | Two drainage inserts were missing and one was observed to need maintenance. | NOV was sent in November 2010. Enforcement through the City Attorney achieved installation and maintenance of all BMPs. | Resolved |
| 6 | WalMart | 9/23/2010 | The condition of the hydrodynamic separator was adequate. | NA | NA |
| 7 | Harley Davidson | 9/24/2010 | The condition of the drainage inserts was adequate. | NA | NA |
| 8 | Penske Truck Leasing | 9/24/2010 | The condition of the drainage inserts was adequate. | NA | NA |

**Table 2-4 (Continued)**
**2009/2010 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 9 | Plaza Bonita Mall Expansion | 9/24/2010 | One drainage insert and one hydrodynamic separator were observed to need maintenance. | The responsible party reported maintenance. A re-inspection is scheduled to be completed in 2011/2012 before the wet season. | In Progress |
| 10 | Sweetwater Town & Country Mall | 9/24/2010 | Two drainage inserts were observed to need maintenance. | NOV was sent in November 2010. Subsequently, the City received verification of maintenance. | Resolved |
| 11 | Bonita Creek | 9/27/2010 | Eight drainage inserts were observed to need maintenance. | City received verification of maintenance. | Resolved |
| 12 | Mirabelle (Cypress Glen Condos) | 9/27/2010 | Four drainage inserts were observed to need maintenance. | NOV was sent in November 2010. Subsequently, the City received verification of maintenance. | Resolved |
| 13 | Paradise Creek Park (CIP) | 9/27/2010 | The condition of the drainage insert was adequate. | NA | NA |
| 14 | Tremont Court Condominiums | 9/27/2010 | Drainage inserts were of a different type than originally proposed. Hydrodynamic separator was in need of maintenance. | NOV was sent in November 2010. The responsible party reported maintenance, but, escalating enforcement is in progress through the City Attorney. | In Progress |
| 15 | Plaza City Apartments | 9/27/2010 | The condition of the hydrodynamic separator was adequate. | NA | NA |
| 16 | 940 W 19th Street | 9/28/2010 | Vegetated swale was observed to need maintenance. | The responsible party reported maintenance, but a re-inspection is scheduled to be completed in 2011/2012 before the wet season. | In Progress |

**Table 2-4 (Continued)**
**2009/2010 Treatment Control BMP Inspections and Follow-Up Actions**

| # | Project | Inspection Date | Inspection Findings | Follow Up | Resolution Status |
|---|---|---|---|---|---|
| 17 | Bay Marina Drive Widening (Marina Gateway) (CIP) | 9/28/2010 | The condition of the high-rate media filters was adequate. | NA | NA |
| 18 | Marina Gateway (Hotel) | 9/28/2010 | Hydrodynamic separator was observed to need maintenance. | NOV was sent in November 2010. The responsible party reported maintenance, but a re-inspection is scheduled to be completed in 2011/2012 before the wet season. | In Progress |

# 3.0 CONSTRUCTION

## 3.1 INTRODUCTION

During 2010/2011, the City continued to implement a program to prevent storm water pollution related to construction activities within the City. Modifications to the City's construction program were last made in late March 2008 as part of its JURMP update. All changes made at that time were implemented for the entire 2010/2011 reporting period.

### 3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2010/2011 reporting period are presented below. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- Distributed storm water requirements applicability checklists to all development projects in the City's jurisdiction.
- Conducted plan checks of erosion control plans and SWPPPs to ensure construction projects planned to comply with the City's minimum BMP requirements.
- Distributed copies of the Construction BMP Fact Sheet with all approved grading permits.
- Conducted 71 construction inspections at 10 sites in 2010/2011 per the frequency in the updated JURMP.
- Issued 21 written warnings, two NOVs, and two citations to construction sites in response to BMP deficiencies with respect to the City's minimum BMP requirements.
- Conducted pre-construction meetings with all large project developers.

## 3.2 SOURCE CHARACTERIZATION

An inventory of active construction projects during the reporting period is presented in Appendix A.2 of this JURMP Annual Report document. The City's inventory was maintained throughout the reporting period by entering permit application forms into the City's inventory spreadsheet on a continuous basis. New construction projects were added to the inventory at the start of construction, and projects were removed from the inventory after construction was completed. Since construction projects were continually being added and removed throughout the fiscal year, inventory updates were usually performed more frequently than the minimum once per month.

## 3.3 Updates to Ordinances and Approval Processes

Minor changes were made to the City's Grading Ordinance during the reporting period, but no changes were made to storm water requirements. Details on any changes to the City's approval process during the reporting period are discussed in Section 3.5 of this document.

## 3.4 Best Management Practice Requirements

The City's construction and grading requirements have not changed since the recent update to the City's JURMP document. A complete list of required construction BMPs is included in the City's BMP Manual, which is an attachment to the City's JURMP. The City continued to assess the implementation and effectiveness of required BMPs at construction sites in 2010/2011.

## 3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below.

### 3.5.1 Education and Staff Training

Education and staff training implemented during the 2010/2011 fiscal year focused on reinforcing the changes made to the City's construction requirements at the time of the City's JURMP update to both City staff and to the construction community. In addition, construction site supervisors and City staff were educated on the new General Construction Permit (effective July 1, 2010) and provided a fact sheet for review. Construction project proponents were educated in BMP requirements during the approval process described below. Please see Section 8 of this JURMP Annual Report document for details on training and educational materials related to construction and grading activities.

### 3.5.2 Construction and Grading Approval Process

During the reporting period, City personnel verified that all construction projects planned to implement the City's minimum BMP requirements prior to issuing any building or grading permits. The City conducted its grading approval process as described thoroughly in Section 5 of the City's updated JURMP. The City requires grading construction projects to submit erosion control plans that indicate what BMPs are to be used at the site. These erosion control plans are reviewed by the City to ensure the site plans to meet the City's minimum construction BMP requirements. The City also reviews Storm Water Pollution Prevention Plans (SWPPPs) for sites greater than one acre that are required to obtain coverage under the General Construction Permit.

Additionally, the City arranged pre-construction meetings with all developers of large projects to ensure an understanding of construction BMP requirements. Approved forms and documents completed by project proponents are kept with each project's file at the City for reference. A Construction BMP fact sheet, known as the "Blue Sheet" within the City because the copies distributed are on blue paper, was also distributed with all construction permits issued (Attachment 3.1). Proper implementation of the minimum BMPs listed on the fact sheet was a condition of approval for all permits issued by the City during the 2010/2011 fiscal year.

During the reporting period, none of the City's active construction sites were larger than 17 acres; therefore the maximum disturbed area limitation did not apply. However, all construction sites were still required to limit exposed cleared or graded areas to the amount of area that could be protected prior to a rain event, as prescribed in the City's seasonal BMP requirements.

Criteria for determining when advanced treatment is required are detailed in the City's JURMP. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites within the City's jurisdiction, and advanced treatment methods were not required at any construction sites.

### 3.5.3 Inspection of Construction Sites

Appendix A.2 of this JURMP Annual Report contains a list of construction projects that were active during the reporting period, along with their assigned TTWQ priorities, the number of weeks the site was active within the rainy season, the numbers of inspections conducted during the wet and dry seasons, the number of follow-up inspections and complaint investigations, and the total number of inspections for each site. In total, 71 construction inspections were performed at 10 construction sites during 2010/2011.

Construction inspections conducted during the reporting period were performed as described in the City's updated JURMP. Key components of the inspections include checks for coverage under the General Construction Permit during the initial inspection and assessments of compliance with the City's BMP and discharge requirements during all inspections. Responsible parties at the sites are educated as needed during inspections. Copies of the inspection forms are kept on file at the City. A copy of the City's construction site information and inspection form is available as Attachment 3.2.

The City conducted inspections at high TTWQ construction sites bi-weekly during the wet season and monthly for medium TTWQ sites. Low TTWQ sites were inspected on an as needed basis. Typically, storm water only inspections were not conducted at low TTWQ sites unless a complaint was called into the City's storm water hotline. Construction inspectors have been trained in the City's minimum construction BMP requirements, and they check BMP implementation at low TTWQ construction sites during their inspections. Any sites found to have problems with BMP implementation are forwarded to the City's Storm Water Compliance Inspector. During the reporting

period, one low TTWQ construction site, AutoZone, was inspected at a higher frequency due to BMP deficiencies. These sites are indicated on the City's inventory in Appendix A.2.

When any violations were noted during routine, follow-up, or complaint investigation inspections, these violations were noted on the project's inspection form, and the sites were given a list of corrective actions necessary to fix the observed violation. During 2010/2011 there were 21 instances of non-compliance observed where enforcement action needed to be taken. In some cases, these issues were resolved while the inspector was still on site. When necessary, appropriate enforcement actions were taken, and City staff followed up with the site until compliance was achieved. Details on the enforcement actions taken for construction sites during the implementation period are described below.

### 3.5.4 Enforcement Measures

Table 3-1 includes the number of violations and enforcement actions taken during the reporting period in response to violations of the City's minimum construction BMP requirements. Enforcement actions are administered in an escalating manner as described in the City's updated JURMP. This year, the City sent inspection results by email to the responsible party with attached photos of improper BMP implementation. This provided clearer communication between the inspector and construction site manager and allowed for quicker resolution of observed deficiencies.

**Table 3-1**
**Summary of Construction Enforcement Actions Taken**

| Written Warnings | Notices of Violation | Administrative Citations | Stop Work Orders |
|---|---|---|---|
| 21 | 2 | 2 | 0 |

No Stop Work Orders were issued in 2010/2011, but the City's JURMP notes that if a Stop Work Order is issued the Regional Board will be notified within five working days. During the reporting period, three complaints were received to the City's storm water hotline regarding construction site activities. A December 2010 complaint regarding construction at AutoZone resulted in the site being inspected at a monthly frequency, although originally designated as a low TTWQ, to ensure proper implementation of required BMPs. Further details regarding complaint investigations and all enforcement actions taken during the reporting period can be found in Section 4 of this document.

None of the violations observed at construction sites during the reporting period were found to endanger human health or the environment. The City was able to address these violations through the City's established enforcement process, and it was not necessary to report any of these sites to the RWQCB.

## 3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

## 3.7 Program Review and Modification

No modifications were made to the City's construction component during 2010/2011.

# 4.0 MUNICIPAL COMPONENT

## 4.1 INTRODUCTION

Throughout 2010/2011, the City of National City continued to manage municipal areas and activities to reduce discharges of pollutants to the MS4 to the MEP. As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and activities. The majority of municipal areas in the City comprise of administrative buildings, fire stations, public parks, recreation and public works facilities. Municipal activities conducted by the City include but are not limited to graffiti abatement, building maintenance, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. Information about the City's prioritized street sweeping program can be found in Table 4-1, and information about the City's MS4 maintenance program can be found in Table 4-2.

### 4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the 2010/2011 reporting period are presented below. The following subsections of this section provide more details on how the City complied with the Municipal Permit during the reporting period.

- The City inspected all high TTWQ fixed municipal facilities.
- The City removed a total of 980 tons of sediment and debris from street sweeping activities.
- The City removed a total of 21.5 tons of trash, sediment, and other debris from standard MS4 cleaning activities.
- The City spent 2,050 man-hours maintaining 442,150 linear feet of sanitary sewer line.
- The City inspected several special events that occurred in the City during 2010/2011 to ensure appropriate BMP implementation and clean up.
- The City received and addressed 14 complaints through the Storm Water Hotline, City website, and other City departments. Enforcement actions resulting from complaint investigations are noted in Table 4-3.

## 4.2 FIXED FACILITIES

### 4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category, fixed

facilities. This is because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar.

### 4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included on the City's municipal inventory, which is included as Appendix A.3. The designations of pollutants potentially generated by municipal facilities on the inventory are based on the pollutant loading potentials shown in Table 6-1 of the City's JURMP. TTWQ prioritizations are assigned via the process laid out in the flow chart shown in Figure 6-1 of the City's JURMP.

### 4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs at all fixed municipal facilities. As mentioned in the City's JURMP, the City uses the CASQA Municipal BMP Handbook to establish appropriate BMPs for fixed municipal facilities. Table 6-2 in the City's JURMP describes the CASQA fact sheets that are used for specific facility types.

The City continues to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. The BMP requirements have not been changed since the City's JURMP was updated in March 2008.

As described in the City's JURMP, City public works employees, fire station employees, and employees at other fixed facilities in the City continue to implement BMPs appropriate to the facility type. City fire response personnel continue to be trained in implementing BMPs for non-emergency fire fighting activities as described in Section 3 of the City's JURMP. There were no changes in BMP requirements for any fixed facilities during 2010/2011.

### 4.2.4 PROGRAM IMPLEMENTATION

As mentioned above, the City's BMP requirements for fixed facilities have not changed since the development of the revised JURMP. Some notable examples of implementation of those BMPs are provided below.

**Parks and Recreational Facilities**
During 2010/2011, the City used fertilizers, herbicides, and pesticides sparingly at parks and other City-owned landscaped areas. All chemicals are used and stored in accordance with the City's JURMP BMPs. The City routinely cleans parks each Monday after weekend use.

**Public Works Facilities, Fire Stations, Other Fixed Facilities**
As previously mentioned, City personnel continued to implement appropriate BMPs for municipal fixed facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance activities at fixed facilities (i.e., landscaping, building

maintenance, etc.) as necessary. Parking facilities associated with fixed municipal facilities were swept quarterly during 2010/2011, and the large paved areas at the City's Public Works Yard were swept weekly. Public Works employees continued to proactively implement a SWPPP at the Public Works Yard, though it is not a requirement. Public Works employees also continued to maintain the BioClean filter inserts on the property as needed.

**Municipal Inspections**

All high TTWQ fixed municipal facilities received an annual routine inspection in 2010/2011. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2010/2011. The City's municipal inspection form is included as Attachment 4.1. All inspections conducted at municipal facilities are tracked using a Microsoft Access database. Table 4-4 at the end of this section lists all high TTWQ municipal fixed facilities requiring inspection in 2010/2011, the date the inspection was performed, and recommended corrective actions from the inspection. Only minor corrective actions were noted, and no follow-up inspections were necessary. Resolutions were documented by all facilities.

In addition to one annual inspection by other City personnel, public works personnel inspect both the Public Works Yard East and Public Works Yard West weekly; street crew personnel inspect the Public Works Yard West and the equipment maintenance crew inspects the Public Works Yard East. Inspection forms are completed and submitted to the City's Storm Water Compliance Inspector.

## 4.3 Roads, Streets, Highways, and Parking Facilities

### 4.3.1 Background

The City conducts regular maintenance of roads, streets, and parking facilities in the City to control pollutants such as sediment, metals, litter, and debris. Note that there are no highways within the City's jurisdiction.

### 4.3.2 Source Characterization

Roads and streets are included as one entity on the City's municipal inventory, which is included in Appendix A.3.

### 4.3.3 Best Management Practices

Street sweeping is the City's primary BMP for roads, streets, and parking facilities. Other BMPs are chosen as needed based on the CASQA Municipal Handbook. The City's sweeping frequency is outlined in the JURMP and described in the following subsection. There were no changes to the BMPs implemented for roads, streets, and parking facilities in 2010/2011.

### 4.3.4 PROGRAM IMPLEMENTATION

During 2010/2011, the City swept a total of 16,253 curb miles, removing approximately 980 tons of debris. High priority streets in the City are swept at least every two weeks, and medium priority streets in the City are swept at least monthly. The City has not designated any streets in the City as low priority. The City does not maintain any stand-alone parking facilities that are not associated with municipal facilities. Seventeen parking facilities that are associated with municipal facilities are maintained and swept during regular maintenance activities at the respective municipal facility, and are considered part of the municipal facility on the inventory. Table 4-1, below, describes the areas assigned high and medium priorities, and the associated sweeping frequency. The table also includes the sweeping frequency for areas of fixed municipal facilities and the associated parking lots.

As a means to address priority pollutants in the San Diego Bay Watershed, the City continued conducting additional sweepings of the all streets in the City. High priority streets were swept between daily and weekly during 2010/2011; medium priority streets were swept every two weeks during 2010/2011.

**Table 4-1**
**Street Sweeping Prioritization and Frequency**

| Category | Description | Approximate Mileage of Route | Sweeping Frequency |
|---|---|---|---|
| High | 8th Street, National City Boulevard, Highland Avenue, Plaza Boulevard | 11.8 miles | At least every two weeks |
| Medium | All other streets in the City | 98.2 miles | At least once per month |
| Fixed Facilities | 17 Parking lots associated with municipal fixed facilities | N/A* | Quarterly |
| Fixed Facilities – Parks | Parking lots associated with parks | N/A* | Every two weeks |
| Fixed Facilities – PW Yard | Public Works Operation Center | N/A* | Weekly |
| **Total Amount of Debris Collected from Street Sweeping Activities: 980 tons** | | | |

* Mileage data is not available for the swept area of parking facilities associated with municipal facilities, and the PW Yard. Mileage accrued while sweeping these facilities is included in the total mileage.

**Inspections**

Because trash, debris, and sediment that have accumulated on City streets are identified and cleaned up via street sweeping, additional inspections beyond this effort are not necessary.

## 4.4 MS4

### 4.4.1 Background

The City's extensive storm water conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during a rain event. The City's MS4 consists of approximately 19 miles of inlets, pipes of varying materials, natural channels, concrete channels, culverts, and 751 catch basins and inlets.

### 4.4.2 Source Characterization

The City's MS4 as one complete entity is included on the City's high TTWQ municipal inventory (Appendix A.3).

### 4.4.3 Best Management Practices

The City maintains a strict MS4 maintenance and cleaning schedule. Maintenance and cleaning are conducted to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. As described in the City's JURMP, BMPs for MS4 maintenance activities are chosen based on the CASQA Municipal Handbook and have not changed during 2010/2011.

### 4.4.4 Program Implementation

Throughout 2010/2011 the City has implemented a thorough MS4 inspection and cleaning schedule. The City continues to track municipal activities, such as MS4 channel cleaning, in a Microsoft Access database. During 2008/2009, the MS4 maintenance logs were updated to allow for the recording of more detailed information regarding the various types of debris removed. Use of these logs was continued during the 2010/2011 reporting period. The City inspected and cleaned all MS4 cleanout locations and open channel segments in 2010/2011, as described in Table 4-2, on the following page.

**Table 4-2**
**MS4 Maintenance Data**

| MS4 Structure | Percent inspected and/or cleaned* | Percent of open channels found with anthropogenic litter | Amount of debris removed from cleaning activities |
|---|---|---|---|
| Catch Basins / Self-Cleaning MS4 Facilities | 100% | N/A | 29,364 pounds |
| Open Channels | 100% | 100% | 33.54 cubic yards (13,416 pounds) |
| Drainage Inserts | 100% | N/A | 194 pounds |
| **Total Debris Removed From MS4 Maintenance Activities: 21.5 tons**** | | | |

* No structures were observed at least 33% of capacity during the reporting period. However, the City cleans out any structures, including self-cleaning structures, in which trash and debris is observed at the time of inspection.
** The weight of the material removed during channel maintenance activities was not recorded. Since trash was the most common item removed, a conversion factor of 400 pounds per cubic yard was used to estimate the total weight of the material removed.

The City's cleanout locations are access points to various sections in the City's MS4, so no additional pipe beyond the cleanout location is normally cleaned. The City uses a vactor truck to clean the MS4 line in the event of a spill. For example, during 2010/2011, one sewage spill occurred, which was successfully intercepted before reaching the receiving water and entirely cleaned up within the City's MS4.

During 2010/2011, the City continued to inspect the open channels in the City and remove trash and debris as necessary by hand. If litter or debris is observed during the routine inspections, it is removed immediately. Of debris removed from open channels, 22.17 cubic yards of trash, 4.13 cubic yards of sediment, and 7.25 cubic yards of organic matter were removed over the course of the fiscal year. The only significant sediment removal occurred in the City's concrete channels. The total length of the channel segments inspected and cleaned by City staff is approximately 25,950 linear feet. Additionally, as part of WURMP efforts that are beyond minimum required maintenance, the City continued to hire a contractor to do biweekly inspections and remove any observed trash from Paradise Creek by hand.

## 4.5 SANITARY SEWER SYSTEM

### 4.5.1 BACKGROUND
