Finally, many RCRA subtitle C facilities have inactive Solid Waste Management Units (SWMU's) on the facility property. These SWMU's may contain areas on the land surface that are contaminated with hazardous constituents. RCRA requires that hazardous waste management facilities must investigate these areas of potential contamination, and then perform corrective action to remediate any SWMU's that are of concern. However, the corrective action process at these facilities will not be completed for a number of years due to the complexity of the cleanup decisions, and due to the fact that many hazardous waste management facilities do not yet have RCRA permits. Until corrective action has been completed at all such subtitle C facilities, SWMU's are a potential source of storm water contamination that should be addressed under the NPDES program. Finally, under section 1004(27) of RCRA, all point source discharges, including those at RCRA regulated facilities, are to be regulated by the NPDES program. Thus, there is no concern of regulatory overlap, and to the extent that the storm water regulations are effectively implemented, it will help address these units in a way that alleviates the need for expensive corrective action in the future.

(v) Landfills, land application sites, and open dumps that receive or have received industrial wastes and that are subject to regulation under subtitle D of RCRA. EPA received numerous comments supporting the regulation of municipal landfills which receive industrial waste and are subject to regulation under subtitle D of RCRA. EPA agrees with these comments. These industries have significant potential for storm water discharges that can adversely affect receiving water.

Two States argued that landfills should be addressed under the non-point source program. EPA disagrees that the non-point source program is sufficient for addressing these facilities. Further, addressing a class of facilities under the non-point source program does not exempt storm water discharges from these facilities from regulation under NPDES. The CWA requires EPA to promulgate regulations for controlling point source discharges of storm water from industrial facilities. Point sources from landfills consisting of storm water are such discharges requiring an NPDES permit. Several commenters argued that these discharges are adequately addressed by RCRA and that regulating them under this storm water rule would be redundant. However, as discussed above, RCRA expressly does not regulate point source discharges subject to NPDES permits. Given the nature of these facilities and of the material stored or disposed, EPA believes storm water permits are necessary. Similarly EPA rejects the comment that storm water discharges from these facilities are already adequately regulated by State authority. Congress has mandated that storm water discharges associated with industrial activity have an NPDES permit.

One commenter wanted EPA to define by size what landfills are covered. In response, it is the intent of these regulations to require permit applications from all landfills that receive industrial waste. Storm water discharges from such facilities are addressed because of the nature of the material with which the storm water comes in contact. The size of facility

will not dictate what type of waste is exposed to the elements.

One commenter requested that the definition of industrial wastes be clarified. For the purpose of this rule, industrial waste consists of materials delivered to the landfill for disposal and whose origin is any of the facilities described under § 122.26(b)(14) of this regulation.

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093. One commenter suggested that the recycling of materials such as paper, glass, plastics, etc., should not be classified as an industrial activity. EPA disagrees that such facilities should be excluded on that basis. These facilities may be considered industrial, as are facilities that manufacture such products absent recycling.

Other facilities exhibit traits that indicate industrial activity. In junkyards, the condition of materials and junked vehicles and the activities occurring on the yard frequently result in significant losses of fluids, which are sources of toxic metals, oil and grease and polychlorinated aromatic hydrocarbons. Weathering of plated and non-plated metal surfaces may result in contributions of toxic metals to storm water. Clearly such facilities cannot be classified as commercial or retail.

One municipality felt that "significant recycling" should be defined or clarified. EPA agrees that the proposed language is ambiguous. It has been clarified to require permit applications from facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093. These SIC codes describe facilities engaged in dismantling, breaking up, sorting, and wholesale distribution of motor vehicles and parts and a variety of other materials. The Agency believes these SIC codes clarify the term significant recycling.

One municipality stated that regulation of these facilities under NPDES would be duplicative if they are publicly owned facilities. One State expressed the view that automobile junkyards, salvage yards could not legitimately be considered industrial activity. As noted above, EPA disagrees with these comments. Facilities that are actively engaged in the storage and recycling of products including metals, oil, rubber, and synthetics are in the business of storing and recycling materials associated with or once used in industrial activity. These activities are not commercial or retail because they are engaged in the dismantling of motors for distribution in wholesale or retail, and the assembling, breaking up, sorting, and wholesale distribution of scrap and waste materials, which EPA views as industrial activity. Further, being a publicly owned facility does not confer non-industrial status.

(vii) Steam electric power generating facilities, including coal handling sites, and onsite and offsite ancillary transformer storage areas. Most of the comments were against requiring permit applications for onsite and offsite ancillary transformer facilities. One commenter stated that these transformers did not leak in storage and if there were leakage problems in handling transformers, such leaks were subject to Federal and State spill clean-up procedures. The same commenter suggested that if EPA required applications from such facilities that it exclude those that have regular inspections, management practices in place, or those that store 50 transformers at any one time.

EPA agrees that such facilities should not be covered by today's rule. As one commenter noted, the Toxic Substances Control Act (TSCA) addresses pollutants associated with transformers that may enter receiving water through storm water discharges. EPA has examined regulations under TSCA and agrees that regulation of storm water discharges from these facilities should be the subject of the studies being performed under section 402(p)(5), rather than regulations established by today's rule. Under TSCA, transformers are required to be stored in a manner that prevents rain water from reaching the stored PCBs or PCB items. 40 CFR 761.65(b)(1)(i). EPA considers transformer storage to be more akin to retail or other light commercial activities, where items are inventoried in buildings for prolonged periods for use or sale at some point in the future, and where there is no ongoing manufacturing or other industrial activity within the structure.

One commenter stated that this category of industries should be loosened so that all steam electric facilities are addressed—oil fired and nuclear. EPA believes that the language as proposed broadly defines the type of industrial activity addressed without specifying each mode of steam electric production. One commenter noted that the EPA has no authority under the CWA (*Train* v. *CPIR, Inc.*, 426 U.S. 1 (1976) to regulate the discharge of source, special nuclear and by-product materials which are regulated under the Atomic Energy Act. EPA agrees permit applications may not address those aspects of such facilities, however the facility in its entirety may not necessarily be exempt. A permit application will be appropriate for discharges from non-exempt categories.

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221–25), 43, 44, 45, and 5171 which have vehicle maintenance shops, material handling facilities, equipment cleaning operations or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or which are identified in another subcategory of facilities under EPA's definition of storm water discharges associated with industrial activity. One commenter requested clarification of the terms "vehicle maintenance." Vehicle maintenance refers to the rehabilitation, mechanical repairing, painting, fueling, and lubricating of instrumentalities of transportation located at the described facilities. EPA is declining to write this definition into the regulation however since "vehicle maintenance" should not cause confusion as a descriptive term. One commenter wanted railroad tracks where rail cars are set aside for minor repairs excluded from regulation. In response, if the activity involves any of the above activities then a permit application is required. Train yards where repairs are undertaken are associated with industrial activity. Train yards generally have trains which, in and of themselves, can be classified as heavy industrial equipment. Trains, concentrated in train yards, are diesel fueled, lubricated, and repaired in volumes that connote industrial activity, rather than retail or commercial activity.

One commenter argued that if gasoline stations are not considered for permitting, then all transportation facilities should be exempt. EPA disagrees with the thrust of this comment. Transportation facilities such as bus depots, train yards, taxi stations, and airports are generally larger than individual repair shops, and generally engage in heavier more expansive forms of industrial activity. In keeping with Congressional intent to cover all industrial facilities, permit applications from such facilities are appropriate. In contrast, EPA views gas stations as retail commercial facilities not covered

by this regulation. It should be noted that SIC classifies gas stations as retail.

(ix) POTW lands used for land application treatment technology/ sludge disposal, handling or processing areas, and chemical handling and storage areas. One commenter wanted more clarification of the term POTW lands. Another commenter requested clarification of the terms sludge disposal, sludge handling areas, and sludge processing areas. One State recommended that a broader term than POTW should be used. EPA notes that on May 2, 1989, it promulgated NPDES Sewage Sludge Permit Regulations; State Sludge Management Program Requirements at 40 CFR part 501. This regulation identified those facilities that are subject to section 405(f) of the CWA as "treatment works treating domestic sewage."

In response to the above comments, EPA has decided to use this language to define what facilities are required to apply for a storm water permit. Under this rulemaking "treatment works treating domestic sewage," or any other sewage sludge or wastewater treatment device or system used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge, with a design flow of 1.0 mgd or more, or facilities required to have an approved pretreatment program under 40 CFR part 403, will be required to apply for a storm water permit. However, permit applications will not be required to address land where sludge is beneficially reused such as farm lands and home gardens or lands used for sludge management that are not physically located within the confines (offsite facility) of the facility or where sludge is beneficially reused in compliance with section 405 of the Clean Water Act (proposed rules were published on February 6, 1989, at 54 FR 5746). EPA believes that such activity is not "industrial" since it is agricultural or domestic application (non-industrial) unconnected to the facility generating the material.

EPA received many comments on the necessity and appropriateness of requiring permit applications for storm water discharges from POTW lands. It was anticipated by numerous commenters that the above cited sludge regulations would adequately address storm water discharges from lands where sludge is applied. However, the sewage sludge regulations do not directly address NPDES permit requirements for storm water discharges from POTW lands and related areas to the extent required by today's rulemaking; the regulations cover only permits for use or disposal of sludge. Also, the regulations proposed on February 4, 1989, cover primarily the technical standards for the composition of sewage sludge which is to be used or disposed. They do not include detailed permitting requirements for discharges of storm water from lands where sludge has been applied to the land. To that extent, EPA is not persuaded by these commenters that POTWs and POTW lands should be excluded from these storm water permit application requirements.

Two commenters noted that some States already regulate sludge use or disposal activities substantially and that EPA should refrain from further regulation. EPA disagrees that this is a basis for excluding facilities from Federal requirements. Notwithstanding regulations in existence under State law, EPA is required by the CWA to promulgate regulations for permit application for storm water associated with industrial activity. Under the NPDES program, States are able to promulgate more rigorous requirements. However a minimum level of control is required under Federal law. One commenter also indicated that a State's sludge land application sites must follow a well defined plan to ensure there is no sludge related runoff. Notwithstanding that a State may require storm water controls for sludge land applications, as noted above, EPA is required to promulgate regulations requiring permit applications from appropriate facilities. EPA views facilities such as waste treatment plants that engage in on-site sludge composting, storage of chemicals such as ferric chloride, alum, polymers, and chlorine, and which may experience spills and bubbleovers are suitable candidates for storm water permits. Facilities using such materials are not characteristic of commercial or retail activities. Use and storage of chemicals and the production of material such as sludge, with attendant heavy metals and organics, is activity that is industrial in nature. The size and scope of activities at the facility will determine the extent to which such activities are undertaken and such materials used and produced at the facility. Accordingly, EPA believes limiting the facilities covered under this category to those of 1.0 mgd and those covered under the industrial pretreatment program is appropriate.

To the extent that permit applicants are already required to employ certain management practices regarding storm water, these may be incorporated into permits and permit conditions issued by Federal and State permitting authorities. EPA has selected facilities identified under 40 CFR part 501 (*i.e.* those with a design flow of 1.0 mgd or more or those required to have an approved pretreatment program) since these facilities will have largest contribution of industrial process discharges. Sludge from such facilities will contain higher concentrations of heavy metal and organic pollutants.

One commenter stated that sludge disposal is a public activity that should be addressed in a public facility's storm water management program under a municipal storm water management program. EPA disagrees. Industrial facilities, whether publicly owned or not, are required to apply for and obtain permits when they are designated as industrial activity.

Another comment stated that a permit should not be required for facilities that collect all runoff on site and treat it at the same POTW. EPA believes that a permit application should be required from such facilities. However, the above practice can be incorporated as a permit condition for such a facility. One commenter stated storm water from sludge and chemical handling areas can be routed through the headworks of the POTW. The agency agrees that this may be an appropriate management practice for POTWs as long as other NPDES regulatory requirements are fulfilled with regard to POTWs.

(x) Construction activities, including clearing, grading and excavation activities except operations that result in the disturbance of less than five acre total land area which are not part of a larger common plan of development or sale. EPA addresses whether these facilities should be covered by today's rule in section VI.F.8.

The December 7, 1988, proposal also requested comments on including the following other categories of discharges in the definition of industrial activities: (xii) Automotive repair shops classified as Standard Industrial Classification 751 or 753; (xiii) Gasoline service stations classified as Standard Industrial Code 5541; (xiv) Lands other than POTW lands (offsite facilities) used for sludge management; (xv) Lumber and building materials retail facilities classified as Standard Industrial Classification 5211; (xvi) Landfills, land application sites, and open dumps that do not receive industrial wastes and that are subject to regulation under subtitle D of RCRA; (xvii) Facilities classified as Standard Industrial Classification 46 (pipelines, except natural gas), and 492 (gas production and distribution); (xviii) Major electrical powerline corridors.

EPA received numerous comments on whether to require permit applications for these particular facilities. The December 7, 1988, proposal reflected EPA's intent not to require permits for these facilities, but rather to address these facilities in the two studies required by CWA sections 402(p)(5) and (6). After reviewing the comments on this issue, EPA believes that these facilities should be addressed under these sections of the CWA. Most of these facilities are classified as light commercial and retail business establishments, agricultural, facilities where residential or domestic waste is received, or land use activities where there is no manufacturing. It should be noted that although EPA is not requiring the facilities identified as categories (xii) to (xviii), in the December 7, 1988, proposal to apply for a permit application under this rulemaking, such facilities may be designated under section 402(p)(2)(E) of the CWA.

Three commenters recommended that EPA clarify that non-exempt Department of Energy and Department of Defense facilities should be covered by the storm water regulation. The regulation clearly states that Federal Facilities that are engaged in industrial activity (*i.e.* those activities in § 122.26(b)(14)(i)–(xi)) are required to submit permit applications. Those applying for permits covering Federal facilities should consult the Standard Industrial Classifications for further clarification.

One commenter questioned how EPA intended to regulate municipal facilities engaged in industrial activities. Municipal facilities that are engaged in the type of industrial activity described above and which discharge into waters of the United States or municipal separate storm sewer systems are required to apply for permits. These facilities will be covered in the same manner as other industrial facilities. The fact that they are municipally owned does not in any way exclude them from needing permit applications under this rulemaking.

One commenter suggested exempting those facilities that have total annual sales less than five million dollars or occupy less than five acres of land. Another commenter thought that all minor permittees should be exempt. EPA believes that the quality of storm water and the extent to which discharges impact receiving water is not necessarily related to the size of the facility or the dollar value of its business. What is important in this regard, is the extent to which steps are taken at facilities to curb the quantity and type of material that may pollute storm water discharges from these facilities. Therefore EPA has not excluded facilities from permitting on such a basis. This same commenter stated that the proposed rules should not address facilities with multiple functions (industrial and retail). EPA disagrees. If a facility engages in activity that is defined in paragraphs (i) through (xi) above, it is required to apply for a permit regardless of the fact that it also has a retail element. Such facilities need only submit a permit application for the industrial portion of the facility (as long as storm water from the non-industrial portion is segregated, as discussed above). This commenter also felt that more studies needed to be undertaken to determine the best way to regulate industries. EPA agrees that storm water problems need further study and for that reason EPA has devoted substantial manpower and resources to complete comprehensive studies under section 402(p)(5), while also addressing industrial sources that need immediate attention under this rulemaking.

One commenter requested that EPA give examples of storm water discharges from each of the facilities that have been designated for submitting permit applications. Agency believes that this is unnecessary and impractical since every facility, regardless of the type of industry, will have different terrain, hydrology, weather patterns, management practices and control techniques. However, EPA intends to issue guidance on filing permit applications for storm water discharges from industrial facilities which details how an industry goes about filing an industrial permit and dealing with storm water discharges.

Today's rulemaking for storm water discharges associated with industrial activity at § 122.26(c)(1)(i) includes special conditions for storm water discharges originating from mining operations, oil or gas operations (§ 122.26(c)(1)(iii)), and from the construction operations listed above (§ 122.26(c)(1)(ii)). These requirements are discussed in more detail in section VI.F.7 and section VI.F.9 of today's notice.

3. Individual Application Requirements

Today's rule establishes individual and group permit application requirements for storm water discharges associated with industrial activity. These requirements will address facilities precluded from coverage under the general permits to be proposed and promulgated by EPA in the near future. EPA considers it necessary to obtain the information required in individual permit applications from certain facilities because of the nature of their industrial activity and because of existing institutional mechanisms for issuing and tracking NPDES permits. Furthermore, some States will not have general permitting authority. Facilities located in such States will be required to submit individual applications or participate in a group application. The following response to comments received on these requirements pertains to these facilities.

Under the September 26, 1984, regulation operators of Group I storm water discharges were required to submit NPDES Form 1 and Form 2C permit applications. In response to post-regulation comments received on that rule, EPA proposed new permit application requirements (March 7, 1985, (50 FR 9362) and August 12, 1985, (50 FR 32548)) which would have decreased the analytical sampling requirements of the Form 2C and provided procedures for group applications. Passage of the WQA in 1987 gave the EPA additional time to consider the appropriate permit application requirements for storm water discharges. On December 7, 1988, application requirements were proposed and numerous comments were received. Based upon these comments, modifications and refinements have been made to the industrial storm water permit application.

Some commenters expressed the view that the permit application requirements are too burdensome, require too much paperwork, are of dubious utility, and focus too greatly on the collection of quantitative data. EPA disagrees. In comparison to prior approaches for permitting storm water discharges and other existing permitting programs, EPA has streamlined the permit application process, limited the quantitative data requirements, and required narrative information that will be used to determine permit conditions that relate to the quality of storm water discharge. To the extent that EPA needs non-quantitative information to develop appropriate permit conditions, EPA disagrees with the view of some commenters that the information required is excessive. In response to comments on earlier rulemakings and a comment received on the December 7, 1988, proposal (stressing that the emphasis should be on site management, rather than monitoring, sampling, and reporting) EPA has shifted the emphasis of the permit application requirements for storm water discharges associated with industrial activity from the existing requirements for collection of

quantitative data (sampling data) in Form 2C towards collection of less quantitative data supplemented by additional information needed for evaluation of the nature of the storm water discharges.

The permit application requirements proposed for storm water discharges reduce the amount of quantitative data required in the permit application and exempt discharges which contain entirely storm water (*i.e.* contain no other discharge that, without the storm water component, would require an NPDES permit), from certain reporting requirements of Form 2C. The proposed modifications also would exempt applicants for discharges which contain entirely storm water from several non-quantitative information collection provisions currently required in the Form 2C. The proposed modifications would rely more on descriptive information for assessing impacts of the storm water discharge. One commenter proposed that information that the applicant has submitted for other permits be incorporated by reference into the storm water permit application. EPA disagrees that incorporation by reference is appropriate. The permitting authority will need to have this information readily available for evaluating permit application and permit conditions. Furthermore, EPA feels that the applicant is in the best position to provide the information and verify its accuracy. However, if the applicant has such information and it accurately reflects current circumstances, then the applicant can rely on the information for meeting the information requirements of the application. Another commenter suggested that EPA should only require the information in § 122.26(c)(1) (A) and (B) (*i.e.*, the requirement for a topographic map indicating drainage areas and estimate of impervious areas and material management practices). As explained in greater detail below, EPA is convinced that some quantitative data and the other narrative requirements are necessary for developing appropriate permit conditions.

Form 2F addressing permit applications for storm water discharges associated with industrial activity is included in today's final rule. A complete permit application for discharges composed entirely of storm water, will be comprised of Form 2F and Form 1. Operators of discharges which are composed of both storm water and non-storm water will submit, where required, a Form 1, an entire Form 2C (or Form 2D) and Form 2F when applying. In this case, the applicant will provide quantitative data describing the discharge during a storm event in Form 2F and quantitative data describing the discharge during non-storm events in Form 2C. Non-quantitative information reported in the Form 2C will not have to be reported again in the Form 2F.

Under today's rule, Form 2F for storm water discharges associated with industrial activity would not require the submittal of all of the quantitative information required in Form 2C, but would require that quantitative data be submitted for:

- Any pollutant limited in an effluent guideline for an industrial applicant's subcategory;
- Any pollutant listed in the facility's NPDES permit for its process wastewater;
- Oil and grease, TSS, COD, pH, BOD5, total phosphorus, total Kjeldahl nitrogen; nitrate plus nitrite nitrogen; and
- Any information on the discharge required under 40 CFR 122.2l(g)(7) (iii) and (iv).

In order to characterize the discharge(s) sampled, applicants need to submit information regarding the storm event(s) that generated the sampled discharge, including the date(s) the sample was taken, flow measurements or estimates of the duration of the storm event(s) sampled, rainfall measurements or estimates from the storm event(s) which generated the sampled runoff, and the duration between the storm event sampled and the end of the previous storm event. Information regarding the storm event(s) sampled is necessary to evaluate whether the discharge(s) sampled was generally representative of other discharges expected to occur during storm events and to characterize the amount and nature of runoff discharges from the site.

One commenter stated that the quantitative information should be limited to those pollutants that are expected to be known to the applicant. EPA believes this would be inappropriate since there will be no way of determining initially whether these pollutants are present despite the expectations of the applicant. Once the data is provided, permits can be drafted which address specific pollutants. This rulemaking requires that the applicant test for oil and grease, COD, pH, BOD5, TSS, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen and total phosphorus. Oil and grease and TSS are a common component of storm water and can have serious impacts on receiving waters. Oxygen demand (COD and BOD5) will help the permitting authority evaluate the oxygen depletion potential of the discharge. BOD5 is the most commonly used indicator of potential oxygen demand. COD is considered a more inclusive indicator of oxygen demand, especially where metals interfere with the BOD5 test. The pH will provide the permitting authority with important information on the potential availability of metals to the receiving flora, fauna and sediment. Total Kjeldahl nitrogen, nitrate plus nitrite nitrogen and total phosphorus are measures of nutrients which can impact water quality. Because this data is useful in developing appropriate permit conditions, EPA disagrees with the argument made by one commenter that quantitative data requirements should be a permit condition and not part of the application process.

In the proposed rule, the Agency used total nitrogen as a parameter. This has been changed to total Kjeldahl nitrogen and nitrate plus nitrite nitrogen for clarity.

Today's rule defines sampling at industrial sites in terms of sampling for those parameters that have effluent limits in existing NPDES permits, as well as for any other conventional or nonconventional parameter that might be expected to be found at the outfall. Comments on the appropriateness of the defined parameters were solicited by the proposal. Numerous commenters maintained that either the parameter list be made industry specific, or that pollutant categories not detected in the initial screen be exempted from further testing. Some suggested that only conventional pollutants, inorganics, and metals be sampled unless reason for others is found.

In terms of specific water quality parameters, it was recommended that surfactants not be tested for unless foam is visible. One commenter also suggested that fecal coliform sampling is inappropriate for industrial permits applications. One commenter favored testing for TOC instead of VOC. In response, VOC has been eliminated from the list of parameters because it will not yield specific usable data. VOC is not specifically required in any sampling in today's rule, except where priority pollutant scans are required.

Some recommended that procedures be modified to facilitate quicker, less expensive lab analyses. Concern was also raised that industry might be required to collect its own rainfall data if there is no nearby observation station. Some commenters stated that EPA should not allow automatic sampling for either biological or oil and grease sampling due to the potential for contamination in sampling equipment.

In response, EPA believes that the sampling requirements for industry in today's rule are reasonable and not burdensome. These requirements address parameters that have effluent limits in existing NPDES permits, as well as for any other conventional or nonconventional parameter that might be expected to be found at the applicants outfall. Under this procedure both industry-specific and site-specific contaminants are already identified in the existing permit. Whether all these parameters need to be made a part of any discharge characterization plans, under the terms of the permit, will be a case-by-case determination for the permitting authority. EPA maintains that the test for surfactants (if in effluent guidelines or in the facility's NPDES permit for process water) is justifiable even when a foam is not obvious at the outfall. The presence of detergents in storm water may be indicated by foam, but the absence of foam does not indicate that detergents are not present.

EPA requested comments on fecal coliform as a parameter. Fecal coliform was included on the list as an indicator of the presence of sanitary sewage. In large concentrations, fecal coliform may be an effective indicator of sanitary sewage as opposed to other animal wastes. EPA believes that sanitary cross connections will also be found at industrial facilities. Furthermore, the test for fecal coliform is an inexpensive test and its inclusion or exclusion should make little impact financially on the individual application costs. Sampling for volatile organic carbon shall be accomplished when required, as it is an appropriate indicator of industrial solvents and organic wastes.

In response to comments, EPA acknowledges that there are certain pollutants that are capable of leaving residues in automatic sampling devices that will potentially contaminate subsequent samples. In these cases, such as for biological monitoring, if such a problem is perceived to exist and it is expected that the contaminant will render the subsequent samples unusable, manual grab samples may be needed. This would include grab samples for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform, and fecal streptococcus. EPA is not disallowing the use of automatic sampling because of possible contamination, as this type of sampling may be the best method for obtaining the necessary samples from a selected storm events.

In addition to the conventional pollutants listed above, this final rule requires applicants, when appropriate, to sample other pollutants based on a consideration of site-specific factors. These parameters account for pollutants associated with materials used for production and maintenance, finished products, waste products and non-process materials such as fertilizers and pesticides that may be present at a facility. Applicants must sample for any pollutant limited in an effluent guideline applicable to the facility or limited in the facility's NPDES permit. These pollutants will generally be associated with the facility's manufacturing process or wastes. Other process and non-process related pollutants, will be addressed by complying with the requirements of 40 CFR 122.21(g)(7) (iii) and (iv).

Section 122.21(g)(7)(iii) requires applicants to indicate whether they know or have reason to believe that any pollutant listed in Table IV (conventional and nonconventional pollutants) of appendix D to 40 CFR part 122 is discharged. If such a pollutant is either directly limited or indirectly limited by the terms of the applicant's existing NPDES permit through limitations on an indicator parameter, the applicant must report quantitative data. For pollutants that are not contained in an effluent limitations guideline, the applicant must either report quantitative data or describe the reasons the pollutant is expected to be discharged. With regard to pollutants listed in Table II (organic pollutants) or Table III (metals, cyanide and total phenol) of appendix D, the applicant must indicate whether they know or have reason to believe such pollutants are discharged from each outfall and, if they are discharged in amounts greater than 10 parts per billion (ppb), the applicant must report quantitative data. An applicant qualifying as a small business under 40 CFR 122.21(g)(8), (*e.g.*, coal mines with a probable total annual production of less than 100,000 tons per year or, for all other applicants, gross total annual sales averaging less than $100,000 per year (in second quarter 1980 dollars)), is not required to analyze for pollutants listed in Table II of appendix D (the organic toxic pollutants).

Section 122.21(g)(7)(iv) requires applicants to indicate whether they know or have reason to believe that any pollutant in Table V of appendix D to 40 CFR part 122 (certain hazardous substances) is discharged. For every pollutant expected to be discharged, the applicant must briefly describe the reasons the pollutant is expected to be discharged and report any existing quantitative data it has for the pollutant.

When collecting data for permit applications, applicants may make use of 40 CFR 122.2l(g)(7), which provides that "when an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also applies to the substantially identical outfalls." Where the facility has availed itself of this provision, an explanation of why the untested outfalls are "substantially identical" to tested outfalls must be provided in the application. Where the amount of flow associated with the outfalls with substantially identical effluent differs, measurements or estimates of the total flow of each of the outfalls must be provided. Several commenters stated that the time and expense associated with sampling and analysis would be saved if the applicant was able to pick substantially identical outfalls without prior approval of the permitting authority. EPA disagrees that this would be an appropriate devolution of authority to the permit applicant. The permitting authority needs to ensure that these outfalls have been grouped according to appropriate criteria (for example do the outfalls serve similar drainage areas at the facility). Furthermore, EPA is not requiring that the permit applicant engage in sampling to demonstrate that the outfalls are indeed substantially identical, because that would of course defeat the purpose of § 122.21(g)(7). The procedure for establishing identical outfalls is not that onerous and provides a means for industry to save substantially on time and resources for sampling.

EPA proposed and requested comment on a requirement that the facility must sample a storm event that is typical for the area in terms of duration and severity The storm event must be greater than 0.1 inches and must be at least 96 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. In general, variance of the parameters (such as the duration of the event and the total rainfall of the event) should not exceed 50 percent from the parameters of the average rainfall event in that area. EPA also requested comments on addressing snow melt events under this definition.

Commenters stated that: median or average rainfall is not an acceptable approach; the minimum depth and duration of rainfall must be specified; the allowable 50% variation is questionable; the total depth of the storm is irrelevant; and the storm should be viewed based on the average intensity of the storm. One commenter

suggested that using the median rainfall event would be a better approach than the average rainfall event.

Others insisted that "representative" or typical storms do not exist in semi-arid climates and that representative rainfall must be site-specific (regional) and seasonal. Several commenters contended that the requirement for 96 dry hours between events is not acceptable, with 48 and 72 hours identified as possible alternatives.

One commenter believed that a typical standard design storm, such as the 1-year, 24-hour, or 10-year, 1-hour, would be preferable. Another commenter felt that the storm event should be based on the rainfall required to generate a minimum discharge level. One commenter questioned whether the storm is to be sampled at all sites simultaneously.

To clarify its decision on what storm event should be sampled, EPA notes that its selection of the storm event considers both regional and seasonal variation of precipitation. This is evidenced in the rule with regard to sites in the municipal application (three events sampled), and in the requirements for industrial group applications (a minimum of two applicants, or one applicant in groups of less than 10, to be represented in each precipitation zone (*see* section VI.F.4 below).

The definition of a 0.1 inch minimum was determined by NURP and other studies to be the minimum rainfall depth capable of producing the rainfall/runoff characteristics necessary to generate a sufficient volume of runoff for meaningful sample analysis. EPA believes by requiring the average storm to be used as the basis for sampling that depth, duration, and therefore average rainfall intensity are being regionally defined. The Agency has also added the option of using the median rainfall event instead of the average. The potential for monitoring events that may not meet this specification should be minimized by allowing the proposed 50 percent variation in rainfall depth and/or duration from event statistics. However, the 50 percent variation need only be met when possible. Further, there is flexibility in the rule where the Director may allow or establish site specific requirements such as the minimum duration between the previous measurable storm event and the storm event sampled, the amount of precipitation from the storm event to be sampled, and the form of precipitation sampled (snowmelt or rainfall). If data is obtained from a rain event that does not meet the criteria above, the Director has the discretion to accept the data as valid.

The December 7, 1988, proposal called for a 96-hour period between events of measurable rainfall, here defined as 0.1 inch, which provided a four day minimum for the accumulation of pollutants on the surface of the outfalls' tributary areas. The key word in the definition is "measurable", which means that the 96-hour period did not necessarily have to be dry, only that no cleansing rainfall (*i.e.* 0.1 inch rain event) has occurred. However, after reviewing comments on this issue EPA has decided to change the period to 72 hours. Many commenters indicated that 96 hours is too restrictive and that securing a sample under such circumstances would be unnecessarily difficult. EPA agrees that the quality or representativeness of the sample would not be adversely affected by this change.

EPA does not agree with comments that the requirement of a particular "design" storm would be appropriate. Many commenters have expressed concern that they might sample an event not meeting the requirements for industrial group applications as defined. Because there is no way to know with sufficient certainty beforehand that an upcoming event will approximate a one-year, twenty-four hour storm, many events would be unnecessarily sampled before this event is realized.

EPA does not intend that a municipality or industry be required to sample all required outfalls for a single storm. This would represent a unmanageable investment in equipment and manpower In some areas, it may be necessary to sample multiple sites for a single event due to the irregularity of rainfall, but not all sites.

EPA described parameters for selecting storm events for sampling of municipal and industrial outfalls in the December 7, 1988, proposal. EPA has received several comments regarding the problems that rainfall measurement in general presents. A recurring comment relative to reporting rainfall, and in verifying that the storm itself is representative, deals with the spatial distribution of rainfall. The rainfall measured at an airport does not always represent rainfall at the site, particularly in summer months when thunderstorms are prevalent. One commenter stated that it would be easier to base the selected storm on either a minimum discharge, or on a discharge duration other than on the total precipitation, because these parameters are easily measured at the site and are not dependent on the airport gauges receiving the same rainfall as the site. A few commenters questioned how to determine typical storm characteristics. One commenter advised that NOAA rainfall reporting stations provide data that represent only daily rainfall totals, not storm event data. One commenter pointed out that the time frame of the sampling requirement does not consider that a particular region may be in the midst of a multi-year drought cycle, and that what little rainfall occurs may have uncharacteristically high levels of pollutants.

The type of rain event sampled is an important parameter in any attempt to characterize system-wide loads based on the sampling results. Rainfall gauges that report only event total depth will provide the information necessary to characterize most events, provided that a reasonable estimate of the event duration can be made. If simulation models are to be used in estimating system-wide loads, rainfall measurement based on time and depth of rainfall will be needed. If the recording stations are not believed to accurately reflect this distribution, then the data will need to be collected by the applicant at a location central to the tributary area of the outfall.

The rainfall data collected by NOAA are in most cases available in the form of hourly rainfall depths. This information can be analyzed to develop characteristic storm depths and durations. In some cases, this information has already been analyzed for many long term reporting stations by various municipalities, states, and universities. The results of these investigations should be available to the applicants.

EPA realizes that prolonged rainless periods occur for both semi-arid areas and areas experiencing droughts and that the first storm after a prolonged dry period may well not be representative of "normal" runoff conditions. In order for the appropriate system-wide characterization of loads to be made, data must be collected. With regard to the municipal permit application, today's rule states that runoff characterization data will be collected during three events at from five to ten sites. The rule gives the Director the flexibility of modifying these requirements.

EPA has defined the parameters for selecting the storm event to be sampled such that at the discretion of the Director, seasonal, including winter, sampling might be required. EPA has received several comments regarding the problems that snowmelt sampling may present. Several commenters are

opposed to monitoring of snowmelt events. The reasons cited include equipment problems and the unreasonableness of expecting this sampling, because of temperatures and the time required for personnel to be waiting for events. A few comments addressed the issues of snow pack depth, ambient temperature, and solar radiation levels, and that the snow pack may filter suspended solids or refreeze such that final melting is uncharacteristically over-polluted relative to normal conditions. Another commenter contended that it is impossible to manage the melting process and therefore unreasonable to expect controls to be implemented relative to snowmelt. In essence, it is contended that there is no first discharge unless the snow pack depth is low and melts quickly.

A few commenters favor monitoring snowmelt, for precisely the same reason that most oppose it: that the runoff from snowmelt is the most polluted runoff generated in some areas on an annual basis. Where this is the case, sampling snowmelt should be undertaken in order to accurately assess impacts to receiving streams. EPA is confident that in areas where automated sampling cannot be relied upon, grab sampling can probably be performed because the nature of the snowmelt process tends to make the timing of samples less of a problem when compared to typical rainfall events. EPA disagrees that management practices, either at industrial facilities or with regard to municipalities, cannot address snowmelt. Some areas may need to reassess their salt application procedures. In addition retention and detention devices may address snowmelt, as well as erosion controls at construction sites. Thus, obtaining samples of snowmelt is appropriate to allow development of such permit conditions.

Today's rule also modifies the Form 2C requirements by exempting applicants from the requirements at § 122.21(g)(2) (line drawings), (g)(4) (intermittent flows), (g)(7) (i), (ii), and (v) (various sampling requirements to characterize discharges) if the discharge covered by the application is composed entirely of storm water. Permit applications for discharges containing storm water associated with industrial activity would require applicants to provide other non-quantitative information which will aid permit writers to identify which storm water discharges are associated with industrial activity and to characterize the nature of the discharge.

Numerous comments were received regarding the requirement to submit a topographic map and site drainage map. Many of these comments offered alternatives to EPA's proposal. Two commenters suggested that a simple sketch of the site would be sufficient. Two commenters stated that one or the other should be adequate. One commenter believed that the drainage map was a good idea, but that the topographic map should be optional. Several commenters submitted that a topographic map was sufficient and that only SPCC plans or SARA submittals should supplement that. Another commenter argued that information relating to the location of the nearest surface water or drinking wells would be sufficient. Other commenters believed that a drainage map alone would indicate all relevant site specific information. Numerous commenters expressed concern that the drainage area map would be too detailed and that one which depicts the general direction of flow should be sufficient. Clarification was requested on whether the final rule would require the location of any drinking water wells. One commenter stated that a U.S.G.S. 7.5 quadrangle map will not illustrate drainage systems in all cases, and that therefore the requirement should be optional.

Several commenters agreed with EPA's proposal. One commenter maintained that drainage maps should be required from developments greater than three acres and from all individual applicants. Several commenters agreed with EPA's proposal that both maps should be provided, with arrows indicating site drainage and entering and leaving points. It was advised that drainage maps are useful in locating sources of storm water contamination, and it is useful to identify areas and activities which require source controls or remedial action. One commenter recommended that the map should extend far enough offsite to demonstrate how the privately owned system connects to the publicly owned system.

After considering the merits of all the comments and the reasons supporting EPA's proposal, EPA is convinced that a topographic map and a site drainage map are necessary components of the industrial application. Existing permit application regulations at 40 CFR 122.21(f)(7) require all permit applicants to submit as part of Form 1 a topographic map extending one mile beyond the property boundaries of the source depicting: the facility and each intake and discharge structure; each hazardous waste treatment, storage, or disposal facility; each well where fluids from the facility are injected underground; and those wells, springs, other surface water bodies, and drinking water wells listed in the map area in public records or otherwise known to the applicant within one-quarter mile of the facility property boundary. (*See* 47 FR 15304, April 8, 1982.) However, as indicated by the comments the information provided under § 122.21(f)(7) is generally not sufficient by itself for evaluating the nature of storm water discharges associated with industrial activity.

As stated in comments, a drainage map can provide more important site specific information for evaluating the nature of the storm water discharge in comparison to existing requirements, which require a larger map with only general information. The volume of storm water discharge and the pollutants associated with it will depend on the configuration and activities occurring at the industrial site. One commenter suggested that it would be appropriate to submit an aerial photograph of the site with all the topographic and drainage information superimposed on the photograph. EPA agrees that this may be an appropriate method of providing this information. EPA is not requiring a specific format for submitting this information.

EPA is also requiring that a narrative description be submitted to accompany the drainage map. The narrative will provide a description of on-site features including: existing structures (buildings which cover materials and other material covers; dikes; diversion ditches, etc.) and non-structural controls (employee training, visual inspections, preventive maintenance, and housekeeping measures) that are used to prevent or minimize the potential for release of toxic and hazardous pollutants; a description of significant materials that are currently or in the past have been treated, stored or disposed outside; and the method of treatment, storage or disposal used. The narrative will also include: a description of activities at materials loading and unloading areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; a description of the soil; and a description of the areas which are predominately responsible for first flush runoff. This requirement is unchanged from the proposal.

Some commenters believed that information on pesticides, herbicides, and fertilizers and similar products is irrelevant, incidental to the facility's production activities, and should not be

addressed by this rulemaking. EPA disagrees. As these materials are applied outside and hence subject to storm events, they are significant sources of pollutants in storm water discharges whether applied in residential or industrial settings. By providing this information in the permit application the permit writer will be able to determine whether such activity is associated with industrial activity and the subject of appropriate permit conditions. Nominal or incidental application of these materials at industrial facilities and non-detects in sampling of storm water discharges for the permit application will result, in most cases, in these materials not being addressed specifically in storm water permits.

Today's rule also requires that permit applicants for storm water discharges associated with industrial activity certify that all of the outfalls covered in the permit application have been tested or evaluated for non-storm water discharges which are not covered by an NPDES permit. (The applicant need not test for nonstorm water if the certification of the plant storm water discharges can be evaluated through the use of schematics or other adequate method). Section 405 of the WQA added section 402(p)(3)(B)(ii) to the CWA to require that permits for municipal separate storm sewers effectively prohibit non-storm water discharges to the storm sewer system. As discussed in part VI.F.7.b of today's preamble, untreated non-storm water discharges to storm sewers can create severe, widespread contamination problems and removing such discharges presents opportunities for dramatic improvements in the quality of such discharges. Although section 402(p)(3)(B)(ii) specifically addresses municipal separate storm sewers, EPA believes that illicit non-storm water discharges are as likely to be mixed with storm water at a facility that discharges directly to the waters of the United States as it is at a facility that discharges to a municipal storm sewer. Accordingly, EPA feels that it is appropriate to consider potential non-storm water discharges in permit applications for storm water discharges associated with industrial activity. The certification requirement would not apply to outfalls where storm water is intentionally mixed with process waste water streams which are already identified in and covered by a permit.

This rulemaking requires applicants for individual permits to submit known information regarding the history of significant spills at the facility. Several commenters indicated that the extent to which this information is required should be modified. One commenter stated that the requirement should be limited to those spills that resulted in a complaint or enforcement action. EPA disagrees. EPA believes that significant spills at a facility should generally include releases of oil or hazardous substances in excess of reportable quantities under section 311 of the Clean Water Act (*see* 40 CFR 110.10 and 40 CFR 117.21) or section 102 of CERCLA (*see* 40 CFR 302.4). Such a requirement is consistent with these regulations and the perception that such spills are significant enough to mandate the reporting of their occurrence. Some commenters stated that industries have already submitted this information in other contexts and should not be required to have to do it again. For the same reason another commenter felt that submittal of this information represents a waste of manpower and resources. EPA disagrees that requiring this information is unduly burdensome. If this information has already been provided for another purpose it follows that it is readily available to the industrial applicant. Thus, the burden of providing this information cannot be considered undue. Furthermore, the permit authority will need to have this available in order to determine which drainage areas are likely to generate storm water discharges associated with industrial activity, evaluate pollutants of concern, and develop appropriate permit conditions. However, to keep this information requirement within reasonable limits and limited to information already available to individual facilities, EPA has declined to expand the reporting requirements to spills of other materials, such as food as one commenter has suggested. However, EPA has decided to add raw materials used in food processing or production to the list of significant materials. Materials such as these may find their way into storm water discharges in such quantities that serious water quality impacts occur. These materials may find there way into storm water from transportation vehicles carrying materials into the facility, loading docks, processing areas, storage areas, and disposal sites.

One commenter urged that any information requested should be limited to a period of three years, which is the general NPDES records retention requirement under 40 CFR 122.21(p) and 40 CFR 112.7(d)(8). EPA agrees with this comment and has limited historical information requirements to the 3 years prior to the date the application is submitted. In this manner this regulation will be consistent with records keeping practices under the NPDES and Oil Spill Prevention programs, except sludge programs.

The December 7, 1988, proposal required the applicant to submit a description of each past or present area used for outdoor storage or disposal of significant materials. One commenter felt that the definition of significant material was too imprecise. EPA disagrees that the language should be made more precise by delineating every conceivable material that may add pollutants to storm water. Rather the definition is broad, to encourage permit applicants to list those materials that have the potential to cause water quality impacts. Stating what materials are addressed in meticulous detail may result in potentially harmful materials remaining unconsidered in permits. However, EPA has decided to add "fertilizers, pesticides, and raw materials used in the production or processing of food" to the definition in response to the comment of one State authority that such materials need to be accounted for due to their potential danger to storm water discharge quality. This same commenter recommended that "hazardous chemicals" should be added. EPA agrees, and will delineate those chemicals as "hazardous substances" which are designated under section 101(14) of CERCLA. Further clarification has been added by requiring the listing of any chemical the facility is required to report pursuant to section 313 of title III of SARA.

Another commenter felt that EPA should not require information of past storage of significant materials. EPA agrees that this proposed requirement is overbroad and has limited the time frame to those materials that were stored in areas 3 years or fewer from the date of the permit application. The 3-year limit is consistent with other Agency reporting requirements as discussed above.

One commenter questioned EPA's proposal not to provide for a waiver from the requirement to submit quantitative data if the applicant can demonstrate that it is unnecessary for permit issuance. Another commenter said that a waiver is inappropriate. EPA believes relevant quantitative data are essential to the process, but in this rulemaking the number of pollutants that must be sampled and analyzed is reduced compared to previous regulations. The proposed requirements for quantitative data are limited to pollutants that are appropriate for given

site-specific operations, thereby making a waiver unnecessary.

Although the concept of a waiver is attractive because of the perceived potential reduction in burdens for applicants, EPA believes that because the storm water discharge testing requirements have already been streamlined, a waiver would not in practice provide significant reductions in burden for either applicants or permit issuing authorities. Requirements to provide and verify data demonstrating that a waiver is appropriate for a storm water discharge may prove to be more of a burden to the applicant and the permitting authorities. Establishing such a waiver procedure would be administratively complex and time-consuming for both EPA and the applicants, without any justifiable benefit. Therefore, this rulemaking does not include a waiver provision.

In response to one commenter, EPA wishes to emphasize that if a facility has zero storm water discharge because it is discharging to a detention pond only, a permit application is not required. Only those discharges to the waters of the United States or municipal systems need submit notifications, individual or group permit applications, or notices of intent where applicable. However, if the detention pond overflows or the discharger anticipates that it may overflow, then a permit application should be submitted.

Two commenters agreed with EPA's proposed requirement to have a description of past and present material management practices and controls. EPA believes that this is important information directly relating to the quality of storm water that can be expected at a particular facility and this requirement is retained in today's rule. However, as with other historical information requirements, EPA is limiting past practices to those that occurred within three years of the date that the application is submitted. One commenter argued that past practices should not be considered unless there is evidence that past practices cause current storm water quality problems. EPA anticipates that the information submitted by the applicant will be used to make this determination and that appropriate permit conditions can be developed accordingly.

One commenter requested clarification on the certification requirement that the data and information in the application is true and complete to the best of the certifying officer's knowledge. This is a fundamental and integral part of all NPDES permit applications. It essentially requires the signatory to assure the permit writer, based upon his or her personal knowledge, that the information has been submitted without a negligent, reckless, or purposeful misrepresentation. EPA intends to interpret this requirement in the same manner for storm water applications as other applications.

4. Group Applications

Today's final rule provides some industries with the option of participating in a group application, in lieu of submitting individual permits. There are several reasons for the group application. First, the group application procedure provides adequate information for issuing permits for certain classes of storm water discharges associated with industrial activity. Second, numerous commenters supported the concept of the group application as a way to reduce the costs and administrative burdens associated with storm water permit applications. Third, group applications will reduce the burden on the regulated community by requiring the submission of quantitative data from only selected members of the group. Fourth, the group application process will reduce the burden on the permit issuing authority by consolidating information for reviewing permit applications and for developing general permits suited to certain industrial groups. Where general permits are not appropriate or cannot be issued, a group application can be used to develop model individual permits, which can significantly reduce the burden of preparing individual permits.

As noted above in today's preamble, EPA intends to promulgate a general permit that will cover many types of industrial activity. Industrial dischargers eligible for such permits will generally be required to seek coverage by submittal of a notice of intent. Facilities that are ineligible for coverage under the general permit will be required to submit an individual permit application or submit a group application. The group application process promulgated today will serve as an important component to implement Tier III of EPA's industrial storm water permitting strategy discussed above. The general permit which EPA intends to promulgate in the near future shall set forth what types of facilities are eligible for coverage.

Some commenters criticized the group application procedure as an abdication of EPA's responsibility to effectively deal with pollutants in storm water discharges. One commenter stated that every facility subject to these regulations should be required to submit quantitative data. In response EPA believes, as do numerous commenters, that the group application procedure is a legitimate and effective way of dealing with a large volume of currently uncontrolled discharges. The only difference between the group application procedure and issuing individual permits based on individual applications is that the quantitative data requirements from individual facilities will be less if certain procedures are followed. EPA is convinced that marked improvements in the process of issuing permits will be achieved when these procedures are followed. Where the storm water discharge from a particular facility is identified as posing a special environmental risk, it can be required to submit individual applications and therefore separate quantitative data. It should also be noted that submittal of a group application does not exempt a facility from submitting quantitative data on its storm water discharge during the term of the permit.

The final rule refines and clarifies some of the requirements of the group application approach set forth in the December 7, 1988 proposal. Several commenters requested that EPA add a provision which would allow a facility that becomes subject to the regulations to "add on" to a group application after that group application has already been submitted. One commenter indicated that some trade associations are prohibited from engaging in an activity which would not apply to all its members, and that an "add on" provision was needed in the event such a prohibition was invoked. Another commenter noted that where a group is particularly large, for example one that consists of several thousand members, that it would be a logistical feat to ensure that all facilities eligible as members of the group are properly identified and listed on the application within the 120 day deadline for submitting part 1A of the application.

EPA believes that a group applicant should have a limited ability to add facilities to the group after part 1A has been submitted and that a provision which allows a group or group representative an unbridled ability to "add on" is impractical for a number of reasons. First, 10% of the facilities must submit quantitative data. Adding facilities after the group has been formed and approved would change the number of facilities that have to submit quantitative data on behalf of the group. This would result in an unwarranted administrative burden on the reviewing authority, which is in the position of having to examine the quantitative data and determine the appropriateness of group members (and those that are

required to submit quantitative data) within 2 months of receiving part 1 of the group application. Further, during the permit application process permitting authorities will be developing permit conditions for an identified and pre-determined group of facilities. Allowing potentially significant numbers of permit applicants to suddenly inject themselves into a group application could unnecessarily hamper or disrupt the timely development of general and model permits. In addition, if a facility were "added on" the number of facilities having to submit quantitative data may drop below 10%. Thus the facility desiring to "add on" may be put in the position of having to submit the quantitative data themselves, which would clearly defeat the purpose of being a part of the group application.

Nevertheless, EPA has added a provision to 122.26(e) which enables facilities to add on to a group application at the discretion of the EPA's Office of Water Enforcement and Permits, and upon a showing of good cause by the group applicant. For the reasons noted above, EPA anticipates this provision will be invoked only in limited cases where good cause is shown. Facilities not properly identified in the group application, and which cannot meet the good cause test will be required to submit individual permit applications. EPA will advise such facilities within 30 days of receiving the request as to whether the facility may add on.

However, the "add on" facility must meet the following requirements: The application for the additional facility is made within 15 months of the final rule; and the addition of the facility does not reduce the percentage of the facilities that are required to submit quantitative data to below 10% unless there are over 100 facilities that are submitting quantitative data. Approval to become part of a group application is obtained from the group or the trade association and is certified by a representative of the group; approval for adding on to a group is obtained from the Office of Water Enforcement and Permits.

Several commenters stated that the application requirements for groups are so burdensome that the advantages of the process are undermined. These concerns are addressed in greater detail below. Among the requirements which commenters objected are the requirements to list every group member's company by name and address. EPA is convinced that a condition precedent to approving a group application is at least identifying the members of the group. Without such information it would be impossible to determine if all the facilities are sufficiently similar. EPA disagrees that industries will be dissuaded from using the group application process because the advantages of the process are undermined. Although commenters perceived many burdens associated with individual permit applications, by far the most significant burden identified by the comments is the requirement for obtaining and submitting quantitative data. The group application significantly reduces this burden by requiring only10% of the facilities to submit quantitative data if the number in the group is over 100. If the number in the group is over 1000, then only 100 of the facilities need submit quantitative information. If group applicants develop cost sharing procedures to reduce the financial and administrative burdens of submitting quantitative data, it is evident that utilizing the group application could save industries as much as 90% on the most economically burdensome aspect of the application.

Several commenters perceived that the group application procedure did not offer them significant savings because under the proposal their particular industry would only be required to test for COD, BOD5, pH, TSS, oil and grease, nitrogen, and phosphorous. These commenters stated that sampling for these pollutants is not particularly expensive. EPA believes that even if a group is required only to submit minimal quantitative data on particular pollutants, substantial savings can accrue to a particular industry if the group has many members. This is particularly true when the number of outfalls to be sampled, the information on storm events, and flow measurements are factored into the cost analysis. An additional benefit for members of the group as well as for permit issuing agencies is that the process of developing a permit, including drafting and responding to public comments on the permit, is consolidated by the group application process. Accordingly, it is less resource intensive for the group to work with permit issuance authorities to develop well founded permit conditions.

One commenter raised a concern about the situation where one of the facilities that is designated for submitting quantitative data drops out of the group. If this happened, then another facility would have to submit quantitative data. In response, EPA notes that one approach would be for the group to have one or two more facilities submit quantitative data than needed to avoid problems from such a departure or to account for new additions to the group. Certainly this issue goes directly to the facility selection process which is a critical component of the group application; the facilities need to be carefully selected and reviewed by the group to prevent such difficulties.

Several comments indicated a confusion over what facilities are eligible to take advantage of the group application procedure. Any industry or facility that is required to submit a storm water permit application under these regulations is eligible to participate in a group application. However, whether a facility can obtain a storm water permit under a group application procedure will depend upon whether that facility is a member of the same effluent guideline subcategory, or is sufficiently similar to other members of the group to be appropriate for a general permit or individual permit issued pursuant to the group application. Accordingly, group applications are not limited to national trade associations. The agency believes that the language in § 122.26(c)(2) adequately addresses these concerns. The process does not prohibit a particular company with multiple facilities from filing a group application as long as those facilities are sufficiently similar.

One commenter expressed concern that a single company would not be able to take advantage of the group application benefits unless the company had more than ten facilities. Under such circumstances the company would have to become integrated with a larger group of facilities owned by other companies in order to take advantage of the benefits afforded by the group application procedure. In response, the Agency is providing for a group application of between four and ten members, however at least half the facilities must submit data. One commenter stated that the number of facilities required to submit quantitative data should be determined on a case by case basis. EPA believes that 10 percent for groups with over ten members will be easiest to implement for both industry and EPA, and will ensure that adequate representative quantitative data are obtained so that meaningful determinations of facility similarity can be made and appropriate permit conditions in general or model permits can be developed.

Another commenter suggested that one facility with a multitude of storm water discharge points should be able to use the group permit application to reduce the amount of quantitative data

that it is required to submit. This is an accurate observation but only to the extent that the facility combines with several other facilities to form a group, in which case only 10% of the facilities need submit quantitative data. The group application procedure in today's rule is designed for use by multiple facilities only. However, if an individual facility has 10 outfalls with ten substantially identical effluents the discharger may petition the Director to sample only one of the outfalls, with that data applying to the remaining outfalls. See § 122.21(g)(7). Thus, existing authority already allows for a "group-like" process for sampling a subset of storm water outfalls at a single facility.

Concern was expressed that the spill reporting requirement from each facility in part 1B would preclude any group from demonstrating that the facilities sampled are "representative," because the incidence of past spills is very site-specific. EPA notes that since it has dropped the part 1B requirements for other reasons discussed below, this comment is now moot.

Numerous commenters noted that if a facility is part of a group application and is subsequently rejected as a group applicant, such an entity would not have a full year to submit an individual permit application. EPA agrees that this is a significant concern. Accordingly, those facilities that apply as a member of a group application will be afforded a full year from the time they are notified of their rejection as a member of the group to file an individual application. EPA notes that it intends to act on group application requests within 60 days of receipt; thus this approach will only provide facilities that are rejected from a group application a short extension of the deadline for other individual applications.

One commenter complained that the cost of defending a group's choice of representative facilities may exceed the cost of submitting an individual permit application, thereby reducing the incentive to apply as group. The agency anticipates that the selection process will be one open to negotiation between the affected parties and one that will end in a mutually satisfactory group of facilities. It is the intent of EPA to reduce the costs of submitting a permit application as much as possible, while providing adequate information to support permitting activities.

Another commenter argued that the use of model permits will create a disincentive for participating in a group because model permits may be used by the permit issuing authority to issue individual permits for discharges from similar facilities that did not participate in the group application. EPA does not agree. The benefit of applying as a group applicant is to take advantage of reduced representative quantitative data requirements. This incentive will exist regardless of whether or how model permits are used. Further, technology transfer can occur during the development of permits based on individual applications as well as those based on group applications.

One commenter suggested moving some of the facility specific information requirements of part 1 of the group application to part 2 of the group application in order to provide more incentive to apply as a group. EPA has considered this and believes such a change would be inappropriate. Part 1 information will be used to make an informed decision about whether individual facilities are appropriate as group members and appropriate for submitting representative quantitative data. Furthermore, information burdens from providing site specific factors in part 1 is relatively minimal, and the information requirements in the proposed part 1B application have been eliminated.

One commenter suggested that trade associations develop model permits since they have the most knowledge about the characteristics of the industries they represent. As noted above, EPA expects that the industries and trade associations will have input, through the permit application process, as to how permit conditions for storm water discharges are developed. While the applicant can submit proposed permit conditions with any type of application, EPA however cannot delegate the drafting of model permits to the permittees. EPA is developing and publishing guidance in conjunction with this rulemaking for developing permit conditions.

One commenter suggested that new dischargers should be able to take advantage of general permits developed pursuant to group applications. As with other general permits, EPA anticipates that such discharges will be able to fall within the scope of a general permit based on a group application where appropriate.

One commenter stated that the group application does not benefit municipalities since there is no requirement for industrial discharges through municipal sewers to apply for a permit. As noted in a previous discussion, industrial discharges through municipal sewers must be covered by an NPDES permit. Such facilities may avail themselves of the group application procedure. Also, municipalities are not precluded from developing a group application procedure under their management plan for industries that discharge into their municipal system, in order to streamline developing controls for such industries.

One industry wanted clarification that facilities located within a municipality would be eligible to participate in a group application. All industrial activities required to submit an individual permit are entitled to submit as part of group application, except those with existing NPDES permits covering storm water. Those facilities that discharge through a municipal separate storm sewer systems required to submit an individual application (because they do not fall within a general permit) are not precluded from using the group application procedure if appropriate.

Other municipalities expressed confusion over the industrial group application concept. The following responds to these comments. First, municipalities are not eligible for participation in a group application because the group application process is designed for industrial activities. Sampling requirements for municipal permit applications are already limited to a small subset of the outfalls from the system, as discussed below. Furthermore, permits for municipal separate storm sewer systems will be issued on a system-wide or jurisdiction-wide basis, rather than individually for each outfall. Thus, today's regulation already incorporates a "grouplike" permit application process for municipalities. Furthermore, it is highly unlikely that various municipal storm sewer systems would be "substantially similar" enough to justify group treatment in the same way as industrial facilities. In response to another comment, this regulation does not directly give the municipality enforcement power over members of an industrial group who may be discharging through its system. Only the permitting authority and private citizens and organizations (including the municipality acting in such a capacity) will have enforcement power over members of the group once permits are issued to those members.

One commenter believed that the States with authorized NPDES programs rather than EPA should establish permit terms for permits based on group applications. In response to this comment, EPA wishes to clarify its role in the group application process. Group applications will be submitted to EPA headquarters where they will be reviewed and summarized. The

summaries of the group application will be distributed to authorized NPDES States. EPA wishes to emphasize that NPDES States are not bound by draft model permits developed by EPA. States may adopt model permits for use in their particular area, making adjustments for local water quality standards and other regional characteristics. Where general permit coverage is believed to be inappropriate, facilities may be required to apply for individual permits. One commenter objected to the group application procedure because it is not consistent with existing Federal permitting procedures, which will lead to confusion in the regulated community. The agency disagrees with this assessment. The group application is a departure from established NPDES program procedures. However, the comments, when viewed in their entirety, reflect widespread support from the regulated community for a group application procedure. Further, the comments reflect that those affected by this rulemaking understand the components of the group application and the procedures under which permits will be obtained pursuant to the group application.

One commenter expressed concern regarding how BAT limits for groups of similar industries will be developed. Technology based limits will be developed based on the information received from the group applicants. If the group applicants possess similar characteristics in terms of their discharge, BAT/BCT limitations and controls will be developed accordingly for those members of the group. If the discharge characteristics are not similar then applying industries are not appropriate for the group.

One commenter has suggested that the proposed group application is too complex with regard to the part 1A, part 1B, and part 2 group application requirements and that EPA should repropose these provisions. As discussed below, EPA has simplified the industrial group application requirements by eliminating the part 1B application. Thus, reproposal is unnecessary.

One commenter criticized the group application concept as not achieving any type of reduction in administrative burden for NPDES States. EPA disagrees with this assessment. If industries take advantage of the group application procedure, EPA will have an opportunity to review information describing a large number of dischargers in an organized manner. EPA will perform much of the initial review and analysis of the group application, and provide NPDES States with summaries of the applications thereby reducing the burden on the States. Furthermore, the procedure encourages a potentially large number of facilities to be covered by a general permit, which will clearly reduce the administrative burden of issuing individual permits.

The final rule establishes a regulatory procedure whereby a representative entity, such as a trade association, may submit a group application to the Office of Water Enforcement and Permits (OWEP) at EPA headquarters, in which quantitative data from certain representative members of a group of industrial facilities is supplied. Information received in the group application will be used by EPA headquarters to develop models for individual permits or general permits. These model permits are not issued permits, but rather they will be used by EPA Regions and the NPDES States to issue individual or general permits for participating facilities in the State. In developing such permits, the Region or NPDES State will, where necessary, adapt the model permits to take into account the hydrological conditions and receiving water quality in their area. One commenter expressed the view that having this procedure managed by EPA headquarters would cause delays and it should be delegated to the States and Regions. EPA disagrees that delay will ensue using this procedure. Furthermore, consistency in development of model and general permits can be achieved if application review is coordinated at EPA headquarters.

a. Facilities Covered. Under this rule the group application is submitted for only the facilities specifically listed in the application and not necessarily for an entire industry. The facilities in the group application selected to do sampling must be representative of the group, not necessarily of the industry.

Facilities that are sufficiently similar to those covered in a general permit (issued pursuant to a group application) that commence discharging after the general permit has been issued, must refer to the provisions of that general permit to determine if they are eligible for coverage. Facilities that have already been issued an individual permit for storm water discharges will not be eligible for participation in a group application. Several commenters believed that this restriction is inequitable since they have experienced the administrative burden of submitting a permit application. EPA disagrees. Industries that have already obtained a permit for storm water discharges have developed a storm water management program, engaged in the collection of quantitative data, and possess familiarity and experience with submitting storm water permit applications. The Agency sees no point to instituting an entirely new permit application process for facilities that have storm water permits issued individually. It makes little sense for these industries to be involved with submitting another permit application before their current permit expires.

As noted above, once a general permit has been issued to a group of dischargers, a new facility may request that they be covered by the general permit. The permitting authority can then examine the request in light of the general permit applicability requirements and determine whether the facility is suitable or not.

b. Scope of Group Applications. Numerous comments were received on how facilities should be evaluated as members of a group application. Several commenters stated that effluent limitation guideline subcategories are not relevant to pollutants found in storm water, but rather to the facility's everyday activities, and therefore similarity should be based on each facility's discharge or the similarity of pollutants expected to be found in a facility's discharge. Other commenters felt that similarity of operations at facilities should be the criteria. Others, believed that an examination of the facility's impact on storm water quality should be the applied criteria. Other commenters suggested that EPA provide more guidance as to how broadly groups can be defined and that a failure to do so would discourage facilities from going to the trouble and expense of entering into the group application process. Some commenters were concerned that facilities would be rejected as a group because of variations in processes and process wastewater characteristics.

EPA does not agree that effluent limitation guideline subcategories are inappropriate as a method for determining group applications. EPA guideline subcategories are functional classifications, breaking down facilities into groups, for purposes of setting effluent limitations guidelines. The use of EPA subcategories will save time for both applicants and permitting authorities in determining whether a particular group is appropriate for a group application. Furthermore, EPA believes that this method of grouping provides adequate guidance for determining what facilities are grouped together. Establishing groups on the extent to which a facility's discharge

affects storm water quality would not provide applicants with sufficient guidance as to the appropriateness of individual industries for group applications and would not provide information needed to draft appropriate model permit conditions for potentially different types of industries, industrial processes, and material management practices.

However, EPA recognizes that the subcategory designations may not always be available or an effective methodology for grouping applicants. Also, there are situations where processes that are subject to different subcategories are combined. EPA agrees that the group application option should be flexible enough to allow groups to be created where subcategories are too rigid or otherwise inappropriate for developing group applications or where facilities are integrated or overlap into other subcategories. For these reasons, this rulemaking does not limit the submission to EPA subcategories alone, but rather allows groups to be formed where facilities are similar enough to be appropriate for general permit coverage.

In determining whether a group is appropriate for general permit coverage, EPA intends that the group applicant use the factors set forth in 40 CFR 122.28(a)(2)(ii), the current regulations governing general permits, as a guide. If facilities all involve the same or similar types of operations, discharge the same types of wastes, have the same effluent limitation and same or similar monitoring requirements, where applicable, they would probably be appropriate for a group application. To that extent, facilities that attempt to form groups where the constituent makeup of its process wastewater is dissimilar may run the risk of not being accepted for purposes of a group application.

Some commenters expressed the view that categories formed using general permit factors are too broad or that the language is too vague. One commenter expressed the view that the standard is too subjective and that permit writers will be evaluating the similarity of discharge too subjectively, while other commenters felt that the criteria should be broad and flexible. Other commenters stated that the effluent guideline subcategory or general permit coverage factors are not related to storm water discharges, because much of the criteria are based upon what is occurring inside the plant, rather than activities outside of the plant. EPA believes that these criteria are reasonable for defining the scope of a group application. EPA disagrees that the procedure, which is adequate for the issuance of general permits, is inadequate for the development of a group application. EPA believes that the activities inside a facility will generally correspond to activities outside of the plant that are exposed to storm events, including stack emissions, material storage, and waste products. Furthermore, if facilities are able to demonstrate their storm water discharge has similar characteristics, that is one element in the analysis needed for establishing that the group is appropriate. EPA disagrees that the criteria are too vague. If facilities are concerned that general permit criteria is insufficient guidance, then subcategories under 40 CFR subchapter N should be used. EPA believes that the program will function best if flexibility for creating groups is maintained.

If a NPDES approved State feels that a tighter grouping of applicants is appropriate individual permit applications can be requested from those permit applicants. One commenter indicated that it was not clear whether the group application procedure could be used for all NPDES requirements. EPA would clarify that the group application is designed only to cover storm water discharges from the industrial facilities identified in § 122.26(b)(14).

As noted above, EPA wishes to clarify that facilities with existing individual NPDES permits for storm water are not eligible to participate in the group application process. From an administrative standpoint EPA is not prepared to create an entirely different mechanism for permitting industries which already have such permits.

c. Group Application Requirements. The group application, as proposed, included the following requirements in three separate parts. Part 1A of a group application included: (A) Identification of the participants in the group application by name and location; (B) a narrative description summarizing the industrial activities of participants; (C) a list of significant materials stored outside by participants; and (D) identification of 10 percent of the dischargers participating in the group application for submitting quantitative data. A proposed part 1B of the group application included the following information from each participant in the group application: (A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) and related information; (B) an estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall and a narrative description of significant materials; (C) a certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested for the presence of non-storm water discharges; (D) existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility; (E) a narrative description of industrial activities at the facility that are different from or that are in addition to the activities described under part 1A; and (F) a list of all constituents that are addressed in a NPDES permit issued to the facility for any of non-storm water discharge. Part 2 of a group application required quantitative data from 10 percent of the facilities identified.

Some commenters felt that spill histories, drainage maps, material management practices, and information on significant materials stored outside are too burdensome or meaningless for evaluating similarity of discharges among group applicants. Several commenters stated that such requirements where the group may consist of several thousand facilities were impractical and would not assist EPA in developing model permits. Many commenters insisted that the requirements imposed in part 1B would effectively discourage use of the group application procedure. EPA agrees in large part with these comments. After reevaluating the components of part 1B, and the entire rationale for instituting the group application procedure, EPA has decided to excise part 1B from the requirements, and rely on part 1A and part 2 for developing appropriate permit condition. Where appropriate, EPA may require facilities to submit the information, formerly in part 1B, during the term of the permit. In other cases, EPA will establish which facilities must submit individual permit applications where more site specific permits are appropriate.

Under the revised part 1 and part 2, EPA will receive information pertaining to the types of industrial activity engaged in by the group, materials used by the facilities, and representative quantitative data. EPA can use such information to develop management practices that address pollutants in storm water discharges from such facilities. For most facilities, general good housekeeping or management practices will eliminate pollutants in storm water. Such requirements can be further refined by determining the nature of a group's industrial activity and by obtaining information on material used at the facility and representative quantitative data from a

percentage of the facilities. Thus, EPA is confident that model permits and general permits can be developed from the information to be submitted under part 1 and part 2.

One commenter felt that more guidance on what makes a facility representative for sampling as part of a group is needed. In response, the Agency believes the rule as currently drafted provides adequate notice.

Another commenter asked how much sampling needed to be done and how much monitoring will transpire over the life of the permit for members of a group. This will vary from permit to permit and will be determined in permit proceedings. This rulemaking only covers the quantitative data that is to be submitted in the context of the group permit application.

One commenter indicated that because of the amount of diversity in the operations of a particular industry, obtaining a sample that could be considered representative would be extremely difficult. EPA recognizes that obtaining representative quantitative data through the group application process will prove to be difficult; however, EPA has sought to minimize these perceived problems. Under the group application concept, industries must be sufficiently similar to qualify. Industries which have significantly different operations from the rest of the group that affects the quality of their storm water discharge may be required to obtain an individual permit. Use of the nine precipitation zones will enable the data in the permit application to be more easily analyzed and patterns observed on the basis of hydrology and other regional factors. How EPA will evaluate the representativeness of the sample is discussed below.

Several commenters asked why the precipitation zone of group members is relevant to the application. The need to identify precipitation zones arises because the amount of rainfall is likely to have a significant impact on the quality of the receiving water. According to an EPA study (Methodology for Analysis of Detention Basins for Control of Urban Runoff Quality; Office of Water, Nonpoint Source Branch, Sept. 1986) the United States can be divided into nine general precipitation zones. These zones are characterized by differences in precipitation volume, precipitation intensity, precipitation duration, and precipitation intervals. Industrial facilities that seek general permits via the group application option may show significantly different loading rates as a result of these regional precipitation differences. As an example, precipitation in Seattle, Washington, located in Zone 7, approaches the mean annual storm intensity of .024 inches/hour with a mean annual storm duration of 20 hours for that Zone. In contrast, precipitation in Atlanta, Georgia, located in Zone 3 approaches the mean annual storm intensity of .102 inches/hour and a mean storm duration of 6.2 hours for that Zone. Atlanta, receives on the average four times more precipitation per hour with storms lasting one-third as long. As a result of these differences, if identical facilities within a group application were situated in each of these areas, their storm water discharges would likely exhibit different pollutant characteristics. Accordingly, data should be submitted from facilities in each zone.

One commenter felt that the EPA should abandon or modify its rainfall zone concept, because storm water quality will depend more on what materials are used at the facility than rainfall. EPA disagrees. Because storm water loading rates may differ significantly as a result of regional precipitation differences, it is necessary that for each precipitation zone containing representatives of a group application, the group must provide samples from some of those representatives. In comments to previous rulemakings it was argued that the amount of rainfall will affect the degree of impact a storm water discharge may have on the receiving stream.

One commenter stated that the precipitation zones illustrated in appendix E of the proposed rulemaking do not adequately reflect regional differences in precipitation and that in some cases the zones cut through cities where there are concentrations of industries without differences in their precipitation patterns. The rainfall zone map is a general guide to determining what areas of the country need to be addressed when determining representative rainfall events and quantitative data. When dealing with rainfall on a national scale, it is near impossible to make generalized statements with a great deal of accuracy. In the case of rainfall zones, rainfall patterns may be similar for facilities in close proximity to each other but none the less in different rainfall zones. In response, EPA has created these zones to reflect regional rainfall patterns as accurately as possible. Because of the variable nature of rainfall such circumstances are sure to arise. However, in order to obtain a degree of representativeness EPA is convinced that the use of these rainfall zones as described is appropriate for the submittal of group applications and the quantitative data therein.

The second and third requirements of part 1 of the group application instruct the applicant to describe the industrial activity (processes) and the significant materials used by the group. For the significant materials listed, the applicant is to discuss the materials management practices employed by members of the group. For example, the applicant should identify whether such materials are commonly covered, contained, or enclosed, and whether storm water runoff from materials storage areas is collected in settling ponds prior to discharge or diverted away from such areas to minimize the likelihood of contamination. Also, the approximate percentage of facilities in the group with no practices in place to minimize materials stored outside is to be identified.

EPA considers that the processes and materials used at a particular facility may have a bearing on the quality of the storm water. Thus, if there are different processes and materials used by members of the group, the application must identify those facilities utilizing the different processes and materials, with an explanation as to why these facilities should still be considered similar.

One commenter felt that a facility should be able to describe in its permit application the possibility of individual materials entering receiving waters. EPA supports the applicant adding site specific information which will assist the permit writer making an informed decision about the nature of the facility, the quality of its storm water discharge, and appropriate permit conditions.

The fourth element of part 1 of the group application is a commitment to submit quantitative data from ten percent of the facilities listed. EPA proposed that there must be a minimum of ten and a maximum of one hundred facilities within a group that submit data. Comments reflected some dissatisfaction with this requirement. Some commenters asserted that ten percent was too high a number and would discourage group applications, while one commenter suggested a lesser percentage would be appropriate where the group can certify that facilities are representative. One commenter suggested that EPA have the discretion to allow for a smaller percentage. Several commenters argued that EPA should be satisfied with fewer than ten percent because EPA often relies on data from less than ten percent of the plants in a subcategory when promulgating effuent guidelines and that EPA should rely on data collection goals

with affected groups as was done in the 1985 storm water proposal. Other commenters pointed out that an anomalous situation could arise where the group was small and facilities were scattered throughout the precipitation zones. For example, if a group consisted of 20 members where a minimum of ten facilities had to submit samples, and two or more members were in each precipitation zone; a total of 18 facilities (90% of the group) would have to submit quantitative data. EPA believes that there must be a sufficient number of facilities submitting data for any patterns and trends to be detectable. However, in light of these comments EPA has decided to modify the language in § 122.26(c) to allow 1 discharger in each precipitation zone to submit quantitative data where 10 or fewer of the group members are located in a particular precipitation zone. EPA believes, however, that one hundred facilities would in most cases be sufficient to characterize the nature of the runoff and thus 100 should remain the maximum. If the data are insufficient, EPA has the authority to request more sampling under section 308 of the CWA.

One commenter suggested that the ten facility cutoff was unreasonable, and that instead of cutting off the group at ten, allow a smaller number in the group and allow the facilities to sample ten percent of their outfalls instead. EPA agrees, in part, and will allow groups of between four and ten to submit a group application. However, the ten percent rule would not be effective in such cases. Therefore, at least half the facilities in a group of four to ten will be required to provide quantitative data from at least one outfall, with each precipitation zone represented by at least one facility.

For any group application, in addition to selecting a sufficient number of facilities from each precipitation zone, facilities selected to do the sampling should be representative of the group as a whole in terms of those characteristics identifying the group which were described in the narrative, i.e., number and range of facilities, types of processes used, and any other relevant factors. If there is some variation in the processes used by the group (40 percent of the group of food processors are canners and 60 percent are canners and freezers, for example), the different processes are to be represented. Also, samples are to be provided from facilities utilizing the materials management practices identified, including those facilities which use no materials management practices. The representation of these different factors, to the extent feasible, is to be roughly equivalent to their proportion in the group.

EPA wishes to emphasize that the provision that ten percent of the facilities need to submit quantitative data only applies to the permit application process. The general or individual permit itself may require quantitative data from each facility.

Submittal of Part 2 of the Group Application. As with part 1, part 2 of the Group Application would be submitted to the Office of Water Enforcement and Permits, in Washington, DC. If the information is incomplete, or simply is found to be an inadequate basis for establishing model permit limits, EPA has the authority under section 308 of the Clean Water Act to require that more information be submitted, which may include sampling from facilities that were part of the group application but did not provide data with the initial submission. If the group application is used by a Region or NPDES State to issue a general permit, the general permit should specify procedures for additional coverage under the permit.

If a part 2 is unacceptable or insufficient, EPA has the option to request additional information or to require that the facilities that participated in the group application submit complete individual applications (e.g. facilities that have submitted Form 1 with the group application may be required to submit Form 2F, or facilities which have submitted complete Form 1 and Form 2F information in the group application generally would not have to submit additional information).

Once the group applications are reviewed and accepted, EPA will use the information to establish draft permit terms and conditions for models for individual and general permits. NPDES approved States and EPA regional offices will continue to be the permit-issuing authority for storm water discharges. The NPDES approved States accepting the group application approach and the EPA Regions may then take the model permits and adapt them for their particular area, making adjustments for local water quality standards and other localized characteristics, and making determinations as to the need for an individual storm water permit where general permit coverage is felt to be inappropriate. Permits would be proposed by the Region or NPDES approved State in accordance with current regulations for public comment before becoming final. In NPDES States without general permit authority, or where an individual permit is deemed appropriate, the model permit can serve as the basis for issuing an individual permit.

The group application is an NPDES permit application just like any other and, as such, would be handled through normal permitting procedures, subject to the regulatory provisions applicable to permit issuance. Incomplete or otherwise inadequate submissions would be handled in the same manner as any other inadequate permit application. The permit issuing authority would retain the right to require submission of Form 1, Form 2C and Form 2F from any individual discharger it designates.

Some commenters offered other procedures for developing a group application procedure; however, these were frequently entirely different approaches or so novel that a reproposal would be required. One commenter suggested that those industries that are identified as being likely to pollute should be required to submit quantitative data. Numerous commenters contended that a generic approach for meeting the required information requirements for group applications would allow EPA to develop adequate general permits. EPA does not view these approaches as appropriate.

5. Group Application: Applicability in NPDES States

Many commenters expressed concern about how the group application procedure will work within the framework of an NPDES approved State. The relationship between EPA and the States that are authorized to administer the NPDES program, including implementation of the storm water program, is a complicated aspect of this rulemaking. Approved States (there are 38 States and one territory so approved) must have requirements that are at least as stringent as the Federal program; they may be more stringent if they choose. Authority to issue general permits is optional with NPDES States.

EPA has determined that ten percent of the facilities must provide quantitative data in the permit application as noted above. Furthermore, these applications are submitted to EPA headquarters. Consequently States, whether NPDES approved or not, are not in a position to reject or modify this requirement. Such States may determine the amount of sampling to be done pursuant to permit conditions. If they choose to issue general permits they may include such authority in their NPDES program and,

upon approval of the program by EPA, may then issue general permits. Within the context of the NPDES provisions of the CWA, if States do not have general permitting authority, then general permits are not available in those States.

In response to one comment, EPA does not have authority to issue general or individual permits to facilities in NPDES approved states. Today's rule provides a means for affected industries to be covered by general permits developed via the group application procedure as well as from general permits developed independently of the group application process. Accordingly, today's rule anticipates that most NPDES States will seek general permit issuance authority to implement the storm water program in the most efficient and economical way. Without general permit issuance authority NPDES States will be required to issue individual permits covering storm water discharges to potentially thousands of industrial facilities.

One commenter recommended that States with approved NPDES programs should be involved in determining what industries are representative for submitting quantitative data. EPA recognizes that States will have an interest in this determination and may possess insight as to the appropriateness of using some facilities. However, EPA may be managing hundreds of group applications and approving or disapproving them as expeditiously as possible. EPA believes that involving the States in this already administratively complex and time consuming undertaking would be counterproductive. In any event, NPDES approved States are not bound by the determinations of EPA as to the appropriateness of groups or the issuance of permits based on model permits or individual permits. However, States will be encouraged to use model permits that are developed by EPA. EPA will endeavor to design general and model permits that are effective while also adaptable to the concerns of different States. Again, States are able to develop more stringent standards where they deem it to be appropriate. There are currently seventeen States that have authority to issue general permits: Arkansas, Colorado, Illinois, Kentucky, Minnesota, Missouri, Montana, New Jersey, North Dakota, Oregon, Rhode Island, Utah, Washington, West Virginia and Wisconsin. As suggested in the comments, EPA is encouraging more States to develop general permit issuing authority in order to facilitate the permitting process.

One commenter advised that the rules should state that a NPDES approved State may accept a group application or require additional information. EPA has decided not to explicitly state this in the rule. However, this comment does raise some points that need to be addressed. Because the group application option is a modification of existing NPDES permit application requirements, the State is free to adopt this option, but is not required to. If the State chooses to adopt the group application and it does not have general permit authority, the group application can be used to issue individual permits. If an approved NPDES State chooses to not issue permits based on the group application, facilities that discharge storm water associated with industrial activity that are located in that State must submit individual applications to the State permitting authority. Before submitting a group application, facilities should ascertain from the State permitting authority whether that State intends to issue permits based upon a group application approved by EPA for the purpose of developing general permits. For facilities that discharge storm water associated with industrial activity which are named in a group application, the Director may require an individual facility to submit an individual application where he or she determines that general permit coverage would be inappropriate for the particular facility.

One commenter stressed that EPA should streamline the procedure for States desiring to obtain general permit coverage. EPA has, over the last year, streamlined this procedure and encourages States to take advantage of this procedure. EPA recommends that States consider obtaining general permit authority as a means to efficiently issue permits for storm water discharges. These States should contact the Office of Water Enforcement and Permits at EPA Headquarters as soon as possible.

6. Group Application: Procedural Concerns

One commenter claimed that the proposed group application process and procedures violated federal law. This commenter claimed that EPA was abrogating its responsibility by allowing a trade association to design a data collection plan in lieu of completing an NPDES application form designed by EPA, thus violating the Federal Advisory Committee Act. The commenter stated that EPA would be improperly influenced by special interests if trade associations were able to design their own storm water data gathering plans. The commenter further asserted that any decisions by EPA on the content of specific group applications would be rulemakings and thus subject to the provisions of the Administrative Procedure Act.

EPA disagrees with the comment that the group application violates the Federal Advisory Committee Act (FACA). FACA governs only those groups that are established or "utilized" by an agency for the purpose of obtaining "advice" or "recommendations." The group application option does not solicit or involve any "advice" or "recommendations." It simply allows submission of data by certain members of a group in accordance with specific regulatory criteria for determining which facilities are "representative" of a group. As such, the group application is merely a submission in accordance and in compliance with specific regulatory requirements and does not contain discretionary uncircumscribed "advice" or "recommendations" as to which facilities are representative of a group.

Thus, the determination of which facilities should submit testing data in accordance with regulatory criteria is little different from many other regulatory requirements where an applicant must submit information in accordance with certain criteria. For example, under 40 CFR 122.21 all outfalls must be tested except where two or more have "substantially identical" effluents. Similarly, quantitative data for certain pollutants are to be provided where the applicant knows or "has reason to believe" such pollutants are discharged. Both of these provisions allow the applicant to exercise discretion in making certain judgments but such action is circumscribed by regulatory standards. EPA further has authority to require these facilities to submit individual applications. In none of these instances are "recommendations" or "advice" involved. EPA also notes that it is questionable whether, in providing for group applications, it is "soliciting" advice or recommendations from groups or that such groups are being "utilized" by EPA as a "preferred source" of advice. See 48 FR 19324 (April 28, 1983). Furthermore, this data collection effort may be supplemented by EPA if, after review of the data, EPA determines additional data is necessary for permit issuance. Other information gathering may act as a check on the group applications received.

EPA also does not agree with this commenter's claim that the group application scheme represents an

impermissible delegation of the Administrator's function in violation of the CWA regarding data gathering. The Administrator has the broadest discretion in determining what information is needed for permit development as well as the manner in which such information will be collected. The CWA does not require every discharger required to obtain a permit to file an application. Nor does the CWA require that the Administrator obtain data on which a permit is to be based through a formal application process (see 40 CFR 122.21). For years "applications" have not been required from dischargers covered by general permits. EPA currently obtains much information beyond that provided in applications pursuant to section 308 of the CWA. This is especially true with respect to general permit and effluent limitations guidelines development. The group application option is simply another means of data gathering. The Administrator may always collect more data should he determine it necessary upon review of a groups' data submission. And, he may obtain such additional data by whatever means permissible under the Statute that he deems appropriate. Thus, it can hardly be said that by this initial data gathering effort the Administrator has delegated his data gathering responsibilities. In addition, since groups are required to select "representative" facilities, etc., in accordance with specific regulatory requirements established by the Administrator and because EPA will scrutinize part 1 of the group applications and either accept or reject the group as appropriate for a group application, no impermissible delegation has occurred. EPA will make an independent determination of the acceptability of a group application in view of the information required to be submitted by the group applicant, other information available to EPA (such as information on industrial subcategories obtained in developing effluent limitations guidelines as well as individual storm water applications received as a result of today's rule) and any further information EPA may request to supplement part 1 pursuant to section 308 of the CWA. Moreover, any concerns that a general permit may be based upon biased data can be dealt with in the public permit issuance process.

Finally, EPA also does not agree that the group application option violates the Administrative Procedures Act. Again, the group application scheme is simply a data gathering device. EPA could very well have determined to gather data informally via specific requests pursuant to section 308 of the CWA. In fact, general permit and effluent limitations guideline development proceed along these lines. It would make little sense if the latter informal data gathering process were somehow illegal simply because it is set forth in a rule that allows applicants some relief upon certain showings. In this respect, several of EPA's existing regulations similarly allow an applicant to be relieved from certain data submission requirements upon appropriate demonstrations. For example, testing for certain pollutants and or certain outfalls may be waived under certain circumstances. Most importantly, the operative action of concern that impacts on the public is individual or general permit issuance based upon data obtained. As previously stated, ample opportunity for public participation is provided in the permit issuance proceeding.

7. Permit Applicability and Applications for Oil and Gas and Mining Operations

Oil, gas and mining facilities are among those industrial sites that are likely to discharge storm water runoff that is contaminated by process wastes, toxic pollutants, hazardous substances, or oil and grease. Such contamination can include disturbed soils and process wastes containing heavy metals or suspended or dissolved solids, salts, surfactants, or solvents used or produced in oil and gas operations. Because they have the potential for serious water quality impacts, Congress recognized, throughout the development of the storm water provisions of the Water Quality Act of 1987, the need to control storm water discharges from oil, gas, and mining operations, as well as those associated with other industrial activities.

However, Congress also recognized that there are numerous situations in the mining and oil and gas industries where storm water is channeled around plants and operations through a series of ditches and other structural devices in order to prevent pollution of the storm water by harmful contaminants. From the standpoint of resource drain on both EPA as the permitting agency and potential permit applicants, the conclusion was that operators that use good management practices and make expenditures to prevent contamination must not be burdened with the requirement to obtain a permit. Hence, section 402(1)(2) creates a statutory exemption from storm water permitting requirements for uncontaminated runoff from these facilities.

To implement section 402(1)(2), EPA intends to require permits for contaminated storm water discharges from oil, gas and mining operations. Storm water discharges that are not contaminated by contact with any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations will not be required to obtain a storm water discharge permit.

The regulated discharge associated with industrial activity is the discharge from any conveyance used for collecting and conveying storm water located at an industrial plant or directly related to manufacturing, processing or raw materials storage areas at an industrial plant. Industrial plants include facilities classified as Standard Industrial Classifications (SIC) 10 through 14 (the mining industry), including oil and gas exploration, production, processing, and treatment operations, as well as transmission facilities. See 40 CFR 122.26(b)(14)(iii). This also includes plant areas that are no longer used for such activities, as well as areas that are currently being used for industrial processes.

a. Oil and Gas Operations. In determining whether storm water discharges from oil and gas facilities are "contaminated", the legislative history reflects that the EPA should consider whether oil, grease, or hazardous materials are present in storm water runoff from the sites described above in excess of reportable quantities (RQs) under section 311 of the Clean Water Act or section 102 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). [Vol. 132 Cong. Rec. H10574 (daily ed. October 15, 1986) Conference Report].

Many of the comments received by EPA regarding this exemption focused on the concern that EPA's test for requiring a permit is and would subject an unnecessarily large number of oil and gas facilities to permit application requirements. Specific comments made in support of this concern are addressed below.

A primary issue raised by commenters centered on how to determine when a storm water discharge from an oil or gas facility is "contaminated", and therefore subject to the permitting program under section 402 of the CWA. Many of the comments received from industry representatives objected to the Agency's intent as expressed in the proposal to use past discharges as a trigger for submitting permit applications.

The proposed rule provided that the notification requirements for releases in excess of RQs established under the CWA and CERCLA would serve as a

basis for triggering the submittal of permit applications for storm water discharges from oil and gas facilities. As described in the proposal, oil and gas operations that have been required to notify authorities of the release of either oil or a hazardous substance via a storm water route would be required to submit a permit application. In other words, any facility required to provide notification of the release of an RQ of oil or a hazardous substance in storm water in the past would be required to apply for a storm water permit under the current rule. In addition, any facility required to provide notification regarding a release occurring from the effective date of today's rule forward would be required to apply for a storm water permit.

Commenters maintained that the use of historical discharges to require permit applications is inconsistent with the language and intent of section 402(1)(2) of the CWA, and relevant legislative history, both of which focus on present contamination. Requiring storm water permits based solely on the occurrence of past contaminated discharges, even where no present contamination is evident, would go beyond the statutory requirement that EPA not issue a permit absent a finding present contamination. Commenters also noted that the proposal did not take into account the fact that past problems leading to such releases may have been corrected, and that requiring an NPDES permit may no longer be necessary. The result of such a requirement, commenters maintained, would be an excessive number of unnecessary permit applications being submitted, at significant cost and minimal benefit to both regulated facilities and regulating authorities.

Commenters also indicated that using the release of reportable quantities of oil, grease or hazardous substances as a permit trigger would identify discharges of an isolated nature, rather than the continuous discharges, which should be the focus of the NPDES permit program under section 402. Such an approach, commenters maintained, is inconsistent with existing regulations under section 311 of the CWA, and would result in permit applications from facilities that are more appropriately regulated under section 311.

Despite these criticisms, many commenters recognized that the Agency is left with the task of determining when discharges from oil and gas facilities are contaminated, in order to regulate them under section 402(1)(2). It was suggested by numerous commenters that the EPA adopt an approach similar to that used under section 311 of the CWA for Spill Prevention Control and Countermeasure (SPCC) Plans. Under SPCC, facilities that are likely to discharge oil into waters of the United States are required to maintain a SPCC plan. In the event the facility has a spill of 1,000 gallons or 2 or more reportable quantities of oil in a 12 month period, the facility is required to submit its SPCC plan to the Agency. The triggering events proposed by the commenters for storm water permits for oil and gas operations are six reportable sheens or discharges of hazardous substances (other than oil) in excess of section 311 or section 102 reportable quantities via a storm water point source route over any thirty-six month period. It was suggested that if this threshold is reached, an operator would then file a permit application (or join a group application) based upon the presumption that its current storm water discharges are contaminated.

In response to these comments, the Agency believes that past releases that are reportable quantities can be a valid indicator of the potential for present contamination of discharges. The legislative history as cited above supports this conclusion. EPA would note that the existence of a RQ release would serve only as a triggering mechanism for a permit application. Under the proposed rule, evidence of past contamination would merely require submission of a permit application and would not be used as conclusive evidence of current contamination. The determination as to whether a permit would be actually required due to current contaminated discharge would be made by the permitting authority after reviewing the permit application. The fact of a past RQ release does not necessarily imply a conclusive finding of contamination, only that sufficient potential for contamination exists to warrant a permit application or the collection of other further information. Today's rule does not change the proposed approach in this respect. Thus, EPA does not believe that today's rule exceeds the authority of section 402(1)(2).

EPA believes that there is no legal impediment to using past RQ discharges as a trigger for requiring a storm water permit application. EPA notes that, as mentioned above, even those commenters who objected to the proposed test on legal authority grounds merely offered an alternate test that requires more releases to have occurred within a shorter period of time before a permit application is required.

Therefore, the only disagreement that remains is over what constitutes a reasonable test that will identify facilities with the potential for storm water contamination. EPA notes that neither the statute nor the legislative history provides any guidance on this question. Furthermore, EPA disagrees with the commenters who suggested that 6 releases in the past 3 years or 2 releases in the past year are necessarily more valid measures of the potential for current contamination than EPA's proposed test. There is no statistical or other basis for preferring one test to the other. However, EPA does agree with those commenters that suggest that a single release in the distant past may not accurately reflect current conditions and the current potential for contamination.

EPA has therefore amended today's rule to provide that only oil and gas facilities which have had a release of an RQ of oil or hazardous substances in storm water in the past three years will be required to submit a permit application. EPA believes that limiting the permit trigger to events of the past three years will address commenters' concerns regarding the use of "stale history" in determining whether an application is required. EPA notes that the three year cutoff is consistent with the requirement for industrial facilities to report significant leaks or spills at the facility in their storm water permit applications. See 40 CFR 122.26(c)(1)(i)(D).

Commenters asserted that EPA and the States must have some reasonable basis for concluding that a storm water discharge is contaminated before requiring permit applications or permits. Commenters believed that § 122.26(c)(1)(iii)(B) as proposed implied that the Agency's authority in this respect is unrestricted. In response, EPA may collect such data by whatever appropriate means the statute allows, in order to obtain information that a permit is required. Usually, the most practical tool for doing so is the permit application itself. However, if necessary to supplement the information made available to the Agency, EPA has broad authority to obtain information necessary to determine whether or not a permit is required, under section 308 of the Clean Water Act. Given the plain language of the CWA and the Congressional intent as manifested in the legislative history, the Agency is convinced that the approach described above is appropriate. Yet, as further discussed below, EPA has also deleted as redundant § 122.26(c)(1)(iii)(B).

Regarding the types of facilities included in the storm water regulation, a number of commenters suggested that the Agency has misconstrued the meaning of facilities "associated with

industrial activity", and has proposed an overly broad definition of such facilities in the oil and gas industry. Specifically, commenters suggested that only the manufacturing sector of the oil and gas industry should be subject to storm water permit application requirements, and that exploration and production activities, gas stations, terminals, and bulk plants should all be exempted from storm water permitting requirements. Commenters maintain that this broad interpretation would subject many oil and gas facilities to the storm water permit requirements, when these were not intended by Congress to be so regulated. As a second point related to this issue, some commenters felt that transmission facilities were not intended to be regulated under the storm water provisions, and should be exempted from permit requirements. This would be consistent, it was argued, with legislative history which concluded that transmission facilities do not significantly contribute to the contamination of water.

The Agency disagrees that these facilities do not fall under the storm water permitting requirements as envisioned by Congress. SIC 13, which is relied upon by EPA to identify these oil and gas operations, describes oil and gas extraction industries as including facilities related to crude oil and natural gas, natural gas liquids, drilling oil and gas wells, oil and gas exploration and field services. Moreover, legislative history as it applies to industrial activities, and thus to oil and gas (mining) operations, expressly includes exploration, production, processing, transmission, and treatment operations within the purview of storm water permitting requirements and exemptions. EPA's intent is for storm water permit requirements (and the exemption at hand) to apply to the activities listed above (exploration, production, processing, treatment, and transmission) as they relate to the categories listed in SIC 13.

Commenters requested clarification from the Agency that storm water discharges from oil and gas facilities require a permit or the filing of a permit application only when they are contaminated at the point of discharge into waters of the United States. Commenters noted that large amounts of potentially contaminated stormwater may not enter waters of the United States, or may enter at a point once the discharge is no longer "contaminated". In these cases, it should be clear that no permit or permit application is required.

EPA agrees that oil and gas exploration, production, processing, or treatment operations or transmission facilities must only obtain a storm water permit when a discharge to waters of the U.S. (including those discharges through municipal separate storm sewers) is contaminated. A permit application will be required when any discharge in the past three years or henceforth meets the test discussed above.

Under the proposed rule, the Agency stated at § 122.26(c)(1)(iii)(B) that the Director may require on a case-by-case basis the operator of an existing or new storm water discharge from an oil or gas exploration, production, processing, or treatment operation, or transmission facility to submit an individual permit application. The Agency has removed this section since CWA section 402(1)(2), as codified in 122.26(c)(1)(iii)(A), adequately addresses every situation where a permit should be required for these facilities.

b. Use of Reportable Quantities to Determine if a Storm Water Discharge from an Oil or Gas Operation is Contaminated. Section 311(b)(5) of the CWA requires reporting of certain discharges of oil or a hazardous substance into waters of the United States (see 44 FR 50766 (August 29, 1979)). Section 304(b)(4) of the Act requires that notification levels for oil and hazardous substances be set at quantities which may be harmful to the public health or welfare of the United States, including but not limited to fish, shellfish, wildlife, and public or private property, shorelines and beaches. Facilities which discharge oil or a hazardous substance in quantities equal to or in excess of an RQ, with certain exceptions, are required to notify the National Response Center (NRC).

Section 102 of CERCLA extended the reporting requirement for releases equal to or exceeding an RQ of a hazardous substance by adding chemicals to the list of hazardous substances, and by extending the reporting requirement (with certain exceptions) to any releases to the environment, not just those to waters of the United States.

Pursuant to section 311 of the CWA, EPA determined reportable quantities for discharges by correlating aquatic animal toxicity ranges with 5 reporting quantities, i.e., 1-, 10-, 100-, 1000-, and 5000- pounds per 24 hour period levels. Reportable quantity adjustments made under CERCLA rely on a different methodology. The strategy for adjusting reportable quantities begins with an evaluation of the intrinsic physical, chemical, and toxicological properties of each designated hazardous substance. The intrinsic properties examined, called "primary criteria," are aquatic toxicity, mammalian toxicity (oral, dermal, and inhalation), ignitability, reactivity, and chronic toxicity. In addition, substances that were identified as potential carcinogens have been evaluated for their relative activity as potential carcinogens. Each intrinsic property is ranked on a five-tier scale, associating a specific range of values on each scale with a particular reportable quantity value. After the primary criteria reportable quantities are assigned, the hazardous substances are further evaluated for their susceptibility to certain extrinsic degradation processes (secondary criteria). Secondary criteria consider whether a substance degrades relatively rapidly to a less harmful compound, and can be used to raise the primary criteria reportable quantity one level.

Also pursuant to section 311, EPA has developed a reportable quantity for oil and associated reporting requirements at 40 CFR part 110. These requirements, known as the oil sheen regulation, define the RQ for oil to be the amount of oil that violates applicable water quality standards or causes a film or sheen upon or discoloration of the surface of the water or adjoining shorelines or causes a sludge or emulsion to be deposited.

Reportable quantities developed under the CWA and CERCLA were not developed as effluent guideline limitations which establish allowable limits for pollutant discharges to surface waters. Rather, a major purpose of the notification requirements is to alert government officials to releases of hazardous substances that may require rapid response to protect public health, welfare, and the environment. Notification based on reportable quantities serves as a trigger for informing the government of a release so that the need for response can be evaluated and any necessary response undertaken in a timely fashion. The reportable quantities do not themselves represent any determination that releases of a particular quantity are actually harmful to public health, welfare, or the environment.

EPA requested comment on the use of RQs for determining contamination in discharges from oil and gas facilities. As noted above numerous commenters supported the concept of using reportable quantities under certain circumstances. Comments on the measurement of oil sheens for the purpose of triggering a permit application were divided. Some commented that it is much too stringent because the amount of oil creating a

sheen may be a relatively small amount. Others viewed the test as a quick, easy, practical method that has been effective in the past.

In relying on the reporting requirements associated with releases in excess of RQs for oil or hazardous substances to trigger the submittal of permit applications for oil and gas operations, the Agency believes that the use of the reporting requirements for oil will be particularly useful. The Agency believes that the release of oil to a storm water discharge in amounts that cause an oil sheen is a good indicator of the potential for water quality impacts from storm water releases from oil and gas operations. In addition, given the extremely high number of such operations (the Agency estimates that there are over 750,000 oil wells alone in the United States), relying on the oil sheen test to determine if storm water discharges from such sites are "contaminated" will be a far easier test for operators to determine whether to file a storm water permit application than a test based on sampling. The detection of a sheen does not require sophisticated instrumentation since a sheen is easily perceived by visual observation. EPA agrees with those comments calling the oil sheen test an appropriate measure for triggering a storm water permit application. In adopting this approach, EPA recognizes, as pointed out by many commenters that an oil sheen can be created with a relatively small amount of oil.

One commenter suggested that contamination must be caused by contact with on-site material before being subject to permit application requirements. The Agency agrees with this comment. Those facilities that have had releases in excess of reportable quantities will generally have contamination from contact with on-site material as described in the CWA. Thus, use of the RQ test is an appropriate trigger. As discussed above, determination of whether contamination is present to warrant issuance of a permit will be made in the context of the permit proceeding.

One commenter believed that the use of RQs is inappropriate because "the statute intended to exempt only oil and gas runoff that is not contaminated at all." The Agency wishes to clarify that reportable quantities are being used to determine what facilities need to file permit applications and to describe what is meant by the term "contaminated." The Director may require a permit for any discharges of storm water runoff contaminated by contact with any overburden, raw material, intermediate product, finished product, by product or waste product at the site of such operations. The use of RQs is solely a mechanism for identifying the facilities most likely to need a storm water permit consistent with the legislative history of section 402(l)(2).

c. Mining Operations. The December 7, 1988 proposal would establish background levels as the standard used to define when a storm water discharge from a mining operation is contaminated. When a storm water discharge from a mining site was found to contain pollutants at levels that exceed background levels, the owner or operator of the site was required to submit a permit application for that operation. The proposal was founded upon language in the legislative history stating that the determination of whether storm water is contaminated by contact with overburden, raw material, intermediate product, finished product, byproduct, or waste products "shall take into consideration whether these materials are present in such stormwater runoff . . . above natural background levels". [Vol. 132 Cong. Rec. H10574 (daily ed. Oct. 15, 1986) Conference Report].

Comments received on this component of the rule suggested that background levels of pollutants would be very difficult to calculate due to the complex topography frequently encountered in alpine mining regions. For example, if a mine is located in a mountain valley surrounded on all sides by hills, the site will have innumerable slopes feeding flow towards it. Under such circumstances, determining how the background level is set would prove impractical. Commenters indicated that it is very difficult to measure or determine background levels at sites where mining has occurred for prolonged periods. In many instances, data on original background levels may not be available due to long-term site activity. As a result, any background level established will vary based on the type and level of previous activity. In addition, mining sites typically have background levels that are naturally distinct from the surrounding areas. This is due to the geologic characteristics that makes them valuable as mining sites to begin with. This also makes it difficult to establish accurate background levels.

Because of these concerns EPA has decided to drop the use of background levels as a measure for determining whether a permit application is required. Accordingly, a permit application will be required when discharges of storm water runoff from mining operations come into contact with any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site. Similar to the RQ test for oil and gas operations, EPA intends to use the "contact" test solely as a permit application trigger. The determination of whether a mining operation's runoff is contaminated will be made in the context of the permit issuance proceedings.

If the owner or operator determines that no storm water runoff comes into contact with overburden, raw material, intermediate product, finished product, byproduct, or waste products, then there is no obligation to file a permit application. This framework is consistent with the statutory provisions of section 402(1)(2) and is intended to encourage each mining site to adopt the best possible management controls to prevent such contact.

Several commenters stated that EPA's use of total pollutant loadings for determining permit applicability is not consistent with the general framework of the NPDES program. Their concern is that such evaluation criteria depart from how the NPDES program has been administered in the past, based on concentration limits. In addition, commenters requested that EPA clarify that information on mass loading will be used for determining the need for a permit only. Since the analysis of natural background levels as a basis for a permit application has been dropped from this rulemaking, these issues are moot.

Commenters noted that the proposed rule did not specify what impact this rulemaking has on the storm water exemptions in 40 CFR 440.131. The commenters recommended not changing any of these provisions. Some commenters indicated that mining facilities that have NPDES permits should not be subject to additional permitting under the storm water rule. EPA does not intend that today's rule have any effect on the conditional exemptions in 40 CFR 440.131. Where a facility has an overflow or excess discharge of process-related effluent due to stormwater runoff, the conditional exemptions in 40 CFR 440.131 remain available.

Several commenters note that the term overburden, as used in the context of the proposed storm water rule, is not defined and recommended that this term should be defined to delineate the scope of the regulation. EPA agrees that the term overburden should be defined to help properly define the scope the storm water rule. In today's rule, the term

overburden has been clarified to mean any material of any nature overlying a mineral deposit that is removed to gain access to that deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations. This definition is patterned after the overburden definition in SMCRA, and is designed to exclude undisturbed lands from permit coverage as industrial activity. However, the definition provided in this regulation may be revised at a later date, to achieve consistency with the promulgation of RCRA Subtitle D mining waste regulations in the future.

Numerous commenters raised issues pertaining to the inclusion of inactive mining areas as subject to the stormwater rule. Some commenters indicated that including inactive mine operations in the rule would create an unreasonable hardship on the industry. EPA has included inactive mining areas in today's rule because some mining sites represent a significant source of contaminated stormwater runoff. EPA has clarified that inactive mining sites are those that are no longer being actively mined, but which have an identifiable owner/operator. The rule also clarifies that active and inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials, nor sites where minimal activities required for the sole purpose of maintaining the mining claim are undertaken. The Agency would clarify that claims on land where there has been past extraction, beneficiation, or processing of mining materials, but there is currently no active mining are considered inactive sites. However, in such cases the exclusion discussed above for uncontaminated discharges will still apply.

EPA's definition of active and inactive mining operations also excludes those areas which have been reclaimed under SMCRA or, for non-coal mining operations, under similar applicable State or Federal laws. EPA believes that, as a general matter, areas which have undergone reclamation pursuant to such laws have concluded all industrial activity in such a way as to minimize contact with overburden, mine products, etc. EPA and NPDES States, of course, retain the authority to designate particular reclaimed areas for permit coverage under section 402(p)(2)(E).

The proposed rule had included an exemption for areas which have been reclaimed under SMCRA, although the language of the proposed rule inadvertently identified the wrong universe of coal mining areas. The final rule language has been revised to clarify that areas which have been reclaimed under SMCRA (and thus are no longer subject to 40 CFR part 434 subpart E) are not subject to today's rule. Today's rule thus is consistent with the coal mining effluent guideline in its treatment of areas reclaimed under SMCRA.

In response to comments, EPA has also expanded this concept to exclude from coverage as industrial activity non-coal mines which are released from similar State or Federal reclamation requirements on or after the effective date of this rule. EPA believes it is appropriate, however, to require permit coverage for contaminated runoff from inactive non-coal mines which may have been subject to reclamation regulations, but which have been released from those requirements prior to today's rule. EPA does not have sufficient evidence to suggest that each State's previous reclamation rules and/or Federal requirements, if applicable, were necessarily effective in controlling future storm water contamination.

8. Application Requirements for Construction Activities

As discussed above, EPA has included storm water discharges from activities involving construction operations that result in the disturbance of five acres total land in the regulatory definition of storm water discharges associated with industrial activity.

This is a departure from the proposed rule which required permit applications for discharges from activities involving construction operations that result in the disturbance of less than one acre total land area and (which are not part of a larger common plan of development or sale; or operations that are for single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than five acre total land areas and which are not part of a larger common plan of development or sale). The reasons for this change are noted below.

Many commenters representing municipalities, States, and industry requested that clearing, grading, and excavation activities not be included in the definition of storm water discharges associated with industrial activity. It was suggested that EPA delay including construction activities until after the studies mandated in section 402(p)(5) of the CWA are completed. Other commenters felt that NPDES permits are not appropriate for construction discharges due to their short term, intermediate and seasonal nature. Another commenter felt that only the construction activities on the sites of the industrial facilities identified in the other subsections of the definition of "associated with industrial activity" should be included.

EPA believes that storm water permits are appropriate for the construction industry for several reasons. Construction activity at a high level of intensity is comparable to other activity that is traditionally viewed as industrial, such as natural resource extraction. Construction that disturbs large tracts of land will involve the use of heavy equipment such as bulldozers, cranes, and dump trucks. Construction activity frequently employs dynamite and/or other equipment to eliminate trees, bedrock, rockwork, and to fill or level land. Such activities also engage in the installation of haul roads, drainage systems, and holding ponds that are typical of the industrial activity identified in § 122.26(b)(14)(i-x). EPA cannot reasonably place such activity in the same category as light commercial or retail business.

Further, the runoff generated while construction activities are occurring has potential for serious water quality impacts and reflects an activity that is industrial in nature. Where construction activities are intensive, the localized impacts of water quality may be severe because of high unit loads of pollutants, primarily sediments. Construction sites can also generate other pollutants such as phosphorus, nitrogen and nutrients from fertilizer, pesticides, petroleum products, construction chemicals and solid wastes. These materials can be toxic to aquatic organisms and degrade water for drinking and water-contact recreation. Sediment runoff rates from construction sites are typically 10 to 20 times that of agricultural lands, with runoff rates as high as 100 times that of agricultural lands, and 1,000 to 2,000 times that of forest lands. Even small construction sites may have a significant negative impact on water quality in localized areas. Over a short period of time, construction sites can contribute more sediment to streams than was previously deposited over several decades.

EPA is convinced that because of the impacts of construction discharges that are directly to waters of the United States, such discharges should be addressed by permits issued by Federal or NPDES State permitting authorities. It is evident from numerous studies and reports submitted under section 319 of the CWA that discharges from construction sites continue to be a major source of water quality problems and water quality standard violations.

Accordingly EPA is compelled to address these source under these regulations and thereby regulate these sources under a nationally consistent program with an appropriate level of enforcement and oversight.

Techniques to prevent or control pollutants in storm water discharges from construction are well developed and understood. A primary control technique is good site planning. A combination of nonstructural and structural best management practices are typically used on construction sites. Relatively inexpensive nonstructural vegetative controls, such as seeding and mulching, are effective control techniques. In some cases, more expensive structural controls may be necessary, such as detention basins or diversions. The most efficient controls result when a comprehensive storm water management system is in place. Another reason that EPA has decided to address this class of discharges is that it is part of the Agency's recent emphasis on pollution prevention. Studies such as NURP indicate that it is much more cost effective to develop measures to prevent or reduce pollutants in storm water during new development than it is to correct there problems later on. Many of these prevention and control practices, which can take the form of grading patterns as well as other controls, generally remain in place after the construction activities are completed.

a. Permit Application Requirements. In today's rulemaking, EPA has set forth distinct permit application requirements for these construction activities, at § 122.26(c)(1)(ii), to be used where general permits to be developed and promulgated by EPA are inapplicable. Such facilities will be required to provide a map indicating the site's location and the name of the receiving water and a narrative description of:

- The nature of the construction activity;
- The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;
- Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a description of applicable Federal requirements and State or local erosion and sediment control requirements;
- Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a description of applicable State or local requirements, and
- An estimate of the runoff coefficient (fraction of total rainfall that will appear as runoff) of the site and the increase in impervious area after the construction addressed in the permit application is completed, a description of the nature of fill material and existing data describing the soil or the quality of the discharge.

Permit application requirements for construction activities do not include the submission of quantitative data. EPA believes that the changing nature of construction activities at a site to be covered by the permit application requirements generally would not be adequately described by quantitative data. The comments received by EPA support this determination. One State commented that a program they instituted has been based on quantitative data for the past 10 years and has proven to be very awkward, even unworkable.

Twenty commenters responded to the issue of appropriate construction site application deadlines including: Three towns (<100,000 population); one medium municipality; one large municipality; one agency associated with a large municipality; three agencies associated counties; three agencies associated with States; two industries; five industrial associations; and one private organization representing industry. The commenters primarily focused on actual deadlines and permitting authority response time.

Applicants for permits to discharge storm water into the waters of the United States from a construction site would normally be required to submit permits in the same time frame as new sources and new discharges. This rulemaking requires permit applications from such sources to be submitted at least 180 days prior to the date on which the discharge is to commence. Four commenters agreed with the application deadline of 180 days prior to commencement of discharge. Three commenters felt it would be difficult to apply 180 days prior to when the discharge was to begin. Three commenters recommended shortening the time period to 90 days. Numerous other commenters were concerned over delays during the permitting authority's review of the permit application. The commenters requested that a maximum response time be set in the regulation. Suggested maximum response times were 90 and 30 days.

In response to these comments, EPA has changed the application deadline for construction permits from at least 180 days prior to discharge to at least 90 days prior to the date when construction is to commence. This change reflects EPA's recognition of the nature of construction operations in that developers/builders may not be aware of projects 180 days before they are scheduled to begin.

Numerous commenters expressed concern over who should be responsible for applying for the permit. Two commenters felt the owner should be responsible so that construction bid documents can include the storm water management requirements and to avoid confusion among multiple subcontractors. One commenter thought that either the owner/developer, or general contractor should be responsible. Another commenter suggested that the designer should obtain the permit which would allow all necessary erosion controls to be part of the project plan. Several commenters requested that the responsibility simply be more clearly defined.

In response to these comments, EPA would clarify that the operator will generally be responsible for submitting the permit application. Under existing regulations at § 122.21(b), when a facility is owned by one person but operated by another, then it is the duty of the operator to apply for the permit. Due to the temporary nature of construction activities, EPA believes that the operator is the most appropriate person to be responsible for both short and long term best management practices included on the site. EPA considers the term "operator" to include a general contractor, who would generally be familiar enough with the site to prepare the application or to ensure that the site would be in compliance with the permit requirements. General contractors, in many cases, will often be on site coordinating the operation among his/her staff and any subcontractors. Furthermore, the operator/general contractor would be much more familiar with construction site operations than the owner and should be involved in the site planning from its initial stages. The application requirements in today's rule are designed to provide flexibility in developing controls to reduce pollutants in storm water discharges from construction sites. A significant aspect to this is the role of State and local authorities in control of construction storm water discharges. Sixty-three commenters addressed the question of what the role of State and local authorities should be. Most of these commenters supported local government control of construction discharges and that qualified State programs should satisfy Federal requirements.

Many commenters representing municipalities, States, and industry, felt that local government should have full control over construction storm water

discharges, either under existing programs or those required by their municipal permit. EPA agrees with these comments as far as discharges through municipal storm sewers are concerned. EPA is requiring municipalities that are required to submit municipal permit applications under this regulation to describe their program for controlling storm water discharges from construction activities into their separate storm sewers. It is envisioned that municipalities will have primary responsibility over these discharges through NPDES municipal storm water permits. However, EPA also plans to cover such discharges under general permits to be promulgated in the near future.

In response to several comments that the regulation should provide flexibility for qualified State programs to satisfy Federal requirements, the application requirements recognize that many States have implemented erosion and sediment control programs. The permit application requires a brief description of these programs. This is intended to ensure consistency between NPDES permit requirements and other State controls. Permit applicants will be in the best position to pass on this site-specific information to the permitting authority. States or Federal NPDES authorities will have the ability to exercise authority over these discharges as will other State and local authorities responsible for construction. EPA envisions NPDES permitting efforts will be coordinated with any existing programs.

The proposed rule requested comments on appropriate measures to reduce pollutants in construction site runoff. Numerous commenters representing municipalities, States, and industry responded. Some commenters recommended specific best management practices (BMPs) whereas others suggested ways in which the measures should be incorporated into the program. One commenter suggested that EPA establish design and performance standards for appropriate BMPs. One State commenter recommended requiring a schedule or sequence for use of BMPs. A municipality suggested developing guidance on erosion control at construction sites and disseminating the guidance to educate contractors and construction workers in proper erosion control techniques. The Agency is continuing to review these recommendations for the purposes of permit development and issuance.

Another commenter suggested that further research be done to determine the effectiveness of particular BMPs in reducing pollutants in construction site runoff. EPA agrees that more research and studies can be undertaken to develop methodologies for more effective storm water controls and will continue to lookat these concerns pursuant to section 402(p)(5) studies. However, EPA is convinced that enough information, technology, and proven BMP's are available to address these discharges in this regulation.

Specific BMPs suggested by the commenters include: wheel washing; locked exit roadways, street cleaning methods which exclude sheet washing; clearing and grading codes; construction standards; riparian corridors; solids retention basins; soil erosion barriers; selected excavation; adequate collection systems; vegetate disturbed areas; proper application of fertilizers; proper equipment storage; use of straw bales and filter fabrics; and use of diversions to reduce effective length of slopes. EPA is continuing to evaluate these suggestions for developing appropriate permit conditions for construction activity.

b. Administrative Burdens. Many commenters representing municipalities, States, and industry commented on the administrative burdens of individually permitting each construction site discharging to waters of the United States. The extensive use of general permits for storm water discharges from construction activities that are subject to NPDES requirements is anticipated to minimize administrative delays associated with permit issuance. Many commenters strongly endorsed extensive use of general permits. In addition the Agency will provide as much assistance as possible for developing appropriate permit conditions.

Many commenters responded to the use of acreage limits in determining which construction sites are required to submit a permit application, including several cities, counties and States. Some commenters generally supported the use of an acre limit. Many commenters suggested increasing the acreage limit. Several suggested using a five acre limit for both residential and nonresidential development. Others suggested greater acreage as the cutoff. Two commenters concurred with the proposed limit of one acre/five acres and one commenter suggested lowering the residential limit to one acre.

Other factors were suggested as a means to create a cutoff for requiring permit applications. Several commenters suggested exempting construction that would be completed with a certain time frame, such as construction of less than 12 months. EPA believes that this is inappropriate because some construction can be intensive and expansive, but nonetheless take place over a short period of time, such as a parking lot. One commenter suggested basing the limit on the quantity of soil moved, i.e., cubic yards. In response, this approach would not be particularly helpful since removal of soil will not necessarily relate to the amount of land surface disturbed and exposed to the elements. Another commenter suggested that where there is single family detached housing construction that should trigger applications as well as the proposed acreage limit. This would not be appropriate since EPA is attempting to focus only on those construction activities that resemble industrial activity. After considering these and similar comments EPA has limited the definition of "storm water discharge associated with industrial activity" by exempting from the definition those construction operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale. In considering the appropriate scope of the definition of storm water discharge associated with industrial activity as it relates to construction activities, EPA recognized that a wide variety of factors can affect the water quality impacts associated with construction site runoff, including the quality of receiving waters, the size of the area disturbed, soil conditions, seasonal rainfall patterns, the slope of area disturbed, and the intensity of construction activities. These factors will be considered by the permit writer when issuing the permit. However, as noted above, EPA views such site-specific factors to be too difficult to define in a regulatory framework that is national in scope. For example, attempting to adjust permit application triggers based upon a myriad of regional rainfall patterns is not a practical solution. However, permit conditions adjusted for specific geographical areas may be appropriate.

Under the December 7, 1988, proposal the definition of industrial activity exempted: construction operations that resulted in the disturbance of less than one acre total land area which was not part of a larger common plan of development or sale; or operations for single family residential projects, including duplexes, triplexes, or quadruplexes, that result in the disturbance of less than five acre total land areas which were not part of a larger common plan of development or sale. EPA distinguished between single family residential development and

other commercial development because other commercial development is more likely to occur in more densely developed areas. Also, it was reasoned that other commercial development provides a more complete opportunity to develop controls that remain in place after the construction activity is completed, since continued maintenance after the permit has expired, is more feasible.

However, EPA has decided to depart from the proposal and use an unqualified five acre area in today's final rule. This limit has been selected, in part, because of administrative concerns. EPA recognizes that State and local sediment and erosion controls may address construction activities disturbing less five acres for residential development; the five acre limit in today's rule is not intended to supersede more stringent State or local sediment and erosion controls. In light of the comments, EPA is convinced that the acreage limit is appropriate for identifying sites that are amount to industrial activity. Several comments suggested higher acreage limits without giving a supporting rationale except administrative concerns. Several commenters agreed that the five acre limit is suitable, but again without specifying why they agreed. EPA is convinced, however, that the acreage limits as finalized in today's rule reflect an earth disturbance and/or removal effort that is industrial in magnitude. Disturbances on large tracts of land will employ more heavy machinery and industrial equipment for removing vegetation and bedrock.

For construction facilities that are not included in the definition of storm water discharge associated with industrial activity, EPA will consider the appropriate procedures and methods to reduce pollutants in construction site runoff under the studies authorized by section 402(p)(5) of the CWA. EPA will also consider under section 402(p)(5) appropriate procedures and methods during post-construction for maintaining structural controls developed pursuant to NPDES permits issued for storm water discharges associated with industrial activity from construction sites.

Numerous commenters requested clarification as to whether permits for storm water discharges from construction activities at an industrial facility are required. EPA is requiring permits for all storm water discharges from construction activities where the land disturbed meets the requirements established in § 122.26(b)(14)(x) and which discharge into waters of the United States. The location of the construction activity or the ultimate land use at the site does not factor into the analysis.

C. Municipal Separate Storm Sewer Systems

1. Municipal Separate Storm Sewers

Today's rule defines "municipal separate storm sewer" at § 122.26(b)(8) to include any conveyance or system of conveyances that is owned or operated by a State or local government entity and is designed for collecting and conveying storm water which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2. It is important to note that today's permit application requirements for discharges from municipal separate storm sewer systems serving a population of 100,000 or more do not apply to discharges from combined sewers (systems designed as both a sanitary sewer and a storm sewer). For purposes of calculating whether a municipal separate storm sewer system meets the large or medium population criteria, a municipality may petition to have the population served by a combined sewer deducted from the total population. Section 122.26(f) of today's rule describes this procedure.

EPA requested comments on whether different language for the definition of municipal separate storm sewer would clarify responsibility under the NPDES permit system. Comments were also requested on whether the definition needed to be clarified by explicitly stating that municipal streets and roads with drainage systems (curb and gutter, ditches, etc.) are part of the municipal storm sewer system, and that the owners or operators of such roads are responsible for such discharges. Numerous comments were received by EPA on this issue. Some commenters questioned whether road culverts and road ditches were municipal separate storm sewers, while others specifically recommended that further clarifying language should be added so that owners and operators of roads and streets understand that they are covered by this regulation. In light of these comments, EPA has clarified that municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains that discharge into the waters of the United States are municipal separate storm sewers. One commenter asked if "other wastes" in the proposed definition of municipal separate storm sewer (40 CFR 122.26 (b)(8)(i)) included storm water. In response, EPA has added "storm water" to this definition in order to clarify that the rule addresses such systems.

EPA requested comments on whether legal classifications such as "storm sewers that are not private (e.g. public, district or joint district sewers)" would provide a clearer definition of municipal separate storm sewer than an owner or operator criterion, especially for the purpose of determining responsibility under the NPDES program. Most commenters agreed that the owner/operator concept, and the additional language noted above, is sufficient for this purpose. EPA also requested comments on to what extent the owner/operator concept should apply to municipal governments with land-use authority over lands which contribute storm water runoff to the municipal storm sewer system, and how the responsibility should be clarified. In response to comments on this point, EPA has addressed these concerns in the context of clarifying what municipal entities are responsible for applying for a permit covering storm water discharges from municipal systems in section VI.H. below.

One commenter expressed a desire for clarification as to whether conveyances that were once used for the conveyance of storm water, but are no longer used in that manner, are covered by the definition. EPA emphasizes that this rulemaking only addresses conveyances that are part of a separate storm sewer system that discharges storm water into waters of the United States.

One commenter stated that if EPA intends to regulate roadside collection systems then EPA must repropose since these were not considered by the public. EPA disagrees with this comment since one of the options specifically addressed the inclusion of roadside drainage systems and roads in the definition of municipal separate storm sewer system. In addition, the public recognized the issue in comments on the proposal. EPA would note that several commenters specifically endorsed EPA's inclusion of these conveyances.

2. Effective Prohibition on Non-Storm Water Discharges

Section 402(p)(3)(B)(ii) of the amended CWA requires that permits for discharges from municipal storm sewers shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers. Based on the legislative history of section 405 of the WQA, EPA does not interpret the effective prohibition on non-storm water discharges to municipal separate storm sewers to apply to discharges that are not composed entirely of storm water, as long as such discharge has been issued a separate NPDES permit. Rather,

an "effective prohibition" would require separate NPDES permits for non-storm water discharges to municipal storm sewers. In many cases in the past, applicants for NPDES permits for process wastewaters and other non-storm water discharges have been granted approval to discharge into municipal separate storm sewers, provided that the permit conditions for the discharge are met at the point where the discharge enters into the separate storm sewer. Permits for such discharges must meet applicable technology-based and water-quality based requirements of Sections 402 and 301 of the CWA. If the permit for a non-storm water discharge to a municipal separate storm sewer contains water-quality based limitations, then such limitations should generally be based on meeting applicable water quality standards at the boundary of a State established mixing zone (for States with mixing zones) located in the receiving waters of the United States.

All options will be considered when an applicant applies for a NPDES permit for a non-storm water discharge to a municipal separate storm sewer. In some cases, permits will be denied for discharges to storm sewers that are causing water quality problems in receiving waters. However, not all discharges present such problems; and in these cases EPA or State permit writers may allow such discharges to municipal separate storm sewers within appropriate permit limits.

Today's rule has two permit application requirements that are designed to begin implementation of the effective prohibition. The first requirement discussed in VI.H.6.a., below, addresses a screening analysis which is intended to provide sufficient information to develop priorities for a program to detect and remove illicit discharges. The second provision, discussed in VI.H.7.b., requires municipal applicants to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to municipal separate storm sewer systems.

Several commenters suggested that either the definition of "storm water" should include some additional classes of nonprecipitation sources, or that municipalities should not be held responsible for "effectively prohibiting" some classes of nonstorm water discharges into their municipal storm sewers. The various types of discharges addressed by these comments include detention and retention reservoir releases, water line flushing, fire hydrant flushing, runoff from fire fighting, swimming pool drainaqe and discharge, landscape irrigation, diverted stream flows, uncontaminated pumped ground water, rising ground water, discharges from potable water sources, uncontaminated waters from cooling towers, foundation drains, non-contact cooling water (such as heating, ventilation, air conditioning (HVAC) water that POTWs require to be discharged to separate storm sewers rather than sanitary sewers), irrigation water, springs, roofdrains, water from crawl space pumps, footing drains, lawn watering, individual car washing, flows from riparian habitats and wetlands. Most of these comments were made with regard to the concern that these were commonly occurring discharges which did not pose significant environmental problems.

EPA disagrees that the above described flows will not pose, in every case, significant environmental problems. At the same time, it is unlikely Congress intended to require municipalities to effectively prohibit individual car washing or discharges resulting from efforts to extinguish a building fire and other seemingly innocent flows that are characteristic of human existence in urban environments and which discharge to municipal separate storm sewers. It should be noted that the legislative history is essentially silent on this point. Accordingly, EPA is clarifying that section 402(p)(3)(B) of the CWA (which requires permits for municipal separate storm sewers to 'effectively' prohibit non-storm water discharges) does not require permits for municipalities to prohibit certain discharges or flows of nonstorm water to waters of the United States through municipal separate storm sewers in all cases. Accordingly, § 122.26(d)(2)(iv)(B)(1) states that the proposed management program shall include: "A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; the program description shall address the following categories of non-storm water discharges or flows only where such discharges are identified by the municipality as sources of pollutants to waters of the United States: Water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash waters. Program descriptions shall address discharges from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States."

However, the Director may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate. In the case of fire fighting it is not the intention of these rules to prohibit in any circumstances the protection of life and public or private property through the use of water or other fire retardants that flow into separate storm sewers. However, there may be instances where specified management practices are appropriate where these flows do occur (controlled blazes are one example).

Conveyances which continue to accept other "non-storm water" discharges (e.g. discharges without an NPDES permit) with the exceptions noted above do not meet the definition of municipal separate storm sewer and are not subject to section 402(p)(3)(B) of the CWA unless the non-storm water discharges are issued separate NPDES permits. Instead, conveyances which continue to accept non-storm water discharges which have not been issued separate NPDES permits are subject to sections 301 and 402 of the CWA. For example, combined sewers which convey storm water and sanitary sewage are not separate storm sewers and must comply with permit application requirements at 40 CFR 122.21 as well as other regulatory criteria for combined sewers.

3. Site-Specific Storm Water Quality Management Programs for Municipal Systems

Section 402(p)(3)(iii) of the CWA mandates that permits for discharges from municipal separate storm sewers shall require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP), including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Director determines appropriate for the control of such pollutants.

When enacting this provision, Congress was aware of the difficulties in regulating discharges from municipal

separate storm sewers solely through traditional end-of-pipe treatment and intended for EPA and NPDES States to develop permit requirements that were much broader in nature than requirements which are traditionally found in NPDES permits for industrial process discharges or POTWs. The legislative history indicates, municipal storm sewer system "permits will not necessarily be like industrial discharge permits. Often, an end-of-the-pipe treatment technology is not appropriate for this type of discharge." [Vol. 132 Cong. Rec. S16425 (daily ed. Oct. 16, 1986)].

A shift towards comprehensive storm water quality management programs to reduce the discharge of pollutants from municipal separate storm sewer systems is appropriate for a number of reasons. First, discharges from municipal storm sewers are highly intermittent, and are usually characterized by very high flows occurring over relatively short time intervals. For this reason, municipal storm sewer systems are usually designed with an extremely high number of outfalls within a given municipality to reduce potential flooding. Traditional end-of-pipe controls are limited by the materials management problems that arise with high volume, intermittent flows occurring at a large number of outfalls. Second, the nature and extent of pollutants in discharges from municipal systems will depend on the activities occurring on the lands which contribute runoff to the system. Municipal separate storm sewers tend to discharge runoff drained from lands used for a wide variety of activities. Given the material management problems associated with end-of-pipe controls, management programs that are directed at pollutant sources are often more practical than relying solely on end-of-pipe controls.

In past rulemakings, much of the criticism of the concept of subjecting discharges from municipal separate storm sewers to the NPDES permit program focused on the perception that the rigid regulatory program applied to industrial process waters and effluents from publicly owned treatment works was not appropriate for the site-specific nature of the sources which are responsible for the discharge of pollutants from municipal storm sewers.

The water quality impacts of discharges from municipal separate storm sewer systems depend on a wide range of factors including: The magnitude and duration of rainfall events, the time period between events, soil conditions, the fraction of land that is impervious to rainfall, land use activities, the presence of illicit connections, and the ratio of the storm water discharge to receiving water flow. In enacting section 405 of the WQA, Congress recognized that permit requirements for municipal separate storm sewer systems should be developed in a flexible manner to allow site-specific permit conditions to reflect the wide range of impacts that can be associated with these discharges. The legislative history accompanying the provision explained that "[p]ermits for discharges from municipal separate stormwater systems * * * must include a requirement to effectively prohibit non-stormwater discharges into storm sewers and controls to reduce the discharge of pollutants to the maximum extent practicable, * * * These controls may be different in different permits. All types of controls listed in subsection [(p)(3)(C)] are not required to be incorporated into each permit" [Vol. 132 Cong. Rec. H10576 (daily ed. October 15, 1986) Conference Report]. Consistent with the intent of Congress, this rule sets out permit application requirements that are sufficiently flexible to allow the development of site-specific permit conditions.

Several commenters agreed with this approach. One municipality recommended that there be as much flexibility as possible so that the permitting authority can work with each municipality in developing meaningful long-term goals with plans for improving storm water quality. This commenter noted that too many specific regulations that apply nationwide do not take into consideration the climatic and governmental differences within the States. EPA agrees that as much flexibility as possible should be incorporated into the program. However, flexibility should not be built into the program to such an extent that all municipalities do not face essentially the same responsibilities and commitment for achieving the goals of the CWA. EPA believes that these final regulations build in substantial flexibility in designing programs that meet particular needs, without abandoning a nationally consistent structure designed to create storm water control programs.

4. Large and Medium Municipal Storm Sewer Systems

During the 1987 reauthorization of the CWA, Congress established a framework for EPA to implement a permit program for municipal separate storm sewers and establishing phased deadlines for its implementation. The amended CWA establishes priorities for EPA to develop permit application requirements and issue permits for discharges from three classes of municipal separate storm sewer systems. The CWA requires that NPDES permits be issued for discharges from large municipal separate storm sewer systems (systems serving a population of more than 250,000) by no later than February 4, 1991. Permits for discharges from medium municipal separate storm sewer systems (systems serving a population of more than 100,000, but less than 250,000) must be issued by February 4, 1992. After October 1, 1992, the requirements of sections 301 and 402 of the CWA are restored for all other discharges from municipal separate storm sewers.

The priorities established in the Act are based on the size of the population served by the system. Municipal operators of these systems are generally thought to be more capable of initiating storm water programs and discharges from municipal separate storm sewers serving larger populations are thought to present a higher potential for contributing to adverse water quality impacts. NURP and other studies have verified that the event mean concentration of pollutants in urban runoff from residential and commercial areas remains relatively constant from one area to another, indicating that pollutant loads from urban runoff strongly depend on the total area and imperviousness of developed land, which in turn is related to population.

The term "municipal separate storm sewer system" is not defined by the Act. By not defining the term, Congress intended to provide EPA discretion to define the scope of municipal systems consistent with the objectives of developing site-specific management programs in NPDES permits. EPA considered two key issues in defining the scope of municipal separate storm sewer system: (1) What is a reasonable definition of the term "system," and (2) how to determine the number of people "served" by a storm sewer system. EPA found these two issues to be intertwined. Different approaches to defining the scope of a system allowed for greater or lesser certainty in deterining the population served by the system.

In the December 7, 1988, proposal, EPA described seven options for defining "municipal separate storm sewer system." In developing these options the EPA considered:

- The inter-jurisdiction complexities associated with municipal governments;
- The fact that many municipal storm water management programs have traditionally focused on water quantity

concerns, and have not evaluated water quality impacts of system discharges or developed measures to reduce pollutants in such discharges;

- The advantages of developing system-wide storm water management programs for municipal systems;
- The geographic basis necessary for planning of comprehensive management programs to reduce pollutants in discharges from municipal separate storm sewers to the maximum extent practicable;
- The geographic basis necessary to provide flexibility to target controls on areas where water quality impacts associated with discharges from municipal systems are the greatest and to provide an opportunity to develop cost effective controls;
- The need to establish a reasonable number of permits for municipal systems during the initial phases of program development that will provide an adequate basis for a storm water quality management program for over 13,000 municipalities after the October 1, 1992 general prohibition on storm water permits expires; and
- Congressional intent to allow the development of jurisdiction-wide, comprehensive storm water management programs with priorities given to the most heavily populated areas of the country.

a. Overview of Proposed Options and Comments. The December 7, 1988, proposal requested comment on seven options for defining large and medium municipal separate storm sewer system. With the addition of a watershed-based approach suggested by certain commenters, eight options or approaches were addressed by the over 200 commenters on this issue: Option 1—systems owned or operated by incorporated places augmented by integrated discharges; Option 2—systems owned or operated by incorporated places augmented with significant other municipal discharges; Option 3—systems owned or operated by counties; Option 4—systems owned and operated by States or State departments of transportation; Option 5—systems within the boundaries of an incorporated place; Option 6—systems within the boundaries of counties; Option 7—systems in census designated urbanized areas; and Option 8—systems defined by watershed boundaries.

Generally, these options can be classified into two categories. The first category of options, Options 1, 2 and 3, define municipal systems in terms of the municipal entity which owns or operates storm sewers within municipal boundaries of the requisite population. The second category of options would define municipal systems on a geographic basis. Under Options 4, 5, 6, 7 and 8 all municipal separate storm sewers within the specified geographic area would be part of the municipal system, regardless of which municipal entity owns or operates the storm sewer. EPA did not propose to define the scope of a municipal separate storm sewer system in engineering terms because of practical problems determining the boundaries of and the populations served by "systems" defined in such a manner. In addition an engineering approach based on physical interconnections of storm sewer pipes by itself does not provide a rational basis for developing a storm water program to improve water quality where a large number of individual storm water catchments are found within a municipality.

In the December 7, 1988, proposal, EPA favored those options that relied primarily on the municipal entity which owns or operates or otherwise has jurisdiction over storm sewers. These options were preferred because it was anticipated that the administrative complexities of developing the permit programs would be reduced by decreasing the number of affected municipal entities. However, most commenters were not satisfied that such an approach would reduce administrative burdens or complexities.

The diversity of arguments and rationales offered in comments justifying the selection of particular option, or combinations thereof, were generally a function of geographic, climatic, and institutional differences around the country. As such, there was little substantive agreement with how this program should be implemented as far as defining large and medium municipal separate storm sewer systems. Of all the options, Option 1 generally received the most favorable comment. However, the overwhelming majority of comments suggested different options or other alternatives. Having reviewed the comments at length, EPA is convinced that the definition of municipal separate storm sewers should possess elements of several of the options enumerated above and a mechanism that enables States or EPA Regions to define a system that best suits their various political and geographical conditions.

The following comments were the most pervasive, and represent those issues and concerns of greatest importance to the public: (1) The approach chosen initially must be realistic and achievable administratively; (2) the definition must be flexible enough to accommodate development of the program on a watershed basis, and incorporate elements of existing programs and frameworks and regional differences in climate, geography, and political institutions; (3) permittees must have legal authority and control over land use; (4) discharges from State highways, identified as a significant source of runoff and pollutants, should be included in the program and combined in some manner with one or more of the other options; (5) the definition should address how the inclusion of interrelated discharges into the municipal separate storm sewer system are timed, decided upon, dealt with, etc.; (6) any approach must address the major sources of pollutants; (7) development of co-permittee management plans must be coordinated or developed on a regional basis and in the same time frame—fragmented or balkanized programs must be avoided; (8) municipalities should be regulated as equitably as possible; (9) flood control districts should be addressed as a system or part of a system; (10) the definition must conform to the legal requirements of the Clean Water Act; and (11) the definition should limit the number of co-permittees as much as possible.

b. Definition of large and medium municipal separate storm sewer system. A combination of the options outlined in the 1988 proposal would address most of these concerns, while achieving a realistic and environmentally beneficial storm water program. Accordingly, EPA has adopted the following definition of large and medium municipal separate storm sewer systems. Large and medium separate storm sewer systems are municipal separate storm sewers that:

(i) Are located in an incorporated place with a population of 100,000 or more or 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (see appendices F and G of part 122 for a list of these places based on the 1980 Census);

(ii) Are located within counties having areas that are designated as urbanized areas by latest decennial Bureau of Census estimates and where the population of such areas exceeds 100,000, after the population in the incorporated places, townships or towns within such counties is excluded (see appendices H and I for a listing of these counties based on the 1980 census) (incorporated places, towns, and townships within these counties are excluded from permit application requirements unless they fall under paragraph (i) or are designated under paragraph (iii)); or (iii) are owned or

operated by a municipality other than those described in paragraph (i) or (ii) that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraphs (i) or (ii). In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in subparagraph (i);

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors.

(iv) The Director may, upon petition, designate as a system, any municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (i), (ii), and (iii).

Under today's rule at § 122.26(a)(3)(iii) the regional authority shall be responsible for submitting a permit application under the following guidelines: The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due; the permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application; each of the operators of municipal separate storm systems described in paragraphs 122.26(b)(4) (i), (ii), and (iii) and (7)(i), (ii), and (iii), that are under the purview of the designated regional authority, shall comply with the application requirements of § 122.26(d).

As noted above, the finalized definition of large and medium municipal separate storm sewer system is combination of the approaches as proposed. (In the following discussion "paragraph (i)" refers to §§ 122.26 (b)(4)(i) and (b)(7)(i); "paragraph (ii)" refers to §§ 122.26(b)(4)(ii) and (b)(7)(ii); "paragraph (iii)" refers to §§ 122.26 (b)(4)(iii) and (b)(7)(iii); and "paragraph (iv)" refers to §§ 122.26 (b)(4)(iv) and (b)(7)(iv)). Paragraph (i) originates from proposed Option 5 (boundaries of incorporated places); paragraph (ii) originates from Option 6 (boundaries of counties) and Option 7 (urbanized areas); paragraph (iii) originates from Options 1 and 5; and paragraph (iv) is an outgrowth of comments on all options, especially Option 4 (State owned systems/State highways) and Option 8 (watersheds).

This definition creates a system by virtue of the fact that storm sewers within defined geographical and political areas, and the owner/operators of separate storm sewers in those areas, are addressed or required to obtain permits. Although within these systems, different segments and discharges of storm water conveyances may be owned or operated by different public entities, EPA is convinced by comments that discharges from such conveyances are interrelated to such an extent that all of these conveyances may be properly considered a "system." These comments are identified and discussed in greater detail below.

c. Response to comments. Many commenters urged that the approach taken must be administratively achievable. Option 5 of the proposal (boundaries of incorporated places), which can be equated to paragraphs (i) and (iii) above, was identified by several commenters as the most workable of all the options. Many commenters stated that Option 1 (systems owned or operated by incorporated places) was inappropriate because of special districts and other owners of systems within the incorporated area; and although EPA proposed a designation provision for interrelated discharges in Option 1, commenters advised that it would be impossible to identify these systems, account for their discharges, and exclude or include them in a timely manner if Option 1 was selected (Option 1 only addresses those systems owned or operated by the incorporated place). The final rule would obviate these concerns, since all the publicly owned sewers within the boundaries of the municipality will be required to be covered by a permit.

Other commenters noted that cities sometimes have storm water conveyances owned or operated by numerous entities. One municipality commented that these problems could be more easily resolved using a unified permit/district wide approach, which the final approach outlined above can accomplish. One county stated that Option 1 of the proposal would result in a permanent balkanization of stormwater programs and that a regional approach focusing on the entire system should be established. Another municipality recommended that all the systems of conveyances within the incorporated city boundaries be issued a permit. In rejecting Option 1 of the proposal, one municipality stated that program inefficiencies would result from implementing a piecemeal program in a contiguous urban environment with different owners and operators. One State conveyed similar concerns. Using a geographical approach, as described in paragraph (i) of the final definition, will best address all of these concerns.

One commenter criticized proposed Option 1 as being contrary to the legal requirements of the WQA, and a further example of EPA's continuing attempt to minimize the scope of a national storm water program. It was noted that the legislative history regarding requirements for large and medium municipal separate storm sewer systems in section 402(p) of the CWA generally does not reference incorporated cities or towns. As a result, the commenter recommended that the term "municipal" in municipal separate storm sewer system refer to separate storm sewers operated by municipal entities meeting the definition of "municipality" in section 502 of the CWA and that the scope of the term "municipal separate storm sewer system" be defined as broadly as possible. This approach would result in defining large and medium municipal separate storm sewer systems to include all municipal separate storm sewers within the 410 counties with a population of 100,000 or more. EPA has adopted the commenter's recommendation to extend the scope of the program to the extent that today's rule covers all municipal separate storm sewers within certain areas rather than only those operated by an incorporated place. EPA disagrees however that it must define the term "system" to include sewers within any municipal boundary of sufficient population with reference to section 502(4). By not providing explicit definitions, section 402(p)(3)(B) of the CWA gives EPA discretion to define how municipal separate storm sewer systems are defined. There is no indication in the language of the CWA or the legislative history that Congress intended that the scope of "municipality" and the scope of "municipal separate storm sewer system" to be identical, particularly since the latter term is not defined in the statute. Furthermore, for the reasons discussed elsewhere in this section, EPA believes that today's definition is a reasonable accommodation of the many conflicting concerns surrounding the proper way to delineate the extent of a

municipal separate storm sewer system serving over 100,000 people.

Several commenters concluded that EPA should be flexible enough to allow the permitting authority broad discretion to establish system wide permits, with flood control districts and/or counties acting as co-permittees with the various incorporated cities within the district boundaries. Commenters expressed concern that Option 1 would not allow for such flexibility.

Arguments that were advanced by commenters in support of proposed Option 1 are equally applicable to paragraph (i), above. Like proposed Option 1, the approach outlined above targets major cities. However, it also has the advantage of addressing municipal separate storm sewer systems which may be interrelated to those owned by the city, a benefit recognized by one municipality that endorsed the selection of proposed Option 5. This will also give the permitting authority more discretion to establish co-permittee relationships.

Paragraph (ii) of the final definition also uses a geographical approach to the definition of municipal storm sewer systems to include municipal storm sewers within urbanized counties. Thus, it closely resembles Option 7 of the proposal. The counties identified in paragraph (ii) have, based on the 1980 Census, a population of 100,000 or more in urbanized,[5] unincorporated portions of the county. In the unincorporated areas of these counties (or in the 20 States where the Census recognizes minor civil divisions, unincorporated county areas outside of towns or townships), the county is the primary local government entity. In these cases, the county performs many of the same functions as incorporated cities with a population of 100,000, and is generally expected to have the necessary legal and land use authority in these areas to begin to implement storm water management programs. Due to the urbanized nature of their population, discharges from the municipal separate storm sewers in these counties will have many similarities to discharges from municipal systems in incorporated cities with a population of 100,000 or more. Addressing these counties in this fashion will not adversely affect small municipalities (incorporated places, towns and townships) within the county, as municipal separate storm sewers that are located in the small incorporated places, townships or towns within these counties are not automatically included as part of the system.

EPA has focused on the unincorporated areas because permit applications cannot be required from systems that serve a population less than 100,000, unless designated. EPA received the comment that if the sewers in incorporated places within such counties were included as part of the system for that county, there would be the potential for systems serving a population less than 100,000 to be improperly subject to permit requirements. EPA agrees with the comment, except that EPA reserves the authority to designate sewers in small incorporated places as part of the system subject to permitting, pursuant to paragraph (iii) of the final definition. Incorporated areas within the identified counties will be required to file permit applications if the population served by the municipal separate storm sewer system is 100,000 or more.

As one commenter noted, the counties addressed by the definition will generally be areas of high growth with a growing tax base that can finance a storm water management program. Numerous counties affected by paragraph (ii) commented on the proposal. Several of these indicated a preference for the county government as the permittee. Others indicated that their county had the ability to perform the functions of the permit applicant and permittee. One county brought to EPA's attention that the county had laid plans for a storm water utility scheduled to be in operation in 1989. Several of the counties supported the use of watersheds, or flexible regional approaches, as the basis for the definition of municipal separate storm sewer systems. The modified definition should satisfy these concerns.

EPA recognizes that some of the counties addressed by today's rule have, in addition to areas with high unincorporated urbanized populations, areas that are essentially rural or uninhabited and may not be the subject of planned development. While permits issued for these municipal systems will cover municipal system discharges in unincorporated portions of the county, it is the intent of EPA that management plans and other components of the programs focus on the urbanized and developing areas of the county. Undeveloped lands of the county are not expected to have many, if any, municipal separate storm sewers.

Paragraphs (i) and (ii) above will help resolve the problems associated with permittees not having adequate land use controls, the legal authority to implement controls, and the ownership of the conveyances. This factor was mentioned by numerous commenters on the proposed options, especially county governments. Under paragraphs (i) and (ii), all publicly owned separate storm sewers within the appropriate municipal boundaries will be defined as part of the municipal system. In many cases, a number of municipal operators of these storm sewers will be responsible for discharges from these systems. Since a number of co-permittees may be addressed in the permits for these discharges, problems associated with the ability to control pollutants that are contributed from interrelated discharges will be minimized. State highways or flood control districts, which may have no land use authority in incorporated cities, will be co-permittees with the city which does possess land use authority. EPA envisions that permit conditions for these systems will be written to establish duties that are commensurate with the legal authorities of a co-permittee. For example, under a permit, a flood control district may be responsible for the maintenance of drainage channels that they have jurisdiction over, while a city is responsible for implementing a sediment and erosion ordinance for construction sites which relates to discharges to the drainage channel. Confusion over ownership of conveyances or systems, at least for the purposes of determining whether they require a permit, will be minimized since all conveyances will be covered. Similarly, under paragraph (ii), the affected counties are expected to have the necessary legal and land use authority to implement programs and controls in unincorporated, urbanized areas because the county government is the primary political or governing entity in these geographical areas.

Many commenters from all levels of State and local government expressed concern about controlling pollutants from State highways. Paragraphs (i) and (ii) will result in discharges from separate storm sewers serving State highways and other highways through storm sewers that are located within incorporated places with the appropriate population or highways in unincorporated portions of specified counties being included as part of the large or medium municipal separate storm sewer system, since all municipal separate storm sewers within the boundaries of these political entities are included. Paragraph (iv) can facilitate

[5] The Bureau of Census defines urbanized areas to provide a description of high-density development. Urbanized areas are comprised of a central city (or cities) with a surrounding closely settled area. The population of the entire urbanized area must be greater than 50,000 persons, and the closely settled area outside of the city, the urban fringe, must generally have a population density greater than 1,000 persons per square mile (just over 1.5 persons per acre) to be included

the submission of a permit application for storm sewers operated as part of an entire State highway system. Paragraph (iv) would allow an entire system in a geographical region under the purview of a State agency (such as a State Department of Transportation) to be designated, where all the permit application requirements and requirements established under § 122.26(a)(iii)(C) can be met.

Paragraphs (i) and (ii) can effectively deal with many of the major sources of pollutants. One municipality noted that Option 5 (paragraph (i)) would require all systems in the incorporated boundaries to obtain permits and institute control measures, rather than just the few owned or operated by incorporated cities. Another municipality noted that this approach could deal with many of the regional variations in sources of pollution. Many commenters, including environmental groups, believed that proposed Option 3 (systems owned or operated by counties), Option 6 (systems within the boundaries of counties), and Option 7 (system in urbanized areas) were good approaches because more sources of pollution would be addressed. It was also maintained that Options 3, 6 and 7 could incorporate watershed planning which, in the view of some commenters, is the only effective way to address pollutants in storm water.

Commenters noted that addressing counties and urbanized areas would focus attention on developing areas which would otherwise be left out in the initial phases of permitting. One commenter noted that most new development in large urbanized areas occurs outside of core cities (incorporated cities with a population of 100,000 or more). Newly developing areas provide opportunities for installing pollutant controls cost effectively. EPA agrees with these comments and notes that paragraph (ii) addresses a significant number of counties with highly developed or developing areas.

However, EPA is convinced that addressing all counties or urbanized areas in the initial phases of the storm water program is ill-advised. Commenters noted that some counties have inappropriate or nonexistent governmental structures, and that a program that addressed all counties in the country with a population of 100,000 or more would be unmanageable, because too many municipal entities nationwide would be involved in the program initially. Commenters advised that defining municipal storm sewer systems solely in terms of the boundaries of census urbanized areas (Option 7) would result in systems which did not correspond to jurisdictions that are in a position to implement a storm water programs. Thus, EPA has modified Option 7 and combined it with Option 6 to create paragraph (ii) above.

Paragraph (iii) incorporates a designation authority such that municipalities that own or operate discharges from separate storm sewers systems other than those described in paragraph (i) or (ii) may be designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the other discharges of the designated storm sewer and the discharges from the large or medium municipal separate storm sewers. In making this determination the physical interconnections between the municipal separate storm sewers, the location of discharges from the designated municipal separate storm sewer relative to discharges from large or medium municipal separate storm sewers, the quantity and nature of pollutants discharged to waters of the United States, the nature of the receiving waters, or other relevant factors may be considered.

Comments indicated that the designation authority as proposed and described above should be retained. One State noted that this approach gives the most flexibility in making the case-by-case designations, while also delineating in sufficient detail what criteria are used to make the determination. This commenter was concerned about being able to regulate many of the interrelated discharges from counties surrounding incorporated cities.

Paragraph (iv) of the final definition allows the permitting authority, upon petition, to designate as a medium or large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (i), (ii), (iii).

Paragraph (iv) was added to the final definitions to respond to a variety of concerns of commenters. One of the prime concerns of commenters was that the definition of large and medium municipal separate storm sewer systems must be flexible enough to accommodate: Programs on a watershed basis, existing storm water programs and frameworks and regional differences in climate, geography, and political institutions. Some States were particularly expressive regarding this concern. One State maintained that an inflexible program could totally disrupt ongoing State efforts. Other commenters urged that the regulation encourage the establishment of regional storm water authorities or other mechanisms that can deal with storm water quality on a watershed basis. One State proposed defining the municipal separate storm sewer system to include all municipal separate storm sewers within a core incorporated place of 100,000 or more, and all surrounding incorporated places within the State defined watershed. One of the State water districts advised that the regulations should be flexible enough to allow regional water quality boards to apply the regulations geographically. One national association expressed concern that existing institutional arrangements for flood control and drainage would be ignored, while another warned against fostering a proliferation of inconsistent patchwork programs based on arbitrary definitions and jurisdictions which bear no relationship to water quality.

EPA is convinced that the mechanism described in paragraph (iv) provides a means whereby the mechanisms and concepts identified above can be utilized or created in appropriate circumstances. In addition, § 122.26(f)(4) provides a means for State or local government agencies to petition the Director for the designation of regional authorities responsible for a portion of the storm water program. For example, some States or counties may currently or in the near future have regional storm water management authorities that have the ability to apply for permits under today's rule and carry out the terms of the permit. Some of these authorities may encompass within their jurisdiction large or medium municipal separate storm sewer systems as defined in today's rule. EPA wishes to encourage such entities to assume the role as permittee under today's rule. That is the purpose of paragraph (iv). Such authorities may petition the Director to assume such a role.

Many commenters expressed the view that municipal management plans must be coordinated or developed among co-permittees on a regional basis and in the same timeframe. Paragraphs (i), (iii) and (iv) would bring in all appropriate municipal entities with jurisdiction over a specified geographical area in the same timeframe. Several commenters, including one State, noted proposed Option 1 would lead to fragmented, ill-coordinated programs. Paragraphs (i), (iii), and (iv) do not suffer this drawback

to the same extent since all the municipal separate storm sewers are addressed within the incorporated place, instead of only those owned or operated by the incorporated place.

Equal treatment of municipalities within a watershed or other specified area was a major subject of comment. Many commenters urged that a degree of fairness could be achieved by requiring permit applications, and the concomitant expenditure of municipal dollars and resources, from all municipalities within an entire urban area that contributes to storm water pollution, rather than from a discrete system within an arbitrary political boundary. Paragraph (i), especially when coupled with paragraphs (ii), (iii), and (iv), can best accomplish a more equitable approach, because all owners and operators of municipal separate storm sewers within a system have responsibilities. In addition, some of the areas outside the incorporated city limits which are engaged in expansive urban or suburban development will be brought into the program. Paragraph (iv) will provide a means for State or regional authorities to use existing or emerging mechanisms to set up storm water management programs, and would require multiple agencies either to become regional co-permittees or to be subject to a regional permit.

Paragraphs (i), (ii), (iii), and (iv) could also require flood control districts to be co-permittees, which was a major concern of counties and numerous cities. One municipality stated that the inclusion of flood control districts would greatly reduce the administrative burden required to prepare a single inter-city discharge agreement and would establish a common legal authority to implement the program. Numerous county agencies believed it imperative that flood control districts be brought into a system-wide permit strategy.

Paragraphs (i) and (iii) may not accommodate the concern of several commenters that the number of co-permittees be kept to a minimum. The fact that all the municipal separate storm sewers within the boundaries of the appropriate incorporated places will be addressed dictates that some permits will have several co-permittees. This is a major concern since it goes directly to achieving an effective initial storm water program. There is concern about being able to bring all the co-permittees together under intra-municipal agreements or contracts within regulatory deadlines. This problem would be resolved in the short term by selecting Option 1. However, Option 1 may still require inter-municipal agreements because of the designation authority under § 122.26 (b)(4)(ii) and (b)(7)(ii) of the proposal. In addition, such inter-jurisdictional problems will arise after October 1, 1992 when the moratorium on requiring NPDES permits for discharges from other municipal separate storm sewers ends. Under the permitting goals established by the CWA, multi-jurisdictional storm water programs and agreements cannot be avoided. Despite interest in limiting the number of co-permittees, EPA decided not to adopt Option 1 for the reasons already stated.

Section 402(p)(3)(B)(i) of the amended CWA provides that permits for municipal discharges from municipal storm sewers may be issued on a system-wide or jurisdiction-wide basis. This provision is an important mechanism for developing the comprehensive storm water management programs envisioned by the Act.

Under the permit application requirements of today's rule, if the appropriate co-applicants are identified, one permit application may be submitted for a large or medium municipal separate storm sewer system (see section VI.G.4 above). System-wide permit applications can in turn be used to issue system-wide permits which could cover all discharges in the system.

Where several municipal entities are responsible for obtaining a permit for various discharges within a single system, EPA will encourage system-wide permit applications involving the several municipal entities for a number of reasons. The system-wide approach not only provides an appropriate basis for planning activities and coordinating development, but also provides municipal entities participating in a system-wide application the means to spread the resource burden of monitoring, evaluating water quality impacts, and developing and implementing controls.

The system-wide approach provided in today's rule recognizes differences between individual municipalities with responsibilities for discharges from the municipal system. Today's application rule requires information to be submitted that enables the permit issuing authorities to develop tailored programs for each permittee with responsibility for certain components, segments, or portions of the municipal separate storm sewer system. The permit application requirements allow individual municipal entities, participating in system-wide applications, to submit site specific information regarding storm water quality management programs to reduce pollutants in system discharges as a whole, or from specific points within the system.

In some cases, it may be undesirable for all municipal entities with storm water responsibility within a municipal system to be co-permittees under one system-wide permit. The permit application requirements in today's rule allow individual municipal entities within the system to submit permit applications and obtain a permit for that portion of the storm sewer system for which they are responsible. Thus, several permits may be issued to cover various subdivisions of a single municipal system.

In summary, EPA believes that the definition of municipal storm sewer system adopted in today's rule has several distinct advantages that were identified in comments:

- The definition adopts features of several options;
- The definition targets areas that have the necessary police powers and land use authority to implement the program;
- The definition can utilize watersheds or accommodate existing administrative frameworks and storm water programs;
- The definition provides that all systems within a geographical area including highways and flood control districts will be covered, thereby avoiding fragmented and ill-coordinated programs;
- The definition has flexible designation authority; and
- The definition addresses major sources of pollutants without being overly broad.

H. Permit Application Requirements for Large and Medium Municipal Systems

1. Implementing the Permit Program

Given the differing nature of discharges from municipal separate storm sewer systems in different parts of the country and the varying water quality impacts of municipal storm sewer discharges on receiving waters, today's permit application requirements are designed to lead to the development of site-specific storm water management programs. In order to effectively implement this goal, EPA intends to retain the overall structure of the municipal permit application as proposed in the December 7, 1988, proposal.

2. Structure of the Permit Application

EPA proposed a two-part permit application designed to meet the goal of

developing site-specific storm water quality management programs in NPDES permits. In response to a request for comments on this aspect of the proposal, numerous comments were received. After reviewing these comments, EPA has decided to retain the two-part permit application. Many commenters agreed that the approach as proposed is appropriate for phasing in and developing site specific storm water management programs. One large municipality strongly endorsed the two-part application, stating that it would facilitate the identification of water quality problem areas and the development of priorities for control measures, thereby allowing for more cost-effective program development. Two State agencies expressed the same view, and noted that the two-part approach is reasonable and well structured for efficient development of programs. One large municipality noted it would allow the permit authority and the permit applicant the time needed to gain the knowledge and data to develop site-specific permits. A medium municipality expressed similar views.

Numerous commenters submitted endorsements of a proposal offered by one of the national municipal associations. This approach responded to EPA's request for comments on alternatives to a two-part application process. These comments recommended having permit applicants submit information regarding their existing legal authority, prepare source identification information, describe existing management plans, provide discharge characterization information based on existing data, and prepare a monitoring, characterization and illicit discharge and removal plan in a one-part application. The remaining requirements such as: implementing plans to remove illicit connections, obtaining legal authority, monitoring and characterization, plans for structural controls, preparation of control assessments, preparation of fiscal analysis, and management plan implementation would be part of the permit and take place during the compliance period of the permit. It was argued that this would result in a more orderly development of stormwater management programs while allowing for quick implementation of efforts to eliminate illicit discharges and initiate some BMPs.

After careful review and consideration of these comments, EPA is convinced that this approach would not meet the goals and requirements of section 402 of the Clean Water Act. Section 402(p)(3)(B) of the CWA requires that permits effectively prohibit non-storm water discharges into storm sewers and incorporate controls that reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques, and system design and engineering methods. The above comments suggesting an alternative for achieving this goal are not entirely compatible with these requirements. In light of the language in the statute, permit conditions should do more than plan for controls during the term of the permit. A strong effort to have the necessary police powers and controls based on pollutant data should be undertaken before permits are issued. In short, the one-part application described by these comments would result in permits that would focus too much on preparation and not enough on implementing controls for pollutants.

In comparison, EPA's approach requires municipalities to submit a two-part application over a two year period. Part one of the application would require information regarding existing programs and the means available to the municipality to control pollutants in its storm water discharges. In addition, part one would require field screening of major outfalls to detect illicit connections. Part two of the permit application would require a limited amount of representative quantitative data and a description of proposed storm water management plans. The purpose of the two-part application process is to develop information, in a reasonable time frame, that would build successful municipal storm water management programs and allow the permit writer to make informed decisions with regard to developing permit conditions. This will include initiating efforts to effectively prohibit non-storm water discharges into storm sewers, and initially implementing controls that reduce the discharge of pollutants to the maximum extent practicable, including management practices and control techniques during the term of the permit. Such an approach clearly meets the statutory mandate of section 402(p)(3)(B).

a. Part 1 Application. Part 1 of the permit application is intended to provide an adequate basis for identifying sources of pollutants to the municipal storm sewer system, to preliminarily identify discharges of storm water that are appropriate for individual permits, and to formulate a strategy for characterizing the discharges from municipal separate storm sewer systems. Several commenters supported retaining these components of the application process. The components of part 1 of the permit application include:

- General information regarding the permit applicant or co-applicants (§ 122.26(d)(1)(i));
- A description of the existing legal authority of the applicant(s) to control pollutants in storm water discharges and a plan to augment legal authority where necessary (§ 122.26(d)(1)(ii));
- Source identification information including: a topographic map, description of the historic use of ordinances or other controls which limited the discharge of non-storm water discharges to municipal separate storm sewer systems, the location of known municipal separate storm sewer outfalls, projected growth, location of structural controls, and location of waste disposal facilities (§ 122.26(d)(1)(iii));
- Information characterizing the nature of system discharges including existing quantitative data, the results of a field screening analysis to detect illicit discharges and illegal dumping to the municipal system, an identification of receiving waters with known water quality impacts associated with storm water discharges, a proposed plan to characterize discharges from the municipal storm sewer system by estimating pollutant loads and the concentration of representative discharges, and a plan to obtain representative data (§ 122.26(d)(1)(iv)); and
- A description of existing structural and non-structural controls to reduce the discharge of pollutants from the municipal storm sewer (§ 122.26(d)(1)(v)).

One commenter disagreed that source identification should be made part of the permit application process beyond the identification of major municipal storm sewer outfalls. In reply, EPA is convinced that the other elements of the source identification are critical for identifying sources of pollutants and creating a base of knowledge from which informed decisions about permit conditions and further data requirements can be determined. One county stated that it already had engaged in extensive monitoring and modeling of watersheds and that its programs should be substituted for EPA's. In response, EPA anticipates that information collected under various State, county or city programs that matches the information requirements in this rulemaking may be used by the applicants in submissions under this rulemaking where the requirements of the rule are met. However, because of the divergence in data collection techniques and information collected by

these programs, EPA disagrees that it would be appropriate to accept a substitution in its entirety without tailoring such a program to today's specific information requirements. One municipality noted that municipal systems are not well documented and responsibility for them is in question. In response, EPA notes that the source identification procedure is designed, in part, to address such shortcomings.

Several municipalities suggested that legal authority could be demonstrated by providing EPA with copies of appropriate local ordinances to demonstrate their legal authority and a statement from the city attorney. EPA agrees that these methods are appropriate for making this demonstration.

Several commenters noted that there was adequate existing municipal legal authority to carry out the program requirements or such authority could be obtained by the municipality. Other commenters stated that municipalities possess some authority over certain activities but may not have authority over discharges from roads and construction. Numerous commenters, however, claimed that certain municipalities had no existing legal authority to carry out the permit requirements and that obtaining all the necessary legal authority could take several years due to cumbersome legislative and political processes. In response, part 1 of the permit application will establish a schedule for the development of legal authority that will be needed to accomplish the goals of the permit application and permits. Some municipalities will have more advanced storm water programs with appropriate legal authority or the ability to establish necessary ordinances. Providing an appropriate schedule will not present difficulties in these circumstances. EPA also notes that the definitions of large and medium municipal separate storm sewer systems finalized in today's rule will in many cases result in a number of co-applicants participating in a system wide application. It is anticipated that the development of adequate inter-jurisdictional agreements specifying the various responsibilities of the co-permittees may in some cases be very complex, thereby justifying the development of a schedule to complete the task. For example, clarifying the authority over discharges from roads may present difficulties where a number of municipal entities operate different roads in a given jurisdiction. In other limited cases, the MEP standard for municipal permits may translate into permit conditions that extend the schedule for obtaining necessary legal authority into the term of the permit. These situations will be evaluated on a case-by-case basis by permit issuing authorities.

Numerous commenters supported the field screening analysis as proposed. Comments from three municipalities noted that it would be a cost effective means of identifying problem areas. One municipality noted that illicit connections can be reliably detected by the screening method proposed. In view of these comments EPA has decided to retain this portion of the regulation. However many commenters expressed concern over how the proposed approach would work given the particular circumstances under which some municipal storm water systems are arranged. Several commenters questioned the effectiveness of dry weather monitoring for several reasons, including the shallow depth of some cities' water tables. Accordingly, an alternative approach may be utilized by the municipal permittee, and this is discussed later in section VI.H.3.

Some comments suggested that if any field screening is required that it be done during the term of the permit. EPA believes that field screening should not be done during the term of the permit exclusively. Unless a field screening is accomplished during the permit application phase there will be scant knowledge, if any, upon which illicit connection programs can be established for the term of the permits. EPA views field screening during the application process as an appropriate means of beginning to meet the CWA's requirement of effectively prohibiting non-storm water discharges into municipal separate storm sewers.

The submittal of part 1 of the permit application will allow EPA, or approved NPDES States, to adjust part 2 permit application requirements to assure flexibility for submitting information under part 2, given the site specific characteristics of each municipal storm sewer system.

EPA agrees with the concerns of commenters regarding the estimate of the reduction of pollutant loads from existing management programs. EPA agrees that sufficient data may not be available to establish meaningful estimates. Therefore this component of the proposed part 1 is not a requirement of today's rule.

b. Part 2 Application. Part 2 of the proposed permit application is designed to supplement information found in part 1 and to provide municipalities with the opportunity of proposing a comprehensive program of structural and non-structural control measures that will control the discharge of pollutants, to the maximum extent practicable, from municipal storm sewers. The components of the proposed part 2 of the permit application included:

- A demonstration that the legal authority of the permit applicant satisfies regulatory criteria (§ 122.26(d)(2)(i));
- Supplementation of the source identification information submitted in part 1 of the application to assure the identification of all major outfalls and land use activities (§ 122.26(d)(2)(ii);
- Information to characterize discharges from the municipal system;
- A proposed management program to control the discharge of pollutants to the maximum extent practicable, from municipal storm sewers (§ 122.26(d)(2)(iv));
- Assessment of the performance of proposed controls (§ 122.26(d)(2)(v));
- A financial analysis estimating the cost of implementing the proposed management programs along with identifying sources of revenue § 122.26(d)(2)(vi);
- A description of the roles and responsibilities of co-applicants (§ 122.26(d)(2)(vii)).

One municipality agreed that the assessment of the performance of controls was a critical component of establishing a viable program and one that could be accomplished within the time frame of the permit application deadlines. One commenter suggested that the applicant describe what financial resources are currently available. In response, EPA will require applicants to describe the municipality's existing budget for storm water programs in part 1 of the permit application requirements. This information will be useful to evaluate the municipality's ability to prepare and implement management plans. In response to other comments, this information will also include an overview of the municipality's financial resources and a description of the municipality's budget, including overall indebtedness and assets.

EPA has retained the financial analysis in this portion of the rule on the advice of two municipal commenters, who agreed that this was an important component of establishing a viable program and one that could be accomplished within the time frame of the permit application deadlines. Another commenter noted that this requirement is appropriate to justify a municipality's proposed management plan.

3. Major Outfalls

In past rulemakings, a controversial issue has been the appropriate sampling requirements for municipal separate storm sewer systems. Earlier storm water rulemakings have been based primarily on the principle that all discharges to waters of the United States from municipal separate storm sewers located in urban areas must be covered by an individual permit. This approach requires that individual permit applications contain quantitative data to be submitted for all such discharges. This approach was criticized because of a potentially unmanageable number of outfalls in some municipal separate storm sewer systems. Most incorporated cities with a population of 100,000 or more do not know the exact number of outfalls from their municipal systems; but based on the comments, the number ranges from 500 to 8,000 or more.

In light of the increased flexibility provided by the WQA and the development of EPA's system-wide approach for regulating municipal separate storm sewer discharges, today's rule will not require submittal of individual permit applications with quantitative data for each outfall of a municipal system. Rather today's rule will encourage system-wide permit applications to provide information suitable for developing effective storm water management programs. Under this approach, not all outfalls of the municipal system will be sampled, but rather more specific and accurate models for estimating pollutant loads and discharge concentrations will be used. The use of these models will require the identification of sources which are responsible for discharging pollutants into municipal separate storm sewers and will not require as much data to calibrate due to the source-specific nature of the model. A number of standard and localized models have been developed for estimating pollutant loads from storm water discharges.

Several commenters support the use of models for developing management plans and estimating pollutant loadings and concentrations. EPA encourages their use where applicable to particular systems.

By adopting an approach that incorporates source identification measures, the amount of quantitative data required to characterize discharges from the municipal system will be reduced because of the increased accuracy of the site-specific models which can be used. Consistent with a system-wide permit application approach, EPA proposed to focus source identification measures on "major outfalls." The proposed definition of major outfalls includes any municipal separate storm sewer outfall that discharges from a pipe with a diameter of more than 36 inches or its equivalent (discharges from a drainage area of more than 50 acres), or for municipal separate storm sewers that receive storm water from lands zoned for industrial activities, an outfall that discharges from a pipe with a diameter of more than 12 inches or its equivalent (discharges from a drainage area of 2 acres or more).

Numerous entities offered comments on this definition. Several commenters concurred with this proposed definition. One commenter maintained that the data collected at such outfalls would be sufficient to estimate pollutant loads as well as concentrations using well calibrated models. Another municipality stated that 50 acres was an excellent approximation for the average drainage area served by a 36-inch storm sewer. Two States and one county supported the definition as proposed. One large municipal entity supported the definition, stating that screening major outfalls could be accomplished with available staff over a three month period. In light of these comments, EPA has decided to retain, in part, the definition as proposed.

Numerous commenters suggested alternative definitions or otherwise disagreed with the proposed definition. Most of these comments expressed concern about the number of outfalls that would have to be tested or screened if the definition was retained. For this reason EPA has decided to limit the total number of major outfalls or equivalent sampling points that have to be tested to 250 or 500 for medium or large systems respectively. This change is discussed in further detail below.

The following are examples of comments that opposed the definition of a "major outfall" as proposed. Several commenters stated that, in the southwest, 6 to 12 foot outfalls are the norm, and that smaller outfalls should not be addressed unless there is a compelling reason to suspect illicit connections. One commenter suggested a size of 54 inches and 50 acres, while another commenter suggested that 48 inches would be appropriate. One commenter suggested that the diameter for industrial pipes should be 18 inches, while another commenter suggested that 50 acres should be the only criterion.

One commenter noted that pipe size will vary according to rainfall patterns and that a single approach would not work universally. This comment, and other similar points of view as noted herein, convinces that Agency that a more flexible approach is needed to identify field screening and sampling locations. However, EPA is also convinced that a universal standard is necessary for purposes of identifying drainage areas within the municipal system and discrete areas of land use that are drained by certain sized outfalls. This information is critical since these conveyances, and lands they drain, are sources of pollutants to waters of the United States from municipal systems and are properly the subject of appropriate permit conditions.

Many commenters suggested placing a limit on the number of major outfalls addressed during the field screening phase of the permit application. Two municipalities stated that the proposed definition of major outfalls in terms to the pipe diameter was too small and that too many outfalls would be covered. One municipality stated that under the proposed definition, it would have over 4700 "major outfalls," a number viewed as being unacceptably large. Several municipalities argued that they would be penalized for over-design of their storm drain system. One municipality stated field screening of outfalls should be limited to 200 for medium cities and 500 for large cities. Some commenters suggested EPA set a percentage of major outfalls for screening, because all pipes in some municipalities meet the definition of major outfall. One commenter suggested that a sliding scale be used to determine the number of outfalls tested: those with 50 test all, those with 100–200 test 50%, etc. Other commenters suggested a flat percentage of outfalls or flat number such as 100.

4. Field Screening Program

EPA also received several comments in response to the proposed field screening methodology. Among the major concerns were: End of pipe sampling may not be practical and the more appropriate and accessible location is likely to be the nearest upstream manhole; the type of discharge should be the criterion for selecting sampling points as opposed to pipe size; a system wide evaluation is more appropriate than checking each outfall; within some systems, major outfalls or pipe size will not reflect discharges from suspect or old land use areas; efforts should be focused on locations where illicit connections are expected; sites should be determined by looking at sites within drainage basin areas based on land use within those basins; land use and hydrology of the watershed should be the criteria for selecting points;

screening should be performed at locations that will allow for the location of upstream discharges; the focus should be exclusively on drainage areas rather than pipe size, since pipe size will vary with slope; a prescribed percentage of total flow may be more appropriate; state water quality standards should be utilized along with focusing on actual quality in the reaches of a stream.

EPA is convinced by these comments that today's rule should allow applicants to either field screen all major outfalls as proposed (first procedure) or use a second procedure to provide for the strategic location of sampling points to pinpoint illicit connections. EPA agrees with comments that the size of the outfall will not always reflect the chance of uncovering illicit connections or discharges, and that field screening points should be easily accessible.

This second procedure is as follows: field screening points and/or outfalls are randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a major outfall or segment of the storm sewer system. The grid shall be established using the following guidelines and criteria:

(1) A grid system consisting of perpendicular north-south and east-west lines spaced 1/4 mile apart shall be overlaid on a map of the municipal storm sewer system, creating a series of cells;

(2) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(3) Field screening points or major outfalls should be located downstream of any sources of suspected illegal or illicit activity;

(4) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system, within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(5) The assessment and selection of cells shall use the following criteria: Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; land use types;

(6) For medium municipal separate storm sewer systems, no more than 250 cells need have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points for detecting illicit connections; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible);

(7) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (1) through (6) above, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen at least 250 or 500 major outfalls respectively using the following method: the applicant shall establish a grid system consisting of north-south and east-west lines spaced 1/4 mile apart overlaid on a map of the boundaries of a large or medium municipal entity described at § 122.26(b), thereby creating a series of cells; major outfalls in as many different cells as possible shall be selected until 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

The methodology outlined above is in response to public comments which indicated that the field screening and sampling of major outfalls as proposed would lead to insurmountable logistical problems in some municipal systems. EPA believes that the above is an effective approach to pinpointing suspected problem points along a given trunkline or segment of separate storm sewer system. Jurisdictions with no extensive or previous history of monitoring, or lack of an intensive monitoring program can utilize the methods described in establishing a program. Furthermore, the approach will allow for the prioritization of outfalls, sampling points, or areas within the municipality where there are suspected illicit connections or discharges, or other circumstances creating higher concentrations and loadings of pollutants.

Paragraph (7) enables municipalities to select major outfalls without regard to the municipal sewer system map that is required for using the procedure described in paragraphs (1) through (6). However, the applicant must still select outfalls within the cells created by overlaying a 1/4 mile grid over a map of the boundaries of the large or medium municipal entity defined under § 122.26(b), and select major outfalls within as many of those cells as possible, up to 500 (large municipal systems) or 250 (medium municipal systems). In this manner, as many different areas and land uses within the municipal system will be covered by the field screening component of the municipal application.

In order to keep the costs of the program within the anticipated limits of the proposed regulation, the number of outfalls or sampling locations using the grid system is to be limited to 500 for large municipal separate storm sewer systems and 250 for medium municipal separate storm sewer systems.

In response to several comments, EPA has clarified the definition of major outfalls with regard to the words, "pipe with an inside diameter of 36 inches or more or its equivalent" and "a pipe with an inside diameter of 12 inches or more or its equivalent." This definition has been modified to specify that single pipes or single conveyances with the appropriate diameter or equivalent are covered.

EPA's proposal required municipal permit applicants to submit a fiscal analysis of expenditures that will be required in order to implement the proposed management plans required in part 2 of the application. The description of fiscal resources should include a description of the source of the funds. Some commenters felt that a fiscal analysis should only be required during the term of the permit. In response, EPA believes that during the two years of permit application development, the permit applicant should be in a position to submit information on the ability and means for financing storm water management programs during the term of the permit. EPA views this information as an important means of evaluating the scope of program and whether the permittee will be devoting adequate resources to implementing the program before that program is mapped out in the permit itself.

5. Source Identification

The identification of sources which contribute pollutants to municipal separate storm sewers is a critical step in characterizing the nature and extent of pollutants in discharges and in developing appropriate control measures. Source identification can be useful for providing an analysis of pollutant source contribution and for identifying the relationship between pollutant sources and receiving water quality problems. In cases where end-of-pipe controls alone are not practicable, it is essential to identify the source of pollutants into the municipal storm

sewer systems to support a targeted approach to control pollutant sources.

The relative contribution of pollutants from various sources will be highly site-specific. The first step in developing a targeted approach for controlling pollutants in discharges from municipal storm sewer systems is identifying the various sources in each drainage basin that will contribute pollutants to the municipal storm sewer system.

This rulemaking phases in the source identification requirements of the permit program by establishing minimum objectives in part 1 of the application and by requiring applicants to submit a source identification plan in part 2 of the application to provide additional information during the term of the permit. The minimum source identification requirements of part 1 of the application have been designed to provide sufficient information to provide an initial characterization of pollutants in the discharges from the municipal storm sewer system. EPA realizes that with many large, complex municipal storm sewer systems, it may be difficult to identify all outfalls during the permit application process. Accordingly, EPA is requiring that known outfalls be reported in part 1 of the application. Part 1 of the application will also include: A description of procedures and a proposed program to identify additional major outfalls; the identification of the drainage area associated with known outfalls; a description of major land use classifications in each drainage area, descriptions of soils, the location of industrial facilities, open dumps, landfills or RCRA hazardous waste facilities which discharge storm water to the municipal storm sewer system; and ten year projections of population growth and development activities (population data and development projections will be useful for future predictions of loadings to receiving waters from municipal storm sewer systems, and capacities required for treatment systems). In general, population projections should reflect various scenarios of development (high, medium, low relative to recent trends).

Part 2 of the application will supplement the information reported in part 1 of the application so that, at a minimum, all major outfalls are identified.

Under today's rule, municipal or public entities responsible for applying for and obtaining an NPDES permit will be required to identify the location of an open dump, sanitary landfill, municipal incinerator or hazardous waste treatment, storage, and disposal facility under RCRA which may discharge storm water to the system as well as all facilities which discharge storm water associated with industrial activity into a large or medium municipal separate storm sewer system.

Requiring these source identification measures is supported by the legislative history of section 405 of the WQA, which instructs that "[i]n writing any permit for a municipal separate storm sewer, EPA or the State should pay particular attention to the nature and uses of the drainage area and the location of any industrial facility, open dump, landfill, or hazardous waste treatment, storage, or disposal facility which may contribute pollutants to the discharge." (emphasis added) [Vol 133 Cong. Rec. S752 (daily ed. Jan. 14, 1987].

One municipality questioned the purpose of the topographic map and commented that the scale of the topographic map is too large to indicate any of the required outfall, drainage, industrial or structural control information. In response, the purpose of the topographic map is to identify receiving waters, major storm water sewer lines that contribute discharges to these waters, and potential sources of storm water pollution. EPA disagrees that a USGS 7.5 scale map is inappropriate for identifying these features within a municipal system. The scale afforded by such a map provides sufficient detail to allow specified delineation of outfalls, while not requiring an overly burdensome map in terms of size. Numerous commenters noted the value of source identification information and generally supported submitting this information in the permit application.

Many commenters questioned the value of the source identification information for the purpose of characterizing pollutant loads and concentrations. Conversely, one commenter opined that the requirement would provide sufficient information to estimate pollutant loadings from each outfall using loading models to estimate loadings by watershed. In response, the source identification information serves several purposes. It is the first step for identifying potential sources of pollutants from which more in depth analysis can be accomplished, under the discharge characterization component of the application. Also, where appropriate, it may be used in conjunction with models to estimate loadings and concentrations. EPA has also taken note of the many comments that question or dismiss the concept of determining pollutant loads and concentrations solely from source identification. Accordingly, EPA is convinced that at least some of the sampling requirements as proposed are necessary to facilitate more accurate system specific estimates of pollutant concentrations and loadings. These are discussed below, in the discharge characterization section.

One commenter suggested that aerial photos be submitted in lieu of topographic maps. EPA agrees that an aerial photograph of the appropriate scale that communicates the same information as a topographic map may be substituted. Today's final rule reflects this flexibility.

The source identification component of the municipal application also requires that municipal applicants identify the industrial activity within the drainage area associated with each major outfall. One commenter stated that where multiple storm sewers outfalls discharge to a stream reach, municipalities should be allowed to delineate a single sewer-shed for identifying sources of industrial activity. In response, the rule does not delimit an applicant's ability to identify industries in groups according to a common series of storm sewer outfalls, if that is an easier or more appropriate methodology for that particular applicant. However, EPA would view this as appropriate only where the land use is of one type, such as industrial. Where land use is mixed within the drainage area associated with each major outfall, such differences need to be identified.

In response to comments, to the extent that EPA is requesting that applicants identify the types of industrial facilities operating within the municipality, the municipality is free to use Standard Industrial Classification (SIC) or other systems which identify the principal products or services of the facility. One commenter disagreed with EPA's decision to require a list of water bodies that are listed under CWA sections 304(1), 319(a), 314(a), and 320, because the States already have this information and that requesting it from permittees could result in "omissions, misunderstandings, and mistakes." EPA believes that these waters should be identified in the application so that appropriate permit conditions can be developed that address storm water discharges that are adversely effecting such waters. EPA believes that having this information immediately at the disposal of the municipality and the permit writer will speed the process and alert the municipality of storm water discharges to listed water bodies and potentially polluted storm water discharges to those waters.

6. Characterization of Discharges

The characterization plan and data collection required in today's rule as elements of Part-one and Part-two of the municipal permit application is comprised of several major components:

- A screening analysis to provide information to develop a program for detecting and controlling illicit connections and illegal dumping to the municipal separate storm sewer system;
- Initial quantitative data to allow the development of a representative sampling program to be incorporated as a permit condition;
- System-wide estimates of annual pollutant loadings and the mean concentration of pollutants in storm water discharges, and a schedule to provide estimates during the term of the permit for each major outfall of the seasonal pollutant loadings and the event mean concentration of pollutants in storm water discharges; and
- An identification of receiving waters with known water quality impacts associated with storm water discharges.

Several commenters noted the importance of developing and targeting management programs based on discharge characterization data and monitoring. Numerous other commenters stressed the importance of a program to identify and eliminate illicit connections and improper disposal. EPA agrees that discharge characterization is an important component of developing management programs. Most of the discharge characterization components of the municipal application procedure have been retained as proposed. However some changes and clarifications have been made, and these are noted below.

a. *Screening analysis for illicit discharges (part 1 of application).* Illicit discharges (non-storm water discharges without a NPDES permit), and illegal dumping to municipal separate storm sewer systems occur in a relatively haphazard manner. Due to the unpredictability of such discharges, today's permit applications require a field analysis for the development of priorities for detecting and controlling such discharges. A field screening approach will provide a means of detecting high levels of pollutants in dry weather flows, which is one indicator of illicit connections. Results of a field test of such discharges will provide further information about the nature of the discharge to determine if further investigation is warranted. Visual observation of dry weather flows has been shown to be one the mos' effective means for tracking down illicit connections and improper disposal.

As discussed in greater detail in section VI.H.7.b of today's preamble, EPA is proposing to require that municipal applicants submit a comprehensive plan to develop a program to detect and control illicit connections and illegal dumping. In order to develop appropriate priorities for these programs, applicants shall submit the results of a screening analysis to be performed on major outfalls or "field screening points" in the systems to detect the presence of illicit hookups and illegal dumping. The results of the screening analysis, referred to as the field screen, would be reported in part 1 of the permit application.

Under the requirements for a field screen, the applicant or co-applicants will submit a description of observations of dry weather discharges from major outfalls or "field screening points" identified in part 1 of the application. At a minimum, the field screen would include a description of visual observations made during a dry weather period. If any flow is observed during a dry weather period, two grab samples will be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observation regarding the potential presence of non-storm water discharges or illegal dumping would be provided. In addition, the applicant should provide the results of a field screen which includes on-site estimates of pH, total chlorine, total copper, total phenol, detergents (or surfacants) along with a description of the flow. EPA is not requiring analytical methods approved under 40 CFR part 136 be used exclusively in the field screen. Rather, the use of inexpensive field sampling techniques such as the use of colormetric detection methods is anticipated. Where the field screen does not involve analytical methods approved under 40 CFR part 136, the applicant is required to provide a description of the method used which includes the name of the manufacturer of the test method, including the range and accuracy of the test. Appropriate field techniques for a field screen of dry weather discharges are discussed in EPA guidance for municipal storm water discharge permit applications.

It should be clarified that data from the field screen is generally not appropriate for comprehensive evaluation of water quality impacts, or estimating pollutant loadings. Rather, the information from the field screen in part 1 of the application will be used along with other information, such as the age of development and degree of industrial activity in the drainage basin, to identify areas or outfalls which are appropriate targets for management programs and for investigations directed at identifying and controlling non-storm water discharges to separate storm sewers during the term of the permit.

In the December 7, 1988, proposal, EPA proposed a second phase of the screening analysis requiring that wet-weather and dry-weather samples be collected and analyzed in accordance with analytical methods approved under 40 CFR part 136 from designated major outfalls for a larger set of pollutants identified with illicit connections. Comments essentially viewed this proposal as too ambitious for the permit application. One commenter recommended that this procedure could best be accomplished during the term of the permit. Some comments maintained that the collection of analytical samples as a follow up to an initial field screen analysis was not the most cost-effective, practicable or efficient method for pinpointing illicit connections. EPA recognizes that several municipal programs to detect and control illicit connections and other non-storm water discharges have been successfully developed and implemented without the use of extensive analytical sampling (for example, programs in Fort Worth, TX and Washtenaw County, MI). After identifying and analyzing the comments on this aspect of the proposal EPA has withdrawn this element of the proposal from today's rule. EPA believes that a follow-up phase to the initial field screening is more appropriate during the term of the permit. Thus, EPA has dropped the field screening requirement proposed for Part 2 of the application.

b. *Representative data (Part 2 of application).* The NURP study showed that pollutant concentrations in urban runoff can exhibit significant variation. Pollutant concentrations in such discharges vary during storm events and from storm event to storm event. Given the complex, variable nature of storm water discharges from municipal systems, EPA favors a permit scheme where the collection of representative data is primarily a task that will be accomplished through monitoring programs during the term of the permit. Permit writers have the necessary flexibility to develop monitoring requirements that more accurately reflect the true nature of highly variable and complex discharges.

Today's rule provides for an initial assessment of the quality of discharges from municipal separate storm sewers based primarily on source identification measures and existing information received in the permit application. This information will be used to begin to characterize system discharges. The analysis developed under this approach will not rely soley on sampling data collected during the application process, but will also incorporate existing data bases such as the one developed under the NURP study. Today's rule requires that some quantitative data will be collected to ensure the system discharges can be appropriately represented by the various existing data bases and to provide a basis for developing a monitoring plan to be implemented as a permit condition.

Today's rule requires that quantitative data be submitted for discharges from selected storm events at between 5 and 10 outfalls or field screening points. The municipality will recommend and the Director will then designate the outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system, on the basis of information received in part 1 of the application. The applicant will be required to collect samples of a storm discharge from three storm events occurring one month apart for each designated outfall or field screening point. This is a modification to the December 7, 1988, proposal wherein only one of the 5 to 10 outfalls was to be sampled during three storm events, and the remaining sampled only once. This requirement may be modified by the Director if the type and frequency of storm events require different sampling. The Director may require samples of discharges to be collected during snow melts or during specified seasons. The Director may also require additional testing during a single event if it is unlikely that there will be three storm events suitable for sampling during the year. Furthermore, the Director may allow exemptions to the three storm event requirement when climatic conditions create good cause for such exemptions; for example, arid regions or areas experiencing drought conditions during the period when applications are developed could be exempted.

EPA has added requirements to sample more storm events in response to comments that the sampling procedure proposed would not necessarily yield representative data. Commenters indicated that: rain events of different intensity may yield different levels and types of pollutants; a rain event after a dry spell of several months will not be representative when compared to rain events occurring closer together, due to the build up of constituents; one sample may reflect short term effects such as improper disposal rather than long term effects; and that rain events are generally too variable to rely on the limited sampling as proposed. Clearly the data collected from sampling storm water discharges has a tendency to vary greatly. The more sampling that is accomplished, the greater extent to which this variability may be accounted for and appropriate management programs developed.

In selecting the amount of data to be collected during the permit application process, EPA has attempted to balance the usefulness of this data against the economic and logistical constraints in actually obtaining it. In some cases the data obtained will support initial loading and concentration estimates obtained using various modeling techniques, from which appropriate permit conditions can be developed. Data obtained may be supplemented with further data collection during the term of the permit.

EPA believes that the requirement that selected major municipal outfalls or "field screening points" be sampled for more than one event will provide verification that the characterization of discharge is valid. Where an ongoing sampling program is defined for the term of the permit, samples taken during the first few years of this period can be used to verify the application results. If a municipality or an industry questions the conclusions drawn from the characterization sampling, it may at its discretion choose to perform additional sampling to either confirm or dispel these concerns.

All samples collected will be analyzed for all pollutants listed in Table II, (organic pollutants), and Table III, (toxic metals, cyanide and total phenol) of appendix D of 40 CFR part 122, and for the pollutants listed in Table M-1 below:

Table M-1

Total suspended solids (TSS).	Total dissolved solids.
COD	BOD_5.
Oil and grease	Fecal coliform.
Fecal streptococcus	pH.
Dissolved phosphorus	
Total ammonia plus organic nitrogen.	Total phosphorus.
Total Kjeldahl nitrogen	Nitrate plus nitrite.

A portion of the NURP program involved monitoring 120 priority pollutants in storm water discharges from lands used for residential, commercial and light industrial activities. The NURP program excluded testing for asbestos and dioxin. Results for seven other organic priority pollutants were not considered valid due to changes in, or constraints on test methods. Seventy-seven priority pollutants were detected in samples of storm water discharges from lands used for residential, commereial and light industries taken during the NURP study, including 14 inorganic and 63 organic pollutants. Table M-2 shows the priority pollutants which were detected in at least ten percent of the discharge samples which were sampled for priority pollutants.

TABLE M-2.—PRIORITY POLLUTANTS DETECTED IN AT LEAST 10% OF NURP SAMPLES

[In percent]

Metals and inorganics	Frequency of detection
Antimony	13
Arsenic	52
Beryllium	12
Cadmium	48
Chromium	58
Copper	91
Cyanides	23
Lead	94
Nickel	43
Selenium	11
Zinc	94
Pesticides:	
Alpha-hexachlorocyclohexane	20
Alpha-endosulfan	19
Chlordane	17
Lindane	15
Halogenated aliphatics:	
Methane, dichloro-	11
Phenols and cresols:	
Phenol	14
Phenol, pentachloro-	19
Phenol, 4-nitro	10
Phthalate esters:	
Phthalate, bis(2-ethylhexyl)	22
Polycyclic aromatic hydrocarbons:	
Chrysene	10
Fluoranthene	16
Phenanthrene	12
Pyrene	15

The NURP data also showed a significant number of these samples exceeded various freshwater water quality criteria. The exceedence of water quality criteria does not necessarily imply that an actual violation of standards will exist in the receiving water body in question. Rather, the enumeration of exceedences serves as a screening function to identify those constituents whose presence in urban storm water runoff may warrant high priority for further evaluation.

Members of this group represent all of the major organic chemical fractions

found in Table II of appendix D of 40 CFR part 122 (volatiles, acid compounds, base/neutrals, pesticides). Today's rule requires testing for all organic constituents in Table II rather than limiting the sampling requirements to the 24 toxic constituents found in the NURP study because they will provide a better description of the discharge at essentially the same cost. (The cost of analyzing samples for organic chemicals strongly depends on the number of major organic chemical fractions tested). The NURP study focused on characterizing storm water discharges from lands used for residential, commercial and light industrial activities. In general, the NURP study did not focus on other sources of pollutants to municipal separate storm sewer systems and, therefore, does not reflect all potential pollutants that may be present in discharges from municipal separate storm sewer systems.

The sampling requirements for the permit application address a limited number of sampling locations but require analysis for a wide range of pollutants. Sampling for a wide range of pollutants as a permit application requirement should provide permit writers with appropriate data to target more specific pollutants when developing requirements for a monitoring program during the term of the permit.

Numerous commenters stated that monitoring for all priority pollutants seemed excessive. However, EPA is convinced that it is more appropriate for permit conditions to focus on and prioritize particular pollutant problems after data covering a broad spectrum of pollutants are developed. As noted above, NURP identified 77 priority pollutants in urban runoff, but only from residential, commercial, and light industrial (*e.g.* industrial parks) areas. One municipal entity stated that this approach is a reasonable and realistic means of providing some useful baseline data, while others recommended sampling a variety of parameters that are included in Tables M–1 and M–2. Another municipal entity stated that characterization of outfall discharge quality during storm events is necessary as a means of targeting source control activities.

EPA is working with the United States Geological Survey (USGS) to evaluate the availability of USGS technical assistance to municipalities through cooperative funding programs to aid in collecting representative quantitative data of storm water discharges from municipal systems.

USGS data collection programs with municipalities typically include storm water discharge samples obtained at various times during a storm hydrograph event. Various USGS field procedures can be used to obtain discharge data for pipes, culverts, etc., typically found in urban areas. Pollutant models can be calibrated with data and long-term rainfall records to simulate the quality of system discharges and compared to other storm water models.

In addition, EPA recognizes that many municipalities have participated in studies, such as NURP, that involve sampling of urban runoff as well as other components of discharges from municipal separate storm sewer systems. All existing storm water sampling data along with relevant water quality data, sediment data, fish tissue data or biosurvey data taken over the last ten years is considered relevant and, under today's rule, must be submitted with part 1 of the application. Sampling data that is submitted must be accompanied with a narrative description of the drainage area served by the outfall monitored, a description of the sampling and quality control program, and the location of receiving water monitoring.

EPA requested comments on the use of existing data, such as that generated under the NURP study, to satisfy the requirement of providing representative sampling data. Commenters did not agree on the value of NURP results as an indicator of representative data. Several commenters expressed the view that existing data could be used to satisfy in whole or in part the representative sampling requirements of the storm water permit application. However, commenters generally did not offer suggested criteria that could be used to verify the validity of existing data. One commenter believed that intensive sampling over a period of ten years in 12 basins, when combined with NURP data, would be adequate.

One commenter supported the use of data, such as that obtained from the NURP study, to target sampling programs. EPA supports such a methodology and has retained this portion of the proposed discharge characterization component. EPA received strong support from an environmental group for retaining this information requirement in part 1 of the application.

In light of these comments EPA believes it is appropriate to retain the representative sampling requirements without resorting to the use of existing data exclusively. Because of the inherent variability in reliability and applicability of existing data, EPA is convinced that a nationally consistent methodology for collecting data is appropriate. This data can then be used in conjunction with other existing data and models to develop appropriate site specific management programs and more generalized management program strategies. Where existing data and data collected under today's rule varies or does not match, further sampling under the term of the permit will be accomplished to more accurately assess the discharge of pollutants.

c. Loading and Concentration Estimates (part 2 of application). The assessment of the water quality impacts of discharges from municipal separate storm sewer systems on receiving waters requires the analysis of both pollutant loadings and concentrations of pollutants in discharges.

The loading and concentration estimates in today's rule will be used to evaluate two types of water quality impacts: (1) Short-term impacts; and (2) long-term impacts. Specifically, the regulation requires estimates of the annual pollutant load of the cumulative discharges to waters of the United States from municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States municipal outfalls during a storm event for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods. Municipalities have options in the use of methodologies, including those presented in NURP for calculating loads.

Short term impacts from discharges from municipal separate storm sewers involve changes in water quality that occur during and shortly after storm events. Examples of short-term impacts that can lead to impairments include periodic dissolved oxygen depression due to the oxidation of contaminants, high bacteria levels, fish kills, acute effects of toxic pollutants, contact recreation impairments and loss of submerged macrophytes. Characterization of instream pollutant concentrations based on estimated pollutant concentrations in system discharges are important for evaluating these types of impacts.

Long-term water quality impacts from discharges from municipal separate storm sewers may be caused by contaminants associated with suspended solids that settle in receiving water sediments and by nutrients which enter receiving water systems with long

retention times. Pollutant loading data are important for evaluation of impairments such as loss of storage capacity in streams, estuaries, reservoirs, lakes and bays, lake eutrophication caused by high nutrient loadings, and destruction of benthic habitat. Other examples of the long-term water quality impacts include depressed dissolved oxygen caused by the oxidation of organics in bottom sediments and biological accumulation of toxics as a result of uptake by organisms in the food chain. An estimate of annual pollutant loading associated with discharges from municipal storm water sewer systems is necessary to evaluate the magnitude and severity of the environmental impacts of such discharges and to evaluate the effectiveness of controls which are imposed at a later time.

Municipal storm water sewer systems generally handle runoff from large drainage areas and the sources of pollution are usually very diffuse. The concentrations of many pollutants in discharges from these systems are often low relative to many industrial process and POTW discharges. The water quality impacts of low concentration pollution discharges tend to be cumulative and need to be evaluated in terms of aggregate loadings as well as pollutant concentrations. A site-specific loading analysis can be used to evaluate the relative contribution of various pollutant sources.

7. Storm Water Quality Management Plans

Today's rule facilitates the development of site-specific permit conditions by requiring large and medium municipal permit applicants to submit, along with other information, a description of existing structural and non-structural prevention and control measures on discharges of pollutants from municipal storm sewers in part I of the permit application. Section 122.26(d)(2)(iv) requires the applicant to identify in part 2 of the application, to the degree necessary to meet the MEP standard, additional prevention or control measures which will be implemented during the life of the permit. Although, in many cases, it will not be possible to identify all prevention and control measures that are appropriate as permit conditions, EPA believes that the process of identifying components of a comprehensive prevention and/or control program should begin early and that applicants should be given the opportunity to identify and propose the components of the program that they believe are appropriate for first preventing or controlling discharges of pollutants.

As noted earlier, EPA recognizes that problems associated with storm water, combined sewer overflows (CSOs) and infiltration and inflow (I&I) are all interrelated even though they are treated somewhat differently under the law. EPA believes that it is important to begin linking these programs and activities and, because of the potential cost to local governments, to investigate the use of innovative, nontraditional approaches to reducing or preventing contamination of storm water. The application process for developing municipal storm water management plans provides an ideal opportunity between steps 1 and 2 for considering the full range of nontraditional, preventive approaches.

The permit application requirements in today's rule require the applicant or co-applicants to develop management programs for four types of pollutant sources which discharge to large and medium municipal storm sewer systems. Discharges from large and medium municipal storm sewer systems are usually expected to be composed primarily of: (1) Runoff from commercial and residential areas; (2) storm water runoff from industrial areas; (3) runoff from construction sites; and (4) non-storm water discharges. Part 2 of the permit application has been designed to allow the applicant the opportunity to propose MEP control measures for each of these components of the discharge. Discharges from some municipal systems may also contain pollutants from other sources, such as runoff from land disposal activities (leaking septic tanks, landfills and land application of sewage sludge). Where other sources, such as land disposal, contribute significant amounts of pollutants to a municipal storm sewer system, appropriate control measures should be included on a site-specific basis. Proposed management programs will then be evaluated in the development of permit conditions.

There is some overlap in the manner in which these pollutant sources are characterized and their sources identified. For instance, improper disposal of oil into storm drains is often associated with do-it-yourself automobile oil changes in residential areas, or improper application or over-use of herbicides and pesticides in residential areas can also occur in industrial areas. Also, some control measures will reduce pollutant loads for multiple components of the municipal storm sewer discharge. These measures should be identified under all appropriate places in the application; as discussed below, however, double counting of pollutant removal must be avoided when the total assessment of control measures is performed.

Although many land use programs have multiple purposes, including the reduction of pollutants in discharges from municipal separate storm sewer systems, the proposed management programs in today's rule are intended to address only those controls which can be implemented by the permit applicant or co-applicants. EPA cannot abrogate its responsibilities under the CWA to implement the NPDES permit program by relying on pollution control programs that are outside the NPDES program. For example, municipal permit management programs may not rely exclusively on erosion or sediment control laws for implementing that portion of management programs that address discharges from construction sites, unless such laws implement NPDES permit program requirements entirely and that such implementation is a part of the permit.

EPA anticipates that storm water management programs will evolve and mature over time. The permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality. The proposed permit applications will require applicants to provide a description of the range of control measures considered for implementation during the term of the permit. Flexibility in developing permit conditions will be encouraged by providing applicants an opportunity to identify in the permit application priority controls appropriate for the initial implementation of management programs. Many commenters endorsed the flexible site-specific storm water program approach as proposed as a method for addressing regional water quality control programs in a cost effective manner. To this extent, EPA agrees with one municipality that management programs should focus on more serious problems and sources of pollutants identified in the municipal system. However, EPA believes that to implement section 402(p)(3), comprehensive storm water management programs which address a number of major sources of pollutants to a system are necessary. Municipal programs should not be focused solely on a single source of pollution, such as illicit connections.

One commenter maintained that management program development

should be flexible enough to allow for consideration of what is attainable based on the area's climate, vegetation, hydrology, and land uses. EPA agrees with this comment. Some strategies for reducing pollutants in the northeast will not be practical in the southwest, such as management programs for deicing activities. The permit application process will determine what strategies are appropriate in different locations.

Several commenters supported addressing storm water pollutant problems through management practices or programs rather than end of pipe controls or treatment. EPA agrees with this comment to the extent that storm water management practices are a general theme of this rulemaking with regard to municipal permits. However, there will be cases where such discharges are best addressed through technology such as retention, detention or infiltration ponds.

One commenter reacted unfavorably to the flexible site-specific management plan approach stating that there is no hard criteria upon which to judge the adequacy of programs. Another commenter felt that there should be a BAT standard for municipal permits. Another commenter stated that the rule should contain specific BMPs that the permittee must comply with. EPA disagrees with these comments. The Clean Water Act requires municipalities to apply for permits that will reduce pollutants in discharges to the maximum extent practicable and sets out the types of controls that are contemplated to deal with storm water discharges from municipalities. The language of CWA section 402(p)(3) contemplates that, because of the fundamentally different characteristics of many municipalities, municipalities will have permits tailored to meet particular geographical, hydrological, and climatic conditions. Management practices and programs may be incorporated into the terms of the permit where appropriate. Permit conditions, which require that storm water management programs be developed and implemented or require specific practices, are enforceable in accordance with the terms of the permit. EPA disagrees with the notion that this regulation, which addressed permit application requirements, should create mandatory permit requirements which may have no legitimate application to a particular municipality. The whole point of the permit scheme for these discharges is to avoid inflexibility in the types and levels of control. Further, to the degree that such mandatory requirements may be appropriate, these requirements should be established under the authority of section 402(p)(6) of the CWA and not in this rulemaking, which addresses permit application requirements.

Some commenters suggested that management programs should be developed as part of the permit conditions and not as part of the permit application. EPA agrees that management programs and their ongoing development should be part of the permit term. However, EPA is convinced, and many commenters agree, that the permit application should contain information on what the permittee has done to date and what it proposes and plans to do during the permit term based upon its discharge characterization and source identification data. This is a reasonable and logical approach and one that meets the intent and letter of section 402(p)(3) of the CWA. As stated above, this would be an appropriate method for implementing storm water management programs that should mature and evolve over time.

Applicants will propose priorities based on a consideration of appropriate controls including, but not limited to, consideration of controls that address: reducing pollutants to municipal separate storm sewer system discharges that are associated with storm water from commercial and residential areas (§ 122.26(d)(2)(iv)(A)); illicit discharges and illegal disposal (§ 122.26(d)(2)(iv)(B)); storm water from industrial areas (§ 122.26(d)(2)(iv)(C)); and runoff from construction sites (§ 122.26(d)(2)(iv)(D)). Permits for different municipalities will place different emphasis on controlling various components of discharges from municipal storm sewers. For example, the potential for cross-connections (such as municipal sewage or industrial process wastewater discharges to a municipal separate storm sewer) is generally expected to be greater in municipalities with older developed areas. On the other hand, municipalities with larger areas of new development will have a greater opportunity to focus controls to reduce pollutants in storm water generated by the area after it is developed, discharges from construction sites, and other planning activities.

EPA requested comments on the process and methods for developing appropriate priorities in management programs proposed in applications and how the development of these priorities can be coordinated with controls on other discharges to ensure the achievement of water quality standards and the goals of the CWA.

Discharges from diffuse sources in residential areas was recognized by several commenters as a significant source of pollutants. Accordingly, these elements of the management plans have been retained. In conjunction with the importance of developing programs for illicit connections, numerous commenters stated that education programs are a priority. Another commenter emphasized that ordinances prohibiting such discharges and their enforcement is a crucial means of a successful program in this regard. EPA agrees with these comments and consequently will retain those portions of management program development that include a description of a program for educational activities such as public information for the proper disposal of oil and toxic materials and the use of herbicides, pesticides and fertilizers.

Some commenters noted that discharge characterization is necessary for development of appropriate management plans. EPA agrees with these comments and has retained the discharge characterization components in this rulemaking. However, EPA disagrees that the results of all discharge characterization procedures (*i.e.*, part 1 and part 2) are necessary to describe and propose a program as required in part 2 of the application. The application of various models is available to permit applicants, where needed, to develop appropriate management programs. All available site specific discharge characterization data should be available to the permit writer to draft appropriate conditions for the term of the permit.

One commenter noted that an important aspect of developing management plans is establishing the necessary legal authority to improve water quality. EPA agrees with this comment and has retained those aspects of the regulation which call for development and attainment of adequate legal authority in both parts of the municipal application.

One commenter stated that programs should address previously identified water quality problems in other programs that are required by section 304(1) of the CWA. EPA agrees that identified water quality problems need to be addressed by management programs, and the municipal permit application will call for an identification of these waters. However, EPA does not endorse addressing these waters to the exclusion of all others within the boundaries of the municipal separate storm sewer system. Some waters may experience substantial degradation after rain events and still not be listed under

section 304(1). Further, water quality impacts in listed waters may not be related to storm water discharges, while other non-listed waters do have water quality impacts from storm water discharges. Similarly, EPA agrees with one commenter that it may be desirable to focus attention and resources on certain problem watersheds within a municipality, and controls may be imposed and programs prioritized on that basis. However, such a focus should not be to the exclusion of other waters and watersheds that have water quality problems (although less troublesome) traceable to storm water discharges. The CWA requires that permits address discharges to waters of the United States, not just waters previously targeted under special programs.

Some commenters expressed concern that the permit application requires the design of management programs before knowing what will be in the permits. EPA disagrees with the thrust of this comment, that is that the order of requirements is inappropriate. The permit applicant will have two years to develop proposed plans which can be considered by permit writers in the development of the permit. Based upon a consideration of the management program proposed by the municipality and other relevant information, permits can be tailored for individual programs. One commenter stated that the cornerstone of management programs are inspection and enforcement programs. EPA agrees that these two elements are important components. Without inspection and enforcement mechanisms the programs will undoubtedly falter. Accordingly these requirements in the description of management programs in the permit application have been retained. In a similar vein, one commenter emphasized the importance of developing legal authority, financial capability, and administrative infrastructure. EPA agrees with this comment and has retained those aspects of the regulation that call for a description of applicants plans and resources in these areas.

One commenter stressed that control of discharges into the municipal system from industries is an important goal of municipal storm water management programs. EPA agrees with this comment and has retained the proposed description of management programs to address discharges from industrial sources. Other commenters identified industries as the principal contributors of pollutants to municipal separate storm sewer systems.

In addition, EPA will continue to evaluate procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality in the studies required under section 402(p)(5) of the CWA. One purpose of these studies will be to evaluate the costs and water quality benefits associated with implementing these procedures and methods. This evaluation will address a number of factors which impact the implementation costs associated with these programs, such as the extent to which similar municipal ordinances are currently being implemented, the degree to which existing municipal programs (such as flood management programs or construction site inspections) can be expanded to address water quality concerns, the resource intensiveness of the control, and whether the control program will involve public or private expenditures. This information, along with information gained during permit implementation will aid in the dynamic long-term development of municipal storm water management programs.

a. *Measures to reduce pollutants in runoff from commercial and residential areas.* The NURP program evaluated runoff from lands primarily dedicated to residential and commercial activities. The areas evaluated in the study reflect some other activities, such as light industry, which are commonly dispersed among residential and commercial areas. The NURP study selected sampling locations that were thought to be relatively free of illicit discharges and storm water from heavy industrial sites including storm water runoff from heavy construction sites. Of course, in a study such as NURP it was impossible to totally isolate various contributions to the runoff. In developing the permit application requirements in today's rule EPA has, in general, relied on the NURP definition of urban runoff—runoff from lands used for residential, commercial and light industrial activities.

NURP and numerous other studies have shown that runoff from residential and commercial areas washes a number of pollutants into receiving waters. Of equal importance is the volume of storm water runoff leaving urban areas during storm events. Large intermittent volumes of runoff can destroy aquatic habitat. As the percentage of paved surfaces increases, the volume and rate of runoff and the corresponding pollutant loads also increase. Thus, the amount of storm water runoff from commercial and residential areas and the pollutant loadings associated with storm water runoff increases as development progresses; and they remain at an elevated level for the lifetime of the development.

Proposed § 122.26(d)(2)(iv)(A) requires municipal storm sewer system applicants to provide in part 2 of the application a description of a proposed management program that will describe priorities for implementing management programs based on a consideration of appropriate controls including:

- A description of maintenance activities and a maintenance schedule for structural controls;
- A description of planning procedures including a comprehensive master plan to control after construction is completed, the discharge of pollutants from municipal separate storm sewers which receive discharges from new development and significant redevelopment after construction is completed (in response to comment this contemplates an engineering policy and procedure strategy with long term planning);
- A description of practices for operating and maintaining public highways and procedures for reducing the impact on receiving waters of such discharges from municipal storm sewer system;
- A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies; and
- A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

Water quality problems caused by municipal storm sewer discharges will generally be most acute in heavily developed areas. Prevention measures may be desirable and cost effective. However, structural control measures may also be effective, although opportunities for implementing these measures may be limited in previously developed areas. Commonly used structural technologies include a wide variety of treatment techniques, including first flush diversion systems, detention/infiltration basins, retention basins, extended detention basins, infiltration trenches, porous pavement, oil/grit separators, grass swales, and swirl concentrators. A major problem associated with sound storm water management is the need for operating

and maintaining the system for its expected life.

The unavailability of land in highly developed areas often makes the use of structural controls infeasible for modifying many existing systems. Non-structural practices can play a more important role. Non-structural practices can include erosion control, streambank management techniques, street cleaning operations, vegetation/lawn maintenance controls, debris removal, road salt application management and public awareness programs.

As noted above, the first component of the proposed program to reduce pollutants in storm water from commercial and residential areas which discharge to municipal storm sewer systems is to describe maintenance activities and schedule. The second component of the proposed program to reduce pollutants in storm water from commercial and residential areas which discharge to municipal storm sewer systems provides that applicants describe the planning procedures and a comprehensive master plan that will assure that increases of pollutant loading associated with newly developed areas are, to the maximum extent practicable, limited. These measures should address storm water from commercial and residential areas which discharge to the municipal storm sewer that occur after the construction phase of development is completed. Controls for construction activities are addressed later in today's rule. One commenter noted the feasibility of developing management plans for newly developing areas. EPA agrees with this comment and has retained that portion of the regulation that deals with a description of controls for areas of new development. Similarly, one municipality stressed the importance and achievability of addressing storm water discharges from construction sites.

As urban development occurs, the volume of storm water and its rate of discharge increases. These increases are caused when pavement and structures cover soils and destroy vegetation which otherwise would slow and absorb runoff. Development also accelerates erosion through alteration of the land surface. Areas that are in the process of development offer the greatest potential for utilizing the full range of structural and non-structural best management practices. If these measures are to provide controls to reduce pollutant discharges after the area has been developed, comprehensive planning must be used to incorporate these measures as the area is in the process of developing. These measures offer an important opportunity to limit increases in pollutant loads.

The third component of § 122.26(d)(2)(iv)(A) provides a description of practices for operating and maintaining public roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems. General guidelines recommended for managing highway storm water runoff include litter control, pesticide/herbicide use management, reducing direct discharges, reducing runoff velocity, grassed channels, curb elimination, catchbasin maintenance, appropriate streetcleaning, establishing and maintaining vegetation, development of management controls for salt storage facilities, education and calibration practices for deicing application, infiltration practices, and detention/retention practices.

The fourth component of § 122.26(d)(2)(iv)(A) provides that applicants identify procedures that enable flood management agencies to consider the impact of flood management projects on the water quality of receiving streams. A well-developed storm water management program can reduce the amount of pollutants in storm water discharges as well as benefit flood control objectives. As discussed above, increased development can increase both the quantity of runoff from commercial and residential areas and the pollutant load associated with such discharges. Disturbing the land cover, altering natural drainage patterns, and increasing impervious area all increase the quantity and rate of runoff, thereby increasing both erosion and flooding potential. An integrated planning approach helps planners make the best decisions to benefit both flood control and water quality objectives.

The fifth component of § 122.26(d)(2)(iv)(A) would provide that municipal applicants submit a description of a program to reduce, to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer. Such a program may include controls such as educational activities and other measures for commercial applicators and distributors and controls for application in public rights-of-way and at municipal facilities. Discharges of these materials to municipal storm sewer systems can be controlled by proper application of these materials. Some commenters noted that insecticides used in residential areas are a probable source of pollutants in storm water discharges from residential areas, as well as salting and other de-icing activities. In response to this comment, part of a community management plan may include controls or education programs to limit the impacts of these sources of pollutants. One commenter noted that many communities already have household toxic disposal programs. Where appropriate these can be incorporated into municipal management programs.

Some commenters suggested substituting the management program description for residential and commercial areas with a simple identification of applicable management practices. EPA agrees that identification of appropriate management practices is a critical component of a program description for these areas. In essence, this is what the program description is designed to achieve. However, for the reasons discussed in greater detail above, EPA is convinced that an appropriate program must address all of the components of the management program for residential and commercial areas that are outlined in today's rule. Further, for the purposes of writing a permit with enforceable conditions, the application should identify a schedule to implement management practices. The applicant should be able to estimate the reduction in pollutant loads as a result of the development of certain management practices and programs (§ 122.26(d)(2)(v). A program may also include public education programs, which are not necessarily viewed as traditional BMPs.

b. *Measures for illicit discharges and improper disposal.* The CWA requires that NPDES permits for discharges from municipal storm sewers "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." In today's rule, EPA will begin to implement this statutory mandate by focusing on two types of discharges to large and medium municipal separate storm sewer systems. *See* § 122.26(d)(1)(iv)(D) and (d)(2)(iv)(B). One type of non-storm water discharges are illicit discharges which are plumbed into the system or that result from leakage of sanitary sewage system. The other class of non-storm water discharges result from the improper disposal of materials such as used oil and other toxic materials.

Illicit discharges. In some municipalities, illicit connections of sanitary, commercial and industrial discharges to storm sewer systems have had a significant impact on the water quality of receiving waters. Although the

NURP study did not emphasize identifying illicit connections to storm sewers other than to assure that monitoring sites used in the study were free from sanitary sewage contamination, the study concluded that illicit connections can result in high bacterial counts and dangers to public health. The study also noted that removing such discharges presented opportunities for dramatic improvements in the quality of urban storm water discharges.

Other studies have shown that illicit connections to storm sewers can create severe, wide-spread contamination problems. For example, the Huron River Pollution Abatement Program inspected 660 businesses, homes and other buildings located in Washtenaw County, Michigan and identified 14% of the buildings as having improper storm drain connections. Illicit discharges were detected at a higher rate of 60% for automobile related businesses, including service stations, automobile dealerships, car washes, body shops and light industrial facilities. While some of the problems discovered in this study were the result of improper plumbing or illegal connections, a majority were approved connections at the time they were built. Many commenters emphasized the identification and elimination of illicit connections as a priority, including leakage from sanitary sewers. EPA agrees with these comments and intends to retain this portion of the program without modification.

A wide variety of technologies exist for detecting illicit discharges. The effectiveness of these measures largely depends upon the site-specific design of the system. Under today's rule, permit applicants would develop a description of a proposed management program, including priorities for implementing the program and a schedule to implement a program to identify illicit discharges to the municipal storm sewer system. This rulemaking will require the initial priorities for analyzing various portions of the system and the appropriate detection techniques to be used.

Improper disposal. The permit application requirements for municipal storm sewer systems include a requirement that the municipal permit applicant describe a program to assist and facilitate in the proper management of used oil and toxic materials. Improper management of used oil can lead to discharges to municipal storm sewers that in turn may have a significant impact on receiving water bodies. EPA estimates that, annually, 267 million gallons of used oil, including 135 million gallons of used oil from do-it-yourself automobile oil changes, are disposed of improperly. An additional 70 million gallons of used oil, most coming from service stations and repair shops, are used for road oiling. Many commenters emphasized the elimination of discharges composed of improperly disposed of oil and toxic material. One commenter identified motor oil as the major source of oil contamination and that EPA needs to encourage proper disposal of used oil. Several other commenters emphasized the importance of recycling programs for oil. EPA agrees with these comments and intends to retain this portion of the program without modification. One commenter identified public awareness and timely reporting of illegal dumping as critical components of this portion of the program. EPA agrees with this comment and intends for management programs to deal with this problem.

c. *Measures to reduce pollutants in storm water discharges through municipal separate storm sewers from municipal landfills, hazardous waste treatment, disposal and recovery facilities that are subject to section 313 of title III of SARA.* As discussed in section VI.C of today's preamble, industrial facilities that discharge storm water through a large or medium municipal separate storm sewer system are required to apply for a permit under § 122.26(c) or seek coverage under a promulgated general permit. Today's rule also requires the municipal storm sewer permittee to describe a program to address industrial dischargers that are covered under the municipal storm sewer permit. Today's rule requires the municipal applicant to identify such discharges (*see* source identification requirements under § 122.26(d)(2)(ii)), provide a description of a program to monitor pollutants in runoff from certain industrial facilities that discharge to the municipal separate storm sewer system, identify priorities and procedures for inspections, and establish and implement control measures for such discharges. Should a municipality suspect that an individual discharger is discharging pollutants in storm water above acceptable limits, and the owner/operator of the system has no authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action. Two example of possible action are: if the facility already has an individual permit, the permit may be reopened and further controls imposed; or if the facility is covered by a promulgated general permit, then an individual site-specific permit application may be required.

In the December 7, 1988, proposal, EPA requested comments concerning what storm water discharges from industrial facilities through municipal systems should be monitored. One of the proposed approaches was to require data on portions of the municipal system which receive storm water from facilities which are listed in the proposed regulatory definition at § 122.26(b)(14) of "storm water discharge associated with industrial activity" (with the exception of construction activities and uncontaminated storm water from oil and gas operations) which discharge through the municipal system. However, given the large number of facilities meeting this definition that discharge through municipal systems, a monitoring program that requires the submission of quantitative data regarding portions of the municipal systems receiving storm water from such facilities may not be practicable. Such a requirement could, for some systems, potentially become the most resource intensive requirements in the municipal permit. Therefore, EPA proposed various ways to develop appropriate targeting for monitoring programs.

EPA requested comments on a requirement that, at a minimum, monitoring programs address discharges from municipal separate storm sewer outfalls that contain storm water discharges from municipal landfills, hazardous waste treatment, disposal and recovery facilities, and runoff from industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA). Section 313 of title III requires that operators or certain facilities that manufacture, import, process, or otherwise use certain toxic chemicals report annually their releases of those chemicals to any environmental media. Section 313(b) of title III specifies that a facility is covered for the purposes of reporting if it meets all of the following criteria:

- The facility has ten or more full-time employees;
- The facility is in Standard Industrial Classification (SIC) codes 20 through 39;
- The facility manufactured (including quantities imported), processed, or otherwise used a listed chemical in amounts that exceed certain threshold quantities during the calendar year for which reporting is required.

Listed chemicals include 329 toxic chemicals listed at 40 CFR 372.45. After 1989, the threshold quantities of listed chemicals that the facility must manufacture, import or process (in order to trigger the submission of a release

report) is 25,000 pounds per year. The threshold for a use other than manufacturing, importing or processing of listed toxic chemicals is 10,000 pounds per year. EPA promulgated a final regulation clarifying these reporting requirements on February 16, 1988, (53 FR 4500).

EPA received numerous comments regarding limiting the types of facilities that are initially subject to monitoring and municipal management programs. Numerous municipalities agreed that focusing on the above facilities is an appropriate means for setting priorities for the development of control measures to eliminate or reduce pollutants associated with industrial facilities. Commenters agreed that the potential for toxic materials in discharges is high because of the high volume of such materials at these facilities and that information regarding discharges and material management practices will be available through section 313 of SARA. One commenter noted that building on an established program will contribute to establishing an effective storm water program. Accordingly, EPA has specified at § 122.26(d)(2)(ii)(C) that the municipal applicant must describe a program that identifies priorities and procedures for inspections and establishing and implementing control measures for these facilities.

Several commenters suggested that these facilities should not be singled out because the presence of the threshold amounts of SARA 313 chemicals does not indicate that significant quantities of those chemicals are likely to enter the facility's storm water runoff. Instead it was suggested that municipalities should monitor storm sewers as a whole to determine what chemicals are present and therefore what facilities are responsible. EPA disagrees with these comments. The object of these requirements is initially to set priorities for monitoring requirements. Then, if the situation requires, controls can be developed and instituted. If a facility is a member of this class of facilities and does not discharge excessive quantities of SARA 313 chemicals, then it may not be subjected to further monitoring and controls. As noted above, the selection of facilities is only a means of setting priorities for facilities for the development of municipal plans.

EPA agrees, however, that there will be other facilities that are significant sources of pollutants and should be addressed by municipalities as soon as possible under management programs. Accordingly, those industrial facilities that the municipal permit applicant determines to be contributing a substantial pollutant loading to the municipal storm sewer system shall be addressed in this portion of the municipal management program.

EPA also requested comments on monitoring programs for municipal discharges including the submission of quantitative data on the following constituents;

- Any pollutants limited in an effluent guidelines for the industry subcategories, where applicable;
- Any pollutant listed in a discharging facility's NPDES permits for process wastewater, where applicable;
- Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;
- Any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

These are the same constituents that are to be addressed in individual permit applicants for storm water discharges associated with industrial activity.

Several industries and municipalities submitted comments on this issue. Some commenters agreed that these are appropriate parameters. Some commenters advised that the ability of municipalities to implement this aspect of the program depended on industries submitting this data. Several industries provided comments suggesting that the approach should allow the permittee flexibility in determining which parameters are chosen because of the burdens of monitoring and the complexity of materials and flows in municipal systems.

In light of these comments, EPA has retained § 122.26(d)(2)(iv)(C) as proposed requiring municipalities to describe a monitoring program which utilizes the above parameters. Monitoring for these parameters provides consistency with the individual application requirements for industries, provides uniformity in municipal applications, and will narrow the parameters to conform to the types of industries discharging into the municipal systems. Monitoring programs may consist of programs undertaken by the municipality exclusively or requirements imposed on industry by the municipality, or a combination of approaches. Appropriate procedures are discussed in municipal permit application guidance.

EPA requested comments on appropriate means for municipalities to determine what facilities are contributing pollutants to municipal systems. Many commenters responded with numerous methodologies. Some of these have been addressed in guidance. Municipalities will have options in selecting the most appropriate methodology given their circumstances as described in their permit applications.

EPA initially favors establishing monitoring requirements to be applied to those outfalls that directly discharge to waters of the United States. EPA received one comment from a municipality with regard to this issue which agreed that this was the most logical approach. Monitoring of outfalls close to the point of discharge to waters of the United States is generally preferable when attempting to identify priorities for developing pollutant control programs. However, under certain circumstances, it may be preferable to monitor at the point where the runoff from the industrial facility discharges to the municipal system. For example, if many facilities discharge substantially similar storm water to a municipal system it may be more practicable to monitor discharges from representative facilities in order to characterize pollutants in the discharge.

As noted by numerous industries, if municipal characterization plans reveal problems from certain industrial dischargers, then such facilities may be required to provide further data from their own monitoring. As noted above, EPA envisions that this data could then be used to develop appropriate control practices or techniques and/or require individual permit applications if a general permit covering the facility proves inadequate.

Comments were also solicited as to whether end-of-pipe treatment generally was more appropriate than source controls for storm water from industrial facilities which discharge to municipal systems. Many commenters, including both municipalities and industries, stated that source controls are the only practical and feasible means of controlling pollutants in storm water runoff, and specifically opposed the concept of end-of-pipe treatment or other controls. Some commenters maintained that, from an economic and environmental standpoint, end-of-pipe treatment may be the only effective means. One advised that the prompt cleanup of spills, controlled wash down of process areas, covering of material loading areas, storm water runoff diversion, covered storage areas, detention basins or other such mechanisms would prevent storm water from mixing with pollutants and possibly discharging them into receiving waters. Another noted that in the urban areas, there is little potential for treatment; consequently, it would seem

that controls and/or retrofitting existing facilities would be necessary when violations are found and that citizens will be better served by source controls appropriate to the individual problem.

EPA agrees with these comments to the extent that source controls and management programs are the general thrust of these regulations. However, in some situations end-of-pipe treatment, such as holding ponds, may be the only reasonable alternative. EPA disagrees with one industrial commenter that the municipalities should be almost entirely responsible for treating municipal discharges at the end of-the-pipe without reliance on source controls by industrial dischargers. Municipal programs may require controls on industrial sources with demonstrated storm water discharge problems. One industrial association noted that its member companies already have incentive to properly handle their materials and facilities because of other environmental programs with spill and erosion controls.

Numerous commenters stated that the program addressing industrial dischargers through municipal systems needs to be clearly defined in order to eliminate, as much as possible, potential conflicts between the system operator and dischargers. EPA has provided a framework for development of management plans to control pollutants from these particular sources. However, because of the differences in municipal systems and hydrology nationwide, EPA is not convinced that program specificity is an appropriate approach. The concept of the management program is to provide flexibility to the permit applicants to develop regional site specific control programs.

One commenter suggested that required controls should be limited to a facility's proportional contribution (based on concentration) of pollutants. EPA disagrees. Most facilities discharging through a municipal separate storm sewer will need to be covered by a general or individual permit. These permits will control the introduction of pollutants from that facility through the municipal storm sewer to the waters of the U.S. Any additional controls placed on the facility by the municipality will be at the discretion of the municipality. EPA is not requiring municipalities to adopt a particular level of controls on industrial facilities as suggested by the commenter.

One commenter questioned how dischargers that discharged both into the waters of the United States and through a municipal system will be addressed and whether there is a potential for inconsistent requirements. Industries that discharge storm water associated with industrial activity into the waters of the United States are required to be covered by individual permits or general permits for such discharges. Dischargers of storm water associated with industrial activity through municipal separate storm sewer systems will be subject to municipal management programs that address such discharges as well as to an individual or general NPDES permit for those discharges. EPA does not believe there is a significant risk of inconsistent requirements, since each industrial facility must meet BAT/BCT-level controls in its NPDES permit. EPA doubts that municipalities will impose much more stringent controls.

Many commenters stated that if cities and municipalities are to be responsible for industrial storm water discharges through their system, then municipalities should have authority to make determinations as to what industries should be regulated, how they are regulated, and when enforcement actions are undertaken. In response, EPA notes that the proposal has been changed and that municipalities will not be solely responsible for industries discharging through their system. Nonetheless, municipalities will be required to meet the terms of their permits related to industrial dischargers. Municipalities may undertake programs that go beyond the threshold requirements of the permit. Some municipal entities stated that municipal permittees should be able to require permit applications from industries in the same manner that EPA does and also require permits. In response, if operators of large and medium municipal separate storm sewer systems wish to employ such a program, then this portion of the management program may incorporate such practices.

d. *Measures to reduce pollutants in runoff from construction sites into municipal systems.* Section VI.F.8 of today's rule discusses EPA's proposal to define the term "storm water discharge associated with industrial activity" to include runoff from construction sites, including preconstruction activities except operations that result in the disturbance of less than 5 acres total land area which are not part of a larger common plan of development or sale. Under today's rule, facilities that discharge runoff from construction sites that meet this definition will be required to submit permit applications unless they are to be covered by another individual or general NPDES permit. Permit application requirements for such discharges are at 40 CFR 122.26(c)(1)(ii).

Section 122.26(d)(2)(iv)(D) of today's rule requires applicants for a permit for large or medium municipal separate storm sewer systems to submit a description of a proposed management program to control pollutants in construction site runoff that discharges to municipal systems. Under this provision, municipal applicants will submit a description of a program for implementing and maintaining structural and non-structural best management practices for controlling storm water runoff at construction sites. The program will address procedures for site planning, enforceable requirements for nonstructural and structural best management practices, procedures for inspecting sites and enforcing control measures, and educational and training measures. Generally, construction site ordinances are effective when they are implemented. However, in many areas, even though ordinances exist, they have limited effectiveness because they are not adequately implemented. Maintaining best management practices also presents problems. Retention and infiltration basins fill up and silt fences may break or be overtopped. Weak inspection and enforcement point to the need for more emphasis on training and education to complement regulatory programs. Permits issued to municipalities will address these concerns.

8. Assessment of Controls

EPA proposed that municipal applicants provide an initial assessment of the effectiveness of the control method for structural or non-structural controls which have been proposed in the management program. Some commenters stated that the assessment of controls should be left to the term of the permit because the effectiveness of controls will be hard to establish. EPA believes that an initial estimate or assessment is needed because the performance of appropriate management controls is highly dependent on site-specific factors. The assessment will be used in conjunction with the development of pollutant loading and concentration estimates (*see* VI.H.6.c) and the evaluation of water quality benefits associated with implementing controls. Such assessments do not have to be verified with quantitative data, but can be based on accepted engineering design practices. Further more precise assessments based upon quantitative data can be undertaken during the term of the permit.

I. Annual Reports

As discussed earlier in today's preamble, EPA has provided for proposed flexible permit application requirements to facilitate the development of site-specific programs to control the discharge of pollutants from large and medium municipal separate storm sewer systems. Many municipalities are in the early stages of the complex task of developing a program suitable for controlling pollutants in discharges under a NPDES permit, while other municipalities have relatively sophisticated programs in place. In order to ensure that such site-specific programs are developed in a timely manner, EPA proposed to require permittees of municipal separate storm sewer systems to submit status reports every year which reflect the development of their control programs.

The reports will be used by the permitting authority to aid in evaluating compliance with permit conditions and where necessary, modify permit conditions to address changed conditions. EPA requested comments on the appropriate content of the annual reports. Based on these comments EPA has added the following in these reports: an analysis of data, including monitoring data, that is accumulated throughout the year; new outfalls or discharges; annual expenditures; identification of water quality improvements or degradation on watershed basis; budget for year following each annual report; and administrative information including enforcement activities, inspections, and public education programs. EPA views this information as important for evaluating the municipal program. Annual monitoring data and identified water quality improvements are important for evaluating the success of management programs in reducing pollutants. If new outfalls come into existence during the term of the permit, these may be sources of pollutants and appropriate permit conditions will be developed. Annual reports should reflect the level of enforcement activity and inspections undertaken to ensure that the legal authority developed by the municipality is properly exercised. Many of the management programs depend upon an ongoing high level of public education. Accordingly, the undertaking of these programs on an annual basis should be documented.

J. Application Deadlines

The CWA provided a statutory time frame for implementing the storm water permit application process and issuance and compliance with permits.

The CWA requires EPA to promulgate permit application requirements for storm water discharges associated with industrial activity and for large municipal separate storm sewer systems by "no later than two years" after the date of enactment (*i.e.* no later than February 4, 1989). In conjunction with this requirement, the Act requires that permit applications for these classes of discharges be submitted within one year after the statutory date by which EPA is to promulgate permit application requirements by providing that such applications "shall be filed no later than three years" after the date of enactment of the WQA (*i.e.*, no later than February 4, 1990).

The CWA also requires EPA to promulgate final regulations governing storm water permit application requirements for discharges from municipal separate storm sewer systems serving a population of 100,000 or more but less than 250,000 by "no later than four years" after enactment (*i.e.* no later than February 4, 1991). Permit applications for medium municipal separate storm sewer systems "shall be filed no later than five years" after the date of enactment of the CWA (*i.e.*, no later than February 4, 1992). The CWA did not establish the time period between designation and permit application submittal for case-by-case designations under section 402(p)(2)(E).

Comments on earlier rulemakings involving storm water application deadlines have established that applicants need adequate time to obtain "representative" storm water samples. Many commenters have indicated that at least one full year is needed to obtain such samples. This is because many discharges are located in areas where testing during dry seasons or winter would not be feasible. The intermittent and unpredictable nature of storm water discharges can result in difficult and time-consuming data gathering. Moreover, some operators of municipal separate storm sewer systems have many storm water discharges associated with industrial activity, which can require considerable time to identify, analyze, and submit applications. This creates a tremendous practical problem for the extremely high number of unpermitted storm water discharges. The public's interest in a sound storm water program and the development of a useful storm water data base is best served by establishing an application deadline which will allow sufficient time to gather, analyze, and prepare meaningful applications. Based on a consideration of these factors, EPA proposed that individual permit applications for storm water discharges associated with industrial activity which currently are not covered by a permit and that are required to obtain a permit, be submitted one year after the final rule is promulgated.

EPA received numerous comments from industries on the one year requirement for submitting applications. Several commenters supported the proposed deadline as realistic, while others believed more time was needed to meet the information and quantitative requirement.

EPA rejects the assertion by some commenters that a year is too short a period of time to obtain the required quantitative data. Today's rule generally requires applications for storm water discharges associated with industrial activity to be submitted on or before November 18, 1991. Operators of storm water discharges associated with industrial activity which discharge through a municipal separate storm sewer are subject to the same application deadline as other storm water discharges associated with industrial activity. Since final regulation at § 122.21(g)(7) provides considerable latitude for selecting rain events for quantitative data, EPA is convinced that in most cases data can be obtained during the one year time frame. If data cannot be collected during the one year time frame because of anomalous weather (*e.g.* drought conditions), then permitting authorities may grant additional time for submitting that data on a case-by-case basis. *See* § 122.21(g)(7).

Operators of storm water discharges which are currently covered by a permit will not be required to submit a permit application until their existing permit expires. In recognition of the time required to collect storm water discharge data, EPA will allow facilities which currently have a NPDES permit for a storm water discharge and which must reapply for permit renewal during the first year following promulgation of today's permit application requirements the option of applying in accordance with existing Form 1 and Form 2C requirements (in lieu of applying in accordance with the revised application requirements).

As discussed in section VI.D.4 and section VI.F.6 of today's preamble, EPA has established a two part permit application both for both group applications for sufficiently similar facilities that discharge storm water associated with industrial activity and for operators of large or medium municipal separate storm sewer systems. The deadlines for submitting

permit applications in today's rule provide adequate time for: (1) Applicants to prepare Part 1 of the application; (2) EPA or an approved State to adequately review applications; and (3) applicants to prepare the contents of the part 2 application.

Part 1 of the group application for storm water discharges associated with industrial activity must be submitted within 120 days from the publication of these final permit application regulations. This time is necessary to form groups and for individual members of the group to prepare the non-quantitative information required in part 1 of the application. Part 1 of the group application will be submitted to EPA Headquarters in Washington, DC and reviewed within 60 days after being received. Part 2 of the application would then be submitted within one year after the part 1 application is approved. It should be noted that many facilities located in States in which general permits can be issued, will be eligible for coverage by a storm water general permit to be promulgated in the near future. Such facilities may either seek coverage under such general permits or participate in the group application.

Several comments were received by EPA that indicated that a period of 120 days was too short a period for groups to be formed. EPA disagrees with these comments. The information that EPA is requiring to be submitted by the group or group representative is information that is generally available such as the location of the facility, its industrial activity, and material management practices. EPA believes that 120 days is sufficient to gather and submit this information along with an identification of 10% of the facilities which will submit quantitative data. To ameliorate any difficulties for applicants, EPA has provided a means for late facilities to "add on" where appropriate, on a case-by-case basis, as discussed in section VI.F.4. above.

Several comments were received with regard to the requirement that new dischargers submit an application at least 180 days before the date on which the discharge is to commence. One commenter noted that it will be difficult for a facility to know when a storm water discharge is to commence since precipitation and runoff cannot be predicted to any degree of accuracy. In response, new dischargers must apply for a storm water permit application 180 days before that facility commences manufacturing, processing, or raw material storage operations which may result in the discharge of pollutants from storm water runoff, and 90 days for new construction sites.

For large municipal separate storm sewer systems (systems serving a population of more than 250,000), EPA proposed that part 1 of the permit application be submitted within one year of the date of the final regulations, with approval or disapproval by the permit issuing authority of the provisions of the part 1 permit application within 90 days after receiving part 1 of the application. The Part 2 portion of the application was to be submitted within two years of the date of promulgation.

For medium municipal separate storm sewer systems (systems serving a population of more than 100,000, but less than 250,000), EPA proposed that permit applications would be required nine months after the date of the final rule, with approval or disapproval of the provisions of the part 1 permit application within 90 days after receiving the part 1 application. The part 2 portion of the application would then be submitted no later than one year after the part 1 application has been approved.

Numerous comments were received by EPA from municipalities on these proposed deadlines. Many of these comments reflect the sentiment that the deadlines are too tight and that the required information would not be available for submission within the required time frame. Some commenters suggested deadlines that would add over three years to the permit application process. Other commenters suggested a revamped application process and a shorter deadline of 18 months. Some commenters explained that additional time would be needed to obtain adequate legal authority, while another stated that an inventory of outfalls required more time. One commenter maintained that intergovernmental agreements will require more time to prepare, and others expressed the view that more time was needed for the review of part 1 of the application by permitting authorities. Others felt more time was needed for collecting data, or hiring additional staff to accomplish the work. Most of these commenters did not provide specific details regarding what would be an appropriate amount of time and why.

After reviewing these comments EPA has decided to modify some of the deadlines as proposed. EPA is convinced that to properly achieve the goals of the CWA, the permit application requirements as discussed in previous sections are appropriate; but that the deadlines for medium municipal separate storm sewer systems should be adjusted so that the program's goals can be properly accomplished. After reviewing comments, EPA believes that medium municipalities will have fewer resources and existing institutional arrangements than large cities and therefore more time should be granted to these cities for submitting parts 1 and 2 of the application.

Accordingly EPA will require large municipal systems to submit part 1 of the permit application no later than November 18, 1991. Part 1 will be reviewed and approved or disapproved by the Director within 90 days. Part 2 of the application will then be submitted November 16, 1992. Medium municipal systems will submit part 1 of the application on May 18, 1992. Approval or disapproval by the Director will be accomplished within 90 days. Part 2 of the application will be submitted by May 17, 1993. These deadlines will give large systems two years to complete the application process, and medium systems 2 years and 6 months to submit applications. EPA is convinced that the permit application schedule is warranted and should provide adequate time to prepare the application.

In establishing these regulatory deadlines EPA is fully aware that they are not synchronized with the statutory deadlines as established by Congress. One commenter argued that the deadlines as proposed were contrary to the deadlines established by Congress and that EPA had no authority to extend these deadlines. (For large municipal separate storm sewer systems and storm water discharges associated with industrial activity, Congress established a deadline of February 4, 1990, for submission of permit applications; for medium municipal separate storm sewer systems, the deadline is February 4, 1992.) In response, this regulation provides certain deadlines for meeting the substantive requirements of this rulemaking—requirements which EPA is convinced are necessary for the development of enforceable and sound storm water permits. EPA believes it is important to give applicants sufficient time to reasonably comply with the permit application requirements set out today. EPA will therefore accept applications for storm water discharge permits up to the dates specified in today's rule. By establishing these regulatory deadlines, however, EPA is not attempting to waive or revoke the statutory deadlines established in Section 402(p) of the CWA and does not assert the authority to do so. The statutory permit application deadlines

continue to be enforceable requirements.

EPA was not able to promulgate the final application regulations for storm water discharges before the February 4, 1990, deadline for industrial and large municipal dischargers despite its best efforts. Further, as noted above, EPA is not able to waive the statutory deadline. Dischargers concerned with complying with the statutory deadline should submit a permit application as required under this rulemaking as expeditiously as possible.

Operators of storm water discharges that are not specifically required to file a permit application under today's rule may be required to obtain a permit for their discharge on the basis of a case-by-case designation by the Administrator or the NPDES State.

The Administrator or NPDES State may also designate storm water discharges (except agricultural storm water discharges), that contribute to a violation of a water quality standard or that are significant contributors of pollutants to waters of the United States for a permit. Prior to a case-by-case determination that an individual permit is required for a storm water discharge, the Administrator or NPDES State may require the operator of the discharge to submit a permit application. 40 CFR 124.52(c) requires the operator of designated storm water discharges to submit a permit application within 60 days of notice, unless permission for a later date is granted. The 60-day deadline is consistent with the procedures for designating other discharges for a NPDES permit on a case-by-case basis found at 40 CFR 124.52. The 60-day deadline recognizes that case-by-case designations often require an expedited response, however, flexibility exists to allow for case-by-case extensions.

The December 7, 1988, proposal also proposed Part 504 State Storm Water Management Programs. The Agency has not included this component in today's rule. The Agency believes this program element is appropriate for addressing in regulations promulgated under section 402(p)(6) of the CWA.

VII. Economic Impact

EPA has prepared an Information Collection Request for the purpose of estimating the information collection burden imposed on Federal, State and local governments and industry for revisions to NPDES permit application requirements for storm water discharges codified in 40 CFR part 122. EPA is promulgating these revisions in response to Section 402(p)(4) of the Clean Water Act, as amended by the Water Quality Act of 1987 (WQA). The revisions would apply to: Storm water discharges associated with industrial activity; discharges from municipal separate storm sewer systems serving a population of 250,000 or more and discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000.

The estimated annual cost of applying for NPDES permits for discharges from municipal separate storm sewer systems is $4.2 million. EPA estimates that an average permit application for a large municipality will cost $76,681 and require 4,534 hours to prepare. The average application for a medium municipality will cost $49,249 (2,912 hours) to prepare. The annual respondent cost for NPDES permit applications, notices of intent, and notifications for facilities with discharges associated with industrial activity is estimated to be $9.5 million (271,248 hours). EPA estimates that the average preparation cost of an individual industrial permit application would be $1,007 (28.6 hours). Average Group application will cost $74.00 per facility (2.1 hours). The average cost of the notification and notice of intent to be covered by general permit is $17.00 (0.5 hours).

The annual cost to the Federal Government and approved States for administration of the program is estimated to be $588,603. The total cost for municipalities, industry, and State and Federal authorities is estimated to be $14.5 million annually.

In general, the cost estimates provided in the ICR focus primarily on the costs associated with developing, submitting and reviewing the permit applications associated with today's rule. EPA will continue to evaluate procedures and methods to control storm water discharges to the extent necessary to mitigate impacts on water quality in the studies required under section 402(p)(5) of the CWA. Executive Order 12291 requires EPA and other agencies to perform regulatory analyses of major regulations. Major rules are those which impose a cost on the economy of $100 million or more annually or have certain other economic impacts. Today's proposed amendments would generally make the NPDES permit application regulations more flexible and less burdensome for the regulated community. These regulations do not, satisfy any of the criteria specified in section 1(b) of the Executive Order and, as such, do not constitute a major rule. This regulation was submitted to the Office of Management and Budget (OMB) for review.

VIII. Paperwork Reduction Act

The information collection requirements in this rule have been submitted for approval to the Office of Management and Budget (OMB) under provision of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.* and have been assigned OMB control number 2040–0086.

Public reporting burden for permit applications for storm water discharges associated with industrial activity (other than from construction facilities) is estimated to average 28.6 hours per individual permit application, 0.5 hours per notice of intent to be covered by general permit, and 2.1 hours per group applicant. The public reporting burden for permit applications for storm water discharges associated with industrial activity from construction activities submitting individual applications is estimated to average 4.5 hours per response. The public reporting burden for facilities which discharge storm water associated with industrial activity to municipal separate storm sewers serving a population over 100,000 to notify the operator of the municipal separate storm sewer system is estimated to average 0.5 hours per response.

The reporting burden for system-wide permit applications for discharges from municipal separate storm sewer systems serving a population of 250,000 or more is estimated to average 4,534 hours per response. The reporting burden for system-wide permit applications for discharges from municipal separate storm sewer systems serving a population of 100,000 or more, but less than 250,000 is estimated to average 2,912 hours per response. Estimates of reporting burden include time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

IX. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.*, EPA is required to prepare a Regulatory Flexibility Analysis to assess the impact of rules on small entities. No Regulatory Flexibility Analysis is required, however, where the head of the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities.

Today's amendments to the regulations would generally make the NPDES permit applications regulations more flexible and less burdensome for permittees. Accordingly, I hereby

certify, pursuant to 5 U.S.C. 605(b), that these amendments do not, have a significant impact on a substantial number of small entities.

List of Subjects in 40 CFR Parts 122, 123, and 124

Administrative practice and procedure, Environmental protection, Reporting and recordkeeping requirements, Water pollution control.

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

Dated: October 31, 1990.

William K. Reilly,

Administrator.

For the reasons stated in the preamble, parts 122, 123, and 124 of title 40 of the Code of Federal Regulations are amended as follows:

PART 122—EPA ADMINISTERED PERMIT PROGRAMS; THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Subpart B—Permit Application and Special NPDES Program Requirements

1. The authority citation for part 122 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

2. Section 122.1 is amended by revising paragraph (b)(2)(iv) to read as follows:

§ 122.1 Purpose and scope.

* * * * *

(b) * * *

(2) * * *

(iv) Discharges of storm water as set forth in § 122.26; and

* * * * *

3. Section 122.21 is amended by revising paragraph (c)(1), by removing the last sentence of paragraph (f)(7), by removing paragraph (f)(9), by adding two sentences at the end of paragraph (g)(3), by revising paragraph (g)(7) introductory text, by removing and reserving paragraph (g)(10) and by revising the introductory text of paragraph (k) to read as follows:

§ 122.21 Application for a permit (applicable to State programs, see § 123.25).

* * * * *

(c) *Time to apply.* (1) Any person proposing a new discharge, shall submit an application at least 180 days before the date on which the discharge is to commence, unless permission for a later date has been granted by the Director. Facilities proposing a new discharge of storm water associated with industrial activity shall submit an application 180 days before that facility commences industrial activity which may result in a discharge of storm water associated with that industrial activity. Facilities described under § 122.26(b)(14)(x) shall submit applications at least 90 days before the date on which construction is to commence. Different submittal dates may be required under the terms of applicable general permits. Persons proposing a new discharge are encouraged to submit their applications well in advance of the 90 or 180 day requirements to avoid delay. See also paragraph (k) of this section and § 122.26 (c)(1)(i)(G) and (c)(1)(ii).

* * * * *

(g) * * *

(3) * * * The average flow of point sources composed of storm water may be estimated. The basis for the rainfall event and the method of estimation must be indicated.

* * * * *

(7) *Effluent characteristics.* Information on the discharge of pollutants specified in this paragraph (except information on storm water discharges which is to be provided as specified in § 122.26). When "quantitative data" for a pollutant are required, the applicant must collect a sample of effluent and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. When an applicant has two or more outfalls with substantially identical effluents, the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls. The requirements in paragraphs (g)(7) (iii) and (iv) of this section that an applicant must provide quantitative data for certain pollutants known or believed to be present do not apply to pollutants present in a discharge solely as the result of their presence in intake water; however, an applicant must report such pollutants as present. Grab samples must be used for pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform and fecal streptococcus. For all other pollutants, 24-hour composite samples must be used. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period greater than 24 hours. In addition, for discharges other than storm water discharges, the Director may waive composite sampling for any outfall for which the applicant demonstrates that the use of an automatic sampler is infeasible and that the minimum of four (4) grab samples will be a representative sample of the effluent being discharged. For storm water discharges, all samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area. For all applicants, a flow-weighted composite shall be taken for either the entire discharge or for the first three hours of the discharge. The flow-weighted composite sample for a storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes (applicants submitting permit applications for storm water discharges under § 122.26(d) may collect flow weighted composite samples using different protocols with respect to the time duration between the collection of sample aliquots, subject to the approval of the Director). However, a minimum of one grab sample may be taken for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours. For a flow-weighted composite sample, only one analysis of the composite of aliquots is required. For storm water discharge samples taken from discharges associated with industrial activities, quantitative data must be reported for the grab sample taken during the first thirty minutes (or as soon thereafter as practicable) of the discharge for all pollutants specified in § 122.26(c)(1). For all storm water permit applicants taking flow-weighted composites, quantitative data must be reported for all pollutants specified in § 122.26 except pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, fecal coliform, and fecal streptococcus. The Director may allow or establish appropriate site-specific sampling procedures or requirements, including sampling locations, the season in which the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled, the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rain fall), protocols for collecting samples under 40 CFR part 136, and additional time for submitting data on a

case-by-case basis. An applicant is expected to "know or have reason to believe" that a pollutant is present in an effluent based on an evaluation of the expected use, production, or storage of the pollutant, or on any previous analyses for the pollutant. (For example, any pesticide manufactured by a facility may be expected to be present in contaminated storm water runoff from the facility.)

* * * * *

(k) *Application requirements for new sources and new discharges.* New manufacturing, commercial, mining and silvicultural dischargers applying for NPDES permits (except for new discharges of facilities subject to the requirements of paragraph (h) of this section or new discharges of storm water associated with industrial activity which are subject to the requirements of § 122.26(c)(1) and this section (except as provided by § 122.26(c)(1)(ii)) shall provide the following information to the Director, using the application forms provided by the Director:

* * * * *

4. Section 122.22(b) introductory text is revised to read as follows:

§ 122.22 Signatories to permit applications and reports (applicable to State programs, see § 123.25).

* * * * *

(b) All reports required by permits, and other information requested by the Director shall be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

* * * * *

5. Section 122.26 is revised to read as follows:

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* (1) Prior to October 1, 1992, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2. The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2.

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(3) *Large and medium municipal separate storm sewer systems.* (i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(*1*) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due;

(*2*) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application;

(*3*) Each of the operators of municipal separate storm sewers within the systems described in paragraphs (b)(4)(i), (ii), and (iii) or (b)(7)(i), (ii), and (iii) of this section, that are under the purview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) *Discharges through large and medium municipal separate storm sewer systems.* In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge: the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) *Other municipal separate storm sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(6) *Non-municipal separate storm sewers.* For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue: a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system.

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(7) *Combined sewer systems.* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of § 122.21 and are not subject to the provisions of this section.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. *See* 40 CFR part 35, subpart I, appendix A(b)H.2.j.

(b) *Definitions.* (1) *Co-permittee* means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) *Illicit discharge* means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) *Incorporated place* means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (appendix F); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters: and

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.

(5) *Major municipal separate storm sewer outfall* (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) *Major outfall* means a major municipal separate storm sewer outfall.

(7) *Medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the latest Decennial Census by the Bureau of Census (appendix G); or

(ii) Located in the counties listed in appendix I, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) *Overburden* means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) *Runoff coefficient* means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) *Significant materials* includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

(13) *Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) *Storm water discharge associated with industrial activity* means the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 CFR part 122. For the categories of industries identified in paragraphs (b)(14) (i) through (x) of this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (b)(14)(xi) of this section, the term includes only storm water discharges from all the areas (except access roads and rail lines) that are listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in this paragraph (b)(14)(i)–(xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(1) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined

materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221–25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (b)(14) (i)–(vii) or (ix)–(xi) of this section are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with section 405 of the CWA;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221–25, (and which are not otherwise included within categories (ii)–(x));

(c) *Application requirements for storm water discharges associated with industrial activity*—(1) *Individual application.* Dischargers of storm water associated with industrial activity are required to apply for an individual permit, apply for a permit through a group application, or seek coverage under a promulgated storm water general permit. Facilities that are required to obtain an individual permit, or any discharge of storm water which the Director is evaluating for designation (*see* 40 CFR 124.52(c)) under paragraph (a)(1)(v) of this section and is not a municipal separate storm sewer, and which is not part of a group application described under paragraph (c)(2) of this section, shall submit an NPDES application in accordance with the requirements of § 122.21 as modified and supplemented by the provisions of the remainder of this paragraph. Applicants for discharges composed entirely of storm water shall submit Form 1 and Form 2F. Applicants for discharges composed of storm water and non-storm water shall submit Form 1, Form 2C, and Form 2F. Applicants for new sources or new discharges (as defined in § 122.2 of this part) composed of storm water and non-storm water shall submit Form 1, Form 2D, and Form 2F.

(i) Except as provided in § 122.26(c)(1)(ii)–(iv), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) of the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present area used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall (within a mile radius of the facility) and a narrative description of the following: Significant materials that in the three years prior to the submittal of this application have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of such materials; materials management practices employed, in the three years prior to the submittal of this application, to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge;

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by a NPDES permit; tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on-site drainage points that were directly observed during a test;

(D) Existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility that have taken place within the three years prior to the submittal of this application;

(E) Quantitative data based on samples collected during storm events and collected in accordance with § 122.21 of this part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(*1*) Any pollutant limited in an effluent guideline to which the facility is subject;

(*2*) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(*3*) Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;

(*4*) Any information on the discharge required under paragraph § 122.21(g)(7)(iii) and (iv) of this part;

(5) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(6) The date and duration (in hours) of the storm event(s) sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours);

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(i), (g)(7)(ii), and (g)(7)(v); and

(G) Operators of new sources or new discharges (as defined in § 122.2 of this part) which are composed in part or entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this section instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this section within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new source or new discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) The operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(14)(x) of this section, is exempt from the requirements of § 122.21(g) and paragraph (c)(1)(i) of this section. Such operator shall provide a narrative description of:

(A) The location (including a map) and the nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements;

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility:

(A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at anytime since November 16, 1987; or

(B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or

(C) Contributes to a violation of a water quality standard.

(iv) The operator of an existing or new discharge composed entirely of storm water from a mining operation is not required to submit a permit application unless the discharge has come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(v) Applicants shall provide such other information the Director may reasonably require under § 122.21(g)(13) of this part to determine whether to issue a permit and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) *Group application for discharges associated with industrial activity.* In lieu of individual applications or notice of intent to be covered by a general permit for storm water discharges associated with industrial activity, a group application may be filed by an entity representing a group of applicants (except facilities that have existing individual NPDES permits for storm water) that are part of the same subcategory (*see* 40 CFR subchapter N, part 405 to 471) or, where such grouping is inapplicable, are sufficiently similar as to be appropriate for general permit coverage under § 122.28 of this part. The part 1 application shall be submitted to the Office of Water Enforcement and Permits, U.S. EPA, 401 M Street, SW., Washington, DC 20460 (EN-336) for approval. Once a part 1 application is approved, group applicants are to submit Part 2 of the group application to the Office of Water Enforcement and Permits. A group application shall consist of:

(i) *Part 1.* Part 1 of a group application shall:

(A) Identify the participants in the group application by name and location. Facilities participating in the group application shall be listed in nine subdivisions, based on the facility location relative to the nine precipitation zones indicated in appendix E to this part.

(B) Include a narrative description summarizing the industrial activities of participants of the group application and explaining why the participants, as a whole, are sufficiently similar to be a covered by a general permit;

(C) Include a list of significant materials stored exposed to precipitation by participants in the group application and materials management practices employed to diminish contact by these materials with precipitation and storm water runoff;

(D) Identify ten percent of the dischargers participating in the group application (with a minimum of 10 dischargers, and either a minimum of two dischargers from each precipitation zone indicated in appendix E of this part in which ten or more members of the group are located, or one discharger from each precipitation zone indicated in appendix E of this part in which nine or fewer members of the group are located) from which quantitative data will be submitted in part 2. If more than 1,000 facilities are identified in a group application, no more than 100 dischargers must submit quantitative data in Part 2. Groups of between four and ten dischargers may be formed. However, in groups of between four and ten, at least half the facilities must submit quantitative data, and at least one facility in each precipitation zone in which members of the group are located must submit data. A description of why the facilities selected to perform sampling and analysis are representative of the group as a whole in terms of the information provided in paragraph (c)(1) (i)(B) and (i)(C) of this section, shall accompany this section. Different factors impacting the nature of the storm water discharges, such as processes used and material management, shall be represented, to the extent feasible, in a manner roughly equivalent to their proportion in the group.

(ii) *Part 2.* Part 2 of a group application shall contain quantitative

data (NPDES Form 2F), as modified by paragraph (c)(1) of this section, so that when part 1 and part 2 of the group application are taken together, a complete NPDES application (Form 1, Form 2C, and Form 2F) can be evaluated for each discharger identified in paragraph (c)(2)(i)(D) of this section.

(d) *Application requirements for large and medium municipal separate storm sewer discharges.* The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(v) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include;

(1) *Part 1.* Part 1 of the application shall consist of;

(i) *General information.* The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

(ii) *Legal authority.* A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

(iii) *Source identification.* (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost effective) extending one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(*1*) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(*2*) A description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area served by the separate storm sewer. For each land use type, an estimate of an average runoff coefficient shall be provided;

(*3*) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(*4*) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(*5*) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(*6*) The identification of publicly owned parks, recreational areas, and other open lands.

(iv) *Discharge characterization.* (A) Monthly mean rain and snow fall estimates (or summary of weather bureau data) and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of whether the water bodies receiving such discharges have been:

(*1*) Assessed and reported in section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(*2*) Listed under section 304(l)(1)(A)(i), section 304(l)(1)(A)(ii), or section 304(l)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(*3*) Listed in State Nonpoint Source Assessments required by section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards due to storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adding significant pollution (or contributing to a violation of water quality standards);

(*4*) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under section 314(a) of the CWA (include the following: A description of those publicly owned lakes for which uses are known to be impaired; a description of procedures, processes and methods to control the discharge of pollutants from municipal separate storm sewers into such lakes; and a description of methods and procedures to restore the quality of such lakes);

(*5*) Areas of concern of the Great Lakes identified by the International Joint Commission;

(*6*) Designated estuaries under the National Estuary Program under section 320 of the CWA;

(*7*) Recognized by the applicant as highly valued or sensitive waters;

(*8*) Defined by the State or U.S. Fish and Wildlife Services's National Wetlands Inventory as wetlands; and

(*9*) Found to have pollutants in bottom sediments, fish tissue or biosurvey data.

(D) *Field screening.* Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description, for either each field screening point or major outfall, of visual observations made during dry weather periods. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observations regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, and detergents (or surfactants) shall be provided along with a description of the flow rate. Where the field analysis does not involve analytical methods approved under 40 CFR part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test. Field screening points shall be either major outfalls or other outfall points (or

any other point of access such as manholes) randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a segment of the storm sewer system or major outfall. The field screening points shall be established using the following guidelines and criteria:

(*1*) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart shall be overlayed on a map of the municipal storm sewer system, creating a series of cells;

(*2*) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(*3*) Field screening points should be located downstream of any sources of suspected illegal or illicit activity;

(*4*) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system, within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(*5*) Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; and land use types;

(*6*) For medium municipal separate storm sewer systems, no more than 250 cells need to have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible); and

(*7*) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (d)(1)(iv)(D) (*1*) through (*6*) of this section, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen no more than 500 or 250 major outfalls respectively (or all major outfalls in the system, if less); in such circumstances, the applicant shall establish a grid system consisting of north-south and east-west lines spaced ¼ mile apart as an overlay to the boundaries of the municipal storm sewer system, thereby creating a series of cells; the applicant will then select major outfalls in as many cells as possible until at least 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

(E) *Characterization plan.* Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this section. Such description shall include: the location of outfalls or field screening points appropriate for representative data collection under paragraph (d)(2)(iii)(A) of this section, a description of why the outfall or field screening point is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls or field screening points for such sampling should reflect water quality concerns (*see* paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) *Management programs.* (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(vi) *Fiscal resources.* (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

(2) *Part 2.* Part 2 of the application shall consist of:

(i) *Adequate legal authority.* A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) *Source identification.* The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(*1*) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

(iii) *Characterization data.* When "quantitative data" for a pollutant are required under paragraph (d)(a)(iii)(A)(*3*) of this paragraph, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Quantitative data from representative outfalls designated by the Director (based on information received

in part 1 of the application, the Director shall designate between five and ten outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) developed as follows:

(*1*) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at § 122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

(*2*) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(*3*) For samples collected and described under paragraphs (d)(2)(iii)(A)(*1*) and (A)(*2*) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:

Total suspended solids (TSS)
Total dissolved solids (TDS)
COD
BOD_5
Oil and grease
Fecal coliform
Fecal streptococcus
pH
Total Kjeldahl nitrogen
Nitrate plus nitrite
Dissolved phosphorus
Total ammonia plus organic nitrogen
Total phosphorus

(*4*) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under § 122.21(c)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(*1*) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section; and

(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) *Proposed management program.* A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on:

(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(*1*) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(*2*) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(*3*) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

(*4*) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

(*5*) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(*6*) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(*1*) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncomtaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States);

(*2*) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;

(*3*) A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation);

(*4*) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(*5*) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

(*6*) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

(*7*) A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary;

(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(*1*) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

(*2*) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7) (iii) and (iv).

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(*1*) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(*2*) A description of requirements for nonstructural and structural best management practices;

(*3*) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(*4*) A description of appropriate educational and training measures for construction site operators.

(v) *Assessment of controls.* Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

(vi) *Fiscal analysis.* For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2) (iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where requirements under paragraph (d)(1)(iv)(E), (d)(2)(ii), (d)(2)(iii)(B) and (d)(2)(iv) of this section are not practicable or are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from such requirements. The Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph except where authorized under this section.

(e) *Application deadlines.* Any operator of a point source required to obtain a permit under paragraph (a)(1) of this section that does not have an effective NPDES permit covering its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) For any storm water discharge associated with industrial activity identified in paragraph (b)(14) (i)–(xi) of this section, that is not part of a group application as described in paragraph (c)(2) of this section or which is not covered under a promulgated storm water general permit, a permit application made pursuant to paragraph (c) of this section shall be submitted to the Director by November 18, 1991;

(2) For any group application submitted in accordance with paragraph (c)(2) of this section:

(i) Part 1 of the application shall be submitted to the Director, Office of Water Enforcement and Permits by March 18, 1991;

(ii) Based on information in the part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving part 1 of the group application.

(iii) Part 2 of the application shall be submitted to the Director, Office of Water Enforcement and Permits no later than 12 months after the date of approval of the part 1 application.

(iv) Facilities that are rejected as members of a group by the permitting authority shall have 12 months to file an individual permit application from the date they receive notification of their rejection.

(v) A facility listed under paragraph (b)(14) (i)–(xi) of this section may add on to a group application submitted in accordance with paragraph (e)(2)(i) of this section at the discretion of the Office of Water Enforcement and Permits, and only upon a showing of good cause by the facility and the group applicant; the request for the addition of the facility shall be made no later than February 18,1992; the addition of the facility shall not cause the percentage of the facilities that are required to submit quantitative data to be less than 10%, unless there are over 100 facilities in the group that are submitting quantitative data; approval to become part of group application must be obtained from the group or the trade association representing the individual facilities.

(3) For any discharge from a large municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by November 18, 1991;

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application;

(iii) Part 2 of the application shall be submitted to the Director by November 16, 1992.

(4) For any discharge from a medium municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by May 18, 1992.

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by May 17, 1993.

(5) A permit application shall be submitted to the Director within 60 days of notice, unless permission for a later date is granted by the Director (*see* 40 CFR 124.52(c)), for:

(i) A storm water discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraph (a)(1)(v) of this section);

(ii) A storm water discharge subject to paragraph (c)(1)(v) of this section.

(6) Facilities with existing NPDES permits for storm water discharges associated with industrial activity shall maintain existing permits. New applications shall be submitted in accordance with the requirements of 40 CFR 122.21 and 40 CFR 122.26(c) 180 days before the expiration of such permits. Facilities with expired permits or permits due to expire before May 18, 1992, shall submit applications in accordance with the deadline set forth under paragraph (e)(1) of this section.

(f) *Petitions.* (1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require a NPDES permit for a discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the Census estimates of the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be reduced proportional to the fraction, based on estimated lengths, of the length of combined sewers over the sum of the length of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) Any person may petition the Director for the designation of a large or medium municipal separate storm sewer system as defined by paragraphs (b)(4)(iv) or (b)(7)(iv) of this section.

(5) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition.

6. Section 122.28(b)(2)(i) is revised to read as follows:

§ 122.28 General permits (applicable to State NPDES programs, see § 123.25).

* * * * *

(b) * * *

(2) *Requiring an individual permit.* (i) The Director may require any discharger authorized by a general permit to apply for and obtain an individual NPDES permit. Any interested person may petition the Director to take action under this paragraph. Cases where an individual NPDES permit may be required include the following:

(A) The discharger or "treatment works treating domestic sewage" is not in compliance with the conditions of the general NPDES permit;

(B) A change has occurred in the availability of demonstrated technology or practices for the control or abatement of pollutants applicable to the point source or treatment works treating domestic sewage;

(C) Effluent limitation guidelines are promulgated for point sources covered by the general NPDES permit;

(D) A Water Quality Management plan containing requirements applicable to such point sources is approved;

(E) Circumstances have changed since the time of the request to be covered so that the discharger is no longer appropriately controlled under the general permit, or either a temporary or permanent reduction or elimination of the authorized discharge is necessary;

(F) Standards for sewage sludge use or disposal have been promulgated for the sludge use and disposal practice covered by the general NPDES permit; or

(G) The discharge(s) is a significant contributor of pollutants. In making this determination, the Director may consider the following factors:

(*1*) The location of the discharge with respect to waters of the United States;

(*2*) The size of the discharge;

(*3*) The quantity and nature of the pollutants discharged to waters of the United States; and

(*4*) Other relevant factors;

* * * * *

7. Section 122.42 is amended by adding paragraph (c) to read as follows:

§ 122.42 Additional conditions applicable to specified categories of NPDES permits (applicable to State NPDES programs, see § 123.25).

* * * * *

(c) *Municipal separate storm sewer systems.* The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the Director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions;

(2) Proposed changes to the storm water management programs that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part;

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year;

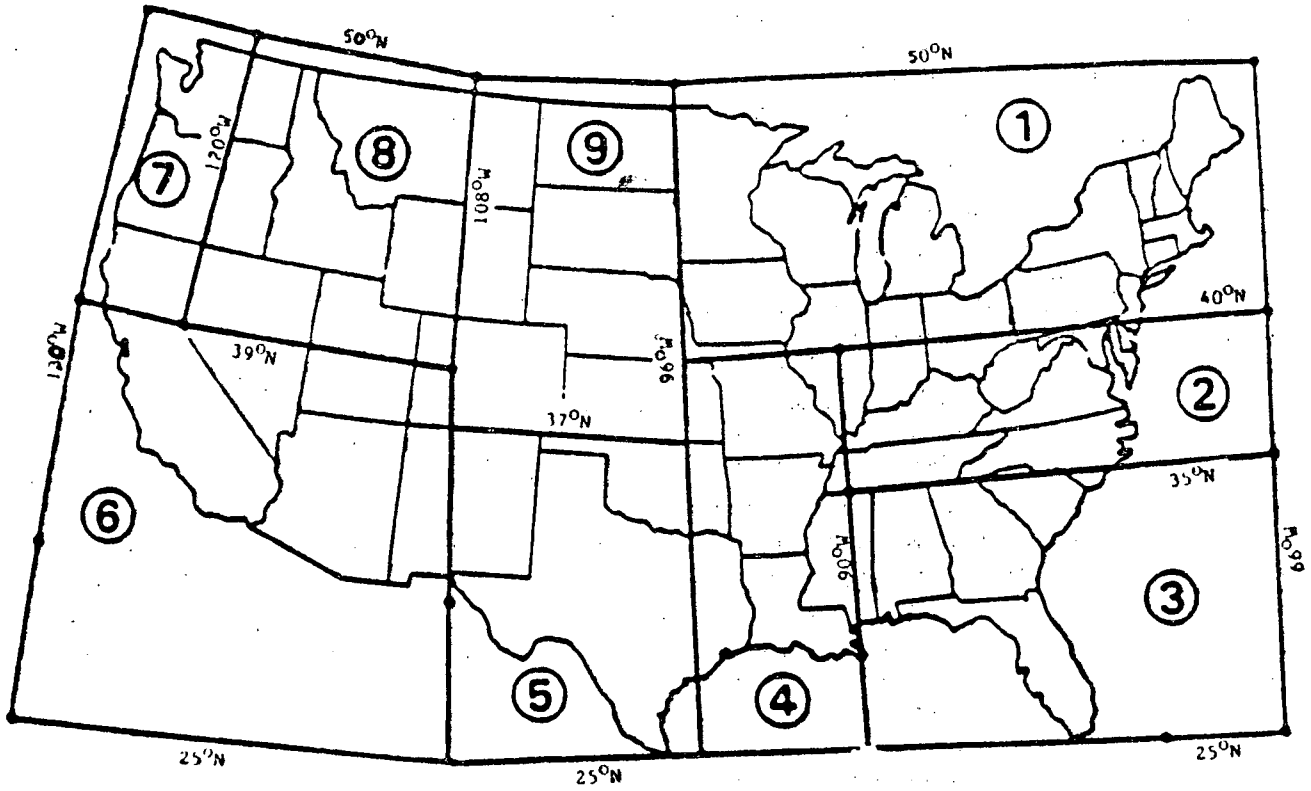
(5) Annual expenditures and budget for year following each annual report;

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs;

(7) Identification of water quality improvements or degradation;

7a. Part 122 is amended by adding appendices E through I as follows:

Appendix E to Part 122—Rainfall Zones of the United States



Not Shown: Alaska (Zone 7); Hawaii (Zone 7); Northern Mariana Islands (Zone 7); Guam (Zone 7); American Samoa (Zone 7); Trust Territory of the Pacific Islands (Zone 7); Puerto Rico (Zone 3) Virgin Islands (Zone 3).

Washington	Snohomish	103,493
	Pierce	196,113

PART 123—STATE PROGRAM REQUIREMENTS

8. The authority citation for part 123 continues to read as follows:

Authority: Clean Water Act, 33 U.S.C. 1251 *et seq.*

9. Section 123.25 is amended by revising paragraph (a)(9) to read as follows:

§ 123.25 Requirements for permitting.

(a) * * *

(9) § 122.26—(Storm water discharges);

* * * * *

PART 124—PROCEDURES FOR DECISIONMAKING

10. The authority citation for part 124 continues to read as follows:

Authority: Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq.*; Safe Drinking Water Act, 42 U.S.C. 300f *et seq.*; Clean Water Act, 33 U.S.C. 1251 *et seq.*; and Clean Air Act, 42 U.S.C. 1857 *et seq.*

11. Section 124.52 is revised to read as follows:

§ 124.52 Permits required on a case-by-case basis.

(a) Various sections of part 122, subpart B allow the Director to determine, on a case-by-case basis, that certain concentrated animal feeding operations (§ 122.23), concentrated aquatic animal production facilities (§ 122.24), storm water discharges (§ 122.26), and certain other facilities covered by general permits (§ 122.28) that do not generally require an individual permit may be required to obtain an individual permit because of their contributions to water pollution.

(b) Whenever the Regional Administrator decides that an individual permit is required under this section, except as provided in paragraph (c) of this section, the Regional Administrator shall notify the discharger in writing of that decision and the reasons for it, and shall send an application form with the notice. The discharger must apply for a permit under § 122.21 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

(c) Prior to a case-by-case determination that an individual permit is required for a storm water discharge under this section (*see* 40 CFR 122.26 (a)(1)(v) and (c)(1)(v)), the Regional Administrator may require the discharger to submit a permit application or other information regarding the discharge under section 308 of the CWA. In requiring such information, the Regional Administrator shall notify the discharger in writing and shall send an application form with the notice. The discharger must apply for a permit under § 122.26 within 60 days of notice, unless permission for a later date is granted by the Regional Administrator. The question whether the initial designation was proper will remain open for consideration during the public comment period under § 124.11 or § 124.118 and in any subsequent hearing.

Note: The following form will not appear in the Code of Federal Regulations.

BILLING CODE 6560-50-M

Application for Permit To Discharge Stormwater Discharges Associated with Industrial Activity

Paperwork Reduction Act Notice

Public reporting burden for this application is estimated to average 28.6 hours per application, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate, any other aspect of this collection of information, or suggestions for improving this form, including suggestions which may increase or reduce this burden to: Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M St., SW, Washington, DC 20460, or Director, Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503.

I. Outfall Location

For each outfall, list the latitude and longitude of its location to the nearest 15 seconds and the name of the receiving water.

A. Outfall Number *(list)*	B. Latitude	C. Longitude	D. Receiving Water *(name)*

II. Improvements

A. Are you now required by any Federal, State, or local authority to meet any implementation schedule for the construction, upgrading or operation of wastewater treatment equipment or practices or any other environmental programs which may affect the discharges described in this application? This includes, but is not limited to, permit conditions, administrative or enforcement orders, enforcement compliance schedule letters, stipulations, court orders, and grant or loan conditions.

1. Identification of Conditions, Agreements, Etc.	2. Affected Outfalls		3. Brief Description of Project	4. Final Compliance Date	
	number	source of discharge		a. req.	b. proj.

B. You may attach additional sheets describing any additional water pollution (or other environmental projects which may affect your discharges) you now have under way or which you plan. Indicate whether each program is now under way or planned, and indicate your actual or planned schedules for construction.

III. Site Drainage Map

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including: each of its intake and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each known past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied; each of its hazardous waste treatment, storage or disposal units (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility.

Continued from the Front

IV. Narrative Description of Pollutant Sources

A. For each outfall, provide an estimate of the area (include units) of impervious surfaces (including paved areas and building roofs) drained to the outfall, and an estimate of the total surface area drained by the outfall.

Outfall Number	Area of Impervious Surface *(provide units)*	Total Area Drained *(provide units)*	Outfall Number	Area of Impervious Surface *(provide units)*	Total Area Drained *(provide units)*

B. Provide a narrative description of significant materials that are currently or in the past three years have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage, or disposal; past and present materials management practices employed, in the last three years, to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied.

C. For each outfall, provide the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the schedule and type of maintenance for control and treatment measures and the ultimate disposal of any solid or fluid wastes other than by discharge.

Outfall Number	Treatment	List Codes from Table 2F-1

V. Nonstormwater Discharges

A. I certify under penalty of law that the outfall(s) covered by this application have been tested or evaluated for the presence of nonstormwater discharges, and that all nonstormwater discharges from these outfall(s) are identified in either an accompanying Form 2C or Form 2E application for the outfall.

Name and Official Title *(type or print)*	Signature	Date Signed

B. Provide a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test.

VI. Significant Leaks or Spills

Provide existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility in the last three years, including the approximate date and location of the spill or leak, and the type and amount of material released.

EPA ID Number *(copy from Item I of Form 1)*

Continued from Page 2

VII. Discharge Information

A,B,C, & D: See instructions before proceeding. Complete one set of tables for each outfall. Annotate the outfall number in the space provided. Tables VII-A, VII-B, and VII-C are included on separate sheets numbered VII-1 and VII-2.

E: Potential discharges not covered by analysis - Is any pollutant listed in Table 2F-2 a substance or a component of a substance which you currently use or manufacture as an intermediate or final product or byproduct?

☐ Yes *(list all such pollutants below)* ☐ No *(go to Section VIII)*

VIII. Biological Toxicity Testing Data

☐ Yes *(list results below)* ☐ No *(go to Section IX)*

IX. Contract Analysis Information

☐ Yes ☐ No *(go to Section X)*

A. Name	B. Address	C. Area Code & Phone No.	D. Pollutants Analyzed

X. Certification

A. Name & Official Title *(type or print)*	B. Area Code and Phone No.
C. Signature	D. Date Signed

EPA ID Number *(copy from Item I of Form 1)*

Form Approved. OMB No. 2040-0086
Approval expires 5/31/92

VII. Discharge Information *(Continued from page 3 of Form 2F)*

Part A - You must provide the results of at least one analysis for every pollutant in this table. Complete one table for each outfall. See instructions for additional details.

Pollutant and CAS Number *(if available)*	Maximum Values *(include units)*		Average Values *(include units)*		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		
Oil nd Grease						
Biological Oxygen Demand (BOD5)						
Chemical Oxygen Demand (COD)						
Total Suspended Solids (TSS)						
Total Kjeldahl Nitrogen						
Nitrate plus Nitrite Nitrogen						
Total Phosphorus						
pH	Minimum	Maximum	Minimum	Maximum		

Part B - List each pollutant that is limited in an effluent guideline which the facility is subject to or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See the instructions for additional details and requirements.

Pollutant and CAS Number *(if available)*	Maximum Values *(include units)*		Average Values *(include units)*		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		

Continued from the Front

Part C - List each pollutant shown in Tables 2F-2, 2F-3, and 2F-4 that you know or have reason to believe is present. See the instructions for additional details and requirements. Complete one table for each outfall.

Pollutant and CAS Number *(if available)*	Maximum Values *(include units)*		Average Values *(include units)*		Number of Storm Events Sampled	Sources of Pollutants
	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite	Grab Sample Taken During First 30 Minutes	Flow-weighted Composite		

Instructions - Form 2F
Application for Permit to Discharge Storm Water Associated with Industrial Activity

Who Must File Form 2F

Form 2F must be completed by operators of facilities which discharge storm water associated with industrial activity or by operators of storm water discharges that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard.

Operators of discharges which are composed entirely of storm water must complete Form 2F (EPA Form 3510-2F) in conjunction with Form 1 (EPA Form 3510-1).

Operators of discharges of storm water which are combined with process wastewater (process wastewater is water that comes into direct contact with or results from the production or use of any raw material, intermediate product, finished product, byproduct, waste product, or wastewater) must complete and submit Form 2F, Form 1, and Form 2C (EPA Form 3510-2C).

Operators of discharges of storm water which are combined with nonprocess wastewater (nonprocess wastewater includes noncontact cooling water and sanitary wastes which are not regulated by effluent guidelines or a new source performance standard, except discharges by educational, medical, or commercial chemical laboratories) must complete Form 1, Form 2F, and Form 2E (EPA Form 3510-2E).

Operators of new sources or new discharges of storm water associated with industrial activity which will be combined with other nonstormwater new sources or new discharges must submit Form 1, Form 2F, and Form 2D (EPA Form 3510-2D).

Where to File Applications

The application forms should be sent to the EPA Regional Office which covers the State in which the facility is located. Form 2F must be used only when applying for permits in States where the NPDES permits program is administered by EPA. For facilities located in States which are approved to administer the NPDES permits program, the State environmental agency should be contacted for proper permit application forms and instructions.

Information on whether a particular program is administered by EPA or by a State agency can be obtained from your EPA Regional Office. Form 1, Table 1 of the "General Instructions" lists the addresses of EPA Regional Offices and the States within the jurisdiction of each Office.

Completeness

Your application will not be considered complete unless you answer every question on this form and on Form 1. If an item does not apply to you, enter "NA" (for not applicable) to show that you considered the question.

Public Availability of Submitted Information

You may not claim as confidential any information required by this form or Form 1, whether the information is reported on the forms or in an attachment. Section 402(j) of the Clean Water Act requires that all permit applications will be available to the public. This information will be made available to the public upon request.

Any information you submit to EPA which goes beyond that required by this form, Form 1, or Form 2C you may claim as confidential, but claims for information which are effluent data will be denied.

If you do not assert a claim of confidentiality at the time of submitting the information, EPA may make the information public without further notice to you. Claims of confidentiality will be handled in accordance with EPA's business confidentiality regulations at 40 CFR Part 2.

Definitions

All significant terms used in these instructions and in the form are defined in the glossary found in the General Instructions which accompany Form 1.

EPA ID Number

Fill in your EPA Identification Number at the top of each odd-numbered page of Form 2F. You may copy this number directly from item I of Form 1.

Item I

You may use the map you provided for item XI of Form 1 to determine the latitude and longitude of each of your outfalls and the name of the receiving water.

Item II-A

If you check "yes" to this question, complete all parts of the chart, or attach a copy of any previous submission you have made to EPA containing the same information.

Item II-B

You are not required to submit a description of future pollution control projects if you do not wish to or if none is planned.

Item III

Attach a site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) depicting the facility including:

each of its drainage and discharge structures;

the drainage area of each storm water outfall;

paved areas and building within the drainage area of each storm water outfall, each known past or present areas used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied;

each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste for less than 90 days under 40 CFR 262.34);

each well where fluids from the facility are injected underground; and

springs, and other surface water bodies which receive storm water discharges from the facility;

Item IV-A

For each outfall, provide an estimate of the area drained by the outfall which is covered by impervious surfaces. For the purpose of this application, impervious surfaces are surfaces where storm water runs off at rates that are significantly higher than background rates (e.g., predevelopment levels) and include paved areas, building roofs, parking lots, and roadways. Include an estimate of the total area (including all impervious and pervious areas) drained by each outfall. The site map required under item III can be used to estimate the total area drained by each outfall.

Item IV-B

Provide a narrative description of significant materials that are currently or in the past three years have been treated, stored, or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of these materials; past and present materials management practices employed, in the last three years, to minimize contact by these materials with storm water runoff; materials loading and access areas; and the location, manner, and frequency in which pesticides, herbicides, soil conditioners, and fertilizers are applied. Significant materials should be identified by chemical name, form (e.g., powder, liquid, etc.), and type of container or treatment unit. Indicate any materials treated, stored, or disposed of together. "Significant materials" includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of CERCLA; any chemical the facility is required to report pursuant to Section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

Item IV-C

For each outfall, structural controls include structures which enclose material handling or storage areas, covering materials, berms, dikes, or diversion ditches around manufacturing, production, storage or treatment units, retention ponds, etc. Nonstructural controls include practices such as spill prevention plans, employee training, visual inspections, preventive maintenance, and housekeeping measures that are used to prevent or minimize the potential for releases of pollutants.

Item V

Provide a certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by an NPDES permit. Tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. Part B must include a description of the method used, the date of any testing, and the onsite drainage points that were directly observed during a test. All non-storm water discharges must be identified in a Form 2C or Form 2E which must accompany this application (see beginning of instructions under section titled "Who Must File Form 2F" for a description of when Form 2C and Form 2E must be submitted).

Item VI

Provide a description of existing information regarding the history of significant leaks or spills of toxic or hazardous pollutants at the facility in the last three years.

Item VII-A, B, and C

These items require you to collect and report data on the pollutants discharged for each of your outfalls. Each part of this item addresses a different set of pollutants and must be completed in accordance with the specific instructions for that part. The following general instructions apply to the entire item.

General Instructions

Part A requires you to report at least one analysis for each pollutant listed. Parts B and C require you to report analytical data in two ways. For some pollutants addressed in Parts B and C, if you know or have reason to know that the pollutant is present in your discharge, you may be required to list the pollutant and test (sample and analyze) and report the levels of the pollutants in your discharge. For all other pollutants addressed in Parts B and C, you must list the pollutant if you know or have reason to know that the pollutant is present in the discharge, and either report quantitative data for the pollutant or briefly describe the reasons the pollutant is expected to be discharged. (See specific instructions on the form and below for Parts A through C.) Base your determination that a pollutant is present in or absent from your discharge on your knowledge of your raw materials, material management practices, maintenance chemicals, history of spills and releases, intermediate and final products and byproducts, and any previous analyses known to you of your effluent or similar effluent.

A. **Sampling:** The collection of the samples for the reported analyses should be supervised by a person experienced in performing sampling of industrial wastewater or storm water discharges. You may contact EPA or your State permitting authority for detailed guidance on sampling techniques and for answers to specific questions. Any specific requirements contained in the applicable analytical methods should be followed for sample containers, sample preservation, holding times, the collection of duplicate samples, etc. The time when you sample should be representative, to the extent feasible, of your treatment system operating properly with no system upsets. Samples should be collected from the center of the flow channel, where turbulence is at a maximum, at a site specified in your present permit, or at any site adequate for the collection of a representative sample.

   For pH, temperature, cyanide, total phenols, residual chlorine, oil and grease, and fecal coliform, grab samples taken during the first 30 minutes (or as soon thereafter as practicable) of the discharge must be used (you are not required to analyze a flow-weighted composite for these parameters). For all other pollutants both a grab sample collected during the first 30 minutes (or as soon thereafter as practicable) of the discharge and a flow-weighted composite sample must be analyzed. However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period of greater than 24 hours.

   All samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area.

   A grab sample shall be taken during the first thirty minutes of the discharge (or as soon thereafter as practicable), and a flow-weighted composite shall be taken for the entire event or for the first three hours of the event.

   Grab and composite samples are defined as follows:

Grab sample: An individual sample of at least 100 milliliters collected during the first thirty minutes (or as soon thereafter as practicable) of the discharge. This sample is to be analyzed separately from the composite sample.

Flow-Weighted Composite sample: A flow-weighted composite sample may be taken with a continuous sampler that proportions the amount of sample collected with the flow rate or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire event or for the first three hours of the event, with each aliquot being at least 100 milliliters and collected with a minimum period of fifteen minutes between aliquot collections. The composite must be flow proportional; either the time interval between each aliquot or the volume of each aliquot must be proportional to either the stream flow at the time of sampling or the total stream flow since the collection of the previous aliquot. Aliquots may be collected manually or automatically. Where GC/MS Volatile Organic Analysis (VOA) is required, aliquots must be combined in the laboratory immediately before analysis. Only one analysis for the composite sample is required.

Data from samples taken in the past may be used, provided that:

All data requirements are met;

Sampling was done no more than three years before submission; and

All data are representative of the present discharge.

Among the factors which would cause the data to be unrepresentative are significant changes in production level, changes in raw materials, processes, or final products, and changes in storm water treatment. When the Agency promulgates new analytical methods in 40 CFR Part 136, EPA will provide information as to when you should use the new methods to generate data on your discharges. Of course, the Director may request additional information, including current quantitative data, if they determine it to be necessary to assess your discharges. The Director may allow or establish appropriate site-specific sampling procedures or requirements, including sampling locations, the season in which the sampling takes place, the minimum duration between the previous measurable storm event and the storm event sampled, the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rainfall), protocols for collecting samples under 40 CFR Part 136, and additional time for submitting data on a case-by-case basis.

B. **Reporting:** All levels must be reported as concentration and as total mass. You may report some or all of the required data by attaching separate sheets of paper instead of filling out pages VII-1 and VII-2 if the separate sheets contain all the required information in a format which is consistent with pages VII-1 and VII-2 in spacing and in identification of pollutants and columns. Use the following abbreviations in the columns headed "Units."

Concentration		Mass	
ppm	parts per million	lbs	pounds
mg/1	milligrams per liter	ton	tons (English tons)
ppb	parts per billion	mg	milligrams
ug/1	micrograms per liter	g	grams
kg	kilograms	T	tonnes (metric tons)

All reporting of values for metals must be in terms of "total recoverable metal," unless:

(1) An applicable, promulgated effluent limitation or standard specifies the limitation for the metal in dissolved, valent, or total form; or

(2) All approved analytical methods for the metal inherently measure only its dissolved form (e.g., hexavalent chromium); or

(3) The permitting authority has determined that in establishing case-by-case limitations it is necessary to express the limitations on the metal in dissolved, valent, or total form to carry out the provisions of the CWA. If you measure only one grab sample and one flow-weighted composite sample for a given outfall, complete only the "Maximum Values" columns and insert "1" into the "Number of Storm Events Sampled" column. The permitting authority may require you to conduct additional analyses to further characterize your discharges.

If you measure more than one value for a grab sample or a flow-weighted composite sample for a given outfall and those values are representative of your discharge, you must report them. You must describe your method of testing and data analysis. You also must determine the average of all values within the last year and report the concentration mass under the "Average Values" columns, and the total number of storm events sampled under the "Number of Storm Events Sampled" columns.

C. **Analysis:** You must use test methods promulgated in 40 CFR Part 136; however, if none has been promulgated for a particular pollutant, you may use any suitable method for measuring the level of the pollutant in your discharge provided that you submit a description of the method or a reference to a published method. Your description should include the sample holding time, preservation techniques, and the quality control measures which you used. If you have two or more substantially identical outfalls, you may request permission from your permitting authority to sample and analyze only one outfall and submit the results of the analysis for other substantially identical outfalls. If your request is granted by the permitting authority, on a separate sheet attached to the application form, identify which outfall you did test, and describe why the outfalls which you did not test are substantially identical to the outfall which you did test.

Part VII-A

Part VII-A must be completed by all applicants for all outfalls who must complete Form 2F.

Analyze a grab sample collected during the first thirty minutes (or as soon thereafter as practicable) of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results except use only grab samples for pH and oil and grease. See discussion in General Instructions to Item VII for definitions of grab sample collected during the first thirty minutes of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Part VII-B

List all pollutants that are limited in an effluent guideline which the facility is subject to (see 40 CFR Subchapter N to determine which pollutants are limited in effluent guidelines) or any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit). Complete one table for each outfall. See discussion in General Instructions to item VII for definitions of grab sample collected during the first thirty minutes (or as soon thereafter as practicable) of discharge and flow-weighted composite sample. The "Average Values" column is not compulsory but should be filled out if data are available.

Analyze a grab sample collected during the first thirty minutes of the discharge and flow-weighted composite samples for all pollutants in this Part, and report the results, except as provided in the General Instructions.

Part VII-C

Part VII-C must be completed by all applicants for all outfalls which discharge storm water associated with industrial activity, or that EPA is evaluating for designation as a significant contributor of pollutants to waters of the United States, or as contributing to a violation of a water quality standard. Use both a grab sample and a composite sample for all pollutants you analyze for in this part except use grab samples for residual chlorine and fecal coliform. The "Average Values" column is not compulsory but should be filled out if data are available. Part C requires you to address the pollutants in Table 2F-2, 2F-3, and 2F-4 for each outfall. Pollutants in each of these Tables are addressed differently.

Table 2F-2: For each outfall, list all pollutants in Table 2F-2 that you know or have reason to believe are discharged (except pollutants previously listed in Part VII-B). If a pollutant is limited in an effluent guideline limitation which the facility is subject to (e.g., use of TSS as an indicator to control the discharge of iron and aluminum), the pollutant should be listed in Part VII-B. If a pollutant in table 2F-2 is indirectly limited by an effluent guideline limitation through an indicator, you must analyze for it and report data in Part VII-C. For other pollutants listed in Table 2F-2 (those not limited directly or indirectly by an effluent limitation guideline), that you know or have reason to believe are discharges, you must either report quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Table 2F-3: For each outfall, list all pollutants in Table 2F-3 that you know or have reason to believe are discharged. For every pollutant in Table 2F-3 expected to be discharged in concentrations of 10 ppb or greater, you must submit quantitative data. For acrolein, acrylonitrile, 2,4 dinitrophenol; and 2-methyl-4,6 dinitrophenol, you must submit quantitative data if any of these four pollutants is expected to be discharged

in concentrations of 100 ppb or greater. For every pollutant expected to be discharged in concentrations less than 10 ppb (or 100 ppb for the four pollutants listed above), then you must either submit quantitative data or briefly describe the reasons the pollutant is expected to be discharged.

Small Business Exemption - If you are a "small business," you are exempt from the reporting requirements for the organic toxic pollutants listed in Table 2F-3. There are two ways in which you can qualify as a "small business". If your facility is a coal mine, and if your probable total annual production is less than 100,000 tons per year, you may submit past production data or estimated future production (such as a schedule of estimated total production under 30 CFR 795.14(c)) instead of conducting analyses for the organic toxic pollutants. If your facility is not a coal mine, and if your gross total annual sales for the most recent three years average less than $100,000 per year (in second quarter 1980 dollars), you may submit sales data for those years instead of conducting analyses for the organic toxic pollutants. The production or sales data must be for the facility which is the source of the discharge. The data should not be limited to production or sales for the process or processes which contribute to the discharge, unless those are the only processes at your facility. For sales data, in situations involving intracorporate transfer of goods and services, the transfer price per unit should approximate market prices for those goods and services as closely as possible. Sales figures for years after 1980 should be indexed to the second quarter of 1980 by using the gross national product price deflator (second quarter of 1980=100). This index is available in National Income and Product Accounts of the United States (Department of Commerce, Bureau of Economic Analysis).

Table 2F-4: For each outfall, list any pollutant in Table 2F-4 that you know or believe to be present in the discharge and explain why you believe it to be present. No analysis is required, but if you have analytical data, you must report them. **Note:** Under 40 CFR 117.12(a)(2), certain discharges of hazardous substances (listed at 40 CFR 177.21 or 40 CFR 302.4) may be exempted from the requirements of section 311 of CWA, which establishes reporting requirements, civil penalties, and liability for cleanup costs for spills of oil and hazardous substances. A discharge of a particular substance may be exempted if the origin, source, and amount of the discharged substances are identified in the NPDES permit application or in the permit, if the permit contains a requirement for treatment of the discharge, and if the treatment is in place. To apply for an exclusion of the discharge of any hazardous substance from the requirements of section 311, attach additional sheets of paper to your form, setting forth the following information:

1. The substance and the amount of each substance which may be discharged.
2. The origin and source of the discharge of the substance.
3. The treatment which is to be provided for the discharge by:
    a. An onsite treatment system separate from any treatment system treating your normal discharge;
    b. A treatment system designed to treat your normal discharge and which is additionally capable of treating the amount of the substance identified under paragraph 1 above; or
    c. Any combination of the above.

See 40 CFR 117.12(a)(2) and (c), published on August 29, 1979, in 44 FR 50766, or contact your Regional Office (Table 1 on Form 1, Instructions), for further information on exclusions from section 311.

Part VII-D

If sampling is conducted during more than one storm event, you only need to report the information requested in Part VII-D for the storm event(s) which resulted in any maximum pollutant concentration reported in Part VII-A, VII-B, or VII-C.

Provide flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, the method of flow measurement; or estimation. Provide the data and duration of the storm event(s) sampled, rainfall measurements, or estimates of the storm event which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event.

Part VII-E

List any toxic pollutant listed in Tables 2F-2, 2F-3, or 2F-4 which you currently use or manufacture as an intermediate or final product or byproduct. In addition, if you know or have reason to believe that 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is discharged or if you use or manufacture 2,4,5-trichlorophenoxy acetic

acid (2,4,5,-T); 2-(2,4,5-trichlorophenoxy) propanoic acid (Silvex, 2,4,5,-TP); 2-(2,4,5-trichlorophenoxy) ethyl, 2,2-dichloropropionate (Erbon); O,O-dimethyl O-(2,4,5-trichlorphenyl) phosphorothioate (Ronnel); 2,4,5-trichlorophenol (TCP); or hexachlorophene (HCP); then list TCDD. The Director may waive or modify the requirement if you demonstrate that it would be unduly burdensome to identify each toxic pollutant and the Director has adequate information to issue your permit. You may not claim this information as confidential; however, you do not have to distinguish between use or production of the pollutants or list the amounts.

Item VIII

Self explanatory. The permitting authority may ask you to provide additional details after your application is received.

Item X

The Clean Water Act provides for severe penalties for submitting false information on this application form.

Section 309(c)(4) of the Clean Water Act provides that "Any person who knowingly makes any false material statement, representation, or certification in any application, . . . shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than 2 years, or by both. If a conviction of such person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both." 40 CFR Part 122.22 requires the certification to be signed as follows:

(A) For a corporation: by a responsible corporate official. For purposes of this section, a responsible corporate official means (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding $25,000,000 (in second-quarter 1980 dollars), if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.

Note: EPA does not require specific assignments or delegation of authority to responsible corporate officers identified in 122.22(a)(1)(i). The Agency will presume that these responsible corporate officers have the requisite authority to sign permit applications unless the corporation has notified the Director to the contrary. Corporate procedures governing authority to sign permit applications may provide for assignment or delegation to applicable corporate position under 122.22(a)(1)(ii) rather than to specific individuals.

(B) For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

(C) For a municipality, State, Federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).

II. FACT SHEET FORMAT

This Fact Sheet briefly sets forth the principle facts and the significant factual, legal, methodological, and policy questions that the San Diego Regional Water Quality Control Board (SDRWQCB) considered in preparing Order No. R9-2004-001. In accordance with the Code of Federal Regulations (CFR) title 40 parts 124.8 and 124.56, this Fact Sheet includes, but is not limited to, the following information:

- **Contact information (Section III);**
- **Public process and notification procedures (Section IV);**
- **A brief description of the type of facility or activity that is being regulated by the Order (Section V);**
- **The type and quantity of pollutants discharged (Section VI);**
- **A brief summary of the basis for the requirements in the Order, including references to the applicable statutory or regulatory provisions (Section VII); and**
- **A discussion of the requirements in the Order (Sections VIII and IX).**

Findings contained in the Order are discussed throughout this Fact Sheet. The findings that broadly apply to the entire Order are discussed in Sections V, VI and VII. Findings that justify specific requirements in the Order are discussed in the applicable subsections of Section VIII.

IV. PUBLIC PROCESS AND NOTIFICATION PROCEDURES

The SDRWQCB followed the schedule listed below for the preparation of Order No. R9-2004-001:

- The SDRWQCB received the Report of Waste Discharge (ROWD) on May 30, 2003
- On December 15, 2003, the SDRWQCB released the Order and supporting Fact Sheet, beginning the public comment period. The documents were available on the SDRWQCB web page at http://www.swrcb.ca.gov/rwqcb9/programs/rsd_stormwater.html and mailed to the Permittees and all other parties who requested a copy.
- A public notice was published in the Riverside Press-Enterprise on December 20, 2003 notifying the public of the opportunity to submit written comments and to present verbal comments to the San Diego Regional Board at the February 11, 2004 meeting.
- The SDRWQCB held a public workshop on January 23, 2004 at the Temecula City Hall. The purpose of the workshop was to answer questions regarding the Order and to discuss the affect of potential new requirements on the business community.
- A public hearing to receive testimony at the San Diego Regional Board meeting was conducted on February 11, 2004.
- The public comment period closed at 5:00 pm on March 10, 2004.
- A response to written comments received during the public comment period and the revised Order were issued on May 7, 2004.
- After deliberation, the San Diego Regional Board adopted the Order at the July 14, 2004 meeting.

In addition to the public process described above, various informal meetings have been conducted with SDRWQCB staff and the Permittees. The meetings served as workshops for the Permittees to express their concerns and questions regarding the permit.

V. DESCRIPTION OF THE TYPE OF FACILITY OR ACTIVITY THAT IS BEING REGULATED BY THE NPDES PERMIT

A. Permit History (Finding Nos. 1 and 2)

The Riverside County Flood Control and Water Conservation District (District), the County of Riverside, and the Cities of Murrieta and Temecula (hereinafter called Permittees), own or operate municipal separate storm sewer systems (MS4s) through which urban runoff is discharged into waters of the United States (U.S.) within the portion of the Santa Margarita watershed located in Riverside County in the San Diego Region (hereinafter referred to as the Upper Santa Margarita Watershed) (**Finding No. 1**). Pursuant to the 1987 Water Quality Act (WQA) and the U. S. Environmental Protection Agency's (EPA) final storm water regulations (the "Phase I rule" at 55 Fed. Reg. 47990), the Permittees obtained a National Pollutant Discharge Elimination System (NPDES) permit for discharges from their MS4(s) to waters of the U.S. in the Upper Santa Margarita Watershed.

In July of 1990, the District, the County, and the City of Temecula obtained a first-round NPDES permit (Order No. R9-90-46). Following its incorporation, the City of Murrieta was added to that permit on May 18, 1992. Then, on May 13, 1998, the SDRWQCB adopted Order No. R9-98-02 as a second-round MS4 permit for the Upper Santa Margarita Watershed. The EPA objected to the order due to the Receiving Water Limitations (RWL) language, which EPA determined did not comply with the federal Clean Water Act (CWA) and its implementing regulations. EPA assumed responsibility and reissued the permit on April 27, 1999. Subsequently on November 8, 2000, the SDRWQCB issued Addendum No. 1 to Order R9-98-02, which incorporated EPA's permit by reference. On May 30, 2003, the District, as the Principal Permittee, submitted a Report of Waste Discharge (ROWD) for renewal of their NPDES MS4 permit (**Finding No. 2**). Order No. R9-2004-001 is the third-round Phase I NPDES MS4 permit for the Upper Santa Margarita Watershed.

B. Permit Coverage (Finding Nos. 19 and 20)

The Order regulates discharges of urban runoff from MS4s owned or operated by the Permittees, and discharges into MS4s from areas within the Permittees' jurisdiction. In the Order, urban runoff is defined as "all flows in a storm water conveyance system and consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water illicit discharges (dry weather flows)."

A MS4 is defined in the federal regulations as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains), owned or operated by a Permittee, and designed or used for collecting or conveying urban runoff (EPA, 2000a). In addition, natural drainage patterns and urban streams are frequently used by municipalities to convey urban runoff away from development within their jurisdiction. Therefore, as stated in **Finding No.19**, the SDRWQCB considers natural drainages that are used for conveyances of urban runoff, regardless of whether or not they've been altered by the municipality, as both part of the MS4s **and** as receiving waters. To clarify, an unaltered natural drainage, which receives runoff from a point source (channeled by a Permittee to drain an area within their

jurisdiction), which then conveys the runoff to an altered natural drainage or a man-made MS4 is both an MS4 and a receiving water (SDRWQCB, 2001c). Whereas, a natural channel which receives sheet flow from a property in a rural area is not part of the MS4.

Federal, state, regional, or local entities within the Permittees' boundaries, and which are not named in the Order, may operate storm drain facilities and/or discharge urban runoff to storm drains and water courses covered by the Order. In addition, discharges into the Permittees' MS4s from agricultural and other activities identified in 40 CFR 122.3 are excluded from federal NPDES regulations. However, the Permittees are responsible for all discharges from their MS4s to receiving waters, and discharges from entities and activities not specifically regulated by the Order may cause or contribute to a condition of contamination or exceedances of water quality objectives. Therefore, Permittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to a MS4 that conveys discharges to waters of the U.S., the operator of the MS4 that does not prohibit or control discharges into its own system essentially accepts responsibility for those discharges (**Finding No. 20**).

In their comments on the Order, the Permittees proposed a procedure to address discharges from third parties outside of their jurisdictions (Permittees, 2004a). The proposed procedure includes documenting and sampling discharges, utilizing the Hazardous Materials Emergency Response Team in emergency situations, verbally notifying the discharger, notifying the appropriate enforcement agency and/or the SDRWQCB, and notifying the discharger of available assistance to address the discharge. The proposed procedure meets the SDRWQCB's expectations for addressing discharges from third parties.

C. Description of Permitted Area (Finding No. 3)

The Upper Santa Margarita Watershed is approximately 548 square miles and includes unincorporated portions of Riverside County, the Cities of Murrieta and Temecula, as well as portions of the Cleveland and San Bernardino National Forests, and the Cahuilla, Ramona, Pauma, and Pechanga Indian Reservations. Approximately 168,400 people reside within the permitted area (Permittees, 2003). Approximately 36,400 people reside in the unincorporated area while approximately 132,000 people reside within the Cities of Murrieta and Temecula (Permittees, 2003).

Temecula Creek, which drains the Palomar Mountains, and Murrieta Creek, which drains the Santa Ana Mountains, are the main drainages in the permitted area. They join to form the Santa Margarita River near the City of Temecula. Main tributaries to Murrieta Creek include Warm Springs Creek and Santa Gertrudis Creek. Main tributaries to Temecula Creek include Pechanga Creek and Arroyo Seco Creek. Vail Lake, Skinner Reservoir, and Diamond Valley Reservoir are major impoundments in the permitted area. For more information about watershed characteristics, see the ROWD (Permittees, 2003).

The Water Quality Control Plan for the San Diego Basin (SDRWQCB, 1994) identifies the following beneficial uses for water bodies in the Santa Margarita Watershed: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1) (potential use), Non-contact Water Recreation (REC2), Warm Freshwater Habitat

WARM, Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), and Rare, Threatened, or Endangered Species (RARE) (**Finding No. 3**).[1]

In addition to providing habitat and recreation opportunities, residents and businesses in the permitted area rely heavily on local water for drinking, agriculture, and industrial supply. Over 40% of water used in the watershed is locally produced (Jenks, 2002). In 2001, local water production in the watershed was 41,765 acre-feet. Imported supplies totaled 66,369 acre-feet. Of the total water supply, 49,212 acre-feet were used for agriculture, 5,390 acre-feet were used for commercial purposes, and 41,802 acre feet were used for domestic purposes (Jenks, 2002). In addition, portions of Fallbrook in San Diego County and the U.S. Marine Corps Base Camp Pendleton, depend on surface and ground water that originates form the Upper Santa Margarita Watershed.

The Santa Margarita River is one of the few remaining natural gorge rivers in Southern California, with approximately 70 species of special concern (rare, threatened, or endangered, regularly inhabiting the watershed, including 30 that are currently protected under the Federal Endangered Species Act (Stein, 1998). Although the majority of the river is not within the jurisdiction of the Permittees, the riparian systems in the upper watershed play an integral role in the maintenance of sensitive downstream ecological functions (Stein, 1998). The upper watershed riparian habitats are in direct hydrologic contact with downstream systems and are associated with freshwater recharge to a series of downstream aquifers (Shapiro, 1991). In addition, these riparian systems in the Upper Santa Margarita Watershed often provide breeding, migratory, or escape habitat for many animal species that reside in the lower watershed (Stein, 1998).

VI. TYPE AND QUANTITY OF POLLUTANTS DISCHARGED

A. Background

Pollutants in Urban Runoff (Finding Nos. 4, 5 and 6)

Urban runoff contains waste, as defined in the California Water Code (CWC), and pollutants that adversely affect the quality of waters of the State. The discharge of urban runoff from an

---

[1] **MUN** – Municipal and Domestic Supply – Uses of water for community, military, or individual water supply systems (i.e., drinking water).
AGR – Agricultural Supply – Uses of water for farming, horticulture, or ranching.
IND – Industrial Service Supply – Uses of water for industrial activities that do not depend primarily on water quality (i.e., mining, cooling water supply, gravel washing, fire protection).
PROC – Industrial Process Supply – Uses of water for industrial activities that depend primarily on water quality.
GWR – Ground Water Recharge – Uses of water for natural or artificial recharge of ground water for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.
REC1 – Contact Water Recreation – Uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible (i.e., swimming, wading, fishing, and white water activities). * Means this is a potential use.
REC2 – Non-contact Water Recreation – Uses of water for recreational activities involving proximity to water, but not normally involving body contact with water (i.e., picnicking, hiking, camping, boating, and sightseeing).
WARM – Warm Freshwater Habitat – Uses of water that support warm water ecosystems.
COLD – Cold Freshwater Habitat – Uses of water that support cold water ecosystems including.
WILD – Wildlife Habitat – Uses of water that support terrestrial ecosystems.
RARE – Rare, Threatened, or Endangered Species – Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant and animal species established under state or federal law as rare, threatened, or endangered.

MS4 is a "discharge of pollutants from a point source" into waters of the United States as defined in the CWA (**Finding No. 4**). Section 13050(d) of the CWC defines "waste" as "sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal." 40 CFR 122.2 defines "point source" as "any discernable, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff." 40 CFR 122.2 defines "discharge of a pollutant" as "Any addition of any pollutant or combination of pollutants to waters of the U.S. from any point source." Also, the justification for control of pollution into Californian waters can be found at CWC section 13260(a)(1), and State Water Resource Control Board (SWRCB) Order WQ 2001-15 verifies that urban runoff contains waste (SWRCB, 2001).

The quality of urban runoff is fundamentally important to the health of the environment and the quality of life in Southern California. The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses resulting in a condition of pollution (i.e., unreasonable impairment of water quality for designated beneficial uses), contamination, or nuisance (**Finding No. 6**). The 1992, 1994, and 1996 National Water Quality Inventory Reports to Congress prepared by the EPA showed a trend of impairment in the Nation's waters from contaminated storm water and urban runoff (EPA, 2000b). The 1998 National Water Quality Inventory Report showed that urban runoff discharges affect 11% of rivers, 12% of lakes, and 28% of estuaries (EPA, 2000b). The report states that ocean shoreline impairment due to urban runoff increased from 55% in 1996 to 63% in 1998. The report notes that urban runoff discharges are the leading source of pollution and the main factor in the degradation of surface water quality in California's coastal waters, rivers, and streams (EPA, 2000b).

Furthermore, the National Urban Runoff Program (NURP) Study found that pollutant levels from illicit discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health (EPA, 1993b).

The most common categories of pollutants in urban runoff include total suspended solids, sediment (due to anthropogenic activities); pathogens (e.g., bacteria, viruses, protozoa); heavy metals (e.g., copper, lead, zinc, and cadmium); petroleum products and polynuclear aromatic hydrocarbons; synthetic organics (e.g., pesticides, herbicides, and PCBs); nutrients (e.g., nitrogen and phosphorus fertilizers), oxygen-demanding substances (decaying vegetation, animal waste), and trash (**Finding No. 5**). The NURP study showed that heavy metals, organics, coliform bacteria, nutrients, oxygen demanding substances (e.g., decaying vegetation), and total suspended solids are found at relatively high levels in urban runoff (EPA, 1993b). It also found that MS4 discharges draining residential, commercial, and light industrial areas contain significant loadings of total suspended solids and other pollutants. The Basin Plan goes on to identify urban runoff pollutants to include lawn and garden chemicals, household and automotive care products dumped or drained on streets, and sediment that

erodes from construction sites (SDRWQCB, 1994). In addition, the SWRCB Urban Runoff Technical Advisory Committee (TAC) finds that urban runoff pollutants include sediments, nutrients, oxygen-demanding substances, heavy metals, petroleum hydrocarbons, pathogenic bacteria, viruses, and pesticides (SWRCB, 1994). Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these untreated pollutants through storm drain networks directly to the receiving waters of the Upper Santa Margarita Watershed.

According to the Center for Watershed Protection, the quality of both surface and ground water in urbanizing areas of arid and semi-arid regions of the southwest is strongly shaped by urbanization. Since rain events are so rare, pollutants have more time to build up on impervious surfaces compared to humid regions. Therefore, the pollutant concentrations of storm water runoff from arid watersheds tends to be higher than that of humid watersheds (Center for Watershed Protection, Article 66).

Impacts From Urbanization (Finding No. 12)

The Natural Resources Defense Council (NRDC) 1999 Report, "Stormwater Strategies, Community Responses to Runoff Pollution" identifies two main causes of the storm water pollution problem in urban areas (NRDC, 1999). Both causes are directly related to development in urban and urbanizing areas:

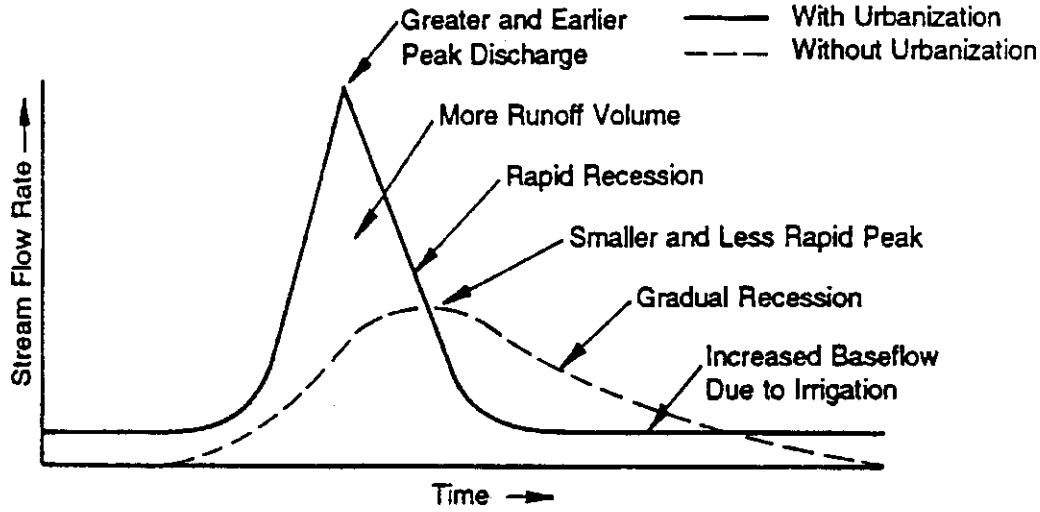
1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.
2. The concentration of pollutants in the runoff. As discussed above, certain industrial, commercial, residential and construction activities are large contributors of pollutant concentrations in urban runoff. As human population density increases, it brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc.

As a result of these two causes, runoff leaving developed urban areas is significantly greater in volume, velocity, and pollutant load than pre-development runoff from the same area (**Finding No. 12**). The Permittees have demonstrated their support for this finding in the DAMP (Permittees, 1993), which states:

> "Many storm water runoff problems are primarily a consequence of urbanization. Water that previously soaked into the ground, removing pollutants by filtering through soil, and eventually replenishing groundwater supplies, now must flow overland and therefore enters local streams more rapidly. The rapid transport of water increases the erosion of stream banks and hillsides and does not permit filtering of pollutants. Sediment carried by storm water runoff can build up in streambeds, harming fish and aquatic habitat. The sediment acts as a transport mechanism for pollutants which adhere to soil particles. Typical urban runoff pollutants found in surface waters include heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals, and litter."

Studies have shown that the level of imperviousness in an area strongly correlates with the quality of nearby receiving waters (EPA, 1999b). One comprehensive study, which looked at numerous areas, variables, and methods, revealed that stream degradation occurs at levels of imperviousness as low as 10 – 20% (EPA, 1999b). Stream degradation is a decline in the biological integrity and physical habitat conditions that are necessary to support natural biological diversity. For instance, few urban streams can support diverse benthic communities with imperviousness greater than or equal to 25% (EPA, 1999b). To provide some perspective, a medium density, single-family home area can be from 25% to 60% impervious (variation due to street and parking design) (Schueler, 1994).

To demonstrate the principle of increased volume and velocity of runoff from urbanization, the following figure shows the flow rate of an urban vs. a natural stream. What the figure demonstrates is that urban stream flows have greater peaks and volumes, as well as shorter retention times than natural stream flows. The greater peak flows and volumes result in stream degradation through increased erosion of stream banks and damage to aquatic habitat. The shorter retention times result in less time for sediments and other pollutants to settle before being carried out to the ocean. This sediment, and the associated pollutants it carries, can be a significant cause of water quality degradation.



Source: Adapted from Schueler, 1997

Increased volume and velocity of runoff adversely impacts receiving waters and their beneficial uses in many ways. According to the TAC report (SWRCB, 1994), increases in population density and imperviousness result in changes to stream hydrology including:

1. Increased peak discharges compared to pre-development levels;
2. Increased volume of storm water runoff with each storm compared to pre-development levels;
3. Decreased travel time to reach receiving water; increased frequency and severity of floods;
4. Reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;

5. Increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization, and
6. Decreased infiltration and diminished ground water recharge.

Even though the rainfall depths in arid watersheds are lower, watershed development can greatly increase peak discharge rates during rare flood events (Center for Watershed Protection, Article 66). A study conducted in arid watersheds around Riverside, CA showed that, over two decades, impervious cover increased from 9% to 22%, which resulted in an increase of more than 100% in the peak flow rate for the two-year storm event. The study also showed that the average annual storm water runoff volume had increased by 115% to 130% over the same time span (Center for Watershed Protection, Article 66).

Flooding caused by the increased volume and velocity of runoff from urbanization in the Upper Santa Margarita Watershed are clear examples of the effects described above. Disastrous flooding has occurred more frequently in recent years. In the last century, major flood events occurred in 1938, 1969, 1980, 1993, 1995, and 1998 (U.S. Army Corps of Engineers, 2000). In the 1993 flood event, the Cities of Murrieta and Temecula sustained $12 million dollars in damage, and Camp Pendleton sustained $88 million in damage (U.S. Army Corps of Engineers, 2000). Future flooding is expected to occur more frequently because of continued urban development within the watershed, and flood damages are expected to continue accruing at an estimated annual rate of $1,780,300 (U.S. Army Corps of Engineers, 2000).

Impacts to Aquatic Life (Finding No. 9)

In addition to chemical and physical impacts, urban runoff often contains pollutants that cause toxicity to aquatic organisms (i.e., adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). Toxic pollutants impact the overall quality of aquatic systems and beneficial uses of receiving waters (**Finding No. 9**). A study of urban runoff samples from Chollas Creek in San Diego County, revealed toxic concentrations of organophospate pesticides and metals (Bay, 2001). In Los Angeles County, storm water samples were found to be toxic to various aquatic organisms in the Los Angeles River, the San Gabriel River, Ballona Creek, and the Santa Monica Bay (LARWQCB, 2001). Also, a water quality data assessment conducted in Aliso Creek in Orange County showed that storm events caused varying degrees of mortality to test organisms (SDRWQCB, 2002a). To date, there has not been sufficient monitoring to determine if toxicity from urban runoff exists in the Upper Santa Margarita Watershed, however, the land uses causing toxicity in other urbanized areas of Southern California are little different than urbanized areas in Murrieta and Temecula.

Impacts to Human Health (Finding No. 7)

In addition to impairing receiving water quality and aquatic life, pollutants in urban runoff can also threaten human health. According to the EPA, spilled fuel, solvents, waste oil, paints, and other maintenance fluids pose a risk to the environment but may be especially harmful if they enter someone's drinking water supply (EPA, 2004b). "The percolation of

contaminated runoff can cause unacceptable consequences to ground water resources." Urban runoff discharges were identified in a California Department of Health Services assessment as one of the most prevalent possible contaminating activities for drinking water sources (EPA, 2004b). This issue of potential source water contamination is of fundamental importance, because of the dependence on local water for domestic use in the Santa Margarita Watershed. Rancho California Water District and Eastern Municipal Water District, which serve the Upper Santa Margarita Watershed, the Fallbrook Public Utilities District, which serves the community of Fallbrook, and Camp Pendleton are among those agencies in the watershed who are directly dependent on surface and ground water for domestic use.

Human health is also a concern related to body contact recreation. Human illnesses have been clearly linked to recreating near storm drains flowing to coastal waters (**Finding No. 7**). A landmark study, conducted by the Santa Monica Bay Restoration Project, found that there was an increased occurrence of illness in people that swam in proximity to a flowing storm drain (Haile, 1996). Although the Upper Santa Margarita Watershed is inland, the watershed drains to the Pacific Ocean, and pollutants generated in the permitted area may impact coastal waters. For example, the Santa Margarita River system provides the main source of beach sand for the beaches of northern San Diego County (Shapiro, 1991). Also, residents in the permitted area who recreate at Southern California beaches benefit from clean water.

Furthermore, urban runoff pollutants in receiving waters can bioaccumulate in the tissues of invertebrates and fish, which may eventually be consumed by humans (**Finding No. 7**). Pollutants such as heavy metals and pesticides, which are commonly found in urban runoff, have been found to bioaccumulate and biomagnify in long-lived organisms at the higher trophic levels (Abel, 1996). Since many aquatic species are utilized for human consumption, toxic substances accumulated in species' tissues can pose a significant threat to public health. The EPA supports this finding when it states, "As runoff flows over areas altered by development, it picks up harmful sediment and chemicals such as oil and grease, pesticides, heavy metals, and nutrients (e.g., nitrogen and phosphorus). These pollutants often become suspended in runoff and are carried to receiving waters, such and lakes, ponds, and streams. Once deposited, these pollutants can enter the food chain through small aquatic life, eventually entering the tissues of fish and humans" (EPA, 2000c).

Environmentally Sensitive Areas (Finding No. 8)

Development and urbanization especially threaten environmentally sensitive areas (ESAs), such as water bodies designated as supporting a RARE beneficial use and CWA section 303(d) impaired water bodies. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may become significant in a particularly sensitive environment. Therefore, additional control to reduce pollutants from new and existing development may be necessary for areas adjacent to or discharging directly to an environmentally sensitive area (**Finding No. 8**). ESAs are defined in the Order as "areas in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would easily be disturbed or degraded by human activities and developments (California Public Resources Code section 30107.5). ESAs subject to urban runoff requirements include but are not limited to

all CWA section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the SWRCB (Basin Plan); water bodies designated with the RARE beneficial use by the SWRCB (Basin Plan); areas within the Western Riverside County Multi-Species Habitat Conservation Plan (MSHCP) plan area that contain rare or especially valuable plant or animal life or their habitat; and any other equivalent environmentally sensitive areas which the Permittees have identified." Areas that meet this definition are inherently sensitive habitats containing unique, rare, threatened, or endangered species, or are not achieving their designated beneficial uses. As discussed above, urban runoff is known to contain a wide range of pollutants and have demonstrated toxicity to plants and animals. Therefore, it is necessary to apply additional controls for developments within, adjacent to, or directly discharging to ESAs. This need for additional controls is addressed within each component of the Order.

The EPA supports the requirement for additional controls, stating "For construction sites that discharge to receiving waters that do not support their designated use or other waters of special concern, additional construction site controls are probably warranted and should be strongly considered" (EPA, 1992a). Further support for requiring additional controls to reduce pollutants in discharges to ESAs can be found in *Mitigation of Storm Water Impacts From New Developments in Environmentally Sensitive Areas*, a technical report written by the LARWQCB (LARWQCB, 2001b).

B. Water Quality Concerns in the Upper Santa Margarita Watershed

In addition to the general information about typical urban runoff-related pollutants discussed above in Section VI.A, various sources document water quality concerns in the Upper Santa Margarita Watershed. **Tables 1 and 2** below summarize existing and potential problems. **Table 3** summarizes exceedances of urban runoff-related pollutants reported in the Permittees water quality monitoring reports, and **Table 4** lists potential sources of the reported exceedances.

Table 1. Water Quality Concerns in the Santa Margarita Watershed

Source	Existing or Potential Problem
SWRCB 303(d) List[2]	**Listings:** Phosphorus (entire 12 miles of Murrieta Creek and upper 18 miles of Santa Margarita River) Eutrophication (estuary) **Constituents of concern:** sedimentation/siltation, iron, manganese, TDS
Riverside County General Plan[3]	Sediment from construction-related erosion; Pollution due to urban storm water runoff
San Diego County WURMP[4]	Eutrophication, nitrogen, phosphorus, diazinon, TDS, other toxic substances, trash
SDRWQCB	Degraded biological and physical integrity

[2] SDRWQCB. 2003. Final 2002 Clean Water Act Section 303(d) List of Water Quality Limited Segments.

[3] County of Riverside. October 2003. County of Riverside General Plan: Multipurpose Open Space Element. Chapter 5, OS-10.

[4] County of San Diego. January 2003. Watershed Urban Runoff Management Program for the Santa Margarita Watershed. Table 4-5.

Bioassessment Data[5]	
SDRWQCB, EPA Draft Operational Guidebook for reference based assessment[6]	Severe physical impacts (Excessive erosion, down cutting, sedimentation, etc.) from rapid and high volumes of urban runoff and a lack of effective runoff management practices
Santa Margarita Regional DAMP[7]	Oxygen demanding substances, heavy metals, pesticides, herbicides, oil and grease, nutrients, settleable solids, TDS, TSS Volatile organic carbon, pathogens, and debris

Impairments and Pollutants of Concern (Finding Nos. 10 and 11)

According to the *Final 2002 CWA Section 303(d) List of Water Quality Limited Segments* (SDRWQCB, 2003a), the entire length of Murrieta Creek (12 miles) and the upper 18 miles of the Santa Margarita River are impaired for phosphorus. Potential sources of the phosphorus impairment include urban runoff and unknown point and nonpoint sources. The Santa Margarita Lagoon is listed as impaired for eutrophication. (**Finding No. 10**). In addition to the impairments, the SDRWQCB has identified various constituents of potential concern (SWRCB, 2003b). These constituents, listed above in Table 1, were not included on the 2002 303(d) list as impairments because available data was not adequate and more information is needed to determine whether water quality objectives and beneficial uses are being met. The impairments and constituents of concern were based on quarterly data collected and analyzed by Camp Pendleton from 1997-2000, data collected and analyzed by the Department of Water Resources from May 1998-November 2000, Rancho California Water District's receiving water monitoring, and grab sampling conducted by the SDRWQCB in June 1998.

The San Diego County's *Watershed Urban Runoff Management Program (WURMP) for the Santa Margarita Watershed* (San Diego County, 2003) states that eutrophication (associated with low dissolved oxygen, and the presence of solids and excessive nutrients), toxic substances (trace elements and synthetic organics), diazinon contamination, and high levels of TDS are potential water quality issues in the watershed, and that these constituents of concern may have detrimental impacts to the beneficial uses. The WURMP prioritizes the problems based on potential beneficial use impairment (Table 2 below). The WURMP states that data is limited and further data collection and assessment should be made to substantiate concerns.

Table 2. WURMP Prioritization of Water Quality Problems[8]

[6] EPA. November 2003. Draft Operational Guidebook for reference based assessment of the functions of riverine waters/wetlands in the Santa Margarita Watershed, Riverside County. Chapter 4.

[7] Permittees, 1993

[8] Table 2 was modified from Table 4-5 of the WURMP (San Diego County, 2003)

Constituents of Concern	Potential Beneficial Use Impairment	Priority
Eutrophication, nitrogen, phosphorus	MUN, REC1, REC2, WARM, COLD, WILD, and RARE	High
Toxic substances – diazinon	WARM, COLD, WILD and RARE	Medium
TDS	MUN and AGR	Medium
Toxic substances – other	WARM, COLD, WILD and RARE	Low
Trash	REC1, REC2, WARM, COLD, WILD and RARE	Low

In addition to the sources discussed above, the Permittees have been conducting water quality monitoring pursuant to the MS4 permit since 1993. Although the program has many deficiencies (SDRWQCB, 2002b), the data shows various persistent exceedances of water quality objectives for urban runoff-related pollutants. Table 3 below lists the monitoring stations and the constituents for which multiple or persistent exceedances of water quality objectives have been reported (Permittees, 2002a, 2002b, and 2003b). Due to inadequate monitoring and reporting, it was not possible to conduct a detailed analysis.

Table 3. MS4 Monitoring Results[9]

Stn #	Station Name	Multiple or Persistent Exceedances of Water Quality Objectives[10] (from 1993 – 2003)
188	Cole Creek	Color, Total Nitrogen, Total Phosphorus, Iron, Manganese
404	Wildomar outlet	MBAS, Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Chromium, Iron, Manganese, Nitrogen-Nitrate, Ammonia, Odor, Thallium, Turbidity, pH, Antimony, Beryllium, Chlorpyrifos, Diazinon
768	Redhawk Channel	Boron, MBAS, Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Fluoride, Iron, Manganese, Nitrogen-Nitrate, Ammonia, Odor, DO, TDS, Sulfate, Turbidity, pH, Antimony, Beryllium, Chlorpyrifos, Diazinon
769	Empire Creek	Boron, MBAS, Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Chromium, Iron, Manganese, Nitrogen-Nitrate, Odor, DO (increasing trend), TDS, Thallium, Turbidity, pH, Antimony, Beryllium, Chlorpyrifos, Diazinon
776	Cal Oaks Channel (Line F)	MBAS, Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Chromium, Iron, Manganese, Nitrogen-Nitrate, Ammonia, Odor, TDS, Turbidity, pH, Antimony, Chlorpyrifos, Diazinon
777	Temecula Creek	Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Iron, Manganese, Nitrogen-Nitrate, DO, TDS, Sulfate, Turbidity, Antimony
778	Lower Murrieta	Color, Total Nitrogen, Total Phosphorus, Fecal Coliform,

[9] Information obtained from Permittee Annual Program Reports (Permittees, 2002a, 2002b, and 2003b).

[10] Does not include California Toxics Rule

	Creek	Iron, Manganese, Nitrogen-Nitrate, Odor, DO, TDS, Sulfate, Turbidity, Antimony, Chlorpyrifos, Diazinon
779	Upper Murrieta Creek	Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Iron, Manganese, Nitrogen-Nitrate, Ammonia, TDS, Turbidity, pH, Antimony
828	Santa Margarita River near Temecula	Color, Total Nitrogen, Total Phosphorus, Fecal Coliform, Chromium, Iron, Manganese, Nitrogen-Nitrate, Odor, DO, TDS, Turbidity, Antimony, Chlorpyrifos, Diazinon

Table 4 below identifies potential sources of the pollutants that exceeded water quality objectives at the majority of the MS4 monitoring stations. This information indicates that urban runoff from construction, residential, industrial, commercial and municipal activities is contributing to the degradation of water quality. Specifically, the data indicate potential illicit discharges from industrial and commercial activities, over-application of pesticides and fertilizers by residents and/or businesses, and sediment discharges from construction sites and/or eroding channels.

Table 4. Potential Sources of Pollutants[11]

Pollutant	Potential Sources
Antimony	Industrial activity
Chlorpyrifos	Organophosphate pesticide commonly used in residential areas
Chromium	Industrial activity (plating operations, manufacture of paints, dyes, explosives, ceramics, and paper)
Diazinon	Organophosphate pesticide commonly used in residential areas
Dissolved oxygen	Biodegradable organics, increased temperatures and salinity decrease dissolved oxygen
Fecal coliform	Bacteria originating from humans, animals, amphibians and birds
Iron	Industrial activity, acid mine drainage, corrosion from iron pipes and other material
Manganese	Industrial sources (manufacture of steel alloys, dry-cell batteries, glass and ceramics, paints and varnishes, inks and dyes, matches and fireworks and agriculture
MBAS	Detergents typically associated with dry cleaners
Nitrogen	Excessive application of fertilizer in agriculture and urban areas, septic tank leachate
Phosphorus	Excessive application of fertilizer in agriculture and urban areas
PH	Industrial wastes can be strongly acidic, and laundry waste, and soda and sulfate-pump rinse water are alkaline wastes
Sulfate	Agricultural runoff, mining, tanneries, sulfate-pump mills, and other plants that use sulfates or sulfuric acid

[11] Potential source information from Permittees, 2003b and San Diego County, 2003.

Turbidity	Microorganisms, detritus, mineral substances, manganese compounds, industrial wastes, and eroded soil and silt.
TDS	Urban runoff, imported water, irrigation practices

Biological and Physical Concerns

In addition to the chemical water quality data described above, biological and physical monitoring in the Upper Santa Margarita Watershed also indicates impacts to receiving waters from urbanization.

According to the *San Diego Regional Water Quality Control Board: 2002 Biological Assessment Report*, based on data collected from 1998 – 2001, the bioassessment stations located in lower Murrieta Creek, lower Temecula Creek, and upper Santa Margarita River exhibited degraded biological and physical integrity (Index of Biotic Integrity (IBI) ranged from "Very Poor" to "Good"). As a comparison, the reference stations in the watershed, located in Sandia Creek and DeLuz Creek, were characterized by a high degree of biological and physical integrity (IBI was consistently "Very Good"). This data indicates that urbanization, not agriculture, is contributing to the impairment of the biological and physical integrity of the receiving waters.

The *Draft Operational Guidebook for reference based assessment of the functions of riverine waters/wetlands in the Santa Margarita Watershed, Riverside and San Diego Counties, California* (EPA, 2003) documents the physical impacts that have resulted from urbanization, including but not limited to:

- Temecula and Murrieta Creeks have been moderately to severely impacted by development and degradation of their watersheds. No hydrogeomorphic reference standard conditions were observed. Local effects are caused by **(a) massive earthwork associated with flood control projects, (b) channelization, (c) hardening of the channel bed and banks with concrete, rip-rap, etc., (d) rapid and high volume inputs of storm water runoff from impervious surfaces associated with urbanizing areas, (e) rapid and concentrated inputs of urban pollutants associated with untreated storm water, and (f) large accumulations of trash/debris**. "Currently, development pressures along the Temecula, Murrieta and Wilson Creeks are severe and apparently irreversible in the context of current land use practices and rates of urbanization."
- **Storm water inputs from roads, yards, and parking areas tend to be direct, without benefit of oil-water separators, grit removal, or retention/detention of storm flows**. "The consequences of poor watershed, riparian, and channel management practices in agricultural and developing areas are clear."
- **It is clear that Murrieta and Temecula Creeks are not performing hydrologic functions to their potential.** Specifically, given the urban setting of these creeks, the degree of development taking place within and near their floodplains, and **the current lack of effective stormwater management practices**, improvements in ecosystem functioning within these systems are likely to occur very slowly, if at all. **"Functional improvements in Murrieta and Temecula Creeks depend not only on changes in stream management techniques, but also upon BMPs throughout the upper watershed."**

- "As a result of urban/suburban development, infiltration rates have decreased, peak flows have increased, and base flows have been diminished in both durations and volume"
- "Significant impacts from erosion resulted from poor sediment and erosion control practices and/or development of impervious and smoothed surfaces in the contributing area."
- **"Landscape-scale development in the Santa Margarita watershed appears to be causing main stem hydrologic and biogeochemical functions to degrade at unprecedented rates."**

A recent environmental assessment of Murrieta Creek (USFWS, 2000) further describes some of the physical impacts that have occurred as a result of urbanization in the Upper Santa Margarita Watershed:

> "Since the 1980's, rapid development and urbanization in Murrieta Creek's watershed, including its floodplain and riparian corridor, has severely altered the watershed's drainage. The urbanization has simultaneously introduced artificial flows from activities such as landscape irrigation, washing down of parking lots, and washing of personal vehicles, and has increased impervious surface, which reduces groundwater recharge. Consequently, the volumes and velocities of the discharges from the surface flows and flows through the storm water conveyance systems into Murrieta Creek have increased dramatically. The changes in the hydrology and the hydraulics of Murrieta Creek and its watershed caused by development, flood control activities, ground water dewatering, and a reduction in groundwater recharge, have upset the natural fluvial processes and greatly diminished the ecological value of Murrieta Creek and its riparian corridor. The increased volumes and velocities have intensified the erosion along the stream bed and banks of Murrieta Creek, its tributaries, and downstream of Murrieta Creek. This erosion has exacerbated the sediment loading into Murrieta Creek and the Santa Margarita River."

The assessment goes on to say that, without appropriate controls, water quality is expected to continue to decline. "Advancing erosion and downcutting of stream channels will continue to feed larger amounts of sediment into the system. [...] Increasing development of the watershed is expected to continue to impact available habitat. In addition, an elimination of infiltration zones, increase in peak discharges with associated impacts on downstream riparian area, and the replacement of native plants with non-native species would likely occur." (USFWS, 2000)

Overall, the chemical, biological, and physical data and information described above indicate that urban runoff is causing degradation of the quality and the biological and physical integrity of the receiving waters in the Santa Margarita Watershed.

VII. BASIS FOR PERMIT REQUIREMENTS

This section discusses the broad legal authority that supports the requirements contained in Order No. R9-2004-001. It also discusses the intent of the federal NPDES storm water regulations and several findings that broadly support all requirements in the Order.

A. Broad Legal Authority (Finding No. 22)

Order No. R9-2004-001 implements the CWA, the Porter-Cologne Water Quality Control Act (Division 7 of the CWC, commencing with Section 13000), applicable state and federal regulations, all applicable provisions of statewide Water Quality Control Plans and Policies adopted by the SWRCB, and the Basin Plan adopted by the SDRWQCB (**Finding No. 22**).

In 1987, Congress established CWA Amendments to create requirements for storm water discharges under the NPDES program, which provides for permit systems to regulate the discharge of pollutants. Under the Porter-Cologne Water Quality Control Act, the SWRCB and each Regional Water Quality Control Board (RWQCB) have primary responsibility for the coordination and control of water quality, including the authority to implement the CWA. Porter Cologne (section 13240) directs the RWQCBs to set water quality objectives via adoption of Basin Plans that conform to all state policies for water quality control. As a means for achieving those water quality objectives, Porter Cologne (section 13243) further authorizes the RWQCBs to establish waste discharge requirements (WDRs) to prohibit waste discharges in certain conditions or areas. Since 1990 the SDRWQCB has issued area-wide MS4 NPDES permits. The Order will renew Order No. R9-98-02 as a means to attain water quality objectives in the Basin Plan by limiting the contributions of pollutants conveyed by urban runoff and to comply with CWA. Further discussions of the broad and specific legal authority associated with the prohibitions and directives of the Order are provided throughout this document.

Specific federal regulations include 40 CFR parts 122, 123, 124 (NPDES Permit Application Regulations for Storm Water Discharges, Final Rule), Part II of 40 CFR Parts 9, 122, 123, and 124 (NPDES – Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges; Final Rule), and 40 CFR 131 Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California; Rule (California Toxics Rule).

The following broad legal authority citations generally apply to all requirements in Order No. R9-2004-001, and provide the SDRWQCB with ample underlying authority to require each of the directives.

CWA 402(p)(3)(B)(ii) – The CWA requires in section 402(p)(3)(B)(ii) that permits for discharges from MS4s "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers."

CWA 402(p)(3)(B)(iii) – The CWA requires in section 402(p)(3)(B)(iii) that permits for discharges from MS4s "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

40 CFR 122.26(d)(2)(i)(B,C,E, and F) – Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B,C,E, and F) provide that each Permittee's permit application "shall consist of: (i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to: [...] (B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer; (C) Control through

ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water; [...] (E) Require compliance with condition in ordinances, permits, contracts or orders; and (F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer."

40 CFR 122.26(d)(2)(iv) – Federal NPDES regulation 40 CFR 122.26(d)(2)(iv) provides that the Permittee shall develop and implement a proposed management program which "shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. [...] Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. [...] Proposed management programs shall describe priorities for implementing controls."

CWC section 13377 – CWC section 13377 provides that "Notwithstanding any other provision of this division, the state board or the regional boards shall, as required or authorized by the Federal Water Pollution Control Act (CWA), as amended, issue waste discharge requirements and dredged or fill material permits which apply and ensure compliance with all applicable provisions of the act and acts amendatory thereof or supplementary, thereto, together with anymore stringent effluent standards or limitation necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance."

In addition to the broad legal authority items cited above, which underlie all of the directives in Order No. R9-2004-001, additional specific legal authority citations applicable to particular directives of the Order are provided in this Fact Sheet as necessary.

Order No. R9-2004-001 is an essential mechanism for achieving the water quality objectives that have been established for protecting the beneficial uses of the water resources in the Santa Margarita Watershed. Federal NPDES regulation 40 CFR 122.44(d)(1) requires MS4 permits to include any requirements necessary to "achieve water quality standards established under CWA section 303, including State narrative criteria for water quality." The term "water quality standards" in this context refers to a water body's beneficial uses and the water quality objectives necessary to protect those beneficial uses, as established in the Basin Plan.

B. Maximum Extent Practicable (Finding No. 14)

Under CWA section 402(p), municipalities are required to reduce the discharge of pollutants from their MS4s to the maximum extent practicable (MEP). MEP is the critical technology-based performance standard that municipalities must attain in order to comply with their MS4 permits. The MEP standard establishes the level of pollutant reductions the municipality must achieve. The MEP standard can be achieved by means of implementing pollution prevention and source control BMPs (as the first line of defense) in combination with treatment control BMPs serving as a backup (additional line of defense).

The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. As knowledge about controlling urban runoff continues to evolve, so does that which constitutes MEP. Reducing the discharge of storm water pollutants to the MEP requires Permittees to conduct and document evaluation and assessment of each program component and revise activities, control measures, best management practices (BMPs), and measurable goals, as necessary to meet MEP. Because MEP is a dynamic performance standard, it is necessary to describe in greater detail, necessary and effective measures that are essential for compliance. **(Finding No. 14)**

To achieve the MEP standard, municipalities must employ whatever BMPs are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:

1. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?
2. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
3. Public Acceptance: Does the BMP have public support?
4. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
5. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc?

If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive BMPs, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost is prohibitive, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP base solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented. (SWRCB, 1993)

A definition of MEP is not provided in either the federal statute or in the federal regulations. The final determination regarding whether a municipality has reduced pollutants to the MEP can only be made by the SDRWQCB or the SWRCB, and not by the municipal discharger. While the SDRWQCB or the SWRCB ultimately define MEP, it is the responsibility of the Permittees to initially propose actions that implement BMPs to reduce pollution to the MEP. In other words, the Permittees' Individual and Watershed SWMPs to be developed under the Order are the Permittees' proposals of MEP. Their total collective and individual activities

conducted pursuant to their SWMPs become their proposal for MEP as it applies both to their overall effort, as well as to specific activities.

It is the SDRWQCB's responsibility to evaluate the proposed programs and specific BMPs to determine what constitutes MEP, using the above guidance and the court's 1994 decision in NRDC v. California Department of Transportation, Federal District Court, Central District of California. The federal court stated that a permittee must evaluate and implement BMPs except where (1) other effective BMPs will achieve greater or substantially similar pollution control benefits; (2) the BMP is not technically feasible; or (3) the cost of BMP implementation greatly outweighs the pollution control benefits. In the absence of a proposal acceptable to the SDRWQCB, the SDRWQCB will define MEP by requiring implementation of additional measures by the Permittees.

The Order represents the SDRWQCB's definition of MEP. The Order provides a minimum framework that allows Permittees the flexibility to develop and implement their own unique programs and BMP requirements and to improve and modify them as necessary to achieve and maintain compliance with the Order, and therefore, the MEP standard. The EPA supports the SDRWQCB's finding that the Order is consistent with the MEP standard when it states, "Overall, we believe that the permit [Order No. R9-2004-001] is fully consistent with the Clean Water Act (CWA), EPA regulations, and is appropriate for the Santa Margarita Watershed..." (EPA, 2004).

C. BMP Implementation (Finding Nos. 15, 16 and 17)

Pollutants can be effectively reduced in urban runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and flows (e.g., rerouting run-on around pollutant sources or keeping pollutants on-site and out of receiving waters). Treatment control BMPs remove pollutants from urban runoff. (**Finding No. 15**)

The SWRCB finds in its Order WQ 98-01 that BMPs are effective in reducing pollutants in urban runoff, stating that "implementation of BMPs [is] generally the most appropriate form of effluent limitations when designed to satisfy technology requirements, including reduction of pollutants to the maximum extent practicable." The TAC further supports this finding by recommending "that nonpoint source pollution control can be accomplished most effectively by giving priority to [BMPs] in the following order:

1. Pollution Prevention – implementation of practices that use or promote pollution free alternatives;
2. Source Control – implementation of control measures that focus on preventing or minimizing urban runoff from contacting pollution sources;
3. Treatment Control – implementation of practices that require treatment of polluted runoff either onsite or offsite."

Pollution prevention, the reduction or elimination of pollutant generation at its source, is an essential aspect of BMP implementation. By limiting the generation of pollutants by urban activities, less pollutants are available to be washed from urban areas, resulting in reduced

pollutant loads in storm water discharges from these areas. In addition, there is no need to control or treat pollutants that are not initially generated. Furthermore, pollution prevention BMPs are generally more cost effective than removal of pollutants by treatment facilities or cleanup of contaminated media (Schueler, 2000).

In the Pollution Prevention Act of 1990, Congress established a national policy that emphasizes pollution prevention over control and treatment. CWC section 13263.3(a) also supports pollution prevention, stating "The Legislature finds and declares that pollution prevention should be the first step in a hierarchy for reducing pollution and managing wastes, and to achieve environmental stewardship for society. The Legislature also finds and declares that pollution prevention is necessary to support the federal goal of zero discharge of pollutants into navigable waters." Finally, the Basin Plan also supports this finding by stating "To eliminate pollutants in storm water, one can either clean it up by removing pollutants or prevent it from becoming polluted in the first place. Because of the overwhelming volume of storm water and the enormous costs associated with pollutant removal, pollution prevention is the only approach that makes sense" (SDRWQCB, 1994).

Controlling urban runoff pollution by using a combination of onsite source control BMPs augmented with treatment control BMPs before the runoff enters the MS4 is important for the following reasons: (1) Many end-of-pipe BMPs (such as diversion to the sanitary sewer) are typically ineffective during significant storm events. Whereas, onsite source control BMPs can be applied during all runoff conditions; (2) End-of-pipe BMPs are often incapable of capturing and treating the wide range of pollutants which can be generated on a sub-watershed scale; (3) End-of-pipe BMPs are more effective when used as polishing BMPs, rather than the sole BMP to be implemented; (4) End-of-pipe BMPs do not protect the quality or beneficial uses of receiving waters between the source and the BMP; and (5) Offsite end-of-pipe BMPs do not aid in the effort to educate the public regarding sources of pollution and their prevention (**Finding No. 17**).

The EPA also supports the utilization of a combination of BMPs to address pollutants in urban runoff. For example, the EPA has found there has been success in addressing illicit discharge related problems through BMP initiatives like storm drain stenciling and recycling programs, including household hazardous waste special collection days (EPA, 1999b). Structural BMP performance data has also been compiled and summarized by the EPA (EPA, 1999e). This data indicates that structural BMPs can be effective in reducing pollutants in urban runoff discharges. The summary provides the performance ranges of various types of structural BMPs for removing suspended solids, nutrients, pathogens, and metals from storm water flows. These pollutants are in general the pollutants of most concern in storm water in the San Diego Region. For suspended solids, the least effective structural BMP type was found to remove 30-65% of the pollutant load, while the most effective was found to remove 65-100% of the pollutant load. For nutrients, the least effective structural BMP type was found to remove 15-45% of the pollutant load, while the most effective was found to remove 65-100% of the pollutant load. For pathogens, the least effective structural BMP type was found to remove <30% of the pollutant load, while the most effective was found to remove 65-100% of the pollutant load. For metals, the least effective structural BMP type was found to remove 15-45% of the pollutant load, while the most effective was found to remove 65-100% of the pollutant load.

As discussed above, developing minimum BMPs and implementing or requiring their implementation at industrial and commercial facilities, construction sites, and residential areas is necessary for the Permittees to ensure that, ultimately, discharges of pollutants into and from its MS4 are reduced to the MEP (**Finding No. 16**). Therefore, **Sections F through H of the Order** require Permittees to develop and require the implementation of minimum BMPs, including pollution prevention as a first line of defense, to reduce the discharge of pollutants in urban runoff to the MEP from all areas and activities with their jurisdictions.

D. Permittee Responsibility for Requiring BMPs (Finding No. 28)

Through its permitting processes, each Permittee authorizes the three major phases of urban development within its jurisdiction. Therefore, each Permittee must assume responsibility for its urban development decisions. The federal regulations clearly require municipalities to address urban runoff during each stage of development. Regarding BMP implementation during each stage of urban development, the EPA recommends that Permittees ensure the appropriate implementation of the structural BMPs by considering some or all of the following: pre-construction review of BMP designs; inspections during construction to verify BMPs are built as designed; post-construction inspection and maintenance of BMPs; and penalty provisions for noncompliance with design, construction or operation and maintenance (EPA, 1999b).

Since municipalities approve and permit construction and land use within their jurisdiction, they must assume responsibility for urban runoff discharges from these activities and land uses. The Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A – D) are clear in placing responsibility on municipalities for control of urban runoff from third party activities and land uses to their MS4 (EPA, 2000a). In order for municipalities to assume this responsibility, they must implement ordinances, permits, and plans addressing urban runoff from third parties. Assessments for compliance with their ordinances, permits, and plans are essential for a municipality to ensure that third parties are not causing the municipality to be in violation of its municipal storm water permit. When conditions of non-compliance are determined, enforcement is necessary to ensure that violations of municipality ordinances and permits are corrected. As stated in **Finding No. 28**, each Permittee is responsible for adoption and enforcement of ordinances and/or policies, implementation of identified BMPs, and for the allocation of funds for the capital, operation, and maintenance, and enforcement expenditures necessary to implement and enforce such BMPs within its jurisdiction. Therefore, when a Permittee determines a violation of its storm water ordinance, it must pursue correction of the violation. Without enforcement, third parties do not have incentive to correct violations. The EPA supports inspections and enforcement by municipalities when it states "Effective inspection and enforcement requires [...] penalties to deter infractions and intervention by the municipal authority to correct violations. Enforcement mechanisms [...] also must be described" (EPA, 1992a).

MS4 permits are issued to municipalities because of their land use authority. The ultimate responsibility for the pollutant discharges, increased runoff, and inevitable long-term water quality degradation that results from urbanization lies with local governments. This responsibility is based on the fact that it is the local governments that have authorized the urbanization (i.e., conversion of natural pervious ground cover to impervious urban surfaces) and the land uses that generate the pollutants and runoff. Furthermore, the MS4 through which

the pollutants and increased flows are conveyed, and ultimately discharged into natural receiving waters, are owned and operated by the same local governments. In summary, the Permittees under the Order are responsible for discharges into and out of their MS4s because (1) they own and operate the MS4; and (2) they have the legal authority that authorizes the very development and land uses with generate the pollutants and increased flows in the first place.

For example, since grading cannot commence prior to the issuance of a local grading permit, the Permittees have a built-in mechanism to ensure that all grading activities are protective of receiving water quality. The Permittee has the authority to withhold issuance of the grading permit until the project proponent has demonstrated to the satisfaction of the Permittee that the project will not violate the Permittee's ordinances or cause the Permittee to be in violation of its MS4 permit. Since the Permittee will ultimately be held responsible for any discharges from the grading project by the SDRWQCB, the Permittee will want to use its own permitting authority to ensure that whatever measures the Permittee deems necessary to protect discharges into its MS4 are in fact taken by the project proponent.

Order No. R9-2004-001 holds the local government accountable for this direct link between its land use decisions and water quality degradation. The Order recognizes that each of the three major stages in the urbanization process (development planning, construction, and the use or operational stage) are controlled by and must be authorized by the local government. Developing minimum BMPs and implementing or requiring their implementation at industrial and commercial facilities, construction sites, and residential areas is necessary for the Permittees to ensure that, ultimately, discharges of pollutants into and from its MS4 are reduced to the MEP (**Finding No. 16**). As discussed in **Finding No. 20**, Permittees cannot passively receive and discharge pollutants from third parties (within or outside of their jurisdiction). In the absence of BMPs, these discharges may cause or contribute to a condition of contamination or exceedances of receiving water quality objectives. Accordingly, the Order requires the local government to implement, or require others to implement, appropriate BMPs to reduce pollutant discharges and increased flow during each of the three stages of urbanization.

E. Dual Regulation of Industrial and Construction Sites (Finding No. 21)

In accordance with federal NPDES regulations and to ensure the most effective oversight of industrial and construction site discharges, discharges of runoff from industrial and construction sites are subject to dual (state and local) storm water regulation. Under this dual system, the SDRWQCB is responsible for enforcing the statewide General Construction Activities Storm Water Permit, SWRCB Order 97-03 DWQ, NPDES No. CAS000001 (General Construction Permit) and the statewide General Industrial Activities Storm Water Permit, SWRCB Order 99-08 DWQ, NPDES No. CAS000002 (General Industrial Permit), and each municipal Permittee is responsible for enforcing its local permits, plans, and ordinances, which may require the implementation of additional BMPs than required under the statewide general permits. (**Finding No. 21**)

According to the EPA, the storm water regulations envision that NPDES permitting authorities [SDRWQCB] and municipal operators [the Permittees] will cooperate to develop programs to monitor and control pollutants in storm water discharges from industrial facilities (EPA, 1992a).

The EPA discusses the "dual regulation" of construction sites in its Storm Water Phase II Compliance Assistance Guide (EPA, 2000c), which states "Even though all construction sites that disturb more than one acre are covered nationally by an NPDES storm water permit, the construction site runoff control minimum measure [...] is needed to induce more localized site regulation and enforcement efforts, and to enable operators [...] to more effectively control construction site discharges into their MS4s." While the Storm Water Phase II Compliance Assistance Guide applies to small municipalities, it is applicable to the Permittees, because they are similar in size and have the potential to discharge similar pollutant types as Phase II municipalities.

Municipalities assume initial responsibility for enforcement against illegal discharges from land uses and activities within their jurisdiction because of their land use authority. Since the municipality approves and permits development and land use, it must ensure that its development or land use decisions do not result in receiving water quality degradation. The SDRWQCB will assist municipalities in enforcement against non-compliant sites after the municipality has exhibited a good faith effort to bring the site into compliance.

VIII. DISCUSSION OF PERMIT REQUIREMENTS

This section discusses each component of Order No. R9-2004-001. Each discussion includes the specific legal authority in addition to the broad legal authority discussed in section VII.A of this Fact Sheet, a discussion of the requirements, and comments on the Permittees' existing and proposed programs related to each component.

A. PROHIBITIONS (Order Section A)

1. Specific Legal Authority for Prohibitions

- CWA section 402(p)(3)(B)(ii) states that municipalities shall "effectively prohibit non-stormwater discharges **into** the storm sewers."
- CWA section 402(p)(3)(B)(iii) requires that permits for discharges from MS4s "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."
- Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(A - D) require municipalities to have legal authority to control various discharges **to** their MS4.
- Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in urban runoff **from** commercial, residential, industrial, and construction land uses or activities.
- Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to "control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality."

- The Basin Plan contains the following waste discharge prohibition: "The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination, or nuisance as defined in California Water Code section 13050, is prohibited."
- CWC section 13050(l) states "(1) 'Pollution' means an alteration of the quality of waters of the state by waste to a degree which unreasonably affects either of the following: (A) The water for beneficial uses. (B) Facilities which serve beneficial uses. (2) 'Pollution' may include 'contamination'."
- CWC section 13050(k) states "'Contamination' means an impairment of the quality of waters of the state by waste to a degree which creates a hazard to public health through poisoning or through the spread of disease. 'Contamination' includes any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected."
- CWC section 13050(m) states "'Nuisance' means anything which meets all of the following requirements: (1) Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. (2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. (3) Occurs during, or as a result of, the treatment or disposal of wastes."
- CWC section 13241 requires each RWQCB to "establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses and the prevention of nuisance [...]."
- CWC section 13243 provides that "A regional board, in a water quality control plan or in waste discharge requirements, may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted."
- CWC section 13263(a) provides that waste discharge requirements prescribed by the SDRWQCB implement the Basin Plan.

2. Discussion of Prohibitions

The entire thrust of Order No. R9-2004-001 is to prevent discharges from MS4s from causing, or threatening to cause, a condition of pollution, contamination, or nuisance. In fact, **Prohibition A.1** exhibits a major component of the SDRWQCB's mission, and is included in its Basin Plan. The SDRWQCB seeks to preserve and enhance the quality of the region's waters, and one primary method to achieve this is by preventing conditions of pollution, contamination, or nuisance in the region's waters.

Because discharges that enter the MS4 are generally discharged unimpeded directly into receiving waters, **Prohibition A.1** applies to both discharges into and from MS4s. Federal NPDES regulations clearly provide the SDRWQCB with the legal authority to require municipalities to control discharges from third parties into their MS4. 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in urban runoff from commercial, residential, industrial, and construction land uses or activities. Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(A - D) require municipalities to have legal

authority to control various discharges to their MS4. This concept is further supported in the Preamble to the Phase II Final Rule NPDES storm water regulations, which states "The operators of regulated small MS4s cannot passively receive and discharge pollutants from third parties" (EPA, 1999b). As discussed in section VII.E of this Fact Sheet, Phase II Final Rule findings are applicable to the Permittees. Finally, underlying the Federal NPDES storm water regulations is the CWA, which states in Section 402(p)(3)(B)(ii) that municipalities shall "effectively prohibit non-stormwater discharges into the storm sewers."

As with Prohibition A.1, **Prohibition A.2** also characterizes a primary goal of Order No. R9-2004-001 and the SDRWQCB. This goal is to protect the beneficial uses of the region's waters and achieve the water quality objectives necessary to protect those uses. The overarching intent of the CWA embodies **Prohibition A.2** as well; the CWA's objective is to "restore and maintain all chemical, physical and biological integrity of the Nation's waters [to make all surface waters] fishable [and] swimmable."

Prohibition A.3 is consistent with the direction provided in SWRCB Order WQ 2001-15 (SWRCB, 2001). The CWA and Federal NPDES regulations clearly require operators of MS4s to reduce pollutants in discharges from MS4s to the MEP. Therefore, the SDRWQCB has prohibited discharges that do not meet this requirement.

Prohibition A.4 pertains to the Basin Plan Prohibitions, which were established by the SDRWQCB pursuant to CWC section 13243. The SDRWQCB is required to implement Basin Plan Prohibitions in Order No. R9-2004-001 pursuant to CWC section 13263(a).

3. Comments on Existing and Proposed Programs Related to Prohibitions

The Permittees report in Section 2.5 of the ROWD states "The Permittees shall continue to maintain adequate legal authority to control the contribution of pollutants to the MS4s by urban runoff and enforce those authorities." The Permittees further report that they are taking "the necessary steps... to ensure that non-storm water discharges to their MS4s do not cause or contribute to violations of water quality objectives or discharge pollutants to waters of the U.S." In addition, Section 3.1 of the ROWD states "The Permittees shall prohibit illicit discharges from entering into the MS4 and require controls to reduce the discharge of pollutants to the [MEP]." The Permittees should determine if they need to revise their existing ordinances to provide the authority to specifically prohibit discharges from their MS4s that have not been reduced to the MEP.

Discharge Prohibition A.4 is not specifically addressed in the ROWD. Again the Permittees should determine if they need to revise their existing ordinances to provide the authority to specifically prohibit discharges in violation of Basin Plan prohibitions cited in Attachment A to Order No. R9-2004-001.

B. NON-STORM WATER DISCHARGES (Order Section B)

1. Specific Legal Authority for Non-Storm Water Discharge Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B) requires MS4 operators "to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer."

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Permittees shall prevent all types of illicit discharges into the MS4 except for the non-storm water discharges listed in Prohibition B.2, provided that these discharges are not found to be a significant source of pollutants to waters of the U.S.
- CWA section 402(p)(3)(B)(ii) requires each Permittee to prohibit non-storm water discharges into its MS4.
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) requires that Permittees shall provide "A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) provides that Permittees shall "investigate portions of the separate storm sewer system that, based on the results of a field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources on non-storm water."
- CWC section 13267 provides that "the regional board may require that any person who has discharged [...] shall furnish, under penalty of perjury, technical or monitoring reports which the regional board requires."

2. Discussion of Non-Storm Water Discharge Requirements

The discharges listed in Non-Storm Water Discharges **Requirement B.2** are referred to as "de minimis" discharges in the Federal NPDES regulations. However, if a municipality identifies any of these discharges as a source of pollutants to waters of the U.S., they must be addressed in the municipalities storm water management plan (40 CFR 122.26(d)(2)(iv)(B)(1)).

The list of "de minimis" discharges in **Requirement B.2** is essentially the same as the current list prescribed by EPA in NPDES Permit No. CAS0108766 and identical to the list in State Board Order No. 2003-0005-DWQ, the General Storm Water Permit for small MS4s (SWRCB, 2003).

3. Comments on Existing and Proposed Programs Related to Non-Storm Water Discharge Requirements

The Permittees currently have the legal authority to prohibit non-storm water discharges to the MS4, and their existing ordinance contains a list of non-prohibited non-storm water discharges that is consistent with the Order.

In Section 3.1 of the ROWD, the Permittees proposed to add street wash water, fire hydrant testing and flushing, and other types of discharges identified and recommended by the Permittees to their list of allowable non-storm water discharges. Fire hydrant testing and flushing is a category of discharge that is considered by the SDRWQCB as a Non-emergency fire fighting flow (**Requirement B.2.q.**). Order No. R9-2004-001 requires that Permittees address discharges from non-emergency fire fighting activities when those discharges are identified as a significant source of pollutants. However, the EPA determined street wash water to be contaminated and deleted it as a non-prohibited discharge when it issued NPDES Permit CAS0108766 in April 1999 (EPA, 1999d). The Permittees have not provided

monitoring data to document that street wash water does not contain pollutants that pose a threat to water quality. In addition, SWRCB Order No. 99-06-DWQ, the Statewide Storm Water permit for Caltrans and State Board Order No. 2003-0005-DWQ, the General Storm Water Permit for small MS4s do not include street wash water as a non-prohibited discharge. Therefore, the SDRWQCB did not include street wash water on the list in **Requirement B.2** of the Order.

The discharge categories in 40 CFR 122.26(d)(2)(iv)(B)(1) comprise an inclusive and not exemplary list. Consequently, the SDRWQCB does not have the authority to add other discharge categories to the list. Pursuant to **Requirement B.1**, discharges other than those listed in Requirement B.2. are allowed if authorized by a separate NPDES permit.

Although Section 3.1 of the ROWD states that Permittees will prohibit any of the listed discharges if they are identified by the Permittees or the SDRWQCB as a source of pollutants, **Requirement B.2** of the Order allows the Permittees the option to implement BMPs to reduce pollutants to the MEP.

Pursuant to Order No. R9-98-02, the Permittees developed BMPs to address fire fighting activities (Permittees, 2000). These BMPs should be incorporated into the Permittees' SWMPs.

C. RECEIVING WATER LIMITATIONS (Order Section C)

1. Specific Legal Authority for Receiving Water Limitations (RWL) Requirements

- CWC section 13241 provides that the "SDRWQCB shall establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses and the prevention of nuisance."
- CWC section 13263(a) provides that waste discharge requirements prescribed by the SDRWQCB implement the Basin Plan.

2. Discussion of RWL Requirements

As stated in **Finding No. 23**, the RWL language specified in the Order is consistent with language recommended by the EPA and established in SWRCB Order WQ-99-05 (SWRCB, 1999a). The RWL in the Order require compliance with water quality standards through an iterative approach for implementing improved and better-tailored BMPs over time.

The iterative BMP process requires the implementation of increasingly stringent BMPs until receiving water standards are achieved. This is necessary because implementation of BMPs alone cannot ensure attainment of receiving water quality objectives. For example, a BMP that is effective in one situation may not be applicable in another. An iterative process of BMP development, implementation, and assessment is needed to promote consistent compliance with receiving water quality objectives. If assessment of a given BMP confirms that the BMP is ineffective, the iterative process should be restarted, with redevelopment of a new BMP that is anticipated to result in compliance with receiving water quality objectives.

On October 14, 1999, the SWRCB issued a legal opinion on the federal appellate decision and provided advice to the RWQCBs on how to proceed in the future (SWRCB, 1999b). In the memorandum, the SWRCB concludes that the recent Ninth Circuit opinion upholds the

discretion of the EPA and the State to (continue to) issue permits to MS4s that require compliance with water quality standards through iterative BMPs. Moreover, the memorandum states, "[...] because most MS4 discharges enter impaired water bodies, there is a real need for permits to include stringent requirements to protect those water bodies. As total maximum daily loads (TMDLs) are developed, it is likely that MS4s will have to participate in pollutant load reductions, and the MS4 permits are the most effective vehicles for those reductions." In summary, the SWRCB concludes that the RWQCBs should continue to include the RWL language established in SWRCB Order WQ 99-05 in all future permits.

It should be noted that while implementation of the iterative BMP process is a means to achieve compliance with water quality objectives, it does not shield the discharger from enforcement actions for continued non-compliance with water quality objectives. Consistent with EPA guidance (EPA, 1998a and 1998b) regardless of whether or not an iterative process is being implemented, discharges that cause or contribute to an exceedance of water quality objectives are in violation of Order No. R9-2004-001.

3. Comments on Existing and Proposed Programs Related to RWL Requirements

The RWL requirements were not discussed in the ROWD.

D. LEGAL AUTHORITY (Order Section D)

1. Specific Legal Authority for Legal Authority Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that the Permittees shall develop and implement legal authority to "Control through ordinance, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(D) provides that the Permittees shall develop and implement legal authority to "Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system."
- Illicit discharge is defined under Federal NPDES regulation 40 CFR 122.26(b)(2) as "any discharge to a municipal separate storm sewer system that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities."
- Federal NPDES regulation 40 CFR 122.26(b)(14) provides that "The following categories of facilities are considered to be engaging in 'industrial activity' for purposes of this subsection: [...] Construction activity including clearing, grading and excavation activities [...]."
- Federal NPDES regulation 40 CFR 122.26(d)(1)(ii) requires from the Permittee "A description of existing legal authority to control discharges to the municipal separate storm sewer system."

- Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in urban runoff from commercial, residential, industrial, and construction land uses or activities.
- CWC section 13243 also provides that a "regional board, in a water quality control plan or in waste discharge requirements, may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted."

2. Discussion of Legal Authority Requirements

An important means for a municipality to control the discharge of pollutants in urban runoff is through development of municipal legal authority. The EPA states "A crucial requirement of the NPDES storm water regulation is that a municipality must demonstrate that it has adequate legal authority to control the contribution of pollutants in storm water discharged **to** its MS4. [...] In order to have an effective municipal storm water management program, a municipality must have adequate legal authority to control the contribution of pollutants to the MS4. [...] 'Control,' in this context, means not only to require disclosure of information, but also to limit, discourage, or terminate a storm water discharge to the MS4" (EPA, 1992a).

Since discharges that enter the MS4 are generally discharged unimpeded directly into receiving waters, the Permittees' legal authority is to apply to both discharges **into** and **from** MS4s. Federal NPDES regulations clearly provide the SDRWQCB with the legal authority to require municipalities to control discharges from third parties into their MS4. 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in urban runoff from commercial, residential, industrial, and construction land uses or activities. Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(A - D) require municipalities to have legal authority to control various discharges **to** their MS4. This concept is further supported in the Preamble to the Phase II NPDES storm water regulations, which states "The operators of regulated small MS4s cannot passively receive and discharge pollutants **from** third parties" (EPA, 1999b). As discussed in section VII.E of this Fact Sheet, Phase II findings for small municipalities are applicable to the Permittees. Finally, underlying the Federal NPDES storm water regulations is the CWA, which states in section 402(p)(3)(B)(ii) that municipalities shall "effectively prohibit non-stormwater discharges **into** the storm sewers."

In order to effectively prohibit illicit or non-storm water discharges, legal authority addressing the discharges must be developed and implemented by each Permittee (see discussion of **Finding No. 28** in Section VII.D of this Fact Sheet). An illicit connection is a connection to the MS4 that carries an illicit discharge. Because illicit discharges to the MS4 are prohibited, illicit connections are also prohibited and must be eliminated. In order to effectively prohibit and eliminate illicit connections, legal authority addressing the discharges must be developed and implemented by each Permittee.

In order for the ordinances to be effective, each Permittee must be able to require compliance with the ordinances. Lack of ordinance enforcement by a Permittee allows third parties to violate a municipality's ordinances with little fear of retribution, leading to receiving water quality degradation. The EPA recommends that a municipality in its urban runoff management program "identify the administrative and legal procedures available to mandate compliance with appropriate ordinances, and therefore, with permit conditions. [Programs] should contain descriptions of how ordinances are implemented and appealed. In particular,

a municipality should indicate if it can issue administrative orders and injunctions or if it must go through the court system for enforcement actions" (EPA, 1992a).

Discharges from Permittees that share an MS4 eventually reach the same receiving water body. Each Permittee that discharges to the shared MS4 is therefore responsible for discharges from the shared MS4, and the impacts of those discharges on receiving waters. The Permittees of a shared MS4 must demonstrate that together they can control the contribution of pollutants over the whole shared MS4. To this effect, the EPA states "When two or more municipalities submit a joint application, each coapplicant must demonstrate that it individually possesses adequate legal authority over the entire municipal system it operates and owns. A coapplicant need not fulfill every component of legal authority specified in the regulations, as long as the combined legal authority of all coapplicants satisfies the regulatory criteria for every segment of the MS4 (including authority over all sources that discharge to the MS4). [...] Coapplicants also may use interjurisdictional agreements to show legal authority and to ensure planning, coordination, and the sharing of the resource burden of permit compliance" (EPA, 1992a).

The Permittees' ability to determine compliance and noncompliance with permit conditions is critical to control pollutant discharges to and from MS4s. Determination of compliance and noncompliance allows for significant sources of pollutants to be identified and addressed, thereby minimizing the discharge of pollutants from the MS4 and the resulting receiving water quality degradation. For this reason each Permittee must have legal authority to carry out the inspections, surveillance, and monitoring necessary to assess compliance. Regarding compliance determination, the EPA states "municipalities should provide documentation of their authority to enter, sample, inspect, review, and copy records, etc., as well as demonstrate their authority to require regular reports" (EPA, 1992a).

Permittees must demonstrate that they can operate pursuant to legal authority to meet the requirements of Federal NPDES regulations 40 CFR 122.26(d)(2)(A-F). For the Permittee to demonstrate this legal authority, the EPA suggests that "One acceptable way to support a declaration of adequate legal authority, including the ability to enforce appropriate ordinances, is for the municipality to provide a certification from the Municipal General Counsel or equivalent. The certification should state that the applicant has the legal authority to apply and enforce the requirements of 40 CFR 122.26(d)(2)(i)(A-F) in State or local courts. The certification would, therefore, cite specific ordinances and the reasons why they are enforceable. The statement should discuss what the municipality can do to ensure full compliance with 40 CFR 122.26(d)(2)(i)" (EPA, 1992a).

3. Comments on Existing and Proposed Programs Related to Legal Authority

Section 2.4.1 of the ROWD states that the Permittees have adopted a comprehensive storm water ordinance and have previously provided a certification of adequate legal authority to the SDRWQCB. The Permittees may have had adequate legal authority to implement Order No. R9-98-02, but the existing ordinances may need to be updated to reflect requirements contained in Order No. R9-2004-001 (i.e. the required implementation of designated minimum BMPs that each Permittee develops for industrial and commercial sites, residential areas and activities, and construction sites), and a new certification will need to be submitted. The Permittees report in Section 2.4 of the ROWD that the Permittees have the legal authority

to prohibit the disposal of pollutants onto public or private land, to prohibit illicit connections and discharges and to prohibit non-storm water discharges (except for those specifically listed).

Section 2.4.1 of the ROWD states that Permittees have the authority to require construction activity to comply with local erosion and sediment control ordinances. Industrial sites are not specifically addressed in the ROWD. However, the ordinances that are currently in place in Riverside County and the City of Temecula state that any industrial discharger, discharger associated with construction activity, or other discharger subject to an NPDES permit shall comply with all requirements of such permit. Compliance with the General Industrial Permit and the General Construction Permit is specifically required.

Section 2.4.1 of the ROWD states that the Permittees have the authority to prohibit illicit connections and discharges to the MS4 and to prohibit the disposal of pollutants on public or private land.

Section 2.4.2.2 of the ROWD lists various enforcement/compliance mechanisms, but is vague about how they will be used. The ROWD states that the SDRWQCB will take the lead in initiating enforcement actions related to high priority incidents. This is incorrect and must be revised in the SWMP. Permittees are responsible for enforcing compliance with all aspects of Order No. R9-2004-001.

Although specific **Requirements D.1.g., D.1.h. and D.1.i**. are not addressed in the ROWD, the model urban runoff ordinance adopted by the Permittees (Riverside County, 1995), requires compliance with existing and future MS4 permits. This general statement may provide adequate legal authority to comply with these requirements of Order No. R9-2004-001.

It should be noted that the ROWD states that the SDRWQCB will take the lead in initiating enforcement actions related to high priority incidents. This is incorrect and must be revised in the SWMP. Permittees are responsible for enforcing compliance with all aspects of Order No. R9-2004-001.

It should also be noted that the District does not have an ordinance to prohibit illicit discharges to its MS4(s) or to require implementation of MS4 permits. The District relies on the legal authority of the municipalities that have jurisdiction over the land uses within the District.

E. STORM WATER MANAGEMENT PLAN (SWMP) (Order Section E)

1. Specific Legal Authority for SWMP Requirements

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A) – (D) require that permittees develop a management program that covers the duration of the permit. The regulations require that permittee plans include descriptions of each required program component to demonstrate how they will reduce pollutants to the MEP using management practices, control techniques and systems, design and engineering methods.

2. Discussion of SWMP Requirements

To meet the above-referenced federal requirements, Section E of the Order requires the development of **Individual and Watershed SWMPs**, and Attachment D provides specific

information that, where applicable, must be included in each Permittee's SWMP. The framework provided in Attachment D allows the Permittees to develop the programs, activities, and measures that will satisfy or exceed the requirements of the federal regulations, and therefore, the Order. It provides the Permittees with the flexibility and discretion to build upon existing programs and develop BMP requirements most appropriate for their jurisdiction.

The Order requires each Permittee to develop its own **Individual SWMP**. This is necessary for each Permittee to describe their own specific programs and activities that will be implemented to reduce pollutants in discharges of urban runoff within their jurisdiction to the MEP. For example, Permittees may have different enforcement protocol or development project review procedures, while another Permittee may lack a program component altogether (i.e., the District has no jurisdiction over residential, commercial, or industrial areas). Therefore, individual plans specific to each Permittee are necessary.

Section E of the Order also requires the development of a **Watershed SWMP**. This is necessary because watershed-wide issues should be addressed collectively (see Section VIII.K of this Fact Sheet for a discussion of the watershed management approach). Also, some programs are conducted collectively by the Permittees, or solely by the Principal Permittee on behalf of the Permittees. For example, the Permittees collaborate to develop materials and implement the public education program. These area-wide programs and activities should be described in an area-wide plan.

The Order requires the Permittees to develop, submit, and implement the SWMP within one year from the date of adoption (**Finding No. 13**). The one-year time schedule is both necessary and feasible for the following reasons:

- In accordance with 40 CFR 122.26(d)(2)(iv)(A) – (D), the Permittees should have developed a comprehensive SWMP as part of their application for permit renewal. In various correspondence, beginning in July of 2002, the SDRWQCB provided the Permittees with specific information that should have been addressed in the management plan to be submitted as an application. The Permittees have disregarded these requests for a detailed SWMP and submitted an application that stated that the DAMP would be revised within 18 months of permit adoption. Providing the Permittees 365 days from the date of permit adoption, is essentially providing them with an additional year. Further additional time is not justified.
- The requirements are based on federal NPDES regulations that have been in place for 13 years. Therefore, the Permittees should have an existing plan that can feasibly be improved to meet the current expectation of the MEP standard within one year.
- 34 other permittees in the San Diego Region were given 365 days to develop and implement similar requirements. All of these permittees met the requirements in a timely fashion. The City of Escondido said the one-year schedule was reasonable, including the inter-departmental planning and review, public meetings, Planning Commission review and approval, and City Counsel approval. The Permittees have not proven that they are significantly different procedurally from the 34 other permittees to warrant additional time.

- The SDRWQB has provided the Permittees with several acceptable models that can be used as examples.
- In order to reduce pollutants in runoff to the MEP, the Permittees, in the rapidly-developing Upper Santa Margarita Watershed, must implement improved urban runoff management programs as soon as possible.

3. Comments on Existing and Proposed Programs Related to SWMP Requirements

As part of the ROWD, the Permittees proposed to update and modify their existing DAMP, dated March 1993, to incorporate new programs and commitments. Section E and Attachment D of the Order provide direction to the Permittees in revising the DAMP, which serves the purpose of, and should be referred to as, a SWMP. It is not required or necessary for the Permittees to abandon existing programs and management measures. The SWMP is just a framework for each Permittee to describe existing and improved programs that will be implemented during the permit term.

The Permittees proposed to improve the DAMP within 18 months from the adoption of the Order. For the reasons described above, and considering that Permittees will be building on existing programs, one year is ample time to develop a SWMP (consisting of the Individual and Watershed SWMPs).

F. DEVELOPMENT PLANNING (Order Section F)

1. Specific Legal Authority for Development Planning Requirements

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(2) provides that Permittees' proposed SWMPs must include "A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed." This regulation generally applies to all directives contained in Requirements F.1-F.4 of Order No. R9-2004-001.

2. Discussion of Development Planning Requirements

As discussed in section VI of this Fact Sheet, urban development can negatively impact water quality by increasing the pollutant load, volume, and velocity of urban runoff. An effective means for minimizing these impacts is to address water quality concerns during the planning phase of urban development. The EPA supports this, stating "Post-construction storm water management in areas undergoing new development or redevelopment is necessary because runoff from these areas has been shown to significantly effect receiving water bodies. Many studies indicate that prior planning and design for the minimization of pollutants in post-construction storm water discharges is the most cost-effective approach to storm water quality management" (EPA, 2000c). The Preamble to the Phase I Final Rule emphasizes that municipalities with large areas of new development have a greater opportunity to focus controls to reduce pollutants in storm water generated by new developments during the planning phase (55 Fed. Reg. 48053). For these reasons, section F

of the Order No. R9-2004-001 includes requirements for the development and implementation of BMPs to reduce the discharge of pollutants in urban runoff from development projects to the MEP.

The EPA finds that the Permittee "must thoroughly describe how the municipality's comprehensive plan is compatible with the storm water regulations" (EPA, 1992a). To achieve this, in accordance with **Requirement F.1**, the Permittee shall incorporate water quality and watershed protection principles and policies into its general plan (or equivalent plan). The EPA supports addressing urban runoff problems in general plans (or equivalent plans) when it states "Runoff problems can be addressed efficiently with sound planning procedures. Master plans, comprehensive plans, and zoning ordinances can promote improved water quality by guiding the growth of a community away from sensitive areas and by restricting certain types of growth (industrial, for example) to areas that can support it without compromising water quality" (EPA, 2000c).

In the Santa Margarita Watershed, there is concern among resource managers that the cumulative impacts associated with rapid development of the upper watershed will degrade the ecological integrity of the entire watershed (Stein and Ambrose, 1998). Controls on new development are critical for the protection of the sensitive ecological functions and downstream aquifers in the Santa Margarita Watershed.

The principles and policies included in **Requirement F.1** are based on TAC findings (SWRCB, 1994). They incorporate basic measures that have been found to minimize pollutants in urban runoff from new development and redevelopment.

Requirement F.2 directs Permittees to incorporate post-construction BMPs into all new development and redevelopment projects during the planning and approval. The EPA finds that review of development plans during the project approval process is necessary, stating:

> "Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective. Further, storm water management program goals should be reviewed during planning processes that guide development to appropriate locations and steer intensive land uses away from sensitive environmental areas. [...] A municipality should describe how it plans to implement the proposed standards (e.g., through an ordinance requiring approval of storm water management programs, a review and approval process, and adequate enforcement)" (EPA, 1992a).

Regarding conditions of approval in storm water permits, the EPA finds that "Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective" (EPA, 1992a). The EPA further finds that "The municipality should consider storm water controls and structural controls in planning, zoning, and site or subdivision plan approval" (EPA, 1992a). In addition, the EPA states each Permittee should "have an ordinance or other

regulatory mechanism requiring the implementation of post-construction runoff controls [...]" (EPA 2000c).

Furthermore, in its Phase II Final Rule, EPA requires small municipalities to "Use an ordinance or other regulatory mechanism to address post-construction runoff from new development and redevelopment projects [...]" (EPA, 1999b). As discussed in section VII.E of this Fact Sheet, Phase II findings and guidance are applicable to the Permittees.

Standard Urban Storm Water Mitigation Plan (SUSMP) - (Requirement F.2.b):

As part of the SWMP, Permittees must also develop SUSMPs for Priority Development Projects. The SUSMPs include requirements for implementation of minimum source control and treatment control BMPs. The treatment control BMPs also have numeric sizing criteria that must be met based on volume or flow (of runoff). By developing and implementing the SUSMPs, the Permittees are reducing the potential negative impacts of urban runoff on receiving waters.

SUSMP requirements are necessary due to the potential for new development to increase the volume, flow velocity, and pollutant load of urban runoff. As the TAC states, "Urban development often results in impacts to the land and consequently the water bodies adjacent to the land. The two major changes that result from urbanization are changes in stream hydrology and an increase in pollutant loading" (SWRCB, 1994). To alleviate these potential negative impacts on receiving waters, each Permittee must develop and implement a SUSMP for various categories of development. This is consistent with EPA guidance, which states "Through ordinances, permits, or contracts, municipalities may mandate storm water controls for new residential, commercial, or industrial developments in order to improve or assure maintenance of the quality of receiving water at or near pre-development levels (EPA, 1992a)". Also, EPA recommends design criteria (such as numeric sizing criteria) and performance standards for post construction BMPs at development sites (EPA, 1992a).

The post-construction requirements and design standards contained in **Section F** of Order No. R9-2004-001 are consistent SWRCB guidance, Superior Court decision, and RWQCB requirements. The SWRCB and RWQCBs have made several recent decisions in regards to inclusion of SUSMP in MS4 permits. In a precendential decision, SWRCB WQ Order No. 2000-11 (SWRCB, 2000b), SWRCB found that the SUSMP provisions constitute MEP for addressing pollutant discharges resulting from Priority Development Projects (**Finding No. 24**). The provisions of Section F of the Order are consistent with those previously issued by the SDRWQCB for Orange County (Order No. R9-2002-0001) and San Diego County (Order No. R9-2001-001), as well as requirements in the Los Angeles County MS4 permit (Order No. R4-2001-182). In SWRCB Order WQ 2001-15, the SWRCB reaffirmed the inclusion of SUSMP requirements as meeting MEP (SWRCB, 2001). On February 13, 2003, the State Superior Court dismissed an appeal of the San Diego County MS4 permit (Order No. R9-2001-001) that includes the SUSMP requirements (Superior Court of CA, 2003).

Requirement F.2.b. gives the Permittees 365 days to develop, adopt, and implement local SUSMPs. This requirement is reasonable because the SUSMPs have been implemented by various neighboring municipalities and several examples of documents and programs exist for the Permittees to use in the development of their own local SUSMPs. For example, on June 12, 2002, the SDRWQCB approved a Final Model SUSMP as meeting the new development and redevelopment controls and SUSMP requirements of the San Diego County

Permit (San Diego Co-Permittees, 2002). The Orange County permittees developed a Model Water Quality Management Plan that can also be used for guidance (County of Orange, 2003). The 640 days for SUSMP implementation requested by the Permittees has not been incorporated into the Order. In addition to the multiple SUSMP examples already available for the Permittees, the City of Murrieta and Riverside County will have developed SUSMP-type requirements pursuant to the Santa Ana RWQCB MS4 permit (Order No. R8-2002-0011) by January 2005, well before the 365-day schedule contained in the Order. Furthermore, the Permittees already have the authority to require BMPs for new development through their existing storm water ordinances. Overall, the 365-day time schedule is practicable for the Permittees.

Priority Development Project Categories

Priority Development Projects include: a) all new development projects; and b) those redevelopment projects that create, add or replace at least 5,000 square feet of impervious surfaces on an already developed site[12], that are listed under the project categories or locations in **Requirement F.2.b.(1)**. The project categories generally result in the large increases in impervious surfaces, are potential significant sources of pollutants, or have a history of storm water mismanagement. SWRCB Order WQ Order 2000-11 addressed the majority of the categories included in **Requirement F.2.b.(1)** and gave RWQCBs discretion to include additional categories or locations in SUSMP requirements in future MS4 permits (SWRCB, 2000b). Those categories that were not included in the precedential outcome of the SWRCB Order are discussed below.

Requirement F.2.b.1.(h) includes streets, roads, highways, and freeways as a SUSMP Priority Development Project category. This is due to their potential to be a significant contributor of pollutants in urban runoff. A Federal Highway Administration (FHA) report finds that concentrations of total suspended solids, nitrate + nitrite nitrogen, and zinc exceed EPA benchmark values for concentrations of these pollutants in urban runoff (FHA, 1990). Another study found that, "Water quality impacts due to highway runoff could be significant particularly in environmentally sensitive areas, such as wetlands, ground-water recharge zones, and drinking water supply watershed" (CTE, 1998). Streets, roads, highways, and freeways also consist of extensive impervious surfaces, which alter flow regimes and increase potential for downstream erosion.

Requirement F.2.b.1.(i) includes retail gasoline outlets (RGOs) as a Priority Development Project category because RGOs are points of confluence for motor vehicles for automotive related surfaces such as repair, refueling, tire inflation, and radiator fill-up and consequently produce significantly greater loadings of hydrocarbons and trace metals (including copper and zinc) than other urban areas. To meet MEP, source control and structural treatment BMPs are needed at RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day. These are

[12] Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces. Where redevelopment results in an increase of less then fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to SUSMP requirements, the numeric sizing criteria discussed in Requirement F.2.b.(3) applies only to the addition, and not to the entire development.

appropriate thresholds since vehicular development size and volume of traffic are good indicators of potential impacts of urban runoff from RGOs on receiving waters. (**Finding No. 25**)

In SWRCB WQ Order No. 2000-11, the SWRCB removed RGOs as a SUSMP category because they were already heavily regulated, and limited on their ability to construct infiltration devices or perform treatment. Order No. 2000-11 also acknowledged that a threshold (size, average daily traffic, etc.) appropriate to trigger SUSMP requirements should be developed and that specific findings regarding RGOs should be included in MS4 permits to justify the requirement (SWRCB, 2000b). The SWRCB removed the RGO category from the San Diego County MS4 permit (Order No. R9-2001-01) because the SDRWCB did not specifically address the issues raised in WQ Order No. 2000-11. As discussed below, the LARWQCB and the SDRWQCB have adequately addressed the issues, and RGOs have been included as a SUSMP category in the Los Angeles County MS4 permit (Order No. R4-01-182), and the statewide general Phase II MS4 permit (WQ Order No. 2003-0005-DWQ). Additional detailed supporting information can found in the technical Report, *Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts* (LA and SDRWQCB, 2001b).

- Heavily Regulated - The heavily regulated distinction does not remove RGOs as significant source of pollutants in urban runoff and therefore should not be a basis for exempting them. Other regulation of RGOs is separate from regulation under the CWA and does not necessarily relate to water quality from urban runoff. Other municipalities already require that RGOs implement structural BMPs even though they are regulated under other programs.

- Treatment Limitations - Structural treatment BMPs are available for RGOs to reduce pollutants and control peak flow rates and velocities that that are both inexpensive and effective. Studies have shown that catch basin inserts can remove hydrocarbons and heavy metals that are the pollutants of concern. Sand or media filters have also been found to be effective and available for use at RGOs. Cisterns are examples of established BMPs to control flow, but RGOs could also use site design measures such as small weirs, baffles, and redirecting roof runoff to pervious areas.

- Safety - No evidence has been provided to indicate that use of these structural BMPs will pose a safety risk. In fact, filter BMP have been installed at RGOs in other municipalities without apparent adverse safety effects. In addition, similar BMPs such as oil/water separators have been used for years by RGOs without apparent adverse safety risks.

- Threshold - Studies indicate that runoff from RGOs contains similar pollutants to runoff from commercial parking lots. In precedential WQ Order 2000-11, the SWRCB determined that parking lots with a size threshold of 5,000 square feet or more is an appropriate SUSMP category (SWRCB, 2000b). Based in part on the similarity of pollutants, the 5,000 square feet size threshold was also included for RGOs in the Order. In addition, other municipalities currently use similar size thresholds for RGOs to require design standards to mitigate storm water runoff. To provide additional flexibility for the Permitees, another threshold of 100 or more motor vehicles ADT has been added to the Order. This threshold is based on requirements from Washington and Oregon for what is

considered a "high use" site. This is an appropriate threshold since vehicular traffic is a good indicator of the amount of pollutants generated at a site.

The SDRWQCB followed the SWRCB's direction for the inclusion of RGOs as a Priority Development Project category by including the above discussion in this Fact Sheet, as well as a specific finding (Finding No. 25) that justifies the regulation of urban runoff from RGOs that meet certain criteria. The SWRCB also addressed the inclusion of RGOs through the appeals of MS4 permits issued by the Los Angeles and San Francisco RWQCBs that included RGOs as a priority development category. The SWRCB held a workshop that identified RGOs as significant sources of pollutants and dismissed the petitions for removal of RGOs from the SUSMP requirements in the permits. The Western States Petroleum Association, who filed the petitions to the inclusion of RGOs, did not appeal the SWRCB's dismissal of the petitions and did not comment on the Order. Finally, the SWRCB adopted a General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2003-0005-DWQ), which includes RGOs as a priority development category.

Considering all of the supporting documentation discussed above, it is appropriate to include RGOs as a Priority Development Project category.

ESAs are also included as a Priority Development Project location for the reasons discussed in section VI of this Fact Sheet. For further information regarding the inclusion of ESAs is contained in the technical report, *Mitigation of Storm Water Impacts from New Development in Environmentally Sensitive Areas* (LARWQCB, 2000c).

Requirement F.2.b.2 specifies that SUSMPs include a list of recommended source control and treatment control BMPs for all projects falling under the Priority Development Project categories. This requirement also establishes criteria that these BMPs must meet. The intent of the requirement is to allow the Permittees and developers flexibility in choosing which combination of source control and treatment control BMPs are to be implemented at a site and to define what minimum performance standards must be met by these selected BMPs.

As described in **Finding No. 18**, urban runoff treatment and/or mitigation in accordance with any of the requirements in Order No. R9-2004-001 must occur prior to the discharge of storm water or urban runoff into receiving waters. Allowing polluted runoff to enter a receiving water prior to treatment to the MEP will result in degradation of the water body and potential exceedances of water quality standards, from the discharge point to the point of dissipation, infiltration, or treatment. Furthermore, the construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body. This requirement is supported by federal regulation 40 CFR 131.10(a) and EPA guidance. According to the EPA, "To the extent possible, municipalities should avoid locating structural controls in natural wetlands. Before considering siting of controls in a natural wetland, the municipality should demonstrate that it is not possible or practicable to construct them in sites that do not contain natural wetlands... Practices should be used that settle solids, regulate flow, and remove contaminants prior to discharging storm water into a wetland" (EPA, 1992a).

The numeric sizing criteria is included to ensure that structural BMPs are sized effectively to remove the pollutants of concern. The sizing criteria are based on capture of runoff from a

24-hour 85th percentile rainfall depth. The 24-hour 85th percentile storm represents the "knee" of a precipitation probability curve from which it is no longer cost effective to treat runoff. The precipitation curve is calculated by using local historical rainfall data on the number and intensity of storm events. SDRWQCB staff has calculated the average 24-hour 85th percentile rainfall depth for area covered by the permit to be 0.6 inch (See Table 2 below). The San Diego SUSMP Staff Report developed for the San Diego MS4 Permit is available for example calculations on how staff determined the average 85th percentile rainfall depth t (SDRWQCB, 2001b). However, the requirements allow needed flexibility for the Permittees and developers to mitigate runoff based on either volume or flow. In addition, the requirements allow for several different options to calculate the amount of runoff to ensure that projects are not required to capture runoff from storm events beyond the point of diminishing returns. For example, a project proponent may demonstrate that the 24-hour 85th rainfall depth may be less than the average 0.6 inch by using local precipitation data.

Table 5. Calculation of 85th Percentile Rainfall Depth for the Upper Santa Margarita Watershed

Wildomar

Total Range (Inches)	Number of Storms	Cumulative	Cumulative Percent
0.01 - 0.09	917	917	29.80
0.10 - 0.49	1344	2261	73.46
0.50 - 0.99	467	2728	88.63
1.00 - 1.99	246	2974	96.62

5.00 – 5.99	1	1988	100.00

Average 85th Percentile Rainfall Depth For Area=(Wildomar + Temecula + Winchester)/3 (0.4 + 0.8 + 0.6)/3= 0.6 inch 85th Percentile Rainfall Depth for Southern Riverside County

Requirement F.2.b.4 allows Permittees the opportunity to develop an equivalent method for calculating the volume or flow to be mitigated. The intent of the requirement is to provide necessary flexibility to Permittees to develop equivalent methods in calculating the volume or flow that must be mitigated from the 24-hour 85th percentile rainfall depth.

As part of the SUSMP (**Requirement F.2.b.5**), the Permittees are required to develop a procedure to identify pollutants or conditions or concern for each Priority Development Project. Identifying the pollutants or conditions or concern for a project is crucial to selecting the appropriate BMPs.

Requirement F.2.b.7 allows Permittees to waive treatment control BMPs when all available BMPs have been considered and rejected as infeasible. The requirement also allows the Permittees to develop a program to require projects that receive waivers, to transfer the cost savings to a fund. The intent of the requirements is to allow Permittees necessary flexibility to waive treatment control BMPs when it can be established that the implementation of treatment control BMPs that meet numeric sizing criteria is not feasible at a given site. This provision also allows Permittees discretion to transfer the costs saving from such a waiver to a fund for water quality projects within the watershed.

Requirement F.2.b.8 defines what restrictions to protect groundwater quality are placed on treatment control BMPs that are designed to primarily function as infiltration devices, but allows Permittees to develop alternative restrictions. Applying large amounts of runoff water in a small area has the potential to adversely impact groundwater quality. The intent of these requirements is to provide necessary restrictions for use of these structural BMPs to protect the beneficial uses (municipal, agricultural, industrial) of groundwater in the Santa Margarita watershed. The intent of the requirements is also to provide the Permittees needed flexibility to develop alternative restrictions for projects or locations.

Requirement F.2.b.9 directs Permittees to develop numeric criteria to ensure discharges from Priority Development Projects maintain or reduce pre-development downstream erosion and protect stream habitat. Development can cause increases in runoff amount and velocity causing down erosion problems. Simply maintaining the peak flow rate may not be adequate to prevent increased downstream erosion because of the increase in duration of erosive flows. According to several studies, this approach is an oversimplification of geomorphological processes (Brown, 2001). Simply controlling the post-development peak discharge rate

causes the duration of erosive flows to increase, which may actually exacerbate channel erosion since bank are exposed to a longer duration of erosive events (Brown, 2001). Development of numeric criteria over the permit cycle is needed to establish a design storm type and level of discharge that is appropriate to protect downstream habitat from increased erosion. Due to urbanization, there is a substantial increase in volume and rates of runoff during smaller storm events. The intent of the requirements in the Order to control peak rates, velocities, volumes, and durations from these smaller storms (typically 1 or 2 year storm events) to maintain downstream erosion and not the larger storm events (Brown, 2001). Section II.A of Monitoring and Reporting Program No. R9-2004-001 requires the Permittees to conduct a study to help develop the numeric criteria.

The Ventura County Flood Control District and the Southern California Coastal Water Research Project are currently conducting studies to evaluate the erosive effects on urbanization in part, to quantitatively predict downstream impacts due to development. The development of numeric criteria by the Permittees should build upon these efforts and not duplicate them. The intent of these requirements is to mitigate these potential increases and prevent downstream erosion problems like the severe bank erosion and channel degradation that has occurred in Murrieta Creek (USFWS, 2000 and EPA, 2003).

The Permittees are encouraged to use any existing programs to meet these requirements and should provide detail on how these programs are implemented in the SUSMPs. It is expected that the Permittees will utilize information from any studies that are conducted on numeric criteria to protect downstream erosion and incorporate them into their development of their own numeric criteria by 2009.

Requirement F.3 requires the Permittees to consider the effects of development projects on water quality during project approval processes. This measure will help ensure that potential water quality problems resulting from the development are identified and addressed. The EPA finds that "Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective" (EPA, 1992a). The EPA further finds that "The municipality should consider storm water controls and structural controls in planning, zoning, and site or subdivision plan approval" (EPA, 1992a). The TAC advises that the Permittees' CEQA initial study checklists be revised to include consideration of water quality effects from new development or redevelopment. The questions included in Requirement F.3. are based on questions recommended by the TAC (SWRCB, 1994).

Requirement F.4 requires Permittees to educate staff (on an annual basis) and the development community on the impacts from development and the requirements of the Order. Training of municipal planning and development review staff is a critical aspect of an urban runoff management program. With adequate training, municipal planning and development review staff can require implementation of BMPs early in the project planning process, thereby minimizing the urban runoff impacts of development in a cost effective manner. The EPA supports training of municipal staff when it identifies "training for

appropriate employees" as a measurable goal of an urban runoff management program (EPA, 2000c).

Education on urban runoff planning issues for the public sector involved with development is equally critical. When the public sector has knowledge of urban runoff issues and regulations, it is more likely to incorporate storm water planning in the development and redevelopment process. In this manner, implementation of measures to address these issues will be included in development plans, saving time and money for the developer and the municipality. The TAC finds that Permittees should "Establish an education/information dissemination program that includes such things as: brochures to distribute to developers and contractors at permit counters and by mail; reference and training manuals for planners, engineers, inspectors, developers, contractors; and training and information exchange workshops" (SWRCB, 1994).

Furthermore, in its Phase II Final Rule, EPA requires small municipalities to "...implement a public education program to distribute educational materials to the community or conduct equivalent outreach activities [...]" (EPA, 1999b). As discussed in section VII.E oft his Fact Sheet, Phase II findings are applicable to the Permittees.

3. Comments on Existing and Proposed Programs Related to Development Planning

Section 6.3 of the ROWD states that, "Within 10 months of permit adoption, each Co-Permittee will review its general plan and land use ordinances to assess whether the following principles and policies are properly considered:

1. Limit disturbance of natural water bodies and drainage systems; conserve natural areas; protect slopes and channels; minimize impacts from urban runoff on the biological integrity of natural drainage systems and water bodies;
2. Minimize changes in hydrology and pollutant loading; require incorporation of source control and structural BMPs to mitigate the projected increases in pollutant loads and flows; ensure that post-construction runoff rates and velocities from a site do not result in significant adverse impact on downstream erosion and stream habitat; limit the quantity of Urban Runoff directed to impermeable surfaces and the MS4s; and maximize the percentage of permeable surfaces to allow more percolation of Urban Runoff in to the ground;
3. Preserve wetlands, riparian corridors, and buffer zones, establish reasonable limits on the clearing of vegetation from the project site;
4. Encourage the use of BMPs to manage Urban Runoff quality and quantity;
5. Provide for appropriate permanent measures to reduce pollutant loads in Urban Runoff from the development site; and
6. Establish development guidelines for areas particularly susceptible to erosion and sediment loss.

In addition each Co-Permittee shall provide a summary of the review and assessment in that year's Annual Progress Report and within 24 months the Co-Permittees shall revise their general plans and land use ordinances as determined necessary during review and assessment."

This proposal is basically consistent with **Requirement F.1**.

Section 6.3 of the ROWD proposes that Permittees will reduce pollutants and runoff flows form new developments and significant redevelopment to the MEP by:

1. Reviewing and revising their respective land use approval and CEQA review processes to ensure that they address urban runoff issues.
2. Developing and implementing a public/business education program.

To be consistent with the **Requirement F.2.a**. the Permittees' proposal must also provide that BMPs will be required and that new developments will not cause or contribute to an exceedance of water quality standards.

Section 6.3 of the ROWD states that Permittees will continue to implement the New Development Guidelines and will continue to address the maintenance, operation and funding of structural BMPs that ensure management of Urban Runoff quality from new development. The Permittees' current processes, including the New Development Guidelines, do not contain specific requirements consistent with those in **Requirement F.2.b.(1)**.

Section 6.3 of the ROWD proposes that, within 9 months of permit adoption, the Permittees will develop a Model Water Quality Management Plan (WQMP) identifying BMPs, including design standards for source control and structural BMPs to be applied when discretionary approval is sought. The WQMP is intended to address regional and sub-regional BMPs and to provide guidelines for site-specific, post-construction BMPs to address management of urban runoff quantity and quality in new development and significant redevelopment projects. The ROWD does not specify priority development categories, numeric criteria, or any other specific provisions required in **Requirement F.b**, which must be included in the WQMP. It should also be noted that the SDRWQCB requires the use of site-specific source and treatment control BMPs and does not encourage the use of regional or sub-regional BMPs. Regional and sub-regional BMPs are sometimes necessary in an area that has already been developed without urban runoff management measures, but it is not justified for a developing area that has the opportunity to incorporate low-impact designs and management measures into new developments during the planning process.

Also, if the Permittees choose to develop a model document, this should be completed within 6 months of the permit adoption date, so that Permittees have sufficient time to begin implementation of SUSMP requirements within 1 year. Permittees are encouraged to use existing model SUSMP documents (County of Orange, 2003; San Diego Co-Permittees, 2002), which the SDRWQCB has previously approved, so that resources can be focused on program implementation instead of developing another similar model.

Section 6.3 of the ROWD proposes that, within 10 months of permit adoption, Permittees shall review their land use approval and CEQA processes to ensure that urban runoff issues are properly considered, and revise if necessary to mitigate impacts to water quality. The ROWD states that the following six factors will be considered in each Permittee's environmental assessment:

- Potential impact that construction of the project may have on urban runoff;
- Potential impact that operation of the project may have on urban runoff;

- Potential for discharge of pollutant in urban runoff from areas identified within the project site to be used for material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas;
- Potential for pollutants in urban runoff discharged from a project site to affect the beneficial uses of receiving waters;
- Potential for significant changes in the flow velocity or volume of urban runoff from a project site to result in environmental harm; and
- Potential for significant increases in erosion of a project site or surrounding areas.

These factors are similar to the examples listed in **Requirement F.3**, therefore, this proposal is sufficient to comply with the **Requirement F.3**.

No specific internal or external training regarding development planning is proposed in the ROWD. It states that the New Development Guidelines, which contains the information needed to acquaint developers and contractors with the requirements for post-construction BMPs, will be made available during the review process for project planning and permitting. This proposal does not meet the MEP standard and, therefore, is insufficient to meet the requirements in **Requirement F.4**.

G. CONSTRUCTION (Order Section G)

1. Specific Legal Authority for Construction Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D) provides that the proposed management program include "A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(1) provides that the proposed management program include "A description of procedures for site planning which incorporate consideration of potential water quality impacts."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(2) provides that the proposed management program include "A description of requirements for nonstructural and structural best management practices."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that each Permittee must demonstrate that it can control "through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from site of industrial activity."
- Federal NPDES regulation 40 CFR 122.26(b)(14) provides that "The following categories of facilities are considered to be engaging in 'industrial activity' for the purposes of this subsection: [...] Construction activity including clearing, grading and excavation activities [...]."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(3) provides that the proposed management program include "A description of procedures for identifying priorities for

inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality."

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(4) provides that the proposed management program include "A description of appropriate educational and training measures for construction site operators."

2. Discussion of Construction Requirements

CWA sections 402(p)(3)(B)(ii-iii) requires each Permittee to prohibit non-storm water discharges into its MS4 and to reduce the discharge of pollutants to the MEP for all urban land uses. The purpose of these two broad requirements is to minimize the short and long-term impacts of urban runoff on receiving water quality. Land used for construction activities is clearly identified in the federal regulations as one of several high priority land uses from which pollutants in urban runoff discharges must be reduced to the MEP by each Permittee.

Requirements G.2 and G.3 are consistent with the EPA statement that "A description of the local erosion and sediment control law or ordinance is needed to satisfy this requirement [i.e., Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(2)]" (EPA, 1992a). Regarding Permittee approval of construction activities, the EPA further states, "applicants must propose site review and approval procedures that address sediment and erosion controls, storm water management, and other appropriate measures. Approvals should be clearly tied to commitments to implement structural and nonstructural BMPs during the construction process" (EPA, 1992a).

Furthermore, the EPA requires small municipalities to develop and implement for construction sites "An ordinance or other regulatory mechanism to require erosion and sediment controls, as well as sanctions to ensure compliance [...]" (EPA, 2000c).

Requirement G.2 provides the Permittees with 365 days to update their grading ordinances and not the 640 days requested the Permittees. The Permittees will have adequate authority to require and enforce minimum BMPs at construction sites prior to the next rainy season and 365 days is adequate to allow for the only minor changes needed in the grading ordinances.

An effective means for reducing pollutants discharges from construction and grading activities is specified under **Requirement G.3** for the Permittees to develop conditions of approval for grading and construction permits that require measures to minimize pollutant discharges. The EPA recommends approval processes which consider water quality impacts, stating that approval process requirements should "include phasing development to coincide with seasonal dry periods, minimizing areas that are cleared and graded to only the portion of the site that is necessary for construction, exposing areas for the briefest period possible, and stabilizing and reseeding disturbed areas rapidly after construction activity is completed (EPA, 1992a)". Other suggested construction and grading conditions of approval listed in this item are based on TAC recommendations (SWRCB, 1994).

During approval and issuance of grading and construction permits, each Permittee must review construction and grading plans to ensure that the conditions of approval are met. The EPA states that to determine if a construction site is in compliance with construction and

grading ordinances and permits, the "MS4 operator should review the site plans submitted by the construction site operator before ground is broken" (EPA, 2000c). Furthermore, the EPA requires small municipalities to develop and implement for construction sites "Procedures for site plan review which incorporate consideration of potential water quality impacts" (EPA, 1999b).

Development of an inventory of construction sites as specified by **Requirement G.4**. will help identify potential sources of pollutants in storm water. By assessing information provided in the inventory (such as site topography and site proximity to receiving waters), sites can be prioritized by threat to water quality. Those sites that pose the greatest threat can then be targeted for inspection and monitoring. This will allow for limited inspection and monitoring time to be most effective. The EPA requires that all construction sites be addressed (and therefore inventoried), stating: "All construction sites, regardless of size, must be addressed by the municipality. To begin to identify these sites, the applicant should obtain lists of construction site operators that are covered by general or individual storm water NPDES permits from the NPDES permitting authority. However, construction sites not covered by a storm water discharge permit also need to be addressed by the municipality. The best way to identify these construction sites and implement an effective BMP program to reduce pollutants in their runoff is through the site planning process" (EPA, 1992a).

Designation of a set of minimum BMPs for construction sites as specified by **Requirement G.5** will help ensure that appropriate, consistent controls are implemented and that discharges of pollutants from construction sites are reduced to the MEP. **Requirement G.5.c.** provides the Permittees with the flexibility to allow different BMPs for the wet and dry seasons. See the discussions regarding BMP Implementation and Permittee Responsibility for Requiring BMPs in Sections VII.C. and VII.D of this Fact Sheet.

Regarding designation of BMPs to be implemented, the EPA states, "the proposed management program should describe requirements for nonstructural and structural BMPs that operators of construction activities that discharge to MS4s must meet" (EPA, 1992a). While minimum BMPs will be required at all construction sites, implementation of particular BMPs will be site specific in order to address various conditions at different sites. Regarding site specific BMPs, the EPA states, "Appropriate structural and nonstructural control requirements will vary by project. Project type, size, and duration, as well as soil composition, site slope, and proximity to sensitive receiving waters will determine the appropriate structural and nonstructural BMPs" (EPA, 1992a).

In order to comply with Order No. R9-2004-001 requirements, implemented BMPs may need to be more stringent than those required under the General Construction Permit. The EPA implies that local sediment and erosion control requirements may be more stringent than General Construction Permit requirements when it states that "construction sites covered under NPDES permit regulations must indicate whether they are in compliance with State and local sediment and erosion control plans" (EPA, 1992a).

Requirement G.6. specifies requirements for inspecting construction sites. Inspections provide a necessary means by which Permittees can evaluate compliance with their municipal ordinances. Inspections are especially important at high-risk areas for pollutant discharges, such as industrial and construction sites. The Order (Attachment C - Definitions) defines the wet season as Oct 1 through April 30, which is consistent with Order No. R9-

2001-001, Order No. R9-2001-0001, Order No. R8-2002-0011, and the SDRWQCB implementation of the General Construction Permit. To ensure that BMPs are properly installed and maintained, the EPA states MS4 operators should "develop procedures for site inspection and enforcement of control measures to deter infractions" (EPA, 1992a).

The EPA further states that "Site inspections are expected to be the primary enforcement mechanism by which erosion and sediment controls are maintained" (EPA, 1992a). When inspections result in findings of noncompliance, follow-up by the Permittee to ensure compliance is necessary. The EPA states "Effective inspection and enforcement requires [...] intervention by the municipal authority to correct violations" (EPA, 1992a). This is supported by the North Carolina Study that provided empirical support for the importance of inspections in increasing construction site compliance with local and state ordinances. Both the frequency and duration of project inspections were positively associated with the level of installation and maintenance compliance at the construction sites (Malcom, 1990). The EPA further finds "inspections give the MS4 operator an opportunity to provide additional guidance and education, issue warnings or assess penalties" (EPA, 2000c). Frequent inspections by Permittees of high priority construction sites will keep compliance a priority, and allow opportunities for inspectors to enhance problem-solving skills among site personnel.

Construction site inspection frequencies are to be based on threat to water quality. The EPA supports this, stating that site inspection procedures should "identify priority sites for inspection and enforcement based on the nature and extent of the construction activity, topography, and the characteristics of soils and receiving water quality" (EPA, 2000c). For example, construction sites that are considered a high threat to water quality are to be given a high priority for inspection. This will allow for limited inspection and monitoring time to be most effective. Bi-weekly to monthly inspection of high threat sites is necessary due to the dynamic nature of construction activities. Medium and low threat construction sites can be inspected less frequently, due to their reduced risk of negatively impacting receiving waters. The minimum inspection schedule in the Permit is reasonable for the Permittees to ensure that construction sites are implementing adequate BMPs. More frequent inspections may be necessary due to site conditions. Review of storm water pollution prevention plans (SWPPPs) can be one effective tool for determining frequency of site inspections. Construction sites that effectively implement the measures of a comprehensive SWPPP may not need to be inspected as frequently as less diligent sites.

Each Permittee must develop grading and storm water ordinances under its Individual SWMP. When a Permittee determines a violation of its grading or storm water ordinance, it must pursue correction of the violation. A critical aspect of the correction of violations is enforcement of ordinances. Enforcement increases the probability of correction of a violation. The EPA supports development of enforceable ordinances and permits when it states "applicants must describe proposed regulatory programs to reduce pollutants in storm water runoff from construction sites to the MS4" (EPA, 1992a). The EPA supports enforcement of these ordinances and permits at construction sites when it states "Effective inspection and enforcement requires [...] penalties to deter infractions and intervention by the municipal authority to correct violations. Enforcement mechanisms [...] also must be described" (EPA, 1992a).

Furthermore, the EPA requires small municipalities to develop and implement "An ordinance or other regulatory mechanism to require erosion and sediment controls, as well as sanctions to ensure compliance [...]" (EPA, 1999b).

Implementation of an education program is an important best management practice for construction sites and activities. The TAC "recognizes that education with an emphasis on pollution prevention is the fundamental basis for solving nonpoint source pollution problems." The TAC points out several target communities for education efforts, including "Government: Educate agencies and officials to achieve better communication, consistency, collaboration, and coordination at the federal, state and local levels" and "Development Community: Educate the development community, including developers, contractors, architects, and local government planners, engineers, and inspectors, on nonpoint source pollution problems associated with development and redevelopment and construction activities and involve them in problem definitions and solutions" (SWRCB, 1994).

The EPA also supports education efforts for parties involved in construction, stating "technical information on how to incorporate storm water management with erosion and sediment control and other BMP training courses are recommended for municipal employees and construction site operators" (EPA, 1992a).

3. Comments on Existing and Proposed Programs Related to Construction

Pollution Prevention as required in **Requirement G.1** is not specifically mentioned in the ROWD.

Section 2.5 of the ROWD proposes that Permittees will, within 18 months of permit adoption, review and revise grading/erosion control ordinances in order to reduce erosion caused by new development and significant redevelopment. The ROWD proposal does not include the specific provisions required in **Requirement G.2**, and ordinances must be revised and adopted no later than 6 months following permit adoption (SWMPs must be implemented in full within 1 year).

The ROWD does not indicate that the Permittees' construction approval processes will be modified to include the requirements in **Requirement G.3**, except that the requirement for evidence of coverage under the General Construction Permit prior to issuance of grading permits.

Section 5.2 of the ROWD states that, within 10 months of permit adoption, "each Permittee will develop an inventory (database) of active construction sites within its jurisdiction for projects for which a building or grading permit has been issued for a site that is 1 acre or larger." This proposal is not consistent with **Requirement G.4** of the Order, since all construction sites, regardless of size, must be included in the inventory.

Section 5.2 of the ROWD proposed that, within 6 months of permit adoption, Permittees shall develop a list of erosion control BMPs appropriate for use during construction. The proposed time frame is adequate, but the list must also include minimum erosion prevention and sediment control BMPs that address **Requirement G.5**. Also, the ROWD does not state that the BMPs will be required, which is necessary to comply with Order No. R9-2004-001. The ROWD does not require additional controls for construction sites that are tributary to

CWA section 303(d) water bodies or within/adjacent to or discharging directly to receiving waters within environmentally sensitive areas, which is necessary to comply with the Order.

The ROWD proposes to initiate inspections of all inventoried sites within 11 months of permit adoption. The ROWD proposal is not sufficient to meet the requirements in Order No. R9-2004-001 because it does not include inspection frequencies. Also, construction inspections should be ongoing, as they were required in Order No. R9-98-02, until new programs begin. Stating that inspections will be "initiated" 11 months after permit adoption would cause Permittees to be in violation of the requirement to continue implementation of Order No. R9-98-02 until the SWMP is fully implemented.

Section 2.4.2.2. of the ROWD, which describes enforcement and compliance responses, states that Permittees will emphasize and encourage voluntary compliance and will initiate enforcement/compliance actions within 60 days form the date a violation was identified. It also says that the SDRWQCB will take all enforcement actions related to compliance with the General Construction Permit and that the SDRWQCB will take the lead in initiating enforcement actions related to high-priority incidents. The Permittees are responsible for enforcing their ordinances and permits related to all violations, especially those of high priority. The SDRWQCB is responsible for enforcement of the General Construction Permit, however, if Permittee ordinances are also violated, Permittees must address these violations. Furthermore, 60 days is an inappropriately long amount of time to allow a violation to occur. The ROWD does not include adequate sanctions to ensure that BMPs are implemented at construction sites. The authority to issue sanctions (including the authority to stop work) at construction sites for lack of adequate BMPs is necessary to proactively prevent discharges. The Enforcement/Compliance Strategy, as described in the ROWD, is insufficient to maintain compliance with Order No. R9-2004-001.

Section 5.2 of the ROWD proposes that, within 10 months of permit adoption, each Permittee will have arranged for training of its current inspection staff and on an annual basis thereafter, and new hires and transfers will be trained within 6 months of starting inspection duties. This proposal to train municipal staff on an annual basis is adequate to meet permit requirements. However, the ROWD does not address external training.

H. EXISTING DEVELOPMENT (Order Section H)

The Existing Development section contains the following three sections:

H.1 Municipal Program

H.2 Industrial/Commercial Facilities Program

H.3 Residential Program

H.1 MUNICIPAL PROGRAM (Order Section H.1)

1. Specific Legal Authority for Municipal Program Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(1) provides that the proposed management program include "A description of maintenance activities and a

maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers."

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(3) provides that the proposed management program include "A description for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(4) provides that the proposed management program include "A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(5) provides that the proposed management program include "A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."
- Federal NPDES regulation 40 CFR 122.26(d)(1)(iii) requires source identification, including the location of MS4 outfalls, the location and description of the activities of each currently operating or closed municipal land fill or other treatment, storage or disposal facility for municipal waste, the location of major structural controls for storm water discharge, and the identification of publicly owned parks, recreational areas, and other open lands.

2. Discussion of Municipal Program Requirements

Municipal facilities and activities are clearly identified in the federal regulations as one of several high priority land uses from which pollutants in urban runoff discharges must be reduced to the MEP. The EPA targets municipal areas and activities "to help ensure a reduction in the amount and type of pollution that (1) collects on streets, parking lots, open spaces, and storage and vehicle maintenance areas and is discharged into local waterways; and (2) results from actions such as environmentally damaging land development and flood management practices or poor maintenance of storm sewer systems" (EPA, 2000c).

As specified by **Requirement H.1.b**, Permittees must first identify all of the municipal areas and activities that generate pollutants within their jurisdiction. The areas and activities listed in **Requirement H.1.b** are either specifically addressed in the federal NPDES regulations

referenced above, or have been determined by the Permittees (Permittees, 2003), the SDRWQCB (SDRWQCB, 2002a), or the EPA (EPA, 1992a) to contribute pollutants to the MS4. Source identification is necessary to characterize the nature and extent of pollutants in discharges and to develop appropriate control measures. It is the first step in developing a targeted approach to urban runoff management.

Regarding **Requirement H.1.d**, MS4 Maintenance is critical to the successful implementation of every SWMP. The requirement to conduct a maintenance program is specifically directed in both the Phase I and Phase II storm water regulations. The EPA finds that "Lack of maintenance often limits the effectiveness of storm water structural controls such as detention/retention basins and infiltration devices. [...] The proposed program should provide for maintenance logs and identify specific maintenance activities for each class of control, such as removing sediment from retention ponds every five years, cleaning catch basins annually, and removing litter from channels twice a year" (EPA, 1992a). Regarding catch basin cleaning, the EPA states, "The removal of sediment, decaying debris, and highly polluted water from catch basins has aesthetic and water quality benefits, including reducing foul odors, reducing suspended solids, and reducing the load of oxygen-demanding substances that reach receiving waters" (EPA, 1999c). It goes on to say, "Catch basin cleaning is an efficient and cost-effective method for preventing the transport of sediment and pollutants to receiving water bodies. The requirement (Requirement H.1.d.(d)) is necessary to identify problem areas and sources of debris in catch basins.

Requirement H.1.e, Management of Pesticides, Herbicides and Fertilizers, is supported by the EPA finding that "The proposed program should include educational measures for the public and commercial applicators, and should include integrated pest management measures that rely on non-chemical solutions to pest control. The program should also describe how educational materials will be developed and distributed. Applicants are encouraged to consider providing information for the collection and proper disposal of unused pesticides, herbicides, and fertilizers, or to establish their own program. [...] In addition, applicants must include a discussion of controls for the application of pesticides, herbicides, and fertilizers in public rights-of-way and at municipal facilities. Planting low-maintenance vegetation, such as perennial ground covers, reduces pesticide and herbicide use. Native vegetation is often preferable because there is less need to apply fertilizers and herbicides, and to perform other forms of maintenance, such as mowing" (EPA, 1992a).

Requirement No. H.1.f, Inspections of Municipal Facilities and Activities, is specified to insure that proper measures are being undertaken to reduce pollutant discharges to the MEP. The EPA supports inspections of municipal areas and activities, stating "Applicants must describe programs that identify measures to monitor and reduce pollutants in storm water discharges from facilities that handle municipal waste, including sewage sludge. [...] The types of facilities that should be included are: active or closed municipal waste landfills; publicly owned treatment works, including water and wastewater treatment plants; incinerators; municipal solid waste transfer facilities; land application sites; uncontrolled sanitary landfills; maintenance and storage yards for waste transportation fleets and equipment; sites for disposing or treating sludge from municipal treatment works; and other treatment, storage, or disposal facilities for municipal waste" (EPA, 1992a). The EPA further states, "Procedures to evaluate, inspect, monitor, and establish control measures for

municipal waste sites over the term of the NPDES permit should be described" (EPA, 1992a)."

3. Comments on Existing and Proposed Municipal Programs

Section 4.1 of the ROWD describes the Municipal Facilities Strategy, which the Permittees developed pursuant to Order No. R9-98-02 to identify BMPs for activities conducted at municipal facilities. This section of the ROWD identifies the types of municipal facilities and the activities conducted at those facilities that have the potential to contribute pollutants to urban runoff (ROWD Table 4-1). The Permittees identified maintenance yards, vehicle and equipment maintenance areas, waste transfer stations, corporation and storage yards, and parks and recreational facilities as "facilities of concern". The number of each type of facility operated by each Permittee is listed in Table 4-2 of the ROWD. All other facilities that may be sources of pollutants, including parking areas, hazardous material collection facilities, and other facilities covered under the General Industrial Permit were not identified as "facilities of concern", and were not included in Table 4-2. As discussed above, all facilities and activities listed in **Requirement H.1.b** of the Order must be identified in the inventory. Also, Table 4-2 only lists the number of each type of facility in each Permittee's jurisdiction. The inventory must include, at a minimum, the name, address, and description of activities conducted at each facility.

The ROWD also identifies potential pollutants of concern from municipal facilities and activities (Table 4-3) and "potential" source control BMPs to address the pollutant-generating activities (Table 4-4). The Permittees propose to "maintain up-to-date site-specific Urban Runoff pollution prevention plans for public agency facilities and activities." If the "potential" BMPs listed in Table 4-4 include pollution prevention methods, and are required to be implemented (as applicable) these programs are adequate to comply with **Requirements H.1.a and c** of the Order.

It is important to note that the ROWD claims that brake pad wear, the operation of internal combustion engines, and tire wear, among other thing, are beyond the ability of the Permittees to control. The EPA and the SDRWQCB do not concur with this claim. The EPA states, "proposed management programs must include a description of practices for operation and maintenance of public streets, roads, and highways, and procedures for reducing the impact of runoff from these areas on receiving waters. [...] Pollutants from traffic can be minimized by using nonstructural controls (e.g., traffic reduction and improved traffic management), structural controls (e.g., traditional and innovative BMPs), and changing maintenance activities" (EPA, 1992a).

Regarding MS4 maintenance, Section 4.2 of the ROWD proposes that, within 12 months of permit adoption, Permittees will develop "Model Maintenance Procedures" for public agency activities and drainage facilities. However, in December 1999, the Permittees submitted proposed "Storm Drain System Inspection and Maintenance" programs, pursuant to Order No. R9-98-02 (Permittees, 1999). Each Permittee's proposed program would satisfy the requirements in **Requirement H.1.d** of the Order. Because such plans have already been submitted, the Permittees do not need 12 months to develop another program, and they do not need additional time to implement maintenance activities. Considering that this is a third-round permit, the Permittees should already be conducting the proposed MS4

maintenance activities and continued implementation would be adequate for compliance with Order No. R9-2004-001 without requiring additional resources.

Regarding the management of pesticides, herbicides, and fertilizers, Section 4.2 of the ROWD proposes that "Permittees shall continue to provide training to municipal staff and to contract field operations staff on fertilizer and pesticide management, maintenance procedures, and other pollution control measures. Permittee staff shall attend at least 3 out of 5 annual training sessions." This proposal satisfies **Requirement H.1.e** of the Order, but it does not address the requirements to include integrated pest management measures that rely on non-chemical solutions.

Section 4.2 of the ROWD proposes to "review municipal activities and facilities annually to identify needed revisions of the Municipal Facilities Strategy". In order to identify needed revisions to BMP requirements and municipal programs, inspections are necessary. Therefore, it is assumed that the Permittees proposal includes inspections of municipal facilities and activities. Considering the small number of municipal facilities that each Permittee operates, with the exception of parks (ROWD Table 4-2), inspecting each facility annually is feasible.

Regarding parks and recreation facilities, the Permittees identified these areas as facilities of concern in the ROWD due to their potential to generate pollutants. Therefore, parks and recreation facilities, or the municipal activity conducted at the facilities must be inspected annually. If the same municipal maintenance staff perform similar landscaping or other activities at all parks, the inspection process could be streamlined to focus on the activities. For example, the Permittees could possibly develop one pollution prevention plan for all parks that includes all activities conducted at municipal parks, and conduct annual inspections of the activities performed to ensure that effective BMPs are being implemented (not necessarily inspecting all parks annually).

Enforcement of municipal areas and activities is not specifically addressed in the ROWD. This program will need to be developed as part of each Permittee's Individual SWMP.

Overall, with minor refinement, the existing and proposed municipal programs are adequate to meet the requirements of **Requirement H.1** of the Order.

H.2 INDUSTRIAL/COMMERCIAL FACILITIES PROGRAM (Order Section H.2)

1. Specific Legal Authority for Industrial/Commercial Facilities Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C) provides that the proposed management program include "A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C)(1) provides that the permittee must "identify priorities and procedures for inspections and establishing and implementing control measures for such discharges."

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A) provides that the permittee develop a proposed management program which includes "A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(ii) provides that the permittee "Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity."
- Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to "control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality."

2. Discussion of Industrial/Commercial Facilities Requirements

The requirements contained in Section H.2 provide a framework for developing management programs to reduce pollutants in urban runoff discharges from industrial and commercial facilities to the MEP.

The EPA supports the industrial/commercial facility requirements when it states, "NPDES permits for MS4s will establish responsibilities for municipal system operators to control pollutants from industrial storm water discharged through their system" (EPA, 1992a). The guidance further states that Permittees are ultimately responsible for discharges to their MS4. Therefore, storm water management programs should do the following:

- Identify priority industries discharging to their systems;
- Review and evaluate SWPPPs and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities to verify that the industries discharging storm water to the MS4 are in compliance with their NPDES storm water permit, if required.

Source identification is necessary to characterize the nature and extent of pollutants in discharges and to develop appropriate BMPs. The industrial and commercial facilities listed in **Requirement H.2.b** are either specifically addressed in the federal NPDES regulations referenced above, or have been determined by the Permittees, or the SDRWQCB (SDRWQCB, 2002a) to contribute pollutants to the MS4. The Permittees have not provided data, or other information, documenting that any of the facilities should be removed from the list because they are not a source of pollutants in the Upper Santa Margarita Watershed.

The EPA supports the list of facilities in the Order when it states the following (EPA, 2004):

> "EPA regulations at 40 CFR 122.26(d)(2)(iv)(A) provide for a broad program of 'source control and structural control measures to reduce pollutants from runoff from commercial and residential areas...' We believe that this regulation provides a firm basis for the permit's [Order] requirements related to commercial facilities. The requirements for outreach to commercial facilities, inspections, and the follow-up enforcement would all be consistent with a program of 'source control' measures to be included in a storm water management program..."

Regarding the list of industrial facilities, EPA goes on to say:

> "The issue of industrial inspections also arose for the Los Angeles County MS4 permit. The State Board, in a memo dated November 9, 2001, from Michael Lauffer of the State Board to Dennis Dickerson, Executive Officer of the Los Angeles Regional Board, noted that under Section 402 (p)(3)(B)(iii) of the CWA, the Board has broad authority to require 'such other provisions...as the State determines appropriate...' and that this would provide a basis for requirements that go beyond specific provisions of the EPA regulations. We would agree with the State Board on this matter, and that the Regional Board would have the authority to require inspections of all the industrial facilities listed in the permit [Order], notwithstanding the specific provisions of the EPA regulations."

Regarding **Requirement H.2.c**, BMP Implementation, guidance from the EPA makes it clear that Permittees are required to designate BMPs for industrial and commercial facilities when it states that permittees should, "Establish and implement BMPs to reduce pollutants from these facilities (or require industry to implement them)" (EPA, 1992a). The EPA goes on to say that BMPs more stringent than those required under the General Industrial Permit may be necessary. The EPA finds that "nothing in the Federal regulations would prohibit the municipality from requiring additional controls beyond the permit requirements for industrial activities. For this reason, the EPA recommends that municipal applicants incorporate a provision in the proposed storm water management program that allows the municipality to require priority industrial facilities to implement the controls necessary for the municipality to meet its permit responsibilities" (EPA, 1992a). These statements from the EPA support the requirement for dual regulation of facilities covered by the General Industrial Permit (see discussion in support of **Finding No. 21** in Section VII.E of this Fact Sheet).

In support of **Requirement H.2.c.(3)**, the EPA recommends that Permittees provide BMP guidance to industrial facilities, stating, "The applicant should suggest procedures for requiring pollutant control measures in runoff from priority industrial facilities. Applicants should provide information to the industrial facilities that discharge to the MS4s and industry-specific guidance on appropriate control measures that industries discharging to the systems should follow" (EPA, 1992a). The EPA goes on to say, "Applicants should provide information to the industrial facilities that discharge to the MS4s and industry-specific guidance on appropriate control measures that industries discharging to their systems should follow" (EPA, 1992a).

Furthermore, inspections are necessary to verify that industries are in compliance with the MS4 permit and local ordinances (EPA, 1992a). According to the EPA, "The proposed management program should describe the inspection procedures that will be followed. [...]

Proposed management programs should address minimum frequency for routine inspections. For example, how often, how much of the site, and how long an inspection may take are appropriate to explain in this proposed management program component. Applicants should also describe procedures for conducting inspections and provide an inspector's checklist" (EPA, 1992a). In further support of inspections and dual regulation of industrial facilities, the EPA states "Municipalities are urged to evaluate pollution prevention plans and discharge monitoring data collected by the industrial facility to ensure that the facility is in compliance with its NPDES storm water permit. Site inspections should include (1) an evaluation of the pollution prevention plan and any other pertinent documents, and (2) an onsite visual inspection of the facility to evaluate the potential for discharges of contaminated storm water from the site and to assess the effectiveness of the pollution prevention plan" (EPA, 1992a).

The EPA also finds that follow-up actions are to be implemented based upon site inspection findings: "The results of inspection may be used as a basis for requiring storm water management controls and enhanced pollution prevention measures" (EPA, 1992a).

Industrial site inspection frequencies specific in **Requirement H.2.d** are based on threat to water quality prioritization in order to allow for limited inspection resources to be most effective. Annual or bi-annual inspection of high threat sites is necessary to ensure that changes to the site that may be detrimental to water quality are identified and addressed.

Requirement H.2.f, Reporting of Non-Filers, is necessary to ensure effective oversight of industrial facilities.

3. Comments on Existing and Proposed Industrial/Commercial Programs

Pursuant to Order No. R9-98-02, the Permittees have developed and implemented an industrial/commercial facilities program that meets or exceeds several of the requirements in Section H.2 of the Order. Each Permittee has already developed a prioritized list of facilities, including industrial facilities as defined at 40 CFR 122.26(b)(14), food facilities, and all other facilities that store, generate, or handle hazardous waste. The method of prioritization used in developing the current lists is consistent with what the SDRWQCB considers to be "high", "medium", and "low". Section 7.3 of the ROWD proposes that, within 9 months of permit adoption, each Permittee will update its existing inventories of industrial and commercial facilities within its jurisdiction that have the potential to discharge pollutants to the MS4. The ROWD says that the industrial and commercial facilities databases will include the name, address, location reference, facility contact and phone number, SIC code, WDID number, assessor's parcel number, and site size.

Also pursuant to Order No. R9-98-02, the Permittees developed the Commercial/Industrial Compliance Assistance Program (CAP) as a mechanism to conduct the required inspections of inventoried facilities. The CAP was formed as an agreement between the District and the County's Department of Environmental Health and involves the completion of a "storm water compliance survey" in addition to the routine inspections that the Department Environmental Health conducts pursuant to other regulations. Through the CAP, the County currently inspects sites with underground storage tanks once per year, sites that handle and generate hazardous waste every two years (began in May 2002), and retail food facilities 1-3 times annually (began in January 2002). Section 7.3 of the ROWD proposes that, within 12

months of permit adoption, each Permittee will implement an inspection frequency for industrial and commercial facilities of no less than:

- Once a year for industrial facilities designated as high priority;
- Once biannually for commercial facilities designated as medium priority; and
- Once during the permit term for facilities designated as low priority.

Except for the facilities that are not captured under the CAP, which must be addressed by each Permittee, the Permittees existing and proposed programs are adequate to comply with the requirements in **Requirement H.2.b and H.2.d.**

Section 7.2 of the ROWD states that, "In conducting a commercial/industrial facility inspection, if it appears that the facility may be required to have coverage under the General Permit for Stormwater Discharges Associated with Industrial Activities and the facility operator has indicated that an NOI has not been filed, the inspector will provide the operator with an informational sheet on the requirements of the General Permit for Stormwater Discharges Associated with Industrial Activities. The inspector also documents the name, address, and SIC code of the facility. Subsequently, a listing of such facilities is compiled and forwarded to the San Diego Regional Board staff on a frequency to be determined by the Permittees." This proposal meets **Requirement H.2.f.**

It is important to note that there are approximately 25 industrial facilities currently covered by the General Industrial Permit within the Upper Santa Margarita Watershed. Most of these facilities are already included in the Permittees' inventories and covered under the CAP. The remaining few that will require inspections and oversight will not constitute a significant burden on the Permittees. Therefore, dual regulation of these sites should not be an issue. In the Permittees comments on the Order, they proposed BMP requirements to comply with Requirement H.2.c.1. The proposed BMPs may be adequate minimum requirements for food facilities and for facilities that store hazardous waste. However, broadly applying these few BMPs to all types of inventoried industrial and commercial facilities may not be adequate or appropriate. Adequate minimum BMPs should address all facility types and activities that could potentially contribute pollutants to the MS4.

Regarding enforcement, Section 2.4.2.2. of the ROWD states that Permittees will emphasize and encourage voluntary compliance and will initiate enforcement/compliance actions within 60 days form the date a violation was identified. It also says that the SDRWQCB will take all enforcement actions related to compliance with the General Industrial Permit and that the SDRWQCB will take the lead in initiating enforcement actions related to high-priority incidents. These statements are incorrect and do not meet the requirements of **Requirement H.2.e**. As discussed in Sections VII.D and VII.E of this Fact Sheet, the Permittees are responsible for enforcing their ordinances and permits related to ALL violations, especially those of high priority. The SDRWQCB is responsible for enforcement of the General Industrial Permit, however, if Permittee ordinances are also violated, Permittees must address these violations. Furthermore, 60 days is an inappropriately long amount of time to allow a violation to occur. The Permittees' Enforcement/Compliance Strategy, as described in the ROWD, is insufficient to meet the enforcement requirements contained in Order No. R9-2004-001.

Section 7.3 of the ROWD proposes that, within 1 year of permit adoption, each Permittee will have arranged for adequate training of all staff inspectors and on an annual basis thereafter. New hires that will be performing inspections will be trained within 6 months of starting field duties. This proposed training schedule meets **Requirement H.2.g** of the Order.

H.3 RESIDENTIAL PROGRAM (Order Section H.3)

1. Specific Legal Authority for Residential Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A) provides that the Permittee develop a proposed management program which includes "A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls."
- Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to "control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality."

2. Discussion of Residential Requirements

Land used for residential activities is clearly identified in the federal regulations as one of several high priority land uses from which pollutants in urban runoff discharges must be reduced to the MEP by each Permittee (40 CFR 122.26(d)(2)(iv)). Residential activities have the potential to be significant sources of pollutants in urban runoff. In residential areas, pollution sources conveyed by the MS4 include activities related to automobile maintenance, landscaping/gardening, home-improvement, pets, and others, including those listed in **Requirement H.3.b.** The requirements contained in Section H.3 will provide a program for the development and implementation of BMPs to reduce pollutants in urban runoff discharges from residential activities to the MEP (see discussion of **BMP Implementation** in Section VII.C of this Fact Sheet).

Pursuant to Order No. R9-98-02 and pre-existing programs, the Permittees have instituted or promoted residential pollution prevention BMPs, including street sweeping, household hazardous waste collections, and education. Nationally, education is increasingly being used as a tool for pollution prevention in residential areas, where the use of regulatory enforcement actions has traditionally been less than in other land use areas. Pollution prevention can encourage responsible residential nutrient management, such as proper fertilization rates and proper pet waste disposal, when a connection is established between such practices and local or regional water quality needs (Nonpoint Source News Notes, 2000). Similarly, source control is vital to protect urban watersheds from pesticides that are applied in residential areas and are transported to streams via the MS4. For example in a

review, "Diazinon Sources in Runoff from the San Francisco Region," the Center for Watershed Protection concluded that, "the only real tool to control diazinon in urban watersheds is source control to either reduce the use of diazinon or to apply it in a safer manner." In addition, where structural BMPs or MS4 facilities are owned or operated by the residential community, pollution prevention activities taken by local governments can include maintenance guidance.

3. Comments on Existing And Proposed Residential Programs

Section 8.0 of the ROWD states that pollution prevention is a major focus of the Permittees' existing StormWater/CleanWater Protection Program, and the following pollution prevention themes are emphasized in public outreach activities and materials:

- Proper disposal of household hazardous waste;
- Proper disposal of used motor oil;
- Pesticide and fertilizer use guidelines;
- Good housekeeping BMPs; and
- Proper disposal of pet waste.

Section 8.2 of the ROWD proposes to educate the public regarding pollutants in urban runoff. Education and outreach may be sufficient to reduce the discharge of pollutants to the MEP from residential areas, however, additional BMPs may be necessary in some cases. These minimum BMP requirements should be identified in each Permittee's Individual SWMP.

I. EDUCATION (Order Section I)

1. Specific Legal Authority for Education Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the proposed management program include "A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(4) provides that the proposed management program include "A description of appropriate educational and training measures for construction site operators."

2. Discussion of Education Requirements

Education is a critical BMP and an important aspect of the SWMP. The EPA finds that "An informed and knowledgeable community is critical to the success of a storm water management program since it helps ensure the following:

> "Greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important. [...]
>
> Greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters". (EPA, 2000c)

Regarding target audiences, EPA states "The public education program should use a mix of appropriate local strategies to address the viewpoints and concerns of a variety of audiences and communities, including minority and disadvantaged communities, as well as children" (EPA, 2000c). The target communities included in Requirement I. are based on recommendations of the TAC (SWRCB, 1994).

3. Comments on Existing and Proposed Education Programs

Public education was strongly emphasized in the Permittees' 1993 DAMP implemented under the first and second term permits. Consequently, the Permittees already have well-developed education programs that may be readily reviewed and revised, as necessary, to satisfy the requirements of Order No. R9-2004-001.

Section 8.2 of the ROWD includes several good program commitments, such as conducting a survey to measure changes in awareness, which should be incorporated into the SWMP.

J. ILLICIT DISCHARGE DETECTION AND ELIMINATION (Order Section J)

1. Specific Legal Authority for Illicit Discharge Detection and Elimination Requirements

- Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) and 40 CFR 122.26(d)(2)(iv)(B)(1) generally apply to all directives under Section J. Illicit Discharge Detection and Elimination of Order No. R9-2004-0001.
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) provides that the permittee include in its proposed management program "a description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens."
- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) provides that the permittee include in its proposed management program "procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water."
- Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(5) provides that the permittee include in its proposed management program "a description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges

or water quality impacts associated with discharges from municipal separate storm sewers."

- Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the permittee include in its proposed management program "a description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."

2. Discussion of Illicit Discharge Detection and Elimination Requirements

In accordance with 40 CFR 122.26(d)(2)(iv)(B) and 122.26(d)(2)(iv)(B)(1), **Requirement J.1** requires each Permittee to actively seek and eliminate illicit discharges and illicit connections. As guidance for detecting and eliminating illicit discharges and connections, the EPA suggests "The proposed management program must include a description of inspection procedures, orders, ordinances, and other legal authorities necessary to prevent illicit discharges to the MS4" (EPA, 1992a).

In order to detect illicit discharges and connections, **Requirement J.2** requires each Permittee to develop and maintain an accurate, up-to-date map of its MS4. An accurate map of the MS4 will enable the Permittees to monitor the system for illicit discharges and connections and to be aware of the entire MS4 within its jurisdiction.

Requirement J.3 requires Permittees to develop and implement an Illicit Discharge Monitoring Program as specified in **section II.B of Monitoring and Reporting Program No. R9-2004-001 (hereafter referred to as the MRP)**. If results indicate that an illicit discharge or connection may be present, **Requirement J.4** specifies that the Permittees shall conduct follow-up procedures to pinpoint the source of the illicit discharge or connection. Once the illicit discharge or connection source is identified, steps may be taken to eliminate the discharge or connection. In this manner, monitoring of dry weather urban runoff can lead to the elimination of illicit discharges and connections and the reduction of pollutants in urban runoff.

Requirement J.5 requires the elimination of illicit discharges and illicit connections as soon as possible. The time needed to eliminate the discharge/connection will depend on the nature and circumstance of the problem including conditions that are not under the control of the Permittees. However, discharges that the Permittees have the ability to eliminate immediately must be eliminated immediately. The EPA supports elimination as soon as possible when it states, "Once the source is identified, the offending discharger should be notified and directed to correct the problem. Education efforts and working with the discharger can be effective in resolving the problem before taking legal action" (EPA, 1992a).

The EPA states that the "proposed management program component should describe how the prohibition on illicit discharges will be implemented and enforced. The description could include a schedule and allocation of staff and resources. A direct linkage should exist between this program component and the adequate legal authority requirements for the ordinances and orders to effectively implement the prohibition of illicit discharges" (EPA, 1992a). Consistent with this statement, **Requirement J.6** requires Permittees to implement and enforce its ordinance, orders, or other legal authority over illicit discharges and connections.

Requirement J.7 pertains to sewage spill prevention and response. Such spills into and from the MS4 can severely impair receiving water quality and pose a significant threat to public health. To avoid these negative impacts, the Order requires Permittees to implement appropriate procedures to prevent, contain, and respond to spills that may discharge into the MS4. The Order contains suggestions of possible appropriate actions. The EPA states, "The goal of a spill prevention program is to reduce the frequency and extent of spills of hazardous materials which can cause water quality impairment" (EPA, 1992a).

Requirement J.8 pertains to public reporting of illicit discharges or water quality impacts associated with discharges from MS4s. Regarding this issue, the EPA states "Timely reporting by the public of improper disposal and illicit discharges are critical components of programs to control such sources. To enhance public awareness, programs may include setting up a public information hotline number, educating school students, community and volunteer watchdog groups, using inserts into utility bills, and newspaper, radio, and television announcements to inform the public about what to look for and how to report incidents" (EPA, 1992a).

The EPA states "If private individuals find the proper disposal of used oil or toxic materials difficult, incidents of improper disposal (such as into the MS4) increase" (EPA, 1992a). Therefore **Requirement J.9** directs the Permittees to propose a program component that will facilitate the proper disposal of used oil and toxics from households by establishing municipally operated collection sites, or ensuring that privately operated collections sites are available. The EPA suggests this program component "should describe outreach plans to handlers of used oil and to the public, and operating plans for oil and household waste collection programs" (EPA, 1992a).

3. Comments on Existing and Proposed Illicit Discharge Detection and Elimination Programs

The ROWD references a reconnaissance survey that the Permittees conducted pursuant to their first-round MS4 permit (Order No. R9-90-46), which identified and removed any illicit connections. According to the 2001-2002 Annual Progress Report, the Reconnaissance survey showed that illicit connections were almost non-existent within the Upper Santa Margarita Watershed, whereas illegal discharges were more commonplace (Permittees, 2001). Based on these results, the Permittees concluded that focusing on inspections of open channels and the curtailment of illicit discharges is a more effective use of resources than inspections of underground storm drains. The EPA concurs with this conclusion when it says, "Permits for older municipalities may emphasize control of cross-connections, while permits for municipalities with large areas of new development may emphasize the installation of permanent structural controls during construction" (EPA, 1992a). **Requirement J.1** of the Order gives the Permittees the flexibility to focus their programs on priority areas, so long as they are actively seeking and eliminating illegal discharges. It should be noted that the reconnaissance survey was conducted 10 years ago and the length of the MS4 has increased significantly. The survey, dated September 30, 1993, covered approximately 25.2 miles of underground storm drains and over 8.9 miles of open channels. According to the ROWD, the District's MS4 currently consists of about 71 miles of open and closed storm drains, and the City of Murrieta's MS4 currently consists of about 18 miles of open and closed storm drains. The total length of Temecula's MS4 is unknown. Therefore, the survey covered less than half

of the current MS4 and cannot serve as evidence that illicit connections are currently non-existent.

Section 3.2 of the ROWD states that the Permittees have programs in place to identify and eliminate illicit connections. According to the 2001-2002 Annual Progress Report, the City of Murrieta conducts annual video inspections of portions of its MS4 and investigates any illicit connections identified, and District and County staff perform visual inspections of open storm drains to check for discharges. The City of Temecula seems to have a reactive program that relies on reports of illegal discharges.

Regarding **Requirement J.2**, the District and the City of Murrieta submitted a map of their MS4s with the ROWD. The City of Temecula has not yet submitted a map.

Section 3.5 of the ROWD proposes that Permittees shall continue to implement and improve routine inspection and monitoring and reporting programs for their MS4s. In order to satisfy **Requirement J.3** of the Order, each Permittee shall describe their inspection and monitoring programs to meet the requirements of Section II.B of the MRP in their Individual SWMPs.

Section 3.5 of the ROWD proposes that, "If routine inspections or dry weather monitoring indicate illicit connections or illegal discharges, they shall be investigated and eliminated or permitted within sixty (60) calendar days of receipt of notice." Sixty days is an unreasonably long time frame for the investigation and elimination of illicit discharges and connections. As stated above, these discharges can cause or contribute to receiving water degradation and are prohibited. Also, illicit discharges are often a discrete event that must be investigated immediately to identify the source. Therefore, the proposed timeframe for investigation and elimination must be decreased to represent the most immediate response time as is possible for the Permittees. In accordance with **Requirement J.5**, illicit discharges that pose a serious threat to public health or the environment must be eliminated immediately, and all others must be eliminated as soon as possible.

Section 3.2 of the ROWD states that the Permittees have programs in place to identify, eliminate, and respond to illicit connections and discharges. However, these programs are not described. According to the 2001-2002 Annual Progress Report, the District manages a toll-free reporting hotline, which satisfies **Requirement J.8** of the Order (Permittees, 2002a). The reports do not mention hotlines for the Cities of Murrieta and Temecula and it is not clear if the countywide hotline is coordinate with the other Permittees. In order for the Cities to satisfy this requirement, Individual SWMPs must either discuss individual public reporting hotlines or describe how the countywide hotline is coordinated.

As indicated in Section 3.3 of the ROWD, the Permittees already have mechanisms in place to facilitate the proper management and disposal of used oil and toxic materials that meet or exceed **Requirement J.8**.

K. WATERSHED-BASED ACTIVITIES (Order Section K)

1. Discussion of Watershed Requirements

Management of urban runoff on a watershed basis is recommended by the SWRCB and the SDRWQCB. The TAC defines watershed-based water quality protection as "the prevention/control of pollution and management of human activities in a geographically or other defined drainage area to protect, restore, and/or enhance the natural resources and

beneficial uses within the watershed" (SWRCB, 1994). The TAC recommends that "All NPDES permits and Waste Discharge Requirements should be considered for reissuance on a watershed basis" (SWRCB, 1994). The SDRWQCB also recommends watershed-based water quality protection, stating in the Basin Plan that "Public agencies and private organizations concerned with water resources have come to recognize that a comprehensive evaluation of pollutant contributions on a watershed scale is the only way to realistically assess cumulative impacts and formulate workable strategies to truly protect our water resources" (SDRWQCB, 1994).

The requirements in Section K of the Order are necessary for the Permittees to identify and mitigate sources of pollutants in urban runoff from the entire watershed that impact common downstream receiving waters. This is the key to addressing the impacts from areas and activities within the Permittees' jurisdiction on downstream receiving waters and their beneficial uses (i.e. Camp Pendleton's drinking water supply) as well as addressing pollutant sources in the watershed which are outside the Permittees' jurisdiction. **Finding No. 20** emphasizes the need for watershed-based activities and collaboration among dischargers in a common watershed. It states, "As operators of the MS4s, the Permittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or exceedances of receiving water quality objectives." Permittees could be held responsible for discharges of pollutants from sources outside of their jurisdiction if they cause or contribute to exceedances of water quality objectives, therefore, it is necessary for Permittees to make efforts to address all sources of pollutants in the watershed.

2. Comments on Existing and Proposed Watershed Programs

The Permittees already collaborate with each other through monthly meetings. However, these meetings, as well as many aspects of the existing DAMP, are countywide. In order to address watershed-specific issues, the Permittees should meet separately to focus on the Upper Santa Margarita Watershed. The Permittees also already participate in San Diego County's current effort to develop a Santa Margarita Watershed Management Plan, the Southern California Stormwater Monitoring Coalition, and the Santa Margarita River Executive Management Team. At this time, this level of participation is appropriate to meet the objectives of Requirement K.3. of the Order.

L. MONITORING AND REPORTING PROGRAM (Order Section L)

See discussion in Section IX of this Fact Sheet.

M. PRINCIPAL PERMITTEE RESPONSIBILITIES (Order Section M)

1. Specific Legal Authority for Principal Permittee Responsibility Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(D) provides that "[The Permittee must demonstrate that it can control] through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system."

- Federal NPDES regulation 40 CFR 122.26(a)(3)(iii)(C) provides that "A regional authority may be responsible for submitting a permit application."

2. Discussion of Principal Permittee Responsibility Requirements

The Principal Permittee responsibilities required in Section M are necessary to facilitate intergovernmental coordination and for the standardization and compilation of required reports. Standardized documents provide for easier assessment and application of report data, making reports more useful for the SDRWQCB and the Permittees, which can result in more effective urban runoff management. The EPA recommends intergovernmental coordination, such as a memorandum of understanding, to define specific municipal roles, responsibilities and points of coordination (EPA, 1992a).

3. Comments on Existing and Proposed Principal Permittee Responsibilities

The Permittees currently operate under an Implementation Agreement, which was executed in November 1998. The Implementation Agreement sets forth the responsibilities of the Principal Permittee and the Permittees and provides for funding of "umbrella" activities. In Section 2.1 of the ROWD, the Permittees propose to amend the implementation agreement to set forth the responsibilities of the Permittees in accordance with the Order.

N. STANDARD PROVISIONS (Order Section O and Attachment B)

The standard provisions included in **Attachment B** of Order No. R9-2004-001 are consistent to all NPDES permits and are generally found in federal NPDES regulation 40 CFR sections 122.22, 122.41, 122.42 and the CWC (specific citations are provided in **Attachment B** of Order No. R9-2004-001).

IX. MONITORING AND REPORTING PROGRAM

The MRP consists of requirements for receiving waters monitoring, monitoring of dry weather flows/illicit discharges, and annual reporting.

A. RECEVING WATERS MONITORING

1. Specific Legal Authority for Receiving Waters Monitoring Requirements

Federal NPDES regulations at 40 CFR 122.26(d)(2)(iii)(D) require municipal permittees to propose a monitoring program for representative data collection for the term of the permit that describes the location of outfalls, field screening points, instream stations, why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

2. Discussion of Monitoring Requirements

According to the EPA, the benefits of sampling data include, but are not limited to (EPA, 1992b):

- Providing a means for evaluating the environmental risk of storm water discharges by identifying types and amounts of pollutants present;

- Determining the relative potential for storm water discharges to contribute to water quality impacts or water quality standard violations;
- Identifying potential sources of pollutants; and
- Eliminating or controlling identified sources more specifically through permit conditions.

Most importantly, monitoring programs are an essential link in urban runoff management efforts. Data collected from monitoring programs can be assessed to determine the effectiveness of management programs and practices, which is vital for the success of the iterative approach used to meet the MEP standard. Specifically, when data indicates that a particular BMP is not effective, an improved BMP can be selected. Also, when water quality data indicate that water quality standards or objectives are being exceeded, particular pollutants, sources, and drainage areas can be identified and targeted for urban runoff management and specific education efforts.

Considering the benefits described above, the MRP has been designed to determine impacts to receiving water quality and beneficial uses from urban runoff and to use the results to refine the SWMP for the reduction of pollutant loadings to the MEP. The primary goals of the MRP include:

1. Assess compliance with Order No. R9-2004-001;
2. Measure and improve the effectiveness of the SWMPs;
3. Assess the chemical, physical, and biological impacts of receiving waters from urban runoff;
4. Characterize urban runoff discharges;
5. Identify sources of specific pollutants;
6. Prioritize drainage and sub-drainage areas that need management actions;
7. Detect and eliminate illicit discharges and illicit connections to the MS4; and
8. Assess the overall health of receiving waters.

Each of the components of the Receiving Waters and Illicit Discharge Monitoring Programs is necessary to meet the objectives listed above. The justifications for each component are discussed below.

Framework

The SDRWQCB typically uses the following framework in NPDES MRPs:

1. Core monitoring to address ongoing, site-specific needs, such as estimating pollutant loads and assessing trends;
2. Regional monitoring to address large spatial scales at infrequent (i.e. every five years) intervals. Regional monitoring is useful to put localized site-specific results into context of the larger ecosystem; and
3. Special studies to address directed needs or to answer specific questions. This monitoring is useful to address unique issues, oftentimes triggered by routine monitoring

to help understand results or identify efficient management measures. Special studies are short-term studies with a predefined beginning, middle and end.

Core Monitoring

Section II.A.1 of the MRP requires mass loading monitoring at three triad[13] and four tributary stations. The mass loading monitoring will provide data representing the total pollutant loadings from specific drainage and sub-drainage areas. This data can be used to help achieve the MRP goals listed above and answer the following management questions:

- Are conditions in receiving waters protective, or likely to be protective, of beneficial uses?
- What is the extent and magnitude of the current or potential receiving water problems?
- What is the relative urban runoff contribution to the receiving water problem(s)?
- What are the sources of urban runoff that contribute t receiving water problem(s)?
- Are conditions in receiving waters getting better or worse?

The number and locations of triad and tributary stations are consistent with the Permitees' proposal (Permittees, 2004b). In addition to one reference station, the triad stations are existing Permittee monitoring stations located in lower Murrieta Creek and lower Temecula Creek. These stations are located at the downstream end of the Upper Santa Margarita Watershed and should be representative of discharges from the entire permitted area. The tributary station locations were proposed by the Permittees and are representative of urbanized sub-drainage areas. Data from these locations will allow the Permittees to better identify sources of pollutants, prioritize drainage areas for management actions, and determine the conditions of the tributary streams (MRP Goals 4,5,6 and 8).

Federal NPDES regulations at 40 CFR 122.21(g)(7)(ii) require the sampling protocols specified in **section II.A.1 of the MRP.** These protocols are necessary to ensure consistent sampling, adequate representation of storm events, and accurate, comparable data.

Section II.A.2 of the MRP requires the Permittees to conduct toxicity monitoring to evaluate the extent and causes of toxicity in receiving waters. Toxicity testing is used to assess the impact of urban runoff on the overall quality of aquatic systems (Center for Watershed Protection, 1996). Evidence of toxicity indicates that pollutants are bioavailable and have the potential to cause degradation to aquatic systems. When combined with chemical data, which by itself does not necessarily reveal the impacts of urban runoff to aquatic life or the beneficial uses of receiving waters, toxicity monitoring data can be used to better determine the extent and causes of impacts to aquatic systems (MRP Goals 3 and 8).

Toxicity testing can also be used to evaluate the effectiveness of urban runoff BMPs and other management measures (MRP Goal No. 2). The Center for Watershed Protection rated it as a "very useful" indicator for assessing municipal storm water programs. Permittees can use the results of toxicity testing to identify areas of high concern and to establish priority locations for BMPs (MRP Goal No. 6).

[13] Triad means a station where chemical, toxicity, and bioassessment monitoring occur.

Section II.A.2.a specifies three freshwater test species for use, because multiple species are needed to provide a more complete assessment of the causes of toxicity in urban runoff (Bay, 2001). Different species vary in their sensitivity to contaminants and, therefore, multiple species can reveal when varying contaminants are present at toxic levels (Bay, 2001). Reliance on single species tests may not provide an accurate assessment of toxicity (Center for Watershed Protection, 1996). The rationale for the specified test species is as follows:

- *Ceriodaphnia dubia* (water flea): represents the invertebrates that live in the water column and serve as a food source for larger invertebrates and small fish. This species is known to be sensitive to metals and pesticides in water, as well as other contaminants. (San Diego County, 2004)
- *Hyalella azteca* (freshwater amphipod): an invertebrate associated with the sediment at the bottom of streams and lakes. It serves as a food source for larger invertebrates as well as fish. This species is generally sensitive to metals and pesticides, as well as nitrogen compounds such as ammonia. (San Diego County, 2004)
- *Pseudokirchneriella subcapitata*, formally known as *Selenastrum capricornutum*: unicellular algae present in the water column of streams and lakes. It is the base of the food chain in freshwater systems. It is sensitive to herbicides and metals and its growth is greatly affected by nutrient loads. (San Diego County, 2004)

An additional reason to use the species listed above, is for consistency with other monitoring in the Santa Margarita Watershed. Pursuant to the County of San Diego's MS4 permit (Order No. R9-2001-01), toxicity testing using these three species occurs at the mass loading station near the mouth of the Santa Margarita River. Using the same species throughout the watershed will allow the results to be comparable and potential sources of toxicity to be better identified.

For cost purposes, toxicity testing is only required on wet weather samples.

Section II.A.3 of the MRP requires the Permittees to conduct bioassessment monitoring. Bioassessment data is a cost-effective tool that measures the effects of water quality over time (CDFG, 2002). It is an important indicator of stream health and impacts from urban runoff. It can detect impacts that chemical and toxicity monitoring cannot. The EPA encourages permitting authorities to consider requiring biological monitoring methods to fully characterize the nature and extent of impacts from urban runoff (EPA, 1996c). Therefore, the SDRWQCB and other RWQCBs commonly require bioassessment monitoring in MS4 and other types of discharge permits.

Bioassessment is the direct measurement of the biological and physical condition, and the attainment of beneficial uses (COLD, WARM, WILD, and RARE) of receiving water, using benthic macroinvertebrates. Bioassessment monitoring integrates the effects of both water chemistry and physical habitat impacts (e.g., sedimentation or erosion) of various discharges on the biological community native to the receiving waters. Moreover, bioassessment is a direct measurement of the impact of cumulative, sub-lethal doses of pollutants that may be below reasonable water chemistry detection limits, but that still have biological affects.

Because bioassessment focuses on communities of living organisms as integrators of cumulative impacts resulting from water quality or habitat degradation, it defines the ecological risks resulting from urban runoff. Bioassessment not only identifies that an

impact has occurred, but also measures the effect of the impact and tracks recovery when control or restoration measures have been taken. These features make bioassessment a powerful tool to assess compliance, evaluate the effectiveness of BMPs, and to track both short and long-term trends (MRP Goals 1,2,3, and 8).

From 1998 through 2001, the SDRWQCB implemented the Ambient Bioassessment Monitoring Program, which monitored rivers and streams in the San Diego region. The monitoring concluded that waters in the Upper Santa Margarita Watershed, including Murrieta Creek, Temecula Creek, and the upper Santa Margarita River, exhibited degraded biological and physical integrity (Index of Biotic Integrity (IBI) ranged from "Very Poor" to "Good"). As a comparison, the reference stations in the watershed, located in Sandia Creek and De Luz Creek, were characterized by a high degree of biological and physical integrity (IBI was consistently "Very Good") (CDFG, 2002). These conclusions support the need for continued bioassessment monitoring to determine the long-term health of the receiving waters and impacts from MS4 discharges.

Through a CWC section 13225 directive, issued in March 2003, the Permittees were required to begin implementing a bioassessment monitoring program. The bioassessment required in the MRP replaces that required under the directive. The program consists of sampling, monitoring, and analysis of data at the three triad stations. The Permittees began bioassessment monitoring four stations in November 2003, pursuant to the directive. For cost purposes, the number of stations was reduced to three.

Section II.A.4 of the MRP requires the Permittees to use the results of the chemistry, toxicity, and bioassessment monitoring, to determine if impacts from urban runoff are occurring and when follow-up actions are necessary. The triad approach allows a wide range of measurements to be combined to more efficiently identify pollutants, their sources, and appropriate follow-up actions. Results from the three types of monitoring shall be assessed to evaluate the extent and causes of pollution in receiving waters and to prioritize management actions to eliminate or reduce the sources. The framework provided in Table 6 below shall be used to determine conclusions from the data and appropriate follow-up actions. The framework in Table 6 was derived from the *Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California* (SMC, 2004).

When, based on the framework in Table 6, data indicates the presence of toxic pollutants in runoff, Permittees are required to conduct a Toxicity Identification Evaluation (TIE). A TIE is a set of procedures used to identify the specific chemical(s) responsible for toxicity to aquatic organisms. When discharges are toxic to a test organism, a TIE must be conducted to confirm potential constituents of concern and rule out others, therefore allowing Permittees to determine and prioritize appropriate management actions. If a sample is toxic to more than one species, it is necessary to determine the toxicant(s) affecting each species. If the type and source of pollutants can be identified based on the data alone and an analysis of potential sources in the drainage area, a TIE is not necessary.

When a TIE identifies a pollutant associated with urban runoff as a cause of toxicity, it is then necessary to conduct a toxicity reduction evaluation (TRE). A TRE is a study conducted in a step-wise process to identify the causative agents of toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. A TRE should include an analysis and discussion of all potential

source(s) causing toxicity, proposed BMPs to eliminate or reduce the pollutants causing toxicity, and suggested follow-up monitoring to demonstrate that toxicity has been removed.

Table 6. Triad Approach to Determining Follow-Up Actions

	Chemistry	Toxicity	Bioassessment	Possible Conclusion Determining Action	Action
1.	Persistent[14] exceedance of water quality objectives	Evidence of toxicity[15]	Indications of benthic alteration[16]	Strong evidence of pollution-induced degradation	Conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
2.	No persistent exceedances of water quality objectives	No evidence of toxicity	No indications of benthic alteration	No evidence of pollutant-induced degradation	No action necessary
3.	Persistent exceedance of water quality objectives	No evidence of toxicity	No indications of benthic alteration	Contaminants are present but not bioavailable	Assess possible upstream sources of pollutants causing exceedances
4.	No persistent exceedances of water quality objectives	Evidence of toxicity	No indications of benthic alteration	Unmeasured contaminants exist with the potential to cause degradation to aquatic life	Conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
5.	No persistent exceedances of water quality objectives	No evidence of toxicity	Indications of benthic alteration	Alteration probably not due to toxic pollutants	No action necessary due to toxic chemicals Initiate TRE for physical sources of benthic alteration
6.	Persistent exceedance of water quality objective	Evidence of toxicity	No indications of benthic alteration	Toxic contaminants are bioavailable, but in situ effects are not demonstrable	If chemical and toxicity tests indicate persistent degradation, conduct TIE to identify

[14] Persistent exceedance shall mean the exceedance of relevant Basin Plan or CTR objectives by 20% for three sampling events.

[15] Evidence of toxicity shall mean a high score, in relation to other stations, on metric that combines magnitude and persistence of toxicity over an entire year.

[16] Indications of benthic alteration shall mean an IBI score of Fair, Poor, or Very Poor.

					contaminants of concern, based on TIE metric, initiate TRE
7.	No persistent exceedances of water quality objectives	Evidence of toxicity	Indications of benthic alteration	Unmeasured toxic contaminants are causing degradation	Conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
8.	Persistent exceedance of water quality objectives	No evidence of toxicity	Indications of benthic alteration	Inconclusive	Initiate upstream source identification (TIE cannot be conducted when toxicity is not present)

Regional Monitoring

Section II.A.II of the MRP requires that the Permittees participate and coordinate with federal, state, and local agencies and other dischargers in the Santa Margarita Watershed in development and implementation of a regional monitoring program as directed by the Executive Officer. The purpose of regional monitoring is to maximize the efforts of all monitoring partners using a more cost-effective monitoring design and to best utilize the pooled resources of the watershed. If a coordinated watershed sampling effort is approved or directed by the Executive Officer, the Permittees' sampling and analytical efforts may be reallocated.

Special Studies

Special studies are intended to address specific research or management issues that are not addressed by the routine core monitoring program. The MRP requires the Permittees to develop and implement a study to determine appropriate numeric criteria for controlling the volume, velocity, duration, and peak discharge rate of runoff to minimize erosion of natural channels and impacts to in-stream habitat. The study is necessary to comply with section F.2.b.9 of the Order.

Various similar studies and other efforts have occurred in southern California to address the issue of downstream erosion caused by increased runoff rates, volumes, velocities and durations. MS4 permits in San Diego, Orange, Los Angeles, and Ventura Counties have similar requirements, and the Southern California Stormwater Monitoring Coalition (SMC) is in the process of conducting a study (funded by Los Angeles County) to assess the connection between stream erosion and urbanization in natural drainage systems in southern California (SCCWRP, 2004). Ventura County has also conducted a similar study. It is expected that the Permittees will build on existing work and utilize the results and

conclusions of previous studies. The Permittees are encouraged to continue the SMC study in an area in the Santa Margarita Watershed.

3. Comments on Existing and Proposed Monitoring Program

The current monitoring program, the *Consolidated Program for Water Quality Monitoring* (District, 1994), was submitted as an element of the NPDES Municipal Storm Water Application for Permit Renewal, Santa Margarita Watershed, dated January 17, 1995. The objectives and components of the program are listed below (the program does not contain sampling frequencies):

1. Program Objectives:
   - Assessment of mass loadings from storm drains
   - Assess influence of land use on water quality
   - Verification and control of illicit discharges
   - Compliance monitoring of water quality
   - Assess effectiveness of various urban practices designed to control pollution
   - Identify problem areas and/or trends
   - Establish database for future reference
   - Identify baseline conditions
   - Identify pollutants of concern

2. Dry weather sampling stations:
   - Wildomar Channel
   - Cal Oaks Drain (permanent station)
   - Empire Creek Channel
   - Redhawk Parkway Drain

3. Wet weather stations:
   - Wildomar Channel
   - Cal Oaks Drain
   - Empire Creek Channel

4. Sediment sampling at the above stations plus the I-15 basin

5. Receiving water stations
   - Upper Murrieta
   - Lower Murrieta
   - Temecula Creek

6. Toxicity testing

The *Consolidated Program for Water Quality Monitoring* contains many of the same program objectives and components as the Monitoring Program. However, as determined and discussed in several documents (SDRWQCB, 2002b, 2002d, 2003b; Permittees, 2002b), the current program has been inadequate to meet its objectives and needs to be improved.

For details regarding previous monitoring, see the documents referenced herein. The Permittees did not propose a monitoring program as part of the ROWD.

B. ILLICIT DISCHARGE MONITORING PROGRAM

1. Specific Legal Authority for Illicit Discharge Monitoring Requirements

- Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) provides that the permittee include in its proposed management program "a description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens."

2. Discussion of Illicit Discharge Monitoring Requirements

Section II.B of the MRP describes the Illicit Discharge Monitoring Program. The requirements are consistent with the specifications for developing a field screening program contained at 40 CFR 122.26 (d)(1)(iv)(D). Although the minimum number of inspections is set at twice during the period of May 1st to September 30th of each year, it is expected that more frequent inspections may be necessary. An emphasis is placed on designing a program with clear criteria and rationale. The programs designed should be flexible and implemented in a manner that will enable the Permittees to identify illicit discharges and illegal connections, respond to citizen complaints, and follow-up on ongoing investigations to identify and eliminate sources.

3. Discussion of Existing and Proposed Dry Weather Monitoring

The Permittees' current water quality monitoring program identifies four dry weather monitoring stations, but no sampling frequencies, sampling protocol, or specific screening program are specified. In order to comply with **Requirement J.3** of the Order, Permittees will need to develop an Illicit Discharge Monitoring Program that meets the requirements in **section II.B of the MRP**.

C. MONITORING COSTS

The cost of the Receiving Waters and Illicit Discharge Monitoring Programs is reasonable, considering the need for the data in the Upper Santa Margarita Watershed. All of the monitoring requirements are necessary to meet the goals of the MRP, stated in Section IX.A above, and are consistent with other MS4 monitoring programs in southern California.

As part of their written comments on the Order (Permittees, 2004b), the Permittees provided cost estimates for the MRP, dated December 15, 2003, and for their proposed revised MRP. The Permittees estimated that the annual cost of the original Receiving Waters and Dry Weather Monitoring Programs would be $468,353. They estimated the annual cost of their proposed revised program to be $255,873. Due to variability of necessary overtime, parameters to be analyzed, necessary TIEs, etc., it is difficult to estimate a total cost of the monitoring program. Therefore, the SDRWQCB is assuming that the Permittees' estimate is representative.

In response to the cost information the Permittees submitted, the SDRWQCB revised and reduced the Receiving Waters and Illicit Discharge Monitoring Program requirements to the essential equivalent of the Permittees' proposal. Therefore, the cost should be equivalent to the Permittees' estimate and is reasonable for an MS4 monitoring program in southern California.

D. REPORTING REQUIREMENTS

1. Specific Legal Authority for Reporting Requirements

- Standard provisions and reporting requirements are consistent to all NPDES permits and are generally found in federal NPDES regulation 40 CFR 122.41.
- Federal NPDES regulation 40 CFR 122.42(c) requires that "The operator of a large or medium municipal separate storm sewer system of a municipal separate storm sewer system that has been designated by the Director under section 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include: (1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management program that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part; (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; (5) Annual expenditures and budget for year following each annual report; (6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; and (7) Identification of water quality improvements or degradation."

2. Discussion of Annual Reporting Requirements

SWMP Reporting Requirements (Section III.A of the MRP)

All of the SWMP reporting requirements are necessary to meet the above-referenced federal requirements and to measure the effectiveness of programs and BMPs. According to the EPA, measurable goals are necessary to evaluate the effectiveness of individual BMPs and the storm water management program as a whole (EPA, 2000d). The EPA strongly recommends that measurable goals include: (1) The activity, or BMP, to be implemented; (2) A schedule or date of implementation; and (3) A quantifiable target to measure progress toward achieving the activity or BMP (EPA, 2002d). The Order is structured so that the descriptions of programs and BMPs are included in the SWMP, and the quantifiable measurements are reported in each annual report.

The current permit, Order No. R9-98-02 requires the annual report to be submitted on September 15 of each year. However, the District submitted a request, dated November 3, 2003, to change the annual report date to October 31. The District's request was based on the difficulty of obtaining necessary materials with sufficient time to prepare a report. The SDRWQCB concurs with the request.

Monitoring Provisions and Reporting Requirements (Sections II.C and III.B of the MRP)

The majority of the monitoring provisions and reporting requirements contained in sections II.C and III.B of the MRP are specified in 40 CFR 122.41. Those that are not are standard provisions in SDRWQCB NPDES permits, or are necessary to meet the objectives of the MRP.

Section II.C.h of the MRP specifies that the Minimum Levels (MLs) listed in Appendix 4 of the State Board Policy for Implementation of Toxics Standards for Inland Surface Water, Enclosed

Bays, and Estuaries of California, 2000 (SIP) shall be used for analyses of priority toxic pollutants identified in the CTR (65 Fed. Reg. 31682). The MLs from the SIP represent the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interferences (SWRCB, 2000a). The SIP's MLs therefore represent the best available science for determining the presence of toxic pollutants at concentrations of concern. If MLs are not used, concentrations of concern of priority toxic pollutants may not be detected. Detection and control of toxic pollutants in surface waters is necessary to achieve the CWA's goals and objectives (65 Fed. Reg. 31683). Using MLs will also provide quantifiable data that is necessary to better assess water quality and BMP effectiveness. Non-detects cannot be used to accurately determine mass loadings. Therefore, the method detection limits (MDLs) used for analysis of priority toxic pollutants must be equivalent to or lower than the MLs in Appendix 4 of the SIP.

SAN DIEGO REGION
MONITORING AND REPORTING PROGRAM No. R9-2004-001
NPDES PERMIT No. CAS0108766
FOR THE DISCHARGES OF URBAN RUNOFF FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE COUNTY OF RIVERSIDE, THE CITY OF MURRIETA, THE CITY OF TEMECULA AND THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT WITHIN THE SANTA MARGARITA WATERSHED IN THE SAN DIEGO REGION

I. PURPOSE 2
II. MONITORING PROGRAM 2
A. Receiving Waters Monitoring 2
B. Illicit Discharge Monitoring 9
C. Monitoring Provisions 10
III. REPORTING PROGRAM 12
A. SWMP Reporting Requirements 12
B. Receiving Waters Monitoring Reporting Requirements 15
C. Certified Perjury Statement 17

I. PURPOSE

This Monitoring and Reporting Program (MRP) is intended to meet the following goals:

1. Assess compliance with Order No. R9-2004-001;
2. Measure and improve the effectiveness of the SWMPs;
3. Assess the chemical, physical, and biological impacts of receiving waters resulting from urban runoff;
4. Characterize urban runoff discharges;
5. Identify sources of specific pollutants;
6. Prioritize drainage and sub-drainage areas that need management actions;
7. Detect and eliminate illicit discharges and illicit connections to the MS4; and
8. Assess the overall health of receiving waters.

II. MONITORING PROGRAM

The Monitoring Program consists of the Receiving Waters Monitoring, Illicit Discharge Monitoring, Monitoring Provisions, and the program assessments required under Section III.B of this MRP. All monitoring program components shall be implemented no later than October 2004, unless otherwise specified herein.

A. Receiving Waters Monitoring

The Receiving Waters Monitoring consists of: 1) **Core Monitoring** requirements to address on-going, site-specific needs, such as estimating pollutant loads and assessing trends; 2) **Regional Monitoring** to address watershed-wide issues; and 3) **Special Studies** to address specific research or management issues.

A.I Core Monitoring

In order to achieve the above goals, the triad[1] and tributary Core Monitoring requirements are intended to generate water quality data that will build upon existing data to begin answering the following management questions:

- Are conditions in receiving waters protective, or likely to be protective, of beneficial uses?
- What is the extent and magnitude of the current or potential receiving water problems?
- What is the relative urban runoff contribution to the receiving water problem(s)?
- What are the sources of urban runoff that contribute to receiving water problem(s)?
- Are conditions in receiving waters getting better or worse?

1. Mass Loadings

   a) The Permittees shall monitor mass loadings from the following three triad stations. Alternative locations representative of urban/urbanizing drainage areas may be selected.

      (1) Lower Temecula Creek;

      (2) Lower Murrieta Creek @ USGS Weir; and

      (3) A reference station representative of natural, undeveloped conditions. Permittees shall evaluate the reference station annually for suitability and select new reference stations as needed.

[1] Triad means a station where chemical, toxicity, and bioassessment monitoring occur.

b) At each triad station, the Permittees shall monitor the first storm event of each monitoring year[2] that produces sufficient flow to collect a composite sample, and a minimum of two additional storm events during each monitoring year.

c) In the event that the required number of storm events are not sampled during one monitoring year at any given station, the Permitees shall submit, with the subsequent Annual Report, a written explanation for a lack of sampling data, including streamflow data from the nearest USGS gauging station.

d) In addition to the storm events, the Permittees shall analyze a minimum of two dry weather samples from each triad station per monitoring year. If flow is insufficient to collect a sample, this shall be documented in the subsequent annual report.

e) Sampling at triad stations shall begin no later than the first storm after October 2004 that produces sufficient flow to collect a composite sample.

f) Mass loading sampling and analysis protocols shall be consistent with 40 CFR 122.21(g)(7)(ii) and with the EPA Storm Water Sampling Guidance Document (EPA 833-B-92-001). Storm water samples shall be flow-weighted composites[3], collected during the first 3 hours of flow, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge, unless the SDRWQCB Executive Officer approves an alternate protocol. Automatic samplers are recommended, but manual samples may be collected from mass loading stations where it is not feasible to install an automatic sampler. Grab samples[4] shall be taken for pathogen indicators and oil and grease. Grab samples are acceptable for dry weather sample collection.

g) Permittees shall measure or estimate flow rates and volumes for each triad sampling event in order to determine mass loadings of pollutants. Data from nearby USGS gauging stations may be utilized, or flow rates may be estimated in accordance with the EPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), Section 3.2.1.

h) At triad stations, the first storm of every sampling year shall be analyzed for the full EPA priority pollutant list (40 CFR 122, Appendix D). For the remaining sampling events, analysis may be reduced to the constituents listed in Table below, unless data from the first storm indicate the need for additional constituents.

[2] A monitoring year is from July 1 through June 30.
[3] A flow-weighted composite sample is a mixed or combined sample that is formed by combining a series of individual and discrete samples of specific volume in proportion to flow.
[4] A grab sample is a discrete, individual sample taken within a short period of time (usually less than 15 minutes).

Table 1. Short List of Constituents	
Trace Metals	**Pesticides**
Total Cadmium	Diazinon
Total Chromium	chlorpyrifos
Total Copper	Other OP pesticides
Total Nickel	
Total Lead	**Conventionals**
Total Zinc	Temperature
Nutrients	pH
Ammonia (NH_3)	Hardness
Total Kjeldahl Nitrogen (TKN)	Specific conductance
Nitrate (NO_3)	Dissolved oxygen
Total phosphorus	MBAS
Bacteria	**PAHs**
Total coliform	
Fecal coliform	**Volatiles** (dry weather only)
E. coli	
	Total suspended solids

2. Water Column Toxicity Testing

The Permittees shall conduct toxicity testing at triad stations to evaluate the extent and causes of toxicity in receiving waters.

a) The Permittees shall analyze all storm samples (at least three annually) collected at the three triad stations for toxicity. The Permittees shall conduct toxicity testing using the following three species and EPA protocol for each sample:

- *Ceriodaphnia dubia* (water flea) – EPA-821-R-02-012 or EPA-821-R-02-013;
- *Hyalella azteca* (freshwater amphipod) – EPA-821-R-02-012; and
- *Pseudokirchneriella subcapitata*, formally known as *Selenastrum capricornutum*, (unicellular algae) – EPA-821-R-02-013.

b) The presence of acute toxicity shall be determined in accordance with EPA protocol (EPA-821-R-02-012). The presence of chronic toxicity shall be determined in accordance with EPA protocol (EPA-821-R-02-013).

3. Bioassessment

The Permittees shall conduct bioassessment monitoring at the three triad stations to evaluate the biological integrity of receiving waters, to detect biological responses to pollutants in urban runoff, and to identify probable causes of impairment not detected by chemical and toxicity monitoring. The program required in this section replaces the program currently being conducted by the Permittees under CWC section 13225 Directive for Assessing Water Quality Impacts of Urban Runoff in the Santa Margarita Watershed, issued by the SDRWQCB on March 6, 2003. Bioassessment monitoring shall include the following:

a) Each bioassessment station shall be monitored twice annually, in May and October of each year. A minimum of three replicate samples shall be collected at each station during each sampling event.

b) Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized procedures set forth in the California Department of Fish and Game's California Stream Bioassessment Procedure (CSBP)[5]. Analysis procedures shall include comparison between station mean values for various biological metrics and the Preliminary San Diego Index of Biotic Integrity (IBI)[6], or any subsequently developed applicable IBI. Sampling, laboratory, quality assurance, and analytical procedures shall follow the standardized "Non-Point Source Bioassessment Sampling Procedures" for professional bioassessment set forth in the CSBP. In the event that the CSBP "Point-Source Professional Bioassessment Procedure" is performed in place of the "Non Point Source Bioassessment Sampling Procedure," justification and documentation of the procedure shall be submitted with the annual monitoring report.

c) A professional environmental laboratory shall perform all sampling, laboratory, quality assurance, and analytical procedures. Permittee staff trained in CSBP methods may collect samples, but data collected by volunteer monitoring organizations shall not be submitted in place of professional assessments.

4. Follow-up Analysis and Actions Based on Triad Approach

When results from the chemistry, toxicity, and bioassessment monitoring described above indicate urban runoff-induced degradation, Permittees shall evaluate the extent and causes of urban runoff pollution in receiving waters and prioritize management actions to eliminate or reduce sources. Toxicity Identification Evaluations (TIEs) shall be used to determine the cause of toxicity, and Toxicity Reduction Evaluations (TRE) shall be used to identify sources and implement management actions to reduce pollutants in urban runoff causing toxicity. Permittees shall conduct TIE(s) and TRE(s) based on Table 2 below.

[5] California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game – Aquatic Bioassessment Laboratory, May 1999.
[6] This document can be downloaded from http://www.swrcb.ca.gov/rwqcb9/programs/bioassessment.html

Table 2. Triad Approach to Determining Follow-Up Actions				
	Chemistry	**Toxicity**	**Bioassessment**	**Action**
1.	Persistent[7] exceedance of water quality objectives	Evidence of toxicity[8]	Indications of benthic alteration[9]	Conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
2.	No persistent exceedances of water quality objectives	No evidence of toxicity	No indications of benthic alteration	No action necessary
3.	Persistent exceedance of water quality objectives	No evidence of toxicity	No indications of benthic alteration	Assess possible upstream sources causing exceedances
4.	No persistent exceedances of water quality objectives	Evidence of toxicity	No indications of benthic alteration	Conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
5.	No persistent exceedances of water quality objectives	No evidence of toxicity	Indications of benthic alteration	No action necessary due to toxic chemicals Initiate TRE for physical sources of benthic alteration
6.	Persistent exceedance of water quality objective	Evidence of toxicity	No indications of benthic alteration	If chemical and toxicity tests indicate persistent degradation, conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
7.	No persistent exceedances of water quality objectives	Evidence of toxicity	Indications of benthic alteration	Conduct TIE to identify contaminants of concern, based on TIE metric, initiate TRE
8.	Persistent exceedance of water quality objectives	No evidence of toxicity	Indications of benthic alteration	Initiate upstream source identification

[7] Persistent exceedance shall mean the exceedance of relevant Basin Plan or California Toxics Rule objectives by 20% for 3 sampling events.
[8] Evidence of toxicity shall mean a high score, in relation to other stations, on metric that combines magnitude and persistence of toxicity over an entire year.
[9] Indications of benthic alteration shall mean an IBI score of Fair, Poor, or Very Poor.

a) Toxicity Identification Evaluations (TIE)

The goal of a TIE is to identify the pollutant(s) causing toxicity in the receiving waters.

(1) Permittees shall conduct Phase I TIEs in accordance with Table 2 above. Permittees shall use EPA protocol described in *Methods for Aquatic Toxicity Identification Evaluations: Phase I Toxicity Characterization Procedures* (EPA/600/6-91/003) or subsequent editions.

(2) If the Phase I TIE is not sufficient to identify the toxicant(s), a Phase II TIE may be required in order to identify or confirm the identity of the pollutants causing toxicity. Phase II TIEs shall be conducted in accordance with Methods for Aquatic Toxicity Identification Evaluations: Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity (EPA/600/R-92/080), or subsequent editions.

(3) In the event that the pollutant causing toxicity has been sufficiently identified through previous TIEs or corresponding chemical monitoring data, a TIE may not need to be conducted.

b) Toxicity Reduction Evaluations (TRE)

The purpose of a TRE is to investigate the cause of and to identify corrective actions to eliminate toxicity from urban runoff in receiving waters.

When a TIE identifies a pollutant(s) associated with urban runoff as a cause of toxicity, Permittees shall initiate a TRE immediately. The TRE shall include all reasonable steps to identify the source(s) of toxicity and propose appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Permittees shall submit the TRE to the SDRWQCB for review. Within 30 days following the approval by the SDRWQCB, Permittees shall revise their SWMPs to incorporate the modified BMPs that will be implemented. At a minimum, a TRE shall include a discussion of the following items:

(1) The potential sources of pollutant(s) causing toxicity;

(2) A list of municipalities and other entities that may have jurisdiction over sources of pollutant(s) causing toxicity; and

(3) Proposed actions that will be taken to reduce the pollutants causing toxicity and methods to measure the effectives of those actions.

5. Tributary Monitoring

a) The Permittees shall collect a grab sample from the first storm event of each monitoring year, a minimum of one additional storm event, and two dry weather events during each monitoring year at the following four tributary stations to help identify sources of pollutants. Alternative locations representative of urban/urbanizing drainage areas may be selected.

(1) Warm Springs Creek, near the confluence with Murrieta Creek;

(2) Santa Gertudis Creek, near the confluence with Murrieta Creek;

(3) Long Canyon Creek near the confluence with Murrieta Creek; and

(4) Redhawk Channel, near the confluence with Temecula Creek

b) If flow is insufficient to collect a sample, this shall be documented in the subsequent annual report.

c) Tributary samples shall be analyzed for constituents of concern. Constituents of concern shall be determined based on exceedances of water quality objectives at respective triad and dry weather monitoring stations, as well as land uses in the area.

d) Sampling at tributary stations shall begin no later than the first storm after October 2004.

A.II Regional Monitoring

The Permittees shall participate and coordinate with federal, state, and local agencies and other dischargers in the Santa Margarita Watershed in development and implementation of a regional watershed monitoring program as directed by the Executive Officer. The intent of a regional monitoring program is to maximize the efforts of all monitoring partners using a more cost-effective monitoring design and to best utilize the pooled resources of the watershed. During a coordinated watershed sampling effort, the Permittees' sampling and analytical effort may be reallocated to provide a regional assessment of the impact of discharges to the watershed.

A.III Special Studies

Special studies are intended to address specific research or management issues that are not addressed by the routine core monitoring program. The Permittees' shall conduct special studies as directed by the Executive Officer, including the study described below.

Numeric Criteria to Control Runoff from New Developments

The Permittees shall develop and implement a study to determine numeric criteria for controlling the volume, velocity, duration, and peak discharge rate of runoff from new developments (required in section F.2.b(9) of Order No. 2004-001) to minimize erosion of natural stream channels and impacts to instream habitat. The Permittees shall propose numeric criteria and a time-schedule for implementation of the criteria on Priority Development Projects within 365 days of the identification of the criteria and no later than the fourth-year Annual Report, or the application for permit renewal. In each Annual Report, the Permittees shall describe the status of this special study, details of implementation, and progress towards the development of numeric criteria. Permittees may satisfy this requirement if they can demonstrate to the SDRWQCB that criteria developed in other areas of Southern California are applicable to and protective of the conditions in the Upper Santa Margarita Watershed. This should be accomplished through demonstrating similarities in areas monitored as part of studies outside of the Santa Margarita Watershed.

B. Illicit Discharge Monitoring

Each Permittee shall develop and implement an Illicit Discharge Monitoring program that meets or exceeds the requirements of this section within 365 days of the adoption of Order No. R9-2004-001. Each Permittees' program shall be designed to emphasize frequent, geographically widespread inspections, monitoring, and follow-up investigations to detect illicit discharges and connections. Each Permittees' Illicit Discharge Monitoring Program shall be described in the Individual SWMP.

1. Station Location

   a) Each Permittee shall select Illicit Discharge Monitoring stations within its jurisdiction. The number of stations shall be sufficient to represent the MS4 and detect illicit discharges that may occur throughout the system. Stations shall be accessible points in the MS4 (i.e., outfalls, manholes or open channels) located downstream of potential sources of illicit discharges (i.e., commercial, industrial, and residential areas). Permittees shall use the MS4 map, developed pursuant to section J.2 of Order No. R9-2004-001, to help locate dry weather monitoring stations and to determine the number necessary to adequately represent the entire MS4. Each identified station shall be inspected at least twice between May 1st and September 30th of each year, and more frequently if the Permittee determines necessary to comply with section J of Order No. R9-2004-001.

   b) In addition to the stations required in section B.1.a. above, each Permittee shall inspect all other dry weather flows that are observed or reported.

2. Illicit Discharge Monitoring Methods

   a) At each inspected site, Permittees shall record the following general information:
      - Time since last rain;
      - Quantity of last rain;
      - Site descriptions (i.e., conveyance type, dominant land uses in drainage area);
      - Flow estimation (i.e., width of surface, approximate depth of water, approximate flow velocity, flow rate); and
      - Visual observations (e.g., odor, color, clarity, floatables, deposits/stains, oil sheen, surface scum, vegetation condition, structural condition, and biology).

   b) If flow or ponded water is observed at a station and there has been at least seventy-two hours of dry weather, a field screening analysis using suitable methods to estimate the following constituents shall be conducted:

      (1) Specific conductance (or calculate estimated Total Dissolved Solids);
      (2) Turbidity;
      (3) PH;
      (4) Temperature; and
      (5) Dissolved Oxygen.

   c) If field screening analysis or visual observations at a site indicate a potential illicit discharge, a sample shall be collected for laboratory analysis. At a minimum, samples shall be analyzed at a laboratory for the following constituents:

      (1) Total hardness;

(2) Oil and grease;
(3) Ammonia Nitrogen;
(4) Total phosphorus;
(5) Copper (total and dissolved);
(6) Surfactants (MBAS);
(7) Diazinon and Chlorpyrifos;
(8) Lead (dissolved);
(9) Nitrate Nitrogen;
(10) E. coli;
(11) Total coliform; and
(12) Fecal coliform.

3. As part of the Illicit Discharge Monitoring Program, the Permittees shall develop numeric criteria for field screening and analytical monitoring results that will trigger follow-up investigations to identify the source causing the exceedance of the criteria. In the event of an exceedance of the criteria, Permittees shall implement the follow-up investigation procedures developed pursuant to section J.4 of Order No. R9-2004-001.

C. Monitoring Provisions

All monitoring activities shall meet the following requirements:

a) Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR 122.41(j)(1)].

b) The Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the SDRWQCB or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge. [40 CFR 122.41(j)(2), CWC section 13383(a)]

c) Records of monitoring information shall include [40 CFR 122.41(j)(3)]:

(1) The date, exact place, and time of sampling or measurements;
(2) The individual(s) who performed the sampling or measurements;
(3) The date(s) analyses were performed;
(4) The individual(s) who performed the analyses;
(5) The analytical techniques or methods used; and,
(6) The results of such analyses.

d) All sampling, sample preservation, and analyses must be conducted according to test procedures approved under 40 CFR part 136, unless other test procedures have been specified in this MRP or approved by the Executive Officer [40 CFR 122.41(j)(4)].

e) Where procedures are not otherwise specified in this MRP, sampling, analysis and quality assurance/quality control must be conducted in accordance with the Quality Assurance Program Plan (QAPP) for the State of California's Surface Water Ambient Monitoring Program, adopted

by the State Water Resources Control Board (SWRCB). The QAPP can be downloaded from the SWRCB web page at: http://www.swrcb.ca.gov/swamp/docs/swamp_qapp.pdf.

f) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or both. [40 CFR 122.41(j)(5)]

g) Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in this MRP [40 CFR 122.41(l)(4)(iii)].

h) All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by the California Department of Health Services or a laboratory approved by the Executive Officer.

i) For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 *Fed. Reg.* 31682), the Permittees shall instruct its laboratories to establish calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Permittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Permittee must submit documentation from the laboratory to the SDRWQCB for approval prior to raising the ML for any priority toxic pollutant.

j) The SDRWQCB Executive Officer or the SDRWQCB may make revisions to this MRP at any time during the term of Order No R9-2004-001, and may include a reduction or increase in the number of parameters to be monitored, locations monitored, the frequency of monitoring, or the number and size of samples collected.

III. REPORTING PROGRAM

A. SWMP Reporting Requirements

The Principal Permittee shall submit a SWMP Annual Report to the SDRWQCB on or before October 31 annually. The reporting period for these annual reports shall be the previous fiscal year. For example, the report submitted on or before October 31, 2005 shall cover the reporting period July 1, 2004 to June 30, 2005. The SWMP Annual Report shall contain the Watershed Annual Report, and the four Individual Annual Reports.

1. **Individual Annual Report** - Each Individual Annual Report shall be a documentation of the activities conducted by each Permittee during the previous annual reporting period. Each Permittee shall submit their Individual Annual Report to the Principal Permittee by a date determined by the Principal Permittee for inclusion in the SWMP Annual Report. Each Individual Annual Report shall, at a minimum, contain the following:

   a) Comprehensive description of all activities conducted by the Permittee to meet all requirements of Order No. R9-2004-001, including, but not limited to, the following information:

      (1) Development Planning (Section F):
         (i) Description of any amendments to the General Plan or the development project approval process;
         (ii) Number of grading permits issued;
         (iii) Number of developments conditioned to meet SUSMP requirements*;
         (iv) Attach one example of a development project that was conditioned to meet SUSMP requirements and a description of the required BMPs;
         (v) Description of any updates to the environmental review process;
         (vi) Description and number of training efforts conducted during the reporting period (for staff, developers, contractors, etc.), including the number of staff trained; and
         (vii) An assessment of program effectiveness based on the measurable goals established in the Permittee's Individual SWMP.*

      (2) Construction (Section G):
         (i) Number of inspections conducted;
         (ii) Number and type of enforcement actions related to construction sites;
         (iii) Description of modifications made to the construction and grading approval process;
         (iv) Description and number of training efforts conducted during the reporting period (for staff inspectors, contractors, and construction site operators); and
         (v) An assessment of program effectiveness based on the measurable goals established in the Permittee's Individual SWMP.*

      (3) Municipal (Section H.1):
         (i) Number of municipal inspections conducted;
         (ii) Number and types of enforcement actions taken;
         (iii) Number of catch basins and inlets that were inspected and the number that were cleaned;

* Items with an asterisk are not applicable to the first annual report.

(iv) Assessment of the amount and type of debris removed from catch basins, streets, and open channels, including an identification of problem areas that generate the most pollutants;

(v) Assessment of effectiveness of BMPs that have been implemented for municipal facilities and activities;

(vi) Description and number of training efforts conducted over the last year (for municipal facility operators and/or inspectors); and

(vii) An assessment of program effectiveness based on the measurable goals established in each Permittee's Individual SWMP.*

(4) Industrial/Commercial (Section H.2):

(i) Number of inspections conducted;

(ii) Number and type of enforcement actions taken; and

(iii) An assessment of overall program effectiveness based on the measurable goals established in the Permittee's Individual SWMP.*

(5) Residential (Section H.3):

(i) A description of residential areas that were focused on during the past year;

(ii) Number and types of enforcement actions taken; and

(iii) Assessment of overall program effectiveness based on the measurable goals established in the Permittee's Individual SWMP.*

(6) Education (Section I):

(i) Description of education efforts conducted by the Permittee (not collectively with other Permittees) during the previous year;

(ii) Assessment of overall program effectiveness based on the measurable goals established in the Permitee's Individual SWMP.*

(7) Illicit Discharge Detection and Elimination (Section J):

(i) Number of illicit discharges, connections and spills reported and/or identified during the reporting period;

(ii) Number of illicit discharges or connections investigated during the reporting period and the outcome of the investigations;

(iii) Number and types of enforcement actions taken for illicit discharges or connections during the reporting period;

(iv) Number of times your agency's hotline was called during the reporting period, as compared to previous reporting periods;

(v) Number and location of dry weather monitoring sites that were monitored during the reporting period;

(vi) Summary of Illicit Discharge Monitoring Program results, including: 1) All inspection, field screening, and analytical monitoring results; 2) All follow-up and elimination activities; and 3) Any proposed changes to station locations and/or sampling frequencies; and

(vii) An assessment of overall program effectiveness based on the measurable goals established in the Permittee's Individual SWMP.*

(8) Public Participation – a description of efforts to include the public in urban runoff management programs during the reporting period (i.e., river clean-ups, volunteer monitoring, Permittee council meetings related to the SWMP, etc.).

b) Assessment of Program Effectiveness - each Permittee shall include an assessment of the effectiveness of its Individual SWMP using the measurable goals and direct and indirect assessment measurements developed in the SWMP, in accordance with **Attachment D** of Order No. R9-2004-001.

c) Fiscal Analysis Component - each Permittee shall include an annual fiscal analysis, for each fiscal year covered by Order No. R9-2004-001, in its Individual Annual Report. This analysis shall evaluate the expenditures (such as capital, operation and maintenance, education, and administrative expenditures) necessary to accomplish the activities of the Pemittee's Individual SWMP. The analysis shall include the following:

(1) A report of the previous reporting period's budget, and a budget for the upcoming reporting period. To the extent possible, the budgets should be broken down by the following programs:

(i) Program management;
(ii) Construction Inspections;
(iii) Development plan review/SUSMP implementation;
(iv) Industrial/Commercial inspections;
(v) Illicit discharge and connection response and elimination;
(vi) Municipal activities (catch basin cleaning, BMP maintenance, etc.);
(vii) Education;
(viii) Monitoring; and
(ix) Other

(2) A description of the source(s) of funds that were utilized during the previous fiscal year and the source(s) of funds proposed to meet the necessary expenditures for the subsequent year, including legal restrictions on the use of such funds.

d) Non-Storm Water Discharges – Permittees shall report on any discharge category listed in Requirement B.2 of Order No. R9-2004-001 that was identified as a source of pollutants during the reporting period. For each identified category, the Permittee shall report whether it elected to prohibit the discharge or to require BMPs to reduce pollutants in the discharge to the MEP. If the discharge is not prohibited, the BMPs that will be implemented, or required to be implemented, shall be described in each Permittee's Individual SWMP Annual Report.

e) Receiving Water Limitations – the report required pursuant to Requirement C.2.a. of Order No. R9-2004-001, if applicable.

f) A summary of all urban runoff related data not included in the annual monitoring report (e.g., special investigations); and

g) Proposed revisions to the Individual SWMP, including areas in need of improvement based on the assessment of effectiveness of each program component.

2. **Watershed Annual Report** – The Watershed Annual Report, to be produced by the Principal Permittee shall describe the area-wide and watershed-based programs and activities (as described in

the Watershed SWMP) conducted during the previous reporting period. At a minimum, the Watershed Annual Report shall contain the following information:

a) A description of all area-wide and watershed-based activities conducted during the reporting period;

b) A description of efforts to coordinate with other stakeholders in the Santa Margarita Watershed, such as San Diego County and the U.S. Marine Corps Base Camp Pendleton;

c) An assessment of water quality in the Santa Margarita watershed area of Riverside County, this assessment shall include data from the previous monitoring report;

d) Identification of water quality improvement or degradation;

e) A prioritization of water quality problems and potential sources;

f) A description of watershed-specific educational activities conducted during the reporting period;

g) Recommended activities to be conducted jointly by the Permittees to address the identified water quality problems;

h) An assessment of overall program effectiveness based on the measurable goals established in the Watershed SWMP; and

i) Proposed revisions to the Watershed SWMP.

B. Receiving Waters Monitoring Reporting Requirements

1. Monitoring Program Annual Report

The Principal Permittee shall submit the Monitoring Program Annual Report (Monitoring Report) to the SDRWQCB on or before October 31 of each year. The Monitoring Report shall contain tabular and graphical summaries as well as discussions and interpretations of the receiving water monitoring data obtained during the previous monitoring year. At a minimum, each Monitoring Report shall include the following:

a) Description of each receiving water monitoring station, including but not limited to:

(1) Station location (latitude and longitude, and a narrative description).
(2) Photographs of triad stations.
(3) Approximate size and land uses of the drainage area.
(4) Any other relevant information.

b) A description of monitoring methods for each type of monitoring, including but not limited to:

(1) Monitoring equipment.
(2) Sampling procedures.
(3) Quality assurance/quality control (QA/QC) procedures (laboratory QA/QC documentation shall be submitted with the report).
(4) Laboratory analytical methods including the method detection limits (MDLs). Analytical data shall be reported with one of the following methods, as appropriate:

- An actual numerical value for sample results greater than or equal to the MDL;
- "Not-detected (ND)" for sample results less than the laboratory's MDL; or

- "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported. This is the concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

c) A description of monitoring results, including but not limited to:

(1) Data and data products, including but not limited to:

- Actual data.
- Identification of exceedances of Basin Plan and CTR objectives.
- Estimated annual mass loadings at each station.
- Toxicity testing results in Toxic Units (TUs).
- Bioassessment data (including electronic data formatted to California Department of Fish and Game Aquatic Bioassessment Laboratory specifications) and analysis using metrics in the CSBP and the San Diego IBI.
- Graphical summaries of data.

(2) Methods used to evaluate data. Methods shall be appropriate to answer the management questions listed in Section II.A of this MRP and to assess the progress towards achieving the goals listed in Section I of this MRP. Examples of methods include, but are not limited to:

- Site-by-site summaries and comparisons of results at triad and tributary stations for wet and dry weather, including graphs of concentrations and toxicity.
- Rough estimates of the relative contribution of urban runoff to total pollutant loads.
- Maps of potential sources of pollutants.
- Any other appropriate analysis.

(3) Discussion of results and analyses of each Monitoring Program Component, including but not limited to:

- Discussion of pollutants of concern and their potential sources.
- Interpretation of bioassessment metric values.
- Discussion of any TIEs that were conducted and the potential sources of toxic pollutants.
- If applicable, a discussion of the development, implementation, and results of any TREs.
- Discussion of any relevant information or conclusions from the Illicit Discharge Monitoring Program.
- Discussion of the progress towards answering the management questions listed in Section II.A of this MRP and achieving the goals listed in Section I of this MRP.
- Discussion of any other data analyses performed.

d) In addition to the information required above, the fourth-year Monitoring Report due no later than October 31, 2008, shall include:

- A discussion of any long-term trends that can be detected from existing data (from all previous permit terms).
- Recommendations for future monitoring based on the results of previous efforts and the progress towards answering the management questions listed in Section II.A of this MRP and achieving the goals listed in Section I of this MRP.
- Recommended modifications to Individual or Watershed SWMPs to address identified source of pollutants in urban runoff.

e) If the Permittees monitor any pollutant more frequently than required by this MRP using test procedures approved under 40 CFR part 136, unless otherwise specified in the Order, the results

of this monitoring shall be included in the calculation and reporting of the data submitted in the Monitoring Reports [40 CFR 122.41(l)(4)(ii)].

f) All Monitoring Reports shall be submitted in both electronic and paper formats.

C. Certified Perjury Statement

All reports submitted to the SDRWQCB shall include the following signed, certified perjury statement:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

I, John H. Robertus, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of a Monitoring and Reporting Program adopted by the California Regional Water Quality Control Board, San Diego Region, on July 14, 2004.

John. H. Robertus
Executive Officer

RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT
JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
SANTA MARGARITA REGION

ORDER NO. R9-2010-0016

JUNE 30, 2012

CERTIFICATION

I certify under penalty of law that this document and all attachments, including the Watershed Workplan and Water Quality Management Plan, were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Signed: _____ Date: June 30, 2012

JASON E. UHLEY
Chief of Watershed Protection Division

2010 SMR MS4 Permit	Order No. R9-2010-0016

EXECUTIVE SUMMARY

This Jurisdictional Runoff Management Program (JRMP) describes the specific Runoff management programs and activities implemented to comply with the requirements of the Municipal Separate Storm Sewer System (MS4) Permit, Order No. R9-2010-0016, issued to the Riverside County Copermittees in the Santa Margarita Region (SMR) by the San Diego Regional Water Quality Control Board (San Diego Regional Board) on November 10, 2010 (2010 SMR MS4 Permit). This JRMP is the principal document that comprehensively translates the MS4 Permit requirements into actions that the Riverside County Flood Control and Water Conservation District (District) is implementing to comply with the 2010 SMR MS4 Permit. This JRMP will be reviewed at least annually to incorporate new and revised compliance programs specified in the 2010 SMR MS4 Permit.

This JRMP is based on a SMR-wide template developed jointly by the Copermittees to promote consistency in the compliance programs implemented in the SMR. The JRMP has been customized to describe the District's compliance procedures and requirements. The terms and acronyms used in this JRMP are defined in the glossary (Appendix A) and defined terms are capitalized. References in brackets {} are references to provisions of the 2010 SMR MS4 Permit.

2.0 INTRODUCTION TO THE DISTRICT JRMP

2.1 Program Overview

The Clean Water Act of 1987 (CWA) established requirements for discharges of Urban Runoff from MS4s under the National Pollution Discharge Elimination System (NPDES) program. The 2010 SMR MS4 Permit regulates discharges of Runoff from MS4 facilities in the SMR. The Copermittees covered under the 2010 SMR MS4 Permit are the County of Riverside, Riverside County Flood Control and Water Conservation District (District) and the cities within the SMR. Each Copermittee is responsible for compliance with the 2010 SMR MS4 Permit.

This JRMP is a programmatic document developed by the District to describe its specific internal management of the Runoff management program as well as ordinances, plans, policies and procedures necessary to manage Runoff and comply with the 2010 SMR MS4 Permit. This JRMP comprehensively translates the 2010 SMR MS4 Permit requirements into programs and implementation plans for the District.

2.2 Description of District MS4 Facilities

The major MS4 facilities owned and operated by the District and regulated under the 2010 SMR MS4 Permit consist of underground storm drains, open channels, retention basins, and detention basins. A map of the District's MS4 facilities is provided in Appendix C. Each year, the District provides an updated map of its MS4 facilities, with modifications and additions to its major MS4 facilities, in the JRMP Annual Report.

Within the jurisdictional boundaries of the District, additional MS4 facilities and discharges may be present that are not owned by the District. These may include MS4 facilities owned or operated by other non MS4 Copermittee entities, including federal, state, tribal and private entities and discharges otherwise permitted by the San Diego Regional Board or the State Water Resources Control Board (State Board).

Table 2-1 lists the Receiving Waters that may receive discharges from the District's MS4 facilities and the associated 303(d) listings. It should be noted that the District is not alone responsible for potential or actual water quality problems or 303(d) listings within any of the identified Receiving Waters; however, the programs identified within this JRMP are designed to reduce the discharge of Stormwater Pollutants from the MS4 to the MEP, effectively prohibit Non-Stormwater discharges, and prevent Runoff discharges from the District's MS4 from causing or contributing to a violation of Water Quality Standards.

Table 2-1: 303(d) Listed Receiving Waters Within and Downstream of the District's Jurisdiction

Receiving Water	303(d) Listings
Long Canyon Creek	Chlorpyrifos, Fecal Coliform, Iron
Murrieta Creek	Chlorpyrifos, Copper, Iron, Manganese, Nitrogen, Phosphorus, Toxicity
Rainbow Creek	Iron, Nitrogen, Phosphorus, Sulfates
Redhawk Channel	Sulfates, Total Dissolved Solids, Chlorpyrifos, Copper, Diazinon, E. coli, Fecal Coliform, Iron, Manganese, Nitrogen, Phosphorus
Sandia Creek	Iron, Sulfates, Total Dissolved Solids
Santa Gertrudis Creek	Chlorpyrifos, Copper, E. coli, Fecal Colifom, Iron, Manganese, Phosphorus
Santa Margarita River (Upper)	Phosphorus, Toxicity
Temecula Creek	Chlorpyrifos, Copper, Phosphorus, Total Dissolved Solids, Toxicity
Warm Springs Creek	Chlorpyrifos, E. coli, Fecal Coliform, Iron, Manganese, Phosphorus, Total Nitrogen as N

3.0 PROGRAM MANAGEMENT

3.1 Departmental Responsibilities

There are multiple District sections with the responsibility to implement elements of this JRMP and to meet the requirements of the 2010 SMR MS4 Permit. An organizational chart depicting the sections involved in implementing the NPDES program is provided in Appendix B. Additionally, key personnel (position title) with implementation responsibilities, and a matrix showing each applicable JRMP element, the departments with implementation responsibilities, the specific responsibilities of each department and organizational unit, and the key personnel by position title are provided in Appendix B.

3.2 Cooperative Activities

3.2.1 Implementation Agreement

The District participates in a cooperative Implementation Agreement with the following Copermittees within the SMR.

- County of Riverside
- City of Murrieta
- City of Temecula
- City of Wildomar

Through this agreement, the District and the other listed Copermittees contribute funds to implement elements of the 2010 SMR MS4 Permit requirements on a region-wide basis. This approach allows for more consistent compliance with many elements of the 2010 SMR MS4 Permit and implementation of programs, as well as increasing cost effectiveness, and providing consistent messages for the public. The regional programs that the District jointly funds and implements regionally through this Implementation Agreement include:

- Joint development of compliance documents required by the 2010 SMR MS4 Permit among the Copermittees
- Funding of the additional responsibilities of the District as Principal Copermittee (described in Section M of the 2010 SMR MS4 Permit)
- Regional public education activities
- Regional training programs for Copermittee staff
- Water quality monitoring as described in the 2010 SMR MS4 Permit Attachment E, Sections II.A through II.F, exclusive of source identification efforts that may be required of the District.
- Joint support for other Regional Programs, including:

- The Compliance Assistance Program (CAP) including Food Service and Hazardous Materials facility inspections
- Household Hazardous Waste and Antifreeze, Batteries, Oil and Latex Paint (ABOP) collection programs
- Participation in the California Stormwater Quality Association (CASQA)

3.2.2 County Department of Environmental Health – CAP Program

The District, on behalf of the other Copermittees, and with funding through the implementation agreement, maintains an agreement with the County of Riverside Department of Environmental Health. Through this agreement, the Department of Environmental Health provides supplemental inspections at businesses inspected by the Department of Environmental Health, to address potential runoff concerns and assist with complying with the inspection requirements of the 2010 SMR MS4 Permit.

3.2.3 County Waste Management Department: HHW / ABOP

The District, on behalf of the other Copermittees, and with funding through the implementation agreement, maintains an agreement with the County of Riverside Waste Management Department. This agreement provides additional financial support to the County's Household Hazardous Waste (HHW) and Antifreeze, Batteries, Oil and Paint (ABOP) collection activities, to help ensure that adequate collection events are available in the Santa Margarita Region.

3.2.4 County Fire Deaprtment: HAZMAT Response Team

The District, on behalf of the other Copermittees, and with funding through the implementation agreement, maintains an agreement with the County of Riverside Fire Department. This agreement provides additional financial support for the County's Hazardous Materials (HAZMAT) Response Team to ensure discharges of hazardous materials that are discharged to or threatening to discharge to MS4 facilities are promptly responded to by the HAZMAT Response Teams.

Major modifications to the interagency agreements and changes in the cooperative activities are described in Annual Reporting to the Regional Board.

3.3 Fiscal Analysis {H.}

The District makes capital expenditures and incurs operation and maintenance (O&M) costs to implement this JRMP and to meet the requirements of the 2010 SMR MS4 Permit. Each year, the capital expenditures and O&M costs incurred during the reporting period and the budgeted capital expenditures and O&M costs planned for the next fiscal year are provided in the Annual Report. Table 3-1 below describes the sources of funding that the District has available to fund these programs.

Table 3-1. Fiscal Resources

Program Element	Funding Source(s)
Program Management and Reporting	NPDES Benefit Assessment
Annual Fee for SMR MS4 Permit	NPDES Benefit Assessment
Implementation Agreement Shared Cost	NPDES Benefit Assessment
Elimination of Illicit Connections & Illegal Discharges	NPDES Benefit Assessment, Zone 7 Maintenance Funds
Municipal Facilities and Activities	Zone 7 Capital Improvement Fund, Zone 7 Maintenance Fund NPDES Benefit Assessment
Development Planning	Developer Fees
Private Development Construction (Inspections)	Not Applicable[1]
Industrial and Commercial Sources (Inspections)	Not Applicable[1]
Retrofit Program	NPDES Benefit Assessment
Public Education & Outreach	NPDES Benefit Assessment,

Table 3-2 below describes limitations on how the District can use the various sources of funding.

Table 3-2. Restrictions on Use of Funding Sources

Source of Funds	Restrictions on Use (if applicable)
Zone 7 Maintenance Funds	District MS4 Maintenance Activities within District's Zone 7
NPDES Benefit Assessment	District Compliance Activities
Zone 7 Capital Improvement Fund	District MS4 facilities within District's Zone 7

3.4 Legal Authority {E.}

A certification of the District's adequate legal authority to comply with 40 CFR 122.26(d)(2)(I)(A-F) and the 2010 SMR MS4 Permit is provided in Appendix B. However, since the District's enabling act (Act 6642) does not provide land use or police powers to the District to control industrial, commercial or development. Therefore, the District does not have ordinances to regulate private development activities, private construction or grading activities, or private businesses or residences.

To ensure compliance with the requirements of the 2010 MS4 Permit, the District relies on the legal concept of Combined Legal Authority with the Copermittees of the 2010 SMR MS4 Permit. Combined Legal Authority, which has been established through a cooperative Implementation Agreement with the

[1] The District's enabling act does not provide the District with land use or police powers. Therefore, the District cannot regulate private, industrial or commercial facilities. See Section 3.4.

Copermittees (see Appendix B-1), assures that violations of the 2010 SMR MS4 Permit related to compliance programs beyond the District's authority can and will be acted upon by the appropriate Copermittee. The Runoff Management and Discharge Controls addressed by the District and Copermittees through Combined Legal Authority include:

- Control the contribution of Pollutants in discharges of Runoff associated with industrial and construction activity to its MS4 facilities and control the quality of Runoff from Industrial and Construction Sites. This requirement applies both to Industrial and Construction Sites which have coverage under the statewide General Permit for Stormwater Discharges Associated with Industrial Activity (Industrial General Permit) or General Permit for Stormwater Discharges Associated with Construction Activity (Construction General Permit), as well as to those sites which do not. Grading ordinances must be updated and enforced as necessary to comply with this Order;
- Prohibit all identified Illicit Discharges not otherwise allowed pursuant to Section B.2 of the 2010 SMR MS4 Permit;
- Prohibit and eliminate Illicit Connections to the MS4;
- Control the discharge of spills, dumping, or disposal of materials other than Stormwater into the MS4;
- Require compliance with conditions in District's and Copermittees' ordinances, permits, contracts or orders (i.e., hold dischargers to its MS4 facilities accountable for their contributions of Pollutants and flows);
- Utilize enforcement mechanisms to require compliance with Copermittees' Stormwater Ordinances, permits, contracts, or orders;
- Control the contribution of Pollutants from one portion of the MS4 to another through interagency agreements with other Copermittees;
- Carry out all inspections, surveillance, and monitoring necessary to determine compliance and noncompliance with the Copermittees' Stormwater Ordinance and permits and with the 2010 SMR MS4 Permit, including the prohibition on Illicit Discharges to the MS4. The Copermittees have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from Industrial Facilities discharging into its MS4 facilities, including Construction Sites;
- Require the use of BMPs to prevent or reduce the discharge of Pollutants into the MS4 from Stormwater to the MEP;
- Require documentation on the effectiveness of BMPs implemented to reduce the discharge of Stormwater Pollutants to the MS4 to the MEP; and
- Implement and enforce Copermittee ordinances within Common Interest Area (CIA) / Homeowners Association (HOA) areas and mobile home parks (MHP).

While the District does not have the authority to regulate private industrial, commercial or development, construction or residential activities within its jurisdictional area, the District does maintain the ability to regulate third-party activities within its rights-of-way through Encroachment Permits, construction contracts and other legal agreements. Within its rights-of-way, the District can:

- Prohibit Illicit Connections and Illegal Discharges (IC/IDs) to District MS4s.
- Prohibit the disposal of Pollutants within District rights-of-way.
- Ensure that private construction activities comply with the Construction General Permit and Copermittees' Stormwater Ordinances.
- Allow for stop work orders or financial securities (bonds) to ensure compliance with the 2010 SMR MS4 Permit provisions.

Table 3-3 lists the District's Ordinances which provide the District authority to regulate activities within its rights-of-way.

Table 3-3. Ordinances Providing Legal Authority

Ordinance No.	Ordinance Short Title	Provision(s) of Ordinance and Description of Authorities Granted	Availability of Ordinance (Online URL or front counter)	Date of last update/status (Pending, draft, or adopted)
14	NPDES Program – Benefit Assessment Ordinances	Establishes the Benefit Assessment Areas in which the District will annually levy a Benefit Assessment to pay for the cost of programs required by the NPDES Program.	Available at the District's main office.	Last updated on June 4, 1991.
19	Encroachment Permit Fees	This ordinance delegates to the General Manager-Chief Engineer of the District the administration of the use of District facilities, right of way, and/or easements for excavation, connections, and other types of encroachments, and the issuance, modification and revocation of permits for such uses, along with the establishment of a Deposit Based Fee schedule for District services.	Available at the District's main office.	Last updated on December 3, 2004.

3.5 Enforcement/Compliance Strategy

As described within this JRMP, the District's enabling act does not provide authority to require compliance of private or public property owners with 2010 SMR MS4 Permit requirements. The District's authority is limited to those activities that occur within its rights-of-way through encroachment permits, contract and other legal agreements. The District relies on Combined Legal Authority for areas outside of its rights-of-way in order to meet the goals of the 2010 SMR MS4 Permit. If the District is made aware of, or observes a violation of a requirement of the 2010 SMR MS4 Permit or Copermittee ordinances that occurs outside of its rights-of-way, the District will forward the information to the appropriate Copermittee for investigation and enforcement under their authorities and ordinances. The District and the other Copermittees must necessarily rely on the actions or inactions of independent third parties such as residents and businesses for the protection of water quality. Accordingly, consistent with the 2010 SMR MS4 Permit and pursuant to the legal authorities described in Section 3.4, compliance with Copermittees' Ordinances is mandated through implementation of various enforcement mechanisms.

This section describes a program wide Enforcement / Compliance Strategy that serves as guidance to the District in prioritizing and conducting enforcement activities within District rights-of-way that are consistent with the 2010 MS4 Permit and appropriate to the severity of the violation. The processes and procedures for conducting enforcement outside of District rights-of-way are described in the other Copermittee JRMPs.

3.5.1 Prioritize Violations

The Copermittees' Stormwater Ordinances cover a wide range of prohibited activities which have varying magnitudes of potential impact on the Beneficial Uses of Receiving Waters. For example, discharges of either Hazardous Materials (e.g., solvents and pesticides) or Non-Hazardous Materials (e.g., food wastes, trash, and debris) into the MS4 are violations of Copermittee Stormwater Ordinances and are subject to enforcement. Similarly, an accidental spill into a catch basin inlet and an intentional discharge from an Illicit Connection are both violations. Prioritizing violations is important in focusing the finite resources of the Copermittees and the District on those violations that may have the greatest potential impact on the quality of Receiving Waters.

Prioritizing violations is based on many factors, including the experience and professional judgment of Copermittee and District staff. The factors that are commonly considered in prioritizing violations of the Copermittee's Stormwater Ordinances and erosion control ordinance and the 2010 SMR MS4 Permit are presented in Table 3-4.

Table 3-4. Prioritization Factors for Violations

Prioritization Factor	Description
Characteristics of the Potential Pollutant	Based on chemical characteristics and potential to impact Beneficial Uses of Receiving Waters. The more Toxic, hazardous, or detrimental to the Beneficial Uses of the Receiving Waters a Pollutant is, the higher priority the discharge.
Sensitivity of the Affected Receiving Waters	The sensitivity of the affected Receiving Waters should be considered directly proportional to the priority of the violation because, for example, a more sensitive Receiving Water may suffer severe adverse effects from the discharge of a particular Pollutant whereas a less sensitive Receiving Water may suffer no adverse effects from the same Pollutant discharge. It is also important to consider that a Receiving Water may be highly sensitive to one potential Pollutant discharge while, at the same time, completely insensitive to another potential Pollutant. Examples of Receiving Waters that may be particularly sensitive include those with municipal supply or wildlife habitat designated Beneficial Uses.
Proximity of Receiving Waters	The closer a Receiving Water is to the discharge, the less chance there is for dispersion, dilution, or degradation of the potential Pollutant. Therefore, the closer the discharge is to Receiving Waters, the higher priority of the violation.
Magnitude of Discharge (volume and mass)	A larger Illegal Discharge should be of a higher priority than a smaller Illegal Discharge because as the magnitude of the Pollutant discharge increases, the extent of impact of the discharge on the environment increases as well.
Responsiveness of the Discharger in taking corrective actions	A discharger who is responsive and implements a good faith effort to correct a violation is more likely to minimize adverse impacts to surface water quality than a discharger who takes no action to correct a violation. Therefore, the priority of a violation should decrease as the responsiveness of the discharger increases.
Intent of the Discharger	Is the violation accidental or the result of an accident or a deliberate attempt to circumvent regulations?
Frequency of the Violation	Violations of Copermittee Stormwater Ordinances and erosion control ordinances that are continuous or reoccurring should be of a higher priority than isolated occurrences of violations. The more frequent a violation, the more likely it is that the discharge will impact surface water quality.
Previous History of Non-Compliance of the Responsible Party	A poor history of non-compliance of a discharger should result in a higher prioritization of subsequent violations as compared to a discharger with a good history of compliance because a history of non-compliance is evidence of a discharger's lack of concern for complying with local Stormwater and erosion control ordinances.

Table 3-5 provides general guidance for categorizing the relative severity of violations based upon the factors and/or circumstances associated with a violation.

Table 3-5. Relative Severity of Violations

Factors Affecting the Severity of Violations	Severity Priority Level		
	High	Medium	Low
Pollutant characteristics	Hazardous Materials (e.g., pesticides and solvents)	Metals, nutrients, sediment, other non-Hazardous Materials	Trash and debris
Sensitivity of Receiving Waters	Drinking water source, wildlife refuge, Illegal Discharges containing Pollutants identified as Impairing the Receiving Water	Recreational reservoir, riparian habitat	Dry, ephemeral stream
Proximity of Receiving Waters	Adjacent	Several hundred feet away	Several hundred yards away
Discharge magnitude	1000's gallons	100's gallons	10's gallons
Responsiveness of discharger	No action to contain or mitigate discharge	Reactive to control discharge when requested (i.e., cooperative)	Implements spill control plan at own initiative or shows good faith effort to respond
Intent of violation	Intentional	Discharge due to lack of controls or negligence	Implemented and maintained controls that failed (i.e., accident)
Frequency of violation	Continuous	Intermittent	Isolated incident
Previous history of discharger	Enforcement and cleanup historically resisted and more than one previous violation	Enforcement and cleanup performed when threatened and one or less previous violations	Enforcement and cleanup performed when requested and no previous violations

Because violations may not clearly fall into any single priority level described in Table 3-5, the priority assigned by Copermittee and District staff to particular violations may involve a subjective weighting of various factors.

3.5.2 Select Appropriate Enforcement Actions

The District will emphasize and encourage voluntary compliance with the District's encroachment permits, contract and other legal agreements to the MEP. Where more advanced enforcement becomes necessary, the District will either conduct enforcement for actions or activities within its rights-of-way or coordinate with the Copermittee who has jurisdiction over the land use or activity for enforcement actions as described in that Copermittee's JRMP. The enforcement or compliance response will be based on the severity of the violation in consideration of the factors in Table 3-5. The types of enforcement/compliance responses available, depending on the circumstances, and in typical order of increasing severity, are:

- Education and information,

When more severe enforcement or compliance responses are required, the District will forward information regarding the violation to the appropriate Copermittee contact with jurisdiction over the land use or activity. The following enforcement actions will be implemented by the District and/or the Copermittee, as appropriate, and described in the following sub-sections:

- Verbal warning,
- Written warning,
- Notice of violation or noncompliance,
- Stop work order or cease and desist order,
- Civil citation or injunction,
- Bonding,
- Administrative fine, and
- Referral to the Environmental Crimes Strike Force for criminal prosecution (infraction or misdemeanor).

3.5.2.1 Administrative Remedies

Education and Information, and Verbal and Written Warnings. Education and information is provided to dischargers by District staff as an element of each enforcement action. Verbal and written warnings may also be provided by Copermittee staff depending on the circumstances of the condition that is causing or threatening to cause a violation of the Copermittees' Stormwater Ordinances. However, unless the condition is an initial violation of the Copermittees' Stormwater Ordinances and consists of a low priority and severity violation, additional enforcement action may be appropriate.

Notice of Noncompliance. The Notice of Noncompliance constitutes a basic request that the property owner or facility operator rectify the condition causing or threatening to cause noncompliance. The Notice of Noncompliance is generally issued by District and/or Copermittee staff when one or more of the following circumstances exist:

- The violation or threat is not significant and has been short in duration.
- The responsible party is cooperative and has indicated a willingness to remedy the conditions.
- The violation or threat is an isolated incident.
- The violation or threat does not affect and will not harm human health or the environment.
- An actual condition of noncompliance exists, but the condition cannot be remedied within a relatively short period of time.
- The owner of the property or facility operator has indicated willingness to come into compliance by meeting milestones established in a reasonable schedule.
- The violation does not pose an immediate threat to human health or the environment.

Stop Work Order or Cease and Desist Order. The Stop Work Order or Cease and Desist Order are appropriate when immediate action is necessary to stop an existing illegal discharge. The Cease and Desist Order may also be appropriately issued as a first step in ordering the removal of nuisance conditions, which threaten to cause an unauthorized discharge of Pollutants if exposed to rain or surface water Runoff. The Cease and Desist Order is generally issued when one or more of the following circumstances exist:

- The violation or threat is immediate in nature and may require an emergency spill response or immediate nuisance abatement if left unattended.
- The violation or threat exhibits a potential situation that may harm human health or the environment.
- Contacts with the property owner or facility operator indicate that further authority of the Copermittee may need to be demonstrated before remedial action is forthcoming.
- Prior Notices of Noncompliance have not obtained a favorable response.

Prior to issuance of any Cease and Desist Order or commencement of other civil or criminal enforcement action against any person, District and/or Copermittee staff should deliver to the discharger a written Notice of Noncompliance, which states the act or acts constituting the violation and directs that the violation be corrected. The Notice of Noncompliance should provide the discharger with a reasonable time period to correct the violation before further proceedings are brought against the discharger. However, a Notice of Noncompliance should not be the first enforcement method used if egregious or unusual circumstances indicate that a stronger enforcement method is appropriate.

3.5.2.2 Criminal Enforcement

Since the District does not have police powers, it relies on the Copermittees for Criminal Enforcement. The criminal enforcement process is described within the Copermittees' JRMPs.

3.5.2.3 Appropriate Enforcement/Compliance Responses

Table 3-6 provides an example of appropriate enforcement responses that correspond to the severity of a violation as determined from Table 3-5. Recognizing the unique characteristics of mobile businesses, enforcement actions against such businesses will typically follow the procedure described in Section 3.5.3 below.

Table 3-6. Enforcement Responses for Violations Where Overlapping Authority Exists

Incident Severity Priority Level	Appropriate Enforcement Responses[1]	Lead Enforcement Agency	
		Copermittee	Regional Board Support
High	Referral to Environmental Crimes Strike Force	X	X
	Citation	X	X
	Infraction	X	X
	Misdemeanor	X	X
Medium	Infraction	X	X
	Misdemeanor	X	X
	Stop work order or cease and desist order	X	
	Notice of non-compliance	X	
Low	Notice of non-compliance	X	
	Written warning	X	
	Verbal warning	X	
	Education and information	X	

[1] Education and information should be incorporated into all enforcement responses.

The District will take the lead in initiating enforcement actions related to violations within District rights-of-way and will engage the other Copermittees with jurisdiction where the enforcement escalates beyond written warnings or notices of non-compliance. For violations outside of District rights-of-way, the applicable Copermittees will take the lead in initiating enforcement actions related to violations within their respective jurisdictions. Where appropriate, however, the Regional Board may be asked to provide support in enforcement actions related to incidents that are or escalate to a high-priority status. State law limits the Authority of the Copermittees, including the District, to assess significant fines and penalties. However, the Regional Board has substantial abilities to assess fines and penalties under state and federal law that can be used to augment local enforcement where superior regulatory Authority and the ability to assess fines and penalties would be beneficial. Additionally, the Regional Board will be responsible for performing all inspections and enforcement actions related to compliance with the Statewide General Permits or other NPDES permits or waivers adopted by the Regional Board.

3.5.3 Enforcement Strategy for Violations Originating from Mobile Businesses {F.3.b.(3)(ii)}

The process for the enforcement of Mobile Business activities is described within the Copermittees' JRMP.

3.5.4 Coordination of Enforcement/Compliance Activities

Coordination with other the Copermittees and government agencies, including the Regional Board, is essential for successful implementation of an enforcement/compliance program. The entire MS4 is not controlled by a single federal, tribal, state, local or private entity, nor does any single entity have authority to take enforcement action for violations occurring outside of its jurisdiction. Further, other governmental agencies may have additional enforcement authorities that are appropriate to the situation. The District coordinates enforcement activities, as practicable, with the appropriate Copermittees, government agencies and tribes in accordance with the following guidelines:

3.5.4.1 Identify Lead Agency

- Enforcement will be coordinated when multiple agencies have jurisdiction and an agency has not been able to obtain compliance from the discharger.
- Unless otherwise agreed to in writing, the lead enforcement agency role will be assigned on the basis of the origin of the discharge.
- The Regional Board may be asked to be the lead enforcement agency for higher priority Illegal Discharges in areas of overlapping Authority, such as for discharges to Receiving Waters, and will be the lead enforcement agency for all enforcement actions related to compliance with the State Industrial or Construction General Permits and other NPDE permits or waivers issued by the Regional Board.
- Investigation and other relevant information will be shared between the participating agencies in a timely fashion.

3.5.4.2 Lead Enforcement Agency Responsibilities.

The lead enforcement agency will assume the following responsibilities:

- Coordinating activities and assigning responsibilities (e.g., investigations, site visits, etc.) among participating agencies;
- Maintaining communication and information exchange among participating agencies;
- Ensuring that follow-up actions are implemented; and
- Documentation and reporting as required.

3.5.4.3 Coordination with the Regional Board

Under the Porter-Cologne Water Quality Act, the State has provided the Regional Boards with overriding Authority to manage water quality and administer compliance with state and federal water quality law. This Authority includes the ability to impose more significant fines and other sanctions than the Copermittees. With this Authority, the Regional Board may be more effective in obtaining the cooperation and compliance from those who violate Stormwater regulations. The Regional Board is notified by the District when findings of potential non-compliance with the State's Industrial or Construction General Permits have been identified The list of contact names maintained by the District identifies the appropriate Regional Board staff to contact to initiate coordination of enforcement activities or to notify the Regional Board of potential findings of non-compliance. Where appropriate, notifications of potential non-compliance should be forwarded to the designated Regional Board contact person by the District's NPDES Section.

3.5.4.4 Coordination with Other Agencies

In addition to the Regional Board, the District may also find it useful or necessary to coordinate or report findings of potential non-compliance to other government agencies with jurisdiction over water quality issues including the California Department of Fish and Game and the United States Fish and Wildlife Service. The list of contact names maintained by the District identifies the appropriate staff at these agencies to contact to initiate coordination of enforcement activities or to notify of potential findings of non-compliance.

3.5.5 Recordkeeping

Enforcement actions taken, and tools such as citations or tickets utilized, and the discharger's return to compliance are tracked in the databases described in the JRMP. Information to be retained by the District regarding their enforcement program includes:

- Documentation of staff training;
- Inspection notes or reports;
- Warning letters, violation notices, etc.;
- Documentation of follow-up actions;
- Contact reports from meetings or conversations with violators, other Copermittees, or other agencies; and
- Copies of notifications of potential non-compliance.

3.6 Receiving Water Limitations {A.3.}

The 2010 SMR MS4 Permit states that discharges from a District MS4 facility that have been found to cause or contribute to the violation of Water Quality Standards (designated Beneficial Uses, Water Quality Objectives developed to protect Beneficial Uses, and the State policy with respect to maintaining high quality waters) are prohibited. The District complies with this prohibition through timely implementation of control measures and other actions as described in this JRMP to reduce Pollutants in Stormwater discharges from District MS4 facilities in accordance with the 2010 SMR MS4 Permit.

If it is determined that discharges from District MS4 facilities are causing or contributing to exceedances of Water Quality Standards that persist, notwithstanding implementation of the control measures specified in the JRMP, the District will collaborate with the Copermittees with jurisdiction over the contributing drainage areas to implement the following procedure:

Notification

If the District determines that discharges from its MS4 facilities are causing or contributing to an exceedance within a Receiving Water of an applicable Receiving Water Quality Standard, within thirty (30) working days, the District's Watershed Protection Division will provide oral or e-mail notification to the Executive Officer, identifying the pertinent information and data supporting the determination, and commit to submitting a full report in accordance with the reporting procedures below.

If the District is notified by the Executive Officer of a determination by the Regional Board that discharges from the District's MS4 are causing or contributing to an exceedance within a Receiving Water of an applicable Receiving Water Quality Standard, within ten (10) working days the Watershed Protection Division will via e-mail acknowledge such notification, and formally request any pertinent supporting information and data not included in the original notification. Following receipt and validation of all information supporting such a determination, the District will commit to providing a full report in accordance with the reporting procedures below.

Reporting

If the Water Quality Standard exceedance documented pursuant to the notification above is solely due to discharges to the MS4 from activities or areas outside the District's or other Coopermittees' jurisdiction or control, within ten (10) working days of becoming aware of the situation, the District will provide documentation of these discharges to the Executive Officer. Subsequently, the District will document the situation within the Annual Report.

Otherwise, following the notifications above the District will, within the Annual Report covering the date of the notification (unless the Executive Officer directs an earlier submittal), provide a report with:

1) A description of the BMPs that are currently being implemented through the JRMP and any additional BMPs that will be implemented to prevent or reduce those Pollutants that are causing or contributing to the exceedance of the applicable Receiving Water Quality Standards. The report may be incorporated in the Annual Report unless the San Diego Regional Board directs an earlier submittal; and

2) An implementation schedule for any new/revised BMPs. If the Executive Officer directs any modifications to the report, within thirty (30) days, the District will submit a revised report.

Update Compliance Programs

Within thirty (30) days following approval by the Executive Officer of the report described above, the District will revise the applicable sections of this JRMP and the monitoring program, to incorporate the approved modified BMPs that have been and will be implemented, the implementation schedule, and any additional monitoring required. The District will implement the revised JRMP and monitoring program in accordance with the approved schedule for implementation of any new/revised BMPs.

3.7 Program Reporting, Evaluation, and Revision {K.3}

The District implements the following Annual Reporting, program evaluation, and program revision requirements as described in the 2010 SMR MS4 Permit.

3.7.1 Annual Reporting {K.3.a.}

Each year the District prepares a JRMP Annual Report summarizing the implementation of the jurisdictional activities described in this JRMP during the reporting period for submittal to the Regional Board. Each Annual Report must verify and document compliance with the applicable provisions of the 2010 SMR MS4 Permit. The District retains records in accordance with the Standard Provisions in Attachment B of the 2010 SMR MS4 Permit, available for review, that document compliance with each requirement of the Permit. The District submits the Annual Report including documentation of implementation of the compliance programs utilizing standardized reporting forms. The reporting forms will be amended as needed to facilitate changes in compliance programs or more accurate reporting of compliance programs.

3.7.2 Program Effectiveness Assessment and Reporting {J.}

The NPDES Section regularly assesses the District's compliance programs described in the JRMP to identify improvements that will promote the reduction of Pollutants in Runoff to the MEP while also supporting the responsible management and allocation of the public resources available for implementation. The strategy for assessing the effectiveness of the Copermittees' JRMP is described in Appendix B.

3.7.3 JRMP Revisions {F.}

As part of the Annual Reporting process, the NPDES Section will review the JRMP to identify the need, if any, for revisions. The District may propose revisions to the JRMP under the following conditions:

- Where needed improvements are identified based on staff experience in implementing the JRMP
- Upon completion of newly developed program elements
- In response to Effectiveness Assessments as described in Section 3.7.2
- In response to persistent Action Level exceedances
- In response to the BMP strategy identified in the Watershed Workplan (see Section 3.8)
- As directed by the Executive Officer to reflect regional and watershed-specific requirements and/or Waste Load Allocations (WLAs) developed and approved pursuant to the Total Maximum Daily Load (TMDL) process for Impaired Waterbodies

- As directed by the Executive Officer where the JRMP must be revised in order to address exceedances of Receiving Water Limitations that have been determined to be contributed to or caused by Runoff

3.8 Watershed Workplan {G}

The District participates in the development and updating of a Watershed Water Quality Workplan (Watershed Workplan) that is designed to identify, prioritize, address and mitigate the highest priority water quality issues/Pollutants in the Upper Santa Margarita watershed within Riverside County.

This plan is available at: http://rcflood.org/NPDES/SantaMargaritaWS.aspx

4.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION (IDDE){F.4.}

The District implements the following program to actively detect and eliminate Illicit Discharges and disposal into the MS4, in accordance with Provision F.4. of the 2010 SMR MS4 Permit.

4.1 Overview

4.1.1 Prohibited Discharges

The District, through its legal Authority (Section 3.4), enforcement mechanisms (Section 3.5), and various other programs summarized in Section 4.2 below, effectively prohibits all types of Non-Stormwater discharges into its MS4 facilities unless such discharge is authorized by a separate NPDES permit or specifically allowed under the 2010 SMR MS4 Permit (summarized in Section 4.1.2 below).

4.1.2 Conditionally Allowed Non-Stormwater Discharges {B.2.}

The District is not required to prohibit the discharges categories identified below.

- Diverted stream flows;
- Rising ground waters;
- Uncontaminated groundwater infiltration (as defined in 40 CFR 35.2005 (20)) to MS4s;
- Uncontaminated pumped groundwater[2];
- Foundation drains[3];
- Springs;
- Water from crawl space pumps[4];
- Footing drains[5];
- Air conditioning condensation;
- Flows from riparian habitats and wetlands;
- Water line flushing;[6& 7]

---

[2] Requires enrollment under Order R9-2008-002. Discharges into the MS4 require authorization from the owner and operator of the MS4.

[3] Requires enrollment under Order R9-2008-002. Discharges into the MS4 require authorization from the owner and operator of the MS4.

[4] Requires enrollment under Order R9-2008-002. Discharges into the MS4 require authorization from the owner and operator of the MS4.

[5] Requires enrollment under Order R9-2008-002. Discharges into the MS4 require authorization from the owner and operator of the MS4.

[6] This exemption does not include fire suppression sprinkler system maintenance and testing discharges. Those discharges may be regulated under Section B.3 of the 2010 SMR MS4 Permit

[7] Requires enrollment under Order R9-2002-0020.

- Discharges from potable water sources not subject to NPDES No. CAG679001, other than water main breaks;
- Individual residential car washing;
- Dechlorinated swimming pool discharges;[8] and
- Emergency fire fighting flows (i.e. flows necessary for the protection of life or property).[9]

4.2 IC/ID Prevention {F.4.}

The programs described in Sections 5 through 9 of the Copermittees' JRMPs are designed to prevent IC/IDs from occurring. Additionally, Section 11 describes the public education efforts implemented to ensure that the public is informed of these requirements. Below are some highlights of specific elements of the District's programs that help prevent IC/IDs.

4.2.1 Legal Authority {F.4.a.(1)}

As described in Section 3.4, the District relies on Combined Legal Authority in order to prohibit IC/IDs.

4.2.2 Connections to Riverside County Flood Control And Water Conservation District MS4 Facilities

The District's Operations and Maintenance Division – Operations Engineering Section requires all proposed or detected third party connections to its MS4 facilities to obtain an Encroachment Permit. Through the Encroachment Permit process, the District ensures that Connections are not designed to drain Illegal Discharges into the MS4.

4.2.3 Inspections {F.4.a.(2)}

The inspection programs implemented by the District described in Sections 5 through 9 of this JRMP provide an opportunity to identify Illicit Connections and for inspectors to work with the Copermittees and property owners to remedy problems that may potentially result in an Illegal Discharge. If routine inspections or Dry Weather monitoring indicate IC/IDs, they will be investigated and eliminated or permitted[10] as described in Sections 4.3 and 4.4.

4.2.4 Maintain MS4 Map {F.4.b.}

An updated map of MS4 facilities owned by the District is maintained and provided to the Regional Board in the JRMP Annual Report. The map includes all segments of the MS4 owned, operated and maintained by the District, all known locations of connections with other MS4s (e.g., Caltrans), and all known locations of District-owned major MS4 outfalls that discharge Runoff to Receiving Waters. The MS4 map will be updated at least annually. The MS4 map, including any Geographical Information

[8] Excluding saline swimming pool discharges.

[9] Specifically excluding non-emergency fire fighting flows, i.e. flows from controlled or practice blazes and maintenance activities, and building fire suppression system maintenance discharges, i.e. sprinkler line flushing.

System (GIS) layers, will be submitted annually with the updated JRMP. This map is useful in identifying and narrowing down potential source areas in response to an observed IC/ID or Action Level exceedance.

4.2.5 Outfall Monitoring {F.4.d.}

The District conducts Dry Weather field screening and analytical monitoring of MS4 outfalls and other portions of its MS4 facilities within its jurisdiction to detect IC/IDs as described in Section 13.

4.2.6 Waste Collection Programs

4.2.6.1 Household Hazardous Waste (HHW) Collection and ABOP Collection Programs

Through the Implementation Agreement (see Section 3.2), the District participates in the HHW and ABOP collection programs in conjunction with the Riverside County Waste Management Department. Mobile HHW collection events are held at sites in the SMR and are scheduled periodically on weekends from 9:00 a.m. until 2:00 p.m. Through the Implementation Agreement, the District also supports one permanent ABOP collection site in the SMR, which is located at:

Murrieta Maintenance Yard / Riverside County Transportation Department
25315 Jefferson Avenue, Murrieta, 92562

The site is open Saturdays from 9:00 a.m. until 2:00 p.m. with the exception of holiday weekends. Mobile and permanent site locations may vary over time. Details, site locations, maps and schedules of operation for both the HHW and ABOP collection events are available on the County Department of Environmental Health (DEH) website at:

http://www.rivcowm.org/opencms/hhw/pdf/HHWEventFlyerPDFs/91709-MASTERHHWSchedule.pdf

or by calling 1-888-722-4234 or 951-358-5055.

Along with materials collected at HHW and ABOP sites, cathode ray tubes can be taken to County landfills for recycling. Used motor oil for recycling may be taken to certified collection centers throughout Riverside County in addition to the ABOP sites.

4.2.6.2 Conditionally Exempt Small Quantity Generator (CESQG)

The CESQG Program is a Hazardous Waste pick-up disposal service for eligible businesses/non-profit organizations in Riverside County. This program provides an affordable way to legally dispose of limited quantities of Hazardous Waste.

Businesses that generate 27 gallons or 220 pounds of Hazardous Waste or 2.2 pounds of extremely Hazardous Waste per month can participate in the CESQG program. Businesses are required to use a licensed hauler to manifest and transport their Hazardous Waste. The most common participants in the CESQG program are painters, print shops, auto shops, builders, churches, schools, non-profit groups and property managers. An appointment for pickup of Hazardous Waste or further information on the CESQG program can be obtained by calling 1-800-952-5566.

4.3 IC/ID Detection {F.4}

In the mid-1990s, the Riverside County Copermittees conducted reconnaissance surveys to identify IC/IDs to the MS4s. The reconnaissance surveys were limited to underground storm drains of 36-inch diameter or larger and open channels and utilized videotaping. Each undocumented connection to the MS4 was traced to its origin. Although 200 undocumented connections to the underground MS4 facilities were found County-wide, none of the connections were determined to be Illicit Connections with regard to the MS4 NPDES program. As underground facilities are difficult to access and the Copermittees inspect the construction of new underground MS4 facilities to verify that no Illicit Connections are being made, it has been determined that additional inspections of the underground MS4 facilities are not warranted. However, the District conducts inspections of open channel MS4 facilities to identify Illicit Connections as an element of routine facility maintenance. Illicit Connections identified during these surveys are documented and removed where necessary in order to comply with the 2010 MS4 Permit.

Although the overall programs described in this JRMP are designed to help prevent IC/IDs into the MS4, the following summarizes the specific methods implemented by the District to detect and eliminate potential IC/IDs

4.3.1 MS4 Facility Inspections {F.4.e}

During the regular maintenance as described in Section 5.3 herein, MS4 facilities are inspected to identify potential Illicit Connections, and evidence of any Illegal Discharges. This is the most direct method to detect IC/IDs. Appropriate field personnel are trained to identify potential IC/IDs during the course of their normal duties. The District staff is familiar with the existing MS4 and the drainage patterns within its jurisdiction and can take steps to identify the source of what appears to be an IC/ID.

4.3.2 Public IC/ID Reports / Hotline {F.4.c}

Predominantly, Illegal Discharges are reported by the public or by District field personnel. Third-party notifications are a direct source of IC/ID information. The public is encouraged to call the Police/Sheriff Department/Code Enforcement to report observed spills or Illegal Discharges.

Additionally, as described in Section 11, the Riverside County Copermittees maintain a Public Education and Outreach program that includes education regarding IC/IDs. Procedures to educate the public about Illegal Discharges and Pollution Prevention where problems are found are included in this program. The District operates, on behalf of the Copermittees, a centralized 24-hour hotline (1-800-506-2556) that may be used by the public to, among other things, report Illegal Discharges from urban areas into public streets, the MS4 and other waterbodies. These calls can be received in English or Spanish and are routed to the appropriate District divisions or contacts.

Upon receiving notification from staff or a third-party, District staff follows the procedures identified in Section 4.4 below.

4.3.3 IC/ID: Construction Site Inspections {F.1.e.(6)(d)}

As described in Sections 5 and 7 herein, the District implements programs to track and verify that District Construction Sites and Private Construction activities within District rights-of-way conducted under an Encroachment Permit issued by the District are in compliance with the 2010 SMR MS4 Permit. As part

of that program, the District supplements the Illicit Discharge Detection and Elimination (IDDE) program by assuring that appropriate BMPs are being implemented to prevent Illegal Discharges, and that no Illicit Connections occur during the installation phase of new MS4 facilities. Illegal Connections are prohibited by the District and are initially verified during the plan check process. The District verifies conformance with the approved plans and conducts inspections at Construction Sites. A Stop Work Order is issued if an IC/ID is observed during an inspection within District rights-of-way, and where applicable, District staff will follow the relevant procedures described below. The Stop Work Order will cease after the IC/ID has been removed or eliminated.

4.3.4 Monitoring Activities {Attachment E, II.C.}

The District, in cooperation with the Copermittees, implements a Non-Stormwater Dry Weather Action Level (NAL) monitoring program at the Major Outfalls from the MS4 facilities. This monitoring program is intended, in part, to help identify MS4 Outfalls and sub-drainage areas that may have Illegal Discharges. The monitoring program is described in the Consolidated Monitoring Program (CMP) http://rcflood.org/NPDES/Monitoring.aspx. Where an Action Level exceedance is detected at a Major Outfall, source identification efforts are conducted as described in Section 4.4.2.

4.3.5 Non-Jurisdictional IC/IDs

Where Non-Jurisdictional IC/IDs to the District's MS4 facilities are identified, the responsible party is notified of the Regional Board requirements and the Executive Officer is notified of the Non-Jurisdictional IC/ID. The District also implements Wet and Dry Weather monitoring programs that may indicate the presence of IC/IDs as described in Section 13.

4.4 IC/ID Response and Reporting {F.4.}

The 2010 SMR MS4 Permit and the CWA requires the Copermittees to prohibit, consistent with the MEP standard, Illegal Discharges (including the discharge of spills, leaks, or dumping of any materials other than Stormwater and Conditionally Authorized Non-Stormwater discharges) into the MS4.

As described in Section 3.4, the District relies on Combined Legal Authority with the Copermittees to control discharges to the MS4. The District coordinates with the Copermittees to implement the following procedures to investigate and inspect portions of the MS4 that, based on the results of field screening, analytical monitoring, or other appropriate information, indicate a reasonable potential of containing IC/IDs or other sources of Pollutants in Non-Stormwater.

After receiving notification of a water Pollution problem on the area-wide hotline, the NPDES Section coordinates with the appropriate Copermittee Stormwater Coordinator to investigate the problem as follows:

4.4.1 Initial Response Timeframe and Requirements

Based on the information reported, the District's Watershed Protection Division – Hydrologic Data Collections Section (Hydrologic Data Collections Section) will assess if the IC/ID is an Emergency Situation that poses an immediate threat to human health or the environment. Any sewage spill over 1,000 gallons or that could impact water contact recreation, any spill that could impact wildlife, any Hazardous Material spill where residents are evacuated, any spill of reportable quantities of Hazardous

Waste (as defined by 40 CFR 117 and 40 CFR 302), or any other spill reportable to the California Emergency Management Agency (Cal-EMA, formerly known as the Office of Emergency Services or OES) is classified as a threat to human health or the environment.

a. If the discharge is a threat to human health or the environment:
    i. Such discharges must be reported immediately by phone to Cal-EMA at 1-800-852-7550 and should also be reported to the Executive Officer of the Regional Board by telephone: 858-467-2952. If these reports to these agencies have already been submitted by other parties, this reporting need not be repeated by the District.
    ii. Investigation (if the source is not immediately known) and elimination activities (as described below) must occur immediately within 24 hours of being put on notice by staff or a third-party.

b. If there are obvious Illicit Discharges (i.e. color, odor, or significant exceedances of Action Levels (>10x the Action Level) investigation as described below must occur within one business day.

c. If Field Screening Data collected as part of the NAL Monitoring program (as described in Section 4.0 of Volume III of the CMP and Section 13.2 of the JRMP) exceeds Action Levels, the District will either:
    i. Coordinate with the applicable Copermittee(s) with jurisdiction over the tributary land use to initiate an investigation (as described below) to identify the source of the discharge within two (2) business days of receiving the data, or
    ii. Document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation. This documentation will be included in the JRMP Annual Report.

d. If Analytical laboratory results collected as part of the NAL Monitoring Program (as described in Section 4.0 of Volume III of the CMP and Section 13.2 of the JRMP) exceeds Action Levels at an outfall, the District will either:
    i. Coordinate with the applicable Copermittee(s) with jurisdiction over the tributary land use to initiate an investigation (as described below) to identify the source of the discharge within five (5) business days of receiving the data, or
    ii. Document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation. This documentation will be provided to the Copermittee who has jurisdictionover the tributary area for inclusion in their JRMP Annual Report.

e. Other reported potential Illicit Discharges that do not meet the criteria identified above will be responded to in a timely manner. Responses to all IC/ID reports may be prioritized.

4.4.2 Investigation {F.4.e.}

The District coordinates with the Copermittees to take appropriate actions to eliminate all detected IC/IDs to its MS4 facilities and coordinates with the Copermittees to conduct investigations based on the data or reports as described above. The following investigative steps will be taken:

1. If there is no active discharge, standing water, or other evidence of recent discharges (stains) at the reported location, Outfall or NAL exceedance location, reconnaissance is complete at that location and observations are documented in the District's complaint database. If necessary, the location may be marked for future additional follow-up.

2. If there are multiple active discharges at the reported location or outfall, staff will coordinate with the applicable Copermittee(s) with jurisdiction over the tributary land use to:
    a. Observe the flows for any odd odors or discoloration
    b. Take photographs of the discharge and the point of entry to MS4 (if known)
    c. Attempt to trace the flow/flows to its origin

3. If there is an active discharge or evidence of recent Dry Weather flow at the reported location or Outfall, staff will coordinate with the applicable Copermittee(s) with jurisdiction over the tributary land use to:
    a. Take photographs of the discharge and the point of entry to MS4 (if known)
    b. Attempt to trace the flow/flows to its origin
    c. Collect the following field parameters – pH, temperature, and specific conductivity
    d. If the field parameters exceed follow-up criteria identified in the CMP, or if there is other visible evidence of an Illegal Discharge (e.g., stains), a continued investigation will be necessary, see Step 4

4. Where the initial investigation identified in Step 3 indicated a potential Illegal Discharge, the District will coordinate with the applicable Copermittee(s) as described above to perform a source investigation as follows:
    a. If active discharge with flow
        - Trace the source of the discharge as far upstream as possible.
        - Additional field measurements and/or lab analyses may be performed and documented (as outlined above) where there is no other evidence of the IC/ID source
    b. If no active discharge but evidence of a recent IC/ID is present at time of investigation, trace the source of the discharge as far upstream as possible

4.4.3 Elimination {F.4.f}

1. If the source is not identified, the District will coordinate with the Copermittee(s) with jurisdiction over the tributary area who will:
    a. Attempt to narrow down potential source areas, and make note in the investigation file
    b. Where appropriate, provide public education material in area
    c. Mark the location for future follow-up where appropriate. Follow-up visit(s) can confirm if the IC/ID has recurred and an attempt will be made by the Copermittee to locate

source. If the IC/ID has not recurred or has been eliminated it is noted and complaint/investigation is closed.

d. If the investigation was initiated in response to a Non-Stormwater Action Level (NAL) exceedance:
    i. The District will conduct additional NAL sampling at the Outfall in subsequent years
    ii. If the results of the additional sampling indicate recurring exceedances of the same NAL(s) with an unidentified source, then the District will coordinate with the appropriate Copermittees with jurisdiction over the tributary land uses to provide an evaluation of needed changes to the programs described in the applicable Copermittees' JRMPs to address the common contributing sources that may be causing such an exceedance. This evaluation will be provided in the District and/or Copermittee JRMP Annual Reports as appropriate. Applicable updates will be made to the Watershed Water Quality Workplan (G. of the 2010 SMR MS4 Permit), Retrofitting Existing Development (F.3.d. of the 2010 SMR MS4 Permit) and Program Effectiveness Assessment and Reporting (J. 2010 SMR MS4 Permit) work plans.

2. If the source is identified, and if:
    a. The source is natural (non-anthropogenically influenced) in origin and in conveyance into the MS4 then the District need not prohibit the discharge.
        i. The District and/or the Copermittee(s) with jurisdiction over the tributary area to the outfall, as appropriate, will report its findings and documentation of its source investigation to the Regional Board in their JRMP Annual Reports covering the period in which the findings were made as appropriate.
    b. The source of the exceedance is a conditionally approved category of Non-Stormwater discharge as described in Section 4.1.2, then the Copermittees will determine if this is an isolated circumstance or if the problem is recurrent to the point that the category of discharges must be addressed through the prohibition of that category of discharge as an Illicit Discharge.
        i. The applicable Copermittee(s) will submit its findings including a description of the steps taken to address the discharge and the category of discharge, to the Regional Board for review in the applicable JRMP Annual Report covering the period in which the findings were made. Such description will include relevant updates to existing ordinances or new ordinances, orders, or other legal means of addressing the category of discharge, and the anticipated schedule for doing so. The Copermittees must also submit a summary of its findings with the Report of Waste Discharge.
    c. The source is in the jurisdiction of another Copermittee, the appropriate Copermittee is notified, and further action is performed by that Copermittee.
    d. The source is a discharge separately permitted by the Regional Board and/or the State Board that is in violation or potential violation of that permit, then
        i. If applicable, a copy of the regulatory permit authorizing the discharge will be obtained, if possible.

ii. The Copermittee must report, within three business days, the findings to the San Diego Water Board including all pertinent information regarding the discharger and discharge characteristics.
iii. The findings of the investigation will be noted in the file and the case will be closed.
iv. If a permitted discharge is perceived to be a threat to human health or the environment it will be reported to the San Diego Regional Board and Cal-EPA as described in Section 4.4.1

e. The source is an Illegal Discharge within the jurisdiction of the District rights-of-way:
i. The source is provided with educational material about IC/IDs, and an attempt is made to have the source resolve the situation immediately.
ii. Where appropriate, District staff will implement enforcement procedures consistent with Section 3.5 of this JRMP.
iii. Follow-up as appropriate to ensure that the IC/ID is eliminated.
iv. Report the findings, including any enforcement action(s) taken, and documentation of the source investigation will be forwarded to the San Diego Water Board in the Annual Report.
v. If unable to eliminate the source of discharge prior to the Annual Report submittal, the District will submit, as part of its JRMP Annual Report, its plan and timeframe to eliminate the source of the exceedance.
vi. Those dischargers seeking to continue such a discharge must obtain coverage under a separate NPDES permit prior to continuing any such discharge.

f. The source is part of a HazMat incident; it is reported to the Incident Commander upon arrival. Coordination with the HazMat team takes place and samples are only collected with approval of the Incident Commander as samples may be done in conjunction with future legal action. Under no circumstances is a site entered or field measurements collected if conditions are unsafe.

4.4.4 Clean-up

The District coordinates with the applicable Copermittees with jurisdiction to ensure that Illegal Discharges are cleaned up where necessary and that no further environmental degradation occurs and the responsible party(ies) restore the area back to its original state to the MEP.

4.4.5 Sanitary Wastes {F.4.h}

The District cooperates and coordinates with the local sanitation districts as described in Appendix C to swiftly respond to and contain sewage spills that may discharge into its MS4 facilities.

As part of those efforts, the District allows local sanitation districts immediate 24-hour access to its MS4 facilities to address and contain sewage spills. The District also works cooperatively with the local sanitation districts to determine and control the impact of infiltration from leaking sanitary sewer systems on Runoff quality.

5.0 DISTRICT AREAS AND ACTIVITIES {F.3.A}

The District implements the following program that is designed to meet the requirements of provision F.3.a of the 2010 SMR MS4 Permit, prevent Illicit Discharges into the MS4, reduce District discharges of Stormwater Pollutants from the MS4 to the MEP, and prevent District discharges from the MS4 from causing or contributing to a violation of Water Quality Standards.

5.1 Planning District Facilities {F.1}

The District's mission is to protect people, property and watersheds of Riverside County from damage or distribution from flood and stormwaters, and to conserve, reclaim and save such waters for beneficial use. In service to that mission, the District may, where necessary, design and build Watershed Protection Projects within the Santa Margarita Region. The District implements the applicable processes and procedures described in Section 6 of this JRMP in the planning and design of District projects. If the District builds Priority Development Projects within the Santa Margarita Region, such as a satellite maintenance yard, a WQMP for the project will be completed.

5.1.1 Priority Development Projects {F.1.d}

- If the District pursues a Priority Development Project as discussed in Section 1 of the SMR WQMP, the Design and Construction Division – Design Section or Engineering Services Section (Design Section) will prepare a Project-Specific WQMP, consistent with the requirements of the SMR WQMP.
- The Preliminary Project-Specific WQMP, whether developed in-house by the Design Section or by a contractor, will be forwarded to the NPDES Section for a thorough review of all items required in the SMR WQMP. The reviewer will use the District's "WQMP Review Checklist" to determine if the Project-Specific WQMP is complete. The Design Section EPM will approve the final Project-Specific WQMP.
- Prior to initiating grading or construction activities, the Design Section will ensure that the construction plans for its Priority Development Projects incorporate the BMPs described in the approved final Project-Specific WQMP. Appendix B includes the Position/Title of the reviewers under the respective departments responsible for implementing these reviews and approvals.
- The O&M Plan described in the Project-Specific WQMP will be integrated into a Facility Pollution Prevention Plan (FPPP) (see Section 5.3.4.1).

5.1.2 Public Works Transportation Projects {F.1.i}

The District does not plan, design or construct transportation projects.

5.1.3 Public Works Unpaved Roads {F.1.i.}

District projects that construct Unpaved Roads must follow the BMP guidance described in Section 6.6.7 of this JRMP.

5.1.4 Design of Flood Control Projects {F.3.a.(4)(a)}

During the design of flood control projects, the applicable Section of the District's Design and Construction Division, in consultation with the Regulatory Division assesses the project's potential

impacts on Receiving Water quality. As such Watershed Protection Projects are not Development Projects intended for human use or occupation, typically no additional Runoff or Pollutants will be expected to be discharged into Receiving Waters as a result of the construction of flood control projects.

5.1.5 Other District Projects

All other District Projects will comply with Section 6.6.

5.2 District Construction Activities {F.2.}

The District implements the applicable requirements of Section 7 of this JRMP in the construction of District projects. This includes, where applicable, compliance with the latest version of the Construction General Permit. As described in Section 5.1 above, the District will prepare a WQMP for all applicable District Priority Development Projects as described in Section 1 of the WQMP.

District construction projects one acre or larger or which are part of a construction project one acre or larger must comply with the Construction General Permit. Prior to commencement of construction activities, the District's Design and Construction Division – Contract Administration Section (Contract Administration Section), files Permit Registration Documents by using the State Board's Storm Water Multiple Application and Report Tracking System (SMARTS) and submitting a Notice of Intent (NOI) fee. Upon completion of the construction project, the Contract Administration Section files a Notice of Termination (NOT) and other project close-out documentation via the State Board SMARTS. The SMARTS website can be accessed at:

https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.jsp

During construction closeout the District will assure satisfactory completion of the requirements in an applicable District project-specific WQMP by:

- Verifying that Structural Stormwater BMPs have been constructed and installed in conformance with approved plans and specifications;
- Assuming responsibility for the long-term funding and implementation, operation, maintenance, repair, and/or replacement of BMPs; and
- Confirming that procedures are in place to implement all Non-Structural BMPs.

Where applicable, the operation and maintenance procedures for the Treatment Control BMPs included in the project-specific WQMP will be incorporated into a municipal FPPP, as described in Section 5.3.4.1. For DistrictWQMP projects, upon completion of construction when contract close-out occurs the responsibility for implementation, operation, and maintenance of BMPs will transfer from the contractor to the Operations and Maintenance Division – Operations Engineering Section (Operations Engineering Section) and become part of the District's program for O&M of District facilities, described in Section 5.3 below.

5.3 Operation and Maintenance of District Areas and Activities {F.3.a.}

The District implements the following measures that have been designed to ensure that District's Areas and Activities meet the requirements of Section F.3.a. of the 2010 SMR MS4 Permit, reduce District

discharges of Stormwater Pollutants from its MS4 facilities to the MEP, and prevents discharges from its MS4 facilities from causing or contributing to a violation of Water Quality Standards. This section describes the program implemented by the District for the operation, maintenance and inspection of the District's Areas and Activities.

5.3.1 Source Identification / Inventory {F.3.a.(1)}

The District maintains an inventory of its Municipal Areas (properties) and Activities (maintenance) that have the potential to generate Pollutants. This inventory is maintained by the Operations and Maintenance Division and a copy is included with each JRMP Annual Report to the Regional Board. Once the construction of a District facility is completed, the Operations and Maintenance Division will work with the District's IT Division to will add the facility to the District's facility GIS database. Linear facilities, such as roads, streets and highways, will not need to be individually inventoried, however, the District's MS4 Facilities are shown on an MS4 map included in Appendix C which is updated and provided in each JRMP Annual Report.

This inventory includes the name, address (if applicable), and a description of the area/activity; which Pollutants are potentially generated by the area/activity; whether the area/activity is adjacent to an Environmentally Sensitive Area (ESA); and identification of whether the area/activity is tributary to and within the same hydrologic subarea as a CWA Section 303(d) water body segment and generates Pollutants for which the water body segment is Impaired.

5.3.2 Typical Minimum BMPs {F.3.a.(2)(b)

Based on the Areas and Activities inventoried and the Pollutants of Concern identified, a list of potential minimum Source Control / Pollution Prevention BMPs was developed; appropriate minimum BMPs applicable to specific facilities or activities are identified per 5.3.3 and 5.3.4 below. The BMPs listed are both effective and widely accepted. The District consults other sources of BMP information and considers implementation of additional methods and measures as appropriate. Appropriate BMPs for each District Area are incorporated into the FPPPs, as applicable. In addition, minimum BMPs for the District's mobile activities are also incorporated into the District's FPPPs.

5.3.3 BMPs for District Activities

The Activities conducted by the District within the Santa Margarita Region include:

- Pesticide and/or herbicide application
- Unpaved Road maintenance
- Painting
- Outdoor loading/unloading of materials
- Outdoor storage of raw materials
- Waste handling and disposal
- Grading
- Construction

- Fence Repair
- Mowing

The District's FPPP describes the specific BMPs deployed for each of these activities {F3.a.(2)}

5.3.4 BMPs for District Areas

5.3.4.1 Facility Pollution Prevention Plan (FPPP) {F.3.a.(2)}

An FPPP is maintained that covers all District Facilities and is designed to identify the minimum Pollution Prevention Methods and BMPs applicable to each District Facility and the District's mobile maintenance activities. The FPPP is maintained at the District's headquarters in Riverside, CA. The District's Operations and Maintenance Division, with assistance from the NPDES Section, is responsible for implementation and update of the FPPP. The FPPP also includes a Facility Inspection Form that is used to record inspection findings.

For any District Facilities that are tributary to and within the same hydrologic unit as a 303(d) listed waterbody and/or within, adjacent to, or discharging directly to an ESA, the FPPP includes any enhanced measures deemed necessary to mitigate Pollutants shown to be generated by the site, for which the water body segment is Impaired. As TMDLs are developed and/or Action Level exceedances are detected, the BMPs implemented at these facilities may be revisited to ensure that all appropriate enhanced measures deemed necessary by the District are implemented.

For other District owned areas that do not have an FPPP (such as vacant land), appropriate BMPs including those identified in the remaining Subsections of 5.3.4. are implemented on an as-needed basis as problems are identified.

5.3.4.2 BMP Implementation for Management of Pesticides, Herbicides, and Fertilizers {F.3.a.(3)}

The District implements BMPs to reduce the contribution of Stormwater Pollutants to the MEP associated with the application, storage and disposal of pesticides, herbicides and fertilizers from District Areas and Activities to MS4 facilities and Receiving Waters. Such BMPs are described in the FPPP applicable to the facility and generally include:

(a) Educational activities, permits, certifications and other measures for District applicators and distributors;

(b) Integrated Pest Management (IPM) measures that rely on non-chemical solutions where possible;

(c) The use of native vegetation where consistent with the facility's intended use and landscaping plan;

(d) Schedules for irrigation and chemical application such that they are not applied in advance of anticipated rain events or during rain events ; and

(e) The collection and proper disposal of unused pesticides, herbicides, and fertilizers.

5.3.4.3 BMP Implementation for Flood Control Structures {F.3.a.(4)}

(a) The District implements procedures to assure that new flood management projects assess the impacts on the water quality of Receiving Waters. See Section 5.1.3.

(b) The District includes water quality protection measures, where feasible, when retrofitting existing flood control structural devices.

(c) The District's Operations and Maintenance Division – Maintenance Section (Maintenance Section) evaluates its existing flood control structures as part of ongoing routine maintenance. For any structures that are found to be causing or contributing to a condition of Pollution, the District implements measures to reduce or eliminate the structure's effect on Pollution, and evaluates the feasibility of retrofitting the structural flood control device. The inventory and evaluation is completed by and submitted to the Regional Board in each JRMP Annual Report.

5.3.4.4 District Maintained Unpaved Roads Maintenance {F.3.a.(10)}

(a) The District implements or requires implementation of BMPs for Erosion and sediment control measures, and to minimize potential impacts on streams and wetlands during their maintenance activities on District maintained unpaved roads, particularly in or adjacent to Receiving Waters. Such BMPs may include, as applicable to the maintenance activity:

- Access roads are stabilized immediately after grading, using gravel to prevent erosion.
- Access roads that are prone to flood damage are stabilized with rock.

(b) The District maintains as necessary its unpaved roads adjacent to streams and riparian habitat to reduce Erosion and sediment transport.

(c) Re-grading of unpaved roads during maintenance is sloped outward where consistent with road engineering safety standards or alternative equally effective BMPs are implemented to minimize Erosion and Sedimentation from unpaved roads; and

(d) Through maintenance of unpaved roads, the District examines the feasibility of replacing existing culverts or design of new culverts or bridge crossings to reduce Erosion and maintain natural stream geomorphology.

5.3.5 Operation and Maintenance of MS4 Facilities and Treatment Controls {F.3.a.(6)}

The District's open channels, catch basins, storm drain inlets, and retention/detention basins are inspected, cleaned, and maintained as described below. Wastes and materials removed are disposed of per applicable laws and appropriate BMPs are deployed as necessary to minimize impacts to the Receiving Waters to the MEP. During the annual inspection and maintenance of MS4 facilities, the District inspects for visual evidence of Illegal Discharges, litter and/or debris accumulation, and other maintenance issues.

(a) Treatment Controls: Currently, the District does not own nor operate any Structural Treatment Control BMPs in the Santa Margarita Watershed.

If the District constructs or maintains any such BMPs in the future, the BMPs will be integrated and identified within the applicable FPPP (see Section 5.3.4.1), and will be inspected as described in Section 5.4 below.

(b) MS4 Facilities: The District implements a schedule of maintenance activities for its MS4 facilities (including but not limited to catch basins, storm drain inlets, detention basins, etc). The maintenance activities include:

i. Inspection and removal of accumulated Waste at least annually between May 1st and September 30th of each year for all open MS4 facilities;

ii. Additional facility cleaning as necessary between October 1st and April 30th of each year;

iii. Open channels and basins are cleaned of observed anthropogenic litter in a timely manner;

iv. Maintenance activities within open channels must not adversely impact Beneficial Uses;

v. Record keeping of the maintenance and cleaning activities including the overall quantity of waste removed;

vi. Proper disposal of Waste removed pursuant to applicable laws; and

vii. Measures to eliminate Waste discharges during MS4 maintenance and cleaning activities.

(c) Low Priority MS4 Facilities: Following two years of inspections, any MS4 facility that requires inspection and cleaning less than annually may be inspected as needed, but not less than every other year. MS4 facilities that have met these criteria and will be inspected every other year are identified below

- *None identified at this time*

5.3.5.1 Flood Control Structure Evaluations {F.3.a.(4)(c)}

The Maintenance Section evaluates its existing flood control structures as part of the ongoing routine maintenance described above, to identify structures that are causing or contributing to a condition of Pollution. For any such structures, where feasible, the District implements measures to reduce or eliminate the structure's effect on Pollution, and evaluates the feasibility of retrofitting the structural flood control device. The inventory and evaluation findings are submitted to the San Diego Regional Board in each JRMP Annual Report.

5.3.5.2 Infiltration From Sanitary Sewer to MS4/Provide Preventive Maintenance {F.3.a.(7)}

The District does not own nor operate a municipal sanitary sewer system, however, the District does cooperate with the local sewer agencies for responding to and addressing any observed infiltration into the District's MS4 facilities. In addition, the District implements the following controls to limit infiltration of seepage from sanitary sewers to MS4 facilities where necessary:

i. Adequate plan checking by the Operations Engineering Section, Design Sections and Contract Administration Section for Encroachment Permits, District Flood Control Projects and any District Priority Development Projects for which the District will assume ownership and maintenance responsibilities;

ii. Incident response training for its field maintenance employees who may identify sanitary sewer spills;

iii. Notification to the appropriate Copermittee for Code enforcement inspections;

iv. MS4 maintenance and inspections;

v. Interagency coordination with sewer agencies; and

vi. Proper education of its staff and contractors conducting field operations on the MS4.

5.4 Inspection of District Areas and Activities {F.3.A.(8)}

(a) In addition to the inspections identified in Section 5.3.5 above, the District inspects the following high priority District Areas and Activities annually:

i. Flood management projects and flood control devices not otherwise inspected per Section F.3.a.(6)(b) of the 2010 SMR MS4 Permit – None at this time

ii. Areas and Activities tributary to and within the same hydrologic subarea as a CWA Section 303(d) Impaired water body segment, where an Area or Activity generates Pollutants for which the water body segment is Impaired – None at this time

iii. District Areas and Activities within or adjacent to or discharging directly to Receiving Waters within ESAs

iv. District Facilities:

[a] maintenance and storage yards for materials, waste, equipment and vehicles

v. All District WQMP projects with Structural post-construction BMPs, including verification that the Structural post-construction BMPs on those projects have been appropriately maintained consistent with the WQMP and/or the FPPP. {F.1.f.(2)(b)(iii)} – None at this time

vi. Other District Areas and Activities that the District determines may contribute a significant Pollutant load to the MS4 – None at this time

(b) Inspections of the District's MS4 facilities are performed concurrently with the maintenance schedule described in Section 5.3.5 above.

(c) Other District Areas and Activities are inspected as needed and in response to water quality data, valid public complaints, and findings from District or contract staff.

(d) Based upon site inspection findings, the District implements all follow-up actions necessary to comply with this Order.

5.5 Enforcement of District Areas and Activities {F.3.a.(9)}

Where necessary, the District will conduct enforcement as discussed in Section 3.4, to ensure that District Areas and Activities are in compliance with the 2010 SMR MS4 Permit.

6.0 DEVELOPMENT PLANNING {F.1.}

6.1 Introduction

As discussed in Section 5, the District primarily designs and builds Watershed Protection Projects. If the District builds a Development Project in the Santa Margarita Region in the future, such as a satellite maintenance yard, the District will implement the applicable provisions of this section. The District supports the County's implementation of the following programs related to the planning and permitting of Development Projects within unincorporated Riverside County. The County's programs are designed to:

- Reduce Development Project discharges of Stormwater Pollutants from the MS4 to the MEP;
- Prevent Development Project discharges from the MS4 from causing or contributing to a violation of Water Quality Standards;
- Prevent Illicit Discharges into the MS4; and
- Manage increases in Runoff discharge rates and durations from Development Projects that are likely to cause increased erosion of stream beds and banks, silt Pollutant generation, or other impacts to Beneficial Uses and stream habitat due to increased erosive force.

This program element links the County's General Plan, environmental review process, and development approval and permitting processes to the later phases of detailed design, construction and operation. A General Plan specifies policies that guide development. The environmental review process examines potential impacts from proposed development with respect to the General Plan policies and many environmental issues, including water quality, and includes consideration of mitigation measures to reduce any identified potentially significant impacts. The development approval and permitting processes carry forth project-specific requirements in the form of conditions of approval, design specifications, tracking, inspection, and enforcement actions. The County's JRMP includes a generalized flow diagram that depicts the relationship of the County's General Plan, environmental review process and development planning and permit process, as well as the project design, construction, and operation phases.

6.2 General Plan {F.1.a.}

The District does not maintain a General Plan. Watershed protection principles and objectives for managing Urban Runoff for land developments are reflected in the appropriate polices, goals and objectives of the Copermittees' General Plans.

6.3 Environmental Review Process {F.1.b.}

The District does not regulate private developments. The County's environmental review process, as it relates to private Development Projects, is described in the County JRMP.

6.4 WATER QUALITY MANAGEMENT PLAN {F.1.d}, {F.1.c.}

The District, in collaboration with the other Copermittees, has developed a WQMP for the Santa Margarita Region of Riverside County, which describes the process for application of required LID Principles (Site Design), Source Control BMPs, LID BMPs, and Treatment Control BMPs, on Priority Development Projects to ensure that the land use approval and permitting process will:

- Reduce Priority Development Project discharges of Stormwater Pollutants from the MS4 to the MEP, and
- Prevent Priority Development Project Runoff discharges from the MS4 from causing or contributing to a violation of Water Quality Standards.

The SMR WQMP and a Project-Specific WQMP template are provided on the following website at: http://rcflood.org/NPDES/Developers.aspx

6.5 Hydromodification Management Plan {F.1.h.}

A Hydromodification Management Plan (HMP) is being developed collectively by the Copermittees to manage increases in Runoff discharge rates and duration from Priority Development Projects. The objectives of the HMP are:

- Estimated proposed project Runoff discharge rates and durations do not exceed the pre-project discharge rates and durations.
- For proposed projects on an already developed site, the estimated proposed project Runoff discharge rates and durations do not exceed the pre-project discharge rates and durations, where the pre-project discharge rates and durations are that of the pre-development, naturally occurring condition.

Upon completion of the HMP in 2013, the HMP will be incorporated into the SMR WQMP. Until that HMP is developed and approved by the Regional Board, the interim Hydromodification requirements described in the SMR WQMP are in effect.

6.6 Development Project Review, Approval, and Permitting {F.1.d.}

6.6.1 Process Overview

During the County's planning process, prior to project approval and issuance of local permits, the District, provides recommended conditions of approval to the County, so that Priority Development Project discharges of Stormwater Pollutants from the MS4 will be reduced to the MEP, will not cause or contribute to a violation of Water Quality Standards, and will comply with the County's ordinances, permits, plans, requirements, and with the 2010 SMR MS4 Permit.

All Development Projects that are submitted to the County for discretionary approval or permitting are required by the County to fill out a Project Application Form. Based on the results of that checklist, each project is categorized as either a "Priority Development Project" or as an "Other Development Project." Since July 2005 the County has required a project applicant prepare a project-specific WQMP for all Priority Development Projects. The requirements for Other Development Projects are described in Section 6.6.6.

The County's Planning Department coordinates the land use case processing, which includes compliance with CEQA procedures, General Plan conformity, ordinance consistency, and public health and safety requirements. The County's Planning Department works closely with many other departments to ensure proper review of these issues. The District provides land development review services to the County with regard to flood hazard risk reduction/mitigation and WQMOs for the unincorporated areas of the County. The District's Planning Division – Development Review Section (Development Review Section) reviews

Priority Development Projects for water quality and flood risks, recommends conditions of approval related to water quality and flood hazard mitigation, and reviews and recommends approval of preliminary and final project-specific WQMPs for Priority Development Projects in unincorporated County of Riverside. Together, these departments review proposed Development Projects for applicability and compliance with WQMP requirements.

6.6.2 Identification of Development Projects Requiring a Project-Specific WQMP {F1.d(1) & (2)}

The County Planning Department's Project Application Form includes a WQMP Applicability Checklist as discussed in Section 6.6.6.

In reviewing project applications, the County's Planning Department reviews the WQMP Applicability Checklist and the other information provided in the project application to verify the applicant's determination as a *Priority Development Project* or an *Other Development Project*.

If a Project-Specific WQMP is required, the County's Planning Department will verify that a preliminary Project-Specific WQMP is included with the project application packet. The County's Planning Department will then forward copies of the project application, including the Project-Specific WQMP, to the District's Development Review Section for review, and as applicable, the District will recommend conditions of approval. Recommended conditions of approval for the project will not be issued unless the preliminary WQMP is submitted and found to be acceptable.

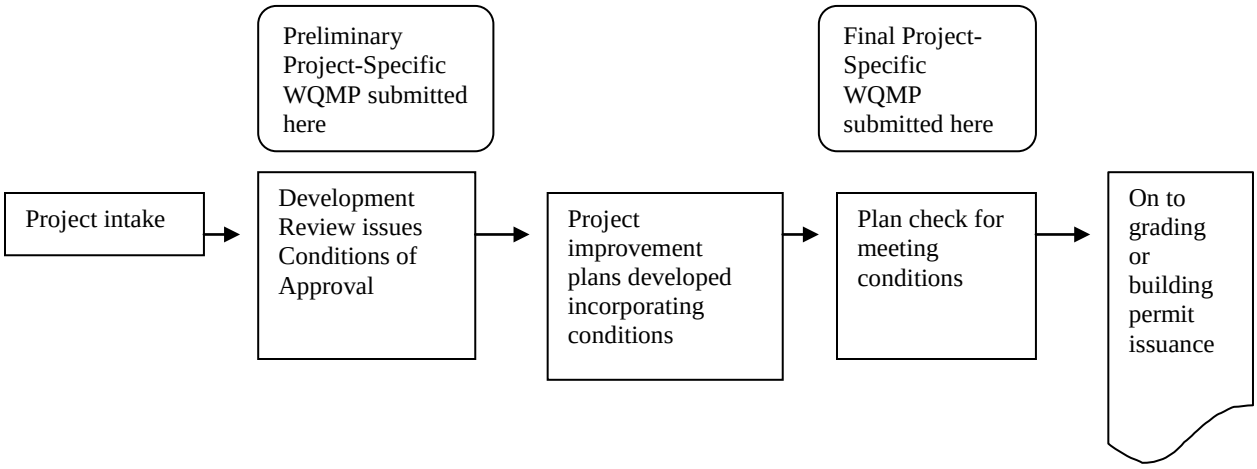
6.6.3 Conditions of Approval {F.1.c}

The District's Development Review Section recommends to the County conditions of approval to assist the County in ensuring that their requirements of the 2010 SMR MS4 Permit are met. The District has developed standardized conditions of approval that may be used. Standard Conditions of Approval used by the District are provided in Appendix D.

6.6.4 Review of Preliminary Project-Specific WQMPs

The County's Planning Department requires preliminary Project-Specific WQMPs to be submitted with the project application for all Priority Development Projects. The level of detail in the preliminary Project-Specific WQMP must be consistent with the level of detail for the overall project design at the time project approval is sought. Prior to issuance of grading or building permits, the project applicant must submit the final Project-Specific WQMP for review and approval. The District's Development Review Section uses a WQMP Review Checklist to facilitate thorough and consistent reviews of preliminary and final project-specific WQMPs. The Project WQMP Review Checklist is an exhibit to the SMR WQMP. Figure 6-2 shows a typical review and approval process.

Figure 6-2. Flowchart of Project Review, Approval & Permitting Process



6.6.5 Review and Approval of Final Project-Specific WQMPs {F.1.d.(9)(a)}

Based on the Conditions of Approval and prior to approval of a final Project-Specific WQMP, the County, in coordination with the District's Development Review Section, will ensure that:

- The final Project-Specific WQMP is prepared and is consistent with the requirements of the SMR WQMP;
- LID BMPs have been incorporated into the site to the extent feasible; or if the project proponent has acceptably demonstrated that LID BMPs are technically infeasible for the project, the Development Review/Plan Check Section will document within the project file a finding of technical infeasibility;
- The entity or entities responsible for BMP implementation and maintenance have been identified; and
- The mechanism for BMP funding is identified.

The District's Development Review Section will advise the County that the conditions of approval have been met prior to the County's approval of a final Project-Specific WQMP.

6.6.6 Requirements for All Development Projects [F.1.c]

Where requested by the County, the District's Development Review Section recommends conditions of approval for Other Development Projects (Development Projects that are not Priority Development Projects), to incorporate LID Principles (Site Design) and Source Control BMPs, where applicable and feasible, into project plans. LID BMPs and Treatment Control BMPs may be required on a case-by-case basis for Other Development Projects that directly discharge Runoff to Receiving Waters listed as Impaired on California's CWA Section 303(d) List of Water Quality Limited Segments. In addition, District Projects that qualify as an Other Development Project will similarly implement the requirements below.

Discharges from Other Development Projects are subject to the following management measures:

(1) Source control BMPs that reduce Stormwater Pollutants of Concern in Runoff; prevent Illicit Discharges into the MS4; prevent irrigation runoff; storm drain system stenciling or signage; properly design outdoor material storage areas; properly design outdoor work areas; and properly design trash storage areas.

(2) The following LID BMPs listed below must be implemented at all Development Projects where applicable and feasible:

(a) Conserve natural areas, including existing trees, other vegetation, and soils;
(b) Construct streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided that public safety is not compromised;
(c) Minimize the impervious footprint of the project;
(d) Minimize soil compaction of landscaped areas;
(e) Minimize disturbances to natural drainages (e.g., natural swales, topographic depressions, etc.); and
(f) Disconnect impervious surfaces through distributed pervious areas.

(3) Buffer zones for natural water bodies, where technically feasible. Where buffer zones are technically infeasible, require project proponent to implement other buffers such as trees, access restrictions, etc.

(4) Other measures necessary so that grading or other construction activities meet the provisions specified in Section 7.0 of this JRMP.

(5) Submittal of documentation of a mechanism under which ongoing long-term maintenance of all structural post-construction BMPs will be conducted.

(6) Infiltration and Groundwater Protection

To protect groundwater quality, restrictions are applied to the use of Treatment Control BMPs that are designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins). Such restrictions are designed so that the use of such infiltration Treatment Control BMPs does not cause or contribute to an exceedance of groundwater quality objectives. At a minimum, each Treatment Control BMP designed to primarily function as a centralized infiltration device is required to meet the restrictions below, unless the Development Project demonstrates that a restriction is not necessary to protect groundwater quality.

(a) Infiltration BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee unless first treated or filtered to remove Pollutants prior to infiltration.
(b) The seasonal high groundwater mark must be at least 10 feet below the invert of the Infiltration BMP.
(c) Infiltration BMPs must be located a minimum of 100 feet horizontally from any water supply wells.
(d) No part of an Infiltration BMP should be within a 2:1 (horizontal:vertical) influence line extending from any septic leach line.
(e) Infiltration BMPs must not be located in soils that, according to a licensed Geotechnical Engineer, do not have adequate physical and chemical characteristics (such as appropriate cation exchange capacity, organic content, clay content, and infiltration rate) for the protection of groundwater.

(7) Where feasible, landscaping with native or low water species shall be preferred in areas that drain to the MS4 or to Waters of the U.S.

(8) Rain water harvesting and water reuse, where feasible, must be encouraged as part of the site design and construction to reduce Pollutants in Stormwater discharges to the MEP.

Additionally, where an Other Development Project proposes a new Unpaved Road, the applicant must incorporate the following or alternative BMPs that are equally effective:

- Identify practices that will minimize road related Erosion and sediment transport;
- Grade Unpaved Roads to slope outward where consistent with road engineering safety standards;
- Incorporate installation of water bars as appropriate; and
- Provide Unpaved Road and culvert designs that do not impact creek functions.

6.6.7 Unpaved Roads Development {F.1.i}

The County implements or requires the implementation of Erosion and sediment control BMPs after construction of new Unpaved Roads. Such BMPs are required for Priority Development Projects and are discussed in the 2012 SMR WQMP, and for Other Development Projects as discussed in Section 6.6.6 above.

6.6.8 Plan Check: Issuance of Grading or Building Permits

6.6.8.1 Plan Check for Priority Development Projects

Construction plans pertaining to the implementation of the final WQMP submitted by the project applicant to the County for plan check will be reviewed by the District's Development Review Section to verify that they properly incorporate all Site Design, Structural LID and/or Treatment Control BMPs identified in the approved final Project-specific WQMP and that they are consistent with the conditions of approval imposed by the County. The designs of Structural Source Control BMPs, LID BMPs, and Treatment Control BMPs are reviewed to verify inclusion of control measures necessary to effectively minimize the creation of Nuisance or Pollution associated with vectors, such as mosquitoes, rodents, flies, etc. The design review during plan check also verifies that Structural BMPs provide adequate access for ongoing maintenance of the BMP after construction. The construction plans are also reviewed for consistency with the BMP design criteria and guidance provided in the SMR WQMP.

6.6.8.2 Plan Check for Other Development Projects

For Other Development Projects, the County's Planning Department reviews the construction plans submitted for a grading or building permit to ensure that the plans incorporate all applicable and appropriate Site Design, Source Control and LID BMPs as described in Section 6.6.6.

6.6.8.3 Standard Notes for Improvement Plans

Prior to the issuance of a grading or building permit, the County's Building and Safety Department requires standard notes to be added to the plan set to address Pollution Prevention during the construction phase of a project.

6.7 Field Verification of BMPs & Permit Closeout{F.1.e.}

The Field verification of BMPs and Permit closeout process is described within the County's JRMP.

6.8 Structural Post-Construction BMP Database and Maintenance Verification {F.1.f}

The County's Planning Department implements a program, as described within the County's JRMP, to verify the maintenance and effectiveness of post construction Structural BMPs constructed pursuant to an approved final Project-Specific WQMP.

6.9 Enforcement for Development {F.1.g}

The programs for enforcement for Development Projects are described within the County's JRMP.

7.0 PRIVATE DEVELOPMENT CONSTRUCTION ACTIVITY {F.2.}

The District regulates private construction activities that occur within its rights-of-way through conditions established in Encroachment Permit, as well as District Construction Projects as discussed in Section 5.1. In areas outside of District rights-of-way, the other Copermittees within their respective jurisdictions implement programs, as described within their respective JRMPs. These programs are designed to:

- Meet the requirements of provision F.2 of the 2010 SMR MS4 Permit;
- Require implementation and maintenance of Structural and Non-Structural BMPs to reduce Pollutants in Stormwater Runoff from Construction Sites to the MS4;
- Reduce Construction Site discharges of Stormwater Pollutants from the MS4 to the MEP; and
- Prevent Construction Site discharges from the MS4 from causing or contributing to a violation of Water Quality Standards.

7.1 Source Identification and Inventory {F.2.b}

The Operations Engineering Section maintains a database of private Construction Sites occurring within District rights-of-way, and the Contract Administration Section maintains an inventory of District construction sites. Construction Sites include any project, including projects requiring coverage under the General Construction Permit, that involves soil disturbing activities including, but not limited to, clearing, grading, disturbances to ground such as stockpiling, and excavation. Construction Sites are included in the database regardless of whether the Construction Site is subject to the Construction General Permit or other individual construction Stormwater NPDES permits. This database is updated when a project applicant submits an application to the District for an Encroachment Permit or when a new District project begins construction. The District's database includes the following project information:

- Assigned Encroachment Permit number
- Project number, name, drawing number and associated sheets of District facilities involved
- Tract Map or Case Numbers
- Watershed or Subwatershed
- Project priority
- Date of inspections performed at each site
- WDID number, if applicable
- Required documents as part of the Application
- Permit Status
- Description of activity occurring within District's rights of way
- Agency involved (cities, County, etc.)
- Design and Construction Division – Contract Administration Section Inspection Staff assigned to monitor construction of the project
- Location information (Latitude and Longitude)

7.2 Construction Site Planning and Project Approval Process {F.2.c}

Prior to issuance of Encroachment Permits for private construction within District's rights-of-way, and for District Construction Projects, the District:

- Requires implementation of the applicable designated BMPs (Section 7.3) and other measures to ensure that Illegal Discharges into the MS4 are prevented, Stormwater Pollutants discharged from the Construction Site are reduced to the MEP, and construction activity discharges from the MS4 are prevented from causing or contributing to a violation of Water Quality Standards in Receiving Waters.

- Ensures that the project proponent's Runoff management plan (or equivalent Construction Site BMP plan) is reviewed by the NPDES Section to verify compliance. The Construction Site BMP plan does not need to be reviewed to ensure that it complies with the Construction General Permit.

- The Operations Engineering Section will verify that project proponents applying for an Encroachment Permit from the District, which are subject to the Construction General Permit, have existing coverage. Where coverage under the Construction General Permit appears to apply, the Operations Engineering Section verifies coverage on the State Board's web page at:

  http://www.swrcb.ca.gov/water_issues/programs/stormwater/databases.shtml#const_db

  For such projects, the Regional and/or the State Board are responsible for conducting inspections and verifying compliance with the Construction General Permit. The Operations Engineering Section's review of the project's Runoff management plan, as well as the Contract Administration Section inspections conducted as described in Section 7.4 below, are to ensure compliance with the Encroachment Permit conditions, as applicable, and the 2010 MS4 Permit.

- Categorizes the project as a high, medium, or low threat to water quality for the purposes of inspection, as described in Section 7.4.

7.3 Construction Site BMPs {F.2.d}

The District has designated a minimum set of BMPs and other measures to be implemented at all Construction Sites within District rights-of-way, as applicable to the site and the activities thereon. The District requires implementation of the designated minimum BMPs and any additional measures necessary to comply with the 2010 SMR MS4 Permit at each Construction Site within its jurisdiction year round. BMP implementation requirements, however, can vary based on Rainy and Dry Seasons. Dry Season BMP implementation must plan for and address unseasonal rain events that may occur during the Dry Season (May 1 through September 30).

7.3.1 Minimum Erosion and Sediment Control Practices {F.2.d(1)(b)}

- Erosion prevention. Erosion prevention is to be used as the most important measure for keeping sediment on site during construction;

- Sediment controls. Sediment controls are to be used as a supplement to erosion prevention for keeping sediment on-site during construction;

- Slope stabilization must be used on all active slopes during rain events regardless of the season and on all inactive slopes during the Rainy Season and during rain events in the Dry Season;

- Permanent revegetation or landscaping as early as feasible; and

- Erosion and sediment controls must be required during the construction of Unpaved Roads.

7.3.2 Minimum Management Measures {F.2.D(1)(a)}

BMP Name	Stormwater BMP Handbook Portal: Construction	Caltrans Construction Site BMP Manual	MS4 Permit Requirement Reference F.2.d.(1):
Stabilize Exposed Soils (one or more or the methods below will be used as needed)			
Chemical Stabilization (Soil Binders)	EC-5	SS-5	(a): (iv), (vii) (viii) (b): (i)
Polyacrylamide	SE-11		(a): (iv), (vii) (viii) b): (i)
Mulching			
Hydraulic Mulch	EC-3	SS-3	(a): (iv), (vii) (viii) b): (i)
Straw Mulch	EC-6	SS-6	(a): (iv), (vii) b): (i),
Wood Mulching	EC-8	SS-8	(a): (iv), (vii) b): (i)
Permanent Seeding			(a): (iv), (vii) b): (i) (iv)
Sodding			(a): (iv), (vii), (viii) b): (i) (iv)
Soil Roughening			
Temporary Seeding/Hydroseeding	EC-4	SS-4	(a): (iv), (vii) (viii) b): (i)
Protect Steep Slopes			
Earth Dikes/Drainage Swales/Lined Ditches	EC-9	SS-9	b): (i), (iii)
Fiber Roll	SE-5	SC-5	b): (i) (iii)
Geotextiles	EC-7	SS-7	b): (i) (iii)
Gradient Terraces			b): (i) (iii)
Soil Retention			b): (i) (iii)
Straw Bale Barrier	SE-9	SC-9	b): (i) (iii)
Temporary Slope Drain	EC-11	SS-11	b): (i) (iii)
Protect Waterways			
Check Dams	SE-4	SC-4	
Outlet Protection/Velocity Dissipation Devices	EC-10	SS-10	(a): (xii) b): (i)
Streambank Stabilization	EC-12	SS-12	(a): (xii)
Temporary Stream Crossings	NS-4	NS-4	b): (i)
Vegetated Buffer			

Phase Construction			
Construction Sequencing (Scheduling)	EC-1	SS-1	(a): (ii), (iii), (iv), (v), (vi), vii b): (i)
Dust Control (Wind Erosion Control)	WE-1	WE-1	(a): (iv), (viii)
Preserve Site Condition			
Entrance/Outlet Tire Wash	TC-3	TC-3	(a): (ix),
Preservation of Existing Vegetation	EC-2	SS-2	(iii) (iv), (xii) b): (i)
Stabilized Construction Entrance/Exit	TC-1	TC-1	(a): (ix)
Stabilized Construction Roadway	TC-2	TC-2	(a): (ix) b): (i) (iv)
Scheduling			(a): (ii) (iii), (iv), (v), (vi), vii b): (i)
Waste Management			
Waste Handling and Disposal	SC-34		(a): (i), (xi.), (x), (xi)
Pollution Prevention			
Spill prevention, Control and Cleanup	SC-11		(a): (i.), (x)

The Operations Engineering Section requires project proponents applying for an Encroachment Permit to submit for review a Runoff Management Plan, SWPPP/Erosion Control Plan or describe other process for requiring a Runoff Management Plan appropriate to various project types/sizes that identifies each of the BMPs used during the construction phase and their deployment at the Construction Site. Similarly, the Contract Administration Section requires a Runoff Management Plan for all District Construction Projects. The Runoff Management Plan:

- Establishes limitations of grading to a maximum disturbed area as determined by Operations Engineering Section before either temporary or permanent erosion controls are implemented to prevent Stormwater Pollution. This maximum area is established on a case-by-case basis depending on the specifics of each project.

  The District has the option of authorizing a temporary increase in the size of disturbed soil areas, by a set amount beyond the maximum, if the individual site is in compliance with the requirements of this JRMP and the site has adequate control practices implemented to prevent Stormwater Pollution;

- Requires preservation of natural hydrologic features where feasible;

- Preserves riparian buffers and corridors where feasible;

- Requires the evaluation and maintenance of all BMPs, until removed; and

- Retains, reduces and provides proper management of all Stormwater Pollutant discharges on site to the MEP standard.

Since BMP technology is constantly changing, the District may consider other BMPs of equivalent or better performance on a case-by-case basis.

7.3.3 Enhanced BMPs {F.2.d.(2)}

The District requires implementation of enhanced measures to address the threat to water quality posed by all Construction Sites tributary to CWA Section 303(d) water body segments Impaired for sediment or turbidity. Currently the District's MS4 facilities do not discharge into CWA Section 303(d) water body segments Impaired for sediment or turbidity. Where necessary, the Encroachment Section also requires implementation of enhanced measures for Construction Sites within, or adjacent to, or discharging directly to Receiving Waters within an ESA (as defined in Attachment C of the 2010 SMR MS4 Permit).

7.3.4 Active/Passive Sediment Treatment (AST) {F.2.d.(3)}:

The Operations Engineering Section and/or the Contract Administration Section, as applicable, requires implementation of AST for sediment at Construction Sites within District rights-of-way (or portions thereof) that it determines to be an exceptional threat to water quality. In evaluating the threat to water quality, the following factors are to be considered by the Encroachment Permit Section:

(a) Soil erosion potential or soil type;

(b) The site's slopes;

(c) Project size and type;

(d) Sensitivity of Receiving Water bodies;

(e) Proximity to Receiving Water bodies;

(f) Non-Stormwater discharges;

(g) Ineffectiveness of other BMPs;

(h) Proximity and sensitivity of aquatic threatened and endangered species of concern;

(i) Known effects of AST chemicals; and

(j) Any other relevant factors.

As defined in the MS4 Permit, AST is a treatment mechanism that uses mechanical, electrical or chemical means to flocculate or coagulate suspended sediment for removal from runoff from construction sites prior to discharge. Such measures are highly expensive and are expected only to be required in cases where there is an exceptional threat and/or demonstrable impacts to receiving water quality and all other available BMPs have been ineffective for the site.

7.4 Construction Site Inspection {F.2.E}

The Contract Administration Section upon request from the Operations and Maintenance Division, conducts Construction Site inspections within District rights-of-way, for compliance with the conditions in the Encroachment Permit (where applicable), and the 2010 SMR MS4 Permit. When conducting inspections of Construction Sites the Contract Administration Section utilizes the inspection form provided in Appendix E. Priorities for inspecting Construction Sites must consider the nature and size of the construction activity, topography, and the characteristics of soils and Receiving Water quality. The Contract Administration Section inspection staff and/or the Operating Engineering Section inspect the inventoried Construction Sites according to the schedule below.

7.4.1 Rainy Season[11] Inspection Frequency

Table 7-1: Construction Site Inspection Frequency

Priority	Supporting Criteria [(a)]	Rainy Season Inspection Frequency
High	• Sites that disturb an area greater than 30 acres with rough grading or with active, unstabilized slopes occurring during the Rainy Season • Sites disturbing an area greater than one (1) acre within the same hydrologic subarea and tributary to Receiving Waters with CWA Section 303(d) listed waters for sediment or turbidity Impairments or within, directly adjacent to, or discharging directly to a Receiving Water within an ESA. • Other sites determined by the District as a significant threat to water quality, considering the following factors: o Soil erosion potential (e.g. Hillside sites) o Project size and type o Sensitivity of and proximity to Receiving Waters (particularly ESAs since no Receiving Waters are 303(d) listed for sediment or turbidity) o History or presence of Illegal Non-Stormwater Discharges o Known past record of non-compliance by the operators of the Construction Site o Any other relevant factors.	Every Two Weeks
Medium	Project Size Sites disturbing an area of one acre or more.	Monthly
Low	Project Size Sites disturbing less than 1 acre.	As needed

7.4.2 Dry Season Inspection Frequency

The District inspects all Construction Sites within District rights-of-way as needed during the Dry Season. High priority sites as defined in Table 7-1 are inspected at least once in August or September each year.

7.4.3 Re-inspections

Based upon site inspection findings, the Contract Administration Section implements all follow-up actions (i.e., re-inspection, enforcement) necessary to comply with the 2010 SMR MS4 Permit. Re-inspection frequencies are determined by the Contract Administration Section based upon the severity of deficiencies, the nature of the construction activity, and the characteristics of soils and Receiving Water quality.

7.4.4 Conducting Inspections

At a minimum, the following items are addressed by Contract Administration Section staff in consultation with the NPDES Section during Construction Site inspections using the construction inspection checklist identified for the Runoff Management Plan:

- Check for coverage under the Construction General Permit NOI and/or WDID No. during initial inspections;
- Assessment of compliance with the conditions listed within the Encroachment Permit and District Construction Contract Documents relating to Runoff issues, including the implementation and maintenance of designated minimum BMPs;
- Assessment of BMP effectiveness;
- Visual observations for Non-Stormwater discharges, potential Illicit Connections, and potential discharge of Pollutants in Stormwater Runoff;
- Review of site monitoring data results, if the site monitors its Runoff in accordance with the Construction General Permit;
- Education and outreach on Stormwater Pollution prevention, as needed; and
- Creation of a written or electronic inspection report.

The Contract Administration Section tracks the number of inspections for each inventoried Construction Site within the District's rights-of-way throughout the JRMP Annual Reporting period to verify that each site is inspected at the minimum frequency required. The Construction Site inspection form is included in Appendix E.

7.5 Enforcement {F.2.f }

The District has developed and implements an escalating enforcement process (Section 3.5) that is designed to achieve prompt corrective actions at Construction Sites for non-compliance with the District's Encroachment Permit conditions or the requirements of the 2010 SEMR MS4 Permit.

The Contract Administration Section responds to construction complaints received from third parties and works with the NDPES Section to assure the San Diego Regional Board that corrective actions have been implemented, if warranted.

7.6 Reporting of Non-Compliant Construction Sites {F.2.g}

If the Operations Engineering Section or Contract Administration Section discovers a violation during inspection that may require high level enforcement, these sections will forward information of the violation to the NPDES Section for further evaluation. The NPDES Section will notify the San Diego Regional Board when the District issues high level enforcement (as defined in Section 3.5) to a

Construction Site that poses a significant threat to water quality in its jurisdiction as a result of violations of the conditions listed within the Encroachment Permit.

In addition, the NPDES Section annually notifies the San Diego Regional Board, prior to the commencement of the Rainy Season (October 1st), of all Construction Sites with alleged violations that pose a significant threat to water quality. Information may be provided as part of the JRMP Annual Report if submitted prior to the Rainy Season. Information provided must include, but not be limited to, the following:

(a) WDID number if enrolled under the Construction General Permit

(b) Site location, including address

(c) Current violations or suspected violations

8.0 INDUSTRIAL AND COMMERCIAL SOURCES {F.1.B.}

As discussed in Section 3.4, the District does not have land use or police powers. Therefore, the District does not have the authority to regulate industrial or commercial facilities. The other Copermittees, within their respective jurisdictions, implement programs, as described within their JRMP, designed to help prevent or reduce discharges to the MS4 from causing or contributing to a violation of Water Quality Standards in Receiving Waters.

9.0 RESIDENTIAL SOURCES {F.C}

As discussed in Section 3.4, the District does not have land use or police powers. Therefore, the District does not have the authority to regulate residential activities. The other Copermittees, within their respective jurisdictions, implement programs designed to help prevent or reduce discharges to the MS4 from residential activities from causing or contributing to a violation of Water Quality Standards in Receiving Waters.

10.0 RETROFITTING EXISTING DEVELOPMENT{F.3.D.}

The District has no jurisdiction over Existing Developments with the Santa Margarita Region. The other Copermittees who have jurisdiction over Existing Developments have conducted and implement a Retrofit Project as described in their Respective JRMPs.

11.0 PUBLIC EDUCATION COMPONENT{F.6.}

Developing programs to increase public awareness and to involve the public can be an effective method for controlling Pollution associated with Runoff. Emphasizing the relevant impact of Runoff to target audiences increases the likelihood that the messages will be noticed and that the audience will support and participate in program implementation. The Riverside County Permittees have developed a County-wide Public Education and Outreach Program that is implemented on their behalf by the District, through the Implementation Agreement.

To leverage Copermittee resources, the Public Education and Outreach Program may partner with other entities including Riverside County's Waste Management Department, Western Riverside Council of Governments, other County-wide Stormwater public education programs in Southern California, the Riverside-Corona Resource Conservation District, and others to promote conservation, Pollution Prevention and environmental awareness. The public education program may also expand outreach opportunities by collaborating with entities such as Riverside County's Agricultural Commissioner and University California Cooperative Extension to promote proper use of pesticides and herbicides to specific target groups such as pesticide applicators and home gardeners.

The Public Education and Outreach Program maintains an Internet website that provides information to residents and businesses about Stormwater management and offers Stormwater Pollution Prevention activities. The website also provides a materials order form for educational materials, and has a tracking mechanism for the number of queries. The website address is http://rcflood.org/stormwater/

11.1 Target Audiences

The District ensures that appropriate education and outreach is available to the following target audiences:

- Copermittee departments and personnel
- New Development / Redevelopment project applicants, developers, contractors, property owners, and other responsible parties
- Construction Site owners and operators
- Commercial Facility owners and operators
- Industrial Facility owners and operators
- Residential community and general public

11.2 Education of Public Audiences

11.2.1 General Education

The NPDES Section, through the Implementation Agreement described in Section 3.2.1, coordinates with the other Copermittees to develop and implement County-wide educational activities through the regional 'Only Rain Down the Storm Drain' program implemented by the NPDES Section. Where necessary those

regional activities are supplemented by the Copermittees with additional localized educational / outreach activities.

In general, these education programs educate each target audience on the following topics, as appropriate and applicable to the target audience's potential Stormwater and Non-Stormwater discharges to the MS4:

(a) Applicable water quality laws, regulations, permits, and requirements;

(b) BMPs;

(c) General Runoff concepts;

(d) Existing water quality, including local water quality conditions, Impaired waterbodies and ESAs; and

(e) Other topics, as determined by the Copermittee(s), such as public reporting mechanisms, water conservation, LID techniques, and public health and vector issues associated with Runoff.

In addition, the NPDES Section implements educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.

11.2.2 Target Audience Topics

The NPDES Section ensures that their education programs provides the following information:

New Development / Redevelopment and Construction Sites {F.6.b.(2)}

As the District does not regulate private Developments and Redevelopments, the County and Cities JRMPs describe the process for educating this Target Audience. For Construction Activities within District rights-of-way, the Contract Administration Section notifies parties the contractor about the importance of educating all construction workers in the field about Stormwater issues and BMPs, in addition to the general topics under Section 11.2.1.

Commercial and Industrial Sites / Sources {F.6.b.(3)}

Not applicable. No Industrial or Commercial Sites are located on District right-of-way.

Residential and General Public {F.6.b.(4)}

Although the District does not have regulatory authority over residences and the general public, the District, through the implementation agreement, collaborates with the other Copermittees to fund the development and implementation of the regional 'Only Rain Down the Storm Drain' public education program. One of the goals of this program is to educate residential and general public target communities on potential Pollutant generating activities (e.g., car washing, mobile operations, yard maintenance) and Pollutant generating products (e.g., pesticides, fertilizers, household chemicals). The target audiences of the residential and general public education programs includes underserved target audiences (e.g.,

disadvantaged communities), residents and managers of CIA/HOA areas, and owners and residents of MHPs.

11.2.3 Methods

Table 11-1 describes the public education and outreach methods that target public audiences:

Table 11-1: Public Education Education/Outreach Methods

Target Audience	JRMP Program Areas Addressed	Education / Outreach Methods
New Development / Redevelopment Project Applicants, Developers, Contractors, Property Owners, and other Responsible Parties	• F.1 • F.6.a • F.6.b.(2)	**Training** • Regional SMR WQMP Launch Training (upon approval of revised SMR WQMP) • Regional HMP Launch Training (upon approval of HMP) **Guidance Documents** • SMR WQMP and HMP Guidance • Regional LID BMP Design Handbook (http://rcflood.org/npdes/lidbmp.aspx) • CASQA Low Impact Development Manual for Southern California (https://www.casqa.org/LID/tabid/240/Default.aspx) • CASQA Stormwater BMP Handbooks (http://www.cabmphandbooks.com/) **Applications / Forms** • WQMP Applicability Checklist **Electronic Outreach** • Regional Quarterly E-newsletters • Website **Other** • Regional Quarterly E-newsletters
Construction Site Owners and Operators	• F.2. • F.6.a. • F.6.b.(2)	**Applications / Forms** • Construction Checklist (a sample is provided in WQMP Chapter 5) **Print Material** • After the Storm • General Construction site supervision • Outdoor Cleaning Activities • Construction Poster **Electronic Outreach** • Regional Quarterly E-newsletters • Website

Target Audience	JRMP Program Areas Addressed	Education / Outreach Methods
Commercial / Industrial Owners and Operators	• F.3.b. • F.6.a. • F.6.b.(3)	**Direct Outreach** • Business Partnerships with garden centers / nurseries, paint stores, hardware stores, home improvement stores, and pet facilities, including training for store staff on specific stormwater / BMP issues **Print Material** • After the Storm • Did you know your facility may need a stormwater permit? • Automotive Maintenance and Car Care • Outdoor Cleaning Activities • Food Service Industry • Industrial / Commercial Facilities • Landscape and Garden • Pools, Spas and Fountains **Electronic Outreach** • Regional Quarterly E-newsletters • E-blasts to mobile service providers • Website
Residential Community and General Public	• F.3.c. • F.6.a. • F.6.b.(4)	**Direct Outreach** • Attendance at region-wide community events • Attendance at local community events • Elementary School Presentations • Outreach at Home Improvement Stores **Print Material** • After the Storm • 10 Ways to Save Water Outdoors • Landscape and Garden • Living on the Edge • Stream Stabilization Fact Sheet • Tips for Horse Care • Septic Tank Systems • Automotive Maintenance and Car Care • Outdoor Cleaning Activities • Pools, Spas and Fountains • What's the Scoop? • Tearsheets on various BMP topics placed in stores as part of Commercial / Industrial outreach **Electronic Outreach** • Regional Quarterly E-newsletters • Website

12.0 DISTRICT STAFF TRAINING{F.6.}

The NPDES Section ensures that District staff and contractors (and Planning Boards and Elected Officials, if applicable) responsible for implementing the requirements of the 2010 SMR MS4 Permit have an understanding of the following topics as applicable to their responsibilities:

(i) Applicable water quality laws and regulations;

(ii) The potential effects and impacts that District departments and personnel activities related to their job duties can have on water quality;

(iii) Plan review policies and procedures to verify consistent application;

(iv) Methods of minimizing impacts to Receiving Water quality resulting from development, construction, and other potential Pollutant generating activities;

(v) Proper implementation of erosion and sediment control, Source Control, Treatment Control, and other BMPs to minimize the impacts to Receiving Water quality resulting from development, construction, and other potential Pollutant generating activities;

(vi) Applicable recordkeeping and tracking mechanisms; and

(vii) Inspection and enforcement procedures, BMP implementation, and review of monitoring data.

12.1 Methods

The following table describes the educational activities conducted that target District staff:

Table 12-1: District Staff Education/Outreach Methods

Target Audience	JRMP Program Area Addressed	Education / Outreach Methods
Management	All	• Staff Meetings • Regional City Manager coordination meetings
NPDES Coordinator	All	• SMR Technical Advisory Committee (TAC) Meetings • SMR Copermittee staff meetings • Regional NPDES training (all applicable modules)
Development Planning Staff	• F.1. • F.6.a. • F.6.b.(1)	• Regional WQMP Training • HMP Training (to be developed upon approval of HMP) • District staff training

Target Audience	JRMP Program Area Addressed	Education / Outreach Methods
Construction Site Approval Inspection and Enforcement	• F.2. • F.4. • F.6.a. • F.6.b.(1)	• Regional Construction Inspection Training • Copermittee staff training
Operation and Maintenance	• F.3.a. • F.4. • F.6.a. • F.6.b.(1)	• Regional Municipal Maintenance Training • Pesticide applicator certification • Copermittee staff training

12.2 Frequency {F.6.b.(1)(b)(2)}

The District trains its staff responsible for oversight and conducting Stormwater compliance inspections and enforcement of construction activities (e.g., construction, inspectors, and other responsible construction staff) annually prior to the rainy season.

13.0 MONITORING PROGRAM {N.}

13.1 Overview

The NPDES Section, through the Implementation Agreement (Section 3.2.1), implements the Santa Margarita Monitoring Plan on behalf of the Copermittees. The Monitoring Plan, available at: http://rcflood.org/NPDES/Monitoring.aspx, addresses the District's responsibilities in the Receiving Waters, MS4 Discharge and Reporting Program No. R9-2010-0016 (MRP, Attachment E to the 2010 SMR MS4 Permit).

Additionally, the NPDES Section conducts source identification monitoring as required per Section II.B.2. and II.C.2. of the MRP, in response to an exceedance of an Action Level.

13.2 Non-Stormwater Dry Weather Action Levels {C.}

The NPDES Section will notify the Copermittees of Analytical results (either laboratory or field screening) that exceed the NALs presented in Table 3 of the 2010 SMR MS4 Permit. In response to such an exceedance, the Copermittees will investigate and seek to identify the source of the exceedance in a timely manner following the procedures described in Section 4.4.2 and 4.4.3. However, if the Copermittee identifies a number of NAL exceedances that prevents it from adequately conducting source investigations at all sites in a timely manner, then the Copermittee will submit a prioritization plan and timeline that identifies the timeframe and planned actions to investigate and report its findings on all of the exceedances to the Regional Board.

The 2010 MS4 Permit notes that neither the absence of exceedances of NALs nor compliance with required actions following observed exceedances, excuses any non-compliance with the requirement to effectively prohibit all types of unauthorized Non-Stormwater discharges into the MS4 or any non-compliance with the prohibitions in the 2010 SMR MS4 Permit.

During any Annual Reporting period in which one or more exceedances of NALs have been documented the District will report a description of whether and how the observed exceedances did or did not result in a discharge from the MS4 that caused, or threatened to cause or contribute to a condition of Pollution, Contamination, or Nuisance in the Receiving Waters.

13.3 Stormwater Action Levels {D.}

The NPDES Section implements the Wet Weather MS4 Discharge Monitoring program and annually evaluates the data compared to the SALs identified in Table 4 of the 2010 SMR MS4 Permit. At each monitoring station, a running average of 20% or greater of exceedances of any discharge of Stormwater from the MS4 to Waters of the U.S. that exceed the SALs for each of the Pollutants listed in Table 4 (below) in Receiving Waters receiving discharges from the District's MS4 facilities requires the District to affirmatively augment and implement all necessary stormwater controls and measures described in this JRMP to reduce the discharge of the associated class of Pollutants(s) to the MEP. The District will utilize the exceedance information when adjusting and executing its annual work plans. The magnitude, frequency, and number of constituents exceeding the SAL(s), in addition to Receiving Water quality data and other information, will be considered when prioritizing and reacting to SAL exceedances in an iterative manner.

GLOSSARY

Glossary

Name	Definition
2010 SMR MS4 Permit	Order R9-2010-0016, an NPDES MS4 Permit issued by the San Diego Regional Board.
Action Level	See Non-Stormwater Action Levels and Stormwater Action Levels
Beneficial Use	The uses of water necessary for the survival or well being of man, plants and wildlife. These uses of water serve to promote the tangible and intangible economic, social and environmental goals. "Beneficial Uses" of the waters of the State that may be protected include, but are not limited to, domestic; municipal; agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. Existing Beneficial Uses are uses that were attained in the surface or groundwater on or after November 28, 1975; and potential Beneficial Uses are uses that would probably develop in future years through the implementation of various control measures. "Beneficial Uses" are equivalent to "Designated Uses" under Federal law. [California Water Code Section 13050(f)].
Best Management Practice (BMP)	Any procedure or device designed to minimize the quantity of Pollutants that enter the MS4 or to control stormwater flow. See Chapter Two.
Bioretention BMP	A type of LID Retention BMP that is designed to capture the Design Capture Volume and absorb that volume entirely into a biologically active soil media. Water retained in this soil media is then evapotranspired by plants in the BMP, or slowly allowed to infiltrate into the underlying soils. This BMP inherently maximizes both Infiltration and Evapotranspiration of Runoff based on the actual limitations of the soil and environment.
Biotreatment BMP	A type of **LID BMP** that can be used in certain circumstances when LID Retention BMPs are not feasible. These BMPs provide similar functions and benefits as LID Bioretention BMPs, such as inclusion of natural biological processes and maximizing opportunities for Infiltration and Evapotranspiration, however, they are not designed to retain the Design Capture Volume in an engineered soil media. Examples of Biotreatment BMPs include extended detention basins, bioswales and constructed wetlands.
California Stormwater Quality Association (CASQA)	Publisher of the California Stormwater Best Management Practices Handbooks, available at www.cabmphandbooks.com
Cease and Desist Order	See Stop Work Order
CEQA	California Environmental Quality Act
Citation	An official summons to appear (as before a court)

Glossary

Name	Definition
Combined Legal Authority	As required by Provision E of the 2010 SMR MS4 Permit, each Copermitee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 through ordinance, statute, permit, contract or similar means. However, as described in USEPA's Part 2 Permit Application Guidance, an individual copermitte is not required to fulfill every component as required in Provision E if the sum of all the Copermittees legal authorities satisfies the regulatory requirement for legal authority. The sum of all the Copermittees legal authorities, in this case, is referred to as Combined Legal Authority.
Condition of Concern	Conditions that may affect the designated Beneficial Uses of a Receiving Water
Condition(s) of Approval (COA)	Requirements a Copermittee may adopt for a project in connection with a discretionary action (e.g., approval of a subdivision map or issuance of a use permit). COAs may specify features required to be incorporated into the final plans for the project and may also specify uses, activities, and operational measures that must be observed over the life of the project.
Construction Site	Any project, including projects requiring coverage under the General Construction Permit, that involves soil disturbing activities including, but not limited to clearing, grading, disturbances to ground such as stockpiling, and excavation.
Copermittee	District, County and Cities of Murrieta, Temecula and Wildomar. The terms *'local Copermittee'* and *'your Copermittee'* refers to the Copermittee that has jurisdiction over the proposed **Priority Development Project**.
CWA	The Federal Clean Water Act
Design Capture Volume (VBMP)	The volume of runoff from the **Design Storm**. This is design sizing standard for LID BMPs, as well as for conventional Treatment Control BMPs whose design is based on treating a particular volume of runoff.
Design Flow Rate (QBMP)	The flow rate resulting from an hourly rainfall intensity of 0.2 inch per hour. The Design Flow Rate will depend on the types of post-development surfaces on the site. Flow-based BMP designs can only be used when implementing conventional Treatment Control BMPs.
Design Storm	The 85th percentile 24-hour storm depth, based on local historical rainfall records. See Exhibit A of the SMR WQMP.
Development Project	Any project that proposes construction, rehabilitation, redevelopment, or reconstruction of any public or private residential, industrial or commercial facility, or any other projects designed for post-construction human activity or occupation.
Directly Connected	Any impervious surface which drains into a catch basin, area drain, or other conveyance structure (such as a street) without first directing the flow across pervious areas (e.g., lawns).

Glossary

Name	Definition
Discretionary Approval	A project which requires the exercise of judgment or deliberation by the public agency or body when they decide to approve or disapprove a particular activity. Discretionary approvals are distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances or regulations. **Check with the Copermittee to determine if a particular action is considered Discretionary.**
Drainage Management Area (DMA)	Individual, discrete drainage areas that typically follow grade breaks and roof ridge lines
Drawdown Time	The time required for a detention or retention BMP to drain and return to the dry-weather condition. For detention BMPs, Drawdown Time is a function of basin volume and outlet orifice size. For infiltration BMPs, Drawdown Time is a function of basin volume and infiltration rate. For Harvest and use BMPs, Drawdown Time is a function of the cistern volume and the demand for use of captured stormwater.
Dry Season	May 1st through September 30th
Dry Weather	Weather is considered dry if the preceding 72 hours has been without precipitation.
DU	Dwelling Unit
EIATIA	Effective Impervious Area To Irrigated Area that would be required to achieve the minimum 40% long-term retention of runoff when harvesting stormwater runoff for outdoor irrigation. See Section 2 of the SMR WQMP.
EIR	Environmental Impact Report
Emergency Situation	IC/IDs that pose an immediate threat to human health or the environment. Any sewage spill over 1,000 gallons or that could impact water recreation, any spill that could impact wildlife, any Hazardous Material spill where residents are evacuated, any spill of reportable quantities of Hazardous Waste (as defined by 40 CFR 117 and 40 CFR 302), or any other spill reportable to the California Emergency Management Agency (Cal-EMA, formerly known as the Office of Emergency Services or OES) is classified as a threat to human health or the environment.
Encroachment Permits	A permit that is required for any person, which includes firms, corporations, public districts, public agencies or political subdivisions, for any excavation, construction, installation or maintenance of any improvement, structure, utility or encroachment in, on, over or under any District rights of way.
Ephemeral	Water bodies, or segments thereof, that contain water only for a short period following precipitation events.

Glossary

Name	Definition
Erosion	When land is diminished or worn away due to wind, water or glacial ice. Often the eroded debris (silt or sediment) becomes a Pollutant via Stormwater Runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road building and timber harvesting.
ESA	Environmentally Sensitive Area. At minimum, as defined in the 2010 MS4 Permit, all Receiving Waters are considered ESAs.
Evapotranspiration	The process of transferring moisture from the earth to the atmosphere by evaporation of water and transpiration from plants.
Facility Pollution Prevention Plan (FPPP)	A plan that the Copermittee maintains that describes the BMPs that are implemented at their municipal facilities to reduce stormwater pollution to the MEP and prohibit illegal discharges.
Final Project-Specific WQMP	A fully completed version of the Water Quality Management Plan that must be submitted and approved prior to recordation of the final map, parcel map or issuance of building permit. See also Preliminary Project-Specific WQMP.
General Plan	Document that specifies policies that guide development.
Harvest and Use BMPs	Stormwater BMPs that capture stormwater runoff in a vault or cistern, and stores that water for later use, such as for irrigation.
Hazardous Materials	Any substance that poses a threat to human health or the environment due to its toxicity, corrosiveness, ignitability, explosive nature or chemical reactivity. These also include materials named by the USEPA in 40 CFR 116 to be reported if a designated quantity of the material is spilled into the Waters of the U.S. or emitted into the environment.
Hazardous Waste	As defined by 40 CFR 117 and 40 CFR 302
Head	In hydraulics, energy represented as a difference in elevation. In slow-flowing open systems, such as most stormwater BMPs, this is the difference in water surface elevation, e.g., between an inlet and outlet.
Hydrograph	Runoff flow rate graphed as a function of time.
Hydrologic Soil Group (HSG)	Classification of soils by the NRCS into A, B, C and D groups according to infiltration characteristics.
Hydromodification	The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport.
Hydromodification Management Plan (HMP)	A Plan that, once developed by the Copermittees, will specify requirements that must be implemented so that projects will not cause Hydromodification.

Glossary

Name	Definition
Illegal Discharge	Defined in 40 CFR 122.26(b)(2) as any discharge to the MS4 that is not composed entirely of stormwater, except discharges pursuant to an NPDES permit, discharges that are identified in Section 4.1.2 of the JRMP, and other discharges authorized by the Executive Officer of the Regional Board.
Illicit Connection	Any unauthorized connection to the MS4 that conveys an Illicit Discharge
Impairment	Describes a condition where a waterbody is presumed by the Regional Board to not be supporting its Beneficial Uses, based on exceedances of certain water quality objectives..
Impervious Area	
Impervious surface	Any surface in the landscape that cannot effectively absorb or infiltrate urban runoff; for example, conventionally paved: sidewalks, rooftops, roads and parking areas.
Implementation Agreement	An agreement among the Copermittees that establishes the responsibilities of each Copermittee and a procedure for funding the shared costs.
Industrial Facility	Industrial Facilities, as defined at 40 CFR § 122.26(b)(14), including: those subject to the General Industrial Permit or other individual NPDES permit; Operating and closed landfills; Facilities subject to SARA Title III; and Hazardous waste treatment, disposal, storage and recovery facilities.
Infiltration BMPs	A type of LID Retention BMP where the primary treatment mechanism is through seepage of runoff into a site's underlying soil.
Infiltration Rate	Rate at which water can be added to a soil without creating runoff (in/hr).
Infraction	Violation
Integrated Pest Management (IPM)	A decision-making process for managing pests that combines biological, cultural, mechanical, physical and chemical tools, and other management practices to control pests in a safe, cost effective and environmentally sound manner that contributes to the protection of public health
Intermittent	Waterbodies, or segments thereof, that contain water for extended periods during the year, but not at all times.
JRMP	Jurisdictional Runoff Management Plan
JRMP Annual Report	Report summarizing a Copermittee's compliance information to be submitted annually to the Regional Board on or before each October 31st of each year, beginning on October 31, 2013. The reporting period for these JRMP Annual Reports must be the previous fiscal year.

Glossary

Name	Definition
LID BMPs	LID BMPs include schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the Pollution of Waters of the United states through Stormwater management and land development strategies that emphasize conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions. LID BMPs include retention practices that do not allow Runoff, suchas infiltration, rain water harvesting and reuse, and evapotranspiration. LID BMPs also include flow-through practices such as biofiltration that may have some discharge of Stormwater following Pollutant reduction.
LID Principles	LID Principles are Site Design concepts that help prevent or minimize the causes (or drivers) of project impacts, and help mimic the pre-development hydrology. Implementing LID Principles will help minimize the need for specific Stormwater BMPs on a project.
LID Retention BMP	A type of Stormwater BMP that is designed to store the Design Capture Volume, and avoid any discharge to downstream systems in storms up to the Design Storm. For the purposes of this WQMP, LID Retention BMPs include Infiltration BMPs, Harvest and Use BMPs, Pervious Pavement BMPs and Bioretention BMPs. See also Other LID BMPs
Low Impact Development (LID)	A stormwater management and land development strategy that emphasizes conservation and the use of onsite natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.
Major Outfall	Outfalls owned by a Copermittee with a pipe diameter of 36 inches or greater or drainage areas draining 50 acres or more. See also **Outfall.**
Maximum Extent Practicable (MEP)	Standard, established by the 1987 amendments to the Clean Water Act, for the reduction of Pollutant discharges from MS4s.
Misdemeanor	A crime less serious than a felony.
Mobile Business	Businesses that conduct services listed in section 8.1.1 but do not operate out of a fixed location.
Municipal Facility	A facility owned by a Copermittee
Municipal Separate Storm Sewer System (MS4)	A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels or storm drains) as defined in 40 CFR 122.26(b)(8).
National Pollutant Discharge Elimination System (NPDES)	As part of the 1972 Clean Water Act, Congress established the NPDES permitting system to regulate the discharge of Pollutants from municipal sanitary sewers and industries. The NPDES was expanded in 1987 to incorporate permits for discharges from MS4s as well (aka MS4 Permits).
Non-Hazardous Materials	For example, food wastes, trash and debris

Glossary

Name	Definition
Non-Jurisdictional IC/ID	An IC/ID originating from a property over which the Copermittee has no applicable jurisdictional authority such as a special district (e.g., school, water, wastewater), federal, state, or tribal property.
Non-Stormwater	All discharges to and from an MS4 that do not originate from precipitation events (i.e., all discharges from an MS4 other than Stormwater). Non-Stormwater includes Illicit Discharges, non-prohibited discharges, and NPDES permitted discharges.
Non-Stormwater Action Levels	This Order includes action levels for pollutants in non-stormwater, dry weather discharges from the MS4. The non-stormwater action levels are designed to ensure that the Order's requirement to effectively prohibit all types of unauthorized discharges of non-stormwater into the MS4 is being complied with. Non-stormwater action levels in the Order are based upon numeric or narrative water quality objectives and criteria as defined in the Basin Plan, the State Water Board's Water Quality Control Plan for Ocean Waters of California (Ocean Plan), and the State Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California (State Implementation Policy or SIP). An exceedance of an action level requires specified responsive action by the Copermittees. This Order describes what actions the Copermittees must take when an exceedance of an action level is observed. Exceedances of non-stormwater action levels do not alone constitute a violation of this Order but could indicate non-compliance with the requirement to effectively prohibit all types of unauthorized non-stormwater discharges into the MS4 or other prohibitions established in this Order. Failure to undertake required source investigation and elimination action following an exceedance of a non-stormwater action level (NAL or action level) is a violation of this Order. The San Diego Water Board recognizes that use of action levels will not necessarily result in detection of all unauthorized sources of non-stormwater discharges because there may be some discharges in which pollutants do not exceed established action levels. However, establishing NALs at levels appropriate to protect water quality standards is expected to lead to the identification of significant sources of pollutants in dry weather non-stormwater discharges.
Non-Structural BMPs	See LID Principles
Notice of Noncompliance	The Notice of Noncompliance constitutes a basic request that the property owner or facility operator rectify the condition causing or threatening to cause noncompliance
NRCS	Natural Resources Conservation Service
O&M	Operation and Maintenance. All BMPs implemented as part of a WQMP must continue to be operational and must be maintained throughout the life of the project.

Glossary

Name	Definition
Operational Source Control BMPs	Source Control programs or activities implemented by a site operator to prevent pollution. Examples include regular sweeping of parking lots and other 'housekeeping' efforts.
Other Development Projects	All Discretionary Development Projects that are not categorized as Priority Development Projects.
Other LID BMPs	Stormwater BMPs that incorporate features that provide for natural biological processes while maximizing opportunities for Infiltration and Evapotranspiration. These are distinguished from **LID Retention BMPs**, with the latter being BMPs that, in addition to the above features, are also designed to retain stormwater runoff.
Outfall	Means a Point Source as defined by 40 CFR 122.2.a, the point where a municipal separate storm sewer discharges to Waters of the U.S. and does not include open conveyances connecting two municipal separate storm sewers, pipes, tunnels or other conveyances which connect segments of the same stream or other Waters of the U.S. and are used to convey waters of the U.S. [40 CFR 122.26(b)(9)].
Permanent Source Control BMP	A type of source control BMP that is a structural part of the site, such as roofs and berms over and around trash and recycling areas.
Permeable or Pervious or Porous Pavements	Pavements for roadways, sidewalks, or plazas that are designed to infiltrate runoff *through* the pavement. Types of Permeable Pavements include pervious concrete, pervious asphalt, porous pavers and granular materials.
Pollutant	Any agent that may cause or contribute to the degradation of water quality such that a condition of Pollution or Contamination is created or aggravated.
Pollutant of Concern	Pollutants for which water bodies are listed as impaired under CWA Section 303(d), pollutants associated with the land use type of a development, and/or pollutants commonly associated with runoff.
Pollution Prevention BMP	Practices that reduce or eliminate the generation of Pollutants.
Pre-Development	Conditions that would exist naturally.
Preliminary Project-Specific WQMP	A preliminary project-specific WQMP is commonly required to be submitted with an application for entitlements and development approvals and must be approved by the Copermittee before any approvals or entitlements will be granted.
Priority Development Project	Development Projects that meet the categories and criteria identified in Table 1-1 (see 2010 SMR MS4 Permit, item F.1.d.).
Priority Pollutant of Concern	Pollutants that are associated with a proposed project and are listed as impaired under CWA Section 303(d).
Project-Specific WQMP	A plan specifying and documenting permanent LID Principles and Stormwater BMPs to control post-construction Pollutants and stormwater runoff for the life of the project, and to maintain Stormwater BMPs for the life of the project. Copermittees may require a preliminary Project-Specific WQMP submittal, to be followed by a final Project-Specific WQMP.

Glossary

Name	Definition
Proprietary Stormwater BMPs	Products designed and marketed by private businesses for treatment of stormwater.
Rainy Season	October 1st through April 30th
Rational Method	A method of calculating runoff flows based on rainfall intensity, tributary area, and a coefficient representing the proportion of rainfall that runs off. In the Rational Method Q=C*I*A as further described in Section 2 of the WQMP.
Receiving Water	Any water body that is identified in the San Diego Basin Plan. The San Diego Basin Plan is available from the San Diego Regional Board's website at www.waterboards.ca.gov/sandiego.
Redevelopment	A Development Project that involves the creation, addition and/or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing existing roadways; new sidewalk construction, pedestrian ramps, or bikelane on existing roads; and routine replacement of damaged pavement, such as pothole repair.
Regional Water Quality Control Board (or Regional Board)	Regional Boards are responsible for implementing Pollution control provisions of the CWA and California Water Code within their jurisdiction. There are nine Regional Boards in California. The Regional Boards issued the 2010 MS4 Permit to the Copermittees on November 10, 2010.
Retrofit	Programs and projects to address the impacts of existing development through reducing the impacts from hydromodification, promote LID, support riparian and aquatic habitat restoration, reduce the discharges of Stormwater Pollutants from the MS4 to the MEP, and prevent discharges from the MS4 from causing or contributing to a violation of Water Quality Standards.
Rights of Way	Any strip or area of land, including surface, overhead, or underground, granted by deed or easement, for construction or maintenance according to designated use, such as for drainage channels, storm drains, flowage easements or impoundment of surface water
Runoff	All flows in a stormwater conveyance system that consists of the following components: (1) stormwater (wet weather flows) and (2) non-stormwater including dry weather flows.
Runoff Management Plan	A site-specific plan identifying BMPs to manage the quality and quantity of runoff from a project site.

Glossary

Name	Definition
Santa Margarita Region (SMR)	The portion of Riverside County covered by Order R9-2010-0016, an NPDES MS4 Permit issued by the Santa Diego Regional Board.
Sedimentation	The action or process of forming or depositing sediment.
Self-treating area	Natural or landscaped area (as described in Section 3.3 of the WQMP) that drains offsite without comingling with developed portions of the site.
Site Design	See **LID Principles**.
Source Control BMP	A facility or procedure to prevent Pollutants from coming into contact with rainfall and/or runoff.
Stop Work Order or Cease and Desist Order	As used in the JRMP, an order from a Copermittee to stop a particular activity.
Stormwater	Per 40 CFR 122.26(b)(13), means stormwater runoff, snowmelt runoff, and surface runoff and drainage. Surface runoff and drainage pertains to runoff and drainage resulting from precipitation events.
Stormwater Action Level	SALs were computed as the 90th percentile of the data set, utilizing the statistical based population approach, one of three approaches recommended by the State Water Board's Storm Water Panel in its report 'The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 2006)". SALs are identified in Section D of the 2010 SMR MS4 Permit. Copermittees must implement a timely, comprehensive, cost-effective stormwater pollution control program to reduce the discharge of pollutants in stormwater from the permitted areas so as not to exceed the SALs. Exceedance of SALs may indicate inadequacy of programmatic measures and BMPs required in this Order.
Stormwater Ordinance	The ordinance or set of ordinances that are consistent with the Legal Authorities described in section 3.4 of this JRMP.
Stormwater Pollutant	A Pollutant associated with Stormwater.
Stormwater Pollution Prevention Plan (SWPPP)	A plan providing for temporary measures to control sediment and other Pollutants *during* construction. In contrast with the WQMP which is a plan to reduce pollutant in runoff during the post-construction use and life of the project.
Structural Stormwater BMPs	Structural Post-Construction BMPs that are designed to address stormwater runoff impacts from the completed site, and throughout the use and life of the project.. Stormwater BMPs consist of LID Principles, LID BMPs, Conventional Treatment BMPs, Hydromodification BMPs, and Permanent Source Control BMPs.
Total Maximum Daily Load (TMDL)	A TMDL is the maximum amount of a Pollutant that can be discharged into a waterbody from all sources (point and non-point) and still maintain Water Quality Standards. Under CWA Section 303(d), TMDLs must be developed for all waterbodies that do not meet Water Quality Standards after application of technology-based controls.

Glossary

Name	Definition
Toxicity	Adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies.
Treatment Control BMP	Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological or chemical process.
TUTIA	Toilet Users To Impervious Area ratio, that would be required to achieve the minimum 40% long-term retention of runoff when harvesting stormwater runoff for toilet use. See Chapter 2 of the WQMP.
Unpaved Road	A long, narrow stretch without pavement used for traveling by motor passenger vehicles between two or more points. Unpaved roads are generally constructed of dirt, gravel, aggregate or macadam and may be improved or unimproved.
Waste	As defined in CWC Section 13050(d), "waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal."
Waste Discharge Requirements	As defined in Section 13374 of the California Water Code, the term "Waste Discharge Requirements" is the equivalent of the term "permits" as used in the Federal Water Pollution Control Act, as amended. The Regional Board usually reserves reference to the term "permit" to Waste Discharge Requirements for discharges to surface Waters of the U.S.
Water Quality Management Plan (WQMP, or SMR WQMP)	Referred to as a Standard Stormwater Mitigation Plan (SSMP) in the 2010 SMR MS4 Permit. This is a plan to reduce the discharge of pollutants to the MEP from the post-construction use and life of a project.

Glossary

Name	Definition
Water Quality Objectives	Numerical or narrative limits on constituents or characteristics of water designated to protect designated beneficial uses of the water. [California Water Code Section 13050 (h)]. California's water quality objectives are established by the State and Regional Water Boards in the Water Quality Control Plans. Numeric or narrative limits for pollutants or characteristics of water designed to protect the beneficial uses of the water. In other words, a water quality objective is the maximum concentration of a pollutant that can exist in a receiving water and still generally ensure that the beneficial uses of the receiving water remain protected (i.e., not impaired). Since water quality objectives are designed specifically to protect the beneficial uses, when the objectives are violated the beneficial uses are, by definition, no longer protected and become impaired. This is a fundamental concept under the Porter Cologne Act. Equally fundamental is Porter Cologne's definition of pollution. A condition of pollution exists when the water quality needed to support designated beneficial uses has become unreasonably affected or impaired; in other words, when the water quality objectives have been violated. These underlying definitions (regarding beneficial use protection) are the reasons why all waste discharge requirements implementing the Federal NPDES regulations require compliance with water quality objectives. (Water quality objectives are also called water quality criteria in the CWA.)
Water Quality Standards	The beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.) of water and the Water Quality Objectives necessary to protect those uses.

Glossary

Name	Definition
Waters of the U.S.	As defined in the 40 CFR 122.2, the Waters of the U.S. are defined as: "(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition: (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water
Wet Season	October 1st to April 30th
Wet Weather	Weather is considered wet if precipitation measuring over 0.10 inches has been received during the preceding 72 hours.

APPENDIX - B

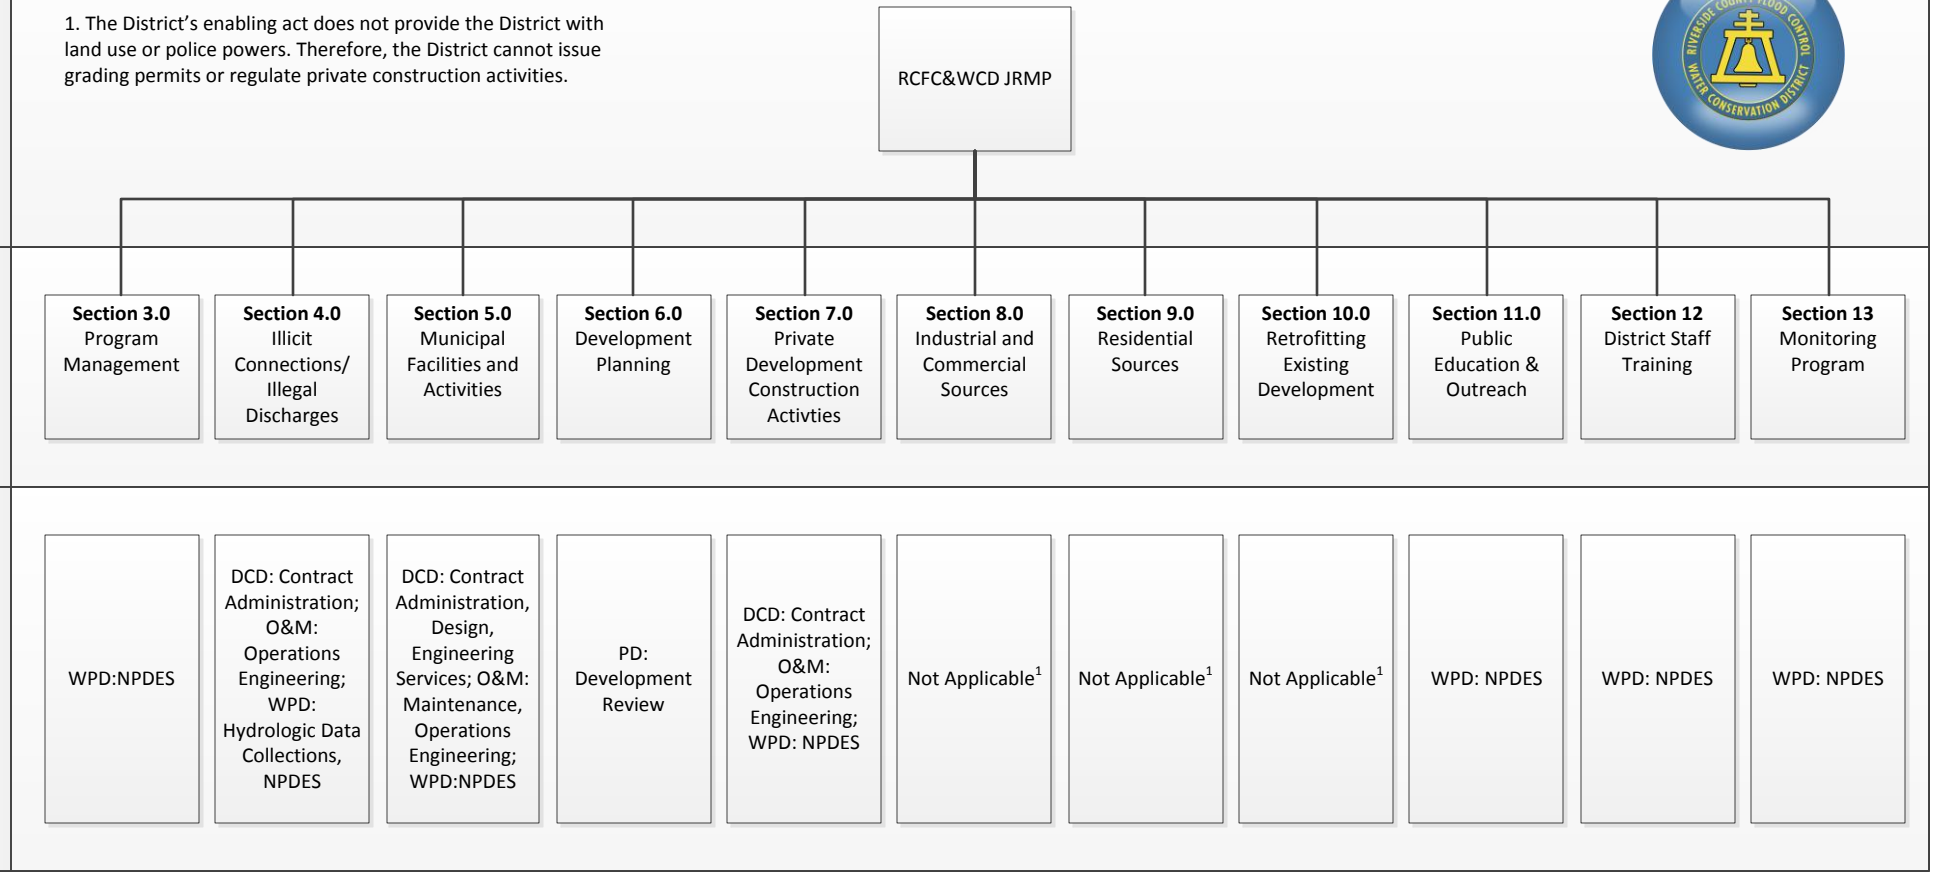
PROGRAM MANAGEMENT

APPENDIX B-1
JRMP ORGANIZATIONAL CHART AND DEPARTMENTAL RESPONSIBILITIES MATRIX

Appendix B.1. District JRMP Implementation Organizational Chart

Notes:

1. The District's enabling act does not provide the District with land use or police powers. Therefore, the District cannot issue grading permits or regulate private construction activities.



Acronyms and Abbreviations

DCD	Design and Construction Division
ERS	Environmental Review Services
O&M	Operations and Maintenance Division
NPDES	National Pollutant Discharge Elimination System
PD	Planning Division
WPD	Watershed Protection Division

Table B-1. JRMP Departmental Responsibilities

Program Element	JRMP Section {Permit reference}	Primary Responsible Division / Section	Responsible Staff (Name or Title as appropriate)
3.0 Program Management	3.1 – Departmental Responsibilities – Maintain matrix	Watershed Protection/NPDES	Engineering Project Manager (EPM)/Senior Civil Engineer
	3.2 – Cooperative Activities		
	3.3 – Fiscal Analysis {H}		
	3.4 – Legal Authority{E.}		
	3.5 – Enforcement/Compliance Strategy	(see individual program sections)	(see individual program sections)
	3.6 – Receiving Water Limitations{A.}	Watershed Protection/NPDES	EPM/Senior Civil Engineer
	3.7 – Program Reporting, Evaluation and Revision {J., K., L}		
4.0 Elimination of Illicit Connections and Illegal Discharges {F.4}	4. 1Overview {A.1., 2}	Watershed Protection/NPDES	EPM/Senior Civil Engineer
	4.2.1 Legal Authority {E.}	See 3.4 above	See 3.4 above
	4.2.2 Connections to MS4 Facilities - Maintain Inventory & Map - Public Works Department	Operations and Maintenance/Operations Engineering	EPM/Senior Civil Engineer
	4.2.3 Inspections	(see individual program sections)	(see individual program sections)
	4.2.4 Maintain MS4 Facility Map{F.4.b.}	Watershed Protection/NPDES	EPM/Senior Civil Engineer
	4.2.5 Outfall Monitoring	Watershed Protection/NPDES	EPM/Civil Senior Engineer

Program Element	JRMP Section {Permit reference}	Primary Responsible Division / Section	Responsible Staff (Name or Title as appropriate)
	4.2.6 Waste Collection Programs	RCFC administers contract with Riverside County Waste Management **Administration of Contract** – Watershed Protection/NPDES	EPM/Civil Senior Engineer
	4.3.1 MS4 Facility Inspections {F.4.e}	As described for section 5	As described for section 5
	4.3.2 Public IC/ID Reports {F.4.c}	Watershed Protection/NPDES	EPM/Senior Civil Engineer
	4.3.3 IC/ID Construction Site Inspections {F.1.e.(6)(d); F.2.e}	Design and Construction/Contract Administration	EPM/ Senior Civil Engineer
		Operations and Maintenance/Operations Engineering	EPM/Senior Civil Engineer
	4.3.4 IC/ID Industrial / Commercial Facilities Inspections {F.3.b.(4)(vi)}	N/A	
	4.3.5 IC/ID Monitoring Activities {Attachment E. II.C}	Watershed Protection/Hydrologic Data Collections	EPM/Senior Civil Engineer
	4.3.6 Non-Jurisdictional IC/IDs (Notification)	Watershed Protection/NPDES	EPM/Senior Civil Engineer
	4.4 IC/ID Response and Reporting {F.4}	**Initial Investigation –** Watershed Protection/Hydrologic Data Collections	EPM/Senior Civil Engineer
		Source Investigation – Watershed Protection/Hydrologic Data Collections	EPM/Senior Civil Engineer
		Elimination – **Coordination with local code enforcement agencies and known Dischargers:** Watershed Protection/Hydrologic Data Collections	EPM/Senior Civil Engineer

Program Element	JRMP Section {Permit reference}	Primary Responsible Division / Section	Responsible Staff (Name or Title as appropriate)
		Elimination – **Reporting:** Watershed Protection/NPDES	EPM / Senior Civil Engineer
	4.4.4 Clean Up	Watershed Protection/Hydrologic Data Collections	EPM / Senior Civil Engineer
	4.4.5 Sanitary Wastes F.4.h}	Sanitary Sewer Overflows into District MS4 **Coordination and Reporting:** Watershed Protection/Hydrologic Data Collection	EPM/Senior Civil Engineer

APPENDIX B-2
INTERAGENCY AND/OR INTERDEPARTMENTAL AGREEMENTS

AGREEMENT

The RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, hereinafter called "DISTRICT", and the RIVERSIDE COUNTY WASTE MANAGEMENT DEPARTMENT, hereinafter called "WASTE MANAGEMENT", hereby agree as follows:

RECITALS

A. In 1987, Congress added Section 402(p) to the Federal Clean Water Act (CWA) {33 U.S.C. §1342(p)}; and

B. Section 402(p) requires certain municipalities to obtain National Pollutant Discharge Elimination System (NPDES) Permits in order to discharge stormwater from Municipal Separate Storm Sewer Systems (MS4s) to waters of the United States; and

C. Section 402(p) also requires operators of certain industrial facilities to obtain NPDES Permits for stormwater discharges associated with designated industrial activities; and

D. Section 402(p) further requires the United States Environmental Protection Agency (USEPA) to promulgate regulations requiring NPDES Permits for designated industrial activities and certain MS4s; and

E. USEPA promulgated such regulations in November 1990; and

F. USEPA has delegated its NPDES permitting authority to the State Water Resources Control Board (SWRCB) to administer the NPDES permitting process within the State; and

G. SWRCB has in turn delegated its NPDES permitting authority to the respective California Regional Water Quality Control Boards (CRWQCB); and

H. DISTRICT was created to provide for the control of flood and stormwaters within the County of Riverside and is empowered to investigate, examine, measure, analyze, study and inspect matters pertaining to flood and stormwaters; and

I. DISTRICT, the County of Riverside, Coachella Valley Water District and the incorporated cities within the County of Riverside (except for Blythe), have obtained NPDES MS4 Permits from the appropriate CRWQCB pursuant to Section 402(p) of the CWA; and

J. USEPA regulations and the NPDES MS4 Permits require municipalities to control the contribution of pollutants to the municipal storm sewer by stormwater discharges associated with industrial activity and the quality of stormwater discharged from sites of industrial activity; and

K. DISTRICT, in accordance with its responsibilities as a Principal Permittee, is developing comprehensive stormwater management programs within the County of Riverside and in the region; and

L. WASTE MANAGEMENT conducts certain area-wide programs and activities pertaining to hazardous waste management, hazardous materials facility compliance inspections, and health and safety code inspections; and

M. Certain aspects of WASTE MANAGEMENT'S activities are consistent with the goals and objectives of NPDES MS4 Permits and the Best Management Practices (BMP) included in the Permittee's regional Drainage Area Management Plans (DAMP); and

N. DISTRICT wishes to support certain WASTE MANAGEMENT programs and activities by entering into this Agreement with WASTE MANAGEMENT to contribute a sum of money to sustain the scope of WASTE MANAGEMENT programs and activities to meet the requirements of NPDES MS4 Permits; and

O. It is understood that this Agreement does not change existing responsibilities for compliance with any NPDES MS4 Permit, and WASTE MANAGEMENT, through any services provided, is not assuming responsibility for NPDES MS4 Permit compliance requirements as they exist or may be established; and

P. Cooperation between DISTRICT and WASTE MANAGEMENT in these matters is in the best interest of the public.

NOW, THEREFORE, the parties hereto do mutually agree as follows:

1. NPDES PROGRAM ACTIVITIES – WASTE MANAGEMENT will perform certain NPDES PROGRAM ACTIVITIES as long as adequate manpower is available within WASTE MANAGEMENT'S staff and reimbursement from DISTRICT is sufficient to perform the activities agreed to including the following: Household Hazardous Waste (HHW) Collection Program, and Antifreeze, Battery, Oil and Latex Paint (ABOP) Program. A scope of services and budget for the HHW and ABOP Programs are described below.

(a) TEMPORARY HHW COLLECTION FACILITY (THHWCF) PROGRAM:

(i) WASTE MANAGEMENT shall conduct not less than fifteen (15) HHW collection events during the first Fiscal Year of this Agreement. Additional events for future Fiscal Years will be scheduled based on the amount of DISTRICT'S contribution to specifically support the HHW program. A minimum of two (2) THHWCF events or a single permanent HHW site shall be established in each of the three (3) NPDES MS4 Permit areas (Santa Ana, Santa Margarita and Whitewater watersheds).

(ii) WASTE MANAGEMENT and DISTRICT shall advertise scheduled HHW collection events in countywide and/or local newspapers.

(iii) DISTRICT and WASTE MANAGEMENT shall work cooperatively with the County of Riverside, incorporated cities, and other interested parties to provide technical assistance and/or coordinate additional HHW collection sites within the NPDES Permit areas.

(b) PERMANENT HHW COLLECTION FACILITY (PHHWCF) AND ABOP PROGRAM:

(i) WASTE MANAGEMENT shall operate at least one (1) PHHWCF and/or ABOP collection center in each of the Santa Ana, Santa Margarita and Whitewater River Watersheds.

(ii) DISTRICT and WASTE MANAGEMENT shall work cooperatively with the County of Riverside, incorporated cities, and other interested parties to facilitate the establishment of additional PHHWCF and/or collection centers within the NPDES Permit areas.

2. ANNUAL PROGRAM REVIEW – During January of each year, DISTRICT and WASTE MANAGEMENT representatives shall meet and review program status, scope, costs, priorities, projected activities and available funding sources for NPDES PROGRAM ACTIVITIES:

(a) DISTRICT and WASTE MANAGEMENT staff shall review available funding resources and develop a preliminary schedule for NPDES program activities based on DISTRICT'S contribution to NPDES PROGRAM ACTIVITIES for the upcoming Fiscal Year.

3. USE OF ABOP/HHW CONTRIBUTION – WASTE MANAGEMENT shall use CONTRIBUTION only for salaries, training, equipment, supplies, waste disposal and other expenses related to providing NPDES PROGRAM ACTIVITIES as agreed upon by DISTRICT and WASTE MANAGEMENT.

4. INDEMNITY AND HOLD HARMLESS - WASTE MANAGEMENT shall indemnify and hold DISTRICT, its officers, employees and agents free and harmless from all claims, actions, damages and liabilities of whatsoever kind and nature arising from death, personal injury property damage or other cause asserted or based upon any act or omission of or by person or persons associated with NPDES PROGRAM ACTIVITIES relating to or in any way connected with the accomplishment of the work or performance of services of NPDES PROGRAM ACTIVITIES. As part hereto of the foregoing indemnity, WASTE MANAGEMENT agrees to protect and to defend at its own expense, including attorneys' fees, DISTRICT, its officers, agents and employees from any and all legal action based upon any negligent acts or omissions, as stated herein, by any person or persons.

5. REPORTS AND INFORMATION – WASTE MANAGEMENT shall submit to DISTRICT on or before October 1st a report on NPDES PROGRAM ACTIVITIES performed by WASTE MANAGEMENT during the previous Fiscal Year (July 1st through June 30th). The report shall include but not be limited to:

(a) Narrative describing the HHW Program (to include a summary of each collection event) and ABOP Program performed by WASTE MANAGEMENT pursuant to this Agreement during the prior Fiscal Year.

(b) Quantities of materials collected by the HHW and ABOP Programs, cost of waste disposal, and costs associated with labor, supply, equipment and materials costs.

6. HHW EVENT – For the purposes of this Agreement, an event is a THHWCF event operated by WASTE MANAGEMENT.

7. PAYMENT – DISTRICT shall contribute a lump sum amount of up to three hundred thousand dollars ($300,000.00) (CONTRIBUTION), no later than May 31st of each Fiscal Year to WASTE MANAGEMENT to support HHW events and ABOP activities for the respective Fiscal Year. Annually, WASTE MANAGEMENT shall submit to DISTRICT a billing statement (invoice) for reimbursement. DISTRICT shall pay CONTRIBUTION to WASTE MANAGEMENT within 30 days upon receipt of WASTE MANAGEMENT'S invoice.

8. CONTINGENCY – CONTRIBUTION and reimbursement shall be contingent upon the approval by DISTRICT'S Board of Supervisors of the annual Benefit Assessment levies for the Santa Ana, Santa Margarita and Whitewater Watershed Benefit Assessment Areas and based on available funding. If CONTRIBUTION or reimbursement determined to be available will be less than the agreed upon not to exceed amount for the next Fiscal Year, DISTRICT will notify WASTE MANAGEMENT in January of the current Fiscal Year of the deficiency in the Benefit Assessment Area's funds so it may adjust, after

consultation and agreement by DISTRICT, the scope of NPDES PROGRAM ACTIVITIES to be provided during the current or next Fiscal Year.

9. COMPLIANCE WITH NPDES PERMITS – NPDES PROGRAM ACTIVITIES, as specified herein, will be performed by WASTE MANAGEMENT under this Agreement. Nothing in this Agreement shall be construed as making WASTE MANAGEMENT responsible for NPDES Permit compliance.

10. NON-INTERFERENCE – DISTRICT understands and agrees that it shall not directly supervise or interfere with any of WASTE MANAGEMENT'S activities contemplated hereunder.

11. TERM OF AGREEMENT – This Agreement shall commence on the date of execution thereof and shall continue in effect until June 30, 2013.

12. TERMINATION OF AGREEMENT – Either party may terminate the provisions of this Agreement related to the HHW and ABOP Programs subject to six (6) months written notice thereof.

13. APPLICABILITY OF PRIOR AGREEMENTS – This Agreement constitutes the entire Agreement between the parties with respect to the subject matter; all prior agreements, representations, statements, negotiations and understandings are hereby superseded.

14. NOTICES – Any and all notices sent or required to be sent to the parties of this Agreement will be mailed by first class mail, postage prepaid, to the following addresses:

Household Hazardous Waste Collection Program Agreement

AAM:blj

7/9/2008

AGREEMENT

The RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT, hereinafter called "DISTRICT", and the COUNTY OF RIVERSIDE, hereinafter called "COUNTY", hereby agree as follows concerning COUNTY'S Hazardous Materials Emergency Response Team:

RECITALS

A. Congress in 1987 added Section 402(p) to the Federal Clean Water Act (CWA) {33 U.S.C. §1342(p)}; and

B. Section 402(p) requires certain municipalities to obtain a National Pollutant Discharge Elimination System (NPDES) Permit to discharge stormwater from Municipal Separate Storm Sewer Systems (MS4s) into waters of the United States; and

C. Pursuant to 33 U.S.C. §1342(p) (2) (C), (D) and (E), DISTRICT, COUNTY, the Coachella Valley Water District (CVWD) and certain incorporated Cities within Riverside County have obtained NPDES Permits for municipal stormwater discharges; and

D. Section 402(p) further requires the United States Environmental Protection Agency (USEPA) to promulgate regulations requiring NPDES Permit applications; and

E. EPA promulgated such regulations and adopted them in November 1990; and

F. EPA delegated authority to the California Regional Water Quality Control Board (RWQCB) to administer the NPDES Permit process within the boundaries of their regions; and

G. DISTRICT was created to provide for the control of flood and stormwaters within the County of Riverside and is empowered to investigate, examine, measure, analyze, study and inspect matters pertaining to flood and stormwaters; and

H. DISTRICT, COUNTY, CVWD and certain incorporated Cities within Riverside County have obtained NPDES Permits from the respective RWQCBs in order to comply with Section 402(p); and

I. The NPDES Permits require the municipal permittees to develop comprehensive stormwater discharge management programs to improve water quality in the County of Riverside and in the region and to respond to emergency incidents to control the discharge of pollutants to the waters of the United States; and

J. COUNTY, through the Riverside County Fire Department, staffs and maintains a HAZARDOUS MATERIALS RESPONSE TEAM, hereinafter called "TEAM"; and

K. DISTRICT in accordance with certain responsibilities described in the NPDES Permits and the NPDES Stormwater Discharge Permit Implementation Agreements for the Santa Ana Region (Santa Ana Drainage Area) dated December 16, 2003; for the San Diego Region (Santa Margarita Drainage Area) dated July 14, 2004; and for the Colorado River Basin Region (Whitewater Drainage Area) dated October 14, 2004; wishes to contribute a sum of money, hereinafter called "CONTRIBUTION", to the funding of TEAM to support TEAM'S existence and current activity status.

NOW, THEREFORE, the parties hereto do mutually agree as follows:

1. TEAM BUDGET CONTRIBUTION – DISTRICT shall contribute the sum of up to three hundred sixty-five thousand dollars ($365,000) per fiscal year to COUNTY on July 1st of each year after execution of this Agreement for the funding of TEAM, as set forth herein. Payment for Fiscal Year 2007-2008 shall be made within 30 days of execution of this Agreement. DISTRICT'S continuing CONTRIBUTION shall be contingent upon sufficient NPDES funds being available for the next Fiscal Year.

2. ANNUAL PROGRAM REVIEW – During January of each year, DISTRICT and COUNTY representatives shall meet and review program status, scope, costs, priorities, projected activities, and available funding for TEAM activities. The DISTRICT shall inform COUNTY of the actual CONTRIBUTION amount for the upcoming fiscal year at this meeting.

3. USE OF CONTRIBUTION – COUNTY shall use CONTRIBUTION only for salaries, equipment and maintenance of TEAM.

4. INDEMNITY AND HOLD HARMLESS – COUNTY shall indemnify and hold DISTRICT, its officers, employees and agents free and harmless from all claims, actions, damages and liabilities of whatsoever kind and nature arising from death, personal injury, property damage or other cause asserted or based upon any act or omission of TEAM relating to or in any way connected with the accomplishment of the work or performance of services of TEAM. As part hereto of the foregoing indemnity, COUNTY agrees to protect and to defend at its own expense, including attorneys' fees, DISTRICT, its officers, agents and employees from any and all legal action based upon any negligent acts or omissions, as stated hereinabove, by any person or persons.

5. REPORTS AND INFORMATION – COUNTY shall submit to DISTRICT on or before August 15th a report summarizing the activities, responses, and cases handled or performed by TEAM between July 1st and June 30th of the previous Fiscal Year. The report shall consist of a narrative describing TEAM, its operations and any major spills, and a categorization of TEAM'S responses showing the following: responses inside and outside DISTRICT'S jurisdiction, traffic related responses, industrial related responses, drug enforcement responses, and other response categories. The report shall also include a description of current TEAM operating expenses and revenue sources (budget).

6. TEAM OPERATIONS – This Agreement does not give DISTRICT any authority to dictate the day to day activities of TEAM, or grant DISTRICT any authority over any

TEAM personnel other than that stated in this paragraph. TEAM shall, at DISTRICT'S request, provide timely response to emergency incidents where a hazardous material is entering or has a reasonable potential to enter a DISTRICT owned storm drain facility, provided that TEAM is not already committed to another incident. TEAM shall respond to emergency incidents irrespective of the local jurisdiction (City or County) in which said DISTRICT facilities are located.

7. TERM OF AGREEMENT – This Agreement shall commence on the date of execution thereof and shall continue in effect until June 30, 2012.

8. TERMINATION OF AGREEMENT – Either party may terminate the provisions of this AGREEMENT subject to (6) months written notice thereof.

9. NOTICES – Any and all notices sent or required to be sent to the parties of this Agreement will be mailed by first class mail, postage prepaid, to the following addresses:

AGREEMENT

National Pollutant Discharge Elimination System
Stormwater Discharge Permit
Implementation Agreement
San Diego Region

(Santa Margarita Drainage Area)

This Implementation Agreement ("Agreement"), entered into by the RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT (the "DISTRICT"), the COUNTY OF RIVERSIDE (the "COUNTY"), and the CITIES OF MURRIETA, TEMECULA and WILDOMAR (the "CITIES"), collectively referred to as "COPERMITTEES" and sometimes also referred to as "Parties", individually each as "Party", establishes the responsibilities of each Party concerning the implementation of and compliance with the National Pollutant Discharge Elimination System ("NPDES") Municipal Separate Storm Sewer System ("MS4") Discharge Permit issued by the California Regional Water Quality Control Board – San Diego Region (CRWQCB-SDR) pursuant to Order No. R9-2010-0016 (the "NPDES Permit").

RECITALS

WHEREAS, Congress in 1987 added Section 402(p) to the Federal Clean Water Act ("CWA") (33 U.S.C.§1342(p)); and

WHEREAS, Section 402(p) of the CWA requires certain municipalities to obtain NPDES Permits in order to discharge stormwater from MS4s to waters of the United States; and

WHEREAS, Section 402(p) of the CWA requires operators of certain industrial facilities to obtain NPDES permits for stormwater discharges associated with designated industrial activities, including construction activities; and

WHEREAS, Section 402(p) further requires the United States Environmental Protection Agency ("EPA") to promulgate regulations for NPDES permit applications; and

WHEREAS, EPA adopted such regulations in November 1990; and

WHEREAS, EPA delegated authority to the California State Water Resources Control Board ("SWRCB") to administer the NPDES permit process within the boundaries of the State of California; and

WHEREAS, SWRCB has in turn delegated its NPDES permitting authority to the California Regional Water Quality Control Boards to administer the NPDES permit process within the boundaries of their respective regions; and

WHEREAS, the jurisdiction of the CRWQCB-SDR includes that portion of Riverside County known as the Santa Margarita Region; and

WHEREAS, DISTRICT was created to provide for, among other things, the control of flood and stormwaters within the County of Riverside and is empowered to investigate, examine, measure, analyze, study and inspect matters pertaining to flood and stormwaters; and

WHEREAS, on January 15, 2009, DISTRICT, COUNTY and CITIES submitted a Report of Waste Discharge as an application to renew NPDES Permit No. CAS0108766; and

WHEREAS, the application for renewal of the NPDES Permit was submitted in accordance with the provisions of the previous NPDES permit (Order No. R9-2004-001) which expired on July 14, 2009; and

WHEREAS, on November 10, 2010, the CRWQCB-SDR adopted Order No. R9-2010-0016 to serve as Waste Discharge Requirements in accordance with Section 13263(a) of the California Water Code and as an NPDES permit pursuant to Section 402(p) of the CWA; and

WHEREAS, the NPDES Permit meets or exceeds the requirements of Section 402(p)(3)(B) of the CWA; and

WHEREAS, the NPDES Permit designates the DISTRICT, COUNTY and CITIES as COPERMITTEES; and

WHEREAS, the NPDES Permit requires designation of a "Principal Copermittee", and DISTRICT, COUNTY and CITIES have agreed that DISTRICT will serve as Principal Copermittee for the term of the NPDES Permit; and

WHEREAS, the Parties believe that cooperation between COPERMITTEES in the administration and implementation of the NPDES Permit is in the best interest of COPERMITTEES; and

WHEREAS, the NPDES Permit provides that the COPERMITTEES collaborate

in the development and implementation of various requirements of the NPDES Permit; and

WHEREAS, DISTRICT is willing to utilize its staff to coordinate the activities of COPERMITTEES to facilitate compliance with the NPDES Permit and CWA requirements; and

WHEREAS, DISTRICT established the Santa Margarita Watershed Benefit Assessment Area (the "BENEFIT ASSESSMENT") pursuant to District Ordinance 14 on May 14, 1991 to offset the DISTRICT'S program and administrative costs associated with the development, implementation and management of the Federally-mandated NPDES Program and DISTRICT is willing to use BENEFIT ASSESSMENT funds to support the DISTRICT's role as Principal Permittee and to support regional program costs to the extent that BENEFIT ASSESSMENT funds are available and can be used for regional programs; and

WHEREAS, COPERMITTEES are to perform and/or execute certain activities prescribed in the NPDES Permit that will benefit all COPERMITTEES.

NOW, THEREFORE, the Parties do mutually agree as follows:

1. Incorporation of the NPDES Permit. The NPDES Permit is hereby incorporated by reference in its entirety and made a part of this Agreement as Exhibit "A".

2. Delegation of Responsibilities. The responsibilities of each of the COPERMITTEES under the NPDES Permit are reiterated below in subsections 2.a. and 2.b. Additional delegated responsibilities of the Parties under this Agreement to implement and/or comply with the NPDES Permit are set forth below in subsections 2.c. through 2.h.:

a. DISTRICT shall:

(1) Comply with Section M (Principal Copermittee Responsibilities), including coordinating the development of updates and reports on programs required under the NPDES Permit that are jointly required of each COPERMITTEE, including the Watershed Water Quality Workplan ("Watershed Workplan"), Standard Storm Water Mitigation Plan ("SSMP"), Hydromodification Management Plan ("HMP"), a model Jurisdictional Runoff

Management Plan ("JRMP"), the Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2010-0016, and any other reports prepared by the DISTRICT on behalf of the COPERMITTEES as required by Sections K.1 and K.2 of the NPDES Permit. DISTRICT will provide COUNTY and CITIES an opportunity to participate in the development and review of, and comment on, such programs, plans and reports prior to submittal to the CRWQCB-SDR.

(2) Comply with Sections A through P (Prohibitions and Receiving Water Limitations, Non-Stormwater Discharges, Non-Stormwater Dry Weather Action Levels, Stormwater Action Levels, Legal Authority, JRMP, Watershed Workplan, Fiscal Analysis, Total Maximum Daily Loads ("TMDLs"), Program Effectiveness Assessment and Reporting, Reporting, Modifications of Programs, Receiving Waters and MS4 Discharge Monitoring and Reporting Program, Standard Provisions, Reporting Requirements and Notifications, as well as Additional Provisions, respectively), as they pertain to pollutant discharges from DISTRICT owned and operated MS4 which are generated directly from or by DISTRICT facilities and operations, at no cost to COUNTY and CITIES.

b. COUNTY and CITIES, at no cost to DISTRICT, shall, for land area within their individual jurisdictions:

(1) Comply with Sections A through P (Prohibitions and Receiving Water Limitations, Non-Stormwater Discharges,

Non-Stormwater Dry Weather Action Levels, Stormwater Action Levels, Legal Authority, JRMP, Watershed Workplan, Fiscal Analysis, TMDLs, Program Effectiveness Assessment and Reporting, Reporting, Modifications of Programs, Receiving Waters and MS4 Discharge Monitoring and Reporting Program, Standard Provisions, Reporting Requirements and Notifications, as well as Additional Provisions, respectively), as they pertain to pollutant discharges from COUNTY/CITY owned and operated MS4, which are generated by jurisdictional land uses, facilities, and operations of the respective COUNTY and CITIES.

(2) Demonstrate compliance with NPDES Permit requirements through timely implementation of the JRMPs; any COPERMITTEE-specific elements of the Watershed Workplan and Monitoring and Reporting Program; and any approved modifications, revisions or amendments thereto.

(3) Provide to DISTRICT (on DISTRICT-provided forms) information needed to satisfy the reporting requirements as described in Sections G, N, and Provision III of Attachment E, or to respond to information requests from the CRWQCB-SDR. COUNTY and CITIES shall specifically:

(a) Submit data necessary to prepare updates to the Watershed Workplan to the DISTRICT no later than August 31st of each year.

(b) Submit any monitoring and sampling data individually collected pursuant to the MS4 Permit, to the DISTRICT at least quarterly as necessary for

DISTRICT to track and prepare reports under the Monitoring and Reporting Program. All applicable monitoring and sampling data individually collected within each fiscal year must be received by DISTRICT no later than August 15th of each year, for inclusion in the monitoring annual report that will be prepared and submitted by the District, pursuant to Section 2.e. herein.

(c) Provide one completed bound hard copy, and two electronic copies (PDF preferred) on CD or DVD, of the completed JRMP annual report to the DISTRICT no later than October 15th of each year.

(d) Provide information on existing MS4 facilities, "major outfalls" (as defined in the NPDES Permit) and/or other data as it pertains to facilities of the COUNTY or CITIES when requested by DISTRICT.

c. Public Education Program. On behalf of COPERMITTEES, DISTRICT shall conduct public education activities on a regional basis that focus on reducing pollution of urban runoff within the Santa Margarita Region, including, as appropriate, developing and disseminating broadcast, online and/or print outreach and advertising, developing brochures, and attending public events. DISTRICT shall also develop and implement mechanisms to determine the effectiveness of the regional public education program. The COUNTY and CITIES shall be individually responsible for developing and implementing any supplemental public education programs that may be necessary to target

individual communities or stakeholders within their respective jurisdictions, pursuant to Section F.6. of the NPDES Permit.

d. COPERMITTEE Training Program. On behalf of COPERMITTEES, and as requested by the COPERMITTEES, DISTRICT shall develop and conduct regional training sessions for COPERMITTEE personnel, covering the aspects of the programs developed by DISTRICT pursuant to Section 2.a.(1) of this AGREEMENT that are regionally uniform among COPERMITTEES. The COUNTY and CITIES shall be individually responsible for developing and implementing and reporting upon any supplemental training that may be necessary to ensure that their personnel are trained adequately regarding local policies and procedures for implementing the requirements of the NPDES Permit, pursuant to section F.6. of the NPDES Permit.

e. Monitoring Program. On behalf of the COPERMITTEES, DISTRICT shall perform sampling of surface water and urban runoff in accordance with the provisions of the NPDES Permit Monitoring and Reporting Program ("MRP"), Attachment E Provisions II.A and II.D-II.F, and prepare and submit Monitoring Reports in accordance with Provision III of Attachment E. The location of the sampling sites shall be determined by COPERMITTEES, subject to approval by CRWQCB-SDR. For Provision II.B. and II.C of the MRP, DISTRICT will coordinate with COPERMITTEES in developing a plan for identifying the list of outfalls to be sampled each year in accordance with the NPDES Permit, and COPERMITTEES shall be individually responsible for conducting outfall sampling, source identifications, and enforcement as necessary for their outfalls. The COPERMITTEES

may, subject to Section 3 herein, request the DISTRICT to conduct the initial outfall sampling required in Provisions II.B. and II.C. on behalf of the COPERMITTEES, however, all source identifications (including any follow-up sampling) and enforcement that may be required will remain the individual responsibility of the respective COPERMITTEES. The DISTRICT shall also enter into a contract with a local lab to provide analysis of water quality samples collected under the MRP. The contract shall be used strictly for water quality samples collected to comply with Provision II of the MRP. DISTRICT shall prepare and submit Monitoring Reports, as required by Provision III of Attachment E, based on data collected by the DISTRICT on behalf of the COPERMITTEES, and data provided to the DISTRICT by the COPERMITTEES in accordance with Section 2.b.(3)(b) of this Agreement.

f. Consultant Services. In the event DISTRICT requires the services of a consultant(s) to assist in performing duties conducted on behalf of the COPERMITTEES pursuant to Section 2 of this Agreement, the cost of said consultant(s) services shall be shared by COPERMITTEES in accordance with the cost sharing provisions set forth in Section 3 of this Agreement. COUNTY and CITIES shall be notified in writing of DISTRICTS request for proposals from one or more consultants, selection of a consultant, consultant's fee, contract timetable and payment schedule, and be allowed the opportunity to participate in decisions related to consultant's services. All consultant agreements are contingent upon the consulting firm's ability to meet DISTRICT standards and requirements, and where applicable approval by the DISTRICT'S

Board of Supervisors.

g. Support for Regional Programs. The COPERMITTEES shall jointly provide funding for certain regional efforts that benefit the Santa Margarita Region, including but not limited to: County Environmental Health's Compliance Assistance Program; the County Fire Department's Hazardous Materials Team; County Environmental Health's Household Hazardous Waste and Antifreeze, Batteries, Oil and Paint collection program; the DISTRICT'S membership with the California Stormwater Quality Association on behalf of COPERMITTEES; the DISTRICT'S administration of Principal Permittee duties, and other NPDES support activities as described in this Agreement, or as needed and agreed to by the COPERMITTEES. Where these programs are implemented countywide in support of other NPDES permit regions, the DISTRICT shall estimate the portion of the total cost of these regional programs that benefits the Santa Margarita Region.

h. Regulation and Enforcement. COUNTY and CITIES shall be responsible for the regulation and enforcement of local ordinances and regulations within their respective jurisdictions to ensure compliance with the NPDES Permit, and to prevent pollutants originating from within their respective jurisdictions from being discharged into the jurisdiction of another Party in a manner which could cause that Party to violate the NPDES Permit. This includes the exercise of police powers and land use controls and the enforcement of ordinances that COUNTY or CITIES presently have adopted or may adopt in the future.

3. Shared Costs. Costs for services to be performed in accordance with Sections 2.c., 2.d., 2.e. and 2.f. of this Agreement shall be shared by the Parties in accordance with the procedure specified below. In December of each year of this Agreement the DISTRICT shall:

a. Estimate the costs of services specified in Sections 2.c., 2.d., 2.e. of this Agreement and 2.f. for the upcoming fiscal year ("ESTIMATED COSTS");

b. Estimate the DISTRICT'S internal costs for developing, implementing and administering the NPDES program in the Santa Margarita Region as specified in 2.a. ("INTERNAL COSTS");

c. Estimate the revenues expected from the BENEFIT ASSESSMENT program ("ASSESSMENT REVENUES");

d. Determine actual costs for NPDES programs administered in the previous fiscal year; and

e. Determine Credits or Debits ("CREDITS" or "DEBITS") due to COUNTY and CITIES based on the difference of the actual contributions from the previous fiscal year with the actual contributions provided by the COUNTY and CITIES for that fiscal year.

By February 1st of each year of this Agreement, the DISTRICT, CITIES and COUNTY, through a NPDES representative assigned by the General Manager-Chief Engineer, City Managers, and County Executive Office, respectively, shall approve, by majority vote, ESTIMATED COSTS for the upcoming fiscal year.

3.1 DISTRICT Contribution

The DISTRICT contribution ("DISTRICT CONTRIBUTION") to programs specified in Sections 2.c., 2.d., 2.e., and 2.f. for the upcoming fiscal year shall be determined using the following formula:

DISTRICT CONTRIBUTION = ASSESSMENT REVENUES -

INTERNAL COSTS - 20% ASSESSMENT REVENUE. [1]

If the calculation yields a negative result, the DISTRICT shall have no contribution for the upcoming fiscal year other than the INTERNAL COSTS it has incurred.

3.2 COUNTY and CITIES Contribution

The total shared COUNTY and CITIES contribution (the "COMBINED CONTRIBUTION") shall be determined using the following formula:

COMBINED CONTRIBUTION = ESTIMATED COSTS - DISTRICT CONTRIBUTION.

The COUNTY'S and individual CITIES' respective pro rata share of the COMBINED CONTRIBUTION ("INDIVIDUAL CONTRIBUTION") shall be determined on the basis of an equally weighted average of population and Benefit Assessment Units within the Santa Margarita Region of Riverside County. More specifically, such percentage contribution shall be calculated as the equally weighted average of:

(a) The population of COUNTY or individual CITIES within the Santa Margarita Region, divided by the total population of the COUNTY and CITIES in the Santa Margarita Region and;

(b) The calculated number of Benefit Assessment Units ("BAU") for COUNTY or individual CITIES, divided by the total BAU for COUNTY and individual CITIES.

The INDIVIDUAL CONTRIBUTION shall be further adjusted by any CREDITS or DEBITS due from the previous fiscal year.

The population of CITIES shall be determined by the latest California State Department of Finance population figures issued in May of each year. COUNTY population shall be based on the most current Tax Rate Area ("TRA") information best fitting the Santa Margarita Region.

The BAU count of COUNTY and CITIES shall be estimated by comparing the most current TRA information best fitting the Santa Margarita Region with the Assessment

[1] District retains 20% of assessment revenue as a reserve for District's administrative and program costs associated with the NPDES Permit pursuant to RCFC&WCD Ordinance No. 14.

Rolls from the current fiscal year's BENEFIT ASSESSMENT Engineer's Report.

COUNTY and CITIES may generate credits toward payments due by providing labor or services in lieu of cash payments. DISTRICT shall determine value of labor or services based on ESTIMATED COSTS for the fiscal year.

DISTRICT shall invoice COUNTY and CITIES for INDIVIDUAL CONTRIBUTION at the beginning of each fiscal year and said invoice shall be due and payable by COUNTY and CITIES within 60 days of receipt of invoice from DISTRICT. The COMBINED CONTRIBUTION for COUNTY and CITIES shall not exceed $2,200,000 (two million, two hundred thousand dollars) annually under this Agreement.

4. Term of the Agreement. The term of this Agreement shall commence on the date of execution by the duly authorized representative of at least three of the five COPERMITTEES. The term of this Agreement shall extend for up to eighteen (18) months beyond the period of time in which the term of the NPDES Permit remains in valid force and effect, unless terminated prior to that date by agreement by all the Parties or withdrawal of all of the Parties in accordance with the terms of this Agreement.

5. Additional Parties. Any City which incorporates after the date of issuance of the NPDES Permit and/or after the commencement of this Agreement ("Prospective City") may file a written request with DISTRICT asking to be added as a Party. Upon receipt of such a request, DISTRICT shall solicit the approval or denial of the Parties. If a majority of the Parties, each having one, co-equal vote, approves the addition of the Prospective City, this Agreement shall be amended to reflect the addition, and the Prospective City shall thereafter become a Party under this Agreement. Upon execution of the Amended Agreement, the Prospective City shall be responsible for the shared costs discussed in Section 3 of this Agreement for the then-current budget year and any subsequent budget year.

6. Withdrawal from the Agreement. Any Party shall be eligible to withdraw from this Agreement after first giving 60 days written notice to the DISTRICT and the CRWQCB-SDR. The withdrawing Party shall agree in such notice to apply with the CRWQCB-SDR for a separate NPDES permit and to comply with all of the requirements established by

CRWQCB-SDR. In addition, withdrawal shall constitute forfeiture of all of the withdrawing Party's already-paid share of the costs allocated pursuant to Section 3. The withdrawing Party shall be responsible for any lawfully assessed penalties as a consequence of its withdrawal. In addition, the withdrawing Party shall remain liable as an Indemnitor Party after the effective date of its withdrawal as described in Section 7 below. The cost allocations to the remaining Parties shall be recalculated in the following budget year.

7. Mutual Indemnification. Each Party (hereafter "Indemnitor Party") shall indemnify, defend and hold harmless any other Party, together with that Party's employees, officers, managers, governing board members, counsel, representatives and agents (collectively "Indemnitee Parties"), from and against any and all damages, liabilities, losses, demands, lawsuits, orders, actions, causes of action, penalties, judgments, claims, costs and expenses (including reasonable attorneys' fees, including through all appeals) arising from or related to any violation of the NPDES Permit or this Agreement (collectively "Losses") to the extent caused by (i) by the acts or omissions of the Indemnitor Party and its employees, agents and representatives, (ii) discharges from the Indemnitor Party's jurisdictional area or facilities, and/or (iii) discharges from any MS4 owned or operated by the Indemnitor Party. The obligations of the Indemnitor Party set forth in this Section 7 are non-exclusive and are in addition to, and do not replace or modify, any other rights of action, whether at law or in equity, that any Party may have against another Party. Nothing in this Agreement shall limit the ability of any Party to seek any relief, legal or equitable, against any non-Party. The obligations set forth in this Section 7 shall survive the termination of this Agreement as to all such acts, omissions or discharges as described in subparts (i) through (iii) hereinabove that occurred, or are alleged to have occurred, while a Party during the term of the Agreement up until such time that it is terminated.

8. Amendments to the Agreement. Except as provided in Section 5, this Agreement may only be amended by consent of all Parties. No amendment to this Agreement shall be effective unless it is in writing and signed by the duly authorized representatives of all Parties.

9. Authorized Signatories. The General Manager-Chief Engineer of DISTRICT, the Chief Executive Officer of COUNTY and the City Managers of CITIES (or their designees) shall be authorized to execute all documents and take all other procedural steps necessary to file for and obtain an NPDES permit(s) or amendments thereto.

10. Notices. All notices shall be deemed duly given when delivered by hand; or three (3) days after deposit in the U.S. Mail, postage prepaid. Notice to the Parties shall be sent to the publically advertised mailing address for the Party.

11. Governing Law and Severability. This Agreement shall be governed and construed in accordance with the laws of the State of California. If any provision or provisions of this Agreement shall be determined to be invalid, illegal or unenforceable, the validity, legality and enforceability of the remaining provisions shall not in any way be affected or impaired hereby.

12. Consent to Waiver and Breach. No term or provision hereof shall be deemed waived and no breach excused, unless the waiver or breach is consented to in writing, and signed by the Party or Parties affected. Consent by any Party to a waiver or breach by any other Party shall not constitute consent to any different or subsequent waiver or breach.

13. Entire Agreement. This Agreement and the exhibits attached hereto constitute the entire agreement between the Parties with respect to the subject matter therein; all prior agreements, representations, statements, negotiations and undertakings are superseded hereby.

14. Execution in Counterparts. This Agreement may be executed and delivered in any number of counterparts or copies (counterparts) by the Parties. As each Party has signed and delivered at least one counterpart to the other Parties, each counterpart shall be deemed an original and, taken together, shall constitute one and the same Agreement, which shall be binding and effective as to the Parties.

15. Non-Waiver of Objections. The entry into, and the performance of this Agreement by the Parties shall not constitute, nor be construed as, any waiver of the COPERMITTEES' objection to any provisions of the NPDES Permit including, without

limitation, any provisions identified in the Petition for Review filed by the COPERMITTEES with the SWRCB, or that provisions of the NPDES Permit constitute an unfunded State mandate without subvention of State funds.

Mr. David Gibson, Executive Officer
California Regional Water Quality Control Board –
San Diego Region
9174 Sky Park Court, Suite 100
San Diego, CA 92123-4340

Re: Order No. R9-2010-0016 (NPDES No. CAS 0108766) of the California Regional Water Quality Control Board – San Diego Region.

Dear Mr. Gibson:

This letter is being provided to you and your Board pursuant to Requirement E.2. of the above-referenced Order. This office serves as legal counsel for both the County of Riverside (the "County") and the Riverside County Flood Control and Water Conservation District (the "Flood Control District"). We have reviewed the provisions of the above-referenced Order, the applicable Ordinances of the County of Riverside and the Flood Control District, applicable statutes with regard to organization and police powers of the County and the organization of the Flood Control District, and all other laws, statutes, ordinances, regulations and rules that we deemed appropriate.

Based on this review, this office is of the opinion that the County and the Flood Control District, as "Copermittees," as this term is defined in said Order, both appear to have adequate legal authority to perform their responsibilities as set forth in said Order, and when required by said Order to do so, appear to have adequate legal authority to implement and enforce the applicable provisions of said Order in accordance with applicable state and federal laws. Moreover, the County and the Flood Control District reserve the right to modify and/or update their legal authority as the need arises during the term of said Order so that the provisions contained therein may be more effectively carried out.

Pursuant to Requirement E.2. (a) of the above-referenced Order, runoff-related ordinances for the County are enforceable under the police powers of the California Constitution and/or other provisions of California statutory law and includes the following: Riverside County Ordinance Nos. 348, 427, 457, 460, 461, 541, 592, 615, 617, 650, 651, 689, 728, 754, 812, 830, 843, 856, 857, 858, 859 and 864. In addition, runoff-related ordinances for the Flood Control District are enforceable under certain provisions of the California Constitution, the Riverside County Flood Control and Water Conservation Act (California Water Code – Appendix) and/or other provisions of California statutory law and includes the following: Ordinance Nos. 14, 19 and 20.

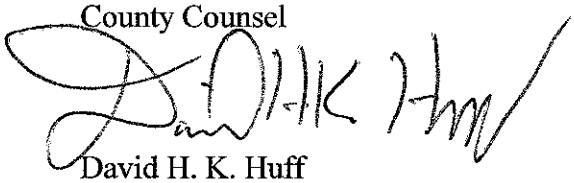
Pursuant to Requirement E.2. (b) of the above-referenced Order, Riverside County Ordinance No. 725 provides local administrative and legal procedures to help assist with mandating compliance with the County's runoff-related ordinances and provides for enforcement actions that can be undertaken through administrative, civil or criminal case avenues.

Pursuant to Requirement E.2. (c) of the above-referenced Order, the County's and the Flood Control District's runoff-related ordinances are adopted by the legislative body of each agency in accordance with provisions of the California Government Code, the Riverside County Flood Control and Water Conservation Act (California Water Code – Appendix) and other applicable provisions of California statutory law. Legal challenges to the County's and the Flood Control District's adopted runoff-related ordinances may be pursued through resort to the judicial court system and in accordance with applicable California and/or Federal law.

Please do not hesitate to contact me in the event that you have any questions or comments, I may be reached at (951) 955-6316 and the e-mail address noted below.

Sincerely,

PAMELA J. WALLS
County Counsel



David H. K. Huff
Deputy County Counsel

APPENDIX B-4
EFFECTIVENESS ASSESSMENTS

Appendix B-4

Performance Evaluation Assessment

Compliance with Section J.1

Section J.1 of the 2010 SMR MS4 Permit requires each Copermittee to annually assess and report upon the effectiveness of the JRMP and Watershed Workplan implementation to (1) reduce the discharge of Storm Water Pollutants from its MS4 facilities to the MEP; (2) prohibit Non-Stormwater discharges; and (3) prevent runoff discharges from the MS4 from causing or contributing to a violation of Water Quality Standards. With submittal of the Report of Waste Discharge, the Copermittees will determine whether their program implementation is resulting in the protection and/or improvement of water quality through an integrated assessment.

Overview

The purpose of the overall program assessment is to ensure that the Copermittee's programs continue to be effective at managing the effects of Runoff on Receiving Water quality as required under section J.1 of the 2010 SMR MS4 Permit. To achieve this objective, the Copermittees have developed an overall program effectiveness assessment strategy. The overall program effectiveness assessment is an iterative process as depicted in Figure 1.

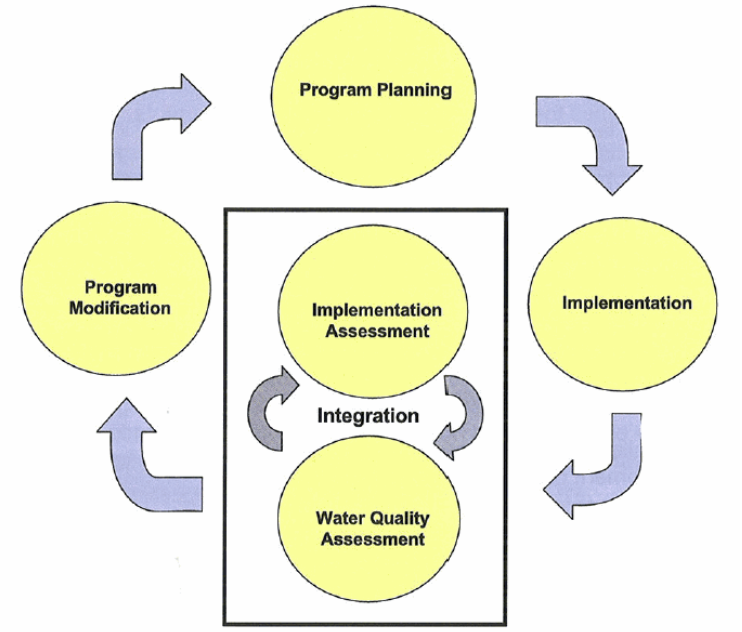

Figure 1

Measurable metrics that will be collected annually. These metrics generally involve: Confirmation of activities, Tabulation of data, Surveys of the public, results from Inspections or site visits, Quantification, and information from the Monitoring program.

CASQA Outcome Levels for each metric; to indicate how each metric can demonstrate the effectiveness of the Permittee's programs (as described below). Data collected through program implementation will be used to assess Level 1 – 4/5 outcomes. The results from the monitoring program will be used to identify water quality trends to evaluate Level 5 & 6 Outcomes

Assessment Intervals at which the Copermittees will evaluate the measurable metrics to determine the applicable CASQA Outcome Levels.

Timeframes in which the Copermittees expect to be able to achieve the desired CASQA Outcome Level. If a desired outcome is not attained within the specified timeframe, the Copermittee(s) will re-assess the BMP to identify any improvements that may be needed to improve their ability to detect and attain the outcome.

CASQA Outcome Levels

CASQA has established six effectiveness assessment levels which are described below. Generally lower level outcomes must be achieved before the higher level outcomes can be expected.

Level 1 – Documenting activities. Level 1 Outcomes provide the program managers with direct feedback on whether the control measures are being developed and implemented as planned and on schedule. Level 1 Outcomes are assumed to be beneficial to water quality and reflect program implementation and are not indicators of the impact of implementation on the environment.

Level 2 – Raising awareness. Level 2 Outcomes provide program managers with feedback on how effective the control measures have been in raising awareness and changing attitudes of target audiences. Level 2 Outcomes are assumed to be beneficial to the environment as increased awareness and attitudinal changes provide the basis for behavioral change.

Level 3 – Changing behavior. By building on Level 2, Level 3 Outcomes provide program managers with feedback on how effective the program elements and control measures have been in motivating target audiences to change their behaviors and implement appropriate BMPs. At Level 3, control measures focus on providing information and incentives for target audiences to take action by changing behavior and implementing recommended BMPs. Both quantitative (i.e., statistically valid) and qualitative methods are used to measure behavior changes. Methods used to measure behavior changes include those used for Level 2 Outcomes as well as direct observation via site visits. Level 3 Outcomes may take the form of a percent and/or change in the percentage of the target audience demonstrating that a behavior change has occurred such as an increase in number of BMPs implemented and maintained at construction sites.

Level 4 – Reducing loads from sources. Level 4 Outcomes provide program managers with feedback regarding reductions in the amounts of pollutants associated with specific sources

resulting from the implementation or enhancement of a BMP. If a large enough portion of the target audience is moved to take action (Level 3), loads into the MS4 are prevented. At Level 4, programs collect data to allow estimation of loads from Pollutant sources that are prevented from being either generated or discharged into the MS4.

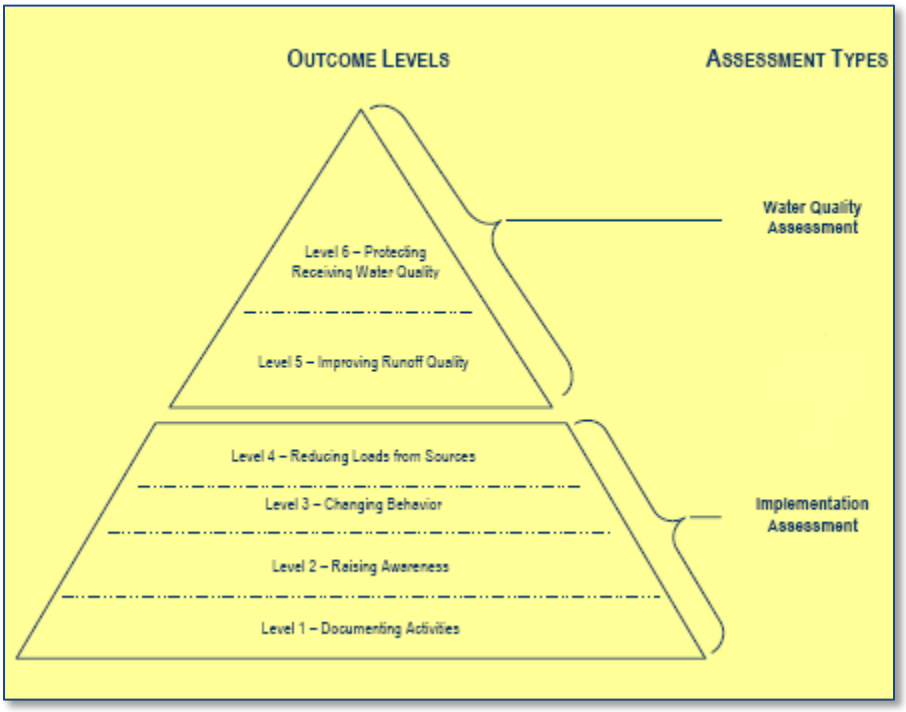
Level 5 – Improving runoff quality. Level 5 Outcomes may be measured as reductions in one or more specific Pollutants, and may reflect effectiveness at a variety of scales ranging from site-specific to programmatic. Over time, as loads are prevented from entering the MS4, runoff and discharge quality are expected to improve. At Level 5, baseline measurements of runoff quality should be measured to allow comparison. Multi-year data sets are needed to have any confidence in the measured change.

Level 6 – Protecting Receiving Water quality. At Level 6, program managers will focus on Outcomes such as compliance with Water Quality Standards, protection of biological integrity, and Beneficial Use attainment. Regardless of the Outcomes targeted, Receiving Water quality usually reflects more than the quality of MS4 discharges. Other influences may have a significant impact on Receiving Water quality, including sanitary sewer overflows, rising groundwater, agricultural and other Non-Point Source discharges. Changes in Receiving Waters and the environment resulting from stormwater programs may only be seen over long periods of time that allow the cumulative impacts of multiple control measures and program elements to result in measurable change in water quality.

Categories of Assessments

The program elements addressed in the overall program effectiveness assessment can generally be broken down into two categories, implementation assessments, and water quality assessments, as shown in the figure below:

Appendix B-4



Assessment Strategy

JRMP Implementation Assessments

The Copermittees have identified implementation assessment metrics for each compliance program area which can potentially demonstrate multiple outcome levels, as summarized below:

JRMP Program	Table #	Potential Outcome Levels					
		1	2	3	4	5	6
IC/ID	1	X		X	X	X	
Permittee Facilities	2	X	X	X	X		
Development Planning	3	X		X		X	
Construction	4	X		X			
Industrial / Commercial	5	X		X			
Residential	6			X	X		
Retrofit	7	X			X	X	
Public Education	8	X	X	X	X		

The specific metrics and associated CASQA Effectiveness Metrics are shown in Tables 1-8 of the Performance Evaluation Assessment.

Water Quality Assessments

In addition to the implementation assessments identified above, data from the Monitoring program will be used to perform Water Quality Assessments, as summarized below:

Appendix B-4

Monitoring Program Element	Potential Outcome Levels					
	1	2	3	4	5	6
Outfalls – Dry Weather				X	X	
Outfalls – Wet Weather				X	X	
Outfalls – High Priority Inland Aquatic Habitat				X	X	
Receiving Waters - Stream Assessment Monitoring				X	X	X
Receiving Waters – MLS Dry Weather				X	X	X
Receiving Waters – MLS Dry Weather				X	X	X

The specific metrics and associated CASQA Effectiveness Metrics for the Monitoring Program Element are shown in Table 9 of the Performance Evaluation Assessment. The revised Santa Margarita Monitoring Program (Volume III of the CMP) describes the monitoring program that will collect the necessary data.

The specific metrics and associated CASQA Effectiveness Metrics for the Watershed Workplan Program Element are shown in Table 10 of the Performance Evaluation Assessment. The Watershed Workplan is discussed in section 3.8 of the JRMP.

Reporting of Effectiveness Assessments

The continued implementation of the BMPs required in the 2010 SMR MS4 Permit are anticipated to result in incremental, but overall improvement in the metrics that may or may not be discernible within the term of the 2010 SMR MS4 Permit, however this assessment program is intended to be an iterative process that can transcend MS4 Permit terms, to ensure that improvements are made consistent with the MEP standard.

Beginning with the FY 2012-2013 Annual Reports, a summary of the Implementation Assessments will be provided within each JRMP Annual Report, and a summary of the Water Quality Assessments will be provided within each Monitoring Annual Report.

These effectiveness summaries will include:

a. The data collected for each of the measurable metrics identified in tables 1-10.

b. A determination of the applicable CASQA outcome level(s) for each metric, upon completion or the applicable assessment interval.

c. Responses to effectiveness assessments: Where the assessments indicate that the desired outcome level has not been achieved at the end of the projected timeframe, the Copermittee(s) will review its(their) applicable activities and BMPs to identify any modifications and improvements needed to maximize effectiveness, as necessary to comply with the 2010 SMR MS4 Permit. If the Copermittee(s) determines that the existing activities/BMPs are adequate, or that the projected timeframe should be

extended, justification and an updated timeframe for attainment of the outcome level will be provided in the Annual Report.

d. A work plan and schedule to address any program modifications and improvements in response to the findings of the assessments will be developed and implemented. The work plan and schedule will be provided and updated with the applicable Annual Report. The work plans will include, at a minimum, the following:

1) The problems and priorities identified during the assessment;
2) A list of Priority Pollutants and known or suspected sources;
3) A brief description of the strategy employed to reduce, eliminate or mitigate the negative impacts;
4) A description and schedule for new and/or modified BMPs. The schedule will include dates for significant milestones;
5) A description of how the selected activities will address an identified high priority problem. This will include a description of the expected effectiveness and benefits of the new and/or modified BMPs;
6) A description of implementation effectiveness metrics;
7) A description of how efficacy results will be used to modify priorities and implementation; and
8) A review of past activities implemented, progress in meeting Water Quality Standards, and planned program adjustments.

Table 1: IDDE (Section 4.0)

Measureable Metrics Collected *(Data Compiled Annually)*	**Highest Potential CASQA Outcome Level** *1 - Documenting Activities* *2 - Raising Awareness* *3 - Changing Behavior* *4 - Reducing Loads* *5 - Improving Runoff Quality* *6 - Protecting Receiving Water Quality*	**Assessment Interval** *(how frequently the annually collected data will be assessed for meeting potential CASQA Outcome Levels)*	**Outcome Timeframe** *(time at which program will be reassessed if desired outcome has not been achieved)*
Number of IC/ID reports received (F.4e.(3))	1	Annual	Annual
Percentage/Number of Dry Weather Source ID Efforts that were completed, and Findings	5	Annual	N/A, Outcome level will depend on outcome of Source ID
Percent/Number of IC/ID related enforcement actions that reached each level of enforcement, as described in section 3.5.2.3 of the JRMP (F.4.f.)	3	ROWD	10+ Years
Estimated volume of anthropogenic trash removed from Permittee MS4 facilities (cubic yards) (F.3.a.(6)(b)(vi))	4	Annual	Annual

Table 2: Municipal Areas and Activities (Section 5.0)

Measureable Metrics Collected *(Data Compiled Annually)*	**Highest Potential CASQA Outcome Level** *1 - Documenting Activities* *2 - Raising Awareness* *3 - Changing Behavior* *4 - Reducing Loads* *5 - Improving Runoff Quality* *6 - Protecting Receiving Water Quality*	**Assessment Interval** *(how frequently the annually collected data will be assessed for meeting potential CASQA Outcome Levels)*	**Outcome Timeframe** *(time at which program will be reassessed if desired outcome has not been achieved)*
Percent/Number of Permittee facilities with appropriate BMPs identified (F.3.a.(2)(b))	2	Annual	Permit Term
Percent/Number of annual facility inspections that require follow-up actions (F.3.a.(8)(c))	3	ROWD	10+ years
Average percent/number of follow-up actions identified in the previous year's Permittee facility inspections that were addressed (F.3.a.(8)(c))	3	ROWD	10+ years
Number of Permittee facility and MS4 operators and maintenance staff that attended Municipal training (F.6.b.(1))	1	Annual	Annually
Estimated tons of Waste removed by Permittee street sweeping, where applicable (F.3.a.(5))	4	Annual	Annually
Estimated tons of Waste removed from Permittee Open Channels (F.3.a.(6)(b))	4	Annual	Annually
Estimated tons of Waste removed from Permittee storm drain inlets (F.3.a.(6)(b)	4	Annual	Annually

Table 3: Development Planning (Section 6.0)

Measureable Metrics Collected *(Data Compiled Annually)*	**Highest Potential CASQA Outcome Level** *1 - Documenting Activities; 2 - Raising Awareness; 3 - Changing Behavior; 4 - Reducing Loads; 5 - Improving Runoff Quality; 6 - Protecting Receiving Water Quality*	**Assessment Interval** *(how frequently the annually collected data will be assessed for meeting potential CASQA Outcome Levels)*	**Outcome Timeframe** *(time at which program will be reassessed if desired outcome has not been achieved)*
Number of acres of **Redevelopment** projects that incorporated LID-based BMPs that are built and completed (F.1.f.(1)) *	5	Annual	N/A**
Number of applicable planning staff that attended WQMP training (F.6.b.(1))	1	Annual	Annual
Number / percent of WQMP Projects where Post-Construction BMP verifications have confirmed that BMPs are properly maintained. (F.1.f.(2))	3	ROWD	10+ years

* *Redevelopment of existing sites is understood to have a Level 5 outcome, based on the implementation of updated stormwater controls such as LID on sites that otherwise may have had the potential to discharge a higher level of pollutants. However the Permittees recognize that the improvements in runnoff quality that are expected from redeveloped sites cannot be directly quantified.*

** *No Outcome Timeframe is established as the Copermittees have no control over the rate or timing of Redevelopment*

Table 4: Private Development Construction Activity (Section 7.0)

Measureable Metrics Collected *(Data Compiled Annually)*	**Highest Potential CASQA Outcome Level** *1 - Documenting Activities* *2 - Raising Awareness* *3 - Changing Behavior* *4 - Reducing Loads* *5 - Improving Runoff Quality* *6 - Protecting Receiving Water Quality*	**Assessment Interval** *(how frequently the annually collected data will be assessed for meeting potential CASQA Outcome Levels)*	**Outcome Timeframe** *(time at which program will be reassessed if desired outcome has not been achieved)*
Construction Site inventory updated (F.2.b.)	1	Annual	Annual
Number of construction sites disturbing over 1 acre that are discovered without applicable building/grading permits. (F.2.e.(6)(b))	3	ROWD	10+ Years
Percent/Number of Construction Sites subjected to enforcement beyond verbal/written warnings (F.2.f.(1))	3	ROWD	10+ Years

Unified Sanitary Sewer Spill Response Procedure

1.0 Background

On November 10, 2010, the California Regional Water Quality Control Board – San Diego Region (Regional Board) issued an area-wide Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) Permit (2010 MS4 Permit) to the Riverside County Flood Control and Water Conservation District (District), the County of Riverside (County), and the incorporated cities of Riverside County within the San Diego Region (collectively, Copermittees).

The 2010 MS4 Permit requires the Copermittees to control the discharge of Pollutants into and from the MS4s to Waters of the United States, including from Sewage Spills. The Copermittees however do not own nor operate any portion of the sanitary sewer system nor associated treatment facilities. Sewering agencies that own or operate sanitary sewer collection systems greater than one mile in length are regulated under State Water Resources Control Board Water Quality Order No. 2006-0003 and the accompanying amendment to its monitoring and reporting program (WQ 2008-0002-EXEC). This order, known as the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Sanitary Sewer Order) serves, among other purposes, to prevent and minimize Potential Pollutants from sanitary sewer overflows (SSOs) originating from these sewer collection systems from entering surface waters. Copermittees that own or operate applicable sanitary sewer collection systems are required to obtain coverage under the Sanitary Sewer Order.

The Regional Board has found that effluent from SSOs that may enter the MS4 can ultimately have a negative impact on Beneficial Uses of Receiving Waters. The Copermittees have developed this Sanitary Sewer Spill Response Procedure to prevent, respond to, contain and clean up sewage from SSOs that have or could impact the MS4.

2.0 Purpose

The local Sewering agenciesare required to provide notification, documentation, spill response and reporting of SSOs from their sanitary sewer collection systems pursuant to established federal and state regulations (including the Sanitary Sewer Order), and individual NPDES permits. This Sanitary Sewer Spill Response Procedure provides a mechanism to ensure effective coordination between those sewering agencies and the Copermittees in the event that an SSO threatens to impact, or impacts, the MS4. This procedure will:

- Enhance communication between the Copermittees, sewering agencies and the Regional Board;
- Clarify and streamline interagency SSO response procedures; and
- Provide additional protection of Receiving Waters.

3.0 SSO Response Procedure

Upon determination by a sewering agency or Copermittee, persons in charge, contractor or field crew that an SSO has occurred that may impact the MS4, the following notification, reporting, response, and sampling procedures will be implemented.

3.1 Notifications

3.1.1 Notification Requirements Applicable to Sewering Agencies:

In compliance with the Sanitary Sewer Order, the following notification requirements are applicable to sanitary sewer collection systems and other facilities owned or operated by sewering agencies:

- For any discharges of sewage that result in a discharge to a drainage channel or surface water, the sewering agency will as soon as possible, but not later than two (2) hours after becoming aware of the discharge, notify the OES, the County Department of Environmental Health, and the Regional Board.
- As soon as possible, but no later than twenty-four (24) hours after becoming aware of a discharge to a drainage channel or a surface water, the sewering agency will submit to the Regional Board a certification that the OES and the County Department of Environmental Health have been notified of the discharge.

The sewering agency with jurisdiction for the spill will provide notification immediately (within 24 hours of becoming aware of the circumstances) for all discharges that endanger human health or the environment as follows:

- By phone to the OES at 800-582-7550 and to the Regional Board at 858-467-2952
- At a minimum:
  - Any sewage spill greater than 1,000 gallons
  - Any sewage spill that could impact water contact recreation
  - Any discharge of sewage into or on any Waters of the State (reportable to OES[1])

In addition, the sewering agency will notify the Highway Patrol of SSOs affecting a State Highway in accordance with OES guidance[2].

1 "California Hazardous Material Spill/Release Notification Guidance." April 2006. California Office of Emergency Services. Page 4. http://www.oes.ca.gov/

2 "California Hazardous Material Spill/Release Notification Guidance." April 2006. California Office of Emergency Services. Page 6. http://www.oes.ca.gov/

Other spill incidents, including any unauthorized discharges that are not reportable to the OES, are reported to the Regional Board's Executive Officer as part of the Annual Report as described in Section 3.3.

3.1.2 Notification Requirements Applicable to Copermittees Not Owning or Operating a Sanitary Sewer Collection System

Should a Copermittee discover an SSO or determine that sewage is entering the MS4, the Copermittee shall immediately notify the appropriate sewering agency.

1. Where the sewering agency determines that the SSO originates from its sewer collection system or facilities, the sewering agency will follow the notification procedures described in Section 3.1.1 and established reporting procedures. No further notification or reporting is required by the Copermittee.
2. Where the sewering agency determines that the SSO originates from a private lateral or private property, the sewering agency will contact the property owner for clean up responsibility and will contact the Copermittee with jurisdiction of the spill. For more information on private property SSOs, see Section 6.0. The Copermittee with jurisdiction for the spill will provide notification immediately (within 24 hours of becoming aware of the circumstances) for all discharges that endanger human health or the environment as follows:
    - By phone to the OES at 800-582-7550 and to the Regional Board at 858-467-2952
    - At a minimum:
        - Any sewage spill greater than 1,000 gallons
        - Any sewage spill that could impact water contact recreation
        - Any discharge of sewage into or on any Waters of the State (reportable to OES[3])
    - In addition, the Copermittee with jurisdiction for the spill will notify the Highway Patrol of SSOs affecting a State Highway in accordance with OES guidance[4].

Should a Copermittee discover discharges of sewage in an area not served by a sewering agency, the Copermittee with jurisdiction for the spill will follow the procedures in sections 3.5 and 4.4.5 of the JRMP as applicable.

Other spill incidents, including any unauthorized discharges that are not reportable to the OES, are reported to the Regional Board's Executive Officer as part of the Annual Report as described in Section 3.3.

4 "California Hazardous Material Spill/Release Notification Guidance." April 2006. California Office of Emergency Services. Page 6. http://www.oes.ca.gov/

3.1.3 Agency Contact Information

To identify sewering agency with jurisdiction in the spill area, **see Attachment A**. A list of the current contact phone numbers for various agencies is provided below:

CONTACT:	**PHONE NUMBER:**
County Department of Environmental Health / Environmental Resources Management	951-955-8980
Governor's Office of Emergency Services (OES)	800-852-7550
Copermittee Staff (whose MS4 may be affected by spill)	**See Attachment B**
Regional Water Quality Control Board: San Diego Region	858-467-2952
Riverside County Flood Control and Water Conservation District	951-955-1200
Sewering agency with jurisdiction in spill area	**See Attachment A**
California Highway Patrol (if highway affected by spill)	**911**

3.2 Minimum Information for Notification

Copermittee staff providing notice should make reasonable attempts to reach sewering agency contacts during and after normal working hours. In cases where sewering agency contacts are not available, messages shall be left. The following minimum information should be conveyed by Copermittee staff as appropriate:

- Identity of caller
- Location, date and time of SSO, status of the SSO (actual or threatened release)
- Quantity of sewage released (estimate of flow or volume)
- Need for public safety or traffic control measures
- Cause of the SSO, if known
- Description of immediate measures taken to contain/mitigate SSO
- Estimate of additional containment and/or clean-up options
- Determination if sewage was discharged to MS4 or areas otherwise impacting the MS4 **(Refer to Attachment A)**
- Determination if SSO reached a state highway

A copy of a sample SSO reporting form is included in **Attachment C**.

3.3 Reporting Requirements

Each Sewering agency is responsible for filing all SSO reports as required under federal and state law for discharges from their sanitary sewer systems, including any applicable NPDES or other permits. Sewering agencies are required to report any discharges to the Department of Environmental Health immediately, per the requirements of Health and Safety Codes Section 5411.5.

Copermittees shall additionally follow specific reporting requirements as described in Section 4 of the JRMP.

The Person in Charge at the responsible sewering agency must CC: the final SSO Report provided to the Regional Board to the affected Copermittees via hard copy or electronic means.

3.4 Response Requirements

Responsible sewering agencies will lead response to SSOs and will assume Person in Charge responsibilities in most cases. Person in Charge of spill response:

- Will take all immediate measures necessary to contain release or potential release of sewage and prevent/minimize impacts to water quality and the MS4.

- May cut locks, open manholes, or otherwise enter MS4 as necessary to contain and clean up SSOs.

- Will contact the maintenance/public works department of the appropriate Copermittee as necessary, and as soon as possible, to notify them of actions within their MS4. Contact numbers are included in **Attachment B**. If necessary, Copermittee staff will support spill response by providing MS4 maps or other support if available.

- Will coordinate with Copermittee staff as necessary to ensure that the clean up adequately remedies impacts of the sewage released to the MS4. It should be noted that the Regional Board prefers that MS4 facilities not be sanitized with disinfectant where not immediately impacting public health (i.e. no chlorine shall be used when discharge is within 1,500 feet of a waterway).

- Will coordinate with local fire, police, and traffic departments as necessary to ensure the safety of the response effort, and to manage traffic and local residents.

4.0 Training Requirements

Sewering Agencies and Copermittee staff will ensure that training for this procedure is incorporated into appropriate training programs related to SSO response.

5.0 Detection Involving Infiltration into MS4

In the event that Copermittees encounter evidence of potential sewage infiltration into the MS4 due to water quality monitoring or field observation, the Copermittees will notify the relevant sewering agency (**see Attachment A**) to coordinate a response.

6.0 Private Property SSOs

Sewering agencies and their contractors will respond to all SSOs within their service area. If a private property is the source of an SSO, agencies and their contractors shall assist in the control and containment to ensure that the sewage does not enter the MS4. If the SSO was a result of a private lateral, the private property owner will be informed of the blockage, and will be responsible to remove the blockage. If the SSO was a result of the sewer trunk line blockage, the response crew will correct the problem.

Glossary

Note: With the exception of the following, most terms used in this document are defined in the Glossary to the JRMP.

Sanitary Sewer Overflow (SSO) - A sanitary sewer overflow is any overflow, spill, release, discharge or diversion of wastewater from a sanitary sewer system. SSOs include:

(i) Overflows or releases of wastewater that reach Waters of the U.S.;
(ii) Overflows or releases of wastewater that do not reach Waters of the U.S.; and
(iii) Wastewater backups into buildings and on private property that are caused by blockages or flow conditions in a sanitary sewer, other than a building lateral. Wastewater backups into buildings caused by a blockage or other malfunction of a building lateral that is privately owned is an SSO when sewage is discharged off private property into streets, stormdrains, or Waters of the U.S.

Sanitary Sewer System - Any system of pipes, pump stations, sewer lines, or other conveyances upstream of a wastewater treatment plant headworks used to collect and convey sewage to a treatment facility. Temporary storage and conveyance facilities (such as vaults, temporary piping, construction trenches, wet wells, impoundments, tanks, highlines, etc.) are considered to be part of the sanitary sewer system, and discharges into these temporary storage facilities are not SSOs.

Sewage - The waste and wastewater produced by residential and commercial establishments and discharged into sewers.

Waters of the State – Any water, surface or underground, including saline waters within the boundaries of the State.

APPENDIX - D

DEVELOPMENT PLANNING

APPENDIX D-1
STANDARD CONDITIONS OF APPROVAL FOR PRIVATE DEVELOPMENT CONSTRUCTION ACTIVITIES

Appendix A – Standard List of Approval for Development Construction Activities

Note: The following standard list of approvals is not applicable to every project and is applied on a case-by-case basis.

5. SERIES – CORRECTIONS PRIOR TO ISSUANCE OF CONDITIONS

1. DRT Compl Resubmit A Pre WQMP (SMR)

In compliance with the currently effective Municipal Stormwater Permit issued by the San Diego Regional Water Quality Control Board [Order No. R9-2010-16, et seq.], and beginning January 1, 2005, all projects that 1) are located within the drainage boundary (watershed) of the Santa Margarita River; and 2) require discretionary approval by the County of Riverside must comply with the Water Quality Management Plan (WQMP) for Urban Runoff. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects within the priority development category. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects. The WQMP provides detailed guidelines and templates to assist the applicant in completing the necessary documentation and calculations. These documents are available on-line at: www.rcflood.org/npdes.

To comply with the WQMP, applicants must prepare and submit a "Project Specific" WQMP. At a minimum, the WQMP must: a) identify the post-project pollutants associated with the development proposal together with any adverse hydrologic impacts to receiving waters; b) identify site-specific mitigation measures or Best Management Practices (BMPs) for the identified impacts including site design, source control and treatment control post-development BMPs; and c) identify a sustainable funding and maintenance mechanism for the aforementioned BMPs. A template for this report is included as 'Exhibit A' in the WQMP. A final Project Specific WQMP must be approved by the District prior to issuance of building or grading permits.

Projects that require a Project Specific WQMP are required to submit a PRELIMINARY Project Specific WQMP along with the land-use application package. The format of the PRELIMINARY report shall mimic the format/template of the final report but may contain less detailed information. For example, each of the points, "a", "b" and "c" (above), must be addressed, rough calculations supporting preliminary BMP sizing must be included, and the footprint/locations for the BMPs must be identified on the tentative exhibit. Detailed drawings are not required at the PRELIMINARY stage.

THE APPLICANT HAS SUBMITTED A REPORT THAT DOES NOT MEET THE CRITERIA FOR A PRELIMINARY PROJECT SPECIFIC WQMP. A REVISED REPORT THAT MEETS THE ABOVE CRITERIA SHALL BE SUBMITTED TO THE DISTRICT. THIS PRELIMINARY PROJECT SPECIFIC WQMP MUST BE APPROVED BY THE DISTRICT PRIOR TO ISSUANCE OF RECOMMENDED CONDITIONS OF APPROVAL

2. CORRECTION FOR NO SUBMITTAL

A PRELIMINARY PROJECT SPECIFIC WQMP MUST BE APPROVED BY THE DISTRICT PRIOR TO ISSUANCE OF RECOMMENDED CONDITIONS OF APPROVAL.

In compliance with the currently effective Municipal Stormwater Permit issued by the San Diego Regional Water Quality Control Board [Order No. R9-2010-16, et seq.], and beginning January 1, 2005, all projects that 1) are located within the drainage boundary (watershed) of the Santa Margarita River; and 2) require discretionary approval by the County of Riverside must comply with the Water Quality Management Plan (WQMP) for Urban Runoff. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects within the priority development category. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects. The WQMP provides detailed guidelines and templates to assist the applicant in completing the necessary documentation and calculations. These documents are available on-line at: www.rcflood.org/npdes.

To comply with the WQMP, applicants must prepare and submit a "Project Specific" WQMP. At a minimum, the WQMP must: a) identify the post-project pollutants associated with the development proposal together with any adverse hydrologic impacts to receiving waters; b) identify site-specific mitigation measures or Best Management Practices (BMPs) for the identified impacts including site design, source control and treatment control post-development BMPs; and c) identify a sustainable funding and maintenance mechanism for the aforementioned BMPs. A template for this report is included as 'Exhibit A' in the WQMP. A final Project Specific WQMP must be approved by the District prior to issuance of building or grading permits.

Projects that require a Project Specific WQMP are required to submit a PRELIMINARY Project Specific WQMP along with the land-use application package. The format of the PRELIMINARY report shall mimic the format/template of the final report but may contain less detailed information. For example, each of the points, "a", "b" and "c" (above), must be addressed, rough calculations supporting preliminary BMP sizing must be included, and the footprint/locations for the BMPs must be identified on the tentative exhibit. Detailed drawings are not required at the PRELIMINARY stage.

10. SERIES – GENERAL CONDITIONS

10. MAP* UNIT PHASING

This is a proposal to develop the [_____] phase of Tract [_____]. The conditions of approval for Tract [_____] shall also apply to this phase. This phase shall be fully protected from the one-

percent annual chance flood flow and shall mitigate its water quality impacts. The necessary water quality features to mitigate impacts due to this phase shall be constructed. The construction of all necessary improvements along with easements and/or permission from affected property owners to safely discharge the concentrated or diverted 100-year tributary flows of this phase shall be required prior to its final map recordation.

10. MAP SUBMIT FINAL WQMP =PRELIM (SMR)

In compliance with the currently effective Municipal Stormwater Permit issued by the San Diego Regional Water Quality Control Board [Order No. R9-2010-16, et seq.], and beginning January 1, 2005, all projects that 1) are located within the drainage boundary (watershed) of the Santa Margarita River; and 2) require discretionary approval by the County of Riverside must comply with the Water Quality Management Plan (WQMP) for Urban Runoff. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects within the priority development category. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects. The WQMP provides detailed guidelines and templates to assist the applicant in completing the necessary documentation and calculations. These documents are available on-line at: www.rcflood.org/npdes.

To comply with the WQMP, applicants must prepare and submit a "Project Specific" WQMP. At a minimum, the WQMP must: a) identify the post-project pollutants associated with the development proposal together with any adverse hydrologic impacts to receiving waters; b) identify site-specific mitigation measures or Best Management Practices (BMPs) for the identified impacts including site design, source control and treatment control post-development BMPs; and c) identify a sustainable funding and maintenance mechanism for the aforementioned BMPs. A template for this report is included as 'Exhibit A' in the WQMP.

The applicant has submitted a report that meets the criteria for a Preliminary Project Specific WQMP (see Flood Hazard Report). However, in order to meet the requirements of a Final Project Specific WQMP, it shall be prepared in substantial conformance to the Preliminary Project Specific WQMP. Also, the applicant should note that, if the project requires a Section 401 Water Quality certification, the Regional Water Quality Control Board may require additional water quality impact mitigation measures.

10. MAP FINAL WQMP ONLY (SMR)

In compliance with the currently effective Municipal Stormwater Permit issued by the San Diego Regional Water Quality Control Board [Order No. R9-2010-16, et seq.], and beginning January 1, 2005, all projects that 1) are located within the drainage boundary (watershed) of the Santa Margarita River; and 2) require discretionary approval by the County of Riverside must comply with the Water Quality Management Plan (WQMP) for Urban Runoff. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects within the priority development category. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects. The WQMP provides detailed guidelines and templates to assist the applicant in completing the necessary documentation and calculations. These documents are available on-line at: www.rcflood.org/npdes.

To comply with the WQMP, applicants must prepare and submit a "Project Specific" WQMP. At a minimum, the WQMP must: a) identify the post-project pollutants associated with the development proposal together with any adverse hydrologic impacts to receiving waters; b) identify site-specific mitigation measures or Best Management Practices (BMPs) for the identified impacts including site design, source control and treatment control post-development BMPs; and c) identify a sustainable funding and maintenance mechanism for the aforementioned BMPs. A template for this report is included as 'Exhibit A' in the WQMP.

The applicant shall submit a report that meets the requirements of a Final Project Specific WQMP (see Flood Hazard Report). Also, the applicant should note that, if the project requires a Section 401 Water Quality certification, the Regional Water Quality Control Board may require additional water quality measures.

10. MAP FINAL WQMP ONLY MAINT.

The BMP facilities proposed with this project will require maintenance by a public agency or homeowners association. To ensure that the public is not unduly burdened with future costs, prior to final approval or recordation of this case, the District will require an acceptable financial mechanism be implemented that provides for maintenance of the BMP facilities in perpetuity. This may consist of a mechanism to assess individual benefiting property owners, or other means as approved by the District.

10. MAP SUBMIT FINAL WQMP>PRELIM (SMR)

In compliance with the currently effective Municipal Stormwater Permit issued by the San Diego Regional Water Quality Control Board [Order No. R9-2010-16, et seq.], and beginning January 1, 2005, all projects that 1) are located within the drainage boundary (watershed) of the Santa Margarita River; and 2) require discretionary approval by the County of Riverside must comply with the Water Quality Management Plan (WQMP) for Urban Runoff. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects within the priority development category. The WQMP addresses post-development water quality impacts from new development and significant redevelopment projects. The WQMP provides detailed guidelines and templates to assist the applicant in completing the necessary documentation and calculations. These documents are available on-line at: www.rcflood.org/npdes.

To comply with the WQMP, applicants must prepare and submit a "Project Specific" WQMP. At a minimum, the WQMP must: a) identify the post-project pollutants associated with the development proposal together with any adverse hydrologic impacts to receiving waters; b) identify site-specific mitigation measures or Best Management Practices (BMPs) for the identified impacts including site design, source control and treatment control post-development BMPs; and c) identify a sustainable funding and maintenance mechanism for the aforementioned BMPs. A template for this report is included as 'Exhibit A' in the WQMP.

The applicant has previously submitted a report that minimally meets the criteria for a Preliminary Project Specific WQMP addressing points a), b) and c), above. While the Preliminary Project Specific WQMP (see Flood Hazard Report) was adequate at the tentative stage, the Preliminary WQMP will need significant revisions at the improvement plan check phase of the development. In order to meet the requirements of a Final Project Specific WQMP, the applicant's engineer shall

submit supporting calculations and detailed drawings for all BMPs to the District for review and approval. Also, the applicant should note that, if the project requires a Section 401 Water Quality certification, the Regional Water Quality Control Board may require additional water quality measures.

10. MAP BMP MAINTENANCE & INSPECT (is CC&R enforceable)

Unless an alternate viable maintenance entity is established, the Covenants, Conditions and Restrictions (CC&Rs) for the development's Home/Property Owners Association (HOA/POA) shall contain provisions for all structural best management practices (BMPs) to be inspected, and if required, cleaned no later than October 15 each year. The CC&Rs shall identify the entity that will inspect and maintain all structural BMPs within the project boundaries. A copy of the CC&Rs shall be submitted to the District for review and approval prior to the recordation of the map.

- OR -

The BMP maintenance plan shall contain provisions for all treatment control BMPs to be inspected, and if required, cleaned no later than October 15 each year. Required documentation shall identify the entity that will inspect and maintain all structural BMPs within the project boundaries. A copy of all necessary documentation shall be submitted to the District for review and approval prior to the issuance of occupancy permits.

10. MAP WQMP ESTABL MAINT ENTITY

This project proposes BMP facilities that will require maintenance by a public agency or homeowners association. To ensure that the public is not unduly burdened with future costs, prior to final approval or recordation of this subdivision, the District will require an acceptable financial mechanism to be implemented to provide for maintenance of the project's site design, source control and treatment control BMPs in perpetuity. This may consist of a mechanism to assess individual benefiting property owners, or other means as approved by the District. The BMPs must be shown on the project's grading plans and any other improvement plans the selected maintenance entity may require.

10. MAP SITE DSGN & SOURCE CTRL BMPS

Development of this project may adversely impact water quality. To mitigate for the potential water quality impacts, the applicant must incorporate site design Best Management Practices (BMPs) and source control BMPs, as applicable and feasible, into the project plans. Site design BMPs include minimizing urban runoff, minimizing impervious footprint, conserving natural areas, and minimizing directly connected impervious areas. Source control BMPs include but are not limited to education, activity restrictions and proper maintenance (non-structural) as well as proper landscape/irrigation design and the protection of slopes and channels (structural). Additional information can be found in Sections V.1 and V.2 of the WQMP template.

10. MAP WQMP REQMT ON ECS/FINAL MAP SAR/SMR (consult county counsel)

A notice of the WQMP requirements shall be placed on the Environmental Constraint Sheet and final map. The exact wording of the note shall be as follows:

NOTICE OF WQMP REQUIREMENTS:

"A final project specific Water Quality Management Plan (WQMP) may be required prior to issuance of a grading or building permit. If required, the WQMP shall be consistent with the requirements of the County of Riverside's Municipal Stormwater Permit which are in effect at the time the grading or building permit is issued. The WQMP shall be submitted to the Flood Control District for review and approval on a fee for service basis." Ask County Counsel/NPDES

50. SERIES – CONDITIONS PRIOR TO MAP RECORDATION

50. MAP* WQMP REQMT ON ECS

A notice of the WQMP requirements shall be placed on the Environmental Constraint Sheet and final map. The exact wording of the note shall be as follows:

NOTICE OF WQMP REQUIREMENTS:

"A final project specific Water Quality Management Plan (WQMP) may be required prior to issuance of a grading or building permit. If required, the WQMP shall be consistent with the requirements of the County of Riverside's Municipal Stormwater Permit which are in effect at the time the grading or building permit is issued. The WQMP shall be submitted to the Flood Control District for review and approval on a fee for service basis." Ask County Counsel/NPDES

50. MAP PHASING

If the tract is built or recorded in phases, each phase must be protected from the one-percent annual chance (100-year) tributary flows and shall mitigate its water quality impacts. Additionally, the water quality features necessary to mitigate impacts associated with each phase shall be constructed. The construction of all necessary improvements along with easements and/or permission from affected property owners to safely discharge the concentrated or diverted one-percent annual chance (100-year) tributary flows of each phase shall be required prior to its final map recordation. (ADDed 50. Series condition?)

50. MAP WQMP ESTABL MAINT ENTITY

This project proposes BMP facilities that will require maintenance by a public agency or homeowners association. To ensure that the public is not unduly burdened with future costs, prior to final approval or recordation of this subdivision, the District will require an acceptable financial mechanism to be implemented to provide for maintenance of the project's site design, source control and treatment control BMPs in perpetuity. This may consist of a mechanism to assess individual benefiting property owners, or other means as approved by the District. The BMPs must be shown on the project's grading plans and any other improvement plans the selected maintenance entity may require.

50. MAP SUBMIT PLANS MINOR REVIEW

The scope of the District's review will be limited to verification that this project has met its obligation under the County's municipal stormwater permit. A copy of the project specific WQMP /BMP improvement plans along with any necessary documentation shall be submitted to the District's Plan Check Section for review and approval. A copy of the improvement and grading plans shall be included for reference. The plans must receive the District's approval prior to issuance of permits. All submittals shall be date stamped by the engineer and include a completed Flood Control Deposit Based Fee Worksheet and the appropriate plan check fee deposit.

50. MAP SUBMIT PLANS

A copy of the project specific WQMP, improvement plans, grading plans, final map, Environmental Constraint Sheet, BMP improvement plans, and any other necessary documentation along with supporting hydrologic and hydraulic calculations shall be submitted to the District for review and approval. All submittals shall be date stamped by the engineer and include a completed Flood Control Deposit Based Fee Worksheet and the appropriate plan check fee deposit.

50. MAP ONSITE BMP EASEMENT ON FINAL MAP

Onsite BMP facilities located outside of road right-of-way shall be contained within BMP easements shown on the final map. A note shall be added to the final map stating, "BMP EASEMENT: To be maintained in accordance with the final project-specific WQMP ".

60. SERIES – PRIOR TO GRADING PERMIT ISSUANCE

60. MAP PHASING

If the tract is to be built in phases, each phase shall be protected from the one-percent annual chance flood (1 in 100-year tributary flows) and shall mitigate its water quality impacts. The necessary BMPs to mitigate water quality impacts due to this phase shall be constructed. The construction of all necessary improvements together with all required easements and/or permission

from affected property owners to safely discharge the concentrated or diverted 100-year tributary flows from this phase shall be required prior to recording the final map. (ADD 50. Series condition?)

60. MAP SUBMIT FINAL WQMP

A copy of the project specific WQMP shall be submitted to the District for review and approval.

60. MAP SUBMIT PLANS

A copy of the project specific WQMP, improvement plans, grading plans, final map, Environmental Constraint Sheet, BMP improvement plans and any other necessary documentation along with supporting hydrologic and hydraulic calculations shall be submitted to the District for review and approval. The plans must receive District approval prior to the issuance of grading permits. All submittals shall be date stamped by the engineer and include a completed Flood Control Deposit Based Fee Worksheet and the appropriate plan check fee deposit.

80. SERIES – PRIOR TO BUILDING PERMIT ISSUANCE

80. MAP SUBMIT PLANS MINOR REVIEW

The scope of the District review will be limited to verification that this proposal has met its obligation under the County's municipal stormwater permit. A copy of the project specific WQMP /BMP improvement plans along with any necessary documentation shall be submitted to the Districts Plan Check Section for review and approval. A copy of the improvement and grading plans shall be included for reference. The plans must receive the District's approval prior to issuance of permits. All plan submittals shall be date stamped by the engineer and include a completed Flood Control Deposit Based Fee Worksheet and the appropriate plan check fee deposit.

80. MAP SUBMIT PLANS

A copy of the project specific WQMP, improvement plans, grading plans, final map, Environmental Constraint Sheet, BMP improvement plans and any other necessary documentation along with supporting hydrologic and hydraulic calculations shall be submitted to the District for review and approval. The plans must receive District approval prior to the issuance of building permits. All submittals shall be date stamped by the engineer and include a completed Flood Control Deposit Based Fee Worksheet and the appropriate plan check fee deposit.

90. SERIES – PRIOR TO BUILDING FINAL INSPECTION

90. MAP BMP - EDUCATION

The Applicant shall distribute environmental awareness education materials on general good housekeeping practices that contribute to protection of stormwater quality to all initial residents. The Applicant may obtain NPDES Public Educational Program materials from the District's NPDES Section by either the District's website www.rcflood.org/npdes, e-mail flood.fcnpdes@rcflood.org, or the toll free number 1-800-506-2555. Please provide Project number, number of units and location of development. Note that there is a five-day minimum processing period requested for all orders. The Applicant must provide to the District's PLAN CHECK Department a notarized affidavit stating that the distribution of educational materials to the tenants is assured prior to the issuance of occupancy permits.

90. MAP IMPLEMENT WQMP

All structural BMPs described in the project-specific WQMP shall be constructed and installed in conformance with approved plans and specifications. It shall be demonstrated that the applicant is prepared to implement all non-structural BMPs described in the approved project specific WQMP and that copies of the approved project-specific WQMP are available for the future owners/occupants. The District will not release occupancy permits for any portion of the project exceeding 80% of the total recorded residential lots within the map or phase within the map prior to the completion of these tasks. (this was removed in 90. USE)

90. MAP BMP MAINTENANCE & INSPECT

Unless an alternate viable maintenance entity is established, the CC&R's for the development's Home/Property Owners Association (HOA/POA) shall contain provisions for all structural best management practices (BMPs) to be inspected, and if required, cleaned no later than October 15 each year. The CC&R's shall identify the entity that will inspect and maintain all structural BMPs within the project boundaries. A copy of the CC&R's shall be submitted to the District for review and approval prior to the recordation of the map.

Or

The BMP maintenance plan shall contain provisions for all treatment controlled BMPs to be inspected, and if required, cleaned no later than October 15 each year. Required documentation shall identify the entity that will inspect and maintain all structural BMPs within the project boundaries. A copy of all necessary documentation shall be submitted to the District for review and approval prior to the issuance of occupancy permits.

90. MAP AS-BUILT BMP

All structural BMPs described in the project-specific WQMP shall be constructed and installed in conformance with approved plans and specifications. As-built plans certified by a registered Civil Engineer shall be submitted.

90. ONSITE BMP EASEMENT ON FINAL MAP

Onsite BMP facilities located outside of road right-of-way shall be contained within BMP easements shown on the final map. A note shall be added to the final map stating, "BMP EASEMENT: To be maintained in accordance with the final project-specific WQMP ".

RIVERSIDE COUNTY FLOOD CONTROL
AND WATER CONSERVATION DISTRICT

January 15, 2009

Mr. John Robertus, Executive Officer
California Regional Water Quality
Control Board – San Diego Region
9174 Sky Park Court, Suite 100
San Diego, California 92123

Dear Mr. Robertus:

Re: Report of Waste Discharge for the Santa Margarita River Region of Riverside County Order No. R9-2004-001, NPDES No. CAS0108766

This letter and the enclosures comprise the Report of Waste Discharge (ROWD) for the area-wide municipal separate storm sewer system (MS4) National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108766, San Diego Regional Water Quality Control Board Order No. R9-2004-001. This ROWD is an application for renewal of the area-wide MS4 NPDES Permit for Riverside County Flood Control and Water Conservation District (RCFC&WCD), the County of Riverside (County), and the incorporated cities of Riverside County within the upper Santa Margarita River watershed (Menifee, Murrieta, Temecula, and Wildomar) collectively referred to herein as "Permittees."

Order No R9-2004-001 does not specify the requirements of the ROWD. However, the attached ROWD includes the following information:

- Applicant information, including Permittee contacts, legal authorities, description of the Permit Area, and funding sources;
- Overview of the upper Santa Margarita River watershed, including population, land use, Receiving Waters, and the MS4;
- Changes in land use and/or population over the 2004 MS4 Permit term and projections for changes over the next MS4 Permit term;
- Highlights of the Permittee compliance programs over the 2004 MS4 Permit term;
- Evaluations of the Permittees existing compliance programs based on water quality data collected to date; and

- Activities the Permittees propose to undertake during the next MS4 Permit term, including implementation of Low Impact Development (LID) requirements and compliance assessments and targets.

In addition, the ROWD includes an assessment of the economic conditions and the projected impact of these conditions on sources of compliance program funding. Based on this assessment, it appears that the major challenge facing the Permittees over the next MS4 Permit term will be maintaining existing compliance programs. In 2004 both the Permittees and the San Diego Regional Water Quality Control Board (Regional Board) staff invested significant time and resources in the development of the current MS4 NPDES Permit (hereinafter referred to as the 2004 MS4 Permit) which define the current compliance program. The Permittees believe, with exceptions outlined in the ROWD, that the existing Permit is protective of water quality and should be reissued as is.

Permittee representatives met with Regional Board staff on September 8, 2008 to obtain guidance for preparation of the ROWD. In that meeting, Regional Board staff provided their expectations regarding the ROWD. Based on the Permittee internal discussions and discussions with Regional Board staff, the Permittees propose to maintain the provisions of the 2004 MS4 Permit and DAMP with limited modifications to reflect:

- Updated references to related orders by the San Diego Regional Board and State Water Resources Control Board (State Board);
- Identification of impairments to Receiving Waters in the Santa Margarita Region;
- Evolution of compliance programs;
- Further standardization and definition of terms;
- Deletion of requirements in the 2004 MS4 Permit that described the development of compliance program elements which were incorporated into the 2005 DAMP;
- Implementation of LID/Hydromodification requirements for New Development projects;
- Implementation of compliance assessments and action levels;
- Necessary modifications to the Watershed SWMP and Individual SWMPs for the 2004 - 2009 MS4 Permit term; and
- Regional Board staff comments made during the term of the 2004 MS4 Permit, including comments received during the September 8th ROWD coordination meeting.

Re: Report of Waste Discharge for Santa Margarita
River Region of Riverside County
Order No. R9-2004-001,
NPDES No. CAS0108766

Especially given the existing and projected economic conditions, the Permittees goal is to work with the Regional Board staff to further refine the provisions of the 2004 MS4 Permit to enhance the effectiveness of existing compliance programs within available funding. In addition, the Permittees will work with the Regional Board staff to ensure that the requirements and expectations of the fourth term MS4 NPDES Permit are clear and unambiguous and that the focus is on addressing identified water quality problems in the Receiving Waters

We look forward to working with the Regional Board staff in the renewal of the area-wide MS4 NPDES Permit. If you have any questions, please call Jason Uhley at 951.955.1273 or Claudio Padres at 951.955.8602.

Very truly yours,

WARREN D. WILLIAMS
General Manager-Chief Engineer

D Toxicity Reduction Evaluation for Pyrethroid Pesticides

1.0 Executive Summary

On July 14, 2004 the San Diego Regional Water Quality Control Board (Regional Board) adopted Order No. R9-2004-001, an area-wide National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit (2004 MS4 Permit); this permit expires on July 14, 2009. A Report of Waste Discharge (ROWD) for renewal of the 2004 MS4 Permit must be submitted no later than 180 days in advance of the expiration date (i.e., by January 15, 2009).

This ROWD is an application for renewal of the 2004 MS4 Permit (NPDES No. CAS0108766) for the MS4 owned and operated by the Riverside County Flood Control and Water Conservation District (District), the County of Riverside (County), and the incorporated cities of Riverside County within the upper Santa Margarita River watershed (collectively, the Permittees). The newly incorporated cities of Menifee and Wildomar are included in this application as a Notice of Intent to participate in the updated MS4 Permit.

The content of this document is structured to identify:

- Information about the applicants (Section 3.0),
- Information on the area to be covered under the MS4 Permit (Section 4.0),
- An overall evaluation of the Permittees' existing programs based on water quality trends (Section 5.0),
- Accomplishments and recommendations for the Permittees' regionally implemented programs (Section 6.0) and
- Accomplishments and recommendations for the programs implemented as part of the Individual Stormwater Management Plans (SWMPs) (Section 7.0).

The Riverside County Drainage Area Management Plan (DAMP) documents the model implementation plan from which each of the existing Permittees has developed their respective Individual SWMP to implement the DAMP. In addition a Watershed SWMP has been developed to describe the programs that will be implemented regionally. The Annual Reports submitted to date describe the implementation of these SWMPs and document how they have evolved over time.

This ROWD builds on these Annual Reports by highlighting the major accomplishments of these programs, evaluating the long-term effectiveness of the programs and recommending revisions to the programs to enhance the efficiency and effectiveness of the programs to manage Urban Runoff to protect Receiving Water quality. To promote clarity of intent, terms defined in the 2004 MS4 Permit are capitalized in this ROWD.

Due to the impacts of the current economic recession on Permittee budgets and the effectiveness of existing Urban Runoff management programs, the Permittees' primary focus during the next MS4 Permit term will be on maintaining existing compliance programs in the face of significant cuts in basic municipal programs and services. Riverside County is one of the areas most affected by the mortgage crisis and the Santa Margarita Region is one of the most impacted areas of Riverside County. This crisis is having significant impacts on Permittee resources and projections for a deepening recession promises to exacerbate these impacts. Further, monitoring data indicates that the existing compliance programs have been effective in maintaining water quality. This ROWD focuses on maintaining the fundamental

structure and content of the Riverside County DAMP and the Individual SWMPs. However, the Permittees have identified several enhancements and/or alterations to their programs that can be implemented to continue to increase the effectiveness of these programs, without increasing costs.

1.1 Highlights of Program Implementation

Sections 6 and 7 of this ROWD describe the numerous accomplishments of the Permittees programs during the 2004 MS4 Permit term. Some highlights of the major accomplishments for the Permittees include:

- Development and implementation of a Water Quality Management Plan (WQMP) that addresses post-construction Urban Runoff management for New and Significant Re-Development.
- Development and implementation of the Watershed SWMP and the Permittee's Individual SWMPs.
- Development of handbook to standardize post-construction Best Management Practice (BMP) selection and design in Riverside County. Ongoing updates to the handbook include a plan to incorporate and promote low impact development design concepts.
- Development and enhancements to the design template for developing project-specific WQMPs
- Development of a Frequently Asked Question (FAQ) document to assist developers and plan review staff in understanding WQMP requirements and expectations.
- Development of coordinated BMP manual for firefighting agencies.
- Development, implementation and maintenance of Permittee databases to track construction sites 1-acre or larger. In addition, the Permittees have standardized a construction reporting spreadsheet used for Annual Reports, updated inspection forms, and enhanced the construction outreach program.
- Creation of Permittee databases to track industrial and commercial facilities.
- Creation and maintenance of the Storm Water Protection website that offers educational resources and free brochures targeting residents, businesses, developers, contractors, and elementary school children.
- Partnership with the Mission Resource Conservation District to provide an educational outreach programs targeting both schools and adults.
- Continued participation in the Consolidated Program for Water Quality Monitoring (Consolidated Monitoring Program) that includes collection of water quality samples at MS4 outfalls and Receiving Waters.
- Participation in regional and statewide monitoring efforts such as the Southern California Monitoring Committee (SMC), Southern California Coastal Water Commission and National Water Resources Institute.
- Participation in the California Stormwater Quality Association (CASQA), including the leadership roles of Officer, Director, and Legislative Chair.
- Development of the Upper Santa Margarita Region Integrated Regional Watershed Management Plan

- Continued partnership and coordination with the Bureau of Reclamation on a watershed plan and water quality model for the Santa Margarita watershed
- Continued participation in the Santa Margarita Lagoon nutrient Total Maximum Daily Load (TMDL) development process
- Participated in a stakeholder workgroup process led by Regional Board staff to revise REC 1 Basin Plan requirements for TMDLs

1.2 Summary Evaluation of Program Implementation

The trend analysis presented in Section G-8.2 of the FY 2007/2008 Watershed Annual Report and reviewed in Section 5.3 of this ROWD indicates that after almost 14 years of active Permittee involvement in MS4 Permit related Urban Runoff management programs, the significant increase in population (over 300 percent) and associated rapid urbanization that the area has experienced has not resulted in any statistically significant increases in Pollutant concentrations in Receiving Waters in the Santa Margarita Region. This indicates that the Permittees MS4 programs are and have been protective of Receiving Water quality. Pyrethroid pesticides, the one Pollutant that does appear to be linked to urbanization, has been addressed through a Toxicity Reduction Evaluation process, outreach programs, and Permittee participation to address pyrethroid pesticides and other pesticide sources at the state and federal level.

To enhance the effectiveness of the MS4 Permit compliance programs, the Permittees have agreed to implement compliance program revisions as described in sections 6 and 7 of this ROWD.

1.3 Summary of Major Recommendations for Program Revision

As described in section 3.4 of this ROWD, the Permittees are facing unprecedented fiscal impacts resulting from the national and state economic crises. The impacts on the Permittees are especially severe due to the disproportionate impact of home foreclosures in the Santa Margarita Region coupled with plummeting sales tax revenue. Unfortunately, it is anticipated that the economic conditions will persist for a significant portion of the term of the next MS4 Permit. During this period, the Permittee's MS4 compliance programs will increasingly compete with more fundamental public services for finite and dwindling resources. The challenge and priority for the Permittees will be to maintain the existing compliance programs in the face of cuts in basic programs and services.

Nevertheless, and although the various programs implemented as part of the Watershed SWMP and the Riverside County DAMP have been determined to be effective overall, Sections 6 and 7 of this ROWD identify certain areas wherein the Permittees are proposing changes to improve the effectiveness, efficiency, and transparency of these programs.

The program revisions recommended in this ROWD reconfigure existing programs in a manner that will increase the Permittees' overall ability to protect Urban Runoff quality, while limiting additional costs that would make these revisions cost-prohibitive in light of the current and foreseeable economy. Some of the major recommendations include:

Enhance Program Effectiveness Assessments and Incorporate Action Levels (Section 6.1.2.1)

The Permittees have carefully evaluated their MS4 Permit compliance programs and annual reporting forms. Based on this review the Permittees determined that:

- The overarching goal of the program is to ensure that Urban Runoff does not cause or contribute to non-attainment of Beneficial Uses in the upper Santa Margarita River watershed;
- Permittee compliance programs are process based and, consistent with the Maximum Extent Practical (MEP) approach, are incrementally adjusted as part of the annual reports and comprehensively reevaluated and if necessary, revamped as part of each ROWD;
- Monitoring data should be used to drive long term program assessments and assess goal attainment as part of the ROWD; and
- Process based Municipal Action Levels (MALs) should be used to evaluate annual program implementation to ensure that programs are implemented to the MEP and identify the needs for incremental adjustments.

The Permittees have proposed revised Effectiveness Assessment metrics and MALs for use in Permittee Annual Reports consistent with the aforementioned findings and as described further in Section 6.1.2.1. The MALs are intended to function as triggers, or minimum bars that if breached, would require the Permittees to evaluate the appropriate program elements to determine if adjustments are necessary to attain the MEP standard. The Permittee proposal will not only add transparency to the Permittees compliance programs but assist Permittees in evaluating and adjusting their Permit compliance programs to assist in attaining Water Quality Standards. Further, the proposed effectiveness assessment metrics can be implemented without significantly increasing the Permittees' program costs.

Revisions to the IC/ID Program (Section 7.8.2)

During the 2007/2008 MS4 Program audits conducted by PG Environmental and Regional Board staff, several questions were raised regarding the Permittees existing Illicit Connection/Illegal Discharge(IC/ID) field monitoring programs. The Permittees have evaluated the Regional Board and PG Environmental staff's comments and proposed a revised IC/ID Program based on the following:

- Random selection of MS4 outfalls throughout the Santa Margarita Region;
- Rotating MS4 outfall sites annually to maximize coverage of the MS4;
- Partnering one District staff person with one city/county code enforcement officer for data collection to ensure consistency in sampling procedure/collection and quick response to detected IC/ID events.

Implementation of a Post-Construction Treatment Control BMP Inspection Program (Section 7.2.2.6)

Consistent with Regional Board staff's request to consider development of a post-construction Treatment Control BMP inspection program, the Permittees have developed a proposal that they plan to implement when economic conditions allow. This proposal would enhance the existing business and Permittee facility inspection programs described in the Riverside County DAMP by incorporating inspections and maintenance verification of Treatment Control BMPs. Treatment Control BMPs constructed as part of residential developments, or other developments not captured by the Permittees' existing business inspections would be addressed through an annual self-certification program.

Revisions to the Dry Weather Monitoring Program (Section 6.4.4.1)

The Permittees have committed to participating in the Regional Watershed Monitoring Program developed in conjunction with the Southern California Coastal Water Research Project (SCCWRP). Six annual monitoring events were scheduled for the upper Santa Margarita River watershed. Consistent with the agreement reached by SCCWRP, Permittee, and Regional Board staff, three of these sites would be collected by the Permittees and three through the Surface Water Ambient Monitoring Program (SWAMP). The costs for implementing the three sites to be implemented by the Permittees would be offset by reducing the Permittees existing dry weather triad monitoring events (three stations) from twice a year to annually.

Development of a LID Manual (Section 7.2.2.1)

The Permittees have committed to develop a Low Impact Development (LID) Implementation Manual based on the LID Manual currently being developed by the SMC and CASQA.

Hydromodification Management Plan (Section 7.2.2.2)

The Permittees have committed to develop a revised hydromodification management plan based on the findings of the final SCCWRP Hydromodification Management report currently under development.

Participate in a Watershed Based TMDL for the Santa Margarita Lagoon (Section 6.4.4.7)

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon watershed-based TMDL has been withdrawn. As described in Section 3.4, economic conditions are also impacting the Permittees' funding sources and the Permittees are struggling to maintain sufficient resources to fund their existing compliance programs. Therefore, the Permittees cannot currently support committing additional funds toward a third party TMDL effort. The Permittees are, however, agreeable to discussing with the Regional Board a elimination or reduction of various required compliance activities that are not measurably enhancing the their ability to attain Water Quality Standards, which in turn could allow the Permittees to redirect some of their existing resources into the third party TMDL effort. Some program elements that could be considered for discussion are described in Section 6.4.4.7.

Pyrethroid Pesticide BMP Implementation

The Permittees have committed to implementing several BMPs to address possible urban sources of pyrethroid pesticides. In addition the Permittees have committed to working through CASQA to facilitate regulatory change in pyrethroid pesticide use to curtail potential causes of receiving water impairment.

Adjustments to the Monitoring Program

The Permittees have proposed additional revisions to the monitoring program to streamline implementation and increase its utility.

2.0 Introduction

The Regional Board adopted Order No. R9-2004-001 (NPDES No. CAS0108766), an area-wide NPDES MS4 permit (2004 MS4 Permit) on July 14, 2004. This ROWD is a required component for renewal of the 2004 MS4 Permit. The 2004 MS4 Permit authorizes discharges of Urban Runoff from the MS4 owned and operated by the Permittees.

Capitalized terms used in this ROWD are defined in the glossary of the Riverside County DAMP. The Riverside County DAMP serves as the model compliance document used by the Permittees to develop the Watershed and Individual SWMPs. To save costs and increase the effectiveness of the MS4 Permit compliance programs, the Permittees will maintain the Riverside County DAMP as the primary document that describes Permittee compliance programs. The Permittees individual and regional compliance programs are then described in more detail in the Individual and Watershed SWMPs.

This ROWD has been written and formatted to address the requirements outlined in United States Environmental Protection Agency (USEPA) *Interpretative Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems* contained in the Federal Register, Volume 61, page 41698 (61 FR 41698), and to include commitments made in the various compliance documents, annual reports and in meetings with the Regional Board.

Additionally, as discussed in the meeting with Regional Board staff on September 9, 2008 and as supported by the above mentioned USEPA guidance, this ROWD relies on the fourth year Annual Reports to document the programs implemented by the Permittees. The fourth year Annual Report also includes a comprehensive evaluation of Permittee monitoring data to date and includes preliminary recommendations for Permittee compliance programs based on that data. As part of the ROWD process, the Permittees have reassessed their existing programs that are described in the Annual Reports, the monitoring conclusions and program recommendations contained in the fourth year Annual Reports, and in this ROWD, are making additional recommendations for revisions to improve the efficiency and effectiveness of these programs at improving and protecting the quality of our Receiving Waters.

The following sections of the ROWD are summarized as follows:

Section 3.0 - Information about the Permittees, their legal authority to implement the existing and proposed programs, the Permit Area, and the Permittee's funding sources and economic outlook relative to continued funding of the MS4 Permit compliance programs.

Section 4.0 – Information about the upper Santa Margarita River watershed, including physiography and geology, hydrology, climate, population, land use, surface water bodies and their Beneficial Uses and Impairments, and the MS4. This information provides context for the MS4 Permit compliance program in the Santa Margarita Region.

Section 5.0 – An overall evaluation of the Permittees existing programs based on water quality data collected to date and proposed compliance program modifications.

Section 6.0 – Evaluation of regional compliance programs, including a summary of accomplishments and proposed program revisions.

Section 7.0 – Evaluation of compliance programs individually implemented by the Permittees, including a summary of accomplishments and proposed program revisions.

3.0 Applicant Information

3.1 Permittee Contact Information

Table 1 provides the contact information for each of the Permittees in the Santa Margarita Region.

Table 1. Permittee Contact Information

	Primary Contact	Staff Contact	Address
District	Warren D. Williams General Manager, Chief Engineer 951.955.1275	Jason Uhley Engineering Project Manager 951.955.1273 juhley@rcflood.org	1995 Market Street Riverside, CA 92501

3.2 Statement of Legal Authority

The Co-Permittees have adopted ordinances regarding the management of Urban Runoff. The ordinances provide the Permittees with the legal authority to implement the requirements of the 2004 MS4 Permit and 40 CFR Section 122.26(d)(2)(i)(A-F). The Permittees also provided certification of adequate legal authority to comply with the 2004 MS4 Permit and to implement the Riverside County DAMP to the

[1] As the Cities of Menifee and Wildomar are recently incorporated, the County of Riverside is currently handling their stormwater and MS4 permitting issues. Once these cities are fully established and staffed, updated contact information will be provided to the Board. The cities will assume responsibility for their programs on October 1, 2009.

Regional Board. However, it is noted that the newly incorporated cities of Menifee and Wildomar will submit their certifications following adoption of the updated MS4 Permit.

However, there are limitations to the authority the Permittees have for enforcement actions. The Permittees do not have legal authority over discharges into their respective MS4 facilities that originate from agricultural activities, state and federal facilities, utilities and special districts, Native American tribal lands, wastewater management agencies and other point and non-point source discharges otherwise permitted by, or under the jurisdiction of, the Regional Board or USEPA. Examples of non-point sources of Pollutants not under the control of the Permittees include materials from operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

Also, the Permittees do not have the authority to enforce the provisions of California's General Permit for Storm Water Discharges Associated with Industrial Activities (General Permit-Industrial) or California's General Permit for Storm Water Discharges Associated with Construction Activity (General Permit-Construction). The State Water Resources Control Board (State Board) issues these NPDES permits, and neither the State Board nor the Regional Board has the authority under the Clean Water Act to delegate responsibility for administering these NPDES permit programs to the Permittees. However, the Permittees' local storm water and erosion control ordinances may address items similar to those identified in these statewide NPDES permits.

3.3 Permit Area

The Permit Area is defined as the urbanized area serviced by the Permittee's MS4 facilities. The Permit Area is located within the area delineated by the County boundary line on the south and the limits of the jurisdiction of the San Diego Regional Board on the north, east, and west. It is important to recognize that the Clean Water Act exempts agricultural activities from regulation under NPDES and the Permittees do not have legal jurisdiction over storm water discharges into their MS4 facilities from:

- California and federal facilities,
- Areas under the jurisdiction of San Diego County,
- Utilities and special districts, and
- Native American tribal lands.

These areas are not included in the Permit Area. In addition, other point and non-point source discharges otherwise permitted by or under the jurisdiction of the Regional Board or USEPA may affect water quality in the Murrieta and Temecula Creek watersheds.

The area of Riverside County under the jurisdiction of the Regional Board is less than 8 percent of the 7,300 square miles within Riverside County. Of the 27 municipalities within the whole of Riverside County, only five include areas under the jurisdiction of the Regional Board.

3.4 Funding Sources and Economic Projections

3.4.1 Funding Sources

The costs incurred by the Permittees in implementing the SWMPs fall into two broad categories:

- **Shared Costs**. These are costs that fund activities performed mostly by the District under the Implementation Agreements. These activities include coordinating the overall storm water program, coordinating other interagency cooperative efforts such as the Compliance Assistance Program (CAP), participating in CASQA activities, representing Permittees at meetings of the Regional Board or State Board and other public forums; preparing and submitting compliance reports and other reports required under the MS4 Permit, conducting Urban Runoff monitoring and public education outreach programs, responding to Water Code Section 13267 requests, providing other program documentation, and coordinating consultant studies, Permittee meetings, and training seminars.
- **Individual Permittee Costs for Individual SWMP Implementation**. These are costs incurred by each Permittee for implementing within its jurisdiction the BMPs (drainage facility inspections for illicit connections, drainage facility maintenance, drain inlet/catch basin stenciling, emergency spill response, street sweeping, litter control, public education, construction activity inspection, development of implementation plans, etc.) comprising the Individual SWMPs.

Historically, the Permittees have employed several funding methods to finance their MS4 Permit compliance activities. Unfortunately, the mortgage crisis, collapse of the housing market, and the economic recession has resulted in the cessation of virtually all development activity and has significantly reduced property and sales tax revenue. Property tax revenues have been reduced by the high level of foreclosure activity, reduced property values and a significant decline in assessed valuations. Property tax revenues have been further reduced by homeowner requests for reassessments to reflect the reduced property values. The impact of these economic conditions on the Permittees in the Santa Margarita Region has been particularly severe. As a result, the aggregate funding available to the Permittees has been severely reduced, and it is anticipated that this condition will continue well into and possibly throughout the next Permit term. The funding methods historically used and the effects of the economic situation on the availability of funds through these sources are summarized as follows:

- **Santa Margarita Watershed Benefit Assessment Area**. In 1991, the District established the Santa Margarita Watershed Benefit Assessment Area to fund its MS4 Permit compliance activities. Currently, the Benefit Assessment revenues fund the District's share of the area-wide MS4 Permit program activities and the District's individual compliance activities as a Permittee. Under the Benefit Assessment each parcel is taxed based on the impervious area of each parcel at a set rate established by District Ordinance 14. This rate has not been increased since 1991 due to Proposition 218. In 2007/08 the Santa Margarita Benefit Assessment generated approximately $410,000 dollars in revenue.

  Outlook: The District expects at best to maintain, if not see temporary reductions in Benefit Assessment revenues due to the significant number of homes that are not paying property tax due to foreclosure. Pursuant to Article 13.D of the California Constitution, an increase in the established Benefit Assessment rate to compensate for these reductions requires approval of 2/3

of the voters or 50 percent of the property owners and is highly unlikely given the current economic climate. Revenues will not increase until the development industry recovers.

- **General Fund /Other Revenues**. The County and the cities utilize general fund revenue to finance most of their MS4 Permit compliance activities. General fund revenue is generated by property tax, sales tax, and auto license taxes.

  Outlook: The Permittees expect a continued reduction in th**e funds** available through General Fund / Other Revenues through at least FY 2009 /2010. Although optimistic that conditions will begin to stabilize toward the end of 2009, the Permittees cannot speculate as to when revenues will recover to previous levels.

- **Fees**. Several Permittees charge fees for services such as inspections, plan check, and other recoverable costs related to compliance with the 2004 MS4 Permit. These fees cover both the direct and indirect costs associated with conducting these inspections/reviews including associated compliance tracking and reporting.

  Outlook: It is notable that, with the virtual collapse of the development industry in the Santa Margarita Region, the fees received by the Permittees have been significantly reduced. With this reduced level of fee-based income, maintenance of the existing inspection and plan review programs will place an increased burden on overall funding of the compliance programs. The Permittees do not expect revenues from fees to recover until the development industry recovers. Even with recovery of the development industry, it is anticipated that over the long-term, revenues from fees will be reduced for the City of Temecula and the County due to the reduced area remaining for development within their jurisdictions.

- **Grants.** The Permittees have actively pursued and, as available, used Grants to fund compliance programs.

  Outlook: In December the state's budget crisis resulted in a directive to state agencies from the Department of Finance to halt projects that rely on bond funds, including those funded by Prop 40, Prop 50, or Prop 84. The State of California is the primary source of grant funding for water quality projects. Future availability of funds to resume grant-funded projects is uncertain.

It is clear that the current economic climate and that of the foreseeable future is creating a significant burden upon the Permittees that will make the continuance of all existing MS4 Permit compliance programs increasingly difficult. New funding sources or alternative combinations of funding sources will likely be required to ensure continued funding of even the current MS4 Permit compliance programs.

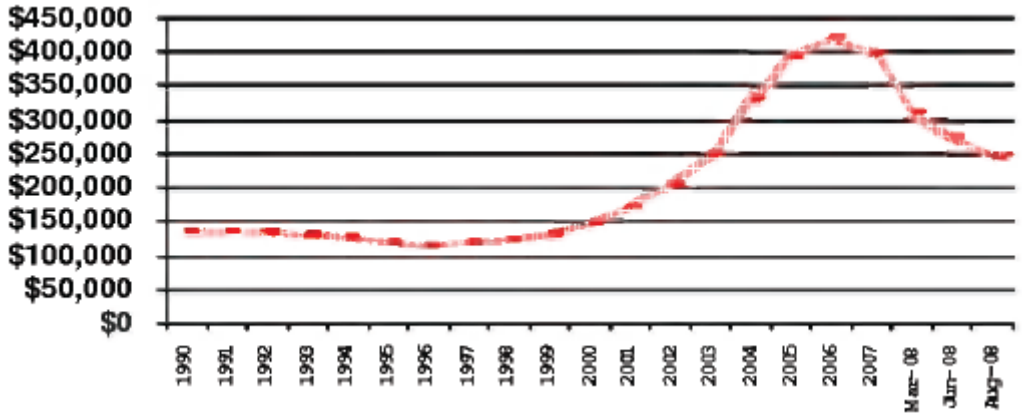
3.4.2 Economic Projections

According to Chicago Title, Southwest Riverside County has experienced a very significant increase in supply of single-family residential units on the market. As a result, housing price indicators are very negative. In the majority of the Southwest Riverside submarket, the pending price is less than the closing price indicating general price weakness. The October, 2008 count of bank owned (REO) properties for Riverside County as a whole was 12,078. The number of home in foreclosure was 23,480. The presence of high levels of REO properties will continue to negatively affect home prices. In addition, the level of foreclosures is increasing.

With regard to other sectors of the economy, Riverside County has taken a serious turn for the worst in 2008, with projections indicating that the severe downturn will continue through 2009 at the very least.

The economic difficulties being faced in the Southwest Riverside submarket is the result of the dramatic downturn in the housing market in this area, the national financial turmoil, the worldwide credit crisis, and the increasing consumer debt crisis. According to Beacon Economics, a respected economics consulting firm in Los Angeles, Inland Southern California is clearly at the epicenter of this economic turmoil, with extremely high rates of unemployment at present. Unemployment rates in Inland Southern California are expected to reach 12.4 percent before this deep recession is over. Housing prices are expected to continue their precipitous decline from their peak levels in the two Inland Southern California counties through at least 2011. According to Dataquick, median home prices in Riverside County peaked at $415,000 in January 2007. At the end of this cycle, the median home price in Riverside County is expected to be $198,000. Figure 1 depicts the median housing price in Riverside County over the period 1990 to August 2008.

Figure 1. Riverside County Median Housing Price (1990 – August 2008)

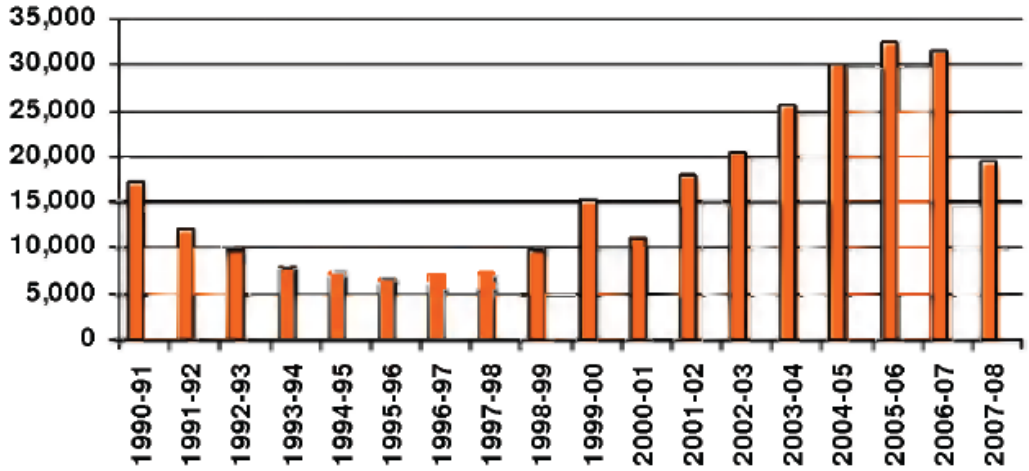


Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 14.

Local Government sales tax revenues remained fairly stagnant through 2006 and began to decline in early 2007, according to Beacon. By the second quarter of 2008, taxable sales in Riverside County declined by 7.7 percent. The decline is expected to continue with taxable sales possibly bottoming out by 2010. Recovery of these reduced revenue streams will likely not occur within the next permit term.

As a direct outcome of the current economy and the economic outlook into the next MS4 Permit term, the number of New Developments proposals has plummeted and any significant rebound is not forecast. New and redevelopment projects will likely remain minimal. As shown in Figure 2, the number of housing units being added each year has dropped below the levels seen at any point in time during the 2004 MS4 Permit. These numbers will likely continue to decrease for a significant portion of the new MS4 Permit term.

Figure 2. Riverside County Housing Units Added (1990 – 2008)



Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 12.

These economic issues and projections directly affect and limit both:

1. The need for including enhanced new and re-development requirements in the new MS4 Permit, and
2. The Permittees ability to fund, and even seek new funding sources for additional MS4 Permit requirements for new and re-development projects.

Therefore, as described in Section 7.2, the Permittees are not recommending and cannot financially support any significant increases to their Development Planning activities. Permittee specific projections are as follows:

3.4.2.1 County of Riverside

The County is operating with a structural deficit of $12 million and plans a 25 percent budget reduction from FY 2008/2009 through FY 2011/2012. The County's current budget of $4.7 billion represents a 5 percent reduction from the previous year and next year's budget is expected to be cut by 10 percent. These cuts are directly associated with the overall decline in property values and the high number of foreclosures. There are concerns about having to use discretionary funds to meet State mental health and social service mandates. In addition, the County is dependent on funds from federal and state sources. If during this time of economic crisis federal and state funding sources are reduced or eliminated, any unfunded State and Federal programs will be terminated. Only core County programs will continue.

The primary source of general fund revenue is from property taxes and sales tax. With the unprecedented number of foreclosures, reduced property values, and declining sales tax revenue, general fund revenue is in a downward spiral. Another source of funding is through the Solid Waste Tipping Fees paid at the County landfills. Volume is down 15 percent since 2006 with anticipated downward trend to 40 percent reduction in solid waste through 2014. Programs that are partially funded through tipping fee allotments will be impacted. Due to the declining economy the recycling market has collapsed. Virtually no recyclable materials are being shipped for reprocessing. This loss of revenue and increased disposal costs is further impacting the general fund.

Cuts of 25 percent for all Net County Cost general fund programs will translate into reduction of County services and elimination of unfunded state and federal programs. Only core value programs will be provided (including public safety and fee programs)

The County has instituted a hiring freeze and required each department to create a report outlining the projected effects of the budget cuts. The County currently employs over 20,000 people, and layoffs are expected to result from the findings of these departmental reports. It is anticipated that this will impact program delivery for stormwater related activities. No County department will be able to sustain current staffing levels as they try to meet the 25 percent budget reduction strategy.[2] [3]

3.4.2.2 City of Menifee

The newly incorporated City of Menifee FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements during the first year of incorporation which expires October 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

3.4.2.3 City of Murrieta

The City of Murrieta's FY 2008/2009 budget did not increase compared to FY 2007/2008. Adjustments were made to reflect less revenue and to absorb any operating costs. However, budget cuts are anticipated for FY 2009/2010 because the immediate economic outlook is not good. There have been approximately 2,000 home foreclosures within the City. Sales tax revenue is estimated to drop 12.5 percent, property tax revenue will drop, and the State took approximately $525,000 out of redevelopment funds. Murrieta did not receive any vehicle licensing fees from the State and it appears likely that the State will take more revenue from the Cities to solve its budget problems. New NPDES requirements that increase compliance costs will create a financial hardship for the City.

3.4.2.4 City of Temecula

Various ongoing tax and investment revenues adopted in the City of Temecula's FY 2008-09 general fund revenues are projected to decrease from FY 2007-08. Sales and use tax revenues are expected to decrease in FY 2008-09 compared to FY 2007-08. This decrease is primarily the result of the decline in general consumer goods, electronic retail, and auto sales. Property tax revenue is also expected to decrease due to decreases in supplemental tax receipts attributed to the impact of the housing crisis. Investment interest revenue is also anticipated to decrease due to a decline in interest rates.

As a result of the 2008/2009 State budget, Temecula's redevelopment agency will have to shift existing funds from property taxes to the State's Education Revenue Augmentation Fund coffer for schools and

[2] "The Realities of Recession in California: A Statewide Report by U.S. Senator Barbara Boxer, December, 2008, p. 18.

[3] Riverside County Executive Office, January, 2008.

colleges. As such, the amount due from the Temecula Redevelopment Agency is expected to be $898,685. As the State of California continues to address its budget deficit, the City of Temecula faces the possibility of additional revenue shifts to State coffers, further losing future revenue streams and threatening existing service levels.

In addition, a Press-Enterprise article dated December 9, 2008, reported that "Between 25 and 30 part-time Temecula employees will be without work in the new year as City officials deal with a lack of revenue and less work to go around." Furthermore, "the city is not immune to the economic slowdown, which has forced its neighbors to lay off workers and slash spending to counter drops in sales tax receipts and building permit fees. In May, the City's Finance Director reported that revenues were down $3 million compared to two years ago."

With these current and projected reductions in revenue and staff, additional requirements in the MS4 Permit or upcoming TMDL-related requirements, without any corresponding cost-equivalent offsets, will exceed the City's ability to effectively implement these new requirements and will begin to compromise the City's existing efforts to manage the existing MS4 Permit requirements.

3.4.2.5 City of Wildomar

The newly incorporated City of Wildomar FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements the first year of incorporation that expires July 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

4.0 Overview of the Upper Santa Margarita River Watershed

4.1 Physiography and Geology

The upper Santa Margarita River watershed is defined as that portion of the Santa Margarita River watershed above the confluence of Murrieta and Temecula Creeks and includes the City of Temecula and portions of the Cities of Menifee, Murrieta, Wildomar, unincorporated County areas, portions of the Cleveland and San Bernardino National Forests, the Cahuilla, Ramona, Pauma, and Pechanga Indian Reservations and properties under the jurisdiction of Caltrans and a variety of special districts. The watershed is bounded by several mountain ranges, including the Santa Ana and Santa Margarita mountains to the North and the Palomar Mountains to the South. The upper Santa Margarita watershed includes areas in Riverside and San Diego Counties and encompasses approximately 588 square miles.

The upper Santa Margarita watershed includes two major sub-basins, drained by Temecula and Murrieta Creeks. Temecula Creek has a drainage area of 366 square miles, with steep rugged topography in the Palomar and Thomas Mountain areas and rolling hills below. The upper 316 square miles of this basin is controlled by Vail Lake (completed in 1949). Murrieta Creek has a drainage area of 222 square miles, with over 50 square miles controlled by Skinner Reservoir (completed in 1974). Although the watershed area is somewhat smaller and less rugged than the Temecula Basin, flood flows have the potential to create greater damage as they flow through the Cities of Temecula and Murrieta.

Temecula and Murrieta Creeks join along the Elsinore fault zone at the head of Temecula Canyon to form the Santa Margarita River. The Temecula Canyon is approximately five miles long, and is a steep, narrow, and rocky canyon. The San Diego-Riverside county line crosses through the Temecula Canyon. From here, the river traverses 27 miles to the Pacific Ocean.[4]

4.1.1 Watershed Characteristics

Over 50 percent of the Santa Margarita watershed has been controlled by the construction of Vail Dam in 1949 and Skinner Reservoir in 1974, which created a significant storage capacity in the upper watershed.[5] [6] 52 percent of the upper Santa Margarita River watershed is controlled by the dams. Due to this storage capacity, peak flow rates during major flow events for both existing and future land use conditions will be lower than under natural conditions.[7] [8]

[4] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 1.

[5] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 14.

[6] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 14.

[7] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 20.

[8] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 20.

4.1.2 Stream Flow Characteristics

Murrieta and Temecula Creeks are perennial interrupted streams, i.e., they include reaches in which the flow is continuous and others where flow is ephemeral. The areas of perennial flow are located in mountain area tributaries outside of the urbanized areas serviced by the MS4s. The perennial flows disappear by seepage into the sands and gravels and resurface upstream of the confluence of Murrieta and Temecula Creeks. The creeks in the urbanized areas of the watershed, located primarily in the valley, are ephemeral and flows are only observed during and immediately after significant storm events. During major storms, after initial wetting, periods of intense rainfall result in rapid increases in stream flow in steep foothill and mountain areas.[9] "Runoff in streams in the watershed is derived primarily from rainfall, and as a result, stream flows exhibit monthly and seasonal variations similar to those shown by the precipitation records. Absence of snow pack in the tributary watershed results in a rapid decrease in flow of streams at the conclusion of the winter precipitation season. Following severe storms, discharge in the larger streams often increases in a few hours time from practically no flow to a rate of thousands of cubic feet per second. Stream flows vary greatly from month to month and from season to season."[10]

Rising groundwater is currently observed in Murrieta Creek below its confluence with the Santa Gertrudis Channel. This is consistent with the observations with the rising groundwater conditions observed by the State of California in 1956.[11] Rising groundwater is also observed in Temecula Creek approximately one quarter mile upstream of the Interstate 15 bridge. In 1956, the State of California observed more extensive rising groundwater conditions occurring as far upstream as the Highway 79 bridge. Based on the virtual absence of non-storm water flows and the rising groundwater conditions in lower Murrieta and Temecula Creeks observed prior to development of the watershed, there is no evidence that the rising groundwater is due to Urban Runoff nor that Urban Runoff has affected the quality of rising groundwater. However, use and disposal of reclaimed water and agricultural and landscape irrigation in the watershed may affect groundwater quality. Until October 2002, the Rancho California Water District augmented the flow of the Santa Margarita River with reclaimed water at a point about five miles upstream from the Temecula gauging station. Since that time, the Rancho California Water District has diverted reclaimed water to the Santa Ana watershed and instead discharged imported water at a location downstream of the confluence of Murrieta and Temecula Creeks in order to meet water supply obligations to Camp Pendleton.

For the average annual event, it is estimated that approximately 89 percent of the volume of runoff in the Santa Margarita Region is due to non-urban land uses not regulated under the federal storm water program. For the 100-year 24-hour event, 93 percent of the volume of runoff will be due to non-urban land uses. These estimates are based on the assumption that precipitation is constant across the watershed. However, precipitation (and resultant runoff volumes) in the non-urbanized upland areas is as much as four times greater than that from the urbanized valley areas.[12]

[9] Riverside Flood Control and Water Conservation District, "Hydrologic Data for 1975-76 Season," March 1982, p. 49.

[10] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 48.

[11] State of California Department of Public Works Division of Water Resources, Bulletin No. 57, "Santa Margarita River Investigation," Volume I, June 1956, p. 48.

[12] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11

4.2 Climate

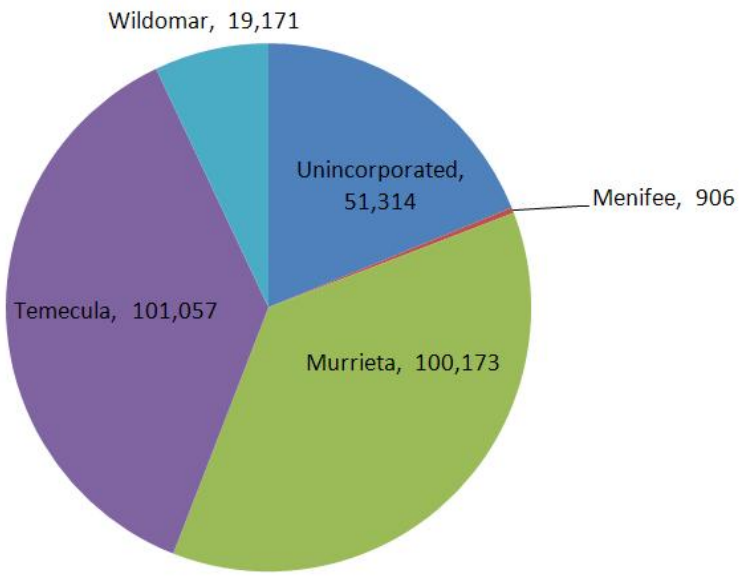
"The climate of the Santa Margarita River watershed is typically Mediterranean, being characterized by warm dry summers and cool rainy winters. About 75 percent of the precipitation occurs during the four-month period from December through March. Mean annual depth of precipitation ranges from less than 10 inches near Vail Reservoir to over 40 inches west of Palomar Observatory, varying with elevation and topographic influences."[13] Precipitation increases with increases in elevation to the summit of the Coastal range. Shading effects of the Coastal range lead to a marked decrease of precipitation throughout the lower portions of the Inland area. Precipitation increases again farther away from the Coastal range in the northeastern area of the Inland area.[14] The significant and varied orographic features also make rainfall prediction particularly challenging in the urbanized portion of the watershed.

4.3 Population and Land Use

4.3.1 Population

The California Department of Finance estimates that as of January 1, 2008, the total population of Riverside County was about 2,088,322. Of the 2.1 million people, approximately 272,621 persons (or 13 percent) reside within the portion of Riverside County under the jurisdiction of the San Diego Regional Board. As shown in Figure 3, approximately 51,314 persons[15] reside in the unincorporated area while approximately 221,307 persons reside within the cities of Menifee, Murrieta, Temecula and Wildomar.

Figure 3. Santa Margarita Region Population by Permittee (2008)



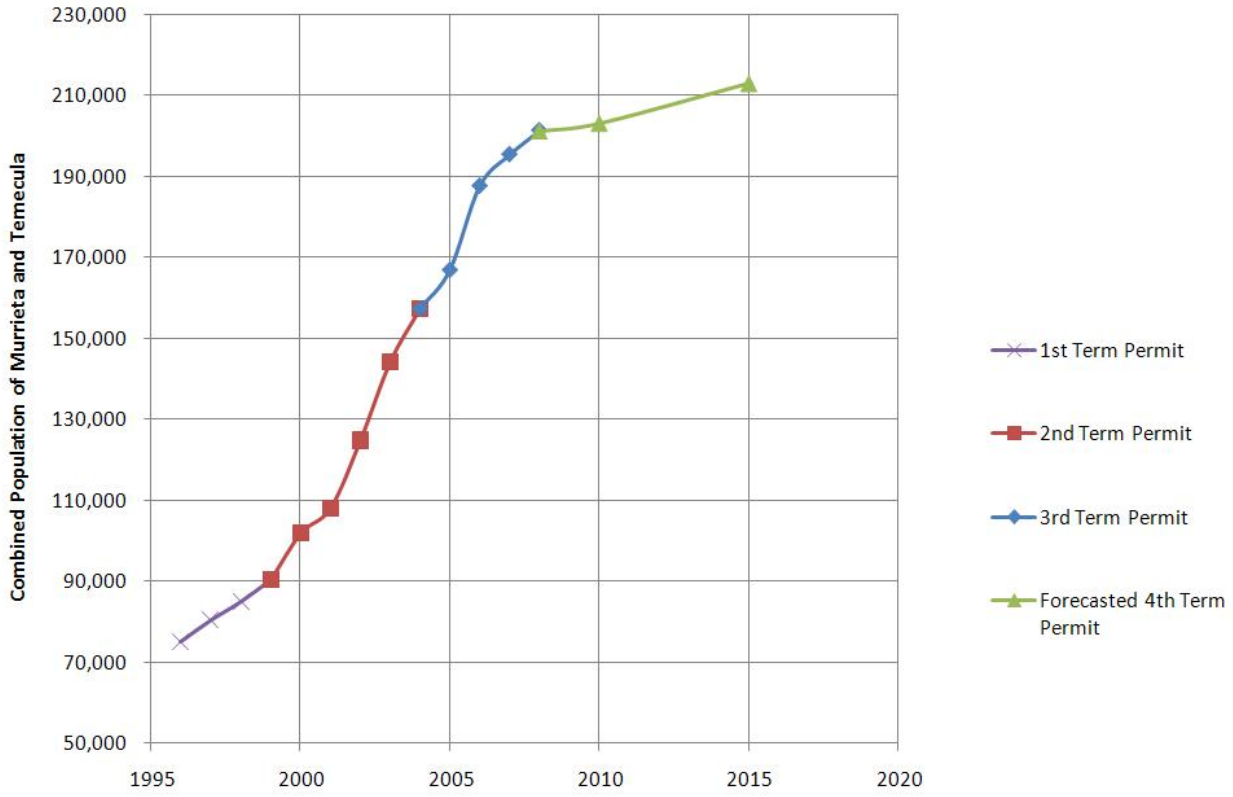
[13] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11.

[14] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 38.

[15] Population estimate for the portion of unincorporated Riverside County within the Santa Margarita River watershed developed by the County TLMA GIS Demographics Unit based on the 2000 Census.

Although the second term and 2004 MS4 Permits covered a period of time that saw a significant amount of growth, due to the current and foreseeable economic conditions described in Section 3.4.2 of this report and decreasing areas available for development, growth during the next MS4 Permit term will be quite limited. In fact, the projected growth rate through 2015 will be significantly less than has been seen since the early 1990s. Figure 4 shows the combined populations of the Cities of Murrieta and Temecula since 1997 and projected through 2015. Similar trends are expected for the unincorporated areas and the portions of the cities of Wildomar and Menifee within the watershed.

Figure 4. Cities of Murrieta and Temecula Combined Population (1997 – 2015)



Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pgs 92 & 124.

Figure 4 clearly demonstrates the dramatic reduction in growth that is expected for the term of the next MS4 Permit when compared to previous permit terms.[16] Establishing trend lines for the population in these cities further demonstrates that the growth rate (population added per year) will be lower than the previous growth rate by approximately 86 percent.

[16] 2008 Riverside County Progress Report

Table 2 shows population projections for the all of the Permittees into the year 2015.

Table 2. Population of Santa Margarita Region Co-Permittees

Co-Permittee	Year			Change (2009 to 2015)
	Estimate 2008 (a)	Estimate 2009 (b)	Projected 2015 (b)	
City of Menifee	906[c]	927[c]	5,232[c]	464%
City of Murrieta	100,173	102,277	109,715	7.3%
City of Temecula	101,057	101,356[d]	103,150	1.8%
City of Wildomar	19,171[c]	19,589[c]	20,127[c]	2.7%
Unincorporated County of Riverside	51,314[c]	52,436[c]	53,793[c]	2.6%
Total	272,621	276,585	292,017	5.6%

Notes:

(a) Unless otherwise noted, populations were obtained from the State of California, Department of Finance, E-4 Population Estimates for Cities, Counties and the State, May 2008.

(b) Unless otherwise noted, projected populations were obtained from Riverside County Center for Demographic Research. Riverside County Progress Report, 2008

(c) Data provided by County of Riverside, Executive Office.

(d) Data provided by City of Temecula.

Since the District is not a general purpose government, it is not included in this listing. Although the current population of the City of Menifee in the Permit Area is small, it is anticipated that the population will increase as it annexes unincorporated areas. Similarly, it is anticipated that the cities of Murrieta and Temecula will gain population as they annex unincorporated areas. It is not anticipated that Wildomar will see significant population increases as it is bounded on all sides by other cities and lands reserved under the MSHCP.

4.3.2 Land Use

Land uses in Riverside County within the Santa Margarita Region include open space, residential, commercial, light industrial, heavy industrial, and agriculture. The agricultural land uses include row crops, nurseries, citrus groves and vineyards, dairies, ranches, poultry and hog farms, and other agricultural related uses with one single-family residence allowed per 10 acres (County of Riverside General Plan, Land Use Element 2003). The conversion of agricultural lands and open space to other "developed" land uses has been ongoing and will continue, although at a much lower rate than previously experienced. Land uses in the Santa Margarita Region are shown in Table 3. These land uses are based on the County of Riverside Assessor Parcel Data, current as of February 2006. It should be noted that the land uses below represent ***zoned*** land uses rather than ***actual*** land uses. This overstates the actual area of urban land use in the Santa Margarita Region. Also, changes in zoning designations can cause odd fluctuations in year-to-year date.

A map of the zoned land uses is provided in Appendix A.

In 1956, only 0.3 percent of the Santa Margarita River watershed (less than two square miles) was urbanized.[17] Although there has been a significant rate of growth in population relative to the State and

[17] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956.

neighboring counties, half a century later, approximately 88 percent of the Santa Margarita River watershed remains as non-urban land uses (rural residential, agriculture, preserves and open space, state lands, federal lands, and tribal lands). Further, almost one-third of the upper Santa Margarita River watershed consists of federal, state, and tribal lands that are not under the jurisdiction of the Permittees' MS4 programs. It is projected that the population of Riverside County will increase approximately 5.6 percent by 2015. If the urbanized area increases proportional to population, 87 percent of the upper Santa Margarita River watershed would remain in non-urban land uses in 2015.

Table 3. 2009 Santa Margarita Region Land Uses

Urban Land Use	Acreage[(a)]	% of Land Use Subtotal	% of Total Land Use
Commercial	8,339	20.0%	2.5%
Industrial	963	2.3%	0.3%
Urban Residential (< 1 acre)	12,656	30.4%	3.7%
Parks & Recreation Facilities	4,291	10.3%	1.3%
Streets & Roads	15,439	37.0%	4.6%
Subtotal – Urban Land Use	41,688		12.3%
Non Urban Land Uses			
Preserves & Open Space	54,141	18.2%	16.0%
Rural Residential (> 1 acre)	106,773	35.9%	31.5%
Agriculture	36,389	12.2%	10.7%
Federal/State/Tribal Lands/Non-County Jurisdiction	100,076	33.7%	29.5%
Subtotal Non Urban Land Use	297,379		87.7%
Total Urban & Non Urban Land Use	339,067		100%

(a) As reported in the FY 2007/2008 Watershed Annual Report.

4.3.3 Conserved Lands

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) was adopted in June of 2003. It is a comprehensive, multi-jurisdictional Habitat Conservation Plan focusing on conservation of species and their associated habitats in western Riverside County. The MSHCP is one of several large, multi-jurisdictional habitat planning efforts in southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP will allow Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts. Further, as floodplains and streams tend to support critical habitat, the MSHCP will preserve many of the remaining natural streams and establish significant buffer areas between those systems and urban land uses.

Much of the remaining non-urbanized lands in the Santa Margarita Region will ultimately be incorporated into the MSHCP. The MSHCP will result in a conserved area in excess of 500,000 acres and focuses on conservation of 146 species. The MSHCP Conservation Area includes approximately 347,000 acres on

existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. A large portion of the conserved lands are in the upper Santa Margarita watershed (at least 145,000 acres). There are approximately 72,318 acres of existing public or quasi-public lands preserved within the upper Santa Margarita River watershed area located in Riverside County.

4.3.4 Anticipated Development 2009-2015

Proposed development during the next MS4 Permit term is an important indicator of potential new Urban Runoff sources. To the extent possible, the Permittees have identified significant New Development projects that, if constructed, will result in the conversion of primarily undeveloped land to developed land. This section describes the expected development within Permittee cities. Consistent with the current and forecasted economic conditions and population estimates, and as supported by the population information and forecasts presented in Section 4.3.1, the Permittees anticipate that the term of the upcoming MS4 Permit will be a time of little development. Following are summaries of anticipated development during the upcoming MS4 Permit.

4.3.4.1 County of Riverside

Projected trends for the County of Riverside's land use can be referenced in the Riverside County General Plan. Maps depicting the areas of future development and type of land use can be found in the General Plan maps that are accessible at http://www.rctlma.org/generalplan/area_maps.html.

- With the incorporation of the cities of Wildomar and Menifee the remaining unincorporated County area to be built out in the Santa Margarita Region during the upcoming MS4 Permit term is going to be considerably smaller.
- It is anticipated that, over the next five years, additional annexations will occur in each of the four city areas (Temecula, Murrieta, Wildomar and Menifee) that will further reduce the unincorporated County area in the Santa Margarita Region.
- The unincorporated County area in the upper Santa Margarita River watershed (east of Temecula, Menifee and Murrieta) will remain in rural, open space and additional MSHCP land uses. In addition, due to drought conditions and depletion of aquifers the prospects of New Development is unlikely. Water districts in the region cannot offer "will serve" letters to provide for water resources they do not have. Infrastructure for water supply and municipal water treatment, MS4 and flood control facilities are virtually non-existent in this area.
- Due to downturn in economy, Development Impact Fees (DIF) and Transportation Uniform Mitigation Fees (TUMF) are and will continue to be significantly under funded. This reduction in transportation funding will result in fewer road and infrastructure projects during the term of the upcoming MS4 Permit. The Transportation Department has projected limited projects for the Santa Margarita Region. The Clinton Keith Road widening project is still in the planning stages. Due to budgetary constraints, unless projects are fully funded through County finance mechanisms (TUMF, DIF, state and federal pass through from bonds and grants) most projects will be put on hold through 2012.

4.3.4.2 City of Menifee

Projected development trends for the City of Menifee are unknown, sphere of influence and annexation opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.3.4.3 City of Murrieta

The area north of Clinton Keith Road along the east side of the I-215 freeway should see some construction towards the end of the next MS4 Permit term. Grading for the construction of a hospital has started along the freeway and it is anticipated that supporting development will follow once the hospital is open. Overall the Planning Department is receiving few applications for New Development projects. For example, a Planning Commission meeting scheduled for January 2009 has been cancelled because there are no New Development items to discuss. In light of the current and foreseeable economic conditions, the City does not anticipate any substantial New Development activity for the next few years, with limited growth possibly resuming toward the end of the next MS4 Permit term.

4.3.4.4 City of Temecula

The City of Temecula is currently experiencing a significant leveling trend in development. Throughout 2008, fewer applications were being processed than in previous years. As such, Temecula does not anticipate processing any substantial number of New Development applications within the next MS4 Permit term. It is anticipated that applications from hereon will be limited to smaller in-fill and redevelopment projects. In addition, proposed annexation areas will be limited to areas that will be set aside mostly for conservation. As Temecula is on the verge of build-out, approximately 1 percent of developable land remains available throughout the City for New Development.

4.3.4.5 City of Wildomar

Projected trends for the City of Wildomar are unknown, sphere of influence opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.4 Surface Water Bodies, Beneficial Uses, and Impairments

Approximately eight percent of Riverside County drains into surface water bodies within the jurisdiction of the Regional Board. Those surface water bodies (or portions thereof) are listed in Sections 4.4.1 and 4.4.2.

Rivers and Streams

Santa Margarita River (Hydrologic Unit Basin Number 2.22)
- Murrieta Creek
  - Slaughterhouse Canyon
- Cole Canyon
  - Warm Springs Creek
    - Diamond Valley Reservoir
- Santa Gertrudis Creek
  - Tucalota Creek
  - Lake Skinner
- Temecula Creek (Hydrologic Unit Basin Number 2.92)
  - Iron Spring Canyon
- Temecula Creek (Hydrologic Unit Basin Number 2.84)
  - Tule Creek
    - Million Dollar Canyon
  - Cottonwood Creek
- Vail Lake
  - Wilson Creek
    - Cahuilla Creek (Hydrologic Unit Basin Number 2.73)
      - Hamilton Creek
    - Cahuilla Creek (Hydrologic Unit Basin Number 2.71)
      - Elder Creek
  - Arroyo Seco Creek
  - Kolb Creek
- Temecula Creek (Hydrologic Unit Basin Number 2.52)
  - Pechanga Creek

Santa Margarita River (Hydrologic Unit Basin Number 2.21)
- DeLuz Creek

4.4.1 Beneficial Uses

The upper Santa Margarita River watershed supports a variety of ecosystems and provides many Beneficial Uses (Table 4)[18]. The ultimate goal of the Riverside County DAMP and the Watershed and Individual SWMPs is to manage Urban Runoff in a manner protective of the Beneficial Uses of these Receiving Waters.

Table 4. Beneficial Uses of Receiving Waters
Upper Santa Margarita River Watershed

Beneficial Use	Murrieta Creek	Cole Canyon	Warm Springs Creek	Santa Gertrudis Creek	Long Valley	Temecula Creek	Santa Margarita River
Municipal and Domestic Supply	X	X	X	X	X	X	X

Warm Freshwater Habitat	X	X	X	X	X	X	X
Cold Freshwater Habitat							X
Wildlife Habitat	X	X	X	X	X	X	X
Rare, Threatened or Endangered Species							X

4.4.2 Current Water Quality Concerns and Issues

Urban Runoff discharged to MS4s in Riverside County ultimately flows to various surface water bodies (inland streams, lakes, and reservoirs) and typically carries Pollutants that originate from numerous dispersed and uncontrolled sources. Examples of Pollutants that may be present in Urban Runoff are fertilizer, heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals, and litter.

Because the upper Santa Margarita River watershed is large and has many land uses, the water quality concerns in sub-watersheds vary. However, each land use can potentially contribute Pollutants to nearby streams, rivers, and lakes. The infrastructure that supports people's activities (e.g., roads, parks, MS4, and wastewater collection and treatment facilities) may contribute to water quality concerns if not properly managed. Other sources of stormwater runoff, including agricultural areas, are exempt from the requirements of the NPDES permitting program established under the Clean Water Act. In addition, some Pollutants, such as total suspended solids, may be found at elevated levels in runoff from non-urban land uses. Further, certain activities that generate Pollutants present in Urban Runoff are beyond the ability of the Permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

[18] www.waterboards.ca.gov/rwqcb9/programs/

As required by Section 303(d) of the Clean Water Act, the State Board maintains a list all waters in the State that do not meet the Water Quality Standards established in the Basin Plans prepared by the Regional Boards for protection of Beneficial Uses. This list, referred to as the "303(d) List," details the Pollutant or stressor on each named water body, the potential source of Pollution, estimated affected area, as well as a priority for development of the associated TMDL. A TMDL is a plan that identifies how much Pollutant load a specific Impaired Waterbody can sustain without impacts to its Beneficial Uses. In addition to identifying the maximum Pollutant load, a TMDL is used to develop implementation plans to meet Water Quality Standards for a designated water body. Table 5 summarizes the 2006 303(d) List of Impaired Waterbodies within the upper Santa Margarita River watershed, as well as the year in which a TMDL is proposed for approval. No TMDLs have been established for Receiving Waters in the upper Santa Margarita River watershed.

Table 5. 2006 303(d) Listings for the Santa Margarita Region

Water Body	Pollutant	Potential Sources	Area Affected	Proposed TMDL Completion
Santa Margarita River (Upper)	Phosphorus	Urban runoff/storm sewers Unknown nonpoint source Unknown point source	18 miles	2019
Murrieta Creek	Iron Manganese Nitrogen Phosphorous	Source unknown Source unknown Source unknown Urban runoff/storm sewers Unknown nonpoint source Unknown point source	12 miles 12 miles 12 miles 12 miles	2019 2019 2019 2019
Temecula Creek	Nitrogen Phosphorus Total dissolved solids	Source unknown Source unknown	44 miles 44 miles	2019 2019

Table G-35 of Appendix G to the Annual Report 2007-2008 additionally identifies pyrethroid pesticides (bifenthrin and permethrin), bacteria (E. coli and fecal coliform), lead, and sediment (turbidity) as Pollutants of Concern in the upper Santa Margarita River watershed that warrant focused attention by Permittee implementation programs. These constituents have been detected intermittently or persistently at Triad and Tributary monitoring stations.

4.5 Municipal Separate Storm Sewer System

A map depicting the MS4 facilities owned and operated by the Permittees is provided in Appendix B.

5.0 Program Evaluation Based on Water Quality Trends

The overall effectiveness of the Permittees programs is assessed based on the analysis of water quality data obtained as part of the Consolidated Monitoring Program. Approximately 14 years of data have been collected through this program and have been cumulatively analyzed in the fourth-year monitoring Annual Report.

5.1 Inherent Limitations to Analyzing Water Quality Data

There are inherent limitations to analyzing water quality data from storm water. Storm water runoff is very different from mechanical wastewater or water treatment processes that usually incorporate water quality monitoring. Discharges from mechanical processes such as treated wastewater effluent and industrial discharges usually:

- Come from a single or a few readily identifiable sources;
- Are generally consistent in flow rate and chemical character from day to day; and
- Can be easily instrumented.

Conversely, Urban Runoff non-point source flows, such as those collected and analyzed as part of the MS4 Permit monitoring programs usually:

- Come from multitudes of unidentifiable or hidden sources, many of which are non-Urban in nature:
  - State, federal or tribal lands
  - Natural leaching of soils
  - Wildlife
  - Aerial deposition
  - Wildfires
- Vary widely in flow rate in response to precipitation events
- Vary widely in chemical character at any given moment due to:
  - Unidentified episodic issues related to natural phenomena
  - Magnitude of rainfall and extent of contributing area
  - Potential one-time illicit discharges that were not identified at the time of sampling
  - Unforeseen or unidentified consequences of changes in numerous land use policies (fire management, development, etc)
- Are subject to significant natural random variation; and
- Cannot be easily instrumented due to the wide variation in depth and velocity and associated impacts of natural or unnatural aggradation and degredation of natural stream beds.

Because ephemeral storm water flows are, by their very nature, particularly random in character, it may take many years before monitoring data trends can be detected or to determine the effectiveness of an

Urban Runoff control measure. Power analyses were conducted for fecal coliform, metals, and nutrients at the stations monitored in the Santa Ana Region during the 2005/06 reporting period. Power analysis is used to determine how many years of monitoring would be required to detect a given trend in the data. This tool was developed by the SCCWRP. Based on the results, for biennial monitoring, and having an 80 percent chance of detecting a change in concentration, it would take about 5-10 years of data collection to detect a change of 50 percent in concentration, 10-15 years of data to detect a 25 percent change, and 15-30+ years of data to detect a 10 percent change. It is expected that results would be similar for other parameters measured in the monitoring program in the Santa Margarita Region.

5.2 Focus Area Constituents of Concern

During the 2004 MS4 Permit term, monitoring data indicated that one or more receiving water samples have been found to contain the following constituents at levels that exceeded Basin Plan Objectives (BPO). As such they have been identified as constituents of concern.

- Nutrients (Ammonia as N, Phosphorus
- Pyrethroid Pesticides (Permethrin, Bifenthrin)
- Pathogen Indicators (E.coli, Fecal Coliform)
- Lead
- Turbidity (lab)

5.3 Analysis of Water Quality Trends

As discussed in the 2008 Santa Margarita Region Annual Monitoring Report, the results of the trend analysis and regression calculations indicate that there are no statistically significant trends in the water quality monitoring data. The lack of trends in the data presented in the Annual Monitoring Report contrasts with the rapid population growth over the same time frame. As discussed in the Annual Monitoring Report, population growth from 1990 to 2008 was approximately 300 percent for the Santa Margarita Region. This significant growth in population and resulting urban land use area contrasts sharply with the lack of statistically significant increases in concentrations of constituents of concern that would otherwise be expected in stormwater runoff from urbanized areas.

These results demonstrate and can be attributed to the effectiveness of the Permittees' programs at addressing the Focus Area Constituents of Concern, which are targeted and designed to prevent the discharge of these constituents into the Receiving Waters.

5.3.1 Recommended Compliance Program Modifications to Address Focus Area Constituents of Concern

Based on the analysis described above and in Appendix G of the 2008 Watershed Annual Report, no significant program modifications are necessary to continue to protect and improve the quality of the Receiving Waters.

Although the Permittees programs have been shown to be protective of Receiving Water quality, through continual evaluation of the programs being implemented and on-going water quality monitoring, additional measures are being proposed as part of this ROWD to address changing conditions and ensure

the ongoing effectiveness of the programs. Recommended changes to ensure the ongoing effectiveness of the Permittees programs are described in Sections 6 and 7 of this report.

6.0 Evaluation and Recommendations for Regionally Implemented Programs

6.1 Program Management

The District is the Principal Permittee for each of the three MS4 permits issued by the three Regional Boards that have jurisdiction in Riverside County. As Principal Permittee, the District performs management functions including coordination with the Regional Boards, preparation of compliance documents and Annual Reports, participation in studies and external cooperative efforts and dissemination of information to the Permittees. The Permittees implement some compliance programs that are common to all of the Permittees and which are implemented on a Countywide or regional basis to increase cost effectiveness and efficiency. Typically, the District also manages Countywide and regional programs.

6.1.1 Program Management Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit the following accomplishments were achieved.

- Updated the Implementation Agreement that sets forth the responsibilities of the Principal Permittee and the Co-Permittees.
- Revised the Riverside County DAMP to reflect requirements in the 2004 MS4 Permit, which served as a model document for the Permittees Watershed and Individual SWMPs.
- Developed Santa Margarita Region Watershed SWMP
- Participated in the Santa Margarita River Executive Management Team (SMREMT) to identify and address the highest priority water quality concerns in the Santa Margarita watershed, including development of a watershed model to assist with land use planning and TMDL development, coordinating watershed monitoring, and developing formal agreements between interested stakeholders for the purposes of evaluating impairment listing and data gaps in the watershed.
- Continued progress with the SMREMT on a uniform watershed plan and model for the Santa Margarita Watershed through the Santa Margarita Watershed Supply Augmentation, Water Quality Protection, and Environmental Enhancement Program.
- Participated in the Santa Margarita Lagoon TMDL workgroup in funding and overseeing the development of a comprehensive program to collect data and model the various inputs to the lagoon to be used to develop a TMDL to address nutrients.
- Participated in the Santa Margarita Watershed Water Quality Monitoring Group to coordinate the monitoring efforts of various stakeholders in the Santa Margarita watershed.
- Participated in the SMC to improve stormwater monitoring science, coordinate data collection efforts, and evaluate the effects of stormwater discharges to receiving waters specific to Southern California.
- Participated actively in various efforts of CASQA.

- Participated in the completion of an Integrated Regional Water Management Plan for the upper Santa Margarita Watershed to help pave the way for greater watershed-wide coordination and management of water resources within the upper watershed as a whole, as well as adjoining watershed and regional planning efforts.
- Participated in the development and implementation of the MSHCP for Western Riverside County which contains a comprehensive land use plan that ultimately conserves the environmental resources and habitat of approximately half of the Santa Margarita Region.
- Participated in the development of a Special Area Management Plan (SAMP) to further manage receiving waters at a watershed scale for the upper Santa Margarita Watershed by identifying, prioritizing and protecting the highest priority Waters of the U.S., while considering the broader needs of growth and transportation improvements.
- Developed and updated methods to track program effectiveness such as resident surveys, tracking hotline inquiries, and web counters.
- Enhanced Public Education program through development of new outreach materials and programs.

6.1.2 Proposed Revisions to Regional Program Management

6.1.2.1 Enhanced Program Effectiveness Assessments and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the effects of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP as part of their implementation of the new MS4 Permit. An assessment strategy based on the CASQA Municipal Stormwater Program Effectiveness Assessment Guidance has been established including the establishment of:

- Measurable goals for each component,
- Measurable metrics to assess progress toward those goals,
- CASQA Effectiveness Levels for each metric; to indicate the level at which each metric can demonstrate the effectiveness of the Permittee's programs at addressing each goal.
- Timeframes in which the Permittees expect to be able to assess effectiveness using each metric.
- Municipal Action Levels (MALs) for appropriate metrics to ensure a minimum level of program implementation and identify shortcomings that could affect the Permittee's progress toward the established goals. The MALs would not be permit compliance measures, but triggers for further Permittee evaluation of the affected compliance program.

If a MAL for a metric is exceeded, the Permittees will review implementation of that program component to identify the cause of the exceedance and identify needed adjustments to avoid future exceedances. The findings of these reviews and any recommended adjustments to the Permittees programs will be reported in the corresponding section of the Annual Report submitted the following year. Further research is particularly needed to establish appropriate Municipal Action Levels for the various program areas.

After a review of the stormwater program, the Permittees have established an initial Assessment Methodology for each component including preliminary goals, measurable metrics, effectiveness levels,

timeframes and MALs for each. These initial assessment methodologies are included in tabular format in Appendix C. Although the Permittees believe the basic proposal is viable, The Permittees will review and finalize these Assessment Methodologies and associated metrics within one year following adoption of the new MS4 Permit as additional data and analysis is necessary to support specific action levels.

6.1.2.2 Revised Reporting Format

The Permittees recommend substantial revisions to the MS4 Permit requirements for the layout of the Annual Report. The Permit requires substantial duplication of reporting, which either increases the volume of the Annual Report, or requires substantial cross-referencing. In either case, it is confusing to write, and most likely, confusing to read. The Permittees recommend a meeting with Regional Board staff in the development of the new MS4 Permit to discuss methods to streamline and clarify reporting requirements.

6.1.2.3 Maintain Enhanced Watershed / MS4 Map

The Permittees are in the process of collecting data to support an enhanced MS4 facilities map. Updates completed to date are provided in the map in Appendix B. This enhanced map demonstrates initial efforts to identify the locations of:

- Receiving Waters
- MS4 facilities
- Areas of historical perennial flows
- Known blow off locations
- Wastewater storage ponds
- Sub-drainage areas
- Known non-Permittee facilities
- 36-inch diameter and larger outfalls

This map will be used to help in the tracking of IC/ID events and issues and continued updates will be submitted with the Annual Reports. The Permittees will continue to enhance this map over the next MS4 Permit term. As described in the Annual Report, the District is in the process of upgrading their web page that offers public access the District's various NPDES activities. Along with these web site upgrades, additional layers will be added to the Web-based GIS map.

6.1.2.4 Elimination of the Watershed SWMP as a separate compliance document from the Riverside County DAMP

The Santa Margarita Region is comprised of only a single watershed. Further, the Permittees' regional compliance programs are described in the Riverside County DAMP. Maintenance of a separate and duplicative Watershed SWMP is confusing, cumbersome, and does not contribute to protection of Receiving Water quality. The Permittees request that the next MS4 Permit be drafted in a fashion that allows the Permittees to maintain the Riverside County DAMP as the primary document describing regional compliance programs for western Riverside County including the Santa Margarita Region. Any

necessary changes for requirements included in the new MS4 Permit will be updated /added to the Riverside County DAMP.

6.2 Permittee Training Programs

6.2.1 Summary

The Permittees jointly fund comprehensive training and education programs for Permittee staff. These training programs are designed to train Permittee employees on the proper use and implementation of BMPs appropriate for their field of work. There are four distinct training courses currently offered including Construction Inspection, Municipal Maintenance, Industrial-Commercial Facility Inspection, and New Development Planning.

6.2.2 NPDES Training Program Accomplishments and Programmatic Improvements

- Evaluated and tested various knowledge retention methods.
- Performed Training Enhancement Analysis study (2005-2006)
- Created an on-line training registration web page where attendees can also obtain training materials.
- Annually updated training materials to address Pollutants of Concern (2005-2007)
- Added component to training to address proper use, application and timing of application of Pesticides (2007-2008)
- Began developing a formalized testing and effectiveness analysis approach (2008)

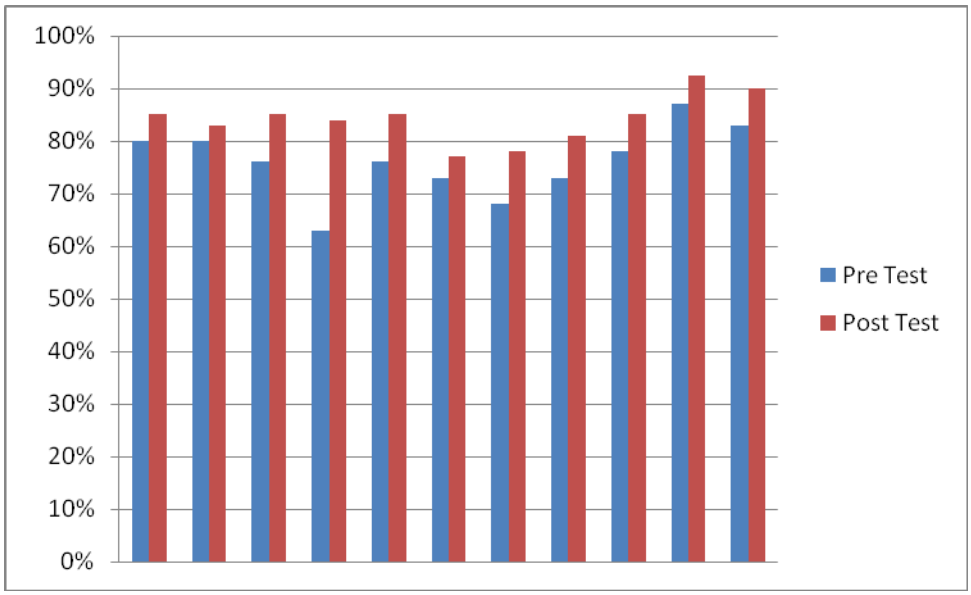
Highlights
Municipal Training: **14** Training Sessions; **900** Attendees
Construction Training: **22** Training Sessions; **626** Attendees
Industrial-Commercial Training: **11** Training Sessions; 426 Attendees
New Development Training: **13** Training Sessions; **345** Attendees

6.2.3 Long-Term Effectiveness Assessment

Throughout the term of the 2004 MS4 Permit the Permittees have evaluated and implemented various quizzes as part of the NPDES training courses. These efforts were intended to assess the retention of knowledge of the attendees and, as described in Provision K.2.m of the Watershed SWMP, serve as a component of the assessment of the long term effectiveness of the Watershed SWMP.

The quizzes used to assess employees' retention of knowledge have evolved over time as the Permittees found what worked and what did not. Quiz questions that were found to be confusing or misleading were refined or eliminated. Thus, a question-by-question analysis of the results is not possible. Instead, results from a number of the training courses with reasonably comparable quizzes were aggregated and an average score (percent correct) was established for each of these training sessions. The results of this analysis are presented in Figure 5.

Figure 5. Training Pre-Test and Post-Test Analysis



Although the required random-sample nature of this analysis is not conducive to the analysis of trends across time, two findings become evident from this analysis:

1. Permittee inspection, maintenance and planning staff generally have a high level of understanding of issues related to stormwater Pollution in their field of work.
2. Average scores on quizzes administered after the training sessions were always higher than scores on quizzes administered before the training session.

Finding 1 above can be attributed to the Permittee's proactive efforts to ensure that their employees are aware of the issues in their field of work that could contribute to stormwater Pollution. This includes annual attendance at the NPDES training courses, and on-the-job training, reminders and meetings. This fact alone is a strong indicator of the effectiveness of the Permittees training programs.

Finding 2 above demonstrates that after attending the NPDES training courses, the attendees have a higher level of understanding of the issues in their field of work related to stormwater Pollution. This indicates that the training materials, delivery and content were effective.

Based on these analyses, general feedback from the training programs, and the overall effectiveness of the Permittees' programs (as described in Section 5.3 herein) the Permittees believe their training programs to be effective. Nevertheless, the following revisions to the training programs have been identified and are proposed for implementation with the new permit to ensure ongoing effectiveness.

6.2.4 Proposed Revisions

6.2.4.1 Continued focus on Focus Area Pollutants of Concern

The Permittees commit to continue to revise the Permittee training programs to focus on Pollutants of Concern.

6.2.4.2 Standardized Effectiveness Quizzes

Over the course of the 2004 MS4 Permit, the Permittees have evaluated various methods of assessing the retention of knowledge and are now recommending a standardized approach to assessing the effectiveness of the training program.

The Permittees plan to create standardized quizzes to assess the retention of knowledge and increased understanding as a result of the Permittees' training sessions. This includes establishing core messages that the Permittees want to impart upon the attendees and, creating clear and understandable quiz questions for each core message.

This approach will help the Permittees identify if any core training messages are not being retained by attendees and to subsequently modify the training. The Permittees also hope that this approach will yield results that will, over time, demonstrate that the knowledge among Permittee staff of issues related to storm water Pollution is increasing, thus clearly demonstrating that the NPDES Training program is effective.

As a necessary part of this effort, a database to track responses will also be created.

6.2.4.3 Attendance Tracking Mechanism

At each training session a sign-in sheet is provided to track attendance to the session. Included in the sign-in sheet is an indication of the Permittee that each attendee is representing. After each training session, these sign-in sheets are scanned to PDF files and sent to each Permittee for their records. This approach requires that each Permittee manually review the sign-in sheets to determine who and how many of their staff attended the training.

The District, on behalf of the Permittees, is currently investigating various form scanning and recognition software packages to determine the feasibility of creating a sign-in sheet that, when scanned, will automatically transfer the attendance list into a database. This would facilitate tracking of staff attendance by each Permittee. At this time the District has not determined if a feasible and cost efficient program is available that will accomplish their needs.

6.3 Public Education

6.3.1 Summary

To leverage finite resources, the Permittees jointly fund a public education program. The District implements this program to disseminate information about Urban Runoff issues and to provide education on how activities may impact Receiving Waters.

The Permittees have established an ongoing watershed-based public education and outreach program known as the **Only Rain Down the Storm Drain** Pollution Prevention Program. The specific objectives of this program include:

- Fostering a broad public awareness of water Pollution concerns;
- Increasing public acceptance of Pollution Prevention activities to curtail everyday human behaviors that contribute to water quality problems;
- Educating/informing the general public, regulators and key local government and state decision makers on Urban Runoff conditions in Riverside County; and
- Promoting stewardship of local water resources.

The **Only Rain Down the Storm Drain** Program implements the public awareness objectives by focusing on three areas of Pollutant reduction/prevention:

- Public behavior;
- Proper management of Pollutants; and
- Business specific education outreach.

In addition, when attempting to make use of the finite resources available to the Public Education Program, the Permittees use these management goals to ensure that resources are used effectively:

- Focusing on Pollutants of Concern specific to each watershed region;
- Coordinating public education efforts with adjacent storm water management programs and other related education programs to share resources, coordinate outreach efforts, and avoid duplication of effort; and
- Adapt public education programs and objectives, based on effectiveness analysis, to address changing MS4 program requirements and objectives.

6.3.2 Public Education Program Accomplishments and Programmatic Improvements

The Public Education Program has developed and distributed the following educational materials during the 2004 MS4 Permit term:

- *After the Storm* – a citizen's guide to understanding MS4 Pollution in your neighborhood or when performing daily activities.
- *Automotive Maintenance & Car Care* – guidelines for keeping your auto shop or retail fuel facility in environmental shape.

- *Outdoor Cleaning Activities* – guideline for outdoor cleaning activities and wastewater disposal.
- *Pools, Spas and Fountains* –Environmental maintenance suggestions for pool, spa, and fountain owners.
- *What's the Scoop* – tips for a healthy pet and a healthier environment.
- *Household Hazardous Waste* – A schedule of collection locations for proper disposal of HHW.
- *Stormwater Pollution Found in Your Neighborhood* – door hanger.
- *Equestrian Management* – Recommendations for BMPs related to equestrian activities.
- *Spray Bottles* – Including directions to make environmental friendly recipes for pest control and household cleaning

The Permittees also initiated development of the following outreach materials

- *Landscaping and Gardening Brochure* – Initiated development a new brochure to address outdoor residential landscaping and gardening activities.
- *Septic System Management Brochure* – initiated development of a brochure to assist with septic system management.

In addition to the information provided on the Storm Water Protection website, the Public Education and Outreach Program has:

- Updated the Public Education and Outreach Program web page.
- Tested and/or implemented several new Public Education and Outreach Program effectiveness tracking mechanisms including call tracking, web counters, testing, and bilingual surveys.
- Enhanced the toll free storm water Pollution reporting hot line to include public education information and support for the public and other interested stakeholders.
- Obtained a trailer with "**Only Rain Down the Storm Drain**" graphics specifically designed for transporting materials to outreach events. It is also used as part of the booth at outreach events.
- Initiated billboard advertising within the Santa Margarita Region.
- Worked with the Mission Resource Conservation District to implement presentations to elementary and middle schools and staff to raise public awareness of Urban Runoff management issues and source control methods and to encourage volunteers, partners, and groups to gather annually for a trash and debris clean-up day in the Santa Margarita Region.
- Developed special newspaper and billing inserts, fliers and advertisements to raise public awareness of Urban Runoff management issues and source control methods. A radio advertising campaign was also developed and implemented for a time.
- Developed and presented workshops regarding household hazardous waste use and proper disposal at major home improvement stores throughout Riverside County.
- Placed advertisements in the Penny Saver and Bargain Bulletin to raise public awareness of Urban Runoff management.

- In cooperation with certain County Service Areas or other programs, pet waste signs with bag dispensers have been installed at various parks to help encourage the proper disposal of animal waste.
- Cooperated with the Western Riverside Council of Government in the Used Oil Block Cycle Grant that decreases the amount of illegally dumped motor oil by promoting the addition of new Certified Oil Collection Centers.
- Established a partnership with County Environmental Health whereby businesses cited by Environmental Health for violations of ordinances related to stormwater issues may be allowed to implement a Supplemental Environmental Project in conjunction with the **Only Rain Down the Storm Drain** program.

6.3.3 Long-Term Effectiveness Assessment

Effectiveness metrics of the Public Education and Outreach Program during the 2004 MS4 Permit term are presented in Section J.1.3 of the FY 2007/2008 Watershed Annual Report. The data indicates that overall impressions have continually exceeded the number of residents in the watershed, HHW/ABOP pounds of waste collected and pounds of waste collected per person have steadily increased over the term of the 2004 MS4 Permit.

In 2005, the **Only Rain Down the Storm Drain** program developed and implemented a survey to be distributed at Public Outreach events to assess the public's level of knowledge related to stormwater Pollution. This original "long" survey contained 13 questions in both English and Spanish as shown in Figure 6.

This survey was used for fiscal years 2005-06 and 2006-07. Through this period of implementation it was found that the survey took too much time to complete and reduced the level of response from event attendees. Therefore, the survey was subsequently revised to a shorter version with revised questions for the 2007-08 fiscal year. The revised "Short" survey that is currently used is shown in Figure 7.

Figure 6. Original "Long" Survey Utilized at Public Outreach Events

Zip Code_____ **Age**_____ **Sex F**__ **M**__ **Date:**_____

THINK YOU KNOW ABOUT STORM DRAIN POLLUTION PREVENTION?

1. Where do you think **storm drain** contents go or flow to? __Treatment Plant __Streams, rivers & lakes
2. Where do you think **sewer pipes** contents go or flow to? __Treatment Plant __Streams, rivers & lakes
3. Are storm drains and sewers part of the same or separate systems? __Same __Separate __Don't know
4. Have you ever been to a Household Hazardous Waste **(HHW)** Collection Event? __Yes __No
5. Did you know that **A.B.O.P.** Antifreeze, Batteries, Oil, and Latex Paint locations and mobile **HHW** Collection Events provide safe havens for the disposal of pollutants? __Yes __No
6. If you have a lawn or garden, where do you (or your gardener) dispose of the green waste (grass, clippings or other)? **(Check all that apply)**

   ☐Trash/garbage ☐Compost/Mulch pile ☐Take to compost facility
   ☐Leave on lawn ☐Removed by gardener ☐Other:_____

7. Where is the best location to wash your vehicles?
   (Check only one)

   ☐Pavement (driveway, street) ☐Dirt Area
   ☐Lawn or Grass ☐Other_____

8. Do you change the motor oil in your vehicle yourself? __Yes __No

   If **Yes**, where do you dispose of it? **(Check all that apply)**

   __in the garbage __at a curbside collection program
   __down the storm drain __collection center (Jiffy Lube, Kragen, etc.)
   __pour it on the ground __Other_____

9. If you have a pet, how often do you pick up after your pet?

   9. a) in your yard? ☐Always ☐Sometimes ☐Never

   9. b) when you walk the pet? ☐Always ☐Sometimes ☐Never

10. Do you think, anything ,other than rainwater, that flows into the storm drains (i.e., trash, chemicals, pet waste, etc.) considered a pollutant? __Yes __No
11. Have you seen or heard the slogans "Only Rain Down the Drain" or "Only Rain Down the Storm Drain"?
    __Yes __No If yes, where? __Radio __Newspaper __ Flier __Billboard __Street Fair, Festival, etc.
12. Are there State laws and local ordinances which STRICTLY PROHIBIT the dumping of pollutants **(EVERYTHING, EXCEPT RAIN WATER)** into the storm drain systems or waterways? ___Yes ___No
13. After this booth visit, have you increased your understanding of storm drain pollution prevention? __Yes __No

Thank you for your time and input… Remember, YOU can do your part by calling our Toll Free Line (1-800-506-2555) to report illegal storm drain pollutant disposal anywhere in Riverside County, or to get more information about storm drain pollution protection to help promote "ONLY RAIN DOWN THE STORM DRAIN".

Figure 7. Revised "Short" Survey Utilized at Public Outreach Events

DO YOU KNOW HOW TO PROTECT OUR STREAMS, RIVERS and LAKES?

City_____ Zip Code_____ Age____ Sex □ F □ M Date: _____

1) Water that leaves your lawn from **Irrigation (water sprinklers), Car washing** and **Rain** flows down streets and/or storm drains and then directly to…

☐ Sewage Treatment Plants ☐ Streams, rivers & lakes

2) Which of the following can LEGALLY be disposed into the storm drain? (*Circle all that apply*)

- **Useable Household Chemicals**
- **Yard waste/clippings/leaves**
- **Paint**
- **Cigarette butts**
- **Empty Household Chemicals containers**
- **Pet Waste**
- **Motor Oil / antifreeze**
- **None of these**

3) Do you feel you are well informed and aware of illegal dumping into the storm drain and its impact in your community or streams, rivers and lakes?

☐ Yes ☐ No

HOW DID YOU DO?

1) Water that leaves your lawn from irrigation, washing your car, or rainwater runoff can pickup motor oil and grease from vehicles, excess fertilizer from your lawn, bacteria from pet waste, and excess pesticides from your yard. These pollutants can be carried down streets and storm drains directly to our streams, lakes, and rivers without treatment! That is why we must take care to properly dispose of waste, maintain our vehicles, and use fertilizers, pesticides and other chemicals only as specified on their labels.

2) It is illegal to dispose of any chemical, constituent or waste into a storm drain! Report illegal disposal of chemicals, constituents, or waste to storm drains at **1(800) 506-2555.** You may properly dispose of many of the wastes listed above by doing the following things:

- **Usable and empty household chemicals, paint, motor oil** – Properly dispose these at Household Hazardous Waste and/or Antifreeze, Batteries, Oil and Paint disposal facilities and events. Call **1 (800) 506-2555** for information on disposal locations and special drop off events near you.
- **Pet waste** – Carefully pick up and dispose in the nearest trash receptacle.
- **Grass, clippings, leaves and yard waste** – Collect and dispose in green waste bins or composting areas that are designed to prevent the compost from mixing with excess irrigation water and/or rainwater runoff.

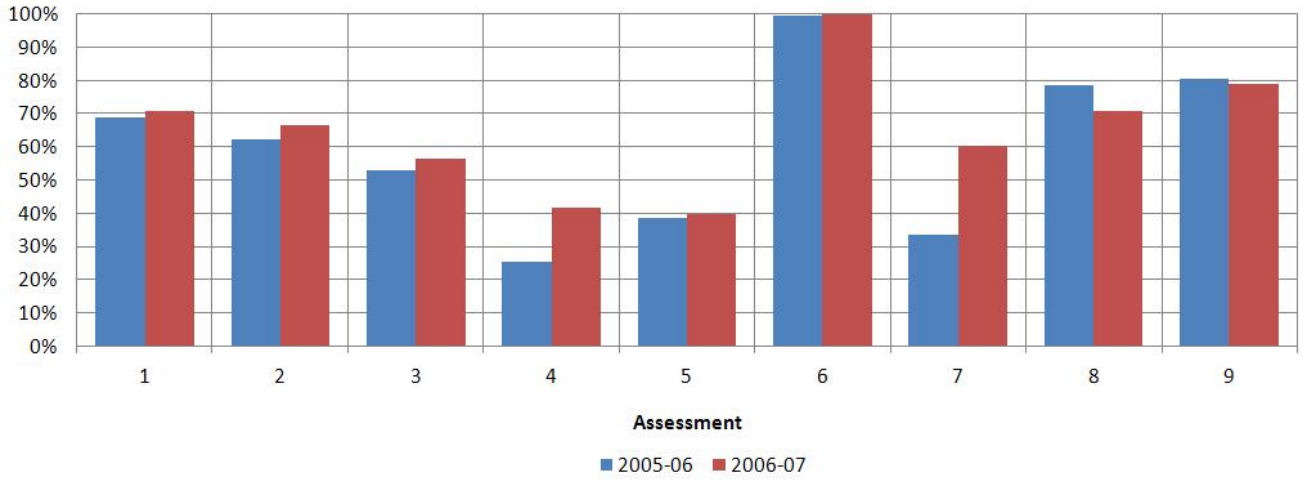
3) Would you like to learn more about protecting our streams, rivers and lakes or wish to report on a illegal storm drain disposal in your area or request a classroom or group demonstration……

Visit www.rcflood.org or call 1 (800) 506-2555.

Remember…Only Rain Down the Storm Drain!

Results have been tabulated for all of the "Long" surveys received and they have been analyzed to determine trends in public awareness. The "Short" survey has been used at two events to date, one of which was quite recent and its results have not yet been tabulated. Using the "Long" survey results, nine questions were used to assess any trends in public awareness. The remaining questions were determined to be either confusing or not applicable to the intent of the assessment. The results of this assessment of survey results are shown in Figure 8.

Figure 8. Assessment of Survey Results (2005-06 vs. 2006-07)



The results shown in the chart in Figure 8 are percent of survey takers that responded as described below:

- Assessment 1: Percent of respondents that understood that storm drains do not go to treatment plants.
- Assessment 2: Percent of respondents that understood that sewer lines go to treatment plants.
- Assessment 3: Percent of respondents that understood that sanitary sewers and storm drains are separate systems.
- Assessment 4: Percent of respondents that had attended a Household Hazardous Waste collection event.
- Assessment 5: Percent of respondents that understood that the best place to wash a car is on the lawn or grass.
- Assessment 6: Percent of respondents that change their own oil that reported that they properly dispose of it.
- Assessment 7: Percent of respondents that have heard of the "Only Rain Down the Storm Drain" program.
- Assessment 8: Percent of respondents that dumping of anything except storm water is a violation of laws and ordinances.
- Assessment 9: Percent of respondents that felt that visiting the Outreach Booth at the event increased their understanding of storm drain Pollution Prevention.

Although implementation of the "Long" survey was limited before it was modified to its current form, the results available do indicate an increase in understanding of these basic principles and can be attributed to the effectiveness of the Permittee's Public Education program. As additional survey results are collected and tabulated, further analysis will be performed to ensure the ongoing effectiveness of the program.

6.3.4 Proposed Revisions

To better address residential sources of pesticides, the Permittees are proposing to coordinate with the University of California Extension Program to enhance the implementation of the U.C. Extension's Master Gardener program in the Santa Margarita Region. Along with information regarding use of drought tolerant landscaping techniques and appropriate methods of fertilizer and irrigation application, the U.C. Master Gardeners also provide residents with information on integrated pest management techniques that minimize pesticide application. The Permittees are proposing to establish an agreement with the U.C. Extension's Master Gardener program in fiscal year 2010-2011 to support master gardener hotline staffing, local presentation and other outreach by the U.C. Master Gardeners.

In addition, through the Permittee's ongoing efforts to internally assess the efficiency and efficacy of their MS4 compliance programs, it was determined that an overhaul of the District's web site was needed. The District's web site contains the public education web site and a technical resource site with the various compliance documents for the program. It was found that information available through the site was often difficult to find and was not user friendly and sometimes was out of date. The Permittees are now reviewing this site to identify and implement needed changes

6.4 Receiving Water Monitoring Program

6.4.1 Summary

A Summary of the Monitoring Program is contained in Appendix G of the Watershed Monitoring Report.

6.4.2 Monitoring Program Accomplishments and Programmatic Improvements

The Monitoring Program accomplished the following goals during the term of the 2004 MS4 Permit:

- Subcontracted monitoring data collection and analysis to MACTEC, Inc. to enhance data collection and reporting capabilities.
- Developed and implemented a Triad Monitoring Program (bioassessment, Toxicity and chemical monitoring) consistent with the goals of the SMC Model Monitoring Program
- Developed watershed boundaries and land use information for all monitoring stations
- Updated the format and technical content of the monitoring Annual Report
- Added fire map information to assist with assessing potential Pollutant sources
- Enhanced monitoring data databases to be compatible with SCCWRP/SMC standard reporting protocols.
- Enhanced monitoring methods to incorporate use of automatic sampling equipment where appropriate

- Conducted several Toxicity Identification Evaluations that led to the identification of pyrethroid pesticides as a cause of wet weather Toxicity in Murrieta and Temecula Creeks and a Toxicity Reduction Evaluation that identified additional BMPs necessary to control sources of pyrethroid pesticides.
- Coordination with the CASQA Pesticide Committee on comments and presentations to California Department of Pesticide Regulation, UC Riverside and others regarding the impacts of pyrethroid pesticides and the need to change regulatory requirements regarding the use of pyrethroid pesticides.
- Participation in or coordination of several BMP studies, including coordination of new development BMP treatment studies (as required by conditions of approval) and the District's LID BMP Demonstration and Testing Facility.
- Continued to update and enhance the Consolidated Monitoring Program to incorporate new monitoring collection methods and data analysis protocols.

6.4.2.1 Participation in Regional Monitoring Efforts

- Participation in the monitoring programs to support development of the Santa Margarita Lagoon TMDL.
- Continued participation in regional and statewide Monitoring and Science efforts such as the Southern California Monitoring Committee to develop:
  - Lab inter-calibration of chemical, bioassessment and Toxicity testing methods
  - Testing methods for bioassessment and Toxicity in Southern California streams
  - Bacterial Reference Watershed Study
  - A storm water research needs report for southern California
- Partnered with SCCWRP on developing hydromodification guidance for Southern California including participation in a series of hydromodification workshops for a CASQA conference.
- Coordination with SCCWRP on the development of the Regional Watershed Monitoring Program for Southern California.

6.4.3 Effectiveness Assessment

The Watershed Monitoring Program was evaluated as part of the Regional Board audits in 2007-2008. As a result of those audits several enhancements were made to the monitoring program, including update of constituent lists, subcontracting of data collection to a monitoring consultant with automatic sampling capabilities, and updates to the Consolidated Monitoring Program and Monitoring Annual Report formats. The Permittees believe that as a result of these changes, the overall monitoring program is effective. However, the revisions presented in section 6.4.4 are recommended to increase monitoring data utility or overall program effectiveness.

6.4.4 Proposed Revisions to Monitoring Program

In updating the Monitoring and Reporting Program, the Permittees request that Regional Board staff meet with them to discuss the following proposed modifications to the monitoring program:

6.4.4.1 Revise Dry Weather Monitoring Program

As noted in Section G.7 (Special Studies) of Appendix G of the FY 2007-2008 Watershed Monitoring Annual Report, the Permittees participated in a SMC Study to develop a regional approach to watershed assessment. The Permittees, in conjunction with Regional Board staff, committed to participating in the resulting watershed monitoring program. The Permittees agreed to monitor three rotating dry weather stations identified for the Santa Margarita Region. Additionally, three stations are to be collected by Regional Board (or SCCWRP staff) using SWAMP funds, and the remaining three will be located in the Santa Ana Watershed region of Riverside County. In exchange for the commitment to participate in the program, the Regional Board staff agreed to reduce the current dry weather monitoring requirements in the new MS4 Permit from two (2) events annually to (1) event annually for each Triad monitoring stations. This would effectively eliminate three existing dry weather samples. The Permittees recommend a meeting with Regional Board staff to discuss these options prior to the release of the draft Permit.

6.4.4.2 Clarify Analyte List

As described in Section G-8.1.5 of the 2008 Monitoring Report (Appendix G of the FY 2007/2008 Watershed Annual Report), 168 analytes have never been detected in samples collected under the current program. The Permittees request that requirements to analyze for these constituents be eliminated unless or until a reason to believe they may be present in stormwater arises.

Basin Plan Objectives are expressed in terms of total metals, while California Toxics Rule (CTR) criteria are expressed in terms of dissolved metals. Although the Permittees do not support comparison of stormwater data to CTR values, the Permit requires it. The Permittees recommend deletion of this requirement. However, if this language is to remain, in order to properly compare results for metals to both sets of objectives, both total and dissolved fractions will be analyzed by the laboratory for the following metals: arsenic, cadmium, chromium (III), chromium (VI), copper, lead, mercury, nickel, selenium, silver, and zinc.

6.4.4.3 Clarify Mobilization Criteria

The District is proposing the following amendment to the monitoring mobilization criteria based on experience and the difficulties faced collecting the first storm and the analysis of the USEPA criteria specific to the Temecula National Weather Service weather station (Consolidated Monitoring Program, Section 4.C.2):

> "Note: If the QPF indicates that more than 0.3-inch is predicted for any 6-hour period, mobilization for sampling will occur."

The District's experience over the past three years indicates that intensities greater than 0.3" in six hours are likely to produce runoff and would warrant mobilization, even on a dry watershed. Further, these mobilization criteria are consistent with EPA-833-B-92-001 guidance regarding minimum depths/durations for storm sampling.

The Permittees recommend that the Regional Board amend the MS4 Permit to reflect these Mobilization Criteria. Due to issues with stream gauges operated by the United States Geological Survey (USGS), the Permittees have concluded that preparing post-storm forensics based on USGS data is not of significant value. A simple test of comparing Quantitative Precipitation Forecast (QPF) reports with actual rainfall and the mobilization criteria should be sufficient to determine compliance with the MS4 Permit.

Mobilization criteria should also reflect practical limitations to storm water monitoring by excluding national holiday periods (Thanksgiving, Christmas, and New Year's Day in particular) and quantifying the probability and the lead time between the forecast and actual rainfall that must be met in order to mobilize.

6.4.4.4 Reduce Wet Weather Events

As was noted in the audits, the Permittees have experienced consistent difficulty collecting three storm events in the upper Santa Margarita River watershed. The Permittees also noted that the San Diego County MS4 Permit only requires the collection of samples from two wet weather events. The Permittees request that the monitoring program for Riverside County be revised to require collection of two storm events. This would not only reduce opportunities for unavoidable non-compliance, it would also be a prudent cost saving measure that would not alter the overall effectiveness of the Permittees monitoring programs.

6.4.4.5 Clarify Triad Method and Follow-up Actions

The MS4 Permit included an early draft of the Triad method envisioned by the Model Monitoring Program (MMP) developed by the SMC. The result was a misapplication of the final Triad approach envisioned by the MMP. Toxicity is currently required to be sampled for at the Triad stations during wet weather events, but not during dry weather when the bioassessments occur. According to the SMC MMP, the three components of the Triad approach (chemistry, Toxicity, and bioassessment) should be conducted at the same time. Bioassessments cannot be conducted during wet weather due to safety concerns and the planning necessary. For this reason the MMP recommends the full triad for dry weather and only chemistry and Toxicity for wet weather.

In an effort to be proactive and supportive of good science, the Permittees have taken the following actions to ensure proper application of the Triad approach:

- Beginning with the 2007-2008 season, Toxicity sampling will be conducted during dry weather, at the same time as the bioassessments and dry weather chemistry sampling events are conducted. Thus, the full Triad approach will be conducted during dry weather. Wet weather monitoring will focus on Toxicity and chemistry. This action will modify the current program to be consistent with the MMP approach.
- The 2006-2007 Annual Report established the framework for proper application of the Triad method (full triad for dry weather, chemistry and Toxicity only for wet weather) by adding new tables (G-21 through G-27), in anticipation of properly applying the Triad method in the 2007-2008 Annual Report.

The Permittees further recommend clarifying the definitions of "persistent", "consistent", and "magnitude" as used in the MS4 Permit to be consistent with the intent of the MMP. In addition, the MS4 Permit inappropriately limits Triad analysis by defining a "fair" Index of Biological Integrity scores as automatically indicative of benthic alteration. This limitation needs to be corrected to prevent Permittee

resources from being inappropriately diverted to expensive source assessment studies. The MMP (and the SMC) envision that watersheds will be prioritized for follow up action based on their relative quality to one another. The envisioned analysis would compare watersheds from throughout southern California. The Permittees support this coordinated and comprehensive approach to addressing water quality.

6.4.4.6 Recognize Limitations of Laboratory Analysis of Bacteria

Babcock Labs prefers to accept bacteria samples between the hours of 7:00 a.m. and 4:00 p.m. during normal business days, and 9:00 a.m. and 12:00 p.m. on weekends. Although Babcock will accept bacteria samples outside those hours, acceptance is contingent upon payment of substantial overtime rates to ensure laboratory staff availability to receive and analyze the samples.

The timing of bacteria sample collection, particularly within the context of automatic sampling, will require consideration of the sample's four-hour holding time and available laboratory receiving hours. The Permittees request that the Permit be modified to only require collection of bacteria samples such that they can be delivered during the regular working hours of the lab to avoid excessive laboratory costs.

6.4.4.7 Participate in a Watershed Based TMDL for the Santa Margarita Lagoon

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon Watershed-Based TMDL has been withdrawn. As described in section 3.4, these economic conditions are also impacting the Permittee's funding sources and they are struggling to maintain resources to fund existing compliance programs. The Permittees currently cannot support additional expenditures associated with assisting in funding a watershed-based TMDL effort. However, the Permittees are agreeable to discussing a re-prioritization of compliance activities in order to reallocate existing Permittee resources for this purpose. For example, where current MS4 Permit compliance programs elements are not measurably enhancing attainment of Water Quality Standards, the Permittees would consider reduction or elimination of those requirements to support reallocation of the associated funding to the development of the watershed based TMDL. Program elements that may be considered for discussion include:

- Toxicity/Pyrethroid Monitoring – Under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) local regulation of pesticides, including pyrethroid pesticides is pre-empted. The Permittees are expending significant resources at the State and Federal level to facilitate regulatory changes in the allowable uses of pyrethroid pesticides, which have been implicated in causing toxicity in receiving waters throughout California. The Permittees have also recognized pyrethroid pesticides as a Pollutant of Concern for the upper Santa Margarita River watershed. The Permittees believe that public education and outreach regarding use and more stringent regulation/management of pesticides, including pyrethroid pesticides, represents the most effective means of controlling pesticides in Urban Runoff. However, continued Toxicity tests, Toxicity Identification Evaluations, and direct monitoring for pyrethroid pesticides are not likely to enhance the Permittee's ability to reduce/eliminate pyrethroid pesticides in Receiving Waters. Greater Receiving Water quality benefits may be realized by reallocating the resources currently allocated to these activities to the development of the watershed-based TMDL.
- Reduction in General Monitoring Requirements – The Permittees continue to expend significant resources on Receiving Water and outfall monitoring and the benefits of these monitoring activities are limited. Further, these costs have more than doubled over the term of the 2004 MS4

Permit due to audit findings recommending the implementation of automatic sampling equipment. Revised MS4 Permit requirements that provide for a simplified monitoring program may allow cost savings to be reallocated from data collection and processing to development of the watershed-based TMDL.

- Watershed/Individual Annual Reporting – The current Annual Reporting requirements are time, labor and cost-intensive exercises. Revised MS4 Permit requirements that provide for a simplified Annual Report requirements would not necessarily produce substantial cost savings (because is the reports are typically produced in-house); however, they would free up staff resources to assist with TMDL development.
- IC/ID Monitoring – Although the Permittees support regular visual inspection of MS4 facilities to identify IC/IDs, field measurements and sampling has not proven to be effective for this purpose. Although sampling of identified IC/IDs for later enforcement purposes may be appropriate, IC/IDs that have been identified and eliminated in the Santa Margarita Region typically result from visual observations and subsequent follow-up efforts by Permittee staff, not field measurements and water quality samples. Revised MS4 Permit requirements that provide for visual inspections of MS4 facilities to identify IC/IDs may yield cost savings that could be reallocated to development of the watershed-based TMDL.

There may be additional opportunities for modification of MS4 Permit requirements to focus the expenditure of Permittee funds on those activities that are most effective at protecting Receiving Water quality. Although the resources available for Permittee compliance activities are finite, the Permittees are supportive of modifications to the MS4 Permit that, while working within available funding limitations, enhance their ability to protect and enhance the quality of Receiving Waters.

7.0 Evaluation and Recommendations for Individual SWMP Programs

The Riverside County DAMP is a programmatic document developed by the Permittees in the Santa Ana and Santa Margarita Regions. It outlines the major programs and policies that the Permittees individually and/or collectively implement to manage Urban Runoff for the protection of Receiving Waters in Western Riverside County, including the Santa Margarita Region. The Riverside County DAMP provides a model for the development of a Permittees' Individual SWMPs in the Santa Margarita Region.

The Permittees continue to support a uniform approach to the implementation of MS4 Permit compliance programs in order to facilitate increased transparency and understanding for residents, regulated entities, and Permittee staff. For this reason, the discussions below focus on programmatic changes to the compliance programs that are necessary to maintain the effectiveness of the model compliance programs described in the Riverside County DAMP. Upon adoption of the new MS4 Permit, the Riverside County DAMP and Individual SWMPs will be revised accordingly.

7.1 Program Management

There are typically multiple Permittee departments that are responsible for implementing the elements of the Individual SWMPs. Each Permittee has designated an NPDES Coordinator who coordinates the overall Permittee compliance programs, collects and analyzes compliance program data, develops and maintains the Individual SWMPs, compiles and submits necessary reports, coordinates with other Permittees, stakeholders and Regional Board staff, and conducts other necessary duties as assigned.

To facilitate inter-Permittee coordination and funding of regional compliance activities such as the Public Education and Monitoring programs, the Permittees have entered into an Implementation Agreement that defines the roles and responsibilities of each Permittee and assigns cost shares for regional programs defined in the agreement. The Implementation Agreement also requires each Permittee to designate an NPDES Coordinator who is also responsible for representing the Permittee's interest at Permittee coordination meetings such as the monthly Santa Ana/Santa Margarita Technical Advisory Committee.

The Permittees in the Santa Margarita and Santa Ana Regions participate in a Management Steering Committee made up of the City Managers, County Executive Officer, and the District's Chief Engineer; or their assigned alternate. Participation in the Management Steering Committee is not mandatory; however, it provides a management-level forum to address Urban Runoff management policies for the Permit Area and coordination of the review, and necessary revisions to the Riverside County DAMP and Implementation Agreement. In addition, the Management Steering Committee promotes a higher level of awareness of the MS4 Permit compliance program by each Permittee's senior management staff.

7.1.1 Accomplishments and Programmatic Improvements

Collectively, the Permittees Program Management activities have achieved:

- Development of the Riverside County DAMP, WQMP and Individual SWMPs following adoption of the 2004 MS4 Permit.
- Revised the Implementation Agreement to account for necessary program enhancements resulting from the new MS4 Permit.

- Established and held monthly meetings of a Technical Advisory Committee comprising of each Permittee's NPDES coordinator, to discuss and coordinate response to issues that arise through the ongoing implementation of the Riverside County DAMP-based programs.
- Voluntarily participate in a Management Steering Committee comprised of Permittee upper management (City Manager or equivalent) to provide a forum to discuss major policy issues related to MS4 Permit compliance program implementation. This also helps the major decision makers within each organization to stay abreast of the status of the implementation of the Riverside County DAMP and aware of upcoming issues and approaches taken by other Permittees.
- Enhanced enforcement and compliance elements of the Riverside County DAMP.
- Developed the Integrated Regional Watershed Management Plan (IRWMP) for the Upper Santa Margarita Watershed.
- Continued progress with the Bureau of Reclamation, San Diego County and other stakeholders on a uniform watershed plan and model for the Santa Margarita River watershed.

7.1.2 Recommended Revisions and Enhancements to Program Management Efforts

7.1.2.1 Assessment Metrics and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the impact of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP following adoption of the new MS4 Permit. These planned changes are further described in Section 6.1.2.1 of this ROWD. The Permittees also recommend streamlining of the reporting forms to focus on the revised Program Effectiveness Assessments.

7.1.2.2 Revised Reporting Format

As a result of continued program effectiveness assessment, following adoption of the new MS4 Permit, the Permittees will update annual reporting forms to incorporate specific reporting requirements for the effectiveness assessment metrics and to remove inappropriate, outdated, or ineffective reporting requirements.

7.2 Development Planning

This program element links each Permittee's General Plan, environmental review process, and development approval and permitting processes to the later phases of detailed design, construction and operation. The development approval and permitting processes carries forth project-specific requirements in the form of conditions of approval, project plans, and design specifications that support tracking, inspection, and enforcement actions.

7.2.1 Development Planning Program Element Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit, the development planning program accomplishments and programmatic improvements included:

- Developed the WQMP to address post construction stormwater runoff quality for New and Significant Re-Development Projects.
- Development of a FAQ for WQMP projects to assist with implementing the WQMP program.
- Developed and subsequently enhanced a BMP design guidance manual to standardize the construction of post construction BMPs.
- Participation in the SMC efforts to develop a LID manual.
- Participation in SCCWRP's hydromodification studies to develop scientifically based hydromodification design guidance for Southern California.
- Enhanced online watershed maps to assist developers and the public with identifying areas tributary to Impaired Waterbodies.
- Adopted and implemented a MSHCP to ensure the regional-scale protection of habitat and natural resources in the approval process for New Developments.

7.2.2 Proposed Revisions to the Development Planning Program Element

7.2.2.1 Low Impact Development

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to (1) better incorporate LID design concepts, and (2) incorporate guidance to describe how developments can offset Treatment Control and hydromodification impacts with LID concepts including infiltration, evapo-transpiration, reuse, and onsite stormwater management. These revisions will follow the completion of the SMC LID BMP Manual and SCCWRPs Hydromodification Study. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.2 Hydromodification

As committed to in the 2004 WQMP (now Appendix O to the Riverside County DAMP), the Permittees have developed numeric guidance for hydromodification and are now working with SCCWRP to develop enhanced hydromodification guidance for Southern California. The Permittees will use the completed guidance to update the WQMP, BMP Design Handbook and other guidance as necessary to effectively mitigate hydromodification impacts. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.3 BMP Design Criteria

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to incorporate additional design guidance to clarify those Treatment Control BMPs that are effective at removing sediment-bound pesticides such as pyrethroid pesticides (consistent with the recommendations of the Toxicity Reduction Evaluation contained in Appendix D.

7.2.2.4 TMDLs

The Permittees will revise the DAMP to identify and include BMPs that are necessary to mitigate the impacts of Urban Runoff on Impaired Waterbodies.

7.2.2.5 Roads

The Permittees believe that standard WQMP requirements for public works road projects create potential avenues for unavoidable non-compliance. The Permittees would like to review this priority development category with Regional Board Staff to develop a better system to manage public works road projects.

7.2.2.6 Inspect and Verify Maintenance of Post Construction Treatment Control BMPs to Ensure Ongoing Effectiveness

As economic conditions allow, the Permittees propose to implement the following approach to inspect and/or verify maintenance of Treatment Control BMPs implemented on Priority Development Projects to ensure their ongoing effectiveness. The development of the program described below will require the Permittee resources that are unavailable in the current economic climate, particularly considering that it would likely require the Permittees to abandon the CAP in lieu of a local Permittee inspection program. The resources that will be required to ramp up new inspection programs are unavailable and may not become available during the term of the new MS4 Permit; however when the economy recovers sufficiently the Permittees propose to implement the program described below.

Integrated Management Practice (IMP) Exemption:

For the purposes of this program, IMPs include BMPs that are landscape based or otherwise serve an additional purpose other than Treatment Control. IMPs will be exempted from Inspection and Maintenance Tracking / Certification requirements if solely through the regular maintenance of the feature's secondary (non-treatment) functions and with Permittee concurrence, it can reasonably be expected that the treatment efficacy of the IMP will be ensured in perpetuity. An example that may satisfy this exemption would be a grassy swale that is mowed as part of regular landscape maintenance, whereas a BMP with a media filter which requires periodic resetting or replacement to maintain treatment effectiveness would not be exempted.

Priority Development projects will be exempted from all Treatment Control BMP Inspection and Maintenance Tracking / Certification requirements if they completely meet their Treatment Control requirements by implementing only IMPs that meet these criteria.

Priority Industrial and Commercial

The following requirements will apply to new priority Commercial and Industrial developments subject to the Permit's Commercial and Industrial business inspection requirements.

- Inspection

  Sites will be inspected per the Individual SWMPs current inspection frequency requirements that are based on the potential of the site to contribute to water quality impairments. At these inspections, in addition to the normal inspection requirements, all Treatment Control BMPs at the site will be inspected. In other words, all Treatment Control BMPs at high-priority facilities will be inspected annually; Treatment Control BMPs at medium-priority facilities will inspected biennially and Treatment Control BMPs at low-priority facilities will be inspected once during the term of the MS4 Permit. Improperly maintained BMPs may subject the maintenance entity to license suspension or administrative citations.

- Proof of Maintenance

  Maintenance records demonstrating compliance with the O&M procedures in the WQMP must be available for review at the time of the inspection. Failure to demonstrate that the BMPs have been maintained appropriately may result in license suspension or other enforcement actions.

Other Priority Developments

The following requirements will apply to new priority residential developments and businesses not otherwise subject to the Permit's Commercial and Industrial business inspection requirements.

- Proof of Maintenance and Self Certification

  The maintenance entity identified in the WQMP will be required to submit maintenance records including a signed certification to the Co-Permittee. The frequency of these submittals will be based on the relative maintenance requirements of the Treatment Control BMPs implemented on that site. BMPs will be categorized into groups as having High, Medium or Low maintenance requirements. If a WQMP project utilizes high-maintenance Treatment Control BMPs it will be categorized as a High-priority residential development, etc. High-Priority residential developments will be required to submit records annually, Medium – biennially, and Low – once every five years. Failure to report will result in administrative citations against the maintenance entity.

Permittee Projects and Permittee Maintained Treatment Control BMPs

This requirement will be included as part of the existing Permittee facility inspection program and inspected per the frequency requirements specified in the Riverside County DAMP.

7.3 Private Development Construction Activities

The Permittees have reviewed their ordinances to ensure that they are adequate to control discharges to the MS4 from construction sites to the MEP. For construction projects that will disturb one acre or more, the Permittees require proof of compliance with the General Permit-Construction prior to issuance of building/grading permits (a copy of the Notice of Intent filed with the State Board). Each of the Co-Permittees provides training for their construction inspectors regarding the proper installation and

maintenance of erosion and sediment control BMPs. Education and outreach to the building industry (developers, construction contractors, engineering firms, etc.) regarding managing discharges from construction sites is also incorporated into the "**Only Rain Down the Storm Drain** Pollution Prevention Program," the Permittees' area-wide public education and outreach program.

7.3.1 Private Development Construction Activities Program Element Accomplishments and Programmatic Improvements

- The Permittees annually distribute construction activities posters to construction sites as part of construction outreach program.
- A standardized construction activity reporting spreadsheet was developed for the Annual Reports.
- The construction inspection forms were updated.
- The Co-Permittees developed and maintained inventory databases of construction sites 1-acre or larger for which they have issued a building or grading permit.
- Prioritized inspections to help target construction activities that present the highest risk to water quality.

Highlights
Conducted over **17,000** construction site inspections
Initiated over **3,800** enforcement actions to gain compliance
626 attendees to NPDES Construction training

7.3.2 Proposed Revisions to the Private Development Construction Activities Program Element

The Permittees are not proposing revisions to their existing construction inspection programs at this time. As previously described, the Permittees expect that development activity will be greatly reduced during the term of the new MS4 Permit. Regional Board staff has however raised the issue of abandoned construction sites. Regulation of abandoned construction sites has proven challenging due to bankruptcy of project proponents, non-responsiveness or inability to locate underlying investment banks that actually own the developments, and the practical limitations encountered by the Permittees in calling bonds. As the Regional Board has enforcement capabilities that often surpass those of the Permittees, to ensure that this issue is effectively addressed the Permittees ask for the close cooperation and support of the Regional Board. Nonetheless, the Permittees are committed to continuing the use of their IC/ID programs, code enforcement tools, and other ordinance authorities to control, to the extent allowable under law, abandoned parcels that are not properly stabilized.

7.4 Existing Development – Permittee Facilities and Activities

The Municipal Facilities Strategy which has been consolidated into Section 5 of the Riverside County DAMP provides guidance for identifying potential storm water Pollutant sources and for selecting appropriate BMPs for implementation at identified facilities of concern owned and operated by the Permittees. The Permittees are implementing the provisions of the Municipal Facilities Strategy within their respective jurisdictions via processes described in their Individual SWMPs. To assist the Permittees in implementing this program, training focused on storm water regulatory requirements and BMPs related

to Permittee maintenance facilities and roadway maintenance activities were conducted twice annually during the 2004 MS4 Permit term.

7.4.1 Permittee Facilities and Activities Program Element Accomplishments and Programmatic Improvements

- The District coordinated preparation of GIS-based maps for Permittee MS4 facilities. The MS4 maps are updated annually with new information provided by the Permittees as part of the Annual Reporting process.
- Development of a GIS Browser that allows interested parties to view MS4 Facilities from the District's website.
- Updated Model Facilities Pollution Prevention Plan for Permittee facilities not requiring coverage under the Industrial General Permit.

Highlights
900 attendees to Municipal NPDES training

7.4.2 Proposed Revisions to Permittee Facilities and Activities Program Element

7.4.2.1 FPPP Guidance

The Permittees commit to developing a revised WQMP template for Permittee projects that better facilitates translation of WQMP BMP requirements into Facility Pollution Prevention Plans, where appropriate.

7.4.2.2 Integrated Pest Management

The Permittees commit to including Ecowise's standardized language for contracted pesticide management services in Permittee pesticide management contracts.

7.5 Commercial and Industrial Sources

The Principal Permittee and the County have implemented the CAP through which the County Department of Environmental Health makes use of existing inspection programs to address storm water compliance survey/inspections of restaurants and facilities that must secure a hazardous materials permit for either storing, handling or generating hazardous materials. As the responsible Certified Unified Program Agency in Riverside County, the County Department of Environmental Health is responsible for regularly inspecting all sites within the County that handle hazardous waste. The CAP is implemented in those cities and unincorporated areas that do not maintain an individual industrial/commercial inspection program through other mechanisms such as POTW waste pre-treatment programs or business license inspection programs.

Revisions to the inspection program requirements contained within the 2004 MS4 Permit expanded the scope of the overall commercial/industrial inspection program beyond the ability of the CAP to address. Each Co-Permittee now implements a supplemental inspection program for facilities not covered by the CAP. In addition, the 2004 MS4 Permit required inventories/databases of facilities, prioritization of

industrial and commercial sources relative to the potential to impact water quality, and specified inspection frequencies based upon facility priority.

The revised industrial and commercial sources program continues to have both regional and local jurisdiction components. Although the overall industrial/commercial inspection program has grown beyond the CAP, the CAP still addresses most of the facilities identified in the 2004 MS4 Permit. With its low overhead cost, it remains a cost effective approach to mitigating the impacts of industrial and commercial facilities on the MS4 and Receiving Waters.

7.5.1 Commercial and Industrial Program Element Accomplishments and Programmatic Improvements

- Reviewed and updated several educational brochures for distribution to inspected facilities.
- Developed outreach posters for gas and automotive service stations.
- Developed standardized inspection reporting forms for Annual Reports.
- Updated food service surveys.
- Extended the agreement with the County's Department of Environmental Health executed in 1999 for the area-wide CAP for the inspection of commercial and industrial facilities through June 30, 2009.
- Created Permittee databases for the inspected commercial and industrial facilities.
- Revised the Riverside County DAMP to reflect development of the industrial and commercial facility database that contains the following information: facility name, address, city, zip code, and Standard Industrial Classification (SIC) codes.
- Provided public education information regarding NPDES storm water permits to any new businesses listed in the Press Enterprise.

Highlights
3,974 inspections of Industrial and Commercial facilities
Over **1000** enforcement actions taken
426 attendees to Municipal NPDES training

7.5.2 Proposed Revisions to Commercial and Industrial Sources Program Element

The expected future expansion of the Commercial and Industrial Inspection Program to address Treatment Control BMPs as described in Section 7.2.2.6 would likely result in an expansion of the CAP that is beyond the ability of Environmental Health staff to accommodate and still achieve their own mandated inspection requirements. The Permittees are therefore proposing to amend the Riverside County DAMP and Individual SWMPs to recognize not only the CAP inspection program but also Permittee specific alternative programs that may develop during the term of the next MS4 Permit.

7.6 Residential Sources

The residential program focuses on educating residents about activities that can potentially contribute to beneficial use impairment. The residential program outreach is focused on Pollutants of Concern. The residential program is primarily implemented through the Regional Public Education Program; however, each Permittee typically conducts additional outreach. In those cases where residential Illegal Discharges are identified, appropriate code enforcement actions are also taken.

7.6.1 Accomplishments and Programmatic Improvements

The residential program achieved the following accomplishments during the term of the 2004 MS4 Permit:

- Developed several new outreach brochures and tools to promote changes in knowledge and behavior regarding activities that potentially generated Pollutants of Concern including landscape and gardening brochure, spray bottles with non-toxic pest control or cleaner recipes, septic system management brochure, updated outdoor activities brochure, and pet waste brochure.
- Implemented billboard advertising promoting "**Only Rain Down the Storm Drain**" message
- Purchased a new trailer to transport public education materials. The trailer is wrapped in graphics supporting the "**Only Rain Down the Storm Drain**" message.
- Point of Sale Outreach Programs to customers of hardware stores regarding paint, pesticides and fertilizers.
- Partnership with Valley Greeters to deliver "**Only Rain Down the Storm Drain**" information to new residents in the Santa Margarita Region.
- Promotion and participation in the annual Santa Margarita Watershed Clean Up Day.
- Continued supplemental support of the HHW/ABOP waste collection programs
- Continued update and revision of the public education information page
- Continued implementation and enhancement of school outreach programs conducted by Mission Resource Conservation District
- Reproduction and distribution of the After the Storm poster

7.6.2 Recommended Revisions

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.7 Public Education and Outreach

Although the bulk of public education and outreach activities are conducted by the District on behalf of the Permittees, the Permittees also conduct outreach activities. These activities include providing informational pamphlets at counters, conducting presentations for local businesses or developers, maintaining a stormwater page or appropriate stormwater links on their individual websites, conducting employee training programs, and attending various public events.

7.7.1 Public Education and Outreach Program Element Accomplishments and Programmatic Improvements

The Public Education and Outreach Program Element had the following accomplishments and improvements over the term of the 2004 Permit (not including those identified in Section 7.6.1):

- Use of a CEQA-style public participation process to develop the Riverside County DAMP, SWMPs, and WQMP
- Duplication and use of the USEPA construction site poster to educate construction site operators
- Distribution of stormwater outreach information to various businesses and construction sites through code enforcement, and building and grading inspectors
- Development and distribution of a automotive shop BMP poster
- Advertisements in the Business Press
- Update of the outdoor activities brochure for mobile operators

7.7.2 Recommended Changes

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.8 Elimination of Illicit Connections and Illegal Discharges

The Riverside County DAMP describes the discharge limitations and prohibitions applicable to the Permittee's MS4 (Section 4.1), procedures to be implemented when persistent exceedances of Water Quality Standards are identified (Section 4.2), responding to and reporting Illegal Discharges (Section 4.4), enforcement measures for IC/IDs (Section 4.5), measures to control litter (Section 4.6), measures to manage sanitary wastes (Section 4.7), and programs to promote collection and proper disposal of hazardous waste (Section 4.8).

7.8.1 IC/ID Program Element Accomplishments and Programmatic Improvements

- Developed Sanitary Sewer Overflow Procedures in coordination with the sanitary sewer operators in the Santa Ana and Santa Margarita Regions and implemented annual updates to Sanitary Sewer Overflow Procedures to ensure proper contact information for outside agencies.
- Established an electronic tracking system for NPDES complaints received through the toll free "Report Storm Water Pollution" hotline, OES or otherwise reported to the District.
- Enhanced public outreach regarding illegal dumping including brochures for: Outdoor Activities, Fountains & Swimming Pools, and Pet Waste, establishment of a Santa Margarita watershed Clean-Up Day and coordination with the County of Riverside Trash Task Force.

- Initiated a cooperative program with the County Environmental Health Department to promote Environmental Enhancement Projects in lieu of fines for environmental crime cases. This initiative resulted in a billboard advertising campaign and BMP posters addressing appropriate BMPs for gas stations and garages.
- Established IC/ID Monitoring Program

Highlights
1,263 potential IC/ID reports received and responded to
Over **5,500** calls received on stormwater pollution hotlines
94 IC/ID Monitoring events
5 monitoring events where field screening exceeding criteria

7.8.2 Proposed Revisions to IC/ID Program Element

The Permittees re-evaluated their existing IC/ID monitoring programs as part of this ROWD. The Permittees believe that the overall monitoring program is effective. However, the Permittees plan to revise their approach to the implementation of the Illicit Discharge monitoring program to increase monitoring data utility or overall program effectiveness.

7.8.2.1 Revise IC/ID Monitoring Program

The Permittees plan to revise their approach to the implementation of the IC/ID monitoring program. The goals of the recommended revisions are to:

- Relocate the IC/ID monitoring sites at MS4 outfalls.
- Distribute the monitoring sites throughout the Santa Margarita Region to detect Illicit Discharges closer to their source before they become excessively diluted.
- Increase efficiency and consistency in sampling resulting in enhanced data quality.
- Enhance response time to identify IC/IDs.

A model Illicit Discharge monitoring plan that accomplishes these goals is described below; a final plan will be incorporated into updated compliance documents with the new MS4 Permit.

7.8.2.2 Model Illicit Discharge Monitoring Plan

The Municipal Permittees will identify MS4 outfalls that could be used for monitoring sites based on maps of the MS4 facilities. This list of preliminary sites will be then field checked to determine the accessibility of the sites and feasibility for inclusion in the IC/ID monitoring program. Inaccessible sites or sites determined to be otherwise infeasible will be removed from the list.

Each Municipal Permittee except Menifee will then divide the list of the viable sites within their jurisdiction into groups of four. As Menifee only has one MS4, it will only monitor that one site. Each group of four sites will be monitored for a period of one year, twice during the dry season. Once all sites have been monitored for a year, sites will be repeated.

A monitoring team will be formed including one District and one Municipal Permittee staff member. The District staff will perform all monitoring/screening activities. The Municipal Permittee staff will be available to assist and will be responsible for initiating any necessary follow-up actions. This approach will provide consistency in screening and monitoring data collection and will allow the Municipal Permittee with jurisdiction over the tributary land use to be immediately aware of exceedances and initiate appropriate follow-up actions.

1.0 Executive Summary

On July 14, 2004 the San Diego Regional Water Quality Control Board (Regional Board) adopted Order No. R9-2004-001, an area-wide National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit (2004 MS4 Permit); this permit expires on July 14, 2009. A Report of Waste Discharge (ROWD) for renewal of the 2004 MS4 Permit must be submitted no later than 180 days in advance of the expiration date (i.e., by January 15, 2009).

This ROWD is an application for renewal of the 2004 MS4 Permit (NPDES No. CAS0108766) for the MS4 owned and operated by the Riverside County Flood Control and Water Conservation District (District), the County of Riverside (County), and the incorporated cities of Riverside County within the upper Santa Margarita River watershed (collectively, the Permittees). The newly incorporated cities of Menifee and Wildomar are included in this application as a Notice of Intent to participate in the updated MS4 Permit.

The content of this document is structured to identify:

- Information about the applicants (Section 3.0),
- Information on the area to be covered under the MS4 Permit (Section 4.0),
- An overall evaluation of the Permittees' existing programs based on water quality trends (Section 5.0),
- Accomplishments and recommendations for the Permittees' regionally implemented programs (Section 6.0) and
- Accomplishments and recommendations for the programs implemented as part of the Individual Stormwater Management Plans (SWMPs) (Section 7.0).

The Riverside County Drainage Area Management Plan (DAMP) documents the model implementation plan from which each of the existing Permittees has developed their respective Individual SWMP to implement the DAMP. In addition a Watershed SWMP has been developed to describe the programs that will be implemented regionally. The Annual Reports submitted to date describe the implementation of these SWMPs and document how they have evolved over time.

This ROWD builds on these Annual Reports by highlighting the major accomplishments of these programs, evaluating the long-term effectiveness of the programs and recommending revisions to the programs to enhance the efficiency and effectiveness of the programs to manage Urban Runoff to protect Receiving Water quality. To promote clarity of intent, terms defined in the 2004 MS4 Permit are capitalized in this ROWD.

Due to the impacts of the current economic recession on Permittee budgets and the effectiveness of existing Urban Runoff management programs, the Permittees' primary focus during the next MS4 Permit term will be on maintaining existing compliance programs in the face of significant cuts in basic municipal programs and services. Riverside County is one of the areas most affected by the mortgage crisis and the Santa Margarita Region is one of the most impacted areas of Riverside County. This crisis is having significant impacts on Permittee resources and projections for a deepening recession promises to exacerbate these impacts. Further, monitoring data indicates that the existing compliance programs have been effective in maintaining water quality. This ROWD focuses on maintaining the fundamental

structure and content of the Riverside County DAMP and the Individual SWMPs. However, the Permittees have identified several enhancements and/or alterations to their programs that can be implemented to continue to increase the effectiveness of these programs, without increasing costs.

1.1 Highlights of Program Implementation

Sections 6 and 7 of this ROWD describe the numerous accomplishments of the Permittees programs during the 2004 MS4 Permit term. Some highlights of the major accomplishments for the Permittees include:

- Development and implementation of a Water Quality Management Plan (WQMP) that addresses post-construction Urban Runoff management for New and Significant Re-Development.
- Development and implementation of the Watershed SWMP and the Permittee's Individual SWMPs.
- Development of handbook to standardize post-construction Best Management Practice (BMP) selection and design in Riverside County. Ongoing updates to the handbook include a plan to incorporate and promote low impact development design concepts.
- Development and enhancements to the design template for developing project-specific WQMPs
- Development of a Frequently Asked Question (FAQ) document to assist developers and plan review staff in understanding WQMP requirements and expectations.
- Development of coordinated BMP manual for firefighting agencies.
- Development, implementation and maintenance of Permittee databases to track construction sites 1-acre or larger. In addition, the Permittees have standardized a construction reporting spreadsheet used for Annual Reports, updated inspection forms, and enhanced the construction outreach program.
- Creation of Permittee databases to track industrial and commercial facilities.
- Creation and maintenance of the Storm Water Protection website that offers educational resources and free brochures targeting residents, businesses, developers, contractors, and elementary school children.
- Partnership with the Mission Resource Conservation District to provide an educational outreach programs targeting both schools and adults.
- Continued participation in the Consolidated Program for Water Quality Monitoring (Consolidated Monitoring Program) that includes collection of water quality samples at MS4 outfalls and Receiving Waters.
- Participation in regional and statewide monitoring efforts such as the Southern California Monitoring Committee (SMC), Southern California Coastal Water Commission and National Water Resources Institute.
- Participation in the California Stormwater Quality Association (CASQA), including the leadership roles of Officer, Director, and Legislative Chair.
- Development of the Upper Santa Margarita Region Integrated Regional Watershed Management Plan

- Continued partnership and coordination with the Bureau of Reclamation on a watershed plan and water quality model for the Santa Margarita watershed
- Continued participation in the Santa Margarita Lagoon nutrient Total Maximum Daily Load (TMDL) development process
- Participated in a stakeholder workgroup process led by Regional Board staff to revise REC 1 Basin Plan requirements for TMDLs

1.2 Summary Evaluation of Program Implementation

The trend analysis presented in Section G-8.2 of the FY 2007/2008 Watershed Annual Report and reviewed in Section 5.3 of this ROWD indicates that after almost 14 years of active Permittee involvement in MS4 Permit related Urban Runoff management programs, the significant increase in population (over 300 percent) and associated rapid urbanization that the area has experienced has not resulted in any statistically significant increases in Pollutant concentrations in Receiving Waters in the Santa Margarita Region. This indicates that the Permittees MS4 programs are and have been protective of Receiving Water quality. Pyrethroid pesticides, the one Pollutant that does appear to be linked to urbanization, has been addressed through a Toxicity Reduction Evaluation process, outreach programs, and Permittee participation to address pyrethroid pesticides and other pesticide sources at the state and federal level.

To enhance the effectiveness of the MS4 Permit compliance programs, the Permittees have agreed to implement compliance program revisions as described in sections 6 and 7 of this ROWD.

1.3 Summary of Major Recommendations for Program Revision

As described in section 3.4 of this ROWD, the Permittees are facing unprecedented fiscal impacts resulting from the national and state economic crises. The impacts on the Permittees are especially severe due to the disproportionate impact of home foreclosures in the Santa Margarita Region coupled with plummeting sales tax revenue. Unfortunately, it is anticipated that the economic conditions will persist for a significant portion of the term of the next MS4 Permit. During this period, the Permittee's MS4 compliance programs will increasingly compete with more fundamental public services for finite and dwindling resources. The challenge and priority for the Permittees will be to maintain the existing compliance programs in the face of cuts in basic programs and services.

Nevertheless, and although the various programs implemented as part of the Watershed SWMP and the Riverside County DAMP have been determined to be effective overall, Sections 6 and 7 of this ROWD identify certain areas wherein the Permittees are proposing changes to improve the effectiveness, efficiency, and transparency of these programs.

The program revisions recommended in this ROWD reconfigure existing programs in a manner that will increase the Permittees' overall ability to protect Urban Runoff quality, while limiting additional costs that would make these revisions cost-prohibitive in light of the current and foreseeable economy. Some of the major recommendations include:

Enhance Program Effectiveness Assessments and Incorporate Action Levels (Section 6.1.2.1)

The Permittees have carefully evaluated their MS4 Permit compliance programs and annual reporting forms. Based on this review the Permittees determined that:

- The overarching goal of the program is to ensure that Urban Runoff does not cause or contribute to non-attainment of Beneficial Uses in the upper Santa Margarita River watershed;
- Permittee compliance programs are process based and, consistent with the Maximum Extent Practical (MEP) approach, are incrementally adjusted as part of the annual reports and comprehensively reevaluated and if necessary, revamped as part of each ROWD;
- Monitoring data should be used to drive long term program assessments and assess goal attainment as part of the ROWD; and
- Process based Municipal Action Levels (MALs) should be used to evaluate annual program implementation to ensure that programs are implemented to the MEP and identify the needs for incremental adjustments.

The Permittees have proposed revised Effectiveness Assessment metrics and MALs for use in Permittee Annual Reports consistent with the aforementioned findings and as described further in Section 6.1.2.1. The MALs are intended to function as triggers, or minimum bars that if breached, would require the Permittees to evaluate the appropriate program elements to determine if adjustments are necessary to attain the MEP standard. The Permittee proposal will not only add transparency to the Permittees compliance programs but assist Permittees in evaluating and adjusting their Permit compliance programs to assist in attaining Water Quality Standards. Further, the proposed effectiveness assessment metrics can be implemented without significantly increasing the Permittees' program costs.

Revisions to the IC/ID Program (Section 7.8.2)

During the 2007/2008 MS4 Program audits conducted by PG Environmental and Regional Board staff, several questions were raised regarding the Permittees existing Illicit Connection/Illegal Discharge(IC/ID) field monitoring programs. The Permittees have evaluated the Regional Board and PG Environmental staff's comments and proposed a revised IC/ID Program based on the following:

- Random selection of MS4 outfalls throughout the Santa Margarita Region;
- Rotating MS4 outfall sites annually to maximize coverage of the MS4;
- Partnering one District staff person with one city/county code enforcement officer for data collection to ensure consistency in sampling procedure/collection and quick response to detected IC/ID events.

Implementation of a Post-Construction Treatment Control BMP Inspection Program (Section 7.2.2.6)

Consistent with Regional Board staff's request to consider development of a post-construction Treatment Control BMP inspection program, the Permittees have developed a proposal that they plan to implement when economic conditions allow. This proposal would enhance the existing business and Permittee facility inspection programs described in the Riverside County DAMP by incorporating inspections and maintenance verification of Treatment Control BMPs. Treatment Control BMPs constructed as part of residential developments, or other developments not captured by the Permittees' existing business inspections would be addressed through an annual self-certification program.

Revisions to the Dry Weather Monitoring Program (Section 6.4.4.1)

The Permittees have committed to participating in the Regional Watershed Monitoring Program developed in conjunction with the Southern California Coastal Water Research Project (SCCWRP). Six annual monitoring events were scheduled for the upper Santa Margarita River watershed. Consistent with the agreement reached by SCCWRP, Permittee, and Regional Board staff, three of these sites would be collected by the Permittees and three through the Surface Water Ambient Monitoring Program (SWAMP). The costs for implementing the three sites to be implemented by the Permittees would be offset by reducing the Permittees existing dry weather triad monitoring events (three stations) from twice a year to annually.

Development of a LID Manual (Section 7.2.2.1)

The Permittees have committed to develop a Low Impact Development (LID) Implementation Manual based on the LID Manual currently being developed by the SMC and CASQA.

Hydromodification Management Plan (Section 7.2.2.2)

The Permittees have committed to develop a revised hydromodification management plan based on the findings of the final SCCWRP Hydromodification Management report currently under development.

Participate in a Watershed Based TMDL for the Santa Margarita Lagoon (Section 6.4.4.7)

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon watershed-based TMDL has been withdrawn. As described in Section 3.4, economic conditions are also impacting the Permittees' funding sources and the Permittees are struggling to maintain sufficient resources to fund their existing compliance programs. Therefore, the Permittees cannot currently support committing additional funds toward a third party TMDL effort. The Permittees are, however, agreeable to discussing with the Regional Board a elimination or reduction of various required compliance activities that are not measurably enhancing the their ability to attain Water Quality Standards, which in turn could allow the Permittees to redirect some of their existing resources into the third party TMDL effort. Some program elements that could be considered for discussion are described in Section 6.4.4.7.

Pyrethroid Pesticide BMP Implementation

The Permittees have committed to implementing several BMPs to address possible urban sources of pyrethroid pesticides. In addition the Permittees have committed to working through CASQA to facilitate regulatory change in pyrethroid pesticide use to curtail potential causes of receiving water impairment.

Adjustments to the Monitoring Program

The Permittees have proposed additional revisions to the monitoring program to streamline implementation and increase its utility.

2.0 Introduction

The Regional Board adopted Order No. R9-2004-001 (NPDES No. CAS0108766), an area-wide NPDES MS4 permit (2004 MS4 Permit) on July 14, 2004. This ROWD is a required component for renewal of the 2004 MS4 Permit. The 2004 MS4 Permit authorizes discharges of Urban Runoff from the MS4 owned and operated by the Permittees.

Capitalized terms used in this ROWD are defined in the glossary of the Riverside County DAMP. The Riverside County DAMP serves as the model compliance document used by the Permittees to develop the Watershed and Individual SWMPs. To save costs and increase the effectiveness of the MS4 Permit compliance programs, the Permittees will maintain the Riverside County DAMP as the primary document that describes Permittee compliance programs. The Permittees individual and regional compliance programs are then described in more detail in the Individual and Watershed SWMPs.

This ROWD has been written and formatted to address the requirements outlined in United States Environmental Protection Agency (USEPA) *Interpretative Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems* contained in the Federal Register, Volume 61, page 41698 (61 FR 41698), and to include commitments made in the various compliance documents, annual reports and in meetings with the Regional Board.

Additionally, as discussed in the meeting with Regional Board staff on September 9, 2008 and as supported by the above mentioned USEPA guidance, this ROWD relies on the fourth year Annual Reports to document the programs implemented by the Permittees. The fourth year Annual Report also includes a comprehensive evaluation of Permittee monitoring data to date and includes preliminary recommendations for Permittee compliance programs based on that data. As part of the ROWD process, the Permittees have reassessed their existing programs that are described in the Annual Reports, the monitoring conclusions and program recommendations contained in the fourth year Annual Reports, and in this ROWD, are making additional recommendations for revisions to improve the efficiency and effectiveness of these programs at improving and protecting the quality of our Receiving Waters.

The following sections of the ROWD are summarized as follows:

Section 3.0 - Information about the Permittees, their legal authority to implement the existing and proposed programs, the Permit Area, and the Permittee's funding sources and economic outlook relative to continued funding of the MS4 Permit compliance programs.

Section 4.0 – Information about the upper Santa Margarita River watershed, including physiography and geology, hydrology, climate, population, land use, surface water bodies and their Beneficial Uses and Impairments, and the MS4. This information provides context for the MS4 Permit compliance program in the Santa Margarita Region.

Section 5.0 – An overall evaluation of the Permittees existing programs based on water quality data collected to date and proposed compliance program modifications.

Section 6.0 – Evaluation of regional compliance programs, including a summary of accomplishments and proposed program revisions.

Section 7.0 – Evaluation of compliance programs individually implemented by the Permittees, including a summary of accomplishments and proposed program revisions.

3.0 Applicant Information

3.1 Permittee Contact Information

Table 1 provides the contact information for each of the Permittees in the Santa Margarita Region.

3.2 Statement of Legal Authority

The Co-Permittees have adopted ordinances regarding the management of Urban Runoff. The ordinances provide the Permittees with the legal authority to implement the requirements of the 2004 MS4 Permit and 40 CFR Section 122.26(d)(2)(i)(A-F). The Permittees also provided certification of adequate legal authority to comply with the 2004 MS4 Permit and to implement the Riverside County DAMP to the

[1] As the Cities of Menifee and Wildomar are recently incorporated, the County of Riverside is currently handling their stormwater and MS4 permitting issues. Once these cities are fully established and staffed, updated contact information will be provided to the Board. The cities will assume responsibility for their programs on October 1, 2009.

Regional Board. However, it is noted that the newly incorporated cities of Menifee and Wildomar will submit their certifications following adoption of the updated MS4 Permit.

However, there are limitations to the authority the Permittees have for enforcement actions. The Permittees do not have legal authority over discharges into their respective MS4 facilities that originate from agricultural activities, state and federal facilities, utilities and special districts, Native American tribal lands, wastewater management agencies and other point and non-point source discharges otherwise permitted by, or under the jurisdiction of, the Regional Board or USEPA. Examples of non-point sources of Pollutants not under the control of the Permittees include materials from operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

Also, the Permittees do not have the authority to enforce the provisions of California's General Permit for Storm Water Discharges Associated with Industrial Activities (General Permit-Industrial) or California's General Permit for Storm Water Discharges Associated with Construction Activity (General Permit-Construction). The State Water Resources Control Board (State Board) issues these NPDES permits, and neither the State Board nor the Regional Board has the authority under the Clean Water Act to delegate responsibility for administering these NPDES permit programs to the Permittees. However, the Permittees' local storm water and erosion control ordinances may address items similar to those identified in these statewide NPDES permits.

3.3 Permit Area

The Permit Area is defined as the urbanized area serviced by the Permittee's MS4 facilities. The Permit Area is located within the area delineated by the County boundary line on the south and the limits of the jurisdiction of the San Diego Regional Board on the north, east, and west. It is important to recognize that the Clean Water Act exempts agricultural activities from regulation under NPDES and the Permittees do not have legal jurisdiction over storm water discharges into their MS4 facilities from:

- California and federal facilities,
- Areas under the jurisdiction of San Diego County,
- Utilities and special districts, and
- Native American tribal lands.

These areas are not included in the Permit Area. In addition, other point and non-point source discharges otherwise permitted by or under the jurisdiction of the Regional Board or USEPA may affect water quality in the Murrieta and Temecula Creek watersheds.

The area of Riverside County under the jurisdiction of the Regional Board is less than 8 percent of the 7,300 square miles within Riverside County. Of the 27 municipalities within the whole of Riverside County, only five include areas under the jurisdiction of the Regional Board.

3.4 Funding Sources and Economic Projections

3.4.1 Funding Sources

The costs incurred by the Permittees in implementing the SWMPs fall into two broad categories:

- **Shared Costs**. These are costs that fund activities performed mostly by the District under the Implementation Agreements. These activities include coordinating the overall storm water program, coordinating other interagency cooperative efforts such as the Compliance Assistance Program (CAP), participating in CASQA activities, representing Permittees at meetings of the Regional Board or State Board and other public forums; preparing and submitting compliance reports and other reports required under the MS4 Permit, conducting Urban Runoff monitoring and public education outreach programs, responding to Water Code Section 13267 requests, providing other program documentation, and coordinating consultant studies, Permittee meetings, and training seminars.
- **Individual Permittee Costs for Individual SWMP Implementation**. These are costs incurred by each Permittee for implementing within its jurisdiction the BMPs (drainage facility inspections for illicit connections, drainage facility maintenance, drain inlet/catch basin stenciling, emergency spill response, street sweeping, litter control, public education, construction activity inspection, development of implementation plans, etc.) comprising the Individual SWMPs.

Historically, the Permittees have employed several funding methods to finance their MS4 Permit compliance activities. Unfortunately, the mortgage crisis, collapse of the housing market, and the economic recession has resulted in the cessation of virtually all development activity and has significantly reduced property and sales tax revenue. Property tax revenues have been reduced by the high level of foreclosure activity, reduced property values and a significant decline in assessed valuations. Property tax revenues have been further reduced by homeowner requests for reassessments to reflect the reduced property values. The impact of these economic conditions on the Permittees in the Santa Margarita Region has been particularly severe. As a result, the aggregate funding available to the Permittees has been severely reduced, and it is anticipated that this condition will continue well into and possibly throughout the next Permit term. The funding methods historically used and the effects of the economic situation on the availability of funds through these sources are summarized as follows:

- **Santa Margarita Watershed Benefit Assessment Area**. In 1991, the District established the Santa Margarita Watershed Benefit Assessment Area to fund its MS4 Permit compliance activities. Currently, the Benefit Assessment revenues fund the District's share of the area-wide MS4 Permit program activities and the District's individual compliance activities as a Permittee. Under the Benefit Assessment each parcel is taxed based on the impervious area of each parcel at a set rate established by District Ordinance 14. This rate has not been increased since 1991 due to Proposition 218. In 2007/08 the Santa Margarita Benefit Assessment generated approximately $410,000 dollars in revenue.

  Outlook: The District expects at best to maintain, if not see temporary reductions in Benefit Assessment revenues due to the significant number of homes that are not paying property tax due to foreclosure. Pursuant to Article 13.D of the California Constitution, an increase in the established Benefit Assessment rate to compensate for these reductions requires approval of 2/3

of the voters or 50 percent of the property owners and is highly unlikely given the current economic climate. Revenues will not increase until the development industry recovers.

- **General Fund /Other Revenues**. The County and the cities utilize general fund revenue to finance most of their MS4 Permit compliance activities. General fund revenue is generated by property tax, sales tax, and auto license taxes.

  Outlook: The Permittees expect a continued reduction in th**e funds** available through General Fund / Other Revenues through at least FY 2009 /2010. Although optimistic that conditions will begin to stabilize toward the end of 2009, the Permittees cannot speculate as to when revenues will recover to previous levels.

- **Fees**. Several Permittees charge fees for services such as inspections, plan check, and other recoverable costs related to compliance with the 2004 MS4 Permit. These fees cover both the direct and indirect costs associated with conducting these inspections/reviews including associated compliance tracking and reporting.

  Outlook: It is notable that, with the virtual collapse of the development industry in the Santa Margarita Region, the fees received by the Permittees have been significantly reduced. With this reduced level of fee-based income, maintenance of the existing inspection and plan review programs will place an increased burden on overall funding of the compliance programs. The Permittees do not expect revenues from fees to recover until the development industry recovers. Even with recovery of the development industry, it is anticipated that over the long-term, revenues from fees will be reduced for the City of Temecula and the County due to the reduced area remaining for development within their jurisdictions.

- **Grants.** The Permittees have actively pursued and, as available, used Grants to fund compliance programs.

  Outlook: In December the state's budget crisis resulted in a directive to state agencies from the Department of Finance to halt projects that rely on bond funds, including those funded by Prop 40, Prop 50, or Prop 84. The State of California is the primary source of grant funding for water quality projects. Future availability of funds to resume grant-funded projects is uncertain.

It is clear that the current economic climate and that of the foreseeable future is creating a significant burden upon the Permittees that will make the continuance of all existing MS4 Permit compliance programs increasingly difficult. New funding sources or alternative combinations of funding sources will likely be required to ensure continued funding of even the current MS4 Permit compliance programs.

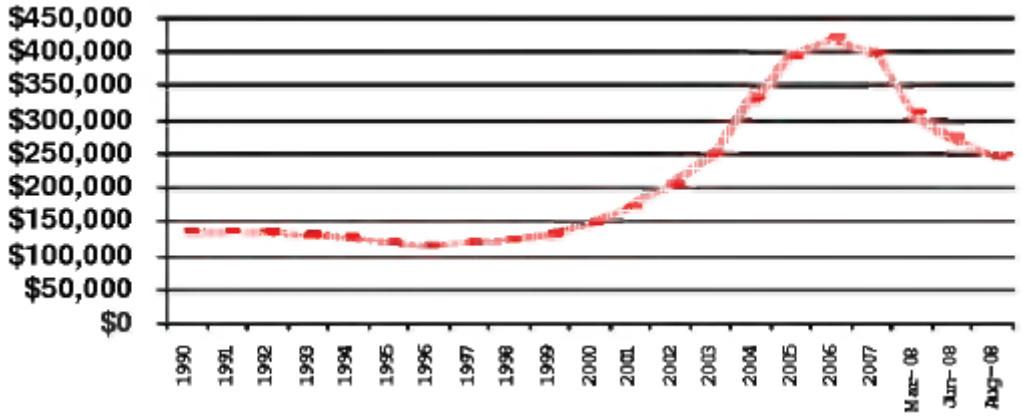
3.4.2 Economic Projections

According to Chicago Title, Southwest Riverside County has experienced a very significant increase in supply of single-family residential units on the market. As a result, housing price indicators are very negative. In the majority of the Southwest Riverside submarket, the pending price is less than the closing price indicating general price weakness. The October, 2008 count of bank owned (REO) properties for Riverside County as a whole was 12,078. The number of home in foreclosure was 23,480. The presence of high levels of REO properties will continue to negatively affect home prices. In addition, the level of foreclosures is increasing.

With regard to other sectors of the economy, Riverside County has taken a serious turn for the worst in 2008, with projections indicating that the severe downturn will continue through 2009 at the very least.

The economic difficulties being faced in the Southwest Riverside submarket is the result of the dramatic downturn in the housing market in this area, the national financial turmoil, the worldwide credit crisis, and the increasing consumer debt crisis. According to Beacon Economics, a respected economics consulting firm in Los Angeles, Inland Southern California is clearly at the epicenter of this economic turmoil, with extremely high rates of unemployment at present. Unemployment rates in Inland Southern California are expected to reach 12.4 percent before this deep recession is over. Housing prices are expected to continue their precipitous decline from their peak levels in the two Inland Southern California counties through at least 2011. According to Dataquick, median home prices in Riverside County peaked at $415,000 in January 2007. At the end of this cycle, the median home price in Riverside County is expected to be $198,000. Figure 1 depicts the median housing price in Riverside County over the period 1990 to August 2008.

Figure 1. Riverside County Median Housing Price (1990 – August 2008)

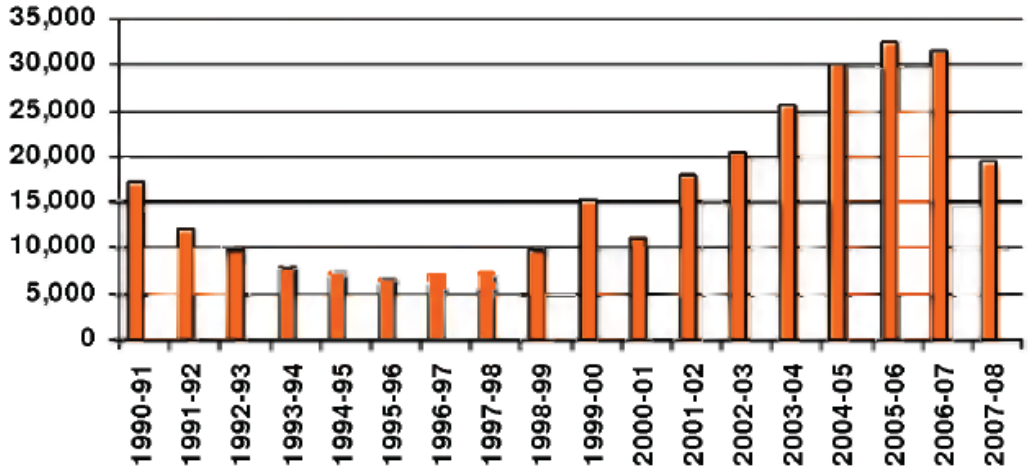


Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 14.

Local Government sales tax revenues remained fairly stagnant through 2006 and began to decline in early 2007, according to Beacon. By the second quarter of 2008, taxable sales in Riverside County declined by 7.7 percent. The decline is expected to continue with taxable sales possibly bottoming out by 2010. Recovery of these reduced revenue streams will likely not occur within the next permit term.

As a direct outcome of the current economy and the economic outlook into the next MS4 Permit term, the number of New Developments proposals has plummeted and any significant rebound is not forecast. New and redevelopment projects will likely remain minimal. As shown in Figure 2, the number of housing units being added each year has dropped below the levels seen at any point in time during the 2004 MS4 Permit. These numbers will likely continue to decrease for a significant portion of the new MS4 Permit term.

Figure 2. Riverside County Housing Units Added (1990 – 2008)



Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pg 12.

These economic issues and projections directly affect and limit both:

1. The need for including enhanced new and re-development requirements in the new MS4 Permit, and
2. The Permittees ability to fund, and even seek new funding sources for additional MS4 Permit requirements for new and re-development projects.

Therefore, as described in Section 7.2, the Permittees are not recommending and cannot financially support any significant increases to their Development Planning activities. Permittee specific projections are as follows:

3.4.2.1 County of Riverside

The County is operating with a structural deficit of $12 million and plans a 25 percent budget reduction from FY 2008/2009 through FY 2011/2012. The County's current budget of $4.7 billion represents a 5 percent reduction from the previous year and next year's budget is expected to be cut by 10 percent. These cuts are directly associated with the overall decline in property values and the high number of foreclosures. There are concerns about having to use discretionary funds to meet State mental health and social service mandates. In addition, the County is dependent on funds from federal and state sources. If during this time of economic crisis federal and state funding sources are reduced or eliminated, any unfunded State and Federal programs will be terminated. Only core County programs will continue.

The primary source of general fund revenue is from property taxes and sales tax. With the unprecedented number of foreclosures, reduced property values, and declining sales tax revenue, general fund revenue is in a downward spiral. Another source of funding is through the Solid Waste Tipping Fees paid at the County landfills. Volume is down 15 percent since 2006 with anticipated downward trend to 40 percent reduction in solid waste through 2014. Programs that are partially funded through tipping fee allotments will be impacted. Due to the declining economy the recycling market has collapsed. Virtually no recyclable materials are being shipped for reprocessing. This loss of revenue and increased disposal costs is further impacting the general fund.

Cuts of 25 percent for all Net County Cost general fund programs will translate into reduction of County services and elimination of unfunded state and federal programs. Only core value programs will be provided (including public safety and fee programs)

The County has instituted a hiring freeze and required each department to create a report outlining the projected effects of the budget cuts. The County currently employs over 20,000 people, and layoffs are expected to result from the findings of these departmental reports. It is anticipated that this will impact program delivery for stormwater related activities. No County department will be able to sustain current staffing levels as they try to meet the 25 percent budget reduction strategy.[2] [3]

3.4.2.2 City of Menifee

The newly incorporated City of Menifee FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements during the first year of incorporation which expires October 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

3.4.2.3 City of Murrieta

The City of Murrieta's FY 2008/2009 budget did not increase compared to FY 2007/2008. Adjustments were made to reflect less revenue and to absorb any operating costs. However, budget cuts are anticipated for FY 2009/2010 because the immediate economic outlook is not good. There have been approximately 2,000 home foreclosures within the City. Sales tax revenue is estimated to drop 12.5 percent, property tax revenue will drop, and the State took approximately $525,000 out of redevelopment funds. Murrieta did not receive any vehicle licensing fees from the State and it appears likely that the State will take more revenue from the Cities to solve its budget problems. New NPDES requirements that increase compliance costs will create a financial hardship for the City.

3.4.2.4 City of Temecula

Various ongoing tax and investment revenues adopted in the City of Temecula's FY 2008-09 general fund revenues are projected to decrease from FY 2007-08. Sales and use tax revenues are expected to decrease in FY 2008-09 compared to FY 2007-08. This decrease is primarily the result of the decline in general consumer goods, electronic retail, and auto sales. Property tax revenue is also expected to decrease due to decreases in supplemental tax receipts attributed to the impact of the housing crisis. Investment interest revenue is also anticipated to decrease due to a decline in interest rates.

As a result of the 2008/2009 State budget, Temecula's redevelopment agency will have to shift existing funds from property taxes to the State's Education Revenue Augmentation Fund coffer for schools and

[2] "The Realities of Recession in California: A Statewide Report by U.S. Senator Barbara Boxer, December, 2008, p. 18.

[3] Riverside County Executive Office, January, 2008.

colleges. As such, the amount due from the Temecula Redevelopment Agency is expected to be $898,685. As the State of California continues to address its budget deficit, the City of Temecula faces the possibility of additional revenue shifts to State coffers, further losing future revenue streams and threatening existing service levels.

In addition, a Press-Enterprise article dated December 9, 2008, reported that "Between 25 and 30 part-time Temecula employees will be without work in the new year as City officials deal with a lack of revenue and less work to go around." Furthermore, "the city is not immune to the economic slowdown, which has forced its neighbors to lay off workers and slash spending to counter drops in sales tax receipts and building permit fees. In May, the City's Finance Director reported that revenues were down $3 million compared to two years ago."

With these current and projected reductions in revenue and staff, additional requirements in the MS4 Permit or upcoming TMDL-related requirements, without any corresponding cost-equivalent offsets, will exceed the City's ability to effectively implement these new requirements and will begin to compromise the City's existing efforts to manage the existing MS4 Permit requirements.

3.4.2.5 City of Wildomar

The newly incorporated City of Wildomar FY 2008/2009 initial budget was estimated from their comprehensive fiscal analysis that was submitted to the Local Agency Formation Commission during the incorporation process. Because of the economic uncertainty, and the fact that the City is only now beginning to staff positions, it is unknown what the immediate impact of the fiscal crisis will be. The County is responsible for assisting the City in meeting its MS4 Permit compliance requirements the first year of incorporation that expires July 1, 2009. Currently, the level of property tax revenue that will be available to the City is uncertain. Funding for MS4 Permit compliance requirements was not explicitly budgeted. A financial hardship currently exists because of the costs associated with incorporation.

4.0 Overview of the Upper Santa Margarita River Watershed

4.1 Physiography and Geology

The upper Santa Margarita River watershed is defined as that portion of the Santa Margarita River watershed above the confluence of Murrieta and Temecula Creeks and includes the City of Temecula and portions of the Cities of Menifee, Murrieta, Wildomar, unincorporated County areas, portions of the Cleveland and San Bernardino National Forests, the Cahuilla, Ramona, Pauma, and Pechanga Indian Reservations and properties under the jurisdiction of Caltrans and a variety of special districts. The watershed is bounded by several mountain ranges, including the Santa Ana and Santa Margarita mountains to the North and the Palomar Mountains to the South. The upper Santa Margarita watershed includes areas in Riverside and San Diego Counties and encompasses approximately 588 square miles.

The upper Santa Margarita watershed includes two major sub-basins, drained by Temecula and Murrieta Creeks. Temecula Creek has a drainage area of 366 square miles, with steep rugged topography in the Palomar and Thomas Mountain areas and rolling hills below. The upper 316 square miles of this basin is controlled by Vail Lake (completed in 1949). Murrieta Creek has a drainage area of 222 square miles, with over 50 square miles controlled by Skinner Reservoir (completed in 1974). Although the watershed area is somewhat smaller and less rugged than the Temecula Basin, flood flows have the potential to create greater damage as they flow through the Cities of Temecula and Murrieta.

Temecula and Murrieta Creeks join along the Elsinore fault zone at the head of Temecula Canyon to form the Santa Margarita River. The Temecula Canyon is approximately five miles long, and is a steep, narrow, and rocky canyon. The San Diego-Riverside county line crosses through the Temecula Canyon. From here, the river traverses 27 miles to the Pacific Ocean.[4]

4.1.1 Watershed Characteristics

Over 50 percent of the Santa Margarita watershed has been controlled by the construction of Vail Dam in 1949 and Skinner Reservoir in 1974, which created a significant storage capacity in the upper watershed.[5] [6] 52 percent of the upper Santa Margarita River watershed is controlled by the dams. Due to this storage capacity, peak flow rates during major flow events for both existing and future land use conditions will be lower than under natural conditions.[7] [8]

[4] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 1.

[5] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 14.

[6] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 14.

[7] Philip Williams & Associates, Santa Margarita Watershed Study: Hydrology and Watershed Processes, October 26, 1998, p. 20.

[8] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 20.

4.1.2 Stream Flow Characteristics

Murrieta and Temecula Creeks are perennial interrupted streams, i.e., they include reaches in which the flow is continuous and others where flow is ephemeral. The areas of perennial flow are located in mountain area tributaries outside of the urbanized areas serviced by the MS4s. The perennial flows disappear by seepage into the sands and gravels and resurface upstream of the confluence of Murrieta and Temecula Creeks. The creeks in the urbanized areas of the watershed, located primarily in the valley, are ephemeral and flows are only observed during and immediately after significant storm events. During major storms, after initial wetting, periods of intense rainfall result in rapid increases in stream flow in steep foothill and mountain areas.[9] "Runoff in streams in the watershed is derived primarily from rainfall, and as a result, stream flows exhibit monthly and seasonal variations similar to those shown by the precipitation records. Absence of snow pack in the tributary watershed results in a rapid decrease in flow of streams at the conclusion of the winter precipitation season. Following severe storms, discharge in the larger streams often increases in a few hours time from practically no flow to a rate of thousands of cubic feet per second. Stream flows vary greatly from month to month and from season to season."[10]

Rising groundwater is currently observed in Murrieta Creek below its confluence with the Santa Gertrudis Channel. This is consistent with the observations with the rising groundwater conditions observed by the State of California in 1956.[11] Rising groundwater is also observed in Temecula Creek approximately one quarter mile upstream of the Interstate 15 bridge. In 1956, the State of California observed more extensive rising groundwater conditions occurring as far upstream as the Highway 79 bridge. Based on the virtual absence of non-storm water flows and the rising groundwater conditions in lower Murrieta and Temecula Creeks observed prior to development of the watershed, there is no evidence that the rising groundwater is due to Urban Runoff nor that Urban Runoff has affected the quality of rising groundwater. However, use and disposal of reclaimed water and agricultural and landscape irrigation in the watershed may affect groundwater quality. Until October 2002, the Rancho California Water District augmented the flow of the Santa Margarita River with reclaimed water at a point about five miles upstream from the Temecula gauging station. Since that time, the Rancho California Water District has diverted reclaimed water to the Santa Ana watershed and instead discharged imported water at a location downstream of the confluence of Murrieta and Temecula Creeks in order to meet water supply obligations to Camp Pendleton.

For the average annual event, it is estimated that approximately 89 percent of the volume of runoff in the Santa Margarita Region is due to non-urban land uses not regulated under the federal storm water program. For the 100-year 24-hour event, 93 percent of the volume of runoff will be due to non-urban land uses. These estimates are based on the assumption that precipitation is constant across the watershed. However, precipitation (and resultant runoff volumes) in the non-urbanized upland areas is as much as four times greater than that from the urbanized valley areas.[12]

[9] Riverside Flood Control and Water Conservation District, "Hydrologic Data for 1975-76 Season," March 1982, p. 49.

[10] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 48.

[11] State of California Department of Public Works Division of Water Resources, Bulletin No. 57, "Santa Margarita River Investigation," Volume I, June 1956, p. 48.

[12] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11

4.2 Climate

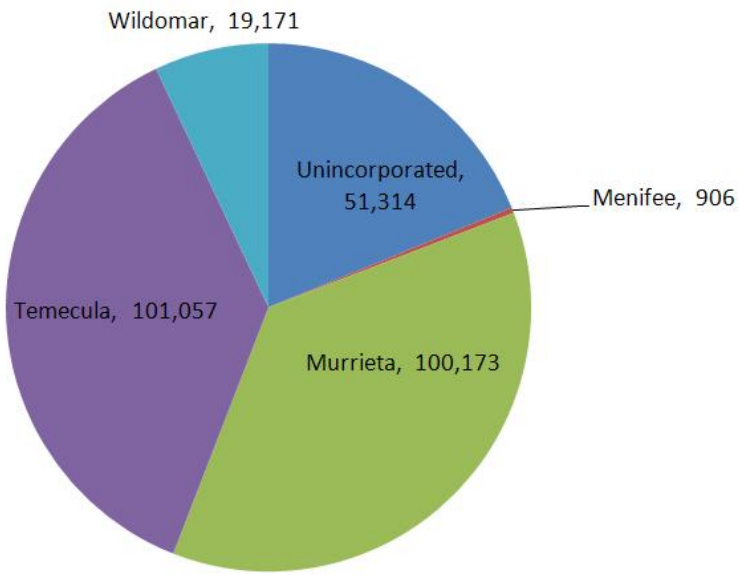
"The climate of the Santa Margarita River watershed is typically Mediterranean, being characterized by warm dry summers and cool rainy winters. About 75 percent of the precipitation occurs during the four-month period from December through March. Mean annual depth of precipitation ranges from less than 10 inches near Vail Reservoir to over 40 inches west of Palomar Observatory, varying with elevation and topographic influences."[13] Precipitation increases with increases in elevation to the summit of the Coastal range. Shading effects of the Coastal range lead to a marked decrease of precipitation throughout the lower portions of the Inland area. Precipitation increases again farther away from the Coastal range in the northeastern area of the Inland area.[14] The significant and varied orographic features also make rainfall prediction particularly challenging in the urbanized portion of the watershed.

4.3 Population and Land Use

4.3.1 Population

The California Department of Finance estimates that as of January 1, 2008, the total population of Riverside County was about 2,088,322. Of the 2.1 million people, approximately 272,621 persons (or 13 percent) reside within the portion of Riverside County under the jurisdiction of the San Diego Regional Board. As shown in Figure 3, approximately 51,314 persons[15] reside in the unincorporated area while approximately 221,307 persons reside within the cities of Menifee, Murrieta, Temecula and Wildomar.

Figure 3. Santa Margarita Region Population by Permittee (2008)



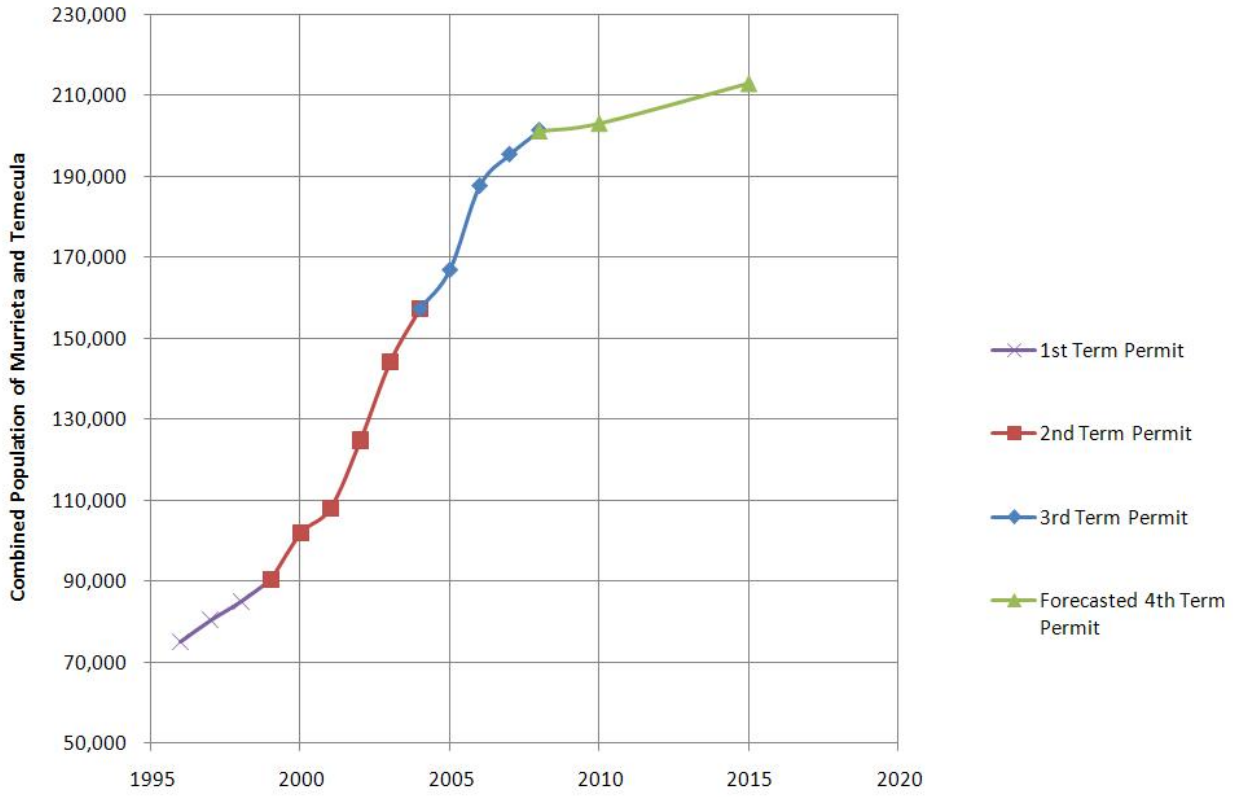
[13] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 11.

[14] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956, p. 38.

[15] Population estimate for the portion of unincorporated Riverside County within the Santa Margarita River watershed developed by the County TLMA GIS Demographics Unit based on the 2000 Census.

Although the second term and 2004 MS4 Permits covered a period of time that saw a significant amount of growth, due to the current and foreseeable economic conditions described in Section 3.4.2 of this report and decreasing areas available for development, growth during the next MS4 Permit term will be quite limited. In fact, the projected growth rate through 2015 will be significantly less than has been seen since the early 1990s. Figure 4 shows the combined populations of the Cities of Murrieta and Temecula since 1997 and projected through 2015. Similar trends are expected for the unincorporated areas and the portions of the cities of Wildomar and Menifee within the watershed.

Figure 4. Cities of Murrieta and Temecula Combined Population (1997 – 2015)



Source: Riverside County Center for Demographic Research. 2008. Riverside County Progress Report, pgs 92 & 124.

Figure 4 clearly demonstrates the dramatic reduction in growth that is expected for the term of the next MS4 Permit when compared to previous permit terms.[16] Establishing trend lines for the population in these cities further demonstrates that the growth rate (population added per year) will be lower than the previous growth rate by approximately 86 percent.

[16] 2008 Riverside County Progress Report

Table 2 shows population projections for the all of the Permittees into the year 2015.

Table 2. Population of Santa Margarita Region Co-Permittees

Co-Permittee	Year			Change (2009 to 2015)
	Estimate 2008 (a)	Estimate 2009 (b)	Projected 2015 (b)	
City of Menifee	906[c]	927[c]	5,232[c]	464%
City of Murrieta	100,173	102,277	109,715	7.3%
City of Temecula	101,057	101,356[d]	103,150	1.8%
City of Wildomar	19,171[c]	19,589[c]	20,127[c]	2.7%
Unincorporated County of Riverside	51,314[c]	52,436[c]	53,793[c]	2.6%
Total	272,621	276,585	292,017	5.6%

Notes:

(a) Unless otherwise noted, populations were obtained from the State of California, Department of Finance, E-4 Population Estimates for Cities, Counties and the State, May 2008.

(b) Unless otherwise noted, projected populations were obtained from Riverside County Center for Demographic Research. Riverside County Progress Report, 2008

(c) Data provided by County of Riverside, Executive Office.

(d) Data provided by City of Temecula.

Since the District is not a general purpose government, it is not included in this listing. Although the current population of the City of Menifee in the Permit Area is small, it is anticipated that the population will increase as it annexes unincorporated areas. Similarly, it is anticipated that the cities of Murrieta and Temecula will gain population as they annex unincorporated areas. It is not anticipated that Wildomar will see significant population increases as it is bounded on all sides by other cities and lands reserved under the MSHCP.

4.3.2 Land Use

Land uses in Riverside County within the Santa Margarita Region include open space, residential, commercial, light industrial, heavy industrial, and agriculture. The agricultural land uses include row crops, nurseries, citrus groves and vineyards, dairies, ranches, poultry and hog farms, and other agricultural related uses with one single-family residence allowed per 10 acres (County of Riverside General Plan, Land Use Element 2003). The conversion of agricultural lands and open space to other "developed" land uses has been ongoing and will continue, although at a much lower rate than previously experienced. Land uses in the Santa Margarita Region are shown in Table 3. These land uses are based on the County of Riverside Assessor Parcel Data, current as of February 2006. It should be noted that the land uses below represent ***zoned*** land uses rather than ***actual*** land uses. This overstates the actual area of urban land use in the Santa Margarita Region. Also, changes in zoning designations can cause odd fluctuations in year-to-year date.

A map of the zoned land uses is provided in Appendix A.

In 1956, only 0.3 percent of the Santa Margarita River watershed (less than two square miles) was urbanized.[17] Although there has been a significant rate of growth in population relative to the State and

[17] State of California Department of Public Works, Division of Water Resources, Bulletin No. 57, Santa Margarita River Investigation, Volume I, June 1956.

neighboring counties, half a century later, approximately 88 percent of the Santa Margarita River watershed remains as non-urban land uses (rural residential, agriculture, preserves and open space, state lands, federal lands, and tribal lands). Further, almost one-third of the upper Santa Margarita River watershed consists of federal, state, and tribal lands that are not under the jurisdiction of the Permittees' MS4 programs. It is projected that the population of Riverside County will increase approximately 5.6 percent by 2015. If the urbanized area increases proportional to population, 87 percent of the upper Santa Margarita River watershed would remain in non-urban land uses in 2015.

Table 3. 2009 Santa Margarita Region Land Uses

Urban Land Use	Acreage[(a)]	% of Land Use Subtotal	% of Total Land Use
Commercial	8,339	20.0%	2.5%
Industrial	963	2.3%	0.3%
Urban Residential (< 1 acre)	12,656	30.4%	3.7%
Parks & Recreation Facilities	4,291	10.3%	1.3%
Streets & Roads	15,439	37.0%	4.6%
Subtotal – Urban Land Use	41,688		12.3%
Non Urban Land Uses			
Preserves & Open Space	54,141	18.2%	16.0%
Rural Residential (> 1 acre)	106,773	35.9%	31.5%
Agriculture	36,389	12.2%	10.7%
Federal/State/Tribal Lands/Non-County Jurisdiction	100,076	33.7%	29.5%
Subtotal Non Urban Land Use	297,379		87.7%
Total Urban & Non Urban Land Use	339,067		100%

(a) As reported in the FY 2007/2008 Watershed Annual Report.

4.3.3 Conserved Lands

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) was adopted in June of 2003. It is a comprehensive, multi-jurisdictional Habitat Conservation Plan focusing on conservation of species and their associated habitats in western Riverside County. The MSHCP is one of several large, multi-jurisdictional habitat planning efforts in southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP will allow Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts. Further, as floodplains and streams tend to support critical habitat, the MSHCP will preserve many of the remaining natural streams and establish significant buffer areas between those systems and urban land uses.

Much of the remaining non-urbanized lands in the Santa Margarita Region will ultimately be incorporated into the MSHCP. The MSHCP will result in a conserved area in excess of 500,000 acres and focuses on conservation of 146 species. The MSHCP Conservation Area includes approximately 347,000 acres on

existing Public/Quasi-Public Lands and approximately 153,000 acres of Additional Reserve Land. A large portion of the conserved lands are in the upper Santa Margarita watershed (at least 145,000 acres). There are approximately 72,318 acres of existing public or quasi-public lands preserved within the upper Santa Margarita River watershed area located in Riverside County.

4.3.4 Anticipated Development 2009-2015

Proposed development during the next MS4 Permit term is an important indicator of potential new Urban Runoff sources. To the extent possible, the Permittees have identified significant New Development projects that, if constructed, will result in the conversion of primarily undeveloped land to developed land. This section describes the expected development within Permittee cities. Consistent with the current and forecasted economic conditions and population estimates, and as supported by the population information and forecasts presented in Section 4.3.1, the Permittees anticipate that the term of the upcoming MS4 Permit will be a time of little development. Following are summaries of anticipated development during the upcoming MS4 Permit.

4.3.4.1 County of Riverside

Projected trends for the County of Riverside's land use can be referenced in the Riverside County General Plan. Maps depicting the areas of future development and type of land use can be found in the General Plan maps that are accessible at http://www.rctlma.org/generalplan/area_maps.html.

- With the incorporation of the cities of Wildomar and Menifee the remaining unincorporated County area to be built out in the Santa Margarita Region during the upcoming MS4 Permit term is going to be considerably smaller.
- It is anticipated that, over the next five years, additional annexations will occur in each of the four city areas (Temecula, Murrieta, Wildomar and Menifee) that will further reduce the unincorporated County area in the Santa Margarita Region.
- The unincorporated County area in the upper Santa Margarita River watershed (east of Temecula, Menifee and Murrieta) will remain in rural, open space and additional MSHCP land uses. In addition, due to drought conditions and depletion of aquifers the prospects of New Development is unlikely. Water districts in the region cannot offer "will serve" letters to provide for water resources they do not have. Infrastructure for water supply and municipal water treatment, MS4 and flood control facilities are virtually non-existent in this area.
- Due to downturn in economy, Development Impact Fees (DIF) and Transportation Uniform Mitigation Fees (TUMF) are and will continue to be significantly under funded. This reduction in transportation funding will result in fewer road and infrastructure projects during the term of the upcoming MS4 Permit. The Transportation Department has projected limited projects for the Santa Margarita Region. The Clinton Keith Road widening project is still in the planning stages. Due to budgetary constraints, unless projects are fully funded through County finance mechanisms (TUMF, DIF, state and federal pass through from bonds and grants) most projects will be put on hold through 2012.

4.3.4.2 City of Menifee

Projected development trends for the City of Menifee are unknown, sphere of influence and annexation opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.3.4.3 City of Murrieta

The area north of Clinton Keith Road along the east side of the I-215 freeway should see some construction towards the end of the next MS4 Permit term. Grading for the construction of a hospital has started along the freeway and it is anticipated that supporting development will follow once the hospital is open. Overall the Planning Department is receiving few applications for New Development projects. For example, a Planning Commission meeting scheduled for January 2009 has been cancelled because there are no New Development items to discuss. In light of the current and foreseeable economic conditions, the City does not anticipate any substantial New Development activity for the next few years, with limited growth possibly resuming toward the end of the next MS4 Permit term.

4.3.4.4 City of Temecula

The City of Temecula is currently experiencing a significant leveling trend in development. Throughout 2008, fewer applications were being processed than in previous years. As such, Temecula does not anticipate processing any substantial number of New Development applications within the next MS4 Permit term. It is anticipated that applications from hereon will be limited to smaller in-fill and redevelopment projects. In addition, proposed annexation areas will be limited to areas that will be set aside mostly for conservation. As Temecula is on the verge of build-out, approximately 1 percent of developable land remains available throughout the City for New Development.

4.3.4.5 City of Wildomar

Projected trends for the City of Wildomar are unknown, sphere of influence opportunities will allow for limited growth once the economic uncertainty of the region is resolved.

4.4 Surface Water Bodies, Beneficial Uses, and Impairments

Approximately eight percent of Riverside County drains into surface water bodies within the jurisdiction of the Regional Board. Those surface water bodies (or portions thereof) are listed in Sections 4.4.1 and 4.4.2.

Rivers and Streams

Santa Margarita River (Hydrologic Unit Basin Number 2.22)
- Murrieta Creek
  - Slaughterhouse Canyon
- Cole Canyon
  - Warm Springs Creek
    - Diamond Valley Reservoir
- Santa Gertrudis Creek
  - Tucalota Creek
  - Lake Skinner
- Temecula Creek (Hydrologic Unit Basin Number 2.92)
  - Iron Spring Canyon
- Temecula Creek (Hydrologic Unit Basin Number 2.84)
  - Tule Creek
    - Million Dollar Canyon
  - Cottonwood Creek
- Vail Lake
  - Wilson Creek
    - Cahuilla Creek (Hydrologic Unit Basin Number 2.73)
      - Hamilton Creek
    - Cahuilla Creek (Hydrologic Unit Basin Number 2.71)
      - Elder Creek
  - Arroyo Seco Creek
  - Kolb Creek
- Temecula Creek (Hydrologic Unit Basin Number 2.52)
  - Pechanga Creek

Santa Margarita River (Hydrologic Unit Basin Number 2.21)
- DeLuz Creek

4.4.1 Beneficial Uses

The upper Santa Margarita River watershed supports a variety of ecosystems and provides many Beneficial Uses (Table 4)[18]. The ultimate goal of the Riverside County DAMP and the Watershed and Individual SWMPs is to manage Urban Runoff in a manner protective of the Beneficial Uses of these Receiving Waters.

Table 4. Beneficial Uses of Receiving Waters
Upper Santa Margarita River Watershed

Beneficial Use	Murrieta Creek	Cole Canyon	Warm Springs Creek	Santa Gertrudis Creek	Long Valley	Temecula Creek	Santa Margarita River
Municipal and Domestic Supply	X	X	X	X	X	X	X

Cold Freshwater Habitat							X
Wildlife Habitat	X	X	X	X	X	X	X
Rare, Threatened or Endangered Species							X

4.4.2 Current Water Quality Concerns and Issues

Urban Runoff discharged to MS4s in Riverside County ultimately flows to various surface water bodies (inland streams, lakes, and reservoirs) and typically carries Pollutants that originate from numerous dispersed and uncontrolled sources. Examples of Pollutants that may be present in Urban Runoff are fertilizer, heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals, and litter.

Because the upper Santa Margarita River watershed is large and has many land uses, the water quality concerns in sub-watersheds vary. However, each land use can potentially contribute Pollutants to nearby streams, rivers, and lakes. The infrastructure that supports people's activities (e.g., roads, parks, MS4, and wastewater collection and treatment facilities) may contribute to water quality concerns if not properly managed. Other sources of stormwater runoff, including agricultural areas, are exempt from the requirements of the NPDES permitting program established under the Clean Water Act. In addition, some Pollutants, such as total suspended solids, may be found at elevated levels in runoff from non-urban land uses. Further, certain activities that generate Pollutants present in Urban Runoff are beyond the ability of the Permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities, and leaching of naturally occurring minerals from local geography.

[18] www.waterboards.ca.gov/rwqcb9/programs/

As required by Section 303(d) of the Clean Water Act, the State Board maintains a list all waters in the State that do not meet the Water Quality Standards established in the Basin Plans prepared by the Regional Boards for protection of Beneficial Uses. This list, referred to as the "303(d) List," details the Pollutant or stressor on each named water body, the potential source of Pollution, estimated affected area, as well as a priority for development of the associated TMDL. A TMDL is a plan that identifies how much Pollutant load a specific Impaired Waterbody can sustain without impacts to its Beneficial Uses. In addition to identifying the maximum Pollutant load, a TMDL is used to develop implementation plans to meet Water Quality Standards for a designated water body. Table 5 summarizes the 2006 303(d) List of Impaired Waterbodies within the upper Santa Margarita River watershed, as well as the year in which a TMDL is proposed for approval. No TMDLs have been established for Receiving Waters in the upper Santa Margarita River watershed.

Table 5. 2006 303(d) Listings for the Santa Margarita Region

Water Body	Pollutant	Potential Sources	Area Affected	Proposed TMDL Completion
Santa Margarita River (Upper)	Phosphorus	Urban runoff/storm sewers Unknown nonpoint source Unknown point source	18 miles	2019
Murrieta Creek	Iron Manganese Nitrogen Phosphorous	Source unknown Source unknown Source unknown Urban runoff/storm sewers Unknown nonpoint source Unknown point source	12 miles 12 miles 12 miles 12 miles	2019 2019 2019 2019
Temecula Creek	Nitrogen Phosphorus Total dissolved solids	Source unknown Source unknown	44 miles 44 miles	2019 2019

Table G-35 of Appendix G to the Annual Report 2007-2008 additionally identifies pyrethroid pesticides (bifenthrin and permethrin), bacteria (E. coli and fecal coliform), lead, and sediment (turbidity) as Pollutants of Concern in the upper Santa Margarita River watershed that warrant focused attention by Permittee implementation programs. These constituents have been detected intermittently or persistently at Triad and Tributary monitoring stations.

4.5 Municipal Separate Storm Sewer System

A map depicting the MS4 facilities owned and operated by the Permittees is provided in Appendix B.

5.0 Program Evaluation Based on Water Quality Trends

The overall effectiveness of the Permittees programs is assessed based on the analysis of water quality data obtained as part of the Consolidated Monitoring Program. Approximately 14 years of data have been collected through this program and have been cumulatively analyzed in the fourth-year monitoring Annual Report.

5.1 Inherent Limitations to Analyzing Water Quality Data

There are inherent limitations to analyzing water quality data from storm water. Storm water runoff is very different from mechanical wastewater or water treatment processes that usually incorporate water quality monitoring. Discharges from mechanical processes such as treated wastewater effluent and industrial discharges usually:

- Come from a single or a few readily identifiable sources;
- Are generally consistent in flow rate and chemical character from day to day; and
- Can be easily instrumented.

Conversely, Urban Runoff non-point source flows, such as those collected and analyzed as part of the MS4 Permit monitoring programs usually:

- Come from multitudes of unidentifiable or hidden sources, many of which are non-Urban in nature:
  - State, federal or tribal lands
  - Natural leaching of soils
  - Wildlife
  - Aerial deposition
  - Wildfires
- Vary widely in flow rate in response to precipitation events
- Vary widely in chemical character at any given moment due to:
  - Unidentified episodic issues related to natural phenomena
  - Magnitude of rainfall and extent of contributing area
  - Potential one-time illicit discharges that were not identified at the time of sampling
  - Unforeseen or unidentified consequences of changes in numerous land use policies (fire management, development, etc)
- Are subject to significant natural random variation; and
- Cannot be easily instrumented due to the wide variation in depth and velocity and associated impacts of natural or unnatural aggradation and degredation of natural stream beds.

Because ephemeral storm water flows are, by their very nature, particularly random in character, it may take many years before monitoring data trends can be detected or to determine the effectiveness of an

Urban Runoff control measure. Power analyses were conducted for fecal coliform, metals, and nutrients at the stations monitored in the Santa Ana Region during the 2005/06 reporting period. Power analysis is used to determine how many years of monitoring would be required to detect a given trend in the data. This tool was developed by the SCCWRP. Based on the results, for biennial monitoring, and having an 80 percent chance of detecting a change in concentration, it would take about 5-10 years of data collection to detect a change of 50 percent in concentration, 10-15 years of data to detect a 25 percent change, and 15-30+ years of data to detect a 10 percent change. It is expected that results would be similar for other parameters measured in the monitoring program in the Santa Margarita Region.

5.2 Focus Area Constituents of Concern

During the 2004 MS4 Permit term, monitoring data indicated that one or more receiving water samples have been found to contain the following constituents at levels that exceeded Basin Plan Objectives (BPO). As such they have been identified as constituents of concern.

- Nutrients (Ammonia as N, Phosphorus
- Pyrethroid Pesticides (Permethrin, Bifenthrin)
- Pathogen Indicators (E.coli, Fecal Coliform)
- Lead
- Turbidity (lab)

5.3 Analysis of Water Quality Trends

As discussed in the 2008 Santa Margarita Region Annual Monitoring Report, the results of the trend analysis and regression calculations indicate that there are no statistically significant trends in the water quality monitoring data. The lack of trends in the data presented in the Annual Monitoring Report contrasts with the rapid population growth over the same time frame. As discussed in the Annual Monitoring Report, population growth from 1990 to 2008 was approximately 300 percent for the Santa Margarita Region. This significant growth in population and resulting urban land use area contrasts sharply with the lack of statistically significant increases in concentrations of constituents of concern that would otherwise be expected in stormwater runoff from urbanized areas.

These results demonstrate and can be attributed to the effectiveness of the Permittees' programs at addressing the Focus Area Constituents of Concern, which are targeted and designed to prevent the discharge of these constituents into the Receiving Waters.

5.3.1 Recommended Compliance Program Modifications to Address Focus Area Constituents of Concern

Based on the analysis described above and in Appendix G of the 2008 Watershed Annual Report, no significant program modifications are necessary to continue to protect and improve the quality of the Receiving Waters.

Although the Permittees programs have been shown to be protective of Receiving Water quality, through continual evaluation of the programs being implemented and on-going water quality monitoring, additional measures are being proposed as part of this ROWD to address changing conditions and ensure

the ongoing effectiveness of the programs. Recommended changes to ensure the ongoing effectiveness of the Permittees programs are described in Sections 6 and 7 of this report.

6.0 Evaluation and Recommendations for Regionally Implemented Programs

6.1 Program Management

The District is the Principal Permittee for each of the three MS4 permits issued by the three Regional Boards that have jurisdiction in Riverside County. As Principal Permittee, the District performs management functions including coordination with the Regional Boards, preparation of compliance documents and Annual Reports, participation in studies and external cooperative efforts and dissemination of information to the Permittees. The Permittees implement some compliance programs that are common to all of the Permittees and which are implemented on a Countywide or regional basis to increase cost effectiveness and efficiency. Typically, the District also manages Countywide and regional programs.

6.1.1 Program Management Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit the following accomplishments were achieved.

- Updated the Implementation Agreement that sets forth the responsibilities of the Principal Permittee and the Co-Permittees.
- Revised the Riverside County DAMP to reflect requirements in the 2004 MS4 Permit, which served as a model document for the Permittees Watershed and Individual SWMPs.
- Developed Santa Margarita Region Watershed SWMP
- Participated in the Santa Margarita River Executive Management Team (SMREMT) to identify and address the highest priority water quality concerns in the Santa Margarita watershed, including development of a watershed model to assist with land use planning and TMDL development, coordinating watershed monitoring, and developing formal agreements between interested stakeholders for the purposes of evaluating impairment listing and data gaps in the watershed.
- Continued progress with the SMREMT on a uniform watershed plan and model for the Santa Margarita Watershed through the Santa Margarita Watershed Supply Augmentation, Water Quality Protection, and Environmental Enhancement Program.
- Participated in the Santa Margarita Lagoon TMDL workgroup in funding and overseeing the development of a comprehensive program to collect data and model the various inputs to the lagoon to be used to develop a TMDL to address nutrients.
- Participated in the Santa Margarita Watershed Water Quality Monitoring Group to coordinate the monitoring efforts of various stakeholders in the Santa Margarita watershed.
- Participated in the SMC to improve stormwater monitoring science, coordinate data collection efforts, and evaluate the effects of stormwater discharges to receiving waters specific to Southern California.
- Participated actively in various efforts of CASQA.

- Participated in the completion of an Integrated Regional Water Management Plan for the upper Santa Margarita Watershed to help pave the way for greater watershed-wide coordination and management of water resources within the upper watershed as a whole, as well as adjoining watershed and regional planning efforts.
- Participated in the development and implementation of the MSHCP for Western Riverside County which contains a comprehensive land use plan that ultimately conserves the environmental resources and habitat of approximately half of the Santa Margarita Region.
- Participated in the development of a Special Area Management Plan (SAMP) to further manage receiving waters at a watershed scale for the upper Santa Margarita Watershed by identifying, prioritizing and protecting the highest priority Waters of the U.S., while considering the broader needs of growth and transportation improvements.
- Developed and updated methods to track program effectiveness such as resident surveys, tracking hotline inquiries, and web counters.
- Enhanced Public Education program through development of new outreach materials and programs.

6.1.2 Proposed Revisions to Regional Program Management

6.1.2.1 Enhanced Program Effectiveness Assessments and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the effects of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP as part of their implementation of the new MS4 Permit. An assessment strategy based on the CASQA Municipal Stormwater Program Effectiveness Assessment Guidance has been established including the establishment of:

- Measurable goals for each component,
- Measurable metrics to assess progress toward those goals,
- CASQA Effectiveness Levels for each metric; to indicate the level at which each metric can demonstrate the effectiveness of the Permittee's programs at addressing each goal.
- Timeframes in which the Permittees expect to be able to assess effectiveness using each metric.
- Municipal Action Levels (MALs) for appropriate metrics to ensure a minimum level of program implementation and identify shortcomings that could affect the Permittee's progress toward the established goals. The MALs would not be permit compliance measures, but triggers for further Permittee evaluation of the affected compliance program.

If a MAL for a metric is exceeded, the Permittees will review implementation of that program component to identify the cause of the exceedance and identify needed adjustments to avoid future exceedances. The findings of these reviews and any recommended adjustments to the Permittees programs will be reported in the corresponding section of the Annual Report submitted the following year. Further research is particularly needed to establish appropriate Municipal Action Levels for the various program areas.

After a review of the stormwater program, the Permittees have established an initial Assessment Methodology for each component including preliminary goals, measurable metrics, effectiveness levels,

timeframes and MALs for each. These initial assessment methodologies are included in tabular format in Appendix C. Although the Permittees believe the basic proposal is viable, The Permittees will review and finalize these Assessment Methodologies and associated metrics within one year following adoption of the new MS4 Permit as additional data and analysis is necessary to support specific action levels.

6.1.2.2 Revised Reporting Format

The Permittees recommend substantial revisions to the MS4 Permit requirements for the layout of the Annual Report. The Permit requires substantial duplication of reporting, which either increases the volume of the Annual Report, or requires substantial cross-referencing. In either case, it is confusing to write, and most likely, confusing to read. The Permittees recommend a meeting with Regional Board staff in the development of the new MS4 Permit to discuss methods to streamline and clarify reporting requirements.

6.1.2.3 Maintain Enhanced Watershed / MS4 Map

The Permittees are in the process of collecting data to support an enhanced MS4 facilities map. Updates completed to date are provided in the map in Appendix B. This enhanced map demonstrates initial efforts to identify the locations of:

- Receiving Waters
- MS4 facilities
- Areas of historical perennial flows
- Known blow off locations
- Wastewater storage ponds
- Sub-drainage areas
- Known non-Permittee facilities
- 36-inch diameter and larger outfalls

This map will be used to help in the tracking of IC/ID events and issues and continued updates will be submitted with the Annual Reports. The Permittees will continue to enhance this map over the next MS4 Permit term. As described in the Annual Report, the District is in the process of upgrading their web page that offers public access the District's various NPDES activities. Along with these web site upgrades, additional layers will be added to the Web-based GIS map.

6.1.2.4 Elimination of the Watershed SWMP as a separate compliance document from the Riverside County DAMP

The Santa Margarita Region is comprised of only a single watershed. Further, the Permittees' regional compliance programs are described in the Riverside County DAMP. Maintenance of a separate and duplicative Watershed SWMP is confusing, cumbersome, and does not contribute to protection of Receiving Water quality. The Permittees request that the next MS4 Permit be drafted in a fashion that allows the Permittees to maintain the Riverside County DAMP as the primary document describing regional compliance programs for western Riverside County including the Santa Margarita Region. Any

necessary changes for requirements included in the new MS4 Permit will be updated /added to the Riverside County DAMP.

6.2 Permittee Training Programs

6.2.1 Summary

The Permittees jointly fund comprehensive training and education programs for Permittee staff. These training programs are designed to train Permittee employees on the proper use and implementation of BMPs appropriate for their field of work. There are four distinct training courses currently offered including Construction Inspection, Municipal Maintenance, Industrial-Commercial Facility Inspection, and New Development Planning.

6.2.2 NPDES Training Program Accomplishments and Programmatic Improvements

- Evaluated and tested various knowledge retention methods.
- Performed Training Enhancement Analysis study (2005-2006)
- Created an on-line training registration web page where attendees can also obtain training materials.
- Annually updated training materials to address Pollutants of Concern (2005-2007)
- Added component to training to address proper use, application and timing of application of Pesticides (2007-2008)
- Began developing a formalized testing and effectiveness analysis approach (2008)

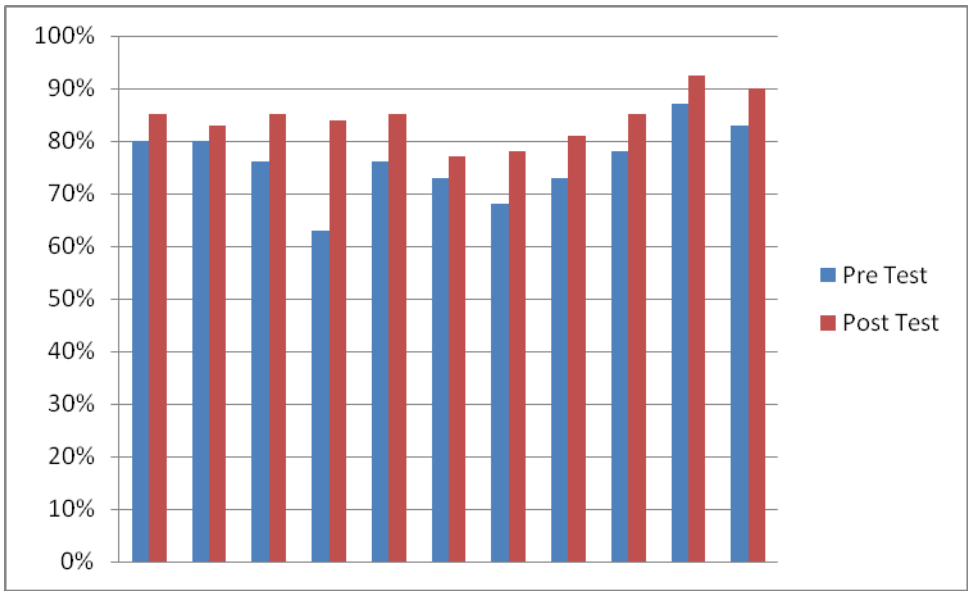
Highlights
Municipal Training: **14** Training Sessions; **900** Attendees
Construction Training: **22** Training Sessions; **626** Attendees
Industrial-Commercial Training: **11** Training Sessions; 426 Attendees
New Development Training: **13** Training Sessions; **345** Attendees

6.2.3 Long-Term Effectiveness Assessment

Throughout the term of the 2004 MS4 Permit the Permittees have evaluated and implemented various quizzes as part of the NPDES training courses. These efforts were intended to assess the retention of knowledge of the attendees and, as described in Provision K.2.m of the Watershed SWMP, serve as a component of the assessment of the long term effectiveness of the Watershed SWMP.

The quizzes used to assess employees' retention of knowledge have evolved over time as the Permittees found what worked and what did not. Quiz questions that were found to be confusing or misleading were refined or eliminated. Thus, a question-by-question analysis of the results is not possible. Instead, results from a number of the training courses with reasonably comparable quizzes were aggregated and an average score (percent correct) was established for each of these training sessions. The results of this analysis are presented in Figure 5.

Figure 5. Training Pre-Test and Post-Test Analysis



Although the required random-sample nature of this analysis is not conducive to the analysis of trends across time, two findings become evident from this analysis:

1. Permittee inspection, maintenance and planning staff generally have a high level of understanding of issues related to stormwater Pollution in their field of work.
2. Average scores on quizzes administered after the training sessions were always higher than scores on quizzes administered before the training session.

Finding 1 above can be attributed to the Permittee's proactive efforts to ensure that their employees are aware of the issues in their field of work that could contribute to stormwater Pollution. This includes annual attendance at the NPDES training courses, and on-the-job training, reminders and meetings. This fact alone is a strong indicator of the effectiveness of the Permittees training programs.

Finding 2 above demonstrates that after attending the NPDES training courses, the attendees have a higher level of understanding of the issues in their field of work related to stormwater Pollution. This indicates that the training materials, delivery and content were effective.

Based on these analyses, general feedback from the training programs, and the overall effectiveness of the Permittees' programs (as described in Section 5.3 herein) the Permittees believe their training programs to be effective. Nevertheless, the following revisions to the training programs have been identified and are proposed for implementation with the new permit to ensure ongoing effectiveness.

6.2.4 Proposed Revisions

6.2.4.1 Continued focus on Focus Area Pollutants of Concern

The Permittees commit to continue to revise the Permittee training programs to focus on Pollutants of Concern.

6.2.4.2 Standardized Effectiveness Quizzes

Over the course of the 2004 MS4 Permit, the Permittees have evaluated various methods of assessing the retention of knowledge and are now recommending a standardized approach to assessing the effectiveness of the training program.

The Permittees plan to create standardized quizzes to assess the retention of knowledge and increased understanding as a result of the Permittees' training sessions. This includes establishing core messages that the Permittees want to impart upon the attendees and, creating clear and understandable quiz questions for each core message.

This approach will help the Permittees identify if any core training messages are not being retained by attendees and to subsequently modify the training. The Permittees also hope that this approach will yield results that will, over time, demonstrate that the knowledge among Permittee staff of issues related to storm water Pollution is increasing, thus clearly demonstrating that the NPDES Training program is effective.

As a necessary part of this effort, a database to track responses will also be created.

6.2.4.3 Attendance Tracking Mechanism

At each training session a sign-in sheet is provided to track attendance to the session. Included in the sign-in sheet is an indication of the Permittee that each attendee is representing. After each training session, these sign-in sheets are scanned to PDF files and sent to each Permittee for their records. This approach requires that each Permittee manually review the sign-in sheets to determine who and how many of their staff attended the training.

The District, on behalf of the Permittees, is currently investigating various form scanning and recognition software packages to determine the feasibility of creating a sign-in sheet that, when scanned, will automatically transfer the attendance list into a database. This would facilitate tracking of staff attendance by each Permittee. At this time the District has not determined if a feasible and cost efficient program is available that will accomplish their needs.

6.3 Public Education

6.3.1 Summary

To leverage finite resources, the Permittees jointly fund a public education program. The District implements this program to disseminate information about Urban Runoff issues and to provide education on how activities may impact Receiving Waters.

The Permittees have established an ongoing watershed-based public education and outreach program known as the **Only Rain Down the Storm Drain** Pollution Prevention Program. The specific objectives of this program include:

- Fostering a broad public awareness of water Pollution concerns;
- Increasing public acceptance of Pollution Prevention activities to curtail everyday human behaviors that contribute to water quality problems;
- Educating/informing the general public, regulators and key local government and state decision makers on Urban Runoff conditions in Riverside County; and
- Promoting stewardship of local water resources.

The **Only Rain Down the Storm Drain** Program implements the public awareness objectives by focusing on three areas of Pollutant reduction/prevention:

- Public behavior;
- Proper management of Pollutants; and
- Business specific education outreach.

In addition, when attempting to make use of the finite resources available to the Public Education Program, the Permittees use these management goals to ensure that resources are used effectively:

- Focusing on Pollutants of Concern specific to each watershed region;
- Coordinating public education efforts with adjacent storm water management programs and other related education programs to share resources, coordinate outreach efforts, and avoid duplication of effort; and
- Adapt public education programs and objectives, based on effectiveness analysis, to address changing MS4 program requirements and objectives.

6.3.2 Public Education Program Accomplishments and Programmatic Improvements

The Public Education Program has developed and distributed the following educational materials during the 2004 MS4 Permit term:

- *After the Storm* – a citizen's guide to understanding MS4 Pollution in your neighborhood or when performing daily activities.
- *Automotive Maintenance & Car Care* – guidelines for keeping your auto shop or retail fuel facility in environmental shape.

- *Outdoor Cleaning Activities* – guideline for outdoor cleaning activities and wastewater disposal.
- *Pools, Spas and Fountains* –Environmental maintenance suggestions for pool, spa, and fountain owners.
- *What's the Scoop* – tips for a healthy pet and a healthier environment.
- *Household Hazardous Waste* – A schedule of collection locations for proper disposal of HHW.
- *Stormwater Pollution Found in Your Neighborhood* – door hanger.
- *Equestrian Management* – Recommendations for BMPs related to equestrian activities.
- *Spray Bottles* – Including directions to make environmental friendly recipes for pest control and household cleaning

The Permittees also initiated development of the following outreach materials

- *Landscaping and Gardening Brochure* – Initiated development a new brochure to address outdoor residential landscaping and gardening activities.
- *Septic System Management Brochure* – initiated development of a brochure to assist with septic system management.

In addition to the information provided on the Storm Water Protection website, the Public Education and Outreach Program has:

- Updated the Public Education and Outreach Program web page.
- Tested and/or implemented several new Public Education and Outreach Program effectiveness tracking mechanisms including call tracking, web counters, testing, and bilingual surveys.
- Enhanced the toll free storm water Pollution reporting hot line to include public education information and support for the public and other interested stakeholders.
- Obtained a trailer with "**Only Rain Down the Storm Drain**" graphics specifically designed for transporting materials to outreach events. It is also used as part of the booth at outreach events.
- Initiated billboard advertising within the Santa Margarita Region.
- Worked with the Mission Resource Conservation District to implement presentations to elementary and middle schools and staff to raise public awareness of Urban Runoff management issues and source control methods and to encourage volunteers, partners, and groups to gather annually for a trash and debris clean-up day in the Santa Margarita Region.
- Developed special newspaper and billing inserts, fliers and advertisements to raise public awareness of Urban Runoff management issues and source control methods. A radio advertising campaign was also developed and implemented for a time.
- Developed and presented workshops regarding household hazardous waste use and proper disposal at major home improvement stores throughout Riverside County.
- Placed advertisements in the Penny Saver and Bargain Bulletin to raise public awareness of Urban Runoff management.

- In cooperation with certain County Service Areas or other programs, pet waste signs with bag dispensers have been installed at various parks to help encourage the proper disposal of animal waste.
- Cooperated with the Western Riverside Council of Government in the Used Oil Block Cycle Grant that decreases the amount of illegally dumped motor oil by promoting the addition of new Certified Oil Collection Centers.
- Established a partnership with County Environmental Health whereby businesses cited by Environmental Health for violations of ordinances related to stormwater issues may be allowed to implement a Supplemental Environmental Project in conjunction with the **Only Rain Down the Storm Drain** program.

6.3.3 Long-Term Effectiveness Assessment

Effectiveness metrics of the Public Education and Outreach Program during the 2004 MS4 Permit term are presented in Section J.1.3 of the FY 2007/2008 Watershed Annual Report. The data indicates that overall impressions have continually exceeded the number of residents in the watershed, HHW/ABOP pounds of waste collected and pounds of waste collected per person have steadily increased over the term of the 2004 MS4 Permit.

In 2005, the **Only Rain Down the Storm Drain** program developed and implemented a survey to be distributed at Public Outreach events to assess the public's level of knowledge related to stormwater Pollution. This original "long" survey contained 13 questions in both English and Spanish as shown in Figure 6.

This survey was used for fiscal years 2005-06 and 2006-07. Through this period of implementation it was found that the survey took too much time to complete and reduced the level of response from event attendees. Therefore, the survey was subsequently revised to a shorter version with revised questions for the 2007-08 fiscal year. The revised "Short" survey that is currently used is shown in Figure 7.

Figure 6. Original "Long" Survey Utilized at Public Outreach Events

Zip Code_____ Age_____ Sex F__ M__ Date:_____

THINK YOU KNOW ABOUT STORM DRAIN POLLUTION PREVENTION?

1. Where do you think **storm drain** contents go or flow to? __Treatment Plant __Streams, rivers & lakes
2. Where do you think **sewer pipes** contents go or flow to? __Treatment Plant __Streams, rivers & lakes
3. Are storm drains and sewers part of the same or separate systems? __Same __Separate __Don't know
4. Have you ever been to a Household Hazardous Waste **(HHW)** Collection Event? __Yes __No
5. Did you know that **A.B.O.P.** Antifreeze, Batteries, Oil, and Latex Paint locations and mobile **HHW** Collection Events provide safe havens for the disposal of pollutants? __Yes __No
6. If you have a lawn or garden, where do you (or your gardener) dispose of the green waste (grass, clippings or other)? **(Check all that apply)**

   ☐Trash/garbage ☐Compost/Mulch pile ☐Take to compost facility
   ☐Leave on lawn ☐Removed by gardener ☐Other:_____

7. Where is the best location to wash your vehicles?
   (Check only one)

   ☐Pavement (driveway, street) ☐Dirt Area
   ☐Lawn or Grass ☐Other_____

8. Do you change the motor oil in your vehicle yourself? __Yes __No

   If **Yes**, where do you dispose of it? **(Check all that apply)**

   __in the garbage __at a curbside collection program
   __down the storm drain __collection center (Jiffy Lube, Kragen, etc.)
   __pour it on the ground __Other_____

9. If you have a pet, how often do you pick up after your pet?

   9. a) in your yard? ☐Always ☐Sometimes ☐Never

   9. b) when you walk the pet? ☐Always ☐Sometimes ☐Never

10. Do you think, anything ,other than rainwater, that flows into the storm drains (i.e., trash, chemicals, pet waste, etc.) considered a pollutant? __Yes __No
11. Have you seen or heard the slogans "Only Rain Down the Drain" or "Only Rain Down the Storm Drain"?
    __Yes __No If yes, where? __Radio __Newspaper __ Flier __Billboard __Street Fair, Festival, etc.
12. Are there State laws and local ordinances which STRICTLY PROHIBIT the dumping of pollutants **(EVERYTHING, EXCEPT RAIN WATER)** into the storm drain systems or waterways? ___Yes ___No
13. After this booth visit, have you increased your understanding of storm drain pollution prevention? __Yes __No

Thank you for your time and input… Remember, YOU can do your part by calling our Toll Free Line (1-800-506-2555) to report illegal storm drain pollutant disposal anywhere in Riverside County, or to get more information about storm drain pollution protection to help promote "ONLY RAIN DOWN THE STORM DRAIN".

Figure 7. Revised "Short" Survey Utilized at Public Outreach Events

DO YOU KNOW HOW TO PROTECT OUR STREAMS, RIVERS and LAKES?

City_____ Zip Code_____ Age____ Sex □ F □ M Date: _____

1) Water that leaves your lawn from **Irrigation (water sprinklers), Car washing** and **Rain** flows down streets and/or storm drains and then directly to…

☐ Sewage Treatment Plants ☐ Streams, rivers & lakes

2) Which of the following can LEGALLY be disposed into the storm drain? (*Circle all that apply*)

- **Useable Household Chemicals**
- **Yard waste/clippings/leaves**
- **Paint**
- **Cigarette butts**
- **Empty Household Chemicals containers**
- **Pet Waste**
- **Motor Oil / antifreeze**
- **None of these**

3) Do you feel you are well informed and aware of illegal dumping into the storm drain and its impact in your community or streams, rivers and lakes?

☐ Yes ☐ No

HOW DID YOU DO?

1) Water that leaves your lawn from irrigation, washing your car, or rainwater runoff can pickup motor oil and grease from vehicles, excess fertilizer from your lawn, bacteria from pet waste, and excess pesticides from your yard. These pollutants can be carried down streets and storm drains directly to our streams, lakes, and rivers without treatment! That is why we must take care to properly dispose of waste, maintain our vehicles, and use fertilizers, pesticides and other chemicals only as specified on their labels.

2) It is illegal to dispose of any chemical, constituent or waste into a storm drain! Report illegal disposal of chemicals, constituents, or waste to storm drains at **1(800) 506-2555.** You may properly dispose of many of the wastes listed above by doing the following things:

- **Usable and empty household chemicals, paint, motor oil** – Properly dispose these at Household Hazardous Waste and/or Antifreeze, Batteries, Oil and Paint disposal facilities and events. Call **1 (800) 506-2555** for information on disposal locations and special drop off events near you.
- **Pet waste** – Carefully pick up and dispose in the nearest trash receptacle.
- **Grass, clippings, leaves and yard waste** – Collect and dispose in green waste bins or composting areas that are designed to prevent the compost from mixing with excess irrigation water and/or rainwater runoff.

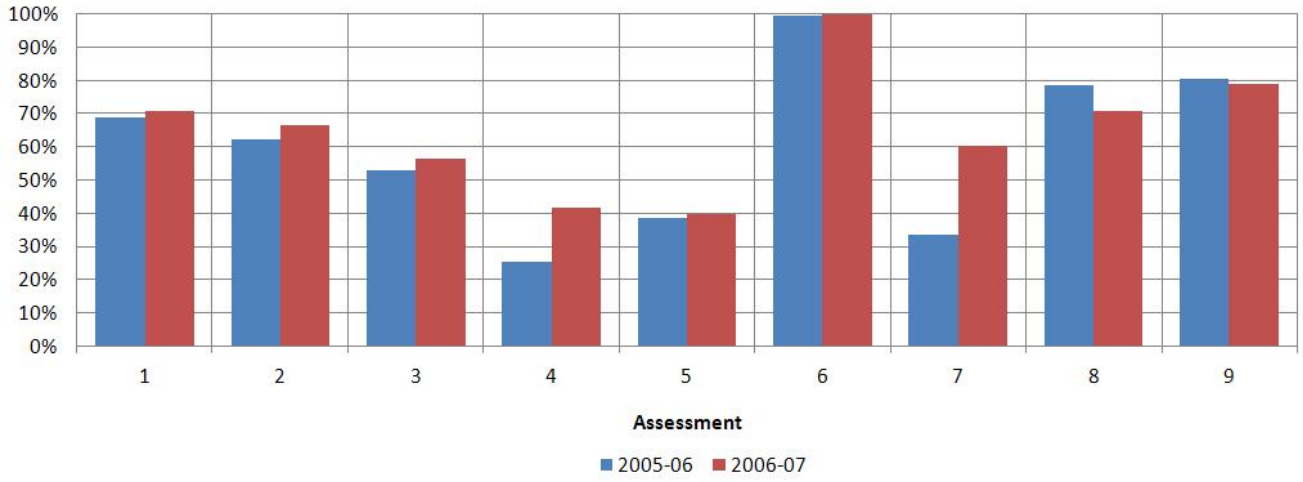
3) Would you like to learn more about protecting our streams, rivers and lakes or wish to report on a illegal storm drain disposal in your area or request a classroom or group demonstration……

Visit www.rcflood.org or call 1 (800) 506-2555.

Remember…Only Rain Down the Storm Drain!

Results have been tabulated for all of the "Long" surveys received and they have been analyzed to determine trends in public awareness. The "Short" survey has been used at two events to date, one of which was quite recent and its results have not yet been tabulated. Using the "Long" survey results, nine questions were used to assess any trends in public awareness. The remaining questions were determined to be either confusing or not applicable to the intent of the assessment. The results of this assessment of survey results are shown in Figure 8.

Figure 8. Assessment of Survey Results (2005-06 vs. 2006-07)



The results shown in the chart in Figure 8 are percent of survey takers that responded as described below:

- Assessment 1: Percent of respondents that understood that storm drains do not go to treatment plants.
- Assessment 2: Percent of respondents that understood that sewer lines go to treatment plants.
- Assessment 3: Percent of respondents that understood that sanitary sewers and storm drains are separate systems.
- Assessment 4: Percent of respondents that had attended a Household Hazardous Waste collection event.
- Assessment 5: Percent of respondents that understood that the best place to wash a car is on the lawn or grass.
- Assessment 6: Percent of respondents that change their own oil that reported that they properly dispose of it.
- Assessment 7: Percent of respondents that have heard of the "Only Rain Down the Storm Drain" program.
- Assessment 8: Percent of respondents that dumping of anything except storm water is a violation of laws and ordinances.
- Assessment 9: Percent of respondents that felt that visiting the Outreach Booth at the event increased their understanding of storm drain Pollution Prevention.

Although implementation of the "Long" survey was limited before it was modified to its current form, the results available do indicate an increase in understanding of these basic principles and can be attributed to the effectiveness of the Permittee's Public Education program. As additional survey results are collected and tabulated, further analysis will be performed to ensure the ongoing effectiveness of the program.

6.3.4 Proposed Revisions

To better address residential sources of pesticides, the Permittees are proposing to coordinate with the University of California Extension Program to enhance the implementation of the U.C. Extension's Master Gardener program in the Santa Margarita Region. Along with information regarding use of drought tolerant landscaping techniques and appropriate methods of fertilizer and irrigation application, the U.C. Master Gardeners also provide residents with information on integrated pest management techniques that minimize pesticide application. The Permittees are proposing to establish an agreement with the U.C. Extension's Master Gardener program in fiscal year 2010-2011 to support master gardener hotline staffing, local presentation and other outreach by the U.C. Master Gardeners.

In addition, through the Permittee's ongoing efforts to internally assess the efficiency and efficacy of their MS4 compliance programs, it was determined that an overhaul of the District's web site was needed. The District's web site contains the public education web site and a technical resource site with the various compliance documents for the program. It was found that information available through the site was often difficult to find and was not user friendly and sometimes was out of date. The Permittees are now reviewing this site to identify and implement needed changes

6.4 Receiving Water Monitoring Program

6.4.1 Summary

A Summary of the Monitoring Program is contained in Appendix G of the Watershed Monitoring Report.

6.4.2 Monitoring Program Accomplishments and Programmatic Improvements

The Monitoring Program accomplished the following goals during the term of the 2004 MS4 Permit:

- Subcontracted monitoring data collection and analysis to MACTEC, Inc. to enhance data collection and reporting capabilities.
- Developed and implemented a Triad Monitoring Program (bioassessment, Toxicity and chemical monitoring) consistent with the goals of the SMC Model Monitoring Program
- Developed watershed boundaries and land use information for all monitoring stations
- Updated the format and technical content of the monitoring Annual Report
- Added fire map information to assist with assessing potential Pollutant sources
- Enhanced monitoring data databases to be compatible with SCCWRP/SMC standard reporting protocols.
- Enhanced monitoring methods to incorporate use of automatic sampling equipment where appropriate

- Conducted several Toxicity Identification Evaluations that led to the identification of pyrethroid pesticides as a cause of wet weather Toxicity in Murrieta and Temecula Creeks and a Toxicity Reduction Evaluation that identified additional BMPs necessary to control sources of pyrethroid pesticides.
- Coordination with the CASQA Pesticide Committee on comments and presentations to California Department of Pesticide Regulation, UC Riverside and others regarding the impacts of pyrethroid pesticides and the need to change regulatory requirements regarding the use of pyrethroid pesticides.
- Participation in or coordination of several BMP studies, including coordination of new development BMP treatment studies (as required by conditions of approval) and the District's LID BMP Demonstration and Testing Facility.
- Continued to update and enhance the Consolidated Monitoring Program to incorporate new monitoring collection methods and data analysis protocols.

6.4.2.1 Participation in Regional Monitoring Efforts

- Participation in the monitoring programs to support development of the Santa Margarita Lagoon TMDL.
- Continued participation in regional and statewide Monitoring and Science efforts such as the Southern California Monitoring Committee to develop:
  - Lab inter-calibration of chemical, bioassessment and Toxicity testing methods
  - Testing methods for bioassessment and Toxicity in Southern California streams
  - Bacterial Reference Watershed Study
  - A storm water research needs report for southern California
- Partnered with SCCWRP on developing hydromodification guidance for Southern California including participation in a series of hydromodification workshops for a CASQA conference.
- Coordination with SCCWRP on the development of the Regional Watershed Monitoring Program for Southern California.

6.4.3 Effectiveness Assessment

The Watershed Monitoring Program was evaluated as part of the Regional Board audits in 2007-2008. As a result of those audits several enhancements were made to the monitoring program, including update of constituent lists, subcontracting of data collection to a monitoring consultant with automatic sampling capabilities, and updates to the Consolidated Monitoring Program and Monitoring Annual Report formats. The Permittees believe that as a result of these changes, the overall monitoring program is effective. However, the revisions presented in section 6.4.4 are recommended to increase monitoring data utility or overall program effectiveness.

6.4.4 Proposed Revisions to Monitoring Program

In updating the Monitoring and Reporting Program, the Permittees request that Regional Board staff meet with them to discuss the following proposed modifications to the monitoring program:

6.4.4.1 Revise Dry Weather Monitoring Program

As noted in Section G.7 (Special Studies) of Appendix G of the FY 2007-2008 Watershed Monitoring Annual Report, the Permittees participated in a SMC Study to develop a regional approach to watershed assessment. The Permittees, in conjunction with Regional Board staff, committed to participating in the resulting watershed monitoring program. The Permittees agreed to monitor three rotating dry weather stations identified for the Santa Margarita Region. Additionally, three stations are to be collected by Regional Board (or SCCWRP staff) using SWAMP funds, and the remaining three will be located in the Santa Ana Watershed region of Riverside County. In exchange for the commitment to participate in the program, the Regional Board staff agreed to reduce the current dry weather monitoring requirements in the new MS4 Permit from two (2) events annually to (1) event annually for each Triad monitoring stations. This would effectively eliminate three existing dry weather samples. The Permittees recommend a meeting with Regional Board staff to discuss these options prior to the release of the draft Permit.

6.4.4.2 Clarify Analyte List

As described in Section G-8.1.5 of the 2008 Monitoring Report (Appendix G of the FY 2007/2008 Watershed Annual Report), 168 analytes have never been detected in samples collected under the current program. The Permittees request that requirements to analyze for these constituents be eliminated unless or until a reason to believe they may be present in stormwater arises.

Basin Plan Objectives are expressed in terms of total metals, while California Toxics Rule (CTR) criteria are expressed in terms of dissolved metals. Although the Permittees do not support comparison of stormwater data to CTR values, the Permit requires it. The Permittees recommend deletion of this requirement. However, if this language is to remain, in order to properly compare results for metals to both sets of objectives, both total and dissolved fractions will be analyzed by the laboratory for the following metals: arsenic, cadmium, chromium (III), chromium (VI), copper, lead, mercury, nickel, selenium, silver, and zinc.

6.4.4.3 Clarify Mobilization Criteria

The District is proposing the following amendment to the monitoring mobilization criteria based on experience and the difficulties faced collecting the first storm and the analysis of the USEPA criteria specific to the Temecula National Weather Service weather station (Consolidated Monitoring Program, Section 4.C.2):

> "Note: If the QPF indicates that more than 0.3-inch is predicted for any 6-hour period, mobilization for sampling will occur."

The District's experience over the past three years indicates that intensities greater than 0.3" in six hours are likely to produce runoff and would warrant mobilization, even on a dry watershed. Further, these mobilization criteria are consistent with EPA-833-B-92-001 guidance regarding minimum depths/durations for storm sampling.

The Permittees recommend that the Regional Board amend the MS4 Permit to reflect these Mobilization Criteria. Due to issues with stream gauges operated by the United States Geological Survey (USGS), the Permittees have concluded that preparing post-storm forensics based on USGS data is not of significant value. A simple test of comparing Quantitative Precipitation Forecast (QPF) reports with actual rainfall and the mobilization criteria should be sufficient to determine compliance with the MS4 Permit.

Mobilization criteria should also reflect practical limitations to storm water monitoring by excluding national holiday periods (Thanksgiving, Christmas, and New Year's Day in particular) and quantifying the probability and the lead time between the forecast and actual rainfall that must be met in order to mobilize.

6.4.4.4 Reduce Wet Weather Events

As was noted in the audits, the Permittees have experienced consistent difficulty collecting three storm events in the upper Santa Margarita River watershed. The Permittees also noted that the San Diego County MS4 Permit only requires the collection of samples from two wet weather events. The Permittees request that the monitoring program for Riverside County be revised to require collection of two storm events. This would not only reduce opportunities for unavoidable non-compliance, it would also be a prudent cost saving measure that would not alter the overall effectiveness of the Permittees monitoring programs.

6.4.4.5 Clarify Triad Method and Follow-up Actions

The MS4 Permit included an early draft of the Triad method envisioned by the Model Monitoring Program (MMP) developed by the SMC. The result was a misapplication of the final Triad approach envisioned by the MMP. Toxicity is currently required to be sampled for at the Triad stations during wet weather events, but not during dry weather when the bioassessments occur. According to the SMC MMP, the three components of the Triad approach (chemistry, Toxicity, and bioassessment) should be conducted at the same time. Bioassessments cannot be conducted during wet weather due to safety concerns and the planning necessary. For this reason the MMP recommends the full triad for dry weather and only chemistry and Toxicity for wet weather.

In an effort to be proactive and supportive of good science, the Permittees have taken the following actions to ensure proper application of the Triad approach:

- Beginning with the 2007-2008 season, Toxicity sampling will be conducted during dry weather, at the same time as the bioassessments and dry weather chemistry sampling events are conducted. Thus, the full Triad approach will be conducted during dry weather. Wet weather monitoring will focus on Toxicity and chemistry. This action will modify the current program to be consistent with the MMP approach.
- The 2006-2007 Annual Report established the framework for proper application of the Triad method (full triad for dry weather, chemistry and Toxicity only for wet weather) by adding new tables (G-21 through G-27), in anticipation of properly applying the Triad method in the 2007-2008 Annual Report.

The Permittees further recommend clarifying the definitions of "persistent", "consistent", and "magnitude" as used in the MS4 Permit to be consistent with the intent of the MMP. In addition, the MS4 Permit inappropriately limits Triad analysis by defining a "fair" Index of Biological Integrity scores as automatically indicative of benthic alteration. This limitation needs to be corrected to prevent Permittee

resources from being inappropriately diverted to expensive source assessment studies. The MMP (and the SMC) envision that watersheds will be prioritized for follow up action based on their relative quality to one another. The envisioned analysis would compare watersheds from throughout southern California. The Permittees support this coordinated and comprehensive approach to addressing water quality.

6.4.4.6 Recognize Limitations of Laboratory Analysis of Bacteria

Babcock Labs prefers to accept bacteria samples between the hours of 7:00 a.m. and 4:00 p.m. during normal business days, and 9:00 a.m. and 12:00 p.m. on weekends. Although Babcock will accept bacteria samples outside those hours, acceptance is contingent upon payment of substantial overtime rates to ensure laboratory staff availability to receive and analyze the samples.

The timing of bacteria sample collection, particularly within the context of automatic sampling, will require consideration of the sample's four-hour holding time and available laboratory receiving hours. The Permittees request that the Permit be modified to only require collection of bacteria samples such that they can be delivered during the regular working hours of the lab to avoid excessive laboratory costs.

6.4.4.7 Participate in a Watershed Based TMDL for the Santa Margarita Lagoon

The Permittees understand that, due to economic conditions, State funding for the Santa Margarita Lagoon Watershed-Based TMDL has been withdrawn. As described in section 3.4, these economic conditions are also impacting the Permittee's funding sources and they are struggling to maintain resources to fund existing compliance programs. The Permittees currently cannot support additional expenditures associated with assisting in funding a watershed-based TMDL effort. However, the Permittees are agreeable to discussing a re-prioritization of compliance activities in order to reallocate existing Permittee resources for this purpose. For example, where current MS4 Permit compliance programs elements are not measurably enhancing attainment of Water Quality Standards, the Permittees would consider reduction or elimination of those requirements to support reallocation of the associated funding to the development of the watershed based TMDL. Program elements that may be considered for discussion include:

- Toxicity/Pyrethroid Monitoring – Under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) local regulation of pesticides, including pyrethroid pesticides is pre-empted. The Permittees are expending significant resources at the State and Federal level to facilitate regulatory changes in the allowable uses of pyrethroid pesticides, which have been implicated in causing toxicity in receiving waters throughout California. The Permittees have also recognized pyrethroid pesticides as a Pollutant of Concern for the upper Santa Margarita River watershed. The Permittees believe that public education and outreach regarding use and more stringent regulation/management of pesticides, including pyrethroid pesticides, represents the most effective means of controlling pesticides in Urban Runoff. However, continued Toxicity tests, Toxicity Identification Evaluations, and direct monitoring for pyrethroid pesticides are not likely to enhance the Permittee's ability to reduce/eliminate pyrethroid pesticides in Receiving Waters. Greater Receiving Water quality benefits may be realized by reallocating the resources currently allocated to these activities to the development of the watershed-based TMDL.
- Reduction in General Monitoring Requirements – The Permittees continue to expend significant resources on Receiving Water and outfall monitoring and the benefits of these monitoring activities are limited. Further, these costs have more than doubled over the term of the 2004 MS4

Permit due to audit findings recommending the implementation of automatic sampling equipment. Revised MS4 Permit requirements that provide for a simplified monitoring program may allow cost savings to be reallocated from data collection and processing to development of the watershed-based TMDL.

- Watershed/Individual Annual Reporting – The current Annual Reporting requirements are time, labor and cost-intensive exercises. Revised MS4 Permit requirements that provide for a simplified Annual Report requirements would not necessarily produce substantial cost savings (because is the reports are typically produced in-house); however, they would free up staff resources to assist with TMDL development.
- IC/ID Monitoring – Although the Permittees support regular visual inspection of MS4 facilities to identify IC/IDs, field measurements and sampling has not proven to be effective for this purpose. Although sampling of identified IC/IDs for later enforcement purposes may be appropriate, IC/IDs that have been identified and eliminated in the Santa Margarita Region typically result from visual observations and subsequent follow-up efforts by Permittee staff, not field measurements and water quality samples. Revised MS4 Permit requirements that provide for visual inspections of MS4 facilities to identify IC/IDs may yield cost savings that could be reallocated to development of the watershed-based TMDL.

There may be additional opportunities for modification of MS4 Permit requirements to focus the expenditure of Permittee funds on those activities that are most effective at protecting Receiving Water quality. Although the resources available for Permittee compliance activities are finite, the Permittees are supportive of modifications to the MS4 Permit that, while working within available funding limitations, enhance their ability to protect and enhance the quality of Receiving Waters.

7.0 Evaluation and Recommendations for Individual SWMP Programs

The Riverside County DAMP is a programmatic document developed by the Permittees in the Santa Ana and Santa Margarita Regions. It outlines the major programs and policies that the Permittees individually and/or collectively implement to manage Urban Runoff for the protection of Receiving Waters in Western Riverside County, including the Santa Margarita Region. The Riverside County DAMP provides a model for the development of a Permittees' Individual SWMPs in the Santa Margarita Region.

The Permittees continue to support a uniform approach to the implementation of MS4 Permit compliance programs in order to facilitate increased transparency and understanding for residents, regulated entities, and Permittee staff. For this reason, the discussions below focus on programmatic changes to the compliance programs that are necessary to maintain the effectiveness of the model compliance programs described in the Riverside County DAMP. Upon adoption of the new MS4 Permit, the Riverside County DAMP and Individual SWMPs will be revised accordingly.

7.1 Program Management

There are typically multiple Permittee departments that are responsible for implementing the elements of the Individual SWMPs. Each Permittee has designated an NPDES Coordinator who coordinates the overall Permittee compliance programs, collects and analyzes compliance program data, develops and maintains the Individual SWMPs, compiles and submits necessary reports, coordinates with other Permittees, stakeholders and Regional Board staff, and conducts other necessary duties as assigned.

To facilitate inter-Permittee coordination and funding of regional compliance activities such as the Public Education and Monitoring programs, the Permittees have entered into an Implementation Agreement that defines the roles and responsibilities of each Permittee and assigns cost shares for regional programs defined in the agreement. The Implementation Agreement also requires each Permittee to designate an NPDES Coordinator who is also responsible for representing the Permittee's interest at Permittee coordination meetings such as the monthly Santa Ana/Santa Margarita Technical Advisory Committee.

The Permittees in the Santa Margarita and Santa Ana Regions participate in a Management Steering Committee made up of the City Managers, County Executive Officer, and the District's Chief Engineer; or their assigned alternate. Participation in the Management Steering Committee is not mandatory; however, it provides a management-level forum to address Urban Runoff management policies for the Permit Area and coordination of the review, and necessary revisions to the Riverside County DAMP and Implementation Agreement. In addition, the Management Steering Committee promotes a higher level of awareness of the MS4 Permit compliance program by each Permittee's senior management staff.

7.1.1 Accomplishments and Programmatic Improvements

Collectively, the Permittees Program Management activities have achieved:

- Development of the Riverside County DAMP, WQMP and Individual SWMPs following adoption of the 2004 MS4 Permit.
- Revised the Implementation Agreement to account for necessary program enhancements resulting from the new MS4 Permit.

- Established and held monthly meetings of a Technical Advisory Committee comprising of each Permittee's NPDES coordinator, to discuss and coordinate response to issues that arise through the ongoing implementation of the Riverside County DAMP-based programs.
- Voluntarily participate in a Management Steering Committee comprised of Permittee upper management (City Manager or equivalent) to provide a forum to discuss major policy issues related to MS4 Permit compliance program implementation. This also helps the major decision makers within each organization to stay abreast of the status of the implementation of the Riverside County DAMP and aware of upcoming issues and approaches taken by other Permittees.
- Enhanced enforcement and compliance elements of the Riverside County DAMP.
- Developed the Integrated Regional Watershed Management Plan (IRWMP) for the Upper Santa Margarita Watershed.
- Continued progress with the Bureau of Reclamation, San Diego County and other stakeholders on a uniform watershed plan and model for the Santa Margarita River watershed.

7.1.2 Recommended Revisions and Enhancements to Program Management Efforts

7.1.2.1 Assessment Metrics and Municipal Action Levels

To ensure that the Permittee's programs continue to be effective at managing the impact of Urban Runoff on Receiving Water quality, the Permittees will revise the Program Effectiveness Assessments for both the Individual SWMP and the Watershed SWMP following adoption of the new MS4 Permit. These planned changes are further described in Section 6.1.2.1 of this ROWD. The Permittees also recommend streamlining of the reporting forms to focus on the revised Program Effectiveness Assessments.

7.1.2.2 Revised Reporting Format

As a result of continued program effectiveness assessment, following adoption of the new MS4 Permit, the Permittees will update annual reporting forms to incorporate specific reporting requirements for the effectiveness assessment metrics and to remove inappropriate, outdated, or ineffective reporting requirements.

7.2 Development Planning

This program element links each Permittee's General Plan, environmental review process, and development approval and permitting processes to the later phases of detailed design, construction and operation. The development approval and permitting processes carries forth project-specific requirements in the form of conditions of approval, project plans, and design specifications that support tracking, inspection, and enforcement actions.

7.2.1 Development Planning Program Element Accomplishments and Programmatic Improvements

During the term of the 2004 MS4 Permit, the development planning program accomplishments and programmatic improvements included:

- Developed the WQMP to address post construction stormwater runoff quality for New and Significant Re-Development Projects.
- Development of a FAQ for WQMP projects to assist with implementing the WQMP program.
- Developed and subsequently enhanced a BMP design guidance manual to standardize the construction of post construction BMPs.
- Participation in the SMC efforts to develop a LID manual.
- Participation in SCCWRP's hydromodification studies to develop scientifically based hydromodification design guidance for Southern California.
- Enhanced online watershed maps to assist developers and the public with identifying areas tributary to Impaired Waterbodies.
- Adopted and implemented a MSHCP to ensure the regional-scale protection of habitat and natural resources in the approval process for New Developments.

7.2.2 Proposed Revisions to the Development Planning Program Element

7.2.2.1 Low Impact Development

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to (1) better incorporate LID design concepts, and (2) incorporate guidance to describe how developments can offset Treatment Control and hydromodification impacts with LID concepts including infiltration, evapo-transpiration, reuse, and onsite stormwater management. These revisions will follow the completion of the SMC LID BMP Manual and SCCWRPs Hydromodification Study. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.2 Hydromodification

As committed to in the 2004 WQMP (now Appendix O to the Riverside County DAMP), the Permittees have developed numeric guidance for hydromodification and are now working with SCCWRP to develop enhanced hydromodification guidance for Southern California. The Permittees will use the completed guidance to update the WQMP, BMP Design Handbook and other guidance as necessary to effectively mitigate hydromodification impacts. See the FY 2007-2008 Watershed Annual Report, Appendix G, Section G.7.2 for additional detail.

7.2.2.3 BMP Design Criteria

The Permittees will revise the Riverside County Storm Water Quality Best Management Practice Design Handbook to incorporate additional design guidance to clarify those Treatment Control BMPs that are effective at removing sediment-bound pesticides such as pyrethroid pesticides (consistent with the recommendations of the Toxicity Reduction Evaluation contained in Appendix D.

7.2.2.4 TMDLs

The Permittees will revise the DAMP to identify and include BMPs that are necessary to mitigate the impacts of Urban Runoff on Impaired Waterbodies.

7.2.2.5 Roads

The Permittees believe that standard WQMP requirements for public works road projects create potential avenues for unavoidable non-compliance. The Permittees would like to review this priority development category with Regional Board Staff to develop a better system to manage public works road projects.

7.2.2.6 Inspect and Verify Maintenance of Post Construction Treatment Control BMPs to Ensure Ongoing Effectiveness

As economic conditions allow, the Permittees propose to implement the following approach to inspect and/or verify maintenance of Treatment Control BMPs implemented on Priority Development Projects to ensure their ongoing effectiveness. The development of the program described below will require the Permittee resources that are unavailable in the current economic climate, particularly considering that it would likely require the Permittees to abandon the CAP in lieu of a local Permittee inspection program. The resources that will be required to ramp up new inspection programs are unavailable and may not become available during the term of the new MS4 Permit; however when the economy recovers sufficiently the Permittees propose to implement the program described below.

Integrated Management Practice (IMP) Exemption:

For the purposes of this program, IMPs include BMPs that are landscape based or otherwise serve an additional purpose other than Treatment Control. IMPs will be exempted from Inspection and Maintenance Tracking / Certification requirements if solely through the regular maintenance of the feature's secondary (non-treatment) functions and with Permittee concurrence, it can reasonably be expected that the treatment efficacy of the IMP will be ensured in perpetuity. An example that may satisfy this exemption would be a grassy swale that is mowed as part of regular landscape maintenance, whereas a BMP with a media filter which requires periodic resetting or replacement to maintain treatment effectiveness would not be exempted.

Priority Development projects will be exempted from all Treatment Control BMP Inspection and Maintenance Tracking / Certification requirements if they completely meet their Treatment Control requirements by implementing only IMPs that meet these criteria.

Priority Industrial and Commercial

The following requirements will apply to new priority Commercial and Industrial developments subject to the Permit's Commercial and Industrial business inspection requirements.

- Inspection

  Sites will be inspected per the Individual SWMPs current inspection frequency requirements that are based on the potential of the site to contribute to water quality impairments. At these inspections, in addition to the normal inspection requirements, all Treatment Control BMPs at the site will be inspected. In other words, all Treatment Control BMPs at high-priority facilities will be inspected annually; Treatment Control BMPs at medium-priority facilities will inspected biennially and Treatment Control BMPs at low-priority facilities will be inspected once during the term of the MS4 Permit. Improperly maintained BMPs may subject the maintenance entity to license suspension or administrative citations.

- Proof of Maintenance

  Maintenance records demonstrating compliance with the O&M procedures in the WQMP must be available for review at the time of the inspection. Failure to demonstrate that the BMPs have been maintained appropriately may result in license suspension or other enforcement actions.

Other Priority Developments

The following requirements will apply to new priority residential developments and businesses not otherwise subject to the Permit's Commercial and Industrial business inspection requirements.

- Proof of Maintenance and Self Certification

  The maintenance entity identified in the WQMP will be required to submit maintenance records including a signed certification to the Co-Permittee. The frequency of these submittals will be based on the relative maintenance requirements of the Treatment Control BMPs implemented on that site. BMPs will be categorized into groups as having High, Medium or Low maintenance requirements. If a WQMP project utilizes high-maintenance Treatment Control BMPs it will be categorized as a High-priority residential development, etc. High-Priority residential developments will be required to submit records annually, Medium – biennially, and Low – once every five years. Failure to report will result in administrative citations against the maintenance entity.

Permittee Projects and Permittee Maintained Treatment Control BMPs

This requirement will be included as part of the existing Permittee facility inspection program and inspected per the frequency requirements specified in the Riverside County DAMP.

7.3 Private Development Construction Activities

The Permittees have reviewed their ordinances to ensure that they are adequate to control discharges to the MS4 from construction sites to the MEP. For construction projects that will disturb one acre or more, the Permittees require proof of compliance with the General Permit-Construction prior to issuance of building/grading permits (a copy of the Notice of Intent filed with the State Board). Each of the Co-Permittees provides training for their construction inspectors regarding the proper installation and

maintenance of erosion and sediment control BMPs. Education and outreach to the building industry (developers, construction contractors, engineering firms, etc.) regarding managing discharges from construction sites is also incorporated into the "**Only Rain Down the Storm Drain** Pollution Prevention Program," the Permittees' area-wide public education and outreach program.

7.3.1 Private Development Construction Activities Program Element Accomplishments and Programmatic Improvements

- The Permittees annually distribute construction activities posters to construction sites as part of construction outreach program.
- A standardized construction activity reporting spreadsheet was developed for the Annual Reports.
- The construction inspection forms were updated.
- The Co-Permittees developed and maintained inventory databases of construction sites 1-acre or larger for which they have issued a building or grading permit.
- Prioritized inspections to help target construction activities that present the highest risk to water quality.

Highlights
Conducted over **17,000** construction site inspections
Initiated over **3,800** enforcement actions to gain compliance
626 attendees to NPDES Construction training

7.3.2 Proposed Revisions to the Private Development Construction Activities Program Element

The Permittees are not proposing revisions to their existing construction inspection programs at this time. As previously described, the Permittees expect that development activity will be greatly reduced during the term of the new MS4 Permit. Regional Board staff has however raised the issue of abandoned construction sites. Regulation of abandoned construction sites has proven challenging due to bankruptcy of project proponents, non-responsiveness or inability to locate underlying investment banks that actually own the developments, and the practical limitations encountered by the Permittees in calling bonds. As the Regional Board has enforcement capabilities that often surpass those of the Permittees, to ensure that this issue is effectively addressed the Permittees ask for the close cooperation and support of the Regional Board. Nonetheless, the Permittees are committed to continuing the use of their IC/ID programs, code enforcement tools, and other ordinance authorities to control, to the extent allowable under law, abandoned parcels that are not properly stabilized.

7.4 Existing Development – Permittee Facilities and Activities

The Municipal Facilities Strategy which has been consolidated into Section 5 of the Riverside County DAMP provides guidance for identifying potential storm water Pollutant sources and for selecting appropriate BMPs for implementation at identified facilities of concern owned and operated by the Permittees. The Permittees are implementing the provisions of the Municipal Facilities Strategy within their respective jurisdictions via processes described in their Individual SWMPs. To assist the Permittees in implementing this program, training focused on storm water regulatory requirements and BMPs related

to Permittee maintenance facilities and roadway maintenance activities were conducted twice annually during the 2004 MS4 Permit term.

7.4.1 Permittee Facilities and Activities Program Element Accomplishments and Programmatic Improvements

- The District coordinated preparation of GIS-based maps for Permittee MS4 facilities. The MS4 maps are updated annually with new information provided by the Permittees as part of the Annual Reporting process.
- Development of a GIS Browser that allows interested parties to view MS4 Facilities from the District's website.
- Updated Model Facilities Pollution Prevention Plan for Permittee facilities not requiring coverage under the Industrial General Permit.

Highlights
900 attendees to Municipal NPDES training

7.4.2 Proposed Revisions to Permittee Facilities and Activities Program Element

7.4.2.1 FPPP Guidance

The Permittees commit to developing a revised WQMP template for Permittee projects that better facilitates translation of WQMP BMP requirements into Facility Pollution Prevention Plans, where appropriate.

7.4.2.2 Integrated Pest Management

The Permittees commit to including Ecowise's standardized language for contracted pesticide management services in Permittee pesticide management contracts.

7.5 Commercial and Industrial Sources

The Principal Permittee and the County have implemented the CAP through which the County Department of Environmental Health makes use of existing inspection programs to address storm water compliance survey/inspections of restaurants and facilities that must secure a hazardous materials permit for either storing, handling or generating hazardous materials. As the responsible Certified Unified Program Agency in Riverside County, the County Department of Environmental Health is responsible for regularly inspecting all sites within the County that handle hazardous waste. The CAP is implemented in those cities and unincorporated areas that do not maintain an individual industrial/commercial inspection program through other mechanisms such as POTW waste pre-treatment programs or business license inspection programs.

Revisions to the inspection program requirements contained within the 2004 MS4 Permit expanded the scope of the overall commercial/industrial inspection program beyond the ability of the CAP to address. Each Co-Permittee now implements a supplemental inspection program for facilities not covered by the CAP. In addition, the 2004 MS4 Permit required inventories/databases of facilities, prioritization of

industrial and commercial sources relative to the potential to impact water quality, and specified inspection frequencies based upon facility priority.

The revised industrial and commercial sources program continues to have both regional and local jurisdiction components. Although the overall industrial/commercial inspection program has grown beyond the CAP, the CAP still addresses most of the facilities identified in the 2004 MS4 Permit. With its low overhead cost, it remains a cost effective approach to mitigating the impacts of industrial and commercial facilities on the MS4 and Receiving Waters.

7.5.1 Commercial and Industrial Program Element Accomplishments and Programmatic Improvements

- Reviewed and updated several educational brochures for distribution to inspected facilities.
- Developed outreach posters for gas and automotive service stations.
- Developed standardized inspection reporting forms for Annual Reports.
- Updated food service surveys.
- Extended the agreement with the County's Department of Environmental Health executed in 1999 for the area-wide CAP for the inspection of commercial and industrial facilities through June 30, 2009.
- Created Permittee databases for the inspected commercial and industrial facilities.
- Revised the Riverside County DAMP to reflect development of the industrial and commercial facility database that contains the following information: facility name, address, city, zip code, and Standard Industrial Classification (SIC) codes.
- Provided public education information regarding NPDES storm water permits to any new businesses listed in the Press Enterprise.

Highlights
3,974 inspections of Industrial and Commercial facilities
Over **1000** enforcement actions taken
426 attendees to Municipal NPDES training

7.5.2 Proposed Revisions to Commercial and Industrial Sources Program Element

The expected future expansion of the Commercial and Industrial Inspection Program to address Treatment Control BMPs as described in Section 7.2.2.6 would likely result in an expansion of the CAP that is beyond the ability of Environmental Health staff to accommodate and still achieve their own mandated inspection requirements. The Permittees are therefore proposing to amend the Riverside County DAMP and Individual SWMPs to recognize not only the CAP inspection program but also Permittee specific alternative programs that may develop during the term of the next MS4 Permit.

7.6 Residential Sources

The residential program focuses on educating residents about activities that can potentially contribute to beneficial use impairment. The residential program outreach is focused on Pollutants of Concern. The residential program is primarily implemented through the Regional Public Education Program; however, each Permittee typically conducts additional outreach. In those cases where residential Illegal Discharges are identified, appropriate code enforcement actions are also taken.

7.6.1 Accomplishments and Programmatic Improvements

The residential program achieved the following accomplishments during the term of the 2004 MS4 Permit:

- Developed several new outreach brochures and tools to promote changes in knowledge and behavior regarding activities that potentially generated Pollutants of Concern including landscape and gardening brochure, spray bottles with non-toxic pest control or cleaner recipes, septic system management brochure, updated outdoor activities brochure, and pet waste brochure.
- Implemented billboard advertising promoting "**Only Rain Down the Storm Drain**" message
- Purchased a new trailer to transport public education materials. The trailer is wrapped in graphics supporting the "**Only Rain Down the Storm Drain**" message.
- Point of Sale Outreach Programs to customers of hardware stores regarding paint, pesticides and fertilizers.
- Partnership with Valley Greeters to deliver "**Only Rain Down the Storm Drain**" information to new residents in the Santa Margarita Region.
- Promotion and participation in the annual Santa Margarita Watershed Clean Up Day.
- Continued supplemental support of the HHW/ABOP waste collection programs
- Continued update and revision of the public education information page
- Continued implementation and enhancement of school outreach programs conducted by Mission Resource Conservation District
- Reproduction and distribution of the After the Storm poster

7.6.2 Recommended Revisions

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.7 Public Education and Outreach

Although the bulk of public education and outreach activities are conducted by the District on behalf of the Permittees, the Permittees also conduct outreach activities. These activities include providing informational pamphlets at counters, conducting presentations for local businesses or developers, maintaining a stormwater page or appropriate stormwater links on their individual websites, conducting employee training programs, and attending various public events.

7.7.1 Public Education and Outreach Program Element Accomplishments and Programmatic Improvements

The Public Education and Outreach Program Element had the following accomplishments and improvements over the term of the 2004 Permit (not including those identified in Section 7.6.1):

- Use of a CEQA-style public participation process to develop the Riverside County DAMP, SWMPs, and WQMP
- Duplication and use of the USEPA construction site poster to educate construction site operators
- Distribution of stormwater outreach information to various businesses and construction sites through code enforcement, and building and grading inspectors
- Development and distribution of a automotive shop BMP poster
- Advertisements in the Business Press
- Update of the outdoor activities brochure for mobile operators

7.7.2 Recommended Changes

Although the Permittees continue to annually assess and modify outreach materials and programs, the Permittees are not recommending any substantive revisions to this program element at this time.

7.8 Elimination of Illicit Connections and Illegal Discharges

The Riverside County DAMP describes the discharge limitations and prohibitions applicable to the Permittee's MS4 (Section 4.1), procedures to be implemented when persistent exceedances of Water Quality Standards are identified (Section 4.2), responding to and reporting Illegal Discharges (Section 4.4), enforcement measures for IC/IDs (Section 4.5), measures to control litter (Section 4.6), measures to manage sanitary wastes (Section 4.7), and programs to promote collection and proper disposal of hazardous waste (Section 4.8).

7.8.1 IC/ID Program Element Accomplishments and Programmatic Improvements

- Developed Sanitary Sewer Overflow Procedures in coordination with the sanitary sewer operators in the Santa Ana and Santa Margarita Regions and implemented annual updates to Sanitary Sewer Overflow Procedures to ensure proper contact information for outside agencies.
- Established an electronic tracking system for NPDES complaints received through the toll free "Report Storm Water Pollution" hotline, OES or otherwise reported to the District.
- Enhanced public outreach regarding illegal dumping including brochures for: Outdoor Activities, Fountains & Swimming Pools, and Pet Waste, establishment of a Santa Margarita watershed Clean-Up Day and coordination with the County of Riverside Trash Task Force.

- Initiated a cooperative program with the County Environmental Health Department to promote Environmental Enhancement Projects in lieu of fines for environmental crime cases. This initiative resulted in a billboard advertising campaign and BMP posters addressing appropriate BMPs for gas stations and garages.
- Established IC/ID Monitoring Program

Highlights
1,263 potential IC/ID reports received and responded to
Over **5,500** calls received on stormwater pollution hotlines
94 IC/ID Monitoring events
5 monitoring events where field screening exceeding criteria

7.8.2 Proposed Revisions to IC/ID Program Element

The Permittees re-evaluated their existing IC/ID monitoring programs as part of this ROWD. The Permittees believe that the overall monitoring program is effective. However, the Permittees plan to revise their approach to the implementation of the Illicit Discharge monitoring program to increase monitoring data utility or overall program effectiveness.

7.8.2.1 Revise IC/ID Monitoring Program

The Permittees plan to revise their approach to the implementation of the IC/ID monitoring program. The goals of the recommended revisions are to:

- Relocate the IC/ID monitoring sites at MS4 outfalls.
- Distribute the monitoring sites throughout the Santa Margarita Region to detect Illicit Discharges closer to their source before they become excessively diluted.
- Increase efficiency and consistency in sampling resulting in enhanced data quality.
- Enhance response time to identify IC/IDs.

A model Illicit Discharge monitoring plan that accomplishes these goals is described below; a final plan will be incorporated into updated compliance documents with the new MS4 Permit.

7.8.2.2 Model Illicit Discharge Monitoring Plan

The Municipal Permittees will identify MS4 outfalls that could be used for monitoring sites based on maps of the MS4 facilities. This list of preliminary sites will be then field checked to determine the accessibility of the sites and feasibility for inclusion in the IC/ID monitoring program. Inaccessible sites or sites determined to be otherwise infeasible will be removed from the list.

Each Municipal Permittee except Menifee will then divide the list of the viable sites within their jurisdiction into groups of four. As Menifee only has one MS4, it will only monitor that one site. Each group of four sites will be monitored for a period of one year, twice during the dry season. Once all sites have been monitored for a year, sites will be repeated.

A monitoring team will be formed including one District and one Municipal Permittee staff member. The District staff will perform all monitoring/screening activities. The Municipal Permittee staff will be available to assist and will be responsible for initiating any necessary follow-up actions. This approach will provide consistency in screening and monitoring data collection and will allow the Municipal Permittee with jurisdiction over the tributary land use to be immediately aware of exceedances and initiate appropriate follow-up actions.

Appendix C
Initial Assessment Methodologies based on CASQA approach

Construction Component Effectiveness Assessments

Goals

I Ensure that all Construction Sites have applicable permits from the Permittee.

II Increase the percentage of Construction Sites that are in compliance with Permittee building and grading permits

III Place additional focus on Construction Sites during Wet Season

IV Ensure that construction inspection staff are properly trained and informed of the issues related to stormwater quality

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of active construction sites that are discovered without building/grading permits	2	Permit Term	Decreasing Trend or minimal %	Y
II	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or minimal %	N
II, III	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings **during wet season**	3	Permit Term	Decreasing Trend or minimal %	N
II	% of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower levels	N
III	% of active permitted construction sites provided wet weather reminders	2	Annually	N/A	Y
IV	% of construction inspectors receiving annual training	1	Annually	N/A	Y

Development Planning Component Effectiveness Assessments

Goals

I Develop Design Guidance for Low Impact Development (LID) BMPs

III Encourage the use of LID-Based Treatment Control BMPs

IV Ensure that appropriate planning staff are trained in WQMP requirements

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Status of SMC LID BMP Design Manual	1	Within Permit Term	Completion	Y
II	% of WQMP projects that met the exemption requirements for inspection and maintenance reporting by implementing only LID-Based Treatment Control BMPs	3	Permit Term	Increasing Trend	N
III	% of applicable planning staff that attended WQMP training.	1	Annually	N/A	Y

Permittee Facilities and Activities Program Effectiveness Assessments

Goals

I Ensure that Permittee Facilities have adequate BMPs implemented and that they are properly maintained
II Ensure that Channels and Inlets are kept free from trash and debris
III Encourage the use of Integrated Pest Management (IPM) on Permittee Facilities
IV Maintain an updated GIS map of the MS4 system
V Ensure the Permittee facility operators and maintenance workers are properly trained in issues related to water quality.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of facilities with appropriate BMPs identified	1	Annually	N/A	Y
I	% of Facilities provided reminders of appropriate BMPs	2	Annually	N/A	Y
I	% of annual facility inspections finding deficiencies in BMP implementation that require follow-up actions	3	Permit Term	Decreasing Trend or minimal %	Y
I	Average % of deficiencies identified in the previous year's inspections that were addressed.	3	Permit Term	Increasing Trend or high %	Y
II	Estimated Tons of Waste removed from Streets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Inlets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Open Channels	5	Annually	N/A	N
III	% of Pest Control Contracts that include language promoting or requiring IPM	1	Annually	N/A	N
IV	% of new Permittee-maintained MS4 facilities added to GIS Map	1	Annually	N/A	Y
V	% of Permittee Facility and MS4 operators and maintenance staff that attended training.	1	Annually	N/A	Y

Industrial-Commercial Facilities Program Effectiveness Assessments

Goals

I Maintain an updated and prioritized list of Industrial and Commercial Facilities

II Ensure the each Industrial and Commercial Facility has implemented BMPs that are appropriate for the activities and features at that facility

III Ensure that implemented BMPs are properly maintained to ensure their effective operation

IV Implement enforcement measures as necessary to reduce the occurance and recurrance of violations

V Ensure that inspectors are appropriately trained to identify problem areas and BMPs maintenance issues.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of new facilities added to database and prioritized	1	Annually	N/A	Y
II	% of inspected facilities with adequate Minimum BMPs in place at time of inspection	3	Permit Term	Increasing Trend or High %	N
III	% of inspected WQMP facilities subject to Post Construction Treatment Control BMP Inspection, with adequately maintained Treatment Control BMP	3	Permit Term	Increasing Trend or High %	N
IV	% of inspected High/Medium priority facilities that were subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or Low %	N
IV	% of enforced sites that are repeat offenders	3	Permit Term	Decreasing Trend or Low %	N
IV	% / Number of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower enforcement	N
V	Percent of applicable inspectors that attended training	1	Annually	N/A	Y

Residential Program Effectiveness Assessments

Goals

I Raise awareness among residents of activities that may be contributing to stormwater pollution
II Increase public awareness of BMPs for residential activities
III Increase public participation in hazardous material collection events
IV Increase public involvement in keeping the watershed clean
V Encourage the use of Alternative Pest Control Methods

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Number of outreach events to Schools	1	Annually	N/A	N
II	Number and type of educational materials distributed that target residential activities	1	Annually	N/A	Y
I, II	Results of Public Ed Surveys	2	Permit Term	Increasing or high level of Knowledge	Y
III	Gallons of Used Oil Collected through Used Oil Block Cycle Grant	4	Annually	N/A	Y
III	Total Pounds collected at HHW/ABOP events	4	Annually	N/A	Y
III	Total Number of participants at HHW/ABOP events	3	Annually	Increasing Trend	Y
IV	Pounds of trash removed through Watershed Cleanup Events	4	Annually (as events occur)	NA	N
V	Number of Home Improvement stores provided outreach and customer educational information for pesticide use	2	Annually	Increasing Trend	Y

Detection and Elimination of Illicit Discharges and Connections Effectiveness Assessments

I Revise and enhance IC/ID Monitoring Program
II Reduce the occurance of Illicit Connections and Discharges
III Increase public reporting of improper disposal into MS4
IV Ensure the IC/ID reports are reviewed and responded to in a timely manner
V Ensure the confirmed IC/ID events are eliminated as quickly as possible
VI Ensure the IC/ID response staff are trained to identify potential sources of Illicit Discharges and recommend BMPs to prevent such discharges

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Revise IC/ID Monitoring Program to screen random MS4 outfalls	1	N/A	N/A	N
II	% of IC/ID Monitoring events with sampleable flow	1	Permit Term	N/A	N
II	% of IC/ID Monitoring events that exceeded criteria and required follow-up	5	Permit Term	Decreasing Trend or low %	N
III	Number of IC/ID reports received	2	Annually	Increasing Trend	N
IV	% of IC/ID reports responded to within 1 business day of receipt	1	Annually	N/A	Y
V	% of confirmed and source-identified IC/ID incidents that required enforcement beyond verbal or written wardnings to eliminate	3	Permit Term	Decreasing Trend or minimal %	N
V	% of each type / level of enforcement	3	Permit Term	Trend toward lower levels	N
VI	% of IC/ID response staff receiving training	1	Annually	N/A	Y

Appendix D
Toxicity Reduction Evaluation for Pyrethroid Pesticides

Riverside County Flood Control and Water Conservation District

Riverside County – Santa Margarita Region Pyrethroid Source Identification Toxicity Reduction Evaluation

Final Phase II Report
January 2009

MACTEC
9177 Sky Park Court
San Diego, California 92123

Executive Summary

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the SMR Permittees to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. This report documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff.

Data gathered under this TRE was compared to data from neighboring counties. Based on available data, problems with pyrethroid-induced toxicity in urban runoff are common among municipalities in Southern California, and methods for addressing the problems are comparable.

A literature review was conducted to determine appropriate source control and treatment control BMPs for reducing the concentration and load of pyrethroids in storm water runoff. The literature source, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are summarized.

Based on the results of the literature review, BMPs are evaluated for applicability and potential effectiveness in the SMR watershed. Many of the most effective and appropriate BMPs are currently being implemented by the Permittees.

A search for pending legislation did not identify any pending legislation pertaining to pyrethroid pesticides.

The most effective strategy to prevent water quality impacts from legal pesticide uses was identified as state or federal regulatory change involving effective labeling and use restrictions. The Permittees propose a five year plan to continue, review, and enhance current activities to reduce pyrethroid-induced toxicity.

1.0 Introduction

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the County of Riverside, the City of Murrieta, the City of Temecula, and the Riverside County Flood Control and Water Conservation District (District, collectively Permittees). The Phase I Status Report (RCFCWCD, 2008) contains the work plan for Phase II and an outline of the topics in this report, as well as additional background information. This Phase II report is divided into six sections.

Section 1 describes the purpose of the TRE and provides an overview of the approach taken by the Permittees. Section 1 also contains a discussion of the regulatory framework of the TRE, a brief project background, a description of the Santa Margarita watershed, pyrethroid pesticide background and usage, and management questions and objectives.

Section 2 describes available pyrethroid and toxicity data from other counties in Southern California, and compares the data to data from Riverside County. The data and comparisons are included to demonstrate that the problems and solutions relating to pyrethroid pesticides facing the Permittees are similar to those of neighboring counties in the region.

Section 3 presents the results of the literature review conducted for this study of pesticide reduction Best Management Practices (BMPs).

Section 4 discusses potential pesticide reduction BMPs, the status of the Permittees implementation of the BMPs, and, when applicable, examples of the implementation of the BMPs in other municipalities. Section 4 also contains a table summarizing the potential BMPs, their advantages and disadvantages, and relative cost.

Section 5 discusses pending legislation relating to pyrethroid pesticides.

Section 6 presents the five-year course of action the Permittees propose to follow to reduce pyrethroid-induced toxicity in the SMR.

1.1 Purpose and Overview of Approach

The purpose of the TRE is to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. The results of Phase I of the TRE are contained in the TRE Status Report (Riverside, 2008). This Phase II report for the TRE study documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff. The goal of Phase II is to establish a course of action and develop modifications to the Permittee's Storm Water Management Plans (SWMPs) to more effectively control the sources of toxicity that were identified in Phase I of the TRE. The Permittees will incorporate the course of action and SWMP modifications into the Report of Waste Discharge (ROWD) that will be submitted to the RWQCB in January 2009.

Phase II activities included:

- A comparison of toxicity and chemistry results to data from adjacent Phase I municipal separate storm sewer system (MS4) permit areas, including San Diego County and Orange County.
- A literature review of current studies and a survey of pesticide reduction BMPs.
- A search for pending legislation regarding pyrethroid pesticides.
- Development of a proposed course of action for the Permittees.

A literature review was conducted of BMP information available from the Urban Pesticide Pollution Prevention (UP3) Project and other pesticide management programs and documents. Information on relevant BMPs was compiled and evaluated to identify potential BMPs that are available to mitigate urban sources of pyrethroids. Existing Permittee programs, such as outreach, regulation, and BMP implementation, were then evaluated for improvement opportunities.

The proposed course of action was determined with consideration of the adequacy of data collection (sufficient precipitation and runoff to collect adequate data) and pending

regulatory actions by California Department of Pesticide Regulation (DPR), and the United States Environmental Protection Agency (EPA).

Land uses in Riverside County are comparable to those in neighboring Orange County and San Diego County, and pyrethroid pesticide-induced toxicity has been observed in those counties. The Permittees are committed to identifying and addressing water quality issues with methods consistent with those used by other stakeholders in Southern California. To this end, data gathered under this TRE was compared to data from neighboring counties, and current pesticide reduction programs used by municipalities throughout California were reviewed.

Source control and treatment control BMPs were researched and evaluated for potential effectiveness in reducing pyrethroid pesticide-induced toxicity in the Santa Margarita watershed. Many of the most effective BMPs are currently implemented by the Permittees, and several have been implemented within the previous Permit term (2004-2008). A proposed five-year course of action for the Permittees was developed by combining the results of the research with the existing programs.

1.2 Regulatory Framework

At the federal level, the authority to regulate pesticide manufacture and use is assigned to the United States Environmental Protection Agency (EPA) under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). In California, pesticide use is regulated at the state level by the DPR. In the SMR, the Permittees are required under the Clean Water Act to control discharges of pollutants, including pesticides that produce water toxicity, to and from their MS4 under the National Pollutant Discharge Elimination System (NPDES).

This TRE was performed as required by Monitoring and Reporting Program (MRP) R9-2004-001.

The MRP, Section II. A. I. 4, states:

> *"When results from the chemistry, toxicity, and bioassessment monitoring…indicate urban runoff-induced degradation, Permittees shall evaluate the extent and causes of urban runoff pollution in receiving waters and prioritize management actions to eliminate or reduce sources. Toxicity Identification Evaluations (TIEs) shall be used to determine the cause of the toxicity, and Toxicity Reduction Evaluations (TREs) shall be used to identify sources and implement management actions to reduce pollutants in urban runoff causing toxicity."*

As local regulation of pesticide use is generally preempted by federal and state law, the Permitttees' authorities are limited to addressing illegal disposal of pesticides, promoting public education, setting the example for minimum pesticide use, and coordinating with the federal and state agencies to facilitate regulatory changes at the state and federal level.

1.3 Project Background

Phase I of the TRE consisted of the toxicity monitoring begun in 2004 and the Toxicity Identification Evaluations (TIE) was initiated in the spring of 2007. The Phase I Status Report (RCFCWCD, 2008) provides a full project background. Toxicity monitoring at Temecula Creek and Murrieta Creek was initiated in 2004 using EPA protocol with the following indicator species: *Ceriodaphnia dubia*, *Selenastrum capricornutum*, and *Hyalella azteca*. Toxicity testing during the 2004-2008 reporting period indicated persistent wet weather toxicity to *Hyalella* in both Temecula Creek and Murrieta Creek. Toxicity was not observed to either *Ceriodaphnia* or *Selenastrum* in any of the samples collected over the four annual reporting periods beginning in the fall of 2004.

Toxicity Identification Evaluations (TIEs) were conducted on the wet weather samples collected from Temecula Creek and Murrieta Creek beginning in April 2007, in accordance with Table 2 of the MRP. The TIEs indicated that pyrethroids were the primary source of toxicity and biological degradation in both Murrieta Creek and Temecula Creek.

As a result of the toxicity and TIEs, storm water monitoring for pyrethroids was initiated in 2007-2008. Results indicate that the pyrethroids permethrin and/or bifenthrin are present in wet weather water samples taken at Murrieta Creek and Temecula Creek.

To further assess the impacts of pyrethroid pesticides the Permittees instituted Dry Weather Toxicity Testing and direct measurement of pyrethroid pesticide concentrations in dry weather water samples during the 2007-2008 reporting period. Toxicity and pyrethroid pesticides were not detected in dry weather water samples at either Murrieta Creek or Temecula Creek.

Phase I of the TRE concluded with the Phase I Status Report. The Phase I Status Report included studies to better characterize patterns and sources of toxicity and to evaluate the hypothesis that the *Hyalella* toxicity is due to pyrethroids.

Bifenthrin and permethrin appear to be the primary toxic elements in Temecula Creek and Murrieta Creek. While bifenthrin and permethrin were applied to both agricultural and non-agricultural land uses, the major sources of pyrethroid toxicity in the SMR are non-agricultural activities. Permethrin was applied more than any other pyrethroid pesticide in the urban landscape. Bifenthrin and permethrin application rates were one and three orders of magnitude higher for structural control applications than agricultural applications in Riverside County. Structural control appears to represent 93% of the total pyrethroids use for Riverside County.

The Status Report outlined the plan for Phase II of the TRE, and this report presents the results of Phase II.

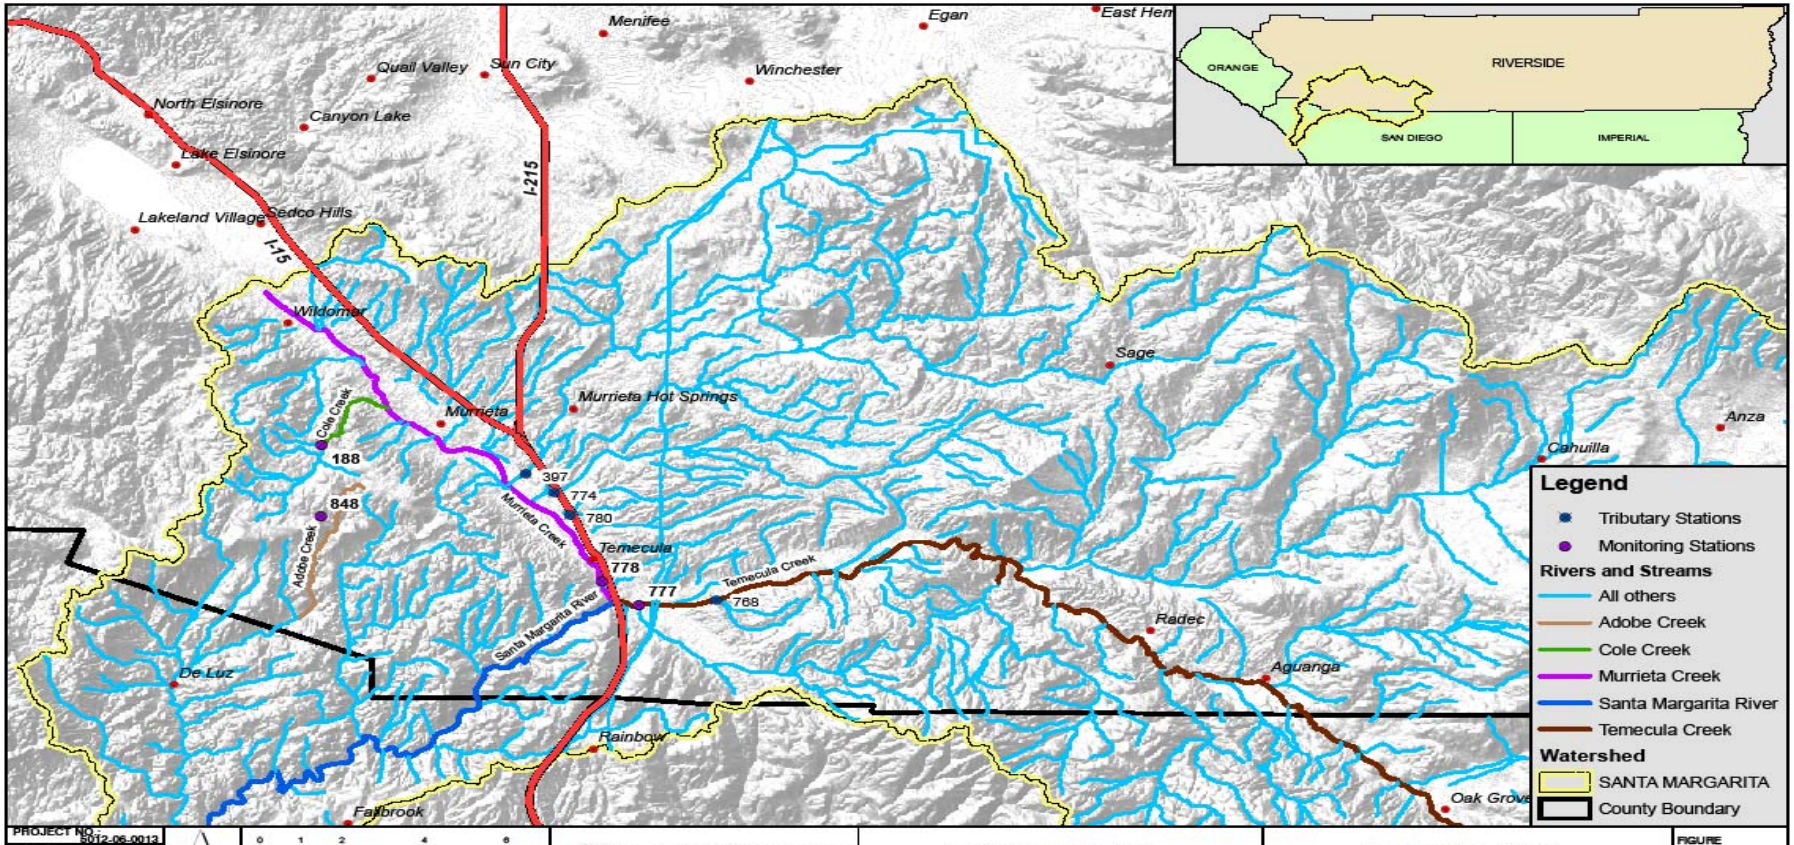
1.4 Watershed Description

The SMR encompasses approximately 750 square miles in southwestern Riverside and northern San Diego Counties (see Figure 1-1). The upper (northeast) portion of the SMR is in Riverside County with the remainder in San Diego County. The SMR is subdivided into the Temecula Creek and Murrieta Creek sub-watersheds and has an arid Mediterranean climate. Creeks in the SMR are ephemeral. Flow in Temecula Creek and in Murrieta Creek results almost exclusively from groundwater during the dry season. It is rare to find flow during dry weather at the tributary stations, and usually this flow infiltrates before reaching Temecula Creek or Murrieta Creek (2006-2007 Monitoring Annual Report). While the ephemeral streams in the SMR are technically receiving waters, the term "Receiving Waters" as used in this TRE Status Report refers exclusively to Murrieta Creek and Temecula Creek.

The Santa Margarita River is formed by the confluence of Murrieta Creek and Temecula Creek. The confluence is located in Riverside County, approximately five miles northeast of San Diego County. The Santa Margarita River flows from Riverside County into San Diego County through the community of Fallbrook and Marine Corps Base Camp Pendleton. The lower estuary and river are protected by Camp Pendleton and are much less developed than surrounding areas in Southern California. The Santa Margarita River is able to support a relative abundance of wildlife and habitats in part because of its undeveloped state.

Figure 1-1

Riverside County Santa Margarita Watershed



As presented in Table 1-1, the total population in the SMR of Riverside County is significantly less than adjacent watersheds covered under similar Phase I MS4 NPDES permits.

Table 1-1

San Diego Region Populations

Jurisdiction	Population
Orange County	3,002,048
San Diego County	2,941,454
SMR/Riverside County	250,483
Unincorporated	55,291
Murrieta	97,257
Temecula	97,935

1.5 Pyrethroid Pesticide Background and Usage

A statewide compilation of the presence and effects of pyrethroid pesticides in urban surface waters, prepared in July 2008 and presented at the 2008 California Association of Stormwater Quality Agencies (CASQA) Conference, outlined the rise in pyrethroid use and its increased presence in urban waterways (Ruby, 2008). A comprehensive survey of pesticide use in Sacramento, San Diego, and Orange Counties also concluded that, as the older pesticides chlorpyrifos and diazinon have been phased out, pyrethroid pesticides have seen increased usage (Wilen, 2005). The Urban Pesticide Pollution Prevention (UP3) Project confirms that pyrethroids are the cause of toxicity in numerous California waterways, particularly in urban waterways. The UP3 Project (www.up3project.org) publishes an annual review of new scientific findings on pesticides in urban surface water (TDC, 2007). Since 2005, the reviews have consistently indicated that pyrethroid use continues to increase and that pyrethroids are found to be the cause of toxicity in urban waterways. The pyrethroid use information is confirmed by data published by the DPR.

Pyrethrins are natural insecticides that are derived from an extract of chrysanthemum flowers. Pyrethroids are synthetic versions of pyrethrins. These chemicals act on the nervous system of insects. Commercial pyrethroid pesticides often contain a synergist that works by restricting the enzymes insects use to detoxify pyrethroids. While pyrethroids have been shown to be one of the least poisonous insecticides to mammals, the effects depend on the level of exposure, the health of the animal, and the environmental circumstances.

Pyrethroids applied in urban areas enter the storm drainage system of the MS4 by surface runoff and are transported directly to receiving waters. Other potential urban sources are runoff from irrigation with reclaimed water, application overspray, and atmospheric deposition. Pyrethroids transported via the MS4, from whatever source, are considered to be non-point discharges. Agriculture, nursery, and urban/suburban uses are the main categories of sources of pyrethroids in the receiving waters of the SMR.

Outdoor structural pest control is the predominant urban use of pyrethroids in most watersheds. However, in the SMR, the acreage dedicated to agricultural land use exceeds the urban land use area by approximately 2:1. Pyrethroid insecticides are applied to a variety of crops in the SMR and California throughout the year. According to the DPR, pyrethroids are commonly used on fruit and nut trees, row crops, and in nurseries. Six of the primary pyrethroids used in California agriculture, in order of decreasing amount applied in 2003, are permethrin, esfenvalerate, lambda-cyhalothrin, cyfluthrin, bifenthrin, and cypermethrin. Therefore, agricultural sources of pyrethroids were considered.

TIE methods for pyrethroids are still being developed. Effective methods require the ability to measure low concentrations of pyrethroids, and this remains a challenge. Fortunately, the development of TIE methods for pyrethroids is progressing and moving towards standardization (San Francisco Estuary Project, 2007). TIEs are planned for storm water samples collected during 2008-2009 when toxicity is evident.

1.6 Management Questions and Objectives

This TRE is designed to confirm the toxic element observed in the samples collected in the Santa Margarita Region, identify likely sources of the toxic element, and propose mitigation measures for those sources. TIEs identified pyrethroids pesticides as the likely toxic element. As the MRP specifies that a TRE must be conducted following toxicant identification through a TIE, Phase I of the TRE focused on the pyrethroids identified as the source of toxicity in the 2007 TIEs. To support this TRE, the Permittees commissioned additional wet and dry weather toxicity testing, water column pyrethroid testing, additional TIEs to verify the persistence of pyrethroids as the toxicant. Based on the resulting information, the TRE evaluates the specific sources of toxicity and likely mitigation.

This TRE study assumes that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in neighboring counties, in particular San Diego and Orange Counties. Under this assumption, the Permittees hypothesized that pyrethroids would be detected in samples at most if not all monitoring locations, that the samples would exhibit toxicity to *Hyalella*, and that TIEs would indicate pyrethroids as the cause of the toxicity. Unlike other regions, dry weather toxicity is not expected in the SMR, as dry weather flows are supported primarily by groundwater.

Based on this assumption, this TRE was designed to provide information to help answer the following five management questions related to the toxicity:

1) Is the pyrethroid toxicity persistent in Temecula Creek and Murrieta Creek?
2) Does the toxicity occur during dry weather?
3) Are there any obvious sources of illicit discharge of pyrethroids that can be abated?
4) What are the likely sources of pyrethroid toxicity in the SMR?
5) What potential management measures are available to the Permittees to mitigate the impacts of pyrethroid pesticide application?

Answers to the first four questions are detailed in the Phase I Status Report. Briefly, toxicity is persistent in the creeks during wet weather, but is not evident in dry weather samples. No

obvious sources of illicit discharge were found. The likely primary source of pyrethroids is structural control performed by pest control operators (PCOs). The final question is addressed during Phase II and is the focus of this report.

2.0 Data Comparison

An assumption of this TRE study is that pyrethroid sources and resultant toxicity patterns in the SMR are analogous to those in similar counties, in particular neighboring San Diego and Orange Counties. To verify this assumption, it was necessary to compare data collected in SMR to data collected in other locations. As part of the 2008 CASQA pyrethroids data compilation, monitoring results were summarized from studies that investigated the presence and effects of pyrethroid pesticides in urban areas of California (Ruby, 2008). The CASQA summary listed the frequency of detection of various pyrethroid pesticides and results of toxicity testing for different indicator species. Results from various northern and Southern California locations were detailed, including results of water column studies from Orange, San Diego and Sacramento Counties.

Pyrethroids, as a class of chemicals, have an affinity for particles and they are considered to be relatively hydrophobic; they are therefore commonly found in sediments of waterways downstream of their application sites. The initial toxicity studies leading to the identification of pyrethroids as pervasive environmental contaminants in California were performed on sediment samples by Don Weston and his colleagues at the University of California, Berkeley (Weston et al., 2005; Amweg et al., 2006). Recently, improvements in analytical methods for pyrethroids in water, and modification of toxicity studies to more effectively test for pyrethroid-based toxicity in water, have lead to increasing evidence of the presence of pyrethroids in water column samples, and toxic effects in the water matrix (see citations for Orange and San Diego County in Ruby, 2008).

Extensive work has been performed on the environmental presence and effects of pyrethroids in urban areas of the neighboring Orange and San Diego counties; however, much of this work has been performed on sediment samples. Although the sediment monitoring results do not correspond directly with the SMR water column test results, sediments are considered to be effective integrators of contaminants from the contributing storm water flows. The deposited sediments are produced as particles settle out from the passing water over some

period of time, and tend to accumulate until they are washed away by higher-velocity flows. Summaries of the relevant sediment study results are therefore included in the discussion that follows.

In Orange County, an ongoing study being performed by UC Davis, in conjunction with UC Riverside and the Orange County UC Cooperative Extension, has consistently found bifenthrin and permethrin in water column runoff samples from residential areas (Haver et al., 2007; Oki, personal communication). In samples from four residential sites they have detected bifenthrin in 100% of samples, with the number of samples varying from 48 to 57 per site (Oki, personal communication). In sediment samples collected in recent years from the Santa Ana Region of Orange County, bifenthrin is commonly detected (32 of 56 samples) and permethrin less frequently so (4 of 56 samples), with sediment toxicity to *Hyalella* common (39 of 54 samples tested were moderately or highly toxic; see summary in Ruby, 2008).

In a 2005 study of six Orange County residential storm drainages and seven tributary streams draining commercial/residential land uses, bifenthrin was detected in 95% of dry weather samples and 100% of wet weather samples (Budd et al., 2007). Because treatment of nursery products is mandatory to control Red Imported Fire Ants, an older DPR study, conducted in 1999-2002, found occasional detects of bifenthrin in urban runoff samples, along with frequent detects in nursery runoff from several Orange County sites.

In San Diego County, under NPDES Permit monitoring conducted since 2004, pyrethroids have been commonly detected in water samples from several receiving waters, and toxicity to *Hyalella* has been increasingly observed in water samples (see summary in Ruby, 2008). Bifenthrin was detected in 12 of 15 samples collected from 2005-2006 and 2006-2007; detection frequency was 100% in samples from Chollas Creek, Agua Hedionda, and Tecolote Creek. Toxicity to *Hyalella* was observed in 22 of 57 samples tested over the three year period, 2004-2007. In a TIE study performed on Chollas Creek samples during 2005-2006,

67% of samples were acutely toxic to *Hyalella*, and the toxicity was found to be likely due to pyrethroids.

In a 2004-2005 study performed by UC Davis and others, sediments from Switzer Creek at its outlet to San Diego Harbor were found to be highly toxic; bifenthrin and permethrin were detected at high concentrations, and a sediment TIE identified pyrethroids as the likely cause of the observed toxicity (Anderson et al., in press). As part of a statewide survey of urban waterways, sediments were tested from several receiving waters in San Diego County. All were found to be highly toxic to *Hyalella* (Holmes et al., in press).

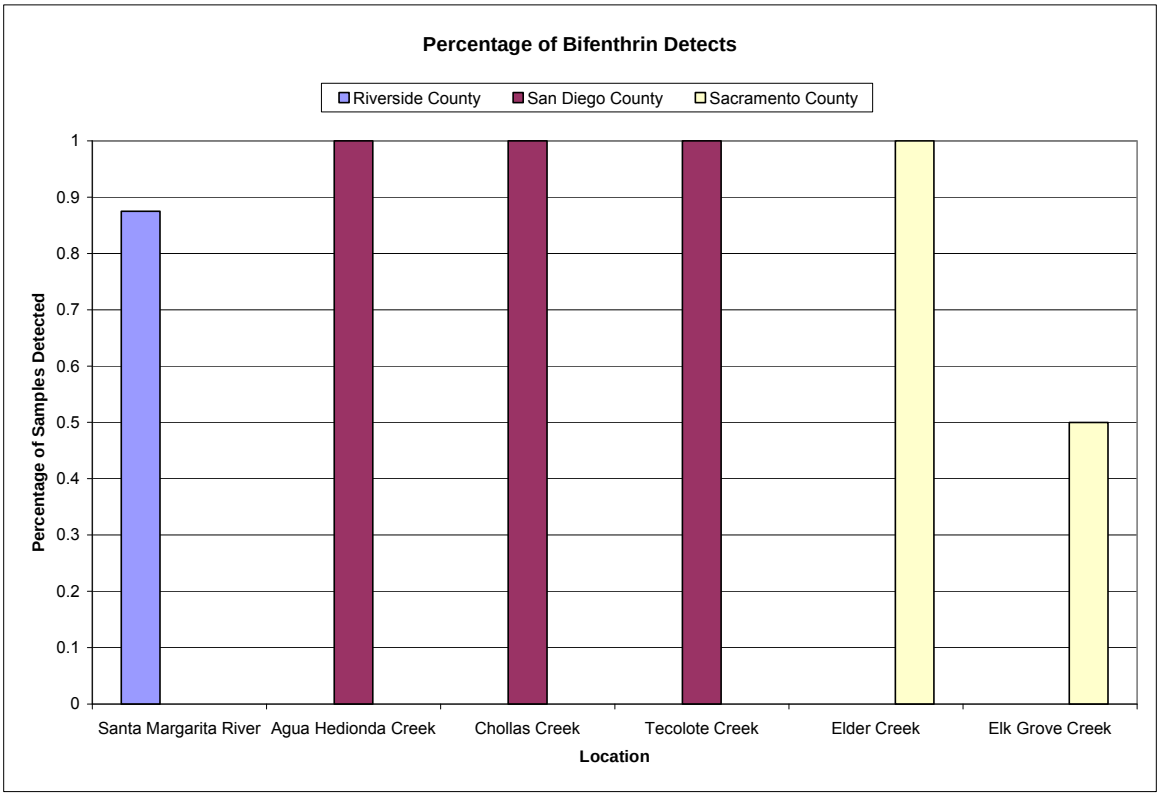
To further compare the pyrethroid sources and toxicity patterns in the SMR to other counties, the CASQA data summary was analyzed to select the studies which reported results for the same constituents and effects identified in the SMR, specifically permethrin, bifenthrin, and toxicity to *Hyalella.* The total number of detections for the different monitoring locations was divided by the total number of samples taken at the sites to calculate the percentage of samples with detectable concentrations of pyrethroids. This normalized metric allowed for comparison of the various datasets.

While permethrin is among the more commonly-used pyrethroids, it is much less toxic to aquatic life than bifenthrin (TDC, 2007). For the purposes of this assessment, bifenthrin detection frequency and frequency of toxic effects were used as the metrics for comparison.

Comparative results for bifenthrin are summarized in Figure 2-1. Data were available for two creeks in Sacramento County and three locations in San Diego County, in addition to the data collected for SMR. Two samples were taken at the Sacramento County sampling locations. For San Diego County, each creek was sampled three times except for Chollas Creek, which was sampled six times. The SMR was sampled a total of eight times. In most cases, bifenthrin was detected in over 80% of samples. Only at Elk Grove Creek in Sacramento County was bifenthrin detected at a notably lower percentage.

Figure 2-1

Percentage of Samples with Bifenthrin Detections

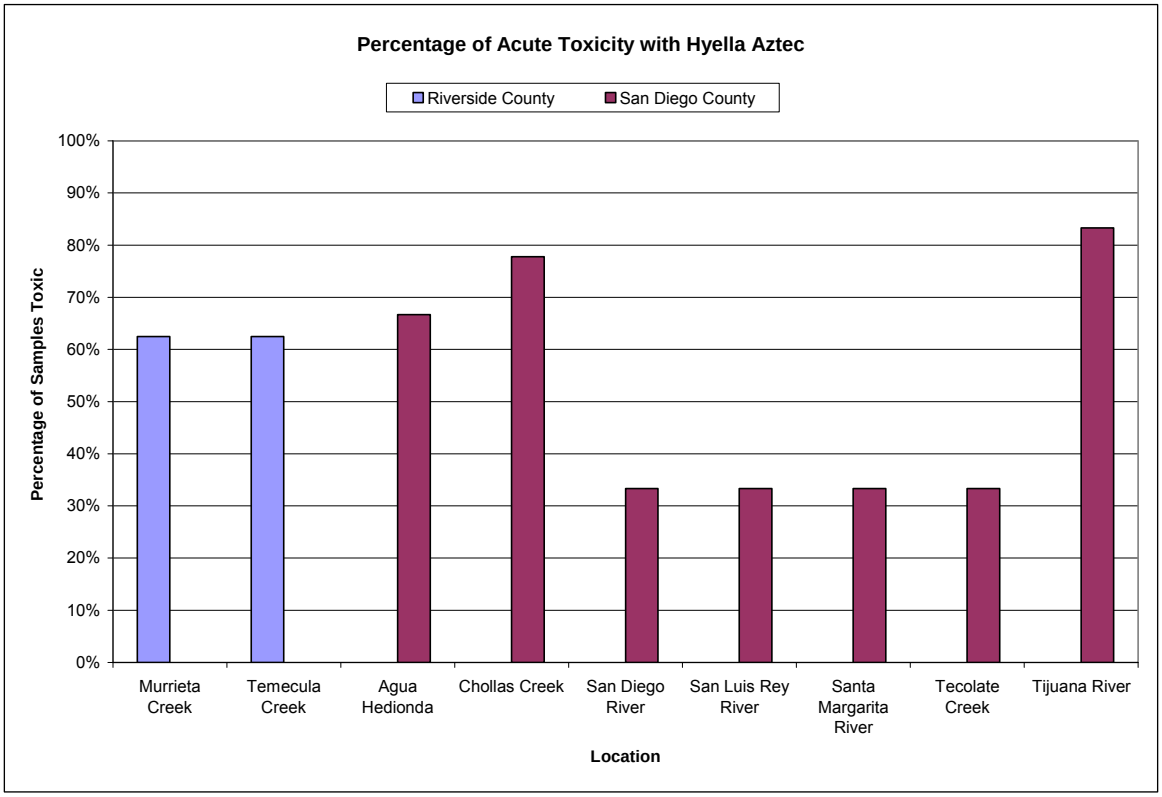


Toxicity to *Hyalella* was documented in water samples from San Diego County, along with the SMR. Toxicity testing was performed on samples from seven San Diego County water bodies. The sample sets ranged from three to nine toxicity tests (Aqua Hedionda, San Dieguito River, Tijuana River, and Chollas Creek). In the SMR, a total of eight toxicity tests were performed on samples from Murrieta Creek and Temecula Creek. The results for frequency of acute toxicity from the SMR were within the range of the results for similar sites in San Diego County (see Figure 2-2).

After comparing the results from different locations, the assumption that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in similar counties appears to be valid.

Figure 2-2

Percentage of Samples with Acute Toxicity to *Hyalella*



3.0 Literature Review

A literature review was conducted during December, 2008 to determine appropriate BMPs for reducing the concentration and load of pyrethroids in storm water runoff. An initial search was made of the Urban Pollution Prevention Program (UP3) website (www.up3program.org) for potential examples of BMP strategies implemented specifically for pyrethroids. The United States Environmental Protection Agency website and the CASQA website were also reviewed for pyrethroid specific BMPs. Widespread use of pyrethroids is relatively recent, and there has been little direct evaluation of BMPs for pyrethroids. Further research was conducted on general storm water BMPs, and their potential for pyrethroid reduction was evaluated based on the design of the BMP and the chemical behavior of pyrethroids.

To identify pending legislation that may be related to pyrethroid pesticides, web searches were conducted on the websites for DPR, the California legislature, the EPA, and the Library of Congress. However, no pending legislation was identified as relevant to pyrethroid pesticides.

Table 3-1 below presents the findings of the literature review. BMPs are categorized as either source control or treatment control, and within each category they are sorted by type. The literature source, a summary of the BMP, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are provided. See Section 4 for further information about each type of BMP.

Table 3-1
Literature Review Matrix

Type of BMP	Literature Source	Summary	Ability to Reduce Toxicity Caused by Pyrethroids	Storm Water Concerns
Source Control				
Regulatory	Pesticides of Interest for Urban Surface Water Quality. Urban Pesticides Use Trends Annual Report. July 2008.	Suggests regulatory changes as a result of increased toxicity due to pyrethroid use	Potentially High	Supplementary to other BMPs, Will take years to show results
Regulatory	Improving Urban Pesticide Regulatory Activities to Protect Water Quality – Annual Update 2007. November 2007.	Discusses recent state and federal regulatory pesticide activities on an annual basis	Potentially High	Supplementary to other BMPs, Will take years to show results
Regulatory	California Department of Pesticide Regulation. http://www.cdpr.ca.gov/docs/registration/reevaluation/chemicals/pyrethroids.htm. 2007.	The reevaluation of the widespread presence of synthetic pyrethroid residues in the sediment of both agricultural and urban dominated California waterways at levels toxic to Hyalella azteca (H. azteca).	Potentially High	Supplementary to other BMPs, Will take years to show results
Integrated Pest Management (IPM)	Building Maintenance - Structural Integrated Pest Management. June 2008.	Promotes reduction in pesticide use through use of municipality IPM and hiring of PCO's trained in IPM	Potentially High	Does not eliminate all uses of pyrethroids
IPM	California Stormwater BMP Handbook. January 2003.	Promotes prevention of pesticide use through use hiring of PCOs that use IPM as an alternative	Potentially High	Does not eliminate all uses of pyrethroids
IPM	City of Santa Monica Toxics Use Reduction Program Integrated Pest Management. June 1997.	Overview of IPM program initiated by the City of Santa Monica	Potentially High	Does not eliminate all uses of pyrethroids
IPM	National Management Measures to Control Nonpoint Source Pollution from Urban Areas. November 2005.	EPA document discussing management practices to help reduce pesticide use	Potentially High	Does not eliminate all uses of pyrethroids
IPM	National Pollutant Discharge Elimination System (NPDES) Phase II BMP & Measureable Goal Examples. February 2008.	Provides examples and goals of good housekeeping BMPs	Potentially High	Does not eliminate all uses of pyrethroids
IPM	The Monterey Bay Green Gardener Program "sample curriculum". www.green-gardener.org/about. Accessed December 2008.	Informs the public and landscapers about the green gardener program and how to get involved	Potentially High	Does not eliminate all uses of pyrethroids

4.0 BMP Analysis

Based on the literature review and the findings of Phase I of the TRE, BMPs were evaluated for their applicability to the SMR. Because the toxicity appears to be principally a wet weather phenomenon, and because the Permittees' jurisdiction includes the urbanized area of the watershed, the analysis focused on BMPs designed to reduce the amount of storm water pollution caused by urban runoff.

The potentially applicable BMPs are divided into Source Control and Treatment Control BMPs and are discussed in detail below. Through the Permittee's proactive efforts to protect the quality of the receiving waters and their beneficial uses, many programs addressing these broad categories are either already in place or are actively being developed. The implementation status for each specific BMP is discussed. Examples of BMP implementation by other municipalities in the region are included as a tool for evaluating the consistency of the Permittees' program with other programs in the region.

4.1 Source Control BMPs

Source control BMPs are designed to curtail pollution at the source before it has the opportunity to enter the storm drain system and pollute waterways. They are generally the preferred type of BMP because reduction of pollution occurs at the source, before runoff has become contaminated (CASQA, 2003). The types of broad categories of source control BMPs that identified as most appropriate for the Santa Margarita watershed are: pursuing regulatory change, implementing IPM strategies including LID, and public outreach and education.

4.1.1 Regulatory Action

Status: Currently being implemented by the Permittees.

Pesticide manufacturers are required to receive approval by USEPA and California DPR for specific pesticide uses, and both agencies can impose use restrictions to prevent unwanted impacts on the environment and public health. At the federal level, a fundamental regulatory disconnect exists between pesticide approval (registration) under FIFRA and water pollution control programs under the Clean Water Act. This has resulted in a repeating pattern, in which a) pesticides are approved for use without sufficient consideration of potential environmental effects, b) water quality and other ecological impacts accrue, c) use restrictions are applied to the offending products (sometimes involving widespread bans on use), and d) new pesticides are approved for use, with subsequent environmental impacts.

In 1962 Rachel Carson published *Silent Spring*, documenting the widespread ecological consequences of pesticide applications. The federal government responded by banning the use of DDT and other organochlorine pesticides, based on extensive evidence of environmental impacts through the process of bioaccumulation. The ban has lead to dramatic recoveries in affected populations of bald eagles and other species; however, the legacy of these long-lasting pesticides near-shore dumping areas in Los Angeles County and elsewhere remains (IWS, 2007).

Eventually the organochlorine pesticides were replaced principally by organophosphate pesticides, especially in urban uses. In the mid-1990s municipal storm water monitoring programs began to document that commonly-used organophosphate pesticides, especially diazinon and chlorpyrifos, were present at toxic levels and causing toxicity to aquatic organisms, principally the common water flea, *Ceriodaphnia*. Although not bioaccumulative, diazinon and chlorpyrifos were discovered to cause widespread toxicity in urban runoff and local receiving waters (TDC, 2001). USEPA subsequently banned most urban uses of diazinon and chlorpyrifos, although EPA's main motivation involved human health effects

on the pesticide applicators, and water quality was not an important factor in those decisions. Again, the ban was also immediately effective, reflected in reduced concentrations of diazinon and chlorpyrifos in urban water samples, and fewer occurrences of organophosphate-based water column toxicity (c.f., references in Ruby, 2008 for San Diego County Municipal Copermittees Annual Urban Runoff Monitoring Reports). But pesticide manufacturers simply replaced the OP pesticides in their products with other active ingredients, principally pyrethroids. Shortly thereafter, researchers and municipal storm water programs began documenting toxic effects from the new pyrethroid products. The pyrethroid impacts were first documented in sediments, and the affected test organism shifted from *Ceriodaphnia* to the sediment-dwelling *Hyalella*.

In the cases of both organochlorine (DDT) and organophosphate (diazinon, chlorpyrifos) pesticides, federal limitations or bans on uses were effective in ameliorating the associated environmental impacts. In both cases, however, new pesticide products were approved for use that then caused related but different impacts to the environment. Therefore it is clear that the most effective strategy for preventing environmental impacts from pesticide use involves implementing an effective process of pesticide approval and registration that comprehensively accounts for and mitigates against such impacts.

For more than ten years CASQA and various other California state and local agencies have promoted better regulation of pesticides at the federal level, encouraging use restrictions as the most effective means of source control. California water quality agencies have sent comment letters to USEPA and DPR on guidance pertaining to the application of pesticides to surface waters and on recommended environmental hazard statements for residential outdoor pesticides (TDC, 2007). These efforts are beginning to show some modest signs of success. In a recent letter to stakeholders, EPA outlined an approach to provide better cooperation between the Office of Pesticide Programs (OPP) and the Office of Water (OW), to allow for “environmentally protective and scientifically defensible effects assessment judgments about contaminants that are or may be found in ambient water”. The Riverside County Permittees plan to continue their support of these efforts through ongoing

participation in the CASQA Pesticides Subcommittee, the Urban Pesticide Pollution Prevention (UP3) Project, and the Urban Pesticide Committee. The Permittees also plan to request that the RWQCB become involved in advocating for more effective pesticide regulation at the state and federal levels.

The Permittees are members of a CASQA subcommittee that addresses pesticide uses impacting stormwater discharges. Effort focuses on providing input to the USEPA and the California Department of Pesticide Regulation (DPR) to improve pesticides regulations so that they more fully protect water quality and are better aligned with the Clean Water Act and California Water Code. (RCFCWCD, 2008). CASQA has also been active in supporting DPR's ongoing reevaluation of allowable pyrethroid pesticide uses (TDC, 2007).

Increasingly, the regulatory response to the water quality impacts resulting from *legal uses of approved pesticides* has been for regional water boards to impose limitations on the allowable loadings of pesticides to impaired waters through the TMDL process. Local agencies have little or no jurisdiction over sales or use of these pesticide products, and therefore do not have the full authority needed to perform loading reductions in resulting TMDLs. An effective regulatory solution must occur at the state and federal levels, to regulate allowable pesticide uses to effectively prevent such water quality impacts.

Current legislation requires users of certain pesticides to be trained, often certified, in the use of those pesticides and to report the amounts applied (State of California, 2008). A similar regulatory approach could be used to promote pesticide alternatives, such as for PCOs to train and certify their technicians in the use of IPM methods (Quarles, 2002). The Permittees are considering supporting regulatory action by the state to include IPM training for PCOs in the requirements for certification and training on the use of pesticides.

Environmentally sensitive and flexible zoning ordinances may be adopted to facilitate the use of LID principles, thereby encouraging private developers to use LID principles (Prince Georges County, 1999). Additional land use restrictions or alternatives to present zoning

laws may help reduce urban storm water runoff, potentially reducing pyrethroid loadings in receiving waters. The Permittees plan to continue promoting LID implementation through interagency communications and cooperation.

4.1.2 Integrated Pest Management

Status: Currently being implemented by the Permittees.

IPM is "a decision-making process for managing pests that uses monitoring to determine pest injury levels, and combines biological, cultural, mechanical, physical, and chemical tools and other management practices to control pests in a safe, cost effective, and environmentally sound manner that contributes to the protection of public health" (Carlsen, 2008). IPM can further be described as an approach to solving pest problems by using information about the pest and landscape to eradicate the pest's habitat in a manner that poses the least risk to humans (Ecology Action, 2007). IPM has many different aspects that help to reduce pests and in turn cause a reduction in pesticide use, including green gardening and structurally integrated pest management (SIPM). BMPs that are typically used as part of an IPM strategy are described in the following sub-sections.

4.1.2.1 Green Gardening

Status: Not currently being implemented by the Permittees, program under consideration and will be enacted in the near future.

The Green Gardener program, implemented through landscapers, promotes environmentally responsible landscaping to reduce the use and need for pesticides. In general, education of gardening and landscape maintenance staff is beneficial for pest reduction as part of an IPM program. It provides alternative methods to landscapers, such as reducing outdoor sources of ants by elimination of their food and water sources through management of honeydew producing insects and plants associated with them (UC Davis, 2007). The Green Gardener

program encourages businesses to participate in environmentally sound landscape maintenance. Healthy landscapes are more resistant to pests (Ecology Action, 2007). Pests that do not have a suitable habitat will leave to find a more hospitable environment. When the pests leave, then there is a lessened need for pesticide applications and lower risk of pyrethroids entering storm water.

The County of Santa Barbara implemented a Green Gardener Program, in which landscapers are encouraged to take a class at the local city college, covering subjects such as IPM strategies and environmentally beneficial landscaping to obtain a "Green Gardener" card. They are then placed on the Green Gardener list, which is then promoted to the public by the County (County of Santa Barbara, 2008). The program benefits both parties; gardeners receive education and advertising at a nominal cost, and the County receives the benefit of more environmentally-friendly landscaping and a reduction in the use of pesticides. Municipalities may promote this type of program by contracting with landscaping companies that have their employees trained in green gardening practices.

Encouraged by the success of the Santa Barbara Green Gardener Program, the Monterey Bay area instituted a similar program. "The goal of the program was to educate and certify local gardeners in resource efficient and pollution prevention landscape management practices" (Ecology Action, 2007). With the support of the State of California Water Resources Control Board, more municipalities are likely to follow (Ecology Action, 2007).

4.1.2.2 Pest Control Contracting

Status: Currently partially implemented by the Permittees.

Many municipalities contract pesticide applications to professional PCOs. Contracting only with PCOs that have IPM training and certification can help realize IPM models and goals. The recently completed EcoWise Certified IPM Contracting Tool Kit (www.EcoWiseCertified.org), provides resources for municipal agencies to use in developing such a program. The EcoWise IPM Tool Kit includes:

- Elements to consider when developing an IPM policy
- Roles and responsibilities of the agency or business in an IPM program
- How to hire and work with a professional IPM service provider

The Took Kit also includes the EcoWise IPM Process along with a number of other helpful resources and sample documents.

Because PCOs are responsible for the majority of pesticides applied in urban areas, distribution of information regarding less-toxic alternatives, lower-use application techniques, and proper disposal, practices to professional applicators is an essential component of the Permitee's pesticide control effort. The Permittees currently distribute information to PCOs through the Public Outreach and Education Program (see Section 4.1.3).

The City of Palo Alto's Regional Water Quality Control Plant includes IPM requirements in their contracts with PCOs (City of Palo Alto, 2008). The City of Santa Monica, as a part of their SIPM program, specified IPM requirements in their PCO contracts (Raphael, 1997). Use of PCOs with IPM training and certification by municipalities encourages local PCOs to invest in IPM training and certification, which in turn, allows their expertise in IPM to expand beyond just the municipality itself (Quarles, 2002). Education of PCOs, hiring only PCOs that have IPM training, and contracting specifically for IPM by local agencies may

create more public awareness and reduce the use of pyrethroids in the Santa Margarita watershed.

4.1.2.3 Structurally Integrated Pest Management Program

Status: Currently being implemented by the Permittees, with additional programs under consideration.

SIPM is a program that controls the access of pests to buildings and the potential food sources within them by protecting the structure itself from pests, with minimal use of pesticides. The Permittees intend to lead by example, sharing success through public outreach programs and encouraging individuals and businesses to do the same. SIPM is a long term solution offering positive potential impacts on budget, reduction of pests and, reduction of pyrethroid pesticide use. Note that SIPM should not be confused with category of pesticide use referred to as structural pest control. SIPM is a BMP designed to reduce the use of pesticides in a structural pest control program.

The City of Santa Monica implemented an SIPM program and experienced a reduction in pests and in the use of pesticides. In addition, Santa Monica reduced pest management costs by 30% (State of California, 2008). California law requires a SIPM strategy for all state-owned buildings and schools (State of California, 2008). The three main aspects of a SIPM strategy are facility design and LID, monitoring, and facility maintenance.

<u>Facility Design</u>

Status: Currently being implemented by the Permittees.

Facility design can play a large role in the exclusion of potential pests. "A facility's planning, design, and construction provides an opportunity to incorporate features that help to exclude pests, minimize pest habitat, and promote proper sanitation" (NIH, 1999). It can also reduce

storm water runoff (NAHB, 2008). Exclusion of pests helps reduce pest infestations and in turn the need for pyrethroid pesticide use. For example, ensuring that the design holds plants and mulch several inches away from the foundation of a building may assist the reduction of ant populations immediately adjacent to the building (UC Davis, 2007). A reduction in storm water runoff may also reduce the amount of pyrethroids that enter receiving waters. Facility designs can incorporate aspects of LID, as discussed below. New development and redevelopment may incorporate designs that aid in the exclusion of pests and the reduction of urban runoff, which may contribute to a reduction of pollutant loads, including pyrethroids.

Pest Monitoring

Status: Currently in not use by the Permittees, program under consideration.

Monitoring structures and adjacent areas may help prevent pest infestations and quickly identify potential problems. Traps, visual inspections, and staff interviews assist in the identification of areas and conditions that may foster pest activity (NIH, 1999). Monitoring for ants, for example, may consist of simple inspections of facilities such as looking under sinks and along pipes and electrical wires (UC Davis, 2007). The City of Santa Monica, as a part of their SIPM, provided training to all general staff, purchasing, carpenters and custodial staff. Specific presentations were given to groups, such as the custodial staff, who learned about products used in control of ant and cockroach populations and general sanitation. The staff is trained in the identification of potential pest infestations and habitat conditions that may foster pest activity (Raphael, 1997). Early identification of pest infestations can increase the effectiveness of specific treatments and reduce the overall need for pesticide use.

Sanitation and Facility Maintenance

Status: Currently not being implemented by the Permittees, program under consideration.

Proper sanitation includes reducing clutter and pest habitat and incorporating proper facility and waste management practices. Records of maintenance and housekeeping conditions may help track pest problems and assist in the determination of whether corrective action is needed or has been taken in a timely manner (NIH, 1999). Sanitation and facility maintenance involves the housekeeping staff, the building maintenance staff, and the landscaping staff.

Improper storage of waste may affect urban runoff, and it may create a hospitable environment for pests, particularly ants. Initial, low-cost steps that municipalities may take to improve waste handling are: controlling litter, keeping waste collection areas clean, and insuring proper disposal of pyrethroid pesticide products, if used, and educating employees and the public. Simple solutions such as rinsing out soda bottles and emptying trash daily prove effective to reduce insect infestations, particularly ants (UC Davis, 2007). An important component of an SIPM monitoring program is regular inspections of solid waste containers for structural damage or leaks (CASQA, 2004).

Educating custodial staff, such as was done in the City of Santa Monica, can reduce the amount of improperly disposed pesticides (Raphael, 1997). Designating staff members to perform a daily checklist of areas around the structure to ensure cleanliness and proper storage of waste can assist the efforts to reduce potential pest infestations and leakage of hazardous waste (CASQA, 2004).

Building maintenance staff also benefit from education and acceptance of responsibility for pest management. Maintenance crews can contribute to an SIPM strategy by securing the structure, such as caulking holes and cracks, assisting in the removal of clutter, and installing

door sweeps (State of California, 2008). Caulking holes in structures can prove effective in keeping ants out of facilities (UC Davis, 2007). Upkeep on building maintenance helps reduce potential pest habitat, and thus may reduce the need for application of pyrethroid pesticides.

Reduction of pest habitat around structures may reduce pest populations in and around structures. Marin County, as part of its integrated pest management program, has reduced rat habitat around the local Civic Center and in turn has seen suppression of the rat population (Carlsen, 2008). Programs similarly tailored to ants may result in a positive effect of pest reduction within the SMR. For example, banding tree trunks with tanglefoot or similar sticky substances can keep ants away from trees (UC Davis, 2007). Education and training may be provided to Permittee landscaping crews to assist in proper vegetation removal and, when necessary, pesticide use. Landscaping crews may be informed that pyrethroid pesticides or any less toxic pesticides are to be used only when a pest problem arises to an intolerable level, that they are not administered when a wet weather event is expected and only when low wind speeds are present (CASQA, 2004). Education of landscaping crews to remove pest habitat may reduce the need for pyrethroid use thus reducing the potential risk of pyrethroids entering storm water runoff.

Also, utilizing low water using vegetation and alternative landscaping techniques such as xeriscaping or naturescaping are efforts that landscape crews can take to reduce pyrethroids in urban runoff. Landscaping crews may also help preserve the water efficiency of the landscape through properly timed fertilizing, weeding, pruning, and pest control. For example, proper collection and disposal of yard clippings can prevent loose vegetation that has possibly been treated with pyrethroid pesticides from entering waterways or storm water drainage systems such as MS4s (CASQA, 2004). Reduction in pest habitat and proper landscaping maintenance may help reduce pest problems, and thus the need for pyrethroid pesticides.

4.1.3 Public Outreach and Education

Status: Currently being implemented by the Permittees.

Public Outreach and Education programs inform the public about storm water issues, proper use and disposal of publically available chemicals, and alternatives to pyrethroid pesticides. Reaching out to the public and providing information about the dangers of pyrethroids pesticides encourages citizens to make educated decisions about pesticide use. It also may accelerate state and federal regulatory changes regarding pyrethroid use through public promotion of such changes. According to the EPA, public education and awareness can be a "key component" in any BMP program for storm water management (EPA, 2008).

The District has enacted a public outreach program to help reduce the potential for pyrethroid pesticides to contaminate receiving waters. This program has initiated: distribution of educational materials to hardware store employees, active participation and distribution of outreach for HHW/ABOP facilities to provide for free venues to dispose of excess pesticides, and distribution of EPA and CalEPA materials to the public. The District also promotes the use of less toxic pesticides, provides education on storm water issues in public schools, and has enacted a multimedia campaign to control urban sources of pyrethroid pesticides (RCFCWCD, 2005).

<u>Education and Outreach to Businesses</u>

Status: Currently being implemented by the Permittees.

Distribution of information regarding pesticides to businesses, particularly hardware stores, is crucial for reducing pyrethroid use and misuse at its source. Education on pyrethroid runoff to local hardware stores may assist local hardware store employees to educate their customers on alternative methods of pest control. An Orange County survey from 2001 found that 55% of pest control products were purchased at hardware stores (Wilen, 2001). In

2006, Riverside County had 177,562 pounds of reported non-agricultural usage of pyrethroid pesticides (RCFCWCD, 2008). Reduction in usage may lead to a reduction of pyrethroids in urban storm water runoff. Educating hardware store employees about urban water quality impacts of pyrethroid pesticides may help reduce the usage and thus the toxicity of runoff in the Santa Margarita Watershed resulting from pyrethroid use, as employees have the ability to recommend alternative methods of pest management to their customers.

Education of nursery employees about pyrethroid management and IPM techniques may also yield significant source control benefits. In general, nursery employees tend to be more knowledgeable about pesticides than employees at hardware stores (Wilen, 2001). Nurseries that use and sell pyrethroids offer the highest return on outreach resources, while those nurseries that have chosen alternate pest management methods serve as examples of IPM in practice. In a recent Riverside County survey, one nursery stated that they do not use pesticides and if their nursery does experience a pest infestation, it is treated naturally (RCFCWCD, 2008). Such nurseries are likely to encourage their clients and customers to use the same methods. Education and outreach can lead to cooperation and sharing of successful and unsuccessful methods of IPM and ultimately reduce pyrethroid pesticide use and toxicity of storm water runoff.

Businesses not in the industry of pesticide sales may also benefit from outreach. The District directs outreach efforts to all businesses; those in the business of selling or using pesticides, and those that are not. The District has coordinated with the County's Business License Department to include an educational insert of the "Only Rain Down the Storm Drain" program to new business license applicants and annual renewal reminders (CRWQCBSD, 2008). Informing companies on proper disposal of hazardous materials such as pesticides is crucial to prevent pyrethroid containers from being improperly disposed of, leaking, and then contributing to storm water pollution.

Several Southern California cities conduct general business outreach as well. Cities such as Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water

pollution relating to landscaping and gardening practices to general businesses (DCWMAC, 2007). Such information informs businesses of alternate methods of pest control beyond pesticide use and imparts knowledge about storm water quality issues. Thus, dissemination of educational materials to local businesses is intended to help reduce pyrethroid runoff by ensuring proper disposal of pesticides and encouraging alternate methods of pest control.

Educational and Outreach to the General Public

Status: Currently being implemented by the Permittees.

The District distributes educational materials within the Santa Margarita Region such as EPA sponsored pamphlets in order to promote reduced use of pyrethroid pesticides and educate the public about alternate practices of pest management. The public purchases retail pesticides and uses them, presumably, according to the manufacturer's instructions and in compliance with regulations listed on the packaging, including proper disposal of empty containers in the municipal waste stream. However, even when used properly, retail pesticides have the potential to contaminate urban runoff, and homeowners may be unaware of the downstream consequences of pesticide use. Depending on the landscaping practices in a neighborhood, promoting alternative pest management strategies and educating the public on storm water quality and pesticide use may be the most beneficial way to reduce the source of pyrethroids in urban runoff (Wilen, 2005).

The District distributes educational materials within other public outreach programs and maintains pest management information on the internet. The District also distributes brochures to educate the public on lawn and garden maintenance, fertilization, and pesticide and household chemical use (RCFCWCD, 2005). These educational materials provide public education on alternative pest control methods, limiting individual use of pyrethroids, and proper disposal of pesticide containers.

Many municipalities perform storm water outreach at festivals and public events by participating in the events and by distributing brochures. The Cities of Lawndale and Torrance plan and attend public festivals and rent booth space to educate the public about storm water quality and the use of pyrethroids (DCWMAC, 2007). Cities including Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water pollution relating to household activities and landscaping and gardening practices to the general public (DCWMAC, 2007). The District participates in events such as the Children's Groundwater Festival, the Southern California Fair, the Community Water Festival, and the Santa Margarita Watershed Clean Up (RCFCWCD, 2005). The Permittees, as well as other municipalities within California, participate in public events and distribute informative materials as a portion of their current public outreach programs.

Education on proper disposal of pesticides

Status: Currently being implemented by the Permittees.

Improper disposal of pesticides is a potential contributor to storm water contamination. Empty containers be disposed of in the municipal waste stream are not likely to contribute to storm water pollution, however, unused pesticides may enter the MS4 by leaking in transit. In Orange County in 2001, 54.5% of people surveyed claimed to have disposed of unwanted pesticides in the municipal waste stream, and 78.6% did not know the location of a household waste disposal site (Wilen, 2001). The District has created a partnership with Riverside County Waste Management to provide educational programs and materials on proper disposal of unwanted waste, including pesticide containers (RCFCWCD, 2005).

Multimedia Outreach

Status: Currently being implemented by the Permittees.

The EPA suggests using multiple media sources to promote and educate on storm water impacts, particularly through public service messages (EPA, 2007). Mass media has proven to be a key source of pollution prevention information for the general public (LADPW, 2002). The District currently participates in a multimedia advertising campaign including: maintaining a website that provides information, distributing mailing inserts regarding water quality issues through various county entities, and billboard advertising campaigns. Many other municipalities, such as the Cities of Palo Alto and Lawndale, also use the world wide web to provide information to the public (City of Palo Alto, 2008) (DCWMAC, 2007).

Public School Programs

Status: Currently being implemented by the Permittees.

A storm water education program for public schools is a concept supported by the EPA (EPA, 2007). The County of Los Angeles has incorporated public school educational programs into its outreach program (LADPW, 2002). The District focuses storm water education efforts on elementary school students (RCFCWCD, 2005). For example, sixth-grade students at Warm Springs Middle School were given an interactive presentation regarding storm water pollution with an enviroscape model that excited and engaged the students; a presentation that has been given over 150 times during the 2003-2004 school year (Jamescourie, 2004). Educational programs in public schools are intended to produce long-term benefits to storm water runoff quality.

Education on Lower Risk Alternative Pesticides

Status: Currently being implemented by the Permittees.

Part of Public outreach includes suggesting less toxic alternatives to pyrethroid pesticides, such as those listed on the Our Water Our World website (www.ourwaterourworld.org). Lower risk pesticides have reduced impacts on human health, lessened toxicity to non-target organisms, decreased potential for water contamination, and lower pest resistance potential (Matteson et al., 2007). The District distributes materials associated with the "Our Water Our World" organization (RCFCWCD, 2008).

However, some of the lower risk pesticides are toxic to beneficial arthropods and still have the potential to pollute surface and ground water (Matteson et al., 2007). Pyrethroids were developed as a less toxic alternative from organophosphate pesticides (Quarles, 2002). In the Santa Margarita Watershed, there was a decrease in water toxicity to *Ceriodaphnia* and an increase in toxicity to *Hyalella* as organophosphate pesticides such as chlorpyrifos and diazinon and were replaced by pyrethroids (RCFCWCD, 2008). The effects on storm water runoff of lower risk pesticides must be carefully evaluated before they are promoted as effective solutions to urban storm water runoff pollution.

4.1.4 Low Impact Development (LID)

Status: Currently being implemented by the Permittees.

LID involves environmentally-friendly building and development designs that mitigate impacts to land and water. LID functions by managing storm water at its source, incorporating a variety of runoff control techniques, using natural features as design features, and protecting natural resources (NAHB, 2008). Municipalities that promote LID have the potential to reduce municipal infrastructure and maintenance costs while balancing growth needs with environmental protection (NAHB, 2008). LID practices include "small scale,

decentralized treatment practices" that include conservation of open space, a reduction of impervious surfaces, and the incorporation of water controls (NAHB, 2008). Reduction of urban runoff volumes may reduce the loadings of pyrethroids to receiving waters in urban areas.

In 2007, EPA implemented a retrofit of the agency headquarters in Washington, D.C., incorporating LID designs to assist with storm water retention (EPA, 2007). Retention of storm water on the land helps prevent pollutants from entering streams and rivers (EPA, 2007). One of the main goals of the EPA LID retrofit was to demonstrate several LID techniques and encourage government agencies and developers to use them (EPA, 2007). LID may be used in conjunction with IPM programs, which would reduce the amount of pesticides used and minimize the urban storm water runoff of pyrethroids. The County of San Diego's most recent MS4 permit requires implementation of LID techniques (County of San Diego, 2007); this appears likely to continue as a trend with other permits in the region as they are renewed. The incorporation of LID principles into development regulations in the Santa Margarita watershed provides a potential solution to runoff of pyrethroids into receiving waters.

4.2 Treatment Control BMPs

Treatment Control BMPs are typically structural devices engineered with the intent to remove pollutants from storm water. Treatment BMPs require construction and long term maintenance, but can be extremely effective (CASQA, 2003). Although treatment BMP's have not been thoroughly investigated specifically for reduction of pyrethroids, some methods may be useful. Pyrethroids bind tightly to soil particles so there is a high probability that pyrethroids would be removed with suspended solids when they pass through treatment BMPs. In addition, pyrethroids degrade over time; permethrin, for example, has a half life in soil of about 30 days and about 10 days on certain plant life. Because pyrethroids have low mobility in soil, infiltration-based treatment BMPs have a low probability of contributing to groundwater contamination (NPTN, 1997).

From the list of available treatment BMP's identified in Table 3-1, the types of treatment BMPs feasible for pyrethroid treatment in the Santa Margarita Watershed, considering the climate, local vegetation, and soil types present are: pervious pavement, media filters, extended detention basins, infiltration basins, and infiltration trenches.

These BMPs and their potential to remove pyrethroids from storm water runoff are described below.

4.2.1 Pervious Pavement

Status: Currently being implemented by Permittees under LID program.

Pervious or porous pavement is "a system comprising a load-bearing, durable surface together with an underlying layered structure that temporarily stores water prior to infiltration or drainage to a controlled outlet" (CASQA, 2003). Pervious surfaces include grass, gravel, and porous concrete and asphalt (CASQA, 2003). The multi layer system assists in preventing pyrethroid pollution by providing a stable structure for pyrethroids to bind to and degrade, thus helping to prevent their transport in to receiving waters. Silts that are deposited within the pavement may need infrequent controlled waste disposal (CASQA, 2003).

The advantage of porous pavement is that urban runoff is reduced while treatment is provided and it is an effective drainage solution in confined urban areas. However, porous pavement is not a viable option on high traffic or high speed roads due to safety issues. There is a small chance that it may contaminate groundwater. It is fairly easy to replace, should there be a clog or damaged area, as small areas can individually be paved (CASQA, 2003). The use of pervious pavement appears to be a growing trend.

4.2.2 Media Filter

Status: Currently being implemented by Permittees via sand filters.

Storm water media filters are usually two-chambered including a pretreatment settling basin and a filter bed filled with sand or other absorptive filtering media. As storm water flows into the first chamber, large particles settle out, and then finer particles and other pollutants are removed as storm water flows through the filtering media in the second chamber. Media filters are highly effective at removing sediment from storm water flows (CASQA, 2003). They are appropriate in low flow areas, particularly with sandy soil. Washington D.C. and Austin, TX have both successfully implemented media filters to treat storm water (VCSQMP, 2002). They "are well suited to Southern California because they do not require vegetation and require less space than other treatment control measures with similar removal efficiencies when a partial treatment sedimentation basin is used" (VCSQMP, 2002).

However, media filters clog easily when exposed to high sediment loads and may decrease in effectiveness after being in use for a few years (CASQA, 2003). A media filter is not appropriate for areas with erosive soil upstream from the treatment filter (VCSQMP, 2002). The lack of abundant native vegetation in the Santa Margarita watershed contributes to a high potential for erosion, so media filters may not be effective in the long term due to clogging. When clogging does occur, media filters may become a nuisance due to mosquito or midge breeding in pooled waters (CASQA, 2003).

4.2.3 Extended Detention Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An extended detention basin (EDB) is a permanent basin "formed by excavation and/or construction of embankments to temporarily detain the Stormwater Quality Design Volume

(SQDV) of storm water runoff to allow sedimentation of particulates to occur before the runoff is discharged"(VCSQMP, 2002). EDBs are constructed with an outlet at the bottom that allows for a slow, time-controlled release. The ultimate goal of EDBs is to level off peak storm water runoff rates (VCSQMP, 2002). Santa Clara Valley and the City of Palo Alto have noted that their detention basins have helped with the reduction of pollutants (EOA, 2004) (City of Palo Alto, 2008). Pyrethroids could be removed in the basin through settling of particulates.

Extended detention basins can serve multiple purposes as they provide for significant trash removal as well (CASQA, 2003). Maintenance is needed to ensure that the pond fully drains after large wet weather events, to avoid creation of standing pools causing mosquito or other vector habitats (CASQA, 2003). Extended detention basins are most effective when used in conjunction with other control measures, and are only moderately successful at removal of sediment. EDBs require relatively large amounts of land and therefore may not be feasible in urban areas of the Santa Margarita watershed (VCSQMP, 2002). There are no available examples of test results from municipalities using an extended detention basin for reduction of pyrethroid pesticides.

4.2.4 Infiltration Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration basin is a shallow impoundment that is designed to infiltrate storm water and utilize the natural ability of soil to remove pollutants in storm water runoff (CASQA, 2003). Infiltration basins store runoff until it eventually enters the soil and infiltrates into the water table (CASQA, 2003). The soil present in the Santa Margarita Region is extremely pervious and may work well with an infiltration basin treatment structure.

Since pyrethroids adsorb onto soil, pyrethroids are likely to be removed from the storm water into the soil. However, there is a slight possibility that they may be resuspended into the

groundwater. Monitoring of pilot sites would be required to determine if there is transport of pyrethroids to the water table.

As with detention basins, maintenance is needed to ensure that the basin fully drains after large wet weather events to avoid creation of standing pools causing mosquito or other vector habitats. Infiltration basins may fail if the storm water volume is greater than the design volume (VCSQMP, 2002). Since infiltration basins require a large amount of open space, installation in urban areas is problematic. There are no available examples of test results from municipalities using infiltration basins for reduction of pyrethroid pesticides.

4.2.5 Infiltration Trench

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration trench is a long and narrow ditch that collects storm water runoff by storing it in the voids in a rock bed and allowing it to infiltrate to the soil matrix (CASQA, 2003). Infiltration trenches are extremely effective at removing fine sediment particles and associated pollutants (CASQA, 2003). Naturally pervious soils are required (VCSQMP, 2002). The Santa Margarita watershed has naturally pervious soils, which would allow for the removal of pyrethroids from the water and into the sandy soil.

Infiltration trenches are typically used in conjunction with grass lined channels or grass filter areas located upstream for maximum removal of sediment and larger particles (VCSQMP, 2002). Due to the arid environment in the Santa Margarita Region, grass lined channels, or even vegetated strips, would require irrigation to maintain the vegetation. If the infiltration trench clogs, it can become a source for mosquito breeding. There are no available examples of test results from municipalities using infiltration trenches for reduction of pyrethroid pesticides.

4.3 BMP Evaluation

A summary of the relative advantages, disadvantages and costs of the various BMPs identified in Sections 4.1 and 4.2 above is presented in Table 6.1 below. The table includes advantages, disadvantages, and the relative cost of implementing the BMPs.

Table 6.1
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Source Control			
Regulatory Change	Reduces the availability of pyrethroids on the market	May take years to achieve full effect	$
Integrated Pest Management	Engages businesses and the public in environmentally sound gardening practices	Need to ensure that employees are following protocols	$
	Has been implemented in various locations throughout CA and the US	Could have some resistance from employees who are use to standard practices	
	SIPM can be put in place directly by the Permittees	Some may find the organic methods of gardening to be too time consuming	
	SIPM can be incorporated directly into current maintenance activities		
	Includes LID aspects		
Public Outreach and Education	EPA states that Public Outreach is key for any BMP program	Cannot control the direct actions of public but only educate	$
	Copermittees have already implemented a public outreach program	Hard to measure the direct impact of pollutant reduction	
	Employees of business have direct impact on the buying choices of the general public		
	Programs have been implemented by many municipalities		

Table 6.1 (continued)
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Treatment Control			
Porous Pavement	Reduces runoff volume while reducing pollutant load as well	Requires ongoing minimal maintenance	$ to $$ depending on size
	Can be easily replaced depending on the size and location of design	No known measured reduction of pyrethroids.	
Media Filter	Do not require vegetation	No known measured reduction of pyrethroids.	$$$
	Highly effective in removal of sediments	Clogging is an issue because of the erosion potential in the watershed.	
	Requires less space than other treatment controls for sediment removal		
Extended Detention Basin	Known for significant trash	Large footprint Moderately successful at removing sediment	$$$
	Standard BMP with many years of maintenance and operational information available	Create an area with vector breeding potential	
		No known measured reduction of pyrethroids.	
Infiltration Basin and Trench	Uses natural ability of soil to remove pollutants.	Unknown if pyrethroids would be transported to the groundwater table.	$ to $$$
	Local soils would allow infiltration	Would require a pilot study to determine transport.	
		No known measured reduction of pyrethroids.	
		Clogging of outlet structure	
		Accumulation of metals in soil	

*Relative Cost: $ = $0 to $50,000, $$ = $50,001 to $100,000, $$$>100,000

5.0 Pending Legislation

There is no relevant pending state legislation relating to pyrethroid pesticides from the California Department of Pesticide Regulation or, in general, the State of California as of December, 2008 (State of California, 2008) (CDPR, 2008). In August 2006, the DPR put rules in place to control insecticide sprays during the dormant season. During winter, pesticides are applied to dormant tree and vine crops to kill overwintering pests and diseases. The new rules restrict the use of most dormant insecticides when residuals can run off into water (DPR 2007-08 Progress Report). However, there are no additional updates relating to pending pyrethroid legislation at this time.

There is no relevant pending federal legislation relating to pyrethroid pesticides from the United States Congress as of December, 2008 (Library of Congress, 2008). Although the EPA is working on proposed mitigation labeling for non-agricultural pyrethroids, there is no indication as to when this legislation may be enacted (TDC, 2007).

6.0 Proposed Course of Action

The Permittees intend to use a phased approach to address the identified sources of pyrethroid pesticides causing toxicity in surface waters of the SMR watershed. As described in Section 4, various source control BMPs and treatment control BMPs are available to address these sources. However, the use of pyrethroid pesticides can not be directly regulated by local governments. The most effective control strategy involves effective labeling and use restrictions via state or federal regulatory action, to prevent water quality impacts from legal pesticide uses. The proposed course of action involves an adaptive management approach with the following broad elements:

- Pursue state and federal regulatory change through CASQA
- Implement a set of source controls targeted specifically at urban pesticide use,
- Through the annual reporting process, monitor the implementation of those controls, assess effectiveness, and identify sources or areas where additional effort is needed,
- Evaluate whether additional controls, including treatment controls, may be needed to further reduce pyrethroid pollution,
- Implement additional controls as needed,
- Continue to monitor implementation, as well as conditions within the target receiving waters, assess effectiveness, and re-evaluate control program

The Permittees will continue to support CASQA and/or other agencies pursuing regulatory change in labeling or use limitations for pyrethroid pesticides. This support will include participation in the CASQA Pesticides Subcommittee and the Urban Pesticide Committee, and supporting the implementation of the Urban Pesticide Pollution Prevention (UP3) Project. Permittee staff will continue to provide staff time and resources necessary for the CASQA Pesticides Subcommittee to complete its negotiations with the California Department of Pesticide Regulation and USEPA regarding labeling and use limitations for pyrethroids.

Source control is generally a more cost-effective approach to pollution abatement than treatment control, as source controls do not involve the costly capital investments of treatment controls. As discussed previously, CASQA, EPA, and other agencies and experts

recommend a source control program as an essential component of a successful pollution reduction strategy.

The basis of source control involves preventing the entrance of the subject pollutant into the discharge stream. For pyrethroid pesticides, this means preventing the pesticide from entering the municipal storm drain system through urban runoff. This can take place by intervention at the various steps in the pest control process:

- Point of sale: reducing the purchase of pyrethroid products through education of PCOs and the public in consequences of pesticide use and alternative means of pest control, including integrated pest management (IPM)
- Application: reducing use of pyrethroids on site through education of PCOs and the public into the importance of proper application methods and the potential consequences of pesticide use, as well as pest control alternatives (IPM techniques)
- Off-site Transport: reducing movement of pyrethroids into municipal storm drain system via use of Green Gardener approaches, IPM, and LID building techniques to reduce irrigation water use, retain storm water runoff on-site, and provide on-site mitigation for runoff pollutants (via grassy swales, infiltration, etc.)

A five-year pyrethroid pollutant reduction program is proposed by the Permittees.

Year 1

- Continue to support state and federal efforts to improve pyrethroid pesticide regulation
- Continue to publicize/promote the services of IPM-certified PCOs, to encourage businesses and homeowners to choose their services
- Continue to implement local agency contracting rules to require contracting of IPM-certified PCOs for municipal pest control (through EcoWise Certified IPM Contracting Tool Kit, e.g.)
- Continue point-of-sale education effort providing instruction in pesticide alternatives and proper use/application (using materials available through Our Water Our World, UP3 Project, CASQA members, e.g.)
- Continue efforts to develop and implement LID guidance for planning and development

Year 2

- Coordinate with the University of California (UC) Extension Master Gardener Program to extend its services to the Temecula/Murrieta area to further promote and support the use of IPM by local residents
- Re-evaluate, enhance as needed, and continue measures implemented in Year 1

Year 3

- Conduct programmatic assessment as part of third-year annual report, evaluate successes and areas where additional efforts are needed and adjust program accordingly
- Re-evaluate, enhance as needed, and continue measures implemented in Years 1 and 2

Year 4

- Evaluate effectiveness of BMPs using water quality monitoring data as part of fourth year annual report
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Year 5

- Conduct programmatic assessment, evaluate successes and areas where additional efforts are needed as part of ROWD process
- Identify additional program elements, including source and/or treatment controls, as needed to effect required pollutant reductions; revise program accordingly
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Many of the source control materials and programs needed are readily available through existing programs such as EcoWise Certified, Green Gardener, Our Water Our World, the UP3 Project, and the Western IPM Center. The following websites provide further information on these and other programs:

Urban Pesticide Pollution Prevention (UP3) Project: www.up3project.org
Green Gardener Program: www.green-gardener.org/about
Western Integrated Pest Management Center: www.wripmc.org
EcoWise Certified Integrated Pest Management: www.ecowisecertified.com
Our Water Our World: www.ourwaterourworld.org
Green California: www.green.ca.gov/EPP/building/structipm.htm

City of San Francisco: http://www.sfenvironment.org/our_programs/topics.html?ti=1
DPR: http://www.cdpr.ca.gov/docs/registration/reevaluation/chemicals/pyrethroids.htm

As a practical measure, it will be necessary to evaluate individual Permittee capabilities and resources, and develop a specific work plan for implementation of the pyrethroid pollutant reduction program.

It is also essential to develop and implement the pyrethroid pollutant reduction program in coordination with other regulatory requirements, especially other pollutant reduction programs mandated under the storm water NPDES Permit and/or load allocations required by TMDLs within the SMR watershed.

Construction Component Effectiveness Assessments

Goals

I Ensure that all Construction Sites have applicable permits from the Permittee.

II Increase the percentage of Construction Sites that are in compliance with Permittee building and grading permits

III Place additional focus on Construction Sites during Wet Season

IV Ensure that construction inspection staff are properly trained and informed of the issues related to stormwater quality

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of active construction sites that are discovered without building/grading permits	2	Permit Term	Decreasing Trend or minimal %	Y
II	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or minimal %	N
II, III	% of active High/Medium priority sites subjected to enforcement beyond verbal/written warnings **during wet season**	3	Permit Term	Decreasing Trend or minimal %	N
II	% of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower levels	N
III	% of active permitted construction sites provided wet weather reminders	2	Annually	N/A	Y
IV	% of construction inspectors receiving annual training	1	Annually	N/A	Y

Development Planning Component Effectiveness Assessments

Goals

I Develop Design Guidance for Low Impact Development (LID) BMPs

III Encourage the use of LID-Based Treatment Control BMPs

IV Ensure that appropriate planning staff are trained in WQMP requirements

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Status of SMC LID BMP Design Manual	1	Within Permit Term	Completion	Y
II	% of WQMP projects that met the exemption requirements for inspection and maintenance reporting by implementing only LID-Based Treatment Control BMPs	3	Permit Term	Increasing Trend	N
III	% of applicable planning staff that attended WQMP training.	1	Annually	N/A	Y

Permittee Facilities and Activities Program Effectiveness Assessments

Goals

I Ensure that Permittee Facilities have adequate BMPs implemented and that they are properly maintained
II Ensure that Channels and Inlets are kept free from trash and debris
III Encourage the use of Integrated Pest Management (IPM) on Permittee Facilities
IV Maintain an updated GIS map of the MS4 system
V Ensure the Permittee facility operators and maintenance workers are properly trained in issues related to water quality.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Effectiveness Assessment Timeframe	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of facilities with appropriate BMPs identified	1	Annually	N/A	Y
I	% of Facilities provided reminders of appropriate BMPs	2	Annually	N/A	Y
I	% of annual facility inspections finding deficiencies in BMP implementation that require follow-up actions	3	Permit Term	Decreasing Trend or minimal %	Y
I	Average % of deficiencies identified in the previous year's inspections that were addressed.	3	Permit Term	Increasing Trend or high %	Y
II	Estimated Tons of Waste removed from Streets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Inlets	4	Annually	N/A	N
II	Estimated Tons of Waste removed from Open Channels	5	Annually	N/A	N
III	% of Pest Control Contracts that include language promoting or requiring IPM	1	Annually	N/A	N
IV	% of new Permittee-maintained MS4 facilities added to GIS Map	1	Annually	N/A	Y
V	% of Permittee Facility and MS4 operators and maintenance staff that attended training.	1	Annually	N/A	Y

Industrial-Commercial Facilities Program Effectiveness Assessments

Goals

I Maintain an updated and prioritized list of Industrial and Commercial Facilities

II Ensure the each Industrial and Commercial Facility has implemented BMPs that are appropriate for the activities and features at that facility

III Ensure that implemented BMPs are properly maintained to ensure their effective operation

IV Implement enforcement measures as necessary to reduce the occurance and recurrance of violations

V Ensure that inspectors are appropriately trained to identify problem areas and BMPs maintenance issues.

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	% of new facilities added to database and prioritized	1	Annually	N/A	Y
II	% of inspected facilities with adequate Minimum BMPs in place at time of inspection	3	Permit Term	Increasing Trend or High %	N
III	% of inspected WQMP facilities subject to Post Construction Treatment Control BMP Inspection, with adequately maintained Treatment Control BMP	3	Permit Term	Increasing Trend or High %	N
IV	% of inspected High/Medium priority facilities that were subjected to enforcement beyond verbal/written warnings	3	Permit Term	Decreasing Trend or Low %	N
IV	% of enforced sites that are repeat offenders	3	Permit Term	Decreasing Trend or Low %	N
IV	% / Number of enforcement actions that reached each level of enforcement	3	Permit Term	Trend toward lower enforcement	N
V	Percent of applicable inspectors that attended training	1	Annually	N/A	Y

Residential Program Effectiveness Assessments

Goals

I Raise awareness among residents of activities that may be contributing to stormwater pollution
II Increase public awareness of BMPs for residential activities
III Increase public participation in hazardous material collection events
IV Increase public involvement in keeping the watershed clean
V Encourage the use of Alternative Pest Control Methods

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Number of outreach events to Schools	1	Annually	N/A	N
II	Number and type of educational materials distributed that target residential activities	1	Annually	N/A	Y
I, II	Results of Public Ed Surveys	2	Permit Term	Increasing or high level of Knowledge	Y
III	Gallons of Used Oil Collected through Used Oil Block Cycle Grant	4	Annually	N/A	Y
III	Total Pounds collected at HHW/ABOP events	4	Annually	N/A	Y
III	Total Number of participants at HHW/ABOP events	3	Annually	Increasing Trend	Y
IV	Pounds of trash removed through Watershed Cleanup Events	4	Annually (as events occur)	NA	N
V	Number of Home Improvement stores provided outreach and customer educational information for pesticide use	2	Annually	Increasing Trend	Y

Detection and Elimination of Illicit Discharges and Connections Effectiveness Assessments

I Revise and enhance IC/ID Monitoring Program
II Reduce the occurance of Illicit Connections and Discharges
III Increase public reporting of improper disposal into MS4
IV Ensure the IC/ID reports are reviewed and responded to in a timely manner
V Ensure the confirmed IC/ID events are eliminated as quickly as possible
VI Ensure the IC/ID response staff are trained to identify potential sources of Illicit Discharges and recommend BMPs to prevent such discharges

Goal Addressed	Measureable Metrics Collected / Compiled Annually	Highest Potential CASQA Effectiveness Level	Timeframe to Determine Effectiveness	Outcome required to support Effectiveness Level	Can a Reasonable Municipal Action Level be developed?
I	Revise IC/ID Monitoring Program to screen random MS4 outfalls	1	N/A	N/A	N
II	% of IC/ID Monitoring events with sampleable flow	1	Permit Term	N/A	N
II	% of IC/ID Monitoring events that exceeded criteria and required follow-up	5	Permit Term	Decreasing Trend or low %	N
III	Number of IC/ID reports received	2	Annually	Increasing Trend	N
IV	% of IC/ID reports responded to within 1 business day of receipt	1	Annually	N/A	Y
V	% of confirmed and source-identified IC/ID incidents that required enforcement beyond verbal or written wardnings to eliminate	3	Permit Term	Decreasing Trend or minimal %	N
V	% of each type / level of enforcement	3	Permit Term	Trend toward lower levels	N
VI	% of IC/ID response staff receiving training	1	Annually	N/A	Y

Riverside County Flood Control and Water Conservation District

Riverside County – Santa Margarita Region Pyrethroid Source Identification Toxicity Reduction Evaluation

Final Phase II Report
January 2009

MACTEC
9177 Sky Park Court
San Diego, California 92123
858-278-3600 FAX 858-278-5300

Executive Summary

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the SMR Permittees to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. This report documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff.

Data gathered under this TRE was compared to data from neighboring counties. Based on available data, problems with pyrethroid-induced toxicity in urban runoff are common among municipalities in Southern California, and methods for addressing the problems are comparable.

A literature review was conducted to determine appropriate source control and treatment control BMPs for reducing the concentration and load of pyrethroids in storm water runoff. The literature source, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are summarized.

Based on the results of the literature review, BMPs are evaluated for applicability and potential effectiveness in the SMR watershed. Many of the most effective and appropriate BMPs are currently being implemented by the Permittees.

A search for pending legislation did not identify any pending legislation pertaining to pyrethroid pesticides.

The most effective strategy to prevent water quality impacts from legal pesticide uses was identified as state or federal regulatory change involving effective labeling and use restrictions. The Permittees propose a five year plan to continue, review, and enhance current activities to reduce pyrethroid-induced toxicity.

1.0 Introduction

This document is the Phase II report for the Santa Margarita Region (SMR) Pyrethroid Source Identification Toxicity Reduction Evaluation (TRE) conducted by the County of Riverside, the City of Murrieta, the City of Temecula, and the Riverside County Flood Control and Water Conservation District (District, collectively Permittees). The Phase I Status Report (RCFCWCD, 2008) contains the work plan for Phase II and an outline of the topics in this report, as well as additional background information. This Phase II report is divided into six sections.

Section 1 describes the purpose of the TRE and provides an overview of the approach taken by the Permittees. Section 1 also contains a discussion of the regulatory framework of the TRE, a brief project background, a description of the Santa Margarita watershed, pyrethroid pesticide background and usage, and management questions and objectives.

Section 2 describes available pyrethroid and toxicity data from other counties in Southern California, and compares the data to data from Riverside County. The data and comparisons are included to demonstrate that the problems and solutions relating to pyrethroid pesticides facing the Permittees are similar to those of neighboring counties in the region.

Section 3 presents the results of the literature review conducted for this study of pesticide reduction Best Management Practices (BMPs).

Section 4 discusses potential pesticide reduction BMPs, the status of the Permittees implementation of the BMPs, and, when applicable, examples of the implementation of the BMPs in other municipalities. Section 4 also contains a table summarizing the potential BMPs, their advantages and disadvantages, and relative cost.

Section 5 discusses pending legislation relating to pyrethroid pesticides.

Section 6 presents the five-year course of action the Permittees propose to follow to reduce pyrethroid-induced toxicity in the SMR.

1.1 Purpose and Overview of Approach

The purpose of the TRE is to identify the source(s) of toxicity in the SMR and develop a plan to reduce the toxicity. The results of Phase I of the TRE are contained in the TRE Status Report (Riverside, 2008). This Phase II report for the TRE study documents the Permittees' ongoing and proposed efforts to identify and reduce sources of pyrethroid pesticide toxicity associated with urban runoff. The goal of Phase II is to establish a course of action and develop modifications to the Permittee's Storm Water Management Plans (SWMPs) to more effectively control the sources of toxicity that were identified in Phase I of the TRE. The Permittees will incorporate the course of action and SWMP modifications into the Report of Waste Discharge (ROWD) that will be submitted to the RWQCB in January 2009.

Phase II activities included:

- A comparison of toxicity and chemistry results to data from adjacent Phase I municipal separate storm sewer system (MS4) permit areas, including San Diego County and Orange County.
- A literature review of current studies and a survey of pesticide reduction BMPs.
- A search for pending legislation regarding pyrethroid pesticides.
- Development of a proposed course of action for the Permittees.

A literature review was conducted of BMP information available from the Urban Pesticide Pollution Prevention (UP3) Project and other pesticide management programs and documents. Information on relevant BMPs was compiled and evaluated to identify potential BMPs that are available to mitigate urban sources of pyrethroids. Existing Permittee programs, such as outreach, regulation, and BMP implementation, were then evaluated for improvement opportunities.

The proposed course of action was determined with consideration of the adequacy of data collection (sufficient precipitation and runoff to collect adequate data) and pending

regulatory actions by California Department of Pesticide Regulation (DPR), and the United States Environmental Protection Agency (EPA).

Land uses in Riverside County are comparable to those in neighboring Orange County and San Diego County, and pyrethroid pesticide-induced toxicity has been observed in those counties. The Permittees are committed to identifying and addressing water quality issues with methods consistent with those used by other stakeholders in Southern California. To this end, data gathered under this TRE was compared to data from neighboring counties, and current pesticide reduction programs used by municipalities throughout California were reviewed.

Source control and treatment control BMPs were researched and evaluated for potential effectiveness in reducing pyrethroid pesticide-induced toxicity in the Santa Margarita watershed. Many of the most effective BMPs are currently implemented by the Permittees, and several have been implemented within the previous Permit term (2004-2008). A proposed five-year course of action for the Permittees was developed by combining the results of the research with the existing programs.

1.2 Regulatory Framework

At the federal level, the authority to regulate pesticide manufacture and use is assigned to the United States Environmental Protection Agency (EPA) under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). In California, pesticide use is regulated at the state level by the DPR. In the SMR, the Permittees are required under the Clean Water Act to control discharges of pollutants, including pesticides that produce water toxicity, to and from their MS4 under the National Pollutant Discharge Elimination System (NPDES).

This TRE was performed as required by Monitoring and Reporting Program (MRP) R9-2004-001.

The MRP, Section II. A. I. 4, states:

> *"When results from the chemistry, toxicity, and bioassessment monitoring…indicate urban runoff-induced degradation, Permittees shall evaluate the extent and causes of urban runoff pollution in receiving waters and prioritize management actions to eliminate or reduce sources. Toxicity Identification Evaluations (TIEs) shall be used to determine the cause of the toxicity, and Toxicity Reduction Evaluations (TREs) shall be used to identify sources and implement management actions to reduce pollutants in urban runoff causing toxicity."*

As local regulation of pesticide use is generally preempted by federal and state law, the Permitttees' authorities are limited to addressing illegal disposal of pesticides, promoting public education, setting the example for minimum pesticide use, and coordinating with the federal and state agencies to facilitate regulatory changes at the state and federal level.

1.3 Project Background

Phase I of the TRE consisted of the toxicity monitoring begun in 2004 and the Toxicity Identification Evaluations (TIE) was initiated in the spring of 2007. The Phase I Status Report (RCFCWCD, 2008) provides a full project background. Toxicity monitoring at Temecula Creek and Murrieta Creek was initiated in 2004 using EPA protocol with the following indicator species: *Ceriodaphnia dubia*, *Selenastrum capricornutum*, and *Hyalella azteca*. Toxicity testing during the 2004-2008 reporting period indicated persistent wet weather toxicity to *Hyalella* in both Temecula Creek and Murrieta Creek. Toxicity was not observed to either *Ceriodaphnia* or *Selenastrum* in any of the samples collected over the four annual reporting periods beginning in the fall of 2004.

Toxicity Identification Evaluations (TIEs) were conducted on the wet weather samples collected from Temecula Creek and Murrieta Creek beginning in April 2007, in accordance with Table 2 of the MRP. The TIEs indicated that pyrethroids were the primary source of toxicity and biological degradation in both Murrieta Creek and Temecula Creek.

As a result of the toxicity and TIEs, storm water monitoring for pyrethroids was initiated in 2007-2008. Results indicate that the pyrethroids permethrin and/or bifenthrin are present in wet weather water samples taken at Murrieta Creek and Temecula Creek.

To further assess the impacts of pyrethroid pesticides the Permittees instituted Dry Weather Toxicity Testing and direct measurement of pyrethroid pesticide concentrations in dry weather water samples during the 2007-2008 reporting period. Toxicity and pyrethroid pesticides were not detected in dry weather water samples at either Murrieta Creek or Temecula Creek.

Phase I of the TRE concluded with the Phase I Status Report. The Phase I Status Report included studies to better characterize patterns and sources of toxicity and to evaluate the hypothesis that the *Hyalella* toxicity is due to pyrethroids.

Bifenthrin and permethrin appear to be the primary toxic elements in Temecula Creek and Murrieta Creek. While bifenthrin and permethrin were applied to both agricultural and non-agricultural land uses, the major sources of pyrethroid toxicity in the SMR are non-agricultural activities. Permethrin was applied more than any other pyrethroid pesticide in the urban landscape. Bifenthrin and permethrin application rates were one and three orders of magnitude higher for structural control applications than agricultural applications in Riverside County. Structural control appears to represent 93% of the total pyrethroids use for Riverside County.

The Status Report outlined the plan for Phase II of the TRE, and this report presents the results of Phase II.

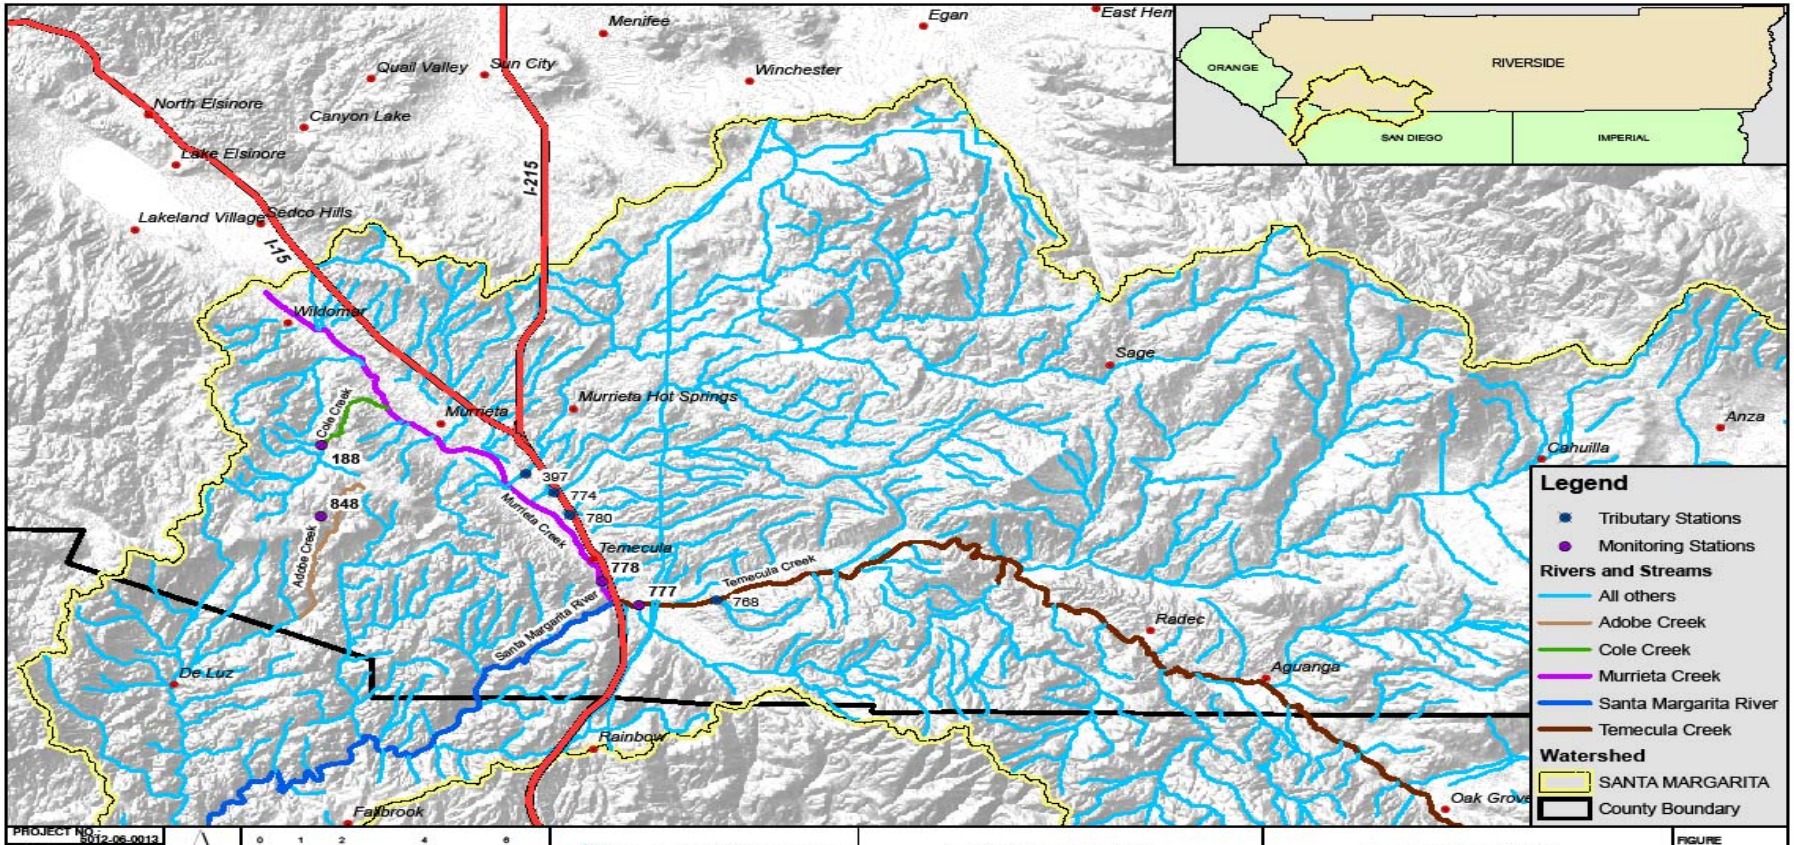
1.4 Watershed Description

The SMR encompasses approximately 750 square miles in southwestern Riverside and northern San Diego Counties (see Figure 1-1). The upper (northeast) portion of the SMR is in Riverside County with the remainder in San Diego County. The SMR is subdivided into the Temecula Creek and Murrieta Creek sub-watersheds and has an arid Mediterranean climate. Creeks in the SMR are ephemeral. Flow in Temecula Creek and in Murrieta Creek results almost exclusively from groundwater during the dry season. It is rare to find flow during dry weather at the tributary stations, and usually this flow infiltrates before reaching Temecula Creek or Murrieta Creek (2006-2007 Monitoring Annual Report). While the ephemeral streams in the SMR are technically receiving waters, the term "Receiving Waters" as used in this TRE Status Report refers exclusively to Murrieta Creek and Temecula Creek.

The Santa Margarita River is formed by the confluence of Murrieta Creek and Temecula Creek. The confluence is located in Riverside County, approximately five miles northeast of San Diego County. The Santa Margarita River flows from Riverside County into San Diego County through the community of Fallbrook and Marine Corps Base Camp Pendleton. The lower estuary and river are protected by Camp Pendleton and are much less developed than surrounding areas in Southern California. The Santa Margarita River is able to support a relative abundance of wildlife and habitats in part because of its undeveloped state.

Figure 1-1

Riverside County Santa Margarita Watershed



As presented in Table 1-1, the total population in the SMR of Riverside County is significantly less than adjacent watersheds covered under similar Phase I MS4 NPDES permits.

Table 1-1

San Diego Region Populations

Jurisdiction	Population
Orange County	3,002,048
San Diego County	2,941,454
SMR/Riverside County	250,483
Unincorporated	55,291
Murrieta	97,257
Temecula	97,935

1.5 Pyrethroid Pesticide Background and Usage

A statewide compilation of the presence and effects of pyrethroid pesticides in urban surface waters, prepared in July 2008 and presented at the 2008 California Association of Stormwater Quality Agencies (CASQA) Conference, outlined the rise in pyrethroid use and its increased presence in urban waterways (Ruby, 2008). A comprehensive survey of pesticide use in Sacramento, San Diego, and Orange Counties also concluded that, as the older pesticides chlorpyrifos and diazinon have been phased out, pyrethroid pesticides have seen increased usage (Wilen, 2005). The Urban Pesticide Pollution Prevention (UP3) Project confirms that pyrethroids are the cause of toxicity in numerous California waterways, particularly in urban waterways. The UP3 Project (www.up3project.org) publishes an annual review of new scientific findings on pesticides in urban surface water (TDC, 2007). Since 2005, the reviews have consistently indicated that pyrethroid use continues to increase and that pyrethroids are found to be the cause of toxicity in urban waterways. The pyrethroid use information is confirmed by data published by the DPR.

Pyrethrins are natural insecticides that are derived from an extract of chrysanthemum flowers. Pyrethroids are synthetic versions of pyrethrins. These chemicals act on the nervous system of insects. Commercial pyrethroid pesticides often contain a synergist that works by restricting the enzymes insects use to detoxify pyrethroids. While pyrethroids have been shown to be one of the least poisonous insecticides to mammals, the effects depend on the level of exposure, the health of the animal, and the environmental circumstances.

Pyrethroids applied in urban areas enter the storm drainage system of the MS4 by surface runoff and are transported directly to receiving waters. Other potential urban sources are runoff from irrigation with reclaimed water, application overspray, and atmospheric deposition. Pyrethroids transported via the MS4, from whatever source, are considered to be non-point discharges. Agriculture, nursery, and urban/suburban uses are the main categories of sources of pyrethroids in the receiving waters of the SMR.

Outdoor structural pest control is the predominant urban use of pyrethroids in most watersheds. However, in the SMR, the acreage dedicated to agricultural land use exceeds the urban land use area by approximately 2:1. Pyrethroid insecticides are applied to a variety of crops in the SMR and California throughout the year. According to the DPR, pyrethroids are commonly used on fruit and nut trees, row crops, and in nurseries. Six of the primary pyrethroids used in California agriculture, in order of decreasing amount applied in 2003, are permethrin, esfenvalerate, lambda-cyhalothrin, cyfluthrin, bifenthrin, and cypermethrin. Therefore, agricultural sources of pyrethroids were considered.

TIE methods for pyrethroids are still being developed. Effective methods require the ability to measure low concentrations of pyrethroids, and this remains a challenge. Fortunately, the development of TIE methods for pyrethroids is progressing and moving towards standardization (San Francisco Estuary Project, 2007). TIEs are planned for storm water samples collected during 2008-2009 when toxicity is evident.

1.6 Management Questions and Objectives

This TRE is designed to confirm the toxic element observed in the samples collected in the Santa Margarita Region, identify likely sources of the toxic element, and propose mitigation measures for those sources. TIEs identified pyrethroids pesticides as the likely toxic element. As the MRP specifies that a TRE must be conducted following toxicant identification through a TIE, Phase I of the TRE focused on the pyrethroids identified as the source of toxicity in the 2007 TIEs. To support this TRE, the Permittees commissioned additional wet and dry weather toxicity testing, water column pyrethroid testing, additional TIEs to verify the persistence of pyrethroids as the toxicant. Based on the resulting information, the TRE evaluates the specific sources of toxicity and likely mitigation.

This TRE study assumes that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in neighboring counties, in particular San Diego and Orange Counties. Under this assumption, the Permittees hypothesized that pyrethroids would be detected in samples at most if not all monitoring locations, that the samples would exhibit toxicity to *Hyalella*, and that TIEs would indicate pyrethroids as the cause of the toxicity. Unlike other regions, dry weather toxicity is not expected in the SMR, as dry weather flows are supported primarily by groundwater.

Based on this assumption, this TRE was designed to provide information to help answer the following five management questions related to the toxicity:

1) Is the pyrethroid toxicity persistent in Temecula Creek and Murrieta Creek?
2) Does the toxicity occur during dry weather?
3) Are there any obvious sources of illicit discharge of pyrethroids that can be abated?
4) What are the likely sources of pyrethroid toxicity in the SMR?
5) What potential management measures are available to the Permittees to mitigate the impacts of pyrethroid pesticide application?

Answers to the first four questions are detailed in the Phase I Status Report. Briefly, toxicity is persistent in the creeks during wet weather, but is not evident in dry weather samples. No

obvious sources of illicit discharge were found. The likely primary source of pyrethroids is structural control performed by pest control operators (PCOs). The final question is addressed during Phase II and is the focus of this report.

2.0 Data Comparison

An assumption of this TRE study is that pyrethroid sources and resultant toxicity patterns in the SMR are analogous to those in similar counties, in particular neighboring San Diego and Orange Counties. To verify this assumption, it was necessary to compare data collected in SMR to data collected in other locations. As part of the 2008 CASQA pyrethroids data compilation, monitoring results were summarized from studies that investigated the presence and effects of pyrethroid pesticides in urban areas of California (Ruby, 2008). The CASQA summary listed the frequency of detection of various pyrethroid pesticides and results of toxicity testing for different indicator species. Results from various northern and Southern California locations were detailed, including results of water column studies from Orange, San Diego and Sacramento Counties.

Pyrethroids, as a class of chemicals, have an affinity for particles and they are considered to be relatively hydrophobic; they are therefore commonly found in sediments of waterways downstream of their application sites. The initial toxicity studies leading to the identification of pyrethroids as pervasive environmental contaminants in California were performed on sediment samples by Don Weston and his colleagues at the University of California, Berkeley (Weston et al., 2005; Amweg et al., 2006). Recently, improvements in analytical methods for pyrethroids in water, and modification of toxicity studies to more effectively test for pyrethroid-based toxicity in water, have lead to increasing evidence of the presence of pyrethroids in water column samples, and toxic effects in the water matrix (see citations for Orange and San Diego County in Ruby, 2008).

Extensive work has been performed on the environmental presence and effects of pyrethroids in urban areas of the neighboring Orange and San Diego counties; however, much of this work has been performed on sediment samples. Although the sediment monitoring results do not correspond directly with the SMR water column test results, sediments are considered to be effective integrators of contaminants from the contributing storm water flows. The deposited sediments are produced as particles settle out from the passing water over some

period of time, and tend to accumulate until they are washed away by higher-velocity flows. Summaries of the relevant sediment study results are therefore included in the discussion that follows.

In Orange County, an ongoing study being performed by UC Davis, in conjunction with UC Riverside and the Orange County UC Cooperative Extension, has consistently found bifenthrin and permethrin in water column runoff samples from residential areas (Haver et al., 2007; Oki, personal communication). In samples from four residential sites they have detected bifenthrin in 100% of samples, with the number of samples varying from 48 to 57 per site (Oki, personal communication). In sediment samples collected in recent years from the Santa Ana Region of Orange County, bifenthrin is commonly detected (32 of 56 samples) and permethrin less frequently so (4 of 56 samples), with sediment toxicity to *Hyalella* common (39 of 54 samples tested were moderately or highly toxic; see summary in Ruby, 2008).

In a 2005 study of six Orange County residential storm drainages and seven tributary streams draining commercial/residential land uses, bifenthrin was detected in 95% of dry weather samples and 100% of wet weather samples (Budd et al., 2007). Because treatment of nursery products is mandatory to control Red Imported Fire Ants, an older DPR study, conducted in 1999-2002, found occasional detects of bifenthrin in urban runoff samples, along with frequent detects in nursery runoff from several Orange County sites.

In San Diego County, under NPDES Permit monitoring conducted since 2004, pyrethroids have been commonly detected in water samples from several receiving waters, and toxicity to *Hyalella* has been increasingly observed in water samples (see summary in Ruby, 2008). Bifenthrin was detected in 12 of 15 samples collected from 2005-2006 and 2006-2007; detection frequency was 100% in samples from Chollas Creek, Agua Hedionda, and Tecolote Creek. Toxicity to *Hyalella* was observed in 22 of 57 samples tested over the three year period, 2004-2007. In a TIE study performed on Chollas Creek samples during 2005-2006,

67% of samples were acutely toxic to *Hyalella*, and the toxicity was found to be likely due to pyrethroids.

In a 2004-2005 study performed by UC Davis and others, sediments from Switzer Creek at its outlet to San Diego Harbor were found to be highly toxic; bifenthrin and permethrin were detected at high concentrations, and a sediment TIE identified pyrethroids as the likely cause of the observed toxicity (Anderson et al., in press). As part of a statewide survey of urban waterways, sediments were tested from several receiving waters in San Diego County. All were found to be highly toxic to *Hyalella* (Holmes et al., in press).

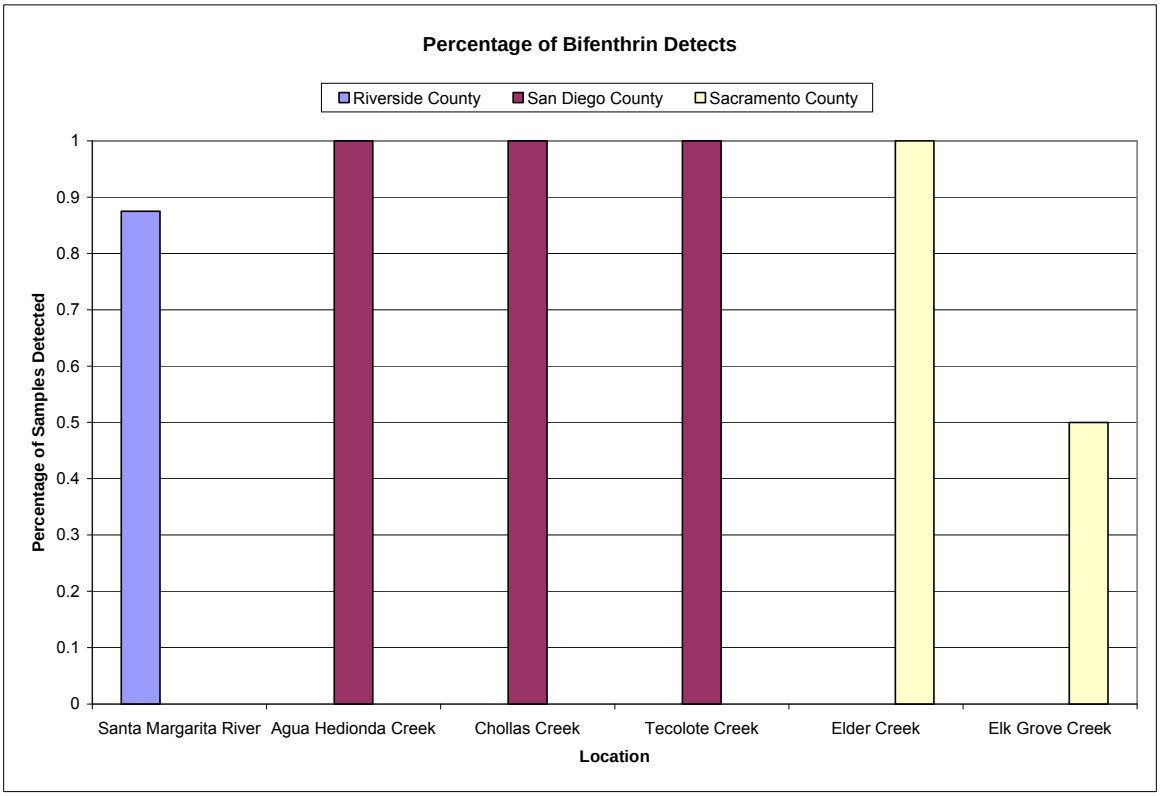
To further compare the pyrethroid sources and toxicity patterns in the SMR to other counties, the CASQA data summary was analyzed to select the studies which reported results for the same constituents and effects identified in the SMR, specifically permethrin, bifenthrin, and toxicity to *Hyalella.* The total number of detections for the different monitoring locations was divided by the total number of samples taken at the sites to calculate the percentage of samples with detectable concentrations of pyrethroids. This normalized metric allowed for comparison of the various datasets.

While permethrin is among the more commonly-used pyrethroids, it is much less toxic to aquatic life than bifenthrin (TDC, 2007). For the purposes of this assessment, bifenthrin detection frequency and frequency of toxic effects were used as the metrics for comparison.

Comparative results for bifenthrin are summarized in Figure 2-1. Data were available for two creeks in Sacramento County and three locations in San Diego County, in addition to the data collected for SMR. Two samples were taken at the Sacramento County sampling locations. For San Diego County, each creek was sampled three times except for Chollas Creek, which was sampled six times. The SMR was sampled a total of eight times. In most cases, bifenthrin was detected in over 80% of samples. Only at Elk Grove Creek in Sacramento County was bifenthrin detected at a notably lower percentage.

Figure 2-1

Percentage of Samples with Bifenthrin Detections

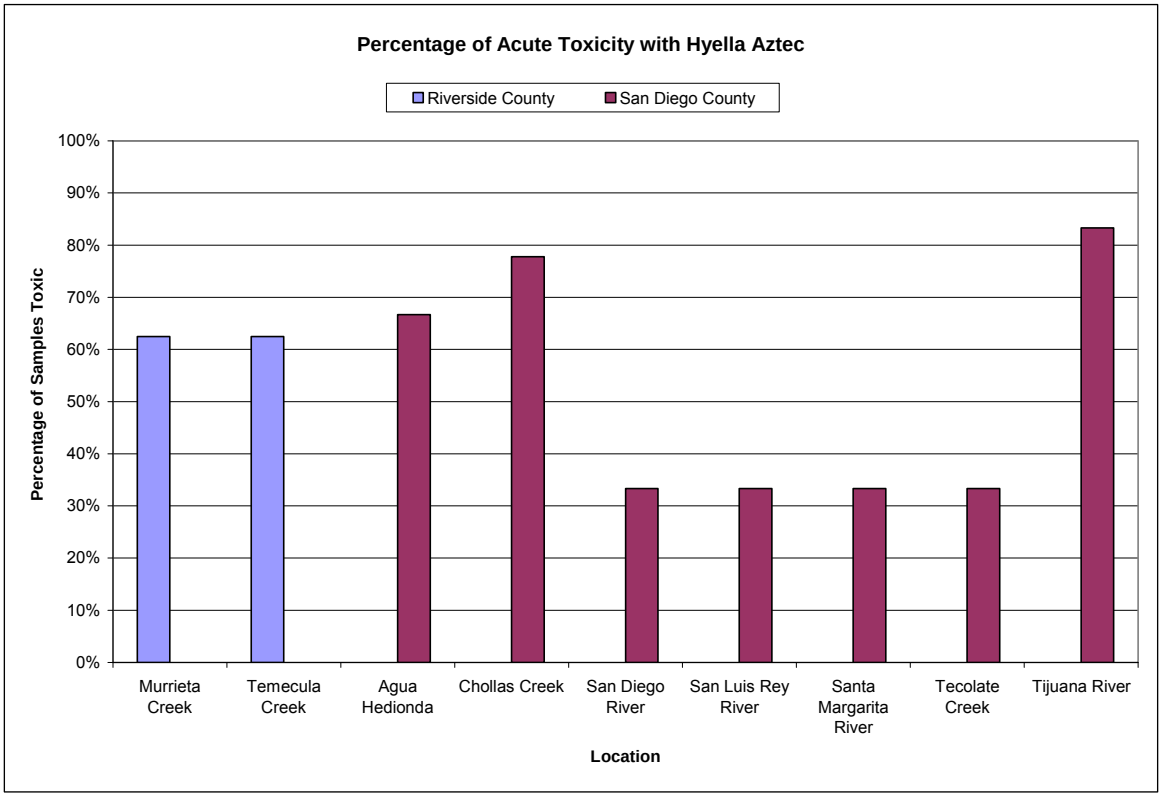


Toxicity to *Hyalella* was documented in water samples from San Diego County, along with the SMR. Toxicity testing was performed on samples from seven San Diego County water bodies. The sample sets ranged from three to nine toxicity tests (Aqua Hedionda, San Dieguito River, Tijuana River, and Chollas Creek). In the SMR, a total of eight toxicity tests were performed on samples from Murrieta Creek and Temecula Creek. The results for frequency of acute toxicity from the SMR were within the range of the results for similar sites in San Diego County (see Figure 2-2).

After comparing the results from different locations, the assumption that pyrethroid sources and resultant toxicity patterns in the SMR are similar to those in similar counties appears to be valid.

Figure 2-2

Percentage of Samples with Acute Toxicity to *Hyalella*



3.0 Literature Review

A literature review was conducted during December, 2008 to determine appropriate BMPs for reducing the concentration and load of pyrethroids in storm water runoff. An initial search was made of the Urban Pollution Prevention Program (UP3) website (www.up3program.org) for potential examples of BMP strategies implemented specifically for pyrethroids. The United States Environmental Protection Agency website and the CASQA website were also reviewed for pyrethroid specific BMPs. Widespread use of pyrethroids is relatively recent, and there has been little direct evaluation of BMPs for pyrethroids. Further research was conducted on general storm water BMPs, and their potential for pyrethroid reduction was evaluated based on the design of the BMP and the chemical behavior of pyrethroids.

To identify pending legislation that may be related to pyrethroid pesticides, web searches were conducted on the websites for DPR, the California legislature, the EPA, and the Library of Congress. However, no pending legislation was identified as relevant to pyrethroid pesticides.

Table 3-1 below presents the findings of the literature review. BMPs are categorized as either source control or treatment control, and within each category they are sorted by type. The literature source, a summary of the BMP, the estimated potential for reducing pyrethroid-induced toxicity, and possible concerns about implementing the BMP are provided. See Section 4 for further information about each type of BMP.

4.0 BMP Analysis

Based on the literature review and the findings of Phase I of the TRE, BMPs were evaluated for their applicability to the SMR. Because the toxicity appears to be principally a wet weather phenomenon, and because the Permittees' jurisdiction includes the urbanized area of the watershed, the analysis focused on BMPs designed to reduce the amount of storm water pollution caused by urban runoff.

The potentially applicable BMPs are divided into Source Control and Treatment Control BMPs and are discussed in detail below. Through the Permittee's proactive efforts to protect the quality of the receiving waters and their beneficial uses, many programs addressing these broad categories are either already in place or are actively being developed. The implementation status for each specific BMP is discussed. Examples of BMP implementation by other municipalities in the region are included as a tool for evaluating the consistency of the Permittees' program with other programs in the region.

4.1 Source Control BMPs

Source control BMPs are designed to curtail pollution at the source before it has the opportunity to enter the storm drain system and pollute waterways. They are generally the preferred type of BMP because reduction of pollution occurs at the source, before runoff has become contaminated (CASQA, 2003). The types of broad categories of source control BMPs that identified as most appropriate for the Santa Margarita watershed are: pursuing regulatory change, implementing IPM strategies including LID, and public outreach and education.

4.1.1 Regulatory Action

Status: Currently being implemented by the Permittees.

Pesticide manufacturers are required to receive approval by USEPA and California DPR for specific pesticide uses, and both agencies can impose use restrictions to prevent unwanted impacts on the environment and public health. At the federal level, a fundamental regulatory disconnect exists between pesticide approval (registration) under FIFRA and water pollution control programs under the Clean Water Act. This has resulted in a repeating pattern, in which a) pesticides are approved for use without sufficient consideration of potential environmental effects, b) water quality and other ecological impacts accrue, c) use restrictions are applied to the offending products (sometimes involving widespread bans on use), and d) new pesticides are approved for use, with subsequent environmental impacts.

In 1962 Rachel Carson published *Silent Spring*, documenting the widespread ecological consequences of pesticide applications. The federal government responded by banning the use of DDT and other organochlorine pesticides, based on extensive evidence of environmental impacts through the process of bioaccumulation. The ban has lead to dramatic recoveries in affected populations of bald eagles and other species; however, the legacy of these long-lasting pesticides near-shore dumping areas in Los Angeles County and elsewhere remains (IWS, 2007).

Eventually the organochlorine pesticides were replaced principally by organophosphate pesticides, especially in urban uses. In the mid-1990s municipal storm water monitoring programs began to document that commonly-used organophosphate pesticides, especially diazinon and chlorpyrifos, were present at toxic levels and causing toxicity to aquatic organisms, principally the common water flea, *Ceriodaphnia*. Although not bioaccumulative, diazinon and chlorpyrifos were discovered to cause widespread toxicity in urban runoff and local receiving waters (TDC, 2001). USEPA subsequently banned most urban uses of diazinon and chlorpyrifos, although EPA's main motivation involved human health effects

on the pesticide applicators, and water quality was not an important factor in those decisions. Again, the ban was also immediately effective, reflected in reduced concentrations of diazinon and chlorpyrifos in urban water samples, and fewer occurrences of organophosphate-based water column toxicity (c.f., references in Ruby, 2008 for San Diego County Municipal Copermittees Annual Urban Runoff Monitoring Reports). But pesticide manufacturers simply replaced the OP pesticides in their products with other active ingredients, principally pyrethroids. Shortly thereafter, researchers and municipal storm water programs began documenting toxic effects from the new pyrethroid products. The pyrethroid impacts were first documented in sediments, and the affected test organism shifted from *Ceriodaphnia* to the sediment-dwelling *Hyalella*.

In the cases of both organochlorine (DDT) and organophosphate (diazinon, chlorpyrifos) pesticides, federal limitations or bans on uses were effective in ameliorating the associated environmental impacts. In both cases, however, new pesticide products were approved for use that then caused related but different impacts to the environment. Therefore it is clear that the most effective strategy for preventing environmental impacts from pesticide use involves implementing an effective process of pesticide approval and registration that comprehensively accounts for and mitigates against such impacts.

For more than ten years CASQA and various other California state and local agencies have promoted better regulation of pesticides at the federal level, encouraging use restrictions as the most effective means of source control. California water quality agencies have sent comment letters to USEPA and DPR on guidance pertaining to the application of pesticides to surface waters and on recommended environmental hazard statements for residential outdoor pesticides (TDC, 2007). These efforts are beginning to show some modest signs of success. In a recent letter to stakeholders, EPA outlined an approach to provide better cooperation between the Office of Pesticide Programs (OPP) and the Office of Water (OW), to allow for “environmentally protective and scientifically defensible effects assessment judgments about contaminants that are or may be found in ambient water”. The Riverside County Permittees plan to continue their support of these efforts through ongoing

participation in the CASQA Pesticides Subcommittee, the Urban Pesticide Pollution Prevention (UP3) Project, and the Urban Pesticide Committee. The Permittees also plan to request that the RWQCB become involved in advocating for more effective pesticide regulation at the state and federal levels.

The Permittees are members of a CASQA subcommittee that addresses pesticide uses impacting stormwater discharges. Effort focuses on providing input to the USEPA and the California Department of Pesticide Regulation (DPR) to improve pesticides regulations so that they more fully protect water quality and are better aligned with the Clean Water Act and California Water Code. (RCFCWCD, 2008). CASQA has also been active in supporting DPR's ongoing reevaluation of allowable pyrethroid pesticide uses (TDC, 2007).

Increasingly, the regulatory response to the water quality impacts resulting from *legal uses of approved pesticides* has been for regional water boards to impose limitations on the allowable loadings of pesticides to impaired waters through the TMDL process. Local agencies have little or no jurisdiction over sales or use of these pesticide products, and therefore do not have the full authority needed to perform loading reductions in resulting TMDLs. An effective regulatory solution must occur at the state and federal levels, to regulate allowable pesticide uses to effectively prevent such water quality impacts.

Current legislation requires users of certain pesticides to be trained, often certified, in the use of those pesticides and to report the amounts applied (State of California, 2008). A similar regulatory approach could be used to promote pesticide alternatives, such as for PCOs to train and certify their technicians in the use of IPM methods (Quarles, 2002). The Permittees are considering supporting regulatory action by the state to include IPM training for PCOs in the requirements for certification and training on the use of pesticides.

Environmentally sensitive and flexible zoning ordinances may be adopted to facilitate the use of LID principles, thereby encouraging private developers to use LID principles (Prince Georges County, 1999). Additional land use restrictions or alternatives to present zoning

laws may help reduce urban storm water runoff, potentially reducing pyrethroid loadings in receiving waters. The Permittees plan to continue promoting LID implementation through interagency communications and cooperation.

4.1.2 Integrated Pest Management

Status: Currently being implemented by the Permittees.

IPM is "a decision-making process for managing pests that uses monitoring to determine pest injury levels, and combines biological, cultural, mechanical, physical, and chemical tools and other management practices to control pests in a safe, cost effective, and environmentally sound manner that contributes to the protection of public health" (Carlsen, 2008). IPM can further be described as an approach to solving pest problems by using information about the pest and landscape to eradicate the pest's habitat in a manner that poses the least risk to humans (Ecology Action, 2007). IPM has many different aspects that help to reduce pests and in turn cause a reduction in pesticide use, including green gardening and structurally integrated pest management (SIPM). BMPs that are typically used as part of an IPM strategy are described in the following sub-sections.

4.1.2.1 Green Gardening

Status: Not currently being implemented by the Permittees, program under consideration and will be enacted in the near future.

The Green Gardener program, implemented through landscapers, promotes environmentally responsible landscaping to reduce the use and need for pesticides. In general, education of gardening and landscape maintenance staff is beneficial for pest reduction as part of an IPM program. It provides alternative methods to landscapers, such as reducing outdoor sources of ants by elimination of their food and water sources through management of honeydew producing insects and plants associated with them (UC Davis, 2007). The Green Gardener

program encourages businesses to participate in environmentally sound landscape maintenance. Healthy landscapes are more resistant to pests (Ecology Action, 2007). Pests that do not have a suitable habitat will leave to find a more hospitable environment. When the pests leave, then there is a lessened need for pesticide applications and lower risk of pyrethroids entering storm water.

The County of Santa Barbara implemented a Green Gardener Program, in which landscapers are encouraged to take a class at the local city college, covering subjects such as IPM strategies and environmentally beneficial landscaping to obtain a "Green Gardener" card. They are then placed on the Green Gardener list, which is then promoted to the public by the County (County of Santa Barbara, 2008). The program benefits both parties; gardeners receive education and advertising at a nominal cost, and the County receives the benefit of more environmentally-friendly landscaping and a reduction in the use of pesticides. Municipalities may promote this type of program by contracting with landscaping companies that have their employees trained in green gardening practices.

Encouraged by the success of the Santa Barbara Green Gardener Program, the Monterey Bay area instituted a similar program. "The goal of the program was to educate and certify local gardeners in resource efficient and pollution prevention landscape management practices" (Ecology Action, 2007). With the support of the State of California Water Resources Control Board, more municipalities are likely to follow (Ecology Action, 2007).

4.1.2.2 Pest Control Contracting

Status: Currently partially implemented by the Permittees.

Many municipalities contract pesticide applications to professional PCOs. Contracting only with PCOs that have IPM training and certification can help realize IPM models and goals. The recently completed EcoWise Certified IPM Contracting Tool Kit (www.EcoWiseCertified.org), provides resources for municipal agencies to use in developing such a program. The EcoWise IPM Tool Kit includes:

- Elements to consider when developing an IPM policy
- Roles and responsibilities of the agency or business in an IPM program
- How to hire and work with a professional IPM service provider

The Took Kit also includes the EcoWise IPM Process along with a number of other helpful resources and sample documents.

Because PCOs are responsible for the majority of pesticides applied in urban areas, distribution of information regarding less-toxic alternatives, lower-use application techniques, and proper disposal, practices to professional applicators is an essential component of the Permitee's pesticide control effort. The Permittees currently distribute information to PCOs through the Public Outreach and Education Program (see Section 4.1.3).

The City of Palo Alto's Regional Water Quality Control Plant includes IPM requirements in their contracts with PCOs (City of Palo Alto, 2008). The City of Santa Monica, as a part of their SIPM program, specified IPM requirements in their PCO contracts (Raphael, 1997). Use of PCOs with IPM training and certification by municipalities encourages local PCOs to invest in IPM training and certification, which in turn, allows their expertise in IPM to expand beyond just the municipality itself (Quarles, 2002). Education of PCOs, hiring only PCOs that have IPM training, and contracting specifically for IPM by local agencies may

create more public awareness and reduce the use of pyrethroids in the Santa Margarita watershed.

4.1.2.3 Structurally Integrated Pest Management Program

Status: Currently being implemented by the Permittees, with additional programs under consideration.

SIPM is a program that controls the access of pests to buildings and the potential food sources within them by protecting the structure itself from pests, with minimal use of pesticides. The Permittees intend to lead by example, sharing success through public outreach programs and encouraging individuals and businesses to do the same. SIPM is a long term solution offering positive potential impacts on budget, reduction of pests and, reduction of pyrethroid pesticide use. Note that SIPM should not be confused with category of pesticide use referred to as structural pest control. SIPM is a BMP designed to reduce the use of pesticides in a structural pest control program.

The City of Santa Monica implemented an SIPM program and experienced a reduction in pests and in the use of pesticides. In addition, Santa Monica reduced pest management costs by 30% (State of California, 2008). California law requires a SIPM strategy for all state-owned buildings and schools (State of California, 2008). The three main aspects of a SIPM strategy are facility design and LID, monitoring, and facility maintenance.

<u>Facility Design</u>

Status: Currently being implemented by the Permittees.

Facility design can play a large role in the exclusion of potential pests. "A facility's planning, design, and construction provides an opportunity to incorporate features that help to exclude pests, minimize pest habitat, and promote proper sanitation" (NIH, 1999). It can also reduce

storm water runoff (NAHB, 2008). Exclusion of pests helps reduce pest infestations and in turn the need for pyrethroid pesticide use. For example, ensuring that the design holds plants and mulch several inches away from the foundation of a building may assist the reduction of ant populations immediately adjacent to the building (UC Davis, 2007). A reduction in storm water runoff may also reduce the amount of pyrethroids that enter receiving waters. Facility designs can incorporate aspects of LID, as discussed below. New development and redevelopment may incorporate designs that aid in the exclusion of pests and the reduction of urban runoff, which may contribute to a reduction of pollutant loads, including pyrethroids.

Pest Monitoring

Status: Currently in not use by the Permittees, program under consideration.

Monitoring structures and adjacent areas may help prevent pest infestations and quickly identify potential problems. Traps, visual inspections, and staff interviews assist in the identification of areas and conditions that may foster pest activity (NIH, 1999). Monitoring for ants, for example, may consist of simple inspections of facilities such as looking under sinks and along pipes and electrical wires (UC Davis, 2007). The City of Santa Monica, as a part of their SIPM, provided training to all general staff, purchasing, carpenters and custodial staff. Specific presentations were given to groups, such as the custodial staff, who learned about products used in control of ant and cockroach populations and general sanitation. The staff is trained in the identification of potential pest infestations and habitat conditions that may foster pest activity (Raphael, 1997). Early identification of pest infestations can increase the effectiveness of specific treatments and reduce the overall need for pesticide use.

Sanitation and Facility Maintenance

Status: Currently not being implemented by the Permittees, program under consideration.

Proper sanitation includes reducing clutter and pest habitat and incorporating proper facility and waste management practices. Records of maintenance and housekeeping conditions may help track pest problems and assist in the determination of whether corrective action is needed or has been taken in a timely manner (NIH, 1999). Sanitation and facility maintenance involves the housekeeping staff, the building maintenance staff, and the landscaping staff.

Improper storage of waste may affect urban runoff, and it may create a hospitable environment for pests, particularly ants. Initial, low-cost steps that municipalities may take to improve waste handling are: controlling litter, keeping waste collection areas clean, and insuring proper disposal of pyrethroid pesticide products, if used, and educating employees and the public. Simple solutions such as rinsing out soda bottles and emptying trash daily prove effective to reduce insect infestations, particularly ants (UC Davis, 2007). An important component of an SIPM monitoring program is regular inspections of solid waste containers for structural damage or leaks (CASQA, 2004).

Educating custodial staff, such as was done in the City of Santa Monica, can reduce the amount of improperly disposed pesticides (Raphael, 1997). Designating staff members to perform a daily checklist of areas around the structure to ensure cleanliness and proper storage of waste can assist the efforts to reduce potential pest infestations and leakage of hazardous waste (CASQA, 2004).

Building maintenance staff also benefit from education and acceptance of responsibility for pest management. Maintenance crews can contribute to an SIPM strategy by securing the structure, such as caulking holes and cracks, assisting in the removal of clutter, and installing

door sweeps (State of California, 2008). Caulking holes in structures can prove effective in keeping ants out of facilities (UC Davis, 2007). Upkeep on building maintenance helps reduce potential pest habitat, and thus may reduce the need for application of pyrethroid pesticides.

Reduction of pest habitat around structures may reduce pest populations in and around structures. Marin County, as part of its integrated pest management program, has reduced rat habitat around the local Civic Center and in turn has seen suppression of the rat population (Carlsen, 2008). Programs similarly tailored to ants may result in a positive effect of pest reduction within the SMR. For example, banding tree trunks with tanglefoot or similar sticky substances can keep ants away from trees (UC Davis, 2007). Education and training may be provided to Permittee landscaping crews to assist in proper vegetation removal and, when necessary, pesticide use. Landscaping crews may be informed that pyrethroid pesticides or any less toxic pesticides are to be used only when a pest problem arises to an intolerable level, that they are not administered when a wet weather event is expected and only when low wind speeds are present (CASQA, 2004). Education of landscaping crews to remove pest habitat may reduce the need for pyrethroid use thus reducing the potential risk of pyrethroids entering storm water runoff.

Also, utilizing low water using vegetation and alternative landscaping techniques such as xeriscaping or naturescaping are efforts that landscape crews can take to reduce pyrethroids in urban runoff. Landscaping crews may also help preserve the water efficiency of the landscape through properly timed fertilizing, weeding, pruning, and pest control. For example, proper collection and disposal of yard clippings can prevent loose vegetation that has possibly been treated with pyrethroid pesticides from entering waterways or storm water drainage systems such as MS4s (CASQA, 2004). Reduction in pest habitat and proper landscaping maintenance may help reduce pest problems, and thus the need for pyrethroid pesticides.

4.1.3 Public Outreach and Education

Status: Currently being implemented by the Permittees.

Public Outreach and Education programs inform the public about storm water issues, proper use and disposal of publically available chemicals, and alternatives to pyrethroid pesticides. Reaching out to the public and providing information about the dangers of pyrethroids pesticides encourages citizens to make educated decisions about pesticide use. It also may accelerate state and federal regulatory changes regarding pyrethroid use through public promotion of such changes. According to the EPA, public education and awareness can be a "key component" in any BMP program for storm water management (EPA, 2008).

The District has enacted a public outreach program to help reduce the potential for pyrethroid pesticides to contaminate receiving waters. This program has initiated: distribution of educational materials to hardware store employees, active participation and distribution of outreach for HHW/ABOP facilities to provide for free venues to dispose of excess pesticides, and distribution of EPA and CalEPA materials to the public. The District also promotes the use of less toxic pesticides, provides education on storm water issues in public schools, and has enacted a multimedia campaign to control urban sources of pyrethroid pesticides (RCFCWCD, 2005).

<u>Education and Outreach to Businesses</u>

Status: Currently being implemented by the Permittees.

Distribution of information regarding pesticides to businesses, particularly hardware stores, is crucial for reducing pyrethroid use and misuse at its source. Education on pyrethroid runoff to local hardware stores may assist local hardware store employees to educate their customers on alternative methods of pest control. An Orange County survey from 2001 found that 55% of pest control products were purchased at hardware stores (Wilen, 2001). In

2006, Riverside County had 177,562 pounds of reported non-agricultural usage of pyrethroid pesticides (RCFCWCD, 2008). Reduction in usage may lead to a reduction of pyrethroids in urban storm water runoff. Educating hardware store employees about urban water quality impacts of pyrethroid pesticides may help reduce the usage and thus the toxicity of runoff in the Santa Margarita Watershed resulting from pyrethroid use, as employees have the ability to recommend alternative methods of pest management to their customers.

Education of nursery employees about pyrethroid management and IPM techniques may also yield significant source control benefits. In general, nursery employees tend to be more knowledgeable about pesticides than employees at hardware stores (Wilen, 2001). Nurseries that use and sell pyrethroids offer the highest return on outreach resources, while those nurseries that have chosen alternate pest management methods serve as examples of IPM in practice. In a recent Riverside County survey, one nursery stated that they do not use pesticides and if their nursery does experience a pest infestation, it is treated naturally (RCFCWCD, 2008). Such nurseries are likely to encourage their clients and customers to use the same methods. Education and outreach can lead to cooperation and sharing of successful and unsuccessful methods of IPM and ultimately reduce pyrethroid pesticide use and toxicity of storm water runoff.

Businesses not in the industry of pesticide sales may also benefit from outreach. The District directs outreach efforts to all businesses; those in the business of selling or using pesticides, and those that are not. The District has coordinated with the County's Business License Department to include an educational insert of the "Only Rain Down the Storm Drain" program to new business license applicants and annual renewal reminders (CRWQCBSD, 2008). Informing companies on proper disposal of hazardous materials such as pesticides is crucial to prevent pyrethroid containers from being improperly disposed of, leaking, and then contributing to storm water pollution.

Several Southern California cities conduct general business outreach as well. Cities such as Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water

pollution relating to landscaping and gardening practices to general businesses (DCWMAC, 2007). Such information informs businesses of alternate methods of pest control beyond pesticide use and imparts knowledge about storm water quality issues. Thus, dissemination of educational materials to local businesses is intended to help reduce pyrethroid runoff by ensuring proper disposal of pesticides and encouraging alternate methods of pest control.

Educational and Outreach to the General Public

Status: Currently being implemented by the Permittees.

The District distributes educational materials within the Santa Margarita Region such as EPA sponsored pamphlets in order to promote reduced use of pyrethroid pesticides and educate the public about alternate practices of pest management. The public purchases retail pesticides and uses them, presumably, according to the manufacturer's instructions and in compliance with regulations listed on the packaging, including proper disposal of empty containers in the municipal waste stream. However, even when used properly, retail pesticides have the potential to contaminate urban runoff, and homeowners may be unaware of the downstream consequences of pesticide use. Depending on the landscaping practices in a neighborhood, promoting alternative pest management strategies and educating the public on storm water quality and pesticide use may be the most beneficial way to reduce the source of pyrethroids in urban runoff (Wilen, 2005).

The District distributes educational materials within other public outreach programs and maintains pest management information on the internet. The District also distributes brochures to educate the public on lawn and garden maintenance, fertilization, and pesticide and household chemical use (RCFCWCD, 2005). These educational materials provide public education on alternative pest control methods, limiting individual use of pyrethroids, and proper disposal of pesticide containers.

Many municipalities perform storm water outreach at festivals and public events by participating in the events and by distributing brochures. The Cities of Lawndale and Torrance plan and attend public festivals and rent booth space to educate the public about storm water quality and the use of pyrethroids (DCWMAC, 2007). Cities including Carson, Gardena, Inglewood, and Lomita distribute informational pamphlets on storm water pollution relating to household activities and landscaping and gardening practices to the general public (DCWMAC, 2007). The District participates in events such as the Children's Groundwater Festival, the Southern California Fair, the Community Water Festival, and the Santa Margarita Watershed Clean Up (RCFCWCD, 2005). The Permittees, as well as other municipalities within California, participate in public events and distribute informative materials as a portion of their current public outreach programs.

Education on proper disposal of pesticides

Status: Currently being implemented by the Permittees.

Improper disposal of pesticides is a potential contributor to storm water contamination. Empty containers be disposed of in the municipal waste stream are not likely to contribute to storm water pollution, however, unused pesticides may enter the MS4 by leaking in transit. In Orange County in 2001, 54.5% of people surveyed claimed to have disposed of unwanted pesticides in the municipal waste stream, and 78.6% did not know the location of a household waste disposal site (Wilen, 2001). The District has created a partnership with Riverside County Waste Management to provide educational programs and materials on proper disposal of unwanted waste, including pesticide containers (RCFCWCD, 2005).

Multimedia Outreach

Status: Currently being implemented by the Permittees.

The EPA suggests using multiple media sources to promote and educate on storm water impacts, particularly through public service messages (EPA, 2007). Mass media has proven to be a key source of pollution prevention information for the general public (LADPW, 2002). The District currently participates in a multimedia advertising campaign including: maintaining a website that provides information, distributing mailing inserts regarding water quality issues through various county entities, and billboard advertising campaigns. Many other municipalities, such as the Cities of Palo Alto and Lawndale, also use the world wide web to provide information to the public (City of Palo Alto, 2008) (DCWMAC, 2007).

Public School Programs

Status: Currently being implemented by the Permittees.

A storm water education program for public schools is a concept supported by the EPA (EPA, 2007). The County of Los Angeles has incorporated public school educational programs into its outreach program (LADPW, 2002). The District focuses storm water education efforts on elementary school students (RCFCWCD, 2005). For example, sixth-grade students at Warm Springs Middle School were given an interactive presentation regarding storm water pollution with an enviroscape model that excited and engaged the students; a presentation that has been given over 150 times during the 2003-2004 school year (Jamescourie, 2004). Educational programs in public schools are intended to produce long-term benefits to storm water runoff quality.

Education on Lower Risk Alternative Pesticides

Status: Currently being implemented by the Permittees.

Part of Public outreach includes suggesting less toxic alternatives to pyrethroid pesticides, such as those listed on the Our Water Our World website (www.ourwaterourworld.org). Lower risk pesticides have reduced impacts on human health, lessened toxicity to non-target organisms, decreased potential for water contamination, and lower pest resistance potential (Matteson et al., 2007). The District distributes materials associated with the "Our Water Our World" organization (RCFCWCD, 2008).

However, some of the lower risk pesticides are toxic to beneficial arthropods and still have the potential to pollute surface and ground water (Matteson et al., 2007). Pyrethroids were developed as a less toxic alternative from organophosphate pesticides (Quarles, 2002). In the Santa Margarita Watershed, there was a decrease in water toxicity to *Ceriodaphnia* and an increase in toxicity to *Hyalella* as organophosphate pesticides such as chlorpyrifos and diazinon and were replaced by pyrethroids (RCFCWCD, 2008). The effects on storm water runoff of lower risk pesticides must be carefully evaluated before they are promoted as effective solutions to urban storm water runoff pollution.

4.1.4 Low Impact Development (LID)

Status: Currently being implemented by the Permittees.

LID involves environmentally-friendly building and development designs that mitigate impacts to land and water. LID functions by managing storm water at its source, incorporating a variety of runoff control techniques, using natural features as design features, and protecting natural resources (NAHB, 2008). Municipalities that promote LID have the potential to reduce municipal infrastructure and maintenance costs while balancing growth needs with environmental protection (NAHB, 2008). LID practices include "small scale,

decentralized treatment practices" that include conservation of open space, a reduction of impervious surfaces, and the incorporation of water controls (NAHB, 2008). Reduction of urban runoff volumes may reduce the loadings of pyrethroids to receiving waters in urban areas.

In 2007, EPA implemented a retrofit of the agency headquarters in Washington, D.C., incorporating LID designs to assist with storm water retention (EPA, 2007). Retention of storm water on the land helps prevent pollutants from entering streams and rivers (EPA, 2007). One of the main goals of the EPA LID retrofit was to demonstrate several LID techniques and encourage government agencies and developers to use them (EPA, 2007). LID may be used in conjunction with IPM programs, which would reduce the amount of pesticides used and minimize the urban storm water runoff of pyrethroids. The County of San Diego's most recent MS4 permit requires implementation of LID techniques (County of San Diego, 2007); this appears likely to continue as a trend with other permits in the region as they are renewed. The incorporation of LID principles into development regulations in the Santa Margarita watershed provides a potential solution to runoff of pyrethroids into receiving waters.

4.2 Treatment Control BMPs

Treatment Control BMPs are typically structural devices engineered with the intent to remove pollutants from storm water. Treatment BMPs require construction and long term maintenance, but can be extremely effective (CASQA, 2003). Although treatment BMP's have not been thoroughly investigated specifically for reduction of pyrethroids, some methods may be useful. Pyrethroids bind tightly to soil particles so there is a high probability that pyrethroids would be removed with suspended solids when they pass through treatment BMPs. In addition, pyrethroids degrade over time; permethrin, for example, has a half life in soil of about 30 days and about 10 days on certain plant life. Because pyrethroids have low mobility in soil, infiltration-based treatment BMPs have a low probability of contributing to groundwater contamination (NPTN, 1997).

From the list of available treatment BMP's identified in Table 3-1, the types of treatment BMPs feasible for pyrethroid treatment in the Santa Margarita Watershed, considering the climate, local vegetation, and soil types present are: pervious pavement, media filters, extended detention basins, infiltration basins, and infiltration trenches.

These BMPs and their potential to remove pyrethroids from storm water runoff are described below.

4.2.1 Pervious Pavement

Status: Currently being implemented by Permittees under LID program.

Pervious or porous pavement is "a system comprising a load-bearing, durable surface together with an underlying layered structure that temporarily stores water prior to infiltration or drainage to a controlled outlet" (CASQA, 2003). Pervious surfaces include grass, gravel, and porous concrete and asphalt (CASQA, 2003). The multi layer system assists in preventing pyrethroid pollution by providing a stable structure for pyrethroids to bind to and degrade, thus helping to prevent their transport in to receiving waters. Silts that are deposited within the pavement may need infrequent controlled waste disposal (CASQA, 2003).

The advantage of porous pavement is that urban runoff is reduced while treatment is provided and it is an effective drainage solution in confined urban areas. However, porous pavement is not a viable option on high traffic or high speed roads due to safety issues. There is a small chance that it may contaminate groundwater. It is fairly easy to replace, should there be a clog or damaged area, as small areas can individually be paved (CASQA, 2003). The use of pervious pavement appears to be a growing trend.

4.2.2 Media Filter

Status: Currently being implemented by Permittees via sand filters.

Storm water media filters are usually two-chambered including a pretreatment settling basin and a filter bed filled with sand or other absorptive filtering media. As storm water flows into the first chamber, large particles settle out, and then finer particles and other pollutants are removed as storm water flows through the filtering media in the second chamber. Media filters are highly effective at removing sediment from storm water flows (CASQA, 2003). They are appropriate in low flow areas, particularly with sandy soil. Washington D.C. and Austin, TX have both successfully implemented media filters to treat storm water (VCSQMP, 2002). They "are well suited to Southern California because they do not require vegetation and require less space than other treatment control measures with similar removal efficiencies when a partial treatment sedimentation basin is used" (VCSQMP, 2002).

However, media filters clog easily when exposed to high sediment loads and may decrease in effectiveness after being in use for a few years (CASQA, 2003). A media filter is not appropriate for areas with erosive soil upstream from the treatment filter (VCSQMP, 2002). The lack of abundant native vegetation in the Santa Margarita watershed contributes to a high potential for erosion, so media filters may not be effective in the long term due to clogging. When clogging does occur, media filters may become a nuisance due to mosquito or midge breeding in pooled waters (CASQA, 2003).

4.2.3 Extended Detention Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An extended detention basin (EDB) is a permanent basin "formed by excavation and/or construction of embankments to temporarily detain the Stormwater Quality Design Volume

(SQDV) of storm water runoff to allow sedimentation of particulates to occur before the runoff is discharged"(VCSQMP, 2002). EDBs are constructed with an outlet at the bottom that allows for a slow, time-controlled release. The ultimate goal of EDBs is to level off peak storm water runoff rates (VCSQMP, 2002). Santa Clara Valley and the City of Palo Alto have noted that their detention basins have helped with the reduction of pollutants (EOA, 2004) (City of Palo Alto, 2008). Pyrethroids could be removed in the basin through settling of particulates.

Extended detention basins can serve multiple purposes as they provide for significant trash removal as well (CASQA, 2003). Maintenance is needed to ensure that the pond fully drains after large wet weather events, to avoid creation of standing pools causing mosquito or other vector habitats (CASQA, 2003). Extended detention basins are most effective when used in conjunction with other control measures, and are only moderately successful at removal of sediment. EDBs require relatively large amounts of land and therefore may not be feasible in urban areas of the Santa Margarita watershed (VCSQMP, 2002). There are no available examples of test results from municipalities using an extended detention basin for reduction of pyrethroid pesticides.

4.2.4 Infiltration Basin

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration basin is a shallow impoundment that is designed to infiltrate storm water and utilize the natural ability of soil to remove pollutants in storm water runoff (CASQA, 2003). Infiltration basins store runoff until it eventually enters the soil and infiltrates into the water table (CASQA, 2003). The soil present in the Santa Margarita Region is extremely pervious and may work well with an infiltration basin treatment structure.

Since pyrethroids adsorb onto soil, pyrethroids are likely to be removed from the storm water into the soil. However, there is a slight possibility that they may be resuspended into the

groundwater. Monitoring of pilot sites would be required to determine if there is transport of pyrethroids to the water table.

As with detention basins, maintenance is needed to ensure that the basin fully drains after large wet weather events to avoid creation of standing pools causing mosquito or other vector habitats. Infiltration basins may fail if the storm water volume is greater than the design volume (VCSQMP, 2002). Since infiltration basins require a large amount of open space, installation in urban areas is problematic. There are no available examples of test results from municipalities using infiltration basins for reduction of pyrethroid pesticides.

4.2.5 Infiltration Trench

Status: Currently not being implemented by the Permittees for pyrethroid reduction.

An infiltration trench is a long and narrow ditch that collects storm water runoff by storing it in the voids in a rock bed and allowing it to infiltrate to the soil matrix (CASQA, 2003). Infiltration trenches are extremely effective at removing fine sediment particles and associated pollutants (CASQA, 2003). Naturally pervious soils are required (VCSQMP, 2002). The Santa Margarita watershed has naturally pervious soils, which would allow for the removal of pyrethroids from the water and into the sandy soil.

Infiltration trenches are typically used in conjunction with grass lined channels or grass filter areas located upstream for maximum removal of sediment and larger particles (VCSQMP, 2002). Due to the arid environment in the Santa Margarita Region, grass lined channels, or even vegetated strips, would require irrigation to maintain the vegetation. If the infiltration trench clogs, it can become a source for mosquito breeding. There are no available examples of test results from municipalities using infiltration trenches for reduction of pyrethroid pesticides.

4.3 BMP Evaluation

A summary of the relative advantages, disadvantages and costs of the various BMPs identified in Sections 4.1 and 4.2 above is presented in Table 6.1 below. The table includes advantages, disadvantages, and the relative cost of implementing the BMPs.

Table 6.1
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Source Control			
Regulatory Change	Reduces the availability of pyrethroids on the market	May take years to achieve full effect	$
Integrated Pest Management	Engages businesses and the public in environmentally sound gardening practices	Need to ensure that employees are following protocols	$
	Has been implemented in various locations throughout CA and the US	Could have some resistance from employees who are use to standard practices	
	SIPM can be put in place directly by the Permittees	Some may find the organic methods of gardening to be too time consuming	
	SIPM can be incorporated directly into current maintenance activities		
	Includes LID aspects		
Public Outreach and Education	EPA states that Public Outreach is key for any BMP program	Cannot control the direct actions of public but only educate	$
	Copermittees have already implemented a public outreach program	Hard to measure the direct impact of pollutant reduction	
	Employees of business have direct impact on the buying choices of the general public		
	Programs have been implemented by many municipalities		

Table 6.1 (continued)
BMP Comparison Table

BMP Technology	Advantages	Disadvantages	Relative Cost*
Treatment Control			
Porous Pavement	Reduces runoff volume while reducing pollutant load as well	Requires ongoing minimal maintenance	$ to $$ depending on size
	Can be easily replaced depending on the size and location of design	No known measured reduction of pyrethroids.	
Media Filter	Do not require vegetation	No known measured reduction of pyrethroids.	$$$
	Highly effective in removal of sediments	Clogging is an issue because of the erosion potential in the watershed.	
	Requires less space than other treatment controls for sediment removal		
Extended Detention Basin	Known for significant trash	Large footprint Moderately successful at removing sediment	$$$
	Standard BMP with many years of maintenance and operational information available	Create an area with vector breeding potential	
		No known measured reduction of pyrethroids.	
Infiltration Basin and Trench	Uses natural ability of soil to remove pollutants.	Unknown if pyrethroids would be transported to the groundwater table.	$ to $$$
	Local soils would allow infiltration	Would require a pilot study to determine transport.	
		No known measured reduction of pyrethroids.	
		Clogging of outlet structure	
		Accumulation of metals in soil	

*Relative Cost: $ = $0 to $50,000, $$ = $50,001 to $100,000, $$$>100,000

5.0 Pending Legislation

There is no relevant pending state legislation relating to pyrethroid pesticides from the California Department of Pesticide Regulation or, in general, the State of California as of December, 2008 (State of California, 2008) (CDPR, 2008). In August 2006, the DPR put rules in place to control insecticide sprays during the dormant season. During winter, pesticides are applied to dormant tree and vine crops to kill overwintering pests and diseases. The new rules restrict the use of most dormant insecticides when residuals can run off into water (DPR 2007-08 Progress Report). However, there are no additional updates relating to pending pyrethroid legislation at this time.

There is no relevant pending federal legislation relating to pyrethroid pesticides from the United States Congress as of December, 2008 (Library of Congress, 2008). Although the EPA is working on proposed mitigation labeling for non-agricultural pyrethroids, there is no indication as to when this legislation may be enacted (TDC, 2007).

6.0 Proposed Course of Action

The Permittees intend to use a phased approach to address the identified sources of pyrethroid pesticides causing toxicity in surface waters of the SMR watershed. As described in Section 4, various source control BMPs and treatment control BMPs are available to address these sources. However, the use of pyrethroid pesticides can not be directly regulated by local governments. The most effective control strategy involves effective labeling and use restrictions via state or federal regulatory action, to prevent water quality impacts from legal pesticide uses. The proposed course of action involves an adaptive management approach with the following broad elements:

- Pursue state and federal regulatory change through CASQA
- Implement a set of source controls targeted specifically at urban pesticide use,
- Through the annual reporting process, monitor the implementation of those controls, assess effectiveness, and identify sources or areas where additional effort is needed,
- Evaluate whether additional controls, including treatment controls, may be needed to further reduce pyrethroid pollution,
- Implement additional controls as needed,
- Continue to monitor implementation, as well as conditions within the target receiving waters, assess effectiveness, and re-evaluate control program

The Permittees will continue to support CASQA and/or other agencies pursuing regulatory change in labeling or use limitations for pyrethroid pesticides. This support will include participation in the CASQA Pesticides Subcommittee and the Urban Pesticide Committee, and supporting the implementation of the Urban Pesticide Pollution Prevention (UP3) Project. Permittee staff will continue to provide staff time and resources necessary for the CASQA Pesticides Subcommittee to complete its negotiations with the California Department of Pesticide Regulation and USEPA regarding labeling and use limitations for pyrethroids.

Source control is generally a more cost-effective approach to pollution abatement than treatment control, as source controls do not involve the costly capital investments of treatment controls. As discussed previously, CASQA, EPA, and other agencies and experts

recommend a source control program as an essential component of a successful pollution reduction strategy.

The basis of source control involves preventing the entrance of the subject pollutant into the discharge stream. For pyrethroid pesticides, this means preventing the pesticide from entering the municipal storm drain system through urban runoff. This can take place by intervention at the various steps in the pest control process:

- Point of sale: reducing the purchase of pyrethroid products through education of PCOs and the public in consequences of pesticide use and alternative means of pest control, including integrated pest management (IPM)
- Application: reducing use of pyrethroids on site through education of PCOs and the public into the importance of proper application methods and the potential consequences of pesticide use, as well as pest control alternatives (IPM techniques)
- Off-site Transport: reducing movement of pyrethroids into municipal storm drain system via use of Green Gardener approaches, IPM, and LID building techniques to reduce irrigation water use, retain storm water runoff on-site, and provide on-site mitigation for runoff pollutants (via grassy swales, infiltration, etc.)

A five-year pyrethroid pollutant reduction program is proposed by the Permittees.

Year 1

- Continue to support state and federal efforts to improve pyrethroid pesticide regulation
- Continue to publicize/promote the services of IPM-certified PCOs, to encourage businesses and homeowners to choose their services
- Continue to implement local agency contracting rules to require contracting of IPM-certified PCOs for municipal pest control (through EcoWise Certified IPM Contracting Tool Kit, e.g.)
- Continue point-of-sale education effort providing instruction in pesticide alternatives and proper use/application (using materials available through Our Water Our World, UP3 Project, CASQA members, e.g.)
- Continue efforts to develop and implement LID guidance for planning and development

Year 2

- Coordinate with the University of California (UC) Extension Master Gardener Program to extend its services to the Temecula/Murrieta area to further promote and support the use of IPM by local residents
- Re-evaluate, enhance as needed, and continue measures implemented in Year 1

Year 3

- Conduct programmatic assessment as part of third-year annual report, evaluate successes and areas where additional efforts are needed and adjust program accordingly
- Re-evaluate, enhance as needed, and continue measures implemented in Years 1 and 2

Year 4

- Evaluate effectiveness of BMPs using water quality monitoring data as part of fourth year annual report
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Year 5

- Conduct programmatic assessment, evaluate successes and areas where additional efforts are needed as part of ROWD process
- Identify additional program elements, including source and/or treatment controls, as needed to effect required pollutant reductions; revise program accordingly
- Re-evaluate, enhance as needed, and continue implementation of revised program as defined in Year 3

Many of the source control materials and programs needed are readily available through existing programs such as EcoWise Certified, Green Gardener, Our Water Our World, the UP3 Project, and the Western IPM Center. The following websites provide further information on these and other programs:

Urban Pesticide Pollution Prevention (UP3) Project: www.up3project.org
Green Gardener Program: www.green-gardener.org/about
Western Integrated Pest Management Center: www.wripmc.org
EcoWise Certified Integrated Pest Management: www.ecowisecertified.com
Our Water Our World: www.ourwaterourworld.org
Green California: www.green.ca.gov/EPP/building/structipm.htm

City of San Francisco: http://www.sfenvironment.org/our_programs/topics.html?ti=1
DPR: http://www.cdpr.ca.gov/docs/registration/reevaluation/chemicals/pyrethroids.htm

As a practical measure, it will be necessary to evaluate individual Permittee capabilities and resources, and develop a specific work plan for implementation of the pyrethroid pollutant reduction program.

It is also essential to develop and implement the pyrethroid pollutant reduction program in coordination with other regulatory requirements, especially other pollutant reduction programs mandated under the storm water NPDES Permit and/or load allocations required by TMDLs within the SMR watershed.

1.0 Introduction

This Report of Waste Discharge (ROWD) is an application for renewal of Order No. R9-2010-0016, an area-wide National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) Permit (2010 MS4 Permit). The MS4s covered under the 2010 MS4 Permit are owned and operated by the Riverside County Flood Control and Water Conservation District (District), the County of Riverside (County), and the Cities of Murrieta, Temecula and Wildomar (collectively, the Co-Permittees).

On November 10, 2010, the San Diego Regional Water Quality Control Board (Regional Board) adopted the 2010 MS4 Permit, which expires on November 10, 2015. Directive K.2.c of the 2010 MS4 Permit requires that a ROWD be submitted no later than 180 days prior to the expiration date. This ROWD has been prepared in consultation with the Co-Permittees and is submitted on their behalf. Table 1-2 lists the required elements for the ROWD and identifies where those elements can be found in the ROWD.

In order to protect lives and property and to prevent damage to the watershed, the Co-Permittees operate and maintain essential drainage infrastructure in the Santa Margarita Region (SMR). The County and the Cities maintain approximately 317 miles of drainage infrastructure in the SMR while the District maintains approximately 90 miles. Environmental stewardship and integrated water resource management continues to be an essential part of the Co-Permittees' responsibilities.

The diligent work performed by the Co-Permittees under the 2010 MS4 Permit has maintained Receiving Water quality and prevented new impairments despite continued growth in population and development within the region. As shown in Table 1-1, the population in the region is projected to have a steady growth rate and by 2020 the region's population is predicted to grow by 5.6%. The challenges posed by this growing population require the Co-Permittees to continue to adapt their BMPs and watershed programs to protect water quality.

Table 1-1 Santa Margarita Region Population Estimates

Co-Permittee	Year			
	Estimate 2015 (a)	Estimate 2016 (b)	Projected 2020 (b)	Change (2015 to 2020)
City of Murrieta	107,455	108,482	112,591	4.8%
City of Temecula	108,450 b	111,585b	119,422	10.1%
City of Wildomar	35,433	36,310	37,204	5.0%
Unincorporated County of Riverside	51,314	52,436	53,793	2.6%
Total	272,621	276,585	292,017	5.6%

Notes:

(a) Unless otherwise noted, populations were obtained from the State of California, Department of Finance, E-4 Population Estimates for Cities, Counties and the State, *2011-2014, with 2010 Census Benchmark*. Sacramento, California, May 2014.

(b) Data gathered from City of Temecula website, "Demographic Snapshot 2014 Report".

During the term of the 2010 MS4 Permit, the Co-Permittees developed and utilized various programs to help protect water quality. These programs include the development of the Individual Jurisdictional Runoff Management Plan (JRMP) that specifies management programs and activities required of each Co-Permittee, as well as the development of the SMR Monitoring and Reporting Program (MRP). The Upper Santa Margarita River Watershed Water Quality Workplan (Watershed Workplan) was also developed during the permit term to identify and prioritize water quality concerns.

The Co-Permittees have also developed new and improved ways to maximize finite resources to protect Receiving Waters more effectively. Such examples are creating a more efficient process to review priority development projects, WQMPs, and track inspections. The Co-Permittees continue to improve procedures to efficiently respond to spills and other illegal discharges. The Co-Permittees also continue to educate the public about improving water quality through different engagements such as hosting public education events, speaking to employees and customers at home improvement stores, and speaking to students at local schools. The Annual Reports submitted under the 2010 MS4 Permit (which are contained in Appendix C) describe the Co-Permittees' various water quality improvement programs in detail.

This ROWD builds on the discussion in the Annual Reports by highlighting the major accomplishments of the Co-Permittees' programs, describing the challenges that they face and discussing their continuing efforts to protect Receiving Water quality. To promote clarity, terms defined in the 2010 MS4 Permit are capitalized in this ROWD.

1.1 ROWD Required Elements Summary

Table 1-2 Location of Required ROWD Elements per Directive K.2.c of 2010 MS4 Permit

Required ROWD Element	ROWD Location
1) Proposed changes to the Co-Permittees' runoff management programs	Section 3.80, and Appendix C
2) Proposed changes to monitoring programs	Section 3.0 and Appendix C
3) Justification for proposed changes	Section 3.80 and Appendix C
4) Name and mailing addresses of the Co-Permittees	Section 1.2

1.2 Co-Permittee Contact Information

The table below provides the contact information for each of the Co-Permittees in the Santa Margarita Region that have either technical or administrative involvement in the MS4 Permit.

Table 1-3 Co-Permittee Contact Information

Co-Permittee	Primary Contact	Staff Contact	Address
District (Principal)	Warren D. Williams General Manager-Chief Engineer 951.955.1275	David Garcia Engineering Project Manager 951.955.1330 dhgarcia@rcflood.org	1995 Market Street Riverside, CA 92501

1.3 Regional Board Jurisdictional Area Exchange

- **City of Wildomar (San Diego Co-Permittee)** - The City of Wildomar requests that the San Diego Regional Board continue regulating all portions of the city, regardless of Regional Board jurisdictional boundaries, for matters pertaining to MS4 permitting.

- **City of Menifee (Santa Ana Co-Permittee)** - At this time during the SMR ROWD process, the City of Menifee request that the San Diego Regional Board continue designating the Santa Ana Regional Board as the sole regulator of the City of Menifee pertaining to MS4 permitting.

2.0 Santa Margarita Region Permit Area Overview

2.1 Physiography and Geology

The upper Santa Margarita River watershed is defined as that portion of the Santa Margarita River watershed above the confluence of Murrieta and Temecula Creeks, and includes the City of Temecula and portions of the Cities of Menifee, Murrieta, Wildomar, unincorporated County areas, portions of the Cleveland and San Bernardino National Forests, the Cahuilla, Ramona, Pauma, and Pechanga Indian Reservations and properties under the jurisdiction of Caltrans and a variety of special districts. The watershed is bounded by several mountain ranges, including the Santa Ana and Santa Margarita mountains to the North and the Palomar Mountains to the South. The upper Santa Margarita watershed includes areas in Riverside and San Diego Counties and encompasses approximately 588 square miles.

The upper Santa Margarita watershed includes two major sub-basins, drained by Temecula and Murrieta Creeks. Temecula Creek has a drainage area of 366 square miles, with steep rugged topography in the Palomar and Thomas Mountain areas and rolling hills below. The upper 316 square miles of this basin is controlled by Vail Lake (completed in 1949). Murrieta Creek has a drainage area of 222 square miles, with over 50 square miles controlled by Skinner Reservoir (completed in 1974). Approximately 13 square miles are tributary to Diamond Valley Lake. Although the watershed area is somewhat smaller and less rugged than the Temecula Basin, flood flows have the potential to create greater damage as they flow through the cities of Temecula and Murrieta.

Temecula and Murrieta Creeks join along the Elsinore fault zone at the head of Temecula Canyon to form the Santa Margarita River. The Temecula Canyon is approximately five miles long, and is a steep, narrow, and rocky canyon. The San Diego-Riverside county line crosses through the Temecula Canyon. From here, the river traverses 27 miles to the Pacific Ocean.[1]

2.2 Permit Area

The Permit Area is defined as the urbanized area served by the Co-Permittees' MS4 facilities. The Permit Area is located within the area delineated by the County boundary line on the south and the limits of the jurisdiction of the San Diego Regional Board on the north, east, and west. The area encompasses approximately 751 square miles, about 10 percent of the Riverside County. It may seem that with increased population growth within the region that urban land use should have increased, however, data shows that only approximately 9% of the region is designated as Urban Land Use. The remaining portion of the region consists of either: Open space, Preserves, Rural Residential (>1ac.), or Agriculture. The Santa Margarita River Watershed Area Land Use Map is attached as Appendix B.

[1] Santa Margarita Watershed Study: Hydrologic and Watershed Processes, Phillips, Williams and Associates, Ltd., October 26, 1998, page 1.

3.0 SMR Water Quality Data Efforts and Outcomes

3.1 Summary

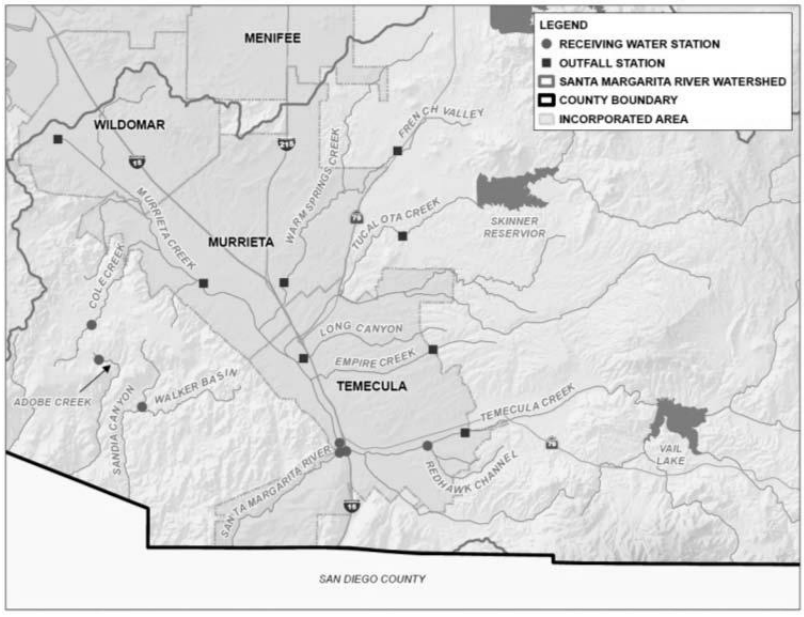
The SMR includes the portion of the Santa Margarita River Watershed within Riverside County. The monitoring station locations are shown in Figure 3-1 below, and are described in detail in the SMR Monitoring Report (see Appendix C). The SMR monitoring program has two general categories of monitoring stations: Receiving Water stations and MS4 outfall stations:

- Receiving Water monitoring stations are in waters of the U.S., and include reference streams and mass loading stations; and
- MS4 outfall stations are discharge points that are major outfalls.

While accomplishments from implementation of the SMR Monitoring and Reporting Program (MRP) are discussed in this section, the entire MRP is attached as Appendix C.

Each year, the Co-Permittees collect water quality samples at Receiving Water and MS4 outfall stations with various sampling frequencies, ultimately resulting in the collection of approximately 56 water quality samples. Anywhere from 80 to 243 constituents per sample undergo laboratory analysis for a full range of potential pollutants including pesticides, nutrients, metals and bacterial indicators. Only a small minority of the analytes were found to have exceeded federal and state Water Quality Standards. Although we only see a small group of constituents within the region having exceedances, the same class of constituents are seen statewide exceeding Water Quality Standards as evident from the CWA 303(d) list of waterbody impairments. The Co-Permittees are making strides in minimizing the exceedances of these particular constituents. The Co-Permittees' stormwater programs continue to adapt in order to protect Receiving Water quality. Accomplishments are highlighted in Section 3.5 below and in the Co-Permittee's individual JRMP annual reports.

Figure 3-1 SMR Monitoring Stations



3.2 Analysis Assessment of Water Quality Data

Figure 3-2 SMR Dry Weather Exceedances FYs 2012-2014

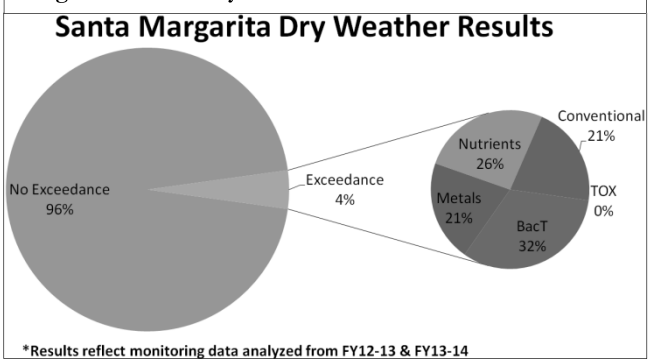


Figure 3-3 SMR Wet Weather Exceedances FYs 2012-2014

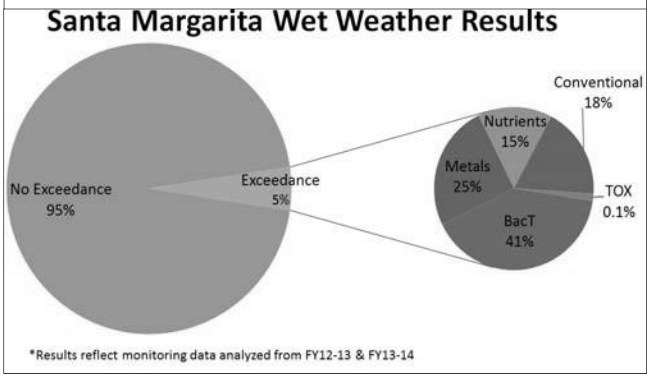


Overall, water quality conditions in SMR Receiving Waters are improving based on the number of waterbody-pollutant pairings in the upper Santa Margarita River watershed. Significant improvements are observed in the water quality sampling data sets. The results are discussed more fully in Section 3.6 (Effectiveness Assessment).

Under the Wet Weather monitoring program, approximately three water quality samples are collected at six Receiving Water stations, as well as one water quality sample from eight MS4 outfall stations. With additional sampling at the outfalls, 11 proximate Receiving Water locations are collected. This results in nearly 1,600 water quality data points.

Additionally, under the Dry Weather monitoring program, approximately two water quality samples are collected at six Receiving Water stations, as well as one water quality sample from eight MS4 outfall stations. With additional sampling at the outfalls, 11 proximate Receiving Water locations are collected. This results in over 1,300 water quality data points. As seen in Figures 3-2 and 3-3, out of the 2,900 water quality data points collected during the permit term, the SMR has only seen approximately 5% exceedances. Long-term trend data, as limited to the mass loading Receiving Water stations, are available in Attachment I (Long-Term Instantaneous Loads and Trends) of the 2013-2014 SMR Monitoring Annual Report attached as Appendix C.

The Co-Permittees have been working diligently to determine the sources of the high priority pollutants by conducting special studies (see Section 3.7.1) and engaging with special work groups (i.e. Nutrient Initiative Group).

3.3 Inherent Limitations to Analyzing Stormwater Quality Data

There are inherent limitations to analyzing water quality data from stormwater. Stormwater runoff greatly contrasts from the wastewater treatment and monitoring process. Discharges from mechanically treated wastewater effluent and industrial discharges usually:

- Come from a single or a few readily identifiable sources;
- Are generally consistent in flow rate and chemical character from day to day; and
- Can be easily instrumented.

Conversely, rain events producing urban runoff and non-point source flows are difficult to collect and analyze due to the fact that they:

- Come from multitudes of unidentifiable or hidden sources, many of which are non-urban in nature:
  - Natural leaching of soils
  - Wildlife
  - Aerial deposition
  - Wildfires
  - State, federal or tribal lands
- Vary widely in flow rate in response to precipitation events
- Vary widely in chemical character at any given moment due to:
  - Unidentified episodic issues related to natural phenomena
  - Magnitude of rainfall and extent of contributing area
  - Potential one-time illicit discharges that were not identified at the time of sampling
  - Unforeseen or unidentified consequences of land use changes
- Are subject to significant natural random variation; and
- Cannot be easily instrumented due to the variation in depth and velocity within water courses or natural stream beds.

Because ephemeral stormwater flows are particularly random in character, it may take many years before statistically significant trends can be identified from the outfall monitoring data in order to properly assess the overall effectiveness of an Urban Runoff water quality control measure.

3.4 Bioassessment Data

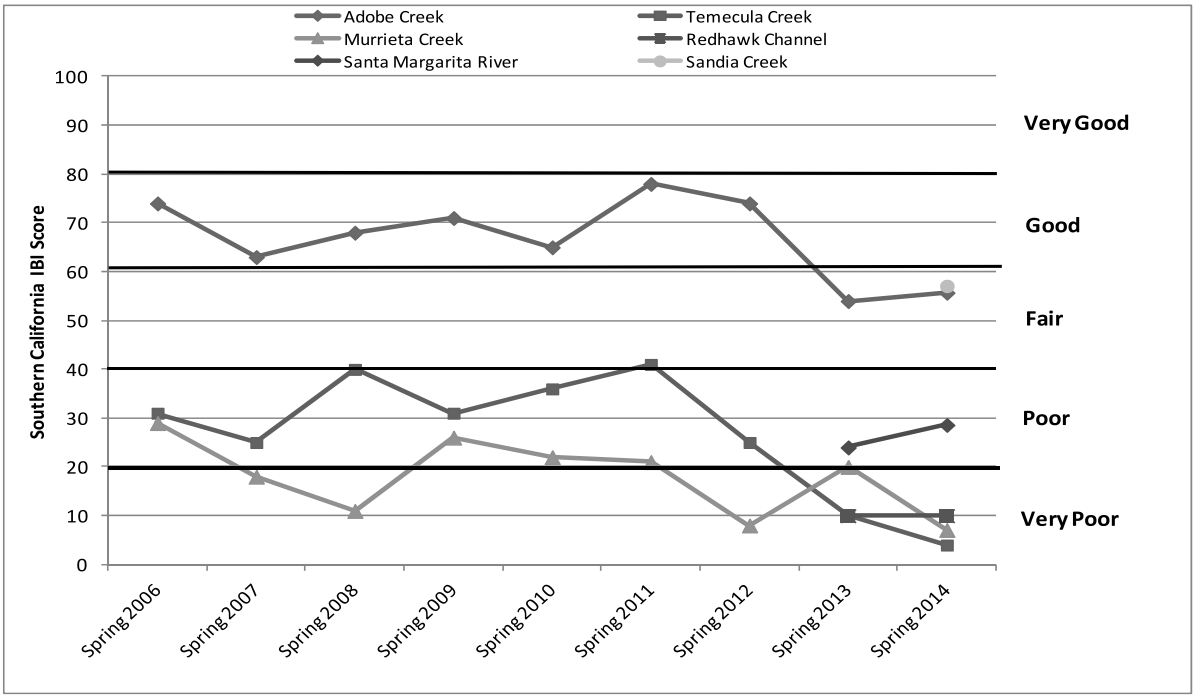
Bioassessment is a field collection method in which the health of a specific ecological population of interest is evaluated (e.g. aquatic insects, algae, fish, plants, etc.).

One population evaluated under this monitoring program were insects that live in the bottom substrate of the Receiving Waters. Where sufficient flows exist to support them, these organisms can provide a measure of water quality because they have a very diverse community structure, live a large portion of their lives in water as larvae or adults, have various sensitivities to natural and anthropogenic impacts, are easy to collect, and have life histories that are well studied. Similarly, algae populations were evaluated because they respond to increased stress due to natural and anthropogenic impacts in ways different than aquatic insects, and thereby together provide a picture of the water quality.

Dry weather bioassessments were performed according to the MRP at four designated Receiving Water stations (Lower Murrieta Creek, Lower Temecula Creek, Redhawk Channel, and Upper Santa Margarita River), as well as at two reference stations (Adobe Creek and Sandia Creek). All bioassessments were performed within the appropriate index period in Dry Weather (May 1st to July 30th).

During the Permit Term, the overall biological health, as determined by the SoCal IBI scores[2], was "Poor" or "Very Poor" for the lower watershed stations. Reference sites (e.g., sites higher in the watershed with limited, to no impacts from urbanization) were rated as "Fair". Figure 4-1 depicts the historical summary of SoCal IBI Scores for the SMR monitoring stations.

Figure 4-1: Summary of SoCal IBI Scores for All Monitoring Stations (Spring 2006–Spring 2014)



Several differences between the reference sites and the receiving water sites were identified. This affects the overall IBI score and examples of these differences include the following:

- Riparian vegetation differs among the stations monitored. The majority of the monitoring stations are located lower in the watershed and have very little canopy coverage as compared to the reference sites. This tends to impact the water temperatures at the sites.
- Water temperatures measured at the majority of the Receiving Water sites were higher than those recorded at the reference sites. Similar to the previous reporting year, these differences in temperature were most likely due to the amount of overhead tree canopy surrounding the creeks. This, coupled with smaller wetted width at the reference sites, can lead to a denser tree canopy directly overhead of a stream, resulting in lower instream temperatures.
- A large difference noted between stations was the percentage gradient (slope) of the stream. Both reference stations have very high gradients (~2-4%), while the lower watershed stations ranged

[2] The SoCal IBI was developed to assess the biological integrity of freshwater streams in the southern California coastal region. Methods described in the *Quantitative Tool for Assessing the Integrity of SoCal Coastal Streams* (Ode et al., 2005) were used to calculate the Southern California Index of Biological Integrity (SoCal IBI) to evaluate the overall health of the benthic macro invertebrate community, based on the counts of various species contained in the taxonomy results.

from very low to moderate (~0.7-1.5%). The steeper gradients create riffles and microhabitats that tend to yield higher IBI scores.

Overall the SMR is a dynamic system with large seasonal variations in flow, from dry streambeds to high-energy flows. This arid hydrological regime is typical in the southwestern region of California and can have significant impacts on bioassessment results.

Mediterranean climates, such as those in southern California, tend to have extremes in rainfall patterns, oscillating from periods of rainfall above normal to those very much below normal. As presented in Table 8 of the 2013-2014 Monitoring Annual Report (Attachment C), since the 1992-1993 reporting year, only three of the 21 periods have experienced at least "normal" (average) rainfall totals. Droughts influence the BMI community by decreasing overall base flows, increasing temperature, and potentially increasing algal growth. In a report on the patterns of BMI communities in non-perennial streams, Mazor et al. (2012)[3] found that as stream flow decreases, overall IBI scores tended to decrease. In general, data suggests that a historic drought period may negatively influence the IBI scores.

It seems likely that the biological community are more responsive to the amount of water present than they are to water quality. The drought appears to inhibit our ability to clearly isolate water quality as the sole cause of low IBI scores. The method used for bioassessment does not adequately distinguish between the effects of simply not having sufficient water present (e.g., arid or drought conditions) and the effects of poor water quality on the target populations. Therefore falling IBI scores are not necessarily an indicator of worsening water quality in an arid region.

3.5 Monitoring Program Accomplishments

- Updated and enhanced the Consolidated Monitoring Program to incorporate new monitoring collection methods and data analysis protocols.
- Developed watershed boundaries and land use information for all monitoring stations;
- Reorganized the technical content of the Monitoring Annual Report;
- Added fire map information to assist with assessing potential Pollutant sources;
- Enhanced monitoring databases to be compatible with SCCWRP/SMC standard reporting protocols;
- Enhanced monitoring methods to incorporate use of automatic sampling equipment where appropriate;
- Designed and constructed the District's LID BMP Demonstration and Testing Facility. The project acts as a laboratory for testing the water quality and water conservation benefits of LID features;

[3] Mazor, R.D., K. Schiff, P. Ode, and E. Stein. Final Report on Bioassessment in Nonperennial Streams. Report to the State Water Resources Control Board. Southern California Coastal Water Research Project Technical Report 695. June 2012.

- Implemented several programs to detect IC/IDs, including field and MS4 facility inspections, IC/ID based Dry Weather outfall monitoring. Performed annual mock storm event exercises that involve physical inspections of storm drains and Receiving Waters;

- Operating procedures for Non-Stormwater Action Levels was developed during the permit term to help with IC/ID follow-up and reporting procedures. This allowed for consistency between Co-Permittees within the region;

- Participated in the Santa Margarita Watershed Nutrient Initiative – Stakeholder Group. The group was formed to address nutrient issues in the Santa Margarita River watershed. The group hopes to set regulatory targets based on state of the science techniques to ensure the biological, chemical, and physical integrity of the Santa Margarita River and its tributaries;

- Continued participation in regional and statewide monitoring and science efforts such as the Southern California Monitoring Coalition (SMC) to develop:

  – Lab inter-calibration of chemical, bioassessment and Toxicity testing methods

  – Testing methods for bioassessment and Toxicity in Southern California streams

  – A stormwater research needs report for southern California

- Continued participation with SCCWRP on the development of the Regional Watershed Monitoring Program for Southern California. Co-Permittees have representatives on the SMC Executive Committee and the Bioassessment Technical Subcommittee.

3.6 Effectiveness Assessment

A cumulative analysis and evaluation of monitoring data indicate that the Co-Permittees' stormwater programs have been effective in preventing further impairment of SMR Receiving Waters even during a time of population growth in the region. The SMR water quality data is encouraging, and the Co-Permittees continue to assess their programs and adapt their efforts to improve water quality throughout the region.

As set forth in the SMR Monitoring Annual Reports, water quality conditions in Receiving Waters appear to be improving. This is based on a decreasing number of exceedances for 303(d)-listed constituents in the SMR. The pollutants with an increase of concentration are addressed through various programs and management activities. The following pollutant waterbody combinations at historically monitored mass loading stations have exhibited statistically significant long-term trends:

- TDS at Murrieta Creek during dry weather—decreasing concentrations
- Nitrogen (total) at Murrieta Creek during dry weather—decreasing concentrations
- Sulfate at Temecula Creek during wet and dry weather—decreasing concentrations
- Fecal coliform at Temecula Creek during wet and dry weather—decreasing counts
- *E. coli* at Temecula Creek during dry weather—decreasing counts
- Manganese at Murrieta Creek during dry weather—increasing concentrations

- The Co-Permittees initiated a Special Study to determine the cause(s) of the high concentrations of Iron and Manganese in the Region. The study is discussed briefly in Section 3.6.1.

The overall effectiveness of the Co-Permittees program is assessed based on the analysis of water quality data obtained as part of the MRP. The data has been collected and analyzed throughout the current permit term. However, the monitoring requirements of the 2010 MS4 Permit were not implemented until Fiscal Year 2012-2013. Although the initial Receiving Water quality data is encouraging, additional time and data is needed to fully assess the monitoring program results.

3.7 Watershed Program Highlights

The Co-Permittees can report the following accomplishments during the entire period of the 2010 MS4 Permit:

- Development of Best Management Practice (BMP) handbook to standardize post-construction selection and design in Riverside County. The handbook became effective September 2011.
- Development of the Upper Santa Margarita River Watershed Water Quality Workplan. Implementation began in June 2012, after submittal to Regional Board.
- Revised Co-Permittee monitoring programs to reflect new 2010 MS4 Permit changes. The changes were put into effect as of October 2012.
- Development of the Co-Permittees' Individual JRMPs. Implementation of JRMPs began in June 2012.
- Development of a Water Quality Management Plan (WQMP) that addresses post-construction stormwater runoff management for New Priority Development Projects and Redevelopment Projects. The WQMP became effective on July 11, 2014.
- Development and enhancements to the design template for developing project-specific WQMPs. The WQMP Template became effective on July 11, 2014.
- Development of the Santa Margarita Region (SMR) Hydromodification Management Plan (HMP). The Compliance plan became effective on July 11, 2014.
- Developed the Santa Margarita Region Hydrology Model (SMRHM) software to help developers analyze projects to meet the HMP requirements. The software became free to the public to download on July 11, 2014.
- Development of WQMP and HMP training and education courses. The courses were developed in 2014 to introduce the new development programs.
- Development of the Stormwater and Water Conservation Tracking Tool in collaboration with the Santa Ana Region Co-Permittees in Riverside County. The tracking tool became available to the public for use in 2014.
- Development and maintenance of Co-Permittee databases to track construction sites of 1-acre or larger in size. In addition, the Co-Permittees have standardized a construction reporting spreadsheet used for Annual Reports, updated inspection forms, and enhanced the construction outreach program.

- Creation of Co-Permittee databases to track industrial and commercial facilities.
- Continuation of the Riverside County Stormwater Pollution Prevention public education program which offers educational resources and free brochures targeting residents, businesses, developers, contractors, and elementary school children.
- Participation in regional and statewide monitoring efforts such as the Southern California Stormwater Monitoring Coalition (SMC), Southern California Coastal Water Commission and National Water Resources Institute.
- Participation in the California Stormwater Quality Association (CASQA), including various leadership roles.
- Continued partnership in the Upper Santa Margarita Region Integrated Regional Watershed Management Plan
- Performance of multiple special studies during the 2010 MS4 Permit term that have helped to identify causes of pollutants within the Santa Margarita Region. These studies are discussed further in Section 3.7.1

3.7.1 Special Studies Conducted

Sediment Toxicity – The goal of the study was to assess the quality of stream sediments and possible contamination from MS4 runoff in receiving waters. The workplan was finalized, based on approval of the Water Board, in May 2013. The results of monitoring metals, organochlorine pesticides, and synthetic pyrethroid pesticides in sediment indicated that the concentrations were generally below target threshold and effect levels.

Trash and Litter Investigation – The goal of the study was to provide information regarding BMP effectiveness for trash and to help guide management actions and BMP implementation for trash in the SMR. The study was submitted to the Regional Board in 2013 along with the Monitoring Annual Report. The report found that trash and litter was not a significant issue in the receiving waters within SMR.

Agricultural, Federal, Tribal and State Input Study – This study investigates the water quality of agricultural, federal, and tribal runoff that is discharged into the Co-Permittees' MS4. The goal of the study was to characterize stormwater flows that are not regulated by the Co-Permittees but have influence upstream of their MS4s. The preliminary findings have found that the highest levels of pollutant concentrations were measured from agriculture land use. The second year of required monitoring for the special study is currently being completed within FY 2014-2015. A final report is anticipated to be submitted with the 2014-2015 Monitoring Annual report.

Low-Impact Development (LID) Retention Impacts Study – The Co-Permittees participated in the development of the special study in order to assess the impacts of LID on surface flows, the potential relationship to beneficial uses, and the effects on water supply rights of down downstream jurisdictions. The LID Retention Impacts Study was prepared in lieu of the required "MS4 and Receiving Water Maintenance Study" (required under Attachment E, Section II.E.S of the 2010 Order) and the "Intermittent and Ephemeral Stream Perennial Conversion Study" (required under Attachment E, Section II.E.6 of the 2010 Order), as described in correspondence received from the Regional Board dated September 14, 2012.

Per agreements with Board staff, a study scope was prepared to evaluate whether or not LID requirements were likely to have a significant impact on storm flows and base flows to the Santa Margarita Gorge. The project team met with Regional Board staff and jointly developed a modeling approach that would provide an indication as to whether or not further assessment would be required. The study and findings were subject to a peer review conducted under the direction of the Southern California Coastal Watershed Research Project (SCCWRP).

The results of this study indicate that the retention of surface runoff will result in greater evaporation and less stormwater runoff to the Santa Margarita Gorge when LID is implemented, as compared to traditional stormwater BMPs only, but greater stormwater runoff then under current conditions. The reduced streamflow at the Gorge under future full build-out with LID for both new and existing development conditions may impact downstream beneficial uses**.**

The peer review comments reflect issues that may need to be addressed for a more comprehensive modeling exercise. However, given the results of this conceptual modeling study and considering the comments from the peer review panel, our preliminary conclusion is that the impacts from LID implementation in the Upper Santa Margarita River watershed would not be significant under likely development scenarios, and no further actions are recommended.

Source Assessment of Iron and Manganese Study – The Co-Permittees initiated a study investigating the persistent exceedances of iron and manganese water quality objectives (WQOs) within SMR. The Co-Permittees initiated a source analysis indicating that iron and manganese concentrations in Receiving Waters are strongly associated with the geology located throughout the SMR. Additional sources, including MS4 contributions were evaluated, but the weight of evidence suggests that iron and manganese concentrations are consistent with the local geology. High concentrations were also observed in reference streams from undeveloped watersheds of similar geological characteristic. The preliminary results are evidence that natural sources are the cause of elevated levels of iron and manganese in Receiving Waters.

3.8 Proposed Program Modifications and Revisions

3.8.1 SMR Monitoring Program

The Co-Permittees request several revisions and/or modifications to the monitoring program.

Removal of Carbamate Pesticides from Constituent List

In the upcoming 2015-2016 Monitoring Year, the Co-Permittees request that Carbamate Pesticides be removed from the constituent lists, based on the data collected during the Permit term. As evidenced by the results of the Monitoring Annual Reports (e.g., Attachment H, Detected Results located within Appendix C), the Carbamate Pesticides have not been detected in the water quality samples. Furthermore this list of Carbamate Pesticides includes many compounds that have been banned by EPA or are in process of cancelling registrations for use (e.g. Carbofuran). This request is in conformance with the requirements of 40 CFR 122.44. With the removal of these constituents, the Co-Permittees will focus on detected constituents that potentially threaten water quality.

Receiving Water Monitoring Revisions

The 2010 Permit focused on the correlation of the water quality chemistry, toxicity, and stream assessment findings to help identify water quality priorities. However, the data collected from outfalls and receiving water stations was limited due to the severe drought conditions. In several cases there was no

flow in the Receiving Water. In the case of the stream assessment program (see Section 3.4), results yielded low IBI scores induced by drought. The Co-Permittees recommend that the next Permit term refocus monitoring efforts towards reliable data collection such as:

- A detailed reconnaissance of region-wide outfalls to identify intermittent and persistent sources of urban runoff into receiving waters, prioritize those locations, and then relocate the outfall monitoring stations to the high priority outfall locations.
- Limit Receiving Water monitoring to the three mass loading stations (i.e., Adobe, Temecula, and Murrieta) as these locations have historical data available for long-term trend comparison. These long-term stations may provide better utility for data comparisons as programs are implemented.
- As described above in Section 3.4, the drought appears to inhibit the Co-Permittees' ability to use IBI scores to correlate the bioassessment results with water quality impacts. The method used for bioassessment does not adequately distinguish between the effects of simply not having sufficient water present and the effects of poor water quality on the target populations. We note that as the drought continues the IBI scores decrease; therefore, falling IBI scores may not be a reliable indicator of worsening water quality in an arid region. The arid conditions may mask an accurate assessment of the water quality impacts on a stream. The Co-Permittees request that the Regional Board suspend stream assessment until an appropriate protocol is developed for arid region.

Revision of the Definition of Wet/Rainy Season

The Co-Permittees request that the Wet/Rainy Season be modified from October 1st to April 30th, to October 1st to May 31st. The extension would more accurately reflect the watershed's precipitation season, and extend the period for successful Wet Weather sampling opportunities.

3.8.2 Proposed JRMP Revisions

The Co-Permittees do not foresee major changes to their JRMPs at this time. However, the City of Temecula and the County are in the process of a minor revision to their standards to emphasize erosion control as the most important measure for keeping sediment onsite during construction.

4.0 Additional Comments on Proposed Permit

- **Previous Comments** - The Co-Permittees previously have expressed concerns regarding inclusion in the San Diego Regional Board's Regional Permit (Order No. R9-2013-0001, as modified by Order No. R9-2015-0001). The Co-Permittees' concerns and legal objections to inclusion in a regional permit are set out more fully in our written comment letter dated January 10, 2013, in Order No. R9-2013-0001 and November 19, 2014 regarding Order R9-2015-0001. For your convenience, these comments are included as Appendix D.

- **Receiving Water Limitations Language -** The Riverside County Co-Permittees continue to believe strongly that every MS4 Permit should incorporate a clear and achievable path to compliance for Co-Permittees. The Co-Permittees are actively participating in the workshops held by Regional Board staff concerning this important topic.

  The focus of the Watershed Workplan is on an iterative, flexible, and priority-setting approach that is intended to enable the Co-Permittees to focus on the most important water quality impairments in the SMR, and improve water quality. As we have previously commented, if the Co-Permittees have no protection from automatic liability for exceedances of water quality standards, they must address each such exceedance, even when that exceedance may be transitory or of minimal environmental or public health consequence. Stretching resources to address such issues diverts limited Co-Permittee resources from the most important threats to water quality and delays overall water quality improvement.

  State Board staff has already strongly signaled its support of alternative compliance language in MS4 permits, as set forth in the draft Order on the petitions challenging the 2012 Los Angeles County MS4 Permit. The Co-Permittees look forward to working with Regional Board staff, permittees from Orange and San Diego Counties, and the other stakeholders to develop appropriate alternative compliance language.

- **Prior Lawful Approval Language -** The Co-Permittees request language that allows each Co-Permittee to evaluate each project independently, in order to determine at their sole discretion, compliance as it relates to Prior Lawful Approval.

- **CEQA Processing Considerations** – Programmatic requirements that entail structural improvements such as retrofits and/or BMPs will trigger CEQA compliance. Future Permit language should discuss lead agency designation and consider CEQA processing in future workplan implementation timelines.

RIVERSIDE COUNTY FLOOD CONTROL
AND WATER CONSERVATION DISTRICT

November 19, 2014

sent via email 11/19/14: Laurie.Walsh@waterboards.ca.gov

Ms. Laurie Walsh, P.E., WRC Engineer
CRWQCB - San Diego Region
2375 Northside Drive, Suite 100
San Diego, CA 92108

Dear Ms. Walsh:

Re: Comment - Tentative Order No. R9-2015-0001Place ID:65801LWalsh

This letter is written by the Riverside County Flood Control and Water Conservation District (District), on behalf of itself, the County of Riverside and the Cities of Murrieta, Temecula, and Wildomar (collectively, the Riverside County Co-Permittees) regarding Tentative Order No. R9-2015-0001 (Tentative Order). The Tentative Order proposes to add the County of Orange and other agencies located in South Orange County within the existing San Diego County Municipal Separate Storm Sewer System (MS4) Permit. The Riverside County Co-Permittees appreciate the opportunity provided by the San Diego Regional Water Quality Control Board (Regional Board) to offer its comments on the Tentative Order.

The Riverside County Co-Permittees wish to reiterate their concerns regarding a Regional MS4 Permit for San Diego, Orange, and Riverside Counties. Those concerns are set out more fully in our written comment letter dated January 10, 2013, on Order No. R9-2013-0001. The Riverside County Co-Permittees will be submitting a Report of Waste Discharge prior to the expiration of their current MS4 Permit, seeking either modification to the Regional Permit or an individual permit covering only those Co-Permittees. For your convenience, the January 10, 2013 comments are attached to this letter. The Co-Permittees request that this comment letter and attachments be added to the record for the Tentative Order, since most of the issues raised in those comments still pertain to the Tentative Order. The Co-Permittees also request that the oral testimony of Riverside County Co-Permittees on Order No. R9-2013-0001 be included in the record for the Tentative Order. The Riverside County Co-Permittees support the South Orange County Co-Permittees general approach to the issues raised by the Tentative Order.

Notwithstanding the Riverside County Co-Permittees' concerns to a Regional Permit, and subject to it, the Co-Permittees offer the following observations regarding the Tentative Order.

1. Need for Path to Compliance

As set forth in our written and oral comments on Order No. R9-2013-0001, the Riverside County Co-Permittees continue to believe strongly that every MS4 permit, including the Tentative Order, should

incorporate a clear and achievable path to compliance for Co-Permittees. As the Executive Officer and staff indicated in the hearings on Order No. R9-2013-0001, the San Diego County Co-Permittees will be out of compliance with the Permit's receiving water limitations (RWL) provisions for years. We agree with staff's assessment, and state further, that the lack of a provision to allow Co-Permittees to be considered in compliance with the RWL provisions leaves the Co-Permittees open to possible enforcement by third-parties and, as importantly, threatens the compliance approach that has been successfully employed by the Riverside County Co-Permittees to address water quality impairments in the Santa Margarita Region.

The Riverside County Co-Permittees agree with staff that a MS4 permit which allows the Permittees to adopt a "fail early and fail often" iterative approach to water quality is preferable to a permit which simply mandates certain actions. The Santa Margarita River Watershed Water Quality Workplan in Riverside County follows an iterative, flexible, and priority-setting approach that is intended to enable the Co-Permittees to focus on the most important water quality impairments in the Region, and make real, quantifiable improvements in water quality. As we have previously commented, if the Co-Permittees have no protection from liability for exceedances of water quality standards, they must address each such exceedance, even when that exceedance may be transitory or of minimal environmental or public health consequence. Stretching resources to address such issues diverts limited Co-Permittee resources from the most important threats to water quality and delays overall water quality improvement.

Recognizing this deficiency in the 2001 MS4 Permit for the Los Angeles County Co-Permittees, in its 2012 Permit, the Los Angeles Water Board adopted a path to compliance with RWLs through the development of adaptive and prioritized watershed management plans. The Riverside County Co-Permittees believe that a similar approach to RWL compliance should be included in the Tentative Order.

2. Hydromodification Provisions

While most of the substantive changes in the Tentative Order have specific application only to San Diego and/or South Orange Counties, the Riverside County Co-Permittees support exemptions for engineered channels and large river reaches in Provision E.3.c.(2)(e). This provision also provides an interim timeframe exemption for the implementation of hydromodification management BMP requirements for priority development projects.

The exemptions identified in Provision E.3.c.(2)(e) are appropriate and reasonable, and should be made permanent exemptions moving forward.

3. Basin Planning and Water Quality Improvement Plan (WQIP) General Comments

For the WQIPs to ultimately succeed, they need to be based upon regionally appropriate water quality standards. These water quality standards require review to ensure that they reflect sustainable conditions for beneficial uses, explicitly consider regulatory policy and environmental trade-offs

inherent in the protection of beneficial uses, and address the nature and impact of stormwater upon beneficial uses.

The Riverside County Co-Permittees would like to thank the Regional Board and staff for working with the Santa Margarita River Nutrient Initiative Group on such a review. This group, which includes dischargers, tribal interests, interested non-profits, scientists, and Regional Board staff, is using a scientifically based and rigorous approach to evaluate potential water quality targets for, and sources of, nutrients in the Santa Margarita Watershed. It is our belief that this effort will lead to more considered, effective, and appropriate management of local receiving waters, and thereby promote quicker and more effective environmental outcomes. It may also assist with the identification and development of innovative and alternative programs to manage nutrients within the Region. This effort will inform the development of the Santa Margarita River Watershed Water Quality Workplan and other regulatory programs.

The Co-Permittees request and encourage Regional Board staff to work with other stakeholders to consider, prioritize, and address other perceived constraints and inconsistencies within the San Diego Region Basin Plan. Such efforts will ultimately result in a better focus of local and regional compliance programs, including the WQIPs, on actions that are more likely to effectively and quickly address public health risks and environmental risks to receiving waters. Such an approach is exactly in line with staff's emphasis on workable solutions to these challenges.

The Riverside County Co-Permittees appreciate the opportunity to comment on the Tentative Order. Should you have any questions regarding these comments, please contact David Garcia at 951.955.1330/dhgarcia@rcflood.org.

Very truly yours,

for JASON E. UHLEY
Chief of Watershed Protection Division

RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT

January 10, 2013

Mr. Wayne Chiu, P.E.
California Regional Water Quality
Control Board, San Diego Region
9174 Sky Park Court, Suite 100
San Diego, California 92123-4340

Dear Mr. Chiu:

Re: Tentative Order No. R9-2013-0001
Regional MS4 Permit
Place ID: 786088Wchiu

The Riverside County Flood Control and Water Conservation District (District) is submitting this comment letter on the above listed Tentative Draft Order on behalf of the Riverside County MS4 Copermittees within the San Diego Region (Riverside County Copermittees) which includes the District, the County of Riverside and the Cities of Murrieta, Temecula and Wildomar. Tentative Draft Order R9-2013-0001 (Draft Permit) was drafted by Board staff to cover Phase I municipal separate storm sewer system (MS4) Copermittees in San Diego County, southern Orange County, and the portion of southwestern Riverside County within the Santa Margarita Hydrologic Unit.

The Riverside County Copermittees have previously commented that the San Diego Water Board lacks authority to adopt a regional permit covering Orange and Riverside Counties, in addition to San Diego County; a comment which is discussed in further detail below and in the attached legal comments. Notwithstanding such objection, and subject to it, the Riverside County Copermittees are providing comments on the Draft Permit.

In the workshop on the Administrative Draft Order held on April 22, 2012 San Diego Water Board staff identified the following desired outcomes for the proposed permit:

- Improving the quality of water discharged from the MS4
- Restoring or enhancing Beneficial Uses and Receiving Water quality

It was further identified by Board staff that to be able to meet those goals, the proposed regional MS4 permit needed to be 1) Strategic, 2) Adaptive, and 3) Synergistic.

Notwithstanding the concerns of the Riverside County Copermittees with regard to the legal authority to issue a regional MS4 permit, the Copermittees agree that being able to adapt and direct resources toward specific water quality priorities in a given watershed, rather than all potential problems simultaneously, is more likely to result in actual and meaningful improvements in water quality. However, to be able to achieve those improvements the MS4 Permit must be crafted to provide the Copermittees with the ability to truly and fully

adaptively manage their programs to focus resources on those BMP strategies and monitoring efforts that are identified as being most effective, consistent with the MEP standard, at addressing watershed priorities.

Unfortunately, many provisions in the Draft Permit, including but not limited to the Receiving Water limitation provisions in Provision A and others discussed in this letter, still do not fully support the achievement of those outcomes. The Draft Permit does not provide the Copermittees with the flexibility to be fully strategic in managing their resources nor the ability to fully adapt their programs to focus on the highest priority water quality needs of the watershed. This comment letter and the other documents submitted herewith (a redline of the Draft Permit and Legal Comments) identify some suggestions which, if adopted by the San Diego Water Board, will help to address these limitations and facilitate the desired improvements.

This comment letter is organized as follows:

1 BACKGROUND 3
2 GENERAL COMMENTS 3
2.1 REGIONAL PERMIT 3
2.2 OUTCOME FOCUS 4
2.3 RESPONSIBILITY FOR MEETING GOALS OF CWA 5
3 SPECIFIC COMMENTS 5
3.1 FINDINGS 5
3.2 PROVISION A, PROHIBITIONS AND LIMITATIONS 9
3.3 PROVISION B, WATER QUALITY IMPROVEMENT PLANS 12
3.4 PROVISION C, ACTION LEVELS 14
3.5 PROVISION D, MONITORING AND ASSESSMENT 14
3.6 PROVISION E.1, LEGAL AUTHORITY 19
3.7 PROVISION E.2, IDDE 20
3.8 PROVISION E.3, DEVELOPMENT PLANNING 24
3.9 PROVISION E.4, CONSTRUCTION 29
3.10 PROVISION E.5., EXISTING DEVELOPMENT 30
3.11 PROVISION E.6, ENFORCEMENT RESPONSE PLANS 31
3.12 PROVISION E.7, PUBLIC ED 31
3.13 PROVISION, E.8 FISCAL ANALYSIS 32
3.14 PROVISION F 32
3.15 ATTACHMENT C 33

As noted, the Riverside County Copermittees also are submitting a redline of the Draft Permit ("Redline") that proposes alternative language intended at achieving solutions to the various issues raised in this letter, and a Legal Comment document ("Legal Comments") that provides additional legal context for the various issues raised in this letter. The Riverside County Copermittees reserve their right, in the context of filing a Report of Waste Discharge ("ROWD") prior to the expiration of Order R9-2010-0016 (the 2010 MS4 Permit), to again address these issues and others relevant and appropriate to the SMR.

1 BACKGROUND

The Riverside County Copermittees were issued an extensive and prescriptive MS4 Permit in November 2010 which greatly expanded monitoring obligations, required special studies, a jurisdictional runoff management program, and Watershed Workplan requirements that were very different than the requirements set forth in the previous MS4 Permit issued to the Copermittees. Development and implementation of the 2010 MS4 Permit compliance requirements has been very expensive, especially in comparison to the relatively few demonstrated impairments of Beneficial Uses in the region and the Copermittees' resources. These requirements have left other important societal needs unfulfilled by the Riverside County Copermittees during a period of unprecedented and continuing economic distress. Further, the Riverside County Copermittees are still in the process of developing and implementing these 2010 MS4 Permit requirements, which is a serious concern given the very different compliance approach proposed in the Draft Permit. The Copermittees hope that the compliance efforts under the current MS4 Permit are taken into account when they submit their ROWD at the expiration of the 2010 MS4 Permit.

2 General Comments

2.1 Regional Permit

The Riverside County Copermittees respectfully submit that the San Diego Water Board is not authorized under the Clean Water Act or under its implementing regulations to issue a regional permit to Copermittees in San Diego County, South Orange County and the Santa Margarita Region (SMR) of Riverside County. As discussed more fully in the Legal Comments, the only circumstance under which the San Diego Water Board could issue such a permit would be if the Copermittees in these counties agreed to such a permit. Additionally, while the Draft Permit purports to affect the conduct of the Riverside County Copermittees upon expiration of the 2010 MS4 Permit in November 2015, the Riverside County Copermittees have not submitted a ROWD requesting coverage under a regional permit. Because no application has been made for the regional permit, which is a requirement set forth in the CWA regulations, the San Diego Water Board lacks jurisdiction to name the Riverside County Copermittees on the Draft Permit at this time.

Notwithstanding the above, the Riverside County Copermittees are submitting the comments in this letter based on:

- The San Diego Water Board staff's stated intent to enroll the Riverside County Copermittees in this permit upon expiration of the 2010 MS4 Permit.
- Statements made by San Diego Water Board staff that this comment period would serve as the primary opportunity for the Riverside County Copermittees to influence their next term MS4 Permit. The Riverside County Copermittees are entitled, as part of the ROWD process, to again raise relevant issues regarding permit provisions, but have undertaken in these comments to address major current concerns.

2.2 Outcome Focus

As mentioned above, the Copermittees agree that being able to adapt and direct resources toward addressing the specific water quality priorities in a given watershed, rather than all potential problems simultaneously, is more likely to result in actual/meaningful improvements in water quality. However, to be able to achieve those improvements, the MS4 Permit must fully integrate the following principles:

- **The Jurisdictional Program requirements must be fully flexible:** The Permit must be written in a way that allows the Copermittees to truly and adaptively manage their programs to fully focus their existing resources on those BMP strategies and monitoring efforts that are identified within the Water Quality Improvement Plan (WQIP) as being most effective, consistent with the Maximum Extent Practicable (MEP) standard, at addressing the watershed's priorities. We understand this to be the goal of the San Diego Water Board as well. While some elements of the Draft Permit embody this need, others do not and require dedication of resources to specific pre-defined efforts, regardless of the identified need for that effort in the watershed. The specific program areas that need more work to this end are:

    - The approach to addressing Non-stormwater discharges
    - Development Planning
    - Retrofitting
    - Channel Rehabilitation

These issues and proposed new language to address these issues are included throughout this letter and/or in the attached Redline.

- **Basin Plan updates need to be Prioritized by the San Diego Water Board:** For outcome-based permitting to be successful, the desired outcomes must be achievable by and appropriate to the Copermittee. To do that, the outcomes must take into account the background conditions in the watershed, and be appropriate for the attainment of Beneficial Uses in the specific waterbody, based on the specific conditions within and influencing that waterbody. The values in the Basin Plan should be comprehensively re-evaluated to ensure that water quality standards are scientifically justified to protect Beneficial Uses. Without updating the Basin Plan, the outcomes that the Copermittees target in the WQIPs would be arbitrary and not guaranteed to achieve the desired beneficial use improvements. Such an update should be pursued aggressively, led by and adequately funded by the San Diego Water Board, with participation by the MS4 Copermittees and other dischargers and stakeholders in the watershed.

- **Other Dischargers need to be Similarly Regulated by the San Diego Water Board:** The MS4 Copermittees are not the only dischargers of pollutants in the watershed. For example, the SMR of Riverside County includes State Lands (such as Caltrans), Tribal Lands, Agricultural Operators, Industrial Permit dischargers, Construction Permit dischargers, Phase II entities, Water Districts, and 'De Minimus' dischargers issued general permit coverage; all of which:

- Have separate regulatory programs (such as permits or waivers) implemented by the San Diego Water Board;
- May discharge pollutants, including non-stormwater, that can affect the quantity and quality of runoff, both directly within Receiving Waters, and in runoff discharges that may enter into and be discharged from the MS4; and
- Cannot be regulated by the Copermittees for the quantity and quality of their runoff because of their separate permits or waivers granted by the NPDES Program Administrator.

As such, while MS4 Copermittees can implement programs to reduce pollutants in discharges that are within their legal jurisdiction, no amount of effort by the MS4 Copermittees can be expected to fully attain water quality standards in the Receiving Waters. The only way to achieve that outcome will be for the NPDES Program Administrator (the San Diego Water Board in most cases) to directly regulate each of these entities to similar levels and standards as set forth by this Permit.

2.3 Responsibility for meeting goals of CWA

The CWA requires Copermittees subject to any MS4 permit, including the Draft Permit, only to address discharges from their MS4s. 33 U.S.C. § 1342(p)(3)(B). The Copermittees are not required to restore Beneficial Uses in any Receiving Water, or to address sources of pollution to those Receiving Waters that are not being discharged into or from those MS4s. However, in various provisions in the Draft Permit, there is a suggestion that the Copermittees are solely responsible for attaining water quality standards in their respective Receiving Waters. The San Diego Water Board must make clear in the Draft Permit that the responsibilities of the Copermittees are limited to their MS4s and the requirements of the CWA for municipal stormwater dischargers. Redline changes have been proposed in the above referenced portions of the Draft Permit to address this issue.

3 Specific Comments

The following comments represent specific high level concerns that the Riverside County Copermittees have identified at this time. Additional comments on the Draft Permit can be found in the Redline, as well as in the attached Legal Comments.

3.1 Findings

The Riverside County Copermittees have two separate sets of comments on the Findings. The first addresses the need for additional findings, with respect to aspects of California law and the physical setting of the SMR. The second set of comments focuses on existing Findings in the Draft Permit.

3.1.1 Needed Additional Findings

The Findings in the Draft Permit fail to fully address the context and conditions under which the proposed permit requirements are to be applied. A more complete explanation of this background is necessary to ensure that the Provisions ultimately included in the Draft Permit are credible, appropriate and legally required, and that the Permit Provisions (which must stem from the Findings) reflect the

context of the broader issues that affect MS4s within the region. The Riverside County Copermittees request that San Diego Water Board staff work with the MS4 Copermittees to expand the Findings, including the addition of findings to address the following:

California Water Law

California law requires that downstream entities must accept runoff from up-gradient properties. Owners and operators of MS4s are not exempt from this legal mandate, even if that runoff contains pollutants. Moreover, flood control districts, including the District, are mandated by the California Legislature (Legislature) to protect the lives and property of residents from floodwaters. The Riverside County Copermittees request that a finding, in the form set forth in the Redlines, be added to the Draft Permit.

Flooding

Many areas that would be under the jurisdiction of the Draft Permit are subject to periodic catastrophic flooding, which results from natural conditions, specifically the presence of mountains and hilly areas in close proximity to development, along with the effect of strong Pacific storms. This flooding would occur even in the absence of development. The Legislature recognized the importance of this issue in the early 20th Century, when it established flood control districts across the state, including in Riverside, Orange and San Diego Counties. Such flooding has, and if not controlled, could result in loss of life and widespread property damage. Further, the flooding can mobilize significant amounts of pollutants from industrial, commercial, residential and agricultural lands, damaging watercourses, habitat, and the Beneficial Uses therein. MS4 systems are designed and constructed to mitigate these impacts. The Riverside County Copermittees request that a finding in the form set forth in the Redline be added to the Draft Permit.

Flood Control District Acts

As noted above, the Legislature established Flood Control Districts in Orange, Riverside, and San Diego Counties through a series of Flood Control Acts. The Legislature determined that protection of life and property from the effects of flooding through the implementation of flood control improvements was a priority, and assigned those Districts with the sole responsibility to design, construct and maintain those improvements necessary to manage and contain floodwaters to prevent such negative impacts, as well as to conserve floodwaters for beneficial use. As noted above, these improvements represent fundamental water quality BMPs inasmuch as they reduce the widespread exposure of runoff to pollutants. The Flood Control Districts, while owners and operators of MS4s, have no authority or powers beyond those granted by the Legislature. The Legislature did not provide the Flood Control Districts, for example, the authority to regulate land uses within the municipal jurisdictions of Riverside County, nor to control the volume or quality of runoff discharged by those land uses. Findings describing the legislative priority for flood control and the limitations on the governing power of the Flood Control Districts should be added to set forth the appropriate role of the Flood Control Districts as MS4 Copermittees. The Riverside County Copermittees request that a finding, in the form set forth in the Redline, be added to the Draft Permit.

Limits on Extent of Permittee Legal Authority

The MS4 Copermittees lack the authority to regulate many significant sources of pollutants that may impact Receiving Waters. For example, the Copermittees cannot regulate pollutants discharged from federal and state lands, facilities, tribal lands, special districts, utilities, agricultural lands, or railroads. Moreover, the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) preclude local regulation of pesticides. The Riverside County Copermittees request that a finding in the form set forth in the Redline be added to the Draft Permit.

3.1.2 Comments on Existing Findings

Findings 3 and 15 (and elsewhere in Draft Permit)

In Findings 3 and 15 (and throughout the Draft Permit), it is stated that the CWA requires controls to reduce the discharge of pollutants "in stormwater" to the MEP. Finding 15, moreover, states that non-stormwater discharges from the MS4 are "not considered stormwater discharges and therefore are not subject to the MEP standard, stating that the MEP standard "is explicitly for 'Municipal . . . Stormwater Discharges" from the MS4s.

These conclusions are directly contrary to the plain language of the CWA, as set forth in the November 16, 1990 preamble accompanying the CWA stormwater regulations. Those authorities provide that the MEP standard applies to *all* pollutants discharged from the MS4, notwithstanding that some may be transported by non-stormwater. Additionally, the Redline reflects deletion of the limitation of the MEP standard to stormwater discharges in multiple locations, reflecting federal law. For a further discussion of this issue, please see the Legal Comments. The Riverside County Copermittees also request deletion of Finding 15.

Finding 11

This Finding states that "[r]ivers, streams and creeks in developed areas used [to convey runoff] . . . are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and Receiving Water." This statement is incorrect and must be deleted (as reflected in the Redline). For reasons more fully set forth in the Legal Comments, natural streams cannot be considered MS4; there is no MS4 "outfall" from a channelized river or stream to a natural stream; and, USEPA itself requires a distinction between MS4s and Receiving Waters.

Finding 12

This Finding states that as operators of MS4s, "Copermittees cannot passively receive and discharge pollutants from third parties." By providing free and open access to an MS4 that conveys discharges to Waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or otherwise control. This statement is incorrect and must be deleted (as set forth in the Redline). As the discussion in the Legal Comments indicates, municipalities must maintain the MS4 to protect the lives and property of their citizens and to prevent nuisance. Flood Control Districts have a statutory obligation to operate and maintain such MS4, an obligation which is not affected by

either the CWA or the terms of the Draft Permit. While an MS4 operator has the obligation to effectively prohibit the entry of non-stormwater into the MS4, it does not have legal responsibility for such discharges, which are the responsibility of the discharger itself and subject to the jurisdiction of the San Diego Water Board, pursuant to Water Code section 13260 *et seq.*

Finding 28

This Finding recites that the San Diego Water Board finds that the requirements of the Draft Permit "are not more stringent than the minimum federal requirements." The Riverside County Copermittees disagree with this finding, as it is not supported by the evidence, *i.e.,* the many requirements in the Draft Permit which exceed the federal MEP standard. Moreover, any decision by the San Diego Water Board to adopt "other provisions" going beyond MEP is not a federal requirement, but rather a discretionary decision taken by a state agency under authorization in the CWA. *See Defenders of Wildlife v. Browner,* 191 F.3d 1159, 1164-65 (9th Cir. 1999). Please see discussion in the Legal Comments. The Finding also indicates that the San Diego Water Board has developed an economic analysis of the Draft Permit. As set forth in the Legal Comments, the Riverside County Copermittees challenge the adequacy of that analysis.

Finding 29

This finding purports to find that the Draft Permit does not constitute an unfunded state mandate. The Riverside County Copermittees disagree with the conclusions set forth in this finding. More importantly, the finding is without legal effect because exclusive jurisdiction as to whether a state mandate exists, and whether it is unfunded lies with the Commission on State Mandates. Government Code §§ 17751 and 17552; *Lucia Mar Unified School District v. Honig* (1988) 44 Cal.3d 830, 837; *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1546, 1596-97. The finding of an agency that has no jurisdiction to make that finding is entitled to no weight and should be deleted, as shown in the Redline. For an additional discussion of these issues, please see the Legal Comments.

Finding 31

The Riverside County Copermittees believe that the Receiving Water Limitation ("RWL") language set forth in the Draft Permit renders compliance with the permit impossible, since exceedances of water quality standards occur routinely through no fault of the MS4 Permittees. Thus, unless the RWL is modified to provide the Copermittees with a means to be in compliance, those Copermittees risk the threat of arbitrary San Diego Water Board enforcement or the bringing of citizen suit lawsuits under the CWA, which could nullify compliance with all other terms set forth in the Draft Permit, as discussed more fully in the Legal Comments. The exposure to third party litigation from the proposed RWL language is one of the most significant threats to an otherwise collaborative approach to achieving long term water quality improvement. This threat was emphasized by the recent bringing of a citizen suit lawsuit against the City of Malibu, the County of Los Angeles and the Los Angeles County Flood Control District based on similar language in the 2001 Los Angeles County MS4 Permit. The Riverside County Copermittees have suggested modifications to Provision A in the Redline and as discussed below and in the Legal Comments that are intended to better support the Iterative Process for compliance authorized by the State Water Resources Control Board in Order No.

2001-15, through the WQIP process. The Copermittees also note that the State Board considered the problems with the RWL language at a recent workshop, which may eventually result in modifications which should, if applicable, be reflected in the Draft Permit. Other requested changes to the Findings are set forth in the Redline.

3.2 Provision A, Prohibitions and Limitations

As noted above, the requirements set forth in Provision A are of great concern to the Riverside County Copermittees. The Copermittees generally support an approach to compliance that utilizes WIQPs as the implementing mechanism for the 'Iterative Process' described in Provision A.4, and that by implementing that iterative process in accordance with A.4, that the Copermittee should be in compliance with Provisions A.1 and A.2. The Redline reflects edits of Provision A to clarify the linkage between the prohibitions and limitations in Provisions A.1. through A.3. and Provision A.4 – which is described as the method for complying with the prohibitions and limitations. It must be noted, however, that the Riverside County Copermittees do not agree with the approach suggested, that any WQIP-based compliance approach be necessarily accompanied by a Reasonable Assurance Analysis. Such analyses can be extremely complex, expensive and time-intensive to develop, and similar analyses are commonly developed within TMDL models; taking a number of years to develop and refine. Given that the Santa Margarita Watershed has no adopted TMDLs; thus, comprehensive pollutant transport and BMP models are not available for the suite of constituents that might be considered for prioritization within a WQIP for the Santa Margarita Watershed. In the context of a TMDL, such models would be developed by the combined resources of the San Diego Water Board and a range of stakeholders and dischargers. Undertaking such an exercise solely with the public resources of the 275,000 residents of the SMR is beyond the financial ability of the Copermittees and would shift the responsibility for development of TMDLs from the San Diego Water Board to the Copermittees. Comments on Provision A can be found below, in the Redline and in the Legal Comments.

3.2.1 Overview of Key Issues

As noted above, an overriding issue for the Riverside County Copermittees is having a permit that, while being appropriately proactive and aggressive at addressing the prioritized water quality conditions with the Receiving Waters, is one that all Copermittees can remain in compliance with while implementing those requirements. As presently drafted (and as made clear by statements in the Fact Sheet), Provision A imposes immediate potential liability on every Copermittee if monitoring in the Receiving Waters reflects exceedances of water quality standards that may have been caused or contributed to by MS4 discharges. San Diego Water Board staff has repeatedly indicated in workshop presentations that they expect that Copermittees will not be able to comply with the Receiving Water Limitations and Discharge Prohibitions for some time. Staff has separately indicated that they are interested in having the Copermittees undertake bold initiatives in trying to address urban runoff pollution, and that the Copermittees have actually been encouraged to "fail early and fail often" as this would reflect such progress in refining these initiatives. The iterative, flexible and priority-setting approach reflected in the WQIP is intended to allow the Copermittees to focus on the most important problems in their watershed. The entire approach is endangered, however, by RWL provisions which would allow either the San Diego Water Board or a citizen plaintiff to sue the Copermittees for any individual exceedance of the

RWLs. Under the current version of Provision A, the unmitigated risk of such actions leads not to bold initiatives but rather to attempts to minimize liability.

As set forth in the Legal Comments, this approach is not mandated by the CWA, State Board orders or the opinion of the Ninth Circuit Court of Appeals in *Natural Resources Defense Council v. County of Los Angeles,* 673 F.3d 880 (9th Cir. 2011), *reversed,* 568 U.S. __ (January 8, 2013). As importantly, the threat of immediate potential noncompliance actually interferes with the ability of the Copermittees, including the Riverside County Copermittees, to comply with the Draft Permit. Instead of being able to focus on pollutants of highest concern in the watershed, as called for in the WQIP, the Copermittees will be forced to try to address every pollutant monitored, since the exceedance of any water quality standard leads to immediate potential liability. Moreover, because citizen plaintiffs are entitled to injunctive relief under Section 505(a) of the CWA, a federal judge could order the Copermittees to undertake steps completely independent of the WQIP or other compliance provisions in the Draft Permit.

The Riverside County Copermittees do not object to compliance provisions that will provide a means to achieve real improvement in water quality. The Copermittees are willing to undertake these Provisions, because the success or failure is in their control. Compliance with the requirements of Provision A, however, is beyond the control of the Copermittees. Based on the statements made during the workshop process, the Riverside County Copermittees believe that the San Diego Water Board is serious about working with the Copermittees on a permit that provides flexibility and problem solving approaches. To ensure that this flexibility is not lost, the Draft Permit must tie in compliance with Provisions A.1 through A.3 to a process set forth in Provision A.4. This approach is shown in the Redline and is discussed further below.

3.2.2 Comments in support of specific changes

Provision A, Introduction

The introduction notes that pollutants "in stormwater discharges" from the MS4 must be controlled to the MEP. As discussed above, the CWA does not differentiate between stormwater and non-stormwater discharges from the MS4; both must be controlled to the MEP standard. The Riverside County Copermittees have requested revised language in the Redline. Additionally, the linkage between compliance with Discharge Prohibitions (Provision A.1), Receiving Water Limitations (Provision A.2) and Effluent Limitations (Provision A.3) should be noted as being defined by Provision A.4. This change is reflected in the Redline.

A.1.a

First, language must be added providing that compliance may be addressed through the process set forth in Provision A.4. This language is provided in the Redline. Second, the Provision prohibiting discharges which are "threatening to cause" a condition of pollution, etc., is unenforceable, because it prohibits an action that, with respect to MS4 operators, is beyond their control. Moreover, there is no authority for such provisions in the Porter-Cologne Act. The Riverside County Copermittees request

deletion of this phrase, as shown in the Redline. Additionally, as set forth in the Legal Comments, the Provision improperly expands the Discharge Prohibitions to Waters of the State.

A.1.b

40 CFR § 122.26(d)(2)(iv)(B)(1) clarifies that the requirement for an MS4 Copermittee to "effectively prohibit" the discharge of Non-stormwater/illegal discharges into its MS4s is to be accomplished through "a program, including inspections, to implement and enforce an ordinance, orders or similar means…". The language of this Provision should reflect federal law in this respect. The Redline reflects this change.

A.1.c

First, this Provision requires the Copermittees to comply with the Basin Plan prohibitions listed in Attachment A. This list is over-inclusive, as it contains requirements that are not applicable to some or all of the Copermittees' MS4 discharges, or to the Riverside County Copermittees in particular. The Riverside County Copermittees request that this Provision be amended to read as follows: "Discharges from MS4s are subject to all applicable waste Discharge Prohibitions in the Basin Plan." This change is noted in the Redline. Second, language must be added providing that compliance with this restriction can be obtained through the process set forth in Provision A.4. This language is provided in the Redline.

A.2.a

First, this Provision and Provisions A.1. and A.3 should be linked to the iterative process described in A.4. Please see the Redline.

Second, not all plans, policies, etc. set forth in Provision A.2.a.(1)-(4) may qualify as "water quality standards" or be applicable to all the MS4 Copermittees. These subsections should be deleted, and replaced with a reference to "Water Quality Standards," which is a defined term in the Draft Permit (This change is reflected in the Redline). Otherwise, the MS4 Permit would become over inclusive with respect to what is considered a water quality standard. Such standards must be established in accordance with federal and state law. If this process has not been followed for a particular requirement, it is not a "water quality standard."

A.3.a

As discussed above, this Provision erroneously states that pollutants "in stormwater discharges" from MS4s must be reduced to the MEP. Please see the Redline.

A.3.b

This Provision should also provide that compliance with a TMDL constitutes compliance with Provisions A.1 and A.2, for those pollutants/waterbodies subject to the TMDL.

A.4.a

The Riverside County Copermittees support an approach whereby compliance with Provisions A.1 through A.3 are achieved through a truly iterative approach, one which reflects the intent of the

precedential State Water Board Order Nos. 99-05 and 2001-015. As set forth in the Redline, the Riverside County Copermittees believe that they and the other Copermittees under the Draft Permit should be considered in compliance with Provisions A.1, A.2 and A.3, as applicable, through development of the WQIP, unless the San Diego Water Board denies approval of a WQIP or amendment thereof. This ensures that the Iterative Process which is the focus of the WQIP, is utilized to provide a means to be in compliance for the Copermittees.

A.4.c

This Provision should be deleted, as is reflected in the Redline. Again, this Provision defeats the purpose of an iterative approach to compliance with the Provisions A.1 through A.3, because it allows the San Diego Water Board to enforce any provision of the Draft Permit, including those provisions at any time. The San Diego Water Board obviously retains full ability to enforce the provisions of the Draft Permit, including with respect to the failure of the Copermittees to carry out required provisions. To short circuit the WQIP/JRMP process, however, is to defeat the entire intent of the Draft Permit.

3.3 Provision B, Water Quality Improvement Plans

3.3.1 Overview of Key Issues

- The goals and requirements of the WQIP need to be aligned with the requirements of the CWA that were established specifically for MS4 permits, and not impose the restoration of Receiving Waters entirely upon MS4 Copermittees.
- The WQIP should focus on addressing sources of pollutants within the jurisdiction of the respective Copermittees.
- The BMP strategies identified in the WQIP should fully inform the selection and design of programs identified in the JRMP. Some minor edits were proposed in Provision B, with additional edits as warranted in Provisions D and E.

3.3.2 Comments in support of specific changes

Introductory paragraph

The introductory language implies that the WQIP should be designed to unilaterally protect, preserve, enhance, and restore water quality and Beneficial Uses in waters of the state. As noted in Section 2.3 above, MS4 Copermittees are responsible only for discharges from their MS4s, not the unilateral protection of Beneficial Uses within their watersheds.

Redline edits were provided to:

- Tie the goals of the WQIP to the requirements of the CWA applicable to MS4 Permits.
- Replace 'waters of the state' with 'Receiving Waters' to be consistent with federal law.
- Clarify the linkage between Provision A and Provision B.

Additionally, Redline edits were provided to clarify that the strategies identified in the WQIP are intended to guide the specific actions that will be implemented by the Copermittees pursuant to Provision E.

B.1

The Riverside Copermittees support the redlines of the San Diego County Copermittees with regard to setting forth that the WQIP for the Santa Margarita Watershed Management Area (WMA) would commence upon enrollment of the Riverside County Copermittees into the Order.

B.2.e.

Two changes have been proposed, as shown in the Redline:

- The introductory paragraph includes language that clarifies that the Numeric Goals are not enforceable compliance standards, effluent limitations, or Receiving Water limitations. This clarification is consistent with San Diego Water Board staffs' verbally stated intent.
- Provision B.2.e.(1) as written requires that the final Numeric Goals be "capable of demonstrating the achievement of the restoration and/or protection of water quality standards in Receiving Waters". As discussed in Provision 2.3 above, meeting WQS in Receiving Waters is a goal of the overall NPDES regulatory programs under the CWA and not as a requirement to be accomplished alone by MS4 Copermittees. Redline edits have been provided to clarify that such goals are only required to be for MS4 discharges.

B.3.

In the Redline, edits were made to the introductory paragraph to ensure that the requirements are consistent with federal law. The CWA requires the 'effective prohibition' of non-stormwater discharges, not 'preventing' or 'eliminating' them.

Edits were also made to Provision B.3.a. to link the strategies more clearly to the Numeric Goals developed pursuant to Provision B.2.e, as well as to link them to the JRMP programs in Provision E.

B.5

In the Redline, edits were made to the introductory paragraph to clarify that the WQIP (and by extension the JRMP and Monitoring programs) are intended to meet the requirements of Provisions A.1, A.2, and A.3. The Tentative Order particularly excluded Provision A.1.b. (dealing with non-stormwater discharges). However, as discussed in the attached Legal Comments, the CWA requires that illegal discharges must be addressed via a program (as included in Provision E.2), and it is appropriate that the program be guided by the priorities and strategies included in the WQIP.

Other edits were made to clearly link Provision B.5 to the applicable requirements of Provision F.

3.4 Provision C, Action Levels

3.4.1 Overview of Key Issues

- The Action Levels (non-stormwater, and stormwater) applicable within each watershed should only be those that are associated with the priority water quality conditions in that watershed, or that are 303(d) listed for that watershed. For example, if Zinc is not a priority pollutant for a watershed, and is not 303(d) listed, there should not be a Zinc action level. This change is needed because Provision D requires analysis for all 'action level' parameters. Analysis for pollutants that are not a priority for a watershed is a waste of Copermittee resources.
- The Copermittees should be able to establish alternative action levels that are appropriate to the WMA within their WQIP. Such alternative action levels would be subject to Executive Officer approval as part of the WQIP approval process.
- Footnote 8 and 10 need to clarify that the NALs and SALs are not enforceable limitations.
- Various references to 'waters of the state' need to be changed to Receiving Waters for consistency with the Draft Order and the CWA.

Please see the Redline for further detailed comments and language changes.

3.5 Provision D, Monitoring and Assessment

The Riverside County Copermittees appreciate the changes in the monitoring program reflected in the Draft Permit, as compared to the Administrative Draft. However, elements of the revised requirements are still infeasible for the Riverside County Copermittees. The comments below identify modifications of areas of the monitoring requirement's which can significantly improve the Copermittees' ability to implement and comply with the requirements, while still maintaining appropriate jurisdictional accountability and assessment requirements to guide the implementation of the WQIPs and JRMP programs. The Redline provides further detailed comments and language changes.

3.5.1 Overview of Key Issues

- Dry Weather MS4 Outfall Monitoring
    - The level of effort dedicated to monitoring and addressing outfalls with non-stormwater discharges should be commensurate with the potential impact that discharge has on a Receiving Water. If a discharge, whether persistent or transient, has no or little potential for impacting a flowing Receiving Water, (e.g. due to infiltration, evaporation, or treatment of the flows), the outfall should be de-emphasized relative to other outfalls that have discharges that have connectivity to a flowing Receiving Water.
    - Outfall Dry Weather Field Screening – As currently drafted, the number of required visual inspections of outfalls during dry weather required per Provision D.2.a.(2)(a) and Provision D.2.b.(1) is both excessive and disproportionate. This will particularly impact smaller jurisdictions, which may be required to do more visual inspections of MS4 outfalls than would larger jurisdictions with more outfalls and more resources.
    - Similarly, as written, the Persistent Flow Outfall Monitoring requirements of Provision D.2.b.(2)(b) are excessive and also will disproportionately impact smaller jurisdictions.

Jurisdictions with several hundred outfalls will likely have significantly more resources to perform the required monitoring than smaller jurisdictions with fewer outfalls, yet both are required to implement the same level of persistent flow monitoring.

- Assessment Requirements
  - The assessment requirements require modeled extrapolation of monitored outfall data to non-monitored outfalls for the purposes of calculating loads from each outfall in each jurisdiction. Such extrapolations though modeling or other calculations will not accurately reflect actual jurisdictional loads, and have no benefit that directly analyzing the monitored data cannot more accurately provide.

3.5.2 Other Global Issues

- As currently drafted, MS4s operated by a flood control district within a city or county would be effectively double-counted for identification of outfalls in each jurisdiction and for performance of the load calculations from each jurisdiction. Additionally, Flood Control Districts have no land use or enforcement authorities outside of the MS4 and rely on the local Copermittee to address pollutant sources and discharges to their MS4. Redline edits have been included to clarify the relationship between districts and the municipal jurisdictions they serve for the purposes of outfall monitoring and the assessment requirements.
- Timelines for monitoring and assessments were clarified throughout and linked to specific reporting requirements of Provision F in the Redline.

3.5.3 Comments in support of specific changes

D.1.a.(3) and D.1.e.

The Redline clarifies that the Receiving Water monitoring described in these sections must be conducted as applicable to the WMA and the Copermittees' MS4 discharges, because some of the monitoring requirements only apply to MS4 discharges to certain waterbodies. Not all Copermittees within a WMA will have discharges to that waterbody.

D.1.b.

The Redline proposes language to allow for alternative long-term monitoring stations to be identified. Using the SMR as an example, the Copermittees might wish to utilize a location other than the existing stations due to the influence of groundwater during dry weather and/or the general lack of MS4 contributions in dry weather to those locations.

Table D-1 and D-6

The Redline proposes an addition to the list of field observations, an assessment for flow connectivity of any MS4 discharges to the sampled Receiving Water. It is important to know whether the sampled Receiving Water included a contribution of flows from MS4 discharges, or whether the data reflect conditions in the absence of an apparent MS4 discharge contribution.

D.2.a.(2)

The Redline clarifies that the identification of annual outfall monitoring requirements is based on municipal Copermittee boundaries, inclusive of Flood Control District MS4 outfalls within their jurisdiction.

The Redline clarifies that the field screening requirements apply to those outfalls in the Copermittee's inventory that are 'accessible'. If an outfall is inaccessible for safety reasons or due to habitat restrictions, it would not need to be field screened.

The Redline simplifies the 'tiers' in Provision D.2.a.(2)(a) by removing the lower tier (i), and expanding the second tier (ii) to cover all Copermittees with 500 or less outfalls. This resolves the disproportionality that occurs for Copermittees with a number of outfalls near the current 125 outfall threshold. For example, as currently drafted, a city with 150 outfalls would be required to do 150 visual inspections per year, but a smaller city with 120 outfalls would be required to do 192 visual inspections per year. The Redline also maintains the 80% requirement from the first tier to help smaller Copermittees manage their workload for meeting the field screening requirements while also conducting the additional source identifications that are required under the Draft Permit.

The Redline includes edits to Footnote 19 to clarify that persistent flow should effectively be a discharge that is hydraulically connected to a flowing Receiving Water. Any other discharges that are not affecting a flowing Receiving Water (such as pooled or ponded water) would be addressed as a Transient Discharge, with source IDs any time an obvious illegal discharge (i.e. color or odor) is identified.

D.2.a.(3)

The Redline incorporates edits proposed by the San Diego County Copermittees to require 10% of the samples in each WMA to be from a first storm event. As described in the comments of the San Diego County Copermittees, this will help avoid overly skewing of the data to 'first flush' data, while still incorporating such data into the data and analyses.

D.2.b.(1)

The Redline removes the requirement that the number of visual inspections performed be equivalent to the number of inspections required under Provision D.2.a.(2)(a).

As areas within a jurisdiction are confirmed not to have non-stormwater discharges, inspections of other outfalls would have to be perpetually (and unnecessarily) increased to maintain compliance with this requirement. For example, if a Copermittee had 150 outfalls, but after the transitional period it confirmed that 100 of those outfalls had no evidence of non-stormwater discharges to flowing Receiving Waters, it would have to visit the remaining 50 outfalls for up to three times a year to meet the requirement in this Provision. As the Copermittee got closer to eliminating non-stormwater flows at more outfalls, inspections at the remaining outfalls would quickly become excessive and unreasonable. Removing this requirement will better incentivize the elimination of non-stormwater

flows, as a Copermittee can look forward to reducing its workload in areas confirmed to not have non-stormwater flows.

D.2.b.(2)(b)

While the Riverside County Copermittees support the San Diego County Copermittees' proposal to reduce the number of required outfalls from 10 to 5 persistently flowing outfalls per WMA, the Riverside County Copermittees believe that applying the same minimum bar to all Copermittees is inappropriate and disproportionately affects smaller Copermittees that have commensurately less staff and resources.

The Riverside County Copermittees propose requiring monitoring of the top 10% of the prioritized persistent flow outfalls, with a lower and upper limit of 1 and 5 respectively, as shown in the redlines. With this change, the level of effort required of any individual Copermittee would scale consistent with the number of persistent flow outfalls within each Copermittees' jurisdiction.

Additionally, the Riverside County Copermittees request changing the requirement of Provision D.2.b.(2)(b)(ii) to require annual monitoring rather than semi-annual monitoring. With this change, a Copermittee could focus more of their annual budget on conduction Source ID efforts – which can result in eliminating problematic non-stormwater flows, rather than on a second monitoring event. Copermittees would still have the option to conduct a second monitoring event if they have more resources available and want to remove the outfall from their monitoring list sooner in accordance with Sub-Provisions [a] through [d].

D.2.b.(2)(e)

The Riverside County Copermittees support the San Diego County Copermittees' comments regarding allowing for a tailored list of constituents to be developed for each WMA. The Redline incorporates those edits.

D.3.

The Riverside County Copermittees support the changes recommended by the San Diego County Copermittees to this section, and these changes are reflected in the Redline.

D.4.a.(2)

This Provision as drafted would require the MS4 Copermittees to make comprehensive evaluations of Beneficial Uses that are beyond their expertise or the scope of an MS4 permit. Such evaluations and determinations would require advanced studies and cannot be answered with the monitoring data collected through this permit. This Provision should either be deleted or, alternatively the Riverside County Copermittees request that the assessments be focused on determining the status and progress toward addressing any Numeric Goals established for those Receiving Waters in the WQIP. Please see the Redline.

D.4.b.(1)

The Redline clarifies that outfall assessments are to be done for the area covered by each Municipal Copermittee (consistent with the proposed definition), and that the data to be used by each Municipal Copermittee would include the data collected from any Flood Control District Copermittee operated MS4s within its jurisdiction. This ensures that jurisdictional data is not double reported for Flood Control District MS4s within a city or county.

For Sub-Provision D.4.b.(1)(c)(iv) three key changes are requested in the Redline:

1) Annual volumes and pollutant loads should only be calculated from the monitored outfalls with persistent discharge to a flowing Receiving Water. This is directly applicable to the purpose of the Draft Permit and an important change, because volume and pollutant data extrapolated to non-monitored MS4 outfalls would be inaccurate and potentially misused if taken out of context. It is understood that San Diego Water Board staff want to ensure that jurisdictional accountability is maintained. However, since MS4 outfall monitoring will be conducted within each jurisdiction, inter-jurisdiction comparisons and accountability can be accomplished using the monitoring data directly without such extrapolations.
2) Added language to require a Copermittee to include in its jurisdictional load calculations any discharge that was demonstrated to have entered another Copermittees' MS4 before being discharged into the flowing Receiving Waters. This is important to ensure that each Copermittee maintains accountability for pollutants discharged to flowing Receiving Waters from within its jurisdiction.
3) The Redline proposes that the calculations of pollutant loads be only for the priority water quality constituents identified in the WQIP.

D.4.b.(2)(b)

Two key changes are recommended in the Redline:

1) Annual volumes and pollutant loads should only be calculated from the monitored outfalls for the monitored storm events. This is an important change because volume and pollutant data extrapolated to non-monitored events would be inaccurate and potentially misused if taken out of context. It is understood that San Diego Water Board staff want to ensure that jurisdictional accountability is maintained, so the Redline proposes that data from the monitored outfalls be extrapolated to identify loads for each jurisdiction during each monitored event. With this information, inter-jurisdiction comparisons and the desired 'accountability' can be accomplished using the monitoring data directly without such extrapolations to non-monitored events.
2) The Redline requests that calculations of pollutant loads be performed only for the priority water quality constituents identified in the WQIP.

D.4.b.(2)(c)

The Redline edits are consistent with those proposed by the San Diego County Copermittees, with minor modifications for clarity.

D.4.d.(2)(c)

It would be difficult to proactively determine the pollutant load reductions that *would* be necessary to demonstrate that discharges *are not* causing or contributing to exceedances of Receiving Water Limitations. Instead it would make more sense to calculate the necessary pollutant load reductions where the discharge has been demonstrated to be causing or contributing to such exceedances. In such circumstances, the necessary parameters would be known to calculate the needed load reduction. These changes are set forth in the Redline.

3.6 Provision E.1, Legal Authority

3.6.1 Overview of Key Issues

The Riverside County Copermittees note that Provision E.1, relating to the establishment of adequately legal authority, exceeds the requirements of federal CWA regulations in several respects. The federal regulations at 40 CFR 122.26(d)(2)(i)(A)-(F), provide explicit guidance for the Copermittees in developing the necessary legal authority to control MS4 discharges within its jurisdiction. However, several of the subsections of Provision E.1 go beyond these federal requirements, with respect to areas not within the responsibility of MS4 dischargers, such as negotiating with non-Copermittee entities. The Riverside County Copermittees have provided requested changes in the Redline, which are explained briefly below.

3.6.2 Comments in support of specific changes

E.1.a(1)

Changes in the Redline to accurately reflect the language of 40 CFR 122.26(d)(2)(i)(B).

E.1.a(2)

Changes in the Redline to accurately reflect the language of 40 CFR 122.26(d)(2)(i)(A). In addition, the Provision as written improperly requires the Copermittees to control the quality of runoff from sites covered by the state general permits for industrial activity and construction. These general permits are enforced by the State Board and the regional boards, and it is a state responsibility which cannot be handed off to the Municipal Copermittees.

E.1.a(3)

Changes in the Redline to accurately reflect the language of 40 CFR 122.26(d)(2)(i)(C).

E.1.a(5)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations. The Provision also improperly requests the Municipal Copermittees to attempt to negotiate with third parties the contribution of pollutants to the Copermittees' MS4. The Copermittees have no jurisdiction over such parties. The San Diego Water

Board has such jurisdiction, and should take responsibility for addressing non-MS4 sources of pollutants that may ultimately enter the MS4.

E.1.a(6)

Changes in the Redline to reflect accurately the language of 40 CFR 122.26(d)(2)(i)(E).

E.1.a(7)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations.

E.1.a(8)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations.

E.1.a(9)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations.

E.1.a(10)

The Redline requests both correction of the language in this Provision to comport with the federal regulations in 40 CFR 122.26(d)(2)(i)(F) and deletion of the second clause of this Provision, which is not found in 40 CFR 122.26(d)(2)(i)(F). Moreover, the requirement to inspect and monitor in the first clause of this Provision covers the issues set forth in the second clause. It is therefore unnecessary.

3.7 Provision E.2, IDDE

3.7.1 Overview of Key Issues

- The Draft Permit requires the Copermittees to address all non-stormwater discharges from the MS4 as illegal discharges, and then describes certain sources that need not be prohibited. This is effectively a 'guilty until proven innocent' provision, where a Copermittee will be required to expend potentially significant resources conducting source identification efforts any time non-stormwater is observed discharging from the MS4. In addition to the issues discussed in the Legal Comments, the Provision raises two practical and logistical problems:
    - This requirement is entirely independent of the determination that there are in fact any significant pollutants in such a discharge. A Copermittee could be spending substantial sums tracking (and then potentially enforcing upon) the source of a discharge that is not negatively impacting Receiving Waters. This not only is a waste of public resources, but would undermine the credibility of stormwater programs.
    - The San Diego Water Board and the State Water Board do not treat non-stormwater flows in the same manner across all of their regulatory mechanisms. For example, Order

> No. R9-2008-0002 allows non-stormwater discharges to occur, POTWs are issued permits for their discharges and agricultural operators can discharge irrigation water. The Copermittees should not be forced to conduct an expensive source investigation, only to find that the discharge complies with a permit or a waiver granted by the Water Board. The Copermittee would have no ability to address such a discharge as an 'illegal discharge', and further would have no ability to recuperate their costs for the source identification.

The best way to address these issues, is to require the Copermittee to have and enforce an effective prohibition of illegal discharges of *pollutants* (through statutes, ordinances, permits, contracts, orders or similar means), and then allow the Copermittee full discretion to determine which non-stormwater discharges have the potential to negatively impact Receiving Waters, consistent with the WQIP priorities – and address those as illegal discharges.

- Several categories of non-stormwater discharge that were previously conditionally exempt consistent with the CWA, are required by the Draft Permit to be treated as illegal discharges, unless they have coverage under another order issued by the San Diego Water Board. In addition to the problems identified above for conducting enforcement in the absence of a pollutant discharge, the San Diego Water Board, not the Copermittees, is responsible for evaluating coverage, need for coverage, and compliance with other orders issued by the Water Board. The Copermittees have neither authority nor jurisdiction. Please see the Redline.
- Several categories of non-stormwater discharge that were previously conditionally exempt consistent with the CWA, are required by the draft permit to be 'controlled' or otherwise prohibited by the Copermittees. The Fact Sheet further describes that such controls are warranted because they could potentially contain pollutants. However, the CWA only requires controls where the discharges are determined to be a significant source of pollutants. Please see Legal Comments for a further discussion of this issue as well as the Redline.
- The Draft Permit eliminates the conditional exemptions for Landscape Irrigation, Irrigation Water, and Lawn Watering (collectively 'irrigation runoff'). The San Diego Water Board has provided no data demonstrating that these discharge categories have contributed a significant pollutant load to Receiving Waters within Riverside County. Information discussed in the Fact Ssheet focuses on data from other counties. The only data from Riverside County is public educational material referring to irrigation runoff; this material, however, was adapted from public education material from other counties. That public educational material was intended to help prevent such discharges from becoming a significant source of impact on the Receiving Waters, and did not constitute a determination that such discharges are in fact, actually a significant source that needs to be subject to a prohibition. See the discussion in the Legal Comments as well as the Redline.
- The Draft Permit, in Provision E.2.a.(7) requires efforts to minimize or eliminate all non-stormwater flows, including those that are natural, conditionally exempt, or otherwise permitted by the San Diego Water Board, regardless of whether or not such discharges are not contributing pollutants to the MS4. Such a requirement conflicts with the prior Provisions E.2.a.(1) through

(5), which state conditions where such discharges need not be prohibited. The requirement should therefore be removed, as set forth in the Redline.

3.7.2 Comments in support of specific changes

E.2.a.(1) and (3)

The Riverside County Copermittees request that this Provision be deleted (as shown in the Redline) and the categories of non-stormwater discharges be re-incorporated into Provision E.2.a.(3). The apparent premise of Provision E.2.a(1) as drafted is that since the San Diego Water Board requires those discharges to have coverage under a separate order, they are illegal if they lack such coverage. The MS4 Copermittees, however, are not responsible for enforcing discharge coverage under separate San Diego Water Board orders; that is the responsibility of the San Diego Water Board itself. Requiring the Copermittees to enforce such entities for their lack of coverage under a separate San Diego Order shifts that responsibility from the Board to Copermittees. This is not authorized by the CWA or the Porter-Cologne Water Quality Act. The Copermittees are, under the CWA, only required to address such discharges as illegal discharges if the discharge is found to be contributing a significant pollutant load to the MS4. By moving those categories to Provision E.2.a.(3), as shown in the Redline, the Copermittees will still be required to treat such discharges as illegal discharges if and when they are found to be contributing significant pollutants to the MS4. This proposed approach is consistent with other MS4 permits in the state, including prior San Diego Water Board orders, and is further consistent with the approach taken for the WQIP, which is intended to allow the Copermittees to focus resources on addressing the specific impacts that MS4 discharges are having on Receiving Water quality.

E.2.a.(2)

This Provision requires the Copermittees to treat water line breaks as illegal discharges, which in turn requires the Copermittee to conduct enforcement measures. Water main breaks are accidental occurrences, or may be the result of acts of nature. It is no more appropriate to treat accidents as illegal and subject to enforcement than it would be for a city to declare vehicular accidents as illegal, and conduct enforcement against those involved. This language needs to be removed as shown in the Redline. Additionally, as discussed in the Legal Comments, a recent case from the federal district court in Virginia suggests that the regulation of mere flow may exceed the authority of the CWA.

E.2.a.(4)

The Redline clarifies that if the 'statues, ordinances, permits, contracts, orders or similar means' are enacted/adopted by a Copermittee, the categories of non-stormwater discharges listed do not need to be treated as illegal discharges. Otherwise, the language could be read to imply that, for example, if it was infeasible for a particular resident to direct wash water to landscaped areas, that the Copermittee would be required to treat that residents' discharge as illegal and enforce upon them.

E.2.a.(5)

Contrary to the provisions of the CWA regulations, prior MS4 permits issued by the San Diego Water Board and other permits in the state, the Draft Permit requires implementation of BMPs, where

feasible, during emergency firefighting activities. During such emergencies, all focus of public resources must appropriately be dedicated to protecting life and property. Any diversions from that mission would only serve to diminish and potentially compromise that mission. The Redline proposes language consistent with that adopted by the San Diego Water Board in 2010 for the Riverside County MS4 Permit (Order R9-2010-0016).

E.2.a.(7)

Provisions E.2.a.(1) through E.2.a.(6) describe circumstances where non-stormwater discharges need not be prohibited. This Provision then requires the Copermittees to minimize such 'conditionally allowed' flows anyway. This requirement exceeds the scope of the CWA and its implementing regulations and makes no sense. The Redline requests deletion of these Provisions.

E.2.b.(1)(d)

This Provision requires the MS4 Copermittees to map all known private outfalls to Receiving Waters. Such a requirement is beyond the scope of an MS4 permit and should be removed, as shown in the Redline. The Draft Permit does not require a Copermittee to address private outfalls to Receiving Waters; this is the responsibility of the San Diego Water Board, which governs all waste dischargers under the authority of the CWA or the Porter-Cologne Act.

E.2.b.(4)

This Provision requires the Copermittees, in conjunction with a spill, to 'prevent contamination of surface water, groundwater, and soil.'This requirement is clearly beyond the scope of an MS4 permit issued under the CWA (which regulates only discharges of water containing pollutants *from* the MS4 to Receiving Waters) and must be removed, as shown in the Redline. The Draft Permit could more appropriately require the Copermittees to 'coordinate, to the extent possible, with spill response teams to prevent entry of spills into the MS4.'

E.2.d.(2)(e)

The Redline requests edits to clarify that the intent of this Provision is to document and attempt to quantify any obvious sources of non-stormwater illegal discharges in response to the outfall monitoring, and that it is not necessary to conduct a full source identification any time there is evidence of water near an outfall.

New Provisions E.2.d.(3)(e)-(f)

The Redline adds two new provisions to this section to address a gap in potential outcomes from a source identification effort. These Provisions address scenarios where a Copermittee identifies A) the illegal discharge is coming from another upstream Copermittees' MS4, or B) that the discharge has been authorized by the San Diego Water Board, either through an order or waiver of WDRs. In the first scenario, the responsibility to continue the source identification, and conduct enforcement, would be transferred to the upstream Copermittee. In the second scenario, the responsibility for follow-up would fall on the San Diego Water Board, after receiving relevant information from the Copermittee. This Provision also provides for reimbursement to the Copermittee for the cost of the source identification, since the San Diego Water Board required the Copermittee to conduct the investigation,

while not commensurately prohibiting all non-storm water discharges from all other sources regulated by the Water Boards.

3.8 Provision E.3, Development Planning

3.8.1 Overview of Key Issues

- Priority Development Projects - The Tentative Order identifies categories of projects that are to be defined as 'Priority Development Projects' (PDPs), which in turn will be required to comply with specific water quality and Hydromodification mitigation and quantitative requirements. The criteria for PDPs is quite broad and would include the majority of development projects, from small convenience stores and residences, to mega malls and specific plan developments. The Fact Sheet describes that while some smaller project types may not have significant pollutant loads, they may have a hydrologic impact upon Receiving Waters. However, it is important to recognize that pursuant to Provision E.3.a., All projects are required to implement a variety of LID principles such as disconnecting impervious surfaces, draining impervious surfaces to landscaped areas, and minimization of soil compaction in landscaped areas. Since such LID principles will be implemented wherever feasible consistent with the MEP standard, these smaller development projects are unlikely to create a pollutant or hydrologic impact. Additionally, the Fact Sheet advocates incentivizing LID design concepts and green infrastructure and building principles. Accordingly, the Redline requests changes to Provision E.3.b.(3) as described in Provision 3.8.2 below. The Legal Comments further note the potential impact of the Virginia case (*Virginia Dept. of Transp. v. U.S. Environmental Protection* Agency) holding that the CWA does not regulate stormwater as a pollutant.
- Design Capture Volume – There are two problems with how the Draft Permit defines the Design Capture Volume:
    - The Draft Permit changes the 'design capture volume' from previous permits by eliminating the term 'runoff'. Prior permits described that the design capture volume is the volume of stormwater runoff from the 24-hour 85th percentile storm event. This permit changes that to be the volume of stormwater produced from a 24-hour 85th percentile storm event. The elimination of the term 'runoff' means that BMPs would need to be sized potentially much larger than previously. For example, if the 85th percentile storm is 1" and a BMP is designed to treat 1 acre of residential land with a coefficient of runoff of 0.6, then under the current permits the BMP must be sized to hold 2,178 cubic feet of water. However, under the language of the Draft Permit, the BMP treating the same area would be required to hold 3,630 cubic feet of water, a 70% increase in BMP size. Accordingly, the Redline restores the term 'runoff'.
    - Additionally, the Draft Permit defines the Design Capture Volume alternatively as: *"the volume of storm water that would be retained onsite if the site was fully undeveloped and naturally vegetated, as determined using continuous simulation modeling techniques based on site-specific soil conditions and typical native vegetative cover."* In addition, to the problem identified above regarding the volume of storm water runoff, this language does not provide a temporal standard for determining which volume to

calculate from a continuous simulation model. Additionally, such models are not commonly used among general practitioners in the civil engineering community. The Redlines propose an alternative and simpler approach for this second definition: "The volume of stormwater runoff produced from a 24-hour 85th percentile storm event, that would be retained onsite in the pre-project condition." This definition is advantageous for several reasons: 1) it is simple for any civil engineer to understand, calculate, and comply with and is based on the same storm and hydrologic calculations as the first option, 2) it respects natural hydrology for the site, which may have had runoff in the pre-project condition, and as such, is more compatible with the intent of LID to mimic natural hydrology, and 3) as a result it is less likely to result in potential degradation of Beneficial Uses downstream, from reductions in flows beyond the pre-project condition.

- Pre-Project vs Pre-Development – Both the Storm Water Pollutant Control BMP requirements and the Hydromodification Management BMP requirements in the Draft Permit specify a 'pre-development' condition as the mitigation standard for all PDPs. In addition to the legal problems with such a standard as set forth in the Legal Comments, there are practical problems with the standard.
    - The presumption made in the discussions in the Fact Sheet are that all Receiving Waters can, and will, be restored to a fully natural condition - effectively to a natural floodplain. This presumption does not address reality, which is that development has occurred in those floodplains over many generations. The San Diego Water Board obviously lacks the authority to force homeowners and businesses to vacate such floodplains to effectuate restored natural conditions. Such an action would represent an unconstitutional taking. Moreover, the Legislature, in the Flood Control Acts covering all three counties proposed to be covered by the Draft Permit, has specifically authorized Flood Control Districts to construct flood control structures required to protect the lives and properties of the citizens.
    - Mitigation to a pre-development condition also may not be necessary to protect Receiving Waters from the effects of Hydromodification. If, for example a Receiving Water with existing development tributary to it, has not experienced increased erosion due to that existing development, there is no reason to require Hydromodification mitigation to anything more than the existing condition. In the counter-example, if under the existing condition the Receiving Water has experienced increased erosion due to that existing development, then, legal issues aside, there would be technical benefit to mitigating to that pre-development condition.

  The Redline proposes alternative language that requires mitigation to a pre-development standard only where it is legal and technically justified based on the conditions of the Receiving Water.
- Alternative Compliance – The alternative compliance project options as set forth in the Draft Permit pose two key problems:

- Several statements are conflicting and thus confusing as to what the required standard is for the various alternative compliance projects. For example, throughout Provision E.3.c. it is stated that 'a PDP may be allowed to comply with Provision E.3.c.(1)(a) and/or Provision E.3.c.(2) if they …'. This language can be mis-read to imply that the project must comply both with Provisions E.3.c.(1)(a) and E.3.c.(2) *and* implement the alternative compliance project (thus negating the benefit of alternative compliance). The Redline clarifies this language.
- The Biofiltration option set forth in the Draft Permit arbitrarily, and without technical basis or justification, **doubles** the sizing standard for biofiltration BMPs from 0.75 times the design capture volume (as set forth in the 2010 MS4 Permit and the 2009 Orange County Permit) to 1.5 times the design capture volume. The existing 0.75 standard was set due to the fact that 1) the 85th percentile 24-hour storm occurs over a period of time, and 2) such BMPs have outflows and will regain some capacity during the storm event, and as such, do not need to instantaneously hold the entire 'Design Capture Volume' to have fully treated that volume. In fact, studies have shown that in addition to yielding excellent pollutant concentration reductions, LID Biofiltration BMPs are excellent at reducing the volume of runoff similar to retention BMPs. According to the ASCE International BMP database 60% or more of the long-term volume of runoff from a site can be retained within a Bioretention BMP (Bioretention BMPs are the primary 'biofiltration' BMP now allowed in Riverside County). In comparison, a Retention BMP sized to hold the runoff from the 85th percentile storm event (the Design Capture Volume) will end up retaining approximately 80% of the long-term volume of runoff. Thus, by simple proportions, a Bioretention BMP sized to 'hold' 100% of the Design Capture Volume may also be able to retain 80% of the long-term volume of runoff. $\left(\frac{0.75\times DCV}{60\%\ retained} = \frac{1.0\times DCV}{80\%\ retained}\right)$. This is being validated through Bioretention BMPs that have been constructed and are being monitored for such volume reductions at the Riverside County Flood Control District's headquarters in Riverside. Further, Biofiltration BMPs have the added benefit of providing better overall treatment of back to back storms. Where a Retention BMP would be full after the first storm, fully bypassing the second storm without treatment, a Biofiltration BMP will have restored some capacity after the first storm, providing for treatment of some or all of the second of the back to back storms. Thus, the attached redlines propose changing the sizing factor for Biofiltration BMPs to 1.0 times the Design Capture Volume. The Redline proposes changes consistent with these comments.

3.8.2 Comments in support of specific changes

Introduction

Provision E.3.g (Strategies to address the highest priority water quality conditions) was moved to the beginning to support and better integrate the development planning programs in the JRMP with the strategies developed in the WQIP.

E.3.a.(3)

The Redline changes the title of this section (and other appropriate references to this Provision) to refer to LID Principles, as identified in the CASQA LID Manual for Southern California (https://www.casqa.org/LIDDemo/LowImpactDevelopmentManual/tabid/242/Default.aspx)

E.3.b.(1)(c) (New Provision)

This Provision was added to clarify the requirements if a project that was already subjected to SSMP requirements redevelops a portion of the site.

E.3.b.(2)

The Redline edits shown for this Provision are primarily to simplify this Provision, by grouping various categories by their applicable square footage threshold and including some of the specifics in the definitions (Attachment C). Other changes (beyond reorganization) include:

- Removing the addition of 'driveways' from subsection (g) as described in Provision 3.8.1 of this letter.
- Adding a footnote for parking lots, to clarify that the trigger would not include parking lots that are not exposed to runoff, such as subterranean or covered parking lots. It is beneficial to not have parking lots exposed to runoff; excluding such parking lots from being defined as a PDP is a good way to encourage such practices.
- Hillside development projects were not included as it is not believed to be necessary anymore with the relatively low threshold (10,000 square feet) identified for other categories included in this and other recent MS4 permits.
- The definition for "Environmentally Sensitive Areas" from existing MS4 permits was restored to include the language referring to discharges that are not commingled with flows from adjacent or other upstream lands (note that the change is shown in the definitions per the re-organization suggested above).

E.3.b.(3)

- The PDP exemption for sidewalks, bicycle lanes, or trails, [E.3.b.(3)(a)] has been expanded to as shown in the Redline to include driveways and parking lots. If those projects implement criteria already described in that section, they are also unlikely to create an impact to Receiving Waters. Further, including those project types in that exemption will further incentivize developers to utilize those LID Principles.
- The exemption described in Provision E.3.b(3)(b), was modified as shown in the Redline, and as discussed in the comment letter submitted by the Riverside County Transportation Department. Please see that letter for a justification for the requested changes.
- As shown in the Redline, the exemptions for new and redeveloped single family residences [E.3.b.(3)(c) and (d)] were consolidated into a new provision [E.3.b.(3)(c)], covering all single family residential projects (both new and redeveloped). The key difference is that such projects would be considered exempt if they are both 1) not part of a larger common plan of development or planned subdivision, and 2) successfully incorporate each of the applicable source control and LID Principles identified in Provision E.2.a.(2)-(3) to the MEP.

- A new Provision-E.3.b.(3)(d), titled 'Watershed Protection Projects' was added in the Redline. The project types described therein are all projects that are undertaken to rehabilitate or prevent environmental, social, and economic damage within the watershed, including Receiving Waters. These projects, while they may in some cases require some level of impervious surfaces to be constructed, are 1) not designed for human use or activity that would generate pollutants, or are designed specifically to mitigate such pollutants; and 2) will implement each of the applicable source control and LID Principles identified in Provision E.2.a.(2)-(3) to the MEP.

E.3.c.(1)

In addition to the edits discussed in Provision 3.8.1 of this letter, the Redline removed subprovision E.3.c.(1)(c) , for two reasons:

- The requirements that must be met to when implementing an alternative compliance project are more fully described in Provision E.3.c.(3).
- The language, as drafted, appeared to require double-mitigation. It requires that: 1) conventional treatment is required to treat the entire volume not retained onsite, and 2) the pollutant load discharged must also be mitigated with an alternative compliance project. Such a scenario would be requiring double-mitigation. The Redline provides a clearer and more simple mitigation standard.

E.3.c.(2)

The Riverside County Copermittees have two concerns with this Provision:

- The first concern is the universal requirement to mitigate to the 'pre-development' standard, as discussed above in section 3.8.1 of this letter. The Copermittees in the Redline propose that this language be changed to the 'pre-project' condition. For new development projects, the 'pre-project' condition will be equivalent to the 'pre-development' condition. For redevelopment projects, the standard would be the conditions that exist onsite prior to the construction of the project. This is appropriate, because in many areas, particularly in areas of existing development that would be subject to 'redevelopment', Receiving Waters are engineered and maintained to 1) provide flood protection for the public, 2) ensure that floodwaters don't comingle with pollutants on adjacent private properties and 3) to ensure that the existing development draining to that system does not cause erosion. In cases where the Receiving Waters are not engineered and maintained, and erosion problems caused by existing development are observed, language has been added to the Redline to provide for additional standards to be developed in the WQIP, based on the WQIP priorities.
- Additionally, the Redline proposes an additional exemption from HMP requirements for projects that discharge into conveyance channels that are engineered and maintained for the build-out condition all the way from the project to a waterbody that is sufficiently resistant to Hydromodification. This language is consistent with the above discussions, and ensures the PDPs are not required to mitigate for non-existent impacts. Please see the specific language in the Redline. The engineered channel exemption can be found in other recent MS4 permits, including the recently adopted Los Angeles County MS4 Permit.

E.3.c.(3)(a) and (b)

These two Provisions were re-written in the Redline to be simpler and clearer on what BMPs, criteria, sizing standards are required for what type of project. This alternative language still meets the intent of the Draft Permit, while being easier to understand and comply with. Aside from simplifying the language, the following other changes were made in the Redline:

- The alternative compliance options must be determined to provide an equal or greater overall water quality benefit for the WMA.
- Additional options were provided for who can design the alternative compliance projects
- All alternative compliance projects are required to be consistent with the strategies in the WQIP. While the specific alternative compliance project would not be required to be identified in the WQIP, the goal of this language is to ensure that allowing the alternative compliance project would not in any way be detrimental to or contrary to the strategies in the WQIP.
- Requirements E.3.c.(3)(a)(iv) and (v) were removed entirely, as they conflict with E.3.c.(3)(a)(iii) which allowed the projects to be in the same WMA (preferably the same HSA)
- Changed the sizing factor for Biofiltration BMPs to 1.0 as discussed in section 3.8.1 of this letter, and deleted the option [d] which required triple mitigation by requiring Biofiltration + Conventional Treatment + Alternative Compliance projects.
- Added Conventional Treatment Control BMPs as an alternative compliance option, only where it has been shown to be technically infeasible to meet E.3.c.(1) and technically infeasible to implement LID Biofiltration Treatment Control BMPs.

E.3.c.(3)(c)

Redline edits in this section are primarily to simplify and consolidate the requirements. Sub-Provision [C] was removed, as it was duplicative of the mitigation standards for the alternative compliance project are specified in E.3.c.(3)(b) and E.3.c.(3)(c)(i)[a].

3.9 Provision E.4, Construction

3.9.1 Overview of Key Issues

This Riverside County Copermittees' comments and edits are set forth in the Redline.

- One key issue for the Copermittees is the edit shown in the Redline to Provision E.4.c, which clarifies that the Copermittees are responsible for *requiring* BMPs at private construction sites, and *implementing* BMPs at Copermittee construction sites.

3.9.2 Comments in support of specific changes

The Redline edits include comments supporting the requested edits.

3.10 Provision E.5., Existing Development

3.10.1 Overview of Key Issues

The Draft Permit includes requirements for advanced programs to identify opportunities and implement programs to facilitate the construction of Retrofit and Stream/Channel/Habitat Rehabilitation projects on private properties. Such requirements are clearly beyond the requirements of the CWA for a management plan to be implemented by an MS4 Copermittee. The Riverside County Copermittees request deletion of these requirements.

Alternatively, the Riverside County Copermittees have the following comments:

While these retrofitting and rehabilitation approaches can be helpful and/or needed in some circumstances, they are not required in all circumstances, nor are required to address all pollutants that may be identified in a WQIP as the highest priority water quality conditions. For example, some pollutants are best addressed with regulatory source controls at the state or federal level, such as the removal of copper from brake pads, and controls on pesticides, while other pollutants can be adequately addressed through inspections and enforcement. There are several problems with requiring Copermittee resources to be invested in such Retrofit and/or Rehabilitation strategies (collectively referred to as 'retrofit'):

- Land Ownership: The land that could potentially be identified for retrofit would likely not be owned by a Copermittee. The Copermittee therefore has no ability to force the property owner to retrofit their property. Although the Copermittee could potentially implement programs to "facilitate" implementation, such a program would still be limited by the rights of the individual property owner. Even if a Copermittee were to attempt to purchase a privately owned existing development for the purposes of retrofit (a step going far beyond any requirements in the CWA or the Porter-Cologne Act), such a process can take many years, and if the owner is unwilling to sell, the retrofit project could never be realized. In any scenario, the process to facilitate such "retrofits" is extremely costly and lengthy, with no guarantee of a benefit to water quality. Retrofits should only be undertaken where the Copermittee identifies it as a necessary step to addressing the MS4 contributions to Receiving Water problems to the MEP. Otherwise, it forces the Copermittee to utilize resources very ineffectively, which is contrary to the goals of the WQIP and may actually be detrimental to water quality.
- Permitting: Aside from the limitations discussed above, stream/channel/habitat restorations have the additional complexities of requiring other regulatory permits that are not the discretion of the San Diego Water Board nor the Copermittees to issue. Such projects can take many decades to implement, and thus, are not expected to be highly effective at addressing the goals of the WQIP, except in rare circumstances.

Redline edits have been provided to clarify that these strategies and programs should only be used when, and to the extent directed by the strategies developed in the WQIP.

3.10.2 Comments in support of specific changes

E.5.b.(1)(b) and (d)

BMP implementation requirements of Provision E.5.b.(1)(b) and (d) have been clarified in the Redline to require the Copermittee to implement BMPs on their existing development, and require implementation of BMPs on private existing development.

E.5.c.(1)(a)(iv)

The Riverside County Copermittees request deletion of this Provision. The Copermittees should be provided the flexibility to schedule inspections as they see fit, provided that the schedules they establish pursuant to E.5.c.(1)(a), and the minimum frequency in E.5.c.(1)(a)(i) are met. Requiring 20% every year will be difficult to track as businesses may be opened or closed throughout the year and throughout the permit term.

Additionally, the Riverside Copermittees understand that other Copermittees may be recommending that E.5.c.(1)(a)(i) be changed to 'once per permit term'. The Riverside Copermittees believe that the current language of 'once every five years' is more appropriate for two reasons: 1) not all Copermittees (i.e. OC and Riverside) will be enrolled into the permit at the beginning of the 'permit term', and 2) not all businesses will be in existence at the beginning of the permit term. Accordingly it is more appropriate to simply require the minimum to be once every five years, that way a program manager can simply look at the last time a facility was inspected, and use that date to schedule the next inspection.

3.11 Provision E.6, Enforcement Response Plans

3.11.1 Overview of Key Issues

The Riverside County Copermittees' edits and comments are shown in the Redline and discussed below.

3.11.2 Comments in support of specific changes

E.6.d.

The terminology in this Provision was changed in the Redline from 'escalated' enforcement to 'progressive' enforcement. The proposed language better reflects the nature of enforcement actions, which are not simply 'escalated' or 'not escalated', as implied by Provision E.6.d.(2), but are progressive as needed in response to the severity of the violation. Since every violation comes with a unique set of circumstances, it is not reasonable to presume that a single set of 'triggers' will universally result in the same level of enforcement.

3.12 Provision E.7, Public Education

3.12.1 Overview of Key Issues

The Riverside County Copermittees' edits and comments are shown in the Redline.

3.13 Provision, E.8 Fiscal Analysis

3.13.1 Overview of Key Issues

The requirement that the Copermittees "must secure all the resources necessary to comply with this Order" exceeds the requirements of the CWA and illegally intrudes on the home rule authority of municipalities to govern themselves. This must be deleted. Please also see Legal Comments.

With regard to other provisions, the Riverside County Copermittees' edits and comments are shown in the Redline.

3.14 Provision F

3.14.1 Overview of Key Issues

- F.1 – WQIP Submittal
  - Based on the schedule for the initial submittal of the Priority Water Quality Conditions and Numeric Goals, and the subsequent 60-day public review, only one month would be left for the Copermittees to finalize strategies based on those conditions and goals and the public input received. This is an insufficient amount of time. The Redline requests modifications to the schedule that would provide for the submittal of the final WQIP within 24 months (instead of 18), to provide additional time for the development of strategies.
- F.1 and F.2.
  - The schedules for submittals should be linked to the receipt of comments on prior submittals, or the approval of prior submittals, rather than the permit adoption date. If it is tied to the permit adoption date, the submittal dates could become out of sync with the comment periods or San Diego Water Board approvals if any unexpected delays occur (for example if the San Diego Water Board is delayed in approving a document, or posting a document online for public comment). The Redline requests appropriate modifications.
  - Implementation dates for the plans are unclear / undefined. The Redline clarifies this issue.
- F.3. Progress Reports
  - The reporting requirements across the transitional period were unclear. Redlines are provided to clarify and consolidate.
  - The Regional Monitoring and Assessment Report language was revised to be consistent with the requirements of the Integrated Assessment of the Water Quality Improvement Plan, rather than an additional, slightly different report, due at the same time.

3.15 Attachments B and C

Comments and edits to Attachments B and C are shown in the Redline.

Very truly yours,

for JASON E. UHLEY
Chief of Watershed Protection Division

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION

TENTATIVE
ORDER NO. R9-2013-0001
NPDES NO. CAS0109266

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS WITHIN THE SAN DIEGO REGION

The San Diego County Copermittees in Table 1a are subject to waste discharge requirements set forth in this Order.

Table 1a. San Diego County Copermittees

Municipal Copermittees	
City of Carlsbad	City of Oceanside
City of Chula Vista	City of Poway
City of Coronado	City of San Diego
City of Del Mar	City of San Marcos
City of El Cajon	City of Santee
City of Encinitas	City of Solana Beach
City of Escondido	City of Vista
City of Imperial Beach	County of San Diego
City of La Mesa	San Diego County Regional Airport Authority
City of Lemon Grove	San Diego Unified Port District
City of National City	

After the San Diego Water Board receives and considers the Orange County Copermittees' Report of Waste Discharge and makes any necessary changes to the Order, the Orange County Copermittees in Table 1b will become subject to waste discharge requirements set forth in this Order after expiration of Order No. R9-2009-0002, NPDES No. CAS0108740 on or after December 16, 2014.

Table 1b. Orange County Copermittees

City of Laguna Hills	City of Laguna Woods
City of Laguna Niguel	County of Orange
City of Lake Forest	~~Orange County Flood Control District~~

City of Mission Viejo	
Special District Copermittee	
Orange County Flood Control District	

After the San Diego Water Board receives and considers the Riverside County Copermittees' Report of Waste Discharge and makes any necessary changes to this Order, the Riverside County Copermittees in Table 1c will become subject to waste discharge requirements set forth in this Order after expiration of Order No. R9-2010-0016, NPDES No. CAS0108766 on or after November 10, 2015.

Table 1c. Riverside County Copermittees

Municipal Copermittee	
City of Murrieta	County of Riverside
City of Temecula	~~Riverside County Flood Control and Water Conservation District~~
City of Wildomar	
Special District Copermittee	
Riverside County Flood Control and Water Conservation District	

The Orange County Copermittees and Riverside County Copermittees may become subject to the requirements of this Order at a date earlier than the expiration date of their current Orders subject to the conditions described in Provision F.6 of this Order if the Copermittees in the respective county receive a notification of coverage from the San Diego Water Board.

The term Copermittee in this Order refers to any San Diego County, Orange County, or Riverside County Copermittee covered under this Order, unless specified otherwise.

This Order provides permit coverage for the Copermittee discharges described in Table 2.

Table 2. Discharge Locations and Receiving Waters

Discharge Points	Locations throughout San Diego Region
Discharge Description	Municipal Separate Storm Sewer System (MS4) Discharges
Receiving Waters	Inland Surface Waters, Enclosed Bays and Estuaries, and Coastal Ocean Waters of the San Diego Region

Table 3. Administrative Information

This Order was adopted by the San Diego Water Board on:	**Month Day, 2013**
This Order will become effective on:	**Month Day, 2013**
This Order will expire on:	**Month Day, 2018**
The Copermittees must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than 180 days in advance of the Order expiration date.	

I, David W. Gibson, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on Month Day, 2013.

I. FINDINGS

Comment [A1]: See discussions in section 3.1 of the comment letter

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds that:

JURISDICTION

1. **MS4 Ownership or Operation.** Each of the Copermittees owns or operates an MS4, through which it discharges storm water and non-storm water into waters of the U.S. within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the U.S.

Many geographical areas subject to this Order are subject to the threat of periodic catastrophic flooding resulting from natural conditions, specifically the presence of mountains and hilly areas in close proximity to urban development and the effect of period strong Pacific Ocean storms. Such flooding would occur in the absence of development. The Legislature recognized the importance of this issue when it established flood control districts across the state, including in Orange, Riverside and San Diego Counties. Such flooding has in the past, and if not controlled, could in the future result in loss of life and property damage. Such flooding can also mobilize significant Pollutants from industrial, commercial, residential and agricultural lands, damaging watercourses and the beneficial uses thereof, including habitat. MS4s are designed and constructed to mitigate such impacts.

2. Riverside County Flood Control and Water Conservation District.

Comment [A2]: See discussion in section 3.1.1 of the comment letter.

In 1945, the California Legislature enacted the Riverside County Flood Control and Water Conservation District Act, establishing the Riverside County Flood Control and Water Conservation District (District). The objects and purposes of the Act are to provide for the control and conservation of flood and storm waters and for the protection of watercourses, watersheds, public highways, life and property within the District from damage or destruction from flood waters. Among its other powers, the District also has the power to conserve, reclaim and save such waters for beneficial use. However the Act does not provide the District with the power to control the volume or quality of discharges that runs off of private property, which may end up in the District's flood control system. The District is governed by the District's Board of Supervisors as a separate legal entity from the County of Riverside.

Many of the flood management systems that the District operates are defined by the Clean Water Act as an MS4, and include many of the larger MS4s within the Santa Margarita watershed region of Riverside County (SMR). District does not however

own or operate streets, catch basins or storm drains smaller than 36 inches that collect runoff from the incorporated and unincorporated jurisdictions within the SMR, and commonly connect into the District's flood management system. Such systems are typically owned and operated by either the County of Riverside or the incorporated Cities within the SMR.

The waters and pollutants that may enter the regional receiving waters and/or the District's flood management systems come from various sources. These sources can include storm water and non-storm water from the Municipal Copermittees under this permit as well as from other NPDES and non-NPDES permittees, including industrial waste water dischargers, waste water treatment facilities, industrial and construction stormwater dischargers, water suppliers, tribal lands, other state and federal government entities, and Caltrans. Sources can also include discharges from Phase II entities such as school districts and discharges from entities that have been granted waste discharge requirements or waivers of waste discharge requirements, including agricultural operations.

The District does not own or operate any municipal sanitary sewer systems, public streets, roads, or highways. The District has no planning, zoning, development permitting or other land use authority, thus, it has no permitting or governing authority over industrial or commercial facilities, residents, new developments or re-development projects, and development construction sites located in any incorporated or unincorporated areas within its service area, including the SMR. The Copermittees that have such authority are responsible for implementing a storm water management program to address pollutants discharged from such industrial and commercial facilities, residential areas, new development and re-development projects, and development construction sites within their jurisdictional boundaries. Nonetheless, as an owner and operator of an MS4, the District is required to control pollutant discharges into and from its MS4, such as through interagency agreements among Copermittees and other owners of a MS4, the contribution of pollutants from one portion of the MS4 to another portion of the MS4 within their jurisdiction.

2. **Legal and Regulatory Authority.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations (Code of Federal Regulations [CFR] Title 40, Part 122 [40 CFR 122]) adopted by the United States Environmental Protection Agency (USEPA), and chapter 5.5, division 7 of the California Water Code (CWC) (commencing with section 13370). This Order serves as an NPDES permit for discharges from MS4s to surface waters. This Order also serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the CWC (commencing with section 13260).

   The San Diego Water Board has the legal authority to issue a regional MS4 permit pursuant to its authority under CWA section 402(p)(3)(B) and 40 CFR 122.26(a)(1)(v). The USEPA also made it clear that the permitting authority, in this case the San Diego Water Board, has the flexibility to establish system- or region-wide permits (55 Federal Register [FR] 47990, 48039-48042). The regional nature of this Order will ensure consistency of regulation within watersheds and is expected

to result in overall cost savings for the Copermittees and San Diego Water Board.

The federal regulations make it clear that the Copermittees need only comply with permit conditions relating to discharges from the MS4s for which they are operators (40 CFR 122.26(a)(3)(vi)). This Order does not require the Copermittees to manage storm water outside of their jurisdictional boundaries, but rather to work collectively to improve storm water management within watersheds.

3. **CWA NPDES Permit Conditions.** Pursuant to CWA section 402(p)(3)(B), NPDES permits for storm water discharges from MS4s must include requirements to effectively prohibit non-storm water discharges into MS4s, and require controls to reduce the discharge of pollutants from the MS4s ~~in storm water~~ to the maximum extent practicable (MEP), and to require other provisions as the San Diego Water Board determines are appropriate to control such pollutants. This Order prescribes conditions to assure compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges in to the MS4s, and require controls to reduce the discharge of pollutants ~~in storm water~~ from the MS4s to the MEP.

Comment [A3]: See discussion in section 3.1.2 of the comment letter.

4. **CWA and CWC Monitoring Requirements.** CWA section 308(a) and 40 CFR 122.41(h),(j)-(l) and 122.48 require that NPDES permits must specify monitoring and reporting requirements. Federal regulations applicable to large and medium MS4s also specify additional monitoring and reporting requirements in 40 CFR 122.26(d)(1)(iv)(D), 122.26(d)(1)(v)(B), 122.26(d)(2)(i)(F), 122.26(d)(2)(iii)(D), 122.26(d)(2)(iv)(B)(2) and 122.42(c). CWC section 13383 authorizes the San Diego Water Board to establish monitoring, inspection, entry, reporting and recordkeeping requirements. This Order establishes monitoring and reporting requirements to implement federal and State requirements.

5. **Total Maximum Daily Loads.** CWA section 303(d)(1)(A) requires that "[e]ach state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard applicable to such waters." The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Clean Water Act Section 303(d) List of Water Quality Limited Segments, commonly referred to as the 303(d) List. The CWA requires the 303(d) List to be updated every two years.

   TMDLs are numerical calculations of the maximum amount of a pollutant that a water body can assimilate and still meet water quality standards. A TMDL is the sum of the allowable loads of a single pollutant from all contributing point sources (waste load allocations or WLAs) and non-point sources (load allocations or LAs), background contribution, plus a margin of safety. Discharges from MS4s are point source discharges. The federal regulations (40 CFR 122.44(d)(1)(vii)(B)) require that NPDES permits to incorporate water quality based effluent limitations (WQBELs) developed to protect a narrative water quality criterion, a numeric water

quality criterion, or both, consistent with the assumptions and requirements of any available WLA for the discharge. Requirements of this Order implement the TMDLs adopted by the San Diego Water Board and approved by USEPA.

6. **Non-Storm Water Discharges.** Pursuant to CWA section 402(p)(3)(B)(ii), this Order requires each Copermittee to effectively prohibit discharges of non-storm water into its MS4. Nevertheless, non-storm water discharges into and from the MS4s continue to be reported to the San Diego Water Board by the Copermittees and other persons. Monitoring conducted by the Copermittees, as well as the 303(d) List, have identified dry weather, non-storm water discharges from the MS4s as a source of pollutants causing or contributing to receiving water quality impairments in the San Diego Region. The federal regulations (40 CFR 122.26(d)(2)(iv)(B)(1)) require the Copermittees to have a program to prevent illicit discharges to the MS4. The federal regulations, however, allow for specific categories of non-storm water discharges or flows to be addressed as illicit discharges only where such discharges are identified as sources of pollutants to waters of the U.S.

7. **In-Stream Treatment Systems.** Pursuant to federal regulations (40 CFR 131.10(a)), in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Runoff treatment must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) must not be constructed in waters of the U.S. Construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

DISCHARGE CHARACTERISTICS AND RUNOFF MANAGEMENT

8. **Point Source Discharges of Pollutants.** Discharges from the MS4s may contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s may contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Water Quality Control Plan for the San Diego Basin (Basin Plan). ~~Storm water and non-storm water discharges from the MS4s are subject to the conditions and requirements established in the Basin Plan for point source discharges.~~

9. **Potential Beneficial Use Impairment.** The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses or which may result~~ing~~ in a condition of pollution, contamination, or nuisance. In addition, the reduction of flows below the

existing condition may impact negatively impact beneficial uses.

10. **Pollutants Generated by Land Development.** Land development has created and continues to create new sources of non-storm water discharges and pollutants in storm water discharges as human population density increases. This brings higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, and trash. Pollutants from these sources are dumped or washed off the surface by non-storm water or storm water flows into and from the MS4s. When development converts natural vegetated pervious ground cover to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area without BMPs that can maintain pre-development conditions will contain greater pollutant loads and have significantly greater runoff volume, velocity, and peak flow rate than pre-development runoff from the same area.

11. **Runoff Discharges to Receiving Waters.** The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. ~~Historic and current development makes use of natural drainage patterns and features as conveyances for runoff. Rivers, streams and creeks in developed areas used in this manner are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and receiving water.~~ Numerous receiving water bodies and water body segments have been designated as impaired by the San Diego Water Board pursuant to CWA section 303(d).

Comment [A4]: See discussion in section 3.1.2 of the comment letter.

Pollutants in Runoff. The most common pollutants in runoff discharged from the MS4s include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa), heavy metals (e.g., cadmium, copper, lead, and zinc), petroleum products and polynuclear aromatic hydrocarbons, synthetic organics (e.g., pesticides, herbicides, and PCBs), nutrients (e.g., nitrogen and phosphorus), oxygen-demanding substances (e.g., decaying vegetation, animal waste), detergents, and trash. ~~As operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not effectively prohibit or otherwise control.~~ These discharges may cause or contribute to a condition of pollution or a violation of water quality standards. California law requires downstream landowners, including owners and operators of MS4, to accept upstream flows, even if that flow contains Pollutants. Failure to do can create conditions.

Comment [A5]: See discussion in section 3.1.2 of the comment letter.

Limitation on Powers of Copermittees. This Order regulates the discharge of non-stormwater into and Pollutants from non-agricultural Anthropogenic sources from the MS4s owned and/or operated by the Copermittees. The Copermittees lack legal

Comment [A6]: This finding is based on Findings I.B and I.C in Order R8-2010-33, applicable to portions of Riverside County within the Santa Ana region.

jurisdiction over discharges into their MS4 from agricultural activities, State and federal facilities, public schools and hospitals, utilities, railroads, special districts, Native American tribal lands, wastewater management agencies and other point and non-point source discharges otherwise permitted by the Water Board. The Water Board recognizes that the Copermittees should not be held responsible for discharges from such facilities or Pollutants in those discharges. Also, certain activities and sources that generate pollutants present in urban runoff may be beyond the ability of the Copermittees to prevent or eliminate. Examples of these activities and sources include, but are not limited to: emissions from internal combustion engines, brake pad wear and tear, atmospheric deposition, non-Anthropogenic sources of bacteria (including wildlife and feral cats and dogs), the regulation of pesticides and leaching of naturally occurring nutrients and minerals from local soils. This Order is not intended to address background or naturally occurring Pollutants or flows.

12.

13. **Human Health and Aquatic Life Impairment.** Pollutants in runoff discharged from the MS4s can threaten and adversely affect human health and aquatic organisms. Adverse responses of organisms to chemicals or physical agents in runoff range from physiological responses such as impaired reproduction or growth anomalies to mortality. Increased volume, velocity, rate, and duration of storm water runoff greatly accelerate the erosion of downstream natural channels. This alters stream channels and habitats and can adversely affect aquatic and terrestrial organisms.

14. **Water Quality Effects.** The Copermittees' water quality monitoring data submitted to date documents various persistent exceedances of Basin Plan water quality objectives for runoff-related pollutants at various watershed monitoring stations. Persistent toxicity has also been observed at several watershed monitoring stations. In addition, bioassessment data indicate that the majority of the monitored receiving waters have Poor to Very Poor Index of Biological Integrity (IBI) ratings. ~~These findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in the San Diego Region. Non-storm water discharges from the MS4s have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds, and contribute significantly to exceedances of applicable receiving water quality objectives.~~

Comment [A7]: These statements are completely unsubstantiated.

15. **~~Non-Storm Water and Storm Water Discharges.~~** ~~Non-storm water discharges from the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard of CWA section 402(p)(3)(B)(iii), which is explicitly for "Municipal … *Stormwater Discharges* (emphasis added)" from the MS4s. Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited.~~

Comment [A8]: See discussion in section 3.1.2 of the comment letter.

16. **Best Management Practices.** Waste and pollutants which are deposited and accumulate in MS4 drainage structures may~~will~~ be discharged from these structures

to waters of the U.S. unless they are removed. These discharges may cause or contribute to, or threaten to cause or contribute to, a condition of pollution in receiving waters. For this reason, pollutants in storm water discharges from the MS4s can be and must be effectively reduced in runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and runoff, therefore keeping pollutants onsite and out of receiving waters. Treatment control BMPs remove pollutants that have been mobilized by storm water or non-storm water flows.

17. **BMP Implementation.** Runoff needs to be addressed during the three major phases of development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges, and protect receiving waters. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations which can negatively affect receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development can generate substantial pollutant loads which are discharged in runoff to receiving waters. Retrofitting areas of existing development with storm water pollutant control and hydromodification management BMPs may in many cases be ~~is~~ necessary to address storm water discharges from existing development that may cause or contribute to a condition of pollution or a violation of water quality standards.

Comment [A9]: It is not necessary in all cases.

18. **Long Term Planning and Implementation.** Federal regulations require municipal storm water permits to expire 5 years from adoption, after which the permit must be renewed and reissued. The San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region occurred over several decades. The San Diego Water Board further recognizes that a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region. This Order includes a long term planning and implementation approach that will require more than a single permit term to complete.

WATER QUALITY STANDARDS

19. **Basin Plan.** The San Diego Water Board adopted the Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for receiving waters addressed through the plan. The Basin Plan was subsequently approved by the State Water

Resources Control Board (State Water Board) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. Requirements of this Order implement the Basin Plan.

The Basin Plan identifies the following existing and potential beneficial uses for inland surface waters in the San Diego Region: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional existing and potential beneficial uses are identified for coastal waters of the San Diego Region: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

20. **Ocean Plan.** The State Water Board adopted the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005 and it became effective on February 14, 2006. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. Requirements of this Order implement the Ocean Plan.

    The Ocean Plan identifies the following beneficial uses of ocean waters of the state to be protected: Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance; rare and endangered species; marine habitat; fish spawning and shellfish harvesting

21. **Sediment Quality Control Plan**. On September 16, 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality (Sediment Quality Control Plan). The Sediment Quality Control Plan became effective on August 25, 2009. The Sediment Quality Control Plan establishes: 1) narrative sediment quality objectives for benthic community protection from exposure to contaminants in sediment and to protect human health, and 2) a program of implementation using a multiple lines of evidence approach to interpret the narrative sediment quality objectives. Requirements of this Order implement the Sediment Quality Control Plan.

22. **National Toxics Rule and California Toxics Rule.** USEPA adopted the National Toxics Rule (NTR) on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the California Toxics Rule (CTR). The CTR promulgated

new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.

23. **Antidegradation Policy.** This Order is in conformance with the federal Antidegradation Policy described in 40 CFR 131.12, and State Water Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*. Federal regulations at 40 CFR 131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. State Water Board Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. State Water Board Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies.

CONSIDERATIONS UNDER FEDERAL AND STATE LAW

24. **Coastal Zone Act Reauthorization Amendments.** Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point source pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point source pollution: agriculture, silviculture, urban, marinas, and hydromodification. This Order addresses the management measures required for the urban category, with the exception of septic systems. The runoff management programs developed pursuant to this Order fulfills the need for coastal cities to develop a runoff non-point source plan identified in the Non-Point Source Program Strategy and Implementation Plan. The San Diego Water Board addresses septic systems through the administration of other programs.

25. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 USC sections 1531 to 1544). This Order requires compliance with receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Copermittees are responsible for meeting all requirements of the applicable Endangered Species Act.

26. **Report of Waste Discharge Process.** The waste discharge requirements set forth in this Order are based upon the Report of Waste Discharge submitted by the San Diego County Copermittees prior to the expiration of Order No. R9-2007-0001 (NPDES No. CAS0109266). The Orange County and Riverside County Copermittees are not immediately covered by the waste discharge requirements in this Order. The San Diego Water Board understands that each municipality is

unique although the Counties share watersheds and geographical boundaries. The Order will continue to use the Report of Waste Discharge process prior to initially making Orange County or Riverside County Copermittees subject to the requirements of this Order.

The federal regulations (40 CFR 122.21(d)(2)) and CWC section 13376 impose a duty on the Copermittees to reapply for continued coverage through submittal of a Report of Waste Discharge no later than 180 days prior to expiration of a currently effective permit. This requirement is set forth in the Orange County Copermittees' and Riverside County Copermittees' currently effective permits at Provisions K.2.b and K.2.c, respectively. The Orange County Permit, Order No. R9-2009-0002 (NPDES No. CAS0108740) expires on December 16, 2014 and the Riverside County MS4 Permit, Order No. R9-2010-0016 (NPDES No. CAS0108766) expires on November 10, 2015.

Unless the Orange County or Riverside County Copermittees apply for and receive early coverage under this Order, the Orange County Copermittees' and the Riverside County Copermittees' respective permits will be superseded by this Order upon expiration of their respective permits, subject to any necessary revisions to the requirements of this Order made after the San Diego Water Board considers their respective Reports of Waste Discharge through the public process provided in 40 CFR 124.

Comment [A10]: Please see Comment Letter and Legal Comments regarding regional permit authority,

27. **Integrated Report and Clean Water Act Section 303(d) List.** The San Diego Water Board and State Water Board submit an Integrated Report to USEPA to comply with the reporting requirements of CWA sections 303(d), 305(b) and 314, which lists the attainment status of water quality standards for water bodies in the San Diego Region. USEPA issued its *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* on July 29, 2005, which advocates the use of a five category approach for classifying the attainment status of water quality standards for water bodies in the Integrated Report. Water bodies included in Category 5 in the Integrated Report indicate at least one beneficial use is not being supported or is threatened, and a TMDL is required. Water bodies included in Category 5 in the Integrated Report are placed on the 303(d) List.

Water bodies with available data and/or information that indicate at least one beneficial use is not being supported or is threatened, but a TMDL is not required, are included in Category 4 in the Integrated Report. Impaired surface water bodies may be included in Category 4 if a TMDL has been adopted and approved (Category 4a); if other pollution control requirements required by a local, state or federal authority are stringent enough to implement applicable water quality standards within a reasonable period of time (Category 4b); or, if the failure to meet an applicable water quality standard is not caused by a pollutant, but caused by other types of pollution (Category 4c).

Implementation of the requirements of this Order may allow the San Diego Water Board to include surface waters impaired by discharges from the Copermittees'

MS4s in Category 4 in the Integrated Report for consideration during the next 303(d) List submittal by the State to USEPA.

28. **Economic Considerations.** The California Supreme Court has ruled that although CWC section 13263 requires the State and Regional Water Boards (collectively Water Boards) to consider factors set forth in CWC section 13241 when issuing an NPDES permit, the Water Board may not consider the factors to justify imposing pollutant restrictions that are less stringent than the applicable federal regulations require. (*City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 618, 626-627.) However, when pollutant restrictions in an NPDES permit are more stringent than federal law requires, CWC section 13263 requires that the Water Boards consider the factors described in CWC section 13241 as they apply to those specific restrictions.

    As noted in the following finding, the San Diego Water Board finds that the requirements in this permit are not more stringent than the minimum federal requirements. Therefore, a CWC section 13241 analysis is not required for permit requirements that implement the effective prohibition on the discharge of non-storm water into the MS4 or for controls to reduce the discharge of pollutants ~~in storm water~~ to the MEP, or other provisions that the San Diego Water Board has determined appropriate to control such pollutants, as those requirements are mandated by federal law. Notwithstanding the above, the San Diego Water Board has developed an economic analysis of the requirements in this Order. The economic analysis is provided in the Fact Sheet.

Comment [A11]: See discussion in section 3.1.2 of the Comment Letter and also Legal Comments..

29. ~~**Unfunded Mandates.** This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following:~~

    ~~**a.** This Order implements federally mandated requirements under CWA section 402 (33 USC section 1342(p)(3)(B)).~~

    ~~**b.** The local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges.~~

    ~~**c.** The local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order.~~

    ~~**d.** The Copermittees have requested permit coverage in lieu of compliance with the complete effective prohibition against the discharge of pollutants contained in CWA section 301(a) (33 USC section 1311(a)) and in lieu of numeric restrictions on their MS4 discharges (i.e. effluent limitations).~~

    ~~**e.** The local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.~~

Comment [A12]: See discussion in section 3.1.2 of the comment letter and in the Legal Comments.

~~f. The provisions of this Order to implement TMDLs are federal mandates. The CWA requires TMDLs to be developed for water bodies that do not meet federal water quality standards (33 USC section 1313(d)). Once the USEPA or a state develops a TMDL, federal law requires that permits must contain water quality based effluent limitations consistent with the assumptions and requirements of any applicable wasteload allocation (40 CFR 122.44(d)(1)(vii)(B)).~~

~~See the Fact Sheet for further discussion of unfunded mandates.~~

30. **California Environmental Quality Act.** The issuance of waste discharge requirements and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with CWC section 13389.

STATE WATER BOARD DECISIONS

31. **Compliance with Prohibitions and Limitations.** The receiving water limitation language specified in this Order is consistent with language recommended by the USEPA and established in State Water Board Order WQ 99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Water Board on June 17, 1999. The receiving water limitation language in this Order requires storm water discharges from MS4s to not cause or contribute to a violation of water quality standards, which is to be achieved through an iterative approach requiring the implementation of improved and better-tailored BMPs over time. Implementation of the iterative approach to comply with receiving water limitations based on applicable water quality standards is necessary to ensure that Pollutant ~~storm water~~ discharges from the MS4 will not ultimately cause or contribute to violations of water quality standards and will not create conditions of pollution, contamination, or nuisance.

Comment [A13]: See discussion in section 3.1.2 of the comment letter.

Comment [A14]: Please see discussion in section 3.1.2 of the Comment Letter and Legal Comments.

32. **Special Conditions for Areas of Special Biological Significance.** On March 20, 2012, the State Water Board approved Resolution No. 2012-0012 approving an exception to the Ocean Plan effective prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint source discharges and NPDES permitted municipal storm water discharges. State Water Board Resolution No. 2012-0012 requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storms when rain water overflows into coastal waters. Specific terms, effective prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBS. The City of San Diego's municipal storm water discharges to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's municipal storm water discharges to the Heisler Park ASBS are subject terms and conditions of State Water Board Resolution No. 2012-0012. The Special

Protections contained in Attachment B to Resolution No. 2012-0012, applicable to these discharges, are hereby incorporated into this Order as if fully set forth herein.

ADMINISTRATIVE FINDINGS

33. **Executive Officer Delegation of Authority.** The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.

34. **Standard Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment B to this Order.

35. **Fact Sheet.** The Fact Sheet for this Order contains background information, regulatory and legal citations, references and additional explanatory information and data in support of the requirements of this Order. The Fact Sheet is hereby incorporated into this Order and constitutes part of the Findings of this Order.

36. **Public Notice.** In accordance with State and federal laws and regulations, the San Diego Water Board notified the Copermittees, and interested agencies and persons of its intent to prescribe waste discharge requirements for the control of discharges into and from the MS4s to waters of the U.S. and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet.

37. **Public Hearing.** The San Diego Water Board held a public hearing on Month Day, 2013 and heard and considered all comments pertaining to the terms and conditions of this Order. Details of the public hearing are provided in the Fact Sheet.

38. **Effective Date.** This Order serves as an NPDES permit pursuant to CWA section 401 or amendments thereto, and becomes effective fifty (50) days after the date of its adoption, provided that the Regional Administrator, USEPA, Region IX, does not object to this Order.

39. **Review by the State Water Board.** Any person aggrieved by this action of the San Diego Water Board may petition the State Water Board to review the action in accordance with CWC section 13320 and California Code of Regulations, title 23, sections 2050, et seq. The State Water Board must receive the petition by 5:00 p.m., 30 days after the San Diego Water Board action, except that if the thirtieth day following the action falls on a Saturday, Sunday or State holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the

Internet at: http://www.waterboards.ca.gov/public_notices/petitions/water_quality or will be provided upon request.

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

II. PROVISIONS

A. PROHIBITIONS AND LIMITATIONS

The purpose of this provision is to describe the conditions under which storm water and non-storm water discharges into and from MS4s are to be effectively prohibited or limited. The goal of the prohibitions and limitations is to protect the water quality and designated beneficial uses of waters of the state from adverse impacts caused or contributed to by MS4 discharges. This goal will be accomplished through the implementation of water quality improvement strategies and runoff management programs that effectively prohibit non-storm water discharges into the Copermittees' MS4s, and reduce pollutants in ~~storm water~~ discharges from the Copermittees' MS4s to the MEP. The process for determination of compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3) is defined in Provisions A.3.b and A.4.

1. Discharge Prohibitions

a. Discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in receiving waters ~~of the state~~ are to be ~~prohibited.~~ effectively prohibited, unless the Regional Board determines such discharges are addressed by the Copermittee through A.3.b or A.4, including any modifications.~~prohibited.~~

b. Non-storm water discharges into MS4s are to be effectively prohibited through a program consistent with the requirements of provision E.2. of this order, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the MS4, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

c. Discharges from MS4s are subject to all applicable waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order, unless the Regional Board determines such discharges are addressed by the Copermittee through A.3.b or A.4, including any modifications.

d. Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No.

Comment [A15]: See discussion in section 3.2 of the comment letter.

Comment [A16]: See discussion in section 3.2.2 of the comment letter.

Comment [A17]: See discussion in section 3.2.2 of the comment letter.

Comment [A18]: See discussion in section 3.2.2 of the comment letter.

2012-0012 applicable to these discharges, included in Attachment A to this Order. All other discharges from the Copermittees' MS4s to ASBS are ~~to be effectively~~ prohibited.

2. Receiving Water Limitations

Comment [A19]: See discussion in section 3.2.2 of the comment letter.

a. Discharges from MS4s must not cause or contribute to the violation of water quality standards in any receiving waters, including but not limited to all applicable provisions ~~contained in:~~below, unless the Regional Board determines such discharges are addressed by the Copermittee through A.3.b or A.4::~~contained in:~~

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives for bays and estuaries:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California;[1]

(4) Priority pollutant criteria promulgated by the USEPA through the following:

[1] State Water Board Resolution No. 68-16

(a) National Toxics Rule (NTR)[2] (promulgated on December 22, 1992 and amended on May 4, 1995), and

(b) California Toxics Rule (CTR).[3,4]

b. Discharges from MS4s composed of storm water runoff must not alter natural ocean water quality in an ASBS.

[2] 40 CFR 131.36
[3] 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR
[4] If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies.

3. **Effluent Limitations**

   a. **TECHNOLOGY BASED EFFLUENT LIMITATIONS**

   Pollutants in ~~storm water~~ discharges from MS4s must be reduced to the MEP.[5]

   b. **WATER QUALITY BASED EFFLUENT LIMITATIONS**

   This Order establishes water quality based effluent limitations (WQBELs) consistent with the assumptions and requirements of all available TMDL waste load allocations (WLAs) assigned to discharges from the Copermittees' MS4s. Each Copermittee must comply with applicable WQBELs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.

4. **Compliance with Discharge Prohibitions and Receiving Water Limitations**

Each Copermittee must achieve compliance with Provisions A.1.a~~,~~ through A.1.c and A.2.a of this Order through timely implementation of control measures and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans required under Provision B must be designed and adapted to ultimately achieve compliance with Provisions A.1.a~~,~~ through A.1.c and A.2.a~~.~~, as described in Provision B.2.~~.~~

   a. If exceedance(s) of water quality standards persist in receiving waters notwithstanding implementation of this Order, the Copermittees must comply with the following procedures:

      (1) For exceedance(s) of a water quality standard in the process of being addressed by the Water Quality Improvement Plan, the Copermittee(s) must implement the Water Quality Improvement Plan as accepted by the San Diego Water Board, and update the Water Quality Improvement Plan, as necessary, pursuant to Provision F.2.c;

      (2) Upon a determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to a new exceedance of an applicable water quality standard not addressed by the Water Quality Improvement Plan, the Copermittees must submit the following updates to the Water Quality Improvement Plan pursuant to Provision F.2.c or as part of the Annual Report required under Provision F.3.b, unless the San

[5] This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in storm water discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding 7.

Comment [A20]: See discussion in section 3.2.2 of the comment letter.

Comment [A21]: See discussion in section 3.2.2 of the comment letter.

Diego Water Board directs an earlier submittal:

(a) The water quality improvement strategies being implemented that are effective and will continue to be implemented,

(b) Water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation or restoration projects, adjustments to jurisdictional runoff management programs, etc.) that will be implemented to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards,

(c) Updates to the schedule for implementation of the existing and additional water quality improvement strategies, and

(d) Updates to the monitoring and assessment program to track progress toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a of this Order;

(3) The San Diego Water Board may require the incorporation of additional modifications to the Water Quality Improvement Plan required under Provision B. The applicable Copermittees must submit any modifications to the update to the Water Quality Improvement Plan within 90 days of notification that additional modifications are required by the San Diego Water Board, or as otherwise directed;

(4) Within 90 days of the San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the applicable Copermittees must revise the jurisdictional runoff management program documents to incorporate the updated water quality improvement strategies that have been and will be implemented, the implementation schedule, and any additional monitoring required; and

(5) Each Copermittee must implement the updated Water Quality Improvement Plan.

b. The procedure set forth above to achieve compliance with Provisions A.1.a, A.1.c and A.2.a of this Order do not have to be repeated for continuing or recurring exceedances of the same water quality standard(s) following implementation of scheduled actions unless directed to do otherwise by the San Diego Water Board.

c. Nothing in Provisions A.4.a and A.4.b prevents the San Diego Water Board from enforcing any of provisions B through I of this Order while the applicable Copermittees prepare and implement the above update to the Water Quality Improvement Plan and jurisdictional runoff management programs.

B. WATER QUALITY IMPROVEMENT PLANS

The purpose of this provision is to develop Water Quality Improvement Plans (WQIPs) that guide the Copermittees' jurisdictional runoff management programs towards achieving the outcome of improved water quality in MS4 discharges and receiving waters. The goal of the Water Quality Improvement Plans is to ~~protect, preserve, enhance, and restorerestore the~~address the impacts of MS4 discharges so that such discharges do not impair water quality and designated beneficial uses of receiving waters~~. of the state.~~ Therefore, implementation of the WQIPs also provides the basis for complying with Provisions II.A.1, II.A.2, and II.A.3, as described in Provision II.A.4. This goal will be accomplished through an adaptive planning and management process that identifies the highest priority water quality conditions within a watershed and implements strategies through the jurisdictional runoff management programs to achieve improvements in the quality of discharges from the MS4s ~~and~~ to receiving waters. As such, the requirements outlined in Provision E may be modified for consistency with the WQIP priorities for the applicable Watershed Management Area, if appropriate justification is provided approved within the WQIP.

Comment [A22]: See section 3.3 of the comment letter for discussions of the changes requested herein.

Comment [A23]: See discussion in section 3.3.2 of the comment letter.

1. Watershed Management Areas

Comment [A24]: See discussion in section 3.3.2 of the comment letter.

The Copermittees must develop a Water Quality Improvement Plan for each of the Watershed Management Areas in Table B-1. A total of ten Water Quality Improvement Plans must be developed for the San Diego Region.

Development of the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area shall commence upon notification of coverage of the Riverside County Copermittees under this Order. Until this time, the County of San Diego shall use the water quality priorities in the Santa Margarita River Watershed Urban Runoff Management Plan, developed pursuant to Order No. R9-2007-0001, to guide implementation of Provisions D and E within its jurisdiction

Table B-1. Watershed Management Areas

Hydrologic Unit(s)	Watershed Management Area	Major Surface Water Bodies	Responsible Copermittees
San Juan (901.00)	South Orange County	- Aliso Creek - San Juan Creek - San Mateo Creek - Pacific Ocean - Heisler Park ASBS	- City of Aliso Viejo[1] - City of Dana Point[1] - City of Laguna Beach[1] - City of Laguna Hills[1] - City of Laguna Niguel[1] - City of Laguna Woods[1] - City of Lake Forest[1] - City of Mission Viejo[1] - City of Rancho Santa Margarita[1] - City of San Clemente[1] - City of San Juan Capistrano[1] - County of Orange[1] - Orange County Flood Control District[1]

Table B-1. Watershed Management Areas

Hydrologic Unit(s)	Watershed Management Area	Major Surface Water Bodies	Responsible Copermittees
Santa Margarita (902.00)	Santa Margarita River	- Murrieta Creek - Temecula Creek - Santa Margarita River - Santa Margarita Lagoon - Pacific Ocean	- City of Murrieta[2] - City of Temecula[2] - City of Wildomar[2] - County of Riverside[2] - County of San Diego[3] - Riverside County Flood Control and Water Conservation District[2]
San Luis Rey (903.00)	San Luis Rey River	- San Luis Rey River - San Luis Rey Estuary - Pacific Ocean	- City of Oceanside - City of Vista - County of San Diego
Carlsbad (904.00)	Carlsbad	- Loma Alta Slough - Buena Vista Lagoon - Agua Hedionda Lagoon - Batiquitos Lagoon - San Elijo Lagoon - Pacific Ocean	- City of Carlsbad - City of Encinitas - City of Escondido - City of Oceanside - City of San Marcos - City of Solana Beach - City of Vista - County of San Diego
San Dieguito (905.00)	San Dieguito River	- San Dieguito River - San Dieguito Lagoon - Pacific Ocean	- City of Del Mar - City of Escondido - City of Poway - City of San Diego - City of Solana Beach - County of San Diego
Penasquitos (906.00)	Penasquitos	- Los Penasquitos Lagoon - Pacific Ocean	- City of Del Mar - City of Poway - City of San Diego - County of San Diego
	Mission Bay	- Mission Bay - Pacific Ocean - San Diego Marine Life Refuge ASBS	- City of San Diego
San Diego (907.00)	San Diego River	- San Diego River - Pacific Ocean	- City of El Cajon - City of La Mesa - City of San Diego - City of Santee - County of San Diego
Pueblo San Diego (908.00) Sweetwater (909.00) Otay (910.00)	San Diego Bay	- Sweetwater River - Otay River - San Diego Bay - Pacific Ocean	- City of Chula Vista - City of Coronado - City of Imperial Beach - City of La Mesa - City of Lemon Grove - City of National City - City of San Diego - County of San Diego - San Diego County Regional Airport Authority - San Diego Unified Port District
Tijuana (911.00)	Tijuana River	- Tijuana River - Tijuana Estuary - Pacific Ocean	- City of Imperial Beach - City of San Diego - County of San Diego

Notes:
1. The Orange County Copermittees will be covered under this Order after expiration of Order No. R9-2009-0002, or earlier if the Orange County Copermittees meet the conditions in Provision F.6.
2. The Riverside County Copermittees will be covered under this Order after expiration of Order No. R9-2010-0016, or earlier if the Riverside County Copermittees meet the conditions in Provision F.6.
3. The County of San Diego is required to implement the requirements of Provision B for its jurisdiction within the Santa

Margarita River Watershed Management Area until the Riverside County Copermittees have been notified of coverage under this Order.

2. Priority Water Quality Conditions

The Copermittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Water Quality Improvement Plan. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and jurisdictional runoff management program implementation efforts by receiving water.

a. ASSESSMENT OF RECEIVING WATER CONDITIONS

The Copermittees must consider the following, at a minimum, to identify water quality priorities based on impacts of MS4 discharges on receiving water beneficial uses:

(1) Receiving waters listed as impaired on the CWA Section 303(d) List of Water Quality Limited Segments (303(d) List);

(2) TMDLs adopted and under development by the San Diego Water Board;

(3) Receiving waters recognized as sensitive or highly valued by the Copermittees, including estuaries designated under the National Estuary Program under CWA section 320, wetlands defined by the State or U.S. Fish and Wildlife Service's National Wetlands Inventory as wetlands, and receiving waters identified as ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (Attachment A);

(4) The receiving water limitations of Provision A.2;

(5) Known historical versus current physical, chemical, and biological water quality conditions;

(6) Available, relevant, and appropriately collected and analyzed physical, chemical, and biological receiving water monitoring data, including, but not limited to, data describing:

(a) Chemical constituents,

(b) Water quality parameters (i.e. pH, temperature, conductivity, etc.),

(c) Toxicity Identification Evaluations for both receiving water column and sediment,

(d) Trash impacts,

(e) Bioassessments, and

(f) Physical habitat;

(7) Available evidence of erosional impacts in receiving waters due to accelerated flows (i.e. hydromodification);

(8) Available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters; and

(9) The potential improvements in the overall condition of the Watershed Management Area that can be achieved.

b. ASSESSMENT OF IMPACTS FROM MS4 DISCHARGES

The Copermittees must consider the following, at a minimum, to identify the potential impacts to receiving waters that may be caused or contributed to by discharges from the Copermittees' MS4s:

(1) The discharge prohibitions of Provision A.1 and effluent limitations of Provision A.3; and

(2) Available, relevant, and appropriately collected and analyzed storm water and non-storm water monitoring data from the Copermittees' MS4 outfalls;

(3) Locations of each Copermittee's MS4 outfalls that discharge to receiving waters;

(4) Locations of MS4 outfalls that are known to persistently discharge non-storm water to receiving waters likely causing or contributing to impacts on receiving water beneficial uses;

(5) Locations of MS4 outfalls that are known to discharge pollutants in storm water causing or contributing to impacts on receiving water beneficial uses; and

(6) The potential improvements in the quality of discharges from the MS4 that can be achieved.

c. IDENTIFICATION OF PRIORITY WATER QUALITY CONDITIONS

(1) The Copermittees must use the information gathered for Provisions B.2.a and B.2.b to develop a list of priority water quality conditions as pollutants, stressors and/or receiving water conditions that are the highest threat to receiving water quality or that most adversely affect the physical, chemical, and biological integrity of receiving waters. The list must include the following information for each priority water quality condition:

(a) The beneficial use(s) associated with the priority water quality condition;

(b) The geographic extent of the priority water quality condition within the Watershed Management Area, if known;

(c) The temporal extent of the priority water quality condition (e.g., dry weather and/or wet weather);

(d) The Copermittees with MS4s discharges that may cause or contribute to the priority water quality condition; and

(e) An assessment of the adequacy of and data gaps in the monitoring data to characterize the conditions causing or contributing to the priority water quality condition, including a consideration of spatial and temporal variation.

(2) The Copermittees must identify the highest priority water quality conditions to be addressed by the Water Quality Improvement Plan, and provide a rationale for selecting a subset of the water quality conditions identified pursuant to Provision B.2.c.(1) as the highest priorities.

d. IDENTIFICATION OF MS4 SOURCES OF POLLUTANTS AND/OR STRESSORS

The Copermittees must identify and prioritize known and suspected sources of storm water and non-storm water pollutants and/or other stressors within their jurisdiction, associated with MS4 discharges that cause or contribute to the highest priority water quality conditions identified under Provision B.2.c. ~~The identification of known and suspected sources of pollutants and/or stressors that cause or contribute to the highest priority water quality conditions as identified for Provision B.2.c must~~ considering the following:

(1) Pollutant generating facilities, areas, and/or activities within the Watershed Management Area, including:

(a) Each Copermittee's inventory of construction sites, commercial facilities or areas, industrial facilities, municipal facilities, and residential areas,

(b) Publicly owned parks and/or recreational areas,

(c) Open space areas,

(d) All currently operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste,,, and

(e) Areas not within the Copermittees' jurisdictions (e.g., Phase II MS4s, tribal lands, state lands, federal lands) that are known or suspected to be discharging to the Copermittees' MS4s;

(2) Locations of the Copermittees' MS4s, including the following:

(a) All major MS4 outfalls [per 40CFR 122.26 (b)(5)] that discharge to receiving waters, and

(b) Locations of major structural controls for storm water and non-storm water (e.g., retention basins, detention basins, major infiltration devices, etc.);

(3) Other known and suspected sources of non-storm water or pollutants in storm water discharges to receiving waters within the Watershed Management Area, including the following:

(a) Other MS4 outfalls (e.g., Phase II Municipal and Caltrans),

(b) Other NPDES permitted discharges,

(c) Any other discharges that may be considered point sources (e.g., private outfalls), and

(d) Any other discharges that may be considered non-point sources (e.g., agriculture, wildlife or other natural sources);

(4) Review of available data, including but not limited to:

(a) Findings from the Copermittees' illicit discharge detection and elimination programs,

(b) Findings from the Copermittees' MS4 outfall discharge monitoring,

(c) Findings from the Copermittees' receiving water monitoring,

(d) Findings from the Copermittees' MS4 outfall discharge and receiving water assessments, and

(e) Other available, relevant, and appropriately collected data, information, or studies related to pollutant sources and/or stressors that contribute to the highest priority water quality conditions as identified for Provision B.2.c.

(5) The adequacy of the available data to identify and prioritize sources and/or stressors associated with MS4 discharges that cause or contribute to the highest priority water quality conditions identified under Provision B.2.c.

e. NUMERIC GOALS AND SCHEDULES

Comment [A25]: See discussion in section 3.3.2 of the comment letter.

The Copermittees must develop and incorporate action levels, interim and final numeric goals[6] and schedules into the Water Quality Improvement Plan. Numeric goals must be used to support Water Quality Improvement Plan implementation and measure progress towards addressing the highest priority water quality conditions identified under Provision B.2.c. . Action Levels, Numeric goals are not enforceable compliance standards, effluent limitations, or receiving water limitations. When establishing numeric goals and corresponding schedules, the Copermittees must consider the following:

(1) Final numeric goals must be based on measureable criteria or indicators, to be achieved in ~~the receiving waters and/or~~ MS4 discharges for the highest priority water quality conditions which will ~~be capable of demonstrating the achievement of the restoration and/or protection~~ comply with the Receiving Water Limitations (A.2) of this Order; ~~water quality standards in receiving waters;~~

(2) Interim numeric goals must be based on measureable criteria or indicators capable of demonstrating incremental progress toward achieving the final numeric goals in the receiving waters and/or MS4 discharges; and

(3) Schedules must be adequate for measuring progress toward achieving the interim and final numeric goals required for Provisions B.2.e.(1) and B.2.e.(2). Schedules must incorporate the following:

(a) Interim dates for achieving the interim numeric goals,

(b) Compliance schedules for any applicable TMDLs in Attachment E to this Order,

(c) Compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A),

(d) Achievement of the final numeric goals in the receiving waters and/or MS4 discharges for the highest water quality priorities must be as soon as possible, and

[6] Interim and final numeric goals may take a variety of forms such as TMDL established WQBELs, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. Except for TMDL established WQBELs, interim and final numeric goals and corresponding schedules may be revised through the adaptive management process under Provision B.5.

(e) Final dates for achieving the final numeric goals must not initially extend more than 10 years beyond the effective date of this Order, unless a longer period of time is authorized by the San Diego Water Board Executive Officer through an approved WQIP or the schedule includes an applicable TMDL in Attachment E to this Order[7].

Comment [A26]: Clarify that a longer period can be granted through the WQIP process.

[7] Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years.

3. Water Quality Improvement Strategies and Schedules

Comment [A27]: See discussion in section 3.3.2 of the comment letter.

The Copermittees must develop specific water quality improvement strategies to address the highest priority water quality conditions identified within a Watershed Management Area. The water quality improvement strategies must address the highest priority water quality conditions by ensuring the effective prohibition of~~preventing or eliminating~~ non-storm water discharges to and from the MS4, reducing pollutants in ~~storm water~~ discharges from the MS4 to the MEP, as applicable to the priority water quality conditions established per provision B.2. ~~and restoring and/or protecting the water quality standards of receiving waters~~.

a. WATER QUALITY IMPROVEMENT STRATEGIES

The Copermittees must identify and prioritize water quality improvement strategies based on their likely effectiveness and efficiency, and design the JRMP programs to focus resources on those strategies to~~implement strategies to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, improve the physical, chemical, and biological receiving water conditions, and~~ achieve the interim and final numeric goals in accordance with the schedules required for Provision B.2.e.(3). The following water quality improvement strategies must be included and described in the Water Quality Improvement Plan:

(1) Specific strategies and/or activities that may be implemented by one or more Copermittees within their jurisdictions through the jurisdictional runoff management programs that will address the highest priority water quality conditions within the Watershed Management Area, in accordance with the following requirements:

(a) Strategies and/or activities must, at a minimum, be described for each jurisdictional runoff management program component where strategies to address the highest priority water quality conditions are required under Provision E;

(b) The Water Quality Improvement Plan must describe the circumstances or conditions when and where the strategies or/activities should be or will be implemented, but specific details about how each Copermittee will implement the strategies and/or activities within its jurisdiction are not required; and

(c) Descriptions of strategies and/or activities must include any monitoring, information collection, special studies, and/or data analysis that is necessary to assess the effectiveness of the strategy and/or activity toward addressing the highest priority water quality conditions.

(2) Additional strategies and/or activities that may be implemented within the Watershed Management Area on a jurisdictional, sub-watershed, or watershed scale by one or more Copermittees, not specifically required under

Provision E, which are designed to achieve the interim and final numeric goals identified in Provisions B.2.e.(1) and B.2.e.(2);

b. IMPLEMENTATION SCHEDULES

(1) The Copermittees must develop schedules for implementing the water quality improvement strategies identified under Provision B.3.a to achieve the interim and final numeric goals identified under Provision B.2.e.(1) and B.2.e.(2). Schedules must be developed for both the water quality improvement strategies implemented by each Copermittee within its jurisdiction and for strategies that the Copermittees choose to implement on a collaborative basis.

(2) The Copermittees must incorporate the implementation compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).

4. Water Quality Improvement Monitoring and Assessment Program

a. The Copermittees in each Watershed Management Area must develop and incorporate an integrated monitoring and assessment program into the Water Quality Improvement Plan that assesses: 1) the progress toward achieving the numeric goals and schedules, 2) the progress toward addressing the highest priority water quality conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts to implement the Water Quality Improvement Plan.

b. The monitoring and assessment program must incorporate the monitoring and assessment requirements of Provision D, which may allow the Copermittees to modify the program to be consistent with and focus on the highest priority water quality conditions for each Watershed Management Area.

c. For Watershed Management Areas with applicable TMDLs, the monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E.

d. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).

5. Iterative Approach and Adaptive Management Process

Comment [A28]: See discussion in section 3.3.2 of the comment letter.

The Copermittees in each Watershed Management Area must implement the iterative approach pursuant to Provision A.4 to adapt the Water Quality Improvement Plan, monitoring and assessment program, and jurisdictional runoff management

programs to become more effective toward achieving compliance with Provisions A.1, A.2, and A.3.~~A.1.a, A.1.c and A.2.a~~, and must include the following:

a. RE-EVALUATION OF PRIORITY WATER QUALITY CONDITIONS

The priority receiving water quality conditions, and numeric goals and corresponding schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.2.c and B.2.e, may be re-evaluated by the Copermittees as needed during the term of this Order as part of the Annual Report. Re-evaluation and recommendations for modifications to the priority water quality conditions, and numeric goals and corresponding schedules must be provided in the Regional Monitoring and Assessment Report pursuant to F.3.c~~Report of Waste Discharge~~, and must consider the following:

(1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan;

(2) Progress toward achieving interim and final numeric goals in receiving waters and/or MS4 discharges for the highest priority water quality conditions in the Watershed Management Area,

(3) Progress toward achieving outcomes according to established schedules;

(4) New information developed when the requirements of Provisions B.2.a-c have been re-evaluated;

(5) New policies or regulations that may affect identified numeric goals;

(6) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality conditions and implementation strategies to address the highest priority water quality conditions;

(7) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees;

(8) San Diego Water Board recommendations; and

(9) Recommendations for modifications solicited through a public participation process.

b. ADAPTATION OF STRATEGIES AND SCHEDULES

The water quality improvement strategies and schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.3, must be re-evaluated and adapted as new information becomes available to result in more effective and efficient measures to achieve the numeric goals established pursuant to

Provision B.2.e. Re-evaluation of and modifications to the water quality improvement strategies, if determined to be necessary, must be provided in the applicable Annual Report per F.3.b.(3)., and must consider the following:

(1) Modifications to the priority water quality conditions, and numeric goals and corresponding schedules based on Provision B.5.a;

(2) Measurable or demonstrable reductions of non-storm water discharges to and from each Copermittee's MS4;

(3) Measurable or demonstrable reductions of pollutants in ~~storm water~~ discharges from each Copermittee's MS4 to the MEP;

(4) New information developed when the requirements of Provisions B.2.b and B.2.d have been re-evaluated;

(5) Efficiency in implementing the Water Quality Improvement Plan;

(6) San Diego Water Board recommendations; and

(7) Recommendations for modifications solicited through a public participation process.

c. ADAPTATION OF MONITORING AND ASSESSMENT PROGRAM

The water quality improvement monitoring and assessment program, included in the Water Quality Improvement Plan pursuant to Provisions B.4, must be re-evaluated and adapted when new information becomes available. Re-evaluation and recommendations for modifications to the monitoring and assessment program, pursuant to the requirements of Provision D, may be provided in the Annual Report, but must be provided in the Report of Waste Discharge.

6. Water Quality Improvement Plan Submittal, Updates, and Implementation

a. The Copermittees must submit the Water Quality Improvement Plans in accordance with the requirements of Provision F.1.

b. The Copermittees must submit proposed updates to the Water Quality Improvement Plan for acceptance by the San Diego Water Board Executive Officer in accordance with the requirements of Provision F.2.c.

c. The Copermittees must commence with implementation of the Water Quality Improvement Plans ~~immediately after acceptance by the San Diego Water Board, in accordance with the schedules, or subsequently updated schedules, within the Water Quality Improvement Plan.~~in accordance with Provision F.1.b.(5).

C. ACTION LEVELS

Comment [A29]: See comment letter section 3.4 for a discussion of the redlines shown herein.

The purpose of this provision is for the Copermittees to incorporate numeric non-stormwater action levels (NALs) and stormwater action levels (SALs) in the Water Quality Improvement Plans (Provision B), and numeric non-stormwater action levels (NALs) in the Illicit Discharge Detection and Elimination (IDDE) program (Provision E.2.).

- For the purposes of the WQIPs, ~~T~~the goal of the action levels is to guide ~~Water Quality Improvement Plan~~ the implementation efforts and measure progress towards the protection of the identified high priority water quality conditions and associated designated beneficial uses of waters of the state from adverse impacts caused or contributed to by MS4 discharges. This goal will be accomplished through monitoring and assessing the quality of the MS4 discharges during the implementation of the Water Quality Improvement Plans.

- For the purposes of the IDDE program, the goal of the non-stormwater action levels is to assist in determining whether a persistent non-stormwater discharge into or from the MS4 contains pollutants at levels that have the potential to negatively affect the identified high priority water quality conditions.

Action levels will be developed and incorporated into the WQIP (Provision B) and the IDDE Program (Provision E). Depending upon the goals/objectives for the use of the action levels and the priority receiving water conditions, the constituents and values at which they are set may differ between watersheds. Copermittees may develop Watershed Management Area specific numeric action levels for non-stormwater and stormwater MS4 discharges using an approach approved by the Regional Board or use the default non-stormwater and stormwater action levels prescribed in C.1 and C.2 below.

The Copermittees will submit the action levels as a part of the WQIP and JRMP submittals. The action levels currently established will serve as the interim action levels until revised action levels are completed and approved. Exceedances of the action levels are not subject to enforcement or non-compliance actions under this Order.

1. Default Non-Storm Water Action Levels[8]

~~The Copermittees must develop and incorporate numeric non-storm water action levels (NALs) into the Water Quality Improvement Plan to: 1) support the development and prioritization of water quality improvement strategies for addressing non-storm water discharges to and from the MS4s, 2) assess the effectiveness of the water quality improvement strategies toward addressing MS4~~

Comment [A30]: As discussed in section 2.4 of the Riverside comment letter.

[8] NALs are not ~~considered by the San Diego Water Board to be~~ enforceable limitations under this Order.

~~non-storm water discharges, required pursuant to Provision D.4.b.(1), and 3) support the detection and elimination of non-storm water and illicit discharges to and from the MS4, required pursuant to Provision E.2.~~[9]

a. The following NALs must be incorporated as applicable to the WMA and the Copermittees' MS4 discharges,~~:~~ if the Copermittees do not establish numeric action levels within the WQIP based on watershed priorities:

(1) Non-Storm Water Discharges from MS4s to Ocean Surf Zone

Table C-1. Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000/1,000[1]	OP
Fecal Coliform	MPN/100 ml	200[2]	-	400	OP
Enterococci	MPN/100 ml	35	-	104[3]	OP

Abbreviations/Acronyms
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Total coliform density NAL is 1,000 MPN/100 ml when the fecal/total coliform ratio exceeds 0.1.
2. Fecal coliform density NAL is 200 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas."

[9] ~~The Copermittees may utilize NALs or other benchmarks currently established by the Copermittees as interim NALs until the Water Quality Improvement Plans are accepted by the San Diego Water Board Executive Officer.~~

(2) Non-Storm Water Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Table C-2. Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	35	-	104[3]	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
BP – Basin Plan water quality objective
NTU – Nephelometric Turbidity Units
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to waterbodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C-3. Non-Storm Water Action Levels for Priority Pollutants

		Freshwater (CTR)		Saltwater (CTR)	
Parameter	Units	MDAL	AMAL	MDAL	AMAL
Cadmium	ug/L	**	**	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	**	**	-	-
Chromium VI	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	**	**	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

Abbreviations/Acronyms:
CTR – California Toxic Rule
ug/L – micrograms per liter
AMAL – average monthly action level
MDAL – maximum daily action level

Notes:
* Action levels developed on a case-by-case basis (see below)
** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to ~~the following equations (~~40 CFR 131.38.b.2 for details~~) will be required:~~

~~Cadmium (Total Recoverable) = exp(0.7852[ln(hardness)] - 2.715)~~
~~Chromium III (Total Recoverable) = exp(0.8190[ln(hardness)] + 0.6848)~~
~~Copper (Total Recoverable) = exp(0.8545[ln(hardness)] - 1.702)~~
~~Lead (Total Recoverable) = exp(1.273[ln(hardness)] - 4.705)~~
~~Nickel (Total Recoverable) = exp(.8460[ln(hardness)] + 0.0584)~~
~~Silver (Total Recoverable) = exp(1.72[ln(hardness)] - 6.52)~~
~~Zinc (Total Recoverable) = exp(0.8473[ln(hardness)] + 0.884)~~

Comment [A31]: Consistent with SD Permittee recommendations.

(3) Non-Storm Water Discharges from MS4s to Inland Surface Waters

Table C-4. Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BP
Turbidity	NTU	-	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times			BP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	33	-	61[3]	BP
Total Nitrogen	mg/L	-	1.0	See MDAL	BP
Total Phosphorus	mg/L	-	0.1	See MDAL	BP
MBAS	mg/L	-	0.5	See MDAL	BP
Iron	mg/L	-	0.3	See MDAL	BP
Manganese	mg/L	-	0.05	See MDAL	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
BP – Basin Plan water quality objective
COLD – cold freshwater habitat beneficial use
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
MDAL – maximum daily action level
WARM – warm freshwater habitat beneficial use
MBAS – Methylene Blue Active Substances
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for freshwater "designated beach areas" and is not applicable to waterbodies that are not designated with the water contact recreation (REC-1) beneficial use.

b. NALs must be identified, developed and incorporated in the Water Quality Improvement Plan for any pollutants or waste constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance in Receiving waters ~~of the state~~ associated with the highest priority water quality conditions related to non-storm water discharges from the MS4s. NALs must be based on:

(1) Applicable water quality standards which may be dependent upon site-specific or receiving water-specific conditions or assumptions to be identified by the Copermittees; or

(2) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. ~~For the NALs incorporated into the Water Quality Improvement Plan, the Copermittees may develop and incorporate secondary NALs specific to the Watershed Management Area at levels greater than the NALs required by Provisions C.1.a and C.1.b which can be utilized to further refine the prioritization and assessment of water quality improvement strategies for addressing non-~~

~~storm water discharges to and from the MS4s, as well as the detection and elimination of non-storm water and illicit discharges to and from the MS4. The secondary NALs may be developed using an approach acceptable to the San Diego Water Board.~~

d. Dry weather monitoring data from MS4 outfalls collected in accordance with Provision D.2.b may be utilized to develop or revise NALs based on watershed-specific data, subject to San Diego Water Board Executive Officer approval.

2. Default Storm Water Action Levels[10]

The Copermittees must develop and incorporate numeric storm water action levels (SALs) in the Water Quality Improvement Plans to: 1) support the development and prioritization of water quality improvement strategies for reducing pollutants in storm water discharges from the MS4s, and 2) assess the effectiveness of the water quality improvement strategies toward reducing pollutants in storm water discharges, required pursuant to Provision D.4.b.(2).[11]

a. The following SALs for discharges of storm water from the MS4 must be incorporated~~:~~ if the Copermittees do not establish stormwater action levels within the WQIP based on watershed priorities::~~:~~

Table C-5. Storm Water Action Levels for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)*	µg/L	3.0
Copper (Total Cu)*	µg/L	127
Lead (Total Pb)*	µg/L	250
Zinc (Total Zn)*	µg/L	976

Abbreviations/Acronyms:
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
ug/L – micrograms per liter

Notes:
* The sampling must include a measure of receiving water hardness at each MS4 outfall. If a total metal concentration exceeds the corresponding metals SAL in Table C-5, that concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hour maximum concentration criterion for the measured level of hardness, then the sample result will not be considered above the SAL for that measurement.

[10] SALs are not ~~considered by the San Diego Water Board to be~~ enforceable limitations under this Order.
[11] The Copermittees may utilize SALs or other benchmarks currently established by the Copermittees as interim SALs until the Water Quality Improvement Plans are accepted by the San Diego Water Board Executive Officer.

b. SALs must be identified, developed and incorporated in the Water Quality Improvement Plan for pollutants or waste constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance in Receiving waters ~~of the state~~ associated with the highest water quality priorities related to storm water discharges from the MS4s. SALs must be based on:

(1) Federal and State water quality guidance and/or water quality standards; and

(2) Site-specific or receiving water-specific conditions; or

(3) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. ~~For the SALs incorporated into the Water Quality Improvement Plan, the Copermittees may develop and incorporate secondary SALs specific to the Watershed Management Area at levels greater than the SALs required by Provisions C.2.a and C.2.b which can be utilized to further refine the prioritization and assessment of water quality improvement strategies for reducing pollutants in storm water discharges from the MS4s. The secondary SALs may be developed based on the approaches recommended by the State Water Board's Storm Water Panel[12] or using an approach acceptable to the San Diego Water Board.~~

d. Wet weather monitoring data from MS4 outfalls collected in accordance with Provision D.2.c may be used to develop or revise SALs based upon watershed-specific data, subject to San Diego Water Board Executive Officer approval.

[12] ~~Storm Water Panel Recommendations to the California State Water Resources Control Board: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 2006)~~

D. MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS

Comment [A32]: See discussion in section 3.5 of the comment letter.

The purpose of this provision is for the Copermittees to monitor and assess the impact on the chemical, physical, and biological conditions of receiving waters caused by discharges from the Copermittees' MS4s under wet weather and dry weather conditions. The goal of the monitoring and assessment program is to inform the Copermittees about the nexus between the health of receiving waters and the water quality condition of the discharges from their MS4s to those receiving waters. ~~.~~ This goal will be accomplished through monitoring and assessing the conditions of the receiving waters, discharges from the MS4s to those receiving waters, pollutant sources and/or stressors, and effectiveness of the water quality improvement strategies implemented as part of the Water Quality Improvement Plans.

1. Receiving Water Monitoring Requirements

The Copermittees must develop and conduct a program to monitor the condition of the receiving waters in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans for each Watershed Management Area, the Copermittees must conduct long-term receiving water monitoring during implementation of the Water Quality Improvement Plan to assess the long term trends and determine if water quality conditions in receiving waters are improving. Any available monitoring data not collected specifically for this Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of this Order may be utilized by the Copermittees. The Copermittees must conduct the following receiving water monitoring procedures:

a. TRANSITIONAL RECEIVING WATER MONITORING

Beginning October 1st or May 1st (whichever is sooner) following enrollment under this order and until ~~Until~~ the monitoring requirements of Provisions D.1.b-e are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following receiving water monitoring in the Watershed Management Area:

(1) Continue the receiving water monitoring programs required in Order Nos. R9-2007-0001~~,~~ (Attachment A, Section II. A. 1-5)~~,~~ R9-2009-0002, and R9-2010-0016;

(2) Continue the monitoring in the Hydromodification Management Plans approved by the San Diego Water Board;

(3) Participate in the following regional receiving water monitoring programs, as applicable to the Watershed Management Area and each Copermittees' MS4 discharges:

Comment [A33]: See discussion in section 3.5.3 of the comment letter.

(a) Storm Water Monitoring Coalition Regional Monitoring,

(b) Southern California Bight Regional Monitoring, and

(c) Sediment Quality Monitoring;

(4) Implement the monitoring programs developed as part of any implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) for the TMDLs in Attachment E to this Order; and

(5) For Watershed Management Areas with ASBS, implement the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012, included in Attachment A to this Order.

b. LONG-TERM RECEIVING WATER MONITORING STATIONS

The Copermittees must select at least one long-term receiving water monitoring station from among the existing mass loading stations, temporary watershed assessment stations, bioassessment stations, and stream assessment stations previously established by the Copermittees to be representative of the receiving water quality in the Watershed Management Area. Additional or alternative long-term receiving water monitoring stations may~~must~~ be selected where necessary to support the implementation and adaptation of the Water Quality Improvement Plan.

Comment [A34]: See discussion in section 3.5.3 of the comment letter.

c. DRY WEATHER RECEIVING WATER MONITORING

During the term of the Order, the Copermittees must perform monitoring during at least three dry weather monitoring events at each of the long-term receiving water monitoring stations. At least one monitoring event must be conducted during the dry season (May 1 – September 30) and at least one monitoring event must be conducted during a dry weather period during the wet season (October 1 – April 30), after the first wet weather event of the season, with an antecedent dry period of at least 72 hours following a storm event producing measureable rainfall of greater than 0.1 inch.

(1) Dry Weather Receiving Water Field Observations

For each dry weather monitoring event, the Copermittees must record field observations consistent with Table D-1 at each long-term receiving water monitoring station.

Table D-1. Field Observations for Receiving Water Monitoring Stations

Field Observations
• Station identification and location
• Presence of flow, or pooled or ponded water
• If flow is present:
- Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate)
- Flow characteristics (i.e. presence of floatables, surface scum, sheens, odor, color)
• If pooled or ponded water is present:
- Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, sheens, odor, color)
• Assessment of any observed connectivity of MS4 discharges to a flowing receiving water.
• Station description (i.e. deposits or stains, vegetation condition, structural condition, and observable biology)
• Presence and assessment of trash in and around station

Comment [A35]: See discussion in section 3.5.3 of the comment letter.

(2) Dry Weather Receiving Water Field Monitoring

For each dry weather monitoring event, if conditions allow the collection of the data, the Copermittees must monitor and record the parameters in Table D-2 at each long-term receiving water monitoring station.

Table D-2. Field Monitoring Parameters for Receiving Water Monitoring Stations

Parameters
• pH
• Temperature
• Specific conductivity
• Dissolved oxygen
• Turbidity

(3) Dry Weather Receiving Water Analytical Monitoring

For each dry weather monitoring event, the Copermittees must collect and analyze samples from each long-term receiving water monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity,

dissolved oxygen, turbidity, hardness, and indicator bacteria Grab samples may also be collected for the analyses described in (f) where MS4 discharge runoff constitutes less than ten percent of the flow;

Comment [A36]: The receiving water stations in Riverside County either do not receive runoff from MS4 discharges or receive deminimus flows during dry weather conditions. The flow at these stations during dry weather consists virtually entirely of rising groundwater. Background receiving water quality conditions In such cases composite samples of receiving waters not affected by MS4 discharges is not warranted.

(d) For all other constituents where runoff constitutes more than ten percent of the flow, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over a typical 24-hour period, which may be collected through the use of automated equipment;

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,

(iv) Applicable NAL constituents, and

(v) Constituents listed in Table D-3.

Table D-3. Analytical Monitoring Constituents for Receiving Water Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Pesticides	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus • Orthophosphate • Nitrite[1]	• Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Mercury • Nickel • Selenium • Thallium • Zinc	• Organophosphate Pesticides • Pyrethroid Pesticides	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

• Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia			

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(4) Dry Weather Receiving Water Toxicity Monitoring

For each dry weather monitoring event, the Copermittees must collect grab or composite samples from each long-term receiving water monitoring station to be analyzed for toxicity in accordance with Table D-4:

Table D-4. Dry Weather Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach	USEPA Protocol[2]
Pimephales promelas	1 acute 1 chronic[1]	EPA-821-R-02-012
Hyalella Azteca	1 acute 1 chronic[1]	EPA-821-R-02-012
Psuedokirchneriella subcapitata	1 acute 1 chronic[1]	EPA-821-R-02-013

Notes:
1. Chronic toxicity testing is not required at receiving water monitoring stations located at mass loading stations if the channel flows are diverted year-round during dry weather conditions to the sanitary sewer for treatment.
2. USEPA protocols must be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Water Board.

(5) Dry Weather Receiving Water Bioassessment Monitoring

Bioassessment monitoring for each long-term receiving water monitoring station is required at least once during the term of this Order. The Copermittees must conduct bioassessment monitoring during at least one dry weather monitoring event at each long-term receiving water monitoring station as follows:

(a) The following bioassessment samples and measurements must be collected:

(i) Macroinvertebrate samples must be collected in accordance with the "Reachwide Benthos (Multihabitat) Procedure" in the most current Surface Water Ambient Monitoring Program (SWAMP) Bioassessment Standard Operating Procedures (SOP), and amendments, as applicable;[13]

(ii) The "Full" suite of physical habitat characterization measurements

[13] Ode, P.R.. 2007. Standard operating procedures for collecting macroinvertebrate samples and associated physical and chemical data for ambient bioassessments in California. California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP) Bioassessment SOP 001. http://www.swrcb.ca.gov/water_issues/programs/swamp/tools.shtml#monitoring

must be collected in accordance with the most current SWAMP Bioassessment SOP, and as summarized in the SWAMP Stream Habitat Characterization Form – Full Version;[14] and

(iii) Freshwater algae samples must be collected in accordance with the SWAMP Standard Operating Procedures for Collecting Algae Samples.[15] Analysis of samples must include algal taxonomic composition (diatoms and soft algae) and algal biomass.

(b) The bioassessment samples, measurements, and appropriate water chemistry data must be used to calculate the following:

(i) An Index of Biological Integrity (IBI) for macroinvertebrates for each monitoring station where bioassessment monitoring was conducted, based on the most current calculation method;[16] and

(ii) An IBI for algae for each monitoring station where bioassessment monitoring was conducted, when a calculation method is developed.[17]

(c) In lieu of the requirements of Provision D.1.c.(5)(a), the Copermittees may conduct the bioassessment monitoring in accordance with the "Triad" assessment approach[18] to calculate the IBIs required for Provision D.1.c.(5)(b). The Copermittees must conduct sampling, analysis, and reporting of specified in-stream biological and habitat data according to the protocols specified in the SCCWRP Technical Report No. 539, or subsequent protocols, if developed.

(6) Dry Weather Receiving Water Hydromodification Monitoring

In addition to the hydromodification monitoring conducted as part of the Copermittees' Hydromodification Management Plans, hydromodification monitoring for each long-term receiving water monitoring station is required at least once during the term of this Order. The Copermittees must collect the

[14] Available at: http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf

[15] Fetscher et al. 2009. Standard Operating Procedures for Collecting Stream Algae Samples and Associated Physical Habitat and Chemical Data for Ambient Bioassessments in California.

[16] The most current calculation method at the time the Order was adopted is outlined in "A Quantitative Tool for Assessing the Integrity of Southern California Coastal Streams" (Ode, et al. 2005. Environmental Management. Vol. 35, No. 1, pp. 1-13). If an updated or new calculation method is developed, either both (i.e. current and updated/new) methods must be used, or historical IBIs must be recalculated with the updated or new calculation method.

[17] When a calculation method is developed, IBIs must be calculated for all available and appropriate historical data.

[18] Stormwater Monitoring Coalition Model Monitoring Technical Committee, 2004. Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California. Technical Report #419. August 2004.

following hydromodification monitoring observations and measurements within an appropriate domain of analysis during at least one dry weather monitoring event for each long-term receiving water monitoring station:

(a) Channel conditions, including:

(i) Channel dimensions,

(ii) Hydrologic and geomorphic conditions, and

(iii) Presence and condition of vegetation and habitat;

(b) Location of discharge points;

(c) Habitat integrity;

(d) Photo documentation of existing erosion and habitat impacts, with location (i.e. latitude and longitude coordinates) where photos were taken;

(e) Measurement or estimate of dimensions of any existing channel bed or bank eroded areas, including length, width, and depth of any incisions; and

(f) Known or suspected cause(s) of existing downstream erosion or habitat impact, including flow, soil, slope, and vegetation conditions, as well as upstream land uses and contributing new and existing development.

d. WET WEATHER RECEIVING WATER MONITORING

During the term of the Order, the Copermittees must perform monitoring during at least three wet weather monitoring events at each long-term receiving water monitoring station. At least one wet weather monitoring event must be conducted during the first wet weather event of the wet season (October 1 – April 30), and at least one wet weather monitoring event during a wet weather event that occurs after February 1.

(1) Wet Weather Receiving Water Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each long-term receiving water monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(b) The flow rates and volumes measured or estimated (data from nearby

USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(d) Presence and assessment of trash in and around station.

(2) Wet Weather Receiving Water Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each long-term receiving water monitoring station.

(3) Wet Weather Receiving Water Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each long-term receiving water monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over the length of the storm event or a typical 24-hour period, which may be collected through the use of automated equipment;

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,

(iv) Applicable SAL constituents, and

(v) Constituents listed in Table D-3.

(4) Wet Weather Receiving Water Toxicity Monitoring

For each wet weather monitoring event, the Copermittees must collect grab or composite samples from each long-term receiving water monitoring station to be analyzed for toxicity in accordance with Table D-5:

Table D-5. Wet Weather Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach	USEPA Protocol[1]
Pimephales promelas	1 acute	EPA-821-R-02-012
Hyalella Azteca	1 acute	EPA-821-R-02-012
Psuedokirchneriella subcapitata	1 acute	EPA-821-R-02-013

Notes:
1. USEPA protocols must be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Water Board.

e. OTHER RECEIVING WATER MONITORING REQUIREMENTS

(1) Regional Monitoring

The Copermittees must participate in the following regional receiving waters monitoring programs, as applicable to the Watershed Management Area and the Copermittee's MS4 discharges:

(a) Storm Water Monitoring Coalition Regional Monitoring; and

(b) Southern California Bight Regional Monitoring.

(2) Sediment Quality Monitoring

The applicable Copermittees must perform sediment monitoring to assess compliance with sediment quality receiving water limits applicable to MS4

discharges to enclosed bays and estuaries. The monitoring may be performed either by individual or multiple affected Copermittees to assess compliance with receiving water limits, or through participation in a water body monitoring coalition. The Copermittees must identify sediment sampling stations that are spatially representative of the sediment within the water body segment or region of interest. Sediment quality monitoring must be conducted in conformance with the monitoring requirements set forth in the State Water Board Sediment Quality Control Plan.

(3) ASBS Monitoring

For Watershed Management Areas with ASBS, the applicable Copermittees must implement the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012, included in Attachment A to this Order.

f. ALTERNATIVE WATERSHED MONITORING REQUIREMENTS

The San Diego Water Board may direct the Copermittees to participate in an effort to develop alternative watershed monitoring with other regulated entities, other interested parties, and the San Diego Water Board to refine, coordinate, and implement regional monitoring and assessment programs to determine the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and/or 3) streams. As directed by the San Diego Water Board, such alternative watershed monitoring would be done in place and stead of the commensurate requirements set forth in Provision D.1.

2. MS4 Outfall Discharge Monitoring Requirements

The Copermittees must develop and conduct a program to monitor the discharges from the major MS4 outfalls to receiving waters in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans and schedule for implementation of monitoring for each Watershed Management Area, the Copermittees must conduct MS4 outfall discharge monitoring during implementation of the Water Quality Improvement Plan to assess the effectiveness of their jurisdictional runoff management programs toward effectively prohibiting non-storm water discharges into the MS4 and reducing pollutants in ~~storm water~~ discharges ~~to and~~ from their MS4s to the MEP. Any available monitoring data not collected specifically for this Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of this Order may be utilized by the Copermittees. The Copermittees must conduct the following MS4 outfall monitoring procedures:

Comment [A37]: Suggest same edits for SD and OC.

a. TRANSITIONAL MS4 OUTFALL DISCHARGE MONITORING

Beginning October 1st or May 1st (whichever is sooner) following enrollment under this order and until~~Until~~ the monitoring requirements of Provisions D.2.b-c

are incorporated into a Water Quality Improvement Plan and schedule for implementation of monitoring that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following monitoring of MS4 outfall discharges to flowing receiving waters ~~monitoring~~ in the Watershed Management Area:

(1) MS4 Outfall Discharge Monitoring Station Inventory

Each Municipal Copermittee must identify all major MS4 outfalls (including those operated by a Special District Copermittee) that discharge directly to receiving waters within its jurisdiction and geo-locate those outfalls on a map of the MS4 pursuant to Provision E.2.b.(1). This information must be compiled into a MS4 outfall discharge monitoring station inventory, and must include the following information:

(a) Latitude and longitude of MS4 outfall point of discharge;

(b) Watershed Management Area;

(c) Hydrologic subarea;

(d) Outlet size;

(e) Accessibility (i.e. safety and without disturbance of critical habitat);

(f) Approximate drainage area; and

(g) Classification of whether the MS4 outfall is known to have persistent dry weather flows, transient dry weather flows, no dry weather flows, or unknown dry weather flows.

(2) Transitional Dry Weather MS4 Outfall ~~Discharge~~ Field Screening ~~Monitoring~~

Until the monitoring requirements of Provision D.2.b are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, each Municipal Copermittee must perform the following dry weather MS4 outfall field screening monitoring to identify non-storm water and illicit discharges being discharged from MS4s within its jurisdiction in accordance with Provision E.2.c, to determine which discharges are transient ~~flows~~ and which are persistent discharges to flowing receiving waters~~flows~~, and prioritize the dry weather MS4 discharges that will be investigated and eliminated in accordance with Provision E.2.d. ~~Each Copermittee must conduct the following dry weather MS4 outfall discharge field screening monitoring within its jurisdiction:~~

Comment [A38]: Suggested change of title to better characterize the requirements of this section, compared to that of D.2.b.

Comments in this section are discussed in section 3.5.3 of the comment letter.

Comment [A39]: Duplicative of previous sentence

(a) Transitional Dry Weather MS4 Outfall Discharge Field Screening Monitoring Frequency

Each Municipal Copermittee must field screen the accessible MS4 outfalls in its inventory developed pursuant to Provision D.2.a.(1) as follows:

(i) ~~For Copermittees with less than 125 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 80 percent of the outfalls must be visually inspected two times per year during dry weather conditions.~~

(ii) For Municipal Copermittees with ~~125 major MS4 outfalls or more, but~~ less than or equal to 500 MS4 outfalls~~,~~ that discharge to receiving waters within a Watershed Management Area, ~~all~~ at least 80 percent of the accessible outfalls must be visually inspected at least annually during dry weather conditions.

(iii) For Municipal Copermittees with more than 500 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 500 outfalls must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls within a Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following:

[a] Assessment of connectivity of the discharge to a flowing receiving water;
[b] Reported exceedances of NALs in water quality monitoring data;
[c] Surrounding land uses;
[d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List; and
[e] Flow rate.

(iv) Municipal Copermittees with more than 500 major MS4 outfalls within its jurisdiction that are located in more than one Watershed Management Area, at least 500 major MS4 outfalls within its inventory must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls in more than one Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following:

[a] Assessment of connectivity of the discharge to a flowing receiving water;
[b] Reported exceedances of NALs in water quality monitoring data;
[c] Surrounding land uses;

[d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List; and
[e] Flow rate.

(v) Inspections of major MS4 outfalls conducted in response to public reports and staff or contractor reports and notifications may count toward the required visual inspections of MS4 outfall discharge monitoring stations.

(b) Transitional Dry Weather MS4 Outfall Discharge Field Screening Visual Observations

(i) An antecedent dry period of at least 72 hours following any storm event producing measurable rainfall greater than 0.1 inch is required prior to conducting field screening visual observations during a field screening monitoring event.

(ii) During the field screening monitoring event, each Municipal Copermittee must record visual observations consistent with Table D-6 at each MS4 outfall discharge monitoring station inspected.

Table D-6. Field Screening Visual Observations for MS4 Outfall Discharge Monitoring Stations

Field Observations
• Station identification and location • Presence of flow, or pooled or ponded water • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate) - Flow characteristics (i.e. presence of floatables, surface scum, sheens, odor, color) - Flow source(s) suspected or identified from non-storm water source investigation - Flow source(s) eliminated during non-storm water source identification • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, sheens, odor, color) - Known or suspected source(s) of pooled or ponded water • Assessment of any observed MS4 discharge ~~with~~ to a flowing receiving water. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology) • Presence and assessment of trash in and around station • Evidence or signs of illicit connections or illegal dumping

(iii) Each Municipal Copermittee must implement the requirements of Provisions E.2.d.(2)(c)-(e) based on the field observations.

(iv) Each Copermittee must evaluate field observations together with existing information available from prior reports, inspections and monitoring results to determine whether any observed flowing,

pooled, or ponded waters are likely to be transient or persistent flow.[19]

Comment [A40]: See footnote edits

(c) Transitional Dry Weather MS4 Outfall Discharge Field Screening ~~Monitoring~~ Records

Based upon the results of the transitional dry weather MS4 outfall discharge field screening monitoring conducted pursuant to Provisions D.2.a.(2)(a)-(b), each Municipal Copermittee must update its MS4 outfall discharge monitoring station inventory, compiled pursuant to Provision D.2.a.(1), with any new information on the classification of whether the MS4 outfall produces persistent flow, transient flow, or no dry weather flow.

(3) Transitional Wet Weather MS4 Outfall Discharge Monitoring

Comment [A41]: See discussion in section 3.5.3 of the comment letter.

Until the monitoring requirements of Provision D.2.c are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area:

(a) Transitional Wet Weather MS4 Outfall Discharge Monitoring Stations

The Copermittees must select at least five wet weather MS4 outfall discharge monitoring stations from the inventories developed pursuant to Provision D.2.a.(1) that are representative of storm water discharges from areas consisting primarily of residential, commercial, industrial, and typical mixed-use land uses present within the Watershed Management Area.

(b) Transitional Wet Weather MS4 Outfall Discharge Monitoring Frequency

Each wet weather MS4 outfall discharge monitoring station selected pursuant to Provision D.2.a.(3)(a) must be monitored twice during the wet season (October 1 – April 30~~)~~.) in the transitional period. The~~). One~~ wet weather monitoring ~~event~~events shall be selected to be representative of the range of hydrologic conditions experienced in the region. At least 10% of samples~~event~~ must be conducted during the first wet weather event of the wet season, ~~and~~to include~~and one wet weather monitoring event~~ at least one such sample in each Watershed Management Area~~, a month after the first wet weather event of the wet season.~~

[19] Persistent flow, for the purposes of provision II.D.2.b.(2) is defined as the presence of an MS4 discharge that is hydraulically connected to a flowing receiving~~, pooled, or ponded~~ water more than 72 hours after a measureable rainfall event of 0.1 inch or greater, during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.

(c) Transitional Wet Weather MS4 Outfall Discharge Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded of the flow from~~at~~ each wet weather MS4 outfall discharge monitoring station:

(i) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and

(ii) The flow rates and volumes measured or estimated from the outfall (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(iii) ~~Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and~~

(iv) Presence ~~and assessment~~ of trash in and around station.

Comment [A42]: This isn't appropriate for a wet weather event.

Comment [A43]: This isn't appropriate for a wet weather event.

(d) Transitional Wet Weather MS4 Outfall Discharge Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each wet weather MS4 outfall discharge monitoring station.

(e) Transitional Wet Weather MS4 Outfall Discharge Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each wet weather MS4 outfall discharge monitoring station as follows:

(i) Analytes that are field measured are not required to be analyzed by a laboratory;

(ii) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(iii) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, and indicator bacteria;

(iv) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant

concentrations and runoff flows using one of the following techniques:

[a] Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or
[b] Flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter, which may be collected through the use of automated equipment, or
[c] If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours;

(v) Only one analysis of the composite of aliquots is required;

(vi) The samples must be analyzed for the following constituents:

[a] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,
[b] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, and
[c] Constituents listed in in Table D-7.

Table D-7. Analytical Monitoring Constituents for Wet Weather MS4 Outfall Discharge Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia	• Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Nickel • Selenium • Thallium • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(f) Other Transitional Wet Weather MS4 Outfall Discharge Monitoring

The San Diego County Copermittees must continue the wet weather MS4 outfall monitoring program developed under Order No. R9-2007-0001, as approved by the San Diego Water Board, through its planned completion.

b. DRY WEATHER MS4 OUTFALL DISCHARGE MONITORING

Each Municipal Copermittee must perform the following dry weather MS4 outfall monitoring within its jurisdiction to identify non-storm water and illicit discharges within its jurisdiction pursuant to Provision E.2.c, and to prioritize the dry weather MS4 discharges that will be investigated and eliminated pursuant to Provision E.2.d. ~~Each Copermittee must conduct the following dry weather MS4 outfall discharge monitoring within its jurisdiction:~~

Comment [A44]: Repetitive of previous sentence

(1) Dry Weather MS4 Outfall Discharge Field Screening Monitoring

Comment [A45]: See discussion in section 3.5.3 of the comment letter.

Each Municipal Copermittee must continue to perform the dry weather MS4 outfall discharge field screening monitoring in accordance with the requirements of Provision D.2.a.(2)., ~~The~~ however the Municipal Copermittee may adjust the field screening monitoring frequencies and locations for the MS4 outfalls in its inventory, as needed, to identify and eliminate sources of persistent ~~flow~~ non-storm water illegal discharges from the MS4 to flowing receiving waters in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan., ~~provided the~~

~~number of visual inspections performed is equivalent to the number of visual inspections required under Provision D.2.a.(2)(a).~~

Comment [A46]: See comments in comment letter

(2) Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring

Each Municipal Copermittee must perform the following non-storm water monitoring of MS4 outfalls that persistently ~~flow MS4 outfall~~ discharge to flowing receiving waters ~~monitoring~~ to determine which persistent non-storm water discharges contain concentrations of pollutants below NALs, and which persistent non-storm water discharges impact receiving water quality during dry weather. ~~Each Copermittee must conduct the following non-storm water persistent flow MS4 outfall discharge monitoring within its jurisdiction:~~

Comment [A47]: Repetitive of previous sentence.

(a) Prioritization of Non-Storm Water Persistent Flow MS4 Outfalls

Based upon the dry weather MS4 outfall discharge field screening monitoring records developed pursuant to Provision D.2.a.(2)(c), each Municipal Copermittee must identify and prioritize the MS4 outfalls within its jurisdiction that have~~with~~ persistent discharges to flowing receiving waters ~~flows~~ based on the highest priority water quality conditions identified in the Water Quality Improvement Plan and any additional criteria developed by the Copermittee, which may include historical data and data from sources other than what the Copermittee collects.

(b) Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring Frequency

Comment [A48]: See comment letter section 3.5.3

(i) Based on the prioritization of major MS4 outfalls developed under Provision D.2.b.(2)(a), each Municipal Copermittee must identify, at a minimum, the top 10 percent of the~~10~~ highest priority major MS4 outfalls with non-storm water persistent flows that the Copermittee will monitor within each Watershed Management Area within its jurisdiction, with a minimum of one persistent ~~flow~~discharge outfall, and a maximum of 5 required per WMA. The location of the selected highest priority non-storm water persistent ~~flow~~ discharge MS4 outfall monitoring stations must be identified on the map required pursuant to Provision E.2.b.(1).

(ii) Each of the highest priority non-storm water persistent flow MS4 outfall monitoring stations identified pursuant to Provision D.2.b.(2)(b)(i) must be monitored under dry weather conditions at least ~~semi~~ annually until one of the following occurs:

[a] The non-storm water discharges have been effectively eliminated (i.e. no flowing, pooled, or ponded water) for three consecutive dry weather monitoring events; or

[b] The source(s) of the persistent flows has been identified as a category of non-storm water discharges that does not require an NPDES permit and does not have to be addressed as an illicit discharge because it was not identified as a source of pollutants (i.e. constituents in non-storm water discharge do not exceed NALs), and the persistent flow can be re-prioritized to a lower priority; or

[c] The constituents in the persistent flow non-storm water discharge do not exceed NALs, and the persistent flow can be re-prioritized to a lower priority; or

[d] The source(s) of the persistent flows has been identified as a non-storm water discharge authorized by a separate NPDES permit.

(iii) Where the criteria under Provision D.2.b.(2)(c)(ii) are not met, but the threat to water quality has been reduced by the Copermittee, the highest priority persistent flow MS4 outfall monitoring stations may be reprioritized accordingly for continued dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.b.(1).

(iv) Each Municipal Copermittee must document removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(b) in the Annual Report. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized MS4 major outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.

(c) Non-Storm Water Persistent Flow MS4 Outfall Discharge Field Observations

During each semi-annual monitoring event, each Municipal Copermittee must record field observations consistent with Table D-6 at each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction.

(d) Non-Storm Water Persistent Flow MS4 Outfall Discharge Field Monitoring

During each ~~semi-annual~~ monitoring event, if conditions allow the collection of the data, each Municipal Copermittee must monitor and record the parameters in Table D-2 at each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction.

(e) Non-Storm Water Persistent Flow MS4 Outfall Discharge Analytical Monitoring

Comment [A49]: See discussion in section 3.5.3 of the comment letter.

During each semi-annual monitoring event in which measurable flow from the MS4 outfall to a flowing receiving water is present, each Municipal Copermittee must collect and analyze samples from each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction as follows:

(i) Analytes that are field measured are not required to be analyzed by a laboratory;

(ii) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(iii) During development of the WQIP, for each WMA, consider the following sources to select constituents for collection of~~Collect~~ grab or composite samples to be analyzed at a qualified analytical laboratory:~~for the following constituents:~~

[a] Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,
[b] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,
[c] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,
[d] Applicable NAL constituents, and
[e] Constituents listed in Table D-8, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary.

(iv) Copermittees may adjust the analytical list for a given WMA in successive monitoring events to add or eliminate constituents based on data that can demonstrate or provide justification regarding need or lack of need for the analysis of specific constituents.

Table D-8. Analytical Monitoring Constituents for Persistent Flow MS4 Outfall Discharge Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Total Hardness • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen	• Cadmium • Copper • Lead • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

• Ammonia		

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

~~(iv)~~(v) If the Copermittee identifies and eliminates the source of the persistent flow non-storm water discharge, analysis of the sample is not required.

c. WET WEATHER MS4 OUTFALL DISCHARGE MONITORING

The Copermittees must perform wet weather MS4 outfall monitoring to identify sources areas of pollutants in ~~storm water~~ discharges from the MS4s in the Watershed Management Area. The Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area:

(1) Wet Weather MS4 Outfall Discharge Monitoring Stations

The Copermittees may adjust the wet weather MS4 outfall discharge monitoring locations and frequencies in the Watershed Management Area, as needed, to identify sources of pollutants in storm water discharges from MS4s in the Watershed Management Area in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan, provided the number of stations is at least equivalent to the number of stations required under Provision D.2.a.(3)(a).

(2) Wet Weather MS4 Outfall Discharge Monitoring Frequency

The Copermittees must monitor the wet weather MS4 outfall discharge monitoring stations in the Watershed Management Area at an appropriate frequency to identify source areas of pollutants in ~~storm water~~ discharges from the MS4s causing or contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan.

(3) Wet Weather MS4 Outfall Discharge Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each wet weather MS4 outfall discharge monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and

(b) The flow rates and volumes measured or estimated (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or

estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

~~(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and~~

~~(d) Presence and assessment of trash in and around station.~~

Comment [A50]: These are inappropriate for wet weather observations.

(4) Wet Weather MS4 Outfall Discharge Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each wet weather MS4 outfall discharge monitoring station.

(5) Wet Weather MS4 Outfall Discharge Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each wet weather MS4 outfall discharge monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter, which may be collected through the use of automated equipment, or

(iii) If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours.

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, and

(iv) Applicable SAL constituents.

3. Special Studies

Comment [A51]: See discussion in section 3.5.3 of the comment letter.

a. Within the term of this Order, the Copermittees must initiate~~develop and implement~~ the following special studies:

(1) At least two~~three~~ special studies in each Watershed Management Area to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to highest priority water quality conditions identified in the Water Quality Improvement Plan.

(2) At least one~~two~~ special study~~studies~~ for the San Diego Region to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that are impacting receiving waters on a regional basis in the San Diego Region.

(3) One of the two~~three~~ special studies in each Watershed Management Area may be replaced by a special study implemented pursuant to Provision D.3.a.(2).

b. The special studies must, at a minimum, be in conformance with the following criteria:

(1) The special studies must be related to the highest priority water quality conditions identified by the Copermittees in the Watershed Management Area and/or for the entire San Diego Region;

(2) The special studies developed pursuant to Provision D.3.a.(1) must:

(a) Be implemented within the applicable Watershed Management Area, and

(b) Require some form of participation by all the Copermittees within the Watershed Management Area;

(3) The special studies developed pursuant to Provision D.3.a.(2) must:

(a) Be implemented within the San Diego Region, and

(b) Require some form of participation by all Copermittees covered under the requirements of this Order.

c. Special studies developed to identify sources of pollutants and/or stressors should be pollutant and/or stressor specific and based on historical monitoring data and monitoring performed pursuant to Provisions D.1 and D.2. Development of source identification special studies should include the following:

(1) A compilation of known information on the specific pollutant and/or stressor, including data on potential sources and movement of the pollutant and/or stressor within the watershed. Data generated by the Copermittees and others, as well as information available from a literature research on the pollutant and/or stressor should be compiled and analyzed as appropriate.

(2) An identification of data gaps, based on the compiled information generated on the specific pollutant and/or stressor in Provision D.3.d.(1). Source identification special studies should be developed to fill identified data gaps.

(3) A monitoring plan that will collect and provide data the Copermittees can utilize to do the following:

(a) Quantify the relative loading or impact of a pollutant and/or stressor from a particular source or pollutant generating activity;

(b) Improve understanding of the fate of a pollutant and/or stressor in the environment;

(c) Develop an inventory of known and suspected sources of a pollutant and/or stressor in the Watershed Management Area; and/or

(d) Prioritize known and suspected sources of a pollutant and/or stressor based on relative magnitude in discharges, geographical distribution (i.e.,

regional or localized), frequency of occurrence in discharges, human health risk, and controllability.

d. Special studies initiated prior to the termacceptance of thethis Orderthe Water Quality Improvement Plan that meet the requirements of Provision D.3.b and are implementedcompleted during the term of this Order may be utilized to fulfill the special study requirements of Provision D.3.a.

e. The Copermittees must submit the monitoring plans for the special studies in the Water Quality Improvement Plans required pursuant to Provision F.1.

f. The Copermittees are encouraged to share the results of the special studies regionally among the Copermittees to provide information useful in improving and adapting the management of non-storm water and storm water runoff through the implementation of the Water Quality Improvement Plans.

4. Assessment Requirements

Each Copermittee must evaluate the data collected pursuant to Provisions D.1, D.2 and D.3, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E, to assess the progress of the water quality improvement strategies in the Water Quality Improvement Plan toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a. Assessments must be performed as described in the following provisions:

a. RECEIVING WATERS ASSESSMENTS

(1) The Copermittees must assess and report the conditions of the receiving waters in the Watershed Management Area as follows:

(a) Based on data collected pursuant to Provision D.1.a, the assessments under Provision D.4.a.(2) must be included in the transitionalfirst Annual Report required pursuant to Provision F.3.b.(21).

(b) Based on the data collected pursuant to Provisions D.1.a-e, the assessments required under Provision D.4.a.(2) must be included in the Report of Waste Discharge required pursuant to Provision F.5.b.

(2) The Copermittees must assess the status and trends of receiving water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams under dry weather and wet weather conditions, as those conditions are affected by discharges from the Copermittees' MS4, to determine the progress towards meeting interim or final goals of the Water Quality Implementation Plan for the Watershed Management Area. For each of the three types of receiving waters that are present in each Watershed Management Area the applicable Copermittees must:

Comment [A52]: See our edits to that section

Comment [A53]: See discussion in section 3.5.3 of the comment letter.

(a) Determine whether or not the conditions of the receiving waters are meeting any applicable numeric goals established pursuant to provision B.2.e.~~protective of the designated beneficial uses~~;

~~(b) Identify the most critical beneficial uses that must be protected or restored to ensure overall health of the receiving water;~~

~~(c) Determine whether or not those critical beneficial uses are being protected and where those beneficial used must be restored;~~

~~(d)~~(b) Identify short-term and/or long-term improvements or degradation of Receiving Water conditions related to those numeric goals~~those critical beneficial uses~~;

~~(e)~~(c) Identify data gaps in the monitoring data necessary to assess Provisions D.4.a.(2)(a)-(d).

b. MS4 OUTFALL DISCHARGES ASSESSMENTS

(1) Non-Storm Water Discharges Reduction Assessments

(a) ~~Each Copermittee must assess and report the progress of its illicit discharge detection and elimination program, required to be implemented pursuant to Provision E.2, toward reducing and effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows:~~

~~(i) Based on data collected pursuant to Provisions D.2.a.(2), the assessments under Provision D.4.b.(1)(b) must be included when complete in the Annual Report required pursuant to Provision F.3.b.(1).~~

~~(ii) Based on the data collected pursuant to Provisions D.2.b, the assessments required under Provision D.4.b.(1)(c) must be included in the first Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter.~~

~~(iii) Based on the data collected pursuant to Provisions D.2.b, the assessment required under Provision D.4.b.(1)(c) must be included in the Report of Waste Discharge required pursuant to F.5.b.~~

(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each

Comment [A54]: See discussion in section 3.5.3 of the comment letter for key changes. Other changes are described in comments below.

Comment [A55]: For clarity and simplicity, these timelines were integrated into the following sections.

Municipal Copermittee must assess and report the following, as applicable to discharges from the MS4 (including Special District Copermittee MS4s) to flowing receiving waters within their jurisdiction, in the Annual Report required pursuant to Provision F.3.b.(2):~~:~~

Comment [A56]: Per edits to that section

(i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flow discharges to flowing receiving waters~~flows~~ within the Copermittee's jurisdiction in the Watershed Management Area;

(ii) Identify sources of transient and persistent flow discharges to flowing receiving waters~~flows~~ within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and

(iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges to flowing receiving waters, pursuant to Provision D.2.b.(1).

(c) Based on the dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.b, each Municipal Copermittee must assess and report the following, as applicable to discharges from the MS4 (including Special District Copermittee MS4s) within their jurisdiction, in each Annual Report required pursuant to F.3.b.(3) and in the Report of Waste Discharge required pursuant to Provision F.5.b.:~~:~~

Comment [A57]: Per edits to that section

(i) The assessments required pursuant to Provision D.4.b.(1)(a~~b~~);

Comment [A58]: Per edits above

(ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges to flowing receiving waters and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations;

(iii) For the highest priority major MS4 outfalls with persistent flow discharges to a flowing receiving water~~flows~~ that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances;

(iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b.(2), and: ~~utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during~~

Comment [A59]: Edits to this section (and sub-sections) is different than SD edits.

~~the monitoring year. These calculations or estimates must be updated annually. Each Copermittee must calculate or estimate:~~

[a] Calculate or estimate annual non-storm water volumes and pollutant loads (associated with the priority constituents identified in the WQIP) collectively discharged from the monitored persistently flowing ~~Copermittee's~~ major MS4 outfalls discharging to flowing receiving waters within the Copermittee's jurisdiction, or discharged into another Copermittee's MS4 as demonstrated through provision E.2.d.~~with an estimate of the percent contribution from each known and suspected source for each MS4 outfall~~;

[b] Identify ~~identify~~ and quantify, where feasible, known sources of non-stormwater flows not ~~[b] Annual non-storm water volumes and pollutant loads from areas or facilities~~ subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.

(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) ~~once per Permit term~~on an annual ~~basis, and then report~~ within the Regional Monitoring and Assessment Report per Provision F.3.c., the following ~~to~~:

[a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area;

[b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and

[c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction.

(vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(v).

(2) Storm Water Pollutant Discharges Reduction Assessments

(a) ~~The Copermittees must assess and report the progress of the water quality improvement strategies, required to be implemented pursuant to~~

Comment [A60]: This is to help ensure jurisdictional accountability for what is being discharged from their jurisdiction.

~~Provisions B and E, toward reducing pollutants in storm water discharges from the MS4s within the Watershed Management Area as follows:~~

~~(i) Based on data collected pursuant to Provisions D.2.a.(3), the assessments under Provision D.4.b.(2)(b) must be included in the first Annual Report required pursuant to Provision F.3.b.(1).~~

~~Based on the data collected pursuant to Provisions D.2.c, the assessments required under ProvisionProvision first Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter.~~

~~Based on the data collected pursuant to Provisions D.2.c, the assessment required under Provisions D.4.b.(2)(c)-(d) must be included in the Report of Waste Discharge required pursuant to F.5.b.~~

(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following in the Transitional Period Monitoring Report required pursuant to Provision F.3.b.(2):

(i) The Copermittees must analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate: ~~storm water volumes and pollutant loads discharged from the MS4s in each Copermittee's jurisdiction within the Watershed Management Area. The Copermittees must calculate or estimate the following for each monitoring year:~~

[a] The average storm water runoff coefficient for each land use type within the Watershed Management Area;

[b] The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each monitored storm event with measurable rainfall greater than 0.1 inch, for each of the priority water quality constituents identified in the WQIP;

[c] The total volume and pollutant loads potentially discharged from each Municipal Copermittee's jurisdiction within the watershed management area, for each monitored event, extrapolated from the data produced from the monitored outfalls.

~~The pollutant loads discharged from each of the Copermittee's major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; and~~

~~[d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within the drainage basin to each of the Copermittee's major MS4 outfalls in its~~

Comment [A61]: See discussion in section 3.5.3 of the comment letter.

Comment [A62]: Removed as this was confusing as it was duplicative of the subsections below.

Comment [A63]: There is no need to perform this analysis for other pollutants not identified as priorities in the WQIP.

~~jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.~~

(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify ~~sources~~ pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).

(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report (i) and (ii) below in the annual reports required per F.3.b.(3), and (i) through (iv) below in the Regional Monitoring and Assessment Report required per F.3.c. ~~the following~~:

(i) The assessments required pursuant to Provision D.4.b.(2)(a~~b~~);

(ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed per Provision B.3, and evaluate whether ~~,rank the MS4 outfalls in the Watershed Management Area according to potential threat to receiving water quality, and produce a prioritized list of major MS4~~ there is a need to update the Water Quality Improvement Plan;

(iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) ~~on an annual basis~~ to:

[a] Identify reductions and progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area;

[b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in ~~storm water~~ discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and

[c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in ~~storm water~~ discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP.

(iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).

Comment [A64]: See discussion in section 3.5.3 of the comment letter.

Comment [A65]: Per edits to that section

Comment [A66]: Per edits above

(d) Within the Regional Monitoring and Assessment report required pursuant to F.3.c. ~~The~~ Copermittees must evaluate all the data collected pursuant to Provision D.2.c, and incorporate new outfall monitoring data into time series plots for each long-term monitoring constituent for the Watershed Management Area, and perform statistical trends analysis on the cumulative long-term wet weather MS4 outfall discharge water quality data set.

c. SPECIAL STUDIES ASSESSMENTS

The Copermittees must in the applicable annual report required pursuant to F.3.b., ~~annually~~ evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Annual Reports required pursuant to Provision F.3.b.

d. INTEGRATED ASSESSMENT OF WATER QUALITY IMPROVEMENT PLAN

As part of the iterative approach and adaptive management process required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:

(1) The Copermittees must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a. The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Regional Monitoring and Assessment Report ~~of Waste Discharge~~ pursuant to Provision F.3.c ~~5.b~~. The priority water quality conditions and numeric goals for the Watershed Management Area must be re-evaluated as follows:

(a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a;

(b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b;

(c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d;

(d) Identify beneficial uses of the receiving waters that are protected or must be restored in accordance with Provision D.4.a;

(e) Evaluate the progress toward achieving the interim and final numeric goals for restoring impacted beneficial uses in the receiving waters.

(2) The Copermittees must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b. The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Regional Monitoring and Assessment Report pursuant to Provision F.3.c~~must be provided in the Annual Reports required pursuant to Provision F.3.b, and provided in the Report of Waste Discharge pursuant to Provision F.5.b~~. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows:

(a) Identify the non-storm water and storm water pollutant loads from the Copermittees' MS4 outfalls in the Watershed Management Area, calculated or estimated pursuant to Provisions D.4.b;

(b) Identify the non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the interim and final numeric goals identified in the WQIP~~for restoring impacted beneficial uses in the receiving waters~~;

(c) Identify any~~the~~ non-storm water and storm water pollutant load reductions, or other improvements to the quality of MS4 discharges, that are necessary for the Copermittees to ~~demonstrate that non-storm water and storm water~~ reduce discharges of pollutants from their MS4s that have been demonstrated to be~~are not~~ causing or contributing to exceedances of receiving water limitations;

Comment [A67]: See discussion in section 3.5.3 of the comment letter.

(d) Evaluate the progress of the water quality improvement strategies toward achieving the interim and final numeric goals identified in the WQIP~~for restoring impacted beneficial uses in the receiving waters~~.

(3) The Copermittees must re-evaluate and adapt the water quality monitoring and assessment program for the Watershed Management Area when new information becomes available to improve the monitoring and assessment

program pursuant to Provision B.5.c. The re-evaluation and recommendations for modifications to the monitoring and assessment program may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Regional Monitoring and Assessment Report ~~of Waste Discharge~~ pursuant to Provision F.3.c~~5.b~~. Modifications to the water quality monitoring and assessment program must be consistent with the requirements of Provision D.1-D.3. The re-evaluation of the water quality monitoring and assessment program for the Watershed Management Area must consider the data gaps identified by the assessments required pursuant to Provisions D.4.a-b, and results of the special studies implemented pursuant to Provision D.4.c.

5. Monitoring Provisions

Each Copermittee must comply with all the monitoring, reporting, and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

E. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS

The purpose of this provision is for each Copermittee to implement a program to control the contribution of pollutants to and the discharges from the MS4 within its jurisdiction. The goal of the jurisdictional runoff management programs is to implement strategies that effectively prohibit non-storm water discharges to the MS4 and reduce the discharge of pollutants in ~~storm water~~ to the MEP. This goal will be accomplished through implementing the jurisdictional runoff management programs in accordance with the strategies identified in the Water Quality Improvement Plans.

Each Copermittee must update its jurisdictional runoff management program document, in accordance with Provision F.2.a, to incorporate all the requirements of Provision E, consistent with their legal authority. Until the Copermittee has updated its jurisdictional runoff management program document with the applicable requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.

Modification of Jurisdictional Runoff Management Program Requirements

Modifications shall be considered and where selected, proposed according to the process in Provision B.5. Proposed modifications may increase, decrease, and/or replace minimum requirements identified in Provision E.

1. Legal Authority Establishment and Enforcement

Comment [A68]: See discussion in section 3.6 of the comment letter.

a. Each Copermittee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 through statute, ordinance, permit, or series of contracts, ~~order, or similar means~~ which~~.~~ ~~This legal authority must~~, at a minimum, authorize the Copermittee to:

(1) Effectively prohibit through ordinance, order or other similar means~~Prohibit and eliminate all~~ illicit discharges ~~and illicit connections~~ to its MS4;

(2) Control, through ordinance, permit, contract, order or similar means the contribution of pollutants in discharges to the MS4 by storm water discharges ~~of runoff~~ associated with industrial and construction activity ~~to its MS4~~, and ~~control~~ the quality of storm water discharges ~~runoff~~ from sites of industrial and construction activity~~sites~~, whose discharges have not been separately authorized through ~~that do not, including industrial and construction sites which~~ have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit)~~, as well as to those sites which do not;~~

Comment [A69]: See discussion in section 3.6.2 of the comment letter.

(3) Control, through ordinance, order or similar means the discharge to the MS4 of spills, dumping, or disposal of materials other than storm water ~~into its~~

Comment [A70]: See discussion in section 3.6.2 of the comment letter.

~~MS4~~;

(4) Control through interagency agreements among Copermittees the contribution of pollutants from one portion of the MS4 to another portion of the MS4;

(5) ~~Control, by coordinating and cooperating with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes through interagency agreements, where possible, the contribution of from their portion of the MS4 to the portion of the MS4 within the Copermittee's jurisdiction;~~

Comment [A71]: See discussion in section 3.6.2 of the comment letter.

(6) Require compliance with conditions in its ~~statutes,~~ ordinances, permits, contracts, or orders~~, or similar means to hold dischargers to its MS4 accountable for their contributions of pollutants and flows~~;

Comment [A72]: See discussion in section 3.6.2 of the comment letter.

(7) ~~Require the use of BMPs to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;~~

(8) ~~Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;~~

(9) ~~Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means; and~~

Comment [A73]: See discussion in section 3.6.2 of the comment letter.

(10) Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with permit conditions~~its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order~~, including the prohibition of illicit discharges and connections to its MS4; ~~the Copermittee must also have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4.~~

Comment [A74]: See discussion in section 3.6.2 of the comment letter.

b. With the first Annual Report required pursuant to Provision F.3.b, each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in this Order.

2. Illicit Discharge Detection and Elimination

Comment [A75]: See discussion in section 3.7 of the comment letter.

Each Copermittee must implement a program to actively detect and eliminate illicit discharges and improper disposal into the MS4, or otherwise require the discharger

to apply for and obtain a separate NPDES permit. The illicit discharge detection and elimination program must be implemented in accordance with the strategies identified in the Water Quality Improvement Plan and include, at a minimum, the following requirements:

STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the illicit discharge detection and elimination program to address ~~non-storm water and~~ illicit discharges and connections that the Copermittee has identified as potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate ~~additional~~ BMPs, focus education, and/or increase/decrease frequency of inspections in specific areas); and

(2) The strategies and/or activities ~~must~~ may be modified from ~~consistent with~~ the default requirements of Provisions E.2.b-e~~a-d and~~ to be consistent with the strategies identified in the Water Quality Improvement Plan;
