c	Have a substantial adverse effect of federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				
d	Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?				
e	Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?				
f	Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

5. CULTURAL RESOURCES. Would the project:

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?				
b	Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?				
c	Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?				
d	Disturb any human remains, including those interred outside of formal cemeteries?				

Comments:

5.a.
5.b.
5.c.
5.d.

6. GEOLOGY AND SOILS. Would the project:

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i.	Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.				
ii	Strong seismic ground shaking?				
iii	Seismic-related ground failure, including liquefaction?				
iv	Landslides?				
b	Result in substantial soil erosion or the loss of topsoil?				
c	Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?				
d	Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?				
e	Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

.

7. GREENHOUSE GAS EMISSIONS. Would the project:						
	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?				
b	Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?				

Comments:

7.a.
7.b.

8. HAZARDS AND HAZARDOUS MATERIALS. Would the project:

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Create a significant hazard to the public or the environment through the routine transportation, use, or disposal of hazardous materials?				
b	Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?				
c	Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?				
d	Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?				
e	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?				
f	For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?				
g	Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?				
h	Expose people or structures to a significant risk or loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

9. HYDROLOGY AND WATER QUALITY. Would the project:

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality?				
b	Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?				
c	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?				
d	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?				
e	Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?				
f	Require the preparation of a project-specific WQMP?				
g	Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				
h	Place within a 100-year flood hazard area structures which would impede or redirect flood flows?				
i	Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?				
j	Inundation by seiche, tsunami, or mudflow?

10. LAND USE AND PLANNING. Would the project:					
Issues and Supporting Information Sources		Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Physically divide an established community?				
b	Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?				
c	Conflict with any applicable habitat conservation plan or natural community conservation plan?				

Comments:

10.a.
10.b.
10.c.

11. MINERAL RESOURCES. Would the project:

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				
b	Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?				

Comments:

11.a.
11.b.

12. NOISE. Would the project result in:					
Issues and Supporting Information Sources		Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?				
b	Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?				
c	A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?				
d	A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?				
e	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?				
f	For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?				

Comments:

12.a.
12.b.
12.c.
12.d.
12.e.
12.f.

13. POPULATION AND HOUSING. Would the project:						
	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?				
b	Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				
c	Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				

Comments:

13.a.
13.b.
13.c.

14. PUBLIC SERVICES.

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
	Fire protection?				
	Police protection?				
	Schools?				
	Parks?				
	Other public facilities?				

Comments:

14.a.

15. RECREATION.

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?				
b	Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?				

Comments:

15.a.
15.b.

16. TRANSPORTATION/TRAFFIC. Would the project:

	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths and mass transit?				
b	Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?				
c	Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?				
d	Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?				
e	Result in inadequate emergency access?				
f	Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?				

Comments:

16.a.
16.b.
16.c.
16.d.
16.e.
16.f.

17. UTILITIES AND SERVICE SYSTEMS. Would the project:						
Issues and Supporting Information Sources		Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?				
b	Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?				
c	Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?				
d	Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?				
e	Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?				
f	Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?				
g	Comply with federal, state, and local statutes and regulations related to solid waste?				

Comments:

17.a.
17.b.
17.c.
17.d.
17.e.
17.f.
17.g.

18. MANDATORY FINDINGS OF SIGNIFICANCE. Would the project:						
	Issues and Supporting Information Sources	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a	Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?				
b	Does the project have impacts that are individually limited, but cumulatively considerable ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?				
c	Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?				

Comments:

18.a.
18.b.
18.c.

19.	**EARLIER ANALYSES. Earlier analyses may be used where, pursuant to the tiering program EIR, or other CEQA process, one or more effects have been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case a discussion should identify the following on attached sheets.**
a	Earlier analyses used. Identify earlier analyses and state where they are available for review.
b	Impacts adequately addressed. Identify which affects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
c	Mitigation measures. For effects that are "Less than Significant with Mitigation Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

DEVELOPMENT PLAN

Introduction

This handout summarizes Temecula's Development Plan requirements. Projects that require a Development Plan review and application requirements are specified in section 17.05 of the Development Code.

What is the purpose and intent of a Development Plan application?

The purpose of a Development Plan Application is to ensure all new construction or remodeling of industrial, commercial, and/or multiple-family residential development is consistent with the General Plan, design standards and performance standards of the Development Code.

When is a Development Plan required?

A Development Plan is required:

For all residential development (excluding individual single-family homes), and all commercial and industrial developments.

When several permits or multiple applications are required for the same project, a combined hearing and review process may be permitted, however separate applications shall be filed for each action requested.

How do I apply for a Development Plan?

Call the Community Development Department, (951) 694-6400, to schedule an application submittal appointment. City staff will meet with you within one to two working days to review your application materials for completeness. The application will be deemed complete at the counter if all submittal materials and fees have been provided.

Who approves Development Plan applications?

The following type of project is decided at the administrative level:

- Administrative Development Plans

The following type of project is decided at the Planning Director level:

- Projects less than 10,000 square feet of gross floor area.

The following types of projects are decided at the Planning Commission level:

- Projects greater than 10,000 square feet of gross floor area.
- Projects that may have special community impacts or other unique circumstances.

What are the criteria for approval?

According to the City's Development Code, in order to approve a Development Plan application, the following findings must be made:

- The proposed use is in conformance with the General Plan for Temecula and with all applicable requirements of State law and other Ordinances of the City.
- The overall development of the land is designed for the protection of the public health, safety, and general welfare.

Development Plan applications may be approved with "Conditions of Approval" which are deemed necessary to protect the public health, safety, and general welfare and assure compliance with the Development Code standards and provisions.

How many times can a Development Plan be extended?

The Development Code permits up to 3 one-year time extensions for Development Plans.

How do I apply for a Development Plan?

Call the Community Development Department, (951) 694-6400, to schedule an application submittal appointment. City staff will meet with you within 1to 2 working days to review your application materials for completeness. The application will be deemed complete at the counter if all submittal materials and fees have been provided.

Owner Certification

☐ **I certify under the penalty of the laws of the State of California that I am the property owner of the property that is the subject matter of this application and I am authorizing to and hereby do consent to the filing of this application and acknowledge that the final approval by the City of Temecula, if any, may result in restrictions, limitations and construction obligations being imposed on this real property.**

Owner/Authorized Agent Signature: _____ **Date:** _____

Print Name: _____

Written authorization from the legal property owner is required. An authorized agent for the owner must attach a notarized letter of authorization from the legal property owner.

DEVELOPMENT PLAN
APPLICATION SUBMITTAL REQUIREMENTS

Initial Submittal Requirements	COM	IND	RES
Completed and Signed Application and Filing Fee	1	1	1
Site Plan (Described in Section A)	20	20	20
Floor Plan/Roof Plan/ (Described in Section B)	20	20	20
Proposed Structure Elevations (Described in Section C)	20	20	20
Conceptual Landscape Plan (Described in Section D)	20	20	20
Conceptual Grading Plan (Described in Section E)	20	20	20
Conceptual Colored Landscape Plan	3	3	3
Proposed Structure Color Elevations (Described in C1)	1	1	1
Proposed Color 3-D Perspective Rendering (only for proposed buildings in the Old Town Specific Plan three or more stories in height). This 3-D rendering is intended to show building height, mass and relative position to its surroundings and neighboring buildings in Old Town. (Described in Section C2)	1	-	1
8 1/2" X 11" Color Photos (Described in Section F)	1	1	1
Material Sample Board (Described in Section G)	1	1	1
Photometric Plan (Described in Section H)	1	1	1
Materials for Architectural Review (Described in Section I)	1	1	1
Statement of Operations (Described in Section J)	20	20	20
MSHCP Information (Described in Section K)	1	1	1
A $60 check made payable to "University of California Regents" and USGS 7.5' series quadrangle map (Consult with the Planning Department) (Described in Section L)	1	1	1
Project-Specific Water Quality Management Plan based on the Initial Applicability Checklist and Conceptual Acceptance Requirements (Described in Section M). Consult with Public Works to assist in determining if this item is required.	1	1	1
Hazardous Waste Site Information Form (Described in Section N)	1	1	1
Developer Disclosure Statement (attached)	1	1	1

Initial Submittal Requirements	COM	IND	RES
Preliminary title report with all referenced supporting documents	2	2	2
Letter of Justification (Described I Section Q)	20	20	20
Traffic Study/Analysis (Consult with Public Works)	1	1	1
Drainage Study/Analysis (Consult with Public Works)	1	1	1
Preliminary Soils and Geotechnical Report (Consult with Public Works to determine if this item is required)	2	2	2
Chemical Classification / Quantification Packet (See Fire Department for package)	1	1	1

Submittal Requirements Prior to Hearing	COM	IND	RES
Public Hearing Information (Described in Section O)	1	1	1
Spiral Bound Color 11"x17" reduction of all exhibits	8	8	8
8 ½"x11" reduction of all exhibits	1	1	1
8 ½"x11" reduction of all previously approved exhibits	1	1	1
Mounted final color building elevations (3'x4')	1	1	1
Full size set of final site plan, elevations, floor plans, grading plan and landscape plan folded to 8½"x11"	4	4	4
Final Color 3-D perspective rendering (only for proposed buildings located within the Old Town Specific Plan that are three or more stories in height). This 3-D rendering is intended to show building height, mass and relative position to its surroundings and neighboring buildings in Old Town. (Described in Section C2). *This is a proposed final version for presentation to the Planning Commission.*	1	1	1
Developer Disclosure Statement – updated (if Planning Commission/City Council approval required)	1	1	1
CD of all project plans in JPEG or PDF format. Electronic file sizes should be limited to 5MB for black and white sheets and 10MB for color sheets	1	1	1

2. PLAN PREPARATION AND GUIDELINES

All plans shall be drawn on uniform sheets no less than 24" X 36" (or as approved by the Community Development Department). **Each complete set consisting of the site plan, floor plan/roof plan, proposed structure elevations, conceptual landscape plan, photometric plan, and conceptual grading plan should be stapled together and folded into 1/8 sections with a folded size not to exceed 8 1/2" X 11".** All plans shall be clear, legible and accurately scaled. The site plan, landscape plan and grading plan should all be at the **same** scale and shall be consistent with each other.

On large scale drawings, 1"=20', or larger, it will generally be desirable to include the conceptual grading of the site on the site plan in lieu of a separate drawing (see Section B). For larger, more complicated sites drawn at a smaller scale (i.e., 1"=40'), a separate conceptual grading plan should be submitted.

SECTION A. SITE PLAN CONTENT

Scale: Engineering scale not to exceed 1"=40'.

The following information shall be included on the plan:

- ❑ Name, address, and phone and fax number of applicant, owner, architect and/or engineer.
- ❑ Graphic scale (with bar scale) and north arrow
- ❑ Vicinity map
- ❑ Date Site Plan prepared
- ❑ Data table formatted in the following order:

○ Assessors Parcel Number		
○ Street Address (if available)		
○ Legal description of the property. (i.e. Tract/Parcel Map and Lot(s)/parcel(s)		
○ Zoning designation		
○ General Plan designation		
○ Existing land use/proposed land use		
○ Total Gross Area:	square feet	acres
○ Total Net Area:	square feet	acres
○ Total Building Area:	square feet	FAR
○ Lot coverage:	Square Feet	Percentage
○ Building area	s.f.	%
○ Parking area	s.f.	%
○ Landscaping area	s.f.	%
○ Parking:	Spaces Required	Spaces Provided
○ Ratio/square foot of use(s)	spaces	spaces
○ Number of disabled spaces	spaces	spaces
○ Total Parking	spaces	spaces
○ Floor Area Ratio		
○ Occupancy classification (per Uniform Building Code)		
○ Type of construction (per Uniform Building Code)		
○ Indicate if building has fire sprinklers and/or alarm		
○ Number of stories		
○ Height of building (as measured from the pre-existing grade, finished grade or floor protection elevation, which ever is lowest to highest point on roof)		

- ❑ Existing property lines in bold and label all dimensions (metes and bounds)
- ❑ Location and dimensions of all existing and proposed easements (with record reference)
- ❑ Proposed lot lines and dimensions, if applicable
- ❑ Delineate and label the minimum setbacks from all property lines
- ❑ Location and dimension of all existing and proposed structures, including building setbacks
- ❑ Location and dimension of all landscaping and pedestrian walkways (shaded)
- ❑ Location and typical dimension of drive aisles, loading zones and parking stalls
- ❑ Location of existing and proposed onsite fuel tanks

- ❑ Location and dimension of all trash enclosure(s)
- ❑ Location of monument sign(s) (existing and proposed)
- ❑ All proposed public improvements, including cross sections
- ❑ Location of existing or proposed fire hydrants within 500 feet of project site
- ❑ Location of existing or proposed Fire Department connections (within 50 feet of a public hydrant and 40 feet away from the building
- ❑ Location of existing or proposed Post Indicator Valve
- ❑ Label interior and exterior turning radius dimensions at entries and drive aisles for emergency vehicle access (minimum interior – 37 feet; exterior – 56 feet; wheel cuts – 50 feet)
- ❑ Location and dimension of all walls and fences
- ❑ Location of all structures, driveways, parking areas, trees and adjoining property lines within 50 feet of the perimeter of the subject property
- ❑ Zoning and existing land use of adjacent parcels
- ❑ Phasing of the project (if proposed)
- ❑ Americans with Disabilities Act (ADA) path of travel (horizontal path of travel only)
- ❑ Location, type and height of all existing and proposed street, parking and pedestrian lights (Indicate any to be relocated)

SECTION B. FLOOR PLAN/ROOF PLAN CONTENTS

Scale: The scale used on the floor and roof plans shall be no less than 1/4" per foot. Large projects shall be no less than 1/8" per foot with 1/4" per foot details). The floor and roof plans shall illustrate <u>all</u> proposed (and existing, if applicable) buildings and structures. The following information shall be included on the floor plans:

- ❑ Proposed use for each room (if available)
- ❑ Proposed square footage for each room
- ❑ Restrooms
- ❑ Exits
- ❑ Doors
- ❑ Hallways
- ❑ Corridors
- ❑ Elevators
- ❑ Patio
- ❑ Fire sprinkler riser room (with direct exterior access)
- ❑ Fire alarm control panel
- ❑ Location of Knox Box
- ❑ Location of Fire Department connection (if wall mounted)

The following information shall be included on the roof plan:

- ❑ All roof pitches and direction of fall
- ❑ Location and detail of all mechanical equipment
- ❑ Spot elevations or other cross-sections necessary to verify that all mechanical equipment is fully screened

SECTION C. BUILDING ELEVATION(S) CONTENT

Scale: No less than 1/4" (large projects no less than 1/8" with 1/4" details).

Illustrative building elevations showing <u>all</u> sides of proposed (and existing, if applicable) buildings and accessory structures (trash enclosures, walls, carports, etc.). Include cross-section(s) of building(s) with proposed grades.

The following information shall be included on the elevation plans:

- ❑ Name, address and phone number, of the applicant, architect and/or engineer
- ❑ Location of building address and wall mounted signs for all sides of the building(s)
- ❑ Shading, as applicable, to give the elevations some graphic dimension

- ❑ Location of walls and fences
- ❑ Roof top mechanical equipment screens
- ❑ A schedule for colors and materials (which corresponds to the color and material board) and specific location of their use
- ❑ Height of buildings with dimensions

SECTION C1. BUILDING COLOR ELEVATION(S) CONTENT

Scale: No less than 1/4" (large projects no less than 1/8" with 1/4" details).

Illustrative building elevations showing all sides of proposed (and existing, if applicable) buildings and accessory structures (trash enclosures, walls, carports, etc.). Include cross-section(s) of building(s) with proposed grades. Colors used on the color elevations shall match those used on the material sample board (See Section F) to the greatest extent possible in order to give the most accurate representation. Colored elevations are to be void of landscaping to clearly demonstrate the aesthetic impact the building(s) will create. In addition to colored elevations, colored renderings may be submitted with landscaping, however, the landscaping must conform with the planting materials indicated on the landscape plan.

SECTION C2. COLOR 3-D PERSPECTIVE RENDERING CONTENT

This submittal requirement is only for proposed buildings three or more stories in height and located within the Old Town Specific Plan. The 3-D color perspective rendering may be submitted as an electronic version in JPEG or PDF format or as a virtual tour (in a format capable of being incorporated into Microsoft PowerPoint and compatible with existing software of the Planning Department). The intent is to illustrate the impact that the proposed building will have on its surroundings and neighboring buildings in Old Town. The proposed building image shall be superimposed into its site area in Old Town and provide a 360-degree 3-D illustration of the proposed building and its existing surroundings within a radius of 300 feet. Four views will be required from north, south, east and west perspective to illustrate the impact the proposed building will have as it relates to its location in Old Town.

SECTION D. LANDSCAPE PLAN CONTENT

Scale: *Engineering scale not to exceed 1"=40'*.

The following information shall be included on the plan:

- ❑ Name, address, and phone number of applicant, architect, engineer and/or landscape architect
- ❑ Scale and north arrow.
- ❑ Location of all proposed buildings, paved surfaces, walls/fences and sidewalks
- ❑ Roof outlines including eave overhang
- ❑ Location, size and identification of all existing and proposed plant material, trees, shrubs and groundcover. Note on plans whether existing landscape is to be removed.
- ❑ A planting legend that identifies plant varieties (botanical and common names), sizes, quantities, and spacing
- ❑ Location and elevation of mounding, if proposed
- ❑ Graphically indicate all slopes, which equal or exceed 3:1
- ❑ Graphically indicate all vehicle sight lines
- ❑ Generally describe type of irrigation system to be implemented

SECTION E. CONCEPTUAL GRADING PLAN CONTENT

Scale: Engineering scale not to exceed 1"=40'.

On large scale drawings, 1"=20', or larger it will generally be desirable to include the conceptual grading of the site on the site plan in lieu of a separate drawing. For larger, more complicated sites drawn at a smaller scale (i.e., 1"=40'), a separate conceptual grading plan should be submitted. A Registered Civil Engineer shall prepare grading plans

The following information shall be included on the plan:

- ❑ Title Block
  - ○ Name, address, and phone and fax number, of applicant, owner and engineer
- ❑ Legend, north arrow, bar and graphic scale, vicinity map
- ❑ Data Table
  - ○ Assessor's Parcel Number(s)
  - ○ Project Name
  - ○ Legal description (i.e. Tract/Parcel Map and lot(s)/parcel (s))
  - ○ Approximate earthwork quantities (CY)
  - ○ Date and Source of Topography (should be current)
- ❑ Metes and bounds (i.e. bearing and distance)
- ❑ Location and dimensions of all existing and proposed easements
- ❑ Existing topography, proposed grades, and natural features to 50 feet from the perimeter of the subject property at minimum two-foot contour intervals
- ❑ All slopes greater than 2:1 must be clearly labeled
- ❑ Limits of FEMA floodplains and floodways (if applicable)
- ❑ Delineation of special hazard zones (i.e., earthquake faults and liquefaction zones)
- ❑ Proposed grading; structures, curbs, retaining and/or sound walls (top and footing elevations), gutters, pavement, walks, swales, mounding, slopes, open space, trails, etc.) per the appropriate City standard
- ❑ Pad and finished floor elevations
- ❑ Location and dimension of all proposed public improvements, including cross sections
- ❑ Locations of existing public and proposed utilities (including sewer and water)
- ❑ Cross-sections at all property lines
- ❑ Driveway, street slopes and surfaces in plan view and cross section
- ❑ Drainage and flood control facilities, including size and type
- ❑ Americans with Disabilities Act (ADA) path of travel

SECTION F. 8 1/2" X 11" COLOR PHOTOS

8½"x11" color photos from interior of site looking north, south, east, and west with direction attached to each photo. Additionally, photos of the project site from off-site in all directions.

SECTION G. MATERIAL SAMPLE BOARD

Size: No larger than 8 ½"x11". An 8½"x11" photo shall also be provided for the file. The material sample board is intended to provide a fair representation of the major exterior materials to be used on the project together with colors and stains. Therefore, no photographs of the materials will be accepted on the material sample boards. The color and material board shall be used in conjunction with the schedule on the elevations in order to determine the specific location and use of colors and materials. The board should be of rigid material (cardboard or foam board, not wood) and shall show the following:

- ❑ Sample of all roofing materials
- ❑ Sample of all siding materials
- ❑ Sample of window glazing materials
- ❑ Sample of all window frames
- ❑ Sample of all canvas awning materials
- ❑ Samples of all paint colors to be used on the buildings applied to the surface of actual

exterior building material samples
- ❑ Manufacturers name and identification numbers of paint colors that correspond to the proposed materials
- ❑ Exterior light fixture details
- ❑ Sample of decorative paving treatments – color, finish, pattern

SECTION H. PHOTOMETRIC PLAN

Include a plan that demonstrates a minimum of one footcandle of illumination throughout the entire onsite parking area.

SECTION I. MATERIALS FOR ARCHITECTURAL REVIEW

The City of Temecula contracts with an Architect to provide an unbiased third party review of all new projects. Provide an electronic version of the following information in JPEG or PDF format omitting all leader lines and callouts:

- ❑ Color photos from interior of site looking north, south, east, and west with direction identified for each photo
- ❑ Site plans
- ❑ Building elevations
- ❑ Floor plans
- ❑ Landscape plans

SECTION J. STATEMENT OF OPERATIONS

Provide a written statement outlining your request for a Development Plan. Your response must give a detailed description of the proposed use and shall include, but is not be limited to:

- ❑ Hours and days of operation
- ❑ Number of employees
- ❑ Number of required parking
- ❑ Average daily peak trips generated
- ❑ Type of equipment or processes used
- ❑ Description of hazardous materials (existing and new)
- ❑ Other descriptions that effectively describe the proposed use

SECTION K. MSHCP INFORMATION

The Riverside County Multi-Species Habitat Conservation Plan has identified areas in the City as "Criteria Cells" that require mitigation for habitat conservation. To find out if your project is within a Criteria Cell area, please go to the MSHCP website at www.rcip.org. From this home page, click on Conservation Summary Report Generator. You will be redirected to a page where you can input the parcel number. If there is more than one parcel number, you must input them one at a time and print out each report individually. A report for each parcel must be attached to the application at time of submittal.

SECTION L. UNIVERSITY OF CALIFORNIA REGENTS

Provide a check made payable to University of California Regents for cultural resource review along with a copy of a USGS Quad map not reduced or enlarge (7.5' Series) showing location of project site. Check for shall be made payable to University of California Regents in the amount of $60 required by University of California.

SECTION M. WQMP INITIAL APPLICABILITY AND CONCEPTUAL ACCEPTANCE CHECKLISTS

Step One: Fill out the Initial Applicability Checklist. If "yes" can be answered to any of the criteria outlined in the Initial Applicability checklist, a Water Quality Management Plan (WQMP) is required for the project and will have to be submitted with the application materials at the time of submittal. Go to Step Two below. [NOTE: If "no" is answered to **all** of the criteria outlined in the Initial Applicability checklist, then a Water Quality Management Plan is not needed for the initial submittal].

Step Two: A WQMP, including the completed Initial Applicability Checklist must be submitted if "yes" was answered in any of the criteria outlined in the Initial Applicability checklist. In addition, the Conceptual Checklist and Supplemental Slipsheets must be completed and submitted with the application materials along with the WQMP. The WQMP template, checklists and slipssheets are available online at:
http://www.cityoftemecula.org/Temecula/Government/PublicWorks/WQMPandNPDES/WQMP.htm

WATER QUALITY MANAGEMENT PLAN (WQMP)

INITIAL APPLICABILITY CHECKLIST

Applicant Name:_____

Planning Application Number:_____

Project Name:_____

	Does the proposed project incorporate any of the following categories? (All questions must be answered)	Yes	No
1	**Modifications to Existing Developments** – This category includes projects that create, add, or replace 5,000 sq. ft. or more of impervious surface on an already developed site. This category includes: (a) Expansion of a building footprint, or addition or replacement of a structure; (b) Increase in the gross floor area, or major exterior construction or remodeling; (c) Replacement of impervious surfaces that are not part of routine maintenance activities; (d) Land disturbing activities related to a structure or impervious surface. **Note:** If modifications create less than 50% of the impervious surface of a previously existing development, and the existing development was not originally subject to WQMP requirements, a WQMP shall be required only to the addition, and not to the entire development.		
2	**Residential Development** - This category includes subdivisions of single-family homes, multi-family homes, condominiums, and apartments consisting of 10 or more dwelling units.		
3	**Non-Residential Development** - This category includes projects where the land area for development is greater than 100,000 sq. ft.		
4	**Automotive Maintenance and Repair Shops** - This category includes facilities engaged in general maintenance and mechanical repairs, body and upholstery repair, painting, transmission and exhaust repair, tire servicing; and glass repair.		
5a	**Restaurants** - This category includes all eating and drinking establishments where the land for development is greater than 5,000 sq. ft.		
5b	**Restaurants** where the land area for development is less than 5,000 sq. ft. are only required to follow the site design and source control requirements of the WQMP.		
6	**Hillside Development** – This category includes any developments that create more than 5,000 sq. ft. of impervious surface, are located in an area with known erosive soil conditions, and where the project will require grading natural slopes of 25% (4:1) or steeper.		
7	**Environmentally Sensitive Areas (ESAs)** – This category includes all development located within or directly adjacent to or discharging directly to an ESA which either creates 2,500 sq. ft. of impervious surface or increases the area of imperviousness by 10% or more of its naturally occurring condition. **Note:** "Directly adjacent" means within 200 feet of the ESA. "Discharging directly to" means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or modification, and not commingled with flows from adjacent lands.		
8	**Parking Lots** – This category includes projects that create 5,000 sq. ft. or more of impervious surface for temporary parking or storage of motor vehicles. This category includes parking areas associated with any of the developments outlined above. Routine maintenance, including removal and replacement, is exempt.		
9	**Streets, Roads, Highways & Freeways** – This category includes projects that create 5,000 sq. ft. or more of impervious surface for transportation of motor vehicles. Routine maintenance, including removal and replacement, is exempt.		
10	**Retail Gasoline Outlets** – This category applies if either of the following criteria is met: (a) 5,000 sq. ft. or more of impervious surface, or (b) a projected 'Average Daily Traffic' count of 100 or more vehicles per day.		

If you answered "YES" to any of the questions above, a project-specific Water Quality Management Plan must be prepared and submitted (see next page).

Conceptual-Level Water Quality Management Plan (WQMP)

A conceptual WQMP shall be submitted as part of the initial application submittal package. Applicants shall confer with the City's engineering staff to ensure adherence with the latest version of the Project-Specific WQMP Template. At a minimum, the following sections of the WQMP template shall be satisfied at this submittal stage. Each section shall adhere to all of the items outlined in the Conceptual Acceptance checklist.

WQMP Section	Title of Section
I	Project Description
III	Pollutants of Concern
IV	Hydrologic Conditions of Concern (Preliminary Surface Hydrology)
V.1	Site Design BMPs
V.3	Treatment Control BMPs
VI	Operation and Maintenance Responsibility for Treatment Controls
Appendix B	WQMP Site Plan
Appendix C	Supporting Detail related to Hydrologic Conditions of Concern (Preliminary Surface Hydrology)
Appendix E	Soil and Percolation Reports that specifically address soil infiltration properties
Appendix F	Treatment Control BMP Sizing Calculations and Design Details

Visit the City's website for detailed information on WQMP requirements:
http://www.cityoftemecula.org/Temecula/Government/PublicWorks/WQMPandNPDES/WQMP.htm

SECTION N. HAZARDOUS WASTE SITE INFORMATION FORM

Government Code Section 65962.5, which became effective July 1, 1987, requires the applicant for any development project to consult specified State-prepared lists of hazardous waste sites and submit a signed statement to the local agency indicating whether the project is located on or near an identified site. Under the statute, no application shall be accepted without this signed statement.

PART A

TO DETERMINE IF YOUR PROJECT IS WITHIN THE ONE-MILE RADIUS OF A HAZARDOUS WASTE SITE refer to the following list of State identified Hazardous Waste Sites. Identify the listed site by placing a check in the box provided and sign and date this form.

Is the project within a one-mile radius of an identified hazardous waste site? Yes No

REGIONAL WATER QUALITY CONTROL BOARD HAZARDOUS WASTE SITES

- ❑ Rancho California Water District, 28061 Diaz Road, Temecula, CA 92590
- ❑ Borg Warner Mechanical Seal, 27941 Front Street, Temecula, CA 92590
- ❑ Chevron Service Station, 28900 Rancho California Road, Temecula, CA 92590
- ❑ Plant Equipment, Inc., 28075 Diaz Road, Temecula, CA 92590
- ❑ Mobil, 28111 Front Street, Temecula, CA 92590
- ❑ Penfold Properties, 28545 Front Street, Temecula, CA 92590
- ❑ C.L. Pharris Ready Mix Plant, 29065 Front Street, Temecula, CA 92590
- ❑ Temecula Fuel Center, 44987 Front Street, Temecula CA 92590
- ❑ Arco, 27641 Ynez Road, Temecula, CA 92590

PART B

TO DETERMINE IF YOUR PROJECT IS WITHIN A ONE-MILE RADIUS OF A PUBLIC WELL SITE, which could potentially be affected by a hazardous waste generator, refer to the following list of State identified Public Well Sites. Identify the listed site by placing a check in the box provided and sign and date this form on the last page.

Is the project within a one-mile radius of an identified public well? Yes No

DHS3 PUBLIC WELL SITES SERVING MORE THAN 200 CONNECTIONS

- ❑ Rancho Cal WD (#102), SW 1/4, SE 1/4, Sec. 2, T8S, R3W
- ❑ Rancho Cal WD (#114, 113), SE 1/4, NE 1/4, Sec. 25, T7S, R2W

I (we) certify that I (we) have investigated and completed this hazardous waste site form, and that my (our) answers are true and correct to the best of my (our) knowledge.

Owner/Representative_____Date_____

SECTION O. PUBLIC HEARING REQUIREMENTS

The following information may be obtained by requesting a "Radius Package" from a title insurance company.

The following items will be required prior to scheduling the application for public hearing:

1. **TWO** identical packages to be inserted in separate 9 1/2" x 12 1/2" manila envelopes. These envelopes shall indicate the case number and the word "labels," and shall contain the following:

   a. One typed set of gummed labels **(30 labels per sheet)** indicating all the property owners' names and the mailing addresses that are within a 600-foot radius of the exterior of the proposed tract boundaries (this list shall be ascertained from the last equalized assessment roll). The Planning Application Number shall be located on all label sheets.

      ***A minimum of the 30 nearest individual property owners (persons owning multiple properties shall only be counted once) shall be provided. Applicant is responsible for crossing out all duplicate labels.**

   b. A photocopy of the aforementioned labels

   c. One label for the representative/engineer

   d. One label for the owner

2. Four typed sets of gummed labels of the owner, engineer, and representative with their mailing addresses. Do not include duplicate sets where representative and owner, etc., are the same. These should be inserted in a letter-sized envelope and stapled to the outside of one of the large manila envelopes mentioned in item 1 above.

3. Certification by the Title Company, engineer, or surveyor that the above list is complete and accurate. The Tax Assessor's Office will not prepare or certify the property owner list (see certification form attached).

4. On a copy of your assessors parcel map show all the parcels within the noticing radius. On the map, print the names of all property owners within the noticing radius as they are listed on the gummed labels.

PROPERTY OWNERS CERTIFICATION

I, _____, certify that on _____
(Print Name) (Month-day-year)

the attached property owners list was prepared by

_____Pursuant to application

requirements furnished by the City of Temecula Planning Department. Said list is a complete and true compilation of owner of the subject property and all other property owners within **600 feet (or the 30 nearest individual property owners, whichever creates the greatest number of public notices (persons owning multiple properties shall only be counted once)** of the property involved in the application and is based upon the latest equalized assessment rolls.

I further certify that the information filed is true and correct to the best of my knowledge. I understand that incorrect or erroneous information may result in processing delays or be grounds for rejection or denial of the application.

NAME:_____

TITLE/REGISTRATION:_____

ADDRESS:_____

PHONE:_____ (Daytime phone no.)

SIGNATURE:_____

DATE: _____ CASE NO.: _____

CITY OF TEMECULA
DEVELOPMENT APPLICATION
DEVELOPER DISCLOSURE STATEMENT

This portion of the Application must be fully completed and signed by the Applicant. If not fully completed and signed, the Application will be deemed incomplete. Additionally, this portion of the Application must be fully completed and signed by the Applicant and filed with the Planning Department again not less than five nor more than ten days prior to the hearing before the Planning Commission and not less than five nor more than ten days prior to the hearing before the City Council, if any.

1. Address of subject property:_____
   Cross street:_____

2. Date this Disclosure Statement is completed:_____

3. Name of Applicant: _____

   A. If Applicant is a limited liability company ("LLC"), please state:
      1) Full name of LLC
      2) Address of LLC
      3) State of registration
      4) Name and address of managing member(s)
      5) Name and address of agent for service of process

   B. If Applicant is a partnership, please state:
      1) Full name of partnership
      2) Address of partnership
      3) State of registration
      4) Name and address of general partners
      5) Name and address of agent for service of process

   C. If Applicant is a corporation, please state:
      1) Full name of corporation
      2) Address of corporation
      3) State of incorporation
      4) Name and address of officers of corporation
      5) Name and address of shareholder with fifty percent (50%) or more of the shares of the corporation, if any
      6) If no shareholder has fifty percent (50%) or more of the corporation's share, name and address of controlling shareholder
      7) Name and address of agent for service of process

4. Name of each Owner of the subject property: _____

_____

A. If Owner is a limited liability company ("LLC"), please state:
   1) Full name of LLC

   2) Address of LLC

   3) State of registration

   4) Name and address of managing member(s)

   5) Name and address of agent for service of process

B. If Owner is a partnership, please state:
   1) Full name of partnership

   2) Address of partnership

   3) State of registration

   4) Name and address of general partners

   5) Name and address of agent for service of process

C. If Owner is a corporation, please state:
   1) Full name of corporation

   2) Address of corporation

   3) State of incorporation

   4) Name and address of officers of corporation

   5) Name and address of shareholder with fifty percent (50%) or more of the shares of the corporation, if any

   6) If no shareholder has fifty percent (50%) or more of the corporation's share, name and address of controlling shareholder

   7) Name and address of agent for service of process

5. If the subject property is in escrow to be conveyed to another party or is the subject of a purchase and sale agreement, state the name of each person in escrow to purchase the subject property or a party to the purchase and sale agreement ("Party in Escrow"): _____

_____

A. If the Party in Escrow is a limited liability company ("LLC"), please state:
   1) Full name of LLC
   2) Address of LLC
   3) State of registration
   4) Name and address of managing member(s)
   5) Name and address of agent for service of process

B. If Party in Escrow is a partnership, please state:
   1) Full name of partnership
   2) Address of partnership
   3) State of registration
   4) Name and address of general partners
   5) Name and address of agent for service of process

C. If Party in Escrow is a corporation, please state:
   1) Full name of corporation
   2) Address of corporation
   3) State of incorporation
   4) Name and address of officers of corporation
   5) Name and address of shareholder with fifty percent (50%) or more of the shares of the corporation, if any
   6) If no shareholder has fifty percent (50%) or more of the corporation's share, name and address of controlling shareholder
   7) Name and address of agent for service of process

6. For any deeds of trust or other liens on the property (other than real property tax liens) please state the following:

   A. Name of beneficiary of the deed of trust or lien

   B. Date of the deed of trust or lien.

I certify under penalty of perjury under the laws of the State of California that the foregoing is true and correct. Executed on the date and location set forth below

Public Works Development Plan

General Requirements

PW-1. Unless otherwise noted, all conditions shall be completed by the developer at no cost to any Government Agency. It is understood that the developer correctly shows on the site plan all existing and proposed property lines, easements, traveled ways, improvement constraints and drainage courses, and their omission may require the project to be resubmitted for further review and revision.

PW-2. A Grading Permit for precise grading, including all on-site flat work and improvements, shall be obtained from the Department of Public Works prior to commencement of any construction outside of the City-maintained street right-of-way.

PW-3. An Encroachment Permit shall be obtained from the Department of Public Works prior to commencement of any construction within an existing or proposed City right-of-way.

PW-4. An Encroachment Permit shall be obtained from the California Department of Transportation prior to commencement of any construction within an existing or proposed State right-of-way.

PW-5. All improvement plans shall be coordinated for consistency with adjacent projects and existing improvements contiguous to the site and shall be submitted on standard 24” x 36” City of Temecula mylars.

PW-6. The project shall include construction-phase pollution prevention controls into the design of the project to prevent non-permitted runoff from discharging off site or entering any storm drain system or receiving water during all field-related activities.

PW-7. A Water Quality Management Plan (WQMP) must be conceptually accepted by the City prior to the initial grading plan check. The WQMP will be prepared by a registered civil engineer and include Low Impact Development (LID) Best Management Practices (BMPs), source controls, and treatment devices.

PW-8. All onsite drainage and water quality facilities shall be privately maintained.

Prior to Issuance of Grading Permit(s)

PW-9. The Water Quality Management Plan (WQMP) must receive final acceptance by the City prior to issuance of any grading permit.

PW-10. A copy of the grading and improvement plans, along with supporting hydrologic and hydraulic calculations shall be submitted to the Riverside County Flood Control and Water Conservation District for approval.

PW-11. A permit from Riverside County Flood Control and Water Conservation District is required for work within their right-of-way.

PW-12. A grading plan shall be prepared by a registered civil engineer in accordance with City of Temecula standards, and shall be reviewed and approved by the Department of Public Works prior to the commencement of grading. The grading plan shall include all necessary erosion control measures needed to adequately protect the site (public and private) and adjoining properties from damage due to erosion.

PW-13. The developer shall post security and enter into an agreement guaranteeing the grading and erosion control improvements in conformance with applicable City Standards and subject to approval by the Department of Public Works in accordance with Grading Ordinance Section 18.24.120.

PW-14. A Soils Report shall be prepared by a registered soil or civil engineer and submitted to the Department of Public Works with the initial grading plan check. The report shall address all soil conditions of the site, and provide recommendations for the construction of engineered structures and pavement sections.

PW-15. A Geological Report shall be prepared by a qualified engineer or geologist and submitted to the Department of Public Works with the initial grading plan check. The report shall address special study zones and the geological conditions of the site, and shall provide recommendations to mitigate the impact of ground shaking and liquefaction.

PW-16. The developer shall have a Drainage Study prepared by a registered civil engineer in accordance with City Standards identifying storm water runoff expected from this site and upstream of this site. The study shall identify all existing or proposed public or private drainage facilities intended to discharge this runoff. The study shall also analyze and identify impacts to downstream properties and provide specific recommendations to protect the properties and mitigate any impacts. Any upgrading or upsizing of downstream facilities, including acquisition of drainage or access easements necessary to make required improvements, shall be provided by the developer.

PW-17. Construction-phase pollution prevention controls shall be consistent with the City's Grading, Erosion and Sediment Control Ordinance and associated technical manual, and the City's standard notes for Erosion and Sediment Control.

PW-18. The project shall demonstrate coverage under the State NPDES General Permit for Construction Activities by providing a copy of the Waste Discharge Identification number (WDID) issued by the State Water Resources Control Board (SWRCB), the project's Risk Level (RL) determination number, and name and contact information of the Qualified SWPPP Developer (QSD). A Stormwater Pollution Prevention Plan (SWPPP) shall be available at the site throughout the duration of construction activities.

PW-19. As deemed necessary by the Department of Public Works, the developer shall receive written clearance from the San Diego Regional Water Quality Board, Riverside County Flood Control and Water Conservation District, Planning Department, or other affected agencies.

PW-20. The developer shall comply with all constraints which may be shown upon an Environmental Constraint Sheet (ECS) recorded with any underlying maps related to the subject property.

PW-21. Permanent landscape and irrigation plans shall be submitted to the Planning Department and the Department of Public Works for review and approval.

PW-22. The applicant shall comply with the provisions of Chapter 8.24 of the Temecula Municipal Code (Habitat Conservation) by paying the appropriate fee set forth in that ordinance or by providing documented evidence that the fees have already been paid.

PW-23. The developer shall obtain letters of approval for any off site work performed on adjoining properties. The letters shall be in format as directed by the Department of Public Works.

PW-24. The developer shall post security and enter into an agreement guaranteeing the grading and erosion control improvements in conformance with applicable City Standards and subject to approval by the Department of Public Works in accordance with Grading Ordinance Section 18.24.120.

PW-25. The site is in an area identified on the Flood Insurance Rate Map. This project shall comply with Chapter 15.12 of the Temecula Municipal Code which may include obtaining a Letter of Map Revision from FEMA. A Flood Plain Development Permit shall be submitted to the Department of Public Works for review and approval.

PW-26. A drainage channel and/or flood protection wall will be required to protect the structures by diverting sheet runoff to streets, or to a storm drain.

Prior to Issuance of Building Permit(s)

PW-27. Final Map shall be approved and recorded.

PW-28. Improvement plans shall conform to applicable City of Temecula Standards subject to approval by the Department of Public Works. The following design criteria shall be observed:

a. Flowline grades shall be 0.5% minimum over P.C.C. and 1.00% minimum over A.C. paving.

b. Driveways shall conform to the applicable City of Temecula Standard Number 207.

c. Streetlights shall be installed along the public streets adjoining the site in accordance with City of Temecula Standard Number 800.

d. Concrete sidewalks and ramps shall be constructed along public street frontages in accordance with City of Temecula Standard Number. 400.

e. Improvement plans shall extend 300 feet beyond the project boundaries.

f. Minimum centerline radii shall be in accordance with City of Temecula Standard Number 113.

g. All curves shall include a 100-foot minimum tangent section.

h. All street and driveway center line intersections shall be at 90 degrees.

i. Public street improvement plans shall include plans and profiles showing existing topography, utilities, proposed centerline, top of curb and flowline grades.

j. Landscaping shall be limited in the corner cut-off area of all intersections and adjacent to driveways to provide for minimum sight distance and visibility.

k. All concentrated drainage directed towards the public street shall be conveyed through under sidewalk drains.

PW-29. The developer shall construct all public improvements outlined in these conditions to City of Temecula General Plan standards unless otherwise noted. Plans shall be reviewed and approved by the Department of Public Works.

PW-30. Improve (Urban Arterial (8–10 lanes divided) Highway Standard No. 100B–134'/150' R/W) to include dedication of half-width street right-of-way, installation of half-width street improvements, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping, utilities (including but not limited to water and sewer), and raised landscaped median.

PW-31. Improve (Urban Arterial (6 lanes divided) Highway Standard No. 100A–134' R/W) to include dedication of half-width street right-of-way, installation of half-width street improvements, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping, utilities (including but not limited to water and sewer), and raised landscaped median.

PW-32. Improve (Principal Arterial (6 lanes divided) Highway Standard No. 100–110' R/W) to include dedication of half-width street right-of-way, installation of half-width street improvements, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping, utilities (including but not limited to water and sewer), and raised landscaped median.

PW-33. Improve (Major Arterial (4 lanes divided) Highway Standard No. 101–100' R/W) to include dedication of half-width street right-of-way, installation of half-width street improvements, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping, utilities (including but not limited to water and sewer), and raised landscaped median.

PW-34. Improve (Secondary Arterial (4 lanes undivided) Highway Standard No. 102–88' R/W) to include dedication of half-width street right-of-way, installation of half-width street improvements, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping and utilities (including but not limited to water and sewer).

PW-35. Improve (Industrial Collector (2 lanes divided) Highway Standard No. 102B–78' R/W) to include dedication of half-width street right-of-way plus six feet, installation of half-width street improvements plus six feet, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping and utilities (including but not limited to water and sewer).

PW-36. Improve (Residential Collector (2 lanes undivided) Road Standard No. 103A–66' R/W) to include dedication of half-width street right-of-way plus twelve feet, installation of half-width street improvements plus twelve feet, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing and striping, and utilities (including but not limited to water and sewer).

PW-37. Improve (General Local Street Standard No. 104–60' R/W) to include dedication of half-width street right-of-way plus twelve feet, installation of half-width street improvements plus twelve feet, paving, curb and gutter, sidewalk, streetlights, drainage facilities, signing, striping and utilities (including but not limited to water and sewer).

PW-38. The developer shall design and construct or provide an in lieu of construction fee for half width raised landscape median on (Urban Arterial Highway Standards–134' R/W), (Principal Arterial Highway Standards–110' R/W), (Major Arterial Highway Standards–100' R/W) from to (along property frontage). Plans shall be reviewed and approved by the Department of Public Works.

PW-39. Install a traffic signal at the intersection of and to include signal interconnect with the signal(s) at the intersection(s) of and .

PW-40. A School Zone signing and striping plan per Caltrans' standards, shall be designed by a registered engineer for the school site within this project and included with the street improvement plans for the project. Designs shall also include a warrant analysis for a flashing yellow beacon and if warrants are met, shall be installed by the developer.

PW-41. All street improvement designs shall provide adequate right-of-way and pavement transitions per Caltrans' standards for transition to existing street sections.

PW-42. The developer shall construct all public improvements in conformance with applicable City Standards and subject to approval by the Department of Public Works including street improvements, which may include, but not limited to, pavement, curb and gutter, median, sidewalk, drive approaches; streetlights, signing, striping, traffic signal systems, other traffic control devices as appropriate; sewer and domestic water systems; under grounding of proposed utility distribution lines; and storm drain facilities.

PW-43. The developer shall vacate and dedicate the abutters rights of access along pursuant to the new location of the driveway.

PW-44. A construction area Traffic Control Plan shall be designed by a registered civil or traffic engineer and reviewed by the Department of Public Works for any street closure and detour or other disruption to traffic circulation as required by the Department of Public Works.

PW-45. A Signing and Striping Plan shall be designed by a registered civil engineer approved by the Department of Public Works for .

PW-46. Bus bays will be designed at all existing and proposed bus stops as directed by Riverside Transit Agency and approved by the Department of Public Works.

PW-47. All access rights, easements for sidewalks for public uses shall be submitted and reviewed by the Department of Public Works and City Attorney and approved by City Council for dedication of the City where sidewalks meander through private property.

PW-48. The building pad shall be certified to have been substantially constructed in accordance with the approved Precise Grading Plan by a registered civil engineer, and the soil engineer shall issue a Final Soil Report addressing compaction and site conditions.

PW-49. This developer must enter into an agreement with the City for a "Trip Reduction Plan" in accordance with Ordinance Number 93-01.

PW-50. The developer shall obtain an easement for ingress and egress over the adjacent property.

PW-51. The developer shall pay to the City the Public Facilities Development Impact Fee as required by, and in accordance with, Chapter 15.06 of the Temecula Municipal Code and all Resolutions implementing Chapter 15.06.

PW-52. The developer shall record a written offer to participate in, and waive all rights to object to the formation of an Assessment District, a Community Facilities District, or a Bridge and Major Thoroughfare Fee District for the construction of the proposed Western Bypass Corridor in accordance with the General Plan. The form of the offer shall be subject to the approval of the City Engineer and City Attorney.

PW-53. The developer shall pay to the City the Western Riverside County Transportation Uniform Mitigation Fee (TUMF) Program as required by, and in accordance with, Chapter 15.08 of the Temecula Municipal Code and all Resolutions implementing Chapter 15.08.

Prior to Issuance of Certificate of Occupancy

PW-54. The project shall submit a completed WQMP Operation and Maintenance (O&M) Agreement that must include the owner's notarized signature, proof of recordation with the County Recorder's Office, and all maintenance procedures for each of the structural treatment control Best Management Practices (BMPs) outlined in the WQMP.

PW-55. The project shall demonstrate that the structural treatment control BMPs outlined in the Water Quality Management Plan (WQMP) have been constructed and installed in conformance with approved plans and are ready for immediate implementation.

PW-56. As deemed necessary by the Department of Public Works the developer shall receive written clearance from Rancho California Water District, Eastern Municipal Water District, or other affected agencies.

PW-57. Corner property line cut off shall be required per City of Temecula Standard No. 603A.

PW-58. All public improvements, including traffic signals, shall be constructed and completed per the approved plans and City standards to the satisfaction of the Department of Public Works.

PW-59. The existing improvements shall be reviewed. Any appurtenance damaged or broken shall be repaired or removed and replaced to the satisfaction of the Department of Public Works.

PW-60. All necessary certifications and clearances from engineers, utility companies and public agencies shall be submitted as required by the Department of Public Works.

NPDES Construction Inspection Notice

PUBLC WORKS DEPARTMENT
LAND DEVELOPMENT DIVISION

EROSION & SEDIMENT CONTROL NOTES

1. These notes are comprehensive and should be applied according to site-specific conditions. **Year-round** pollution prevention measures, also known as Best Management Practices (BMP's), must be installed prior to any field activities. Additional erosion prevention and sediment controls must be installed and maintained prior to and throughout each rainy season. The developer/contractor is responsible for erosion and sediment controls throughout the duration of the project for all clearing, disking, grading, excavating and stockpiling activities, and on all exposed slopes and inactive pads throughout the entire site. The developer/contractor is also responsible for any discharges from subcontractors.

2. All runoff shall be filtered prior to discharging from a site or to any type of private or public storm water conveyance system (natural watercourses, streets, gutters, concrete-lined v-ditches, storm drains, flow-lines, inlets, outlets, etc.). All non-permitted discharges are prohibited from entering any storm water conveyance system year-round.

3. If the project will disturb, expose or stockpile one (1) acre or more of soil, the site must be covered under the State General Construction Permit. A Waste Discharge Identification (WDID) Number and risk level determination shall be provided to the City prior to issuance of a grading permit, and a Storm Water Pollution Prevention Plan (SWPPP) shall be implemented throughout the duration of the project. The SWPPP shall be readily available to City and State inspectors and updated to reflect current site conditions during construction. The construction permit can be downloaded at www.waterboards.ca.gov/water_issues/programs/stormwater construction. BMP handbooks can be downloaded at www.cabmphandbooks.com.

4. Additional erosion and sediment control materials shall be stockpiled at various locations throughout the site for immediate implementation within seven (7) days prior to any forecasted rain. The developer/contractor shall make available equipment and workers for emergency work to protect the site.

5. Perimeter protection must be installed prior to any clearing activities. Clearing shall be limited to areas that will be immediately graded or disturbed. A combination of erosion and sediment controls shall be implemented in areas that have been cleared. All disturbed areas of an inactive site, as described in of the Grading Manual, shall also be protected.

6. All erosion and sediment controls shall be inspected, restored, repaired or modified year-round throughout the site to protect perimeters, adjacent properties, environmentally sensitive areas, and all private and public storm water conveyance systems. If any erosion or sediment controls fail during any rain event, more effective ones will be required in their place.

7. Erosion controls shall include, but are not limited to, applying and establishing vegetative cover, wood mulch, stapled or pinned blankets (straw, coconut or other), plastic sheeting (minimum 10-mil), polypropylene mats, spray-on controls to all disturbed areas, or other measures approved by the City Engineer. Jute netting shall not be used as a stand-alone erosion control. For slopes greater than 4:1, provide fiber rolls and either a bonded fiber matrix product applied to a rate of 3500 lb/acre or a stabilized fiber matrix product applied to a rate of 10 gal/acre. The City may approve different application rates for slopes less than 4:1.

8. Sediment controls shall include, but are not limited to, desilting basins, graded berms, fiber rolls, silt fences, gravel bag chevrons (filled with minimum ¾" gravel), check dams, drainage inlet protection, etc. Fiber rolls shall be installed in 15 foot (15') increments measured along on the face of the slope. Silt fence shall be installed along interior streets and combined with gravel-bag or silt fence chevrons inside the sidewalk right-of-way or back of curbs.

9. All onsite and offsite flow lines (v-ditches, brow-ditches, terrace drains, ribbon gutters, curb gutters, etc.), storm water conveyance systems, check dams, chevrons, silt fences and desilting basins shall be free of sediment, construction materials, waste, miscellaneous debris, and deteriorated erosion and sediment controls **year-round**.

10. Construction waste and miscellaneous debris shall be placed in water-tight bins. Wire mesh receptacles will not be allowed. Wash-out stations shall be provided for concrete, paints, stucco, and other liquid waste and shall be lined with plastic and located away from streets, sidewalks, right-of-ways, flow-lines, etc. Prior to any forecasted rain, bins and wash-outs shall be covered with a lid or plastic tarp.
11. Construction access points shall be stabilized with a combination of rock and shaker plates year-round to prevent track-out. Interior access points (all proposed driveways, material storage and staging area entrances/exits, etc.) shall also be protected with rock to prevent track-out onto interior streets. Routine street sweeping shall be performed on all paved streets where tracking is observed. Vacuum sweepers shall be used when street sweeping becomes ineffective. Controlled street washing will only be allowed prior to the application of asphalt seal coats, and only when all pertinent drainage inlets are protected.
12. Desilting basins shall be designed according to the guidance provided in CASQA's construction BMP handbook.
13. Storm water runoff shall not be directed over any slopes without permanent down drains installed. Erosion and sediment controls are required on all exposed slopes until sufficient permanent landscaping has been established. 100% slope protection must be in place prior to the issuance of a certificate of occupancy.
14. Material storage and staging areas shall be established. Fuel tanks, portable toilets, liquids, gels and powders shall be stored away from all private / public storm water conveyance systems, sidewalks, right-of-ways and flow-lines and shall have secondary containment. Inactive stockpiles of soil shall be covered at all times. Active stockpiles shall be covered prior to a forecasted rain.
15. All portable mixers shall have plastic liners underneath with gravel-bags placed on the down-hill side of the liners to contain discharges.
16. Impounded water shall be secured from the public. Signage indicating "Ponded Water-Do Not Enter" shall be posted.
17. No obstructions, other than BMP's, shall be allowed within any storm water conveyance system, unless alternative drainage facilities have been approved by the City Engineer.

August 22, 2011

To: Project Developers, Property Owners, Project Managers, Field Superintendents, and Contractors.

RE: Requirements for Construction Projects.

The City of Temecula is requiring **year-round pollution prevention measures,** also known as Best Management Practices (BMPs), at every active and inactive construction site throughout the City. You are responsible for preventing pollutants at your site from reaching any type of storm water conveyance system (gutters, streets, flow lines, inlets, ditches, storm drains, natural drainage courses, creeks) or neighboring properties at all times. This is especially important between **October 1st and April 30th**, when you are required to **upgrade your Wet-Weather BMPs (erosion control measures)**.

Compliance with the **State's Construction General Permit (CGP)** is also required if your project disturbs, exposes, clears, grades, or stockpiles one acre or more of soil. Proof of a Waste Discharge Identification (WDID) Number and Risk Level Determination must be provided to the City. A Storm Water Pollution Prevention Plan (SWPPP) must be onsite at all times, updated frequently, and readily available to City and State inspectors.

At a minimum, the following requirements must be implemented:

- The City shall be notified if your project becomes inactive, or if portions within your project become inactive, or if construction activities cease for seven (7) consecutive calendar days. Inactivity will require: 1) the submittal of a BMP implementation plan to the City demonstrating current conditions and proposed compliance during the period of inactivity, and 2) establishment of 100% vegetative coverage as the primary erosion control on all inactive areas of the project.
- All storm water conveyance systems, check dams, chevrons, silt fences, temporary desilting basins, etc. shall be free of sediment, construction materials, waste, miscellaneous debris, and deteriorated BMPs;
- Waste and debris shall be placed in water-tight trash bins, and covered with a solid lid or plastic tarp prior to any forecasted rain;

- Additional BMPs shall be stockpiled throughout your site for immediate implementation prior to any forecasted rain;
- Wash-out stations shall be provided for concrete, paints, stucco, etc. These stations shall be water-tight and located away from streets, sidewalks, flow lines, and drainage inlets;
- Portable toilets shall have secondary containment and be placed away from streets, sidewalks, flowlines, and drainage inlets;
- Construction access locations shall implement a combination of rock and shaker plates. Interior access points (driveways, staging areas, etc.) shall also be protected with rock;
- All completed slopes and inactive pads shall have a combination of erosion and sediment control BMPs;
- All portable mixers shall have plastic liners underneath with gravel bags placed on the down-hill side of the liners to contain discharges;
- Street sweeping shall be performed on all paved areas, at all construction exits, during hauling operations, and on all haul route streets on a regular basis. Vacuum sweepers shall be used when street sweeping becomes ineffective;
- Water shall be filtered and drained from basins within 72-hours of collection;
- ESC plans and Standard ESC Notes must be adhered to at all times;
- The project developer is responsible for discharges from all contractors, landscapers, and other personnel working at the site.

City inspectors will begin conducting Wet-Weather inspections by **October 1st** at each site. Failure to implement wet-weather BMPs in addition to year-round BMPs will result in citations, Stop Work notices, suspension of business licenses, withholding of occupancies, and case referrals to the San Diego Regional Water Quality Control Board. If existing BMPs are inadequate, more effective BMPs will be required.

Please call me at (951) 308-6387 if you have any questions regarding this information.

Sincerely,

Aldo Licitra

C. BEST MANAGEMENT PRACTICES (BMP) ASSESSMENT:

		N/A	Yes	No	Comments
C.1	**General Areas**				
a.	Is the site free of evidence of unauthorized releases?				
b.	Is the site free of evidence of illicit connections?				
c.	Are onsite inlets and flowlines free of dirt, litter, stains, other material?				
d.	Are onsite inlets and flowlines protected from unauthorized releases?				
e.	Is washwater from all cleaning activities disposed properly? Where to?				
f.	Are biodegradable soaps used? Specify activity.				
g.	Is roof water drained to parking lot / landscaping?				
C.2	**Landscaped Areas**				
a.	Are adequate erosion prevention measures employed? (vegetation or physical stabilization)				
b.	Are irrigation systems programmed to minimize over-watering and runoff?				
c.	Are inlets or flowlines free of landscape waste (tree or shrub trimmings, grass clippings, etc)?				
d.	Is landscape material (fertilizers, pesticides, etc) stored onsite and/or protected by runoff?				
C.3	**Materials and Wastes Areas**				
a.	Are all materials and activities protected from exposure to stormwater?				
b.	Are adequate trash containers provided? (covered, no leaks) Are these areas free of litter and stains?				
c.	Are adequate recycling containers provided? (covered, no leaks) Are these areas free of litter and stains?				
d.	Is service provided to prevent trash and recycling containers from overflowing?

1. CHEMICAL STORAGE * The outside storage area is kept secure to minimize the possibility of a release. Chemicals / materials are protected from precipitation / stormwater runoff and the containers show no signs of leaking.			
2. DUMPSTER * Lid closed. No liquids are leaking from dumpster; surrounding area is free of trash.			
3. ABOVEGROUND TANKS * No ground staining, no spillage observed and no discharge to storm drain. Tanks are maintained to minimize the possibility of a release (secondary containment).			
4. ONSITE STORM DRAIN* Protected from accidental discharge other than stormwater.			
5. POWER WASH OR STEAM CLEAN* (discharge to sewer) Drains to oil/water separator connected to a sanitary sewer and not a septic system or storm drain. Steam cleaning not discharged to parking lot, storm drain or soil.			
6. PARKING LOT / DRIVEWAY* Free of excess trash, chemical staining or liquids other than water.			
7. OTHER* Non-storm water discharge (i.e. non-hazardous process discharge).			
8. MOP WATER TO SANITARY SEWER VIA CLARIFIER. Mop water is not dumped to the soil, parking lot, gutter, street, or other areas susceptible to storm water runoff and discharge to the storm drain.			
9. STORM WATER EDUCATIONAL BROCHURES GIVEN TO FACILITY OR POSTERS DISPLAYED FOR EMPLOYEES. If no, what informational material should be sent to the facility?			
10. IF A SWPPP IS REQUIRED, WAS IT AVAILABLE FOR REVIEW? See storm water handout for industrial facilities.			
11. NOTICE OF INTENT. Has the site obtained necessary permit coverage under the General Industrial Permit, if appropriate?

Dan York
Director of Public Works

[Note: per Attachment B: Standard Provisions, Reporting Requirements and Notifications, provision 5.(b)(2) of the 2010 SMR MS4 Permit: [Applications [40CFR 122.22(a)(3)] All permit applications shall be signed by either a principal executive officer or ranking elected official.]

I. EXECUTIVE SUMMARY

This Annual Report describes the storm water management program for the City of Wildomar (City) Fiscal Year 2013/2014, July 1, 2013 through June 30, 2014. This Annual Report is intended to document the programs the City has implemented to comply with the requirements of the municipal separate storm sewer system permit (MS4 Permit) issued to the Santa Margarita Watershed Permittees by the San Diego Regional Water Quality Control board on July 14, 2004. The City did not incorporate until July 1, 2008, so it was not a permittee at the time the MS4 Permit was issued.

The City has a population of 32,176 people (as of 2010)[1] and encompasses approximately 23.7 square miles, with 31% draining to the Santa Ana River Watershed, and 69% draining to the Santa Margarita River Watershed. In 2010, the City requested that the San Diego Regional Water Quality Control Board be named as the regulator for all portions of the city including those portions in the Santa Ana River Watershed. This request was approved by the Regional Water Quality Control Board in a letter dated September 28, 2010.

During the reporting period, the City reviewed and approved for entitlement two priority development projects requiring project specific Water Quality Management Plans (WQMP). The City also reviewed and approved three priority development projects for construction and/or grading activities and accepted their WQMPs. The entitlement projects reviewed and approved include a 10-lot single family residential development (TTM 36519/PA 12-0392) and a 7-parcel commercial/retail development (TPM 30522/PA 10-0301). The projects reviewed and approved for construction include an 84-lot single family residential development (TTM 32535/Project 13-0058), a 102-lot single family residential development (TTM 25122/Project 13-0030), and a single parcel commercial/retail development (PP 10-0222/Project 13-0109). Two of the three projects approved for construction were issued grading permits and commenced grading activities during the reporting period. Other projects were also under review for entitlement approval or construction approval but did not receive approval during the reporting period. The City also conducted inspections for thirteen (13) construction project sites, ten (10) of which were active.

The City swept a total of 2,575.44 [2] curb miles of streets and cleaned 278 catch basins, preventing 489 cubic feet of debris (catch basins: including soil, vegetation, and litter) plus 135.05 tons (street sweeping) from reaching the MS4 outfalls. The City inspected construction sites during the reporting period according to the schedule set forth in the City's MS4 permit and issued several written warnings to developers. No high level enforcement actions were taken by the City. The State Water Resources and Quality Control Board (SWRQCB) performed several inspections within the City's jurisdiction during the reporting period and issued Notices of Violations to developers within the City. The City performed one (1) Industrial and Commercial inspection during the reporting period. The County performed three (3) Industrial and Commercial inspections within the City's jurisdiction during the reporting period. The City also responded to five (5) IC/ID incidents and followed-up accordingly.

The City participated in two (2) community events at which public information booths were present for stormwater pollution prevention education. The City's three (3) parks re-opened during the reporting period, after being closed for several years. The City has assessed the parks' post-construction BMPs and has budgeted to repair the BMPs to ensure that they are functional and effective.

I. EXECUTIVE SUMMARY

As the City continues to see development and growth, staff is continuing to assess and update the stormwater management program to improve the City's monitoring and program implementation.

[1] http://quickfacts.census.gov/qfd/states/06/0685446.html

[2] Sweeping only includes County Service Area (CSA) sweeping and street sweeping by CR&R Environmental Services. Value does not include street sweeping performed by franchise agreement with Waste Management.

II. INTRODUCTION

The City of Wildomar (City) is located primarily within the Santa Margarita River Watershed (SMR), with portions of the City located within and draining into the Santa Ana River Watershed (SAR). The City incorporated in July 2008 and in 2010, the City requested that the San Diego Regional Water Quality Control Board be named as the regulator for all portions of the city including those portions in the Santa Ana River Watershed. This request was approved by the Regional Water Quality Control Board in a letter dated September 28, 2010. The City's storm water management (NPDES) program is administered by the Public Works and Engineering Department. The Public Works and Engineering Department manages and administers the NPDES program as specified in the City's Jurisdictional Runoff Management Plan (JRMP) and in compliance with the MS4 Permit. The program implementation is addressed through items such as development planning, construction inspections, municipal facility management, industrial and commercial inspections, residential outreach and response, illicit discharge detection and elimination, and SMR Workplan participation. The remainder of this report provides details regarding the City's implementation of the NPDES program during the reporting period (FY 2013-2014).

1. DEVELOPMENT PLANNING
(SECTION F.1. of ORDER NO. R9-2010-0016)

New Development

1) General Plan/Environmental Review K.3.c.(4)1

a) Description of any amendments/updates to the General Plan as required by Section F.1.a. of the 2010 SMR MS4 Permit:
There were no updates to the City's General Plan during the reporting period. The City is currently working on its General Plan update. Adoption of the update is expected to occur during the first quarter of 2015. The General Plan includes policies which encourage water conservation, runoff reduction (by reduction of impervious areas), drought-resistant landscaping, educational outreach, minimization of pollutant discharges, incorporation of natural drainage systems in developments, and on-site or near-site stormwater retention. The updates also include provisions for establishing and maintaining regulations regarding water preservation.

b) Description of any amendments/updates to the environmental review process as required by Section F.1.b. of the 2010 SMR MS4 Permit.
The development environmental review process is managed by the State. City staff and consultant staff review projects accordingly. The City routinely requires EIRs to be prepared for development projects.

c) Description of any planned updates to the General Plan or the environmental review process within the next Annual Reporting period as required by Sections F.1.a.&b of the 2010 SMR MS4 Permit.
The City is currently working on its General Plan update. Adoption of the update is expected to occur during the first quarter of 2015. The General Plan includes policies which encourage water conservation, runoff reduction (by reduction of impervious areas), drought-resistant landscaping, educational outreach, minimizing pollutant discharges, incorporation of natural drainage systems in developments, and on-site or near-site stormwater retention. The updates include provisions for establishing and maintaining regulations regarding water preservation.

The City also anticipates developing its own local CEQA guidelines in the coming year.

2) SSMP status as required under Section F.1.d. of the 2010 SMR MS4 Permit K.3.c.(4)2.

The Santa Margarita Copermittees submitted a SSMP (Water Quality Management Plan (WQMP) to the Regional Water Quality Control Board (RWQCB) in June 2012. A letter of "Conditional Finding of Adequacy" from the RWQCB was received on September 16, 2013. The Copermittees resubmitted the SSMP and received Conditional Approval on May 12, 2014. The new SSMP became effective on July 11, 2014.

Description of all revisions to the SSMP, including where applicable:

a) Identification and summary of where the SSMP fails to meet the requirements of the 2010 SMR MS4 Permit as required under Section F.1.d. of the 2010 SMR MS4 Permit:
The 2014 Model SSMP/WQMP complies with the 2010 SMR MS4 Permit and received

Conditional Approval from the RWQCB on May 12, 2014. The SSMP became effective on July 11, 2014.

b) Updated procedures for identifying Pollutants of Concern for each Priority Development Project as required under Section F.1.d.(3) of the 2010 SMR MS4 Permit:

The new (2014) SMR WQMP (SSMP), approved by the RWQCB on April 8, 2014, sets forth the following procedures for developers to identify Pollutants for Concern for Priority Development Projects (PDP):

1. Identify Receiving Waters – Use the most recent version of the Water Quality Control Plan for the in the San Diego Region Basin to determine the PDPs proximate Receiving Waters. This information can be accessed from the following site:
    a. http://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/
2. Identify Impairments in those Receiving Waters by Reviewing:
the 303(d) listings for all downstream Receiving Waters:
    a. http://waterboards.ca.gov/santaana/water_issues/programs/tmdl/303d.shtml
and any Pollutants being addressed by an adopted TMDL:
    b. http://waterboards.ca.gov/santaana/water_issues/programs/tmdl/
3. Identify Pollutants associated with your site/project - This includes legacy Pollutants that may be present on the project site, as well as Pollutants that are listed for the category of development on [the table] below. That table may be updated by the Copermittees periodically based on updated studies and information. Updates will be reported in the JRMP Annual Report to the San Diego Regional Board submitted by the Copermittee with Jurisdiction over the project site, and reflected in an update to this WQMP.

1. DEVELOPMENT PLANNING
(SECTION F.1. of ORDER NO. R9-2010-0016), CONT

Priority Development Project Categories and/or Project Features (check those that apply)	General Pollutant Categories							
	Bacterial Indicators	**Metals**	**Nutrients**	**Pesticides**	**Toxic Organic Compounds**	**Sediments**	**Trash & Debris**	**Oil & Grease**
Detached Residential Development	P	N	P	P	N	P	P	P
Attached Residential Development	P	N	P	P	N	P	P	P[(2)]
Commercial/Industrial Development	P[(3)]	P	P[(1)]	P[(1)]	P[(5)]	P[(1)]	P	P
Automotive Repair Shops	N	P	N	N	P[(4, 5)]	N	P	P
Restaurants (>5,000 ft^2)	P	N	N	N	N	N	P	P
Hillside Development (>5,000 ft^2)	P	N	P	P	N	P	P	P
Parking Lots (>5,000 ft^2)	P[(6)]	P	P[(1)]	P[(1)]	P[(4)]	P[(1)]	P	P
Retail Gasoline Outlets	N	P	N	N	P	N	P	P

P = Potential

N = Not Potential

(1) A potential Pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected

(2) A potential Pollutant if the project includes uncovered parking areas; otherwise not expected

(3) A potential Pollutant is land use involving animal waste

(4) Specifically petroleum hydrocarbons

(5) Specifically solvents

(6) Bacterial indicators are routinely detected in pavement runoff

c) Updated Treatment Control BMP ranking matrix as required by Section F.1.d.(6)(b)(i) of the 2010 SMR MS4 Permit:
The new Model WQMP (SSMP) approved by the RWQCB includes a BMP Selection Matrix that prioritizes LID BMPs in this order: Harvest and Use, Infiltration, Permeable Pavement, Bioretention, and Biotreatment.

d) Updated site design and Treatment Control BMP design standards as required by Sections F.1.d.(4)(c)(i) and F.1.d.(6)(b)(ii) of the 2010 SMR MS4 Permit.
The new Model WQMP (SSMP) approved by the RWQCB includes updated BMP design standards.

3) Priority Development Projects K.3.c.(4)3

a) The City of Wildomar reviewed and approved five (5) Priority Development Projects during the reporting period. The projects include:
   i. Entitlement Approval:

a. 10-lot Single Family Residential Subdivision (TTM 36519/PA 12-0392)
b. 7-parcel Commercial/Retail Development (TPM 30552/PA 10-0301)

ii. Grading/WQMP Approval/Acceptance:
a. Commercial-Retail Center (PP 10-0222/Project 13-0109)
- *Grading and Improvement Plan Approval, WQMP Acceptance*

b. 84-lot Single Family Residential Subdivision (TTM 32535/PA 13-0078)
- *Grading and Improvement Plan Approval, WQMP Acceptance*

c. 102-lot Single Family Residential Subdivision (TTM 25122/PA 13-0120)
- *Grading Plan Approval, WQMP Acceptance*

b) The following LID and Source Control BMPs were required as applicable approved Priority Development Projects as required by the 2010 SMR MS4 Permit:

Reference	LID BMP Requirements
F.1c.(2)(a)	**Conserve natural areas, including existing trees, other native vegetation, and soils.**
F.1c.(2)(b)	**Construct streets, sidewalks, or parking lots aisles to the minimum widths necessary, provided that public safety is not compromised.**
F.1c.(2)(c)	**Minimize the impervious footprint of the project**
F.1c.(2)(d)	**Minimize soil compaction to landscaped areas**
F.1c.(2)(e)	**Minimize disturbances to natural drainages**
F.1c.(2)(f)	**Disconnect impervious surfaces through distributed pervious areas**
F.1c.(2)(b)(i)	**Maintain or restore natural storage reservoirs and drainage corridors (including depressions, areas of permeable soils, swales, and ephemeral and intermittent streams)**
F.1c.(2)(b)(ii)	**Construct pervious areas to effectively receive and infiltrate, retain and/or treat Runoff from Pervious areas, and to minimize soil compaction in these areas**
F.1c.(2)(b)(iii)	**Construct low-traffic areas with permeable surfaces, where appropriate soil conditions exist**
F.1c.(2)(c)(i)	**Structural Infiltration BMPs**
F.1c.(2)(c)(i)	**Structural Harvest and Use BMPs**
F.1c.(2)(c)(ii)	**Structural Bioretention BMPs**

	Source Control BMP Requirements
F.1.d.(5)(a)	**Prevent illicit discharges into the MS4**
F.1.d.(5)(b)	**Minimize storm water pollutants of concern in runoff**
F.1.d.(5)(c)	**Eliminate irrigation runoff**
F.1.d.(5)(d)	**Include storm drain system stenciling or signage**
F.1.d.(5)(e)	**Include properly designed outdoor material storage areas**
F.1.d.(5)(f)	**Include properly designed outdoor work areas**
F.1.d.(5)(g)	**Include properly designed trash storage areas**
F.1.d.(5)(h)	**Include water quality protection requirements applicable to individual priority project categories**

c) The following process was implemented to verify that Site Design, Source Control, and Treatment Control BMPs were required on all applicable Priority Development Projects as required under Section F.1.d.(9) of the 2010 SMR MS4 Permit:

All project applications submitted to the Planning Department are routed to the Engineering Department for review and comment prior to project conditioning and/or approval. The application packet includes a WQMP Applicability Checklist to inform the applicant of whether or not a WQMP (SSMP) will be required. The Engineering Department is responsible for reviewing the applications, confirming if the project is a Priority Development Project and a WQMP is required, and reviewing WQMPs for compliance with the MS4 Permit during entitlement review and grading and improvement plan review. During this year, the 2014 Model WQMP was not approved until April and was not enforced until July 2014. Consequently, projects during the reporting period were reviewed for compliance with the 2004 MS4 Permit.

4) Following are the names and locations of all Priority Development Projects that were granted a waiver from implementing LID BMPs pursuant to Section F.1.d.(4) of the 2010 SMR MS4 Permit K.3.c.(4)4:

None

5) Treatment Control BMPs K.3.c.(4)5

a) A current copy of the City of Wildomar's BMP maintenance tracking database of approved Treatment Control BMPs and Treatment Control BMP maintenance required under F.1.f.(1) of the 2010 SMR MS4 Permit is attached (Attachment B). This database includes an identification of all high-priority Priority Development Projects that have a final approved Project-Specific WQMP and their structural post-construction BMPs implemented since July 2005.

Please note, this database is being updated and may not include all approved and constructed post-construction BMPs.

b) The City of Wildomar verifies that the following structural post-construction BMPs on the inventoried WQMP projects have been implemented, are maintained, and are operating effectively through inspections, self-certifications, surveys, or other equally effective approaches as required under the 2010 SMR MS4 Permit:

Reference	LID BMP Requirements
F.1c.(2)(a)	**The implementation, operation, and maintenance of all (100 percent) approved and inventoried final public and private Project-Specific WQMPs are verified every five years**
F.1c.(2)(b)	**All (100 percent) projects with BMPs that are high priority are issued self-**

	certification letters annually[a][b].
F.1c.(2)(c)	**All (100 percent) of the Priority Development Projects with BMPs are issued self-certification letters annually[a][b].**
F.1c.(2)(d)	**As appropriate, the City of Wildomar coordinates its inspections with the facility inspections implemented pursuant to Section F.3 of the 2010 SMR MS4 Permit**
F.1c.(2)(e)	**For verifications performed through a means other than direct inspection by the City of Wildomar, adequate documentation is required to provide assurance that the required maintenance has been completed**
F.1c.(2)(f)	**Appropriate follow-up measures (including re-inspections, enforcement, maintenance. Etc.) are conducted to ensure the Treatment Control BMPs continue to reduce Storm Water Pollutants as originally designed**
F.1c.(2)(b)(i)	**Inspections note observations of vector conditions, such as mosquitoes. Where conditions are identified as contributing to mosquito production, the City of Wildomar notifies its local vector control agency.**

[a] The City issued self-certification letters for owners/responsible parties of facilities with post-construction BMPs. Four (4) of seven (7) total owners responded. Only one (1) owner addressed the development's post-construction BMPs. This owner performed maintenance on the BMPs appropriately to correct violations.
[b] The City implements self-certifications as a method to ensure that post-construction BMPs are maintained. City inspections for post-construction BMP facilities will be scheduled under the City's Stormwater Facilities BMP Maintenance Agreement, an agreement which is part of Project WQMPs, or as the City receives business registrations for those business, facilities, or entities who are legally responsible for post-construction BMPs.

6) The following Priority Development Projects have been required to implement hydrologic control measures to protect downstream Beneficial Uses and prevent adverse physical changes to downstream channels in compliance with Section F.1.h of the 2010 SMR MS4 Permit K.3.c.(4)6:

Name	Location	Planned Management Measures
TTM 36519/PA 12-0392 **Lesle Tract Map** **10-lot Single Family Residential Subdivision**	34915 Orange St. Wildomar, CA Sedco Tract 1, Lot 48	Infiltration Trenches to mitigate excess post-development runoff volumes. *Note: Final WQMP currently in plan review.*
TPM 30522/PA 10-0301 Bundy at Orange Commercial Site	SEC Bundy Canyon Road at Orange Street	Sand Filter Basin

1. DEVELOPMENT PLANNING
(SECTION F.1. of ORDER NO. R9-2010-0016), CONT

TTM 32535/Project 13-0058 **North Ranch** **81-lot Single Family Residential Subdivision**	North of the intersection of Clinton Keith Rd. and Stable Lanes Rd.	Infiltration Basin Detention Basin Catch Basin Inlet Filter *Note: BMPs are not specifically for HCOC* *Note: Under construction*
TTM 25122/Project 13-0030 **Rancho Fortunado I** **102-lot Single Family Residential Subdivision**	SWC of the intersection of Palomar St. and McVicar Sr.	Three (3) detention basins Filterra units Catch Basin Inlet Filters *Note: BMPs are not specifically for HCOC* *Note: Under construction*
PP 10-0222/Project 13-0109 **Plaza de Bundy Canyon** **Commercial/Retail Development**	21940 Bundy Canyon Rd. Wildomar, CA 92595	Underground Infiltration Basin Two (2) Bio-Swales *Note: BMPs are not specifically for HCOC* *Note: Under construction*

7) The following table provides a description of all activities related to the enforcement of the Stormwater Ordinance in New Development and Redevelopment Projects in the City of Wildomar's jurisdiction as required under Section F.1.g. of the 2010 SMR MS4 Permit during the reporting period and a summary of the effectiveness of the enforcement activities K.3.c.(4)7:

Violation	Project Name & Address	Enforcement Action	Effectiveness
BMPs Not Maintained	**Anne Sullivan Nursery School** 21776 Palomar St. Wildomar, CA 92595	Education and Warning	Result: Good Maintenance was performed on BMPs

2. CONSTRUCTION
SECTION F.2. of ORDER NO. R9-2010-0016)

1) **Ordinances K.3.c.(4)1**

   a) **Describe updated relevant ordinances as required under Section F.2.a. of the 2010 SMR MS4 Permit**

   The City did not update any ordinances related to construction BMPs during the reporting period. The City adopted the 2013 California Building Code (CBC) which includes provisions regarding slope protection. The 2013 CBC can be located online at http://www.bsc.ca.gov/codes.aspx. The 2013 CBC is adopted by reference as set forth in Chapter 15.12.010 of the City's Municipal Code (Attachment C) (http://qcode.us/codes/wildomar/view.php?topic=15-15_12-15_12_010&frames=on).

   b) **Describe planned ordinance updates within the next Annual Reporting period, if applicable**

   The City is in the process of updating its stormwater ordinances to ensure compliance with the 2010 SMR MS4 Permit. The updated ordinances are anticipated to be adopted by City Council during FY 2014-2015.

2) **Describe any changes to procedures used for identifying priorities for inspecting sites and enforcing control measures that consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality as required by Section F.2.e of the 2010 SMR MS4 Permit K.3.c.(4)2.**

The City inspects construction sites based on the 2010 SMR MS4 Permit's schedule:

1. Rainy Season (October – May):
   a. Sites 30 acres or larger – every two weeks
   b. Sites less than 30 acres but larger than 1 acre – every month
   c. Sites less than 1 acre – as needed
2. Dry Season:
   a. All sites – as needed

3) **Describe any changes to the designated minimum and enhanced BMPs as described in Section F.2.d.(1) of the 2010 SMR MS4 Permit K.3.c.(4)3:**

There were no changes to the minimum and enhanced BMPs during this reporting period.

4) **Summarize the finding of the Construction Inspection Program specified in Section F.2.e. of the 2010 MS4 Permit K.3.c.(4)4:**

   a) **Total number and date of inspection conducted at each Construction Site**

   93 - Construction Inspections

   b) **Number, date, and types of enforcement actions by Construction Site**

   Due to the large number of inspections performed, the inspection dates are not included

herein. Inspection dates and details are included in Attachment D.

Rainy Season Inspections:

29 inspections – In compliance/No enforcement necessary
55 inspections – Written warnings

Dry Season Inspections:

5 inspections – In compliance/No enforcement necessary
4 inspections – Written warnings

c) Brief description of each high-level enforcement action at Construction Sites including the effectiveness of the enforcement:

No inspections performed by the City of Wildomar required high-level enforcement actions during the reporting period. The RWQCB performed five (5) construction site inspections during the rainy season and issued five (5) Notices of Violation (NOVs).

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

1) Following is the current inventory of all City of Wildomar facilities and activities that have the potential to generate Pollutants as required under F.3.a.(1) of the 2010 SMR MS4 Permit [K.3.c.(4)1]

Type	Name
Park	Marna O'Brien Park
	Regency Heritage Park
	Windsong Park
Other	Wildomar Cemetery

The City's three parks were closed for the majority of the reporting period. They reopened in April 2014.

2) Following is the current list of minimum BMPs for the City of Wildomar facilities included in the inventory addressed in item 1) above K.3.c.(4)2

BMP Code	Description	Used
SC-10	Non-Stormwater Discharges	☒ Yes ☐ No
SC-11	Spill Prevention, Control and Clean-up	☒ Yes ☐ No
SC-20	Vehicle and Equipment Fueling	☒ Yes ☐ No
SC-21	Vehicle and Equipment Cleaning	☒ Yes ☐ No
SC-22	Vehicle and Equipment Repair	☒ Yes ☐ No
SC-30	Outdoor Loading/Unloading of Materials	☒ Yes ☐ No
SC-31	Outdoor Liquid Container Storage	☐ Yes ☒ No
SC-32	Outdoor Equipment Maintenance	☐ Yes ☒ No
SC-33	Outdoor Storage of Raw Materials	☒ Yes ☐ No
SC-34	Waste Handling and Disposal	☒ Yes ☐ No
SC-35	Safe Alternative Products	☐ Yes ☒ No
SC-40	Contaminated or Erodible Areas	☐ Yes ☒ No
SC-41	Building and Grounds Maintenance	☒ Yes ☐ No
SC-42	Building Repair and Construction	☒ Yes ☐ No
SC-43	Parking/Storage Area Maintenance	☒ Yes ☐ No
SC-44	Drainage System Maintenance	☒ Yes ☐ No
SC-60	Housekeeping Practices	☒ Yes ☐ No
SC-61	Safe Alternative Products	☒ Yes ☐ No
SC-70	Road and Street Maintenance	☒ Yes ☐ No

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

SC-73	Landscape Maintenance	☒ Yes ☐ No
SC-74	Drainage System Maintenance	☒ Yes ☐ No
SC-75	Waste Handling and Disposal	☒ Yes ☐ No
SC-76	Water and Sewer Utility Maintenance	☐ Yes ☒ No

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

3) Describe any changes to procedures to assure that flood management projects assess the impacts on the water quality of Receiving Waters as required under Section F.3.a.(4) of the 2010 SMR MS4 Permit [K.3.c.(4)3]

The City issued a Request for Proposal for the design and construction of Wildomar Channel Lateral C-1 (RFP issued near the end of the reporting period). The City and the Riverside County Flood Control and Water Conservation District entered into a cooperative agreement for the design and construction of this Master Drainage Plan facility. In addition to evaluating and planning for appropriate post construction BMPs, the project's consultant engineering firm has been tasked with completing the CEQA evaluation, a Determination of Biologically Equivalent or Superior Preservation Analysis (DBESP) for Impacts to MSHCP riparian/riverine areas.

4) Following is a summary and assessment of BMP retrofit projects implemented at flood control structures as specified in Section F.3.a.(4)(c) and F.3.d of the 2010 SMR MS4 Permit [K.3.c.(4)4]:

a) **Listing of flood control facilities retrofitted:**

None*

b) **Listing and description of flood control structures evaluated for retrofitting:**

None*

c) **Listing of flood control structures still needing to be evaluated and the schedule for evaluation:**

None*

* The City does not own or operate its own flood control facilities. All flood control facilities within the City's jurisdiction are owned and operated by the Riverside County Flood Control and Water Conservation District.

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

5) Following is a summary of the municipal structural Treatment Control BMP operations and maintenance activities as specified in F.3.a.(6) of the 2010 SMR MS4 Permit [K.3.c.(4)5]:

Type of Structural Treatment Control BMP	Number of Inspections	Findings
Catch Basin Filters	Inspections Conducted Quarterly	N/A
Park WQMPs	See below*	N/A

*The City's three parks re-opened in April 2014. Some of the parks' post-construction BMPs required maintenance and re-installation due to the lack of maintenance while the parks were closed. City staff has observed the BMPs as they are being maintained but have not performed formal inspections of the BMPs. Moving forward, the City will work towards implementing the WQMP maintenance as specified in the Project Specific WQMP for each park.

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

6) Summary of the MS4 facilities operations and maintenance activities, including amount material removed from, including justification for less than annual inspection as required under Section F.3.a.(6)(b) of the 2010 SMR MS4 Permit [K.3.c.(4)(6)]:

MS4 Facility Type	Number of Facilities Maintained	Amount of Material Removed (tons)	Facilities Planned for Bi-Annual Inspections and Justification
Catch Basins **Total**	**278**	**Sediment** **275.80 cf** **Vegetation** **169.19 cf** **Litter** **39.61 cf** **Total** **489 cf***	
Debris Basins **Total**	None	**0.0 tons (wet weight)**	
Open Channels **Total**	None	**0.0 tons (wet weight)**	
Other MS4 Facilities	**2,575.44 curb miles swept***	**135.05 tons****	
Facility Total		**489 cf plus 135.05 tons**	

*City's maintenance contractor does not record data in tons.

**Sweeping only includes County Service Area (CSA) sweeping and street sweeping by CR&R Environmental Services. Value does not include street sweeping performed by franchise agreement with Waste Management.

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

7) The following table contains a Summary of municipal areas/programs inspection activities as specified by Section F.3.a.(8)(a&b) of the 2010 SMR MS4 Permit [K.3.c.(4)6] including:

a) **Number and date of inspections conducted at each facility [K.3.c.(4)7.(a)].**

b) **BMP violations identified during each facility inspection [K.3.c.(4)7.(b)].**

c) **The number, date and types of enforcement actions received at each facility [K.3.c.(4)7.(c)]**

d) **Summary of inspection findings and follow-up activities for each inspected facility [K3.c.(4)7.(d)]**

Facility	Inspections		BMP Violation	Enforcement			Summary of Inspection	
	#	Date		#	Date	Type	Findings	Follow-up
Total								

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

8) The following activities implemented to address sewage infiltration into the MS4 as specified in F.3.a.(7) of the 2010 SM4 MS4 Permit [K.3.c.(4)8]

Description of Sewage Infiltration Controls	Used
Adequate plan checking for construction and new development	☒ Yes ☐ No
Incident response training for municipal employees that identify sanitary sewer spills	☒ Yes ☐ No
Code enforcement inspections	☒ Yes ☐ No
MS4 maintenance and inspections	☒ Yes ☐ No
Interagency coordination with sewer agencies	☒ Yes ☐ No
Education of staff and contractors conducting field operations on the MS4 or its municipal sanitary sewer (if applicable)	☒ Yes ☐ No

9) Describe BMPs and their implementation for unpaved roads construction and maintenance as specified in F.3.a.(10) of the 2010 SMR MS4 [K.3.c.(4)8]:
The City does not allow the construction of new unpaved roads.

Description of Unpaved Road Construction and Maintenance BMPs	Used
Lost Road – crushed base with recycled asphalt application BMPs were implemented during the material application.	☒ Yes ☐ No
Lost Road – Magnesium Chloride ($MgCl_2$) application **BMPs: Magnesium Chloride application reduces weathering of roadway surface and potential roadway material runoff**. • **Application also inhibits dust formation and serves as the primary motive for implementing this road construction.** • City a**pplication**s of $MgCl_2$ are **scheduled** to ensure that timing is appropriate with respect to current and forecasted weather conditions	☒ Yes ☐ No

4. INDUSTRIAL / COMMERICIAL
(SECTION F.3.b. of ORDER NO. R9-2010-0016)

1) **Attachment E contains the updated inventory of Industrial and Commercial Facilities as required under Section F.3.b.(1) of the 2010 SMR Permit [K.3.c.(4)1&2]. This inventory includes the following information by facility or mobile business:**

   a) **Number and date of inspections conducted at each facility or mobile business.**

   b) **BMP violations identified during the inspection.**

   c) **Number, date, and type of enforcement actions.**

   d) **Brief description of each high-level enforcement action at Industrial/Commercial sites including the effectiveness of the enforcement and follow-up activities.**

2) **All changes to the designated minimum and enhanced BMPs required under Section F.3.b.(2)b&c of the 2010 SMR MS4 Permit [K.3.c.(4)3]**

Minimum BMP	CASQA BMP Fact Sheet	Used
Hazardous Waste/Materials storage areas are clean, no signs of leakage, and protected from rainfall and Runoff;	SC-34	☒ Yes ☐ No
Trash bin areas are clean, the bin lids are closed, the bins are not filled with liquid, and no signs of leakage from the trash bins	SC-34	☒ Yes ☐ No
Aboveground tanks have been properly maintained including no signs of leakage, and secondary containment in good condition	SC-11, SC-31, SC-33	☒ Yes ☐ No
Onsite storm drain inlets are protect from inappropriate non-storm water discharges	SC-44	☒ Yes ☐ No
Oil/water separators are connected to sanitary sewer	NA	☒ Yes ☐ No
Wash water from wash pads (steam cleaning or high pressure cleaning) is directed to the sanitary sewer and does not discharge to the MS4	SC-10	☒ Yes ☐ No
Mop bucket wash water is discharged to sanitary sewer via clarifier	SC-10	☒ Yes ☐ No
Parking lot areas are free of trash, debris, and fluids other than water	SC-43	☒ Yes ☐ No
Facility has coverage under the Industrial General Permit, if appropriate	NA	☒ Yes ☐ No
Minimum BMP	CASQA	☒ Yes ☐ No
Oil and grease Wastes are not discharged onto a parking lot, street or adjacent catch basin	SC-10	☒ Yes ☐ No
Trash bin areas are clean, the bin lids are closed, the bins are not filled with liquid, and the bins have not been washed out into the MS4	SC-43	☒ Yes ☐ No
Floor mats, filters and garbage containers are not washed in adjacent parking lots, alleys, sidewalks, or streets and that no wash water is discharged to MS4S	SC-10	☒ Yes ☐ No

4. INDUSTRIAL / COMMERICIAL
(SECTION F.3.b of ORDER NO. R9-2010-0016), CONT.

Parking lot areas are cleaned by sweeping, not by hosing down, and that facility operator uses dry methods for spill cleanup	SC-43	☒ Yes ☐ No

3) Provide a list of Industrial Facilities, including each name, address, and SIC code in the City of Wildomar's jurisdiction, that may require coverage under the General Industrial Permit, but has not submitted an NOI [K.3.c.(4)4]

There are no industrial facilities in the City of Wildomar that may require coverage under the General Industrial Permit, but have not submitted an NOI.

Facility Name	Facility Address	SIC Code
Lake Elsinore Unified School District Transportation Facility	21641 Bundy Canyon Rd. Wildomar, CA 92595	4151

5. RESIDENTIAL
(SECTION F.3.c. of ORDER NO. R9-2010-0016)

1) Provide an updated list of minimum BMPs required for residential areas and activities as required by Section F.3.c.(2)(b) of the 2010 SMR MS4 Permit [K.3.c.(4)1]

Area of Activity		Designated BMPs	Reference Material
A	Automobile repair, maintenance, washing and parking	• Collect and properly dispose of automotive fluids and other waste • Clean up spills using dry cleanup methods where possible • Store Hazardous Materials away from rain and runoff • Avoid hosing down parking areas. • Prevent all wash water, leaks and/or spills from entering the street or MS4	**Brochures (see Attachment F):** • Automotive Maintenance and Car Care Brochure • Outdoor Cleaning **CASQA BMP Fact Sheets:** • SC-20, • SC-21, • SC-22, • SC-43
B	Home and garden care activities and product use (pesticides, herbicides and fertilizers)	• Prevent irrigation runoff • Store and apply pesticides, fertilizers and other chemicals in accordance with their labeling • Avoid applying pesticides, herbicides and fertilizers before forecasted rain	**Brochures (see Attachment F):** • Landscape and Garden • 10 Ways to Save Water Outdoors **CASQA BMP Fact Sheets:** • SC-73, • SD-10, • SD-12
C	Disposal of trash, pet waste, green waste, and Household Hazardous Waste (e.g., paints, cleaning products)	• Properly dispose of pet waste • Collect green waste and never blow such waste into the street, gutter or MS4 • Never dispose of waste in a street, gutter or MS4 • Take Household Hazardous Waste to a designated collection center	**Brochures (see Attachment F):** • After the Storm • What's the Scoop • Tips for Horse Care • Landscape and Garden • Pools, Spas and Fountains **HHW and ABOP Collection Events** http://www.rivcowm.org/opencms/hhw/schedule.html **Videos:** • Animal Care • Household Hazardous Waste • Managing your Lawn and Garden • Outdoor Activities http://rcflood.org/stormwater/ (Videos found in the Media Library)

5. RESIDENTIAL
(SECTION F.3.c of ORDER NO. R9-2010-0016) CONT.

2) Provide a summary of the number and type of applicable runoff and stormwater enforcement actions taken within residential areas and activities as required under Section F.3.c.(3) of the 2010 SMR MS4 Permit [K.3.c.(4)2]:

Number by Area or Activity			Enforcement and Compliance Responses
A	B	C	
1*	1**		Education and information
1*			Verbal Warning
1*	1**		Written Warning
			Notice of Non-Compliance
			Administrative Compliance Order
			Misdemeanor
			Infraction
			Citation
			Referral to SDRWQCB
			Total

* Same activity – Yamas Drive: unpermitted car wash within City right-of-way

** Same activity – Sundrops Lane: unpermitted stockpiling on private drainage easement with potential discharge to City right-of-way

3) Describe the City of Wildomar's efforts to manage runoff and Stormwater Pollution in common interest areas and mobile home parks as required under Section F.3.c.(4) of the 2010 SMR MS4 Permit [K.3.c.(4)2]:

Mobile home parks and common interest areas are managed and enforced in the same manner as other residential areas. New mobile home developments and new developments with common interest areas are conditioned to provide water quality BMPs in accordance with the 2010 SMR MS4 Permit and Model SSMP/WQMP.

6. RETROFITTING EXISTING DEVELOPMENT (SECTION F.3.d. of ORDER NO. R9-2010-0016)

1) **Provide an updated inventory and prioritization of existing developments identified as candidates for retrofitting as required under Section F.3.d.(2) of the 2010 SMR MS4 Permit [K.3.d.(4)1]:**

   The 2010 SMR MS4 Permit Copermittees prepared a Santa Margarita Region Retrofit Program Study in May 2012. This Study establishes the framework for the Copermittees to identify conditions of concern and retrofit strategies to address those concerns. The Retrofit Program Framework Diagram is included in Attachment G.

2) **Describe the City of Wildomar's efforts to retrofit existing developments during the reporting period as required under Section F.3.d.(2) of the 2010 SMR MS4 Permit [K.3.d.(4)2]:**

   The first step in the Compermittee's Retrofit Program Framework is to identify specific issues to be addressed by retrofit. Issues are identified when illicit discharges are detected or action levels are exceeded. No illicit discharges were reported and no action levels were exceeded this year, so the City did not proceed beyond the first step in the Retrofit Program Framework Diagram.

3) **Describe the City of Wildomar efforts taken to encourage private landowners to retrofit existing development as required under Section F.3.d.(4) of the 2010 SMR MS4 Permit [K.3.d.(4)3]:**

   Project applicants who submit plans for entitlement are requested to indicate any plans for low impact development on the plans which they submit. The applicant is referred to the Riverside County Flood Control's Low Impact Development webpage. A handout describing low impact development is also provided to the applicant. These projects typically include accessory structures and second units.

4) **Provide a list of all retrofit projects that have been implemented including site location, a description of the retrofit project pollutants expected to be treated, and the tributary acreage of runoff that will be treated as required under Section F.3.d.(5) of the 2010 SMR MS4 Permit [K.3.d.(4)4]:**

   No retrofit projects occurred within the City during the last reporting year.

5) **Describe any proposed retrofit or regional mitigation projects and timelines for future implementation [K.3.d.(4)5]:**

   There are no retrofit or regional mitigation projects currently proposed within the City of Wildomar.

6) **Describe any proposed changes to the City of Wildomar's overall retrofitting program [K.3.d.(4)6]:**

   The City will continue to implement the retrofit program as outlined in the Retrofit Program Study. This study established a framework for the Copermittees to follow to identify and implement retrofit projects. The study identified three City owned sites with soils suitable for a retrofit BMP. One is an existing park, one is a future school site, and one is a future park site.

7. ILLICIT DISCHARGE DETECTION AND ELIMINATION (SECTION F.4 of ORDER NO. R9-2010-0016) CONT.

1) Describe any changes to the legal authority to implement Illicit Discharge Detection and Elimination (IDDE) activities as required under Section F.4.a.(1) of the 2010 SMR MS4 Permit [K.3.d.(4)1]:

There were no changes to the City's legal authority to implement IDDE activities during the reporting period.

2) Describe any changes to the established IDDE investigation procedures as specified under Section F.4.e. of the 2010 SMR MS4 permit [K.3.d.(4)2]:

There were no changes to the established IDDE investigation procedures during the reporting period.

3) Describe any changes to public reporting mechanisms, including phone numbers and web pages as required under Section F.4.c of the 2010 SMR MS4 Permit [K.3.d.(4)3]

There were no formal changes to the public reporting mechanisms during the reporting period. The City updated its phone systems to include a dedicated Public Works/Engineering line (951-677-7751, Line 5). This line is made available via a call-tree presented to callers when they call the City's main phone number. The City also has a new dedicated Public Works/Engineering email address (wildomarpw@cityofwildomar.org).

4) Summarize Illicit Discharges (including spills and water quality data events) and how each significant case was resolved [K.3.d.(4)4]:

Illicit Discharge Incident	How Resolved
1. December 4, 2013 • **TR 31736-1: Construction - Developer's subcontractor drained sewer ball-testing water into off-site storm drain which drains into watercourse**	Discharge drained into rip-rap at the headwall of the outfall. Subcontractor pumped drained and ponded water from discharge location into project's onsite infiltration basin. Silt fence was present around the discharge location/rip-rap and headwall. Developer repaired damaged silt fence following the incident.
2. **January 2014** • **TR 31736-1: Construction – Discharge of slurry into flow line while developer's utility subcontractor completed vault work at the corner of George Ave. and Clinton Keith Rd.**	Developer had protected downstream catch basin. Subcontractor removed the material prior to reaching the MS4.

7. ILLICIT DISCHARGE DETECTION AND ELIMINATION (SECTION F.4 of ORDER NO. R9-2010-0016) CONT.

3. **January 10, 2014** • **32818 Willow Bay Rd. – Illegal Connection**	The City received notice from Riverside County Flood Control and Water Conservation District that an illegal connection from the Willow Bay Rd. home was made into the Flood Control Channel behind the home. The City sent the homeowner a letter informing them of the violation and performed a site visit. The homeowner followed-up by closing the illegal connection.
4. February 12, 2014 • Yamas Dr. - Unpermitted Car Wash in City Right-of-Way discharging into Catch Basin	City staff responded to complaints about car wash. Car wash activities were required to cease. Business owners were directed to obtain a City business registration and relocate to an appropriate location outside City right-of-way and to implement BMPs. Educational materials were also provided to the business owners.
5. **June 6, 2014** • **21465 Palomar St. - Sanitary Sewer Overflow from Business Park Septic System into City Right-of-Way**	Elsinore Valley Municipal Water District responded first to the incident. The City took over in following-up with the incident. Business owner responded the same day by having a pump truck come out. Another clean up crew came to address the discharge in the parking lot and right-of-way. Environmental Health was contacted as they are the permitting agency for septic systems. After obtaining permits, the system was dug up and replaced. No further discharges have occurred.

5) Describe any instances when field screening and analytical data exceeded Action Levels, including those instances for which no investigation was conducted [K.3.d.(4)5]:

There were no instances in which field screening and analytical data exceeded Action Levels.

6) Describe the follow-up and enforcement actions taken in response to investigations of Illicit Discharges and a description of the outcome of the investigation/enforcement actions as required under Section F.4.e,f, & g. [K.3.d.(4)6]:

Discharge incidents below correspond to the same incident number in the table above, in Section 7.4 of this report. Please find in the table above the full descriptions for the incidents and follow-up/enforcement actions listed below.

Illicit Discharge Incident	Follow-up and Enforcement Action	Outcome
1. **TR 31736-1 (1)**	See response above under Section 7.4.	All future sewer-ball testing discharges were discharged into the onsite infiltration basin.
2. **TR 31736-1 (2)**	See response above under Section 7.4.	Subcontractor collected

7. ILLICIT DISCHARGE DETECTION AND ELIMINATION (SECTION F.4 of ORDER NO. R9-2010-0016) CONT.

		material prior to reaching MS4.
3. **32818 Willow Bay Rd.**	See response above under Section 7.4.	Homeowner closed connection.
4. **Yamas Dr.**	See response above under Section 7.4.	Business activities ceased, owners provided with educational materials.
5. **21465 Palomar St.**	See response above under Section 7.4.	No further discharges have occurred.

The City also investigated and responded to notices of incidents/conditions which were not illicit discharges but which could potentially result in or become an illicit discharge should the conditions not be properly addressed. These incidents/conditions are usually addressed by a site visit and/or letter issued to the appropriate party informing them of the concerns and potential violations.

8. WORKPLANS

1) Provide a summary of workplans including priorities, strategy, implementation schedule and effectiveness evaluations.

The Upper Santa Margarita Watershed Water Quality Workplan (Watershed Workplan) has been developed in compliance with Directive G of the San Diego Regional Water Quality Control Board's Order No. R9-2010-0016. The purpose of the Watershed Workplan is to:

1) Characterize the Receiving Water quality in the Upper Santa Margarita River Watershed's Receiving Waters
2) Identify and prioritize water quality problem(s) in terms of constituents by location in the Upper Santa Margarita River Watershed's Receiving Waters.
3) Identify the likely sources of the highest priority water quality problem(s) within the Upper Santa Margarita River Watershed.
4) Develop a watershed Best Management Practice (BMP) implementation strategy to attain Receiving Water Quality Objectives for the highest priority water quality problem(s).
5) Develop a strategy to monitor improvements in Receiving Water quality directly resulting from implementation of the BMP implementation strategy described in this Watershed Workplan.
6) Establish a schedule for development and implementation of the BMP and monitoring strategies outlined in this Watershed Workplan.

The Watershed Workplan is reviewed annually and updated to identify needed changes to prioritize water quality problem(s) listed in the Workplan.

Throughout Fiscal Year 2013-2014, the SMR Copermittees have been assessing the Watershed Workplan programs based upon the criteria set forth by CASQA. Section 12 of this JRMP Annual Report discusses the effectiveness of the implementation of the Watershed Workplan and the CASQA outcome levels achieved. The District and the Copermittees continue to implement the schedule as seen in Figure 1 of the Watershed Workplan that outlines implementation of various storm water programs.

9. NON-STORMWATER DISCHARGES

1) **Identify any non-stormwater discharge category listed in Requirement B.2 of Order No. R9-2010-0016 that was identified as a source of Pollutants to Waters of the U.S. during the reporting period. For each identified category, the Copermittee must report whether it elected to prohibit the discharge or to require BMPs to reduce Pollutants in the discharge to the MEP. If the discharge is not prohibited, the BMPs that will be implemented, or required to be implemented, are described below:**

Non-Stormwater Discharge Categories (per Requirement B.2)	Source of Pollutant	Prohibited	Required BMPs
Diverted stream flows	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Rising ground waters	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to MS4s	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Uncontaminated pumped ground water	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Foundation drains	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Springs	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Water from crawl space pumps	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Footing drains	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Air conditioning condensation	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Flows from riparian habitats and wetlands	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Water line flushing	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Discharges from potable water sources not subject to NPDES Permit No. CAG679001, other than water main breaks	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Individual residential car washing	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No
Dechlorinated swimming pool discharges	☐ Yes ☒ No	☐ Yes ☒ No	☒ Yes ☐ No

2) **Provide a description of any updates to ordinances, orders, or similar means to prohibit non-storm water discharge categories identified under Section B.2 of the 2010 SMR MS4 Permit.**

There were no updates to the City's stormwater ordinance during the reporting period. The City is currently in the process of updating its stormwater ordinance.

3) **Identify any control measures to be required and implemented for non-stormwater discharge categories identified as needing controls by the San Diego Water Board.**

None of the non-stormwater discharge categories listed was identified as needing controls within the City by the San Diego Water Board.

9. NON-STORMWATER DISCHARGES CONT.

4) Provide a description of a program to address Pollutants from non-emergency firefighting flows identified by the City of Wildomar to be significant sources of Pollutants:

The City has not identified non-emergency firefighting flows as a significant source of Pollutants.

10. RECEIVING WATER LIMITATIONS

This section includes the report required pursuant to Requirement A.3.a.(1) of Order No. R9-2010-0016, if applicable.

Requirement A.3.a.(1) states:

"Upon a determination by either a Copermittee or the San Diego Regional Board that storm water MS4 discharges are causing or contributing to an exceedance of an applicable water quality standard, the Copermittee must notify the San Diego Regional Board within 30 days and thereafter submit a report to the San Diego Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any Pollutants that are causing or contributing to the exceedance of Water Quality Standards. The report may be incorporated in the Annual Report unless the San Diego Regional Board directs an earlier submittal. The report must include an implementation schedule. The San Diego Regional Board may require modifications to the report;"

There were no discharges within the City determined to be causing or contributing to an exceedance of an applicable water quality standard during the reporting period.

The City relies on RCFCWCD to conduct any permit required water quality monitoring.

11. FISCAL ANALYSIS CONT.

1) The following table provides estimated expenditures for the current reporting period, the preceding reporting period, and the next reporting period. This table identifies the expenditures (such as capital, operation and maintenance, education, and administrative expenditures) necessary to accomplish the activities described in the City of Wildomar's JRMP as required under Section H.2 of the 2010 SMR MS4 Permit.

Program Element	Fiscal Year 2014-2015		Fiscal Year 2013-2014		Fiscal Year 2012-2013	
	Capital Expenditures	O&M/Admin Expenditures	Capital Expenditures	O&M/Admin Expenditures	Capital Expenditures	O&M/Admin Expenditures
Program Management		$25,000		$20,000		$20,000
Annual Fee for MS4 NPDES Permit		$15,000		$15,000		$9,500
Implementation Agreement Shared Cost		$190,700		$52,000		$227,000
Construction Inspections		(2)		(2)		(2)
Development Planning		(2)		(2)		(2)
Industrial and Commercial Inspections		$35,000		$35,000		$35,000
Illicit Connections & Illegal Discharges Program		(3)		(3)		(3)
Municipal Facilities and Activities						$48,000
Public Education & Outreach		(1)		(1)		(1)

Monitoring Program		(1)		(1)		(1)
Retrofit Program		(1)		(1)		(1)
Other						
Total	$	$265,700	$	$122,000	$	$339,500

Notes:
(1) These items are included in the "Implementation Agreement Shared Cost."
(2) These items are included in the cost billed to the project developer and are not tracked separately.
(3) IC/ID program activities are not tracked separately.

2) A description of the source(s) of funds that are proposed to meet the necessary expenditures for the subsequent year.

Source of Funds	Capital Expenditures	Percent of Total Program Funding	Restrictions on Use (if applicable)
General Fund		81%	
LLMD 89-1-C/CSA 152		19%	Maximum parcel assessment established at annexation into district. Must be used for fossil filter replacement and street sweeping within specified neighborhoods.

11. FISCAL ANALYSIS CONT.

3) Provide a narrative description of circumstances resulting in a 25 percent or greater annual change for any budget line item.

The Program Management cost will increase by 25% ($5,000) from the current reporting period to the next fiscal year (FY 2014-2015). This reflects the anticipated time to be spent in implementing the NPDES program. Activities covered under the program management cost include, but are not limited to, items such as staff response to IC/ID incidents, business registration review for NDPES compliance, coordinating the inspection program, collating the data for the JRMP annual report, and general program management.

The Implementation Agreement Shared Cost item has increased by approximately 267% ($138,700) from the current reporting period to the next fiscal year (FY 2014-2015). This reflects the City's share of the additional cost spent by the Copermittees to prepare studies and reports to comply with the 2010 SMR MS4 Permit.

12. ASSESSMENT AND RESPONSE REPORTING

1) **The following is the City of Wildomar summary of its effectiveness assessments as required under Section J.3 of the 2010 SMR MS4 Permit.**

12.1.a.1 Illicit Discharge Detection and Elimination Effectiveness Assessment

Table 12-1: Illicit Discharge Detection and Elimination Program Effectiveness

Measureable Metrics Collected	Data	CASQA Outcome Level
Number of IC/ID reports received (F.4.e.(3))	1	Level 1
Percentage/Number of Dry Weather Source ID Efforts that were completed and Findings	0	Level 5
Estimated volume of anthropogenic trash removed from City of Wildomar MS4 facilities (tons) (F.3.a.(6)(b)(vi))	489 cf* plus 135 tons**	Level 4

*City's maintenance contractor does not record data in tons.

** Sweeping only includes removal by County Service Area (CSA) sweeping and street sweeping by CR&R Environmental Services. Value does not include street sweeping performed by franchise agreement with Waste Management.

12.1.a.2 Municipal Areas and Activities Effectiveness Assessment

Table 12-2: Municipal Areas and Activities Program Effectiveness

Measureable Metrics Collected	Data	CASQA Outcome Level
Percent/Number of City of Wildomar facilities with appropriate BMPs identified (F.3.a.(2)(b))	33[a]	Level 2
Number of City of Wildomar facility and MS4 operators and maintenance staff that attended Municipal training (F.6.b.(1))	0	Level 1
Estimated tons of Waste removed by City of Wildomar street sweeping, (F.3.a.(5))	135.05[b]	Level 4
Estimated tons of Waste removed from City of Wildomar Open Channels (F.3.a.(6)(b))	0[c]	Level 4
Estimated tons of Waste removed from City of Wildomar storm drain inlets (F.3.a.(6)(b))	489 cf[d]	Level 4

[a] Includes: 30 catch basin filter inserts, 3 parks with post-construction BMPs
[b] Sweeping only includes County Service Area (CSA) sweeping and street sweeping by CR&R Environmental Services. Value does not include street sweeping performed by franchise agreement with Waste Management.
[c] Open channel flood control facilities within the City are maintained by Riverside County Flood Control District
[d] The City's maintenance contractor does not record removal in tons

12.1.a.3 Development Planning Effectiveness Assessment

Table 12-3: Development Planning Program Effectiveness

Measureable Metric Collected	Data	CASQA Outcome Level
Number of acres of Redevelopment projects that incorporated LID-based BMPs that are built and completed (F.1.f.(1))	0*	Level 5
Number of applicable planning staff that attended WQMP training (F.6.b.(1))	0	Level 1

*No redevelopment projects were approved or constructed this year.

12.1.a.4 Private Development Construction Activity Effectiveness Assessment

Table 12-4: Private Development Construction Activity Program Effectiveness

Measureable Metrics Collected	Data	CASQA Outcome Level
Construction Site inventory updated (F.2.b.)	Yes	Level 1
Number of construction inspection staff that attended Construction training (F.6.b.(b))	2	Level 1

12.1.a.5 Industrial and Commercial Effectiveness Assessment

12.1.a.7 Retrofit Program Effectiveness Assessment

Table 12-7: Retrofit Program Effectiveness

Measureable Metrics Collected	Data	CASQA Outcome Level
Number of times the Retrofit Program has identified a potential solution to a specific identified problem	0*	Level 1

*No specific problems were identified.

12.1.a.8 Public Education Effectiveness Assessment

Table 12-8: Public Education Program Effectiveness

Measureable Metrics Collected	Data	CASQA Outcome Level
Number of outreach events to schools	6*	Level 1
Number of Public Events where outreach was conducted	16*	Level 1
Pounds of trash removed through watershed cleanup events	182,687 lbs	Level 4
Number of home improvement stores provided outreach / customer education information for pesticide use	5/3*	Level 1
Number of E-Newsletters signups	60	Level 2
% of E-Newsletters clicked	26%**	Level 2

*SMR data, not Copermittee specific; **SMR Quarterly Average

12.1.a.9 Watershed Workplan Effectiveness Assessment

Table 12-9: Watershed Workplan Program Effectiveness

Measureable Metrics Collected	Data	CASQA Outcome Level
Annual Public Review Meeting conducted	1	Level 1
Updated Characterization of Receiving Water Quality	(See Below)	Level 1
Updated prioritization of water quality problems	(Refer to SMR Annual Monitoring Report, Table 41)	Level 1
Descriptions of likely sources updated	(Refer to SMR Monitoring Annual Report, Section 5.3)	Level 1

12. ASSESSMENT AND RESPONSE REPORTING

Updated BMP Implementation Strategy	(See Below)	Level 1
BMPs implemented according to schedule	(See Below)	Level 1
Number of Collaborative Meetings Attended	5	Level 1

Updated Characterization of Receiving Water Quality:

The Copermittees submitted an Annual SMR Monitoring Report for the reporting period to the Regional Water Quality Control Board on October 1, 2014. This monitoring report indicates that "overall, water quality conditions in the SMR receiving waters appear to be getting better, based on the number of Clean Water Act (CWA) Section 303(d)-listed constituents in the Upper Santa Margarita River Watershed with statistically significant downward trends."

Updated BMP Implementation Strategy:

The City of Wildomar did not implement any new BMPs during this reporting period. The City of Wildomar is implementing the current BMP Implementation Strategy per Section 4 of the Upper Santa Margarita River Watershed Workplan.

BMPs Implemented According to Schedule:

The City of Wildomar did not implement any new BMPs during this reporting period.

a) Response to effectiveness assessments:

The City of Wildomar does not plan any program modifications for the next year. The SMR Copermittees expect that future monitoring and the associated data will foster a better understanding of Pollutants and their impacts to Receiving Waters. Results from monitoring activities/studies will continue to guide the Copermittees in assessing and managing their programs to protect Receiving Waters in the SMR to the maximum extent practicable.

b) A description of any steps to be implemented to improve the City of Wildomar's ability to assess program effectiveness.

The City of Wildomar and Copermittess do not plan any modifications to program monitoring at this time. Future monitoring and studies will provide additional information to guide the Copermittees in assessing and managing their programs to protect Receiving Waters in the SMR to the maximum extent practicable.

10. RECEIVING WATER LIMITATIONS

This is the second year that the City has been subject to Order No. R9-2010-0016. The City reviewed and approved two (2) Priority Development Projects for entitlement and reviewed and approved three (3) Priority Development Projects for construction. The construction approvals included rough grading approvals and WQMP acceptances. Of the three construction projects, only two were issued grading permits and began construction activities during the reporting period. The entitlement projects reviewed and approved include a 10-lot single family residential development (TTM 36519/PA 12-0392) and a 7-parcel commercial/retail development (TPM 30522/PA 10-0301). The projects reviewed and approved for construction include an 84-lot single family residential development (TTM 32535/Project 13-0058 – grading permit for 31.17 disturbed acres), a 102-lot single family residential development (TTM 25122/Project 13-0030 – grading permit for 41.7 acres), and a single parcel commercial/retail development (PP 10-0222/Project 13-0109).

The City swept 2,575.44[1] curb miles of streets and cleaned 278 catch basins this fiscal year, thereby preventing approximately 489 cubic feet (catch basins) and 135.05 tons (street sweeping) of debris from reaching the MS4 outfalls.

The City inspected construction sites during the reporting period according to the schedule set forth in the City's MS4 permit and issued several written warnings to developers. No high level enforcement actions were taken by the City. Out of a total of ninety-three (93) inspections, the City issued a total of fifty-nine (59) written warning to developers of construction sites. The Public Works department began reviewing business registrations this reporting period to request storm water compliance deposits from business owners of specific business requiring inspections to allow City staff to perform Commercial/Industrial Inspections, as specified in the City's JRMP. The City performed one (1) Industrial and Commercial inspection during the reporting period. The County performed three (3) Industrial and Commercial inspections within the City's jurisdiction during the reporting period. The City issued self-certification letters for owners/responsible parties of facilities with post-construction BMPs. The City also responded to five (5) illicit discharges during the reporting period.

The City participated in two (2) community events at which public information booths were present for stormwater pollution prevention education. The City also re-opened its three (3) parks during the reporting period, all of which had been closed for several years. The City has assessed the parks' post-construction BMPs and has budgeted to repair the BMPs to ensure that they are functional and effective.

The City's JRMP, in cooperation with the other Copermittees, complies with the 2010 SMR MS4 Permit. Based on the information collected to date, the City's program is effectively protecting the Receiving Waters and no changes are proposed at this time. Future monitoring and studies will provide additional information to guide the City in assessing and managing its programs.

[1] Sweeping only includes County Service Area (CSA) sweeping and street sweeping by CR&R Environmental Services. Value does not include street sweeping performed by franchise agreement with Waste Management.

13. RECOMMENDATIONS

14. RECOMMENDATIONS

The City of Wildomar does not plan any modifications to its water quality program and assessment at this time. The City incorporated the Public Works Department in the business registration review process during the reporting period to ensure that businesses requiring NPDES Compliance Inspections are tracked and provide a deposit for inspections. As the Public Works Department continues to monitor business registrations to ensure compliance with the NPDES program, the City intends to further develop the industrial/commercial tracking database and perform more industrial/commercial inspections to ensure that pollutants reaching the MS4 are continually reduced to the maximum extent practicable. Future monitoring and studies will provide additional information which the City will utilize in determining if modifications to its program will improve program effectiveness.

CRS REPORT
Prepared for Members and
Committees of Congress

Summary

The Environmental Protection Agency (EPA) and states implement a federally mandated program for controlling stormwater discharges from industrial facilities and municipalities. Large cities and most industry sources are subject to rules issued in 1990 (Phase I rules), and EPA issued permit rules to cover smaller cities and other industrial sources and construction sites in 1999 (Phase II rules). Because of the large number of affected sources and deadline changes that led to confusion, numerous questions have arisen about this program. Impacts and costs of the program's requirements, especially on cities, are a continuing concern.

The 109th Congress enacted omnibus energy legislation (P.L. 109-58, the Energy Policy Act of 2005) that included a provision giving the oil and gas industry regulatory relief from some stormwater control requirements. In 2008, a federal court vacated an EPA rule implementing this provision. EPA intends to issue a revised rule that repeals the one that was vacated by the court and codifies the statutory exemption in P.L. 109-58, but the agency does not have a specific schedule for doing so. In the 111th Congress, the House passed a bill that included a provision that would repeal the exemption in P.L. 109-58, but the Senate took no action. Similar legislation has been introduced in the 114th Congress (H.R. 1460).

Congress often looks to federal agencies to lead or test new policy approaches, a fact reflected in legislation enacted in the 110th Congress. Section 438 of the Energy Independence and Security Act (P.L. 110-140, EISA) requires federal agencies to implement strict stormwater runoff requirements for development or redevelopment projects involving a federal facility in order to reduce stormwater runoff and associated pollutant loadings. EPA has issued technical guidance for federal agencies to use in meeting these requirements.

In 2009 the National Research Council issued a report calling for major changes to strengthen EPA's stormwater regulatory program, which it criticized as being inconsistent nationally and failing to adequately control all sources of stormwater discharge that contribute to waterbody impairment. In response, EPA began efforts to expand regulations and strengthen the current program with a revised rule. Agency officials said that the new rule would focus on stormwater discharges from newly developed and redeveloped, or post-construction, sites, such as subdivisions, roadways, industrial facilities, and commercial buildings or shopping centers. The rule was originally due to be proposed in 2011, but EPA missed that and several subsequent deadlines, due to analytic problems associated with developing the rule. In 2014, the agency announced that it would defer action on a national rule and instead will provide incentives, technical assistance, and other approaches for cities to address stormwater runoff themselves.

Background

Stormwater discharge systems are the pipes and sewer lines that carry rainwater or snow melt, but not domestic sanitary wastes, away from urban areas and commercial and industrial facilities. For many years the focus of the nation's water quality programs was on controlling pollutants associated with industrial *process* wastewaters and municipal sewage discharges. More diffuse and episodic discharges (such as rainfall runoff from farm lands and urban runoff) and discharges believed to be relatively uncontaminated received less attention from policymakers and regulators.

However, as the traditional sources of water pollution have become better controlled through laws and regulations, attention has increasingly focused on remaining problems that continue to prevent attainment of state and tribal water quality standards. Stormwater is one such source of pollution. For some time, it was generally believed that stormwater was largely clean, or uncontaminated. However, studies have demonstrated that this type of discharge—from rainfall and snow melt—carries with it large amounts of organic and toxic pollutants that can harm water quality, including oil and grease, heavy metals, pesticides, soil, and sediment.

In urban areas, widespread residential and commercial development results in the removal of vegetation cover and building of impervious structures such as roads and parking lots. These activities may change natural drainage patterns in an area, causing higher runoff flows during wet weather events. Urbanization and the human alteration of landscapes and land uses that is associated with it have resulted in the degradation of conditions in downstream waterbodies. States report that stormwater discharges, including urban runoff, industrial activity, construction, and mining, are a significant source of surface water quality problems today. But control of stormwater discharges and other sources of wet weather pollution, including overflows from combined and separate sewer systems, is complicated because discharges generally are intermittent and are less amenable to "end of pipe" solutions than conventional industrial and municipal water pollution.

Recognition of the water quality problems of stormwater runoff led Congress in 1987, when it last comprehensively amended the Clean Water Act (CWA), to direct EPA to implement a specific permit program for stormwater discharges from industrial sources and municipalities (P.L. 100-4). Even before the 1987 amendments, the issue of how to regulate stormwater discharges had a lengthy history of regulatory proposals, delays, legal challenges, and court decisions. Still, EPA had been unable to devise a comprehensive and flexible administrative process for regulating stormwater discharges before requirements were legislated in 1987. In that legislation, Congress established a phased and tiered approach to permitting of stormwater discharges that fundamentally redesigned the CWA's approach to stormwater discharges. Congress recognized that EPA's difficulties in addressing sources of stormwater stemmed in part from the large number of sources potentially subject to regulation, so the 1987 legislation adopted a procedure that would enable the major contributors of stormwater pollutants to be addressed first, and remaining stormwater discharges in later phases.

EPA initially issued regulations to implement Congress's legislative mandate in 1990, utilizing a series of phased requirements.[1] Phase I applied to large dischargers: those associated with industrial activities, municipal separate storm sewer systems serving 100,000 people or more, and construction projects disturbing more than 5 acres. Smaller sources were slated for possible

[1] U.S. Environmental Protection Agency, "National Pollutant Discharge Elimination System Application Regulations for Storm Water Discharges," 55 *Federal Register* 47990-48091, November 16, 1990.

regulation under Phase II of the program (discussed below) and included cities and towns with separate storm sewer systems serving fewer than 100,000 people, commercial operations, and smaller construction projects. Stormwater requirements are one element of the comprehensive permit program, the National Pollutant Discharge Elimination System (NPDES), authorized in Section 402 of the act. Under the act, it is illegal to discharge pollutants from point sources (e.g., industrial plant pipes, sewage treatment plants, or storm sewers) into the nation's waters without an NPDES permit—permits are the fundamental compliance and enforcement mechanism of the law. EPA manages the NPDES stormwater program in four states (Idaho, Massachusetts, New Hampshire, and New Mexico), plus the District of Columbia and most U.S. territories, and has delegated that authority to the remaining 46 states and the Virgin Islands.

An estimated 123,000 industrial facilities (twice the number of industrial sources subject to the base NPDES program) and 220 municipalities and counties were covered by the 1990 permit rules for Phase I of the program. The initial procedures and deadlines were complex and were made more confusing by subsequent deadline extensions.[2]

The 1987 CWA amendments directed delegated states (or EPA) to issue stormwater permits not later than four years after enactment of that legislation. This would have required permits to be issued by February 4, 1991, but this did not occur, in part because EPA's 1990 rule was issued 21 months after the statutory deadline. Regulated sources must comply with stormwater permits within three years of their issuance.

Permits require dischargers, at a minimum, to implement pollution prevention plans, although remediation or additional treatment of runoff may also be required. Permits issued to municipalities require cities to develop, implement, and enforce a stormwater management program that addresses key areas such as public education, eliminating illicit connections to storm sewers, good housekeeping of municipal operations, and control of erosion and sedimentation from construction sites.

Prior to implementation of the stormwater regulatory program, the universe of NPDES permittees nationwide was less than 70,000 industrial and municipal facilities. The addition of stormwater permittees greatly expanded this regulatory program. EPA estimates that the total number of stormwater permittees at any one time exceeds half a million—thus, NPDES stormwater permittees outnumber wastewater permittees more than five-fold.

Industrial Facilities

Industries that manufacture, process, or store raw materials and which collect and convey stormwater associated with those activities were required to apply for an NPDES permit under the Phase I program. Several industries were specifically identified in EPA's 1990 regulation: mining operations; lumber and wood products; paper and allied products; printing, chemical products, paints, varnishes, and lacquers; stone, clay, glass, and concrete; metals; petroleum bulk terminals; hazardous waste treatment facilities; salvage operations; and powerplants.

Industrial facilities had several options to comply with these permit requirements. Chiefly, they could obtain either individual or group permits. Applications for *individual* facility permits were due to be submitted by October 1, 1992. For *group* permits (covering multiple facilities with

[2] Moreover, the 1990 regulations themselves were challenged by an environmental group, the Natural Resources Defense Council. In 1992, a federal appeals court ruled that EPA had failed to meet certain deadlines specified in the 1987 legislation and had been improper in exempting from regulation light industry and construction sites that affect less than 5 acres of land. *Natural Resources Defense Council v. EPA*, 966 F.2d 1292 (9th Cir. 1992).

similar stormwater discharges), a two-step process applied: submitting a list of facilities to be covered by September 30, 1991, and submitting more detailed information, such as sampling data on 10% of facilities in the group and a description of a stormwater management program, by October 1, 1992.[3]

EPA also provided a third option for industrial facilities, through a *general* permit procedure. A general permit is one that covers discharges from more than one facility, thus making the large number of stormwater permittees more manageable. Sources are only required to submit a Notice of Intent to be covered by a general permit, rather than the detailed application for an individual permit. EPA expected that general stormwater permits will make for a less costly and burdensome permitting process through less extensive testing and control requirements, as well as minimal monitoring and reporting. For most sources, general permits require preparation of a pollution prevention plan, and compliance with the plan six months later. EPA issued general permits for stormwater discharges associated with industrial and construction activities that disturb 5 acres or more, which apply in the four states where EPA is the permitting authority for the stormwater program. Using the EPA general permit as a model, most other states that have been delegated permitting responsibility use similar general permits to reduce the administrative burden of the industrial stormwater permit program.

Congress addressed the deadlines for stormwater permitting of industrial facilities twice. Congress first extended aspects of the deadlines for group applications by industrial facilities (P.L. 102-27, Dire Emergency Supplemental Appropriations Act of 1991), and in the 1991 Surface Transportation Act (P.L. 102-240), Congress clarified the deadlines applicable to industrial activities that are municipally owned or operated (such as airports or powerplants).

Municipalities

Phase I

Much of the controversy about stormwater requirements has focused on impacts on cities, not industrial sources. Municipalities with separate storm sewer systems (called MS4s) were subject to EPA's regulations under staggered deadlines based on the size of population served. In the 1990 Phase I regulations that apply to industrial activities, EPA also regulated discharges from medium-size and large cities (covering those with populations greater than 100,000 persons). The Phase I regulations are primarily application requirements that identify components that must be addressed in permit applications. The rules require large and medium MS4s to develop a stormwater management program, track and oversee industries facilities that are regulated under the stormwater program, conduct monitoring, and submit periodic reports. The regulations specified deadlines for these cities to provide regulators with information on legal authority over stormwater discharges and to provide detailed information on source identification and monitoring data. EPA identified 173 cities and parts of 47 urban counties as covered by Phase I.

[3] The same deadlines also applied to industrial activities owned or operated by municipalities with a population of 250,000 or more. For industrial activities owned or operated by municipalities with populations of more than 100,000 but less than 250,000, the respective deadlines were May 18, 1992, and May 17, 1993. Certain government-owned or -operated activities (airports, powerplants, and uncontrolled sanitary landfills) also were subject to the May 1992 and May 1993 deadlines, even if the unit of government has a population of less than 100,000.

Phase II

The 1987 CWA amendments exempted smaller cities (with populations of less than 100,000) from any stormwater permit requirements until October 1, 1992, and directed EPA to develop a suitable approach to address them under Phase II of the stormwater regulatory program. Because of problems in formulating a permitting strategy, EPA did not issue regulations by the 1992 deadline, nor did it meet the deadline in a one-year extension that Congress provided in P.L. 102-580. In 1995, EPA convened an advisory committee of stakeholders to assist in developing rules by March 1, 1999, a deadline set in a judicial consent order in *Natural Resources Defense Council v. EPA* (Civ. No. 95-0634 PFL [DDC, Apr. 6, 1995]) that required EPA to clarify the scope of coverage and control mechanisms for the Phase II program. Based in part on extensive discussions with the stakeholder advisory committee and with another court-approved extension, EPA issued a final Phase II rule in 1999.[4] EPA estimated that the rule would make approximately 3,000 more river miles safe for boating annually and protect up to 500,000 people a year from illness due to swimming in contaminated waters.

The 1999 Phase II rule extended Phase I by requiring permits of two additional classes of dischargers on a nationwide basis: (1) operators of MS4s serving populations of less than 100,000 persons in urbanized areas as defined by the Bureau of the Census, and (2) operators of construction activities that disturb greater than 1 and less than 5 acres of land (larger construction sites are covered by the Phase I rules). Separate storm sewer systems such as those serving military bases, universities, large hospital or prison complexes, and highways are also included in the definition of small MS4. EPA estimated that 5,040 small cities are covered by Phase II, along with about 110,200 construction starts per year.[5]

Waivers from coverage are available both for small cities (those with fewer than 10,000 persons) and construction activities if the discharges are not causing water quality impairment. At the same time, additional small municipal systems and construction sites may be brought into the stormwater program on a case-by-case basis, if permitting authorities determine that they are significant contributors to water pollution. Under the 1999 rule, covered facilities were required to apply for NPDES permit coverage by March 2003 (most under a general rather than an individual permit) and implement stormwater management programs that include six minimum management controls that effectively reduce or prevent pollutant discharges into receiving waters, such as pollution prevention and eliminating illicit discharge connections for municipal operations. The rule also provided that municipally operated industrial activities not previously regulated were required to apply for permit coverage under the same schedule as other facilities covered by Phase II.

In the final Phase II rule, EPA attempted to balance statutory requirements for a nationally applicable program with sufficient administrative flexibility to focus on significant water quality impairments. For example, EPA encouraged permitting authorities to use general rather than individual permits for the majority of covered dischargers. The agency's decision to not include

[4] U.S. Environmental Protection Agency, "National Pollutant Discharge Elimination System—Regulations for Revision of the Water Pollution Control Program for Storm Water Discharges," 64 *Federal Register* 68721-68851, December 8, 1999.

[5] Although precise numbers are not available, EPA now estimates that the number of regulated MS4s is about 7,000 (including 1,000 under Phase I and 6,000 under Phase II). The number of industrial permittees is estimated to be around 100,000. The construction site portion of the program each year covers about 200,000 permittees under Phase I (5 acres or greater) and another 200,000 under Phase II (1 to 5 acres). See National Research Council of the National Academy of Sciences, Water Science and Technology Board, *Urban Stormwater Management in the United States*, The National Academies Press, Washington, DC, 2009, p. 36.

construction sites smaller than 1 acre was based on the belief that regulating the smallest of such sites would overwhelm the resources of permitting authorities and might not yield corresponding water quality benefits. Further, EPA modified the previous Phase I rule to exclude industrial facilities that have "no exposure" of their activities (such as raw materials) to stormwater, thus reducing coverage by an estimated 76,000 facilities that have no industrial stormwater discharges. These efforts to provide flexibility notwithstanding, many regulated entities continued to criticize the scope of the stormwater program, saying that EPA had greatly underestimated the cost of the Phase II rules (projected to be $297 million annually for small cities and $505 million annually for construction activities).

Cities of all sizes have complained about the costs and difficulties of complying with EPA's regulations, especially because there is no specific CWA grant or other type of assistance program to help pay for developing and implementing local stormwater programs. Many contend that cities already are burdened with numerous environmental compliance requirements and lack adequate resources to address stormwater controls in addition to drinking water, solid waste, wastewater treatment, and sludge disposal problems. Where cities need to construct or install technology to control stormwater discharges, the principal source of financial assistance is the CWA's state revolving fund (SRF) loan program that is administered by states. However, because SRF assistance is not restricted to meeting just stormwater project needs, competition for available funds for all types of eligible projects is intense.[6]

Many municipal and industrial dischargers covered by the Phase I and Phase II programs have reached the end of their initial permit terms (NPDES permits are issued for five-year terms). For permit renewals, the agency is implementing a streamlined reapplication process that will not require the extensive information collection that characterized the first round of permitting.

Implementation of permits (i.e., translating permits into specific steps to manage stormwater runoff) is now the challenge for permitting authorities and permittees. According to a 2001 Government Accountability Office (GAO) report, local governments are primarily using best management practices (BMPs, sometimes called stormwater control measures, or SCMs) to prevent or slow stormwater from quickly reaching nearby waterbodies and degrading water quality, rather than requiring that stormwater be transported to treatment facilities.[7] BMPs include nonstructural measures to minimize contaminants getting into stormwater (e.g., street sweeping) and structural practices such as detention ponds to separate contaminants from stormwater. GAO criticized EPA for not establishing systematic efforts or measurable goals to evaluate the effectiveness of the program in reducing stormwater pollution or to determine its costs, which local governments have portrayed as high. In the 1999 rules, EPA set a goal of beginning to evaluate implementation of Phase II of the program in 2012.

In a 2007 report, GAO examined implementation of the stormwater regulatory program by municipalities.[8] GAO found that implementation of both Phases I and II had been slow: nearly 11% of communities were not permitted as of 2006; and even in communities with permits, delays occurred due to litigation or other disputes. Thus, GAO reported that because many communities were still in the early stages of implementation at the time of the report, it was too

[6] For additional information, see CRS Report 98-323, *Wastewater Treatment: Overview and Background*, by (name re dacted) .

[7] U.S Government Accountability Office, *Water Quality, Better Data and Evaluation of Urban Runoff Programs Needed to Assess Effectiveness*, GAO-01-679, June 2001.

[8] U.S. Government Accountability Office, *Clean Water, Further Implementation and Better Cost Data Needed to Determine Impact of EPA's Storm Water Program on Communities*, GAO-07-479, May 2007.

early to determine the overall program burden. While EPA's regulations provide flexibility, which could limit program burden, increased burden could result if communities are required by states or EPA to expand stormwater management activities or meet more stringent specific permit conditions in the future. GAO found that EPA is not collecting complete and consistent cost and other data, which hampers assessment of program burden.

The 1999 Phase II rules were challenged by environmental groups. The litigation resulted in a 2003 federal court ruling (Environmental Defense Center v. EPA, 344 F.3d 832 (9th Cir. 2003)). The Phase II rules allowed permitting authorities to issue general permits for MS4 stormwater discharges and required regulated MS4s to submit a Notice of Intent (NOI) to be covered by the general permit. The court found that the Phase II rules failed to require review of NOIs and failed to make NOIs available to the public or subject to public hearings and directed EPA to revise the rules to correct these procedural shortcomings. Following the court's ruling, EPA issued guidance but did not propose revised rules. In 2014, the environmental groups sued EPA for failing to follow the court's nearly 12-year-old ruling. Under a settlement agreement with the environmental plaintiffs, EPA agreed to issue final revised rules by November 17, 2016.

The agency issued revised MS4 rules on November 17.[9] The new rule allows states to choose between two options for increasing scrutiny of the MS4s' compliance plants. It allows states and other authorities crafting general permits for small MS4s to either outline in the permit terms all compliance methods that are open to permittees, or set up a "two-step" process in which facilities that apply for coverage must add their compliance plans as enforceable permit terms, including a notice-and-comment process for each plan. According to EPA, the two-step general permit allows the permitting authority to establish some requirements in the general permit and others applicable to individual MS4s through a second proposal and public comment process. Most states reportedly were pleased that the final rule provides permitting authorities with flexibility, although a few states said that allowing states to choose the regulatory approach would be more time-intensive and expensive than the system under the previous MS4 rules. Environmentalists' responses to the new rule were mixed, with some supporting EPA's actions and saying that the revised rule would lead to tighter controls on MS4 permits, but others contending that the rule's flexibility would make oversight by the public more difficult.

Congressional Interest

Prior to issuance of the final Phase II rule in 1999, Congress included language in EPA's FY2000 appropriation bill (P.L. 106-74) directing the agency not to issue the final rule before submitting a detailed impact analysis to Congress. To meet a court-ordered deadline for the regulation, EPA released the report concurrently with the Phase II rule.[10] In the 106th Congress, legislation was introduced to exempt construction sites of less than 5 acres and certain above-ground drainage ditches from stormwater permitting requirements. At a 1999 Senate hearing, EPA witnesses opposed the bill, saying that above-ground drainage ditches and small construction sites are significant sources of water pollution and thus should be subject to stormwater management requirements. No further action occurred.

[9] A prepublication version of the *Federal Register* Notice for the rule is available at https://www.epa.gov/npdes/npdes-stormwater-final-ms4-general-permit-remand-rule.

[10] U.S. Environmental Protection Agency, Office of Water, *Report to Congress on the Phase II Storm Water Regulations*, EPA 833-R-99-001, September 1999, http://www.epa.gov/npdes/pubs/ReptoCong_PhII_SWR.pdf.

In response to concerns about program impacts and costs, the 107th Congress enacted legislation allowing states to use Section 319 grant funds, which are used for projects to manage nonpoint sources of water pollution, for projects or activities related to developing and implementing a Phase II stormwater program (§301 of P.L. 107-303). This authority only applied to Section 319 funds in FY2003. Legislation to extend this authority beyond FY2003 was introduced in the 108th Congress, but was not enacted.

Oil and Gas Facilities

As the March 2003 Phase II deadline approached (affecting small municipalities and construction sites), EPA proposed a two-year extension of the rule for small oil and gas exploration and production facility construction sites to allow the agency to assess the rule's economic impact on that industry. EPA had initially assumed that most oil and gas facilities would be smaller than one acre in size and thus excluded from Phase II rules, but newer data indicated that up to 30,000 new sites per year would be of sizes subject to the rule. In March 2005 EPA extended the exemption until June 2006 for further study and said it would issue a specific rule for small oil and gas construction sites by that date. The postponement did not affect other industries, construction sites, or small cities covered by the 1999 rule. Under the 1987 amendments to the CWA, the *operations* of facilities involved in oil and gas exploration and production generally were exempted from compliance with stormwater runoff regulations (so long as the runoff is uncontaminated by pollutants), but the *construction* of associated facilities was not.

Omnibus energy legislation enacted in the 109th Congress (P.L. 109-58, the Energy Policy Act of 2005) included a provision addressing this issue. Section 323 amends the CWA to specifically include construction activities at *all* oil and gas development and production sites, regardless of size (including sites larger than 5 acres, previously covered by Phase I), in the law's general statutory exemption for oil and gas facilities from stormwater rules. Its intention was to exempt from the CWA all uncontaminated stormwater discharges that occur while setting up drilling operations.

Oil and gas officials, who supported the provision, said that the existing EPA stormwater rules create time-consuming permitting requirements, even though the short construction period for drilling sites carries little potential for stormwater runoff pollution. Opponents argued that the provision did not belong in the omnibus energy legislation and that there is no evidence that construction at oil and gas sites causes less pollution than other construction activities, which are regulated under EPA's stormwater program.

EPA promulgated a rule to implement Section 323 in 2006.[11] The rule was criticized by some interest groups and Members of Congress who argued that EPA had exceeded its authority by broadly defining the scope of contamination that is exempted by the rule beyond the statutory language to also include stormwater discharges contaminated solely with sediment. In May 2008, a federal court held that the rule is arbitrary and capricious, and it vacated the rule.[12] EPA petitioned the court to rehear the case, but the request was denied—thus, the exemption is no longer in effect. At the time, EPA said that it intends to issue a revised rule that would remove the 2006 rule from the Code of Federal Regulations consistent with the court vacatur and codify the

statutory exemption in P.L. 109-58, but the agency has not proposed any revisions or announced a specific schedule for doing.

Legislation to repeal Section 323 was introduced in the 109th Congress, but no further action occurred. In the 111th Congress, legislation to repeal the exemption passed the House (the provision was Section 728 of H.R. 3534, the Consolidated Land, Energy, and Aquatic Resources Act), but it was not enacted. In the 114th Congress, a bill has been introduced to repeal the oil and gas exemption enacted in P.L. 109-58. This bill, H.R. 1460, also would direct the Secretary of the Interior to conduct a study of stormwater runoff from oil and gas operations that may result in contamination. Similar legislation was introduced in the 113th Congress.

Stormwater Management at Federal Facilities

Congress often looks to federal agencies to lead or test new policy approaches, a fact reflected in legislation passed in 2007. Section 438 of P.L. 110-140, the Energy Independence and Security Act (EISA), requires federal agencies to implement strict stormwater runoff requirements for development or redevelopment projects involving a federal facility in order to reduce stormwater runoff and associated pollutant loadings to water resources. The legislation requires agencies to use site planning, construction, and other strategies to maintain or restore, to the maximum extent technically feasible, the predevelopment hydrology of the property.

To assist agencies in meeting these requirements, EPA issued technical guidance.[13] The guidance provides two options for meeting the performance objective of preserving or restoring the hydrology of a site: retaining the 95th percentile rainfall event (i.e., managing rainfall on-site for storm events whose precipitation total is less than or equal to 95% of all storm events over a given period of record), or site-specific hydrologic analysis (i.e., using site-specific analysis to determine predevelopment runoff conditions). According to the guidance, using a performance-based approach rather than prescriptive requirements is intended to give site designers maximum flexibility in selecting appropriate control practices. Issuance of the guidance also fulfilled an element of an October 2009 executive order that formally assigned to EPA the responsibility to issue the Section 438 guidance, in coordination with other agencies, and to do so by December 5, 2009.[14]

In December 2010 Congress passed legislation requiring federal agencies to pay local fees for treating and managing stormwater runoff. The legislation amends CWA Section 313, which requires federal agencies to comply with all federal, state, and local water pollution control requirements as nongovernmental entities, including the payment of reasonable service charges. The issue emerged earlier in 2010 when several federal agencies announced that they would not pay stormwater fees assessed by the District of Columbia, claiming that the fees amounted to a tax that the agencies were not required to pay, because the waiver of sovereign immunity in Section 313 applies to fees and charges, but not a tax. The legislation was intended to clarify uncertainty over whether federal agencies must pay local stormwater fees. President Obama signed the legislation in January 2011 (P.L. 111-378).

[13] U.S. Environmental Protection Agency, Office of Water, Technical Guidance on Implementing the Stormwater Runoff Requirements for Federal Projects Under Section 438 of the Energy Independence and Security Act, EPA 841-B-09-001, December 2009, http://www.epa.gov/owow/NPS/lid/section438/pdf/final_sec438_eisa.pdf.

[14] Executive Order 13514, "Federal Leadership in Environmental Energy and Economic Performance," 71 *Federal Register* 52117-52127, October 8, 2009.

A continuing aspect of the issue of interest in a few locations is the scope of P.L. 111-378 and whether it requires the government to pay local stormwater fees retroactively. After the Bonneville Power Administration objected to paying retroactive stormwater fees imposed by two Washington localities following passage of the federal facility amendment, the matter ended up in federal court. The government took the position in the litigation that the legislative change amounted to a redefinition of "service charges," instead of a clarification of Congress's original intent, and would only apply prospectively. In 2012, a federal district court rejected the government's position and held that the CWA amendment was merely a clarification of the statute and thus is entitled to retroactive effect.[15] The federal government did not appeal this ruling. A similar case in Georgia was dismissed following a settlement agreement between the parties, but the settlement did not resolve lingering questions whether stormwater charges are fees for "reasonable services provided" or taxes, an issue of concern more broadly than just regarding government facilities.

EPA's Stormwater Rulemaking

In 2006 EPA requested the National Research Council of the National Academy of Sciences (NRC) to conduct a review of the existing stormwater regulatory program. The resulting report, issued in 2009, called for major changes to EPA's stormwater control program that would focus on the flow volume of stormwater runoff instead of just its pollutant load. The committee observed that—

> stormwater discharges would ideally be regulated through direct controls on land use, strict limits on both the quantity and quality of stormwater runoff into surface waters, and rigorous monitoring of adjacent waterbodies to ensure that they are not degraded by stormwater discharge.... Presently, however, the regulation of stormwater is hampered by its association with a statute that focuses primarily on specific pollutants and ignores the volume of discharges.[16]

The NRC report recommended that EPA adopt a watershed-based permitting system encompassing all discharges—stormwater and wastewater—that could affect waterways in a particular drainage basin, rather than individual permits that do not account for cumulative conditions from multiple sources in the same watershed. Under the proposed watershed permitting strategy, responsibility to implement watershed-based permits and control all types of municipal, industrial, and construction stormwater discharges would reside with MS4 permittees. The report criticized EPA's current approach, which leaves much discretion to regulated entities to set their own standards through stormwater management plans and to self-monitor. As a result, enforcement is difficult and variable, and information to assess the water quality benefits of the regulatory program is limited. The report also noted that adequate resources, including new levels of public funds, will likely be required to operate a more comprehensive and effective stormwater permitting program.

Subsequently, EPA initiated information-gathering and public dialogue activities as a prelude to possible regulatory changes that would respond to the NRC's criticism of inconsistency in stormwater requirements nationally and embrace the report's recommendation to adequately control all sources of stormwater discharge that contribute to waterbody impairment. EPA proposed to collect data from MS4s, states, and industry entities involved in developing or redeveloping sites on the scope of the current regulatory program and management practices, as

[15] United States v. Renton, W.D. Wash., No. C11-1156JLR, May 25, 2012.

[16] *Supra* note 5, p. 3.

well as information on control, pollution prevention technologies, and BMPs applied to stormwater discharges from newly developed and redeveloped sites.[17]

In response to the NRC report, EPA began work to develop a rule to revise the existing stormwater regulatory program. The rule also followed a 2010 settlement agreement between EPA and environmental litigants, which called for EPA to revise existing rules "to expand the universe of regulated stormwater discharges and to control, at a minimum, stormwater discharges from newly developed and redeveloped sites."[18] In the settlement, EPA committed to consider supplemental provisions as part of the national rule that would apply only to the Chesapeake Bay watershed, a region where municipal stormwater discharges are a significant cause of water quality impairment and are one of the only sources of pollutants with increasing loads to the Bay and its tributaries.

In early 2010 EPA held a series of listening sessions across the country as part of a process seeking public comments on potential considerations for regulatory changes.[19] The agency also sent survey questionnaires to property owners and developers, municipal sewer system authorities, state regulators, and EPA regional offices to obtain their input. Some industry groups reportedly criticized possible expansion of the current program, saying that EPA's authority to regulate stormwater does not extend to regulation of post-construction discharges. Some states also said that EPA lacks the technical knowledge to regulate stormwater across the nation, while states with comprehensive regulations, such as Florida and Maryland, demonstrate that regulation is best done at the state and local level, because of locational differences in stormwater discharges. EPA officials noted that a number of states have developed their own stormwater management programs, particularly in the Northeast, where lawsuits have pushed regulators, and also in some high-precipitation states in the Northwest. A number of commenters urged EPA to ensure that performance standards designed to reduce storm runoff be flexible so that communities can create requirements appropriate to their stormwater needs. Cost is a key issue raised by some states and municipalities concerned about the possibility of mandatory retrofit requirements that would impose a significant economic burden on cities.[20] Some state and local government representatives—while they concerned about details of a rule—believed that a national rule would provide needed uniformity and consistency in stormwater programs across the nation.

During efforts to develop a national rule, EPA explored regulatory options that would strengthen the regulatory program by establishing specific post-construction requirements for stormwater discharges from new development and redevelopment, which currently are not regulated. While MS4s are required to address stormwater discharges from new development and redevelopment in their management plans, existing rules do not include specific management practices or standards to be implemented. Other options that EPA considered included expanding the area defined as MS4s to include rapidly developing areas, devising a single set of consistent regulations for all MS4s, and requiring MS4s to address stormwater discharges in areas of existing development through retrofit practices. EPA officials said that the rule would focus on

[19] U.S. Environmental Protection Agency, "Stakeholder Input; Stormwater Management Including Discharges from New Development and Redevelopment," 74 *Federal Register* 68617-68622, December 28, 2009.

[20] Examples of urban retrofits include breaking up concrete and installing stones, thereby replacing an impermeable surface with a permeable one that will absorb runoff; and adding vegetation and trees to parking lots.

stormwater discharges from developed, or post-construction, sites, such as subdivisions, roadways, industrial facilities, and commercial buildings or shopping centers, and to seek to ensure that even after development projects are completed, runoff levels from sites are equivalent to pre-construction hydrology. The proposal, referred to as the "post-construction rule," likely would set a first-time stormwater retention performance standard to limit runoff that would otherwise enter an MS4 system. By retaining a portion of rainfall on-site, the discharge of pollutants for that volume is prevented from entering the sewer system. Requirements in the post-construction rule, once finalized, would be incorporated into MS4 permits as permits come up for renewal.

The stormwater rulemaking drew some interest from Members of Congress. In 2013, Republican members of the Senate Environment and Public Works Committee urged EPA to suspend work on the rulemaking until the agency could seek meaningful input from small businesses and provide a report to Congress on the necessity for new stormwater regulations.[21]

Under the 2010 settlement with environmentalists, EPA was initially due to propose a national rule by September 2011 and complete the rule in 2014. Subsequently, the deadlines were renegotiated several times. Under the last deadline, EPA was to propose regulations by June 17, 2013, but EPA missed that deadline, and on June 18, the environmental plaintiffs notified the agency that it was in breach of the legal settlement. At that point, EPA and the plaintiffs had reached a legal impasse; EPA reportedly continued to work on the rule, while the environmental groups considered further legal action. Finalizing a rule with national application was said to be complicated by a number of analytic issues, particularly how to calculate costs and benefits of the proposal and how to incorporate flexibility, such as possibly including lengthy implementation plans for retrofit projects and allowing states with equivalent stormwater programs to regulate in lieu of EPA.

In mid-March 2014, EPA announced that it would defer action on the post-construction stormwater rule and instead will provide incentives, technical assistance, and other approaches for cities to address stormwater runoff themselves. In particular, the agency said that it will leverage existing requirements to strengthen municipal stormwater permits and will continue to promote green infrastructure as an integral part of stormwater management.[22]

Although EPA discontinued development of a national stormwater rule, the agency continues to pursue some of the ideas that the rule had been expected to incorporate, such as emphasizing on-site retention of stormwater at construction sites or requiring green infrastructure, when individual MS4 permits come up for renewal. These concepts are reflected, for example, in the MS4 permit for Washington DC, issued by EPA in 2013, and EPA's 2014 proposed MS4 general permit for Massachusetts; both were crafted by EPA, which is the NPDES permitting authority in DC and Massachusetts. In the majority of states, permitting authority has been delegated to states (see page 2). In those cases, environmental groups are reportedly pursuing a permit-by-permit approach of encouraging states to strengthen the terms of new and reissued MS4 permits.

SUBJECT: FY 11/12 Final Adopted Budget

Board Members:

On June 13, 2011, the Board approved the FY 11/12 recommended budget, part of a multiyear plan to return the county to structural balance. The Board then directed additions and corrections for FY 11/12 based on testimony during budget hearings. The final budget is now balanced, using reductions that total more than $31 million. The budget also incorporates more than $28 million in reserves and one-time sources exceeding $51 million, an amount higher than we had planned.

While this budget year has been challenging, we cannot rest. We already anticipate the budget for FY 12/13 will carry comparable fiscal challenges and fewer options. Revenue will likely slip further, difficult budget decisions again will be unavoidable and reserves offer only a dwindling lifeline.

Amid concerns about relying on speculative revenue and one-time funds for ongoing expenses, we cannot achieve structural balance in two years as originally planned. We must extend our fiscal recovery plan. We face a distressing FY 12/13 budget gap of over $80 million and our first hurdle is substituting for the $51 million in one-time money proposed in the current-year budget. We cannot rely every year on unpredictable one-time sources to fund ongoing services, but we are relying on them this year. Reserves for economic uncertainty upon budget adoption will be down to $125 million, backstopping a budget that could siphon a significant portion of those reserves if we do not act decisively.

Delaying final budget recommendations until September has reaped some benefit. We have a clearer picture of where the fund balance ended in FY 10/11 and can present budget options based on available year-end data rather than projections. The recommended budget was based on a beginning fund balance of $20 million; the total is closer to $45 million due to departmental savings of about $14 million, contingency

savings of about $19 million and discretionary revenue that was about $12 million higher than budgeted. The final budget recommendations in this document use $17.9 million of that additional fund balance to support $51 million in addbacks the Board endorsed and directed during budget formulation.

While discretionary revenue was $12 million higher than expected, Prop. 172 revenue growth was not as robust and increased by $4.3 million rather than $11 million originally projected. More importantly, many solutions proposed for avoiding public-safety reductions relied on Prop. 172 funds. The final budget recommendations in this document substitute $11.3 million in fund balance for Prop. 172 revenue. A table summarizing the revised Prop. 172 revenue allocations and additional use of general-fund balance is included as Attachment F. This backfill, while unsustainable, appears necessary to ameliorate immediate public-safety reductions.

Looking to the economy, data provided in the last few weeks from our economists at California State University, Fullerton, confirm negative assessed-valuation projections over the next two years. With state revenue receipts 10 percent ($583 million) below projections in July, the reports all suggest we should anticipate further declines in county revenue.

While the budget reflects the impact of state budget cuts and includes adjustments for anticipated realignment involving state corrections reform, the source of ongoing funding for these changes still is unclear. Additionally, the state has not released firm plans for other realignment elements, including public social services. Whether the state will fully fund realignment costs is unconfirmed, so we must limit our expenses to available funding. Departments should track all mandated costs. As in recent years, deferred state payments could jeopardize our ability to maintain core discretionary programs. Per Board direction, the Executive Office recommends suspending any programs for which state funding is withheld, and discontinuing programs for which state funding has been withdrawn.

Also, as in recent years, department heads are expected to manage spending to prevent additional demand on the general fund. Any general-fund budget request should be presented with the quarterly budget report, when it can be evaluated in the context of the latest economic data, departmental needs and any updates related to new resources.

Several potentially significant policy items already have been identified and will be presented for Board action in the first-quarter report. Contingency funds will have to be used if other revenue does not materialize. The Registrar of Voters anticipates costs for additional space needed to make election operations more efficient. State budget reductions also suspended reimbursement for costs related to vote-by-mail ballots. The Assessor wishes to add 10 essential positions not currently filled because of budget

reductions. Potential funding has been identified that would reduce the need for NCC in covering the costs for these positions.

Use of one time money has had to expand to support other policy decisions. For example, service increases have been ordered in the Detention Health and Mental Health medical system; reductions in fire stations and municipal staffing were not taken, so structural deficits in Fire remain; District Attorney reductions did not cover additional cuts to balance from the prior administration; and the Sheriff's proposals to close budget gaps may be uncertain.

What is certain is the significant and persistent gap between spending and the revenue available to support it. To reconcile, our choices are basic: reduce costs (particularly in payroll), shift costs, find new reoccurring revenue or depend on one time-revenue.

Next year, additional cuts in net county cost (NCC) should be expected. To be effective, cuts must apply to all NCC-funded departments. The principal impact of those cuts affects the public-safety group, which presently consumes more than 60 percent of NCC. Although NCC cuts should be targeted toward layoffs, the resulting staff cuts might not be tolerable for the Board because of the effect on the public safety group. Alternatively, if cuts were targeted only to non public safety, it is questionable whether the yield could bridge the budget gap.

An immediate hiring freeze in all departments would reduce payroll costs but also would disproportionately affect public-safety departments. I am mindful the Board rejected a proposed hiring freeze earlier this year.

Negotiated labor savings with employee bargaining units will reduce the depth of budget cuts. Proposals to shift pension costs are in negotiation and the Board could consider other compensation.

Turning to revenue-based options, we could direct staff to build budgets that anticipate significant one-time revenue. That option poses even greater risk if adequate revenue does not materialize, such as Prop. 172 funding. It limits Board flexibility and would require drastic cost-cutting to compensate in the event revenue falls below projections.

Other revenue-based alternatives could include drawing cash reserves from restricted funds and borrowing against assets. These options leverage cash assets or loans against facilities to pay for operations. They are not solutions and only increase future costs, delaying the return to a structurally balanced budget.

If we face further cuts to services, the prospect of reduced payroll and potentially reduced compensation, then departments must plan for another round of budget cuts and staffing turbulence in the next fiscal year. If so, we should also finalize plans for those cuts during the current fiscal year to ensure full savings in FY 12/13. Therefore, I will provide an early action plan for FY 12/13 for adoption with the first-quarter report on

November 1, 2011. However, I look forward to Board deliberation today on its preferred courses of action to guide that plan.

IT IS THEREFORE RECOMMENDED that the Board of Supervisors:

1) Approve Resolution No. 2011-243 (Attachment A) adopting the FY 11/12 budget including all elements approved in the recommended budget as well as final budget changes in authorized positions on Schedule 20 (Attachment C), amending the existing Ordinance 440;
2) Approve Resolution No. 2011-244 (Attachment B) confirming the occurrence of a public (Beilenson) hearing;
3) Approve the recommendations for budget changes (Attachment D);
4) Approve the updated summary budget schedules 21-23 (Attachment E);
5) Receive and file the Prop. 172 distribution report (Attachment F);
6) Receive and file the economic update from Cal State Fullerton (Attachment G);
7) Ratify the CEO proposal for targeting future NCC cuts to reduce payroll.

Respectfully submitted,

Bill Luna
County Executive Officer

FINAL CHANGES TO FY 11/12 RECOMMENDED BUDGET

GENERAL OVERVIEW

FY 10/11 ended with the County of Riverside still waiting for economic recovery, a rational state budget, and fiscal certainty. The data does not yet conclude that our local economy has hit bottom. Sales taxes were up modestly in FY 10/11 and the foreclosure rate continues to fall, though the number of foreclosures is still very high. These improvements must be considered in light of unemployment that persists near a historic high and property values that fell slightly again this year. At the state level, real reform seems to be under way. While this is necessary, most of the financial details of the reform's centerpiece (realignment) still are uncertain. As we struggled to balance our own budget while preserving essential services, general-fund departments adjusted to a third year of cuts while preparing for what they had hoped would be a final cut in FY 11/12. Unfortunately, it now appears additional cuts will be necessary in FY 12/13.

The Board has held to its two-fold goal of balancing the budget while preserving reserves. Unfortunately, our local economy has been more adversary than ally in this effort. Soft revenue, particularly property taxes, has left us short of budget balance. As of June's recommended budget, we are $28 million short of balance and reserves are at the lower end of manageable levels.

Closing the gap can be accomplished only with additional cuts to general-fund departments. Savings could come through labor negotiations or by again decreasing net county cost (NCC) support for departments. The actions in this document do not close the remaining budget gap.

Additional appropriations of $25 million for Board directed add-backs are recommended for critical services. An additional budget adjustment of $1.4 million for the Public Defender is on the same agenda for Board approval. The additions are funded with about $9 million of new ongoing revenue and about $16 million in one-time revenue from beginning balance and other sources. Unless we identify new, ongoing revenue to replace one-time funds, the structural deficit will continue grow.

FY 11/12 REVENUE UPDATE

Dr. Adrian R. Fleissig and Dr. Mira Farka (CSUF) have provided an update to the economic forecast report that went to the Board during the FY 11/12 budget process. The full report is included with this document as Attachment G. This forecast will be one of the tools used by the Executive Office as it begins early planning for the FY 12/13 budget.

One central theme of the report is that our local economic recovery will be slow and protracted. Continued weakness in jobs, unemployment, and real estate prices are expected, specifically:

- Job growth should resume at a slow and uneven pace, unable to offset job losses from the recession.
- Unemployment will remain in double-digits during 2012 and 2013.

- Weakness in the housing market will persist due to high foreclosures and distressed properties.
- Commercial real estate sector is not expected to recover noticeably over the next twelve months.

Our recurring discretionary revenues – property tax, supplemental property tax, sales tax, Teeter funds, document transfer revenue, interest, and a few others – came in very nearly on target. The revenue with the largest reduction, Teeter, was balanced by a dramatic recovery in supplemental property taxes. Four unbudgeted items that totaled about $13 million represent the net extra supplemental revenue that contributed to the new year's beginning balance. These three revenues included a state payment for SB 90 claims, unclaimed money, the release of old reserves, and proceeds from selling county property to the courts.

Solid sales tax revenue in the first half of the year was followed by generally disappointing numbers in the second half. Early encouraging projections were not realized. The FY 10/11 drop in sales tax revenue, due to city incorporations, was not as steep as expected, though the decline will continue in FY 11/12. Particularly disappointing were the final numbers for Prop. 172. Early projections called for $11 million in growth but the actual increase was little over $4 million.

Guarded optimism continues to be the reasonable course. Property taxes, Teeter and interest revenue are projected to fall slightly in the new year. Sales tax (not including new city incorporations), Prop. 172 and document transfer revenues are forecast to be up modestly. As a whole, discretionary revenue will probably end FY 11/12 slightly below what was generated in FY 10/11. Revenue growth will not provide this year's final step to a balanced budget. Further, there are no indications that strong revenue growth can be expected for the following fiscal year.

BEGINNING FUND BALANCE

Each year's beginning fund balance is generated from leftover contingency, department savings, and extra discretionary revenue. The final, audited amount will be calculated with the Comprehensive Annual Financial Report (CAFR) in December; however, the Executive Office and Auditor-Controller were able to accurately estimate the beginning balance at $45 million. The recommended budget assumed $20 million in beginning balance, so there is $25 million additional beginning balance to build into the final/adopted budget. This was generated by departments staying within their budgets.

BOARD OF SUPERVISOR FUND BALANCE AND RESERVE POLICY

To make fund balance information presented in governmental financial statements more useful, the Governmental Accounting Standards Board (GASB) issued GASB Statement No. 54 (GASB 54), *Fund Balance Reporting and Government Fund Type Definitions*. GASB 54 shifted the focus of fund balance reporting from the availability of fund resources for budgeting to the extent to which the government is bound to honor spending constraints

on those fund resources. As mandated by GASB 54, Board Policy A-30 – *Government Fund and Reserve Balance* – will be brought before the Board for review and approval on today's agenda. The final budget recommendations will result in fund balance levels that are consistent with the new policy.

STATE BUDGET IMPACT – REALIGNMENT

Realignment of the state's health, social, and safety programs to counties will cause little disruption if adequate funding accompanies our added responsibilities. County departments such as Probation, Mental Health, and Department of Public Social Services (DPSS) are prepared to adjust as needed. What remains to be seen is whether lawmakers provide appropriate supporting revenue.

Initial statewide changes are supported by the $5.1 billion provided in FY 11/12, with that amount projected to increase to $6.4 billion in FY 14/15. Financing comes from a dedicated portion of state sales tax revenue and vehicle license fees. However, the funding provisions are not guaranteed. They will be operative only if ballot measures prior to November 17, 2012 authorize continued dedicated state revenues to realignment. Further, realignment is being implemented thus far without constitutional safeguards that county governments sought.

The impact of the new state budget on individual departments is felt most strongly in public safety, mental health, the hospital, and DPSS.

PUBLIC SAFETY

Probation will not close its Twin Pines or Van Horn youth facilities. The Youth Accountability Teams will also continue operating. The Citizens Options for Public Safety (COPS) and Juvenile Justice Crime Prevention Act programs were also included in the state budget. Previously, these efforts were funded with a share of the temporary increase in VLF and sales tax, which sunset on June 30, 2011 and were not extended. The state included these programs under realignment funding. Realignment implementation has been delayed until October 1, 2011 and is funded for nine months.

Counties will provide treatment, supervision, and incarceration of the non-violent, non-serious, non-high risk sexual offenders. Funds also are designated for start-up, planning, and technical assistance. To address the impact of this realignment:

- A community corrections partnership (CCP) established to develop local strategies. Membership is mandated and the partnership is chaired by the chief probation officer.
- An allocation of approximately $21 million will be shared by the Probation Department, Sheriff's Department and other CCP partners such as the Department of Mental Health and police departments. Probation is the designated fiscal administrator for the management of funds received.

- An additional one-time allocation of approximately $1.5 million will be provided for initial implementation costs as well as $200,000 for CCP planning.
- A separate allocation of $755,421 will be shared by the District Attorney and Public Defender. The allocation for the courts will be established at a later date.

MENTAL HEALTH

The realignment of mental health programs is funded with a one-time redirection of Mental Health Services Act (MHSA) dollars. If state revenue is less that estimated and triggers are implemented in January 2012, the department may be affected. Impacts are unknown at this time but the department will continue to monitor and update as appropriate.

RIVERSIDE COUNTY REGIONAL MEDICAL CENTER (RCRMC)

RCRMC anticipates a new revenue reduction of approximately $4 million due to the implementation of a fee on intergovernmental transfers for the operation of Medi-Cal managed care plans and the transfer of federal funds to cover state expenses for uncompensated care. The state retained hospital-fee revenue of approximately $2.4 million. RCRMC will implement cost-saving measures and continue to monitor expenses.

DEPARTMENT OF PUBLIC SOCIAL SERVICES (DPSS)

State funding for CalWORKs, In-Home Support Services (IHSS) administration, foster care, and adoptions assistance is expected to decrease by $7 million. In addition, the department estimates that $1.4 million in additional NCC support may be needed to offset the loss of child support collection revenue retained by the state. The department will adjust programs and reduce costs to mitigate the impacts and will report on actual needs in the first quarter.

DPSS anticipates increased federal and state revenue of $1.6 million for CalFresh administration due to projected caseload growth. There is no impact to the general fund.

If revenue falls short of state projections and triggers are implemented, DPSS estimates that $9.2 million in funding for IHSS anti-fraud efforts and IHSS service hours will be at risk. Reductions to child care funding are unknown at this time, but could be significant.

ITEMS RAISED DURING BUDGET HEARINGS

The Board approved the recommended budget for FY 11/12 on June 13, 2011. Included within the recommended budget were almost $24.4 million in addbacks for Probation ($2 million), Fire ($2.4 million), and DPSS ($20 million). During budget hearings, several departments presented additional information for Board consideration with final budget recommendations. Based on Board direction during hearings, the Executive Office has updated the recommended budget and presents the following changes for adoption.

ONE-TIME MONEY IN FY 11/12 BUDGET
In millions of dollars

Department	Use of Fund Balance	Prop. 172 Surplus Use	Other Revenue Source	Total Additions
Probation	-	-	1.98	1.98
Fire	0.6	0.5	2.4	3.5
DPSS	-	-	20.0	20
District Attorney	2.2	1.6	-	3.8
Sheriff	7.7	5.8	-	13.5
Juvenile Hall	0.5	0.6	-	1.1
Assessor	-	-	0.75	0.75
Public Defender	1.4	-	-	1.4
Detention Health	3.7	-	-	3.7
MH - Detention	1.8	-	-	1.8
Total	**17.9**	**8.5**	**25.1**	**51.5**

It should be noted that the request from the Public Defender for $1.4 in additional funding was presented following the official close of budget hearings. The request will be presented as a separate item on the same agenda for Board approval.

The following narrative provides an overview of the items raised during budget hearings. The associated budget adjustments have been detailed on Attachment D.

ASSESSOR-CLERK-RECORDER

The Assessor-Clerk-Recorder reported that cuts to its operations would likely delay the completion of the 2012 assessment roll and assessment appeals. The department has requested funding for 10 appraisers at an annual cost of $75,000 each. The funding is needed to maintain operations at a level that will allow assessment related processes to be completed without delay. The Executive Office recommends that the Board approve the department's request. Total projected shortfall to be funded is $750,000.

Since the close of budget hearings, the department has identified revenue related to a newly established penalty for failing to report a change of ownership or change in control of a legal entity. This revenue could reduce the need for additional general fund use. An accurate estimate of that revenue will not be available until January 2012. The Board will receive an update during the midyear budget report.

DETENTION HEALTH SERVICES (DHS)

DHS provides medical services to those in Sheriff's correctional facilities and Probation's juvenile detention facilities. Funding was directed to restore staffing. Total projected shortfall to be funded is $4.8 million, $1.1 million of which will be funded through Probation.

The balance of the shortfall ($3.7 million) will be supported with general fund balance from FY 10/11 and will restore the department to FY 09/10 service levels.

DISTRICT ATTORNEY

During budget hearings, the District Attorney presented a budget plan to meet the department's budget target. The plan reflected reductions in personnel costs and additional revenue sources. The total projected shortfall to be funded was $5.1 million. About $1.6 million of the shortfall will be funded with new Prop. 172 revenue and $2.2 with FY 10/11 general fund balance. An anticipated $1.3 million in savings from the imposition of labor contract terms on the Riverside Sheriff's Association (RSA) will allow the department to meet its final budget target.

FIRE

The Fire Chief presented a budget plan that identified revenue sources and cost savings to meeting the department's budget target without closing fire stations or reducing municipal staffing levels. Fire reports that the total projected shortfall to be funded is $7.5 million. Although revenue enhancement related to American Medical Response services was originally estimated to be $1.3 million, realistically there will be no additional revenue. About $500,000 of the shortfall will be funded with new Prop. 172 revenue and $600,000 with FY 10/11 general fund balance. An additional $1.6 million in savings from the pass-through of CalPERS rate reductions will assist the department with meeting its target. All in, the Fire Department has a continuing structural deficit of $4.8 Million. The bulk of the shortfall will be covered by the department through various cost containment measures and increased revenue, which would not result in the elimination of services.

MENTAL HEALTH - DETENTION

The department provides mental health services to individuals incarcerated in Sheriff's correctional facilities and Probation's juvenile detention facilities. To restore staffing at the Southwest Detention Center and augment current staffing at the Robert Presley Detention Center for 24/7 coverage, the department requested additional funding. Total projected shortfall to be funded is $1.3 million. This shortfall will be offset with the use of general fund balance from FY 10/11 and will restore the department to FY 09/10 service levels.

PROBATION

Budget reductions to detention health services have significantly impacted Probation's juvenile hall operations. To meet state and federal requirements for juvenile facilities at the lowest cost, funding is required to restore staffing for juvenile detention health services to minimum levels. Total projected shortfall to be funded is $1.1 million. About $600,000 of the shortfall will be funded with new Prop. 172 revenue and $500,000 with FY 10/11 general fund balance. The funds will be used to reimburse Detention Health Services for services provided at juvenile facilities.

REGISTRAR OF VOTERS

The Registrar of Voters recommended several improvements for the 2012 presidential

election cycle, including a temporary increase in operating space. The cost for temporary space is unknown at this time but will require additional funding. No additional adjustments have been made to the budget.

SHERIFF

On March 29, 2011, the Sheriff outlined the impact of budget reductions on the department's operations. In order to fully fund operations the Sheriff reported the department would need about $287 million in NCC funding. This would reestablish FY 09/10 levels, add for the cost of living adjustments, Prop. 172 revenue losses, internal service cost increases, expanded operations at the Larry Smith Correctional Facility, and merit/pension cost increases. Based on this information and a NCC target of $226 million, the Executive Office estimated the department had a funding shortfall of $62 million. This did not include $20 million related to detention health services, which could be funded within the RCRMC, Mental Health, or Probation budgets.

During budget hearings, the Sheriff presented a plan for meeting budget targets without layoffs. The alternate plan included service reductions, alternate revenue sources, and savings related to personnel costs. Total projected shortfall to be funded (as presented during the budget workshop) was $62 million. About $5.8 million of the shortfall will be funded with new Prop. 172 revenue and $7.7 million with FY 10/11 general fund balance. The department also intends to fund $3 million of its shortfall with the use of its subfunds. The balance of the shortfall ($40 million) will be funded with various savings and a contract for services with the newly incorporated city of Jurupa Valley.

The CEO observed that Jurupa Valley contract revenue was speculative. It should be noted that the Sheriff has stated there is some risk that alternate revenue identified for meeting the budget target will not materialize. The department has agreed to make the appropriate adjustments to operations to mitigate shortfalls in revenue. The following table illustrates the status of estimated savings and revenue as proposed by the Sheriff:

STATUS OF SHERIFF'S ESTIMATED SAVINGS/REVENUE
In millions

	Amount	Status
Imposition Savings (RSA)	$12.2	Ongoing
Personnel Savings (attrition/no expansion)	$7.8	Ongoing
Service reductions (patrol – unincorporated)	$5.1	Ongoing
Service reductions (SAFE Team)	$0.9	Ongoing
Service reductions (Aviation)	$1.0	Ongoing
Jurupa Valley Contract Service Revenue	$13.0	No active FY 11/12 contract negotiations
Total	**$40.0**	

The Sheriff anticipates a continuing structural deficit of $5.5 million with all savings and additional funding taken into account. The department requests a portion of its FY 10/11

budget surplus be used to cover the deficit for FY 11/12. The CEO has already recommended this budget surplus be used to backfill the shortfall caused by the lower than expected growth in Prop. 172 revenue.

OTHER CORRECTIONS TO THE RECOMMENDED BUDGET

As required by law, several proposed revisions were submitted to the Clerk of the Board and made part of the public record prior to the close of budget hearing. These revisions included budget adjustments related to the:

- Forms 11 requesting FY 11/12 budget adjustments approved by the Board after the recommended budget document went to print.
- Corrected position and asset reports (Schedules 20-23 to the recommended budget).

The Executive Office has incorporated these changes, as well as corrections to minor misprints and errors that did not require a budget adjustment, into the final budget recommendations for adoption by the Board.

RESOLUTION NO. 2011-243

RESOLUTION OF THE BOARD OF SUPERVISORS OF THE COUNTY RIVERSIDE ADOPTING THE FISCAL YEAR 2011/12 BUDGET

BE IT RESOLVED AND ORDERED by the Board of Supervisors of the County of Riverside, State of California, in regular session assembled on September 13, 2011, that pursuant to Sections 29080 through 29092 of the Government Code, the budget of the County of Riverside, including all districts, agencies, and authorities governed by this Board, is hereby adopted for Fiscal Year 2011/12, in accordance with the financing requirement of the recommended budget, less such deletions and reductions plus such additions and increases as have been made by order of this Board during and after the final budget hearing commenced on June 13, 2011, and prior to the adoption of this resolution, said adoption being by reference to the financing requirements of the recommended budget on file with the Clerk of this Board and the minutes of this Board as to changes therein, and that said final budget consists of:

(a) Appropriations by objects of expenditures within each budget unit;

(b) Other financing uses by budget unit;

(c) Intrafund transfers by budget unit;

(d) Transfers-out by fund;

(e) Appropriations for contingencies by fund;

(f) Cancellations and provisions for reserves and designations by fund and purpose;

(g) The means of financing the budget requirements;

(h) The gross appropriations limit and the total annual appropriations subject to limitation; and

(i) Amendment of Ordinance No.440 regarding authorized positions by budget unit.

BE IT FURTHER RESOLVED that within the object of Salaries and Employee Benefits, the object of Services and Supplies, the object of Other Charges, and the subobject of Fixed Assets for Equipment, for each budget unit, the listing of items are only for convenience, and shall not restrict expenditure, within the limits of the total appropriation for the specified object or subobject, by the official responsible for that budget unit except as otherwise provided by procedures and adopted by the Board of Supervisors.

RESOLUTION NO. 2011-244

RESOLUTION OF THE BOARD OF SUPERVISORS OF THE COUNTY OF RIVERSIDE CONFIRMING THE OCCURRENCE OF A PUBLIC (BEILENSON) HEARING

WHEREAS, the Board of Supervisors, scheduled a public hearing, also known as a Beilenson Hearing on May 16, 2011, to consider proposed reduction of medical services at certain Riverside County Department of Public Health Family Care Centers and California Children Services as required by Health & Safety Code section 1442.5, subd. (a):

WHEREAS, public notice of the May 16, 2011 hearing was given as required by Health & Safety Code section 1442.5, subd. (a);

WHEREAS, the public hearing occurred at the time and place set forth in the public notice during which the Board of Supervisors received public comment and information on the proposed reduction of medical services; now therefore,

BE IT RESOLVED by the Board of Supervisors of the County of Riverside, State of California, in regular session assembled on September 13, 2011, that prior to its decision on the proposed reduction of medical services at certain Riverside County Department of Public Health Care Centers and California Children Services, the Board of Supervisors held a public hearings as required by Health and Safety Code section 1442.5, subd. (a).

Assistant County Executive Officer

Executive Office, County of Riverside

May 30, 2011

Honorable Board of Supervisors
County of Riverside
Robert T. Andersen Administrative Center
4080 Lemon Street, 5th Floor
Riverside, CA 92501-3651

SUBJECT: FY 11/12 Recommended Budget

Board Members:

Attached is my FY 11/12 recommended budget for your consideration and approval. Approval of this budget provides needed spending authority beginning July 1, 2011. My staff will construct the final budget after budget hearings scheduled on June 13, 2011. The final budget, scheduled for adoption September 13, 2011, will build upon the recommended budget that is before you today, with adjustments at your direction.

Determined to eliminate the growing structural deficit, Board members set a two-year goal to balance the budget; this budget approaches that goal. Because it remains your highest priority, public safety was cut less than other functions, but all general-fund departments sustained painful reductions.

The structural deficit that soared to $130 million will be about 5 percent ($28 million) of general-fund discretionary revenue when we start the new fiscal year. There was no way to get to this point easily - services have been reduced and the workforce funded by the general fund is down 9 percent since September 2008. The Board's fiscal discipline has allowed us to avoid what might otherwise have been a disastrous year. We have met our fiduciary duty but core services are being reduced.

With passage of this budget, the reserve for economic uncertainty will fall to about $120 million, or 21 percent of general-fund discretionary revenue. Much lower and we lose flexibility and become vulnerable to even a small solution aimed our way when the state addresses its budget crisis. For context, rating agencies would likely prefer a number over 30 percent.

Last year, Moody's rating service put us on negative outlook, warning that without significant reform we would be downgraded. This year, we have avoided a downgrade but all rating agencies judge that Riverside County will have to improve to remain in the group of AA-rated California counties. While we benefit by our Board's resolve and our underlying economic drivers, our deficit, our shrinking reserves, and the state's budget woes still present significant challenges.

County-retained economists from Beacon Economics and Cal State Fullerton agree our local economy is out of recession and slowly improving. Economic news is better than a year ago but still mixed. Riverside County faces persistently high unemployment and assessed values show no sign of substantial increases in the near term. Although we still have challenges we hope the worst has passed.

This recommended budget includes difficult choices, carefully crafted with information gathered as we moved from budget workshops in November through department-head testimony in April about the effects of budget cuts.

- Public-safety departments are cut 3 percent to 5 percent of net county cost (NCC).
- Other departments generally are cut an average of 19 percent of NCC with a few exceptions.
- Staff reductions will continue.

Most labor unions and management have sustained temporary 10 percent wage reductions. Spread out over a year or two, payroll savings have helped the county preserve vital services and jobs. The last two unions to address sacrifice are public-safety employee unions.

The county also is preparing for expected increases in retirement benefit costs. Both CalPERS and our own actuary agree that increases over the next few years will be sizable. Year-over-year increases of $20 million are possible and the costs of current retirement benefits are unsustainable in the longer term. Realizing this the Board has directed that all ongoing labor negotiations include a discussion of two major potential shifts: 1) that employees pay more of their own retirement costs; and 2) that all new employees have a retirement benefit package lower than the existing benefit.

Built on conservative principles, this budget recognizes challenges in the economy. The state budget is sure to hurt the county but we cannot accurately predict the full effect until the state budget is approved. Should the approved budget ultimately be similar to the governor's May Revise budget, our departments' existing budgets should be able to accommodate the additional state cuts. Our final budget is scheduled for adoption on September 13, 2011 to allow for any benefit from year-end fund balance and state impacts. Should the adopted state budget create greater impacts on our finances, adjustments will be recommended at that time or in the quarterly reports. We also have directed departments to prepare plans in the event a realigned revenue stream is not established.

During budget impact workshops at the end of March two issues were raised. As we go to print new information has been presented:

- The Sheriff previously indicated his budget would be short by $60 million and would trigger substantial layoffs of both sworn and non-sworn employees. Serious reductions in patrol and corrections would result. The Sheriff has since reviewed his budget options and now recommends additional revenue. Cost savings would be added to reduce the overall shortfall to $16.5 million.
- Concern was expressed over reductions in funding for jail inmate health and mental health care. The department managers for RCRMC and Mental Health, along with the Sheriff, have reviewed the need for improved service levels. They recommend that a return to the FY 09/10 budget level of $20.9 million would provide an appropriate enhancement to meet inmate and youth offender needs in accordance with the intent of legal requirements. This would require an appropriation of $6.6 million beyond what is included in the recommended budget.

The following are my recommended motions to initiate the final steps of the two-year budget plan. My budget summary on the following pages details the differences between this year's and next year's budget.

IT IS THEREFORE RECOMMENDED that the Board of Supervisors:

1) Approve the FY 11/12 recommended budget effective July 1, 2011, including: appropriations and estimated revenue, reserves and designations, Resolution No. 440-8862 modifying position levels (included in the budget report as Schedule 20), and fixed assets and vehicle requests;
2) Tentatively schedule adoption of the final budget for Tuesday, September 13, 2011;
3) Direct the Executive Officer to make the personnel changes, including necessary layoffs, which are incorporated in this budget document; and
4) Open budget hearings.

Respectfully submitted,

BILL LUNA
County Executive Officer

RESOLUTION NO. 440-8862

BE IT RESOLVED BY THE Board of Supervisors of the County of Riverside, State of California, in regular session assembled on June 13, 2011 that pursuant to Section 5.A of Ordinance No. 440, the County Executive Officer is authorized, with an operative date of July 01, 2011, to make changes to the existing Departmental Section of Ordinance No. 440 as listed in Schedule 20 to the FY 11/12 recommended budget, a copy of which is attached hereto and by this reference made a part hereof.

(This Page Intentionally Left Blank)

GENERAL OVERVIEW AND STATE BUDGET

While most economists agree that the recession has officially ended, the most optimistic economic forecasts project slow growth, if any, over the near future. Reminiscent of this last fiscal year, the county's budget plans for FY 11/12 anticipate little help from the economy or the state. Reports of stabilizing job and housing markets produce guarded optimism at best. Locally, the unemployment rate as well as housing foreclosures have been trending downward. This trend fuels the hope that the worst is in the past.

In March, the Governor proposed the FY 11/12 state budget that addressed the $26.6 billion budget deficit with spending cuts, tax extensions, and other solutions. Spending cuts and the first phase of the Governor's realignment plan were approved by the state legislature. The effect of these items has been reflected in the impacted departments' budgets. Further progress was hindered when the Governor was unable to obtain the support for the other provisions, including the extension the current sales tax and vehicle licensing fees for five years, within his budget plan.

The May revisions to the budget have been released and represent the Governor's best effort to close the budget deficit and address the state's ongoing fiscal problems. Although the revisions reflect positive revenue data for the beginning of 2011, the state continues to report an $11 billion budget shortfall. The May revise also reflects the Governor's preference for a balanced approach to meeting budget challenges although the impact of an all cuts approach was provided. The impact would include further reductions in CalWORKs, eliminating domestic and related services for IHSS recipients, capping Medi-Cal coverage, and making deeper reductions to developmental services. The Governor also notes that if the dedicated funding stream for realignment is not passed, many of these programs would be eliminated. The county's strategy is to keep current budget tactics unchanged and to direct departments to develop a state budget impact mitigation plan that can be executed as early as July 2011.

COUNTY DISCRETIONARY REVENUE

A $10.1 million decline in discretionary revenue is projected for FY 11/12. This decline includes a loss of $2.0 million in franchise fees, $1.7 million in sales taxes, $0.9 million in interest income, and $1.7 million in other miscellaneous revenue sources. See the table 4 on page 10 for more detail.

Most of Riverside's discretionary revenue is directly related to property values. Property taxes account for 46 percent of the revenue, 33 percent is from state property tax pass-throughs, and 6 percent is from delinquent property tax penalties. The property tax figure is based on the Assessor's preliminary Proposition 8 analysis of property valuation and it is expected the actual amount will not deviate significantly. The Auditor-Controller provides the property tax related estimates while the Treasurer-Tax Collector provides the estimates for interest income.

Three independent sales tax forecasts predict a moderate increase to sales tax revenue in the near term. This growth in sales tax revenue is not enough to compensate for tax

revenue that will be transferred (estimated to be approximately $7 million) to the new cities of Eastvale and Jurupa Valley. The county's safety sales tax revenue seems to have stabilized at $110.5 million in FY 09/10. It is expected to be between $117 and $121 million in FY 10/11. In FY 11/12, it is projected to be between $118 and $121 million. Additional revenue beyond $110.5 million is placed into a separate fund for public safety needs as directed by the Board.

The county's long-term outlook for discretionary revenue is gradually improving. What remains a matter of active debate is if the county will begin to see a recovery in FY 12/13. The optimistic camp (Beacon Economics) calls for a modest gain in property values, while the more pessimistic camp (Cal State Fullerton economists) forecasts continued falling property values. By all accounts, the growth associated with a significant portion of the county's discretionary revenue will be modest at best. The county is currently projecting a smaller revenue loss ($10 million) than last year's more than $33 million loss. While encouraging, the county will not grow its way out of its current economic difficulties any time soon.

STRUCTURAL DEFICIT

In FY 07/08, the first clear signs of economic deterioration became unmistakable. By the end of the next fiscal year, a sizeable disparity had developed between ongoing revenues and ongoing operating expenses. This disparity, or structural deficit, was projected to exceed $130 million in FY 10/11 if the Board did not exercise steadfast fiscal restraint. It has been the Board's preference to temper the impact of revenue declines with the use of general fund reserves and a multi-year reduction in general fund support. Distributing reductions over several years has allowed department managers to implement gradual changes to business processes while minimizing the severity of service cut impacts during any fiscal year.

With the approval of the FY 10/11 budget, the Board strongly affirmed its commitment to balancing the budget in two years while preserving reserves that were fast approaching critical levels. The Board is still on target to eliminate the structural deficit during FY 11/12. Toward that end, this budget contains about $55 million in cuts and reductions as well as the use of about $28 million from the reserve for economic uncertainty. This final year of cuts will put seemingly insurmountable pressure on county managers and staff to preserve essential services. Unfortunately, some services will be slowed or eliminated while some portion of the workforce will be lost to attrition and layoffs.

ACTIONS TAKEN TO OVERCOME BUDGET CHALLENGES

This budget is conservative and recognizes difficult economic conditions. Steps taken over the last few years to address some of the challenges include:

- Negotiation of increased employee participation in retirement costs
- Negotiation of second retirement tier for new employees

- Department-led control of general fund employment levels
- Implementation of Board-approved furloughs
- Implementation of countywide cost control efforts
- Reduction of the workforce through early retirement
- Reduction of the county's vehicle fleet
- Delay or cancellation of capital projects
- Revision or introduction of Board policies that improved business processes and cash management
- Organization of a long-term initiative to increase efficiency through information technology
- Organization of committees to evaluate pension policies and recommend reform as necessary

BUDGET WORKSHOPS, TESTIMONY, AND BEILENSEN HEARINGS

As in the previous year, the Board asked for early budget impact workshops. These budget workshops began in late March and included testimony from department heads. This input and the additional time to consider options allowed the Board to assign measured, targeted cuts to general fund departments.

On May 16, the Board heard testimony from two independent economists hired by the Executive Office. The economist from Beacon Economics forecast that the county's assessed valuation will remain relatively flat for FY 11/12, experience moderate growth in FY 12/13, and pick up in earnest during FY 13/14 and beyond. Beacon Economics prognosis was encouraging although it reported significant risks remain. The next economists from Cal State Fullerton communicated a more pessimistic view of the county's recovery. They predicted assessed valuation would remain relatively flat for the next two fiscal years with modest growth thereafter. They reported many risks to the forecasted recovery.

A Beilensen hearing was held for the Community Health Agency's Children's Services Unit following the economists report. Prior to making a decision to eliminate or reduce the level of medical services offered to the public, the Board is required to hold public hearings. The Board heard testimony from the department head and various members of the public. Comments from the Board indicated a desire to restore cuts so that service levels would remain unchanged.

Based on comments during the workshops and hearings, it is clear that public safety remains a high priority. However, the Board also recognizes the severity of cuts to other departments over the last few years and acknowledges that public safety cuts are necessary to preserve other core services important to the public. On average, public safety departments net county cost targets will be cut by four percent for FY 11/12.

Other departments will be cut an average of 19 percent. Layoffs are expected and displaced employees will be offered similar positions in other divisions, when possible.

FY 11/12 BUDGET HIGHLIGHTS

- Budget Impact workshops and department testimony allowed the Board to carefully consider general fund departments' challenges. The Board reaffirmed its goal of structural balance during FY 11/12.
- Community improvement funds will be reduced to $2.4 million for FY 11/12.
- General fund contingency is about 3.4 percent of discretionary revenue ($20 million), while the Board-approved benchmark is 4.0 percent of discretionary revenue ($23.3 million.) If Board commitments require additional appropriations, contingency funds may be used.
- Together the reserves for economic uncertainty and disaster relief total about 23 percent of discretionary revenue ($135.7 million). The Board-approved target minimum for these reserves is 15 percent of discretionary revenue ($87.3 million.)
- No ongoing general funds are appropriated in the recommended budget for new capital projects.
- The state's fiscal situation remains uncertain. Known cuts are included in this budget. Additionally, departments have prepared contingency plans for likely potential cuts. The county will address the state's revised budget proposal in its final budget, assuming the state has adopted a budget by that time. Board direction to minimize the use of the reserve for economic uncertainty offers a cushion to adjust to the effects of the state's budget plan.
- Layoffs will be necessary. Departments will work to minimize the effect on employees by offering new positions in other divisions, if possible. The first-quarter report will include an update.
- The general fund carryover at year-end, excluding reserves, was budgeted at $20 million. Historically, the carryover has been well over $40 million. Additional beginning fund balance may be available when the final budget is presented to the Board for adoption. This assumption envisions that some contingency funds will not be needed and can be carried forward.

COUNTYWIDE BUDGET SUMMATION

COUNTYWIDE SPENDING AND REVENUE

The FY 11/12 recommended budget establishes about $4.8 billion in appropriations for Riverside County. Countywide revenue is expected to remain stable at about $4.4 billion. The $386 million difference between appropriations and revenue is backed with fund balance, reserves, and designations. These sources represent revenue collected in earlier fiscal years.

The county's budget is divided into three fund groups: governmental, proprietary, and special district. Governmental funds account for basic services such as public protection, social services, and general administration. Proprietary funds reflect activities financed primarily by revenue generated from the activities themselves, such as the county hospital. Special districts are separate local governmental agencies created to perform governmental or proprietary functions within limited boundaries. When local taxes are inadequate or competing demands for existing tax dollars make it difficult for the county to provide all of the services county constituents' desire, they form special districts to pay for new or higher levels of existing services. The following table provides a fiscal year comparison of the county budget by fund group.

Table 1

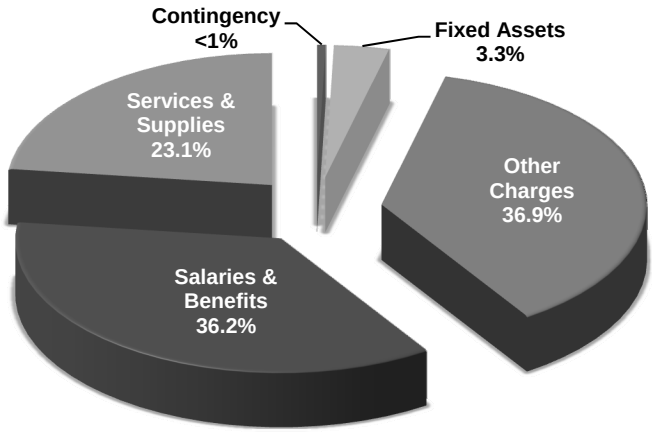
Fiscal Year Comparison of the County Budget
(In Millions)

Estimated Appropriations	FY10/11 Adopted Budget	FY11/12 Recommended Budget	Change ($)	Change (%)
Governmental funds	3,231.4	3,138.9	(92.5)	(2.9%)
Proprietary funds	926.8	956.7	29.9	3.2%
Special district funds	581.5	688.3	106.8	18.4%
All County Funds	**$4,739.7**	**$4,783.9**	**$44.2**	**<1%**
Estimated Revenue				
Governmental funds	3,050.0	2,951.0	(99.0)	(3.2%)
Proprietary funds	849.2	848.4	0.8	(<1%)
Special district funds	496.7	598.3	101.6	20.5%
All County Funds	**$4,395.9**	**$4,397.7**	**$1.8**	**<1%**

The county anticipates spending 36 percent of its resources on salaries and benefits. Another 60 percent is spent on supplies and other charges, such as payments on debt and intra-county transactions. About three percent of the county's appropriations are budgeted for the acquisition of capital assets. Chart 1 illustrates countywide spending by category.

Chart 1

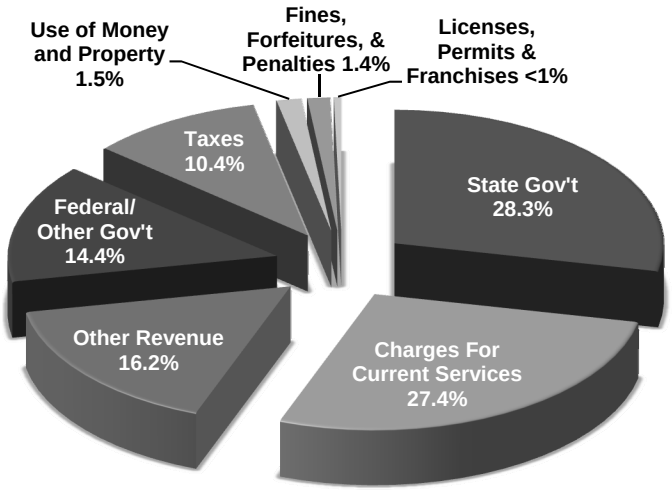
Countywide Appropriations
(by Category)



The county's largest source of revenue is derived from the state government. The smallest sources of revenue are from licenses, permits, and franchises; use of money and property; and fines, penalties, and forfeitures. Together, these sources represent less than four percent of the county's total revenue. The following chart reflects countywide revenue by its source.

Chart 2

Countywide Revenue
(by Source)



The governmental fund group accounts for most of the county's finances and includes:

- General fund - the county's basic operating fund which is used to report all operating activity not accounted for in other specialized funds.

- Special revenue funds - used to report the operating activity associated with specific revenue sources that are restricted to a particular purpose
- Capital project funds – used to report the operating activity associated with the construction, rehabilitation, and acquisition of capital assets.
- Debt service funds – used to report activity associated with the repayment of debt.

The proprietary fund group includes internal service and enterprise funds. Internal service funds are used to account for operating activity between county departments that are supported by cost recovery. Enterprise fund are used to account for county functions that are primarily supported with user charges to external parties. The following table compares the FY 10/11 adopted budget to the FY 11/12 recommended budget and summarizes spending by fund group.

Table 2

Fiscal Year Comparison of County Appropriations

Financing sources include all new revenue, any released reserves, and fund balance carried over from the previous year. Financing uses include all new appropriations and increases to reserves. By law, budgeted financing sources must equal financing uses. The table below summarizes the FY 11/12 recommended spending plan by financing sources and uses. In total, $386 million in reserves and fund balance will be needed to support planned spending.

Table 3

Summary of Sources and Uses by Fund Type
(In Millions)

Total Financing Sources	Fund Balance and Reserve Cancellations	Financing Sources	Total Available Financing

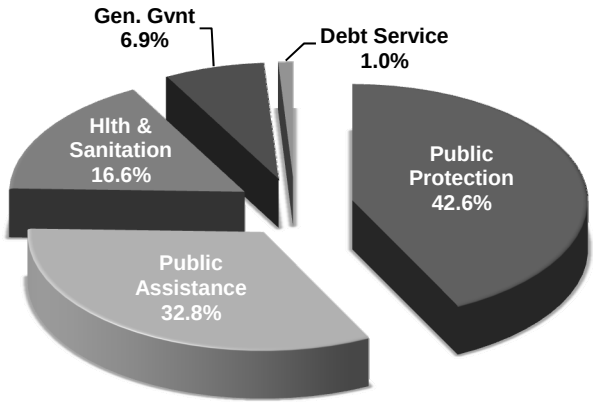
GENERAL FUND APPROPRIATIONS

The FY 11/12 general fund budget includes $2.5 billion in spending authority. The chart on the next page shows general fund appropriations by function. Public protection accounts for the largest portion of general fund appropriations totaling slightly more than $1 billion. About $803 million is appropriated for public assistance and another $406 million is appropriated in support of health and sanitation services. General government services account for just over $169 million.

Chart 3

General Fund Appropriations
(by Function*)



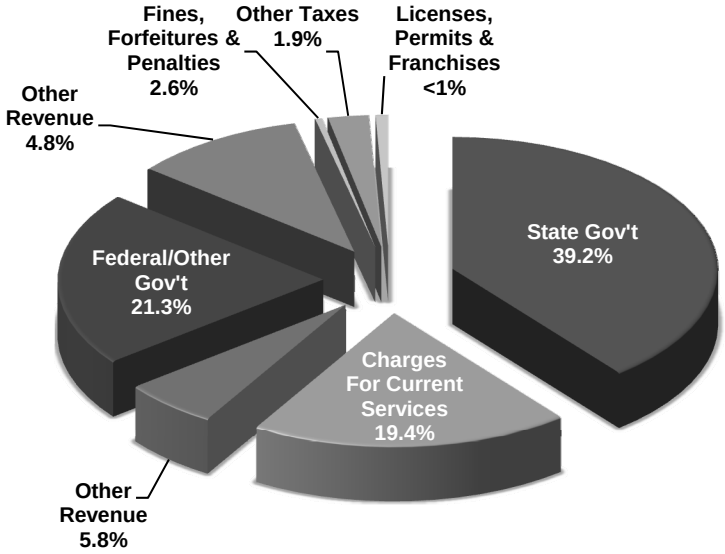
* *Functions not shown are public ways and facilities as well as education, recreation, and culture which account for less than one percent ($2.9 million) of general fund appropriations.*

GENERAL FUND REVENUE

About $2.4 billion in revenue is expected to support general fund operations using the county general fund. The next chart reflects all sources of anticipated general fund revenue, the largest portion of which will be received from the state ($937 million). Revenue received from federal and other government entities totals $507 million. The county expects to receive $463 million from charges for services.

Chart 4

General Fund Revenue
(by Source)



GENERAL FUND DISCRETIONARY REVENUE

The greater part (76 percent) of general fund revenue is restricted and can only be used for the purpose it was collected. It is at the Board's discretion to determine how the unrestricted portion (24 percent) will be spent on core services. For FY 11/12, general fund discretionary revenue is estimated to be about $582 million, a two percent decrease ($10.1 million) from last year's budget projection. Although certain discretionary general fund revenues show signs of growth, other revenue estimates continue to weaken. The primary cause of the overall decrease was related to eroding Teeter Overflow revenue. Growth within sales tax collections would have offset this decrease except it is anticipated there will be a revenue loss associated with the newly incorporated cities. Revenue neutrality agreements with these cities will help offset these losses beginning in FY 14/15.

The following table reflects the allocation of discretionary revenue by source. A discussion of key revenue sources follows.

Table 4

Year to Year Comparison of General Fund Discretionary Revenue
(In Millions)

	FY10/11 Final Budget	FY11/12 Recommended Budget	Change ($)	Change (%)	Percent of Revenue
Property Taxes	263.8	266.4	2.6	1%	45.8%

Total	**$ 592.1**	**$ 582.0**	**($ 10.1)**	**(1.7%)**	

* Does not include Public Safety Sales Tax

Property Taxes

Property tax revenue is estimated at $266.4 million for FY 11/12. This revenue represents 46 percent of the county's discretionary revenue and includes $85.1 million in redevelopment tax increment pass-through funds. As property values in the county decline, this revenue falls.

Motor Vehicle In-lieu Fees

Motor vehicle in-lieu revenue is estimated at $189 million and represents about 33 percent of the county's discretionary revenue. The state converted this revenue source

to property tax revenue several years ago. This revenue is now tied to county assessed property values, just like property tax revenue.

Teeter Overflow

In 1993, the county adopted the Teeter Plan, which provides an alternate procedure to distribute property taxes. The Teeter Plan is financed, and debt service paid, as delinquent properties are redeemed. State law requires that a tax-loss reserve fund be established with a balance equal to one percent of the Teeter roll. Any delinquent collections exceeding the one percent may be transferred to the general fund. This excess is called the Teeter overflow.

Despite the frailty of the local housing and employment markets, there is a downward trend in property tax delinquency rates. Timely payment of property taxes by financial institutions that have taken ownership of distressed properties may be the primary cause. This trend, reinforced with a slow economic recovery, will continue to erode this revenue in future years. The recommended FY 11/12 budget projects this overflow to be about $35.5 million.

Court Fines and Penalties

Fines and penalties are estimated at $27 million. Comprising almost five percent of the county's revenue, fines and penalties are mostly dedicated to funding the county's obligation to the trial courts and are subject to state maintenance-of-effort requirements. The county continues to shift fines and fees resulting from trial-court reform to the state.

Sales Taxes

Sales and use taxes are estimated at $21.3 million and represent about four percent of the county's discretionary revenue. This amount reflects anticipated losses of revenue associated with the incorporation of the cities of Eastvale and Jurupa Valley.

Tobacco Taxes

In 1998, when the Master Tobacco Litigation Settlement was finalized, tobacco companies agreed to pay compensation for causing tobacco-related problems across the nation. Riverside County along with other cities and counties entered into an agreement with the state regarding how California's share of the settlement was to be allocated. In 2007, the county sold bonds backed by the future stream of tobacco-tax settlement income for one lump-sum amount, reducing what it would have otherwise received to $10 million per year. These funds are passed on to the county hospital.

GENERAL FUND RESERVES AND DESIGNATIONS

The recommended budget incorporates the use of about $55 million in general fund reserves to fund one-time and ongoing expenditures in support of general fund operations. In this budget, $34 million in discretionary reserves (including $7 million from the property tax system designation for the CREST project, as approved by the Board in October 2010), $20 million in unreserved fund balance, and $19.7 million in restricted reserves are being drawn upon to support recommended spending. Additionally, $2.4 million will be set aside for community improvements. The table

below depicts proposed changes to general fund reserves and expected year-end balances.

Table 5

Estimated General Fund Reserves and Designations
(In Millions)

Name	FY10/11 Expected Ending Balance	FY11/12 Recommended Changes	FY 11/12 Reserves and Designations

GENERAL FUND DISCRETIONARY ALLOCATIONS - NET COUNTY COST

In accordance with Board policy, general fund support authorized by the Board in the previous year's final budget plus ongoing commitments approved by the Board during the year form the basis for the general fund's net county cost (NCC) allocated in the subsequent year's recommended budget. NCC represents the allocation of discretionary revenue and reserves in support of various county services. In an effort to move toward structural balance, net county costs were reduced disproportionately between departments, but overall by eight percent. For FY 11/12, NCC allocations are expected to exceed discretionary revenue by about $28 million. The table on the next page compares ongoing net county cost for FY 10/11 and FY 11/12.

Table 6

Changes in Ongoing Net County Costs
(In Millions)

	FY10/11 Budget	FY11/12 Recommended Budget	Change ($)	Change (%)
Public Protection	497.5	467.5	(30.0)	(6.0%)
General Government	34.0	25.4	(8.6)	(25.3%)
Health & Sanitation	67.4	57.8	(9.6)	(14.2%)
Public Assistance	45.9	37.2	(8.1)	(19.0%)
Education, Recreation, &Culture	1.5	1.2	(0.3)	(20.0%)
Debt Service and Contingency	39.5	41.2	1.7	4.3%
Total Net County Cost	**$ 685.8**	**$ 630.3**	**($55.5)**	**(8.1)%**

The largest share of discretionary resources (74 percent) is allocated to public protection ($467.5 million). The Sheriff's Department will receive $225.6 million. The District Attorney's Office will receive about $58.7 million. The Fire Department, which also receives structural fire-tax revenue, will receive about $40.6 million in general fund support. As required by state law, the county plans on spending almost $35.1 million for individuals that have been charged with a crime and need legal representation but cannot afford to hire a privately retained attorney. Those funds are allocated to the Public Defender's Office, the Alternate Public Defender, confidential court orders, and indigent defense. The Probation Department will receive about $29.4 million. The public ways and facilities function will not have a general fund allocation. Education, recreation, and culture make up less than one percent of general fund net county cost allocations ($1.2 million). The chart on the next page illustrates ongoing general fund allocations by function.

CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Signed: _____ 9/24/15

George Johnson — Date
Chief Assistant County Executive Officer

[Note: per Attachment B: Standard Provisions, Reporting Requirements and Notifications, provision 5.(b)(2) of the 2010 SMR MS4 Permit: [Applications [40CFR 122.22(a)(3)] All permit applications shall be signed by either a principal executive officer or ranking elected official.]

I. EXECUTIVE SUMMARY

Executive Summary FY 2014-2015

The County of Riverside (County), the Riverside County Flood Control and Water Conservation District (District), Coachella Valley Water District (CVWD) and the twenty-nine cities of Riverside County including Banning, Beaumont, Blythe, Calimesa, Canyon Lake, Cathedral City, Coachella, Corona, Desert Hot Springs, Eastvale, Hemet, Indian Wells, Indio, Jurupa Valley (July 2011), La Quinta, Lake Elsinore, Menifee, Moreno Valley, Murrieta, Norco, Palm Desert, Palm Springs, Perris ,Rancho Mirage, Riverside, San Jacinto, Temecula and Wildomar (Cities) are regulated pursuant to the Federal Clean Water Act and the California Water Code through the following National Pollution Discharge Elimination System (NPDES) and Municipal Separate Storm Sewer System (MS4) permits depending on location:

- Whitewater River Basin, NPDES Permit No. CAS617002 and California Regional Water Quality Control Board, Colorado River Region, Board Order R7-2013-0011;

- Santa Ana River Watershed, NPDES Permit No. CAS601833 and California Regional Water Quality Control Board, Santa Ana River Region, Board Order R8-2010-0033; and

- Santa Margarita River Watershed, NPDES Permit No. CAS0108766 and California Regional Water Quality Control Board, San Diego Region, Board Order R-9-2010-016.

The District serves as the Principle Permittee within the three watersheds described above, with the unincorporated County areas, Cities (depending on geography) and CVWD (Whitewater River Basin only) designated as the Co-Permittees. Collectively the Permittees are required as part of the NPDES and MS4 permit process to adopt, develop and implement adaptable stormwater management programs to protect surface water quality to the maximum extent practicable (MEP) and to report annually on their progress with respect to specific compliance activities.

Executive Office

The County Executive Officer and his staff provide for management and administrative oversight for County activities including long range planning, budget, internal and inter-governmental affairs. The Executive Office coordinates all National Pollution Discharge Elimination System (NPDES) and Municipal Separate Storm Sewer System (MS4) activities with County departments to ensure consistency and regulatory compliance with all applicable laws and regulations.

Capital Improvement Projects

To ensure that all municipal construction projects have adequate funding and that all environmental requirements including CEQA, NPDES/stormwater and air quality criteria is considered, the County Executive Office formed the Capital Improvement Project Oversight and Review Committee. The makeup of the committee includes representatives from the Executive Office with finance, NPDES and construction expertise, Director of Economic Development Agency and management staff, County Information Technology staff. All

proposed projects must have adequate funding, be reviewed for various project requirements and approved prior to commencement of work.

Economic Development Agency
The Riverside County Economic Development Agency (EDA) includes various divisions made up of Community Development (Aviation, County Service Areas, and Housing) Economic Development and Redevelopment, Work Force Development, Life Style & Leisure (County Fair and National Date Festival) and Facilities Management including Capital Improvement Projects (CIP). The inclusion of Facilities Management Department within the Economic Development Agency was due to the fact that CIPs are managed from the conceptual idea, environmental study, project design, construction, and then maintained by Facilities Management. Economic and Redevelopment projects go through the same process as CIP. To save costs the building and construction functionality of EDA and Facilities Management was merged.

Leadership in Energy and Environmental Design (LEED™) Certification
The LEED™ "green building rating is a nationally accepted benchmark for the design, construction and operation of green buildings. LEED™ gives building owners and operators the tools they need to have an immediate and measurable impact on their buildings' performance in five key areas:
• Sustainable site development
• Water conservation
• Energy efficiency
• Materials selection, and
• Indoor air quality.

The County of Riverside EDA is on the cutting edge as it has incorporated LEED™ criteria into CIP per Board Policy H-29.

County Service Area 152 (CSA 152)
The Economic Development Agency assumed control of County Service Area's (CSAs) in July of 2002. CSAs are an alternative method of providing governmental services by the County within unincorporated areas to provide extended services such as sheriff protection, fire protection, local park maintenance services, water and sewer services, ambulance services, streetlight energy services, landscape services and street sweeping. CSA 152 is designated as the mechanism to provide limited street-sweeping maintenance for MS4 within the service area.

Transportation Land Management Agency
The Riverside County Transportation Land Management Agency (TLMA) is made up of the following departments: Transportation, Building & Safety, Code Enforcement, Planning, Environmental Programs, Administrative Services which includes Geographic Information System (GIS) and database management.

Building and Safety Department **–** In 2007, the County established a business registration and licensing ordinance. Ordinance 857, Section 13 provides for water quality inspections and enforcement of the MS4 permit requirements. Over 10,000 establishments have been registered within the unincorporated portion of the County. For those businesses that meet the criteria for a water quality inspection an additional inspection fee is charged. This is a revenue neutral program and the fee only covers the cost of registration and the time required to perform the water quality inspections.

I. EXECUTIVE SUMMARY

Code Enforcement Department- The Code Enforcement Department is the investigatory unit that does follow-up investigations on land use complaints. This includes illegal connections and illicit discharges (IC/ID) investigations. The Code Enforcement Department has taken a more proactive approach to community policing and outreach by implementing a community improvement planning process in the economically underserved communities throughout the County. The community improvement plan is used to address conditions that otherwise lead to blighted conditions. "The Posting" a monthly newsletter provides success stories throughout the area. Over the past few years during the recession, the Code Enforcement Department has been the hardest hit when it comes to layoffs. They have been reduced from a staff of 80 to approximately 40 to service one of the largest counties in the state.

Planning Department- The Planning Department is the entry portal for private residential and commercial development review for the unincorporated county areas. A checklist is utilized to ensure that projects conform to the MS4 permit requirements. Projects that meet specified criteria are subject to the submission of a Water Quality Management Plan (WQMP) which is synonymous with the Standard Urban Stormwater Mitigation Plan (SUSMP). Previously, the WQMP was reviewed by the Riverside County Flood Control and Water Conservation District for substantial conformity, with recommended conditions of approval forwarded to TLMA. This process has now been modified to provide better internal consistency and better customer service. WQMP reviews and approvals are now conducted by the Transportation Department. The WQMP is required to address post construction best management practices (BMPs), long term maintenance and monitoring.

Transportation Department- The County Transportation Department provides design specifications, construction, monitoring, and maintenance of publicly owned roads, right of way and some MS4 facilities. One of the tools utilized by the Transportation Department to ensure compliance of the MS4 facilities is through the formation of Landscape and Lighting Maintenance Districts (LLMDs). Each LLMD is responsible for ensuring that MS4 facilities and structural (fossil filter) BMPs in their right of way are routinely cleaned and maintained. County Service Area (CSA) 152 provides for street sweeping in the annexed areas. Another function of the Transportation Department is the mapping of MS4 facilities that are owned and operated by the department. GIS mapping is a fluid process and continues to grow as new areas in the county are developed. The Department's Environmental Compliance staff is responsible for WQMP reviews and approvals; and inspections of existing and businesses, residential and industrial/commercial development for MS4 compliance measures. Referrals are made to the Regional Board for observed non-compliance issues associated with the Statewide General Construction Permit and/or MS4 Permit.

Department of Environmental Health

The DEH responds to hazardous materials emergency spills and large sewage discharges (greater than 1000 gallons) that have the potential of entering the MS4. The DEH also performs complaint investigations for some IC/ID. The DEH also is part of the District Attorney's Environmental Crimes Task Force where some misdemeanor and felony environmental crimes investigations are handled. DEH acts as the Local Enforcement Agency (LEA) for solid waste issues. As part of the franchise trash haulers agreement some jurisdictions in the unincorporated portions of the county require mandatory trash pickup and street sweeping.

I. EXECUTIVE SUMMARY

Special Districts

Flood Control and Water Conservation District (District)

The Control and Water Conservation District (District) operates and maintains major flood control facilities such as dams, flood basins, levees, open channels and major underground storm drains. In most cases, the District does not maintain storm drain inlets or pipes less than 36 inches in diameter. These smaller facilities are typically maintained by City or County Transportation Department crews. The engineering design of all projects constructed by the District is performed under the direct supervision of one of the District's two design teams. They are responsible for coordinating all activities involved in moving projects forward from the conceptual planning phase to the actual start of construction.
The construction section administers all District construction contracts and inspects the construction of all flood control projects to be accepted for operation and maintenance by the District.

In addition, as part of the plan review process for private development and CIPs within the County, the District's planning section review and make recommendations on WQMP submittals.

Regional Parks and Open Space District

The Riverside County Regional Park and Open-Space District was created by the electorate in November 1990 by a 64% vote and formed on January 29, 1991. The District is an independent agency governed by the Board of Supervisors, which sits as the District Board of Directors. The Park District presently employs approximately 100 staff who bring to their jobs a high degree of dedication to the public and wide variety of skills and abilities.
At the present time, the district manages and operates more than 44,000 acres, which includes forty parks, reserves, historic or archaeological sites and ninety miles of regional trails. The staff includes professionals in the fields of accounting and finance, biology, building and grounds maintenance, carpentry and construction, ecology, as well as environmental restoration.
Additional fields include historic preservation, interpretation, landscape architecture, museum and curatorial management, park planning, personnel administration, recreation, security, trails planning and construction, weddings and special events, wildlife habitat management, and a host of other disciplines.

Waste Resources Department

The mission of the Riverside County Waste Resources Department is to provide for the protection of the general public health and welfare by efficient management of Riverside County's solid waste system through:

- Provision of facilities and programs which meet or exceed all applicable local, State, Federal and land use regulation;

- Utilization of up-to-date technological improvements;

- Development and maintenance of a system that is balanced economically, socially and politically; and

• Economically feasible recovery of waste materials.

The Waste Management Department currently operates six landfills; an additional privately owned and operated landfill is located in Western Riverside County. In addition to the landfills, there are eight privately owned and operated transfer stations.

Recycling and Specialty Programs

Household Hazardous Waste (HHW) – Residential Program

The County of Riverside established the Household Hazardous Waste Program in October 1988 with the formation of a mobile community HHW collection program. This HHW program has evolved and is comprised of a combination of three permanent HHW collection centers, two Antifreeze, Battery, Oil and Paint (latex only) ABOP collection centers and temporary collection events at 16 locations throughout the County.

Conditionally Exempt Small Quantity Generator (CESQG) – Business Program

As an enhancement to the HHW program and to encourage small businesses to properly handle their hazardous waste, the County provides the CESQG program as an affordable and legal solution for the proper disposal of hazardous waste. The program is on an appointment only basis; a hazardous waste disposal contractor comes to the business to ensure proper labeling, and documentation is provided.

Universal and e-Waste

Universal Wastes are hazardous wastes that are generated by several sectors of society, rather than a single industry or type of business. Universal Wastes contain harmful chemicals, which, if put in the trash may harm people or the environment. E-waste includes:

• Common Batteries – AA, AAA, C and D cell and button batteries (e.g. hearing aid and watch batteries). Automotive type batteries are not Universal Waste. When they become waste, they are regulated under a different law.

• Fluorescent Tubes, Bulbs and Other Mercury Containing Lamps – Fluorescent light tubes and bulbs, Hi Intensity discharge (HID), metal halide, sodium and neon bulbs.

• Electronic Devices – Televisions, computer monitors, computers, printers, VCR's, cell phones, telephones, radios, and microwave ovens.

• Mercury-Containing Devices – Thermostats, switches, thermometers, dental amalgam, pressure and vacuum gauges, novelty items, counterweights and dampers, and medical devices known as dilators.

• Non-Empty Aerosol Cans that Contain Hazardous Materials - Labeled Toxic, Flammable, or Corrosive.

I. EXECUTIVE SUMMARY

Riverside County's Backyard Composting Program

This program has been developed to aid the residents of Riverside County in composting their organic material, so that we can all recycle more and discard less. Composting harnesses the natural process of decomposition by turning organic matter (such as fruit and vegetable wastes, grass clippings, leaves, and some animal manures) into a useful product for your landscape or garden. Composting can also improve hard, depleted soils, so that flowers, vegetables, and fruit trees can thrive in a nutrient-rich environment. Composting also improves the soil by boosting its fertility, its moisture-holding capabilities, and its texture.

Composted material is actually rather expensive to buy. But anyone with a little extra room in a garden, a little extra time, and a good source of compostable materials can produce good, high quality compost in as little as four weeks – absolutely free! By composting, you return the earth's nutrients back to the soil, where your plants absorb them, thereby becoming healthier. Healthy plants are far more resistant to diseases and pests. Instead of throwing away your organic waste, compost them! You will cut down your trash collection service, and you will be prolonging the life of Riverside County's rapidly depleting landfill space!

Sharps

Hypodermic needles, lances, and other sharp material associated with medical treatment can be collected in sharps containers and brought to the HHW collection centers for proper disposal. Sharps containers can be obtained from your HHW collection center or local pharmacy.

Construction Activities

The Waste Management Department's construction and industrial activities include maintenance of County operated landfills and stabilization of closed landfills. This includes the requirement to prevent and mitigate stormwater or other discharges including sediment, solid waste and liquids from entering an MS4 system.

Pharmaceuticals and Outdated Medicines

The County has instituted as part of their Household Hazardous Waste Collection Program the ability for residents to bring outdated prescription drugs and other medications to the collection center for proper disposal.

I. EXECUTIVE SUMMARY

Concluding Remarks

The County continues to have budgetary challenges due to state mandates of other social service programs. Prison realignment (AB109) as well as pending litigation for mental health services of inmates is predicted to continue placing great strain on the general fund. Further, recent state changes in the new gas tax (Section 2103) program have reduced revenue projections in this fund source significantly. These changes are associated with the recent rapid decline in gas prices nationwide, especially in California. However, the County is anticipating no reductions in MS4 permit compliance funding.

II. INTRODUCTION

Due to the fact that Riverside County does not have a centralized public works agency, the County Executive Office provides management and administrative oversight for County departmental NPDES program activities. This includes coordination of the following Departments:

- *Economic Development Agency/Facilities Management*
- *Transportation Land Management Agency (TLMA), which includes:*
    - *o Building and Safety*
    - *o Code Enforcement*
    - *o Planning*
    - *o Transportation*
- *Environmental Health*
- *Parks District*
- *Waste Management Department*

During FY 14/15, the County moved its Building and Safety Environmental Compliance Inspectors into the Transportation Department's NPDES section. This move will help consolidate resources and provide greater efficiencies through inspections, WQMP review, and overall agency program management. In FY 15/16, the Business License and Registration was also moved out of Building and Safety into the Transportation Department's NPDES section. Further information will be provided in the FY 15/16 annual progress report. Lastly, FY 15/16 becomes the first year that the Transportation Department Environmental Compliance Inspectors begin the centralization of the County's post-construction BMP inspection program. Additional details about this program will also be included in the FY 15/16 annual progress report.

.

1. DEVELOPMENT PLANNING
(SECTION F.1. of ORDER NO. R9-2010-0016)

New Development

1) General Plan/Environmental Review K.3.c.(4)1

a) Description of any amendments/updates to the General Plan as required by Section F.1.a. of the 2010 SMR MS4 Permit:

A comprehensive update to the County of Riverside General Plan (GPA No. 960) was recently adopted by the Board of Supervisors on September 22, 2015. Details regarding this update will be included in the FY 15/16 annual progress report.

b) Description of any amendments/updates to the environmental review process as required by Section F.1.b. of the 2010 SMR MS4 Permit.

The recent adoption of GPA 960 may require updates to internal environmental review processes. As GPA 960 is implemented during FY 15/16, any changes will be reported in the FY 15/16 annual progress report.

c) Description of any planned updates to the General Plan or the environmental review process within the next Annual Reporting period as required by Sections F.1.a.&b of the 2010 SMR MS4 Permit.

The County is already planning its next General Plan update after the recent adoption of GPA 960. Additional information will be provided within the FY 15/16 annual progress report.

2) SSMP status as required under Section F.1.d. of the 2010 SMR MS4 Permit K.3.c.(4)2.

Description of all revisions to the SSMP, including where applicable:

a) Identification and summary of where the SSMP fails to meet the requirements of the 2010 SMR MS4 Permit as required under Section F.1.d. of the 2010 SMR MS4 Permit:

Comments and a conditional approval were received on the revised draft SSMP from Regional Board staff on September 17, 2013. The County had 180 days to revise and implement the SSMP to reflect the outstanding conditions presented in the letter. Pursuant to the Conditional Finding of Adequacy, the County adopted the fully compliant SSMP in March 2014.

b) Updated procedures for identifying Pollutants of Concern for each Priority Development Project as required under Section F.1.d.(3) of the 2010 SMR MS4 Permit:

Updated procedures for identifying POCs are included in the 2014 SSMP.

c) Updated Treatment Control BMP ranking matrix as required by Section F.1.d.(6)(b)(i) of the 2010 SMR MS4 Permit:

An updated Treatment Control BMP ranking matrix is included in the 2014 SSMP.

d) Updated site design and Treatment Control BMP design standards as required by Sections F.1.d.(4)(c)(i) and F.1.d.(6)(b)(ii) of the 2010 SMR MS4 Permit.

Updated site design and Treatment Control BMP design standards are discussed in the 2014 SSMP. The Low Impact BMP Design Handbook was developed by the Riverside County Flood Control and Water Conservation District provides guidance on development projects within the county.

3) Priority Development Projects K.3.c.(4)3

a) The County of Riverside reviewed and approved nine (9) Priority Development Projects during the reporting period.

b) The following LID and Source Control BMPs were required as applicable approved Priority Development Projects as required by the 2010 SMR MS4 Permit:

Reference	LID BMP Requirements
F.1c.(2)(a)	**Conserve natural areas, including existing trees, other native vegetation, and soils.**
F.1c.(2)(b)	**Construct streets, sidewalks, or parking lots aisles to the minimum widths necessary, provided that public safety is not compromised.**
F.1c.(2)(c)	**Minimize the impervious footprint of the project**
F.1c.(2)(d)	**Minimize soil compaction to landscaped areas**
F.1c.(2)(e)	**Minimize disturbances to natural drainages**
F.1c.(2)(f)	**Disconnect impervious surfaces through distributed pervious areas**
F.1c.(2)(b)(i)	**Maintain or restore natural storage reservoirs and drainage corridors (including depressions, areas of permeable soils, swales, and ephemeral and intermittent streams)**
F.1c.(2)(b)(ii)	**Construct pervious areas to effectively receive and infiltrate, retain and/or treat Runoff from Pervious areas, and to minimize soil compaction in these areas**
F.1c.(2)(b)(iii)	**Construct low-traffic areas with permeable surfaces, where appropriate soil conditions exist**
F.1c.(2)(c)(i)	**Structural Infiltration BMPs**
F.1c.(2)(c)(i)	**Structural Harvest and Use BMPs**
F.1c.(2)(c)(ii)	**Structural Bioretention BMPs**

	Source Control BMP Requirements
F.1.d.(5)(a)	**Prevent illicit discharges into the MS4**
F.1.d.(5)(b)	**Minimize storm water pollutants of concern in runoff**
F.1.d.(5)(c)	**Eliminate irrigation runoff**
F.1.d.(5)(d)	**Include storm drain system stenciling or signage**
F.1.d.(5)(e)	**Include properly designed outdoor material storage areas**
F.1.d.(5)(f)	**Include properly designed outdoor work areas**
F.1.d.(5)(g)	**Include properly designed trash storage areas**
F.1.d.(5)(h)	**Include water quality protection requirements applicable to individual priority project categories**

c) The following process was implemented to verify that Site Design, Source Control, and Treatment Control BMPs were required on all applicable Priority Development Projects as required under Section F.1.d.(9) of the 2010 SMR MS4 Permit:

The approved 2014 SSMP includes an updated guidance manual and template that all applicable Priority Development Projects must complete. In addition, a review checklist was created for plan check staff to utilize. These documents are available on the Flood Control District's website here:

http://www.floodcontrol.co.riverside.ca.us/NPDES/SantaMargaritaWS.aspx#SMmember

4) Following are the names and locations of all Priority Development Projects that were granted a waiver from implementing LID BMPs pursuant to Section F.1.d.(4) of the 2010 SMR MS4 Permit K.3.c.(4)4:

No projects were granted a waiver in FY 14/15.

5) Treatment Control BMPs K.3.c.(4)5 (Note: Verify that each of the following is applicable and true)

a) A current copy of the County of Riverside's BMP maintenance tracking database of approved Treatment Control BMPs and Treatment Control BMP maintenance required under F.1.f.(1) of the 2010 SMR MS4 Permit is attached. This database includes an identification of all high-priority Priority Development Projects that have a final approved Project-Specific WQMP and their structural post-construction BMPs implemented since July 2005.

A copy of the database is provided in Attachment B.

b) The County of Riverside verifies that the following structural post-construction BMPs on the inventoried WQMP projects have been implemented, are maintained, and are operating effectively through inspections, self-certifications, surveys, or other equally effective approaches as required under the 2010 SMR MS4 Permit:

Reference	LID BMP Requirements
F.1c.(2)(a)	**The implementation, operation, and maintenance of all (100 percent) approved and inventoried final public and private Project-Specific WQMPs are verified every five years**
F.1c.(2)(b)	**All (100 percent) projects with BMPs that are high priority are inspected annually prior to each Rainy Season**
F.1c.(2)(c)	**All (100 percent) of the Priority Development Projects with BMPs are inspected annually**
F.1c.(2)(d)	**As appropriate, the County of Riverside coordinates its inspections with the facility inspections implemented pursuant to Section F.3 of the 2010 SMR MS4 Permit**
F.1c.(2)(e)	**For verifications performed through a means other than direct inspection by the County of Riverside, adequate documentation is required to provide assurance that the required maintenance has been completed**
F.1c.(2)(f)	**Appropriate follow-up measures (including re-inspections, enforcement, maintenance. Etc.) are conducted to ensure the Treatment Control BMPs continue to reduce Storm Water Pollutants as originally designed**
F.1c.(2)(b)(i)	**Inspections note observations of vector conditions, such as mosquitoes. Where conditions are identified as contributing to mosquito production, the County of Riverside notifies its local vector control agency.**

6) **The following Priority Development Projects have been required to implement hydrologic control measures to protect downstream Beneficial Uses and prevent adverse physical changes to downstream channels in compliance with Section F.1.h of the 2010 SMR MS4 Permit K.3.c.(4)6:**

All PDPs that were submitted during this reporting year were required to implement HCOC's in compliance with the 2014 WQMP/SSMP and HMP as identified in the Order.

7) **The following table provides a description of all activities related to the enforcement of the Stormwater Ordinance in New Development and Redevelopment Projects in the County of Riverside as required under Section F.1.g. of the 2010 SMR MS4 Permit during the reporting period and a summary of the effectiveness of the enforcement activities K.3.c.(4)7:**

Please see database in Attachments B.

2. CONSTRUCTION
SECTION F.2. of ORDER NO. R9-2010-0016)

1) **Ordinances K.3.c.(4)1**

   a) **Describe updated relevant ordinances as required under Section F.2.a. of the 2010 SMR MS4 Permit (attach copies):**

   During this reporting period, no county ordinances were updated. However, the Board of Supervisors on July 21, 2015 adopted the updated Ordinance 859.3 Water Efficient Landscape Requirements, which, among other provisions, prohibits the use of natural turf grass in front yards of new residential subdivisions. This Ordinance exceeds the state's requirement, which allows turf to be irrigated using subsurface drip systems.

   b) **Describe planned ordinance updates within the next Annual Reporting period, if applicable:**

   In FY 15/16, County Ordinance 857 (adopted in 2006) will be re-evaluated, and potentially amended to: (1) appropriate inspection frequency; (2) meet current State mandates (specifically the provisions of the three NPDES MS4 Permits applicable to unincorporated County of Riverside); and (3) ensure Ordinance 857 has a clear and understandable goal of water quality compliance. Since the inception of Ordinance 857 in 2006, four cities have incorporated; therefore, less commercial/industrial facility oversight is required by the County. A re-evaluation of the Commercial/Industrial Facilities inventory and an assessment of facility inspection fees, protocol, and frequency is also warranted.

2) **Describe any changes to procedures used for identifying priorities for inspecting sites and enforcing control measures that consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality as required by Section F.2.e of the 2010 SMR MS4 Permit K.3.c.(4)2:**

   No changes to procedures used for identifying priorities for inspecting sites have been identified during this reporting period.

3) **Describe any changes to the designated minimum and enhanced BMPs as described in Section F.2.d.(1) of the 2010 SMR MS4 Permit K.3.c.(4)3:**

   No changes to designated minimum and enhanced BMPs have been identified during this reporting period.

4) **Summarize the finding of the Construction Inspection Program specified in Section F.2.e. of the 2010 MS4 Permit K.3.c.(4)4:**
   a) **Total number and date of inspection conducted at each Construction Site**

2. CONSTRUCTION
(SECTION F.2. of ORDER NO. R9-2010-0016), CONT

Please see Database contained in Attachment C.

b) Number, date, and types of enforcement actions by Construction Site

Please see database in Attachment C.

c) Brief description of each high-level enforcement action at Construction Sites including the effectiveness of the enforcement:

No high-level enforcement in FY14/15 reporting period.

Other comments:

Currently, all Transportation Department Construction Projects with one (1) or more acres of new disturbance are uploaded to the SMARTS (Storm Water Multiple Application and Report Tracking System). The Transportation Department will continue this practice for tracking construction projects in FY15/16. The Department's Resident Engineer/Inspector conducts a site walk each day which includes a visual check of construction site BMPs. The Project QSP conducts and documents inspections in accordance with the Construction General Permit requirements. See Attachment C for additional details.

The Department currently has an NPDES Coordinator who comprehensively administers the Department's Municipal NPDES Program. The NPDES Coordinator works closely with the Planning and Design, Construction and Operations and Maintenance Divisions. The NPDES Coordinator is also responsible to disseminate NPDES compliance information to Department staff. Focused training refreshers were provided to appropriate employees in the Transportation Department to keep staff up to date on NPDES MS4 Permit regulations. The NPDES Coordinator regularly attends the SMR Technical Advisory Committee meetings.

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

1) *Attachment D* **contains the current inventory of all County of Riverside facilities and activities that have the potential to generate Pollutants as required under F.3.a.(1) of the 2010 SMR MS4 Permit [K.3.c.(4)1]:**

The Transportation Department owns and operates a total of 1066 Inlets, 130 Outlets, 716 Culverts, 18 Soft Bottom Swales, 17 Hard Bottom Channels, 1 Engineered Infiltration Trench, 1 Permeable Pavement facility and 1 Basin in the Santa Margarita River Watershed. The Transportation Department owns and operates a total of 2 Maintenance Yards and two Material Sites in the Santa Margarita River Watershed. Please see Transportation Inventory Attachment D titled "Santa Margarita River Watershed Transportation Department Facility Inspections" for an inventory of the facilities and inspections results.

2) **Following is the current list of minimum BMPs for the County of Riverside facilities included in the inventory addressed in item 1) above K.3.c.(4)2:**

BMP	Description	Used
SC-10	Non-Stormwater Discharges	☒ Yes ☐ No
SC-11	Spill Prevention, Control and Clean-up	☒ Yes ☐ No
SC-20	Vehicle and Equipment Fueling	☒ Yes ☐ No
SC-21	Vehicle and Equipment Cleaning	☒ Yes ☐ No
SC-22	Vehicle and Equipment Repair	☒ Yes ☐ No
SC-30	Outdoor Loading/Unloading of Materials	☒ Yes ☐ No
SC-31	Outdoor Liquid Container Storage	☒ Yes ☐ No
SC-32	Outdoor Equipment Maintenance	☒ Yes ☐ No
SC-33	Outdoor Storage of Raw Materials	☒ Yes ☐ No
SC-34	Waste Handling and Disposal	☒ Yes ☐ No
SC-35	Safe Alternative Products	☒ Yes ☐ No
SC-40	Contaminated or Erodible Areas	☒ Yes ☐ No
SC-41	Building and Grounds Maintenance	☒ Yes ☐ No
SC-42	Building Repair and Construction	☒ Yes ☐ No
SC-43	Parking/Storage Area Maintenance	☒ Yes ☐ No
SC-44	Drainage System Maintenance	☒ Yes ☐ No
SC-60	Housekeeping Practices	☒ Yes ☐ No
SC-61	Safe Alternative Products	☒ Yes ☐ No
SC-70	Road and Street Maintenance	☒ Yes ☐ No
SC-73	Landscape Maintenance	☒ Yes ☐ No
SC-74	Drainage System Maintenance	☒ Yes ☐ No
SC-75	Waste Handling and Disposal	☒ Yes ☐ No
SC-76	Water and Sewer Utility Maintenance	☐ Yes ☒ No

3) Describe any changes to procedures to assure that flood management projects assess the impacts on the water quality of Receiving Waters as required under Section F.3.a.(4) of the 2010 SMR MS4 Permit [K.3.c.(4)3]:

Please see the County of Riverside Flood Control and Water Conservation District's Annual Report.

4) Following is a summary and assessment of BMP retrofit projects implemented at flood control structures as specified in Section F.3.a.(4)(c) and F.3.d of the 2010 SMR MS4 Permit [K.3.c.(4)4]:

a) Listing of flood control facilities retrofitted:

Please see the County of Riverside Flood Control and Water Conservation District's Annual Report.

b) Listing and description of flood control structures evaluated for retrofitting:

Please see the County of Riverside Flood Control and Water Conservation District's Annual Report.

c) Listing of flood control structures still needing to be evaluated and the schedule for evaluation:

Please see the County of Riverside Flood Control and Water Conservation District's Annual Report.

5) Following is a summary of the municipal structural Treatment Control BMP operations and maintenance activities as specified in F.3.a.(6) of the 2010 SMR MS4 Permit [K.3.c.(4)5]:

The Transportation Department implements a schedule of inspection and maintenance activities to verify proper operation of all its Municipal Structural Treatment Controls BMPs designed to reduce storm water pollutant discharges to/or from its MS4 facilities.

Type of Structural Treatment Control BMP	Number of Inspections	Findings
Detention Basin (Rancho California Rd & Anza Rd Roundabout WQMP	8	10/02/2015 Semiannual (April & October) 8/7/2015 Routine 8/21/2015, 12/8/2015, 12/15/2015, 1/5/2015, 2/26/2015, 3/5/2015 Post-Rain Event, Basin is operating properly.
Infiltration Trench (Scott Rd Improvements WQMP	9	8/21/2014, 9/18/2014, 12/8/2014, 12/15/2014, 1/5/2015, 2/26/2015, 3/5/2015, 5/18/2015 Post-Rain Event 8/7/2014 Routine Infiltration Trench is operating properly.
Fossil Filter Inlet inserts in Landscaping and Lighting Maintenance District 89-1.	163	3 Times Annually. Fossil Filters needing replacement were replaced promptly. Litter and debris are removed from filters during each inspection to ensure they are operating properly.
Swale at Glenoaks Fire Station	1	9/2014 - Project is within it closeout process. Site construction verification issues yielded imperfections in BMP construction. The site's civil engineer and contractor modified BMPs for compliance.
Swales at Southwest Justice Center Parking Lot	1	This facility was inspected during the last reporting period, but was un-intentionally omitted from the annual report. It was inspected on 9/24/2014 and the maintenance personnel found deficiencies related to clogged drain

		inlets, missing vegetation, and clogged drain pipe. These deficiencies were subsequently rectified.
French Valley Airport Parking Lot Bioretention	**1**	**The BMPs at this site consist of twice monthly maintenance of the landscape in the basin by an outside contractor. Further, twice weekly visual inspections of the facility by maintenance staff for trash and debris where any noted items are picked up and removed is noted on airport inspection forms for the airside operations.**
Lake Skinner Recreation Area **Grass Filter Strip, Grass Swale, Landscape Filer Basin**	**1**	**The facility is routinely inspected by park maintenance staff and cleared of trash and debris to ensure maximum functionality.**

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

6) Summary of the MS4 facilities operations and maintenance activities, including amount material removed from, including justification for less than annual inspection as required under Section F.3.a.(6)(b) of the 2010 SMR MS4 Permit [K.3.c.(4)(6)]:

MS4 Facility Type	Number of Facilities Maintained	Amount of Material Removed (tons)	Facilities Planned for Bi-Annual Inspections and Justification
MS4 Facilities Inlets Outlets Culverts Soft Bottom Swales Hard Bottom Channels Basin Infiltration Trench Permeable Pavement Facility **Total**	Inspected Cleaned 1066 409 130 51 716 342 18 13 17 6 1 0 1 9 1 10 **1950 821**	**120.34 tons (wet weight)**	The Transportation Department owns and operates a total of 1066 Inlets, 130 Outlets, 716 Culverts, 18 Soft Bottom Swales, 17 Hard Bottom Swales, 1 Engineered Infiltration Trench, 1 Permeable Pavement Facility, and 1 Basin in the Santa Margarita River Watershed. The Transportation Department inspect and remove accumulated waste from all MS4 facilities at least once a year between May 1 and September 30 (dry season) of each year; and additional MS4 facilities cleaning performed as necessary between October 1 and April 30 as specified in the MS4 permit. See Attachment D for additional inspection schedule information.
Roadside Litter Removal Program	23 miles	20 tons (wet weight)	
Street Sweeping	18,914 curb miles (Countywide)	1,134 tons (wet weight)	
Facility Total		**1,274.34 tons (wet weight)**	

3. MUNICIPAL
(SECTION F.3 of ORDER NO. R9-2010-0016), CONT

7) The following table contains a Summary of municipal areas/programs inspection activities as specified by Section F.3.a.(8)(a&b) of the 2010 SMR MS4 Permit [K.3.c.(4)6] including:

a) Number and date of inspections conducted at each facility [K.3.c.(4)7.(a)].

b) BMP violations identified during each facility inspection [K.3.c.(4)7.(b)].

c) The number, date and types of enforcement actions received at each facility [K.3.c.(4)7.(c)]

d) Summary of inspection findings and follow-up activities for each inspected facility [K3.c.(4)7.(d)]

Facility	Inspections		BMP Violation	Enforcement			Summary of Inspection	
	#	Date		#	Date	Type	Findings	Follow-up
Murrieta Maint. Yard	1	11/14/2014	0		N/A		Site is Compliant	
Anza Maintenance Yard	1	11/17/2014	0		N/A		Site is Compliant

Lake Skinner Rec. Area	1	Various	0		N/A		Site is Compliant	
Total	**8**							

8) The following activities implemented to address sewage infiltration into the MS4 as specified in F.3.a.(7) of the 2010 SM4 MS4 Permit [K.3.c.(4)8]

The County does not own or operate any sanitary sewer facilities or infrastructure.

9) Describe BMPs and their implementation for unpaved roads construction and maintenance as specified in F.3.a.(10) of the 2010 SMR MS4 [K.3.c.(4)8]:

The Transportation Department implements erosion and sediment control BMPs when conducting maintenance of unpaved roads. Whenever possible, unpaved roads that require maintenance are graded to direct runoff from unpaved roads onto adjacent flat, vegetated areas. When runoff must be direct onto a slope, the spacing of over side drains is reduced to minimize the volume and velocity of the runoff in any one location. Additionally, appropriate energy dissipation materials (gravel, bags, straw bales, riprap, fiber rolls, etc.) are used to reduce the velocity of flows and promote infiltration.

Maintenance of County- owned unpaved roads that are directly adjacent to creeks and riparian habitat are maintained only when absolutely necessary to protect public safety. When re-grading and maintenance of unpaved roads is necessary, roads are graded with consideration of road safety and minimizing the potential for erosion and sedimentation. When major maintenance requires the replacement of culverts, the natural stream geomorphology is considered in order to minimize future maintenance and to reduce the potential for failure.

For unpaved roads crossing jurisdictional drainages, the Transportation Department has entered into a "Long Term Routine Maintenance Lake and Streambed Alteration Agreement" with the California Department of Fish and Wildlife (CDFW) for the operation and maintenance of its roads and related drainage improvements within unincorporated Riverside County. The County-maintained system includes hundreds of miles of roads with various drainage improvements, some of which may encroach onto areas under the jurisdiction of the CDFW. The agreement requires the Transportation Department to implement measures (BMPs) to avoid, minimize, and/or mitigate potential impacts associated with the maintenance activity. An annual report detailing all the maintenance activities within or affecting jurisdictional areas of the CDFW is prepared and submitted to the CDFW. Additionally, for maintenance activities beyond those described in the agreement and for a single maintenance activity affecting 0.5 acre or more, the Transportation Department must make a pre-notification for review and comment by CDFG.

The Transportation Department no longer constructs new unpaved roads. Further, the Transportation Department no longer accepts new unpaved roads into their system of County maintained roads.

4. INDUSTRIAL / COMMERICIAL
(SECTION F.3.b. of ORDER NO. R9-2010-0016)

1) *Attachment E* **contains the updated inventory of Industrial and Commercial Facilities as required under Section F.3.b.(1) of the 2010 SMR Permit [K.3.c.(4)1&2]. This inventory includes the following information by facility or mobile business:**

a) Number and date of inspections conducted at each facility or mobile business.
b) BMP violations identified during the inspection.
c) Number, date, and type of enforcement actions.
d) Brief description of each high-level enforcement action at Industrial/Commercial sites including the effectiveness of the enforcement and follow-up activities.
See database contained in Attachment E.

2) All changes to the designated minimum and enhanced BMPs required under Section F.3.b.(2)b&c of the 2010 SMR MS4 Permit [K.3.c.(4)3.]:

Minimum BMP	CASQA BMP Fact Sheet	Used
Hazardous Waste/Materials storage areas are clean, no signs of leakage, and protected from rainfall and Runoff;	SC-34	☒ Yes ☐ No
Trash bin areas are clean, the bin lids are closed, the bins are not filled with liquid, and no signs of leakage from the trash bins	SC-34	☒ Yes ☐ No
Aboveground tanks have been properly maintained including no signs of leakage, and secondary containment in good condition	SC-11, SC-31, SC-33	☒ Yes ☐ No
Onsite storm drain inlets are protect from inappropriate non-storm water discharges	SC-44	☒ Yes ☐ No
Oil/water separators are connected to sanitary sewer	NA	☒ Yes ☐ No
Wash water from wash pads (steam cleaning or high pressure cleaning) is directed to the sanitary sewer and does not discharge to the MS4	SC-10	☒ Yes ☐ No
Mop bucket wash water is discharged to sanitary sewer via clarifier	SC-10	☒ Yes ☐ No
Parking lot areas are free of trash, debris, and fluids other than water	SC-43	☒ Yes ☐ No
Facility has coverage under the Industrial General Permit, if appropriate	NA	☒ Yes ☐ No
Minimum BMP	CASQA	☒ Yes ☐ No
Oil and grease Wastes are not discharged onto a parking lot, street or adjacent catch basin	SC-10	☒ Yes ☐ No
Trash bin areas are clean, the bin lids are closed, the bins are not filled with liquid, and the bins have not been washed out into the MS4	SC-43	☒ Yes ☐ No
Floor mats, filters and garbage containers are not washed in adjacent parking lots, alleys, sidewalks, or streets and that no wash water is discharged to MS4S	SC-10	☒ Yes ☐ No
Parking lot areas are cleaned by sweeping, not by hosing down, and that facility operator uses dry methods for spill cleanup	SC-43	☒ Yes ☐ No

3) Provide a list of Industrial Facilities, including each name, address, and SIC code in the Copermittee Name's jurisdiction, that may require coverage under the General Industrial Permit, but has not submitted an NOI [K.3.c.(4)4]:

See Database contained in Attachment E.

5. RESIDENTIAL
(SECTION F.3.c. of ORDER NO. R9-2010-0016)

1) **Provide an updated list of minimum BMPs required for residential areas and activities as required by Section F.3.c.(2)(b) of the 2010 SMR SM4 Permit [K.3.c.(4)1]"**

Please visit http://rcflood.org/Stormwater/ for the latest brochures regarding these activities.

Area of Activity		Designated BMPs	Reference Material
A	Automobile repair, maintenance, washing and parking	• Collect and properly dispose of automotive fluids and other waste • Clean up spills using dry cleanup methods where possible • Store Hazardous Materials away from rain and runoff • Avoid hosing down parking areas. • Prevent all wash water, leaks and/or spills from entering the street or MS4	**Brochures (see above link):** • Automotive Maintenance and Car Care Brochure • Outdoor Cleaning **CASQA BMP Fact Sheets:** • SC-20, • SC-21, • SC-22, • SC-43
B	Home and garden care activities and product use (pesticides, herbicides and fertilizers)	• Prevent irrigation runoff • Store and apply pesticides, fertilizers and other chemicals in accordance with their labeling • Avoid applying pesticides, herbicides and fertilizers before forecasted rain	**Brochures (see above link):** • Landscape and Garden • 10 Ways to Save Water Outdoors **CASQA BMP Fact Sheets:** • SC-73, • SD-10, • SD-12
C	Disposal of trash, pet waste, green waste, and Household Hazardous Waste (e.g., paints, cleaning products)	• Properly dispose of pet waste • Collect green waste and never blow such waste into the street, gutter or MS4 • Never dispose of waste in a street, gutter or MS4 • Take Household Hazardous Waste to a designated collection center	**Brochures (see above link):** • After the Storm • What's the Scoop • Tips for Horse Care • Landscape and Garden • Pools, Spas and Fountains **HHW and ABOP Collection Events** http://www.rivcowm.org/opencms/hhw/schedule.html **Videos:** • Animal Care • Household Hazardous Waste • Managing your Lawn and Garden • Outdoor Activities http://rcflood.org/stormwater/ (Videos found in the Media Library)

5. RESIDENTIAL
(SECTION F.3.c of ORDER NO. R9-2010-0016) CONT.

2) Provide a summary of the number and type of applicable runoff and stormwater enforcement actions taken within residential areas and activities as required under Section F.3.c.(3) of the 2010 SMR MS4 Permit [K.3.c.(4)2]:

Number by Area or Activity			Enforcement and Compliance Responses
A	B	C	
0	3	**15**	Education and information
0	10	**20**	Verbal Warning
0	3	**12**	Written Warning
0	0	**1**	Notice of Non-Compliance
0	0	**0**	Administrative Compliance Order
0	0	**0**	Misdemeanor
0	0	**0**	Infraction
0	0	**1**	Citation
0	0	**0**	Referral to SDRWQCB
0	**16**	**49**	**Total**

*Also, please see database contained in Attachment F***.**

3) Describe the County of Riverside's efforts to manage runoff and Stormwater Pollution in common interest areas and mobile home parks as required under Section F.3.c.(4) of the 2010 SMR MS4 Permit [K.3.c.(4)2]:

The County responds to and investigates citizen complaints. If issues are verified and/or discovered by County staff, the Code Enforcement Department will open a case against the proposed violator and bring the situation to remedy in conformance with the JRMP Enforcement and Compliance strategy. In addition to the enforcement and compliances efforts listed above, the Code Enforcement Department provides outreach via a newsletter called "The Posting" which highlights its achievements and recent abatement cases. Issues of the The Posting and a narrative summary of activities are contained in the Attachment G.

6. RETROFITTING EXISTING DEVELOPMENT (SECTION F.3.d. of ORDER NO. R9-2010-0016)

1) Provide an updated inventory and prioritization of existing developments identified as candidates for retrofitting as required under Section F.3.d.(2) of the 2010 SMR MS4 Permit [K.3.d.(4)1]:

APN: 964-450-030 Rancho Bella Vista Community Association.

2) Describe the County of Riverside efforts to retrofit existing developments during the reporting period as required under Section F.3.d.(2) of the 2010 SMR MS4 Permit [K.3.d.(4)2]:

The County's ability to retrofit existing development is extremely constrained. The elimination of redevelopment agencies in 2011 has significantly affected the County's ability to enhance or restore properties with structural BMPs. Further, the County is ineligible to apply for Prop 1 grants due non-compliance with CASGEM for the Cahuilla basin. CASGEM compliance is compounded by current federal/tribal adjudication/litigation that is still active within the court system that the county is not party to. However, the County is vigilant in identifying potential opportunities that could result in a public-public partnership, or private-public partnership. At present, the County is working with the Flood Control district to identify solutions for retrofitting those outfalls where exceedances apply. Site visits and preliminary discussions on engineering solutions are currently underway. Additionally, the County Transportation Department is currently evaluating locations at the Rancho Bella Vista community in unincorporated French Valley for retrofit of catch basins to include trash racks/screens.

3) Describe the County of Riverside's efforts taken to encourage private landowners to retrofit existing development as required under Section F.3.d.(4) of the 2010 SMR MS4 Permit [K.3.d.(4)3]:

On May 18, 2015, the County hosted a Drought Workshop to solicit feedback from County Departments, the public, and water districts to hear how they were mitigating the effects of the current, very prolonged drought. During this workshop, the County Board of Supervisors heard about several rebate programs for residents regarding turf buyback rebates, efficient sprinkler heads, and smart irrigation timers available for free or at a reduced cost. In addition, and with the assistance of the Flood Control District, the County created a website where residents can input their address and find out what water efficient rebate programs are available to them. Further, the County is a very active member of the Riverside County Water Task Force. Task Force meetings have been extremely beneficial to the public. Educating the public regarding reducing errant irrigation discharges from front lawns has been crucial to the County's effort to minimize and reduce pollutant transport to receiving waters.

6. RETROFITTING EXISTING DEVELOPMENT (SECTION F.3.d. of ORDER NO. R9-2010-0016)

4) Provide a list of all retrofit projects that have been implemented including site location, a description of the retrofit project pollutants expected to be treated, and the tributary acreage of runoff that will be treated as required under Section F.3.d.(5) of the 2010 SMR MS4 Permit [K.3.d.(4)4]:

In compliance with the Santa Margarita Region Retrofit Program Study prepared in 2012, the County is in the process of evaluating structural BMPs for use at Flood Control's outfall sites where the County is the response agency to dry-weather monitoring exceedances. The County Transportation Department is currently evaluating trash screens (with potential nutrient reduction media) for use in the Ranch Bella Vista housing development catch basins.

5) Describe any proposed retrofit or regional mitigation projects and timelines for future implementation [K.3.d.(4)5]:

During FY 15/16, the County, in coordination with Flood Control, will evaluate its two monitoring locations for retrofit. Further, the Transportation Department will begin evaluating trash capture screens for use in its catch basins within residential developments as a pilot program. The County wishes to utilize tested and proven technology to minimize maintenance problems and maximize public safety and thus is methodically analyzing the best locations for these devices.

6) Describe any proposed changes to the County of Riverside's overall retrofitting program [K.3.d.(4)6]:

No changes to the County's overall retrofitting program guidance occurred during this reporting period.

7. ILLICIT DISCHARGE DETECTION AND ELIMINATION (SECTION F.4 of ORDER NO. R9-2010-0016) CONT.

1) Describe any changes to the legal authority to implement Illicit Discharge Detection and Elimination (IDDE) activities as required under Section F.4.a.(1) of the 2010 SMR MS4 Permit [K.3.d.(4)1]:

There were no changes to legal authority during the reporting period.

2) Describe any changes to the established IDDE investigation procedures as specified under Section F.4.e. of the 2010 SMR MS4 permit [K.3.d.(4)2]:

In August 2014, the County of Riverside was selected by the USEPA for a MS4 program audit within the Santa Margarita Watershed. Findings of the audit team concluded that there could be procedural improvements within the JRMP for enhanced communication between departments, and that the Enforcement/Compliance Strategy should be revised for consistent enforcement across applicable departments. The County typically updates its JRMP near the close of the fiscal year. Proposed modifications during this FY will be reported in the following annual progress report. Otherwise, no changes to the established IDDE investigation procedures have been noted during this reporting period.

3) Describe any changes to public reporting mechanisms, including phone numbers and web pages as required under Section F.4.c of the 2010 SMR MS4 Permit [K.3.d.(4)3]:

None noted. See the Flood Control District's report for information regarding the telephone hotline and web pages.

4) Summarize Illicit Discharges (including spills and water quality data events) and how each significant case was resolved [K.3.d.(4)4]:

On December 17, 2014, the wet weather monitoring of the County's assigned outfall (902MS4263) did exceed the Stormwater Action Level (SAL) of 2.6mg/L for Nitrate and Nitrite at 2.97 mg/L. Based upon observations noted on the field data sheet, the stormwater flows appeared near stagnant and murky with vegetation present. The Transportation Department performed follow up for this exceedance and could not identify the cause.

On June 9, 2015, the dry weather monitoring of the County's assigned outfall (902MS4263) revealed exceedances of several constituents:

1. *Enterococcus is above the NAL (61 MPN/100mL) at >16,000 MPN/100mL.*
2. *Fecal Coliform is above the NAL (400 MPN/100mL) at 5,000 MPN/100mL.*
3. *Total Nitrogen is above the NAL (1 mg/L) at 3.6 mg/L.*
4. *Total Phosphorus is above the NAL (0.1 mg/L) at 0.22 mg/L.*
5. *DO measured at 4.84 mg/L at the Outfall*

Upon transmission of these findings from the monitoring team at Flood Control, the county initiated its IC/ID response. The results of the investigation by the Code Enforcement Department did not yield any findings of cause. Thus, the likely reason for these elevated levels is due to the that fact that the sample was collected from slow flowing water during dry, hot weather and it appears that the elevated levels of Bacterial Indicators and Nutrients may reflect the low flow, almost stagnant conditions, which would also explain the eutrophication evidenced by the low Dissolved Oxygen. Under these conditions, the combination of sunlight and presence of organic matter may have provided sufficient media to promote algal growth and the propagation of bacterial indicators, and concentration of nutrients. It should be noted that: a) No NAL exceedances were observed for the metals in comparison to the hardness-based criteria; b) there was no continuity of flow from the outfall to the downstream Mass Loading Station; and c) TPH was not required and thus not reported because no sheen was observed during sampling.

The County has taken the following steps to address the exceedances of constituents for this particular outfall:

1. *Face-to-face education and outreach to the Rancho Bella Vista HOA board meeting on August 4, 2014. Residents were in attendance.*
2. *Reminder of NPDES requirements to homeowners contained within CC&Rs appeared in the May 2015 HOA Newsletter which went out to every resident of the community.*
3. *Warning letters and fines sent by Eastern Municipal Water District for water waste*
4. *The Flood Control District has recently performed maintenance on the outfall to ensure flowlines are not blocked and that standing water is reduced to a minimum.*

In addition, the audit team from USEPA visited this outfall during the August 2014 program audit. Upon reaching the site, it was discovered that there was several pieces of trash and debris, including an open bag of fertilizer, lying around the maintenance turnaround pad. The County promptly called the Rancho Bella Vista Community HOA to have this trash and debris properly disposed of. Additional documentation regarding the SAL, NAL, community outreach and the USEPA audit site visit can be found in Attachment H.

Follow up actions planned for FY 15/16 include joint project evaluation and design with the Flood Control District for a retrofit project of dry weather diversion. In addition, the County will continue its education, outreach, and reporting within this community to ensure water quality targets are achieved.

5) Describe any instances when field screening and analytical data exceeded Action Levels, including those instances for which no investigation was conducted [K.3.d.(4)5]:

See responses to No. 4 above.

7. ILLICIT DISCHARGE DETECTION AND ELIMINATION (SECTION F.4 of ORDER NO. R9-2010-0016) CONT.

6) Describe the follow-up and enforcement actions taken in response to investigations of Illicit Discharges and a description of the outcome of the investigation/enforcement actions as required under Section F.4.e,f, & g. [K.3.d.(4)6]:

Illicit Discharge Incident	Follow-up and Enforcement Action	Outcome
CV1404375	Inspection conducted by the Code Enforcement Department	Written Warning
CV1500639	Inspection conducted by the Code Enforcement Department	Education and Information

8. WORKPLANS

1) Provide a summary of workplans including priorities, strategy, implementation schedule and effectiveness evaluations.

The Upper Santa Margarita Watershed Water Quality Workplan (Watershed Workplan) was developed in compliance with Directive G of the San Diego Regional Water Quality Control Board's Order No. R9-2010-0016.

The purpose of the Watershed Workplan is to:

1) Characterize the Receiving Water quality in the Upper Santa Margarita River Watershed's Receiving Waters

2) Identify and prioritize water quality problem(s) in terms of constituents by location in the Upper Santa Margarita River Watershed's Receiving Waters.

3) Identify the likely sources of the highest priority water quality problem(s) within the Upper Santa Margarita River Watershed.

4) Develop a watershed Best Management Practice (BMP) implementation strategy to attain Receiving Water Quality Objectives for the highest priority water quality problem(s).

5) Develop a strategy to monitor improvements in Receiving Water quality directly resulting from implementation of the BMP implementation strategy described in this Watershed Workplan.

6) Establish a schedule for development and implementation of the BMP and monitoring strategies outlined in this Watershed Workplan.

The Watershed Workplan is reviewed annually and updated to identify needed changes to prioritize water quality problem(s) listed in the Workplan.

Throughout Fiscal Year 2014-2015, the SMR Copermittees have been assessing the Watershed Workplan programs based upon the criteria set forth by CASQA. Section 12 of this JRMP Annual Report discusses the effectiveness of the implementation of the Watershed Workplan and the CASQA outcome levels achieved. The District and the Copermittees continue to implement the schedule as seen in Figure 1 of the Watershed Workplan that outlines implementation of various storm water programs. Further, and as noted above regarding the County's SAL and NAL exceedances which rank as a Priority 2 in the Watershed Workplan, the County will begin engineering and design studies to identify a potential retrofit at outfall No. 902MS4263.

9. NON-STORMWATER DISCHARGES

1) **Identify any non-stormwater discharge category listed in Requirement B.2 of Order No. R9-2010-0016 that was identified as a source of Pollutants to Waters of the U.S. during the reporting period. For each identified category, the Copermittee must report whether it elected to prohibit the discharge or to require BMPs to reduce Pollutants in the discharge to the MEP. If the discharge is not prohibited, the BMPs that will be implemented, or required to be implemented, are described below:**

Non-Stormwater Discharge Categories (per Requirement B.2)	Source of Pollutant	Prohibited	Required BMPs
Diverted stream flows	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Rising ground waters	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to MS4s	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Uncontaminated pumped ground water	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Foundation drains	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Springs	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Water from crawl space pumps	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Footing drains	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Air conditioning condensation	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Flows from riparian habitats and wetlands	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Water line flushing	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Discharges from potable water sources not subject to NPDES Permit No. CAG679001, other than water main breaks	☒ Yes ☐ No	☒ Yes ☐ No	☒ Yes ☐ No
Individual residential car washing	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No
Dechlorinated swimming pool discharges	☐ Yes ☒ No	☐ Yes ☒ No	☐ Yes ☒ No

2) Provide a description of any updates to ordinances, orders, or similar means to prohibit non-storm water discharge categories identified under Section B.2 of the 2010 SMR MS4 Permit.

In conjunction with the Governor's emergency Order regarding irrigation overspray, the County is partnering with local water districts to eliminate irrigation overspray discharges to the MS4. Further, the County recently adopted a revision to Ordinance 859.2 Water Efficient Landscape Requirements, which among several updated provisions, prohibited natural turf in front yards of new residential subdivisions. On May 18, 2015, the Board of Supervisors hosted a drought workshop and reaffirmed their support for Governor Brown's Emergency Order, which stipulated, among other water conservation measures, that all sprinkler irrigation discharges that cause runoff be prohibited. See Attachment I for further details on the County's drought actions and Ordinance 859.3 update.

3) Identify any control measures to be required and implemented for non-stormwater discharge categories identified as needing controls by the San Diego Water Board.

See No. 2 above.

4) Provide a description of a program to address Pollutants from non-emergency firefighting flows identified by the County of Riverside to be significant sources of Pollutants:

As part of preparation of the County's JRMP, the County has prepared and submitted with its JRMP the "Best Management Practices Plan for Firefighting Activities" as Appendix C.1 to the JRMP. The purpose of this plan is to identify Best Management Practices (BMPs) used by firefighting agencies for Runoff management in the Santa Margarita Region of Riverside County. Section B.3 of the 2010 SMR MS4 Permit adopted by the San Diego Regional Water Quality Control Board (Regional Board) requires each Copermittee to develop and implement a program to address Pollutants from non-emergency firefighting flows (i.e., flows from controlled or practice blazes and maintenance activities) identified as significant sources of Pollutants to Waters of the U.S.

The Riverside County MS4 Permittees in cooperation with the Riverside County Fire Agencies have developed fire department activity procedures to provide guidance to Fire Prevention and Firefighting personnel for management of Runoff. Guidance is provided in the form of recommended BMPs that are incorporated as part of the individual Jurisdictional Runoff Management Plans (JRMP), and as applicable into Facility Pollution Prevention Plans. When followed, implementation of the BMPs will minimize discharges of Runoff to the municipal separate storm sewer system (MS4) associated with non-emergency firefighting activities.

12. ASSESSMENT AND RESPONSE REPORTING

This section includes the report required pursuant to Requirement A.3.a.(1) of Order No. R9-2010-0016, if applicable.

Requirement A.3.a.(1) states:

"Upon a determination by either a Copermittee or the San Diego Regional Board that storm water MS4 discharges are causing or contributing to an exceedance of an applicable water quality standard, the Copermittee must notify the San Diego Regional Board within 30 days and thereafter submit a report to the San Diego Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any Pollutants that are causing or contributing to the exceedance of Water Quality Standards. The report may be incorporated in the Annual Report unless the San Diego Regional Board directs an earlier submittal. The report must include an implementation schedule. The San Diego Regional Board may require modifications to the report;"

The County provides funding in support of the Flood Control District's regional water quality monitoring program through the Implementation Agreement funding mechanism. The District provides notification to the County, where applicable, of any exceedances of an applicable water quality standard. In addition, the District has retained the services of a consultant to provide monitoring support within the upper SMR.

11. FISCAL ANALYSIS CONT.

1) The following table provides estimated expenditures for the current reporting period, the preceding reporting period, and the next reporting period. This table identifies the expenditures (such as capital, operation and maintenance, education, and administrative expenditures) necessary to accomplish the activities described in the County of Riverside's JRMP as required under Section H.2 of the 2010 SMR MS4 Permit. The analysis should also include a description of the source(s) of funds that are proposed to meet the necessary expenditures for the subsequent year.

Program Element	Funding Source	FY 2014-2015 Budget	FY 2014-2015 Expenditures	FY 2015-2016 Budget
Program Management and Reporting[1]	General Fund	$261,250	$239,520	$145,000
Annual Fee for MS4 NPDES Permit	General Fund	$60,000	$58,264	$60,000
Implementation Agreement Shared Cost[2]	General Fund	$430,000	$305,611	$430,000
Elimination of Illicit Connections & Illegal Discharges	Departmental Budgets	N/A	N/A	N/A
Municipal Facilities and Activities (EDA/Facilities Mgmt)	General Fund	$100,000	$125,000	$145,000
Development Planning[1]	DBF	$175,000	$171,250	$175,000
Private Development Construction (Inspections)[1]	DBF	$175,000	$171,250	$175,000
Industrial and Commercial Sources (Inspections)[1]	DBF	$175,000	$171,250	$175,000
Retrofit Program (CIP)	General Fund/Gas Tax/CSA 152	$0	$1,000	$10,000
Public Education & Outreach	Part of IA	N/A	N/A	N/A
Z5508000 - NPDES Program Administration[1]	Gas Tax	$140,000	$141,558	$152,000
Z5506000 – MS4 Mapping	Gas Tax	$100,000	$90,048	$108,300
Z5501000 –SMR River Watershed Activity MS4 Facilities Inspection & Cleaning Program	Gas Tax	$70,000	$71,480	$72,000

Z5502001 – Volcano Fire	Gas Tax	$100	$91	$117
Z5509000 – Municipal Inspections (Trans)[1]	Gas Tax	$14,000	$14,290	$16,750
Z5509001 – NPDES Inspections Transportation Yards	Gas Tax	$29,000	$28,565	$34,000
Street Sweeping CSA 152[1]	Gas Tax	$450,000	$448,726	$450,000
Roadside Litter Removal[1]	Gas Tax	$325,000	$323,404	$325,000
	Total	**$2,504,350**	**$2,361,307**	**$2,473,167**

[1]*Inlcudes funding for the three watershed regions.*

[2]*This includes area-wide programs for monitoring, public education, HHW, and Hazmat Response.*

2) Provide a narrative description of circumstances resulting in a 25 percent or greater annual change for any budget line item.

FY 15/16 budget included allocation of funds to begin engineering assessments of outfall retrofit. Additionally, the County Transportation Department is going start a pilot program for trash rack installations in the unincorporated areas around French Valley. As these items progress, additional information will be provided in the JRMP annual progress report.

12. ASSESSMENT AND RESPONSE REPORTING

1) **The following is the County of Riverside summary of its effectiveness assessments as required under Section J.3 of the 2010 SMR MS4 Permit. The Program Effectiveness reporting must include:**

a) The results of each of the effectiveness assessments performed pursuant to J.1.b, including the demonstrated CASQA effectiveness level(s);

12.1.a.1 Illicit Discharge Detection and Elimination Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Number of IC/ID reports received (F.4.e.(3))	179	Level 1
Percentage/Number of Dry Weather Source ID Efforts that were completed and Findings	100/1	Level 5
Estimated volume of anthropogenic trash removed from County MS4 facilities (tons) (F.3.a.(6)(b)(vi))	**113.40 tons** (Countywide Street Sweeping Program) **28 tons** (SMR Roadside Litter Removal Program)	Level 4

12.1.a.2 Municipal Areas and Activities Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Percent/Number of County facilities with appropriate BMPs identified (F.3.a.(2)(b))	100/8	Level 2
Number of Copermittee facility and MS4 operators and maintenance staff that attended Municipal training (F.6.b.(1))	4-Transportation Department	Level 1
Estimated tons of Waste removed by County street sweeping, (F.3.a.(5))	1134 (Countywide)	Level 4
Estimated tons of Waste removed from County Open Channels (F.3.a.(6)(b))	118.82	Level 4
Estimated tons of Waste removed from County storm drain inlets (F.3.a.(6)(b))	105.99	Level 4

12. ASSESSMENT AND RESPONSE REPORTING

12.1.a.3 Development Planning Effectiveness Assessment

Measureable Metric Collected	Data	CASQA Outcome Level
Number of acres of Redevelopment projects that incorporated LID-based BMPs that are built and completed (F.1.f.(1))	0	Level 5
Number of applicable planning staff that attended WQMP training[1] (F.6.b.(1))	29	Level 1

12.1.a.4 Private Development Construction Activity Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Construction Site inventory updated (F.2.b.)	Database contained in Appendix G is up to date	Level 1
Number of construction inspection staff that attended Construction training[1] (F.6.b.(b))	40- Transportation Department 18-Code Enforcement 14- Building and Safety	Level 1

12.1.a.5 Industrial and Commercial Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Industrial and Commercial Facilities inventory updated (F.3.b.(1)(a))	Database contained in Appendix G is up to date	Level 1
Number of applicable Industrial and Commercial Facility inspection staff that attended Industrial-Commercial training[1] (F.6.b.(1)(c))	4-Transportation Department 1-Building and Safety	Level 1

12.1.a.6 Residential Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Gallons of used oil collected at collection events (F.3.c.(2)(c))[1]	N/A	Level 4
Total pounds collected at HHW/ABOP events (F.3.c.(2)(c))[1]	N/A	Level 4

[1]*The County Waste Resources Department runs these for the County. See Attachment J for details.*

12.1.a.7 Retrofit Program Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Number of times the Retrofit Program has identified a potential solution to a specific identified problem	1	Level 1

[1]*Training Records are located in Attachment M*

12. ASSESSMENT AND RESPONSE REPORTING

12.1.a.8 Public Education Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Number of outreach events to schools	3	Level 1
Number of Public Events where outreach was conducted	154	Level 1
Pounds of trash removed through watershed cleanup events	See RCFC Report	Level 4
Number of home improvement stores provided outreach / customer education information for pesticide use	4	Level 1
Number of E-Newsletters signups	318	Level 2
% of E-Newsletters clicked	28	Level 2

SMR data, not Copermittee specific. The Public Education Report is located in Attachment N.

12.1.a.9 Watershed Workplan Effectiveness Assessment

Measureable Metrics Collected	Data	CASQA Outcome Level
Annual Public Review Meeting conducted	✓	Level 1
Updated Characterization of Receiving Water Quality	✓	Level 1
Updated prioritization of water quality problems	✓	Level 1
Descriptions of likely sources updated	✓	Level 1
Updated BMP Implementation Strategy	✓	Level 1
BMPs implemented according to schedule	✓	Level 1
Number of Collaborative Meetings Attended [1]	5	Level 1

[1] *Meeting information is located in Attachment O.*

Updated Characterization of Receiving Water Quality:

As noted in the *Flood Control District's annual report submittal, The climate in the SMR is semi-arid, and most streams are ephemeral. The extended drought conditions in southern California increase the frequency of Visited Not Sampled (VNS) monitoring events. Although, it was another dry year with 71% of regional average annual rainfall, compared to the previous three years (see Table 9), it was an increase, which resulted in some improved metrics. While all Southern California Index of Biotic Integrity (SoCal IBI, or IBI) scores had been trending downward from 2011 through 2014, in 2015, all but one site improved substantially. Furthermore, abatement of streamside transient encampments (such as conducted at the upstream end of the Lower Temecula Creek sampling reach) have reduced trash contributions and streambed disturbances, which may have helped increase 2015 IBI scores.*

12. ASSESSMENT AND RESPONSE REPORTING

Updated BMP Implementation Strategy:

The County is currently implementing the BMP Implementation Strategy as set forth per Section 4 of the Upper Santa Margarita River Watershed Workplan.

BMPs Implemented According to Schedule:

As noted above, the County's assigned outfall's (902MS4263) and associated NAL and SAL exceedances will require not only continued educational outreach, but will likely require an engineered retrofit solution. The County is working with the Flood Control District to prepare a feasibility and capital requirements report during FY 15/16. Upon completion of this document, the Flood Control District will program its CIP budget appropriately for the FY 16/17 budget year based upon the findings of this report. These efforts will be documents in subsequent annual reports.

b) Response to effectiveness assessments:

The County's effectiveness assessments and the data collection effort to yield such data reveal that the County's continued push toward consolidation of programs is necessary from a database/IT perspective and personnel perspective. While the County is in the midst of introducing advanced software (Land Management System) for its land-use approval and inspection process, it is not anticipated to be fully integrated until the end of FY 15-16. Until then, the County is still reliant on proprietary software that proves challenging for data extraction purposes.

c) A description of any future steps needed to improve the County of Riverside's ability to assess program effectiveness.

During FY 15/16, the County will work on a "bridge" spreadsheet for data reporting until the new Land Management System is fully functional, and so that this data can be more readily disseminated using the upcoming reporting forms in the new Regional Permit.

13. CONCLUSIONS/RECOMMENDATIONS

The County continues to effectively balance competing prioritization of societal needs (e.g., indigent health, public safety protection, etc.) with receiving water protection, environmental stewardship, and drought mitigation planning efforts. While this past year has proven challenging from a drought perspective, the monitoring report shows favorable trends in water quality improvements and protection. However, the County is still experiencing compliance issues with outfall 902MS4263 related to sampling of ponded, near-stagnant water. Further, as general fund resources are increasingly subject to competition, the County is vigilant in identifying program efficiencies and other revenue sources. The following recommendations below will be executed in FY 15/16 and reporting in the subsequent annual report.

- *Outfall 902MS4263 engineering study and capital planning analysis*
- *Consolidation of the Business License program into the Transportation Dep. NPDES Group*
    - *Review and revision of Ordinance 857, and Ordinance of the County of Riverside Establishing a Business Registration and Licensing Program to ensure effectiveness and fairness*
- *Consolidation of county-wide Post-Construction BMP inspections for county owned and maintained facilities into the Transportation Department NPDES Group*
- *A centralized database for easier data collection methods*

During the August 2014 USEPA Audit, the audit team provided several suggestions for program improvement, and identified one potential permit violation. The potential permit violation is related to the counties underground mapping effort of its storm drain lines less than 36". Currently, the County Transportation Department has mapped, through GIS tools and analysis, approximately 50% of the underground stormdrain lines for which it maintains in the Santa Margarita Watershed. Please see Attachment K that shows an example of this completed linework. Other updates to the JRMP, including SOPs for WQMP inspection and review, construction site compliance SOPs that show revised Notice of Violation forms, and the Enforcement/Compliance Strategy updates can be found within the revised JRMP in Attachment L.

INTRODUCTION

In 1987, Congress amended the Federal Clean Water Act (CWA) to require public agencies which serve urbanized areas with a population greater than 100,000 and other designated areas to obtain permits to discharge urban stormwater runoff from municipally owned drainage facilities including streets, highways, storm drains and flood control channels. In November 1990, the United States Environmental Protection Agency (USEPA) promulgated enforceable regulations establishing Municipal Separate Storm Sewer System (MS4) Permit requirements under its National Pollutant Discharge Elimination System (NPDES) Program. In California, USEPA has delegated its NPDES permitting authority to the State Water Resources Control Board (SWRCB). The SWRCB issues and enforces NPDES MS4 Permits through its nine California Regional Water Quality Control Boards (CRWQCBs).

The Riverside County Flood Control and Water Conservation District (District) service area encompasses portions of three major watersheds (drainage areas): the Santa Ana, the Santa Margarita and the Whitewater. The discharge of stormwater from MS4s within each of these three watersheds is regulated pursuant to an NPDES MS4 Permit (NPDES Permit) administered by a separate CRWQCB. **The District must comply with the provisions of these NPDES Permits in order to legally operate and maintain its flood control and drainage system infrastructure.** The USEPA and the CRWQCB can impose significant penalties for non-compliance, as high as $32,500 per day per violation. In addition, private citizens can pursue enforcement actions under the Federal CWA.

In the case of the Santa Margarita Watershed, the District, along with the County of Riverside (County) and the City of Temecula obtained an "early"[1] NPDES Permit from the CRWQCB - San Diego Region (Regional Board) on July 16, 1990. The Regional Board added the then newly incorporated City of Murrieta to the Permit on May 18, 1992.

This first NPDES Permit was considered a "Developmental Permit". The Permittees (District, County, and the cities of Temecula and Murrieta) were authorized to continue discharging stormwater from their municipally owned storm drains and flood control facilities while developing various elements of an area-wide stormwater management program. Although the initial NPDES Permit "expired" on July 16, 1995, its provisions remained in effect in accordance with the applicable provisions of the NPDES Permit Program regulations. The Regional Board adopted a "second–round" NPDES Permit (Board Order 98-02) for the Santa Margarita Watershed on May 13, 1998. However, USEPA Region IX raised an objection to specific language that was included in Board Order 98-02 at the direction of the SWRCB. Region IX subsequently took action to issue its own NPDES Permit (CAS0108766) in accordance with the Memorandum of Agreement between Region IX and the SWRCB and the NPDES regulations at 40 CFR123.44(h). On June 25, 1999, Region IX "returned" the NPDES Permit to the Regional Board for implementation. On November 8, 2000, the Regional Board issued Addendum No. 1 to Board Order No. 98-02, which incorporated, by reference, the EPA Permit into their Board Board Order.

In general, both Board Order No. 98-02 and the USEPA Permit validated the Permittees' overall stormwater management efforts by incorporating the major elements of the initial 1993 Drainage

[1] The term "early" is used to indicate permits that were issued prior to the promulgation of the final USEPA rules for permitting municipal stormwater discharges [40CF122.26, November 1990].

Area Management Plan (1993 DAMP) and other stormwater management program elements that the Permittees have subsequently developed. However, both Board Order 98-02 and the USEPA Permit identified certain additional programs and activities that the Permittees were required to implement in accordance with specified time schedules in order to achieve compliance with Board Order No. 98-02, the USEPA Permit, and the Federal Clean Water Act. Board Order 98-02 expired on November 30, 2003. The Permittees submitted a joint Report of Waste Discharge (ROWD) on May 30, 2003, requesting renewal of the Permit by the Board. On July 14, 2004, the San Diego Regional Water Quality Board (Regional Board) adopted Board Order No. R9-2004-001, the Third-term Santa Margarita Region (SMR) MS4 Permit (Third-term SMR Permit). The Third-term SMR Permit required several additional or enhanced program elements, such as strict control on new developments, enhancements to construction, industrial and commercial inspection programs, and a new emphasis on water quality monitoring and program effectiveness evaluations. Compliance programs were developed or enhanced to address the Third-term MS4 Permit between July 2004 and July 2005. These program elements were then incorporated into the updated Drainage Area Management Plan for the Santa Ana/Santa Margarita Region (SA/SMR DAMP). The Permittees submitted a joint ROWD on January 15, 2009, requesting renewal of the Permit by the Regional Board. The Regional Board responded to the ROWD and permit renewal process on February 18, 2010. The District and Permittees worked with the Regional Board to develop the watershed's Fourth-term MS4 Permit which was adopted on November 10, 2010 and included the newly incorporated City of Wildomar. Although the District and Co-Permittees are currently being regulated under the fourth-term MS4 Permit, the District and Co-Permittees have been working with Regional Board staff in the development of a Regional NPDES Permit. The development of the Regional NPDES Permit initially began in early 2012 and was adopted in May 2013. The Regional NPDES Permit will regulate Permittees within portions of Riverside, San Diego and Orange County. The District and Co-Permittees will be regulated under the Regional NPDES Permit once the current 2010 NPDES Permit expires.

From the beginning, the Permittees' Stormwater Management Program has been guided by the following principles:

1. Utilize existing municipal departments/programs to meet NPDES Permit requirements whenever possible.

2. Minimize duplication of effort through coordinated Permittee compliance actions.

3. When necessary, develop new or enhanced stormwater management programs (Best Management Practices) that are both cost-effective and acceptable to the public.

The Santa Margarita Watershed Benefit Assessment Area (SMWBAA) was established pursuant to District Ordinance No. 14 on May 14, 1991 (copy attached - see Appendix B). The SMWBAA was formed to offset the District's program and administrative costs associated with the development, implementation and management of identified stormwater management activities required by the federally mandated NPDES Permit Program. **The District must continue to develop and implement these stormwater management activities in order to legally operate and maintain its flood control and drainage facilities.** A map showing the boundaries of the SMWBAA is attached hereto as Appendix C.

The cost of the District's various NPDES Permit compliance activities fluctuates from year to year. Although some expenses do not change significantly on a yearly basis, certain costs are

cyclical (*e.g.*, preparing Permit applications and negotiating Permit provisions), while expenses associated with collecting water samples and laboratory analysis may vary according to the amount of rainfall occurring in a given year or in response to certain information requests from the Regional Board. Costs associated with the development and production of public education materials are not always incurred on a Fiscal Year basis. Occasionally, additional consultant services may be needed to assist the District with the development of a particular Permit requirement or program activity. Also, certain activities or programs may be expanded or curtailed from time to time and, occasionally, new programs or activities must be developed and implemented.

Currently, the regulation and management of stormwater runoff is a topic of increasing interest amongst the public, municipalities, regulatory authorities, and legislators. Although new laws and/or regulations could result in changes to the assessment rate in future years, **the proposed assessment rate for Fiscal Year 2013-2014 is equal to or less than the assessment rate that was enrolled and levied for Fiscal Year 1996-1997 and all subsequent years.**

APPORTIONMENT METHODOLOGY

SMWBAA assessments are apportioned on the basis of proportionate stormwater runoff generated by each parcel. This method of assessment is consistent with State law and the District Act. The amount of benefit is computed based upon a parcel's size (acreage) and its use classification. A single-family residential structure on a 7,200 square foot lot (1/6 of an acre) is defined as one benefit assessment unit (BAU). The BAUs for other types of land use are calculated in proportion to the amount of runoff generated by a single-family residence on a 7,200 square foot lot.

In comparison with a typical single family residence, industrial and commercial properties typically generate more stormwater runoff and higher pollutant loads on a per acre basis. Thus, commercial/industrial parcels are assessed at a higher rate per acre than residential parcels. Because agricultural discharges are currently exempt under the NPDES Permit regulations, parcels within the SMWBAA that are used for agricultural purposes are exempted from the assessment. Vacant undeveloped parcels that effectively generate no urban pollutants are also exempt. In addition, large tracts of land that consist mostly of Federally or State owned forest or similar property have been excluded from the SMWBAA. Refer to Appendix B for a more detailed discussion of the apportionment methodology.

CURRENT YEAR ASSESSMENTS (FY 2012-2013)

In July 2012, the District's Board of Supervisors confirmed a benefit assessment rate for FY 2012-2013 of $4.00 per BAU. Following is a summary of FY 2012-2013 assessments:

Rate	Billed Parcels	BAUs	Assessments	Corrections	Amount Paid*
$4.00	83,022	131,829	$527,315.22	$0.00	$497,258.25

* Through April 30, 2013

Property owners may request a review of their assessment(s) by contacting the District. District staff considers each request by reviewing information such as assessor's parcel maps, aerial photographs, and, when necessary, conducting site visits. The Auditor/Controller is notified of any needed corrections and a new tax bill is issued or, in cases where the assessment has been paid, a refund is made. Last year, no corrections were processed.

RECOMMENDED BENEFIT ASSESSMENT RATES (FY 2013-2014)

The District recommends that for FY 2013-2014, the SMWBAA assessment rate remain unchanged at $4.00 per BAU. This BAU rate would result in an equivalent charge per acre for the following land uses:

Group	Land Use Category	BAU/Acre	Assessment Rate*
A	Commercial, Industrial	12	$48.00/acre
B	Apartments/Mobile Home Parks, Churches and Schools	9	$36.00/acre
C	Single-family Residential	6**	$24.00/acre
D	Agricultural/Vacant Undeveloped	Exempt	$0.00/acre
E	Golf Courses	0.10	$0.40/acre
F	Undeveloped Portions of Parcels	0.05	$0.20/acre

* Refer to Appendix B for a detailed discussion of the Benefit Assessment methodology.
** 1 BAU per single-family residence, assuming six equally sized residential parcels per acre.

The projected revenue for FY 2013-2014, using the proposed benefit assessment rate of $4.00 per BAU is as follows:

Rate	Parcels*	BAUs	Assessment*	Projected Revenue**
$4.00	83,022	131,829	$527,315.22	$487,766.58

* Based on FY 2012-2013 Assessor's information
** Assumes a 7.5% delinquency rate

The projected revenue along with any remaining portion of the ending fund balance from FY 2012-2013 will fund the District's NPDES Stormwater Management Program activities for the Santa Margarita Watershed area in FY 2013-2014. The proposed FY 2013-2014 budget is presented in Appendix A.

During the early years of the NPDES Program, there were many uncertainties regarding startup costs (consultant costs, amount of sampling that would be required, overall program scope, etc.) since the program was new for both the regulatory authorities and the Permittees. Consequently, the initial assessment rates were set conservatively to ensure that all permit obligations could be met. To date, the District has been able to maintain a modest fund balance since the benefit assessments were first levied in FY 1991-1992. The District is gradually reducing the fund balance by maintaining the current assessment rate while sustaining expenditure levels that are slightly above projected revenues. It should also be noted here that the current trend in

California is toward more stringent regulation of municipal stormwater runoff, and with the recent adoption of the fourth-term Santa Margarita NPDES MS4 Permit, it is expected that the District's NPDES Permit compliance costs will increase significantly in Fiscal Year 2013-2014 and over the next few years.

ASSESSMENT ROLL

The SMWBAA Assessment Roll provides a listing by Assessor's Parcel Number of the proposed FY 2013-2014 Benefit Assessment to be levied on each parcel of property in the SMWBAA. The Assessment Roll is identified as Appendix D and incorporated herein by this reference. This Engineer's Report along with the SMWBAA Assessment Roll will be placed at the following locations for review by the public:

Clerk of the Board of Supervisors
4080 Lemon Street, 1st floor
Riverside, CA 92501

Riverside County Flood Control
and Water Conservation District
1995 Market Street
Riverside, CA 92501

City of Murrieta
24601 Jefferson Avenue
Murrieta, CA 92562

City of Temecula
41000 Main Street
Temecula, CA 92590

The Engineer's Report may also be viewed or downloaded at
http://rcflood.org/NPDES/

NPDES PROGRAM HIGHLIGHTS (FY 2012-2013)

The following tasks were accomplished or are ongoing for the year ending June 30, 2013 in compliance with the 2010 Santa Margarita NPDES Permit:

A. The District and Co-Permittees participated in a series of meetings with stakeholders and staff at the Regional Board, discussing the draft Regional NPDES Permit, which the Regional Board adopted on May 8, 2013. The District and Santa Margarita Permittees will be regulated under the adopted Regional NPDES Permit, once the current 2010 NPDES Permit expires.

B. Developed the Standard Stormwater Mitigation Plan (SSMP) Template and Guidance documents for new development, in accordance with the 2010 NPDES Permit. The SSMP requires developers to submit a project-specific SSMP for qualified new development and redevelopment projects, and identifies water quality impacts of the proposed development, and mitigation measures for those impacts. The Regional Board required revision of the SSMP to incorporate an increased focus on low impact development (LID) design practices and BMPs. The SSMP Template and Guidance documents are currently awaiting Regional Board approval.

C. Developed the Transportation Project Guidance (TPG) Template and Guidance documents for Permittee road projects, in accordance with the 2010 NPDES Permit. The TPG requires the development and implementation of standard roadway design and post-construction BMP guidance that comply with the Development Planning requirements of the 2010 NPDES Permit as an alternative to preparing a project-specific SSMP.

D. Completed and submitted for Regional Board approval, the Jurisdictional Runoff Management Plan (JRMP). The JRMP is a Copermittee specific document which describes the programs and procedures the Co-Permittees will implement to comply with the provisions of the 2010 NPDES Permit, and the responsible departments and staff. The JRMP replaces two past compliance documents: the Drainage Area Management Plan (DAMP), and the individual Storm Water Management Plans (SWMP).

E. Initiated a Hydromodification Mapping study, which will be used as a regional Planning tool, and details rivers, streams and receiving waters within the Santa Margarita River watershed that will be susceptible to the effects of hydromodification from increased run-off due to new development.

F. The District and Co-Permittees are in the process of developing a Hydromodification Management Plan (HMP) per the requirements of the 2010 NPDES Permit. The HMP consists of managing increases in runoff discharge rates and durations from all Priority Development Projects. The HMP will be incorporated into the SSMP. The final draft HMP will be submitted to the Regional Board no later than June 30, 2013. Once approved, the District and each Copermittee will implement the HMP. A public training seminar will be held shortly after the Regional Board approval of the HMP. This seminar will focus on HMP requirements, and how to implement the HMP into development and redevelopment projects.

G. Completed and submitted the Watershed Workplan which identifies and prioritizes areas within the Santa Margarita River watershed that require action to improve water quality,

likely sources causing water quality problems, likely sources of pollutants, and an implementation strategy and schedule to attain receiving water quality objectives. The District and Co-Permittees are required to review and update the Watershed Workplan annually to identify any needed changes to the prioritized water quality problem(s) listed in the workplan. All updates are presented during Annual Watershed Review Meeting.

H. Developed a new JRMP Annual Reporting Form per the requirements of the 2010 NPDES Permit. Fiscal Year 2012-2013 will be the first year of implementing the new annual reporting form for the District and Co-Permittees.

I. Continued presentation of semi-annual municipal employee stormwater training programs. These training classes focus on the requisite knowledge for properly implementing the SWMP, and address Permittee functions such as Development Planning, Municipal Activities, Industrial/Commercial Inspections and Construction Inspections. Fall and spring training sessions were held at the District and also at the cities of Temecula and Wildomar to provide close proximity for the Co-Permittees.

J. Continued to chair the Santa Margarita Technical Advisory Committee, comprised of Co-Permittees; interested parties are also encouraged to attend. The Co-Permittees coordinate their Urban Runoff management activities to work toward achieving the greatest protection of Receiving Water quality. This committee serves as a forum to effectively disseminate information, discuss regional and statewide program issues, and plan and coordinate Co-Permittee actions to achieve compliance with the NPDES MS4 Permit.

K. Continued implementation of the Commercial/Industrial Compliance Assistance Program (CAP) to conduct focused outreach to restaurants, automotive repair shops and certain other commercial and industrial establishments to encourage implementation of appropriate stormwater Best Management Practices and facilitate consistent and coordinated enforcement of local stormwater quality ordinances. Site visits included use of a survey checklist to document stormwater management practices for each facility.

L. Continued financial support to area-wide Stormwater Pollution Prevention Programs, including Hazardous Materials Response (HAZMAT) Team, the Household Hazardous Waste (HHW) temporary and permanent collection events and "ABOP" (Anti-freeze, Batteries, Oil, and Paint) program.

M. Developed, prepared and submitted a comprehensive District Annual Report and Watershed Annual Report to the Regional Board.

N. Continued to utilize the District's $2.5 million LID Project to test, demonstrate and evaluate the effectiveness of LID practices in stormwater capture and management, treating pollutants of concern associated with urban runoff, mitigating the impacts of hydromodification from urban development, and identifying optimum design criteria and standards for LID BMPs in Riverside County. This project implements a variety of LID BMPs, and provides a facility in a centralized location which is convenient for educating residents, regulators, developers, municipal employees, engineers and other interested stakeholders from many Southern California communities. Data collected will also be provided to the regional Southern California Stormwater Monitoring Coalition (SMC) LID Project. As this project will have statewide and regional benefits, the project is partially funded by a Proposition 13 grant and in partnership with SAWPA.

O. The District completed development of an enhanced LID BMP Design Manual, which is focused on landscape-based BMPs and infiltration BMPs capable of addressing identified water quality impairments across Riverside County. The LID BMP Design Manual is available on the District's website. In May 2012, the District's Board of Supervisors adopted the LID BMP Manual and ordered the establishment of a Water Quality Facilities Maintenance Community Facilities District. The District is currently working on establishing consulting services agreements for the CFD formation and legal services. Once the agreements are executed, the funding generated by this CFD will support tracking and maintenance of residential and some commercial/industrial post-construction BMPs in the unincorporated County area.

P. Continued enhancement of the collection and analysis of water quality samples in accordance with the NPDES Permit's Monitoring and Reporting Program. Mass load sampling of three monitoring stations during three winter storms continues to be conducted.

Q. Continued active participation in the California Stormwater Quality Association (CASQA). On behalf of the Co-Permittees, the District serves many leadership roles within the organization, specifically: Jason Uhley, Board Member from 2010-present, Legislative Chair since 2003, Treasurer since 2010; and active contributory membership roles in the Monitoring & Science, Legislative, and Construction Sub-committees.

R. Continued active participation in the CASQA Pesticides Subcommittee, with the goal of facilitating changes to State and Federal pesticides regulations. These changes will improve processes for evaluating the environmental impacts on Receiving Waters of new pesticides, and also change labeling and use requirements for existing pesticides, such as pyrethroids.

S. Continued participation in the Stormwater Monitoring Coalition (SMC), a regional monitoring group comprised of Southern California Phase 1 Municipal NPDES Permit holders whose focus is developing effective, meaningful stormwater quality monitoring techniques.

T. Continued coordination with the SMC on a southern California bioassessment monitoring program.

U. Developed a new Stormwater Pollution Prevention Presentation for elementary schools, to be presented by the District's consultant.

V. Continued to chair the Public Education Subcommittee. Meetings include Co-Permittee representation from each watershed to review elements of regional public education programs and program materials.

W. Continued an ongoing effort to redesign the District's NPDES Public Education webpage to improve its effectiveness, usability and quality of information regarding MS4 compliance programs. The webpage is currently being reformatted extensively to add more usable and interactive data as well as add information pertinent to new permit requirements, based on recommendations from the District's consultant. The webpage will provide information for the general public, Permittees, regulators, public and in-house personnel.

X. Continued to host the District's NPDES website which provides information regarding the regional MS4 Permit compliance programs. The website provides pertinent information for Permittees, regulators, public and in-house personnel.

Y. Continued distribution of focused BMP brochures targeting Construction Activities, Pet Care, Guidelines for Swimming Pool, Jacuzzi and Garden Fountain Maintenance, Septic Tank Maintenance, Restaurant/Food Service Industry, Professional Mobile Services, Automobile Service Industry, Outdoor Cleaning Activities and Industrial Facilities. Efforts continue to ensure that brochures are updated as necessary.

Z. Implemented a new series of Home Gardening Workshops at local nurseries and garden centers to promote alternatives to fertilizer and pesticide usage, presented by the District's consultant. Store staff is trained and point-of-purchase displays are placed at paint, pesticide and fertilizer departments.

AA. Developed and executed informative e-newsletters. E-newsletters are sent out quarterly and focus on one key area of pollution prevention in each issue, for a variety of target audiences. The e-newsletters are also tightly integrated with the revised District website to enhance our ability to outreach to target audiences.

BB. Continued to provide outreach material for County and District new employee orientation sessions regarding appropriate stormwater stewardship practices including clean water information and promotional items that link back to the County's "Only Rain Down the Storm Drain" message. Attendees receive a carry bag containing After the Storm, Outdoor Cleaning Activities, Pool and Spa Maintenance, Pet Care and Tips for Horse Care brochures. Various promotional items that reinforce outreach messages such as dust pans (use dry cleanup methods), imprinted with the "Only Rain Down the Storm Drain" logo and the 1-800 Toll Free line are also distributed.

CC. Continued to apply for Proposition 84 Grant funding through the Upper Santa Margarita Watershed Integrated Regional Watershed Management Plan, for planning projects within the Santa Margarita Region that would additionally help provide funding for compliance document development required by the 2010 NPDES Permit. A grant was subsequently awarded in September 2012 to fund the development of nutrient water quality objectives and receiving water targets for the Santa Margarita River and Lagoon.

PROGRAM/WORK ITEMS (FY 2013-2014)

With adoption of the 4th Term NPDES Permit, Board Order No. R9-2010-0016, on November 10, 2010, significant development and revisions to compliance documents and programs have commenced in order to comply with the new requirements.

The following program activities will be emphasized for the coming year:

NPDES PERMIT COMPLIANCE PROGRAM IMPLEMENTATION

Board Order No. R9-2010-0016 was adopted by the Regional Board on November 10, 2010. Following the adoption of the NPDES Permit, the District was designated as the Principal Co-Permittee and began establishing teams of consultants to revise and develop compliance programs. Compliance documents which have been finalized and require implementation during FY 2012-2013 specifically include the:

- Jurisdictional Runoff Management Plan (JRMP),
- Water Quality Management Plan (WQMP),
- Watershed Workplan, and
- Consolidated Monitoring Program (CMP).

Costs to implement these programs will be significant; where feasible, these programs have been coordinated with the development of the Santa Ana NPDES Permit programs. However, there are many requirements in the Santa Margarita NPDES Permit that are unique from the Santa Ana Permit programs. For such requirements, the District's share of the cost for implementing these programs will be wholly from the SMWBAA funds. Additional information on these new compliance efforts is provided below

LID PROJECT

Construction of the District's $2.5 million LID Project was completed in Spring of 2012; this project implements a variety of LID BMPs, and is being used to test and demonstrate the effectiveness of LID practices in stormwater capture and management, treating pollutants of concern associated with urban runoff, mitigating the impacts of hydromodification from urban development, and identifying optimum design criteria and standards for LID BMPs in Riverside County. Water quality monitoring and hydrology studies will continue to be conducted over the coming years, and data collected is also being provided to the regional SMC LID Project.

The project provides a facility in a centralized location, which is convenient for educating residents, regulators, developers, municipal employees, engineers and other interested stakeholders from many Southern California communities.

PROGRAM MANAGEMENT

As Principal Permittee, the District conducts certain activities to coordinate the efforts of the other Co-Permittees and facilitate compliance with the 2010 NPDES Permit. These activities include chairing quarterly meetings of the Santa Margarita Technical Advisory Committee, administration of area-wide programs (e.g., public education, household hazardous waste collection, hazardous material spill response, stormwater sample collection and analysis), program development and preparation of the Annual Report to the Regional Board. Per 2010 NPDES Permit requirement, and due to an increase in program compliance documentation development, implementation of the programs detailed in the JRMP will be the most significant

program management activity for FY 2013-2014. The District will also focus its efforts on identifying and commenting on statewide issues that affect local stormwater programs.

AREA-WIDE PROGRAMS

The District will also continue to provide financial support for several important "area-wide" BMP programs implemented on behalf of the Co-Permittees, including:

Public Education

Coordination and oversight of the area-wide NPDES public education and outreach efforts, including public events, school and adult education programs, printed brochures and commercial mass-media campaigns. Continued development and distribution of focused educational outreach materials for specific industries and businesses such as restaurants, auto repair shops, outdoor cleaning businesses, and other commercial and industrial activities that are potential sources of stormwater pollution. Additionally, e-newsletters are developed and distributed quarterly, and the public education webpage is under an ongoing redesign effort to improve its effectiveness, usability and quality of information regarding MS4 compliance programs.

Training for Municipal Employees

Municipal training programs to improve understanding of NPDES Permit requirements and stormwater BMPs. The classes focus on methods to reduce and/or eliminate sources of stormwater pollution from public agency facilities and activities. Training is conducted specifically for construction inspection staff, industrial/commercial facilities inspection staff, municipal facilities maintenance staff, Compliance Assistance Program inspectors, and staff responsible for new development/re-development project review.

Hazardous Materials Emergency Spill Response

Providing financial support to the County Fire Department's Hazardous Materials Emergency Spill Response Team to ensure that hazardous chemical incidents (spills or illegal dumping) are responded to quickly, and effectively cleaned up.

Household Hazardous Waste Collection / ABOP

Providing financial support to the County Waste Management Department to support ongoing mobile Household Hazardous Waste (HHW) collection events and operation of the "ABOP" (Antifreeze, Batteries, used motor Oil, and latex Paint) program, which provide local residents with opportunities to properly dispose of HHW.

Compliance Assistance Program

Continuation of a partnership with the County Environmental Health Department to conduct outreach and education to specific commercial establishments and industrial facilities in conjunction with existing Facility Inspection Programs. In addition, this program provides feedback through survey forms concerning the compliance status of commercial and industrial facilities to both the Co-Permittees and the Regional Board.

WATER QUALITY MONITORING

On behalf of all Permittees, the District conducts both wet and dry weather sample collection and analysis in accordance with the 2010 NPDES Permit's Monitoring and Reporting Program. Program development for the additional monitoring required in the NPDES Permit's MRP was completed during FY 2012-2013. The Permittees have also been participating in a study of the Santa Margarita River to develop Numeric Nutrient Endpoints for a Santa Margarita River

Nutrient TMDL. Additionally, based on the results of the TRE special study, the District will continue to verify and address potential Pyrethroid Toxicity in both Murrieta and Temecula Creeks.

NEW DEVELOPMENT

In order to comply with the 2010 NPDES Permit requirements, the SSMP was revised during FY 2011-2012. The revised SSMP requirements impact both public and private projects. Significant revisions include the expansion of project types subject to the SSMP, LID and hydromodification requirements, requirements to establish an urban runoff fund or water quality credit system for those projects that cannot implement LID, and development of a database and inspection program to track and ensure maintenance of structural post-construction BMPs.

To implement these requirements, the Permittees will have to utilize and fine tune the following program items, which were created during the past fiscal year:

- GIS level mapping of stream segments in the Santa Margarita River Watershed which has determined streams that are susceptible to Hydromodification from new or existing development.
- Feasibility criteria for determining when infiltration, capture and re-use or evapotranspiration are not feasible for a specific development site. The NPDES Permit requires that these BMPs be used unless a technical feasibility study indicates that they are not feasible for a particular project.
- The revised LID BMP Design Manual to incorporate LID and HMP concepts including infiltration and filtration BMPs, capture and re-use technologies and evapotranspiration, and to mitigate increased runoff from Priority Development Projects.
- The updated project-specific WQMP Template, Guidance and training to assist Permittees and developers with the transition to the new requirements. During the upcoming fiscal year, the SSMP Template will be revised to account for the HMP requirements.
- The TPG Template and TPG Guidance to assist Co-Permittee transportation engineers to comply with the new requirements.

These program items will be implemented during FY 2013-2014.

INDIVIDUAL JURISDICTION RUNOFF MANAGEMENT PLANS

As part of the 2010 NPDES Permit, the District will implement a JRMP that describes its specific runoff management programs and activities implemented to comply with the requirements of the 2010 NPDES Permit. The JRMP is the principal document that comprehensively translates the NPDES Permit requirements into actions. The JMRP will be reviewed at least annually to incorporate new and revised compliance programs specified in the 2010 NPDES Permit.

WATERSHED WORKPLAN IMPLEMENTATION

In accordance with 2010 NPDES Permit requirements, the District developed a plan to indentify, prioritize, address and mitigate the highest priority water quality issues and/or pollutants in the Upper Santa Margarita River watershed. During FY 2013-2014, the items detailed within the Workplan will be implemented.

HYDROMODIFICATION MANAGEMENT PLAN (HMP) DEVELOPMENT

In accordance with 2010 NPDES Permit requirements, the District, in conjuction with the SMR Co-Permittees have been developing an HMP to manage increases in runoff discharge rates and durations from all Priority Development Projects. The HMP will require projects to have estimated post-project runoff discharge rates and durations that do not exceed pre-development discharge rates and durations. Amodeling software is currently being developed and finalized to perform the necessary calculations to estimate pre-development and post-project runoff discharge rates. A Hydromodification Susceptibility Map is also being developed, which will identify and address channel segments for their susceptibility and geomorphic stability.

CONSOLIDATED MONITORING PROGRAM

The District updated the Consolidated Monitoring Program (CMP) to describe the monitoring efforts that were implemented to comply with the 2010 NPDES Permit. During FY 2012-2013, these monitoring efforts were implemented. The CMP update describes significant increases in monitoring requirements including:

- Expansion of the IC/ID Program to require implementation of a more rigorous and proactive detection and elimination program based action levels. This includes development and implementation of Permittee specific schedules to conduct systematic investigations of MS4 facilities and outfalls with a diameter of 36 inches or larger to receiving waters as well as industrial areas tributary to outfalls with a diameter 18 inches or larger and with specified acreage as outlined in the NPDES Permit.
- Additional Bioassessment requirements, which require reconnaissance of three new viable sampling locations.
- New High Priority Inland Aquatic Habitat monitoring.
- Five special monitoring studies.

These efforts, which are unique to the Santa Margarita watershed, will continue to be implemented during the coming fiscal year.

INTEGRATED REGIONAL WATERSHED MANAGEMENT PLAN

The District and the County of Riverside are continuing to support Rancho California Water District in the implementation of an Integrated Regional Watershed Management Plan for the Santa Margarita River region in Riverside County. The plan identifies necessary coordination and projects to sustain water quality and water supply, control flooding, and protect and/or enhance open space and critical habitat areas. Several other agencies are also participating in the effort. The plan not only provides guidance for future planning efforts, it also opens the Santa Margarita Region to participate in solicitation of funds for various Integrated Watershed Management Plan grant programs associated with Propositions 40, 50 and 84.

CONCLUSIONS AND RECOMMENDATIONS

The area-wide Municipal Stormwater Program for the Santa Margarita Watershed has been implemented in an efficient, cost-effective manner through the ongoing cooperative efforts of the District, the Co-Permittees, the Regional Board and the Riverside County Fire Department and Environmental Health Department. The District's NPDES Program activities, which are funded by these SMWBAA assessments, are required to comply with the current NPDES Permit for the Santa Margarita Watershed and enforceable provisions of the California Water Code and the Federal Clean Water Act which regulate the discharge of stormwater from MS4s. These mandatory stormwater management program activities are an essential component of the District's continuing operation and maintenance of its critical public safety facilities; therefore, the following action is recommended:

Levy a Flood Control Benefit Assessment in the Santa Margarita Watershed Benefit Assessment Area at an unchanged rate of $4.00 per benefit assessment unit for FY 2013-2014.

GLOSSARY

ABOP – A permanent collection facility that accepts Anti-freeze, Batteries, Oil and latex Paint for recycling and/or proper disposal

BAU – Benefit Assessment Unit

BMP – Best Management Practice

CAP - Compliance Assistance Program. A stormwater outreach and reporting program conducted in conjunction with selected facility inspection programs conducted by the Riverside County Environmental Health Department.

CMP – Consolidated Monitoring Program

CRWQCB – California Regional Water Quality Control Board

CWA - Clean Water Act

DAMP – Drainage Area Management Plan

District – Riverside County Flood Control and Water Conservation District

FY – Fiscal Year

HAZMAT Team –Hazardous Materials Emergency Response Team

HHW – Household Hazardous Waste. Commonly used household chemicals that may be toxic or require special handling for proper disposal, *e.g.*, automotive fluids, pesticides, fertilizers, paint, cleaning products, pool chemicals, etc.

HMP – Hydromodificaiton Management Plan

JRMP – Jurisdictional Runoff Management Plan

LID – Low Impact Development

MS4 – Municipal Separate Storm Sewer System

NPDES – National Pollutant Discharge Elimination System.

Board Order No. R9-2004-001 – An Order of the California Regional Water Quality Control Board – San Diego Region to regulate stormwater discharges from municipal stormwater facilities owned or operated by the District, County of Riverside, or the Cities of Murrieta and Temecula.

Board Order No. R9-2010-0016 - An Order of the California Regional Water Quality Control Board – San Diego Region to regulate stormwater discharges from municipal stormwater facilities owned or operated by the District, County of Riverside, or the Cities of Murrieta, Temecula and Wildomar.

Regional Board – San Diego Regional Water Quality Control Board

ROWD – Report of Waste Discharge

SA – Santa Ana

SA/SMR DAMP – Santa Ana and Santa Margarita Regional Drainage Area Management Plan.

SAWPA – Santa Ana Watershed Project Authority

SMR – Santa Margarita Region of Riverside County

SMWBAA – Santa Margarita Watershed Benefit Assessment Area

SSMP - Standard Stormwater Mitigation Plan

SWRCB – State Water Resources Control Board

USEPA – United States Environmental Protection Agency

WQMP - Watershed Quality Management Plan

APPENDIX B

RCFC&WCD Ordinance No. 14
(May 14, 1991)

0896

ORDINANCE NO. 14

AN ORDINANCE OF THE RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION DISTRICT ESTABLISHING A BENEFIT ASSESSMENT FOR THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) STORMWATER PROGRAM

The Board of Supervisors of the Riverside County Flood Control and Water Conservation District, State of California, do ordain as follows:

ARTICLE I

GENERAL

Section 1. Title.

This Ordinance shall be known as the "NPDES Program - Benefit Assessment Ordinance" of the Riverside County Flood Control and Water Conservation District.

Section 2. Purpose.

The United States Environmental Protection Agency (the "EPA") has, consistent with Section 402 of the Federal Clean Water Act, as amended, promulgated the National Pollutant Discharge Elimination System Regulations (the "NPDES Regulations") pursuant to which the EPA, through the appropriate California Regional Water Quality Control Board (the "CRWQCB") has required the Riverside County Flood Control and Water Conservation District (the "District") and other affected public entities to secure a National Pollutant Discharge Elimination System Stormwater Permit (the "NPDES Permit") which does require the District to develop, implement and manage identified programs dealing with stormwater runoff. The parcels of land within the respective watersheds within the District's jurisdiction for which a NPDES Permit is

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL

RIVERSIDE, CALIFORNIA

6-4-91
A 2

REVISED

required will benefit from these programs. The Board of Supervisors of the District has determined, pursuant to the Riverside County Flood Control and Water Conservation Act (the "District Act"), which is Chapter 48, as amended, of the California Water Code Appendix, to establish certain Benefit Assessment Areas in which the District will annually levy a Benefit Assessment to pay the cost of these programs required by the NPDES Permit. The Board of Supervisors of the District, consistent with Section 48-14 of the District Act, held a noticed public hearing at which time all testimony, oral and written, was considered. As the conclusion of the public hearing, the Board of Supervisors of the District adopted resolutions establishing the Benefit Assessment Areas. The provisions of this Ordinance confirming the establishment of the Benefit Assessment Areas and providing for the annual levy of a Benefit Assessment are consistent with the District Act and the reports prepared by the Chief Engineer of the District and accepted by the Board of Supervisors of the District.

The Board of Supervisors of the District finds that the Benefit Assessment to be annually levied shall be based on the proportional stormwater runoff generated by each lot or parcel within the Benefit Assessment Area. Revenues derived from the Benefit Assessment shall be applied exclusively to pay the District's administrative and program costs associated with the NPDES Permit required for the Benefit Assessment Area and are to be apportioned to the Benefit Assessment Area in which they are collected.

ARTICLE II

DEFINITIONS

Section 1. Unless otherwise specifically provided or required by the context, certain terms or expressions used herein have the meanings set forth below:

a.) "Benefit Assessment" means the Benefit Assessment to be levied annually on each Parcel within a Benefit Assessment Area pursuant to Article IV of this Ordinance.

b.) "Benefit Assessment Area" means a Benefit Assessment Area formed pursuant to Section 48-14 of the District Act by the Board of Supervisors and identified in Article III of this Ordinance.

c.) "Board of Supervisors" means the Board of Supervisors of the Riverside County Flood Control and Water Conservation District.

d.) "Chief Engineer" means the Chief Engineer of the Riverside County Flood Control and Water Conservation District.

e.) "County" means the County of Riverside, State of California.

f.) "CRWQCB" means the California Regional Water Quality Control Board for the region in which the Benefit Assessment Area has been established.

g.) "District" means the Riverside County Flood Control and Water Conservation District.

h.) "District Act" means the Riverside County Flood Control and Water Conservation District Act, Statutes 1945, Chapter 1122, as amended; California Water Code,

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 - 10TH STREET
RIVERSIDE, CALIFORNIA

Appendix, Chapter 48.

i.) "EPA" means the United States Environmental Protection Agency, which, pursuant to the Clean Water Act of 1976, as amended by the Water Quality Act of 1987, has jurisdiction to establish the NPDES program and promulgate regulations pursuant thereto.

j.) "NPDES Permit" means the permit, issued by the regional CRWQCB, dealing with stormwater runoff in association with the National Pollutant Discharge Elimination System (NPDES) and the regulations promulgated by the EPA.

k.) "NPDES Regulations" means the final regulations dated November 16, 1990, and any subsequent amendments thereto promulgated by the EPA governing the National Pollutant Discharge Elimination System (NPDES).

l.) "Ordinance" means this Ordinance No. 14 of the Riverside County Flood Control and Water Conservation District.

m.) "Parcel" means a parcel of property identified by Assessor parcel number as shown on the equalized tax rolls of the County of Riverside, State of California.

ARTICLE III

ESTABLISHMENT OF BENEFIT ASSESSMENT AREAS

Section 1. Formation of Benefit Assessment Areas.

Pursuant to Section 48-14 of the District Act, the Board of Supervisors noticed three public hearings to consider the establishment of three Benefit Assessment Areas for each of which a NPDES Permit would be required by the NPDES Regulations. At the

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 10TH STREET
RIVERSIDE CALIFORNIA

conclusion of the hearings, the Board of Supervisors adopted Resolutions Nos. F91-21, F91-22, and F91-23 which established, respectively, the Santa Ana Watershed Benefit Assessment Area, the Santa Margarita Watershed Benefit Assessment Area, and the Whitewater Watershed Benefit Assessment Area. The legal descriptions for each of the Benefit Assessments Areas are attached hereto, marked respectively Exhibits A, B, and C, and are by this reference incorporated herein.

Section 2. Amendment to or Additional Benefit Assessment Areas.

The District may amend the boundaries of each of the Benefit Assessment Areas or create additional Benefit Assessment Areas, if in the District's administrative judgment the NPDES Regulations and the NPDES Permits issued pursuant thereto so require. To amend the boundaries to a Benefit Assessment Area or to create an additional Benefit Assessment Area, the District is to comply with provisions of the District Act then governing the creation of a benefit assessment area.

ARTICLE IV

REPORT OF CHIEF ENGINEER, HEARING THEREON; CONFIRMATION OF BENEFIT ASSESSMENT BY THE BOARD OF SUPERVISORS

Section 1. Report.

The Chief Engineer shall cause to be prepared annually a written report for each Benefit Assessment Area regarding the Benefit Assessment to be levied and shall file each report with the Clerk of the Board of Supervisors.

Section 2. Content of the Report.

Each report shall contain the District's estimate of

WILLIAM C KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 - 10TH STREET
RIVERSIDE, CALIFORNIA

its administrative and program costs in association with the NPDES Permit for the Benefit Assessment Area for the ensuing fiscal year. Said estimate of cost shall be apportioned to each Parcel on the basis of proportionate stormwater runoff generated from each Parcel to be assessed. Only Parcels not otherwise exempted by this Ordinance or the NPDES Regulations shall have a Benefit Assessment levied on them. The report shall identify all Parcels by Assessor parcel number on which a Benefit Assessment is to be levied and the amount of the assessment.

Section 3. Resolution Accepting Report and Noticing Public Hearing.

Upon the report being filed with the Clerk of the Board of Supervisors, the Board of Supervisors is, by resolution, to accept, if appropriate, the report and to set a date, time and place for a hearing on said report. Prior to the date of the hearing, a notice specifying the date, time, place and purpose of the hearing and identifying those locations at which a property owner may review the report shall be published in a newspaper of general circulation within the Benefit Assessment Area pursuant to the provisions of Section 6066 of the California Government Code. In addition, the District shall cause the notice of the hearing to be posted in at least three public places within the boundaries of the Benefit Assessment Area at least seven (7) days prior to the date of the hearing.

Section 4. Hearing.

The Board of Supervisors shall hear the matter on the date and at the time specified in the notice, or as continued for good cause. At the hearing, the Board of Supervisors shall hear

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 10TH STREET
RIVERSIDE, CALIFORNIA

and consider all testimony, oral and written, presented, including all written protests. At the conclusion of the hearing, the Board of Supervisors may revise, change, reduce or modify any Benefit Assessment and shall make its determination upon each Benefit Assessment identified in the report. Thereafter, by resolution it shall confirm the assessments. Such confirming resolution shall be adopted no later than August 10 of each fiscal year in which the Benefit Assessment is to be levied and collected.

Section 5. Enrollment.

The District shall provide certified copies of the confirming resolutions and the roll of confirmed Benefit Assessments, in an acceptable format, to the Auditor-Controller of the County on or before August 10 of each fiscal year.

ARTICLE IV

LEVY OF BENEFIT ASSESSMENT

Section 1. Determination of the Amount to be Assessed.

The District is to estimate for the fiscal year in which the Benefit Assessment is to be levied the administrative and program costs that it will incur pursuant to the NPDES Permit issued for each Benefit Assessment Area. This estimate of costs is to be apportioned among the Parcels within each Benefit Assessment Area on the basis of proportionate stormwater runoff generated by each Parcel. The Benefit Assessment levied and collected within each Benefit Assessment Area may only be applied toward the costs incurred pursuant to the NPDES Permit for that Benefit Assessment Area. If at the conclusion of any fiscal year there remains in the account for a Benefit Assessment Area unexpended funds, the remaining balance shall be applied toward

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 - 10TH STREET
RIVERSIDE, CALIFORNIA

the estimated costs for the next fiscal year and thereby reduce the amount of the Benefit Assessment to be levied. Benefit Assessments levied and collected pursuant to this Ordinance may not be applied toward any other costs or expenses of the District nor may they be applied to the costs of a Benefit Assessment Area other than the Benefit Assessment Area for which they were levied and collected.

Section 2. Determination of Proportionate Storm Water Runoff and Amount of Benefit Assessment to be Levied.

a.) Benefit Assessment Unit. The District shall express the of proportionate stormwater runoff factor as a decimal. The standard against which all property is to be measured shall be a single-family residential parcel of 7,200 square feet (1/6 acre) in size to which a runoff factor of 0.40 is ascribed and shall be called a Benefit Assessment Unit (BAU).

The runoff factor for each of the classes listed in subsection (b) below are as follows:

Group A	0.80
Group B	0.60
Group C	0.40
Group D	Exempt
Group E	0.0067
Group F	0.0033

The runoff factor for each group is compared to the runoff factor of the standard Benefit Assessment Unit (Group C) as described above. This results in a runoff factor ratio. The runoff factor ratio shall be that ratio established by comparing Benefit Assessment Units assigned to one of the groups listed

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
1535 - 10TH STREET
RIVERSIDE, CALIFORNIA

above, compared to the standard Benefit Assessment Unit represented by Group C. The number of Benefit Assessment Units per parcel size for each of the classes listed in subsection (b) below are as follows:

Group A	12 BAU/acre
Group B	9 BAU/acre
Group C	1 BAU/7200 sq. ft. lot
Group D	Exempt
Group E	0.10 BAU/acre
Group F	0.05 BAU/acre

b.) Classification of Parcels. All Parcels shall be assigned to one of the following classifications based on land use:

Group A: Commercial or industrial use

Group B: Institutional uses, ie. churches, or hospitals, or multiple family residential use having four or more units per parcel, ie. apartments or mobile home parks.

Group C: Single family residential or multiple family residential having three or fewer units on 1/6 of an acre parcel.

Group D: Agricultural uses, including dairies, poultry, livestock, groves, orchards, row crops, field crops, vines or dry farming.

Group E: Golf courses, cemeteries, etc. and that portion of a single family residential parcel in excess of 7,200 square feet (1/6 acre) but less than 2.5 acres.

Group F: The undeveloped portion of a parcel such

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 - 10TH STREET
RIVERSIDE, CALIFORNIA

as the portion of a single family residential parcel exceeding 2.5 acres.

Calculation of the Benefit Assessment Units to be attributed to a single family residential unit on a Parcel larger than 1/6 acre is cumulative with that portion of the Parcel in excess of the 1/6 acre which falls in either Group E or F being assigned the appropriate BAU for the amount of acreage falling within either Group E or F.

It is determined that Parcels used as a railroad, gas, water, telephone, cable television, electric utility right-of-way, electric line right-of-way or other utility right-of-way will benefit from the programs required by the NPDES Permit and will be subject to the Benefit Assessment to be levied pursuant to this Ordinance.

c.) Exempted Land Uses. All land uses expressly exempted by the NPDES Regulation will be exempted from the levy of a Benefit Assessment pursuant to this Ordinance. Those land uses exempted are:

1.) Agricultural uses, including dairies, poultry, livestock, groves, orchards, row crops, field crops, vines or dry farming.

2.) Vacant, undeveloped parcels.

3.) Publicly owned parcels which are parcels owned by a Federal, State or local public entity or agency and used for public purposes.

d.) Determination of Benefit Assessment Units per Parcel. Once a Parcel is classified and its acreage is

WILLIAM C KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 - 10TH STREET
RIVERSIDE, CALIFORNIA

determined, the appropriate BAU's per acre for its classification will be multiplied by the acreage to determine the total Benefit Assessment Units for the Parcel

e.) Determination of Benefit Assessment to be levied per Benefit Assessment Unit. The aggregate number of Benefit Assessment Units within a Benefit Assessment Area will be divided into the estimated administrative and program costs for the Benefit Assessment Area to determine the amount of Benefit Assessment to be levied per Benefit Assessment Unit. The Benefit Assessment to be levied on a Parcel is determined by the number of Benefit Assessment Units ascribed to the Parcel and the assessment value of each unit.

ARTICLE V

COLLECTION OF BENEFIT ASSESSMENT.

Section 1. Collection by Treasurer/Tax Collector.

The confirmed Benefit Assessment for each Parcel shall appear as a separate item on the tax bill issued by the Treasurer-Tax Collector of the County. The Benefit Assessment shall be levied and collected at the same time and in the same manner as the general ad valorem property taxes and shall be subject to the same penalties and the same procedures for sale in case of delinquency. If, for the first year the Benefit Assessment is levied, the property on which the Benefit Assessment is levied has been transferred or conveyed to a bona fide purchaser for value, or if a lien of a bona fide encumbrancer for value has been created and attached thereon, prior to the date on which the first installment of ad valorem property taxes would become delinquent, the Benefit Assessment shall not result in a

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
1535 - 10TH STREET
RIVERSIDE, CALIFORNIA

lien against the real property but shall be transferred to the unsecured roll.

Section 2. Applicable Law.

All laws applicable to the levy, collection and enforcement of ad valorem property taxes shall be applicable to Benefit Assessments, except as otherwise provided herein.

Section 3. Validity of Benefit Assessment Not Affected by Time Limits.

Failure to meet the time limits set forth in this Ordinance for whatever reason shall not invalidate any Benefit Assessment levied hereunder.

ARTICLE VI

CORRECTION OR CHANGE TO THE TAX ROLL

Section 1. Initiation of the Correction or Change.

A correction or change to the tax roll with respect to a Benefit Assessment may be made by the Chief Engineer, either on his own initiative, or on application by a property owner (the "Assessee").

Section 2. Initiation by Flood Control Engineer.

The Chief Engineer may initiate a correction or change to the tax roll at any time within four (4) years of the date of the resolution of the Board of Supervisors confirming Benefit Assessments placed upon the tax roll.

Section 3. Initiation by the Assessee.

The Assessee may initiate a correction or change to the tax roll by filing a written application with the Chief Engineer within 60 days following his/her receipt of the tax bill reflecting the Benefit Assessment. The application shall contain

WILLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
1535 - 10TH STREET
RIVERSIDE, CALIFORNIA

or include the following information, together with such additional information deemed relevant by the Assessee or requested by the Chief Engineer:

1. Assessor's parcel number.

2. Gross acreage.

3. Use of property as of the preceding March 1st.

4. Measurements of man-made impervious area, if known.

5. Copy of the tax bill containing the benefit assessment.

Section 4. Categories of Corrections or Changes.

Upon approval of the Chief Engineer, corrections or changes shall be made with respect to:

1. Ownership of a Parcel;

2. Address of an owner of a Parcel;

3. Subdivision of an existing Parcel;

4. Land use category of all or part of a Parcel;

5. Computation of the area of a Parcel;

6. Erroneous computation of the Benefit Assessment.

Corrections to the tax roll shall not be valid unless and until approved by the Board of Supervisors. All corrections or changes must be reported by the Chief Engineer to the Auditor-Controller of the County, who shall prepare the amended billing, as the case may be. The Chief Engineer shall give written notice to the Assessee of the action taken on the application.

If the Assessee disagrees with the Chief Engineer's determination, he/she may file an appeal with the Board of Supervisors within 30 days after receipt of the written notice.

ARLLIAM C. KATZENSTEIN
COUNTY COUNSEL
SUITE 300
3535 10TH STREET
RIVERSIDE CALIFORNIA

The appeal shall be initiated by a written application filed with the Clerk of the Board of Supervisors for refund of all or part of the Benefit Assessment. The decision of the Board of Supervisors shall be final and shall complete the administrative process. Any further action by the Assessee for recovery of any part of the Benefit Assessment shall be by complaint for refund filed in the Superior Court.

ARTICLE VII

EFFECTIVE DATE OF ORDINANCE

This Ordinance shall take effect and be in force 30 days after the adoption by the Board of Supervisors. Before the expiration of fifteen (15) days after the effective date of this Ordinance it shall be published once in The Press-Enterprise, a newspaper of general circulation in the County of Riverside.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 131

[FRL–0W–6118–9]

RIN–2040–AC56

Water Quality Standards Regulation

AGENCY: Environmental Protection Agency.

ACTION: Advance notice of proposed rulemaking.

SUMMARY: EPA is today publishing this advance notice of proposed rule making (ANPRM) seeking comments from interested parties on possible revisions to the Water Quality Standards Regulation at 40 CFR Part 131. This ANPRM is intended to initiate discussions on what if any changes are needed in the national water quality standards program to improve the effectiveness of water quality standards in restoring and maintaining the quality of the Nation's waters. EPA will consider all comments before deciding whether to propose revisions to the regulation. EPA is particularly interested in comments on certain key portions of the current Water Quality Standards Regulation (the regulation) contained in 40 CFR Part 131, which establishes requirements for adoption of water quality standards pursuant to section 303 of the Clean Water Act (CWA or the Act). This ANPRM identifies specific issues on which EPA solicits comment. In addition to the specific issues on which EPA solicits comments, EPA is interested in comments on any other aspects of the program. EPA requests comments with the objectives of: supporting watershed or place-based environmental water quality management, ensuring that current water quality criteria and water quality assessment science can be easily incorporated into State and Tribal water quality programs, and enhancing effective implementation of the Act.

DATES: Written comments must be submitted by midnight January 4, 1999.

ADDRESSES: Send written comments to W–98–01, WQS-ANPRM Comment Clerk, Water Docket, MC 4101, US EPA, 401 M Street, S.W., Washington, D.C. 20460. Comments may also be submitted electronically to OW-Docket@epamail.epa.gov. The record is available for inspection from 9:00 to 4:00 p.m., Monday through Friday, excluding legal holidays at the Water Docket, East Tower Basement, USEPA, 401 M St., S.W., Washington, D.C. For access to docket materials, please call (202) 260–3027 to schedule an appointment.

FOR FURTHER INFORMATION CONTACT: Rob Wood at U.S. EPA Standards and Applied Science Division (4305), 401 M Street SW, Washington, DC 20460 (e-mail: WOOD.ROBERT@EPA.GOV) (telephone: 202–260–9536).

SUPPLEMENTARY INFORMATION: EPA will hold a series of full-day public meetings for the purpose of discussion and debate on the issues presented in this notice. EPA plans to hold the public meetings during the 180-day public comment period on this notice. Dates, times and locations of public meetings will be announced to the public.

A. Potentially Affected Entities

This ANPRM by itself will have no regulatory impact or effect. The ANPRM does contain EPA interpretations of core areas of the regulation as well as EPA thinking about how the regulation may need to be changed. As discussed in more detail below, this ANPRM marks the beginning of a national dialogue on possible changes to the water quality standards regulation and program. If changes to the regulation are proposed and ultimately made final, to the extent such changes would require and/or authorize changes to State and Tribal water quality standards, States and authorized Tribes would be affected. If changes to State and Tribal water quality standards result from any final rule that EPA may promulgate in the future, entities subject to compliance with State or Tribal water quality standards would also potentially be affected. For example, States and Tribes authorized to implement the National Pollutant Discharge Elimination System (NPDES) Permit Program would need to ensure that permits they issue include any limitations on discharges necessary to comply with any water quality standards established as a result of any subsequent final rulemaking. Therefore, entities discharging pollutants to waters of the United States under NPDES could be affected by subsequent proposed and final rulemaking. Categories and entities that may ultimately be affected include:

Category	Examples of potentially affected entities
State, Tribes and Jurisdictional Governments	States, Tribes authorized to administer water quality standards, and jurisdictional governments.
Industry	Industrial dischargers of pollutants to waters of the U.S.
Municipalities	Publicly-owned treatment works discharging pollutants to waters of the U.S.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities that could be affected by any subsequent final rulemaking. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section.

B. Water Docket Information

The record for this notice has been established under docket number W–98–01 and includes supporting documentation. When submitting written comments to the Water Docket, (see **ADDRESSES** section above) please reference docket number [W–98–01] and submit an original and three copies of your comments and enclosures (including references). To ensure that EPA can read, understand and therefore properly respond to comments, the Agency would prefer that commenters cite the specific question(s) in the notice to which each comment refers. The questions presented in this notice for public comment are organized by subsection and numbered. Each question has a unique number (for example III.B.3.a., question 1) for this purpose.

Comments must be received or postmarked by midnight January 4, 1999. Commenters who want EPA to acknowledge receipt of their comments should enclose a self-addressed, stamped envelope. No facsimiles (faxes) will be accepted.

Electronic comments are encouraged and may be submitted to the Water Docket (see **ADDRESSES** section above). Electronic comments must be submitted as an ASCII file or a WordPerfect file avoiding the use of special characters and any form of encryption. Electronic comments must be identified by the docket number, [W–98–01], and be received by midnight of January 4, 1999. Comments and data will also be accepted on disks in WP5.1 format or

ASCII file format. No confidential business information (CBI) should be sent via e-mail.

The remainder of this Supplementary Information section is organized as follows:

I. Purpose and Objectives of This ANPRM

A. General Purpose and Vision

On February 14, 1998, the visionary ''Clean Water Action Plan'' was announced by the Administrator of EPA and the Secretary of Agriculture. The ''Clean Water Action Plan'' is a blueprint for restoring and protecting the Nation's precious water resources. A key element of the plan is advancement of the watershed approach to water quality protection. EPA's belief is that refining designated uses and implementing better more integrated water quality criteria to protect the refined uses, two important themes of this ANPRM, are essential steps in carrying out the blueprint presented. Revision of the water quality standards regulation can be an essential component in implementing the vision of the ''Clean Water Action Plan.''

States, Tribes and EPA have developed functional water quality standards programs under the current regulation and these programs have provided the basis for significant water quality improvement in the United States. Simply put, the current regulation is not broken. Rather, with the renewed interest in watershed management combined with improved methods for water quality assessment, a comprehensive evaluation for the purpose of strengthening the regulation is appropriate at this time. EPA and the public need to examine whether changes in the regulation could enhance water quality management on a watershed basis and focus resources on areas of greatest concern. A review of the regulation will also complement similar outreach discussions EPA is currently undertaking for the purposes of reviewing the water quality planning and management and total maximum daily load (TMDL) programs as well as aspects of the NPDES program. EPA is committed to ensuring that these programs, combined, form an even stronger integrated basis for water quality planning, priority setting and implementation on a watershed basis.

In recent years there has been a rising level of scrutiny placed on water quality standards and the State, Tribal and EPA decisions based on water quality standards. The increased scrutiny comes from virtually all parties affected by water quality-based decisions and is evidenced by the growing tide of challenges to State standards, EPA policies and guidance, and individual water quality-based decisions. Remaining water quality problems in the U.S. are often difficult to assess, define and solve. Once agreed upon, the solutions will be less conventional than we are used to and may result in different regulatory approaches. Examples of such problems include aquatic and riparian habitat destruction from municipal and agricultural run-off and fish tissue contamination from chemicals with many and diverse sources.

EPA believes that this scrutiny will continue and that an evaluation of the water quality standards program and its regulatory and policy underpinnings to identify where these program underpinnings may need to be strengthened, clarified or revised is imperative. Our task under the Clean Water Act is to ensure adequate water quality even where it is difficult to do so. To accomplish this task, EPA envisions a national water quality standards program in which: the best possible information on whether designated uses are being attained and how to attain and maintain them is available and used; water quality criteria are selected from a wide-ranging menu of scientifically sound criteria that can be tailored to each watershed; national norms of consistency and flexibility in State and Tribal water quality standards are clear; and innovative, cost-effective approaches are

encouraged. To realize this vision, EPA believes that a structured national debate is needed to identify a focused set of issues that may ultimately lead to changes to the water quality standards regulation and policy.

The ANPRM process allows EPA to begin this work by consulting with all interested parties to find out what changes, if any, are necessary and desirable, to make the water quality standards regulation more responsive to current needs and to identify opportunities for further clarifications of policy and guidance by EPA. In the fourteen years since EPA last revised the water quality standards regulation, interested parties have gained considerable experience in developing and implementing water quality standards. This experience will provide valuable information for review of these regulations.

The most significant shift in water quality management programs in recent years has been the increased emphasis on the use of watershed based programs. It is increasingly apparent that EPA, States, Tribes, municipalities and the public share a common view that water quality programs, including water quality standards, can be better tailored to the characteristics, problems, risks and implementation tools available in individual watersheds or basins with meaningful involvement of the local communities. The water quality standards regulation should ensure that States and Tribes have the flexibility to define the water quality standards and hence the environmental objectives of a water body according to the characteristics of the ecosystem and the needs of the water's users within the bounds established under the CWA. The regulation must allow the States and Tribes to tailor water body use designations and criteria to protect these uses within individual basins or watersheds based on the needs in the basin. The present use of broad, jurisdiction-wide use classifications and lists of associated chemical criteria may be at once too general and too narrow for some waters, lacking the refinement necessary to tailor water quality management actions to specific watersheds. This general approach reflects the historical lack of information on specific basins or water bodies and the need to ensure that all waters receive adequate protection. Additionally, it should be made clear how much flexibility States and Tribes have to adjust use designations as information improves about whether a designated use or a higher use can be attained and to reflect natural and human caused changes in water quality that may have occurred. The challenge for EPA, States and Tribes is to identify and use opportunities to refine use designations for waters where it makes sense and better match the water quality criteria to the refined use, thus making water quality standards more flexible. In addition, to more effectively implement the standards, the criteria that are used need to better integrate multiple stressors and their cumulative impacts in order to more effectively protect designated uses.

Significant scientific advancements in recent years have added to the ability to assess environmental impacts and risks related to changes in water quality. As they are further developed, new and emerging sophisticated and integrated analytical tools such as bioassessment, criteria for bioaccumulative chemicals, sediment quality criteria and toxicity assessments will increasingly allow States, Tribes, EPA and the public to characterize better the ecological condition of water resources. At present, this improving capability, used in a tailored watershed planning and management framework, can enhance the ability of States and Tribes to characterize and protect locally agreed upon goals for maintaining and protecting the chemical, physical and biological integrity of individual basins. In the long term, chemical, physical and biological assessment methods will continue to improve. As they do, the water quality standards program should be designed to accommodate effectively the new science. In the meantime, progress should not be stalled by incomplete knowledge.

With the new science and assessment methodologies, however, come new challenges for States and Tribes to identify the resources necessary to make use of these advances. One of the main themes of this ANPRM is the need for better data, and new types of data, in order to support a more refined approach to water quality protection. EPA recognizes, however, that efforts to obtain such data, and develop the analytical capacity to integrate it into existing regulatory programs, could encounter significant resource constraints in some States and Tribes. EPA is well aware that in order for a new, data-intensive, watershed-specific approach to succeed, it must be workable for the States and Tribes that will have to implement it. EPA welcomes comments regarding concerns over resource constraints and ideas for how to address them.

The water quality standards program must protect the nation's waters as envisioned in the CWA. It must establish requirements that are necessary to attain and maintain healthy, sustainable ecosystems. It must be flexible enough for States and Tribes to ensure that standards are protecting water quality in a way that makes sense. EPA seeks to avoid a program that results in costly requirements that have little or no environmental benefit. Thus EPA intends to use its experience and that of the States, Tribes, municipalities, the regulated community, environmental groups and the general public in implementing and utilizing water quality standards over the last fourteen years, to evaluate the regulation and determine if changes are needed to allow greater State, Tribal and local flexibility to develop innovative, cost-effective ways to protect water quality.

EPA may determine through the ANPRM process that the concepts described above can be better integrated into water quality management decision making through development of new or revised policies and guidance rather than revisions to the regulation. Because of this possibility, EPA is reserving its decision whether to propose and finalize revisions to the regulation. At minimum, EPA believes that any revisions to the water quality standards regulation should result in a regulation that can be used to render protective, tailored, site-specific water quality-based decisions that bear reasonable compliance costs for the regulated community, as well as reasonable implementation costs for States, Tribes and EPA. At the same time, the regulation should allow sufficient flexibility to States and Tribes, if they choose, to implement water quality standards programs in a manner that is no more burdensome than under the existing regulation.

B. Objectives

In publishing this ANPRM, EPA is beginning a review of the regulation in a public forum in an attempt to identify possible amendments to the regulation, and new guidance or policy that may be needed to address three distinct objectives. They are: (1) to eliminate any barriers and develop incentives to enhance State and Tribal implementation of watershed-based water quality planning and management; (2) to enhance State and Tribal capability to incorporate current criteria and water quality assessment science into their water quality standards programs, and; (3) to improve the regulation so that it may be implemented more efficiently and effectively (including cost-effectively). Meeting these three objectives, EPA believes, will facilitate further water

quality improvements locally and nationally. EPA urges commenters to keep all three main objectives in mind when reviewing, analyzing and commenting on this ANPRM.

II. Introduction to Water Quality Standards

A. Statutory History

The first comprehensive legislation for water pollution control was the Water Pollution Control Act of 1948 (Pub. L. 845, 80th Congress). This law adopted principles of State-Federal cooperative program development, limited federal enforcement authority, and limited federal financial assistance. These principles were continued in the Federal Water Pollution Control Act (Pub. L. 660, 84th Congress) in 1956 and in the Water Quality Act of 1965. Under the 1965 Act, States were directed to develop water quality standards establishing water quality goals for interstate waters. By the early 1970's, all the States had adopted such water quality standards. Since then, States have revised their standards to reflect new scientific information, the impact on water quality of economic development and the results of water quality controls.

Due to enforcement complexities and other problems, an approach based solely on water quality standards was deemed too weak to make a difference. The purely water quality-based approach prior to 1972 lacked enforceable Federal mandates and standards, and a strong impetus to implement plans for water quality improvement. The result was an incomplete program that in Congress' view needed strengthening. In the Federal Water Pollution Control Act Amendments of 1972 (Pub. L. 92–500, Clean Water Act or CWA), Congress established the National Pollutant Discharge Elimination System (NPDES) whereby each point source discharger to waters of the U.S. is required to obtain a discharge permit. The 1972 Amendments required EPA to establish technology-based effluent limitations that are to be incorporated into NPDES permits. In addition, the amendments extended the water quality standards program to intrastate waters and required NPDES permits to be consistent with applicable State water quality standards. Thus, the CWA established complementary technology-based and water quality-based approaches to water pollution control. Now, after nearly 25 years of investment in technology-based controls and some $70 billion in sewage treatment plant construction, attention is turning back to water quality standards as a mechanism to make improvements in water quality beyond those that have been achieved through technology-based controls.

Water quality standards serve as the foundation for the water-quality based approach to pollution control and are a fundamental component of watershed management. Water quality standards are State or Tribal law or regulation that: define the water quality goals of a water body, or segment thereof, by designating the use or uses to be made of the water; set criteria necessary to protect the uses; and protect water quality through antidegradation provisions. Although the CWA gives EPA an important role in determining appropriate minimum levels of protection and providing national oversight, it also gives considerable flexibility and discretion to States and Tribes to design their own programs and establish levels of protection above the national minimum. States and Tribes adopt water quality standards to protect public health or welfare, enhance the quality of water, and serve the purposes of the Act. ''Serve the purposes of the Act'' (as defined in Sections 101(a), 101(a)(2), and 303(c) of the Act) means that water quality standards should: (1) include provisions for restoring and maintaining chemical, physical, and biological integrity of State and Tribal waters, (2) provide, wherever attainable, water quality for the protection and propagation of fish, shellfish, and wildlife and recreation in and on the water (''fishable/swimmable''), and (3) consider the use and value of State and Tribal waters for public water supplies, propagation of fish and wildlife, recreation, agricultural and industrial purposes, and navigation. See 40 CFR 131.2.

Section 303(c) of the CWA establishes the basis for the current water quality standards program. Section 303(c):

1. Defines water quality standards;
2. Identifies acceptable beneficial uses: public water supply, propagation of fish and wildlife, recreational purposes, agricultural and industrial water supplies and navigation;
3. Requires that State and Tribal standards protect public health or welfare, enhance the quality of water and serve the purposes of the Act;
4. Requires that States and Tribes review their standards every three years;
5. Establishes the process for EPA review of State and Tribal standards, including where necessary the promulgation of a superseding Federal rule in cases where a State's or Tribe's standards are not consistent with applicable requirements of the CWA or in situations where the Administrator determines that Federal standards are necessary to meet the requirements of the Act.

The decade of the 1970's saw State and EPA attention focus on creating the infrastructure necessary to support the NPDES permit program and development of technology-based effluent limitations. While the water quality standards program continued, it was a low priority in the overall CWA program. In the early 1980's, it began to be recognized that greater attention to the water quality-based approach to pollution control would be needed to effectively protect and enhance all of the nation's waters.

The first statutory evidence of this was the enactment of a CWA requirement that after December 29, 1984, no construction grant could be awarded for projects that discharged into stream segments which had not, at least once since December 1981, had their water quality standards reviewed and revised or new standards adopted as appropriate under Section 303(c). (Public Law 97–117, Section 24, ''Revised Water Quality Standards.'') The efforts by the States to comply with this one-time requirement essentially made the States' water quality standards current as of that date for segments with publicly-owned treatment works (POTWs) discharging into them.

Additional impetus to the water quality standards program occurred on February 4, 1987, when Congress enacted the Water Quality Act of 1987 (Pub. L. 100–4). Congressional impatience with the lack of progress in State adoption of standards for toxics (which had been a national program priority since the early 1980's) resulted in the 1987 adoption of new water quality standard provisions in the Water Quality Act amendments. These amendments reflected Congress' conclusion that toxic pollutants in water are one of the most pressing water pollution problems. One concern Congress had was that States were relying, for the most part, on narrative criteria to control toxics (e.g., ''no toxics in toxic amounts''), which made development of effluent limitations in permits difficult. To remedy this, Congress adopted section 303(c)(2)(B), which essentially required development of numeric criteria for those water body segments where toxic pollutants were likely to adversely affect designated uses.

The 1987 Amendments gave new teeth to the control of toxic pollutants. As Senator Mitchell put it, Section 303(c)(2)(B) requires ''States to identify waters that do not meet water quality

standards due to the discharge of toxic substances, to adopt numerical criteria for the pollutants in such waters, and to establish effluent limitations for individual discharges to such water bodies.'' (From Senator Mitchell, 133 Cong. Rec. S733.) To assist States in complying with Section 303(c)(2)(B), EPA issued program guidance in December 1988 and instituted an expanded program of training and technical assistance.

Section 518 was another major addition in the 1987 Amendments to the Act. This section extended participation in the water quality standards and 401 certification programs to certain Indian Tribes. The Act directed EPA to establish procedures by which a Tribe could ''qualify for treatment as a State,'' at its option, for purposes of administering the standards and 401 certification programs. The Act also required EPA to create a mechanism to resolve disputes that might develop when unreasonable consequences arise from a Tribe and a State or another Tribe adopting different water quality standards on common bodies of water.

Furthermore, with the 1987 Amendments, the Act explicitly recognized EPA's antidegradation policy for the first time. The intent of the antidegradation policy in EPA's regulation was and is to protect existing uses and the level of water quality necessary to protect existing uses and to provide a means for assessing activities that may impact high quality waters and ruling on whether such projects could proceed. Section 303(d)(4) of the Act requires that water quality standards in those waters that meet or exceed levels necessary to support designated uses ''may be revised only if such revision is subject to and consistent with the antidegradation policy established under this section.''

B. Regulatory History

In the late 1960's and early 1970's the water quality standards program was initiated and administered based on minimal guidance and Federal policies—many of which are still reflected in the water quality standards program today.

EPA first promulgated a water quality standards regulation in 1975 (40 CFR 130.17, 40 *FR* 55334, November 28, 1975) as part of EPA's water quality management regulations mandated under Section 303(e) of the Act. As discussed earlier, the standards program had a relatively low priority during this time. This was reflected in the minimal requirements of the first Water Quality Standards Regulation. Few requirements on designating water uses and procedures were included. The Regulation was general, requiring ''appropriate'' water quality criteria necessary to support designated uses and incorporating the antidegradation policy. Toxic pollutants or any other specific criteria were not mentioned.

Some States developed detailed water quality standards regulations while others adopted only general provisions which proved to be of limited use in the management of increasingly complex water quality problems and created disparities in requirements on regulated entities. The few water quality criteria that were adopted addressed a limited number of pollutants and primarily described fundamental water quality conditions (e.g., pH, temperature, dissolved oxygen and suspended solids) or dealt with conventional pollutants.

In the late 1970s, EPA determined that existing State water quality standards needed to be better developed. EPA moved to strengthen the water quality program to complement the technology based controls. EPA amended the Water Quality Standards Regulation to explicitly address toxic criteria requirements in State standards and other legal and programmatic issues. November 8, 1983 (54 *FR* 51400). This regulation is more comprehensive than its predecessor and includes more specific regulatory and procedural requirements. The 1983 regulation created the concept of use attainability analysis, added detail on the adoption of numeric criteria including authorization for site-specific criteria, and listed specific procedural requirements and definitions not included in the original 1975 regulation. The regulation specified the roles of the States and EPA and the administrative requirements for States in adopting and submitting their standards to EPA for review. It also delineated the EPA requirements for review of State standards and promulgation of federal standards.

The 1983 regulation provided States (and subsequently in 1991) Tribes with the option of refining their use designation process by allowing them to establish subcategories of uses, such as cold water and warm water aquatic life designations. The 1983 regulation also clarified that States (and subsequently Tribes) may adopt discretionary policies affecting the implementation of standards, such as mixing zones, low flows, and variances.

In support of the 1983 Regulation, EPA simultaneously issued program guidance entitled *Water Quality Standards Handbook* (December, 1983). The Handbook provided guidance on the interpretation and implementation of the Water Quality Standards Regulation. This document also contained information on scientific and technical analyses that are used in making decisions that would impact water quality standards. EPA also developed the *Technical Support Document for Water Quality-Based Toxics Control* (EPA 44/4–85–032, September, 1985) (TSD) which provided additional guidance for implementing State water quality standards. In 1991, EPA revised and expanded the TSD. (EPA 505/2–90–001, March 1991). In 1994, EPA issued the *Water Quality Standards Handbook: Second Edition* (EPA–823–B–94–006, August 1994).

To accelerate compliance with CWA section 303(c)(2)(B) (created by the 1987 Water Quality Act), EPA started action in 1990 to promulgate numeric water quality criteria for those States that had not adopted sufficient water quality standards for toxic pollutants. The intent of the rulemaking, known as the National Toxics Rule, was to strengthen State water quality management programs by increasing the level of protection afforded to aquatic life and human health through the adoption of all available criteria for toxic pollutants listed under 307(a) of the CWA (priority pollutants) present or likely to be present in State waters. This action culminated on December 22, 1992, with EPA promulgating Federal water quality criteria for priority toxic pollutants for 14 States and Territories (see 57 FR 60848).

Subsequent to the promulgation of criteria under the National Toxics Rule, EPA altered its national policy on the expression of aquatic life criteria for metals. On May 4, 1995 at 60 FR 22228, EPA issued a stay of several metals criteria (expressed as total recoverable metal) previously promulgated under the National Toxics Rule for the protection of aquatic life. EPA simultaneously issued an interim final rule that changed these metal criteria promulgated under the National Toxics Rule from the total recoverable form to the dissolved form.

The Water Quality Standards Regulation was amended in 1991 to implement Section 518 of the Act to expand the standards program to include Indian Tribes (56 FR 64893, December 12, 1991). EPA added 40 CFR 131.7 to describe the requirements of the issue dispute resolution mechanism (to resolve unreasonable consequences that may arise between a Tribe and a State or another Tribe when differing water quality standards have been adopted for a common body of water) and 40 CFR 131.8 to establish the

procedures by which a Tribe applies for authorization to assume the responsibilities of the water quality standards and section 401 certification programs.

Fourteen years since its last major revision, the water quality standards regulation is undergoing review and potential revision in light of experiences gained in its implementation by States, Tribes, EPA and the public. The review is intended to reflect the changing nature of the program and to identify specific changes that will strengthen water quality protection and restoration, facilitate watershed management initiatives, and incorporate evolving water quality criteria and assessment science into water quality standards programs. Based on the review and the comments expected on the ANPRM, EPA may decide to revise parts of the regulation and/or change some of its existing policies and guidance for the water quality standards program.

Water quality standards are essential to a wide range of surface water activities, including: (1) setting and revising water quality goals for watersheds and/or individual water bodies, (2) monitoring water quality to provide information upon which water quality-based decisions will be made, (3) calculating total maximum daily loads (TMDLs), waste load allocations (WLAs) for point sources of pollution, and load allocations (LAs) for natural background and nonpoint sources of pollution, (4) developing water quality management plans which prescribe the regulatory, construction, and management activities necessary to meet the water body goals, (5) calculating NPDES water quality-based effluent limitations for point sources, in the absence of TMDLs, WLAs, LAs, and/or water quality management plans, (6) preparing various reports and lists that document the condition of the State's or Tribe's water quality, and (7) developing, revising, and implementing an effective section 319 management program which outlines the State's or Tribe's control strategy for nonpoint sources of pollution.

Note: The term ''State'' as used in this Notice refers to the fifty States, all Territories of the United States, and the District of Columbia. The term ''Tribe'' or ''Tribal'' as used in this Notice generally refers to all Indian Tribes authorized to administer the water quality standards. On occasion, the term ''Tribe'' or ''Tribal'' refers to Indian Tribes that are eligible to seek authorization to administer the water quality standards, but have not yet secured such authorization. There are some parts of the law and regulation where ''State'' is now interpreted to mean ''State or Tribe.''

C. Water Quality Guidance for the Great Lakes System

On March 23, 1995, EPA published in the **Federal Register** its Water Quality Guidance for the Great Lakes System (60 FR 15366, March 23, 1995) (Great Lakes Guidance). The Guidance consists of water quality criteria for 29 pollutants to protect aquatic life, wildlife, and human health, and detailed methodologies to develop criteria for additional pollutants; implementation procedures to develop more consistent, enforceable water quality-based effluent limits in discharge permits, as well as TMDLs of pollutants that can be allowed to reach the Great Lakes and their tributaries from all sources; and antidegradation policies and procedures.

Section 118(c)(2) of the Clean Water Act (CWA) (Pub. L. 92–500 as amended by the Great Lakes Critical Programs Act of 1990 (CPA), Pub. L. 101–596, November 16, 1990) required EPA to publish proposed and final water quality guidance on minimum water quality standards, antidegradation policies, and implementation procedures for the Great Lakes System. EPA responded to these requirements by initiating a rulemaking, publishing the Proposed Water Quality Guidance for the Great Lakes System (proposed Guidance) in the **Federal Register** on April 16, 1993 (58 FR 20802). EPA also published four subsequent documents in the **Federal Register** identifying corrections and requesting comments on additional related materials. EPA received over 26,500 pages of comments, data, and information from over 6,000 commenters in response to these documents and from meetings with members of the public.

After reviewing and analyzing the information in the proposal and these comments, EPA developed and published the Great Lakes Guidance, codified at 40 CFR Part 132. Part 132 contains six appendixes of detailed methodologies, policies, and procedures. Detailed discussion of the final Guidance is provided in ''Final Water Quality Guidance for the Great Lakes System: Supplementary Information Document'' (SID), (EPA, 1995, 820–B–95–001) and in additional technical and supporting documents which are available in the docket for the rulemaking. Copies of the SID and other supporting documents are also available from EPA in electronic format, or in printed form for a fee upon request.

Developing the Great Lakes Guidance was an enormous effort based on extensive public comment and analysis on some of the same issues that are addressed in this ANPRM. One principal difference between the provisions in the Great Lakes Guidance and the regulation, policy and guidance that is the subject of this ANPRM is that where the Great Lakes Guidance addressed programs in the Great Lakes States only, this ANPRM addresses the national water quality standards regulation and program, and thus the programs of all States and Tribes with water quality standards authority. Where the Great Lakes Guidance addressed an issue or issue area that is also addressed in the ANPRM, that analysis and conclusion may or may not be relevant to the discussion of the national program. Where it is, today's ANPRM identifies the specific relevant Great Lakes Guidance provisions in the specific issue discussions. Many of the provisions in the Great Lakes Guidance were developed to address the unique problems in the Great Lakes Basin that stem from known contamination by bioaccumulative chemicals and the long retention time of water in the Lakes. Commenters should keep in mind that the Great Lakes provisions were derived for States that are in the Great Lakes Basin in whole or part and should consider the uniqueness of the Great Lakes Basin when evaluating Great Lakes Guidance provisions for application outside of the Great Lakes Basin.

III. Program Areas for Public Comment

A. Introduction

Entering its 33rd year, the water quality standards program has begun to evolve from one with a narrow focus on establishing water body uses and adopting chemical criteria for basic water quality characteristics addressing the most obvious sources of pollution to a more comprehensive program. In recent years the scientific community has developed greater knowledge of the full range of stressors adversely impacting surface waters. EPA believes the water quality standards program should evolve to keep pace with expanding science to address water quality problems in a more comprehensive way, accommodating more specific and sophisticated water use classifications, criteria for more pollutants, new forms of criteria and companion ecological and health indicators, and closer integration with other programs. At the same time, EPA realizes that such an evolution could require a significant increase in analytical resources from States, Tribes and the regulated community, and that changes to the existing program must be structured in a way that is workable.

This is an appropriate time to begin a structured national debate aimed at identifying the focused changes necessary to strengthen the underpinnings of water quality standards and implementation. In the fourteen years since the regulation was last revised, there have been numerous scientific developments, statutory changes, court decisions, and implementation issues affecting the water quality standards program. The shift in program focus beyond just chemical contamination to include ecosystem protection and watershed approaches necessitates reexamining basic program concepts. In addition, there is an opportunity to address possible barriers to effective water quality improvements where it is determined that regulatory changes are possible under existing law.

In recent years, EPA has heard from the States and Tribes as well as the environmental and regulated communities regarding the necessity and focus of a revision to the water quality standards regulation. As indicated by the wide range of issues and options presented in this advance notice, views of the different stakeholder groups often differ considerably. Many stakeholders believe that a revised regulation is needed for continued improvements in water quality protection. Others believe changes are needed to allow more flexible, cost-effective approaches by States and Tribes. Conversely, many stakeholders have said that the regulation is sufficient and does not need to be reviewed.

A key issue presented here relates to the degree of specificity necessary should EPA revise the regulation. There are many who support a more flexible regulation to allow States and Tribes to address new and changing circumstances. Under a more flexible regulation, States and Tribes could more easily tailor their programs to deal with pressing water quality restoration and protection needs that are not well addressed presently. Others support a regulation with more specific regulatory requirements. The latter would promote a more consistent minimal level of protection in State and Tribal water quality standards, provide more clarity on standards issues, and serve as a stronger tool in encouraging States and Tribes to take appropriate restoration and protection actions. EPA urges commenters to consider the appropriate balance between flexibility, national consistency, and consistency within States and Tribes when commenting on any of the ideas presented in this notice.

One of the outcomes of this ANPRM and follow-on actions can be establishment of a clearer set of national minimum policies and implementation procedures on which EPA will reliably and predictably base its approval and disapproval decisions on State and Tribal water quality standards submittals. EPA remains committed to making consistent decisions from State to State and Tribe to Tribe and State to Tribe to meet our obligation to ensure an appropriate level of protection nationally and that the goals of the Act are achieved. Clarifying these national norms will serve to better articulate the norms of protection from State to State and Tribe to Tribe and State to Tribe and also to clarify national norms of flexibility. Defining the appropriate level of consistency, in turn, defines the appropriate degree level of flexibility. In addition, establishing norms of consistency and flexibility should help to resolve State or Tribal differences with EPA on water quality standards early in the process, before the approval/disapproval stage.

While the following discussion describes specific areas and issues for public review, the public is welcome to comment on any aspect of the water quality standards program. EPA emphasizes, however, that publication of this Notice does not commit the Agency to proceeding with a regulatory change. EPA has not decided whether it will, in fact, propose regulatory amendments, and, if proposed, how extensive that effort might be. This decision will be made after considering the comments received and the need to address other priority activities as well as any Congressional and Executive Branch directives. A potential outcome of this public review may be additional guidance and/or policies rather than regulatory changes.

EPA has not determined the next steps it will take after evaluation of all the comments received on this ANPRM. It is likely that any follow-on proposed rule to amend 40 CFR 131 would focus on a relatively narrow set of issues and that many other issues could be resolved through policy and guidance. EPA requests that commenters identify the five to seven issues considered highest priority for possible regulatory amendments. The summary section at the end of this notice contains a brief summary of the potential changes to the water quality standards regulation that are discussed and considered in this ANPRM. The list of potential changes includes the full range of potential changes to the regulation on which EPA is specifically requesting comment. Each potential change to the regulation is discussed in detail in the corresponding section of the ANPRM.

B. Uses

1. Background

Section 131.10 of the current regulation describes States' and authorized Tribes' responsibilities for designating and protecting uses. The regulation requires that States and Tribes specify the water uses to be achieved and protected; requires protection of downstream uses; allows for sub-category and seasonal uses, for instance, to differentiate between cold water and warm water fisheries; sets out minimum attainability criteria; lists six factors of which at least one must be satisfied to justify removal of designated uses which are not existing uses; prohibits removal of existing uses; establishes a mandatory upgrading of uses which are existing but not designated; and establishes conditions and requirements for conducting use attainability analyses.

These provisions make a distinction between existing and designated uses and set out specific requirements to ensure protection of these two broad use categories. Designated uses are defined as those uses specified in water quality standards for each water body or segment whether or not they are being attained. EPA interprets existing uses as those uses actually attained in the water body on or after November 28, 1975 (the date of EPA's initial water quality standards regulation), whether or not they are included in water quality standards. 40 CFR 131.3(e). Designated uses focus on the attainable condition while existing uses focus on the past or present condition. Section 131.10 then links these two broad use categories in a manner which intends to ensure that States and Tribes designate appropriate water uses, reflecting both the existing and attainable uses of each water body. For this discussion it is important to consider both the distinction between and linkage of designated and existing uses.

It is in designating uses that States and Tribes establish the environmental goals for their water resources, and it is in designating uses that States and Tribes are allowed to evaluate the attainability of those goals. Because water quality standards perform the dual function of establishing water quality goals and ultimately serving as the regulatory basis for water quality-based treatment controls and strategies, typically, although not exclusively, via water quality criteria protecting those uses, a State or Tribe often weighs the environmental, social and economic

consequences of its decisions in designating uses. The regulation allows the State or Tribe some flexibility in weighing these considerations and adjusting these goals over time. Reaching a conclusion on the uses that appropriately reflect the potential for a water body, determining the attainability of those goals, and appropriately evaluating the consequences of a designation, however, can be a difficult and controversial task. Appropriate application of this process involves a balancing of environmental, scientific, technical, and economic and social considerations as well as public opinion and is therefore one of the most challenging areas of the current regulation.

To direct this decision making-process, the regulation establishes requirements that must be followed when designating uses or concluding that attaining a use is infeasible. When performing this attainability analysis, a State or Tribe considers physical, chemical, biological and economic factors that may limit the potential for achieving the goal use.

EPA's current water quality regulation effectively establishes a ''rebuttable presumption'' that ''fishable/swimmable'' uses are attainable and therefore should apply to a water body unless it is affirmatively demonstrated that such uses are not attainable. EPA believes that the rebuttable presumption policy reflected in these regulations is an essential foundation for effective implementation of the Clean Water Act as a whole. The ''use'' of a water body is the most fundamental articulation of its role in the aquatic and human environments, and all of the water quality protections established by the CWA follow from the water's designated use. This approach preserves States' and Tribes' paramount role in establishing water quality standards, in this instance, in weighing any available evidence regarding the attainable uses of a particular water body. The rebuttable presumption approach does not restrict the discretion that States and Tribes have to determine that ''fishable/swimmable'' uses are not, in fact, attainable in a particular case. Rather, if the water quality goals articulated by Congress are not to be met in a particular water body, the regulations simply require that such a determination be based upon a credible, ''structured scientific assessment'' of use attainability.

Because there is a presumption that the uses specified in sections 101(a)(2) and 303(c) of the Clean Water Act are attainable (protection and propagation of fish, shellfish and wildlife and recreation in and on the water [101(a)(2)]; public water supplies, propagation of fish and wildlife, recreational purposes, agricultural purposes, and navigation [303(c)(2)(A)]), the criteria for overcoming that presumption are carefully circumscribed. The economic use removal test, for example, requires a showing that the cost of compliance with the use(s) would result in ''substantial and widespread economic and social impact.'' This is a high threshold to ensure that the interim goals of section 101(a)(2) and the section 303(c) uses are not abandoned without appropriate cause.

The general construction of the § 131.10 requirements for designating uses, supplemented with specific Agency guidance, has worked well in most situations over the last 14 years, and the use designation process is well established in State and Tribal water quality standards programs. There are, however, a number of new issues that have arisen since the 1983 regulation was promulgated. Often these new issues are associated with site-specific decision-making, and EPA expects the trend toward site-specific application of water quality standards will accelerate as States and Tribes begin implementing watershed protection programs, using field biological information to more precisely describe aquatic communities to be protected or restored, and applying new watershed or ecosystem-specific approaches to criteria development. As explained in the ''Objectives'' discussion in this document, one of the principal reasons for this notice is to determine whether or not the current regulation is sufficiently flexible to accommodate an expected shift in program emphasis beyond chemical contaminants to ecosystem protection and watershed approaches that will necessarily place greater emphasis on integrated assessments of both chemical and non-chemical stressors and watershed-specific decision-making.

While it is important to identify potential barriers to needed flexibility, commenters should identify, as well, any changes or clarification that may be needed to ensure that an appropriate level of national consistency is maintained across and within all jurisdictions. In this section of the notice, EPA seeks comment on the following issues: (1) refined designated uses with more focus on watersheds and ecosystems, (2) existing uses, (3) attainability and removal of designated uses, and (4) alternatives to removal of designated uses.

2. Refined Designated Uses

The current regulation at 40 CFR 131.10(a), based on section 303 of the CWA, requires that States and authorized Tribes specify appropriate water uses to be achieved and protected, taking into consideration the use and value of water for public water supplies, protection and propagation of fish, shellfish and wildlife, recreation in and on the water, agricultural, industrial, and other purposes including navigation. The regulation also allows, but does not require, States and Tribes to identify more specific sub-categories of these general use categories.

Over the years, States and Tribes have created many different use classification systems ranging from a straightforward replication of uses specifically listed in section 303 of the Act to more complex systems that express designated uses in very specific terms or establish sub-classifications which identify different levels of protection. For example, some States simply specify ''water supply'' as a use classification applicable throughout the State while others may identify several specific sub-categories related to the quality of the raw water supply and anticipated treatment requirements. Similarly, some States designate general ''aquatic life'' uses while others list a variety of sub-categories based on a range of aquatic community types which may include descriptions of core aquatic species representative of each sub-category. Although a variety of approaches have evolved and become established in State and Tribal programs, the current regulation is not specific about the level of precision States or Tribes must achieve in designating uses.

There are advantages and drawbacks for either the general or specific use classification systems and it is not clear that either is necessarily superior in ensuring full protection of State or Tribal water quality. There is, however, a need for the use designation process, whether implementing a general or specific classification system, to clearly articulate and differentiate intended levels of protection with enough specificity so that decision-makers can appropriately develop and implement the standards on a site-or watershed-specific basis and so that the public can understand, identify with, and influence the goals set for waters they care about.

Lack of precision in uses and criteria assigned to protect those uses can inadvertently result in either a lesser or greater level of protection than was actually intended when the water quality standards were adopted. Although the designated use specificity

issue may apply to any of the Section 303 general use categories, it may be most relevant for aquatic life uses. Aquatic communities can vary significantly from water body-to-water body. As noted above, however, State and Tribal use classifications generally do not reflect the variability among aquatic community types and may list, instead, very general descriptions such as ''aquatic life'' as the designated use. Where this is the case, it is possible that measurable changes in aquatic community composition or production could occur at a specific site and still satisfy the definition of ''aquatic life,'' *unless* somewhere in its process the State or Tribe has documented information about its specific intent in applying the ''aquatic life'' classification to each water body. For example, an activity that causes the discharge of sediment, altering the physical habitat in the receiving water body, could result in a measurable change in aquatic community structure and function (e.g., the types of aquatic species found in that segment). Yet, that activity may arguably satisfy a general ''aquatic life'' use protection requirement simply because of a lack of specificity in the regulatory description of that designated use. In this case, lack of precision in the designation or description of the use could result in under protection of the resource, unless somewhere in the State or Tribal process an intended level of protection is specified.

Alternatively, lack of precision in uses and assigned criteria could result in standards that are over protective, resulting in application of unnecessary control requirements. In assigning criteria to protect general use classifications, a State or Tribe must ensure that the criteria are sufficiently protective to safeguard the full range of waters in the State or Tribe (i.e., criteria would be based on the most sensitive use). While this approach will result in full protection of all State or Tribal waters, the approach has been challenged, especially for aquatic life uses, where evidence suggests that the general use and criteria will require controls more stringent than needed to protect either the existing or potential aquatic community for a specific water body. Although EPA supports broad application of statewide or tribe-wide criteria to ensure that sensitive uses are protected where site-specific information is lacking, the Agency's current thinking is that there is a growing need to more precisely tailor use descriptions and criteria to match site-specific conditions, ensuring that uses and criteria provide an appropriate level of protection which, to the extent possible, is neither over nor under protective. This concept was reflected in the Agency's 1994 Combined Sewer Overflow Policy (59 FR 18688).

The level of protection issue is one of both use and criteria. To have a meaningful effect, a more precise use description must be accompanied by more focused criteria, appropriately tailored to the refined use description. EPA recognizes that, at present, national or statewide or tribe-wide criteria generally are not sufficiently precise to distinguish among all of the various sub-categories of uses. As water quality standards issues become more watershed-specific or site-specific, however, the trend will very likely be toward more specific use descriptions and; because the essential purpose of the criteria is to describe, evaluate attainment of, and protect the designated use; more site-specific criteria development.

A potential constraint for refining the aquatic life uses would be the resource commitment often associated with developing a comprehensive biological database. Because of the resource constraints, it may be difficult for a State or Tribe to develop designated uses (or use descriptions) for each segment that include a detailed biological description of the aquatic community to be protected. Simply from a practical standpoint, it may be more workable to reserve such precise determinations for watershed-specific decision-making. Therefore, in highlighting the issue of greater specificity, EPA is suggesting that one, but perhaps not the only, way to resolve this issue is to mandate much greater specificity in a State or Tribal use classification structure.

Obviously, there is a need for designated use descriptions in State and Tribal regulation to be defined, at a minimum, with sufficient specificity to ensure existing and potential uses will be protected and/or attained. The difficulty is in striking a balance between specificity sufficient to ensure uses are appropriately protected and flexibility needed to allow efficient widespread application of a classification system to all State or Tribal waters. A question has been raised about, and EPA is considering, whether or not the current regulation and guidance provide the framework needed to strike the appropriate balance and the guidance on when and how to refine uses.

Aquatic Life

An issue related to the manner in which States and Tribes define designated aquatic life uses is the occasional confusion expressed between the actual intent of the CWA section 101(a)(2) interim goals and the ''fishable/swimmable'' short hand expression often used to describe those interim goals. EPA acknowledges that the phrase ''fishable/swimmable'' does not fully describe the intent and scope of the CWA section 101(a)(2) interim goals. The confusion over the expression ''fishable'' often surfaces where there is an action aimed at removing an aquatic life use from a particular water body where there are no sport or commercial fisheries. In these instances, an argument is often made that the water body does not meet the ''fishable'' intent of the section 101(a)(2) interim goals because the water body naturally supports only ''minnows'' and/or aquatic invertebrates. EPA believes this is an unacceptable argument for removing an aquatic life designated use or excluding an aquatic life designated use. As explained in EPA's Questions and Answers on Antidegradation (USEPA, 1985, p. 3), the Agency considers the protection afforded by standards to focus on an appropriately representative aquatic community whether or not that community includes sport or commercial fish:

> The fact that sport or commercial fish are not present does not mean that the water may not be supporting an aquatic life protection function. An existing aquatic community composed entirely of invertebrates and plants, such as may be found in a pristine tributary alpine stream, should be protected whether or not such a stream supports a fishery. Even though the shorthand expression ''fishable/swimmable'' is often used, the actual objective of the Act is to restore the chemical, physical and biological integrity of our Nation's waters (Section 101(a)). The term ''aquatic life'' would more accurately reflect the protection of the aquatic community that was intended in Section 101(a)(2) of the Act.

Thus, EPA's current interpretation of the regulation means that the Agency will not approve State or Tribal action to exclude aquatic life protection based on a conclusion that a water body does not support a ''fishery'', implying a sport or commercial fishery. EPA's current thinking is that it would improve the regulatory text to reflect this interpretation explicitly.

More specific to this discussion of refined designated uses is the question of whether or not the Agency should mandate that a minimum ''aquatic life'' use sub-category or sub-categories be included in all State or Tribal designated use classification systems to ensure appropriate protection of waters

which do not support commercial or sport fisheries (or any fish).

Refined Designated Uses and Use Attainability Requirements

There is one additional issue related to the refined designated use discussion that should be addressed. A question has been raised about the applicability of the use attainability requirements when establishing refined designated uses (with particular emphasis of aquatic life uses). The question raised is: since refined designated uses may be less inclusive than broad designations, will EPA consider development of a more refined use description to be a change in use subject to the use attainability requirements? Under current regulation, the combination of a new use sub-category and less stringent criteria triggers the use attainability requirements in § 131.10 of the Federal regulation (see § 131.10(j)(2)). However, it is possible that under certain circumstances, this requirement could be modified.

Such a modification would focus on the kind of information that should accompany any refined use classification based on a more precise biological description, whether or not formal use attainability assessment requirements apply. Essentially, there are two issues to be addressed: (1) does the refined description of the aquatic community reflect the reference condition (i.e., natural states) for the kinds of waters to which the new classification is to be applied? and (2) are any newly proposed criteria scientifically defensible? These are basic questions which would have to be addressed whether or not the use attainability requirements were invoked. As a result, a proposal to refine use categories will have to be accompanied by a rationale explaining how it was determined that the proposed biological description appropriately reflects the potential for waters to which the new sub-classification is to be applied. If warranted, this refined description can then serve as the basis for deriving defensible and appropriate criteria specific to the new sub-classification.

Request for Comment Refining Use Designations

EPA seeks comment on the following questions:

1. The current regulation is not specific about the level of precision States or Tribes must achieve in designating uses. The regulation allows for subcategories of uses, but does not mandate such an approach. Should the regulation be revised to promote or require greater specificity in designated uses, particularly for aquatic life uses, to support watershed-specific decision-making such as is anticipated in implementing watershed or place-based initiatives?

2. Where a State or Tribe utilizes broadly-defined designated uses, could the desired level of specificity be adequately addressed in State or Tribal standards that clearly articulate the intent of the designated uses as they would apply to specific waters of the State or Tribe?

3. If EPA were to specify a required level of precision in establishing use categories, what factors should be considered in prescribing a level of specificity? That is, what factors should be considered in striking a balance between specificity sufficient to ensure uses are afforded an appropriate level of protection and flexibility/efficiency needed to allow widespread application of the classification system?

4. At a minimum, should the regulation require that State and Tribal aquatic life use categories include a sub-category or sub-categories that may be assigned to protect aquatic communities that do not include a ''fishery''? Alternatively, should the regulation explicitly reflect EPA's current interpretation of the regulations to the effect that State and Tribal aquatic life classification systems protect a range of aquatic communities whether or not there are sport or commercial fish (or any fish) present?

5. Should the use attainability requirements in 131.10(j)(2) be modified to recognize situations where scientifically defensible less stringent criteria may be appropriate for refined uses which reflect the reference condition for particular waters?

3. Existing Uses

a. Protection of Existing Uses. The requirement to protect existing uses is addressed in two places in the current regulation—Section 131.10, designation of uses and Section 131.12, antidegradation. (see discussion of antidegradation, ''tier 1'', in section III.D of this document) As discussed in the background section above, the regulation defines ''existing uses'' as ''those uses actually attained in the water body on or after November 28, 1975, whether or not they are included in the water quality standards.'' (40 CFR 131.3(e)) As a result, the focus of existing uses, is on the past or present condition of the water body. Furthermore, by establishing requirements prohibiting the removal of existing uses and ensuring those uses will be appropriately recognized in State and Tribal water quality standards, the current regulation ensures that the better of the past or present condition, at a minimum, will be maintained and protected. Determining whether or not an existing use has occurred in the past or is currently in place is not always a straightforward task, however, and over the years, a number of questions have been raised about exactly what the ''existing use'' provisions in 131.10 require. These questions generally fall into two categories: (1) what is the link between existing uses and the State or Tribal use classification system? and (2) what is the relationship between existing uses, existing water quality and potential uses, i.e. uses that may be attainable in the water body whether or not those uses are presently designated for the water body or are presently being attained?

The first question addresses the relationship between the existing use protection provisions in Section 131.10 and State or Tribal use classification systems. There appears to be some confusion on this point. The confusion seems to center on what may appear to be conflicting mandates—protect what is there and allow no further erosion of water quality, and appropriately designate the existing use in regulation using the established classification system. The existing use definition and the requirement that existing uses be protected suggests to some that the description of existing uses is constrained by the way in which a State or Tribe has described its designated uses in its classification system. That is, they argue that an existing use, to be adequately protected, needs to fit into one of the categories or sub-categories established in State or Tribal regulation, and as a result, a decision about whether or not a use is ''existing'' is likewise constrained by the use descriptions and criteria established in that classification system.

For purposes of Section 131.10, this is generally the case. Again, this Section of the Federal regulation establishes two requirements with respect to existing use protection: (1) a prohibition against removal of a designated use where that use is determined to be an existing use, and (2) a requirement that existing uses be protected by State or Tribal regulation. To ensure a workable process, EPA interprets Section 131.10 as necessarily recognizing a linkage between the existing use protection provisions and the established State or Tribal use classification system. This interpretation of the regulatory framework, however, also presumes a responsibility on the part of a State or Tribe to establish a classification system that is sufficiently flexible and/or

encompassing to assure an appropriate level of protection for the anticipated range of existing uses (see discussion on refined designated uses in this chapter).

As explained earlier in the discussion on refined designated uses, a variety of use classification systems has evolved and become established in State and Tribal programs. Although there are likely some advantages to a more refined use classification system when it comes to protecting existing uses (more precise categories in which to fit the existing use), such a system may not be necessary as long as the State or Tribal standards clearly articulate the intended and appropriate level of protection for existing uses (again, see discussion of refined designated uses). The following example illustrates the point. An acid bog is a water body type which may be fairly widespread but which, as a classification type, may not appear in many State or Tribal standards. Where the aquatic characteristics of an acid bog are discovered to constitute an existing use, a State or Tribe could: (1) establish a classification type and criteria for acid bogs to ensure appropriate protection by way of a specific designation, or (2) classify the bog within the existing, general classification system, e.g., warm water aquatic life, and adopt any needed site-specific criteria to ensure the existing nature and quality of this specific water resource is protected. Either approach can result in an appropriate level of protection and there may not be a need for States or Tribes to include an ''acid bog'' water body type in their classification system. Under either approach the standards must articulate clearly the intended and appropriate level of protection, ensuring protection of the existing use.

It is also important to remember that the existing use provisions in both §§ 131.10 and 131.12 must be considered together. The classification requirements in § 131.10 ensure that all existing uses will be recognized and protected through appropriate classification of those water bodies in the standards (and/or application of appropriate site-specific criteria where the existing classification system is broadly constructed). The antidegradation-based existing use protection provision guarantees that individual activities on individual water bodies will be examined to ensure those activities will not eliminate existing uses, whether or not those uses are currently recognized in the State or Tribal standards. The antidegradation provisions, through the general requirement that existing uses be protected, ensure immediate protection from specific activities which may threaten the existing use, and the classification requirements ensure recognition and longer-term protection from any present or future stressors through specific designation in the standards. Both these provisions apply and should not be considered in isolation. Together they constitute the existing use protection requirements, ensuring the existing uses and water quality to support those uses are maintained and protected.

The second question addresses the relationship between existing uses, existing water quality and potential uses. The Agency's guidance, Questions and Answers on Antidegradation, August, 1985 (Notice of Availability, 50 *FR* 34546, August 26, 1985 [included as appendices to *Water Quality Standards Handbook,* cited above]) addresses this issue, in part. The answer to ''question 7'' states: ''an existing use can be established by demonstrating that fishing, swimming, or other uses have actually occurred since November 28, 1975, or that the water quality is suitable to allow such uses to occur (unless there are physical problems which prevent the use regardless of water quality).'' Using an example of a healthy shellfish community which is not currently being harvested, the answer goes on to explain that the existence of a use (past or present) is not dependent solely upon a demonstration that the use is being satisfied in a functional sense (i.e., in this case, the shellfish harvested). In this example, ''shellfish harvesting'' is considered an existing use, even though there is presently no harvesting underway, because the water quality and habitat support a healthy shellfish community suitable for harvesting. The answer further explains that to assume otherwise ''* * *would be to say that the only time an aquatic protection use 'exists' is if someone succeeds in catching fish.'' As illustrated in this example, the existing use question must address both the current or past functional use *and* the current or past (since November 28, 1975) water quality, and the intent of the regulation is to ensure the existing use and the water quality necessary to support that use are maintained and protected. Thus, in this example, the shellfish harvesting use is to be protected by designated uses in water quality standards.

The shellfish example is a good one in that it clearly illustrates EPA's position that an existing use finding can be made either where the use is or has been ''actually attained'' or where the water quality necessary to support the use is in place even if the use, itself, is not currently established, as long as other site-specific factors, for example physical problems like flow or substrate, would not, despite the suitable water quality, prevent attainment of the use. The ''other factors'' caution is important in understanding EPA's position on existing uses. In making an existing use determination, there is a link between the use and water quality. To be considered an existing use, the use must have been actually attained in the past, is now attained or water quality is sufficient to support the use. However, for some sites, water quality, alone, may be an insufficient basis for making an existing use finding if there are other factors that would prohibit the use from taking place regardless of the quality of the water at a site. In the shellfish example, the necessary water quality is present, and there are no obvious limiting factors which would prohibit present or future shellfish harvesting.

Although this example is useful in illustrating important principles in implementing existing use protection requirements, it is a rather straightforward example. An appropriate resolution of the existing/designated use issue may be somewhat less clear-cut where either the existing water quality or the existing use is marginal (i.e., it is difficult to determine whether or not the use is actually attained, or whether or not there are factors, other than water quality, that could prohibit the use). It is in addressing these situations that questions have been raised about what the current regulation requires. A principal difficulty in addressing these questions may lie in resolving the linkage between the present and past conditions protected by the ''existing uses'' provisions and the attainable or potential condition protected by ''designated uses'' provisions. It may be useful to evaluate this issue by considering the link between existing and designated uses established in the current regulation.

Obviously, any decision about whether or not a use is an ''existing use'' must be a water body-specific determination. The existing use determination is, therefore, site-specific, and decisions should consider water quality and other limiting factors such as the physical habitat specific to a particular water body. A few examples may help illustrate the issue. A somewhat common existing use question applies to primary contact recreation: if a few people on a few occasions ''swim'' in a water body that does not have the quality or physical characteristics to support swimming, is this an existing use, even if the water body is posted ''no swimming'' due to

bacterial contamination and lacks the physical features to actually support swimming? The straightforward answer to this question is that ''swimming'' is not an existing use because the present (or past) condition does not support that use. This conclusion is based on the very limited actual ''use'' and, more importantly, the lack of suitable water quality and physical characteristics that would support a recreational swimming use now or in the future (as determined by the water quality requirements and recreational swimming considerations, including safety considerations, in the State or Tribal classification system for primary contact recreation).

A question has been raised as to how to interpret the regulation in the context of this example. One could determine that because the water body is not suitable for swimming, and has not been since 1975, primary contact recreation is not an existing use. Alternatively, one could determine primary contact recreation to be an existing use because the water body was actually used for swimming, even though the use was occasional and water quality and physical characteristics were not acceptable to support such a use. EPA believes the first alternative is the better interpretation of Agency regulations and guidance in this example, because the use is not established and the water quality and other factors would appear to prohibit actually attaining a recreational swimming use.

Stating that this is an appropriate interpretation of the regulation means that EPA would not object if a State or Tribe reached a conclusion, in a similar case, that this was not an existing use. As noted above, however, existing use decisions are very site-specific, and it is possible that, on a specific water body under similar circumstances, a different conclusion could be reached by a State or Tribe based on public comment at a hearing and a decision to take a protective approach to the incidental use for that specific resource. The Federal requirements do not prohibit a State or Tribe from taking a more protective approach than would be required by the water quality standards regulation.

Although, in the above example, a State or Tribe could conclude that primary contact recreation is not an existing use, it may well be an attainable use that must be protected as a designated use by the State's or Tribe's water quality standards. This finding would depend on whether the physical condition of the water body is suitable for swimming and whether the water quality problems limiting the use are controllable. (See 40 CFR 131.10(j) and discussion on use attainability analysis below). The point is that, although the existing use provisions most directly address past or present conditions, decisions about existing uses generally are not made in isolation. With respect to uses contained in CWA Section 101(a)(2), the regulation links existing and designated uses, and it may be useful to view these provisions as a continuum in examining the broader question of use protection.

Some States and Tribes have recognized that continuum in developing use attainability guidance for recreational uses which includes questions about the actual use, existing water quality, water quality potential, recreational facilities, location, safety considerations, physical conditions of the water body, and access

Note: access here means restricted access, as in fenced property; access is not intended to suggest the ''remoteness'' of the water body; in EPA's view, remoteness is not a valid basis for an attainability decision on recreation.

When all of these factors are considered, the adopted water quality standards are consistent with both the existing and designated use provisions. For example, suppose a city has created a greenway along a stream that receives wastewater effluent upstream of the greenway and has posted ''no swimming'' signs. The greenway attracts children leading to the inevitable ''unauthorized'' swimming. If the physical condition of the stream is suitable for swimming, the swimming occurs on a frequent basis and the greenway provides recreational facilities and access, the only factor limiting the use may be a water quality problem that in the judgement of the State or Tribe can be controlled to achieve the primary contact use. The linkage between existing and designated uses encourages the evaluation of this full suite of factors in making a decision about whether or not primary contact recreation should be protected.

A similar existing use question is often raised for aquatic life uses where the existing aquatic community is impaired as a result of marginal water quality. A common example in the western part of the country is a mountain stream impaired by historic hard rock mining (with the impacts occurring well before November 28, 1975). Although the physical condition of the stream may represent ideal trout habitat, the trout population may be severely limited, in poor condition or absent as a result of the toxic effects of metals. In its classification system, however, a State or Tribe may describe and designate this type of stream as a ''salmonid spawning'' use based on its physical habitat and potential. For streams such as these, where a few adult trout are present but there is no evidence of younger age classes, the question is asked—is this an existing ''salmonid spawning'' use?

Again, the appropriate answer, based on EPA regulations and guidance, is that this is not an existing use (although it may nonetheless be an appropriate designated use if it has the potential to support salmonid spawning). The current use, matching the classification description, is absent, and the limiting water quality problems have been in existence prior to November 28, 1975. (This does not mean, necessarily, there is not some existing aquatic life use which would then serve as the regulatory ''floor'' for this water body; see the ''limited'' aquatic life use discussion in the use attainability analysis discussion in this section below and the ''tier 1'' discussion in the antidegradation section, III. D) As in the ''swimming'' example, however, there can be a gradation of conditions, and occasionally it may be difficult to draw a bright line and conclude, with confidence, that this is where the existing use begins.

In situations similar to this impaired stream example, where the existing water quality problems are considered controllable by the State or Tribe, arguments have been made on both sides of the existing use issue: the salmonid spawning use is not existing, *or* the salmonid spawning use is in place, albeit currently at an impaired level. Disputes about the correct interpretation of Agency guidance become even more difficult to resolve where the existing impacts to water quality are not as great as those in the above example. Often streams impacted by historical mining, such as the one described above, are headwater streams. As the water moves downstream, clean water tributaries reduce the effect of the metals contamination, and fish, in number, begin to move into these ''improved'' waters. Nevertheless, many such streams would be considered impaired when compared to unaffected, similar waters (reference streams). And, despite supporting ''fairly good numbers'' of trout, the existing water quality in such streams often exceeds the chronic and, occasionally, acute standards for metals. In situations such as these, States and Tribes have had difficulty in reaching conclusions about whether or not an existing use, matching the classification, is in place. Because States and Tribes may evaluate existing uses when they are designating uses, threshold existing use

determinations may lead to questions about the potential for the water body and the appropriate designated uses for it.

EPA's current interpretation is that the existing use should be identified either where the use has taken place or the water quality sufficient to support the use has existed since November 28, 1975, or both. That is to say, State and Tribal existing use decisions can be based on a finding that the use, as defined in the classification system, and/or the water quality needed to support the use is in place (and there are no other factors that would prohibit actually attaining the use). This interpretation does not fully address the issue of partially impaired uses. Thus, a fuller explanation may be needed in the regulation or policy of how that interpretation is applied where the use or the water quality may be somewhat impaired. EPA is considering whether changes to the regulation or additional guidance is needed to explain the Agency's position and to offer direction in making such determinations.

Request for Comment on Existing Uses

EPA seeks comment on the following questions:

1. Does EPA need to further clarify the existing use protection provisions in § 131.10, more clearly explaining that existing uses are defined by the uses made of water bodies and existing water quality, where that quality is or was sufficient to allow the use to occur (and there are no other limiting factors)? If so, will the clarification require a regulatory amendment or can the needed clarification be accomplished in Agency policy or guidance?

2. Does EPA need to expand its guidance to explain how the current regulation addresses existing use decisions where there is some semblance of a use even though the water quality is insufficient to support the use in, for example a safe or healthful manner? Should this additional guidance clarify the linkage between existing and designated uses?

3. Should the regulatory definition of ''existing use'' at 40 CFR 131.3(e) be modified? If so, how?

4. Use Attainability.

a. Attainability of Uses. States and Tribes may remove a designated use, that is not an existing use, if they can demonstrate that attaining the designated use is infeasible. (40 CFR 131.10(g)) The current regulation identifies the factors that must be considered in making such a demonstration. As explained in the regulation, existing uses, by definition, are attainable and must be protected by designated uses in water quality standards (40 CFR 131.10(h)(1), 131.10(i) and 131.12(a)(1)). Further, at a minimum, uses are considered attainable if they can be achieved by implementing effluent limits required under Sections 301(b) and 306 of the Clean Water Act (Act) and by implementing cost-effective and reasonable best management practices (BMPs) for nonpoint source control. (40 CFR 131.10(h)(2)).

These existing uses, technology and BMP provisions establish the basic regulatory threshold test for what the attainable use of a water body is and thus what the minimum use designation for the particular water body must be. Where either the use is existing or the use can be attained through implementation of Clean Water Act technology requirements and/or implementation of applicable State requirements regarding BMPs for nonpoint source control, 40 CFR 131.10(h) establishes that the use is attainable and must be designated. Once a use is designated, it is presumed to be attainable and may not be removed (downgraded) unless the State or Tribe can demonstrate that attaining the designated use is not feasible based on one of the six use removal criteria (40 CFR 131.10(g)). Therefore, uses are considered attainable if: (1) the use is existing; (2) the use can be attained through application of CWA technology requirements and/or State or Tribe required BMPs; or, (3) none of the use removal criteria is satisfied. EPA has in the past recommended that these use removal criteria referenced under number 3 above, serve as additional tests, over and above numbers 1 and 2 above, for determining when a use is attainable. Clearly these use removal criteria (131.10(g)) are designed to determine whether a use is attainable and therefore can serve that purpose equally effectively when considering whether to remove a designated use (the situation where they are clearly required to be used) and when considering whether a use is attainable and should be designated. The discussion below on use attainability analysis (UAA) and non section 101(a)(2) uses further discusses the relationship between designation of attainable uses, UAAs, and the analysis required to justify use removal. That discussion solicits comment on whether the use removal criteria at § 131.10(g), in addition to being the regulatory justifications for use removal, should, consistent with EPA's interpretation of the regulation, be included in the basic elements of a UAA.

Despite what EPA believes are fairly clear guidelines in the current regulation and guidance, questions have been raised about EPA's minimum attainability requirements. The Agency's current thinking is that basic attainability requirements, the methods for demonstrating attainability, the circumstances under which attainability analysis must be done, and what that analysis must consist of should be clarified in the regulation.

b. Removal of Designated Uses. The regulation (at 40 CFR 131.10(g)) specifies that States and Tribes may remove a designated use which is not an existing use if attainment of a use is not feasible due to the following:

(1) Naturally occurring pollutant concentrations prevent the attainment of a use; or,

(2) Natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the use, unless these conditions may be compensated for by the discharge of sufficient volume of effluent discharges without violating State or Tribal water conservation requirements to enable uses to be met; or,

(3) Human caused conditions or sources of pollution prevent the attainment of the use and cannot be remedied or would cause more environmental damage to correct than to leave in place; or;

(4) Dams, diversions or other types of hydrological modifications preclude the attainment of the use, and it is not feasible to restore the water body to its original condition or operate such modification in a way that would result in the attainment of a use; or,

(5) Physical conditions related to the natural features of the water body, such as the lack of a proper substrate, cover, flow, depth, pools, riffles, and the like, unrelated to water quality, preclude attainment of aquatic life protection uses; or,

(6) Controls more stringent than those required by Sections 301(b) and 306 of the Act would result in substantial and widespread economic and social impact.

The use removal criteria were included in the regulation to address those circumstances where the attainability of certain uses would be precluded by conditions over which the water quality protection provisions in the regulation had little or no control. The uncontrollable conditions considered most likely to limit attainability were: natural water quality or habitat limitations, irretrievable human-caused contamination or conditions, or insupportable economic and social costs. These general

conditions, then, formed the basis for the six use removal criteria. Although EPA believes the use removal criteria have functioned reasonably well, the growing number and reoccurring nature of the questions raised about these criteria have convinced EPA of the need to review this central element of the program.

Some have argued that the six criteria and their interpretation are overly stringent, making any proposal to remove a designated use futile even where a use was ''mistakenly'' designated. Others argue that the use removal criteria and their interpretation are overly generous, granting the possibility of use removal where the principal stressor is a condition which should not be immune from the water quality protection provisions in the federal regulation (operation of dams is one example used in arguing this position). Others complain that there seems to be no national consistency in the way the use removal criteria are interpreted by EPA, the States or the Tribes. And, finally, questions also have been raised about whether or not the criteria adequately address or apply to all uses equally. The key to appropriate application of the use removal criteria is to focus on whether or not a condition, at a specific site, would preclude attaining a designated use. A decision on this question is not always straightforward however, and as a result, there are questions about the application of the use removal criteria. A few examples may help the discussion.

Criterion number 1 allows removal of a designated use where ''naturally occurring pollutant concentrations prevent attainment of the use.'' A reoccurring question about this provision is: under what circumstances should ''naturally occurring pollutant concentrations'' be the justification for use removal versus the basis for calculating site-specific criteria, acknowledging that the natural condition defines the existing use? Often, the numerical criteria assigned to the designated use are the initial benchmark for estimating whether or not a designated use will be attained. In this approach, a comparison of the natural condition with the numerical criteria is used in the evaluation of attainability. Where such an analysis demonstrates clearly that the naturally occurring pollutant concentrations would *preclude* the designated use, the use may be removed. There are, however, examples of situations where statewide or national criteria for one or more contaminants are exceeded, and yet the available information on the overall condition of the water indicate the use is supported. This situation is most common for aquatic life uses where local populations of aquatic organisms may have acclimated to natural conditions outside the estimated ''normal'' tolerance range, where species on the edge of their distribution are reproducing but are physiologically stressed or where broadly derived criteria may not be appropriate for the particular aquatic community at that site. In such a situation, the observed condition of the resource obviously will take precedence over the predicted condition, and the natural water quality will form the basis for site-specific criteria since the use is clearly not precluded. Again, the key to answering the use removal question is to determine whether or not ''natural conditions'' preclude attainment of the use, and because of the site-specific circumstances discussed above, answering this question involves more than a simple comparison of numeric criteria with the natural condition.

Criterion number 2 allows removal of a designated use where natural, ephemeral, intermittent, or low flow conditions would preclude the use unless these conditions may be compensated for by the discharge of sufficient volume of effluent discharges without violating State or Tribal water conservation requirements to enable uses to be met (emphasis added). Questions have been raised about exactly what the above italicized language means. EPA's interpretation of this phrase is that, where an effluent discharge creates an essentially perennial flow for what naturally would be ephemeral or intermittent waters, the resulting aquatic community is to be protected. EPA's current thinking is that in situations such as these, the second criterion for use removal means that a State or Tribe cannot remove a use of a water body where the augmented flow supports an aquatic life use.

Criterion number 4 allows removal of a use where dams, diversions or other types of hydrological modifications preclude the attainment of the use, and it is not feasible to restore the water body to its original condition or operate such modification in a way that would result in the attainment of a use. As indicated above, some have argued that operation of dams is an inappropriate basis for concluding that Section 101(a)(2) uses are not attainable, and they have suggested this criterion be removed from the regulation. In arguing this position, these commenters have pointed to the 1986 amendments to the Federal Power Act (Electric Consumer's Protection Act, or ECPA) and the legislative history of these amendments as an indication of Congress' intent to give equal priority to protecting and restoring fish and wildlife habitat even where dams exist. Specifically, the ECPA states:

> * * *In deciding whether to issue any license the {Federal Energy Regulatory Commission}, in addition to the power and development purposes for which licenses are issued, shall give equal consideration to the purposes of energy conservation, the protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat), the protection of recreational opportunities, and the preservation of other aspects of environmental quality. (ECPA amending the Federal Power Act, Section 4(e), 16 U.S.C. Section 797(e))

The legislative history, these commenters believe, provides a particularly clear indication of congressional intent to protect and restore aquatic life uses. They specifically point to that part of the record which states that no one ''expect[s] 'business as usual,' '' but rather the expectation is that:

> [P]rojects licensed years earlier must undergo the scrutiny of today's values as provided in this law and other environmental laws applicable to such projects. If nonpower values cannot be adequately protected, FERC should exercise its authority to restrict or, particularly in the case of original licenses, even deny a license on a waterway. (H.R. Rep. No. 99–934, 99th Cong., 2d Sess. (1986) at 22)

Groups arguing for removal of criterion 4 use the amendments to the Federal Power Act as an example of the recognition being given today's environmental values and the importance of restoring and enhancing the aquatic habitats and recreational uses of water resources. They maintain that ''...the Water Quality Rule should be updated to recognize that aquatic and recreational uses can not be removed based simply on the existence of a dam.'' EPA's current thinking is that the above rationale and legislative history raise a serious question about whether the existence of a dam and the infeasibility of operating that dam in a way that will result in attaining the designated use, measured against today's values, is sufficient reason to remove a designated use. EPA is interested in commenters views on this issue.

Criterion number 5 allows removal of a designated use where physical conditions related to the natural features of the water body, such as the lack of proper substrate, cover, flow, depth, pools, riffles, and the like, unrelated to water quality, preclude attainment of

aquatic life protection uses. Notwithstanding the reference to aquatic life uses in 131.10(g)(5), some have argued that recreational uses, especially swimming uses, might also be limited by physical factors (especially where safety is an issue), and they have asked whether or not the physical factors consideration could be applied to evaluations of recreational use attainability. As now written, the regulatory language would not allow consideration of physical factors, alone, as the basis for removing a designated recreational use. In the preamble to the 1983 regulation, EPA explained that, while the Agency recognized that physical factors also affect recreational uses, States, and now Tribes, would need to give consideration to incidental uses of the water body even though it may not make sense to encourage use of a stream for swimming because of the flow, depth or velocity of the water. Instead, the preamble discussion explained that based on prudent public health considerations, the use protection question was not to be judged wholly on an analysis of the water body's suitability for swimming but rather on whether or not swimming would actually occur. EPA's current thinking is that physical factors, alone, would not be sufficient justification for removing or failing to designate a primary contact recreation use.

EPA's suggested approach to the recreational use question has been for States and Tribes to look at a suite of factors such as, the actual use, existing water quality, water quality potential, access, recreational facilities, location, safety considerations, and physical conditions of the water body in making any use attainability decision. The guidance suggests that any one of these factors, alone, may not be sufficient to conclude that designation of the use is not warranted. Nevertheless, there clearly are situations such as high flows caused by storm events where the physical conditions of a water body would make swimming, if not impossible, extremely dangerous. It is in addressing situations such as these that questions have been raised about the applicability of physical factors to the recreational use issue. The question is sometimes posed in terms of whether or not a State or Tribe would incur some liability by designating or continuing to designate such waters as swimmable. They argue that a reasonable, common sense approach is to acknowledge that there are certain waters for which primary contact recreation is not an attainable use solely because of the physical condition of the water. EPA is, therefore, considering whether the regulation or Agency guidance should be amended to allow consideration of physical factors, alone, as the basis for removing or not designating primary contact recreational uses.

The above discussion is about EPA's interpretation of the conditions that would have to be satisfied to either remove or not designate recreational uses. As explained earlier in this section, satisfying those conditions gives a State or Tribe the option of either removing or not designating the use. It does not, however, create an obligation. A specific example may help. A western State was concerned, partly for liability reasons, about designating swimming uses for a number of waters where the physical conditions and other factors made swimming, if it did occur, unwise. Although available information indicated the actual swimming use was limited or nonexistent, the State also wanted to ensure protection of that use, based on public health considerations, should it occur. The issue for the State was striking the appropriate balance between the two concerns: the possibility of inadvertently encouraging swimming where it should not occur because of safety considerations and protecting that use if it did occur. To resolve this issue, the State designated these waters for secondary contact recreation but assigned primary contact recreation bacteriological criteria to provide an appropriate level of protection should swimming occur, however unlikely. In this way, the State felt it did not inappropriately encourage swimming in these waters, but if swimming did occur, the required water quality would provide an appropriate level of protection. This is an approach to the ''incidental use'' issue, discussed in the existing use section of this chapter, that, while acknowledging uncertainty, errs on the side of protectiveness.

Consistency

EPA has provided guidance on implementing the requirements in § 131.10(g). Although EPA believes the guidance has been fairly comprehensive and has functioned reasonably well, the growing number and recurring nature of the questions raised about implementation of the use removal criteria have convinced EPA to solicit comments on the need for additional guidance or regulatory changes to ensure appropriate and consistent application of the use removal criteria.

As indicated in the introduction to this discussion, one of the reoccurring concerns about implementation of §§ 131.10(j) and 131.10(g) with respect to designating or removing uses, is that to some, there are instances of inconsistency in the way the § 131.10(g)(1)–(6) criteria are interpreted by EPA, the States or the Tribes. One example that has been cited is that the application of the fish consumption use is dissimilar in different regions of the country. In one area of the country, some maintain, the fish consumption use is applied to all waters assigned any aquatic life use without regard to whether or not there is a credible exposure pathway to humans by way of contaminated fish. In other areas of the country, the application of the fish consumption use allows consideration of occurrence, size and species of fish present and evidence that fishing actually occurs as a basis for concluding that there is a potential exposure pathway and the use should be designated. An associated consistency issue has to do with the manner in which the terms in § 131.10(g) are interpreted. An example is the term ''feasible'' in criterion number 4. Feasibility could be based on technical considerations, such as the ability to operate an impoundment in an efficient manner that does not degrade water quality, as EPA intended when it originally wrote the regulation. Alternatively, some have suggested that feasibility could be based on economic considerations or a balanced consideration of cost and technology (EPA's current thinking is that the term ''feasible'' in use removal criterion number 4, regarding the operation of dams should continue to refer to technical feasibility and not to economic feasibility. Criterion number 6, not number 4, is the appropriate avenue to address economic feasibility of attaining the designated use because it establishes an appropriate test of economic infeasibleness.)

EPA's view is that the use removal criteria should be clear and consistently interpreted. Questions and/or positions such as those described above suggest there may be a need for additional guidance on or interpretation of § 131.10(g) to ensure the § 131.10(g) criteria are consistently interpreted and applied, and to address whether review under § 131.10(g) could be done for categories of sources.

c. Use Attainability Analysis. A use attainability analysis (UAA) is a structured scientific assessment of the factors affecting the attainment of uses specified in section 101(a)(2) of the Act (the ''fishable/swimmable'' uses). The factors to be considered in such an analysis include the physical, chemical, biological, and economic use removal

criteria described in the current regulation (40 CFR 131.10(g)(1)–(6)). The current regulation (40 CFR 131.10(j)) establishes the requirement that States and Tribes conduct a UAA when designating uses that do not include the section 101(a)(2) uses, removing section 101(a)(2) uses, or designating new subcategories of section 101(a)(2) uses that require less stringent criteria.

New Information for Waters Without Section 101(a)(2) Use Designations

The current regulation (§ 131.20(a)) specifically requires the re-examination of water bodies with less than Section 101(a)(2) use designations every three years to determine if new information has become available. If new information indicates that a use is attainable, the State or Tribe is to revise the use accordingly. EPA interprets the current regulation as requiring review of past UAA-based use designation decisions when there is new information that could have a bearing on that use designation decision.

The 1983 preamble to the regulation explained that a State or Tribe need only conduct a UAA once for a given water body. The preamble went on to explain, however, that where the UAA is used as justification for removing a section 101(a)(2) use or failing to designate a section 101(a)(2) use, the State is required to review the basis for that decision in subsequent triennial reviews to determine whether or not the circumstances have changed in a way that would alter the original decision. EPA recognizes that the requirement to review new information about past UAA-based use designation decisions, because it creates a demand for further analysis of the decision by the State or Tribe, can serve to discourage States and Tribes from generating new information. EPA's current thinking is that interested parties should be encouraged to generate and consider relevant information that could have a bearing on the use designation decision for a particular water and that the trigger for reviewing past use designation decisions should be clear. In addition, EPA is interested in comments on whether there should be some definable burden placed on the State or Tribe to actively seek information for such waters. The Agency may need to be more specific in requiring that States and Tribes specify the procedures they will use in identifying water bodies where ''new information'' has become available and ensuring new information is generated where appropriate.

UAAs and Non Section 101(a)(2) Uses

The current regulation indicates that the UAA requirements apply to uses specified in Section 101(a)(2) of the Act. The regulation at 40 CFR 131.10(j) specifically requires that a State or Tribe conduct a UAA where: ''(1) the State [or Tribe] designates or has designated uses that do not include the uses specified in Section 101(a)(2) of the Act, or (2) the State [or Tribe] wishes to remove a designated use that is specified in Section 101(a)(2) of the Act or to adopt subcategories of uses specified in Section 101(a)(2) of the Act which require less stringent criteria.'' Although the regulation at 40 CFR 131.10(g) has always provided that States and Tribes may not remove a designated use unless they can demonstrate that attaining the use is not feasible, the regulatory language does not expressly require the State or Tribe to conduct a UAA as defined in 40 CFR 131.10(j) before a use not referenced in section 101(a)(2) may be removed. As a result, some have questioned whether or not the UAA requirements actually apply to uses other than those referenced in Section 101(a)(2), such as water supply or agriculture. EPA's position on this issue is that, while the analysis to downgrade a use not included in CWA section 101(a)(2) is not expressly referenced in § 131.10(j), 40 CFR 131.10(g) of its own terms requires the State or Tribe to document whether any use being considered for removal is attainable under the six criteria outlined in that section. Where such a use is shown to be attainable, it may not be removed (downgraded). In practice, EPA believes there is no cognizable difference between these two analyses. EPA is thus considering whether it should combine these elements of 40 CFR 131.10(g) and 131.10(j) or otherwise clarify the relationship between these provisions in the regulation. Given EPA's position that the regulation requires the use attainability of a water body to be documented before any of its uses may be removed, EPA is interested in a discussion of specific attainability issues that might arise in applying the UAA requirements to non-Section 101(a)(2) uses such as water supply or agriculture.

Information in UAAs

The regulation is not specific about what a UAA should contain other than the general description contained in the definition of a UAA at 40 CFR 131.3(g). Instead, EPA has issued various national and regional guidance documents to assist with the completion of such analyses. Some have suggested, however, that the regulation be amended to provide more specificity on information needed in a UAA. Topics for consideration might include: what specific questions should a use attainability analysis address? what are the data requirements? and what are the requirements for reporting the results of the analysis? EPA seeks comment on this issue.

UAAs and Refinement of ''Fishable/Swimmable'' Use Designation

As long as a State or Tribe designates uses that fall within the broad range of uses consistent with the section 101(a)(2) goals, there is no requirement to conduct a UAA. In fact, 40 CFR 131.10(k) explicitly states that ''a State is not required to conduct a use attainability analysis . . . whenever designating uses which include those specified in section 101(a)(2) of the Act.'' As a result, there does not appear to be a mechanism that ensures State or Tribal waters are not under-classified (i.e., a use subcategory is designated for a water when a higher or more protective subcategory is actually attainable). Some have suggested that the regulation be amended or guidance clarified to require a UAA (i.e., a structured scientific assessment) whenever an aquatic life use is designated (or refined) to ensure the level of protection assigned matches the potential for the water body. EPA's current thinking is that there needs to be a solid underlying rationale for use designations. One of the emerging themes from EPA and the larger community of parties interested in further protecting water quality is that refining designated uses and tailoring suites of criteria to the refined uses in watersheds is an important future direction of this program. Clearly for this approach to succeed, a solid evaluation of attainability must be at the heart of any decision to characterize designated uses in greater detail than has been the norm. EPA is interested in comment on this view, in particular as it relates to the rebuttable presumption that the generic uses described as fishable/swimmable are attainable.

Thresholds for Aquatic Life Use Designation

In part 2 of this section, ''Refined Designated Uses'', there is a discussion explaining EPA's position that the definition of ''aquatic life'' is not limited to those waters that support ''fisheries.'' That discussion explains that a more biologically-grounded definition of aquatic life would be sufficiently expansive to include aquatic communities made up, for example,

entirely of invertebrate organisms. This broad definition of ''aquatic life uses'' has an impact on the manner in which UAAs are planned and evaluated. The current regulation allows States and Tribes to designate uses for certain waters that do not include the section 101(a)(2) uses, where such uses are not attainable. As a result, some States and Tribes have waters which have not been assigned an aquatic life designated use. However, if aquatic life uses are defined broadly, as EPA believes they should be, there would be very few, if any, waters that would not be considered as supporting some type of existing aquatic life use.

Aquatic communities form a continuum, making it difficult, if not impossible in the biological sense, to identify where the threshold for aquatic life use begins. As a result, some have suggested that a broad definition of aquatic life would appear to revoke the option of excluding aquatic life protection from a water body since essentially all waters support some level of aquatic life. They have suggested, therefore, that there is a need to identify a threshold, based on some physical rather than biological limitation, that could be used as an acceptable justification for concluding that an aquatic life use is not attainable. For example, some States and Tribes have urged the use of a flow-based threshold to justify a conclusion that an aquatic life use in not attainable. Generally, ephemeral waters (waters whose channel does not intersect the ground water table and which are dependent on precipitation events for their flow) are suggested as an appropriate threshold. In a biological sense, this may not be a satisfactory solution since there are ecologically important ephemeral waters which should receive aquatic life use protection regardless of the temporal nature of the flow. This is especially true for many ephemeral wetlands. EPA is considering whether changes are needed in the regulation or guidance to address whether, and under what circumstances, UAAs may be used to justify a non-aquatic life use classification, given the broad range of aquatic communities that may exist.

Request for Comments on Use Removal and Use Attainability

EPA seeks comment on the following questions:

1. Although EPA believes the use removal criteria in § 131.10(g) have functioned reasonably well, questions have been raised about the applicability of specific section 131.10(g) criteria and the manner in which EPA interprets those criteria. EPA seeks comment on the use removal criteria. Are the six criteria sufficiently comprehensive or should other factors be considered as a basis for removing designated uses? Are the criteria too comprehensive and are certain of the criteria inappropriate as a basis for designated use removal? Is there a need to modify the existing criteria to more clearly address the full range of use removal issues that have developed since the regulation was originally published?

2. Even with the statements in the current regulation, questions have been raised about the minimum requirements of a use attainability analysis. Is there need for further clarification in guidance, policy or in the regulatory text on this issue?

3. Triennial review of UAA-based use designations that do not include section 101(a)(2) uses, are currently triggered only when new information becomes available. Should EPA require that States and Tribes specify procedures they will use in identifying what constitutes new information and thus when the review of the UAA-based use designations is required?

4. Although 40 CFR 131.10(g) requires an assessment of attainability before removal of any designated use, the regulatory language does not expressly require an analysis called a UAA as specified in 40 CFR 131.10(j) any time a State or Tribe seeks to designate a non section 101(a)(2) use. EPA, however, believes that the analysis under either provision is equivalent. Should the current regulation be revised to clarify that the UAA requirements apply to any ''downgrade'' of a use and not just the CWA Section 101(a)(2) uses? Can any needed clarification be achieved through guidance or policy? EPA would be interested in comments on factors to be considered in evaluating the attainability of non Section 101(a)(2) uses, such as water supply or agricultural uses which generally take place after the water is diverted from the natural water body.

5. How should the water quality standards regulation, guidance or policy be modified to provide more specificity on appropriate factors to consider in developing a use attainability analysis?

6. In order to ensure the present aquatic life use designation (or use subcategory) matches the attainable level of aquatic life use in a water body, should the water quality standards regulation, policy or guidance be modified to clarify that a periodic review of designated uses is required where a State or Tribe has designated only marginal or limited aquatic life uses?

7. Are changes needed in the water quality standards regulation, policy or EPA guidance to address whether, and under what circumstances, use attainability analyses may be used to justify a non-aquatic life use classification, given the broad range of aquatic communities that may exist?

d. Alternatives to ''Downgrade'' of the Designated Use. As discussed above, where a State or Tribe believes that a particular designated use is not attainable, States and Tribes have the option of refining a water body's designated use, for example by creating subcategories of the use and describing the use in more detail. A subcategory can, and may need to be, water body-specific if the State's or Tribe's use classification system is not sufficiently precise to accommodate the subcategory of designated use for the water body in question. States and Tribes also have the option of removing the designated use and replacing the removed use with a new one that, under the regulation, reflects attainable conditions in the water body. Use removal and to a lesser extent refinement are also commonly referred to as use ''downgrade.'' Both of these options, refinement and removal of the designated use, are not time-limited. That is, the designated use that results from exercising either of these options becomes the new goal use of the water body. In the following discussion, three alternatives to use downgrade that have been used by States are presented. They are variances, temporary standards, and ambient-based criteria. These alternatives are less ''draconian'' than use downgrading in the sense that they can provide adjustments to particular aspects of the standards—*i.e.*, to the criteria for particular pollutants or the criteria as applied to certain dischargers—without changing the designated use and the full suite of criteria to protect the designated use. EPA's current thinking is that often the attainable condition of particular water bodies is not well understood due to uncertainty about expected results of water quality improvement actions. In such situations, EPA believes it may be appropriate to implement water quality protection actions, assess the results of those actions, and implement additional measures where necessary to continue to improve water quality. EPA believes that iterative assessment and implementation in these types of situations is probably the best way to gain an understanding of the ultimate attainable condition of the water body. The mechanisms described below may be well-suited to this situation because they leave the designated use of the

water body, the ultimate goal, in place while providing a defined period of time (in the case of variances and temporary standards) to document, through implementation and assessment, the water quality improvements that are possible through various measures and thus, the attainability of the goal.

i. Variances. One option authorized under the regulation that is used by some States or Tribes is the water quality standard variance. A variance is a short-term exemption from meeting certain otherwise applicable water quality standards. EPA authorizes States and Tribes to include variances in their water quality standards. (see 40 CFR 131.13). Agency guidance on variances identifies what the Agency believes to be the essential elements of a variance:

—a variance should be granted only where there is a demonstration that one of the use removal factors (40 CFR 131.10(g)) has been satisfied;
—a variance is granted to an individual discharger for a specific pollutant(s) and does not otherwise modify the standards;
—a variance identifies and justifies the numerical criteria that will apply during the existence of the variance;
—a variance is established as close to the underlying numerical criteria as is possible;
—a variance is reviewed every three years, at a minimum, and extended only where the conditions for granting the variance still apply;
—upon expiration, of the variance, the underlying numerical criteria have full regulatory effect;
—a variance does not exempt the discharger from compliance with applicable technology or other water quality-based limits; and
—a variance does not affect effluent limitations for other dischargers.

With these safeguards in place, the principal difference between a variance and a downgrade of a designated use is that a variance is temporary. That is, when the variance expires, an affirmative showing would be needed to continue it, or the underlying standards are applicable. Because a variance is temporary, it actively supports the improved water quality goal, and it can, under appropriate circumstances serve as an environmentally preferable alternative to what otherwise might become a permanent change in a designated use.

Historically, the intent of the variance provision has been to: provide a mechanism by which permits can be written to meet a modified standard where discharger compliance with the underlying water quality standard is demonstrated to be infeasible within the meaning of § 131.10(g) at the present time (e.g., meeting the standard would cause substantial and widespread social and economic impact); encourage maintenance of original standards as goals rather than removing uses that may be ultimately attainable; and ensure the highest level of water quality achievable during the term of the variance.

EPA has approved State and Tribal use of variances when the individual variance is included in State or Tribal water quality standards, each variance is subject to the same public review as other changes in water quality standards, the State or Tribe demonstrates that meeting the standard is unattainable based on one or more of the grounds listed in 40 CFR 131.10(g) for removing a designated use, existing uses are protected, the variance secures the highest level of water quality attainable short of achieving the standard and the State or Tribe demonstrates that advanced treatment and alternative effluent control strategies have been considered (See 48 FR 51400, 51403 (Nov. 8, 1983); Water Quality Standards (WQS) Handbook at 5–12; Memorandum from EPA's Office of Water, ''Variances in Water Quality Standards,'' March 15, 1985; and Decision of the General Counsel No. 58, In Re Bethlehem Steel Corporation, March 29, 1977).

The Preamble to the 1983 water quality standards regulation revision suggested that substantial and widespread social and economic impact, the sixth element for use removal under § 131.10(g), is an important and appropriate test that, if met, could be used as the basis for granting a variance (see 48 *FR* 51403). Subsequently, on March 15, 1985, EPA issued further guidance on the conditions under which a variance might be granted. The 1985 EPA Office of Water guidance explained that it would be appropriate to grant short-term variances to individual dischargers based on any of the six factors for removing a designated use as listed at § 131.10(g). As variances represent a temporary downgrade in the water quality standards, EPA reasoned that more stringent treatment of variances than permanent downgrades would not be appropriate. In practice, however, the only factor that is commonly used to grant a discharger-specific variance is the economic test. The Office of Water guidance continued to interpret variances as being limited to individual dischargers.

In ''Guidance for State Implementation of Water Quality Standards for CWA Section 303(c)(2)(B)'' (December 1988; Notice of Availability published at 54 FR 346, January 5, 1989), EPA recommends that States and Tribes adopt a variance provision whenever adopting statewide or tribe-wide criteria for a large number of toxic pollutants for human health or aquatic life protection. The rationale behind this recommendation was to avoid unreasonable consequences from adopting State- or Reservation-wide criteria which could underestimate or overestimate the toxic potential of some pollutants in a specific water body.

The Water Quality Guidance for the Great Lakes System (Great Lakes Guidance) published March 1995 by EPA (56 FR 15366, March 23, 1995; 40 CFR section 132) contains provisions allowing for variances from water quality standards. Variances granted under the Great Lakes Guidance are pollutant-specific and point source-specific and are limited to five years or the term of the NPDES permit implementing the variance, whichever is less. Variances may be granted for any of the reasons listed at 40 CFR 131.10(g) for which a use downgrade may be considered. Like all revisions to State or Tribal water quality standards, EPA review and approval is required of any variance granted by a State or Tribe and variances may be renewed following the same procedure originally used for applying for a variance. Variances are also subject to review as part of a State's or Tribes triennial review of water quality standards. Multiple discharger variances (a variance that applies to multiple point sources discharging to the same water body) are also allowed under the Great Lakes Guidance. Variances granted under the Great Lakes Guidance provisions may not jeopardize the continued existence of any Federally listed threatened or endangered species. Further, under the Guidance, variances are not available for new or recommencing discharges. A recommencing discharge is a source that recommences discharge after terminating operations. (40 CFR 122.2).

The Great Lakes Guidance was developed in concert with many other provisions addressing designated uses, criteria, antidegradation and various implementation policies for the Great Lakes States and Tribes. Any evaluation of the level of protection afforded water quality under the Great Lakes Guidance variance procedures should be made in the context of the Great Lakes Guidance as a whole. Similarly, the water quality standards regulation is more than simply the sum of its parts. Any

approach to the implementation of water quality standards variances must be evaluated in the context of the entire regulation.

EPA is considering whether implementation of the variance provision has been a useful component of the water quality standards program, and the overall program for protection of water quality standards. In 1990, EPA conducted a survey of State variances and variance provisions (National Assessment of State Variance Procedures, Report, November 1990, Office of Water Regulations and Standards). This study showed that variances had been granted on a very limited basis. In fact, only 16 out of 57 States and Territories had granted variances and some of those had done so infrequently. EPA lacks detailed information on why variances are not being significantly utilized in most States and Tribes. EPA is interested in information regarding alternative mechanisms that are being used by States or Tribes in lieu of variances to provide necessary short term and temporary relief from applicable criteria, and how any alternative approaches address the feasibility of ultimately attaining the criteria associated with the underlying designated use.

EPA is considering whether it would be useful to include in the regulation more explicit language reflecting current EPA thinking and practice regarding variances. As explained above, in order to issue variances, States or Tribes must include variances as part of the State's or Tribe's water quality standards. EPA believes, however, that in some instances States may be misusing variances. For example, over the years, there have been instances where a State has improperly granted a ''variance'' from compliance with NPDES permit limits, failing to include these variances within the water quality standards themselves. There has also been some confusion regarding the necessity of formal adoption of individual variances into State and Tribal water quality standards and whether the public participation process associated with NPDES permit issuance sufficiently addresses those same needs for variance adoption. EPA is also considering whether to specify the degree to which individual dischargers must document the continued need for a variance before the variance can be renewed at each triennial review. EPA is considering whether the water quality standards regulation should provide more specific guidelines on the use and content of variance policies. EPA's current thinking is that the regulation may need to articulate certain aspects of variances more explicitly, including:

—explicit reference to the criteria listed in 40 CFR 131.10(g) as the criteria for granting a variance;
—explicit statement that the granting of a variance may not result in any loss or impairment of an existing use;
—explicit statement that before a variance can be granted, the applicant must provide documentation that treatment more advanced than that required by sections 303(c)(2)(A) and (B) of the CWA has been carefully considered, and that alternative effluent control strategies have been evaluated and reasonable progress is being made toward meeting the underlying or original standards;
—explicit statement requiring the highest level of water quality achievable under the relaxed, interim standard during the period of the variance.
—explicit statment that a variance shall not be granted if standards will be attained by implementing cost-effective and reasonable best management practices for nonpoint source control.

EPA believes that such a clarification of its policy regarding variances could serve to encourage proper use of variances by States and Tribes while at the same time reducing the possibility of inappropriate use.

ii. Temporary Standards. As indicated in the discussion on variances above, the 1985 EPA Office of Water guidance explained that it would be appropriate to grant short-term variances to individual dischargers based on *any* of the six factors for removing a designated use as listed at § 131.10(g). Of the six use removal factors, the first five address water quality and habitat features of the water body as a whole. These same factors are not, however, ideally suited to making decisions about the capabilities of individual dischargers. For example, it is not immediately clear how use removal factor five, ''physical conditions related to natural features of a water body * * * preclude attainment of a use'', could be applied to a decision about an individual discharger. On the other hand, the sixth factor, the substantial and widespread economic and social impact factor, is well suited to decisions about individual dischargers which explains why the economic hardship test has been historically applied in evaluating variances.

Several States have applied factors similar to the first five use removal factors in establishing variances for entire water body segments or portions of water body segments. These States sometimes refer to these as ''temporary standards'' or ''temporary modifications''. This has been done where the problems in a water body are significant and widespread, involving point and nonpoint sources of pollution and their impacts on water quality and habitat, that is waters significantly impaired by multiple sources and not just one or a few point sources. For example, where historic mining practices have severely impaired both water quality and habitat throughout a headwater basin, temporary standards have been used. Rather than downgrading these waters, the States have applied temporary standards with specific expiration dates for certain pollutants affected by the historic mining practices. In this way, the States have maintained designated uses and underlying criteria for other pollutants, while recognizing that existing ambient conditions for certain pollutants are not correctable in the short-term. In such cases, the temporary standards provide a basis for permit limits in the shorter-term. The temporary standards approach is then used by these States as the basis for remediation of damaged water resources because the underlying designated use and criteria to protect that use actively drive water quality improvements in the longer-term. EPA Regional Offices have approved the use of such temporary standards.

Temporary standards have been implemented to date with little specific Agency guidance on a water body approach to variances. EPA is considering whether the water quality standards regulation or guidance should specifically address temporary standards. EPA's current thinking is that if the regulation or Agency guidance were to specifically address temporary standards, such regulation or guidance would need to address certain relevant issues including: application criteria to be used in deciding which waters might qualify for temporary standards; a way of identifying the existing, impaired water quality conditions; a mechanism for specifying the water quality needed to fully attain the anticipated uses; and a plan and driving mechanism aimed at achieving needed water quality and habitat improvements to fully support compliance with the designated uses.

Where EPA has provided guidance to individual States on use of State temporary standards provisions, EPA has advised that any temporary standard should:

—be granted only where there is a demonstration that one of the use removal factors (40 CFR 131.10(g)(1) through (6) has been satisfied;

—be granted for a specific water body or portion of a specific water body as defined in State standards;
—identify and justify the numerical criteria that will apply during the existence of the temporary standard and identify a ''remediation plan'' aimed at compliance with the underlying designated uses and criteria;
—be established as close to the underlying numerical criteria as is possible;
—be reviewed every three years, at a minimum, and extended only where the conditions for granting the temporary standard still apply;
—be in effect only for the specified term of the temporary standard (or extension thereof), and upon expiration of the temporary standard, the underlying numerical criteria have full regulatory effect;
—not exempt any discharge to the water body from compliance with applicable technology or water quality-based limits (based on the temporary standards) or best management practices;
—not apply to any new discharger to the water body; and
—protect existing uses.

EPA is considering whether the use of temporary standards represents a viable alternative to use refinement or removal. EPA is also considering whether the regulation or guidance should explicitly address use of temporary standards, including specific limitations on the use of temporary standards like those listed above.

iii. Ambient-based Criteria. On a limited basis, States have developed and EPA has approved ''ambient-based criteria.'' These ambient-based criteria have been developed for specific water bodies and pollutants where such criteria are shown to protect the designated use and the existing use. EPA believes that ambient-based criteria can be preferable to a ''downgrade'' of a use because the underlying designated use is retained and because they may be limited to only a small subset of pollutants.

EPA has issued a policy memorandum concerning one type of ambient-based criteria, site-specific criteria for aquatic life protection that are based on natural conditions. (See Memorandum from Tudor T. Davies, Director Office of Science and Technology, Subject: Establishing Site-Specific Aquatic Life Criteria Equal to Natural Background, November 5, 1997.) This policy states that States and Tribes may establish site-specific aquatic life criteria equal to natural background conditions, but such criteria must be scientifically defensible. Additionally, the State's or Tribe's water quality standards should contain or provide specific authority for site-specific criteria based on natural background. States and Tribes should also identify procedures for determining natural background. EPA's current policy also states that the State or Tribal procedure for determining natural background needs to be specific enough to establish natural background concentration accurately and reproducibly. States and Tribes should also provide for public notice and comment on the provision, the procedure and the site-specific application of the procedure. The States or Tribes will also need to document the resulting site-specific criteria in its water quality standards, including specifying the water body segment the site-specific criterion applies to. This can be accomplished through adopting the site-specific criteria into the State and Tribal water quality standards, or, alternatively by appending the site-specific criteria to the water quality standards.

In addition, a second approach that some States have used and EPA has approved is where the State or Tribe could have met the test for downgrading a use under 40 CFR 131.10(g)(3) *i.e.*, ''Human caused conditions or sources of pollution prevent the attainment of the use and cannot be remedied or would cause more environmental damage to correct than to leave in place'', but instead of downgrading the use, the State or Tribe established certain criteria based on ambient conditions where those ambient conditions were shown to be irreversible. In addition to assuring that the existing use is protected, EPA is interested in assuring that where the ambient concentration of a pollutant cannot be improved, *i.e.*, it is irreversible, that such condition be maintained and not made worse. When this occurs, EPA believes that for other pollutants in the same water body for which applicable criteria are being or can be met, those criteria should remain in place and not be made less protective via a use downgrade. EPA's current thinking is that the ambient-based criteria need to be the best attainable. In addition, EPA's current thinking is that in order to establish ambient-based criteria, the State or Tribe should conduct an analysis equivalent to a use attainability analysis for a downgrade that should include a thorough description of the biota that will be protected via applicable water quality criteria (both the unchanged pre-existing criteria and the ambient-based criteria).

EPA is interested in hearing comments regarding these ambient-based criteria mechanisms, and specifically whether the regulation should discuss these mechanisms more specifically, and whether the regulation should be more explicit about the biological evaluation necessary to describe the aquatic life use being protected. EPA is also interested in comments on whether the other relief mechanisms based on the § 131.10(g) reasons, such as variances and temporary standards, should also require criteria which reflect the best attainable conditions.

Request for Comments on Alternatives to Downgrading a Designated Use

EPA seeks comment on the following questions:

1. EPA requests comment on whether variances, temporary standards and/or ambient-based criteria can under certain circumstances offer an environmentally preferable alternative to refinement or removal (downgrade) of the designated use? Under what circumstances?

2. Does the current water quality standards regulation or Agency guidance or policy discourage persons from seeking variances and/or discourage States and Tribes from granting variances (including temporary standards)? What components of the procedures are most problematic?

3. Reflecting EPA's current interpretation of the regulation, should the regulation make explicit that individual variances and temporary standards must be documented in a State's or Tribe's water quality standards before implementation as part of NPDES permits?

4. Reflecting EPA's current interpretation of the CWA and the regulation, should the regulation contain express reference to the factors listed in 40 CFR 131.10(g) as the criteria under which a variance (including temporary standards) from water quality standards will be allowed? Should any of these factors be deleted? Should any new factors be added?

5. Reflecting EPA's current interpretation of the CWA and the regulation regarding existing uses, should the variance portion of the regulation at 40 CFR 131.13 underscore that the granting of a variance must not result in any loss or impairment of an existing use, for example by cross-referencing the requirement at 40 CFR 131.12(a)(1) that existing uses must be protected?

6. To reflect current practice and EPA guidance, should the regulation be

amended to require documentation by either the applicant or the State or Tribe demonstrating that treatment more advanced than that required by sections 303(c)(2)(A) and (B) of the CWA has been carefully considered, and that alternative effluent control strategies have been evaluated and reasonable progress is being made toward meeting the underlying or original standards?

7. Should the regulation require that States and Tribes document in their water quality standards the criteria that are applicable to the water body or segment thereof during the period of a variance or temporary standards?

8. Should the regulation discuss ambient-based criteria mechanisms more specifically?

9. Should the regulation be more explicit about the biological evaluation necessary to describe the aquatic life use being protected where ambient-based criteria are used?

10. EPA is also interested in comments on whether the other relief mechanisms based on the § 131.10(g) reasons, such as variances and temporary standards, should in the regulation, expressly be required to require criteria which reflect the best attainable conditions?

11. Do the alternatives to use removal help address pulsed or intermittent impacts, such as those from urban and rural runoff?

C. Criteria

The following section discusses water quality criteria in the water quality standards programs. EPA is considering the implementation of and effectiveness of different types of criteria and on the desirability of changes to the water quality standards regulation as it pertains to criteria. The scope of the criteria section includes all Clean Water Act criteria for which EPA has issued national criteria guidance, and several types of criteria for which there is no national criteria guidance but where criteria guidance and policy are being contemplated.

1. Background

Water quality criteria are levels of individual pollutants or water quality characteristics, or descriptions of conditions of a water body that, if met, will generally protect the designated use of the water. EPA, under section 304(a) of the Act, periodically publishes recommendations (guidance) for use by States and Tribes to set water quality criteria. Water quality criteria are developed to protect aquatic life and human health, and in some cases wildlife, from the deleterious effects of pollutants and other effects of pollution. There are three principal categories of water quality criteria: criteria to protect human health, criteria to protect aquatic life, and criteria to protect wildlife. Within these broad categories, there are different types of criteria, for example within the human health category, there are chemical-specific and microbiological criteria. Within the aquatic life category, there are chemical-specific criteria, toxicity criteria, biological criteria, sediment criteria and physical criteria such as habitat and flow balance. These criteria may be expressed in either narrative or numeric forms. Many of these criteria may be developed to apply generally, or they may be developed to apply to site-specific situations. The CWA section 303(a)–(c) requires all States, and any Tribe that has water quality program authority, to evaluate the need for water quality criteria to protect a designated use and then adopt water quality criteria (either EPA's or its own) sufficient to protect uses designated for State or Tribal waters. Economic and technological factors (e.g., the ability of analytical techniques to detect the pollutant and treatment cost considerations) may not be used to justify adoption of criteria that do not protect the designated use.

Narrative criteria are descriptions of conditions necessary for the water body to attain its designated use. Often expressed as ''free from'' certain characteristics, narrative criteria can be the basis for controlling nuisance conditions, e.g. floating debris or objectionable deposits. Narrative criteria are often the basis for limiting toxicity in discharges. States and Tribes establish narrative criteria where numeric criteria cannot be established or to supplement numeric criteria under 40 CFR 131.11(b)(2). When a water body is classified for more than one use, criteria necessary to protect the most sensitive use must be applied to the water body. 40 CFR 131.11(a).

CWA section 304(a) directs EPA to develop criteria guidance. These criteria recommendations assist States and Tribes in developing water quality standards. The AWQC are published pursuant to Section 304(a)(1) of the CWA which states:

> The Administrator * * * shall develop and publish * * * (and from time to time thereafter revise) criteria for water quality accurately reflecting the latest scientific knowledge (A) on the kind and extent of all identifiable effects on health and welfare including, but not limited to, plankton, fish, shellfish, wildlife, plant life, shorelines, beaches, esthetics, and recreation which may be expected from the presence of pollutants in any body of water, including ground water; (B) on the concentration and dispersal of pollutants, or their byproducts, through biological, physical, and chemical processes; and (C) on the effects of pollutants on the biological community diversity, productivity, and stability, including information on the factors affecting rates of eutrophication and rates of organic and inorganic sedimentation for varying types of receiving waters.

Pursuant to section 304(a), EPA has developed to date, aquatic life criteria guidance for 31 chemicals and human health criteria guidance for 100 chemicals. For the most part, States and Tribes have found such EPA criteria guidance useful in setting standards to protect designated uses. Since 1980, most States and Tribes have adopted at least some of the criteria guidance published by EPA pursuant to CWA section 304(a). However, EPA's resources available to develop criteria guidance are limited. Thus, there are cases where the scientific information or data necessary to develop criteria exist but EPA has been unable to establish section 304(a) criteria guidance.

States and Tribes may establish numeric criteria using CWA section 304(a) criteria guidance, section 304(a) criteria guidance modified to reflect site-specific conditions, or other scientifically defensible methods. 40 CFR 131.11(b)(1). There are situations where EPA relies on the 304(a) criteria guidance when promulgating replacement standards for a State or Tribe pursuant to section 303(c). EPA promulgation of 304(a) criteria for States or Tribes is discussed in more detail below.

Numeric criteria are values expressed as levels, concentrations, toxicity units, or other numbers deemed necessary to protect designated uses. Water quality criteria developed under Section 304(a) are based solely on data and scientific judgments on the relationship between pollutant concentrations and environmental and human health effects. EPA criteria under section 304(a) do not reflect consideration of economic impacts or the technological feasibility of meeting the chemical concentrations in ambient water. As discussed below, 304(a) criteria are used by States and Tribes to establish water quality standards, and ultimately provide a basis for controlling discharges or releases of pollutants.

Numeric criteria are important because they provide a proven effective basis for implementation of the CWA. For example, these criteria often form the basis for NPDES water quality-based permit limits for point source dischargers and for establishing TMDLs for a water body as a whole. Numeric criteria can also be useful in assessing

and managing nonpoint source pollution problems.

The Act uses the term ''criteria'' in two separate ways. In section 303(c), the term is part of the definition of a water quality standard. That is, a water quality standard is comprised of designated uses, and the criteria necessary to protect those uses. Thus, States and Tribes are required to adopt regulations that contain legally enforceable criteria. However, in section 304(a) the term ''criteria'' is used in the scientific sense. That is, under section 304(a), EPA develops scientifically sound criteria guidance which may form the basis for State, Tribal or Federal adoption of water quality standards pursuant to section 303(c). Thus, two distinct purposes are served by the section 304(a) criteria. The first is as guidance to the States and Tribes in the development and adoption of water quality criteria that will protect designated uses, and the second is as the basis for promulgation of legally enforceable water quality criteria by the State or Tribe, or via a superseding Federal rule when such action is necessary.

As with all science, new information leads to new insights concerning pollutant impacts on water quality. This ongoing evolution affects two important and inter-related responsibilities of the Agency, which are carried out concurrently. First, from time to time EPA revises the 304(a) water quality criteria to reflect the latest data and advances in criteria science. EPA compiles the current water quality criteria guidance from time to time in a series of guidance documents: the Green Book in 1968, the Blue Book in 1972, the Red Book in 1976, and the Gold Book in 1986. The second responsibility pertains to the requirements of section 303(c).

As part of the water quality standards triennial review process defined in section 303(c)(1), the States and Tribes are responsible for maintaining and revising water quality standards. Section 303(c)(1) requires States and Tribes to review, and modify if appropriate, their water quality standards at least once every three years. If EPA determines that a new or revised standard is not consistent with the requirements of the CWA, or EPA determines that a revised standard is necessary to meet the requirements of the Act, Section 303(c)(4) authorizes EPA to promulgate replacement water quality standards. From time to time EPA has chosen to undertake such promulgations. In doing so, EPA considers the most current available scientific information, such as toxicity data and exposure assumptions.

With a number of Federal promulgations of water quality criteria under section 303(c)(4) occurring over time, or the publication of a new or revised 304(a) criteria guidance document, the criteria value(s) in an earlier Federal action may differ from the value(s) in a subsequent Federal action. This has led to some confusion among the public with regard to what EPA's current section 304(a) water quality criteria may be for a given chemical at any given time, and, what values EPA would promulgate for a State or Tribe under section 303(c). Currently, EPA interprets the most recent Federal action, whether taken pursuant to 303(c) or 304(a), as establishing the current section 304(a) criteria guidance. When EPA determines that a Federal rule is necessary to correct deficiencies in State criteria, EPA looks to the most recent criteria science, as articulated in either section 304(a) criteria guidance or EPA's most recent statement contained in a proposed or final section 303(c) rule.

To date, the most recent Federal recalculation of section 304(a) criteria occurred in the proposed California Toxics Rule (CTR)(62 FR 42160), July 30, 1997. The proposed CTR was undertaken pursuant to CWA section 303(c)(2)(B). In the Water Quality Act of 1987, Congress increased the emphasis on numeric criteria for toxic pollutants by enacting section 303(c)(2)(B). This section requires all States and any Tribe with water quality standards authority to adopt ambient water quality criteria for toxics (priority pollutants) for which EPA has published criteria under section 304(a), and for which the discharge or presence could reasonably be expected to interfere with the designated use adopted by the State or Tribe. In adopting such criteria, States and Tribes must establish numerical values based on: (1) 304(a) criteria; (2) 304(a) criteria modified to reflect site-specific conditions; or, (3) other scientifically defensible methods.

Again, EPA views the criteria program as constantly evolving. Whenever new or revised criteria are published, whether under 304(a) or a rule under 303(c), that action establishes the Agency's most current section 304(a) criteria guidance.

Whenever a State or Tribe revises its water quality criteria EPA compares the State criteria values and the basis of their derivation to the criteria contained in the most recent Federal action (either 303(c)(4) rule making or 304(a) criteria guidance publication). Thus, there may be cases where the applicable policies and science have evolved such that EPA would be comparing State or Tribe adopted criteria values to Federal criteria values other than those in older rules or criteria guidance to determine whether to approve the State's or Tribes's criteria. This approach is necessary to encourage State and Tribal adoption of the most recent section 304(a) criteria.

2. Ambient Water Quality Criteria to Protect Aquatic Life

Aquatic life criteria are scientifically-derived values, derived by States, Tribes, or EPA, to protect aquatic life from the deleterious effects of pollutants in ambient water. States and Tribes may use EPA's section 304(a) criteria guidance in developing such criteria. When developing numeric aquatic life criteria, States and Tribes usually express two concentrations; one that protects against acute effects (effects from short term exposure) and one that protects against chronic effects (effects from long term exposure). The short-term concentration is expressed as a Criterion Maximum Concentration (CMC) and is the highest ambient concentration of a toxicant to which aquatic organisms may be exposed for a short time period without causing an unacceptable effect. The long-term concentration is expressed as a Criterion Continuous Concentration (CCC) and is the highest ambient concentration of a toxicant to which aquatic organisms can be continuously exposed without causing an unacceptable effect.

Water quality criteria to protect aquatic life consist of three components—magnitude, duration and frequency. Magnitude refers to the acceptable concentration of a pollutant. Duration is the period of time (averaging period) over which the ambient concentration is averaged for comparison with criteria concentrations. Frequency is how often the criteria can be exceeded to allow the aquatic community sufficient time to recover from excursions of aquatic life criteria and to thrive after recovery.

The numerical aquatic life criteria are expressed as short-term and long-term concentrations in order that the criteria more accurately reflect toxicological and practical realities. The combination of a Criterion Maximum Concentration (CMC), over a one-hour acute duration (a short-term average acute limit), and a Criterion Continuous Concentration (CCC), over a four-day chronic duration (a long-term average chronic limit) provide protection of aquatic life and its uses. Recommended averaging periods are kept relatively short because excursions higher than the average can

kill or cause substantial damage in short periods.

The frequency limitations specify that both the acute and chronic criteria may be exceeded once in a three-year period on the average. The recommended once in a three-year period coupled with the 4-day chronic averaging period used for the CCC approximately corresponds to the historically used criterion concentrations that occurs in a once-in-ten year seven-day-average low flow (7Q10). The once-in-three-year period coupled with the one-hour acute averaging period used for the CMC approximately corresponds to the historically used criterion concentration that occurs in a once-in-ten year one-day-average low flow (1Q10)

The method by which EPA derives criteria is updated from time to time, to incorporate advances in the science. To overcome the limitations in the previous approaches to duration and frequency, a new risk assessment methodology is being developed. EPA expects that the new risk assessment methodology will include an approach that will better handle variable concentrations by use of a kinetic-based toxicity model coupled with a population response model. A kinetic-based toxicity model considers the speed at which effects appear in different individuals and at different concentrations. The kinetic-based model allows prediction of the toxicity of any series of time-variable concentrations. It can predict how often effects would occur, and what fraction of individuals in the species would be affected.

To weigh the full impact that a particular time series of concentrations would have on the exposed population of a species, an additional factor is being considered: how long it takes to replace those individuals lost due to the toxic effects. Consideration of this involves the use of a population model indicating rates of recovery of different taxonomic groups to stresses. The intent of this part of the derivation is to allow the toxic impact to be portrayed as the overall average reduction in the number of individuals in a species, both during lethal or sublethal periods and during recovery periods, accounting for both partial lethality and partial recovery.

Request for public comment on Aquatic Life Criteria

EPA requests comments on the following question:

1. Prior to completion of all of the aquatic life methodology revisions, should EPA use the tools that have thus far been developed (the kinetic model of individual organism response to derive the appropriate duration/averaging period of the criterion or to evaluate mixing zone alternatives and the population effects model to derive the allowable frequency of excursion above the criterion) to re-examine and possibly revise its recommendations on the duration and frequency of criteria excursions?

3. Site-Specific Criteria

EPA also provides guidance on how States and Tribes may develop site-specific numeric aquatic life criteria that are either more or less stringent than the criteria adopted by the State or Tribe and that would normally apply to a water body. Currently, national guidance only has recommendations and methods for establishing site-specific water quality criteria for aquatic life but guidance is under development for deriving site-specific sediment quality criteria as well.

The regulation currently specifies that States and Tribes may adopt numeric criteria based on published CWA section 304(a) guidance, section 304(a) guidance modified to reflect site-specific conditions, or other scientifically defensible methods. 40 CFR 131.11(b). EPA recognizes that States and Tribes may want to develop numeric criteria that vary from CWA section 304(a) guidance for specific waters (e.g., where chemical and physical characteristics of local waters alter the bioavailability and/or toxicity of a pollutant; or when the species or community actually present or desired may be more or less sensitive than the species or community represented by the criteria database.) In such situations, a site-specific criterion may be appropriate. EPA has developed and continues to develop guidance to assist States and Tribes in the development of site-specific criteria. (See *Water Quality Standards Handbook, Second Edition,* EPA 823–B–94–005a, August, 1994, pp 3–38 through 3–45 and documents cited therein.)

Site-specific criteria are allowed by regulation and must be submitted to EPA for review and approval, as are any changes to a WQS. The regulation at 40 CFR 131.11(b)(1) specifically provides States and authorized Tribes with the opportunity to adopt water quality criteria that are ''* * * modified to reflect site specific conditions.'' Under 40 CFR 131.5(a)(2), EPA reviews State and Tribal standards to determine ''whether a State has adopted criteria to protect the designated uses'' and whether such criteria are scientifically defensible (40 CFR 131.11(b)).

Existing guidance and practice are that EPA will approve site-specific criteria developed on the basis of sound scientific rationales.

Currently, EPA has specified three scientifically defensible procedures that States and Tribes may follow in deriving site-specific aquatic life criteria. These are the Recalculation Procedure, the Water-Effect Ratio Procedure and the Resident Species Procedure. These procedures can be found in the Water *Quality Standards Handbook* (USEPA, 1994). States may also develop other procedures for deriving such criteria as long as they are scientifically defensible. EPA also recognizes there may be naturally occurring concentrations of pollutants that may exceed the national criteria guidance published under Section 304(a) of the Clean Water Act.

The Great Lakes Guidance contains a procedure for developing site-specific criteria for protection of wildlife. While the Great Lakes States and Tribes must adopt a procedure consistent with that procedure, other States and Tribes may derive site-specific criteria using the procedure in the Great Lakes Guidance and such criteria can be more or less stringent than the applicable wildlife criteria where scientifically defensible. This is most likely to be in cases where a site-specific Bioaccumulation Factor (BAF) has been developed.

The Great Lakes Guidance also provides a procedure for modifying human health criteria on a site-specific basis based on differences in fish consumption or BAF. With regard to aquatic life criteria, if a State or Tribe could demonstrate that physical or hydrological conditions preclude aquatic life from remaining at a site for a period of time in which acute or chronic effects may occur, less stringent site-specific aquatic life criteria are allowed.

EPA's current thinking is that States and Tribes should identify in their water quality standards the methods they intend to use for site-specific criteria development and generally the circumstances under which such criteria may be developed. Additional discussion and request for comment on emerging rationales and methods for site-specific criteria, beyond that described and referenced above, is contained in section B.4.d of this notice, entitled ''Alternatives to Removal of the Designated Use.''

Request for Comments on Site-Specific Criteria

EPA seeks public comment on the following questions:

1. Should the regulation be modified to require States and Tribes to specifically authorize and identify the procedures for developing site-specific water quality criteria? Would additional EPA guidance be necessary?

2. Should the regulation or EPA guidance specify the circumstances under which site-specific criteria are necessary?

3. Does EPA need to develop guidance, policy, or clarify the regulation regarding site-specific criteria based on ambient conditions?

4. Should EPA explore broadening the concept of site-specific criteria to include watershed-specific or ecosystem-specific criteria perhaps in conjunction with a refined use designation? If so, what type of additional guidance or policy is necessary to fully explain these concepts and are any changes to the regulation needed to enable and/or facilitate use of watershed or ecosystem-specific criteria?

4. Narrative Water Quality Criteria

Narrative criteria can be an effective tool for controlling the discharge of pollutants when numeric criteria are not available. Narrative criteria, which have become known as ''free froms'', were first developed in 1968 and continue to be used in State and Tribal water quality standards. EPA guidance explains that these ''free froms'' apply to all waters of the United States at all flow conditions (including ephemeral and intermittent streams) (see *Water Quality Standards Handbook: Second Edition* (EPA–823-B–94–006, August 1994). Narrative 'free from' criteria guidance indicates that all waters be free from substances, for example, that (a) cause toxicity to aquatic life or human health, (b) settle to form objectionable deposits, (c) float as debris, oil, scum and other materials in concentrations that form nuisances, (d) produce objectionable color, odor, taste or turbidity, or (e) produce undesirable aquatic life or result in the dominance of nuisance species.

The toxic ''free froms'' include protection from both chronic and acute toxicity and include all pollutants which cause toxic effects, including but not limited to those listed under Section 307(a) if necessary to protect the designated use. All States have adopted narrative water quality criteria pursuant to section 303(c). See 48 FR 51400–51402, November 8, 1983. EPA guidance interprets these ''free froms,'' as with all criteria, to apply to the ambient water quality, not distinguishing between point sources and nonpoint sources of toxicity.

Currently, 40 CFR 131.11(a)(2) of the water quality standards regulation requires States and Tribes that have established narrative criteria for toxic pollutants to identify the methods by which the State or Tribe intends to regulate point source discharges of toxic pollutants based on such narrative criteria. EPA regulations at 40 CFR 122.44(d)(1)(v) and (vi) require narrative criteria to be implemented through NPDES permit limits. More specifically, when the permitting authority determines that a discharge causes, has the reasonable potential to cause, or contributes to an excursion above a narrative criterion, the permit must, under most circumstances, contain effluent limits for whole effluent toxicity. In addition, where the permitting authority determines that a specific pollutant for which the State or Tribe has not adopted a chemical criterion is in a discharge in an amount that causes, has the reasonable potential to cause, or contributes to an excursion above a narrative criterion, the permit must contain effluent limits for that pollutant that are based on an interpretation of the State's or Tribe's narrative criterion. The regulation provides three options for interpreting the narrative criterion, and in addition, EPA has provided guidance on this requirement in both the Technical Support Document for Water Quality-Based Toxics Control and the Water Quality Standards Handbook (both Cited above). The guidance advises States and Tribes to develop implementation procedures that explain the application and integration of all mechanisms used by the State or Tribe to ensure that narrative criteria are attained (e.g., chemical-specific requirements, whole effluent toxicity requirements, and biological criteria, where biological criteria programs have been developed by the State or Tribe). The rationale for this approach is that comprehensive written procedures facilitate implementation decisions, reduce inconsistencies that can result in different requirements for similar situations, and promote effective and sensible application of narrative toxics criteria.

Although all States and Tribes have some type of customary practice for implementing narrative criteria, and many States and Tribes have developed implementation policies on narrowly defined topics (e.g., to explain application of whole effluent toxicity testing requirements), very few, if any, States and Tribes have developed comprehensive written implementation procedures that address all of the narrative toxics criteria implementation issues. The result may be inconsistent application of narrative toxics requirements within those States and Tribes that have not developed such procedures. In addition, the lack of documented methods makes it difficult for EPA to evaluate whether aquatic life and or human health is being adequately protected.

Request for Comments on Narrative Criteria

EPA seeks public comment on the following questions:

1. Should the regulation require adoption of ''free froms'' and similar criteria as being the minimum floor allowable under the Clean Water Act.

2. Reflecting current practice, should the regulation specify that States and Tribes are required to adopt narrative criteria for all waters?

3. At this time, EPA has limited information about how States and Tribes are implementing narrative criteria with regard to nonpoint source activities. How can narrative criteria best be implemented in the nonpoint source context and what might EPA do, including modifying the regulation, to enhance or further the use of narrative criteria?

4. Does the existing requirement for States and Tribes to identify methods for implementing narrative toxics criteria need to be clarified, and if so, should EPA clarify the requirement with additional guidance, or with revisions to the regulation?

5. What minimum elements should be included in an implementation method for narrative toxics criteria? Should implementation methods describe application and integration of all of the various mechanisms used to regulate point sources, or should such methods focus on only certain aspects of toxics control (e.g., chemical-specific limits, whole effluent toxicity limits)?

6. The current regulation requires the State or Tribe to identify the method by which the State or Tribe intends to regulate point source discharges of toxic pollutants on water quality limited segments based on such narrative criteria.

Should this narrative criteria translation method apply only to point source discharges of toxic pollutants on water quality limited segments or to both point and non-point sources?

7. Should the regulation more explicitly require implementation procedures for narrative criteria other than toxics criteria? Should the regulation include minimum requirements for these implementation procedures?

5. State or Tribe Derived Criteria

States and Tribes may develop their own criteria although the water quality standards regulation 40 CFR 131.11 provides that where such criteria are less stringent than 304(a) criteria

guidance, the State or Tribe must demonstrate the criteria are scientifically defensible. Despite this available flexibility, and for a variety of reasons, most States and Tribes are reluctant to derive their own criteria. EPA is evaluating whether either changes to the water quality standards regulation or development of additional guidance would assist State or Tribal efforts to develop protective criteria. For example, for many pollutants where EPA criteria guidance has not been issued, information is available which would be useful in determining a protective water quality criterion. Sources of such information include relevant scientific literature, EPA's Integrated Risk Information System (IRIS), EPA's Aquatic Toxicity Database (AQUIRE), a database of high quality aquatic life toxicity data (under development), and other sources.

Request for Comment on State or Tribal Derived Criteria

EPA requests comment on the following question:

1. Would changes to the water quality standards regulation or development of additional guidance assist State or Tribal efforts to derive criteria? What changes or guidance would be most helpful?

6. Water Quality Criteria for Priority Pollutants

EPA has not revised the water quality standards regulation to incorporate CWA section 303(c)(2)(B) which was added to the CWA in 1987. EPA has, however, issued guidance on how States and Tribes may comply with section 303(c)(2)(B). The ''Guidance for State Implementation of Water Quality Standards for CWA Section 303(c)(2)(B):December, 1988'' provides three options for compliance:

Option 1 States and Tribes may adopt Statewide or Reservation-wide numeric chemical-specific criteria for all priority toxic pollutants where EPA has issued CWA section 304(a) criteria guidance.

Option 2 States and Tribes may adopt numeric chemical-specific criteria for those stream segments where the State or Tribe determines that the priority toxic pollutants for which EPA has issued CWA section 304(a) criteria guidance are present and can reasonably be expected to interfere with designated uses.

Option 3 States or Tribes may adopt a chemical-specific translator procedure that can be used to develop numeric criteria as needed.

The phrase ''translator procedure'' in this context means a method for translating a State's or Tribe's narrative toxics criterion into chemical-specific, numeric criteria sufficient to comply with CWA section 303(c)(2)(B). As discussed in EPA guidance (''Guidance for State Implementation of Water Quality Standards for CWA Section 303(c)(2)(B),'' December 1988, Notice of Availability at 54 FR 346, January 5, 1989), such translator procedures generally identify the equations, protocols, and data sources that are used to translate narrative criteria into derived chemical-specific criteria. Such translator procedures are different from the narrative criteria implementation procedures required in 40 CFR 131.11(a)(2) of the water quality standards regulation in that such implementation procedures must be adopted into the State's or Tribe's regulations and generally describe all mechanisms that are used and integrated to attain narrative criteria, including chemical-specific, whole effluent toxicity, and biological methods (see the discussion of narrative criteria implementation procedures in sub-section (c)(6) above). EPA believes that revisions to the water quality standards regulation to incorporate the CWA section 303(c)(2)(B) requirements would enhance public understanding of EPA's implementation of the provision.

EPA's guidance on CWA section 303(c)(2)(B) established a presumption that any information indicating that such pollutants are discharged or present in surface waters (now or in the future) may be considered sufficient justification to require adoption or derivation of numeric criteria. The guidance made clear that the requirement to adopt (or derive) criteria applies not just to pollutants that are already affecting surface waters, but also to pollutants that have the potential to affect surface waters in the future. The rationale for this approach is that it is important to have numeric criteria applied to waters where current or future activities may result in sources of priority toxics that warrant regulatory controls or other pollution abatement or assessment activities. This interpretation of section 303(c)(2)(B) is now reflected in EPA guidance included in the *Technical Support Document (TSD) for Water Quality-Based Toxics Control* (TSD) and the *Water Quality Standards Handbook* (see page 30 in the TSD).

In implementing CWA section 303(c)(2)(B), many States and Tribes have adopted statewide or reservation-wide criteria for all priority toxics where EPA has issued CWA section 304(a) criteria guidance. Taking this approach eliminates the need to determine whether a ''reasonable expectation'' for use interference exists on a water body-by-water body basis, and thus greatly simplifies the process for establishing numeric criteria for priority toxics. In other States and Tribes, however, broad application of numeric criteria for priority toxics has not occurred, and the ''reasonable expectation'' question has been a significant implementation issue. EPA is considering whether its existing guidance on this issue is adequate to support equitable decisions nationally.

Another issue stemming from CWA section 303(c)(2)(B) implementation concerns the State or Tribe option to develop a ''translator procedure'' to achieve compliance. In EPA's CWA section 303(c)(2)(B) guidance, this approach was described as Option 3. The guidance intended to be used are the 1980 Human Health Guidelines and 1985 Aquatic Life Guidelines. All of which have been both peer reviewed and publicly reviewed and thus meet the requirements of ''scientific defensibility'' under 40 CFR 131.11.

Although EPA believes that adoption of such chemical-specific translator procedures potentially provide a State or Tribe with a useful means of establishing criteria, there are several issues associated with the use of such procedures. For example:

(1) It may be difficult for the public to stay abreast of the current applicable criteria where a State or Tribe does not routinely publish an updated list of State or Tribe criteria and provide wide distribution.

(2) Public participation may occur primarily on the details of the procedure itself, rather than the pollutant-specific criteria resulting from application of the procedure.

(3) Without requirements to submit to EPA for review and approval the individual criteria generated using the translator procedure, there could be a tendency to not include such criteria in the State's or Tribe's water quality standards at the time they are generated.

A third issue that arises from State and Tribal efforts to implement CWA section 303(c)(2)(B) concerns the provision for priority toxic pollutants that are not the subject of CWA section 304(a) criteria guidance. Where such numeric criteria guidance is not available, and where necessary to protect the designated uses, CWA section 303(c)(2)(B) provides that when a State or Tribe (1) reviews Water Quality Standards or (2) revises or adopts new standards pursuant to this paragraph, States and Tribes are to adopt criteria based on biological monitoring or assessment methods.

When adopting criteria based on biological monitoring or assessment methods, States and Tribes currently

have considerable latitude to devise an approach to satisfy the requirement. For example, States and Tribes may establish ambient criteria for the parameter toxicity. Alternatively, States and Tribes could adopt narrative biological criteria. Clearly, a variety of approaches, representing a range of resource commitments, may be used to satisfy this requirement. All of these approaches must meet the test of ''scientific defensibility'' and be consistent with the goals of the CWA.

Request for Comments on Water Quality Criteria for Priority Pollutants

EPA seeks public comment on the following questions:

1. With regard to compliance with section CWA section 303(c)(2)(B), would it be better to include only a general requirement, such as one which repeats the language in the statute itself, or should the regulation reflect EPA's interpretation of the options to achieve compliance with the provision?

2. Have problems or issues arisen in the implementation of CWA section 303(c)(2)(B) that may need to be addressed by changes in the regulation or revised EPA guidance?

3. What factors should be considered in determining whether a ''reasonable expectation'' for use interference exists? How has the ''reasonable expectation'' threshold decision been interpreted and addressed by the States or Tribes? Does EPA need to clarify when a ''reasonable expectation'' for use interference exists, and if so, should the Agency clarify the requirement by issuing additional guidance, by issuing regulatory requirements, or a combination of the two approaches?

4. Where a State or Tribe adopts a chemical-specific translator procedure for derivation of numeric criteria, what process should the State or Tribe follow to ensure that notice of State derived criteria is provided to the public?

5. Should EPA require States or Tribes using translator procedures to publish an updated list of criteria for all water bodies?

6. Should EPA revise the regulation to explicitly require that, where a translator procedure is used to derive criteria, public participation is required for each individual criterion, even where an opportunity for public participation was previously provided when the procedure itself was adopted?

7. Should submission of each criterion derived using translator mechanisms for review and approval or disapproval be a requirement, even where EPA previously reviewed and approved the procedure itself? If so, should implementation of derived criteria (e.g., in NPDES permit renewal and development) proceed even where EPA has not yet issued an approval/disapproval decision?

8. Does this statutory provision need to be further clarified and interpreted by the Agency? Should changes to the water quality standards regulation or Agency guidance be pursued?

7. Criteria for Non-Priority Pollutants with Toxic Effects

Over the years, an issue which has periodically arisen, particularly for non-priority pollutants, has been the proper approach to identifying the circumstances for which adoption of numeric criteria is required. Currently, the regulation does not elaborate on how this question should be addressed; it only provides the general mandate to adopt criteria ''sufficient to protect uses.''

EPA's current thinking is that the regulation should probably be modified to further specify the circumstances under which numeric criteria for non-priority pollutants must be adopted. One approach would be to model the requirements for non-priority pollutants after the requirements included in CWA section 303(c)(2)(B) for priority pollutants. That is, for non-priority pollutants where EPA has issued criteria guidance, the regulation could require adoption of numeric chemical-specific criteria where the discharge or presence of the pollutant can reasonably be expected to interfere with designated uses. EPA could define ''reasonable expectation'' broadly to support adoption of criteria before new pollution sources are proposed, or more narrowly for non-priority pollutants, limiting such a requirement for adoption of criteria to only those water bodies and pollutants where uses are already being interfered with, or where pollution sources now exist or are certain to occur in the near future. Establishing Such a requirement would encourage development of criteria for commonly-discharged and highly toxic pollutants like ammonia and chlorine that are currently not considered priority pollutants under section 307(a) of the CWA.

Strengthening the requirements for adoption of criteria for non-priority pollutants would address a concern of some that many of the CWA section 307(a) priority pollutants are no longer an appropriate focal point for State, Tribe and EPA toxic control efforts (e.g., some of the pesticides included on that list are no longer in widespread use).

Request for Comments on Criteria for Non-Priority Pollutants With Toxic Effects

EPA seeks public comment on the following questions:

1. For what specific pollutants and under what circumstances should adoption of criteria for non-priority pollutants be required by regulation?

2. Should EPA amend the water quality standards regulation or issue additional guidance to clarify when adoption of numeric chemical-specific criteria for non priority pollutants is necessary to ''protect designated uses''?

3. Should EPA require States or Tribes to adopt narrative criteria and a narrative criteria translation method for both 307(a) and other pollutants which elicit toxic effects on organisms?

8. Criteria Where Data or Guidance is Limited

A key issue facing States and Tribes seeking to develop aquatic life and human health criteria concerns the data requirements necessary to support derivation of a criterion. (In developing national CWA section 304(a) criteria guidance, EPA has established minimum data requirements.) When sufficient, acceptable data are not available, however, many States and Tribes have resorted to adoption of lowest observed effect levels (LOELs) as criteria in order to ensure that some level of protection is in place. LOELs are based on the lowest observed concentration of a chemical at which a statistically significant adverse effect was observed in an aquatic test organism. However, EPA would counsel against adoption of water quality criteria based on LOELs alone because they may not ensure protection of aquatic life uses since: (1) they represent effect concentrations, and (2) there may be significant limitations in the database upon which they are supported.

Thus, if this approach is used, States and Tribes are encouraged to use safety factors to approximate better a protective water quality level. The particular safety factor employed generally depends on the amount and quality of data concerning the LOEL. EPA has approved this approach in particular instances because criteria based on such LOELs provide more protection than no criteria at all.

A better approach to developing values with sparse data was developed and promulgated by EPA as part of the Water Quality Guidance for the Great Lakes System (Great Lakes Guidance). Under that Guidance's Tier II procedure, States and Tribes derive values to interpret the narrative criteria for

pollutants where the minimum data requirements for derivation of a criterion are not satisfied (see appendix C of 40 CFR Part 132.) These values are then used in place of the absent criteria as the basis for NPDES permit limits where needed. EPA's current thinking is that this approach for establishing values for interpreting the narrative for pollutants where data are limited is preferable to adoption of criteria based on a LOEL.

The Tier II methodology in the Great Lakes Guidance is designed to be used in the absence of the full set of data needed to meet criteria data requirements. For pollutants for which criteria have not been adopted into State or Tribal water quality standards, Great Lakes States must, under the guidance, use methodologies consistent with either the criteria (GLI Tier I) or Tier II methodologies, depending on the data available to implement their existing narrative water quality criteria that prohibit toxic pollutants in toxic amounts in all waters.

In adopting the Great Lakes Tier II methodology, EPA, working with the States, determined that there is a need to regulate pollutants more consistently in the Great Lakes System when faced with limited data on which to base criteria. Many of the Great Lakes States are already employing procedures similar to the approach in the final Guidance to implement narrative criteria. EPA determined the Tier II approach improves upon existing mechanisms by utilizing all available data. The Tier II aquatic life methodology is used to derive Tier II values which can be calculated with fewer toxicity data than under the Tier I water quality criteria methodology. Tier II values can, in certain instances, be based on toxicity data from a single taxonomic family, provided the data are acceptable. The Tier II methodology generally produces more stringent values than the Tier I criteria methodology, to reflect greater uncertainty in the absence of additional toxicity data. As more data become available, the derived Tier II values tend to become less conservative. That is, they more closely approximate Tier I numeric criteria.

States and Tribes may also develop their own criteria derivation procedure under option 3 of EPA's CWA section 303(c)(2)(B) guidance for priority toxic pollutants. This approach allows for timely derivation of criteria based on the latest available data, and may be used to derive criteria for pollutants for which EPA has not issued guidance. However, as for all criteria, such a procedure would need to result in criteria that are scientifically defensible, so again the issue of minimum data requirements is important.

Request for Comment on Criteria Where Data or Guidance is Limited

EPA requests comment on the following questions:

1. Should adoption of a lowest observed effect concentration be considered an acceptable option where no other criteria guidance is available, or should use of an uncertainty factor (e.g., 0.1, 0.5) be required to better approximate a protective water quality level? If an uncertainty factor is used, should that factor vary based on the amount and quality of data used to drive the LOEL? If so how?

2. Should EPA develop a method for derivation of alternative values for pollutants where the minimum data requirements included in EPA's criteria guidelines are not satisfied, such as the tier 2 procedure in EPA's Water Quality Guidance for the Great Lakes System?

3. How applicable should the Tier 2 process be to States and Tribes outside of the Great Lakes? Does the regulation need to be modified to include Tier 2 specifically for the entire country?

4. Does the information included in EPA's toxicity databases (e.g., IRIS, AQUIRE) need to be made more accessible to States, Tribes, or others seeking to develop their own criteria? If so, how can this be accomplished?

9. Toxicity Criteria

Toxicity criteria are an additional type of water quality criteria used to protect aquatic life. Toxicity criteria are expressed in terms of ''toxic units'' that cause toxic effects to aquatic organisms and are determined by exposing aquatic organisms to water samples (e.g., ambient water or effluent discharges). Whole effluent toxicity (WET) testing can be effective for controlling discharges containing multiple pollutants. It can also provide a method for addressing synergistic and antagonistic effects on aquatic life.

EPA is considering revising the water quality standards regulation to require States and Tribes with water quality standards authority to develop a numeric quantification of acceptable surface water levels for the parameter ''toxicity.'' Doing so would implement the narrative criteria that waters be ''free from'' toxics in toxic amounts. Currently, States and Tribes use various approaches to implementing their narrative criteria, including using numeric toxicity values and implementing them through NPDES permits. However, there is no current requirement for States or Tribes to specify numeric criteria for toxicity in their water quality standards. Under current requirements and guidance, States and Tribes do not always specify implementation of toxicity criteria and test methods as a required means to implement the narrative water quality criteria.

Toxicity is commonly measured by exposing test organisms (e.g. Ceriodaphnia, Fathead minnow) to various concentrations of chemicals or chemical mixtures in water. EPA has promulgated methods for measuring aquatic toxicity in effluents and surface waters in 40 CFR Part 136. EPA provided a recommendation on the allowable magnitude of this parameter in the 1991 Technical Support Document for Water Quality-based Toxics Control (TSD) that would facilitate State or Tribal implementation of such a requirement. The recommendation reads: For protection against acute toxicity, ''the criterion maximum concentration (CMC) should not exceed 0.3 acute toxic units to the most sensitive of at least 3 test species; for chronic protection, the criterion continuous concentration (CCC) should not exceed 1.0 chronic toxic units to the most sensitive of at least 3 test species.'' Such a quantification serves, in conjunction with numeric criteria for individual pollutants and biological criteria, to establish an integrated and fully protective basis for assessment and control of pollutants.

Request for Comment on Toxicity Criteria

EPA seeks public comment on the following question:

1. Should the regulation be modified to explicitly require States and Tribes to adopt numeric toxicity criteria, or alternatively to use toxicity values and test methods as a required means to interpret and implement the narrative criteria? Or, is the current practice acceptable, whereby some States or Tribes have numeric toxicity criteria, some utilize toxicity methods to interpret their narrative requirements of no toxics in toxic amounts, and others use toxicity mainly as a tool to assess effluent quality, but not as the basis for permit limits?

10. Sediment Quality Criteria

Sediment quality criteria (SQC) are being developed by EPA pursuant to sections 304(a)(1) and 118(c)(7)(C) of the CWA in recognition that many water bodies are not meeting water quality goals even though ambient water quality criteria are being met. (See ''The Incidence and Severity of Sediment Contamination in Surface Waters of the

United States, Volume 1: National Sediment Inventory,'' Office of Science and Technology, September 1997, EPA–823–R–97–006.) The contaminants of interest are those that preferentially partition to sediments, become sequestered, and remain bioavailable to the aquatic community. SQC are intended to protect against chronic effects to benthic organisms resulting from sediment contamination. The development and implementation of SQC is intended primarily to enable development of pollutant-specific State standards and NPDES permit limits needed for implementation of a more effective source control program. In addition, SQC will be useful in other programs, such as developing clean-up levels for sediment remediation activities and in evaluating sediments dredged from the Nation's waterways.

Sediment quality criteria have been proposed for five non-ionic organic compounds: acenapthene, dieldrin, endrin, fluoranthene, and phenanthrene. See, Technical Basis for Deriving Sediment Quality Criteria for Nonionic Organic Contaminants for the Protection of Benthic Organisms by Using Equilibrium Partitioning (EPA–822–R–93–011); Acenapthene (EPA–822–R–93–013); Dieldrin (EPA–822–R–93–015); Endrin (EPA–822–R–93–016); Fluoranthene (EPA–822–R–93–012); Phenanthrene (EPA–822–R–93–014). In addition to non-ionic organic compounds, the Agency also is working to develop SQC for metals. After considering public comments, EPA intends to publish final SQC dieldrin and aldrin in final form. The proposed criteria for acenapthene, fluoranthene, and phenanthrene will not go final; instead, EPA plans to propose a total PAH sediment criterion. In addition to its work on SQC, the Agency also is working to develop standardized methods for performing chronic sediment bioassay tests.

The EPA Science Advisory Board subcommittee reviewing SQC for non-ionic organics concluded that: ''these criteria not be used as stand-alone, pass-fail values for all applications.'' (EPA–SAB–EPEC–93–002). EPA is developing a users manual to provide guidance on use of SQC in a regulatory context to ensure consistency with that recommendation. The guidance would recommend that SQC be used in conjunction with chronic sediment bioassay tests in determining compliance with State standards, such as in interpreting the narrative criterion of no toxics in toxic amounts. Such an approach is currently being developed in more detail, and the users guidance will be made available to the public for comment prior to being finalized.

Request for Comment on Sediment Quality Criteria

EPA seeks public comment on the following questions:

1. Should the current regulation be revised to specifically address sediment quality criteria, and if so, what should such revisions address?

2. What chemicals or classes of compounds should receive priority for development of SQC?

11. Biological Criteria

Biological Integrity, Assessments and Criteria '

The Clean Water Act directs EPA to work with States and Tribes to restore and maintain the biological integrity of the Nation's surface waters (CWA 101(a), 303, 518(e)). Biological integrity is defined as a balanced, integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of the natural habitat of a region (Karr and Dudley, EPA–440/5–90–004, 1981). Biological integrity does not necessarily represent an aquatic system untouched by human influence, but does represent one that is balanced, adaptive and reflects natural evolutionary processes. Designated uses and criteria to protect those uses in State and Tribal water quality standards programs provide the means to achieve biological integrity.

To more fully protect aquatic resources and provide more comprehensive assessments of aquatic life use attainment, it is EPA's policy that States and Tribes should designate aquatic life uses for their waters that appropriately address biological integrity and adopt biological criteria necessary to protect those uses (EPA–823–B–93–002, Office of Water Memorandum to EPA Regions, Policy on Bioassessment and Biological Criteria, 1991). Designated uses to support aquatic life can cover a broad range, or continuum, of biological conditions with some waters being closer to the ideal of biological integrity than others. The attainable levels of biological integrity for any water is a State and/or Tribal determination involving public participation.

For example, the State of Maine used the water quality classification law to establish the minimum standards for three levels of biological integrity. These levels correspond to the water quality classification system and are increasingly restrictive, proceeding from the minimum state standard, Class C, to Class A, the most protective standard. These refinements serve to explicitly specify the designated aquatic life uses that apply to each classification category. Class C requires that the structure and function of the biological community be maintained and provides for the support of all indigenous fish species. The intermediate standard of Class B requires that there be no detrimental changes to the aquatic community, that all indigenous species are supported and that habitat be unimpaired. The Class A standard requires that aquatic life be ''as naturally occurs'' and habitat be characterized as ''natural.'' Within Class A, there is even a subset, Class AA, that further specifies ''free-flowing'' habitat. Waters with the Class AA designation are protected from any additional discharge or alteration. Under this system, attainment of the aquatic life classification standards for a given water body is evaluated using numeric biological criteria that were statistically derived from a statewide database. The numeric biological criteria are slated to go to rule-making in 1998.

Biological assessments are used to evaluate the condition of a water body using direct measurements of the resident biota in surface waters. Biological assessments integrate the cumulative impacts of chemical, physical, and biological stressors on aquatic life. Biological criteria, derived from biological assessment information, can be used to define State and Tribal water quality goals for aquatic life by directly characterizing the desired biological condition for an aquatic life use designation. Biological criteria are narrative descriptions or numerical values that describe the reference condition of the aquatic biota inhabiting waters of a specific designated aquatic life use (EPA–440/5–90–004). Biological criteria are based on integrated measures, or indices, of the composition, diversity, and functional organization of a reference aquatic community. The reference condition describes the attainable biological conditions for water body segments with common characteristics within the same biogeographic region. In summary, biological criteria provide a direct measure of the desired condition of the aquatic biota. This capability serves a dual purpose—goal setting and environmental impact analysis. Biological assessments are then conducted to evaluate if a water body is attaining its designated aquatic life use.

Biological criteria can play an important role in water quality programs and when properly implemented, complement and support

other methods and criteria, such as chemical water quality criteria and whole effluent toxicity criteria. The latter are measures, or indicators, of environmental stress and exposure whereas the biological assessments and criteria measure the cumulative effects of stressors on the aquatic community, whether chemical, physical or biological stressors, singly or in combination. A water quality program that employs the full array of methods and criteria will develop the information needed for more accurate assessment of impairment and effective resource management.

The linkage of biological effects, stressor identification and exposure assessment is particularly important when there are multiple stressors impacting a water body, especially when a watershed management approach is taken, or where wet weather flows are a major source of impairment in the water body. A comprehensive water quality program with biological, chemical, toxicity, and physical components will enable States and Tribes to make better decisions and focus limited resources to maximize environmental gain. A critical issue facing EPA's National Water Program is the manner and extent to which biological assessments and criteria should be incorporated into water quality programs to transition to a more comprehensive water quality control program that will better identify impairments and track improvements. This includes integrating biological assessments and criteria into use designations and attainability analyses, watershed management strategies and source control requirements.

Biological criteria typically include measures of the types, abundance, and condition of aquatic plants and animals, providing information on the status and function of the aquatic community in response to the cumulative impact of both chemical and nonchemical stressors. For example, Ohio uses a multi metric approach to develop numeric biological criteria for two different assemblages: benthic macro invertebrates (bottom dwelling insects, etc.) and fish (Yoder, 1995). Biological indices have been derived that integrate measurable structural and functional characteristics of the in-stream fish and macro invertebrate communities which help assess the health of the community. Structural characteristics are based on measures of biological community structure such as diversity or taxa richness (e.g. total number of taxonomic groups) and the representation of specific taxonomic groups (e.g. number of mayfly or caddisfly taxonomic groups) within the community. Functional characteristics include measures of biological function such as feeding strategy (e.g. percent carnivores, omnivores), environmental tolerance (e.g. number of intolerant and tolerant species), and disease symptoms (e.g. percent diseased species and anomalies, including deformities, eroded fins, lesions and external tumors in fish).

The Ohio biological criteria were developed based on ecoregional reference conditions and provide a quantitative biological description of the State's designated aquatic life uses for warm water rivers and streams, including exceptional, general, modified and limited warm water habitat. The description and derivation of the indices and ecoregions are contained in the ''Biological Criteria for the Protection of Aquatic Life: Volume II. Users Manual for Biological Field Assessment of Ohio Surface Waters'' cited in Ohio's Water Quality Standards. Ohio uses biological criteria to support all aspects of its water quality management program (Yoder, 1995). Ohio's approach is another example of how a State can adopt biologically-based refined designated aquatic life uses and biological criteria consistent with EPA's policy.

Application of Biological Assessments and Criteria in State and Tribal Water Programs

Biological assessments and criteria can be an important component of State and Tribal watershed management programs by assisting in prioritization and targeting of actions, setting restoration goals and performance standards, and documenting results. For example, North Carolina has adopted narrative biological criteria into its water quality standards regulation that references standardized methods for data collection and analysis for fish and macro invertebrate communities. Specific biological indices, metrics, or numeric criteria are not included in the water quality standards regulation. However, by citing the standardized methods in the State's water quality standards, North Carolina established a mechanism for consistent, quantitative translation of the narrative biological criteria. Under the State's five year basin-wide management program, benthic macro invertebrate and fish community data are presented in individual basin-wide assessment reports. Macroinvertebrate and fish community surveys, special studies, and other water quality sampling activities are conducted in the second and third years of the cycle to provide information for assessing status and trends through the basin. Water quality management plans are being developed for all of the State's major river basins on five year cycles.

Biological assessments and criteria can fulfill several assessment functions within the NPDES permitting process. In conjunction with pollutant concentration and toxicity data, biological assessments can be used to detect previously undetected chemical water quality problems and to evaluate the effectiveness of control actions. Biological findings of use impairment can trigger the necessary technical investigations which can identify the source or sources of impairment and determine appropriate corrective measures through point or nonpoint source controls as appropriate. The State of Maine uses biological assessments and criteria to evaluate the effectiveness of controls and to inform the permit review process. Aquatic life criteria are specified in the water quality classification law and attainment is assessed using quantitative data and a multi variate statistical model. Findings of biological impairment trigger management intervention to identify possible causes. Permits have been modified and enforcement actions initiated to address biological impacts. Alternatively, favorable biological findings have been used in a tiered approach to re-direct limited agency and permittee resources to more urgent concerns.

In Maryland, investigators use bioassessments as an integral part of the Rapid Stream Assessment Technique (RSAT) to conduct watershed-wide stream quality reconnaissance, rapid screening of general storm water BMP performance and for elucidating general watershed land use—stream quality relationships (Galli, J., 1997). In Michigan, biological assessments have been used in the Wayne County Rouge River National Wet Weather Demonstration Project to identify impacts and to guide decision-makers and the public in evaluating options for preventing, reducing and minimizing pollution loading impacts on the river under a watershed approach to wet weather pollution management (Cave, 1997).

Biological assessments and criteria can be useful in evaluating highly variable or diffuse sources of pollution such as storm water runoff. These types of point source pollution do not lend themselves well to traditional chemical water quality monitoring and a biological assessment of their cumulative impact may effectively evaluate these discharges and the success of control actions.

Bioassessments have been successfully used in Florida to assess the cumulative impacts of multiple pollution sources within a watershed, in particular, storm water runoff and other nonpoint source discharges (McCarron, Livingston and Frydenborg, 1997). The Florida Storm water/Nonpoint Source Bioassessment Projects have found that bioassessments, over time, help reflect impacts from the fluctuating environmental conditions and highly variable pollutant inputs of wet weather discharges. Bioassessments also help to evaluate the habitat degradation typically associated with Storm water discharges. Bioassessments were also identified by key storm water experts from across the Nation as an important environmental indicator tool for assessing the impacts of storm water runoff and the effectiveness of storm water management strategies (Claytor and Brown, 1996).

When attempting to identify the specific sources of use impairment (stressors), the role that biological assessments and criteria will play needs to be carefully defined. Stressor identifications based solely on biological information may be straightforward in certain water bodies where a single source is the cause of impairment. In these cases, paired bioassessments, conducted above and below the discharge point, or in the vicinity of the source, may readily identify the degree of impairment and the efficacy of chosen control strategies. In small urban watersheds, dominated by storm water runoff, bioassessments and criteria may provide a direct means to measure and control the storm water impacts.

However, in complex water bodies, where numerous sources contribute to the observed biological impairment, it may be difficult for bioassessments to distinguish the relative degrees of impairment from each contributing source. Given these situations, EPA anticipates that a stressor identification evaluation (SIE) procedure will need to be developed to provide the technical tools and information that watershed managers can use to identify and evaluate the different sources of impairment that the bioassessments reveal and the specific stressors associated with each source (e.g. flow, turbidity, temperature, metals, etc.).

Guidance on Development of Biological Criteria

EPA has developed and will continue to develop technical guidance on conducting bioassessments and developing biological criteria for the following specific water body types: streams and wadable rivers, lakes and reservoirs, estuaries and near coastal waters, wetlands and large rivers. Technical guidance for streams and small rivers biological assessments and criteria was published in 1996 (EPA 822–B–96–001). Publication of technical guidance on lakes and reservoirs is expected in 1998 followed by guidance on estuaries and near coastal waters by 1999. Technical guidance development for wetlands was initiated in 1997 and for large rivers in 1998. Completion of these documents is planned within 5 years.

Guidance on Implementation of Biological Criteria

EPA is currently considering how to best advance State and Tribal adoption and implementation of biological criteria. A draft discussion document on implementation of biological criteria by States and Tribes sets forth an iterative, step-wise approach to development of biological criteria and adoption in State and Tribal water quality standards. (draft guidance document on biological criteria implementation, EPA, March 1998) Elements of a stepwise approach could include:

(1) establishment of a long term goal to restore and maintain biological integrity of State or Tribal surface waters where determined feasible;

(2) implementation plan for development of biological criteria for specific water body types, including time frame;

(3) development of standardized biological assessment methods, regional reference conditions, and biological database to support refinement of designated aquatic life uses and development of biological criteria;

(4) adoption of narrative biological criteria into water quality standards;

(5) adoption of quantitatively-based biological criteria in water quality standards.

In developing a flexible, stepwise approach, EPA is evaluating options for adoption of biological criteria that would result in the consistent translation of narrative biological criteria into numeric criteria (e.g. quantitatively-based biological criteria). A quantitatively-based biological criteria could be defined as:

(1) A narrative statement adopted into State or Tribal water quality standards that describes specific designated aquatic life uses and cites technical procedures existing outside of regulation. The technical procedures result in the translation of the narrative statement into quantitative measures; including description of how biological assessment data is collected and analyzed, and how the biological criteria are developed.

—and/or—

(2) A narrative statement as above plus the adoption of the technical procedures or the actual numeric biological criteria in State or Tribal water quality standards.

These two options for adopting quantitatively-based biological criteria are based on existing State models such as Maine, North Carolina and Ohio (EPA 230–R–96–007). North Carolina has adopted a narrative biological criteria for its aquatic life use classification and cites in the water quality standard regulation the standardized methods for data collection and analysis. Maine and Ohio have developed more refined classifications of their aquatic life uses and developed biological criteria for each specific use. Both States cite technical manuals specifying standardized methods. Ohio has adopted its numeric biological criteria directly into its standards regulation. As mentioned earlier, the Maine Department of Environmental Protection is currently embarking on a rule making process to adopt its existing standardized field methods, statistical analysis protocols and numeric classification criterion (numeric biological criteria) into its water quality regulation. Similar to Ohio, these rules will codify the technical procedures for determining attainment of aquatic life use classification. EPA describes these various States' work for consideration as possible models of biological criteria that would result in the consistent translation of narrative biological criteria into numeric criteria (e.g. quantitatively-based biological criteria).

A Regulatory Requirement for Biological Criteria

EPA is considering whether it should explicitly require States and Tribes to adopt biological criteria in either the narrative or numeric form, and, if not, whether an alternative approach to encouraging the use of biological criteria is appropriate. Some States and Tribes have already allocated resources to biological criteria development because a regulatory requirement is anticipated at some time in the future. Others have been unwilling to commit resources to development of biological criteria before specifically required to do so. Concerns have also been raised about yet another regulatory requirement to be imposed over existing requirements that are still not fully implemented—adding new layers of requirements in a piecemeal fashion without adequate resources. EPA is sensitive to the concern that

generating the data and developing the analytical capacity to incorporate biological criteria into water quality standards may present a significant resource challenge to some States and Tribes.

Advocates for a requirement for States and authorized Tribes to adopt biological criteria argue that States and Tribes will not implement biological criteria in a timely manner, if at all, without an explicit Federal regulatory requirement. The viewpoint has been expressed that States and authorized Tribes will not adequately increase program emphasis or resources if biological criteria are not required and, as a consequence, biological criteria will be relegated to a lesser role then chemical water quality criteria or whole effluent toxicity. Some States have either direct (i.e. executive orders, legislative mandates) or indirect limitations on adopting new regulations and policies that are more stringent than that required by Federal legislation. Adopting biological criteria may be seen in some States and Tribes as exceeding minimum Federal requirements. Concern has been expressed that without biological criteria as a fundamental component of a State or Tribal water quality standards program, transition of water quality standards programs to a more integrated ecosystem approach with an emphasis on watersheds will not succeed.

Adoption of Narrative Biological Criteria

As an alternative to requiring adoption of numeric biological criteria, EPA could require States and Tribes to adopt a narrative biological criteria. The narrative biological criteria could be a statement of intent adopted in a State's or Tribe's water quality standards to formally consider the fate and status of aquatic biological communities and to establish the framework for the consistent and quantitative translation of a State's or Tribe's designated aquatic life uses and development of numeric biological criteria. EPA has published a document on procedures for initiating narrative biological criteria (EPA–822–B–92–002). An example of a narrative biological criteria based upon that publication follows:

> The State will preserve, protect, and restore the water resources in their most natural condition deemed attainable. The condition of these water bodies shall be determined from the measures of physical, chemical, and biological characteristics of each surface water body type, according to its designated use. As a component of these measurements, the biological quality of any given water system shall be assessed by comparison to a reference condition(s) based upon similar regional hydrologic and watershed characteristics (reference standardized methods and operating protocols).
>
> Where attainable, such reference conditions or reaches of water courses shall be those observed to support the variety and abundance of aquatic life in the region as is expected to be or has been historically found in natural settings essentially undisturbed or minimally disturbed by human impacts, development or discharges. This condition shall be determined by consistent sampling and reliable measures of selected indicated communities of flora and/or fauna as established by [cite appropriate State agency or agencies] and may be used in conjunction with acceptable chemical, physical, and microbial water quality measurements and records judged to be appropriate to this purpose.
>
> Regulations and other management efforts relative to these criteria shall be consistent with the objective of preserving, protecting and restoring the most natural communities of fish, shellfish, and wildlife attainable in these waters; and shall protect against degradation of the highest existing or subsequently attained uses or biological conditions pursuant to State antidegradation requirement.

EPA is considering what could constitute approvable narrative biological criteria and the feasibility of EPA promulgating narrative biological criteria where a State or Tribe fails to adopt such criteria.

Time Frame for Adoption of Biological Criteria in State and Tribal Water Quality Standards

In 1991 EPA issued a policy that established as a long-term Agency goal the development and adoption of biological criteria in State and Tribal water quality programs (Transmittal of Final Policy on Biological Assessments and Criteria, memorandum from Tudor Davies, Director of the EPA Office of Science and Technology, to Regional Water Management Division Directors, June, 1991). EPA has identified as a program priority during the FY1997–1999 Water Quality Standards Triennium that States and Tribes initiate and continue to expand development of scientifically defensible biological-based classification systems (FY 1997–1999 Water Quality Standards Priorities, memorandum from Tudor Davies, Director of the EPA Office of Science and Technology, July 22, 1996). Based on State experiences, development of biological criteria can range between five to ten years, depending on several factors such as available resources, existing State expertise, existing data bases and geographic variability. If EPA were to require or recommend that States and Tribes adopt biological criteria, EPA would need to determine appropriate time frames for adoption and implementation of these criteria. EPA is considering whether the following are reasonable and appropriate time frames for adoption of biological criteria in State and Tribal water quality programs:

1. narrative biological criteria for streams and an implementation plan for development of quantitatively-based biological criteria for streams in the 2000–2003 Water Quality Standards Triennium.

2. narrative biological criteria and an implementation plan for development of quantitatively-based biological criteria for other applicable water body types (e.g. lakes and reservoirs, estuaries and near coastal waters, large rivers and wetlands) within ten years following EPA publication of technical guidance.

Linkage of Biological Criteria to Stressor-Identification

One of the potential benefits of developing a biological criteria program is the increased ability to assess water quality impairment due to nonpoint source pollution, broadening the scope of most water quality-based programs beyond regulation of effluent discharges. However, many currently regulated point source dischargers are skeptical that greater focus on nonpoint source would actually occur, particularly considering the time and resource constraints on most State and Tribal programs. Industry and municipalities are concerned that biological criteria bring an additional layer of regulatory and associated costs and that they may be an easy target for additional requirements whether their discharge is the source of impairment or not. EPA recognizes that the role biological assessments and criteria will play to help identify specific stressors or sources of use impairment will need to be carefully defined and is interested in practical, effective approaches to evaluate potential stressors and sources of impairment when a water body fails biological criteria.

Request for Comment on Biological Criteria, Assessment and Implementation

EPA is soliciting comment on the following questions:

1. Should EPA amend the regulation to explicitly require States and Tribes to adopt biological criteria or are there alternative approaches that EPA should consider? Should EPA seek to ensure that biological criteria will be developed and implemented in all State and Tribal water quality programs?

2. If EPA were to explicitly require States and Tribes to adopt biological

criteria, should it require a narrative only, or a combination of both narrative and numeric criteria as described in the draft implementation guidance (e.g quantitatively-based biological criteria)? What should EPA promulgate if a State or Tribe fails to adopt biological criteria in its water quality standards?

3. If EPA were to explicitly require biological criteria, what is a reasonable time frame for State or Tribal adoption?

4. What are practical, effective approaches to identify and evaluate potential stressors and sources of impairment when a water body fails biological criteria?

5. In what ways can biological criteria and biological assessments be used to effectively manage known stressors or sources of impairment, including urban and rural runoff?

12. Wildlife Criteria

Wildlife criteria are designed to protect mammals and birds from adverse impacts from pollutants due to consumption of food or water from a water body. A wildlife criteria methodology applicable to the Great Lakes Basin and a few wildlife criteria were published as part of the Great Lakes Guidance. EPA does not have an active wildlife criteria guidance program at this time but it is a potential emerging criteria program. The wildlife criteria that EPA promulgated in the Great Lakes Guidance are for the following four chemicals: DDT (and metabolites), mercury, PCBs, and dioxin (2,3,7,8–TCDD).

Request for Comment on Wildlife Criteria

EPA requests comment on the following question:

1. Does the regulation need to be clarified to specifically address the development of wildlife criteria guidance for the protection of aquatic dependent wildlife?

13. Physical Criteria

Physical criteria is a concept that takes into account the physical attributes of the aquatic environment, such as quality of habitat and hydrologic balance. Commenters on the draft ANPRM identified physical habitat and hydrologic balance criteria as additional important forms of criteria that should be discussed in the ANPRM. EPA agrees that physical habitat parameters, including flow, are important and often overlooked parameters that influence and at some sites control whether or not an aquatic life use is or will be attained. For example, research referenced by Schueler (see Schueler, T. The Importance of Imperviousness. Watershed Protection Techniques, Fall 1994) suggests that in many small urban streams substantial loadings from municipal separate storm sewer systems are severely degrading the aquatic habitat. The authors suggest that the primary cause of this habitat impairment is the high volume and velocity of the storm water flows into this type of stream. The high flows exceed the peaks in the natural flow regime of these streams and as a result stream bank erosion, turbidity and siltation occur and the local habitat is degraded. Further habitat destruction in larger downstream receiving waters often results from the physical deterioration of the upstream urban systems. For example, some recent studies have shown that in some lakes the biggest source of silt and sediment deposition into the lake is actually from the eroded material that comes directly out of the stream bed and stream banks that are scoured out during elevated wet weather peak discharges and extended hydrographs. This can lead to eutrophication, increased turbidity, decreased light penetration, submerged aquatic vegetation (SAV) loss, spawning bed smothering, and shellfish habitat damage.

Studies of this phenomenon suggest that until these man-made flow regimes are better managed and the resulting stresses to physical habitat corrected, no amount of control of pollutants is likely to restore the aquatic ecosystem to a level more closely resembling a natural state.

The character of natural waters is obviously affected by wet weather events. Flowing waters, especially, can change dramatically with the seasons and in response to specific precipitation events. Seasonal and event driven changes in flows, sediment loads, temperature, etc. are common and natural processes which are integral to the maintenance of natural waters and their aquatic communities. Human-caused changes to the landscape, however, have altered these natural processes, and for many waters, the altered flows and the contamination now associated with wet weather discharges (discharges that occur in whole or in part as the result of wet weather events) present significant environmental problems. Although these problems are generally well recognized, they have been difficult to address effectively precisely because of their magnitude and variable nature.

The CWA's objectives include the protection and restoration of the physical integrity of our nation's waters. Scientific experts agree that overall physical habitat loss is the single biggest factor in the loss of aquatic species. Physical habitat damage and loss to the nation's waters includes: (1) Wetlands losses; (2) the denuding of stream banks through unwise forestry, farming, mining, and urbanization; (3) the embedding of stream bottoms with fine-grained silt from poorly designed and managed farm and construction sites; (4) the damming of river systems; (5) the channelization and/or concrete lining of rivers and streams; (6) the obliteration of ephemeral and first-order streams and springs during urbanization and; (7) the widening and deepening of stream channels due to high-velocity urban storm flows.

All seven of these phenomena are common forms of aquatic habitat damage and loss, and yet there is little national guidance to address the physical parameters that contribute to these impacts. In addition, EPA does not have a clear picture of how often physical habitat parameters, including flow are used by States and Tribes to assess, manage, and/or regulate activities that damage habitat. Some commenters on the draft asserted that water quality criteria guidance is needed to address these forms of habitat loss, to create threshold values to protect designated uses and to provide measuring tools for monitoring watershed and water body health. EPA agrees that further investigation of the role of physical habitat parameters, including hydrologic balance, in water quality standards programs is necessary. EPA is considering the relative importance of such criteria guidance as compared to other forms of criteria guidance such as ambient water quality criteria, sediment criteria and biological criteria; and on the likelihood that States and Tribes would develop and implement such criteria if technical guidance and supporting policy were available. EPA is also interested in identifying examples of where such criteria guidance has already been used as the basis for assessing, managing and protecting water quality.

With respect to hydrologic balance, EPA discusses the issue in the antidegradation section of this ANPRM. Some commenters on the draft ANPRM suggested that maintaining hydrologic balance in surface waters, though important in the context of antidegradation, is also important for other aspects of water quality standards. These commenters suggested that hydrologic balance should be part of basic water quality criteria guidance for watershed and water body assessment and for long-term urban storm water abatement and prevention plans under

the storm water NPDES program, as well as for the traditional NPDES program.

EPA is further interested in issues associated with hydrologic imbalances created by various industries and land operations, and the options for researching and creating a set of hydrologic balance criteria guidance. These could include, for instance, regional minimum stream flow criteria on a seasonal or average monthly basis, a groundwater-recharge criterion meant to maintain adequate stream base flow, and a peak-flood and bank full discharge prevention criterion, perhaps based on hydrologic regions of the country.

Request for Comment on Physical Criteria

EPA seeks comment on the following questions:

1. Would it be useful to explicitly identify physical criteria such as habitat and hydrologic balance in 40 CFR 131 as a valid form of criteria that States and Tribes can adopt in their water quality standards?

2. Would EPA technical guidance on physical criteria be useful to States and Tribes? Is it necessary?

3. What are some examples of physical criteria that are being used today and what are they being used for?

4. What should be the principal uses for physical criteria? Would these help address pulsed or intermittent impacts, such as those from urban and rural runoff?

14. Human Health

Human health water quality criteria are scientifically derived values developed by States, Tribes, or EPA to protect human health from the deleterious effects of carcinogens and noncarcinogenic toxicants. Human health criteria take into account the health effects from the consumption of aquatic organisms and drinking water. Human health criteria are based on the potential of carcinogens and noncarcinogenic toxicants to cause adverse impacts to human health. When adopting criteria to protect human health, a State or Tribe may use EPA's Section 304(a) criteria documents or other information on factors to derive human health criteria. However, if a State or Tribe decides to adopt criteria less stringent than recommended by EPA, the State or Tribe must provide documentation which supports that the approach is based on sound scientific rationale.

Changes to the Human Health Criteria Methodology are anticipated for proposal in the **Federal Register** in 1998. These changes to the 1980 ambient water quality criteria (AWQC) derivation guidelines (45 FR 79347) are intended to reflect the many significant scientific advances that have occurred during the past 17 years in such key areas as cancer and noncancer risk assessments, exposure assessments and bioaccumulation. Comments on any of the key area issues, as well as implementation issues, are welcome and should be made during the public comment period following the anticipated 1998 proposal.

The following discussion focuses on three key policy-related issues, including: choice of risk levels; fish consumption assumptions and environmental justice, and the use of maximum contaminant levels.

a. Risk Levels. Criteria for specific pollutants for the protection of human health rely in part on risk levels (incidence of cancer). Numeric criteria for carcinogens are based on three inter-related assumptions: exposure, cancer potency, and risk level. Exposure considerations are based on a wide range of factors, including an estimate of the rate of fish and drinking water consumption, an estimate of the body weight of an exposed individual, and an estimate of the rate of a chemical's relative tendency to bioaccumulate in fish tissue as compared to the surrounding water. Cancer potency factors (q1*) provide a measure of a chemical's potential to cause cancer, and are typically derived from studies on laboratory animals. The risk level represents an incremental increase in cancer incidences resulting from exposure to the chemical.

EPA guidance sets forth a range of criteria values that result in calculated risk levels of 10^{-5}, 10^{-6}, and 10^{-7} for informational purposes. Most States and Tribes select either a 10^{-5} or 10^{-6} risk level as an appropriate value, i.e., one additional cancer incidence per one hundred thousand or one million exposed individuals, respectively. This level seems to represent some general scientific and public consensus that the cancer risks are acceptably small or insignificant. States and Tribes, however, are not limited to selecting among the risk levels published in the CWA section 304(a) guidance documents.

If exposure assumptions are changed, while the assumed risk level remains the same, the criterion will change accordingly. The risk to people who intake more than the default exposure assumptions increases with the degree of change in the intake rates. For example, if the State or Tribe chooses to protect at a risk level of 10^{-5} and assumes a fish consumption rate of 6.5 gm/day, but some individuals within the State or Tribe actually eat 65 gm/day of fish, the criterion actually protects those individuals at a risk level of 1 x 10^{-4} (one additional cancer case per 10,000 people). The risk level can change based on the relative change in each parameter. When adopting these standards, States and Tribes are strongly encouraged to provide documentation that the assumptions made in establishing the criteria are reasonable and adequately protect the population, including highly exposed subpopulations at the risk level asserted in the States' and Tribes' standards. EPA strongly encourages States and Tribes to highlight these provisions of their standards during the public participation process.

EPA's current criteria documents indicate the risk level within a range of 10^{-5} to 10^{-7} for the general population. The policy has been to allow States and Tribes to select appropriate risk levels and is consistent with the framework of the CWA that recognizes and supports State and Tribal primacy in making risk management decisions to protect its population provided that the goals of the Act are met. EPA's approval of different cancer risk levels to protect human health in different States or Tribes is subject to debate. Many have questioned States' and Tribes' selection and EPA's approval of various risk levels to protect human health. Some assert that EPA should require all States and Tribes to adopt a single risk level. Others believe EPA should require States and Tribes to develop data on the different exposure assumptions that may be present within the State or Tribe.

With regard to subpopulations that may consume higher amounts of fish than is assumed for the general population, EPA's Great Lakes Guidance stated that a risk level of 10^{-4} for such subpopulations in the Great Lakes basin can be protective.

In a draft proposal of the water quality criteria methodology revisions, EPA is considering proposing that risk levels in the range of 10^{-4} to 10^{-6} be adopted in deriving criteria. However, the proposed revisions also note that care must be taken in situations where the AWQC includes fish intake levels based on the general population to ensure that the risk to more highly exposed subgroups (subsistence, minority) does not exceed the 10^{-4} risk level. Furthermore, EPA is considering proposing the 10^{-6} risk level as the level that ensures protection for all exposed population groups. As stated before, all comments regarding methodology, including risk levels,

should be made during the public comment period following the anticipated 1998 Human Health Criteria Methodology proposal.

EPA intends to foster consistent approaches between Agency program offices, including its approach to determining allowable risk levels. The Food Quality Protection Act of 1996 (FQPA) amended the Federal Food, Drug and Cosmetic Act (FFDCA) to prohibit EPA from issuing tolerances for pesticide residues in or on food unless the Agency determined that there is a ''reasonable certainty'' that the residues will result in ''no harm.'' Tolerances are allowable levels of chemicals in food; food containing residues in excess of a tolerance may not be sold in commerce. The legislative history of FQPA indicated Congressional support for EPA's view that reasonable certainty of no harm would generally be met when a non-threshold risk is below a 10^{-6} level. For threshold risks, the legislative history contained general support for a margin of safety of 100, except that the Statute required the Agency to add an additional 10-fold margin of safety to protect infants and children, unless the Agency concluded on the basis of reliable data that a different margin would be safe for infants and children. In determining whether dietary exposures are safe, the FQPA also directs EPA to consider non-occupational exposures to chemicals used as pesticides, and to aggregate risks from chemicals that share a common mechanism of toxicity. EPA's Office of Pesticide Programs is in the process of developing new policies in response to the FQPA. EPA's Office of Water will consider these policies when they are completed.

b. Fish Consumption Assumptions. EPA's recommended human health criteria under CWA section 304(a) guidance are currently derived with a fish consumption rate of 6.5 grams per day (roughly one quarter ounce of fish and shellfish). This value represents an average based on market survey data gathered in 1973–74, and reflects a national average for all consumers and nonconsumers of fish and shellfish from estuarine and fresh waters. Again, EPA intends to propose revisions to the human health methodology for deriving ambient water quality criteria, including revisions of the fish consumption rate. Some assumptions regarding fish consumption and criteria policy are also discussed in FR Vol. 61, No. 239, 65183 (December 11, 1996).

EPA recognizes that, while important, the national fish consumption estimate is one of many different parameters used to set ambient water quality criteria to protect human health and that the interactions of these parameters adds substantial complexity to the methodology. However, because this component is easily understood, it receives the most attention from the general public. Overall, EPA considers its human health criteria methodologies to be conservative and protective of human health.

EPA also recognizes that there are subpopulations that consume greater quantities of fish and has considered this as part of the human health methodology for developing water quality criteria. State and Tribal human health criteria are often based on a risk level of 10^{-5} or 10^{-6} to protect people inclined to consume higher quantities than the average. In addition, with regulatory actions for carcinogens, individuals consuming even 20 times the 6.5 gram amount would still be protected at the 10^{-4} risk level. (EPA is *not* proposing a national risk level of 10^{-4} here, rather EPA is acknowledging that the level of risk is relative to the consumption of fish (i.e., it is greater for individuals consuming more fish than the national average).

A similar rationale for the protectiveness of a criterion may not apply to non-carcinogenic pollutants (i.e., RfD-based chemicals), where significantly higher fish consumption rates may (when combined with other exposure sources) result in exposures significantly exceeding the RfD. Although there are safety factors associated with an RfD, they are related to uncertainties associated with the toxicological evaluation, not with the sources and levels of exposure. Therefore, significantly higher intakes may require more stringent criteria to protect human health.

EPA is seeking ways to implement Executive Order 12898 (February 16, 1994, 59 FR 7629) regarding environmental justice to ensure that water quality criteria are developed taking into account populations such as Native Americans and other minorities, as well as other subsistence fishers. This would include working with the scientific community and the public to improve EPA's health assessments and risk assessments and incorporate relevant issues into its policies and guidance. This also includes mechanisms for public participation (e.g., meetings) for the purposes of fact-finding, receiving comments, and conducting inquiries concerning environmental justice.

Relevant to water quality standards, EPA recognizes the need to address issues regarding different fish consumption patterns among subsistence, minority populations. EPA acknowledges that these groups may consume a greater quantity of fish than the national average. In addition, these groups have asserted that States and Tribes should be required to take a more aggressive role in protecting them.

Guidance for Assessing Chemical Contaminated Data for Use in Fish Advisories (Vol. 1–IV, USEPA, 1993 and 1994) notes that fish and shellfish consumption rates vary greatly for sections of the U.S. population (e.g., by gender, race, age, cultural and recreational activity, and income levels). Given the wide variations in consumption patterns, it would not seem to be possible for States and Tribes to provide the same level of protection from contaminated fish for all consumers. EPA believes criteria should ensure adequate protection of all significant populations and subpopulations from reasonable risks.

States and Tribes are encouraged to consider local surveys when selecting fish consumption rates to protect their populations since the national average value may not be indicative of local consumption habits. In its Water Quality Guidance for the Great Lakes System (60 FR 15366, March 23, 1995), EPA included a Great Lakes-specific fish consumption rate of 15 grams per day. This rate was based on several fish consumption surveys from the Great Lakes (see 60 FR 15366 at 15374, March 23, 1995.) EPA has also published for external peer review ''Draft Guidance for Conducting Fish and Wildlife Consumption Surveys.'' (U.S. EPA 1997).

States and Tribes could be encouraged to modify criteria on a site-specific basis to provide additional protection appropriate for highly exposed subpopulations. That is, where high-end consumers would not be adequately protected by criteria derived using the default fish intake assumption, the State or Tribe may modify this assumption to provide appropriate additional protection. Again, such a recommendation was made in the Great Lakes Guidance. This preference will also be stated in the proposed revisions to the human health methodology for deriving ambient water quality criteria.

c. Maximum Contaminant Levels. Under the Safe Drinking Water Act (SDWA), EPA develops chemical-specific numeric values for use in protecting public drinking water supplies. They are maximum contaminant level goals (MCLGs) and maximum contaminant levels (MCLs). A MCLG is a non-enforceable concentration of a drinking water contaminant that is protective of

adverse human health effects and allows an adequate margin of safety. A MCL is the maximum permissible level of a contaminant in water which is delivered to any user of a public water system. MCLGs are based solely on human health considerations (i.e., an identified adverse effect to human health, combined with an exposure intake estimate). In contrast, MCLs are to be as close to the MCLG as feasible, taking into consideration the availability and the cost of treatment technologies as well as the availability of analytical methodologies. When these two additional factors beyond health (treatment cost and analytical factors) are considered, the MCL for some chemicals is a higher (i.e., less stringent) value than the MCLG. However, there are also many chemicals for which the MCL is equal to the MCLG. This is particularly true for noncarcinogens. Over 80% of all current MCLs for noncarcinogens are identical to the corresponding MCLG for that substance. For carcinogens, MCLs are always higher than MCLGs because MCLGs for carcinogens are routinely set to zero.

Some States and Tribes utilize MCLs and MCLGs, as criteria to protect human health under the CWA. For some chemicals, the MCL or MCLG is more stringent than CWA section 304(a) human health criteria. In other cases, CWA criteria are more stringent than the MCL or MCLG. These differences come about for three basic reasons. First, as noted above, the 304(a) criteria under the CWA and MCLGs under the SDWA are strictly health-based values that do not account for treatment costs or analytical limitations. The MCL, however, does take into account treatment costs and analytical limitations. Second, the methodologies used to calculate the 304(a) criterion and the MCLG—both health-based values—for the same chemical often differ. Third, the MCLG and the 304(a) criterion sometimes have been calculated at different times, often years apart, using the current risk and exposure information at the time. Where different information on risk and exposure was used, differences in the numerical values can be expected.

It is important to consider some of the methodological differences between the derivation of 304(a) criteria and MCLs and MCLGs. Although the methods under SDWA and CWA both use the same reference dose (RfD) or cancer potency slope, and both methods assume a 70 kg adult and consumption of 2 liters of water per day, there are several important differences. One difference is that MCLGs for chemicals that are known or likely carcinogens are usually set equal to zero, while CWA section 304(a) criteria for carcinogens are based on an incremental cancer risk level and are never set equal to zero. For chemicals with limited evidence of carcinogenicity, the MCLG is usually based on the chemical's reference dose (RfD) for noncancer effects with the application of an additional uncertainty factor of 1 to 10 to account for its possible carcinogenicity. In contrast, the 1980 CWA section 304(a) criteria guidelines do not differentiate among carcinogens with respect to the weight of evidence grouping; all were derived based on lifetime carcinogenic risk levels.

Another important difference between the two methodologies is that a single determined risk value (single reference dose or single cancer risk value within the 10^{-4} to 10^{-6} range) is used in setting an MCLG, while CWA section 304(a) criteria have been derived for each of the three incremental risk levels spanning 10^{-5} to 10^{-7}, with the decision on which value to adopt left to the State or Tribe.

Another important methodological difference is in the approach to accounting for exposure sources. MCLGs for RfD-based chemicals developed under the SDWA follow a relative source contribution (RSC) approach in which the percentage of exposure that is attributed to drinking water is determined relative to the total exposure from all sources (e.g., drinking water, food, air). The rationale for this approach is to ensure that an individual's total exposure to a chemical does not exceed the RfD. To develop CWA human health criteria for noncarcinogens, the 1980 CWA National Guidelines recommended taking non-fish dietary sources and inhalation into account. However, data on these other sources were generally not available. Therefore, it was typically assumed that an individual's total exposure to a chemical came solely from drinking water from the water body and consumption of fish and shellfish living in the water body. Also, CWA criteria are based on a prediction of exposure from fish and shellfish using a bioconcentration factor (BCF) to estimate the bioconcentration of the individual chemical, and a fish/shellfish consumption rate. To date, under the current MCLG methodology, BCFs have not been used in the exposure estimates and fish/shellfish consumption rates have been only marginally accounted for (e.g., via general FDA dietary estimate or conservative default assumption).

Because of the differences in the approach to exposure and the basis of toxicity values, the health-based drinking water goal (MCLG) is sometimes more stringent than the CWA human health criterion (304(a) criterion). However, the opposite is sometimes true. An example of the former is 1,4-dichlorobenzene, for which both the MCL and MCLG are 75 ug/L and the 304(a) criterion (for protection of human health from the exposures of drinking water and consuming contaminated fish) is 400 ug/L. In this case, the MCLG was developed based on an assumption that 20% of the total exposure is from drinking water (the RSC factor applied to this noncarcinogen), whereas the CWA criterion effectively assumes that non-water exposure is negligible. Additional sources of difference between the two values are: (1) the BCF/BAF for 1,4-dichlorobenzene is low and thus does not make the 304(a) value significantly lower; (2) the MCLG was derived from an RfD of 0.1 mg/kg/day, while the 304(a) criterion utilized an Acceptable Daily Intake (ADI, now replaced by the use of RfDs) of 0.013 mg/kg/day; and, (3) the MCLG included a safety factor of 10,000, whereas the water quality criterion included a safety factor of only 1,000.

In contrast, for noncarcinogens where the BCF/BAF is high, the CWA criteria may be roughly equivalent or more stringent than the health-based drinking water levels because of the considerable exposure via fish/shellfish consumption that is assumed in deriving the CWA criteria. As with the previous example, the difference may be compounded if the toxicological values have a different basis. An example is endrin, for which the MCL and MCLG are 2 ug/L and the CWA section 304(a) human health criterion (again, for protection from the exposures of drinking water and consuming contaminated fish) is 0.76 ug/L. In this case, the drinking water level is, again, developed based on the RSC assumption of 20%, whereas the CWA criterion assumes that non-water exposure is negligible. However, the BCF/BAF for endrin is quite high (3,970) and drives the 304(a) value significantly lower. Furthermore, the MCLG was derived from an RfD of 3.0×10^{-4} mg/kg/day, while the CWA criterion utilized an ADI of 1.0×10^{-3} mg/kg/day. With endrin, both the MCLG and the water quality criterion included a safety factor of 100.

Of course as noted above, the MCL takes into account the cost or availability of treatment technology or analytical methods, and may be much less stringent than the CWA human health criterion, regardless of the

exposure assumptions or toxicological basis (e.g., 1,1,2-trichloroethane).

Because of the differing methods used to implement the SDWA and the CWA, EPA has recommended that, where consideration of available treatment technology, costs, or availability of analytical methodologies has resulted in MCLs that are less protective than MCLGs or CWA section 304(a) criteria, States and Tribes should consider using MCLGs and/or health-based CWA section 304(a) criteria to protect surface waters that are designated for water supply use under the State's or Tribe's water quality standards. Furthermore, when adopting water quality criteria to protect a surface water designated for drinking water supply use, States and Tribes should carefully consider what value (e.g., the MCLG or the 304(a) value) provides a defensible estimate of the water quality level necessary to fully protect the use, and whether relevant exposure routes have been adequately considered in the derivation of each value.

EPA stated its policy on the use of Section 304(a) human health criteria versus MCLs in 45 FR 79318, November 28, 1980. Additionally, a memorandum from R. Hanmer to the EPA Regional Water Management Division Directors dated December 12, 1988, provided detailed guidance with regard to this policy. Specifically, for the protection of public water supplies, EPA encouraged the use of MCLs. When fish ingestion is considered an important activity, EPA recommended the use of 304(a) criteria to protect human health. In all cases, if a 304(a) criterion did not exist for a chemical, an MCL was deemed a suitable level of protection.

The forthcoming proposed human health criteria guidelines (scheduled for publication in 1998 and cited above) are expected to recommend a slightly different approach. Although EPA considers the use of MCLs to protect surface waters under the CWA to be acceptable in the absence of 304(a) criteria, EPA expects to recommend that:

—MCLs only be used when they are numerically the same as the MCLG and only when the sole concern is the protection of public water supply sources (e.g., where the chemically toxic form in water is not the form found in fish tissue and, therefore, fish ingestion exposure is not an issue of concern);

—where consideration of available treatment technology, costs, or availability of analytical methodologies has resulted in MCLs that are different than MCLG values or 304(a) criteria, States and Tribes consider using MCLGs and/or 304(a) criteria to protect surface waters designated for water supply use;

—where fish consumption is an existing or potential activity, States and Tribes ensure that their adopted human health criteria adequately address this exposure route;

—where fish consumption is a designated use, States and Tribes use 304(a) criteria to protect that use because fish consumption and bioaccumulation are explicitly addressed by the 304(a) methodology;

—where water monitored at existing drinking water intakes has concentrations at or below MCLGs, then the water could be considered to meet a CWA designated use as a drinking water supply and a criterion reflecting that level could be adopted; and,

—for carcinogens where the MCLG is equal to zero, States and Tribes base a criteria value at the drinking water intake on an acceptable cancer risk level (i.e., a level within the range of 10–4 to 10–6), to protect human health. It is not intended that MCLGs of zero would be used as the basis for State or Tribal water quality criteria.

As States and Tribes may be more stringent than EPA, States and Tribes may adopt an MCL or MCLG as a water quality criterion that is more stringent than EPA's recommended section 304(a) criterion. In situations where a recommended 304(a) criterion is less protective than an MCL, EPA expects to recommend in the 1998 human health criteria methodology proposal use of the MCL instead of the recommended 304(a) criterion because it would help to ensure adequate source water protection and avoid costly compliance problems for downstream water supply utilities.

EPA has considered extensively this issue of equivalency between the drinking water component of CWA section 304(a) criteria and MCLGs or MCLs. EPA expects to move toward similar assessment methodologies (including its exposure and relative source contribution [RSC] policies) for deriving CWA criteria and MCLGs. Consistent exposure evaluation methodologies for deriving CWA 304(a) criteria for human health protection *and* MCLGs under SDWA, would, over time, eliminate the need to consider using MCLs for adopting State water quality standards. In the meantime, where there are differences between the MCLG and the 304(a) criteria for human health protection, EPA expects to continue to recommend using as the water quality criterion the value that, in the judgement of the State or Tribe, best accounts for the relevant routes of exposure. Of course, EPA will also approve use of the more stringent value.

Request for Comments on Human Health Criteria

EPA seeks public comment on the following questions:

1. Should the regulation require, or should guidance recommend, higher intake assumptions for site-specific or regional situations when subpopulations that are highly exposed have been identified? If so, what should be the basis for such intake assumptions?

2. Should the regulation be modified to clarify (beyond the guidance being proposed in 1998) the use of MCLs and MCLGs in State water quality standards? [Note: Comments on the establishment of similar assessment methodologies for deriving CWA criteria and MCLGs should be made during the public comment period following the anticipated 1998 Human Health Criteria Methodology proposal.]

15. Microbiological Criteria

Currently EPA has a criteria document titled ''Ambient Water Quality Criteria for Bacteria—1986'' which provides information on microbiological indicator organisms, sampling frequencies, and risk based criteria guidance which States and Tribes can use in establishing State or Tribal standards, especially for recreational waters. The indicators used are the Enterococci for fresh and salt waters (33/100mL and 35/100mL respectively) and *E. Coli* for fresh waters (126/100mL). It is recommended that sampling be performed on a weekly basis and the acceptability criteria are based on a running average level of the indicators on a monthly basis. The EPA Office of Research has completed a new Enterococci method (See ''Membrane Filter Test Method for Enterococci in Water,'' EPA–821–R–97–004, May 1997). This indicator method allows samples to be read in 24 hours rather than the 48 hours of the old Enterococci method.

In 1997, EPA established the Beaches Environmental Assessment Closure and Health Program (''BEACH'' Program) to protect the health of beach goers through assistance to State, Tribal, and local health officials in designing, developing and implementing beach monitoring and advisory programs. The BEACH Program will also survey local beach authorities about their programs and develop an Internet website to provide the public with information on local beach water quality conditions,

beach advisories and closures, and health risks associated with swimming in contaminated water.

While the Enterococci and *E. Coli* indicators and criteria guidance are satisfactory for determining risks from acute gastrointestinal disease they are not necessarily acceptable for determining risks from enteric viruses nor from pathogenic enteric protozoa such as *Giardia* and *Crypto Sporidium* since these pathogens are much more resistant environmentally and experience different treatment effectiveness. EPA is currently evaluating how it may develop human health criteria for protection from these organisms.

EPA may conduct additional research to develop indicator methods for non-enteric pathogens that cause skin, respiratory, eye, ear, and throat infections that are not detected by the current indicator methods. EPA also intends to examine the phenomenon of regrowth of the current indicators on soil and vegetation in tropical areas, and if deemed necessary add indicator development studies to replace the current indicators in tropical recreational areas. Further studies are proposed to examine rapid chemical indicators of fecal pollution to see if a tiered sampling protocol can be established for recreational water monitoring. Also, EPA plans to examine the development of improved monitoring strategies that States, Tribes and local authorities could use to assess the true impact of pollution during wet weather events. Finally, EPA will examine various computer models that could be used to predict microbial pollution from storm water events in watersheds and at recreational areas. These models would be validated by microbiological monitoring.

Request for Public Comment on Microbiological Criteria

EPA seeks public comment on the following questions:

1. Where and how is it best to conduct future programs to determine the safety of recreational waters?

2. What communication strategies would best inform the public about pathogen exposures?

3. What guidance should EPA provide to States, Tribes, and local governments on how to conduct beach monitoring activities?

16. Nutrient Criteria

In the National Water Quality Inventory 1994 Report to Congress, nutrients (nitrogen and phosphorous) are cited as one of the leading causes of water quality impairment in our Nation's rivers, lakes and estuaries. While nutrients are essential to the health of aquatic ecosystems, excessive nutrient loadings can result in the growth of aquatic weeds and algae, leading to oxygen depletion, increased fish and macro invertebrate mortality and other water quality impairments. In December 1995, EPA held a National Nutrient Assessment Workshop with the goal of developing a comprehensive nutrient strategy which would provide tools that can be used in assessing and controlling nutrients in all types of water bodies. Major conclusions from that workshop were: (1) a single set of national nutrient criteria is not a realistic goal, and (2) nutrient criteria need to be set on an ecoregional or watershed basis. EPA has since been developing a national nutrient strategy in order to communicate the specific approach and activities necessary to meet the goals and major conclusions of the National Nutrient Assessment Workshop.

On February 14, 1998, the ''Clean Water Action Plan'' was announced by the Administrator of EPA and the Secretary of Agriculture. The ''Clean Water Action Plan'' is a blueprint for restoring and protecting the Nation's precious water resources. As part of this Action Plan, EPA intends to identify the major sources of nitrogen and phosphorous in our waters and to identify actions to address these sources. In particular, EPA intends to accelerate development of nutrient criteria guidance for waters in every geographic region in the country, so that EPA and the States and Tribes can begin implementing a criteria system for nitrogen and phosphorous runoff for lakes, rivers, and estuaries by the year 2000. EPA will assist States and Tribes in adopting numeric water quality criteria for nitrogen and phosphorous, which EPA expects will take the form either of State- or Tribe-derived criteria where data is available, or criteria based on EPA default ranges applicable to their ecoregion(s). Where a State or Tribe does not adopt appropriate nutrient standards, EPA intends to begin the process of promulgating nutrient standards. To support meeting these expectations, EPA anticipates the following actions described below.

First, EPA intends to publish a National Nutrient Strategy which will present currently available tools for assessing eutrophication, identify important implementation issues related to controlling eutrophication, and provide the Agency's plan for developing water body-type guidance on nutrient over enrichment.

This national strategy will also present EPA's expectations for action on the part of States and Tribes, namely, development of numeric nutrient criteria and standards on a regional/watershed basis. Second, by the end of the year 2000, EPA expects to publish the water body-type guidance documents which would serve as ''user manuals'' for assessing and controlling nutrient over enrichment for specific water body types: lakes and reservoirs, rivers and streams, and estuarine and coastal waters. These documents will include techniques for assessing the trophic state of a water body and a methodology for developing region-specific nutrient criteria. In each document, EPA intends to provide regional nutrient ranges for phosphorus and nitrogen (and other parameters), which EPA would expect States and Tribes to use in setting nutrient criteria in the absence of any criterion that has been developed site-specifically. EPA intends to use existing State and Tribal projects and data, supplemented with new regional case studies and demonstration projects that are being conducted to collect information in data-limited areas of the country. An important component in developing default nutrient values is determining the appropriate scale of application (e.g., watershed, ecoregion, Northern lakes/Southern lakes, etc.). Finally, in order to promote the use of the water body-specific guidance, and ensure the development of nutrient criteria on a watershed or ecoregional basis nationwide, EPA will undertake several activities, including: (1) training in EPA regions and States, and Tribes, through the use of Regional Technical Assistance Centers; (2) appointing EPA Regional Nutrient Coordinators who will oversee the development and implementation of nutrient criteria and standards in each of the EPA Regions; and (3) offering assistance grants which will provide financial support to States and Tribes in their efforts to assemble existing data, including nutrient endpoint data, and to establish nutrient criteria either by watershed or ecoregion, where sufficient data are available.

Request for Comments on Nutrient Criteria

EPA requests comment on the following questions:

1. Should the regulation specifically require States and Tribes to adopt and implement numeric nutrient criteria?

2. What capabilities do States and Tribes have right now for developing and implementing water quality criteria for nutrients?

3. What are the institutional impediments to collecting nutrient data and developing nutrient standards, for example, staff numbers and expertise and financial resources?

4. Which States or Tribes are using an ecoregion or watershed approach to develop numeric nutrient standards (EPA is aware of some States doing this)? For those States and Tribes that do not, on what scale do their nutrient standards apply—statewide or by water body type?

D. Antidegradation

1. Background

The Federal antidegradation policy has its roots in the Water Quality Act of 1965 (Pub. L. 89–234), which stated in its declaration of policy, ''The purpose of this Act is to enhance the quality and value of our water resources and to establish national policy for the prevention, control, and abatement of water pollution.'' Policy guidelines established by the Department of the Interior in 1966 for use in the approval of States' water quality standards contained additional direction on antidegradation, stating that ''In no case will standards providing for less than existing quality be acceptable'' and ''The water quality standards proposed by a state should provide for: . . . The maintenance and protection of quality and use or uses of waters now of a high quality or of a quality suitable for present and potential future uses.'' Secretary of the Interior Udall further defined the Federal policy on antidegradation in 1968, when he said that each State was to include a statement similar to the following in their water quality standards:

Waters whose existing quality is better than the established standards as of the date on which such standards become effective will be maintained at their existing high quality. These and other waters of a State will not be lowered in water quality unless and until it has been affirmatively demonstrated to the State water pollution control agency and the Department of the Interior that such change is justifiable as a result of necessary economic or social development and will not interfere with or become injurious to any assigned uses made of, or presently possible in, such waters. This will require that any industrial, public or private project or development which would constitute a new source of pollution or an increased source of pollution to high quality waters will be required, as part of the initial project design, to provide the highest and best degree of waste treatment available under existing technology, and, since these are also Federal standards, these waste treatment requirements will be developed cooperatively.

The Federal Water Pollution Control Act Amendments of 1972 (Pub. L. 92–500) continued to emphasize the prevention of pollution and, in 1973, EPA developed guidance for State water quality standards under the Amendments that essentially repeated the 1968 statements of Secretary Udall.

In 1975, EPA promulgated regulations at 40 CFR 130.17(e) that required the States to develop an antidegradation policy and implementation procedures. The 1975 rule contained provisions that are very similar to those in 40 CFR 131.12, and provided protection for existing uses, high quality waters, high quality waters that constituted an outstanding National resource, and waters impaired by thermal discharges. EPA issued final rules on November 8, 1983 (48 FR 51400) that retained, with certain changes, the 1975 antidegradation policy and incorporated it into the regulations at 40 CFR 131.12. The changes to the 1975 antidegradation policy are discussed in the preamble to the 1983 rulemaking (48 FR 51402–51403), but they were generally intended to clarify the policy with no change in coverage or effect. An exception to this was the change in the provisions applicable to outstanding National resource waters, which eliminated the strict ''no degradation'' requirement in favor of a limited exception for activities that result in temporary and short-term lowering of water quality. The 1983 regulation (40 CFR 131.12(a)) provides that a State or Tribe is to identify its method for implementing the antidegradation policy, i.e., decision measures for assessing activities that may impact the integrity of a water body.

The 1987 Water Quality Act Amendments to the Clean Water Act (CWA) explicitly incorporated reference to antidegradation policies in section 303(d)(4)(B), which requires that such antidegradation requirements be satisfied prior to modifying certain NPDES permits to include less stringent effluent limitations (this concept is referred to as antibacksliding).

On March 23, 1995, EPA published the final Water Quality Guidance for the Great Lakes System (the Great Lakes Guidance). The Great Lakes Guidance includes an antidegradation component that is intended to work in conjunction with the other components of the Great Lakes Guidance to address the most pressing threats to water quality in the Great Lakes. In order to achieve this end, the focus of the antidegradation component is on decisions pertaining to new or increased loadings of specified bioaccumulative chemicals of concern within the Great Lakes basin. For other types of pollutants, States and Tribes are required to comply with the existing regulations at 40 CFR 131.12.

In the course of establishing a framework for making decisions regarding increased loadings of bioaccumulative chemicals of concern, the Great Lakes Guidance touches on a number of issues. The Great Lakes Guidance provides a procedure for identifying high quality waters on a pollutant-by-pollutant basis. The Great Lakes Guidance also defines how a significant lowering of water quality will be identified for purposes of determining whether or not an antidegradation review is required. Finally, the Great Lakes Guidance includes implementation procedures that describe how an antidegradation review should be conducted. In all cases, the antidegradation components of the Great Lakes Guidance are tailored to the control of bioaccumulative chemicals of concern; other solutions may be necessitated by environmental threats faced elsewhere in the Nation.

EPA's current thinking is that on a national scale, antidegradation is not being used as effectively as it could be and that a structured national debate on antidegradation is key to improvement. The debate needs to identify deficiencies in antidegradation policy and implementation provisions and begin the process of strengthening antidegradation as a meaningful mechanism to attain and maintain water quality standards. EPA invites comments and suggestions on the three-tiered approach currently in use and described below, as well as possible other approaches to more effectively accomplish the intent of the antidegradation requirements. As part of the ''Clean Water Action Plan'' announced on February 14, 1998 by the Administrator of EPA and the Secretary of Agriculture, EPA plans to develop additional guidance on Antidegradation. The discussion below articulates current EPA thinking in several areas of antidegradation. Elements of this current EPA thinking will likely be incorporated into the Antidegradation guidance EPA develops under the ''Clean Water Action Plan.''

2. General Description of Antidegradation

An antidegradation policy performs an essential function as part of the of States' and Tribes' water quality standards. Designated uses establish the water quality goals for the water body, water quality criteria define the minimum conditions necessary to achieve the goals and an antidegradation policy specifies the framework to be used in making

decisions regarding changes in water quality. The intent of an antidegradation policy is to ensure that in all cases, at a minimum, water quality necessary to support existing uses is maintained (tier 1), that where water quality is better than the minimum level necessary to support protection and propagation of fish, shellfish and wildlife, and recreation in and on the water (''fishable/swimmable''), that water quality is also maintained and protected unless, through a public process, some lowering of water quality is deemed to be necessary to allow important economic or social development to occur (tier 2), and to identify water bodies of exceptional recreational or ecological significance and maintain and protect water quality in such water bodies (tier 3). Antidegradation plays a critical role in allowing States and Tribes to maintain and protect the finite public resource of clean water and ensure that decisions to allow reductions in water quality are made in a public manner and serve the public good.

The watershed approach may be a powerful tool to achieving antidegradation goals (i.e., maintaining the chemical, physical, and biological integrity of the Nation's waters). Many and varied uses are made of the Nation's waters and in some cases, these uses conflict. The ability of particular waters to accommodate all uses is limited. High quality surface waters are an important and finite resource whose availability affects the health, welfare, and economic well-being of all the citizens of the United States. When operating properly, the antidegradation policies of States and Tribes ensure that water quality is conserved where possible and lowered only when necessary, and that those affected by the lowering of water quality have a say in the final decision. As a result, antidegradation policies are well-suited to assist States, Tribes and local communities in establishing and achieving watershed goals. Sensitive or highly valued water bodies can be identified and protected from degradation through outstanding national resource water (ONRW) or related designations. In other water bodies, where water quality is better than the minimum necessary to support fish and aquatic life and recreation, water quality should be maintained unless there is a demonstrated need to lower water quality. Consistent with the watershed approach and community-based environmental management, States' and Tribes' antidegradation policies and procedures can be a basis for a systematic and accessible planning process that protects against development having negative impacts on water quality. Additional authorities exist at the local level beyond State, Tribal and federal authorities which may allow additional protections to be put in place in accordance with the watershed management plan.

The water quality standards regulation requires each State and authorized Tribe to adopt, as part of its water quality standards, an antidegradation policy consistent with 40 CFR 131.12 and identify implementation methods for such a policy. This antidegradation policy provides a multi-level approach for the protection of water quality and applies to both point and non-point source activities. The level of protection that is provided to a specific segment depends upon a number of factors (e.g., a key determinant is whether existing water quality is found to exceed levels necessary to support ''fishable/swimmable'' uses). Antidegradation requirements are typically triggered when an activity is proposed that may have some effect on existing water quality. Such activities are reviewed to determine, based on the level of antidegradation protection afforded to the affected water body segment, whether the proposed activity can be authorized. ''Antidegradation reviews'' under all three tiers of antidegradation should be documented and subjected to public review and comment (e.g., as part of the public review of the water quality certification, NPDES permit, or other regulatory action).

Identifying the universe of activities that trigger antidegradation requirements is a fundamental and often controversial issue because of the number and variety of activities that can affect water quality. Clearly, a wide range of activities that affect water quality may be subject to antidegradation requirements, and States and Tribes have considerable flexibility in applying antidegradation policies.

The federal antidegradation requirements do not create, nor were they intended to create, State or Tribal regulatory authority over otherwise unregulated activities. It is the position of EPA that, at a minimum, States and authorized Tribes must apply antidegradation requirements to activities that are ''regulated'' under State, Tribal, or federal law (i.e., any activity that requires a permit or a water quality certification pursuant to State, Tribal or federal law, such as CWA § 402 NPDES permits or CWA § 404 dredge and fill permits, any activity requiring a CWA § 401 certification, any activity subject to State or Tribal nonpoint source control requirements or regulations, and any activity which is otherwise subject to State or Tribal regulations that specify that water quality standards are applicable). Where a State or Tribe wishes to require antidegradation reviews for activities that are not currently ''regulated'' under this definition, EPA recommends that a complete discussion of the activities requiring an antidegradation review be included in the State or Tribal water quality standards or other State or Tribal regulation. Although States and authorized Tribes have discretion to apply antidegradation requirements more broadly than minimally required, application of antidegradation requirements to activities that are otherwise unregulated under State, Tribal, and federal water law is not required by the federal water quality standards regulation.

EPA's current thinking is that antidegradation principles can and should be considered in connection with a number of activities even where application of the antidegradation review requirements is not explicitly required by the regulation. EPA is interested in identifying ways to better implement antidegradation, especially for activities such as urban and agricultural run-off. As part of general planning for development that is likely to affect surface water quality, it makes sense to consider existing ambient water quality and evaluate available means to protect that water quality. Thus, although a State or Tribe may not require a formal antidegradation review for a particular activity (e.g., an unregulated nonpoint source), there may still be value in applying the antidegradation principles in an analysis of potential environmental impacts.

In sum, EPA's current thinking is that the antidegradation policy is significantly underused as a tool to attain and maintain water quality and plan for and channel important economic and social development that can impact water quality. EPA believes this is especially true for nonpoint source run-off. This ANPRM provides an opportunity to identify and evaluate options for clarifying and strengthening antidegradation policy and its implementation.

States and authorized Tribes often submit implementation procedures to EPA for review as part of the water quality standards triennial review required by section 303(c) of the Act. This enables EPA to determine if the implementation procedures fulfill the requirements of the antidegradation

policy. The antidegradation policy itself is expressly required by 40 CFR 131.20(c) to be submitted to EPA for review. EPA's longstanding policy is that the implementation procedure should also be submitted to EPA for review. Often, however, implementation procedures are not submitted to EPA. EPA's current thinking is that an important change to the regulation would be to clarify under 40 CFR section 131.20(c) that State and Tribal antidegradation implementation procedures (in addition to the policy) must be included in the submittal of a State's or Tribe's water quality standards. Such a change could establish the foundation for additional substantive changes to the regulation concerning national norms for antidegradation implementation procedures.

A State's or Tribe's implementation method is on occasion so constructed as to essentially set aside the intent of the antidegradation policy. EPA has disapproved this aspect of State standards where the implementation procedure is inconsistent with the policy. Revising the regulation to specify requirements addressing the content of such implementation procedures (e.g., a core set of issues that must be resolved), and clarifying that implementation procedures must be included in the submittal package, may help to clarify EPA's role in determining whether State or Tribal antidegradation implementation procedures adequately uphold and implement the State's or Tribe's antidegradation policy. In addition, specifying in the regulation the basic elements of an implementation procedure could serve to better establish national norms for State and tribal antidegradation procedures. EPA is considering whether it would assist States and Tribes if the regulation were amended to identify the basic elements that must be included in an antidegradation implementation method.

Guidance on developing antidegradation implementation methods is provided through EPA's Regional Offices. EPA has not issued national guidance on these implementation methods and is interested in comments on whether national guidance on antidegradation implementation methods is needed, and whether elements of such guidance should be referenced or included in the Regulation.

Request for Comments on General Antidegradation Policy

EPA requests comment on the following questions:

1. What changes or clarifications could be made to the current tiered approach to protecting waters under antidegradation that would streamline and enhance antidegradation implementation?

2. Should the regulation be amended to identify the basic elements that must be included in an antidegradation implementation method and would such changes assist States and Tribes in understanding the requirements and in utilizing the flexibility available?

3. Is national guidance on antidegradation implementation methods needed and should elements of such guidance be referenced or included in the Regulation?

3. 40 CFR 131.12 (a)(1) ''tier 1''

Section 131.12 (a)(1) of the antidegradation policy contained in the water quality standards regulation requires that existing uses and the water quality necessary to protect them be maintained and protected. This provision, in effect, establishes the floor of water quality in the U.S. It also protects the environment where the existing use of a water body happens to be better than the use designated by the State or Tribe. An existing use as defined in 40 CFR 131.3 can be established by demonstrating that a use has actually occurred since November 28, 1975, or that the water quality is suitable to allow such uses to occur, whether or not such uses are designated uses for the water body in question. All waters of the U.S. are subject to tier 1 protection. In general, waters that are subject to only tier 1 antidegradation policies are those water bodies that do not exceed the CWA Section 101(a)(2) goals, or do not have assimilative capacity to receive additional quantities of a pollutant(s) without jeopardizing the existing use. Existing uses and additional issues related to defining them and their relationship to designated uses are further discussed in section III(B)(3) of this document.

Antidegradation policies are generally implemented for tier 1 by a review procedure that evaluates any discharge to determine whether it would impair an existing use. Prior to authorizing any proposed activity, a State or authorized Tribe shall ensure that water quality sufficient to protect existing uses fully will be achieved. In addition to ensuring that existing uses will be protected, the State or Tribe should ensure that all existing uses are designated in accordance with 40 CFR 131.10(i).

a. Tier 1 Implementation. In order to implement tier 1, a State or Tribe must define what is meant by the term ''existing in-stream water use'' (40 CFR 131.12(a)(1)) and must also be able to identify the level of water quality that is required to permit an existing use to continue to occur. Section 131.3 defines existing uses as, ''those uses actually attained in the water body on or after November 28, 1975 * * *'' Traditionally, when establishing designated uses, States and Tribes tend to define uses in terms of broad classes, such as warm water fishery or secondary contact recreation. Inherent in each of the broad use categories are specific uses that may be affected by a change in water quality. For example, a warm water fishery designated use may include the existing use of large mouth bass fishery. Many people would be upset if the warm water fishery designated use was protected in such a way as to allow a decline in the bass population. The central question faced by States and Tribes in determining whether or not a proposed action will impact existing uses is whether each specific use within a use class must be maintained (each individual type of species), or whether only the use class itself must be maintained (allow changes in species composition, but maintain a fishery). State and Tribal interpretations of this requirement vary considerably and are often tied to the degree of precision the State or Tribe achieves in defining designated uses.

Many States and some Tribes have addressed these questions by using the same degree of precision for both designated and existing uses. EPA's current thinking is that this is an acceptable approach as long as the State's or Tribe's designated uses and criteria applicable to those uses are adequate to ensure that existing uses are maintained under the federal antidegradation provisions. It would not be acceptable, for example, for a state to allow the loss of an existing natural cold water community in favor of a warm water community because both satisfy the general use designation of ''aquatic life.'' Nor would it be acceptable to allow shifts from existing pollution intolerant communities to communities that tolerate degraded conditions. The advantage of this approach is that the same criteria used to protect the designated use can be assumed to also protect the existing use. Under this approach, however, the protection afforded to existing uses is limited by the degree of refinement associated with the designated uses. States and Tribes that have more specific designated uses (i.e., including a number of use sub-categories) can potentially provide more protection by addressing more subtle changes to the existing use. States and

Tribes with less specific designated uses would have less precision associated with their existing use protection scheme.

An important tier 1 implementation issue concerns how a State or Tribe will prevent negative or harmful impacts to existing uses when water quality criteria that have been established to protect the designated uses are not adequate to protect the existing uses. For example, a regulated discharge of uncontaminated sediment may result in significant negative or harmful impacts to aquatic life habitat and loss of aquatic life use. In such cases, where clean sediment or siltation criteria have not been developed for the site, and where the State or Tribe has not established clear procedures to implement narrative criteria governing sedimentation, it may be difficult to prohibit such loss of use, particularly where a State or Tribe has not adopted biological criteria.

A second example arises where a proposed activity will result in the discharge of a substance for which numeric criteria have not been adopted by the State or Tribe, but sufficient data to derive criteria or a numeric translation of the narrative criteria are available. Where a range of numeric criteria can potentially be justified for the particular substance to protect the designated and/or existing use, it may be difficult or contentious for the State or Tribe to derive effluent limits protective of the existing use.

A third example arises where a proposed hydrologic modification will result in diminished flow in a water body and create the potential for loss of existing aquatic life use either through increased temperatures or turbidity, or loss of habitat. State and Tribal water quality criteria generally do not describe minimum acceptable flows and may not, by themselves, adequately protect against such loss of use. In *P.U.D. No. 1 of Jefferson County and City of Tacoma* v. *Washington Department of Ecology,* (114 S.Ct 1900 (1994)), the Supreme Court ruled that State certifications under section 401 of the CWA may include conditions to ensure compliance not only with a State's water quality criteria, but also with a State's designated uses or antidegradation policy. The Court concluded that a State could require, in this case, a dam to be designed and operated in such a way as to maintain stream flows necessary to protect the designated use of a stream. While this specific case had to do with a dam and stream flows necessary to protect a use, it should be noted that the opinion applies more broadly than to just flow and that in addition to maintenance of in-stream flows to protect water quality standards, States may also apply any other parameter that may not be specifically identified in the State's standards. EPA notes that where such implementation methods are spelled out, as a practical matter, they may be more easily implemented. (See related discussion in Section III.B. on uses). EPA believes that tier 1 methods or policies for addressing situations such as those described above may need to be included in an antidegradation implementation procedure.

Request for Comments on Antidegradation Tier 1

EPA specifically requests public comment on the following questions:

1. Do State and Tribal programs under the existing regulation do an adequate job of protecting existing in-stream uses?

2. Is a more detailed definition of ''existing in-stream water uses'' needed in the regulation? Should it be the same as ''existing uses?'

3. Should the regulation define what constitutes loss of an existing in-stream water use?

4. Should a clear approach to maintaining and protecting existing uses that may not be adequately protected by strict application of water quality criteria be a required element of an antidegradation implementation procedure?

5. Should the regulation specify under antidegradation that protection of both existing and designated uses is required?

4. 40 CFR 131.12 (a)(2) ''tier 2''

''Tier 2'' (§ 131.12(a)(2)) antidegradation policies are intended to protect the waters in which water quality is better than necessary to support propagation of fish, shellfish and wildlife, and recreation in and on the water body. These are called high quality waters. For such high quality waters, existing water quality must be maintained and protected unless it is demonstrated that a lowering of water quality is necessary to accommodate important economic or social development. The protection of high quality waters envisioned by the regulation encourages a systematic, public decision making process for determining whether or not to allow limited deterioration of water quality in high quality waters.

a. Identification of ''High Quality'' Waters. Identifying waters that are ''high quality'' and subject to tier 2 protection is an important antidegradation issue. The water quality standards regulation requires application of tier 2 requirements ''where the quality of the waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water.'' However, the regulation does not include specific guidelines for identifying high quality waters. Various EPA guidance documents, including those issued by EPA's Regional offices, make a variety of suggestions concerning approaches to defining tier 2 waters. Not surprisingly, States and Tribes have developed various ways to identify tier 2 waters.

Existing approaches for identifying high quality waters fall into two basic categories: (1) pollutant-by-pollutant approaches, and (2) water body-by-water body approaches. States and Tribes following the first approach determine whether water quality is better than applicable criteria for specific pollutants that would be affected by the proposed activity. Thus, available assimilative capacity for any given pollutant is always subject to tier 2 protection, regardless of whether the criteria for other pollutants are satisfied. Such determinations are made at the time of the antidegradation review (i.e., as activities that may degrade water quality are proposed). States and Tribes following the second approach weigh a variety of factors to judge a water body segment's overall quality. Such determinations may be made prior to the antidegradation review (i.e., the State or Tribe may assign ''high quality'' designations in the State or Tribal standards), or during the course of the antidegradation review. Under this water body-by-water body approach, sometimes referred to as the ''designational'' approach, assimilative capacity for a given pollutant may not be subject to tier 2 protection if, overall, the segment is not deemed ''high quality.''

There are advantages and disadvantages to each approach. EPA's current thinking is that neither approach is clearly superior and that either, when properly implemented, is acceptable. EPA has approved both approaches in State standards. Some States and Tribes have found the pollutant-by-pollutant approach to be easier to implement because the need for an overall assessment considering various factors is avoided. Also, decisions are driven strictly by water column data (i.e., rather than judgments concerning a segment's overall value or quality) and thus may be less susceptible to challenge. The pollutant-by-pollutant approach may result in more waters receiving some degree of tier 2 protection because it would cover

waters that are clearly not attaining goal uses (i.e., waters which are not supporting ''fishable/swimmable'' goal uses but that possess assimilative capacity for one or more pollutant).

The water body-by-water body approach, on the other hand, allows for a weighted assessment of chemical, physical, biological, and other information (e.g., unique ecological or scenic attributes). In this regard, the water body-by-water body approach may be better suited to EPA's stated vision for the water quality standards program: refined designated uses with tailored criteria, complete information on uses and use attainability, and clear national norms. The water body-by-water body approach preserves water quality even if criteria for certain pollutants are not attained or if criteria for certain uses may be limited, such as fish consumption. This approach also allows for the high quality water decision to be made in advance of the antidegradation review (and included in the water quality standards for the segment), which may facilitate implementation. A water body-by-water body approach also allows States and Tribes to focus limited resources on protecting higher-value State or Tribal waters. The water body-by-water body approach can also distinguish between high quality waters and high water quality and preserve high quality waters on the basis of physical and biological attributes, rather than high water quality attributes alone. However, the flexibility of the water body-by-water body approach is also its principal disadvantage where a State or Tribe does not develop inclusive qualification criteria. For example, where a State's or Tribe's implementation guidelines define a narrow universe of waters, many deserving high quality waters may not receive tier 2 protection. Thus water quality may actually decrease in the waters not classified for tier 2 protection without a public review of the development decision. Also, a potential problem can arise if the process of identifying high quality waters becomes so complicated, resource-intensive, and data-intensive that the primary purpose of tier 2 (i.e., seeking to maintain and protect existing quality by identifying whether there are reasonable less-degrading or non-degrading alternatives) is not adequately accomplished. In other words, the limited resources available for water quality protection could be spent on the identification process at the expense of analysis of the necessity for degradation.

b. Tier 2 Implementation. The current regulation provides a great deal of flexibility to States and Tribes in implementing tier 2 requirements. Some States and Tribes devote little effort to implementing their tier 2 requirements, some States and Tribes apply tier 2 requirements in an inconsistent or infrequent manner, and other States and Tribes have active programs that routinely and consistently implement tier 2. In general, those States and Tribes that actively implement their tier 2 requirements do so by conducting an antidegradation review to determine whether proposed activities that might affect water quality may be authorized. EPA's current sense is that the antidegradation policy, in reality, has little effect on decisions related to surface water quality unless the State or Tribe adopts an implementation procedure and uses it. EPA currently reviews all State and Tribal water quality standards at the time of adoption/revision to ensure they establish a clear approach to implementation. A brief discussion of a number of the major implementation issues is presented below.

i. Triggers for tier 2 Review. Although not discussed in 40 CFR 131.12 of the water quality standards regulation, State and on occasion Tribal tier 2 implementation procedures often include guidelines which are used to determine when the water quality degradation that will result from a proposed activity is significant enough to warrant further antidegradation review. Where the degradation is not significant, the antidegradation review is typically terminated for that proposed activity. The significance evaluation is usually conducted on a pollutant-by-pollutant basis, even where a water body-by-water body approach is used to identify high quality waters, and significant degradation for any one pollutant triggers further review for that pollutant.

Applying antidegradation requirements only to activities that will result in significant degradation is a useful approach that allows States and Tribes to focus limited resources where they may result in the greatest environmental protection. However, there is a great deal of variation in how States and Tribes define significant degradation. Significance tests range from simple to complex, involve qualitative or quantitative measures or both, and may vary depending upon the type of pollutant (e.g., the approach may be different for highly toxic or bioaccumulative pollutants). In some cases, States have also created categorical exemptions from tier 2 review (e.g., they have exempted entire categories of activities from antidegradation reviews based on a general finding that such activities do not result in significant degradation). States or Tribes that define a high threshold of significance may be unduly restricting the number of proposed activities that are subject to a full antidegradation review. Further the approach currently used by some States may not adequately prevent cumulative water quality degradation on a watershed scale. The current regulation does not specify a significance threshold below which an antidegradation review would not be required. EPA's current thinking is that a clear national norm regarding this ''significance test'' is necessary and should be developed and established in either the regulation or national guidance.

A related issue concerns whether tier 2 should be applied to pollutants where numeric criteria have not been adopted. For example, where there is a proposed discharge of a pollutant to a ''high quality'' segment, and the background concentration of the pollutant is at or near zero in the water body, should significant degradation be evaluated and should it be evaluated any differently where numeric criteria for the pollutant have not been adopted? For example, where a State or Tribe lacks numeric criteria for nutrients such as nitrogen and phosphorus (a common occurrence), increased discharges of these nutrients can be expected to result in changes in plant life or species diversity. If the State or Tribe relies entirely on a pollutant loadings comparison to numeric criteria for the tier 2 evaluation, new loadings of nutrients may not even be evaluated under tier 2.

EPA's sense is that, in practice, the current tier 2 requirements tend to be used to protect high quality waters only where such high quality supports fishing and swimming uses. However, limiting tier 2 protection to assimilative capacity associated with only fishing and swimming uses means that the protection afforded by tier 2 can end up being narrower than intended. For example, where a water has unique ecological significance (e.g., acid bog or thermal spring) not captured by ''fishable/swimmable,'' the State or Tribe may not believe it is appropriate to designate the water as high quality under tier 2. In this case, the unique ecological characteristic would warrant protection as an existing use. The State or Tribe also has the option of designating the water ONRW, yet, as discussed elsewhere in this section, EPA believes that many States and Tribes are not inclined to designate waters ONRW. The result in this example is that a water with unique

ecological significance that may warrant a relatively high level of protection, falls through the crack between tiers 1 and 2 where the State or Tribe interprets the level of protection afforded by those tiers too narrowly.

ii. ''Necessary'' Lowering of Water Quality. The water quality standards regulation requires that the water quality of high quality waters not be lowered unless the State or Tribe determines that such degradation is necessary to accommodate important social and economic development. Given the variety of available engineering approaches to pollution control and the emerging importance of pollution prevention, the finding of necessity is among the most important and useful aspects of an antidegradation program and potentially an extremely useful tool in the context of watershed planning. An approach that has been recommended by EPA is to require the proponent of the proposed activity to develop an analysis of pollution control/pollution prevention alternatives. In conducting its antidegradation review, the State or Tribe then ensures that all feasible alternatives to allowing the degradation have been adequately evaluated, and that the least degrading reasonable alternative is implemented. Also, note that where less-degrading alternatives are more costly than the pollution controls associated with the proposal, the State or Tribe should determine whether the costs of the less-degrading alternative are reasonable. EPA believes that such an alternatives analysis approach can be an effective tool for maintaining and protecting existing assimilative capacity. EPA's current thinking is that specifying what would constitute an acceptable alternatives analysis in the regulation, could result in the addition of substance and rigor to the ''tier 2'' antidegradation reviews conducted by States and Tribes.

iii. Identification of ''Important'' Social or Economic Activities. Another task that must be completed as part of an antidegradation review is to evaluate whether a proposed activity that will result in degradation is necessary to accommodate important social or economic development in the area in which the waters are located. (40 CFR 131.12(a)(2)) The significance of determining if an activity will provide for important social or economic benefit is that, absent important social or economic benefit, degradation under tier 2 must not be allowed. Factors that may be addressed in such an evaluation include: (a) employment (i.e., increasing, maintaining, or avoiding a reduction in employment), (b) increased production, (c) improved community tax base, (d) housing, and (e) correction of an environmental or public health problem. Some States or Tribes have addressed this issue by requiring the applicant to bear the burden of demonstrating the social and economic importance of the proposed activity. However, approaches for evaluating social and economic importance vary widely. EPA published *Interim Economic Guidance for Water Quality Standards: Workbook,* Appendix M to the ''Water quality Standards Handbook—Second Edition'' in March 1995 (EPA–823–B–95–002, March 1995). This guidance specifically addresses the determination of social and economic importance in the context of a tier 2 antidegradation review and should be useful to States and Tribes in determining the relative economic consequences of various development proposals and their relationship to water quality standards. EPA's current thinking is that determining the social and economic importance of a proposed activity is an important public question best addressed by State, Tribal or local interests, perhaps as part of the development of a basin plan.

iv. Tier 2 and Identification of Waters under CWA Section 303(d). Section 303(d) of the Clean Water Act and EPA regulations require States to develop lists of waters that do not meet State water quality standards, even after point sources of pollution install the minimum required levels of pollution control technology. Section 303(d) lists must be submitted to EPA every two years. The waters on the lists are called water quality-limited waters and are defined in EPA regulations as waters ''where it is known that water quality does not meet applicable water quality standards, and/or is not expected to meet applicable water quality standards, even after the application of the technology-based effluent limitations required by section 301(b) and 306 of the [Clean Water] Act.'' 40 CFR 130.2(j). States are then required to develop total maximum daily loads (TMDLs) for water quality-limited waters.

EPA's current policy is that States include waters on section 303(d) lists if applicable water quality standards are not met or are not expected to be met by the next list submission deadline, i.e., within two years (see memorandum from Robert Wayland, Director Office of Wetlands, Oceans and Watersheds, to Water Management Division Directors, Regions I–X, Directors Great Water Body Programs and Water Quality Branch Chiefs, Regions I–X, Subject: National Clarifying Guidance for 1998 State and Territory Section 303(d) Listing Decisions, August 27, 1997). In determining whether to list waters, States should consider all aspects of applicable water quality standards, including narrative and numeric criteria, designated uses, and antidegradation policies.

EPA is currently discussing with stakeholders possible changes and clarifications to the water body listing regulations and guidance under section 303(d) of the Act. Changes and/or clarifications could include a statement in the regulation, or a clarification, that identifies existing tier 2 antidegradation analyses and decisions as ''existing and readily available water quality-related data and information'' that must be considered under 40 CFR 130.7(b)(5) when deciding whether to place a water body on a section 303(d) list. Information from existing antidegradation tier 2 reviews on assimilative capacity for particular water bodies could be used to determine whether a water body is likely to not meet water quality standards in the near future and thus required to be included on the section 303(d) list. In addition, EPA could amend the existing antidegradation regulations to direct States and Tribes to consider the 303(d) listing status of a water body, and the information supporting that status, when determining whether a proposed activity that is expected to degrade water quality in that water body can be authorized under tier 2 of the State's or Tribe's antidegradation provisions.

v. Achieving all cost-effective and reasonable best management practices for nonpoint sources. This implementation issue arises from one sentence that is included in the federal antidegradation policy at 40 CFR 131.12(a)(2):

> Further, the State shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control.

This sentence has been somewhat controversial over the years because it could be interpreted to require a State or Tribe to include, in its water quality standards, a provision requiring adoption of authority for, as well as achievement of, best management practices (BMPs) for nonpoint sources prior to allowing degradation of high quality waters. EPA has interpreted 131.12(a)(2) as not requiring a State or Tribe to establish BMP requirements for nonpoint sources where such BMP requirements do not exist. As EPA clarified in a February 22, 1994 guidance memorandum, State and

Tribal antidegradation rules need only include provisions to assure achievement of BMPs that are required under State or Tribal nonpoint source control laws or regulations. (Memorandum from Tudor T. Davies, Director EPA Office of Science and Technology to EPA Water Management Division Directors, Regions I–X, Subject: Interpretation of Federal Antidegradation Regulatory Requirement, February 22, 1994) Thus, States and Tribes that have adopted nonpoint source controls must assure that such controls are properly implemented before authorization is granted to allow point source degradation of water quality.

EPA's current thinking is that the term ''all cost-effective and reasonable best management practices for nonpoint source control'' in 40 CFR 131.12(a)(2) would be more effective if read more broadly. In other words, the term could include nonpoint source best management practices established through Federal, State, Tribal, and local authorities and programs that address activities on the land or water that create or exacerbate impacts to surface waters. This construction is consistent with EPA's Total Maximum Daily Load (TMDL) program under Section 303(d) of the Clean Water Act. There, EPA's current policy is that in achieving pollutant load reductions from nonpoint sources, EPA and States should work in partnership, using all available Federal, State, and local authorities and programs. As EPA stated in an August 1997 TMDL guidance memorandum, States are expected to achieve nonpoint source pollutant load reductions through such authorities and programs, including non-regulatory, regulatory, or incentive-based programs. EPA is considering applying the same test to § 131.12(a)(2).

In addition, EPA's current thinking is that it may be time to begin to more actively ensure implementation of this requirement: to implement cost effective and reasonable best management practices for nonpoint source control before allowing lowering of water quality in a water body. One way to do this would be to specify that State and Tribal antidegradation implementation procedures include a step under which States and Tribes inventory their nonpoint source authorities and programs, and, as part of each antidegradation review, include in the record documentation on how those authorities and programs were applied to activities in a watershed in which additional loadings subject to an antidegradation review have been considered. Emphasizing this requirement by specifying it as a required aspect of a State or Tribal antidegradation implementation procedure, in EPA's view, would facilitate use of antidegradation policy as a tool to ensure that nonpoint sources are controlled where possible in accordance with water quality standards, before any additional assimilative capacity in a water body can be allocated to an activity. EPA is interested in comment on this current thinking and specifically on whether it would be helpful to revise the regulation to clarify the relationship between nonpoint source controls and tier 2 antidegradation requirements.

In summary, numerous stakeholders have commented to EPA that antidegradation reviews are conducted inconsistently across the country and that EPA should attempt to improve the national consistency of such reviews. EPA is interested in comment on the appropriate balance between national consistency and State and Tribal flexibility in the implementation of the tier 2 provision and on what changes may be needed to the regulation or EPA policy or guidance to ensure that the tier 2 provision is implemented in a nationally consistent manner that is consistent with the intent of the antidegradation provision, and whether a consistent approach should be the goal of States' and Tribes' watershed programs.

Request for Comments on Antidegradation Tier 2

EPA requests comment on the following questions:

1. Does the existing requirement to apply tier 2 ''where the quality of the waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water'' while at the same time ''protecting existing uses fully'' need to be clarified with respect to which waters are afforded tier 2 antidegradation protection, and if so, should the Agency clarify the requirement with additional guidance, or with revisions to the regulation?

2. What factors should be considered in identifying ''high quality'' waters? Should the decision be based strictly on chemical water column quality (i.e., a pollutant-by-pollutant approach), or should a segment's overall quality or other factors be considered (i.e., a water body-by-water body approach)?

3. Given EPA's current thinking that both approaches may be acceptable and neither is necessarily superior, are the two approaches compatible and could they be implemented together?

4. Should application of tier 2 be clarified so that protection of assimilative capacity associated with non-fishable/swimmable uses is clearly required?

5. What methods are currently being used by States and Tribes to define ''significant degradation''?

6. How should ''significant degradation'' be defined? Is there a need for a nationally consistent approach? Should EPA issue additional guidance, or revise the regulation to include, for purposes of implementing tier 2 requirements, a definition of significant degradation? Are categorical exemptions appropriate, and if so, under what circumstances?

7. How should cumulative effects in a watershed be considered in assessing the significance of the degradation that will occur as a result of a proposed activity?

8. How should the ''necessity'' of degradation be determined? When should the costs of less degrading alternatives be considered reasonable?

9. How should significant degradation be evaluated for pollutants where no numeric criterion has been adopted?

10. Is additional Agency guidance or regulatory requirements necessary to help States and Tribes address social and economic importance (e.g., additional methods or options beyond those discussed in the March 1995 Interim Economic Guidance document)?

11. Should evaluating the importance of proposed discharges be entirely a State or Tribal determination and not be a required element for EPA review?

12. Would it be appropriate to revise the regulation to clarify the relationship between nonpoint source controls and tier 2 antidegradation requirements?

13. Should EPA revise the regulation to expressly state that States and Tribes are to consider the 303(d) listing status of a water body, and the information supporting that status, when determining whether a proposed activity that is expected to degrade water quality in that water body can be authorized under tier 2 of the State's or Tribe's antidegradation provisions?

14. Is greater consistency between individual State and Tribal programs desirable and, if so, what changes may be needed to the regulation or EPA guidance to ensure that the tier 2 provision is implemented in a nationally consistent manner?

5. 40 CFR 131.12 (a)(3) ''Tier 3''

Tier 3 of the antidegradation policy is intended to identify and protect waters of extraordinary ecological, recreational or other significance. Tier 3 of the antidegradation policy incorporates the

concept of Outstanding National Resource Waters (ONRW). The rationale for this provision is that some water bodies are of such high quality or of such exceptional ecological significance that the commonly applied designated uses such as warm water fishery and primary contact recreation and criteria to protect those uses are not suitable or may not provide adequate protection to maintain the high water quality or ecological significance in a given water body.

ONRWs are intended to include the highest quality waters of the United States. Additionally, the ONRW antidegradation classification offers special protection for waters of ''exceptional ecological significance,'' i.e., those water bodies which are important, unique, or sensitive ecologically, but whose water quality, as measured by the traditional characteristics such as dissolved oxygen or pH, may not be particularly high, such as thermal springs. Waters of exceptional ecological significance also include waters whose characteristics cannot adequately be described by traditional parameters (such as wetlands and estuaries).

Tier 3 of the antidegradation policy provides the highest level of protection to water bodies by prohibiting the lowering of water quality. The only exception to this prohibition as discussed in the preamble to the water quality standards regulation is for activities that result in short-term and temporary changes in the water quality of the ONRW. EPA guidance has not defined temporary and short-term specifically, but views these terms as limiting water quality degradation for weeks or months, not years. The intent is to limit degradation to the shortest possible time.

a. Designating ONRWs. The designation of water bodies as ONRWs has been limited in its application. Overall, there are relatively few water bodies designated as ONRWs in the United States, although some States have designated a high percentage of State waters as ONRWs. Several States have been reluctant to adopt ONRWs because of concerns regarding the process for adopting ONRW classifications and the level of protection afforded to a water once it is classified as an ONRW.

Regarding the process for adoption of ONRWs, the existing regulation requires the State or Tribe to provide an ONRW level of protection in their antidegradation policies, but there is no requirement that any water body be so designated or any specificity as to how that is to be done. One way to address this issue may be for EPA to amend the regulation to require States and Tribes to establish a nomination process with criteria guidelines in which the public could petition the State or Tribe for designation of certain waters as ONRWs. It would then be up to the State or Tribe to set criteria for the ONRW selection process with the final decision made by the State or Tribe after consideration of the public comment. EPA currently recommends three categories of waters which could be eligible for ONRW designation: waters of (1) National and State parks, (2) wildlife refuges, and (3) exceptional recreational or ecological significance.

Regarding the level of protection that is afforded to a water body once it is classified as an ONRW, a common concern is that classifying a water as ONRW will result in a federal prohibition on any further development of any kind in the watershed. As described above, the federal antidegradation policy regarding ONRWs is that once classified as an ONRW, the water quality of the ONRW must be maintained and protected. One way, but perhaps not the only way, to ensure that the water quality is maintained and protected would be to prohibit activities that would generate additional pollutant loads and or water quality impacts in the ONRW. This approach is commonly referred to as ''no new or increased discharge'' and was explained by EPA in its promulgation of antidegradation provisions for the State of Pennsylvania in 1996 (61 FR 64816, December 9, 1996). As discussed in the Pennsylvania rule, the federal policy requiring the water quality to be maintained and protected is subject to some interpretation by States and Tribes.

EPA believes there is considerable uncertainty from jurisdiction to jurisdiction concerning the impact of the ONRW classification on the local community or the State or Tribe. How will the State or Tribe handle future needs for development in the area of the ONRW? What role does EPA play in ensuring that the State or Tribe provides the highest protection measures to ONRWs? EPA's current thinking is that this ''no further development in the watershed prohibition'' may be an overly strict interpretation of the protection required by tier 3 and that a public debate is necessary to clarify the level or range of protection that is afforded to a water by classifying it as an ONRW, and how that level or range should be determined.

One way to remove uncertainty surrounding the implications of ONRW designations is for States and Tribes to adopt concurrent with the ONRW the implementation methods for that water body that define what attributes of the water will be protected and how this will be accomplished by both point and nonpoint sources. It may make sense for the regulation to include this requirement in order for all parties concerned to know the impact on development of such a designation before adopting an ONRW.

i. Relationship of Tier 3 to the Wild and Scenic Rivers Act. Additionally some States have not adopted waters as ONRWs when there has been concern regarding ONRW requirements and the requirements of a wild, scenic, or recreational water body. Although the Department of Interior (DoI) founded the antidegradation policy from which the concept of an outstanding national resource water (ONRW) that EPA currently uses evolved, an ONRW is different from the Wild and Scenic Rivers program administered by DoI. ONRWs are designated by the State or Tribe in their water quality standards. Wild and scenic rivers are given their designation by Congress or the Department of Interior pursuant to the Federal Wild and Scenic Rivers Act. The main purpose of the Wild and Scenic Rivers Act is to keep waters free-flowing. The main purpose of an ONRW designation is to maintain and protect high quality waters that constitute outstanding resources due, for example, to their exceptional recreational or ecological significance, which can include free-flowing water. EPA does not see any conflict between these two programs.

b. Tier 3 Implementation. EPA in chapter 4 of the Water Quality Standards Handbook interprets the ''water quality to be maintained and protected'' provision of the regulation as requiring no new or increased discharges to ONRWs and no new or increased discharge to tributaries to ONRWs that would result in lower water quality in the ONRWs. The only exception is for short-term and temporary changes. In contrast, some States, Tribes, and EPA Regions have interpreted this provision to allow new discharges as long as the water quality is either maintained or improved. Alternatively, some States, Tribes and Regions have interpreted water quality in terms of the characteristics for which the water body was selected to be an ONRW and have strictly maintained those characteristics while allowing other characteristics to become degraded. EPA has also allowed a proposed activity that will result in a new or expanded source where the applicant agrees to implement or

finance upstream controls of point or nonpoint sources sufficient to offset the water quality effects of the proposed activity. This offset is generally called trading and is accomplished through a TMDL pursuant to CWA Section 303(d) requirements. Such TMDLs include an appropriate margin of safety and address, in particular, the uncertainties associated with any proposed nonpoint source controls, as well as variability in effluent quality for point sources.

This variability in interpretation has created ONRWs across the Nation that vary in terms of the stringency of point source controls, and types of water bodies considered to be ONRWs. Restrictions on physical changes have also been implemented in an inconsistent manner. EPA is considering whether the existing ONRW protection program is addressing an appropriate universe of waters and whether the flexibility provided under the regulation, in terms of coverage and protection requirements, needs to be further restricted, maintained, or expanded. It may make sense to have an ONRW designation which is permanent and allows no change in water quality and applicable to few waters while creating a subset of waters which can have some change in water quality under certain circumstances.

c. Tier 2½. Several States and Tribes have already created, as part of their antidegradation policy, a provision that is in between EPA's recommended tier 2—high quality waters and tier 3—Outstanding National Resource Waters, sometimes referred to as Tier 2½. This additional tier is given various names, such as Outstanding State Resource Waters, Outstanding Tribal Waters, Special Protection Waters, or Water of Exceptional Significance. When it supplements tier 2 and tier 3 provisions, EPA has accepted this provision as being consistent with the intent and spirit of the antidegradation policy. Inclusion of a tier 2½ within the regulation would encourage States and Tribes to apply more stringent controls than would be required under tier 2 but with more flexibility to make adjustments in criteria and permitting decisions than would normally be allowed if the water body in question were designated as an ONRW. Any additional flexibility that might be created by a tier 2½ classification to allow additional activities that could marginally affect water quality, might not be necessary where a State or Tribe (or EPA) considers such flexibility to already exist in the context of the ONRW classification. In commenting on the flexibility afforded by the tier 2½ classification, commenters are urged to state their understanding of the flexibility currently afforded in the ONRW classification.

Request for Comments on Antidegradation Tier 3

EPA seeks comment on the following questions:

1. Should EPA add definitions of important terms to the ONRW part of the regulation, including a definition of ''degradation'' which clarifies that temporary or short-term effects on ONRW waters could be authorized? Should definitions of ''short-term'' and ''significant'' also be included?

2. Should EPA require States and authorized Tribes to establish both a process and qualification criteria which would allow the public to nominate waters for the ONRW designation? Would EPA guidance be helpful?

3. Should the tier 2½ antidegradation policy concept be explicitly recognized in the federal regulation and what, if any, limits or factors for application of the tier should be included?

4. States (and Tribes) have differing interpretations of the level of protection afforded ONRWs. Should EPA further specify in the regulation what maintaining and protecting water quality in ONRWs means?

6. 40 CFR 131.12 (a)(4) ''Thermal Discharges''

The requirement to prevent potential water quality impairment associated with thermal discharges contained in § 131.12 (a)(4) of the regulation is intended to coordinate the requirements and procedures of the antidegradation policy with those established in the CWA for setting thermal discharge limitations. Regulations implementing section 316 may be found at 40 CFR 124.66. The statutory scheme and legislative history indicate that limitations developed under section 316 take precedence over other requirements of the CWA. EPA is not requesting comment on this section of the regulation. This provision is mentioned here only in the interest of completeness.

E. Mixing Zones

1. Background

The current regulation (at 40 CFR 131.13) describes States' and Tribes' discretionary authority to include, in their water quality standards, policies that affect the implementation of those standards. For example, States and Tribes may adopt policies on mixing zones, variances, and schedules of compliance for water quality-based NPDES permit limits. If included in their water quality standards or other implementing regulations, States and Tribes are required to submit such policies to EPA for review and approval. The policies governing the implementation of water quality standards are inseparable from the standards themselves and, consequently, EPA reviews both to determine whether implementation policies are compatible with the State or Tribal water quality standards provisions, technically well founded and consistent with the CWA.

Concerns have been expressed both by the regulated community and environmental groups over the lack of specificity in State and Tribal mixing zone policies and implementation procedures adopted under this general policies provision. These groups believe that this lack of specificity may result in rather subjective and inconsistent implementation of water quality standards, from site-to-site. EPA has also, through its ten regional offices, not always applied uniform standards in reviewing individual States' and Tribes' mixing zone provisions.

In encouraging the implementation of water quality management activities consistent with a broader watershed approach, EPA has encountered inconsistent implementation of mixing zone provisions across State and Tribal borders, within whole watersheds, and sometimes along a single water body. Remedies to water quality problems designed along watershed boundaries can be limited in their effectiveness as a result of differing policies, procedures and treatment of the same water body by different authorities. A certain amount of flexibility is, however, essential when dealing with complex water quality problems on a watershed or basin scale. EPA's current thinking is that it is preferable to be more explicit about where the program requires consistency and where flexibility is allowed or encouraged.

The current regulation does not articulate any EPA requirements regarding the content of mixing zone implementation procedures. Rather, EPA guidance addressing mixing zones, and stream design flows is contained in several documents, including the *Water Quality Standards Handbook: Second Edition* (the Handbook) and the *Technical Support Document for Water Quality-based Toxics Control, March, 1991* (the TSD). Although program and technical guidance identifies the approaches to standards implementation which EPA recommends and considers protective of water quality, guidance is not equally effective at delineating what constitutes

minimally acceptable content or the approaches EPA considers to be not approvable or inconsistent with the CWA. Further, most regulatory agencies, as well as the regulated community, are most concerned with what is required rather than what is recommended. Policy or guidance is not binding whereas regulation is. Guidance is better designed to provide detailed descriptions of the variety of technically sound implementation approaches and their underlying scientific basis; regulation provides the clearest direction regarding required minimal program content and identification of those components of the program where flexibility is allowed.

EPA is considering an expansion of the section of the regulation addressing general policies to provide clear, detailed and specific direction to States and Tribes on the development and content of mixing zone policies and implementation procedures. EPA's current thinking is that greater specificity within this portion of the regulation may be needed to clarify the minimum necessary elements of State and Tribal mixing zone policy and implementation procedures. EPA's current thinking is that this area of the regulation needs to articulate a clear level of national consistency in mixing zone implementation that results in a consistent level of protection across the country and at the same time, where State and Tribal flexibility is not only encouraged, but possibly essential to program efficiency and accuracy.

2. EPA Policy and Guidance on Mixing Zones

The concept of mixing zones as a regulatory tool to address the incomplete mixing of wastewater discharges in receiving waters has been embraced by both EPA and its predecessor agencies as part of a larger regulatory effort to ensure that point source discharges of wastes do not impair beneficial uses. EPA interprets the CWA as allowing the use of mixing zones as long as the provisions addressing toxicity at section 101(a)(3) are met and the designated uses of the water body as a whole are protected. One court has considered the application of a mixing zone in a discharge permit and upheld EPA's use of a limited mixing zone (*See Hercules* v. *EPA*, 598 F.2d 91 (D.C. Cir. 1978)). The concept of a mixing zone is covered by a series of guidance documents issued by EPA and its predecessor agencies (see, for example: *Water Quality Criteria* (Green Book), Federal Water Pollution Control Administration, 1968, pp. 29–31; *Water Quality Criteria 1972* (Blue Book), EPA, March 1973, pp. 112–115, 231–232, 403–457; *Guidelines for Developing or Revising Water Quality Standards*, January 1973; *Chapter 5—Guidelines for State and Areawide Water Quality Management Program Development*, November, 1976; *Allocated Impact Zones for Areas of Non-Compliance*, EPA Region 1, October 1986; *The Water Quality Standards Handbook*, August, 1994, pp.5–1 to 5–11; *Technical Support Document for Water Quality-based Toxics Control* (TSD), March, 1991, pp. 31–34, 56–60, 69–89).

Many definitions of mixing zones have been offered, differing primarily by perspective (i.e., engineering, hydrological, ecological, regulatory) and their application. From a hydrological/engineering perspective, mixing zones can be defined based upon the recognition of incomplete mixing of an effluent with its receiving water (e.g., ''that area or volume of dilution water necessary to reduce contaminant concentrations to some acceptable level or to a totally mixed condition''). Biologically, mixing zones can be defined based on the premise that surface water quality criteria can be exceeded under limited circumstances without causing unacceptable toxicity or, more broadly, impairment of the designated beneficial uses (e.g., ''the area contiguous to a discharge where receiving water quality is not required to meet water quality criteria nor other requirements applicable to the receiving water'').

EPA's policy on the use of mixing zones has evolved since its early recognition within general water quality guidance, primarily in association with the institution and evolution of the NPDES permit program (e.g., the TSD). Initially, guidance emphasized the need to ensure that the biological integrity of the aquatic community in the receiving stream was protected and that such determinations must be based on site-specific evaluations. In the late 1980's EPA and authorized NPDES States began increasing the development and issuance of water quality-based effluent limits. With this increase, came a demand for widely applicable national guidance to support those programs. EPA and States, in essence, needed wasteload allocation and water quality-based permit limit derivation methods that were relatively simple to use and could be implemented with little site-specific data. EPA met this demand by issuing revised guidance (the TSD and Handbook, cited above, are examples) and by accepting a wide range of State mixing zone practices. As a result, mixing zone provisions have become less prescriptive than earlier guidance that envisioned data rich, site-specific studies, and more reliant on often cursory evaluations, general mixing assumptions, and best professional judgement.

EPA's current policy addresses mixing zones as allocated impact zones (AIZs) where certain numeric water quality criteria may be exceeded as long as: there is no lethality to organisms passing through the mixing zone, there are no significant risks to human health, and the designated and existing uses of the water body are not impaired as a result. These AIZs or mixing zones, if disproportionately large, could unacceptably impact the integrity of the aquatic ecosystem and have unanticipated ecological consequences on the water body as a whole resulting in impairment of the designated or existing uses. Therefore, EPA's policy has emphasized a holistic approach to mixing zone regulation which considers location, size, shape, outfall design and in-zone quality. Mixing zone guidance produced by EPA since 1972 has consistently emphasized the need to protect both nonmotile benthic and sessile organisms in the mixing zone as well as swimming and drifting organisms (Water Quality Criteria 1972). States and Tribes, however, have focused primarily, if not exclusively, on the protection of swimming and drifting organisms and the need to provide ''zones of passage'' within waters with mixing zones. In its dependence upon conditions protective of swimming and drifting organisms to define mixing zones, this approach results in an incomplete implementation of the original concept supporting mixing zones. As originally designed, EPA's mixing zone policy provided for the prevention of lethality to swimming and drifting organisms by limiting the size of the mixing zone and to nonmotile organisms by limiting the placement or location of mixing zones.

Although existing EPA guidance on the implementation of mixing zones (cited above) is quite detailed, at present, the regulation itself simply provides that States and Tribes may adopt, as part of their water quality standards, mixing zone policies and that such policies are subject to EPA review and approval (40 CFR 131.13). In addition, EPA may separately review individual State and, once approved to administer NPDES, Tribal mixing zone determinations as part of the wasteload allocation and NPDES permit review process, outside the standards adoption and review process to ensure appropriate implementation of the State's mixing zone policy.

EPA is considering expanding the current provisions at 40 CFR 131.13 addressing State and Tribal development of mixing zone policies within their water quality standards program to address the content and design of those policies.

3. State and Tribal Mixing Zone Policies

While there are advantages to the more flexible general approach adopted in the late 1980's, the generality of the current regulation has led to some uncertainty as to what constitutes an approvable mixing zone policy. Because the regulation lacks detailed requirements concerning EPA's standards of review of State and Tribal mixing zone provisions, EPA is considering changing the language regarding State and Tribal adoption of mixing zone policies to address specifically the content of such policies. EPA's current thinking is that greater specificity would provide for increased public participation in State, Tribal and Federal decision-making; a clearer understanding by the State, Tribe and public of what EPA considers an approvable mixing zone policy; a reduction in the number of NPDES permit appeals and objections based on differing interpretations of a State or Tribal mixing zone policy; and a more consistent review of State and Tribal submissions by EPA itself.

Fundamental to any such policy, EPA is considering requiring States and Tribes to indicate explicitly in their water quality standards whether or not they allow mixing zones for each of the various uses designated for a given water body. Such provisions could address mixing zones applied to either acute or chronic aquatic life and other water quality criteria (e.g., public water supply, livestock watering, wildlife protection, etc.). Under this approach, if the State or Tribe does not explicitly authorize mixing zones, then no mixing zones would be allowed in State or Tribal waters, and all applicable criteria would have to be met at the end-of-pipe. (Memorandum from Robert Perciasepe, Assistant Administrator for Water to Water Program Directors, Regions I-X, Subject: EPA Guidance on Application of State Mixing Zone Policies in EPA-Issued NPDES Permits, August 6, 1996). Alternatively, States and Tribes could determine that such prohibitions would be applied to only a subset of uses or pollutants rather than across all use categories and pollutants. Some States or Tribes have used this approach to prohibit mixing zones in their highest use classes (e.g., class AA), while allowing mixing zones in more highly impacted watersheds (e.g., class C or D waters).

States and Tribes could also be required to specify the conditions under which mixing zones are allowed in each site-specific application and the limitations to those applications (e.g., size, shape, length, placement, etc.). In addition, States and Tribes could be required to identify any circumstances, pollutants, locations or conditions for which the use of mixing zones is prohibited. States and Tribes could specify circumstances where only chronic mixing zones would be allowed (i.e., no acute mixing zone or zone-of-initial dilution) and circumstances where acute and/or chronic mixing zones would be prohibited. Current EPA guidance, for example, recommends States and Tribes consider prohibition of mixing zones when bioaccumulative pollutants are present in the discharge or where an effluent is known to attract biota. Other circumstances where mixing zone prohibitions or location restrictions might be appropriate include areas used by aquatic life for breeding or feeding, locations of shellfish beds, locations of critical habitat for threatened and endangered species, across tributary mouths, shallows, near shore areas and in areas of critical habitat.

This change would clarify in the regulation the State and Tribal general authority to provide mixing zones, the scope of that authority, and the site-specific factors evaluated by States and Tribes when deciding whether a mixing zone is authorized in each individual case. EPA is considering making this potential clarification to the regulation, its implications, and how mixing zone policies can be designed to better support and foster a watershed management framework.

4. Mixing Zone Requirements

Some States and Tribes that have adopted mixing zone provisions within their water quality standards have not specified mixing zone requirements (e.g., water quality within mixing zones, the allowable size of mixing zones, etc.) under their mixing zone policies. EPA is therefore considering including as regulatory requirements certain specifications derived from EPA's guidance on mixing zones. Regarding policy content, EPA might revise the regulation to require that State and Tribal mixing zone policies address a minimum number of elements. Those required elements might include provisions that: identify conditions and circumstances (e.g., particular locations) when mixing zones are not permitted; identify any pollutants or classes of pollutants for which mixing zones are prohibited; identify the mechanisms to be used to ensure that mixing zones do not impinge on ecologically or recreationally sensitive areas; identify the mechanisms to be used to determine complete and incomplete mixing of effluent and receiving water; identify conditions when a mixing analysis is required; identify default design flows for implementing criteria; identify maximum allowable mixing zone size and configuration, as well as how mixing zones dimensions are determined; specify what water quality conditions must be met within mixing zones; state whether zones of initial dilution are allowed; and state whether there are special conditions established for bioaccumulative pollutants.

Identification in the regulation of minimum elements of State or Tribal mixing zones procedures would establish the basis for EPA review and approval of State and Tribal mixing zone provisions. It would also facilitate the review of individual mixing zone determinations made under the wasteload allocation/permit approval process by EPA, other agencies and the public. This would not significantly change EPA's guidance or current approach to mixing zone policies. Rather, it would clarify and codify the basis by which EPA will review and approve or disapprove State and Tribal mixing zone policies and their site-specific implementation through NPDES permits.

As discussed previously, EPA's mixing zone guidance is premised fundamentally on the prevention of lethality within the mixing zone and siting such that areas of critical habitat are avoided, resulting in the protection of designated uses. One aspect of this guidance is that, for aquatic life uses, water quality within the mixing zone should be such that, at a specified concentration of a contaminant (i.e., magnitude), any ''swimming or drifting'' organism would not remain in the mixing zone long enough to receive an exposure that is sufficiently long (i.e., duration) to cause lethality. If the combination of the concentration of a given pollutant or the combined effect of multiple pollutants (e.g., whole effluent toxicity) in a discharge and the duration of exposure to that concentration are low enough, there is no lethality within the mixing zone, and the criteria (magnitude and duration components together) are met.

This approach, however, only provides protection in situations in which water column organisms pass in and out of the mixing zone. This interpretation does not adequately

protect stationary or sessile organisms within the mixing zone; organisms that remain within the mixing zone for extended periods because the mixing zone extends into feeding or breeding areas or critical habitat (e.g., tributary mouths, shallows, shoreline habitat in large, fast-flowing rivers); critical habitat areas for endangered or threatened species; or instances where mixing zone conditions attract organisms. EPA's mixing zone policy and guidance address those instances where the provisions protecting swimming and drifting organisms are not adequate to protect nonmotile benthic and sessile organisms or critical habitat areas by limiting the location, size and shape of mixing zones. In some instances, this policy has been implemented in a fragmented manner. In such instances, these latter restrictions to mixing zone placement are inadequately addressed. EPA always has discretion to object to, and take over if necessary, permits that provide site-specific mixing zones in cases where such mixing zones would fail to protect all aspects of designated uses. However, oversight of individual permits is not an efficient approach to resolving program-level issues. To clarify the meaning of its policy and ensure a more complete implementation of protective mixing zone provisions, EPA is considering changes to the regulation.

EPA could require that State and Tribal mixing zone policies specifically identify prohibitions (where appropriate) or limit mixing zones where necessary to protect existing or designated uses. Some States and Tribes already include prohibitions against the use of mixing zones where they could intrude upon public drinking water supply intakes or public swimming beaches, or where mixing zones prove to be attractive to aquatic life or wildlife (e.g., water temperature). EPA might require that State and Tribal mixing zone provisions specifically address instances such as these where restrictions on mixing zones are appropriate. Additionally, EPA is considering requiring that State and Tribal water quality standards include a description of the State's or Tribe's methodology for specifying the location, geographic boundaries, size, shape and in-zone quality of mixing zones.

EPA could also clarify its current policy that an approvable mixing zone methodology must be scientifically defensible and ensure the protection of designated uses in the water body as a whole. This would require that the methodology, at a minimum, be sufficiently precise to support consistent regulatory actions (e.g., an NPDES permit). EPA is considering this change to ensure that State and Tribal mixing zones do not adversely affect the integrity of State and Tribal waters and to address inconsistent allocation of mixing zones from site-to-site. Under this approach, for example, when a State or Tribe assumes that either complete or incomplete mixing occurs, the State's or Tribe's implementation procedure could require the analyses supporting the mix assumption to be documented in the record (e.g., permit fact sheet). EPA is considering the need for additional language in the water quality standards regulation to clarify the essential elements of State or Tribal mixing zone provisions and, alternatively, whether such language would be better established in guidance. EPA's current thinking is that a certain amount of professional judgement is necessary in making site-specific mixing zone determinations and that clarifications to the regulation regarding the minimum mixing zone policies and implementation procedures should not preclude such flexibility. However, the policy and implementation procedures should be clarified so that the guidelines and framework for making site-specific mixing zone determinations are clear to everyone.

5. Mixing Analyses

The above discussion focuses on establishing State and Tribal mixing zone policies and procedures. The following discussion addresses the application of such procedures in individual permitting decisions.

Where point source discharges mix in a slow or ''incomplete'' manner with receiving waters and the State or Tribe has authority to provide a mixing zone, EPA guidance recommends that a mixing zone analysis be incorporated into the derivation of water quality-based effluent limits (WQBELs) in NPDES permits. The mixing zone analysis should demonstrate compliance with State or Tribal mixing zone requirements (e.g., size, shape, location and in-zone quality) that are included in the water quality standards. Providing a mixing zone in incomplete-mix situations acknowledges the mixing behavior of the discharge and limits excursions above criteria to a specified zone. Where a discharge mixes with the receiving water in a rapid and ''complete'' manner, by definition a mixing zone analysis is not needed and an evaluation of the assimilative capacity of the receiving water and a dilution allowance based on stream design flow conditions specified in the State or Tribal water quality standards is often incorporated into the derivation of WQBELs.

Presently, all State-issued NPDES permits are reviewable by EPA. EPA may object to individual permits and assume authority to issue such permits. When EPA is the permit issuing authority, it must follow the applicable State or Tribal water quality standards and ensure that any water quality-based effluent limits in the permit are derived from and comply with the applicable State or Tribal water quality requirements. A permit that does not include a defensible mixing zone analysis might not fully protect downstream designated uses. A common example is where a discharge mixes slowly (i.e., incomplete mixing is occurring), but the permit limit is based on an assumption that the entire design flow of the stream rapidly and completely dilutes the effluent. When this does not occur and not all of the dilution water mixes rapidly with the effluent discharge, the result may be a lengthy downstream plume (i.e., mixture of effluent and surface water) with water quality characteristics that exceed applicable chemical-specific or toxicity criteria, are potentially lethal to aquatic life, and may impair the designated use. Such plumes are of concern because:

(1) Chemical-specific criteria, ambient toxicity criteria or other narrative criteria may not be achieved in the extended plume;

(2) Effluent plumes can extend far downstream, causing impact beyond the limited area of a mixing zone and resulting in use impairment;

(3) There may be intakes for public drinking water systems located downstream, but within reach of an extended plume;

(4) Effluent plumes may be located along the shore in shallow waters that are critical nursery areas for sensitive species and which constitute important or critical habitat, particularly in large, channelized rivers;

(5) Aquatic life might be attracted to the plume because of its temperature differential or other characteristics;

(6) Threatened or endangered species may reside within or near the plume area, and

(7) Additional dischargers may be located downstream and the cumulative effects of all discharges may not be adequately considered, particularly regarding unintended overlapping plumes.

EPA believes the rate of ambient mixing and the complete versus incomplete mix decision is a critical but frequently overlooked component of water quality-based permitting.

Although a mixing zone analyses requires site-specific information and additional resources, EPA believes that the approach currently followed by some States and Tribes might be too simplistic, might allow lethality within areas of critical habitat or ecological importance and may not fully protect designated uses. EPA's current thinking is that the regulation should be made more explicit as to the circumstances under which mixing zones must be supported by site-specific data and analysis. EPA is considering the need for specific requirements within the regulation governing the development and content of mixing zone analysis procedures as part of State and Tribal implementation procedures.

6. Narrative Criteria for Mixing Zones

Historically, States have relied on narrative criteria as a means to provide baseline protection for water quality, to address toxicity from combinations of pollutants or unknown pollutants through whole effluent toxicity testing and limits, and to control pollutants for which there are no chemical-specific criteria available. EPA has consistently maintained that prevention of nuisance conditions (e.g., materials that will settle to form objectionable deposits, floating debris, oil, scum, foam and other matter, toxic conditions, etc.), through the application of narrative criteria, apply to all waters, at all times, including mixing zones. Despite this long-standing policy, EPA is unaware if, in practice, States and Tribes have had any difficulty ensuring the maintenance of these narrative criteria within mixing zones. EPA is interested in comment which might identify any instances where the application of narrative criteria has created difficulties for States and Tribes implementing these provisions in mixing zones.

In addition, EPA has traditionally interpreted these narrative ''free froms'' as including a prohibition against lethality in all waters, including within mixing zones. However, lethality is a non-conservative endpoint for measuring toxicity. Section 101(a)(3) of the CWA establishes a goal of prohibiting ''the discharge of toxic pollutants in toxic amounts'' which could be interpreted as applying to chronic as well as acute toxicity. EPA guidance on appropriate water quality within mixing zones also recommends that ''the total time-toxicity exposure history must not cause deleterious effects in exposed populations of important species, including post-exposure effects'' (EPA, 1973). EPA is considering how such an interpretation (i.e., applying chronic toxicity endpoints to water quality within a mixing zone) could be implemented in the context of the application of narrative criteria within a mixing zone.

Guidance developed by EPA in 1985 (TSD) established a rationale for allowing zones-of-initial-dilution (ZIDs) or acute mixing zones. That guidance limited the use of ZIDs to extremely small areas of the receiving water under limited conditions and to discharges using rapid diffusers which produce effluent discharge velocities exceeding 10 feet per second. That guidance was premised on the rationale that organisms would be *physically* precluded from maintaining a position within the ZID, thus preventing lethal exposures. Benthic and sessile organisms were also protected where ZID placement was controlled and directed away from such critical areas (e.g., near shore, shallows, etc.). In addition, EPA reasoned, high rate diffusers achieve compliance with both acute and chronic criteria within a smaller area, utilizing less receiving water volume for dilution than other discharge designs. Consequently, high rate diffusers are believed to provide greater protection of water quality by their rapid dispersion of effluent within a smaller volume of surface water. Where acute criteria are not applied at the end-of-pipe, current EPA guidance provides for a number of alternative means of protecting against lethality in a mixing zone, even in situations that do not rely on high rate diffusers. Alternatives to requiring compliance with acute criteria at the end-of-pipe or employing a high-rate diffuser to ensure compliance ''within a very short distance from the outfall'' require a significant amount of site-specific data. Such site-specific data could be requested of NPDES permit applicants. It is EPA's experience that the collection of this kind of data does not occur on a routine basis. EPA is interested in public comment on the relationship between ZIDs or acute mixing zones and narrative criteria prohibitions against lethality and States' and Tribes' experiences with the application of acute mixing zones under varying site-specific and discharge-specific conditions. EPA is also interested in comments on whether the water quality benefits of using high rate diffusers justify potentially detrimental effects on stream bed or shore line habitat.

7. Mixing Zones for Bioaccumulative Pollutants

States and Tribes should exercise caution when evaluating whether a mixing zone is appropriate in cases where bioaccumulative pollutants are present. The impacts of bioaccumulative compounds may extend beyond the boundaries of a given mixing zone with resulting impairment of a water body's designated uses, particularly where stationary species (e.g. shellfish) are present, where uncertainties exist regarding the assimilative capacity of a water body or where bioaccumulation in the food chain is known to be a problem. Sediment contamination has also become a major concern in both flowing and non-flowing water bodies. Concerns about sediment contamination require additional attention since typical mixing zone evaluations focus only on water column toxicity. The effects of persistent and bioaccumulative pollutants may not be detected for some distance from the point of discharge, well outside the mixing zone, or possibly not in the water column at all. Some members of the public have expressed concern regarding the use of mixing zones in situations where bioaccumulative pollutants are present in a discharge and have urged EPA to develop specific regulatory requirements prohibiting the use of mixing zones where these pollutants are present.

Mixing zone policies are developed to address complete and incomplete mixing conditions associated with point source discharges. These policies identify whether mixing zones are allowed and define how a State or Tribe will limit the amount of surface water allocated to mixing under a variety of circumstances. These circumstances include considerations specific to the effluent and pollutants discharged (e.g., toxicity, solubility) and to the water body receiving the waste (e.g., shallow, flowing or non-flowing, high flow or low flow, critical habitat). The potential for bioaccumulation problems can depend on a number of site-specific factors and the use of mixing zones for bioaccumulative pollutants may be best dealt with on a site- or basin-specific basis. EPA's mixing zone guidance emphasizes that the determination by a State or Tribe that a mixing zone is appropriate must be preceded by a separate determination that there is available assimilative capacity in the receiving water. Localized water quality concerns are to be balanced with the larger scale issue of overall pollutant loading to the entire water body or segment. Perhaps concerns about the fate and transport of bioaccumulative pollutants are more effectively addressed under total maximum daily load (TMDL) development and determinations of assimilative capacity which incorporate information on water

column, sediment and tissue contamination. EPA is considering the appropriateness of using mixing zones when controlling for bioaccumulative pollutants.

As discussed in more detail in Section C of this Notice, EPA has recently developed methodologies for deriving sediment quality criteria for non-ionic organics and metals and has proposed sediment quality criteria for five organics. In addition, EPA is working on implementation procedures or a ''user's guide'' for these sediment criteria which will address risk management decisions such as the application of mixing zones.

The regulatory impact of special restrictions on mixing zones for a particular family of pollutants is largely determined by how that family of pollutants is defined within the regulation. The issue of definition of bioaccumulative pollutants is also addressed in the discussion of water quality criteria in Section C of this notice.

In its Great Lakes Guidance, EPA established a twelve year phase out of mixing zones for existing discharges of bioaccumulative chemicals of concern (BCCs) in the Great Lakes Basin and a ban on such mixing zones for new discharges (effective March 1997). The Great Lakes Guidance also allowed States and Tribes to establish limited exceptions to the mixing zone phase-out for existing discharges based on water conservation or economic and technical considerations. The general prohibition on mixing zones for BCCs was established largely because of the persistent and toxic nature of even minute amounts of BCCs in the environment; an effect amplified in the Great Lakes by the tendency of the Lakes to act as ''sinks'' for pollutants discharged to the Great Lakes Basin. In addition, there are documented problems with effects of BCCs in Great Lakes waters (e.g., contamination of Great Lakes salmonid sport fisheries with PCBs and Basin-wide mercury contamination). The Great Lakes Guidance provision phasing out mixing zones for BCCs reflected the Agency's thinking that, in general, mixing zone allowances for BCCs are not appropriate.

On June 6, 1997, the United States Court of Appeals for the District of Columbia Circuit issued its decision in *American Iron and Steel Institute, et al.* v. *EPA, 115 F.3d 979 (D.C. Cir. 1997).* The Court's decision upheld the Great Lakes Guidance on all but three issues. One of these three issues was the phase out of on mixing zones for BCCs. Specifically, the Court vacated the final Guidance insofar as it would eliminate mixing zones for bioaccumulative chemicals of concern (BCCs). While the Court acknowledged the possibility of environmental benefit of the mixing zone provisions, the Court found that EPA failed to show that the provisions were justified in light of the costs. EPA continues to support elimination of mixing zones for BCCs within the Great Lakes Basin wherever it is technically and economically feasible to do so. Thus, EPA intends to propose reinstating this provision in the near future.

8. Stream Design Flow Policies

States and Tribes typically identify, within their water quality standards, stream design flow conditions to implement numeric water quality criteria. The stream flow conditions are typically expressed as predictable low flow conditions below which numeric water quality criteria do not apply. Examples of commonly used stream design flows include: the lowest seven consecutive day average stream flow that has the annual probability of occurring once in ten years (7Q10); the lowest single day stream flow that has the annual probability of occurring once in ten years (1Q10); and the harmonic mean stream flow. The stream design flows typically employed with aquatic life criteria (i.e., 7Q10 and 1Q10), sometimes referred to as critical low flows or drought flows, are intended to define stream flow conditions at and above which the designated uses are presumed to exist and applicable numeric water quality criteria must be met in order for those uses to be attained. The underlying concept is that these low flow events are a part of the dynamic hydrologic character of all flowing water bodies. Low flow conditions present special challenges to the integrity of the aquatic community. Even under these low flow conditions, however, the long-term beneficial use could be maintained unless toxic conditions stress the aquatic community beyond its ability to tolerate and recover.

In practice, stream design flows serve several purposes in addition to defining the minimum stream flows below which numeric water quality criteria do not apply. Many States and Tribes have used the stream design flows, or fractions thereof, to define the amount of stream flow that can be assumed to always be available to dilute effluent. Under rapid and complete mixing conditions, the entire stream design flow is used as the basis for determining permit limits. That is, no mixing zone is necessary. Under slow or incomplete mixing conditions, where a mixing zone is necessary, fractions of stream design flow are used to calculate assimilative capacity on which permit limits can be based; in other words, to crudely define the mixing zone. Often this default approach is used by regulatory agencies in response to limited resources, lack of site-specific information and the time pressures of permit reissuance. This default approach to defining the mixing zone is, in EPA's view, acceptable as long as the mixing of the effluent in the receiving water occurs away from critical areas and the amount of dilution provided is conservative for a broad range of possible effluent/receiving water dilution scenarios. However, where a complete mixing assumption does not hold true, such as where an effluent plume does not disperse quickly, and too much of the receiving water is allocated for dilution, this default assumption approach will not ensure attainment of water quality standards because numeric water quality criteria will be exceeded in a larger area than anticipated (outside the regulatory mixing zone). The default use of fractions of stream design flows instead of more exacting mixing zone determinations is not always appropriate. In some instances, the effluent plume may never fully mix with the specified amount of receiving water, resulting in plumes where criteria are exceeded extending far beyond what may be considered protective of designated uses or allowed under standards. EPA has recommended that site-specific information on the mixing characteristics of a discharge be collected to verify the level of protection assumed to be provided to a water body using default mixing zone provisions.

EPA believes it is important for individual States and Tribes to make consistent dilution allowance decisions from one site to the next. Requiring States and Tribes, as part of their water quality standards, to specify how dilution allowances under complete and incomplete mix situations will be established may be an appropriate way to ensure consistent decision-making.

To best define dilution allowances for implementing water quality standards, it is useful to define both stream design flows and effluent design flows. In particular, a distinction should be made between the stream design flows to be used for different ambient water quality criteria (e.g., aquatic life acute, aquatic life chronic, human health carcinogen). In addition, effluent design flows may vary in some cases based upon seasonal changes or production cycles. Stream design flows may be applied as a maximum dilution allowance or adjusted in individual cases based on

any stream-specific or pollutant-specific considerations. Stream design flows, if they are used, must correspond to the duration and frequency components of the ambient water quality criteria contained in the State or Tribal water quality standards. Currently, States and Tribes must justify the scientific validity of their stream design flow policies where they differ from EPA's recommendations. States and Tribes may also establish specific guidelines for restricting dilution allowances in individual cases (e.g., States and Tribes may adopt special restrictions on dilution allowances for human health criteria where a discharge is within 2 miles of a drinking water intake).

EPA's Great Lakes Guidance and its Technical Support Document for Water Quality-Based Toxics Control identify acute and chronic stream design flows to be utilized in drafting permit limits. The Guidance establishes a 7Q10 or 4-day, 3-year biologically-based stream design flow for implementation of the aquatic life criterion continuous concentration (chronic criteria); a 1Q10 for the implementation of the aquatic life criterion maximum concentration (acute criteria); harmonic mean flow for implementation of human health criteria; and a 90Q10 for the implementation of wildlife criteria.

In cases where complete and rapid mixing of effluent with receiving water does not occur, site-specific mixing determinations must be made. Although the selection of fractions of stream design flows for the assignment of available dilution for point source discharges does affect the size of the regulatory mixing zone, such default assignments are not hydrologically linked to the actual behavior of the effluent plume in the receiving water, may not protect swimming and drifting organisms or sessile or benthic organisms and are not equivalent to a mixing analysis. There may be other instances where the reliance on a fixed percentage of flow or cross-sectional area of the receiving stream in lieu of an actual mixing analysis may not reflect the mixing behavior of an effluent. In some high dilution situations, there may be more rapid dilution occurring than is assumed in dilution calculations.

If complete and instantaneous mixing actually occurs, using less than 100% of the design flow can be a means of accounting for situations where the actual assimilative capacity of the water body is unknown. States and Tribes typically determine water body assimilative capacity based on ambient background concentration of a pollutant, when data on such concentrations is available. The assimilative capacity is the difference between the background level of a pollutant and the highest level that would comply with the water quality criterion. Where information on all sources of a given contaminant to a specific water body is incomplete, or where the State or Tribe wishes to reserve assimilative capacity for the future, States and Tribes should allocate less than 100% of the assimilative capacity of that water body at design flow by utilizing less than 100% of the design flow for dilution. EPA is interested in comment addressing the use of these stream design flows or fractions of stream design flows in setting mixing zones and in reserving assimilative capacity in a water body.

The Great Lakes Guidance allows States and Tribes to use default assumptions for available dilution in the absence of site-specific mixing data. The default dilution assumption for open waters (e.g., lakes) provides for ten-to-one dilution. The Guidance also allows for a demonstration to determine actual mixing zone water quality, size, placement and behavior. Under the Guidance, for open waters, in no case can mixing zone size exceed that area in which discharge-induced mixing occurs. As a default, the Guidance restricts the mixing zone for protection of aquatic life from acute effects (i.e., the dilution allowed in calculating limits based on an acute aquatic life criterion or CMC) to 2 parts receiving water to 1 part effluent, at water body design flow or volume.

As a default for implementing criteria for the protection of aquatic life from chronic effects (CCC) in flowing waters (e.g., rivers and streams), the Great Lakes Guidance allows States and Tribes to use up to 25% of the design flow for dilution. If a site-specific mixing analysis is performed, a larger mixing zone may be established. Mixing zones for acute aquatic life criteria in flowing waters are limited to the final acute value or FAV (2× the acute criterion) just as in open waters. EPA is interested in comment on whether this FAV default ''cap'' approach is appropriate for waters outside the Great Lakes Basin.

As stated above, the Great Lakes Guidance allows increases above the default mixing zone allowances when site-specific mixing zone analyses are conducted. These demonstrations compile data on the mixing behavior of the effluent at a particular site (e.g., the size, shape and location of the mixing zone). The Guidance also required that mixing zones maintain existing and designated uses and comply with narrative water quality criteria (e.g., ''free froms'').

The Great Lakes Guidance also specifies that mixing zones may not jeopardize the existence of threatened or endangered species or their critical habitat.

EPA advocates the watershed approach to water quality protection. For the water quality standards program, the emphasis has been toward refinement of designated uses and incorporation of new and emerging sophisticated and integrated analytical tools as a means to better characterize the ecological condition of water resources and more effectively protect designated uses (see section I(A) ''General Purpose and Vision'' of this document). The development and implementation of mixing zone policies by States and Tribes constitutes risk management at the sub-watershed level. EPA has consistently emphasized the need to ensure that State and Tribal mixing zone provisions protect the designated uses of receiving waters. Site-specific data collected through a mixing zone analysis will ensure that designated uses will be protected the loss of ecological integrity from the discharge of effluents will be prevented. An emphasis on the protection of designated uses and maintenance of ecological integrity is essential to the watershed approach. The watershed approach requires increased site-specific information on local aquatic systems and an assessment of the impact of all discharges to local ecosystems. The watershed approach also depends upon the meaningful involvement of local communities in risk management decision-making. Explicit, clear implementation policies provide the public with the information necessary to understand decisions being made by regulators and the impact of those decisions on local resources.

Request for Comments on Mixing Zone Policies and Implementation Procedures

EPA requests comment on the following questions:

1. Should the regulation be changed to expressly require States and Tribes to include a statement in their water quality standards indicating whether mixing zones are allowed?

2. Should the regulation be changed to expressly require States and Tribes to specify procedures by which mixing zone decisions for individual discharges would be made?

3. Should the regulation be modified to identify the minimum requirements or elements for State and Tribal mixing zone policies (including size, location, and methodologies)?

4. Consistent with current EPA policy, should the regulation explicitly require narrative criteria to apply in mixing zones?

5. Should the regulation require States and Tribes to identify in their mixing zone provisions what minimum water quality conditions are required within mixing zones?

6. Are there any circumstances, types of pollutants or water body types (e.g., wet weather discharges) where mixing zones should be restricted or prohibited?

7. Should mixing zones for bioaccumulative pollutants be prohibited? If so, under what circumstances? Should such prohibitions be addressed on a water body- or basin-specific basis? Should EPA allow exceptions to any such prohibitions?

8. Should the regulation require States and Tribes to specify procedures and decision criteria for evaluating complete and incomplete mixing?

9. Should the regulation require different mixing zone/dilution procedures for complete and incompletely mixed situations?

10. Should an assumption of rapid and complete mixing within State and Tribal implementation procedures be prohibited except where a defensible technical rationale is included in each site-specific determination?

11. Should the regulation explicitly allow the use of default mixing zone assumptions based on fractions of stream design flow in the absence of site-specific data?

12. Should the regulation be clarified, consistent with current EPA policy, to require States and Tribes to identify the water body design flows or volumes upon which their water quality standards are based?

F. Wetlands as Waters of the United States

The current water quality standards regulation contains no definition of ''waters of the United States,'' although this term is used in the definition of ''water quality standards.'' The phrase ''waters of the United States'' has been defined elsewhere in Federal regulations, including regulations governing the National Pollutant Discharge Elimination System (NPDES). That definition at 40 CFR 122.2 includes wetlands whose use, degradation or destruction could affect interstate commerce and wetlands adjacent to other waters of the U.S. However, because this definition does not appear in 40 CFR 131, some have questioned whether Part 131 applies to wetlands. EPA's position is that the Part 131 regulations do apply to wetlands. EPA is considering including the definition for ''waters of the United States'' under the standards regulation as well, or, at a minimum, cross-referencing the definition at 40 CFR 122.2 as a means of clarifying that the existing regulation applies to wetlands that fall within the definition of waters of the United States. Currently, EPA plans no review or revision of the existing definition of ''waters of the United States'' as part of any revision of the water quality standards regulation. Therefore, under the ANPRM, EPA is interested in comment limited to whether the existing definition should be included within the standards regulation in some form.

EPA believes that some States or Tribes may not be providing the same protection to wetlands that they provide to other surface waters, including designation of attainable uses consistent with the CWA and assignment of protective water quality criteria. Therefore, EPA wishes to emphasize that wetlands require the same protection under water quality standards as other waters of the U.S. Section 303 of the CWA requires the protection of all ''waters of the U.S.'' under standards. Addition of the definition of ''waters of the U.S.'' under a revision of the regulations would not constitute an expansion of authority or application, but merely a clarification of those requirements already contained within the CWA. Treatment of jurisdictional issues would not be affected by such a revision, including treatment of waters constructed as waste treatment systems (e.g., wetlands constructed for wastewater treatment). Notwithstanding protection of wetlands under other provisions of the CWA (e.g., Section 404), Section 303 clearly establishes a baseline level of protection applicable to all waters. Further, it is this treatment under water quality standards which provides for protection of wetlands as applied under Section 404.

Necessary components of water quality standards for wetlands are designated uses and criteria, as defined in 40 CFR 131.6. EPA recognizes that uses and criteria should reflect the unique physical, chemical and biological characteristics of wetlands. States and Tribes are encouraged to develop and adopt appropriate classification systems which provide protection of beneficial uses of wetlands through the application of physical, chemical and biological criteria. EPA also recognizes that certain parameters, conditions or even pollutants may be most appropriately addressed by criteria which specifically reflect differences between wetlands and other surface waters.

Request for Comments on Wetlands

EPA requests public comment on the following questions:

1. Should ''waters of the United States'' be defined in the water quality standards regulation?

2. Should EPA provide explicit reference in the regulation to the applicability of water quality standards to wetlands?

3. Do the current regulation and existing guidance provide the necessary regulatory clarity, technical tools, and incentives for States and Tribes to develop appropriate standards for wetlands?

4. Are specific programmatic changes needed to facilitate the development of water quality standards for wetlands?

G. Independent Application Policy

1. Introduction

Section 101(a) of the Clean Water Act states: ''The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters.'' To this end, States and Tribes designate single or multiple uses for their waters including aquatic life protection. For the purposes of assessing the extent to which aquatic life is protected and whether actions to protect aquatic life are needed, the CWA requires that States and Tribes adopt water quality criteria necessary to support designated uses. For waters where aquatic life protection is an applicable designated use, the extension of the CWA requires States and Tribes to adopt criteria protective of aquatic life. Taken together, chemical, physical, and biological integrity define the overall ecological integrity of an aquatic ecosystem. Over the years, EPA, States and Tribes have developed various tools to assess the extent to which water quality attains this objective. These tools have been developed to build on and support the capabilities of each other and provide a comprehensive set of elements necessary for implementing water quality standards and achieving the objective of the CWA. EPA policy and guidance recommends that States and Tribes use chemical-specific, toxicity, and biological criteria to monitor and protect designated uses. In 1991, EPA established its policy on independent application (U.S. EPA, transmittal memorandum of final policy on biological assessment and criteria from Tudor Davies to Regions, June 19, 1991). EPA's independent application policy speaks to how assessments based

on these three kinds of criteria are to be integrated into all forms of water quality management decision-making. EPA's independent application policy and the ensuing discussion here address the issue of how the three different kinds of assessments are interpreted only in the context of protection of aquatic life and aquatic life uses and not in the context of protection of human health or wildlife.

With the advent of different ways of assessing the health of aquatic systems comes the possibility of conflicting results. To address such conflicts, EPA developed the policy of independent application. Independent application states that where different types of monitoring data are available for assessment of whether a water body is attaining aquatic life uses or for identifying the potential of pollution sources to cause or contribute to non attainment of aquatic life uses, any one assessment is sufficient to identify an existing or potential impact/impairment, and no one assessment can be used to override a finding of existing or potential impact or impairment based on another assessment. The independent application policy takes into account that each assessment provides unique insights into the integrity and health of an aquatic system. In addition, each assessment approach has differing strengths and limitations, and assesses different stressors and their effects, or potential effects, on aquatic systems. For example, while biological assessments can provide information in determining the cumulative effect of past or current impacts from multiple stressors, these assessments may be limited in their ability to predict, and therefore prevent, impacts. While chemical-specific assessments are useful to evaluate and predict ecosystem impacts from single pollutants, chemical-specific methods are unable to assess the combined interactions of pollutants (e.g., additivity). Similar to biological assessments, toxicity testing provides a means of evaluating the aggregate toxic effects of pollutants, and like chemical assessments, can also be used when testing effluent to predict single chemical impacts. One of the limitations of toxicity testing, however, is that the identification of pollutants causing toxicity is not always possible or cost-effective. Each of these three assessment approaches relies on different kinds of water quality data, measures different endpoints and, in practice, will be interpreted in the context of implementing a water quality management program that includes assessment and pollution control. EPA's policy on independent application is based on the premise that any valid, representative data indicating an actual or projected water quality impairment must not be ignored when determining the appropriate action to be taken. Independent application recognizes the strengths and limitations of all three assessment approaches.

The next three sections briefly describe three assessment approaches (biological, toxicological and chemical) one could likely be evaluating when using independent application. Those three sections are then followed by two parallel discussions on different uses of water quality data. One use relates to the NPDES permits program to determine whether a permit must contain water quality-based chemical or toxicity limits, and what those numeric limits should be. The other relates to the use of such data to evaluate the quality, or condition, of waters under the CWA section 305(b) and 303(d) programs. At the core of both of these contexts is the question ''are the present applicable water quality criteria complete and appropriate for the water body, and how are we to measure attainment of the present or future criteria that apply to any water body in question?'' Thus, in its most basic sense, independent application remains a water quality standards question. Any changes to or clarifications of the policy on independent application must therefore be considered first under the rubric of water quality standards and then in the separate contexts of permitting and water quality evaluation which are based on water quality standards.

States and Tribes routinely determine whether water bodies are attaining their designated uses and whether existing pollution controls adequately protect those uses. Some States and Tribes have recommended to EPA that it modify the independent application policy. Currently, EPA's policy of independent application is the same for both NPDES permitting and water quality assessment programs. However, EPA recognizes that each of the programs has somewhat different data needs and attributes. Therefore, today's notice separates the two distinct uses of independent application to better focus the discussion.

a. Biological Assessments. Biological assessments are based on quantifying differences between expected biological community attributes such as structure, function and condition (known as a reference condition) and the biological community attributes found at a specific site being evaluated. The extent to which the community at the site deviates from the reference conditions is indicative of the degree of impairment at the specific site. The strength of biological assessments is their ability to provide a direct measure of the health of aquatic ecosystems. Biological assessments are also able to detect non-chemical impacts (e.g., habitat loss, sedimentation, temperature effects) in addition to chemical toxicity problems.

States and Tribes that use biological assessments, use them primarily to evaluate the ecological condition of water bodies and to determine whether a water body is healthy, threatened, or impaired (i.e., aquatic life use attainment decisions). In some instances, States and Tribes have used biological assessments to establish monitoring requirements in an NPDES permit, but generally, most use bioassessments to make non-regulatory, general, water resource management decisions. Data from a biological assessment can be compared to a gradient that shows the reference (expected) conditions without impairment on one end and the worst situation on the other. States and Tribes generally use the results to determine whether additional measures are needed to protect the water segment, or determine how close to attainment an impaired system is. Biological assessments can also play a role in linking impairment to causative agents. This link is often not definitive, but can be very useful in helping to identify the causes and sources of many impairments. Some States and Tribes have used indicator species or groups to distinguish effects of toxicity from effects of organic enrichment. For example, one State documented that a midgefly larvae is found to be predominant in areas contaminated by electroplating or metal wastes. Although biological assessments cannot be used to predict conditions in a mathematical modeling sense, over time they can be used to indicate the direction of change, and the degree of that change, in the condition at a particular site. This information, where it is based on enough data using relatively sensitive appropriate metrics, can be very valuable in deciding whether the current condition is likely to be maintained under similar conditions in the future, or whether there are early warning signs of biological impacts giving reason to believe that additional regulatory actions may be needed to prevent water quality standards impairment. Regulatory actions that are a response to measured change in biological condition will tend to be restorative more than preventative (i.e.,

once biological impact is measured, by definition, that impact was not prevented). Although, slight changes that are not sufficient to render a water in non-attainment of its aquatic life use, can provide early warning of potentially more significant future changes. In contrast, as noted above, regulatory actions based on impairment predicted, for example via a chemical-specific modeling analysis, tend to be preventative. To the extent that conditions in a water body do change (e.g., flow), biological assessments do not reveal potential future impacts under other exposure conditions (e.g., low-flow conditions). Programmatically, there are concerns regarding quality assurance and quality control for various biological assessment techniques since they have yet to be promulgated, or standardized, in any EPA programs. This is mainly due to the site-specific nature of biological assessments. Implementation of biological criteria is also discussed in section (B) of this notice.

b. Toxicological Assessments. Toxicological assessments are conducted by exposing aquatic organisms to effluent or ambient water samples or sediment samples in a laboratory and determining the effects on the exposed organisms. Because toxicity assessments evaluate the overall effects of the entire suite of constituents in a sample, they are ideal for identifying interactions between chemicals that can alter the expected effects of individual chemicals on exposed organisms. Toxicity assessments also capture the toxic effects of chemical compounds not commonly monitored for or for which chemical-specific criteria are lacking. In addition, because it can be manipulated in the laboratory, toxicity testing can predict the likelihood of ecological impacts before they occur. This allows safeguards to be put into place before an actual ecological impact occurs.

Toxicity assessments are usually limited by the variety of species that can be cultured in the laboratory. While numerous test species can be used to evaluate the toxicity of individual samples, typically only two or three species are used for such tests. By comparison, eight different families are required to develop chemical-specific criteria. For some toxicants, the broader sensitivity range provided by testing eight different families is particularly important, for example, where the mode of toxicity action is specific (e.g., pesticides). Identifying the cause of toxicity can, in some situations, be a difficult, expensive, and lengthy process. Another consideration is that toxicity testing does not detect habitat perturbations which can greatly limit a water resources aquatic life use. Finally, toxicity assessments are only valid for as long as all the sample testing conditions remain the same. Ambient conditions affecting toxicity may change over time necessitating additional testing.

c. Chemical Assessments. Chemical assessments measure individual chemical constituents (e.g., copper, lead) or chemical conditions (e.g., pH, temperature, hardness, organic content) in a medium. Chemical assessments may be performed on effluent or ambient water samples or sediment samples. Chemical analyses are usually simpler to conduct and generally less expensive than toxicity assessments or bioassessments, particularly if there are only a few chemicals of concern, but the information from these tests may provide limited insight into the ecological condition of the water body. If information is available on pollutant persistence and degradation, modeling can be used to predict pollutant fate and transport under a variety of exposure scenarios. Further, chemical-specific assessments are ideal for predicting the likelihood of ecological impacts where they may not yet have occurred either because a proposed activity affecting water quality has not been implemented or critical exposure conditions have not yet been experienced by the aquatic community. For these reasons, regulatory actions based on chemical-specific assessment can be preventative as well as restorative.

Basing regulatory and management decisions on chemical assessment of water quality is an important and proven aspect of water quality assessment and protection. However, as an indirect measure of aquatic health, one of the principal limitations to chemical assessments is dependence upon chemical-specific benchmarks (such as chemical water quality criteria) for determining whether water quality is suitable or unsuitable for attaining and maintaining aquatic life uses. As noted elsewhere in this notice, stressors other than specific chemicals in a water body are often a significant or even predominant cause of nonattainment of aquatic life uses. EPA's current thinking is that complete reliance on chemical-specific assessments of water quality is too narrow of a focus and fails to provide information on other important ecosystem stressors. In addition, as noted elsewhere in this notice, there are currently water quality criteria for the protection of aquatic life for 31 chemicals. There are tens of thousands of chemicals discharged into surface waters. (Note, however, that the chemicals for which there are criteria tend to be the most frequently discharged). Thus there is the added problem of too few criteria and too many chemicals, making it inappropriate to rely *exclusively* on the chemical-specific approach. Another substantial limitation of chemical-specific benchmarks is that for a given site, the benchmarks that are used, may not be the best that are available to reflect the level of protection applicable at the site. For example, site-specific aquatic life criteria are generally different (higher or lower) than the national recommendations for the same chemical. And yet absent site-specific criteria, the national recommendations are often used.

2. Independent Application and Water Quality Assessments

a. Independent Application. States and Tribes often collect or have access to monitoring data that measure the concentration of specific chemicals in an effluent or water body, the level of toxicity present in ambient water or discharges to a water body and/or the biological community composition within a water body. These data are then interpreted by comparing them to reference conditions or criteria to determine whether or not aquatic life uses are attained. EPA's 1991 policy on independent application was explicit about the use of independent application in water quality programs: ''This policy, therefore, states that appropriate action should be taken when any one of the three types of assessment determines that the standard is not attained. States and Tribes are encouraged to implement and integrate all three approaches into their water quality programs and apply them in combination or independently as site-specific conditions and assessment objectives dictate.'' In implementing this policy, EPA recommends that data from the three assessment approaches be applied independently in water quality programs since each method provides unique and distinct information on the characteristics of the water body. In other words, EPA recommends that differences in assessment results be resolved in one of two ways: either presume an adverse impact when any one source of data indicates an adverse impact, or reevaluate the complete data set and modify the applicable criteria to account for the new site-specific information. Given EPA's mission to protect the environment and absent definitive data to demonstrate that an assessment is in error or otherwise biased, EPA presumes

where an assessment indicates impairment, that assessment is valid.

In the context of applying the independent application policy to the assessment of water bodies, there are two distinct CWA provisions to consider: (1) section 305(b), which requires States and Tribes to report to EPA and EPA to report to Congress a description of the quality of the Nation's waters; and (2) section 303(d), which relates to identification of waters where technology-based limitations and other required controls are not stringent enough to ensure that applicable water quality standards will be attained and maintained. With respect to the section 305(b) Report, the CWA broadly calls for States and Tribes to assess water quality conditions in a biennial report. EPA transmits these reports to Congress, together with an analysis of the reports describing water quality conditions. Because these are water quality assessment reports that States and Tribes submit to EPA, and not specific regulatory decisions, there may be sufficient flexibility in the interpretation of data to allow a more integrated approach to evaluating limitations and inconsistencies in the interpretation of data produced under various approaches. For example, direct assessments of the condition of the waters (e.g., biological assessment) could be weighted more heavily than indirect measurements (e.g., chemical and toxicity).

With respect to section 303(d), the CWA and EPA's implementing regulations require States and Tribes to identify those waters for which technology-based limitations and other required controls are not stringent enough to achieve water quality standards applicable to such waters. *See* 303(d)(1)(A), 40 CFR 130.7(b)(1). When identifying waters pursuant to 303(d), the methods used to determine non-attainment of standards for water quality reporting under 305(b) should also be used. However, water bodies are eliminated from 303(d) list consideration if technology-based controls or other required Federal, State, Tribal or local requirements will result in the attainment of applicable water quality standards. TMDLS developed to secure restoration of designated uses are largely dependent upon chemical criteria and assessment to define acceptable pollutant loadings.

The question arises as to whether States and Tribes have the flexibility to exclude a water body from 305(b) reports and 303(d), i.e., conclude that the designated use was protected, even in the face of data indicating one or more excursions of the applicable chemical-specific water quality criteria. EPA would like to consider possible mechanisms under the existing CWA and the legal theories supporting them to address these questions.

As with determining the need for regulatory controls (permit limits), similar data evaluation issues face States, Tribes and EPA in performing water body assessments for purposes of sections 303(d) and 305(b) of the CWA. With respect to such assessments, EPA's goals for States and Tribes are twofold: (1) to encourage the use of chemical, toxicological, physical and biological data in making water body assessments; and, (2) to ensure that the data are interpreted and reported in a consistent and scientifically defensible manner so that documents such as the 305(b) report to Congress provide valid and useful information on the status of the Nation's waters as a whole, irrespective of State or Tribal boundaries.

EPA recognizes that there may be instances where these goals appear to be in conflict. It is possible that as States and Tribes implement biological assessment programs, they may identify new areas of impact that were previously undetected using other assessment techniques and that this may lead to a reluctance on the part of States and Tribes to develop the expertise necessary to conduct biological assessments. Although this tendency is contrary to the goals and objectives of the CWA, the fact is that addressing new and previously unaddressed threats to surface water quality places additional strain on already limited State and Tribal resources. Some also feel that adherence to a strict independent application policy for assessment purposes discourages the use of more data than minimally needed to make an aquatic life use assessment. In most cases, the minimal amount of data would be a chemical grab sample for a few water quality characteristics such as temperature, pH, BOD, or dissolved oxygen. Collecting minimal data for assessment reporting is much easier and less resource intensive for States and Tribes that are required to increase their reporting coverage, and these States and Tribes would not have to deal with differing interpretation of assessment results.

However, EPA believes that placement of waters on section 303(d) and section 305(b) lists should be based on broad thorough assessment data, not on limited and narrow data. The former will help ensure that targeted water quality controls and management actions are appropriate and will result in water quality standards attainment; the latter can result in significant outlays of State and Tribal resources targeted on waters where water quality problems are not well understood. EPA is considering how best to obtain accurate, high-quality assessment data and how to reconcile differences between assessments conducted using different techniques in a manner that fosters consistency and remains scientifically defensible.

b. Alternatives to Independent Application.

There is considerable sentiment among various stakeholder groups that there is a need to better incorporate more comprehensive data, particularly biological data, into the water quality assessment framework described above and that doing so will facilitate collection and use of more integrated and insightful water quality data. EPA shares this view. Some have used the term ''weight-of-evidence'' to describe an alternative to the present EPA policy of independent application that could facilitate integration of chemical, physical, toxicological and biological data into the assessment program. However, EPA recognizes that individuals' views about the meaning of the term ''weight of evidence'' vary considerably and this variation should be addressed. The term ''weight-of-evidence'' has been interpreted by some to mean that one approach to assessment, e.g., biological, could routinely be used to override conclusions drawn using another assessment technique, e.g., chemical. EPA believes that approach is hierarchical, not a weight-of-evidence approach. EPA's position is that each approach, chemical, toxicological, physical and biological has inherent strengths and limitations and that all valid water quality assessment data generated under any of these approaches should be used in assessing the health of aquatic ecosystems, in ways that adequately take into account the strengths and limitations of each approach.

EPA's current thinking is that as forms of water quality assessment data have become broader (chemical, physical, biological and toxicological), and as the amount of such data increases, the water quality standards and assessment programs need to facilitate continued collection and use of such data, and that doing so will lead to more thorough water quality assessments, more insightful water quality criteria, and better descriptions of aquatic life designated uses. EPA would not support an approach that could lead to collecting fewer and narrower water quality data by States, Tribes and dischargers. On the contrary,

EPA's current thinking is that to employ a weight-of-evidence approach, a State or Tribe (or EPA) would need to have a comprehensive set of water quality data to evaluate the chemical, physical, toxicological and biological conditions in a water and to conduct ecological impact assessment to determine the precise causes of impacts (chemical, physical, biological, and toxicological) and how best to address them. EPA's current thinking is that the most appropriate context for using a weight-of-evidence approach would be in establishing criteria. In addition, as discussed below, EPA is interested in evaluating the use of a weight-of-evidence approach for assessment and reporting under section 305(b) of the CWA. However, once the criteria are established for a water body, the assessment for purposes of listing under section 303(d) of the CWA and permitting under NPDES, must be based on all applicable water quality criteria.

EPA's 305(b) reporting guidelines interpret the independent application policy to apply to aquatic life use assessments for State 305(b) reports, not just to permitting for protecting waters due to reasonable potential to violate water quality standards. This policy helps protect against dismissing valuable information when evaluating aquatic life use attainment, particularly in detecting impairment. This approach is most protective when there is limited data available and when there is no documentation on the rigor of the assessment. EPA is concerned that lack of information can provide false confidence about the health of the nation's water bodies. However, EPA is now developing a comprehensive approach for conducting aquatic life use assessments which integrates chemical, toxicological, physical and biological data, and includes consideration of the strengths and limitations of the assessment methods and the data. This shift toward more integrated assessments is reflected in EPA's most recent guidance to the States and Tribes on conducting 305(b) assessments, particularly in determining nonattainment (EPA's Guidelines for Preparation of the 1996 State Water Quality Assessments (305(b)) reports, EPA 841 B–95–001) and is the primary focus of the Office of Water's Criteria and Standards program Plan. The 1996 305(b) guidelines are consistent with the Policy on Independent Application while incorporating a weight-of-evidence approach in determining the degree of impairment (partial or nonsupport). The 1996 guidelines do not allow for a finding of full support, or attainment, of aquatic life use when there are differences in assessment results. Under certain circumstances, however, the guidelines allow for the possibility of a finding of partial support, even where results of different assessments are not fully consistent. Generally, *in assessing severity of impairment,* assessments based on data with high levels of information, or rigor, should be weighted more heavily than those based on data with low levels of information, and, rigorous biological data should be weighted more heavily than other data types. EPA recommends that the results of biological assessments, especially those with high levels of information, be the basis for the overall aquatic life use support (ALUS) determination if the data indicate impairment. This is because rigorous biological data provide a direct measure of the status of the aquatic biota and detect the cumulative impact of multiple stressors on the aquatic community, including new or previously undetected stressors.

Determining the level of information or rigor for each assessment is a critical component of the 305(b) guidelines on making an ALUS determination. The levels of information allow characterization of the quality and the temporal and spatial coverage of the data States and Tribes utilize to conduct their use assessments. Levels of information are identified for assessments based on biological, physical, chemical and toxicological data. For example, measures of the condition of the aquatic community using indices incorporating multiple assemblages of aquatic organisms based on a regional reference approach would rate higher than a measure of a single organism or single metric or annual fixed station monitoring for chemical contaminants. Likewise, three years of bi-monthly fixed station monitoring for chemical contaminants would rate higher than annual fixed station monitoring for the same chemicals or a biological measure of a single organism or metric. Understanding the breadth and robustness of the assessment methods used in evaluating whether a water body is attaining its designated aquatic life use is important information for EPA, the States, and the public.

In the future, EPA will be evaluating possible scenarios where a finding of full support could be justified despite differences in assessment results. For example, a finding of full support based on rigorous biological data may be justified despite differences with chemical specific assessment results *depending* on the magnitude and frequency of the chemical exceedances and the applicability of the chemical benchmark to the site. It will be important for EPA to carefully evaluate such potential scenarios and to define the adequate data requirements and level of rigor necessary to support a determination of full support despite differences in assessment results. Equally important, EPA will need to carefully consider the ramifications of such determinations on other parts of its water program.

Another permutation of the weight-of-evidence approach to aquatic life use assessment is to establish a hierarchy in which the results of one method could always override the other methods should there be difference in assessment results. Most frequently, it has been argued that biological assessments could always override chemical assessments in determining whether the designated aquatic life uses are being attained. Some prefer this approach because a rigorous biological assessment provides a direct measure of existing ecosystem health and have expressed concern that the policy of independent application oversimplifies the relationship among different data sets used to assess current water quality conditions. Proponents of this approach contend that biological assessment is an integrated assessment that incorporates the information that would be provided through either chemical or toxicological assessments into a single, comprehensive measure of aquatic ecosystem health. Some advocate the acceptance of rigorous biological data as the ultimate arbiter of aquatic life use attainment. They also suggest that, at least with respect to current aquatic life condition assessments, chemical, toxicological, and biological assessments are not independent; each measures the same assessment endpoint, but from different stressors. These proponents say that biological assessment is the only assessment approach available to integrate and reflect current effects from chemical, toxicological, physical, and nonpoint source stressors. Because of this they suggest that rigorous data based on biological assessments and criteria should automatically supersede data from other sources when determining aquatic life use attainment. Some contend that if biological data demonstrate that biological criteria are attained, then the water body is attaining its designated use, even if other monitoring data such as toxicological or chemical data demonstrate an excursion, or potential for an excursion, above a water quality criterion.

Some also contend that rigorous biological assessments should be used

to supersede assessments based on predicted impacts such as water quality modeling and wasteload allocations in decision making for aquatic life use assessments. One concern with this perspective is that non-rigorous biological assessments could be used in such situations, though EPA has 305(b) reporting guidance which suggest minimum quality of biological assessments that could also be used for these situations. In this guidance, EPA recommends using more than one assemblage (fish and/or macro invertebrates/and or algae), several index values or metrics (multiple metrics), an index period for sampling, and ecoregional or other biogeographic regional calibration.

EPA agrees that rigorous biological assessment based on adequate site-specific data is a direct assessment of aquatic ecosystem health, unlike chemical and toxicity assessments. However, biological assessments are less well suited for use in preventing water quality impacts and will only reflect impacts once they have occurred. Though this may be less of a concern in waters with a relatively constant level of discharge where there has been ongoing biological assessment. A second objective of water quality assessment under the CWA, beyond assessing when the aquatic life use is impaired, is assessing when stressors, if left unchecked, will cause impairment. As discussed above, the chemical-specific approach is especially strong for use in identifying and predicting impacts before they happen.

EPA is concerned that the use of a hierarchical approach may ignore or undermine valuable information, whether that information is biological, physical, chemical, or toxicological, and not trigger the appropriate action to address the inconsistency (e.g., evaluation of existing criteria and development of site-specific criteria). Therefore, EPA does not support such an approach. EPA has a number of concerns with any approach wherein data from certain assessment techniques may be automatically superseded by those from others. A primary concern is the failure of such a system to make use of all valuable information. In all cases, criteria, whether chemical-specific, toxicological, physical or biological, are derived with the intent of identifying a threshold beyond which unacceptable impacts to aquatic ecosystems are expected to occur. In most cases, it is expected that when different assessment techniques (i.e., chemical and biological) are used for determining attainment of aquatic life uses, the techniques will yield similar results if all are done rigorously. In addition, it is expected to be rare for chemical assessments to indicate nonattainment where biological assessment indicate attainment; analyses conducted by the State of Ohio confirm this. (See Yoder, C., ''Answering Some Concerns about Biological Criteria Based on Experiences in Ohio.''). However, it is also expected that in certain cases, different assessment techniques will result in different determinations of aquatic life use attainment due to the fact that each technique evaluates aquatic life use attainment differently, and some take into account safety factors for ensuring future attainment while others focus on the current status of the condition. When different assessment techniques that are intended to measure similar environmental endpoints and yield comparable results fail to do so, it may be an indication that assumptions underlying the criteria are not valid for a particular site, or that the data were not rigorous.

While in some cases it may be appropriate to weigh one set of data more heavily than another in making a use attainment determination, in others it may be preferable to take advantage of such circumstances as opportunities to validate and cross-check criteria, making adjustments as indicated by the data. This could result, for example, in an adjustment to a specific chemical criterion in a particular water if rigorous biological assessment indicated that such an adjustment is appropriate. Such information is also useful to EPA in improving national criteria development methodologies.

Lack of comparability in assessments is also a concern for either a weight-of-evidence or a hierarchical approach to aquatic life use assessments. Therefore, it is important that there be a common understanding between States, Tribes and EPA as to how conflicts in data interpretation will be resolved in evaluating and reporting water quality. Developing comparable methods to handle data conflicts will make comparisons between States and Tribes more useful, such as in 305(b) reports. Without a consistent approach to resolving data conflicts, assessments of water quality data at the national level becomes problematic. EPA's policy of independent application is one way of providing a consistent and defensible framework for data evaluation in order to minimize this problem.

Request for Comments on integration of data in water quality assessments

EPA is interested in comment on how chemical, physical, toxicological, and biological assessments can be effectively incorporated and implemented in State and Tribal water quality standards programs to achieve the goals of the CWA.

EPA requests comments on the following questions:

1. How can conflicting interpretations of water quality assessment data be reconciled in a scientifically defensible manner? Should each kind of water quality information stand alone as a scientific measure of current water quality conditions and ecosystem health? Alternatively, are there situations where one type of data should be given more weight than another in determining use attainment?

2. How should States and Tribes evaluate water quality information generated using chemical, toxicological, physical, and biological methods when determining use attainment status?

3. When interpretation of water quality data indicate inconsistent results, what factors (i.e., data richness), if any, should EPA consider relevant to determining ''appropriate actions''?

4. Should EPA explicitly address in the water quality standards regulation the evaluation assessments using chemical, toxicological, physical and biological assessment methods?

5. Should an approach be instituted where independent application may be relaxed for water quality assessment strategies and decisions when a State or Tribe has established a comprehensive monitoring and assessment program including biological monitoring and assessment? What guidelines should be used to evaluate a State or Tribal biological monitoring and assessment program?

6. How should the policy of independent application address the distinction between situations where adequate rigorous data are available for each assessment technique and situations where available data for one or more of the assessment techniques are limited in quantity or quality? Specifically, should the policy be modified to more explicitly encourage or require, where feasible, additional monitoring, particularly where limited data are to be used as a basis for regulatory action?

3. Independent Application and NPDES Permitting

a. Independent Application. Clean Water Act section 101(a) states that ''[t]he objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters.'' In the context of implementing water quality-based pollution controls under the NPDES program, EPA has maintained that independent

application of all forms of water quality assessment data (i.e., chemical, physical, toxicological and biological) is clearly consistent with this objective. In addition to restoring impaired surface waters, water quality-based pollution controls are often implemented to prevent water quality standards impairment that projections indicate will occur in the absence of the water quality-based controls. Thus, predictive assessment tools are necessary and have proven effective in the NPDES water quality-based program.

An important question in NPDES permitting that EPA's policy of independent application was specifically developed to address is: how should differences in interpretation of water quality data produced using different water quality assessment techniques for aquatic life uses be reconciled? Upon examination of this question, EPA determined that differences in data interpretation do not necessarily equate to contradictory results. Different assessment results may be complementary since the different approaches can measure different aspects of water quality. For aquatic life uses, all three data types (chemical, toxicological, and biological) provide useful information and should be used to protect designated uses. Because the different types of assessments often focus on different aspects of aquatic community health and each has different strengths and limitations, it is possible that any one type of assessment may fail to detect impairments, or potential impairments of the designated use. For that reason, EPA's current interpretation of the CWA and its implementing regulations is that all three types of data (chemical, toxicological, and biological) should be used when evaluating the reasonable potential for a discharge to cause or contribute to an excursion above a water quality criterion and, if one approach indicates that water quality is, or will be, impacted, the results from the other methods could not be used to refute that finding. Under this approach, where ''reasonable potential'' is found, the NPDES permitting authorities must take appropriate ''actions;'' that is, implement water quality-based effluent limits that are derived from and comply with the applicable water quality criteria. These ''actions'' may also include additional monitoring to determine whether a problem exists, or to derive site-specific criteria if a particular criterion is found to be inaccurate for a site. The policy on independent application is presented in further detail in Chapter 1 of EPA's 1991 Technical Support Document for Water Quality-based Toxics Control (TSD) and in chapter 1 of EPA's Water Quality Standards Handbook—Second Edition, September 1994 (Handbook) (both documents cited above).

In the Great Lakes Guidance, EPA maintained its policy of independent application with respect to determining the need for water quality-based effluent limits, making it an explicit implementation requirement in the Great Lakes States. The Guidance, in Appendix F, Procedure 5, section F ''Other Applicable Conditions,'' states ''When determining whether WQBELs are necessary, information from chemical-specific, whole effluent toxicity and biological assessments shall be considered independently.'' (40 CFR Part 132, Appendix F, Procedure 5, Section F.3.).

In the permitting context, EPA's independent application policy reflects language in sections 301(b)(1)(C) and 303 of the CWA and permit regulations implementing these statutory provisions at 40 CFR 122.44(d). Pursuant to section 303 of the CWA, States and Tribes adopt chemical-specific numeric criteria and toxicity criteria as part of their water quality standards. Section 303(c)(2)(B) of the CWA further requires States and Tribes to adopt, as part of their water quality standards, numeric criteria for toxic pollutants for which EPA has published guidance under section 304(a), and whose discharge or presence in State or Tribal waters could reasonably be expected to interfere with the designated uses adopted by the State or Tribe for those waters. (As discussed elsewhere in this document, all States and Tribes have narrative water quality criteria as well.)

Section 301(b)(1)(C) of the CWA requires effluent limitations in NPDES permits that are ''necessary to meet water quality standards'' or necessary to ''implement any applicable water quality standard.'' Consistent with this provision, EPA's permitting regulations at 40 CFR 122.44(d) require that effluent limits be imposed where the discharge has the ''reasonable potential'' to cause or contribute to an excursion above water quality criteria and specifically describe how those limits are to be expressed (e.g., chemical-specific versus WET limits). Therefore, once a numeric (or narrative) water quality criterion becomes part of a State's or Tribe's water quality standards, and a permitting authority determines that a discharge of a pollutant would have a reasonable potential to cause or contribute to an excursion above the applicable numeric or narrative criterion, the regulation requires that a limit for that pollutant be established as necessary to meet the water quality criterion. Although the CWA specifies that permit limits must meet water quality standards, it is the permitting regulations that specify the factors that must be considered when determining whether or not there is reasonable potential to cause or contribute to an excursion above a State or Tribal water quality standard, and specifically describe how such limits are to be expressed.

EPA regulations at 40 CFR 122.44(d)(1)(iii)–(v) describe the conditions under which water quality-based effluent limits for specific chemicals and for whole effluent toxicity are required in NPDES permits. While these regulations do not specifically use the term ''independent application,'' the concept is expressly laid out. These regulations require chemical-specific limits when the permitting authority determines there is a reasonable potential for the discharge to cause or contribute to the excursion above the chemical-specific criterion. Likewise, the regulations require limits for whole effluent toxicity if the permitting authority determines there is a reasonable potential for the discharge to cause or contribute to the excursion above the numeric criterion for toxicity or narrative criterion for water quality. Except under limited circumstances (where the State or Tribe lacks a chemical-specific criterion for a pollutant of concern), these regulations do not allow a permitting authority to forgo one type of limit, e.g. a chemical limit, where another type of data, e.g., toxicity, indicate no toxicity. Instead, the two types of data are required to be considered independently.

The independent application policy provides a consistent and coherent protocol for resolving conflicts in interpreting monitoring data when determining ''reasonable potential.'' Where such conflicts exist and cannot be reconciled, independent application directs States and Tribes to presume that the data that indicate a current or potential impact are valid and to take appropriate steps to prevent or remediate the impact. The reconciliation phase allows a State or Tribe to gather additional or more detailed data prior to taking regulatory action. Data interpretation conflicts may be best addressed by identifying the cause of the conflict and recalibrating the models and criteria to better reflect the newly acquired site-specific information. However, if the causes of the data interpretation conflicts cannot be resolved, under independent application, the State or Tribe must take

action based on the data indicating impairment or the reasonable potential for impairment of the water body.

EPA believes this procedure for addressing conflicting interpretations of monitoring data is appropriate for a number of reasons. First, as stated earlier, each of the different assessment techniques monitors aquatic ecosystem health from a slightly different perspective. Consequently, it is entirely plausible that only one of the assessment techniques would detect a real or potential impact. Second, assuming that the data generated by the different techniques are of comparable quality and relevance, an indication of a water quality problem using any of the techniques is sufficient reason to implement controls. That being the case, EPA believes the independent application of water quality data in determining when water quality-based effluent limits are necessary for individual dischargers is consistent with the CWA.

Reconciliation of data interpretation conflicts allows flexible evaluation of data. Once a permit application is received from a discharger, States and Tribes frequently engage in discussions with the discharger over the quality and representativeness of the data. This period of data review and evaluation is also an ideal time for addressing any data interpretation conflicts in order to ensure that permitting decisions are defensible and the permit limits that are imposed are necessary to protect designated uses. States and Tribes, together with permittees, may obtain additional data to verify earlier data or conduct timely studies to support the development of site-specific criteria. Ultimately, these site-specific criteria may serve as the basis for a permit limit, or a decision that it is not necessary to limit a pollutant in a particular discharge. All of the actions above are consistent with the independent application policy and the CWA.

Critics of EPA's policy believe either that data from certain types of water quality assessments have inherently greater value than data obtained by other means or that, in a sense, data quality and ecological significance should be averaged, such that if data obtained from two different assessment methods agree and data from a third disagree with the other two, the two could ''outweigh'' the one. In either case, all of the available data would be considered together, under the assumption that each assessment technique measures a similar endpoint. Under such an approach to data evaluation, limits on effluent toxicity would be appropriate and acceptable as surrogates for chemical-specific limits. Similarly, biological assessment data that do not indicate unacceptable levels of impact on the biological community could serve as the basis for a decision not to include either chemical-specific or effluent toxicity limits designed to support an aquatic life use in a facility's discharge permit. Proponents of this view argue that independent application forces them to take inappropriate regulatory actions when faced with conflicting assessment data. EPA does not agree in principle with this view.

b. Alternatives to Independent Application. States, Tribes, municipalities, and dischargers have expressed concerns that the policy of independent application results in more protection than is necessary to attain and maintain aquatic life designated uses. Many express a preference for an approach which invests data obtained using certain assessment techniques with greater credibility than those obtained in other ways. Such an approach, as discussed above, is sometimes referred to as a weight-of-evidence approach. Under such an alternative approach, assuming a high level of confidence in all the available data, one form of data—usually it is argued biological data— would be the ultimate arbiter of whether water quality-based effluent limits are needed in a discharger's permit. To determine, for example, whether a water quality-based effluent limit is needed for a particular chemical pollutant, the risk of adverse impact on the aquatic community would be determined based on all of the available data relying more heavily on high quality, thorough biological data and on the judgment of the individual conducting the evaluation. Several States and members of the regulated community have advanced this approach as preferable to EPA's independent application policy, arguing that such flexibility to exercise judgment is appropriate.

EPA's current thinking is that it should not promote an alternative approach to making ''reasonable potential'' decisions that places greater emphasis on biological data. Instead, EPA's current thinking is that such an evaluation of water quality and ecosystem health to determine the appropriate and applicable criteria against which discharges will be evaluated is most appropriately done during the setting of the applicable criteria for a water body. In that arena, it may be feasible to use biological assessment as a basis for determining the appropriate criteria for a given water body. However, once the criteria are set, EPA believes that the current regulation requires ''reasonable potential'' evaluations against all the applicable criteria, and that the policy of independent application in this context is appropriate.

If biological data indicate that designated uses are being attained in spite of projected or actual chemical-specific criteria exceedances, then additional site-specific analysis should be done to ensure that controls are developed that are necessary to adequately protect the water body from use impairment. Site-specific approaches could include mixing zone studies, more refined water quality modeling to support wasteload allocation, or the development of site-specific criteria. In any case, chemical-specific and toxicity criteria are proven and necessary bases of water quality-based effluent limits. In ''reasonable potential'' analysis, chemical-specific monitoring is usually focused on pollutant concentrations in the effluent and the projected ambient result of those concentrations being discharged. Thus, this type of analysis commonly yields projected rather than measured water quality impacts. Where biological impact is not detected using biological assessment methods, it is possible that impairment that is projected and plausible, may simply have not yet occurred. However, where discharges to a stream have been relatively constant over time and there has been ongoing biological assessment, this would be less of a concern. EPA's view is that it would be inappropriate to ignore projected impairment simply because the impairment has not yet been observed in the environment.

An additional argument in favor of retaining the independent application policy for ''reasonable potential'' determinations has to do with the suitability of certain types of data and the unsuitability of others for certain applications within the water pollution control program. For example, biological data are not amenable in the same way as chemical-specific data for use in waste load allocations, load allocations, total maximum daily load calculations or antidegradation reviews. An approach that would allow biological data to negate a finding of ''reasonable potential'' would suggest possible site-specific inadequacies of particular criteria without providing the information needed to determine definitively whether or not the criteria are appropriate or what any alternative criteria should be. As a consequence, a void would be created in the implementation of State or Tribal water quality standards which would render them unable to perform all of their

intended functions. Proponents of independent application contend that instead of discarding data and invalidating criteria where conflicting interpretations exist, an effort should be made to determine why the interpretations conflict and to refine the applicable criteria to better reflect the conditions found at the site. Taking this step would ensure that, over time, a full suite of appropriate criteria would be developed for every site and that all appropriate and necessary pollution controls are implemented. In addition, such an approach is consistent with the CWA. Some States and Tribes may be concerned, however, that revising water quality standards, especially where such revision is to deal with a single permitting decision, may be so resource intensive that it is not a realistic option.

As discussed above, if numeric water quality criteria exist and are applicable to a water body, permits for dischargers to the water body must ensure that those criteria are met under section 301(b)(1)(C) and the implementing regulations at 40 CFR 122.44(d). On occasion, States, Tribes and dischargers have asserted that biological and toxicity data from specific waters conflict with chemical data. EPA's current thinking is that instances of clear disagreement between biological and toxicity data and chemical data are infrequent. Based on this belief, EPA would not support a radical shift away from chemical criteria and limits or toxicity criteria and limits. Those tools are simply too important as proven tools for assessing potential impacts to surface waters and improving water quality. EPA's current thinking also suggests that it is important for there to be flexibility to resolve instances of disagreement between different forms of data and that perhaps mechanisms for such flexibility can be clarified or improved. EPA's current thinking is that through collection of broader and more thorough water quality data, EPA, States and Tribes will be able to develop more complete profiles of water body conditions and stressors and that through such evaluation the ''necessary actions'' (e.g., water quality-based effluent limits for one or more pollutants, listing of the water body as not attaining its aquatic life designated use, or best management practices to address nonpoint sources of pollution) to improve water quality in a given water will become more obvious.

Disagreement between biological, toxicity and chemical data for the same water is cited by some States and dischargers as a potential situation in which independent application would force unnecessary and burdensome requirements on dischargers. Those opposed to independent application of criteria would like to see States and Tribes given greater latitude to determine when limits based on a given criterion are necessary. They suggest that this could be achieved if States and Tribes were to include, in the chemical-specific criteria or toxicity criteria portions of their water quality standards, statements explaining circumstances under which the otherwise applicable criteria would not apply at a particular site or would have to undergo some review and revision, while assuring the designated use of the water body would be maintained. Such circumstances could include where the form of the pollutant in the effluent or receiving water is not the form addressed by the chemical criterion in the State or Tribe's standards; or, where a substantial amount of biological and or toxicity data indicate that discharges of the pollutant at levels that would exceed the chemical criteria are not causing the aquatic life use in a particular water body or segment of the water to be impaired. If these conditions could be met, permitting authorities would have the flexibility to determine that a numeric water quality-based effluent limit for the pollutant in question is not required, or that an alternate limit should apply. This type of flexibility, to rely on biological evaluations *in the criteria setting phase*, where data are sufficient to support such flexibility, could be a strong incentive for States and Tribes to develop stronger biological criteria and assessment programs including monitoring reference areas and complete chemical and toxicity monitoring programs, including site-specific data on most sensitive species to chemical(s) for which flexibility is being sought. EPA approval of water quality standards implementing such an option requires acceptance of an interpretation that sections 301(b)(1)(C) and 303(c)(2)(B) of the CWA allow States and Tribes to identify, within their water quality standards, conditions or circumstances which would render specific numeric criteria not applicable to certain waters in specific instances, or alternatively in need of refinement.

EPA has significant technical questions about how such an option could be implemented within the context of a State's or Tribe's water quality standards. EPA is especially interested in detailed technical comments describing how such an option would be included in a State's or Tribe's water quality standards, how such an option would ensure protection of designated uses in water bodies where criteria are deemed not applicable. In addition, EPA is soliciting comment on specific procedures that could be used by a State or Tribe to arrive at a decision that a criterion is not applicable at a specific site. In particular, EPA is interested in technical evaluations of what types of data would be necessary to support such a decision, the quantity and quality of the data and how the data would be evaluated. Finally, EPA seeks detailed technical comments indicating how other elements of the water quality standards program would function in situations where chemical or toxicological water quality criteria were adjusted based on biological assessments. For example, if a State or Tribe were to employ the option discussed above, it is not apparent how critical water quality program elements such as determining the need for permit limits or whether or not a new discharge could be allowed to a stream segment could occur absent chemical-specific or toxicity-based criteria applicable to the water body. To be workable, this option may need to be paired with a scientifically defensible mechanism for making decisions about activities such as permit limits and load increases. Since chemical criteria and chemical-specific interpretations of narrative criteria currently are the principal benchmark used for these functions, would pursuing the option discussed above be workable, or would it introduce a level of complexity into State and Tribal water quality standards that could result in slowed or suspended water pollution control programs, and expose aquatic ecosystems to greater risk because of the lack of an identified threshold of impact?

EPA's current thinking is that significant flexibility already exists within the current regulatory framework to account for available biological and toxicity data. For example, numeric criteria, once adopted, may be modified to better reflect conditions at a specific site. Bioassessment and toxicity data can play a valuable role in identifying sites where conditions differ sufficiently from those assumed in the calculation of the national or State or Tribe-wide criteria to warrant site-specific modification of the criteria. Bioassessment and toxicity data can also provide useful information in identifying instances where a given constituent in an effluent is toxicologically distinct from a similar substance for which a criterion is available, indicating the need for a separate criterion for the constituent in

question. Establishing site-specific criteria would provide relief similar to that contemplated in the option proposed above.

Lastly, public participation is a basic tenet of the water quality standards development process. Public participation is also sought in the context of issuing NPDES permits. During standards development, public input is sought to assist the regulatory agency in identifying the appropriate water quality goals for the waters under the jurisdiction of a State or Tribe. During NPDES permit issuance, public input is again sought to verify that the permit proposed to be issued is consistent with the water quality goals. Some assert that these two public participation steps seek input on different questions and are not interchangeable. Does the weight-of-evidence option discussed above reduce the opportunity for meaningful public participation in the standards setting process by making it more difficult for the public to determine which water quality criteria will apply to which water bodies, and, as a result, what the water quality goals for an individual water body are? EPA is considering how a weight-of-evidence approach might be implemented in a manner that does not restrict the opportunities for meaningful public participation in the water quality goal setting process.

Request for Comments on Independent Application

EPA requests comment on the following questions:

1. What is the rationale for modifying the independent application policy as it pertains to NPDES permitting? Under what circumstances could it be justified?

2. If there are circumstances where an approach other than independent application is acceptable, should any one type of water quality data receive greater weight and why?

3. How should States and Tribes evaluate effluent data generated using chemical, toxicity and biological methods in determining reasonable potential to cause or contribute to an impairment?

4. Would checks or oversight mechanisms be necessary to ensure that where decisions about reasonable potential are based on chemical, toxicity and biological methods, such decisions are made with integrity? For example, EPA or public oversight?

5. Are there any cases which indicate that either chemical-specific, whole effluent toxicity or biological approaches do not legitimately represent some aspect of use attainment?

6. Should EPA explicitly incorporate into the water quality standards regulation the independent application policy?

7. Should independent application be addressed the same or differently for permitting than for assessment and use attainment decisions under 305(b) reporting and 303(d) listing?

8. If EPA were to separate the use of independent application in determining the use attainment status of a water body from the use of independent application when determining reasonable potential for an effluent, what approach, independent application, weight-of-evidence, or hierarchical, should be used for use attainment decisions? NPDES permitting? What would the implications be if the programs used two different policies?

9. Would a policy allowing numeric criteria to not apply to all waters where supported by scientifically defensible data be workable? Would it unnecessarily complicate the regulatory program, for example by delaying the issuance of permits? Are existing mechanisms of criteria setting and permit issuance sufficiently flexible?

IV. Summary and Potential Program and Regulation Changes

EPA believes that the water quality standards program and decisions it yields will continue to be the focus of growing pressure and scrutiny as solutions to remaining surface water quality problems in this country are found to be increasingly elusive, difficult, and/or expensive. The task set forth by the Clean Water Act is to improve water quality even where it is difficult to do so. To accomplish this task, EPA envisions a national water quality standards program in which: the best possible information on whether designated uses are being attained and how to attain and maintain them is available and used; water quality criteria are selected from a wide-ranging menu of scientifically sound criteria and tailored to each watershed; and national norms of consistency and flexibility in State and Tribal water quality standards are clear.

With this vision in mind, EPA, through this ANPRM, begins a review of the water quality standards regulation in a public forum in an attempt to identify possible amendments to the regulation and new guidance or policy that may be needed to address three distinct objectives: (1) eliminate any barriers to, and otherwise enhance State and Tribal implementation of, watershed-based water quality planning and management; (2) facilitate use of new, more integrated water quality assessment and criteria science in water quality standards programs, and; (3) improve the regulation so that it can be implemented more efficiently and effectively (including cost-effectively).

The preceding pages of this ANPRM outline current regulatory provisions, accompanying guidance and policy, and current practices in the core areas of the water quality standards program. Each section of the ANPRM identifies issues that have been raised to EPA that come out of the collective experiences of States, Tribes, cities, industry and environmental advocates, as well as EPA's experience. The issue discussions are followed by specific questions that are intended to elicit focused comments. It is important for commenters to focus on these specific questions as a vehicle for developing comments. It is equally important for commenters to develop ideas that address the three objectives above in a more general sense and to identify the five to seven highest priority issues the commenter believes EPA should address in a follow-on regulatory proposal. EPA welcomes ideas on how the water quality standards regulation, policy and or guidance can be revised to facilitate water quality management on a watershed basis. In requesting comment on eliminating barriers to and facilitating implementation of watershed-based water quality planning and management, EPA directs commenters' attention primarily to the sections on designated uses, criteria, antidegradation, mixing zones and independent application. In requesting comment on how to facilitate use of new, more integrated water quality assessment and criteria science in water quality standards, EPA directs commenters' attention primarily to the sections on biological criteria, and independent application. In requesting comment on how to improve the efficiency and effectiveness (including cost-effectiveness) of the water quality standards program, all sections of the ANPRM are relevant for review.

EPA seeks a water quality standards program that protects the nation's waters as envisioned in the CWA, that establishes requirements that are necessary to attain and maintain healthy and sustainable ecosystems, and that is flexible enough for States and Tribes to protect water quality and at the same time avoid costly requirements that have little or no environmental benefit.

Below is a brief summary outline of the potential changes to the water quality standards program and

regulation that are discussed and considered in this ANPRM. The list of potential changes includes the potential changes to the program and regulation on which EPA is specifically requesting comment. Each area of potential change is discussed in detail in the specified section of the ANPRM. It is possible that EPA will ultimately propose some of the changes outlined below. It is also possible that EPA will conclude based on the public comments it receives that some or all of the issues presented in the ANPRM can be best addressed through non-regulatory mechanisms such as guidance or policy.

A. Uses

1. Refinement of use designations to achieve increased specificity in aquatic life and recreation uses being protected.
2. Minimum elements of a use attainability analysis (UAA).
3. When is UAA required/not required?
a. UAAs whenever an aquatic life use is designated (beyond fishable/swimmable) to see if the use reflects the highest potential for the water body.
b. Periodic review of marginal or limited aquatic life use designations.
c. When is a use considered attainable?
d. Conditions under which refinements in designated uses may be considered actions not requiring analysis to support use removal and alternatively the conditions under which such action is considered a use removal requiring justification under § 131.10(g).
e. Circumstances under which UAA is required and circumstances under which UAA must be reviewed.
4. Removal of designated uses.
a. Minimum aquatic life uses for all waters, because even degraded water bodies support some form of aquatic life.
b. Evaluate use removal provision at § 131.1(10)(g) allowing removal of a use due to the existence/operation of a dam.
c. Clarify whether the physical factors reason for removing a use includes removal of a recreational use due to poor physical access to the water. Alternatively, the removal of a use for physical factors could be limited to aquatic life uses only.
d. Clarify in § 131.10 that at least one of the six use removal criteria must be met to remove any use, not just aquatic life and recreation uses.
5. Alternatives to use downgrade such as variances, temporary standards and ambient-based criteria.
a. Recognize site-specific criteria set to natural background levels as a permissible alternative to use downgrade.
b. Recognize site-specific criteria set to irreversible anthropogenic background levels as a permissible alternative to use downgrade.

B. Criteria

1. Ambient Water Quality criteria for Aquatic Life Protection.
a. Examination and possible interim revisions to EPA recommendations on the duration and frequency of criteria excursions to account for organism response model and population response model.
2. Site-specific criteria and procedures.
a. Specify that States and Tribes must have regulatory procedures for establishing site-specific criteria.
b. Minimum requirements for development of site-specific criteria.
3. Narrative criteria and interpretation procedures.
a. Identify additional methods for implementation of narrative criteria.
b. Clarify that States and Tribes are required to adopt narrative criteria for all waters. (all States already have).
4. Codification of CWA requirement to adopt numeric toxics criteria.
a. Define ''reasonable expectation'' under 303(c)(2)(B). (''States and Tribes may adopt numeric chemical-specific criteria for those stream segments where the State or Tribe determines that the priority toxic pollutants for which EPA has issued CWA section 304(a) criteria guidance are present and can reasonably be expected to interfere with designated uses.'' emphasis added)
5. Chemical criteria beyond priority pollutants.
a. Develop and recommend or require criteria for certain non-priority pollutants.
6. Numeric values in the absence of criteria or data sufficient for criteria.
a. States and Tribes develop method for derivation of alternative values where minimum data requirements for criteria not satisfied. Specific EPA derivation procedure or guidelines.
7. Require or recommend that State and Tribes adopt numeric toxicity criteria.
8. Sediment quality criteria.
a. Require or recommend that States and Tribes adopt sediment criteria (narrative or numeric).
b. Specify in regulation that States and Tribes have the flexibility to adopt sediment quality criteria.
9. Biological criteria.
a. Require or recommend that States and Tribes adopt biological criteria (narrative or numeric).
b. Specify in regulation that States and Tribes have the flexibility to adopt biological criteria.
c. Specify linkage between biological criteria and stressor identification.
10. Wildlife Criteria.
a. Recognize in regulatory text that wildlife criteria are valid forms of water quality criteria.
b. Recognize in regulatory text that wildlife criteria endpoints other than bioaccumulation endpoints are valid bases for wildlife criteria.
11. Physical criteria: Existing and potential future role of.
a. Identify physical criteria such as habitat (including clean sediment) and hydrologic balance criteria in 40 CFR 131 as valid forms of criteria that States and Tribes can adopt in their water quality standards.
12. Human Health Criteria.
a. Higher fish consumption assumptions for site-specific or regional situations when subpopulations that are highly exposed have been identified.
b. Clarification of the use of MCLs and MCLGs in State and Tribal water quality standards.

C. Antidegradation

1. Minimum elements of State and Tribal antidegradation implementation procedures.
a. Revise regulation to include the minimum elements of a State and Tribal antidegradation implementation method.
b. Revise the regulation to explicitly say that State and Tribal antidegradation implementation procedures (in addition to just the policy) must be submitted in triennial review package and are reviewable by EPA.
2. Tier 1 protection (protection of existing uses).
a. Define or clarify what constitutes loss of an existing in-stream water use.
b. Specify that a clear approach to maintaining and protecting existing uses that may not be adequately protected by strict application of water quality criteria is a required element of an antidegradation implementation procedure.
3. Waters covered by tier 2 level protection.
a. Clarify waters subject to tier 2 level protection.
b. Clarify tier 2 provision requiring all cost effective and reasonable best management practices for nonpoint sources prior to allowing a lowering of water quality.
c. Clarify that States and Tribes are to consider the 303(d) listing status of a water body, and the information supporting that status, when determining whether a proposed activity that is expected to degrade water quality in that water body can be authorized under tier 2 of the State's or Tribe's antidegradation provisions.

4. Outstanding national resource water (ONRW) classification, level of protection, and public role in nominating.

a. Public nomination of ONRWs.

b. Level of protection afforded to ONRWs.

5. Creation of Antidegradation tier 2.5.

a. Revise the regulation to explicitly recognize tier 2.5 protection.

D. Mixing Zone Policy and Implementation Procedures

1. Specify that, to use mixing zones, States and Tribes must indicate in their water quality standards whether they allow mixing zones, conditions under which mixing zones are allowed, minimum requirements for mixing zones.

2. Procedures and decision criteria used in addressing complete and incomplete mixing.

3. Site-specific technical justification for rapid and complete mix assumption.

4. State and Tribe policies and procedures to address rate of mixing.

5. Clarify in regulation that narrative criteria apply in mixing zones.

6. Restrict Mixing zones for bioaccumulative chemicals of concern.

E. Applicability of Water Quality Standards to Wetlands

1. Clarify in 40 CFR Part 131 that wetlands with interstate commerce connection are waters of the U.S. requiring water quality standards.

F. Evaluation of EPA Policy of Independent Application (IA)

1. Increase use of chemical, toxicological, physical and biological data in making water body assessments in a consistent and scientifically defensible manner.

2. Specify how, and the circumstances under which, different forms of assessments (chemical, toxicological, physical and biological) can be used together to determine:

a. When a designated aquatic life use is or is not attained,

b. The type and value of criteria that should apply to a water, and

c. When water quality-based effluent limits are required in a permit.

3. Specify the adequate data base and level of rigor necessary in biological assessments to support a determination of full use support despite differences in assessment results.

In addition to the potential program and regulation changes outlined above, EPA is also requesting comment on the costs and benefits and potential reporting and record keeping requirements that might be associated with these changes. These issues are discussed more fully in the next section.

V. Regulatory Assessment Requirements

A. Executive Order (E.O.) 12866, Regulatory Planning and Review

Under Executive Order 12866, [58 **Federal Register** 51,735 (October 4, 1993)] the Agency must determine whether the regulatory action is ''significant'' and therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Order defines ''significant regulatory action'' as one that is likely to result in a rule that may:

(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

While this advance notice of proposed rule making establishes no regulatory requirements it could ultimately result in a rule that would satisfy one or more of the above criteria. It has therefore been determined that this action is a ''significant regulatory action'' under the terms of Executive Order (E.O.) 12866. As such this action was submitted to OMB for review. Changes made in response to OMB suggestions or recommendations have been documented in the public record.

Under the terms of E.O. 12866, EPA is to prepare for any significant regulatory action an assessment of its potential costs and benefits. If that action satisfies the first of the criteria listed above, this assessment must include, to the extent feasible, a quantification of these costs and benefits, the underlying analyses supporting such quantification, and an assessment of the costs and benefits of reasonably feasible alternatives to the planned regulation. Because the purpose of this notice is to initiate a structured national debate on a broad set of issues rather than to propose specific regulatory changes, it is not feasible to quantify the costs and benefits of any resulting regulations at this time. The Agency is aware, however, that this notice could lead to a regulatory action for which the preparation of a quantitative assessment of costs and benefits would be appropriate. The Agency is thus requesting comment on the costs and benefits of any of the possible regulatory changes discussed in this notice, as well as on appropriate methodologies for assessing them. The Agency would be particularly interested to hear from States and Tribes that may already have experience implementing some of the measures discussed in this Notice and may already have prepared analyses of the costs and/or benefits of such measures. Other members of the public are also encouraged to submit any data they may have on the costs and benefits of specific measures (e.g., conducting biological assessments).

B. The Regulatory Flexibility Act (RFA) as Amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) of 1996

Under the RFA, (5 U.S.C. 601 *et seq.*), as amended by SBREFA, for proposed rules, EPA generally is required to conduct an initial regulatory flexibility analysis (IRFA) describing the impact of the regulatory action on small entities as part of rulemaking. However, under section 605(b) of the RFA, if the Administrator for the Agency certifies that the rule will not have a significant economic impact on a substantial number of small entities, EPA is not required to prepare an IRFA. The requirement applies to proposed rules only and as this notice is an ANPRM, these requirements do not apply to this notice.

C. Paperwork Reduction Act

Under the implementing regulations for the Paperwork Reduction Act, an agency is required to certify that any agency-sponsored collection of information from the public is necessary for the proper performance of its functions, has practical utility, is not unnecessarily duplicative of information otherwise reasonably accessible to the agency, and reduces to the extent practicable and appropriate the burden on those required to provide the information (5 CFR 1320.9). Any proposed collection of information must be submitted, along with this certification, to the Office of Management and Budget for approval before it goes into effect. Most of the potential regulatory changes discussed in this Notice could entail new reporting and record keeping requirements for States and Tribes and/or members of the regulated public. EPA

is interested in comments on any and all aspects of these potential paperwork requirements, and in particular on how they should be structured to fulfill the requirements that they have practical utility, are not unnecessarily duplicative of other available information, and are the least burdensome necessary to satisfy the purposes of the Water Quality Standards Program.

Dated: June 25, 1998.

Robert Perciasepe,

Assistant Administrator for Water.

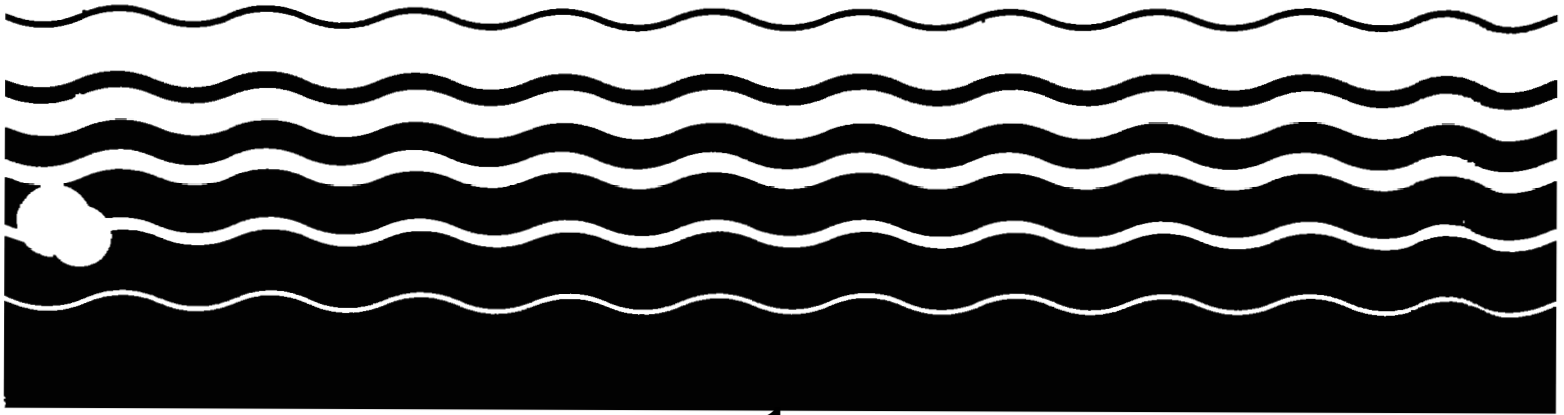
Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges From Municipal Separate Storm Sewer Systems



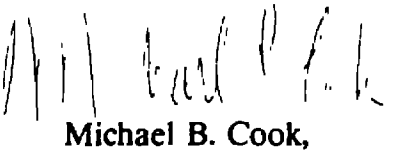
FOREWORD

This manual provides detailed guidance on the development of Part 2 permit applications for municipal separate storm sewer systems. It provides technical assistance and support for all municipal separate storm sewer systems subject to regulatory requirements under the National Pollutant Discharge Elimination System (NPDES) program for storm water point source discharges. This manual also emphasizes the application of pollution prevention measures and implementation of Best Management Practices (BMPs) to reduce pollutant loadings and improve water quality.

The control of pollution from urban and industrial storm water discharges is critical in maintaining and improving the quality of the Nation's waters. Pollutants in storm water discharges from many sources are largely uncontrolled. The *National Water Quality Inventory, 1990 Report to Congress*, provides a general assessment of water quality based on biennial reports submitted by the States under Section 305(b) of the Clean Water Act (CWA). The report indicates that roughly one third of the impairment in assessed waters is due to storm water runoff.

This document was issued in support of Environmental Protection Agency (EPA) regulations and policy initiatives involving the development and implementation of a national storm water program. This document is Agency guidance only. It does not establish or affect legal rights or obligations. Agency decisions in any particular case will be made applying the laws and regulations on the basis of specific facts when permits are issued or regulations promulgated.

This document will be revised and expanded periodically to reflect additional guidance. Comments from users are welcomed. Send comments to U.S. EPA, Office of Wastewater Enforcement and Compliance, 401 M Street, SW, Mail Code EN-336, Washington, D.C. 20460.



Michael B. Cook,
Director
Office of Wastewater Enforcement
and Compliance

CHAPTER 1
INTRODUCTION

1.0 INTRODUCTION

1.1 OVERVIEW

Control of pollution from urban and industrial storm water discharges is an important factor in maintaining and improving the quality of the Nation's waters. To help improve the quality of storm water discharges, Congress passed the Water Quality Act (WQA) in 1987. The WQA added to the Clean Water Act (CWA) a provision [Section 402(p)] that directed the U.S. Environmental Protection Agency (EPA) to establish final regulations governing storm water discharges under the National Pollutant Discharge Elimination System (NPDES) program.

In response, EPA published regulations in the November 16, 1990, Federal Register (55 FR 47990) that established NPDES permit application requirements for storm water point source discharges As part of these regulations, municipal separate storm sewer systems (MS4s) that serve populations greater than 250,000 ("large MS4s"), MS4s that serve populations between 100,000 and 250,000 ("medium MS4s"), and other MS4s identified by the permitting authority must be covered by NPDES permits. The regulations establish a two-part application process for these MS4s In April 1991, EPA issued guidance on the preparation of Part 1 of the NPDES permit application for discharges from MS4s (EPA, 1991b). The present manual provides guidance on the preparation of Part 2 applications. The information in this manual should help municipalities focus their efforts on activities that meet the application requirements.

1.2 SUMMARY OF THE CLEAN WATER ACT REQUIREMENTS

Section 402 of the CWA prohibits the discharge of any pollutant to waters of the United States from a point source, unless that discharge is authorized by a NPDES permit. Efforts to improve water quality under the NPDES program have traditionally focused on reducing pollutants in discharges of industrial process wastewater and municipal sewage. As pollution control measures have been implemented for these discharges, it has become evident that diffuse sources of water pollution (those occurring over a wide area) are also major contributors to water quality degradation. Recent studies, including the Nationwide Urban Runoff Program (NURP) study (EPA, 1983), have shown that storm water runoff from urban and industrial areas typically contains the same general types of pollutants that are often found in wastewater in industrial discharges. Pollutants commonly found in storm water runoff include heavy metals, pesticides, herbicides, and synthetic organic compounds such as fuels, waste oils, solvents, lubricants, and grease. These compounds can have damaging effect on both human health and aquatic ecosystems. In addition to pollutants, the high volumes of storm water discharged from MS4s in areas of rapid urbanization have had significant impacts on aquatic ecosystems due to physical modifications such as bank erosion and widening of channels.

The statutory provisions governing discharges from MS4s are contained in CWA Section 402(p)(3)(B). In general, Congress provided that permits for discharges from MS4s:

- May be issued on either a system- or jurisdiction-wide basis;
- Shall effectively prohibit non-storm water discharges into the MS4, and
- Shall require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP).

Under the storm water program, the initial round of NPDES permits will emphasize the use of Best Management Practices (BMPs) to reduce pollutant loadings from MS4s. These BMPs include pollution prevention measures, management practices, control techniques, and design and engineering practices. As with any discharger subject to the NPDES program, MS4s must meet technology-based requirements [in this case, the "maximum extent practicable" standard of Section 402(p)] as well as applicable water quality standards.

1.3 THE PERMIT APPLICATION PROCESS

The goal of the NPDES program for municipal storm water is the reduction and elimination of pollutants in storm water discharges from large and medium MS4s. The permit application process in 40 CFR 122.26(d) is designed to meet this goal by developing site-specific NPDES permits containing storm water management programs for individual MS4s. Site-specific permitting is crucial given the differing nature of discharges from MS4s in different parts of the country and the varying impacts of these discharges on receiving waters. To facilitate this process, the regulations specify a two-part permit application.

Part 1 of the permit application initiates the process through which municipalities began to identify sources of pollutants to the municipal storm sewer system. Part 1 also requires municipalities to propose strategies to characterize storm water discharges from their municipal separate storm sewer systems. *Guidance for the Preparation of Part 1 of The NPDES Permit Applications for Discharges From Municipal Separate Storm Sewer Systems* was issued in April 1991, and is available through EPA's Storm Water Hotline [(703) 821-4823].

The present manual describes how to meet the Part 2 permit application requirements for storm water discharges from large and medium MS4s Part 2 of the permit application builds upon the foundation established in Part 1 and provides for the development of comprehensive storm water management programs. Part 2 requires particular information that MS4s must have developed to have an effective storm water control plan. However, each applicant is given flexibility on how to present and organize this information in a way which best suits the MS4's needs and is most consistent with its overall storm water management strategy. This guidance presents examples which illustrate some alternative ways to present information that will fulfill the Part 2 permit application requirements.

1.4 WHO MUST SUBMIT A PART 2 APPLICATION

Municipalities, incorporated places, and counties with unincorporated urban areas that own or operate a large or medium MS4 that discharges to waters of the United States are required to obtain a NPDES storm water permit. In addition, small MS4s (less than 100,000) that are owned or operated by a municipality other than those identified in the NPDES regulation can be designated by the permitting authority as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers.

Under EPA's definition of MS4, "large" MS4s serve populations greater than 250,000, and "medium" MS4s serve populations of at least 100,000, but less than 250,000. Population is determined by the most recent Decennial Census by the Bureau of the Census. A list of large and medium municipalities identified in the November 16, 1990, rule is contained in Exhibit 1-1, in which population was based on the 1980 Census. **After the publication of the November 16, 1990, rule, the Bureau of the Census released data for 1990, and, as a result, some additional municipalities may be required to submit applications, while others may fall below 100,000. These changes are not reflected in Exhibit 1-1.**

Source. 55 FR 48073, November 16, 1990.

The definition of MS4 excludes those conveyances that are designed to discharge storm water runoff combined with municipal sanitary sewers ("combined sewer systems"). Therefore, municipalities that own or operate combined sewer systems may petition to have their population, based on Bureau of the Census figures, reduced by the number of people served by the combined sewer system. If the total population served by the separate storm sewer system alone is less than 100,000, the municipality may be eligible for an exemption from NPDES storm water permit requirements. Municipalities should contact their permitting authority for additional information. **Exhibit 1-1 does not reflect any modifications in the application requirements for cities with combined sewer systems.**

1.5 SUBMITTING THE PART 2 APPLICATION

Completed Part 2 applications should be submitted to the appropriate permitting authority listed in Exhibit 1-2. For municipalities in States with authorized NPDES programs, the permitting authority is the State office listed in Exhibit 1-2. Because some of these States may have application requirements in addition to EPA's, municipalities in States with authorized NPDES programs should contact their States for guidance. For municipalities in States without approved NPDES programs, the permitting authority is the EPA Regional Office listed in Exhibit 1-2.

Municipalities with populations greater than 250,000 (large MS4s) were to submit their Part 2 applications by November 16, 1992. Municipalities with populations greater than 100,000, but less than 250,000 (medium MS4s), must submit Part 2 applications by May 17, 1993. Inquiries regarding Part 2 applications or the permitting process should be directed to the appropriate permitting authority.

1.6 USE OF INFORMATION IN PART 1 AND PART 2 APPLICATIONS

The information submitted in the Part 1 and Part 2 permit applications provides applicants with a starting point for developing comprehensive storm water management programs. For example, the field screening data submitted with the Part 1 application provides a basis for a program to control illicit discharges. Also, the application information may assist in prioritizing controls and in long-term tracking of program effectiveness.

Permitting authorities will use the information from each municipality's Part 1 and 2 applications as the basis for establishing conditions in that municipality's NPDES storm water permit. For example, if a municipality submits a satisfactory application, all or part of its proposed storm water management program is likely to become an integral part of its permit

1.7 ORGANIZATION OF THIS MANUAL

Chapter 1, *Introduction*, provides a brief overview of the Part 2 permit application process It discusses who must submit a Part 2 application and how the information in the applications will be used It also contains a summary of the statutory and regulatory basis for the NPDES storm water program.

Chapter 2, *The Part 2 Application*, describes the statutory and regulatory requirements of municipal NPDES storm water permit applications in more detail. Chapter 2 outlines the specific requirements of the Part 1 and Part 2 applications, explains how Part 2 builds on the Part 1 application, and describes the interconnection among the various components of the Part 2 application.

Chapter 3, *Adequate Legal Authority*, describes how municipalities must demonstrate that they have adequate legal authority to carry out the program requirements [§122.26(d)(2)(i)]

Chapter 4, *Source Identification*, provides guidance on identifying major outfalls and inventorying dischargers to the MS4 [§122.26(d)(2)(ii)]

Chapter 5, *Discharge Characterization*, provides guidance for submitting quantitative data on the MS4 and developing a proposed monitoring program [§122.26(d)(2)(iii)].

Chapter 6, *Proposed Management Program*, describes the steps municipalities must take when they develop site-specific storm water management programs [§122.26(d)(2)(iv)]. These plans are the heart of the municipal permit application, and the permitting authority will probably incorporate all or part of the municipality's proposed management program into their NPDES storm water permit. In their proposed management programs, municipalities must describe management practices, control techniques and systems, design and engineering methods, and other provisions that are aimed at reducing the discharge of pollutants to the "maximum extent practicable"

Chapter 7, *Assessment of Controls*, explains how a municipality can assess the effectiveness of its storm water management program and target priorities through the use of direct and indirect measures [§122.26(d)(2)(v)]

Chapter 8, *Fiscal Analysis*, provides guidance on estimating necessary capital and operation and maintenance expenditures, and financing these expenditures [§122.26(d)(2)(vi)].

1.8 OTHER GUIDANCE AVAILABLE

Municipalities should use this guidance document together with the Part 1 guidance (EPA, 1991b). Exhibit 1-3 lists other sources of guidance available from EPA's Storm Water Hotline [(703) 821-4823] In addition, applicants may wish to obtain further information from the documents identified in the bibliography at the end of this guidance (Appendix A).

CHAPTER 2
THE PART 2 APPLICATION

2.0 THE PART 2 APPLICATION

2.1 BACKGROUND

The NPDES permit application requirements for MS4s [40 CFR 122.26(d)] establish a two-part application designed to meet the goal of developing comprehensive site-specific storm water quality management programs for MS4s.

The purpose of the two-part application process is to develop information, in a reasonable time frame, that will build successful storm water management programs and allow permitting authorities to make informed decisions about permit conditions. The application process is designed to focus the efforts of municipalities in two areas: prohibiting non-storm water discharges into storm sewers, and implementing controls that reduce the discharge of pollutants from MS4s to the maximum extent practicable.

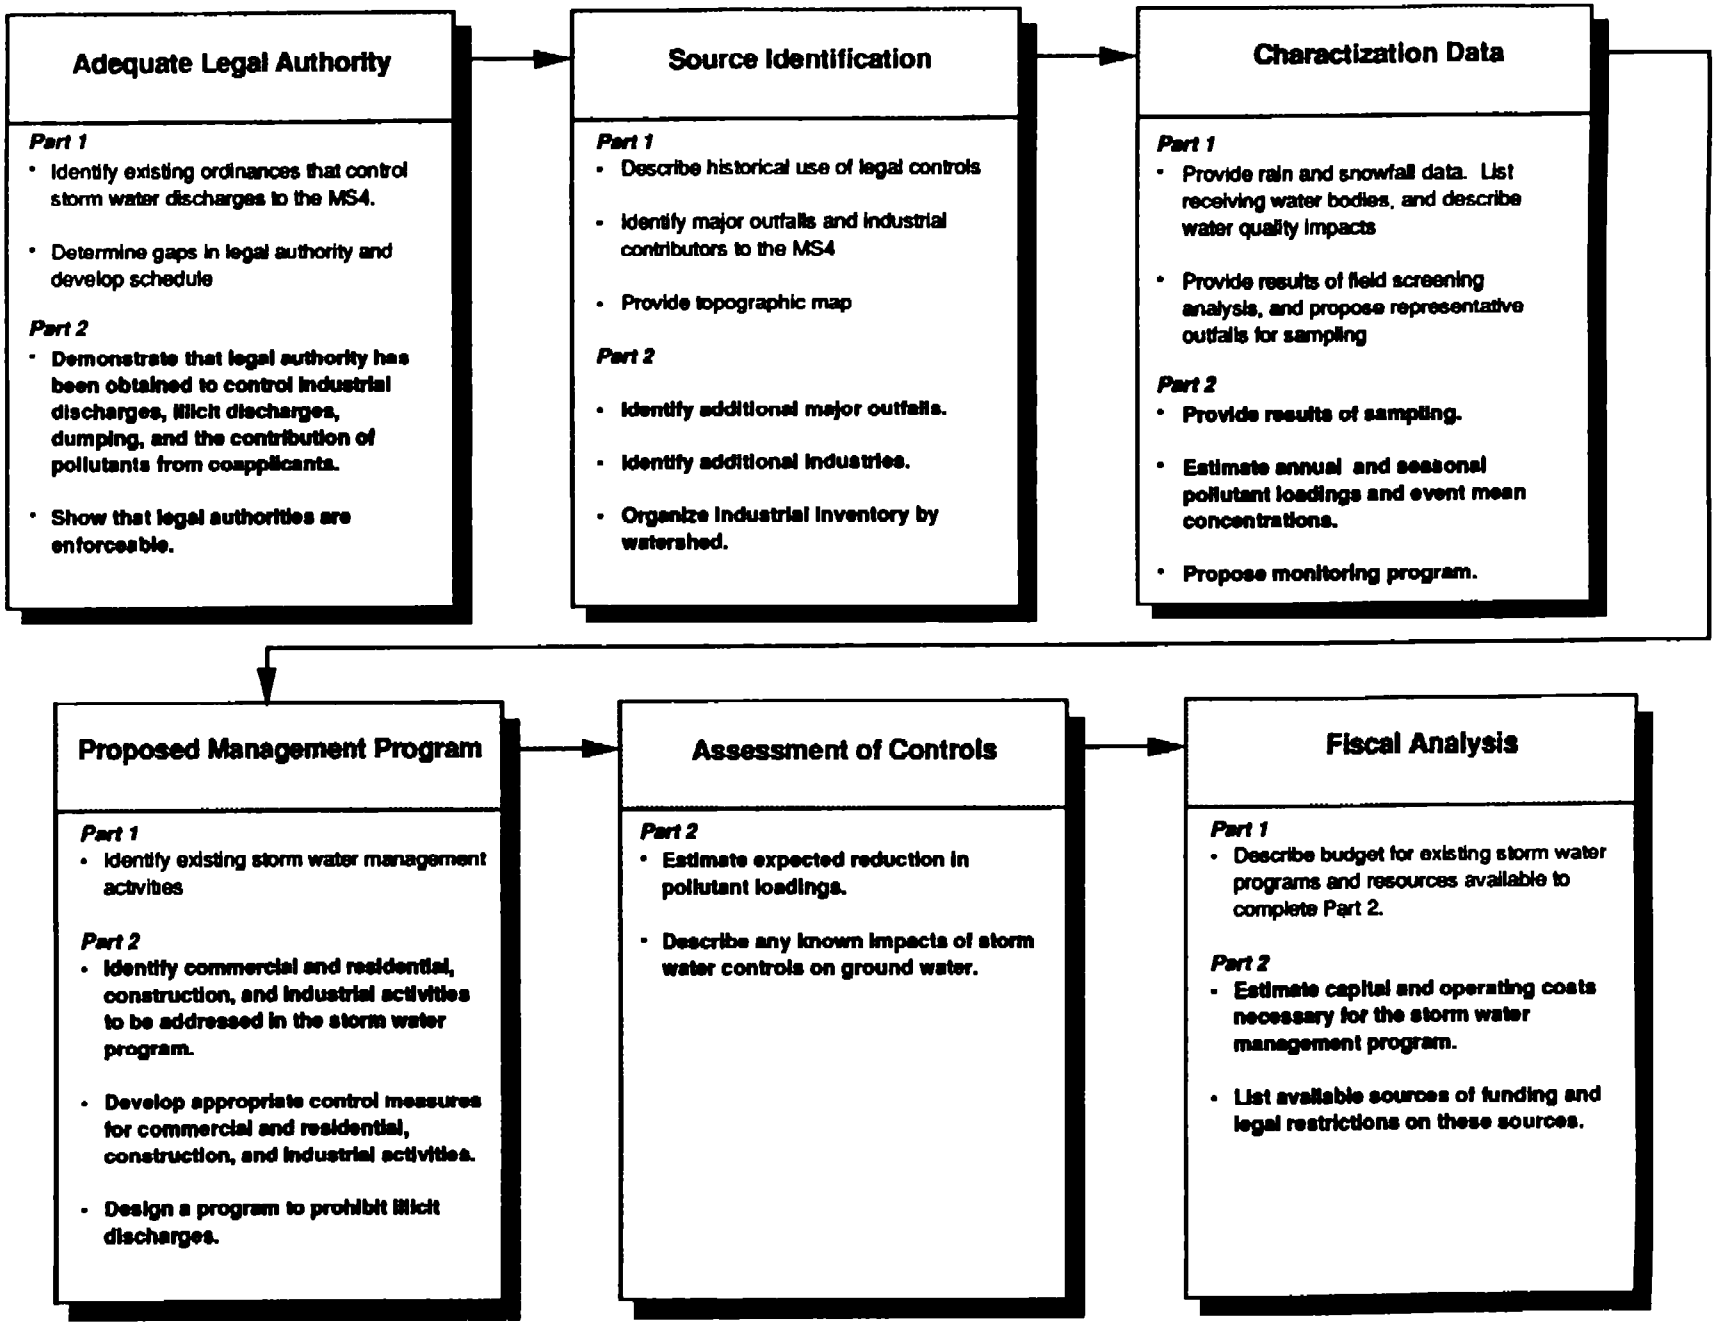
Part 1 of the application requires information on existing programs and legal authority. In addition, Part 1 requires the results from field screening of major outfalls to detect illicit connections. The **Part 2** application requirements are intended to build upon the information submitted with the Part 1 application Each part has virtually the same major areas of concern, but the Part 2 application requires a greater level of detail. Part 2 of the permit application requires a demonstration of adequate legal authority, additional information on pollutant sources and outfalls, a limited amount of representative quantitative sampling data, a proposed monitoring program, a proposed storm water management program, an estimate of the effectiveness of storm water controls, and a fiscal analysis. The requirements for the Part 1 and Part 2 applications are summarized briefly in Exhibit 2-1, and described in more detail in Section 2 2 The storm water regulations underlying this guidance can be found in Appendix B

Before applicants proceed with the detailed development of their permit applications; they **should recognize the fundamental** requirements:

- Who or what are the primary contributors of pollutants in storm water discharges from MS4s?
- Where are these sources of pollutants located in relation to receiving water resources?
- What is the magnitude of these pollutant sources and their potential impact on receiving waters?
- How does the municipality plan to reduce or eliminate the contribution of pollutants in storm water discharges or prevent the damaging influences of these discharges?
- Why did the municipality select the activities or best management practices (BMPs) it proposes?
- When will the municipality implement its proposed program?
- How will the applicant assess the effectiveness of the program? What criteria or measures will apply?
- How will the municipality fund proposed program activities?

Wherever appropriate, the applicant must also show that it has adequate legal authority to implement, enforce, or mandate compliance with applicable ordinances, statutes, contracts, or other similar vehicles as required by the storm water regulation.

Exhibit 2-1: Part 1 and Part 2 Storm Water Application Requirements.



These questions (described above) that an applicant must address follow a natural progression or development. For example, before applicants can identify how they will reduce the contribution of pollutants in storm water discharges (the fourth bullet point above), they must identify pollutant sources and estimate the magnitude of pollutant loads (bullet points 1-3 above).

2.2 PART 1 APPLICATIONS

Sections 2.2.1 and 2 2 2 provide overviews of the regulatory requirements of §122 26(d). Section 2 2 3 describes the relationship among the various application provisions.

2.2.1 Overview of the Part 1 Application

Part 1 applications consist of the following six elements

- **General information.** The applicant's name, address, telephone number of contact person, ownership status and status as a State or local government entity

- **Legal authority.** A description of existing legal authority to control discharges to the MS4, and if this authority does not meet the required criteria, a list of additional authority needed and a schedule and commitment to seek such authority.

- **Source identification.** A description of the historic use of ordinances, guidance, or other controls that limit non-storm water discharges to any publicly owned treatment works (POTW), and a topographic map covering an area one mile beyond the service boundaries of the MS4 showing:

  - the location of known municipal sewer system outfalls;

  - a description of all land use activities;

  - the location and activities of landfills;

  - the location and permit number of any known discharge to the MS4;

  - the location of major structural controls for storm water discharges (such as retention basins, or major infiltration devices); and

  - identification of publicly owned parks, recreational areas, and other open lands.

- **Discharge characterization.** A summary of the types and characteristics of storm water discharges, including:

  - monthly mean rain and snowfall estimates and the average number of storm events per month;

  - existing quantitative data describing the volume and quality of discharges from the MS4, including a description of the outfalls and sampling methods used;

  - a list of "downstream" water bodies receiving discharge from the MS4, and a description of the impact of outfall upon them;

  - the results of field screening analysis for illicit discharges at either selected field screening points or major outfalls covered in the permit application; and

  - a proposed characterization plan for conducting sampling and obtaining the quantitative data necessary to complete Part 2 of the application.

- **Management programs.** A description of existing management programs to control pollutants from the municipal separate storm sewer system. For example, what procedures are in place to control pollution from construction activities, and how do they work? What is the program (such as investigation procedures and how they operate) for identifying illicit connections to the municipal storm sewer system?

- **Fiscal resources** A presentation of the municipality's budget for existing storm water programs and for completing Part 2 of the permit application.

2.2.2 Overview of the Part 2 Application

The Part 2 application must include the following elements:

- **Adequate legal authority.** A demonstration that the municipality can operate according to the legal authority established by ordinance, statute, or series of contracts. The municipality also must demonstrate that its authority is enforceable. A discussion of how adequate legal authority may be demonstrated appears in Chapter 3 of this guidance.

- **Source identification.** An inventory, organized by watershed, of the facilities that may discharge storm water associated with industrial activity to the MS4. The applicant also must identify the location of any major outfall that discharges to waters of the United States that was not reported in Part 1. A discussion of the information to be submitted for each such facility in the inventory appears in Chapter 4 of this guidance.

- **Characterization data.** Sampling results for 5-10 outfalls designated by the permitting authority, estimates of cumulative annual pollutant loadings and event mean concentrations, and a proposed schedule to submit estimates of seasonal pollutant loadings and event mean concentrations for each major outfall identified in the source identification sections of Part 1 and 2. The *Characterization Data* provision of the Part 2 application also requires the development of an on-going monitoring program covering the term of the permit. Procedures for meeting the requirements of this section appear in Chapter 5.

- **Proposed management program.** A program that shows the municipality's comprehensive planning process for the reduction and control of pollutants, the staff and equipment available to implement the program, and a full description of how controls will be implemented to reduce pollutants from all sources of storm water. Municipalities must also describe how the program will be implemented and maintained. The Part 2 requirements for a proposed management program are described in Chapter 6.

- **Assessment of controls.** An estimate of the projected effectiveness of the municipal storm water management program, and an identification of the known impacts of storm water controls on ground water. The assessment of controls is discussed in Chapter 7.

- **Fiscal analysis.** A fiscal analysis of the capital and operation and maintenance expenditures needed to accomplish the activities (including implementation) required by the characterization data and proposed management program sections of the Part 2 application. This fiscal analysis must include projected expenses for each fiscal year of the permit term. A discussion of the fiscal analysis is included in Chapter 8.

2.2.3 Relationship Among Application Requirements

The required elements of the Part 2 application are related to each other. As a result, this guidance addresses how the application elements are related, and how information gathered for one requirement will assist the applicant in meeting other requirements. For example, the information gathered for the *Industrial Source Identification* provision of the Part 2 application will assist the municipality in.

- Targeting monitoring goals to potential pollutant sources, which may include selecting monitoring locations and chemical specific sampling frequencies (a requirement of the *Characterization Data* provision);

- Identifying illicit discharges (a requirement of the *Proposed Management Program's* illicit connection provision);

- Identifying facilities with the greatest potential for degrading receiving water quality (a requirement of the *Proposed Management Program's* industrial program provision), and

- Targeting sites that handle, store, or transport toxic or hazardous materials for on-site inspections (another requirement of the *Proposed Management Program's* industrial program provision).

As another example, the information that the applicant must prepare for the *Characterization Data* provision (e.g., the results of the sampling requirement and the estimated event mean concentrations and annual pollutant loads) may help the municipality:

- Evaluate the contribution of pollutants in storm water discharges from individual sources and determine which sources may require inspections or controls (a requirement of the *Proposed Management Program's* industrial program provision);

- Predict the impact of storm water discharges on receiving waters known to be impacted. (In the *Proposed Management Program*, additional controls may be warranted for construction sites or other industrial activities that discharge to these waters); and

- Determine what BMPs may be appropriate for given areas (another requirement of the *Proposed Management Program*)

Exhibit 2-2 summarizes some of these key interrelationships, although many other interrelationships exist. A more detailed discussion of specific information requirements and interrelationships among provisions is provided in subsequent chapters As municipalities prepare their permit applications, they should coordinate all program requirements.

Exhibit 2-2
Examples of Relationship Among Part 2 Requirements

					Fiscal Analysis
				Assessment of Controls	Cost/benefit analysis identifies the most cost-effective BMPs
			Proposed Management Program	Estimates of reductions in pollutant loadings predicts impact of storm water management activities	Fiscal analysis considers costs of controls, maintenance, and capital improvements Management program may include feasibility analyses that consider cost.
		Characterization Data	Annual pollutant loads help prioritize areas for BMPS On-going monitoring indicates success of BMPs and need to re-prioritize	On-going monitoring program verifies program effectiveness. Instream monitoring verifies biological recovery.	Fiscal analysis considers cost of on-going monitoring
	Source Identification	Land use information and organization of industry by watershed defines representative sampling points	Inventory of industrial users helps the city target facilities for inspections and control measures	Estimates of pollutant load reductions depend on land use	Industrial inventory identifies potential sources of storm water utility fees
Adequate Legal Authority	Some sources or outfalls may be outside a city's jurisdiction. Interjurisdictional agreements may be necessary.	Authority to require sampling and obtain information for industries and dischargers outside of the MS4's jurisdiction at sampling points	Legal authority needed to implement BMPS, control and inspect industry, and prohibit dumping and illicit discharge	Need information gathering and inspection authority where it is necessary to inspect, monitor, and enter the facility or the site	Legal authority is required for some financing plans, such as a storm water utility

2.3 ADDITIONAL FACTORS TO BE CONSIDERED IN DEVELOPING THE PART 2 APPLICATION

As discussed in the previous section, the various provisions of the Part 2 application process are interconnected

All municipalities covered by §122 26(d) must submit a Part 2 permit application that meets the requirements of the storm water permit application regulations. However, each MS4 is unique, and each Part 2 submission will be different. Municipal separate storm sewer systems differ in many ways, including population served, geologic and climatologic settings, density of development, and form of government These underlying factors make each applicant unique

The major factors that applicants should consider are

- Population and projected growth rate;
- Zoning and existing land use patterns;
- Nature of watershed and receiving waters;
- Climatic conditions, soil types, and watershed delineations,
- Existing municipal functions and municipal lands,
- Other environmental impacts;
- Public involvement; and
- Intergovernmental coordination.

In addition, municipalities must implement their storm water management programs in a manner that is consistent with other applicable Federal, State, and local environmental laws.

Population and Projected Growth Rates

Some storm water BMPs are more appropriate for densely developed areas, while other methods may be more useful in developing areas Consequently, defining current population densities and projecting future areas of population growth provides the basic information that can assist in the evaluation and prioritization of appropriate storm water control strategies

Zoning and Existing Land Use Patterns

Through ordinances, permits, or contracts, municipalities may mandate storm water controls for new residential, commercial, or industrial developments in order to improve or assure maintenance of the quality of receiving waters at or near pre-development levels. The Nationwide Urban Runoff Program (NURP) study (EPA, 1983), pointed out that some of the best opportunities for implementing cost effective measures to prevent or reduce pollutants in storm water occur during new development. These measures may include structural controls, such as storm water detention basins or constructed storm water wetlands, or nonstructural alternatives such as cluster development and buffer zones Sections 122.26(d)(1)(iii)(B)(2) and 122 26(d)(2)(ii) require the municipality to establish comprehensive management plans for new development (see Chapter 6)

Nature of Watershed and Receiving Waters

The types of storm water controls appropriate for a MS4 depend on the nature of the watershed and the receiving waters. This includes geologic and hydrologic features such as slope drainage patterns and stream size For example, roadside swales may not be practical in areas with steep terrain, but can be very useful in flat areas In addition, structural BMPs or other management measures that control the volume and timing of release are appropriate where uncontrolled storm water may cause physical impacts to receiving waters (especially small streams, rivers, and wetlands).

Information on the watershed and the receiving waters is required in the Part 1 permit application [§122 26(d)(1)(iv)(C)]. In Part 1, applicants are required to list water bodies that receive discharges from the MS4. The list of water bodies includes downstream segments, lakes, and estuaries where pollutants from the system discharges may accumulate and result in non-attainment of State water quality standards Part 1 also requires a description of known water quality impacts. Applicants must include a discussion of water bodies that were cited in:

- State reports required by CWA Sections 305(b), 304(l), and 314(a);
- The State Nonpoint Source Report; and
- Other reports identifying sensitive watersheds

Part 1 applicants should also include in this discussion a description of impacts caused by dissolved oxygen depression, bioaccumulation of toxics, excessive sedimentation, hydrologic modification, habitat destruction, etc.

Municipalities are expected to give priority consideration to those classes of pollutant sources that contribute significant loadings or pose a significant impact on receiving waters. Applicants must consider control methods that address storm water discharges from commercial and residential areas; illicit discharges and illegal disposal, storm water discharges from industrial areas; and storm water runoff from construction sites. Municipalities' permits will differ substantially in the emphasis placed on controlling various sources of pollutants in discharges from the MS4. Permits for older municipalities may emphasize control of cross-connections, while permits for municipalities with large areas of new development may emphasize the installation of permanent structural controls during construction

The Part 2 storm water permit application requires descriptions of management programs to address sources of pollutants discharged to separate storm sewer systems. For management strategies to be effective, municipalities must give prior consideration to the nature (e g., physical and biological parameters) and the designated uses of receiving waters such as streams, tributaries, and natural wetlands For example, a storm water management program for a newly developing area with an existing shallow, slow-moving stream could include provisions to ensure that the post-development peak discharge flow rate for the stream is held to a certain percentage of its historical or pre-development peak discharge flow rate

Climatic Conditions, Soil Types, and Watershed Delineations

Seasonal variations in precipitation can have a significant impact on storm water quality For example, extended dry seasons in areas such as the southwestern United States result in pollutant loads distinctly higher than in other parts of the country during the first several storms of the wet season. Areas with more frequent rain and snowfall throughout the year may have more storm water discharges, but the discharges may have consistently lower pollutant concentrations than those in the Southwest. In addition, areas with significant snowfall may experience a peak in storm water discharge volume and pollutant concentration during the spring thaw.

Natural soil conditions affect the potential for storm water to recharge ground water. Porosity and permeability are properties of the soil that govern the size and number of the interstitial spaces through which water may flow. Compaction (e.g , compression of the soil by heavy machinery) will reduce the amount of void space in the soil and thereby reduce the amount of rainfall that infiltrates through the soil to ground water. Natural soil conditions are very important when siting structures designed for storm water infiltration. In addition, identifying such sites must take into consideration potential ground water impacts

that may result whenever infiltration is part of the storm water management program

Existing Municipal Functions and Municipal Lands

The Part 2 application affords municipalities the opportunity to discuss alternatives in the *Proposed Storm Water Management Program*. When considering the wide range of municipal functions, applicants need to establish which agencies will be responsible for implementing each portion of a storm water management program. (This could be outlined in the *Adequate Legal Authority* chapter of the Part 2 application, as discussed in Chapter 3 of this guidance.) Many of these agencies, will have primary missions other than dealing with storm water or water quality. Expansion of the established charter of an agency to include an element of storm water control may require legislative action, moderately expanding the scope of other municipal agencies' missions to include storm water concerns can be much more cost effective than the initiation of entirely new programs.

Applicants should identify existing municipal functions that impact the quality of storm water discharges. These functions may include snow removal activities such as road deicing, vehicle maintenance operations, and herbicide, pesticide, and fertilizer application to public lands. Municipalities can modify these activities to improve storm water quality through oversight of future land development, modifications to flood management structures, changes in materials used or in material handling or application practices, maintenance of roads, and installation of structures such as retention basins

The municipal agency (or agencies) responsible for storm water runoff control should also consider the extent to which municipal lands and activities contribute pollutants to runoff. The same BMPs recommended for private lands may also be incorporated into the development and maintenance of a municipality's own lands and activities. For example, reduced use of pesticides and fertilizers on park land and open spaces usually decreases the contribution of these contaminants to storm water runoff. Implementing BMPs on municipal lands also shows the municipality's commitment to an effective storm water management program BMPs are discussed in greater detail in Section 6.4 of this guidance.

Other Environmental Impacts

Municipalities should consider those activities that can directly or indirectly alter the natural hydrograph of a stream and potentially degrade an otherwise stable aquatic habitat. These factors are particularly important when considering impacts to wetlands, riparian areas, ground water, small rivers, and streams. In addition, the installation of detention or rapid infiltration ponds may have negative impacts on ground water. The installation of culverts or concrete drainage channels and other such structures typically increases the volume and velocity of runoff, which can lead to increased erosion, siltation, and sedimentation in receiving waters. Therefore, installation of these structures can contribute to the degradation of a neighboring habitat.

Public Involvement

Municipal applicants must ensure that they provide adequate public education and ample opportunities for public participation. Public participation should focus on spreading awareness of program objectives and components. Education and public involvement programs must be defined as part of the *Proposed Storm Water Management Program* [§122.26(d)(2)(iv)]. Generally, the public should be involved as early as possible in storm water management initiatives.

Conflict and confusion can be minimized if the program includes a schedule for initial public contact and milestones for public involvement throughout the development and implementation phases. Public education programs are expected to target specific

audiences, including those regulated or affected by the storm water management program (e.g., developers, building contractors, and industrial operators) and those that can assist with program implementation (e.g., volunteers and citizens). For example, one large municipal applicant (Seattle) described an existing public participation program in its Part 1 Application submission. Elements of this program may be instructive to municipalities completing Part 2 of the application because it has generic components that are likely to be applicable to other large (and perhaps medium) municipalities. Excerpts from Seattle's public involvement program are provided in Exhibit 2-3 for reference.

Elements of this municipality's program that are particularly important to consider include of the role of an advisory and outreach group and its relationship to the entire process. Effective public participation programs clearly identify the role of the public

The potential exists for a considerable range in the level of participation the public may actually have in the decision-making process. Generally, the municipal authority is going to make the decisions. However, the authority can choose to use the "participation" process to simply inform the public of decisions, or to allow the views of the public to be registered prior to decision milestones In other cases, although uncommon, the public may have an actual voice or vote in making decisions.

The timing and frequency of meetings and the duration of the groups established for public participation will usually be dictated by the nature of the issues being addressed For example, an ad hoc group established to address a single issue may discover that the issue cannot be effectively addressed without consideration of a broader range of issues that the municipality may also be considering In this instance it may be appropriate for the group to expand its scope, hold regular meetings, and actively participate in the authority's decision making process Therefore, applicants should outline in their Part 2 applications how such coordination will be accomplished

Intergovernmental Coordination

If a number of municipal entities (e.g., multiple cities or a city and a county) are participating in the permit application process as coapplicants, various mechanisms can be used to improve intergovernmental coordination to ensure that the roles and responsibilities of each entity are well defined. Each entity must fulfill its responsibilities to implement applicable program measures. Examples of some of the appropriate coordination techniques and their benefits include:

- **Memoranda of agreement (MOA).** MOAs can define specific municipal roles, responsibilities, and points of coordination that help minimize duplication of effort and ensure accountability;

- **Cross-training of staff.** This allows for the identification of gaps in staffing (e.g., neglected areas of responsibility or insufficient staff levels) as well as providing the benefits of increased versatility and opportunities for learning from others;

- **Interagency advisory committees.** Their objective is to arm decision makers with a comprehensive understanding of the implications of proposed activities or decisions; and

- **Regularly scheduled intermunicipal staff meetings.** These can facilitate an open and thorough exchange of information and solidify new lines of communication

Exhibit 2-3
Excerpts from a Public Involvement Program

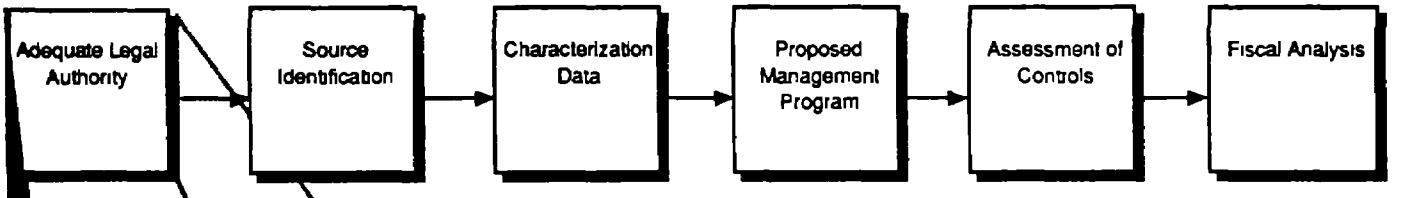
The public involvement program [of the City of Seattle] has been designed to assist in developing an acceptable city-wide plan for addressing drainage and water quality problems. Acceptable is defined as a plan that is both technically sound and sensitive to the needs and interests of the citizens. The involvement program has two major elements: a Citizen Advisory Committee (CAC) and a community outreach effort The initial role of the CAC was to provide guidance to City staff and consultants preparing various sections of a Comprehensive Drainage Plan Until the adoption of the Comprehensive Drainage Plan by the City Council, the CAC provided direction on drainage policy issues, assisted with the public review of the draft plan and environmental impact statement (EIS), and helped coordinate comments sent to the city from the public during the review period. Following council adoption of the plan, the CAC was reconstituted into a Drainage and Wastewater Advisory Committee which serves as an on-going sounding board to the Drainage and Wastewater Utility, the mayor, and the City Council on both sewer and drainage matters.

The community outreach effort was established for two purposes. The first was to ensure adequate public review and support of the Comprehensive Drainage Plan and EIS Comments received during the review were used by the Drainage and Wastewater Utility, the mayor, and the City Council in making decisions about the Drainage Plan and the City's on-going drainage program. The second purpose was to begin educating residents and business people about the importance of their role in solving flooding, landslide, and water quality problems throughout the city. This community outreach/education role remains an on-going effort of the Drainage and Wastewater Utility.

Source City of Seattle, *NPDES Storm Water Permit Application, Part 1*, City of Seattle, November 1991 37

Single municipalities with separate governing functions may face the same challenges as coapplicants when they prepare their Part 2 applications. Many of the same coordination steps may be necessary within a single municipal jurisdiction. The need for *intra*governmental coordination may be most crucial in large municipalities that have functions that impact storm water quality spread throughout the organizational structure of the municipality. For example, a planning department may be in charge of implementing a stream buffer policy, while a public works department may plan, site, and construct storm water BMPs Still other agencies may be responsible for implementing erosion and sediment control requirements, and permitting and inspection functions. Storm water-related responsibilities within governmental organizations may be allocated in this manner due to the relatively recent emergence of storm water quality as an important issue. Nonetheless, effective coordination within the government of a single municipality may be as critical to the success of the storm water management program as is intergovernmental coordination for coapplicants Therefore, applicants should outline in their Part 2 applications how such coordination will be accomplished.

CHAPTER 3
ADEQUATE LEGAL AUTHORITY



Adequate Legal Authority

Part 1

- Identify existing ordinances that control storm water discharges to the MS4
- Determine gaps in legal authority and develop schedule

Part 2

- **Demonstrate that legal authority has been obtained to control industrial discharges, illicit discharges, dumping, and contributions of pollutants from coapplicants.**
- **Show that legal authorities are enforceable.**

3.0 ADEQUATE LEGAL AUTHORITY

3.1 BACKGROUND

A crucial requirement of the NPDES storm water regulation is that a municipality must demonstrate that it has adequate legal authority to control the contribution of pollutants in storm water discharged to its MS4. This guidance manual and the storm water program emphasize development and implementation of storm water management programs as described in Chapter 6. In order to have an effective municipal storm water management program, a municipality must have adequate legal authority to control the contribution of pollutants discharged to the MS4.

Part 1 of the permit application requires applicants to describe their existing legal authority to control the discharge of pollutants from MS4s and evaluate the adequacy of these ordinances. Where existing ordinances were lacking, a proposed schedule to obtain the necessary authority was included with the Part 1 application. In Part 2 of the application, municipal applicants must demonstrate that they now possess adequate legal authority to:

- Control construction site and other industrial discharges to the MS4;
- Prohibit illicit discharges and control spills and dumping;
- Control potential sources of pollutants from discharges to or from coapplicants' MS4s, or MS4s that are interconnected or shared with other entities;
- Require compliance with all regulations and statutes, and
- Carry out inspection, surveillance, and monitoring procedures

Section 3.2 reviews each of these regulatory requirements. Section 3.3 describes specific procedures a municipality may use to demonstrate adequate legal authority.

3.2 SUMMARY OF REGULATORY REQUIREMENTS

3.2.1 Control Construction Site and Other Industrial Discharges to the MS4.

> §122.26(d)(2)(i)(A) [The applicant must demonstrate that it can control] through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.

The municipality, as a permittee, is responsible for compliance with its permit and must have the authority to implement the conditions in its permit. To comply with its permit, a municipality must have the authority to hold dischargers accountable for their contributions to separate storm sewers.

"Control," in this context, means not only to require disclosure of information, but also to limit, discourage, or terminate a storm water discharge to the MS4. For example, construction sites (of 5 or more acres) and other industrial activities that discharge storm water through MS4s are required to obtain individual NPDES permits or coverage under general NPDES permits from EPA or an authorized NPDES State. These permits require compliance with applicable Federal and State regulations. However, a municipality, to satisfy its permit conditions may need to impose additional requirements on discharges

from permitted industrial facilities, as well as discharges from industrial facilities and construction sites not required to obtain permits. Therefore, a municipality should develop a mechanism to assure that all industrial facilities and constructions sites that discharge to the MS4 know their obligation to comply with the applicable terms of the municipality's storm water ordinances.

3.2.2 Prohibit Illicit Discharges and Control Spills and Dumping

> §122.26(d)(2)(i)(B) [The applicant must demonstrate that it can prohibit] through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer
>
> §122.26(d)(2)(i)(C) [The applicant must demonstrate that it can control] through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water

To demonstrate that it possesses adequate legal authority to control storm water discharges, a municipality must be able to effectively prohibit illicit discharges and illegal dumping An illicit discharge is "any discharge that is not composed entirely of storm water except discharges pursuant to a NPDES permit . . . and discharges resulting from fire fighting activities" [40 CFR 122.26(b)(2)].

3.2.3 Control Contributions of Coapplicants

> §122 26(d)(2)(i)(D) [The applicant must demonstrate that it can control] through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system

An operator of a MS4 may participate in an application with one or more other operators, or may submit an individual application for the separate storm sewer it operates. As indicated in the box above, the operator of a discharge from a large or medium MS4 may submit, through the use of interjurisdictional agreements, a system-wide permit application. The system-wide application can accommodate existing storm water programs, on a watershed basis, as well as programs which must take into account regional differences in climate, geography, and political institutions. Such an application should cover issues of liability, financial contributions, access to records, enforcement responsibilities, and any other applicable areas of mutual concern.

When two or more municipalities submit a joint application, each coapplicant must demonstrate that it individually possesses adequate legal authority over the entire municipal system it operates or owns. A coapplicant need not fulfill every component of legal authority specified in the regulations, as long as the combined legal authority of all coapplicants satisfies the regulatory criteria for every segment of the MS4 (including authority over all sources that discharge to the MS4).

As coapplicants, for example, a county and a flood control district within that county may together possess adequate legal authority. The flood control district may have legal authority to build, operate, and maintain structures associated with major drainage channels within the county. The county itself may have legal authority to control pollutants in discharges from privately owned lands to the MS4s and legal authority to build, operate, and maintain structures associated with minor drainage channels that tie into major drainage channels. In this situation, the combined legal authority of the coapplicants may be adequate for the system, provided that the only discharge to major drainage channels comes from the county's separate storm sewer system. As another example, a department of transportation or flood control district with no land use authority could be a co-permittee with

a city that does possess land use authority over the entire jurisdiction.

Coapplicants also may use interjurisdictional agreements to show adequate legal authority and to ensure planning, coordination, and the sharing of the resource burden of permit compliance When more than one entity is submitting an application for a MS4 (either as coapplicants or as individual applicants for different parts of a system), the role of each party must be well defined. Each applicant or coapplicant must show the ability to fulfill its responsibilities, including legal authority for the separate storm sewers it owns or operates.

Applicants and coapplicants may use the procedures outlined in Section 3 3 to demonstrate adequate legal authority in their Part 2 permit applications. These procedures are guidelines, however, and are not intended to be the only possible approaches that applicants may follow.

3.2.4 Require Compliance with all Regulations and Statutes

To meet the requirements of §122 26(d)(2)(i)(E), the applicant must show that it has adequate authority to enforce its ordinances.

> §122 26(d)(2)(i)(E) [The applicant must demonstrate that it can require] compliance with conditions in ordinances, permits, contracts or orders

One acceptable way to support a declaration of adequate legal authority, including the ability to enforce appropriate ordinances, is for the municipality to provide a certification from the Municipal General Counsel or equivalent The certification should state that the applicant has the legal authority to apply and enforce the requirements of §122 26(d)(2)(i)(A)-(F) in State or local courts The certification would, therefore, cite specific ordinances and the reasons why they are enforceable. The statement should discuss what the municipality can do to ensure full compliance with §122.26(d)(2)(i).

In a Part 2 application, through a statement from the Municipal General Counsel or through some other method, a municipality should identify the administrative and legal procedures available to mandate compliance with appropriate ordinances, and, therefore, with permit conditions. Applications should contain descriptions of how ordinances are implemented and appealed In particular, a municipality should indicate if it can issue administrative orders and injunctions or if it must go through the court system for enforcement actions

3.2.5 Carry Out Inspection, Surveillance, and Monitoring Procedures

In their Part 2 applications, municipalities must propose programs to control the contributions of pollutants from industrial facilities and prohibit illicit discharges For both of these activities, municipalities must have the legal authority to carry out inspection, surveillance, and monitoring procedures necessary to determine compliance.

> §122.26(d)(2)(i)(F). [The applicant must demonstrate that it can carry] out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

To meet this requirement, municipalities may wish to consider establishing ordinances that require industrial facilities to perform inspections and report the results to the city. In many municipalities, these facilities may perform similar inspections under a pretreatment program. In their Part 2 applications, municipalities should provide

documentation of their authority to enter, sample, inspect, review, and copy records, etc., as well as demonstrate their authority to require regular reports

3.3 PROCEDURES FOR DEMONSTRATING ADEQUATE LEGAL AUTHORITY

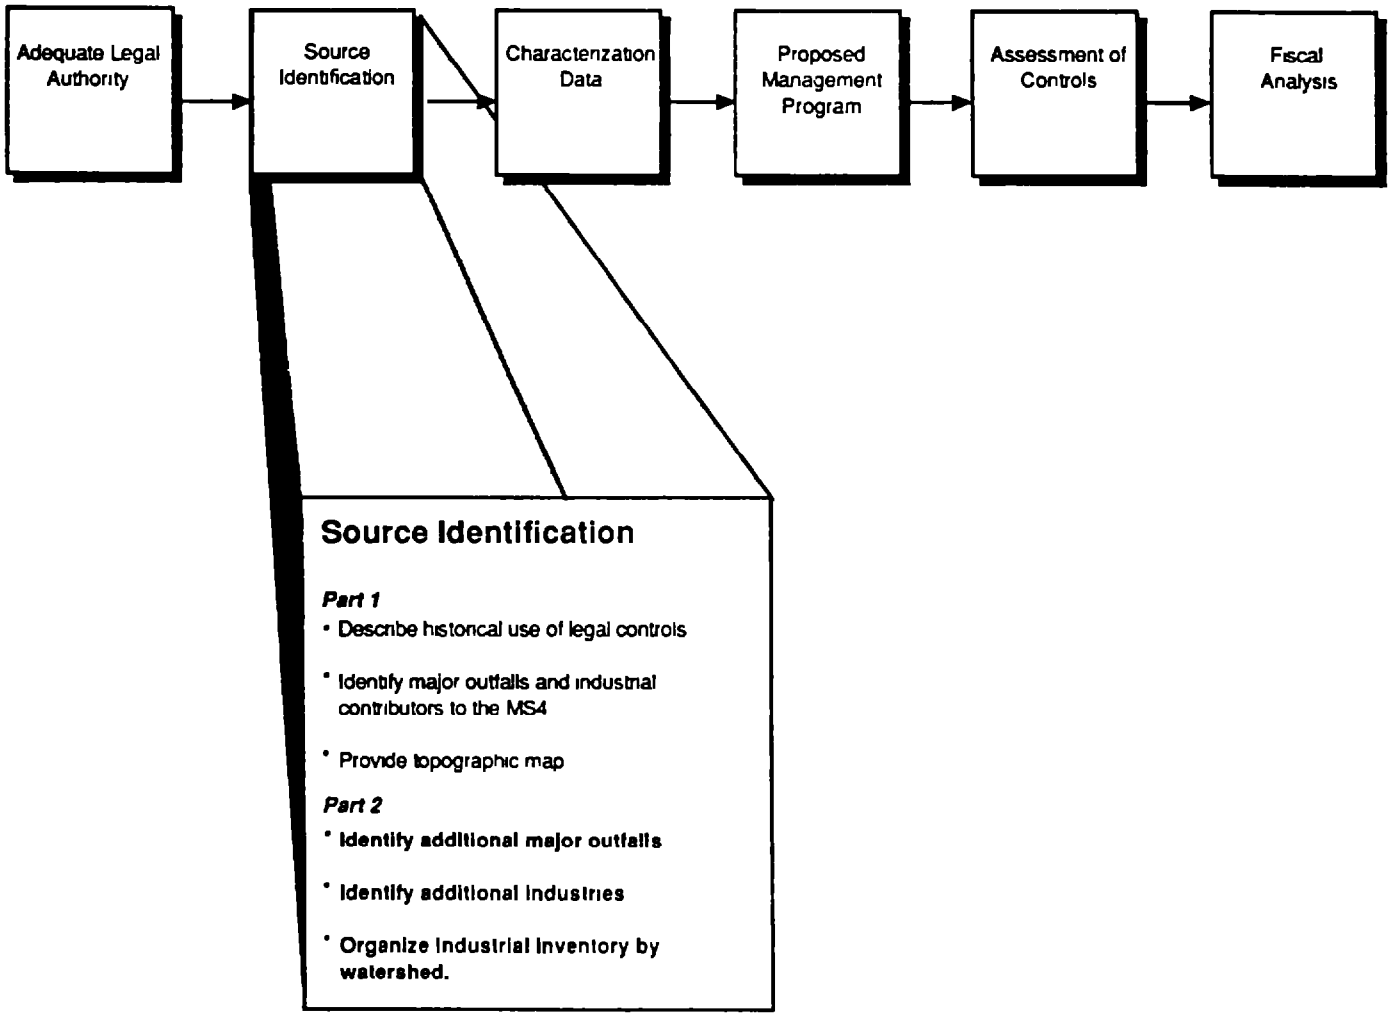
The Part 2 application requires the applicant or coapplicants to cite and describe specific ordinances currently in effect and demonstrate that the jurisdiction for these ordinances covers the entire area served by the MS4 In addition, the applicant may elect to discuss specific changes in ordinances passed since the submission of the Part 1 permit application to illustrate how legal authority has evolved to meet the regulatory requirements in §122 26(d)(2)(i) One method by which an applicant can partially demonstrate that it has adequate legal authority is to develop a matrix that compares, in a side-by-side format, the regulatory requirements in §122 26(d)(2)(i)(A)-(F) and the municipality's legal authority Once completed, the matrix would indicate whether an adequate legal framework exists to address all key regulatory requirements identified in §122 26(d)(2)(i)(A)-(F). Furthermore, the matrix could also illustrate where the authority to mandate compliance is vested.

In order to support an assertion of adequate legal authority, applicants should include the complete text of the applicable portions of the ordinances or other such provisions in the application The applicant should also provide a specific explanation of why and how the language of a particular ordinance or other authority meets Federal regulatory requirements The application should indicate to whom the ordinance applies and how it will operate to control, prevent, or stop discharges that violate permit conditions. For example, the municipality may describe and provide an excerpt from a city ordinance that prohibits non-storm water discharges to the MS4.

Appendix C illustrates one way to detail the existence of ordinances that establish the legal authority required in §122 26(d)(2)(i) A narrative discussion of the historical use of these ordinances to control pollutants in storm water discharges also may be included The example in Appendix C shows what the applicant may do to satisfy §122.26(d)(2)(i)

Substantial effort should be devoted to obtaining the necessary legal authority before the Part 2 application is submitted However, some municipalities may find that the two-year application process does not allow enough time to secure adequate legal authority as described in this section. This may be due to the need for State statutory or legislative changes In this instance, the Part 2 application must include a detailed description of what changes are needed and a schedule of when they will be accomplished. The schedule must include timetables for drafting proposed changes, public comment periods, and final authorizations

CHAPTER 4
SOURCE IDENTIFICATION



4.0 SOURCE IDENTIFICATION

4.1 BACKGROUND

In Part 1 of the NPDES storm water permit application, applicants are required to identify the location of known major outfalls discharging to waters of the United States from MS4s. Applicants also are required to provide information and data on existing land use activities. The identification of outfalls and land use activities is the first step in the process of:

- Identifying the sources of pollutants in storm water runoff;
- Linking the sources of pollutants in runoff to specific water quality impacts and other impacts that may result in degradation of aquatic resources;
- Identifying those activities or physical factors that have the most significant impact on water quality;
- Defining control measures that yield improvements in storm water quality; and
- Developing methodologies by which engineers, urban planners, and managers can make long term decisions that not only provide for economic growth, but also have discernible environmental benefits through imposed storm water controls.

The source identification requirements in the Part 2 permit application reflect three basic steps. First, municipalities must identify any major outfalls that were not already identified in the Part 1 application. Second, applicants must compile an inventory of industrial activities that may discharge storm water to a MS4. Third and finally, applicants must organize the inventory of industrial activities on a watershed basis.

Organizing the inventory by watershed allows the municipality to focus on activities within discrete areas that may contribute pollutants in storm water discharges to waters of the United States. For example, combining outfall data with the industrial inventory organized by watershed may help the municipality to identify probable areas of illicit connections. This information will also be useful for municipalities when they develop specific strategies [e.g., best management practices (BMPs)] as part of their proposed storm water management programs. The following sections discuss regulatory requirements and procedures for completing the source identification section of the Part 2 permit application. Section 4.2 provides guidance on identifying major outfalls, Section 4.3 provides guidance on compiling an inventory of industrial dischargers, and Section 4.4 provides guidance on organizing the inventory of industrial discharges by watershed.

4.2 MAJOR OUTFALLS

The first portion of the Part 2 Source Identification provision states:

> §122.26(d)(2)(ii) *Source Identification.* [The applicant must provide the] location of any major outfall that discharges to waters of the United States that was not reported [in Part 1 of the application]

4.2.1 Definition of a Major Outfall

According to 40 CFR 122 26(b)(5), a major outfall is a MS4 outfall that discharges from a single pipe with an inside diameter of at least 36 inches The term also includes discharges from a single conveyance other than a circular pipe serving a drainage area of more than 50 acres.

For those municipal separate storm sewer systems that receive storm water runoff from lands zoned for industrial activity, major outfalls also include outfalls that discharge from a single pipe with an inside diameter of 12 inches or more, or discharge from other than a circular pipe associated with a drainage area of 2 acres or more. This definition also applies to outfalls of drainage areas that have both industrial and non-industrial activity. For example, if a three acre drainage area is zoned half woodland and half industrial, the discharges from that area would still be considered a major outfall. Because the definition of major outfall includes consideration of drainage area, municipalities may need to consider conveyances such as ditches and swales when identifying major outfalls

4.2.2 Identifying Major Outfalls

The first step in this section of the Part 2 application is the identification of major outfalls not identified in the Part 1 application [§122.26(d)(2)(ii), cited in box above]. When identifying these major outfalls, municipalities should build upon the approach used in the Part 1 application. One way to identify major outfalls is a review of sewer system maps. These maps can provide information on sewer system type (e g , separate storm versus combined sewer), pipe size, and outfall location However, depending upon the age of the sewer system maps, they may not provide complete information about newly developed areas or improvements to older areas Often, interviews with sewer system maintenance personnel can provide information on the most recent changes to the sewer system The municipality should also consider conducting field surveys (e g., visual inspection of the banks of receiving waters) to locate major outfalls

When submitting a Part 2 permit application, municipalities should include a brief description of how additional major outfalls were identified This description is not intended to be a lengthy list of each sewer system employee interviewed, but rather an outline of the methods employed

4.3 INVENTORY OF INDUSTRIAL DISCHARGERS

The second step in this portion of the Part 2 application is assembling an inventory of industrial storm water dischargers

> **§122 26(d)(2)(ii)** *Source Identification* Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity

This section describes how municipalities may develop the inventory of industrial facilities Section 4.4, below, provides guidance on organizing these facilities by watershed.

4.3.1 Facilities that must be Included in the Inventory

As stated above, applicants must provide an inventory of each facility that may discharge to the MS4 storm water associated with industrial activity. Industrial storm water dischargers that must be included in this inventory fall into 11 classes of industrial activities as defined in the November 1990

regulations Six of these classes were defined in a narrative format and five were defined by Standard Industrial Classification (SIC) codes. Specific categories of industries are identified in §122.26(b)(14)(i)-(xi). Exhibit 4-1 provides a list of the SIC codes and industry categories cited in the regulatory definition.

4.3.2 Identifying the Industrial Facilities

As a first step in developing a comprehensive industrial storm water inventory, the applicant must review **facility notifications**. Industrial facilities were required to notify municipalities by May 15, 1991, of their intent to discharge storm water to the municipal storm sewer system [§122.26(a)(vi)(4)]. Each facility should have submitted to the municipality information including facility name, facility location, and facility type (such as SIC code or other industry categorization).

In addition, municipalities should explore other sources of information on industrial facilities to help identify gaps in inventory. One specific source of information a municipality should review is **facility information submitted under other programs**. For example, SIC codes are often required for air pollution permit applications, hazardous materials management permits, pretreatment program applications, building permits, business licenses, or local tax rolls. A municipality may take the list of SIC codes provided in Exhibit 4-1 and compare it with existing information on SIC codes or industrial categories which has been submitted by industrial facilities under other programs.

Under 40 CFR 122.28, facilities that discharge storm water associated with industrial activity must submit an individual permit application, participate in a storm water group permit application, or file a **Notice of Intent (NOI)** to be covered by a general permit. These applications and NOIs are another source of information on industrial dischargers. For existing facilities, applications or NOIs were to be submitted by October 1, 1992; for new facilities, they must be submitted prior to the commencement of industrial activity However, in the Intermodel Surface Transportation Efficiency Act of 1991, Congress provided that permit application requirements be reserved for industrial activities owned or operated by municipalities with a population of less than 100,000, with the exception of airports, power plants, and uncontrolled sanitary landfills If EPA is the permitting authority in a State, applications and NOIs should be submitted to EPA, if a State has NPDES authority, they should be submitted to the State. Section 308 of the CWA provides the legal authority for any individual (including a municipality) to obtain information from the NPDES permitting authority. A municipality may be able to obtain a list of the facilities in its jurisdiction that have applied for coverage under a general or individual permit or that have applied for coverage as a member of a group

Additional sources of information on industrial facilities may include **zoning maps** showing industrial parks, manufacturing and industrial listings in **telephone books, trade association listings, pretreatment industrial waste surveys, the Chamber of Commerce Manufacturing Directory, and Dunn and Bradstreet.**

In the Part 2 application, a municipality should provide a brief description of the sources it reviewed in identifying the industrial dischargers. As part of the proposed storm water management program, which is described in Chapter 6, municipalities should describe a plan for collecting new or updated information on industrial dischargers throughout the life of the permit.

Exhibit 4-1
Industry Categories Cited in the
Definition of Storm Water Associated with Industrial Activity

1. Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR Subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category 11 below.

2 Facilities described by SIC 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373 *

3. Facilities described by SIC 10 through 14 (mineral industry), including:

   - active or inactive mining operations, except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434 11(1) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990, and

   - oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, by-products, or waste products located on the site of such operations

4 Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA.

5. Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under Subtitle D of RCRA.

6. Facilities involved in the recycling of materials (metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards) including but not limited to SIC 5015 and 5093

7. Steam electric power generating facilities, including coal handling sites.

8. Transportation facilities described by SIC 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171, which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under 1 - 7 or 9 - 11 are associated with industrial activity.

(Continued)

Exhibit 4-1 (continued)

9. Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that is located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not located within the facility, or areas that are in compliance with Section 405 of the CWA.

10 Construction activity including clearing, grading, and excavation activities except operations that result in the disturbance of less than five acres of total land area which are not part of a larger common plan of development or sale **

11 Facilities described by SIC 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and which are not otherwise included within categories 2 - 10).*

Source 55 FR 48065, November 16, 1990

*Please note the SIC 285 is covered under Category 11 Also note that for the industries identified in Category 11, the term includes only storm water discharges from all areas (except access roads and rail lines) where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water

**On June 4, 1992, the United States Court of Appeals for the Ninth Circuit found that EPA's rationale for exempting construction sites of less than five acres and certain uncontaminated storm water discharges from Category 11 light industrial facilities from Phase I of the storm water program to be invalid and has remanded these exemptions for further proceedings (see *Natural Resources Defense Council* v *EPA* No 91-70176)

4.4 ORGANIZING THE INDUSTRIAL INVENTORY BY WATERSHED

Once the industrial inventory is complete, the applicant must organize the inventory by watershed, or drainage area. The main objective of this requirement is to associate discrete discharges with specific watersheds, which may help the municipality identify relationships between pollutant sources and receiving water quality problems To help organize the industrial inventory by watershed, municipalities should consider the long-term benefits of using automated database systems to help organize and update information on

- Locations of major outfalls or system modifications;
- Land use designations and composition;
- Dischargers of storm water associated with industrial activity,
- Other NPDES permit holders,
- Location/inventory of structural controls, and
- Locations of illicit connections

This information can help satisfy the requirement that discharges of storm water associated with industrial activity be organized by watershed Using an automated database system or the map submitted in the Part 1 application may be helpful in satisfying this requirement However, the regulations do not require Part 2 applicants to use a particular database or submit certain information, and municipalities may elect to use other methods.

The following procedure is provided as an example of one way to organize industrial dischargers by watershed:

1. Create a transparent overlay of tax maps covering the entire area served by the MS4.

2 Indicate on the maps the location of each industrial activity according to its address with an appropriate symbol or code.

3 Produce an overlay of existing watersheds from a topographical map, for example, United States Geological Survey (USGS) maps, covering the area that the MS4 supports Previously performed hydrological surveys may be helpful in delineating the boundaries of existing watersheds Municipalities may elect to sub-divide existing watersheds into smaller units if this will assist in management planning.

4 Align the tax map and watershed overlay so that industrial activity locations can be transposed to the watershed overlay.

A number of PC-based tools can be used to organize information on facilities and outfalls. For example, computer-aided design (CAD) packages, in conjunction with third-party software packages, are specifically designed to present information on separate transparent layers that can be "turned off and on" when necessary One layer could contain information on watershed topography and another could contain the locations of industrial storm water dischargers. Additional layers might contain information on the layout of the municipal system, locations of structural source controls and outfalls, and land-use patterns (both present and future)

A CAD-based system can be useful, not only in presenting information easily and graphically, but also in its ability to transfer spatial data, such as XYZ coordinates, to commonly available PC-based database applications This spatial data can be merged with other databases containing more generic information including facility name, address, and SIC codes However, one potential drawback to CAD systems is that most of them cannot store "real-world" (e g., latitude-longitude) coordinates and are not generally designed for spatial analyses

Information stored in a CAD format may also be input into a Geographic Information System (GIS) With some conversion, the CAD system coordinates may be transformed into the "real-world" coordinates typically employed by GIS GIS are integrated database management systems designed for the input, storage, retrieval, analysis, output, and display of geographically or spatially indexed data

The key attribute of GIS is the relational database capabilities that make these systems powerful tools for conducting spatial analyses. Using GIS, a municipality could overlay several layers of data and derive new information from this existing information. For example, using GIS, an applicant could overlay a map showing the 100-year flood plain with a map showing locations of industrial facilities The GIS could then calculate the amount of industrial area within the 100-year flood plain and plot this data on a new overlay This type of spatial analysis might be a powerful tool in the design of the municipality's storm water management program.

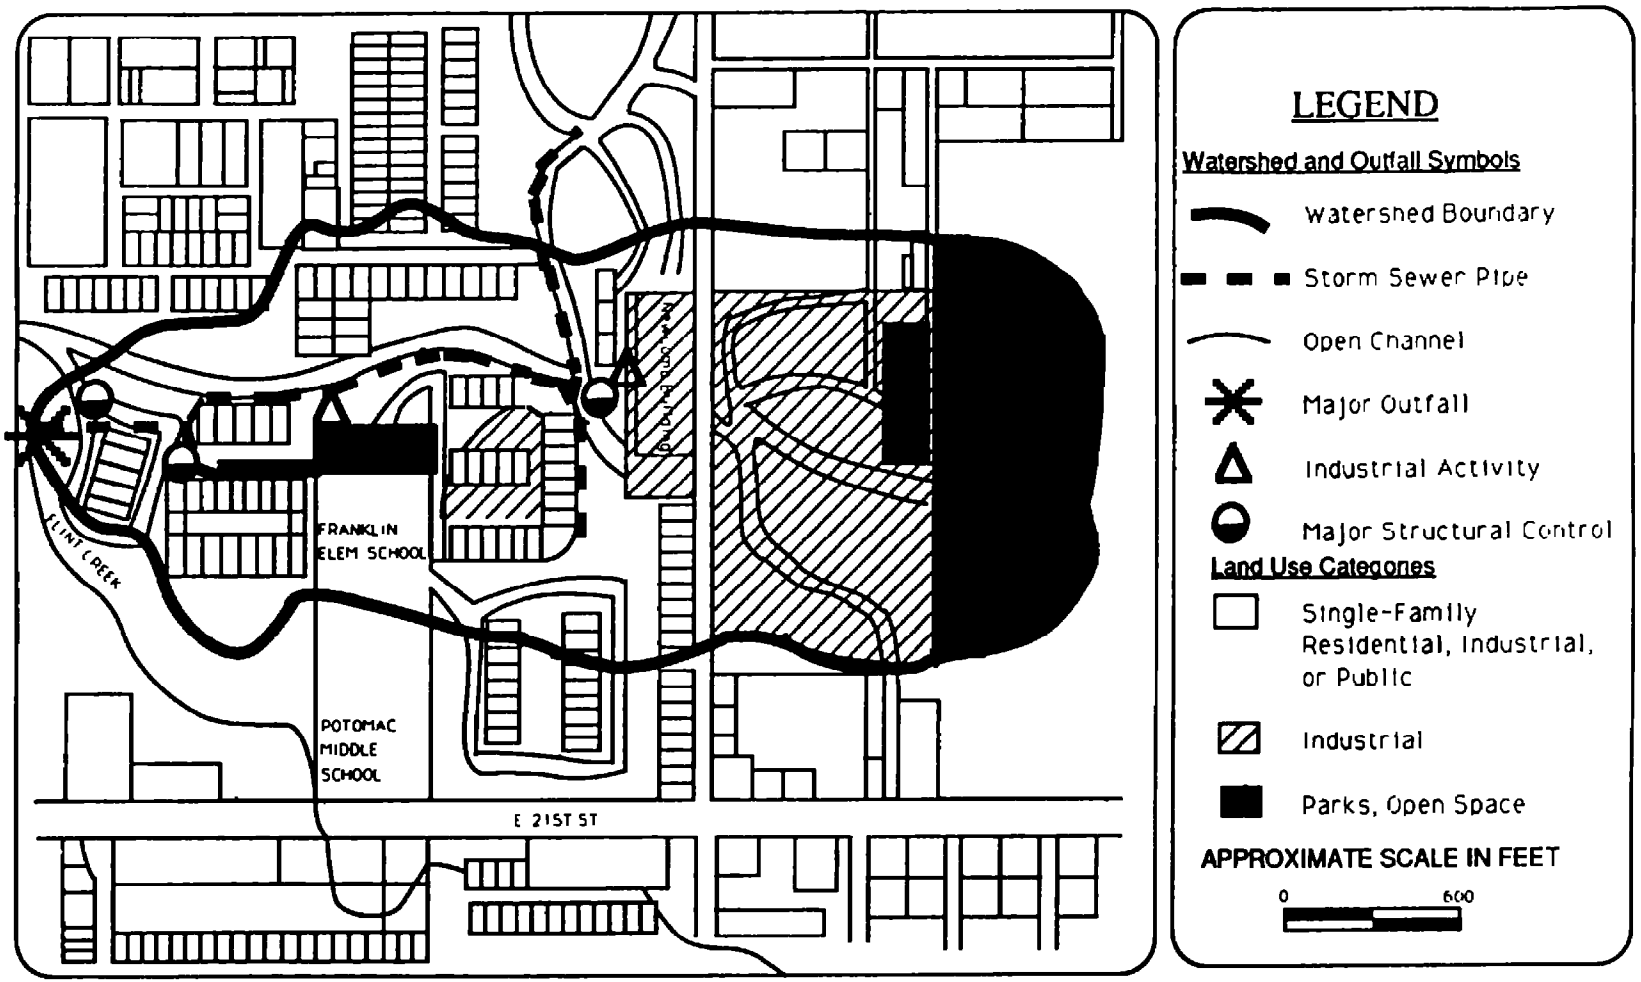
Another benefit of GIS is the ability for common data to be shared efficiently among several agencies. For example, the flood management agency, department of transportation, and storm water control agency could all contribute data to and use analyses from the same GIS. On the other hand, one potential drawback to GIS is their relatively high cost. Often, developing accurate, appropriate base maps is one of the most resource intensive parts of the system.

The techniques presented in this section to organize industrial dischargers by watershed are not the only methods that the applicant can use For example, municipalities may elect to present the information in tabular form. Using a CAD, GIS, or other automated system is entirely up to the municipality There is no requirement that municipalities use these systems in the development of either the Part 1 or Part 2 NPDES permit applications Each applicant will have to examine its existing resources (including computer systems, personnel, and budget) and projected needs before deciding which method will be the most efficient and most useful in the long term

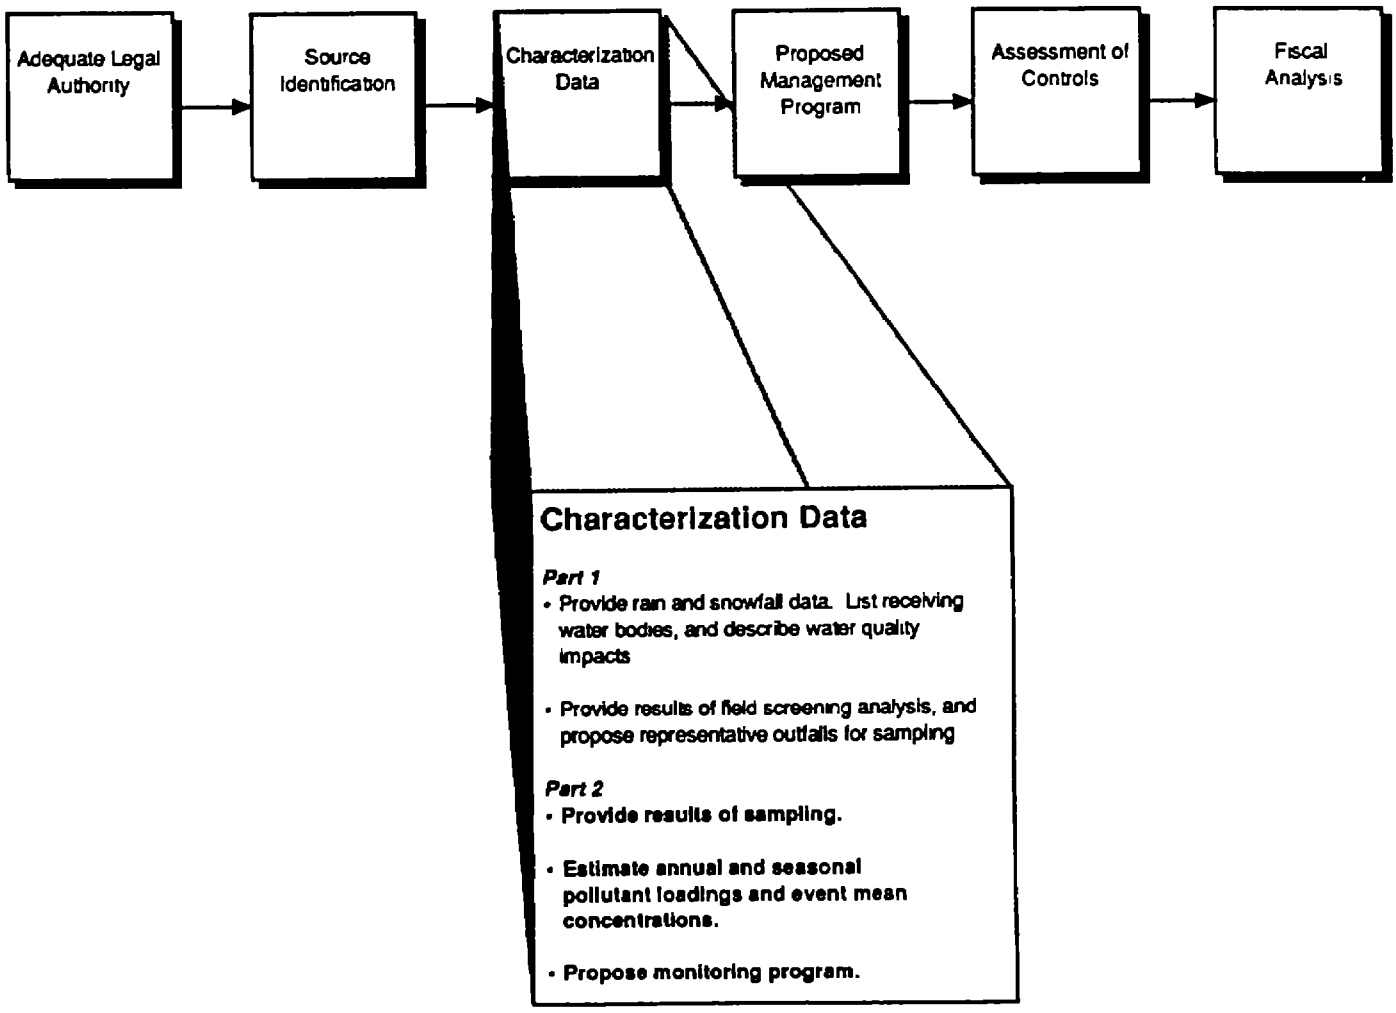
A discussion of maintaining and/or updating the industrial inventory is provided in Section 6.3.3.2 of this guidance.

Exhibit 4-2 illustrates an example of the procedure discussed in Sections 4.3 and 4 4

Exhibit 4-2
Example of a Map Organizing Industry by Watershed



CHAPTER 5
CHARACTERIZATION DATA



5.0 CHARACTERIZATION DATA

5.1 BACKGROUND

5.1.1 Objective of this Section

This section addresses the requirements for reporting the physical and chemical characteristics of municipal storm water runoff as specified by 40 CFR 122.26(d)(2)(iii). These requirements describe the minimum quantitative and descriptive data necessary to begin characterizing storm water discharges.

The applicant is encouraged to provide additional information, if available, which may provide a basis for a more effective storm water management program. The additional information may also help the permitting authority make more informed decisions regarding the specifications of the permit to be issued.

The NPDES permit application regulations require the applicant to identify all major outfalls that are part of the MS4 [§122.26(d)(1)(iii) and 126(d)(2)(ii)]. Part 1 requires the municipality to propose a sampling plan that identifies 5-10 outfalls that would be appropriate for representative data collection under Part 2 of the application [§122.26(d)(1)(iv)(E)]. The next step is to collect and analyze samples from these outfalls (or others designated by the permitting authority) for a variety of pollutant parameters from 3 representative storm events.

5.1.2 Potential Impacts of Storm Water Runoff

The Nationwide Urban Runoff Program (NURP) study showed that discharges from MS4s contribute to the degradation of water quality in the Nation's waters (EPA, 1983). The NURP study also concluded that the effects of urban runoff on receiving water quality are very site specific. The effects depend on the types, size, and hydrology of the water body, the designated beneficial use, the pollutants which affect that use, the urban runoff quality characteristics, and the amounts of urban runoff dictated by local rainfall patterns and land use. *The National Water Quality Inventory, 1990 Report to Congress* as required by Section 305(b) of the Clean Water Act, stated that one-third of the impairment in assessed waters is due to storm water runoff (EPA, 1990d).

Quantity Impacts

Urbanization often increases the quantity and reduces the quality of storm water runoff. For example, vegetated or forested areas with pervious surfaces are often replaced with impervious surfaces (e.g., concrete and asphalt) that prevent or minimize the amount of rainfall available for ground water recharge. This increases the volume and velocity of storm water runoff.

Vegetated areas play a crucial role in ground water recharge and in the maintenance of stream baseflow. This is especially true during extended dry periods, when ground water is often the only source that preserves stream baseflow. In highly urbanized areas, ground water recharge may be so severely reduced that ground water flow to perennial streams during dry periods is not sufficient. Further, the natural hydrology of a watershed is often altered by urbanization, because developing areas often provide drainage appurtenances that rapidly conduct storm water runoff away from these areas. Such drainage may also affect the geometry of natural streams, especially where natural streams have been modified through the installation of man-made channels. Ultimately, reduced perviousness due to urbanization increases the magnitude and the frequency of localized flooding which can have the long term effect of substantially increasing the width of natural streams through erosion and scouring.

Increases in peak discharge velocity and runoff volume can also result in substantial erosion of natural streambanks and the washout of benthic habitats. Since streambeds often consist of unconsolidated silt and sediment, they may be stripped away substantially by excessive discharge velocities Increased discharge velocities can also lead to undercutting and destabilization of streambanks, which may cause erosion that extends beyond the natural boundary of the streambank

Further, silt and sediment can increase the turbidity of the receiving water, thus interfering with the growth of aquatic plants which depend on photosynthesis. Increased turbidity can also interfere with aquatic feeding, eliminate spawning areas for fish, and cause abrasion and clogging of fish gills. Also, because silt and sediment may remain in the watershed, they can blanket benthic habitats and severely reduce streamflow capacity

In the presence of excessive volumes of storm water runoff and discharge velocities, the net impact on receiving waters can be almost indistinguishable from impacts commonly associated with the discharge of toxics (e g , increased mortality, reduced biodiversity, and reduced reproduction)

Deposition and Resuspension of Toxicants

Research is currently on-going to examine the impact of the deposition and resuspension of toxicants as a result of wet weather events Questions about the survivability of benthic habitats when exposed to toxicants in deposited sediments still remain. The impact of resuspended toxicants from the sediments is not well known since toxics are often bound to sediment particles that may reduce the concentrations available for biological uptake and subsequent bioaccumulation The applicant should also be aware that different metal contaminants in sediments can exhibit different solubilities Under varying conditions of pH and temperatures, metals deposited in sediment can become soluble again and be reintroduced into the water column

Excessive Bacterial Levels

The NURP study final report concluded that "coliform bacteria are present at high levels in urban runoff and can be expected to exceed EPA water quality criteria during and immediately after storm events." Thus is of significant concern, particularly in swimming and shellfish areas.

Dissolved Oxygen Depression

The presence of oxygen-consuming pollutants in receiving waters can lead to severe dissolved oxygen depression Factors that can cause dissolved oxygen depression include the resuspension of biodegradable organic material (which can occur in the presence of high flow velocities) or the discharge of organic pollutants in storm water discharges. The NURP study demonstrated that storm water discharges exhibit biochemical oxygen demand (BOD) levels in excess of levels commonly associated with secondary treated effluent from publicly owned treatment works (POTWs). Severe dissolved oxygen depression could contribute to fish kills, which are one of the most readily observable impacts of pollution on receiving waters.

Eutrophication

Eutrophication, or the aging of a water body, can be accelerated by excessive nutrient loadings from storm water. Advanced stages of eutrophication are often associated with substantial variations in dissolved oxygen concentration. Nutrients of concern are nitrogen and phosphorus. Phosphorus is typically the growth-limiting nutrient for plants in fresh water systems. Storm water discharges routinely contain excess concentrations of these nutrients, which can lead to excessive algal growth, commonly referred to as algal blooms. Excessive concentrations of algae can cause odor and taste problems in drinking water and can result in aesthetically unpleasant

environments. In addition, the eventual decomposition of large concentrations of algae can depress dissolved oxygen in the water body to levels where fish kills occur. In nature, the process of eutrophication occurs over a substantial period of time, however, storm water discharges can rapidly accelerate this process.

Exceedance of Chronic Toxicity Criterion

Long-term exposure to toxics in excess of chronic toxicity criteria can cause sublethal effects on aquatic life. Indicators of chronic toxicity include reduced fertility, reproduction, and growth rates and a decline in the diversity of aquatic organisms The NURP study clearly indicated that storm water discharges contain concentrations of trace metals, such as lead, cadmium, zinc, and copper in amounts that exceed the chronic toxicity criteria. Prolonged exposure to chronic concentration levels of toxics can also be lethal to aquatic organisms, primarily from the bioaccumulation of toxics within the cell tissue of the organism over a extended period of time

Thermal Impacts

The temperature of storm water runoff may become significantly elevated via conductive and convective heat transfer with impervious, man-made surfaces In the case of contact with impervious surfaces, the resulting temperature elevation of storm water runoff can be substantial. For example, the surface temperature of parking lots during summer months may exceed 100 degrees Fahrenheit. Consequently, storm water runoff from these parking lots will be elevated in temperature. Many aquatic organisms are extremely sensitive to changes in water temperature. Increased water temperature also reduces dissolved oxygen in streams, rivers, lakes, and wetlands Therefore, significant discharges of storm water at elevated temperatures can, over the long term, lead to the alteration of aquatic populations.

5.1.3 Use of the Characterization Data

The NURP study analyzed storm water discharge from 28 sites representing 12 major river basins of the United States NURP detected 77 EPA priority pollutants present in the storm water discharges sampled, including samples with concentrations that exceeded water quality criteria for certain pollutants. Those pollutants detected in at least 10 percent of the samples studied in NURP are identified in Exhibit 5-1.

The data gathered for storm water discharge characterization can be used to create a baseline measurement of pollutant concentration and loadings The data also can be used to evaluate the effectiveness of best management practices (BMPs) as well as help identify storm water control priorities. In addition, it can be used to help identify the sources of pollutants in storm water runoff, to help establish an effective monitoring program for the life of the permit, and to help predict the impact of storm water runoff on receiving waters that are known to be impaired.

5.1.4 Storm Water Sampling and Analysis Procedures

The regulation requires that the process of collecting quantitative data for storm water characterization follow certain guidelines

> §122.26(d)(2)(iii) *Characterization data* When "quantitative data" for a pollutant are required under paragraph (d)(1)(iii)(A)(3) of this paragraph, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136 When no analytical method is approved the applicant may use any suitable method but must provide a description of the method

Exhibit 5-1. Priority Pollutants Detected in at Least 10% of NURP Samples.

PARAMETERS	FREQUENCY OF DETECTION (%)
Metals and Inorganics	
Antimony	13
Arsenic	52

Source: U.S. Environmental Protection Agency, *Results of the Nationwide Urban Runoff Program*. EPA Planning Division (National Technical Information Service (NTIS) Accession No. PB84-8552). December 1983.

The data collection procedures must follow the guidelines for storm water sampling outlined in §122.21(g)(7), *Effluent Characteristics*. This portion of the NPDES regulation describes the conditions under which a storm water discharge will be sampled, and which collection procedure (grab sample versus flow-weighted composite sample) is required for the water quality parameter being analyzed. These guidelines are discussed in more detail in Sections 5.3.2 and 5.3.4 of this guidance manual. In addition, EPA has available a *Storm Water Sampling Guidance Document* that describes in detail the methods used for storm water discharge sampling (EPA, 1992a).

The methods for the chemical analyses of storm water discharge samples must be conducted in accordance with 40 CFR Part 136, *Guidelines for Establishing Test Procedures for the Analysis of Pollutants*. These guidelines refer the applicant to EPA-approved methods and cite the source of the approved methods (e.g., Standard Methods for the Examination of Water and Wastewater, ASTM methods, etc.). Note that alternative methods (i.e., those not included in Part 136) may be used under certain circumstances (see Section 5.3.4) as described in 40 CFR Part 136, and reiterated in the Characterization Data section of Part 2 of the storm water discharge NPDES permit.

The specific constituent pollutants and water quality parameters that must be analyzed in the storm water samples are presented in Section 5.3.4.

5.2 SUMMARY OF REGULATORY REQUIREMENTS

The following is a summary of the characterization data requirements for the Part 2 application:

- Quantitative data on physical and chemical characteristics of the discharge taken from at least 5 to 10 representative outfalls chosen by the permitting authority (Section 5.3).
- Estimates of both the annual pollutant load and event mean concentration of the cumulative discharges from all municipal outfalls during a storm event (Section 5.4).
- A proposed schedule to provide estimates for each major outfall of the seasonal pollutant load and the event mean concentration for constituents detected in required sampling (Section 5.5); and
- A proposed monitoring program for the life of the permit that meets specific requirements established in the regulations (Section 5.6).

5.3 QUANTITATIVE AND QUALITATIVE DATA REQUIREMENTS

5.3.1 Selection of Representative Sampling Sites

In the Part 1 application, the municipality is required to describe a plan for obtaining characterization data [§122.26(d)(1)(iv)(E)]. The plan should reflect the requirements of §122.26(d)(2)(iii).

Different types and intensities of land use activities influence, in part, the types of pollutants and the pollutant concentrations in municipal storm water runoff. Therefore, Part 1 of the permit application [§122.26(d)(1)(iii)(B)(2)] requires the applicant to describe the land use activity within the area to be covered by the permit. In Part 1, the applicant also must select a subset of all the major outfalls (see Section 4.2.1 for definition of major outfall) identified that represented surface runoff discharge of the various land use activities described. In some cases, a municipality preparing a Part 2 application may want to supplement its sampling program by collecting and analyzing samples from major outfalls that were not identified in the Part 1 application or designated by the permitting authority. This additional sampling may provide the

municipality with data that better characterizes its MS4 discharges

5.3.2 Criteria for Storm Water Discharge Sampling

Land use activities are not the only factors that affect the pollutant composition of storm water runoff Storm water composition also varies according to the nature of the storm event (e.g , duration, volume), and the composition may vary throughout the duration of a single storm event (i.e., the initial discharge, or "first flush," tends to have higher pollutant loads). In order to obtain data that represents an "average" storm event, EPA requires samples from three separate storm events to characterize the surface water runoff; however, the permitting authority may allow exemptions

> §122.26(d)(2)(iii)(A)(1) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at §122 21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions),

The criteria for sampling storm water discharge are detailed in §122.21(g)(7), *Effluent Characterization* EPA's *Storm Water Sampling Guidance Document* addresses these criteria. For the purpose of this discussion, a brief synopsis of these criteria follows:

- For each outfall or field screening point selected, samples must be collected from three separate storm events.
- The three storm events must be at least one month apart
- Each sampled storm event must have a rainfall of at least 0 1 inch in the drainage area
- There must be no storm event in excess of 0 1 inch in the drainage area for at least 72 hours prior to the sampled storm event
- The rainfall event should not vary by plus or minus 50 percent from the average or median per storm volume and duration for the region.

EPA understands that climatic conditions may make it difficult for some municipalities to sample storm events meeting these criteria. For example, storm events may be so infrequent in arid and semi-arid areas that sufficient samples cannot be obtained by the application deadline. In other areas, storms may be so frequent that it may not be possible to wait the required 72 hours between storm events. In such cases, the applicant should confer with the permitting authority in advance. In instances where representative storm events do not occur prior to the application due date, the municipality should submit its application with as much information as possible. It should include an explanation [certified by a principal executive officer or ranking elected official in accordance with §122.22(a)(3)] as to why sampling data were unavailable.

The municipality may need to perform some initial research and calculation to meet the requirements listed above In order to determine what constitutes an average storm event for the area, the applicant should contact the National Weather Service or National Oceanographic and Atmospheric Administration's National Climate Center Weather data is also available commercially and from airports. The applicant may also refer to the information provided in the *Storm Water Sampling Guidance Document.*

5.3.3 Narrative Description of Storm Event

> **§122.26(d)(2)(iii)(A)(2)** A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0 1 inch rainfall) storm event;

Under §122 26(d)(2)(iii)(A)(2), the municipality must provide a narrative description of each storm that produced the discharge to be chemically and physically characterized Such a narrative description must include

- The date and duration of the rainfall event that produced the discharge sampled Measurements describing the peak intensity of the storm, if available, should also be reported,
- The amount of rainfall Rainfall conditions may vary significantly across large drainage areas, so rainfall characteristics should be spatially averaged over the drainage area, if possible If more than one rain gauge is used, averages should be reported. Rain gauges operated near the drainage area by the National Weather Service may be used, or the discharger may collect this information,
- The time elapsed since the last rainfall event greater than 0.1 inches. Historical rainfall data from rainfall gauges can be used to provide this information. If a gauge records only daily data, municipal field personnel could be asked to provide information on times during the day a rainfall event began or ended

5.3.4 Chemicals/Water Quality Parameters to be Measured

The storm water discharge samples must be analyzed for a number of pollutant parameters

> **§122.26(d)(2)(iii)(A)(3)** For samples collected and described under paragraphs (d)(2)(iii)(A)(*1*) and (A)(2) of this section, quantitative data shall be provided for the organic pollutants listed in Table II, the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants
>
> Total suspended solids (TSS)
> Total dissolved solids (TDS)
> COD
> BOD_5
> Oil and grease
> Fecal coliform
> Fecal streptococcus
> Ph
> Total Kjeldahl nitrogen
> Nitrate plus nitrite
> Dissolved phosphorus
> Total ammonia plus organic nitrogen
> Total phosphorus
>
> [*Note that total kjeldahl nitrogen is actually a substitute for total ammonia plus organic nitrogen*]

The complete list of chemicals is provided in Exhibits 5-2, 5-3, and 5-4. Exhibits 5-2 and 5-3 are derived from 40 CFR Part 122, Appendix D, Tables II and III, respectively. Exhibit 5-4 comes from the text of the regulation (see box above) The EPA-approved analysis procedure for the pollutants in Exhibits 5-2 and 5-3 can be found in 40 CFR Part 136. If a municipality is seeking approval to use an alternative method of analysis, then a request should be made according to procedures outlined in 40 CFR 136 4

Section 122.21(g)(7) specifies that certain pollutant parameters will be analyzed on grab samples taken from the outfall, whereas the remainder of the pollutant parameters require that composite samples be taken from the outfall. These types of sampling procedures are differentiated as follows:

Grab samples: discrete, individual samples taken within a short period of time (usually less than 15 minutes). Analysis of grab samples characterizes the quality of a storm water discharge at a given time of the discharge. The following measurements must be made from grab samples:

- pH
- Temperature
- Cyanide
- Total phenols
- Residual chlorine
- Oil and grease
- Fecal coliform
- Fecal streptococcus

Note that measurements of temperature and pH must be taken in the field to avoid time-dependent changes that may occur between sampling time and actual analyses.

Flow-weighted composite samples: single unit volumes composed of a mixture of samples collected proportional to flow throughout the entire runoff event or at least for the first three hours of the storm water event, if it lasts more than three hours. The flow-weighted composite sample must consist of at least three discrete aliquots per hour from the storm water discharge, or a continuous sampler may be used.

All parameters (see Exhibits 5-2, 5-3, 5-4) not listed under the description of grab samples above must be analyzed from flow-

weighted composite samples Details on taking flow-weighted composite samples may be found in the EPA *Storm Water Sampling Guidance Document*.

5.3.5 Additional Quantitative Data

Section 122 26(d)(2)(iii)(A) concludes with a provision that allows the permitting authority to request additional quantitative data if necessary to determine permit conditions.

> §122 26 (d)(2)(iii)(A)(4) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness),

To ensure the storm water discharge system is accurately represented, the permitting authority may require that quantitative data include additional parameters and may establish specific sampling conditions, such as:

- Location where the sample is taken;
- Season of sample collection;
- Form of precipitation (snowmelt, rainfall);
- Evidence of impact to aquatic ecosystems, or
- Other parameters necessary to ensure the system is accurately characterized.

The data generated from the qualitative and quantitative analyses described under §122.26 (d)(2)(iii)(A) will be used to calculate the annual pollutant loads and event mean concentrations for each pollutant as described in subsequent parts of this section Estimates of annual pollutant loads and event mean concentrations would then be used to assist in establishing storm water management priorities and selecting BMPs

5.4 ESTIMATION OF SYSTEM-WIDE EVENT MEAN CONCENTRATIONS AND ANNUAL POLLUTANT LOADS

The applicant must submit estimates of the event mean concentration and annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls.

> §122.26(d)(2)(iii)(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under §122 21(g)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods,

Estimates of annual pollutant loads will be somewhat imprecise; however, municipalities should exercise best professional judgement in deriving these estimates A description of what assumptions were made to derive pollutant loadings must be included.

Under §122.26(d)(2)(iii)(B) (see box above) applicants must provide the following:

- Estimates for the event mean concentration for pollutants listed in Exhibit 5-5 below, which can be used to estimate the annual pollutant load associated with all municipal outfalls identified under §122 26(d)(1)(iii) and (d)(2)(ii);

- A description of the procedures for estimating constituent loads and concentrations, and

- Details on data analysis, models used, and calculation methods

Data sources and procedures that municipal applicants may use to estimate event mean concentrations and annual pollutant loads of the cumulative discharges are discussed below.

The primary purpose for estimating annual pollutant loads and event mean concentrations is to assign priorities for implementing BMPs. Municipalities should consider the magnitude of individual pollutant loadings when assigning priorities to resources to reduce these loadings. The areas receiving the highest priority for implementation of BMPs will be those portions of the MS4 that appear to contribute the largest load of pollutants to the system. Therefore, it is the relative value of these calculations that is of importance within this regulation, not the absolute value.

Over time the accuracy of the available methods to calculate loads and concentrations will improve and the use of these estimates may assume a larger role in determining permit conditions and estimating the success of the comprehensive municipal storm water management program. The emphasis for now, however, is on the application of the most practicable methods to reasonably estimate annual loads and event mean concentrations.

5.4.1 Data Sources

The Part 1 application requires municipalities to submit all existing storm water sampling data, along with all relevant water quality data, sediment data, fish tissue or other biosurvey data taken over the past 10 years. All historical data must accompanied by a narrative description of the watershed served by the outfall from which the data are obtained, a description of the sampling and quality control program, and the monitoring location of the receiving water.

To estimate an annual pollutant load for a given pollutant, a value must be derived for the average concentration, or event mean concentration, of that pollutant. To derive this value, applicants may use either site-specific data, or data from a national or regional study, such as NURP.

Municipalities with adequate historical data may choose to use these data to estimate annual pollutant loads in the Part 2 application. However, many applicants may not have enough site-specific data to develop valid estimates. These applicants may choose to use generic data (e.g., from regional and national studies), such as the data provided in the NURP study. The NURP study's estimated range of detected concentration for specific pollutants is summarized in Exhibit 5-6.

Exhibit 5-5: Pollutants for which Event Mean Concentrations and Annual Pollutant Loads Must be Calculated

Pollutant	Pollutant
BOD_5	Total phosphorus
COD	Dissolved phosphorus
TSS	Cadmium
Dissolved solids	Copper
Total nitrogen	Lead
Total ammonia plus organic nitrogen	Zinc

Phthalate, bis(2-ethylhexyl)	4 - 62
Polycyclic aromatic hydrocarbons:	
Chrysene	0.6 - 10
Fluoranthene	0.3 - 2
Phenanthrene	0.3 - 10
Pyrene	0.3 - 16

Source. U.S. Environmental Protection Agency, *Results of the Nationwide Urban Runoff Program*, EPA Planning Division (National Technical Information Service (NTIS) Accession No. PB84-8552) December 1983

The applicant should be aware of limitations associated with data from national and regional studies before deciding on methods to estimate pollutant loadings In some cases, it may be more appropriate to use any available site-specific data rather than data from national or regional studies. For example, the NURP study did not collect pollutant concentration data from industrial areas. In this instance, even limited site specific concentration data from industrial areas may be more meaningful.

EPA encourages applicants to seek data from a variety of sources to better characterize the quality of their storm water discharges. Regardless of the data source, a description of the procedures for estimating constituent loads and concentrations, including any modeling, data analysis, and calculation methods, must be included

There will be a degree of uncertainty associated with estimating pollutant loadings in the Part 2 application The requirement to calculate pollutant loadings and concentrations is intended to be a planning and screening effort to assign program priorities, and not necessarily to determine absolute values.

5.4.2 Event Mean Concentrations

Event mean concentrations (C_i in Equation 1 on page 5-16) are determined from analyses of flow-weighted composite samples collected from each of the designated field screening points. Section 2 2 4 of the *Storm Water Sampling Guidance Document* describes procedures for collecting flow-weighted composite samples (EPA, 1992a). Concentration values must be reported in the applicant's Part 2 Permit Application for each representative storm event sampled. The applicant should report the average of these results as the event mean concentration for each parameter measured Municipalities are encouraged to present data in a tabular format However, the applicant has flexibility to present the data in other ways, provided the data is clearly presented.

As stated previously, applicants must sample storm events for at least three hours, or for the entire storm event if it lasts less than three hours If a storm event lasts more than three hours, the applicant may choose among three approaches for calculating the event mean concentration of the storm First, the applicant may report the event mean concentration for the first three hours of the event (or longer, if the applicant monitored more than three hours). Second, if the applicant has data available on the correlation between flow and concentration which allows it to be more specific about the event mean concentration, an estimation technique may be used to derive the event mean concentration. If the applicant uses such an estimation technique, the methodology must be explained Third and finally, the applicant may monitor the entire storm event and report the actual event mean concentration.

Whichever approach the applicant uses, the same method should be used to derive event mean concentrations in the future. This will assist the applicant in identifying meaningful trends in changes in event mean concentrations over time.

5.4.3 Annual Pollutant Loadings

Municipalities may choose from a variety of acceptable procedures for estimating the annual pollutant loads of the cumulative discharge. This guidance contains an example of calculating the annual pollutant loads using the "simple method," which is adapted from Schueler (1987). The guidance also discusses some dynamic models that applicants may wish to employ.

Regardless of which method applicants choose, they must describe and document the specific technique used. The description should include (but is not limited to) the key equations used to calculate reported values, such as.

- Assumptions for selecting site-specific parameters (e g., runoff coefficients),

- References to any source documentation (e g , previously completed studies or reference textbooks), and

- Justification for any assumed parameter values

The Simple Method

The following method of computing pollutant loadings is referred to as the "simple method" and is adapted from Schueler (1987). For purposes of satisfying Part 2 application requirements, the simple method provides a quick and reasonable estimate of pollutant loadings with a minimal amount of data required Although the regulations require a system wide (cumulative) annual pollutant load calculation for each of the pollutants listed in Exhibit 5-5 (above), the single pollutant load values provide limited insights into potential problem areas and what BMPs might yield the best results. Consequently, the municipality may want to consider using the simple method to estimate "individual" pollutant loadings from drainage areas The individual pollutant loadings can be aggregated to derive a cumulative annual pollutant loading for the entire MS4 In the procedure below, for example, Step 1 computes the annual loading for each outfall of the MS4 Then in Step 2, the resulting pollutant loadings are summed to derive annual pollutant loads on a per-watershed basis In Step 3, the annual pollutants loads for each watershed are summed to derive a system-wide annual pollutant load.

As stated above, this procedure is only one example of how a municipality could calculate a system-wide annual pollutant load. Estimates of annual pollutant loads for individual outfalls, watersheds, or other discrete areas are not specifically required by the regulations However, municipalities will find such estimates helpful in making relative comparisons among different areas of the MS4 Ultimately, these estimates could assist the municipality with selecting BMPs and assigning priorities to potential problem areas

Step 1: Use the Simple Method to Calculate Annual Pollutant Loads on a Per-Outfall Basis

The first step in this example is to calculate annual pollutant loads for individual outfalls. However, the applicant may choose to begin by calculating annual pollutant loads for each watershed or other discrete area. As stated above, this example uses the simple method, which is given by the following equation:

EQUATION 1:

$$L_i = \left[\frac{(P)(CF)(Rv_i)}{12}\right](C_i)(A_i)(2.72)$$

where: L_i = Annual pollutant load (lb/outfall/yr)
P = Annual precipitation (in/yr)
CF = Correction factor that adjusts for storms where no runoff occurs (a value of 0 9 is typically used)
Rv_i = Weighted-average runoff coefficient for the area served by the outfall (the calculation of runoff coefficients is discussed below)
C_i = Event mean concentration of pollutant (mg/L)
A_i = Catchment area (acres)

The numbers 12 and 2.72 are conversion factors that account for unit conversions.

Each of the parameters in Equation 1 is defined below:

- **Annual pollutant load** is the total amount of a specific pollutant discharged in pounds per time period (in this case, per year) for the particular segment of the MS4 being modeled (in this case for each outfall) Pollutant loads may also be expressed for alternative time periods, or on a system-wide or watershed basis

- **Annual precipitation** is the total inches of rainfall occurring in a single year plus the contribution of snowmelt Estimates of the annual rainfall can be based on the rainfall data provided in Part 1 of the application

- **Correction factor** is an adjustment factor for the number of storm events that do not actually produce any runoff (i.e., the percentage of storm events that have a total accumulation greater than a specific threshold value). This value will vary by region. Without this adjustment factor, the municipality would be assuming that all storm events produce runoff, which may or may not be the case. A typical value for this correction factor is 0.9 (90%). However, this value can vary between climatic regions. Municipalities should review historical rainfall data to estimate the percentage of storm events that produce runoff versus the number of storm events per year.

- **Weighted-average runoff coefficient** is a relative measure of imperviousness or the percentage of rainfall that becomes surface runoff Runoff coefficients are a function of the type of surface, intensity of the rainfall, the degree of soil saturation and storativity (storage capacity) of the soil. To determine runoff coefficients, the municipality may use Equations 2 or 3 (which follow). Alternatively, the municipality may use actual field measurements, relevant hydrologic studies, average values published in civil engineering reference manuals, or default values provided in Exhibit 3-12 of EPA's *NPDES Storm Water Sampling Guidance Document*

- **Event mean concentration of pollutant** is the event mean concentration value for the specific pollutant determined from the analysis of flow-weighted composite samples. Equation 1 requires a value for each pollutant concentration As discussed previously, the applicant may use site-specific concentration data (e g , storm water sampling data) or generic (e g , NURP) data to derive event mean concentrations In other words, the applicant should use best professional judgement to decide which of the following concentration values to use

  – a mean concentration value from the NURP study;

    OR

  – an average of all event mean concentrations from all samples over three representative storm events;

    OR

  – an event mean concentration attributable to a specific land use activity

  The applicant will have to consider the extent of the variability of the data when selecting an appropriate concentration value. NURP or other regional studies used to estimate pollutant concentrations can be compared to existing site-specific data in order to assess the uncertainty associated with generic approaches.

- **Catchment area** is the size of the drainage area for the particular segment of the MS4 being modeled (in this case, the outfall drainage area). Areas that are served by combined sewers or that are not otherwise served by the MS4 should not be included

Weighted-average runoff coefficient. Runoff coefficients can be based on flow measurements or estimated from land use characteristics. In order to determine an average runoff coefficient for an area with a diversity of land

use activities, the following equation should be used to estimate a weighted-average runoff coefficient

EQUATION 2

$$Rv_i = \frac{(\sum A_i R_v)}{\sum A_i}$$

where. Rv_i = Weighted-average runoff coefficient
A_i = Catchment area (acres)
R_v = Catchment runoff coefficient

As an alternative to Equation 2, Equation 3 can be used to estimate weighted-average runoff coefficients from percent imperviousness data (Shelley, 1986)

EQUATION 3

$$Rv_i = 0.05 + 0.009 * I$$

where. Rv_i = Weighted-average runoff coefficient
I = Percent imperviousness

The percent imperviousness can be estimated from land use data Residential land can be assumed to be 24% impervious, commercial land 75% impervious; industrial land 55% impervious; and open space 15% impervious The percent imperviousness of residential land was estimated from the following empirical equation of NURP and USGS data, which relates population density to percent imperviousness

EQUATION 4

$$I = 9 * D^{0.5}$$

where I = Percent imperviousness
D = Population density (persons/acre)

Similar to Equation 1, individual parameters for Equations 2, 3, and 4 can be used on a system-wide basis, or modified to reflect more realistic conditions within smaller or discrete segments (e g , individual watersheds or outfalls).

Step 2. Use the Per-Outfall Annual Pollutant Loads to Calculate Per-Watershed Annual Pollutant Loads

If the simple method is used to compute the annual loading on a per-outfall basis, Equation 5 may be used to estimate annual pollutant loadings on a per watershed basis. The approach of computing pollutant loadings on a watershed basis is used by some counties where larger watersheds are segregated into smaller watersheds or drainage areas on the basis of similar land use designations One county uses this method in conjunction with forecasts of future development within the county to develop preliminary estimates of future pollutant loadings This approach minimizes the possibility of computing an annual pollutant loading that is too conservative.

EQUATION 5

$$L_w = \sum L_i$$

where: L_w = Annual pollutant load for a particular watershed
ΣL_i = Summation of individual annual pollutant loadings from all major outfalls within a specific watershed

Step 3: Use the Watershed-Based Annual Pollutant Loads to Calculate System-Wide Annual Pollutant Loads

To calculate the annual loadings system-wide, use the following equation

EQUATION 6

$$L_n = \sum L_w$$

where L_n = Annual pollutant load for an entire MS4

ΣL_w = Summation of individual annual pollutant loadings from all watersheds within a municipal separate storm sewer system

Dynamic Models

In instances where a municipality has a significant amount of historical data for the drainage areas serviced by storm sewer outfalls, including historical precipitation data and receiving water concentration and flow data, the MS4 may elect to use dynamic models to derive pollutant loads and to analyze the effects of MS4 discharges on receiving waters.

Dynamic models are designed to calculate a complete probability distribution for the output being modeled Therefore, dynamic models take into consideration the inherent variability of data associated with MS4 discharges, such as variations in concentration, flow rate, and runoff volume

One benefit of using a dynamic model is that the calculation of a complete probability distribution allows the modeler to consider a multitude of "what-if" scenarios. For example, when sufficient historical data is available, the modeler could consider the benefits and risks associated with alternative BMP strategies.

Dynamic models have one additional benefit over steady-state models in that dynamic models determine the entire discharge concentration frequency distribution. Consequently, this would enable the modeler to examine the effects of storm water discharges on receiving water quality in terms of the frequency by which water quality standards may be exceeded For purposes of computing pollutant loadings, a number of models are available including EPA's Stormwater Management Model (SWMM) and Hydrologic Simulation Program (HSPF), U S Army Corps of Engineers' Storage, Treatment, Overflow, Runoff Model (STORM), and Illinois State Water Survey's Model QILLUDAS (or Auto-QI).

Regardless of the method employed, the applicant must document how pollutant loadings are derived Applicants must provide estimates of annual pollutant loads and event mean concentrations for each outfall with their Part 2 applications. However, some outfalls will need to be more completely characterized, and conditions will change after the permit is approved. This is one reason why, as described in Section 5.4, data collection will continue throughout the term of the permit. Estimates of the individual contribution of pollutant loadings for each watershed or major outfall will help the applicant select priorities for specific watersheds.

5.5 PROPOSED SCHEDULE FOR SEASONAL LOADS AND REPRESENTATIVE EVENT MEAN CONCENTRATIONS OF MAJOR OUTFALLS

§122.26(d)(2)(iii)(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(*1*) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section;

Seasonal pollutant loads are important because they are a more accurate representation of loadings that may occur during a short time interval. To further refine the annual pollutant load estimates, Part 2 requires the applicant to propose a schedule to estimate seasonal

pollutant loadings and event mean concentrations for each major outfall

The quality of the data available when the Part 2 application is prepared will affect the accuracy and usefulness of the initial estimates of pollutant loadings and average concentrations These estimates can be improved as more site-specific data are collected during the term of the permit. A long-term site specific monitoring program will capture the variability in data that is essential to estimate more accurate pollutant loadings over time. Therefore, the impacts associated with these loadings can also be estimated with greater certainty. In addition, a site specific record collected over a longer time frame allows the effectiveness of the comprehensive municipal storm water management program to be evaluated

Estimates must be submitted for any contaminant detected in any sample required under the Part 2 sampling effort [§122.26(d)(2)(iii)(B)]. Seasonal pollutant load estimates are required for any pollutants listed in Exhibits 5-2, 5-3, and 5-4 that were detected during the sampling procedure described in Section 5 3.4. Therefore, the analyses required for seasonal pollutant loads will potentially be more comprehensive than the analyses of annual pollutant loads This results from the possibility that additional pollutants will be detected as part of the storm water characterization studies.

In some regions, precipitation patterns vary significantly from season to season, resulting in significantly different pollutant loadings throughout the year. In arid and semi-arid parts of the country, pollutants accumulate during dry spells, resulting in significantly higher pollutant concentrations in storm water discharges after extended dry weather Because of the buildup of accumulated pollutants, pollutant concentrations in discharges from MS4s are typically highest during the "first flush," or initial discharge

In other regions, pollutants that accumulate in snow may lead to high pollutant concentrations in runoff from the spring thaw Therefore, using an annual average pollutant loading might disguise the impact of shock loadings (discharges that occur within a very short time period and which often exceed acute toxicity criteria) of certain pollutants. Numerous factors contribute to the total volume of snowmelt runoff including shortwave and longwave radiation, condensation or vaporization, convected heat transfer by wind, heat content of rain water, and conductive heat transfer from the ground. Therefore, for regions with significant snowfall, pollutant loading estimates need to be adjusted to account for the additional volume of runoff attributable to snowmelt.

Since snowmelt runoff can occur in either the presence or absence of a storm event, the computation of seasonal pollutant loadings becomes significantly more complex The determination of total snowmelt runoff, however, is beyond the scope of this manual. Affected municipalities are encouraged to contact the U.S. Geological Survey or the Army Corps of Engineers for historical data on snowmelt runoff.

The effects of pollutant load can also vary by season Nutrient pollutant loads from storm water discharges can promote algal blooms in receiving waters during the spring and summer, but they may be of little consequence during winter in surface waters with good flushing characteristics. Quantifying seasonal variations in pollutant loads may aid the development of more cost-effective storm water management programs.

Pollutant loads also may vary significantly from one outfall to another. Within a drainage area, the type of land use, the percent of surface that is impervious, and the extent of exposure of storm water to contaminants affect the pollutant load from an outfall. Procedures for estimating seasonal pollutant loadings must be proposed for major outfalls only

Under §122.26(d)(2)(iii)(C) the regulation requires a schedule to provide estimates of:

- The seasonal pollutant load for each identified major outfall.
- The event mean concentration of a representative storm for any constituent detected in any sample required.

The following steps can be taken to develop a proposed schedule for estimating seasonal loadings at major outfalls:

1. Use historical or long-term hydrologic data to define seasons.
2. Describe the procedure to be used to estimate seasonal loads. This could be an adaption of the simple method or another mathematical model used for annual loads (e.g., instead of using a total annual rainfall accumulation, use an average rainfall accumulation associated with a specific season). If the simple method is used, the municipality could still use Equation 1. However, the amount of rainfall (P) would no longer be an annual value. Instead, it would be the amount of rainfall associated with a particular season defined by the municipality. In addition, the applicant may have to adjust the average runoff coefficient to reflect seasonal changes (e.g., frozen ground can behave like an impervious surface and substantially increase the amount of runoff). Lastly, substantial differences in the frequency and duration of seasonal storm events may increase or decrease the correction factor CF (e.g., during a dry season, the number of storms that actually produce runoff may be substantially lower than during a wet weather season).
3. Identify data elements that need to be refined. In cases where there is substantial seasonal variation, revised runoff coefficient values may be necessary. For example, during rainy seasons, ground surfaces are more saturated than during the dry season. As a result, the same amount of rainfall in the wet season will lead to a greater volume of storm water runoff than in the dry season.
4. Proposed procedures for collecting the appropriate data or otherwise improving estimates.
5. Provide an approximate time frame for data collection and submission of seasonal load estimates.

Proposed procedures for estimating seasonal pollutant loadings and event mean concentrations should explain when and how data used for the estimates will be obtained. The data can be based on site-specific information, or they can be obtained from municipal systems with similar characteristics (such as Regional NURP data).

5.6 COLLECTION OF REPRESENTATIVE DATA FOR PROPOSED MONITORING PROGRAM FOR THE TERM OF THE PERMIT

Under §122.26(d)(2)(iii)(D), applicants are given the opportunity to propose monitoring programs to be carried out during the term of the permit.

> **§122.26(d)(2)(iii)(D)** A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

Applicants should consider their specific needs and identify priorities for the proposed

monitoring program After receiving the Part 2 application, the permitting authority will review proposed monitoring programs and make appropriate adjustments when establishing permit conditions

The applicant must propose a monitoring program for representative data collection for the term of the permit that describes·

- The location of outfalls or field screening points to be sampled (or the location of instream stations);
- Why the location is representative;
- The frequency of sampling;
- Parameters to be sampled, and
- A description of sampling equipment.

Municipalities must submit sampling data over the life of a permit so that changes in storm water quality can be assessed Like initial sampling data, the data from an ongoing monitoring program can be used by the municipality to allocate resources to achieve reduction in pollutants The monitoring data will also serve as an environmental indicator of the success of the storm water management program. Many municipalities may require an extended period of time (possibly the entire permit term) and substantial data to definitively evaluate the effectiveness of a storm water management program. Therefore, a plan for data collection must be proposed by the municipality for the five-year term of the permit. During the permit term, the results of the monitoring program will be submitted in the municipality's annual report [§122.42(c)(4), discussed in Section 7.3 of this guidance].

5.6.1 Goals of a Monitoring Program

The first and most important step in developing a proposed monitoring program is to define the program's objectives as clearly as possible Development of monitoring program goals should be closely coordinated with development of the proposed storm water management program Applicants are required to propose monitoring programs as part of their proposed management programs to reduce pollutants from industrial site runoff. The monitoring plan is part of *Characterization Data* [§122 26(d)(2)(iii)]. The storm water management program is discussed in Section 6.

A comprehensive monitoring program should be designed to support specific goals, including·

- Characterizing discharges;
- Evaluating the source of specific pollutants,
- Evaluating the performance of specific source controls; and
- Identifying the full range of chemical, physical, and biological water quality impacts.

5.6.1.1 Characterizing Discharges

Monitoring pollutants in discharges from MS4s serves several purposes. Quantitative data on specific pollutants in storm water runoff can support estimates of annual and seasonal pollutant loadings and modelling efforts to identify the magnitude of water quality impacts. Over the long term, monitoring data may suggest that new outfalls should be selected for sampling As municipalities gain experience in storm water sampling, they likely will target BMPs that achieve the greatest improvements in storm water quality.

5.6.1.2 Evaluating the Source(s) of Specific Pollutants

Some sources of storm water (e.g., industrial sources that must be covered by NPDES permits, highways with heavy traffic flows, and large parking lots) are expected to generate significantly higher concentrations of pollutants than typical urban runoff. Monitoring efforts to quantify sources of

priority pollutants can provide support for resource allocations to address pollutant sources posing the greatest environmental risk How proposed monitoring efforts will be structured to identify and quantify pollutant sources should be discussed in proposed storm water management programs.

The monitoring program may also include procedures to conduct dry-weather monitoring over the term of the permit to help detect illicit discharges and improper dumping. This can include recording visual observations and odors observed in dry weather flows.

5.6.1.3 Evaluating the Performance of Specific Controls

Pollutant removal efficiencies are fairly well known for certain structural BMPs. However, sampling may still be necessary to ensure that the BMP is meeting original design expectations The expected pollutant removal efficiency for a structural control must take into account site-specific conditions For example, an infiltration basin has a certain expected pollutant removal efficiency, but actual field efficiency is affected by subsurface soil conditions and the extent and frequency of maintenance

The efficiency of a particular structural control will be affected by many factors, such as detention time. However, efforts to determine the efficiency of structural controls must include consideration of pollutant concentrations and flow volumes into and out of the control. The efficiency of nonstructural source controls can be characterized by comparing discharges at a given location before and after the control measures are implemented. Over time, sufficient monitoring data may be gathered to draw substantive conclusions about the effectiveness of certain BMPs. Alternatively, discharges from a sampling site with source controls can be compared with discharges from a similar site that lacks source controls Efforts to monitor the effectiveness of controls should be closely coordinated with the assessment of control efficiencies discussed in Chapter 7

5.6.1.4 Identifying the Full Range of Chemical, Physical, and Biological Water Quality Impacts

Characterizing the effect of storm water discharges on water quality is complicated by a number of factors. EPA recommends an integrated approach to assessing water quality impacts associated with discharges from MS4s Monitoring procedures that help assess water quality impacts include:

- Discharge and receiving water monitoring to support water quality models and to identify hydraulic impacts of increased peak flows and to identify parameters of concern, and
- In-stream monitoring of water chemistry;
- Bioassessments and biosurveys; and
- Sediment sampling

Discharge and Receiving Water Monitoring to Support Water Quality Models

As discussed above, when there is sufficient historical data available from monitoring, these data may be used as inputs to models that predict or validate the effects of pollutant loadings from MS4s on receiving water quality characteristics. In addition to monitoring data, data on receiving water quality characteristics are also necessary to calibrate a particular model.

Once the model has been calibrated to reflect site-specific conditions, future monitoring data could be used to validate long term reductions in pollutant loadings, the effectiveness of nonstructural BMPs, and/or pollutant removal efficiencies of existing structural controls

The information gathered from this approach may also help define those BMPs that which appear to be the most effective. For example, in developing areas, monitoring data could eventually support future planning efforts that would seek to minimize the impact of future development on local receiving waters.

In-stream Monitoring

Using models to estimate pollutant concentrations in receiving waters can be inaccurate In-stream monitoring can directly measure pollutant concentrations. General designs for in-stream monitoring are:

- **Monitoring above and below a set location** This method is generally more useful for evaluating control effectiveness than documenting the severity of a diffuse source of pollutants

- **Monitoring at different times** Monitoring at different times and seasons can provide valuable information on seasonal variations in pollutant concentrations Dry weather in-stream monitoring can be compared with in-stream monitoring during storm events

- **Paired watersheds.** Evaluating similar water bodies can document management program improvements by controlling for meteorologic and hydrologic variability. This approach can also be used to compare receiving waters to background conditions associated with undeveloped watersheds

Detailed guidance on applying these approaches is provided in the draft *Nonpoint Source Monitoring and Evaluation Guide*, February 26, 1988, Nonpoint Source Branch, U S EPA

Bioassessments and Biosurveys

A biological assessment, or "bioassessment," is an evaluation of the biological condition of a water body using biological surveys and other direct measurements of resident biota in surface waters. A biological survey or "biosurvey," consists of collecting, processing, and analyzing representative portions of a resident aquatic community to determine the community structure and function Biosurveys and bioassessments can be used directly to evaluate the overall biological integrity (structure and/or functional characteristics) of an aquatic community Deviations from the biological integrity can be measured directly using biosurveys only when the impacted community is compared against a predetermined reference condition. Without the proper reference conditions, biosurveys may underestimate the extent of impairment.

Biosurveys are useful in that they can assess or detect the aggregate effect of impacts upon an aquatic community where discharges are multiple, complex, and variable, and where point, nonpoint, and storm water discharges are all affecting the biological condition of the receiving water Because of this, biosurveys cannot measure the impacts of one particular discharge or effluent being discharged to receiving waters. Currently, biosurveys cannot be used as a predictive water quality assessment tools.

Biosurveys provide a useful monitor of both aggregate ecological impact and historical trends in the condition of an aquatic ecosystem They can also detect impacts that other assessment methods may miss. More importantly, biosurveys can detect impacts caused by habitat degradation such as channelization, sedimentation, and historical contamination that disrupt the interactive balance of the components of the aquatic community

Sediment Sampling

Pollutants, both organic and inorganic, associated with storm water discharges may become physically or chemically bound with sediment particles Depending upon the size distribution of the sediment particles, a portion of the contaminated sediment particles will settle out of the water column Consequently, the potential exists for a buildup of contaminated sediment over time. The effects of heavily contaminated sediments on both benthic habitat and water quality have been documented to the extent that EPA is developing sediment quality criteria (SQC) that will allow assessments of the toxicological effects of contaminated sediments on varying types of receiving waters.

The amount of sediment material found in storm water discharges suggests that applying sediment quality criteria could be a useful component of a monitoring program. For example, sediment quality criteria could be a valuable preventative tool to ensure that point source discharges of storm water do not cause or contribute to the contamination of sediments

In addition, a MS4 could make comparisons of field measurements to sediment quality criteria as a means of providing an early warning of a potential problem. Consequently, an early warning could provide an opportunity to take corrective action to prevent further contamination For long term planning, consideration could also be given to the feasibility of establishing target levels or goals that would ensure that point sources discharges of storm water do not contribute to sediment contamination

5.6.2 Monitoring Procedures

Monitoring procedures will depend on the objectives of the monitoring effort To a large extent, the type of receiving water will be an important factor in developing monitoring procedures and techniques. For example, grab samples may be appropriate for monitoring discharges from a retention pond, while composite samples may be appropriate for monitoring flows into the pond The following information, at a minimum, should be included for each sampling site.

- The criteria for storm selection,
- Whether grab, composite, continuous, or other sampling techniques are to be used,
- The criteria on when to begin and end sample collection;
- The basis for selecting the time interval between sequentially collected samples,
- How seasonal factors affect the selection of monitoring frequencies,
- The method of estimating rates or volumes of flow passing the sampling point, and
- The analytical methods used for analyzing pollutant parameters and their detection limits

Location of Monitoring Sites and Description of Drainage Basins

The selection of monitoring sites should depend on the goals of the monitoring program. Applicants should identify the location of each proposed monitoring site and the boundary of its drainage basin. They should describe the estimated size and land use characteristics of the drainage basin for each sampling location The applicant also should explain why the sampling sites are representative or will otherwise provide information to support a monitoring program goal. Other monitoring sites can be selected to evaluate unique conditions in the drainage area that have significant or unusual potential for generating pollutants in storm water discharges

Samples should be analyzed in accordance with the analytical methods approved under 40 CFR Part 136

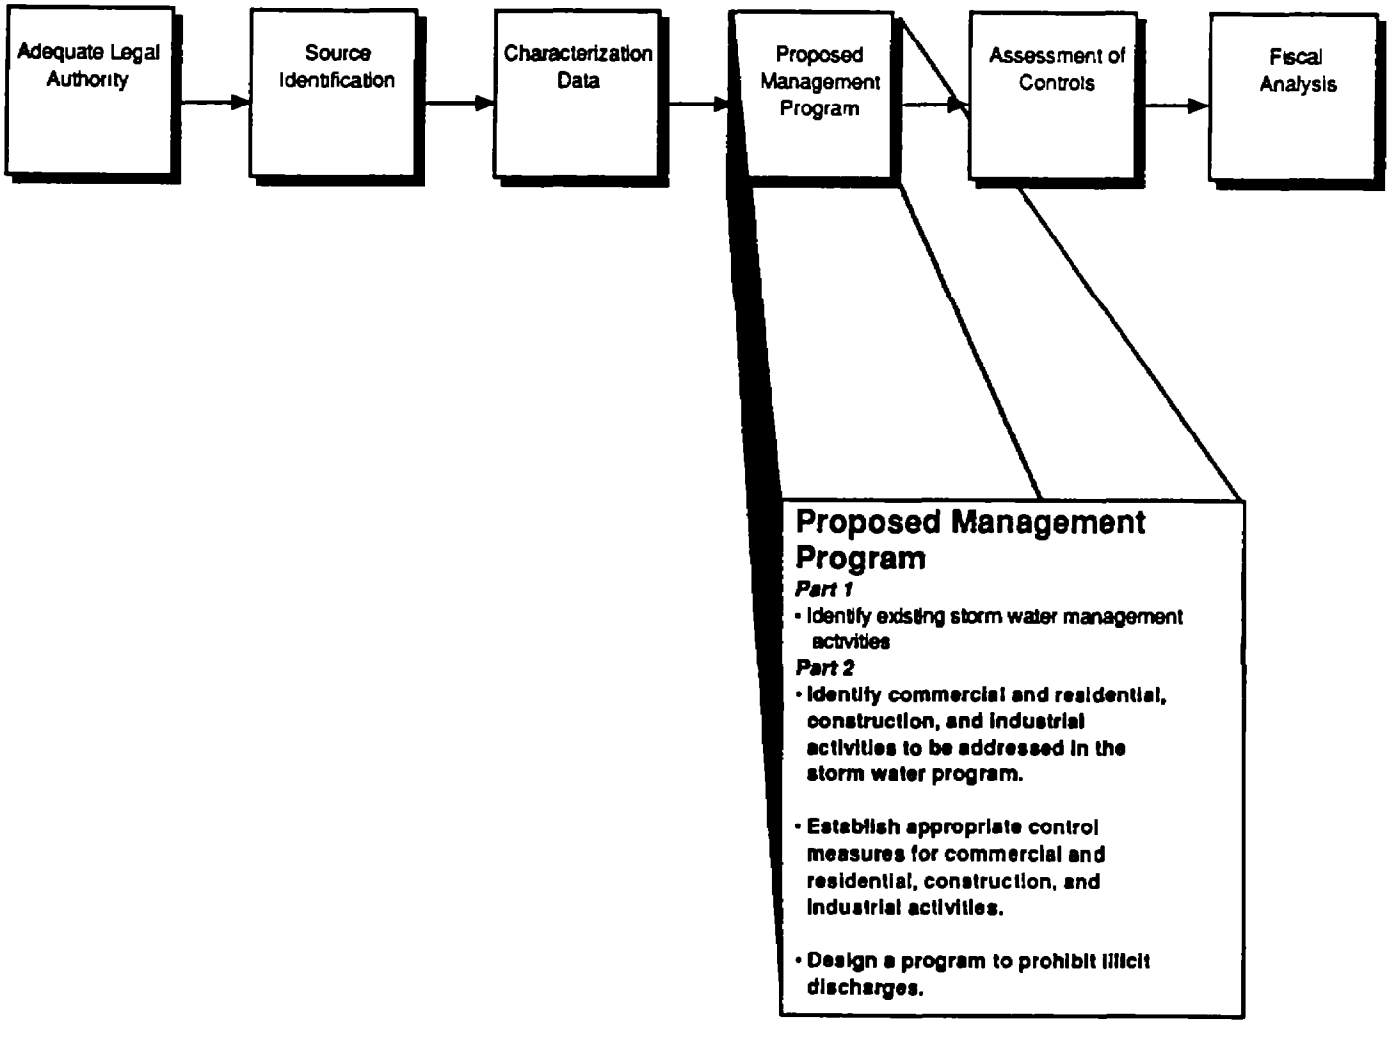
Parameters to be Analyzed

The applicant must list all parameters to be analyzed, which should depend on the objective of the sampling effort. For example, it may only be necessary to monitor several indicator parameters (such as TSS, settleable solids, nutrient, and a metal) to characterize the pollutant removal efficiency of a wet pond.

Sampling Equipment

The applicant must describe the equipment to be used in the proposed sampling program. Only the primary pieces of equipment need be identified. Descriptions can be made by reference to equipment supplied by a vendor or manufacturer if distinctive enough to be readily identified.

CHAPTER 6
PROPOSED MANAGEMENT PROGRAM



6.0 PROPOSED MANAGEMENT PROGRAM

6.1 BACKGROUND

Under the Part 2 application requirements, municipalities must propose site-specific storm water management programs. This is the most important aspect of the permit application. The Part 2 application requirements provide each MS4 with the flexibility to design a program that best suits its site-specific factors and priorities.

The regulations require the applicant to provide a description of the range of control measures considered for implementation during the term of the permit. Applicants must meet all the requirements of the Part 2 application regulation. However, flexibility in developing permit conditions is encouraged by allowing municipalities to emphasize the controls that best apply to their MS4. For example, a municipality that expects significant new development may focus more on requirements for new development and construction, while a municipality that does not expect significant new development may focus more on a program to prohibit illicit discharges or control industrial contributions. In any case, a satisfactory proposed management program will address· management practices; control techniques and systems; design and engineering methods, and other measures to ensure the reduction of pollutants to the "maximum extent practicable (MEP)."

If the municipality proposes a thorough and complete program, the permitting authority is likely to incorporate all or part of the proposed management program into the NPDES storm water permit written for that municipality Therefore, the proposed programs provide municipalities with the opportunity to have substantial input into their NPDES permit conditions.

This section of the guidance manual describes the minimum information requirements for proposed storm water management programs. Examples of how the program elements should be addressed are provided. These examples illustrate minimum information requirements for the program elements, and occasions when municipalities may opt to go beyond minimum requirements in order to meet the MEP standard

6.2 SUMMARY OF REGULATORY REQUIREMENTS

The municipality must develop and submit a proposed management program that covers the duration of the permit The program must integrate the information and actions described in the Part 1 application and portions of the Part 2 application (see Chapters 3, 4, and 5 of this guidance). The regulatory requirements for the proposed management program are in 40 CFR 122.26(d)(2)(iv)

At a minimum, the proposed management program must include:

- A comprehensive planning process that involves both public participation and intergovernmental coordination;
- A description of management practices, control techniques, and system design and engineering methods to reduce the discharge of pollutants to the MEP; and
- A description of staff and equipment available to set up and assess the storm water management program.

Additional provisions under §122 26(d)(2)(iv)(A) require applicants to include:

- Programs to control storm water runoff from commercial and residential areas, construction sites, and industrial

facilities (including waste handling sites), (Section 6 3),

- Identification of structural control measures to be included in these proposed programs, such as detention controls, infiltration controls, and filtration controls that the municipality plans to apply to the activities addressed in its storm water management program (Section 6.4); and

- Programs to detect and remove illicit discharges, and to control and prevent improper disposal into the MS4 of materials such as used oil or seepage from municipal sanitary sewers (Section 6.5).

6.3 PROGRAMS TO CONTROL STORM WATER RUNOFF FROM COMMERCIAL AND RESIDENTIAL AREAS, CONSTRUCTION SITES, AND INDUSTRIAL FACILITIES

A proposed management program must identify the activities or areas that require controls to reduce pollutants in storm water runoff Specifically, a proposed management program must address storm water runoff from **commercial and residential areas** (Section 6.3.1), **construction sites** (Section 6.3.2), and **industrial facilities** (Section 6.3 3). Also, areas where illicit connections or illegal discharges may occur must be identified (Section 6.5).

In addition to the requirements of the proposed storm water management program, other provisions of the Part 1 and Part 2 applications require information that will help enable the municipality to focus on identifying activities and areas that may need control measures Examples of these provisions include

- Identification of sources [Part 1, §122 2(d)(1)(iii)(B)(3)-(4), and Part 2, §122 26(d)(2)(ii)];

- Identification of water bodies that may be adversely affected by storm water runoff [Part 1, §122 26(d)(1)(iv)(C)],

- Organization of sources by watershed [Part 2, §122 26(d)(2)(ii)],

- Description of land use activities [Part 1, §122 26(d)(1)(iii)(B)(2)];

- Results of field screening analysis [Part 1, §122 26(d)(1)(iv)(D)];

- Results of the sampling program [Part 2, §122 26(d)(2)(iii)(A)(3)],

- Estimates of annual pollutant loads and event mean concentrations, and schedules to submit seasonal pollutant loads and event mean concentrations [Part 2, §122.26(d)(2)(iii)(B) and (C)], and

- Findings from an on-going monitoring program [Part 2, §122 26(d)(2)(iii)(D)].

6.3.1 Commercial and Residential Activities

Under §122.26(d)(2)(iv)(A), applicants must propose structural and source control measures to reduce pollutants from commercial and residential areas.

> **§122.26(d)(2)(iv)(A)** [The proposed management program must include a] description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls

To ensure that proposed control measures are effective, the applicant should study how storm water runoff from pollutant sources affects the existing municipal system, how the proposed

control measures will enhance the existing system, and what impact the proposed measures will have on receiving waters The control measures should recognize and emphasize the interaction between pollutant sources and the physical attributes of the municipal system and receiving waters.

Specific commercial and residential activities that must be addressed include maintenance activities and a maintenance schedule for structural controls to reduce pollutants in storm water runoff. This provision is discussed in Section 6.4.2. Other activities to be addressed include:

- Post-construction controls to reduce pollutants in discharges to MS4s resulting from new development and significant redevelopment (Section 6 3 1 1),
- Practices for maintaining and operating public streets, roads, and highways that will reduce the impact on receiving waters from storm water runoff discharges (Section 6 3 1 2);
- Procedures to assure that the impacts on receiving waters from flood management projects are assessed, and that existing structural control devices have been evaluated to determine if retrofit controls are feasible (Section 6 3.1.3);
- A program to monitor pollutants in runoff from operating or closed municipal landfills that identifies priorities and procedures for inspections and establishing and implementing control measures (Section 6.3 1.4); and
- A program to reduce to the maximum extent practicable, pollutants in storm water runoff associated with the application of pesticides, herbicides, and fertilizer (Section 6 3.1.5).

To reduce pollutants in storm water runoff from commercial and residential activities, a proposed management program might include the use of infiltration devices, detention and retention basins, vegetated swales, water quality inlets (which may include oil and water or oil/grit separators), screens, channel stabilization/riparian habitat enhancement efforts, wetland restoration and preservation projects, as well as various source control strategies and other nonstructural control measures

6.3.1.1 New Development and Significant Redevelopment

Summary of Regulatory Requirement

New development or redevelopment often increases impervious land surfaces, which usually leads to increased pollutant levels in storm water runoff Chemical and thermal changes in storm water runoff are commonly associated with new development and can adversely affect the quality of receiving waters In addition, urbanization results in an increase in the volume of storm water discharges.

The Nationwide Urban Runoff Program (NURP) study (EPA, 1983) and more recent investigations indicate that controlling the contribution of pollutants in storm water discharges at the onset of land development is the most cost-effective approach to storm water quality management Mitigating problems caused by pollutants after they have entered a MS4 is often more expensive and less efficient than preventing or reducing the discharge of pollutants at the source Therefore, a satisfactory proposed management program will propose structural and nonstructural measures to reduce pollutants in storm water discharges from areas of new development and redevelopment Examples of such measures are discussed below

§122.26(d)(2)(iv)(A)(2) [The applicant must include a] description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed

Provisions under §122.26(d)(2)(iv)(A)(2) focus on the reduction of pollutants in storm water runoff **after** construction in areas where new development or redevelopment is completed Controls that are required **during** construction are discussed in Section 6.3 2 of this guidance

Post-Construction Controls

Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective

Further, storm water management program goals should be reviewed during planning processes that guide development to appropriate locations and steer intensive land uses away from sensitive environmental areas A municipality may, for example, include provisions in the planning process that ensure that all new development in targeted areas or zones provides for a certain percentage of undisturbed area to assist in preserving post-development runoff quality and velocity as similar as possible to pre-development conditions In its Part 2 application, a municipality should describe how it plans to implement the proposed standards (e g, through an ordinance requiring approval of storm water management programs, a review and approval process, and adequate enforcement)

The proposed storm water management program should identify and include **planning procedures** and **control measures** that will be used in the municipality.

Planning Procedures

Comprehensive planning procedures typically involve incorporation of land use goals and objectives into a plan document or a plan map. These plans are often called Master Plans, Comprehensive Land Use Plans, or Comprehensive Zoning Plans

Comprehensive or master plans are often non-binding. They provide support and direction to local officials that have the authority to make land use decisions

While applicants do not need to submit a complete comprehensive or master plan with the Part 2 application, they should detail the planning process employed by the municipality. They must thoroughly describe how the municipality's comprehensive plan is compatible with the storm water regulations The description should clearly

- Identify management objectives for streams, wetlands, and other receiving waters;
- Identify areas where urban development is likely to occur and areas that are sensitive to the effects of urbanization. Consideration should be given to receiving waters, topography, soil types, ground water uses and potential impacts, and other relevant factors;
- Describe standards such as design criteria and performance standards for storm water controls for new developments, such as buffer zones,

open space preservation, erosion and sediment controls, etc.;

- Describe other measures to minimize the effects of new development on storm water quality (these may include local code and ordinance requirements); and

- Identify or discuss the site development review process for the evaluation and approval of storm drainage or storm water management programs. Requirements in drainage or storm water management programs can be coordinated with review of other related plans such as those for site grading or landscaping.

There will be great variation among municipalities in their sophistication of land use planning If the municipality has recently updated its land use plan, it may detail storm water quality issues In other instances, there may be no policy to include storm water quality considerations in land use decisions. In such cases, the applicant must describe how consideration of those activities that affect storm water quality are to be incorporated into the municipality's comprehensive or master plan and its approval process for construction projects

Control Measures

Most traditional storm water control measures focus on efficient collection and conveyance of storm water runoff to an offsite location This approach can increase downstream property damage due to increased storm water runoff quantity and flow velocity. Corrective action often involves expensive public works projects, such as enlarging and reinforcing channels or constructing swales to provide an adequate outfall from affected or damaged areas The traditional approach has typically involved downstream channel stabilization projects However, these projects may also result in increased storm water runoff quantity and flow velocity.

Some recent approaches to storm water management include preserving the natural features of a watershed by maintaining vegetative cover and establishing buffer zones and open space or green areas. The benefit of employing this approach is the protection afforded to riparian areas and wetlands, as well as the preservation of a stable watershed. One additional benefit from this approach includes maintaining ground water recharge through infiltration. These approaches to storm water management minimize the impact of erosion, flooding, and other damage to natural drainage features such as streams, wetlands, and lakes. Preservation of natural habitat can be achieved through effective storm water quality control measures More recent approaches use storm water to:

- Recharge ground water sources with runoff from impervious areas;

- Preserve baseflows of surface water bodies;

- Augment water supplies used for street cleaning and other municipal functions, such as watering public lawns,

- Increase recreational opportunities including swimming, fishing, and boating; and

- Sometimes, augment drinking water supplies if it is treated and in compliance with all applicable drinking water standards.

The municipality should consider storm water controls and structural concerns in planning, zoning, and site or subdivision plan approval. An example of effective structural control is described in Exhibit 6-1. Non-structural control measures are highly recommended for new development. They can be included during the planning, site-selection, and development stages. Examples of non-structural controls include street sweeping, buffer strip preservation, and public education.

Exhibit 6-1
Storm Water Programs in Delaware and Florida

Delaware requirements for on-site measures include water quality ponds with permanent pools Ponds must be designed to release the equivalent volume of runoff from the first 1/2 inch of runoff from the site over a 24-hour period and have a storage volume designed to accommodate at least 1/2 inch of runoff from the site Water quality ponds without permanent pools may also be used in Delaware's program. These pools are to be designed to release the first inch of runoff from the site over a 24-hour period.

Developers are instructed to consider infiltration practices only after ponds are eliminated for engineering or hardship reasons. Infiltration structures must be designed to accept at least the first inch of runoff from all streets, roadways, and parking lots Other practices may be acceptable if they meet the equivalent removal efficiency of 80 percent for suspended solids. More stringent requirements may be established on a case-by-case basis.

The 80 percent removal efficiency for suspended solids that Delaware requires takes into account pollutant settling. The 24-hour detention period allows for substantial settling where most of the pollutant removal occurs. In addition, the requirement that the first inch of runoff be released over a period of no less than 24 hours reduces downstream erosion

Source Schueler, 1987

For significant redevelopment, municipalities can incorporate both structural and nonstructural storm water controls However, there are generally far more constraints and limitations on the control opportunities available at redevelopment sites One of the primary constraints is the availability of sufficient open area to accommodate structural controls such as detention ponds. In instances where redevelopment is occurring in densely urbanized areas, storm water runoff volumes may be so large that sufficient storage capacity can not be provided without further compounding problems associated with siting and retrofitting existing storm water conveyance systems In such cases, the municipality should consider nonstructural control measures such as traffic flow control, the use of porous construction materials for roads and parking lots, revisions to street sweeping or deicing policies, or public education programs

6.3.1.2 Public Streets, Roads, and Highways

Summary of Regulatory Requirement

Public streets, roads, and highways can be significant sources of pollutants in discharges from MS4s Therefore, proposed management programs must include a description of practices for operation and maintenance of public streets, roads, and highways, and procedures for reducing the impact of runoff from these areas on receiving waters.

§122.26(d)(2)(iv)(A)(3) [The application must include a] description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities

Road maintenance practices, especially snow management and road repair, and traffic are significant sources of pollutants in storm water discharges Measures to reduce the pollutants in storm water runoff from these sources should be addressed in the proposed management program

Snow Management

Deicing salts are the main source of pollutants in runoff of urban snowmelt. Municipalities can reduce these pollutants by calibrating equipment, educating equipment operators, using alternative deicing materials, and properly storing deicing materials. As alternatives to deicing salts, the Federal Highway Administration is considering many materials that may be less polluting. However, most of these deicers contain sodium or chloride ions that are harmful to roadside trees, shrubs, and soils. One deicer, calcium magnesium acetate (CMA) may be the best option for environmentally sensitive areas (Chollar, 1990) In salt storage facilities, salt piles should be completely covered, storage and handling areas should have impervious surfaces, and contaminated runoff should be contained

Road Repair

Road maintenance and repair activities may contribute pollutants through erosion caused by the elimination of stabilizing vegetation from roadside shoulders and ditches. Maintenance crews can decrease the potential for erosion by disturbing only the area under repair. Graded areas should also be limited in size so that repairs can be completed the same day and graded areas stabilized by the end of the workday. Other measures to reduce pollutants in storm water include scheduling potential pollutant-causing repair work during dry seasons, when possible

Municipal equipment yards and maintenance shops that support road maintenance activities can also be significant sources of pollutants Therefore, municipalities should consider instituting procedures that address spill prevention, material management practices, and good housekeeping

Traffic

Oil and grease and metals from traffic are the pollutants of most concern with respect to aquatic toxicity and their ability to "wash off" roadways and enter a MS4

In almost all instances, the pollutant concentrations in initial storm water discharge from heavily travelled streets is significant When the initial runoff reaches the velocity needed to entrain particulates, highly soluble pollutants that have accumulated between storms are transported to the storm sewer system. Therefore, shortly after a storm event begins, the pollutant loading in the initial flow to a MS4 is often the greatest

Pollutants from traffic can be minimized by using nonstructural controls (e.g, traffic reduction and improved traffic management), structural controls (e g, traditional and innovative BMPs), and changing maintenance activities. Traditional structural controls to reduce pollutants in road runoff include vegetated swales, infiltration devices and detention/retention basins Highways often afford opportunities for using structural controls such as detention basins on entrance or exit ramps and upstream or downstream of culvert crossings (Steward, 1992). Smaller roads may also have low-cost structural control opportunities available at culvert crossings such as vegetated swales Many structural controls can also be placed on public or private land that is outside the right-of-way, but still may be proximate enough to capture road runoff. Any time controls are placed at culvert crossings, potential wetland impacts and instream treatment issues need to be considered

Maintenance activities that can reduce pollutants in storm water discharges include catch basin cleaning, litter control, and targeted street sweeping For municipalities that have

developed transportation plans under the Clean Air Act, applicants should describe how they will review the plan, and amend it where appropriate, to address water quality concerns Potential locations for installing new structural controls to reduce pollutants from road and highway runoff should be identified by applicants.

6.3.1.3 Flood Management Projects

Summary of Regulatory Requirement

The traditional focus of storm water management in many communities has been water quantity (i e., flood) control. The proposed management program must demonstrate that flood management projects take into account the effects on the water quality of receiving water bodies, and the program must discuss whether existing structural flood control devices can be retrofitted to control water quality.

> §122.26(d)(2)(iv)(A)(4) [The application must include a] description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible

Opportunities for pollutant reduction should be considered when determining specific controls to be proposed as the MEP standard in the storm water management program.

Control Measures

Storm water management devices and structures that focus solely on water quantity are usually not designed to remove pollutants, and may sometimes harm aquatic habitat and aesthetic values. For example, channels that are completely lined with concrete typically do not provide for aquatic habitat and tend to increase potentially erosive velocities and elevate ambient water temperatures, resulting in downstream channel enlargement and increased pollutant loadings However, this condition can be mitigated through alternative stabilization methods.

Channel management measures that can enhance streams and their ecological values include corridor preservation, biological bank treatment, and, where necessary, geomorphic restoration (Ferguson, 1991). The municipality may also install structural devices to dampen the hydraulic energy of the flow and minimize downstream erosion. As another example, willow saplings could be planted between rip-rap, timbers, and other stabilization structures that are anchored into terraces on the side of the streambank.

Flood-control projects can be built or subsequently modified to address water quantity and water quality concerns. Sometimes existing flood control structures can be retrofitted to provide water quality benefits as well as water quantity control (EPA, 1989b). Basin retrofits are a common example. For such a retrofit, dry flood control or detention basins can be converted to wet basins by modifying outlet orifices Additional storage can be obtained by raising the elevation of the basin embankment.

Dry retention basins, or extended dry or wet retention basins can be used to improve water quality. Dry retention basins are not as efficient or as effective in improving water quality as extended dry or wet retention basins, but dry retention basins are generally less costly to design and maintain. The decision to use dry retention or extended dry or wet retention basins should consider all these factors.

Optimally, such measures should be considered in the planning process (discussed previously). However, they can also be implemented later in the land development

process (e g , site review or public facilities requirements stage)

If a flood control authority is responsible for a portion of the MS4, the applicant should take the lead in coordinating efforts to incorporate pollutant reduction considerations in flood control projects EPA recommends the use of Memoranda of Agreement and Memoranda of Understanding to clarify roles and responsibilities between two or more political entities.

6.3.1.4 Municipal Waste Facilities

Applicants must describe programs that identify measures to monitor and reduce pollutants in storm water discharges from facilities that handle municipal waste, including sewage sludge.

> §122.26(d)(2)(iv)(A)(5) [The application must include a] description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges

The first step is to identify facilities that handle municipal waste and summarize their operations The types of facilities that should be included are

- Active or closed municipal waste landfills,
- Publicly owned treatment works, including water and wastewater treatment plants,
- Incinerators,
- Municipal solid waste transfer facilities
- Land application sites,
- Uncontrolled sanitary landfills,
- Maintenance and storage yards for waste transportation fleets and equipment,
- Sites for disposing or treating sludge from municipal treatment works; and
- Other treatment, storage, or disposal facilities for municipal waste.

Applicants may combine this part of the proposed management program with the program established under §122 26(d)(2)(iv)(C), which sets standards for monitoring and controlling pollutants from similar types of solid waste facilities (e.g , those with hazardous wastes, or subject to the requirements of SARA Title III—Section 313 of the Emergency Protection and Community Right-to-Know Act). Monitoring should include all the parameters listed in §122 26(d)(2)(iv)(C) and any additional parameters listed in an effluent guideline. Procedures to evaluate, inspect, monitor, and establish control measures for municipal waste sites over the term of the NPDES permit should be described For example, after one year of monitoring each waste handling facility category listed above, the municipality may have collected enough data to decide which facilities or types of facilities should receive a higher priority for pollutant reduction More attention could then be focused on the high-priority sites

6.3.1.5 Pesticides, Herbicides, and Fertilizers

The proposed management program must include a description of procedures to reduce the contribution of pollutants associated with pesticides, herbicides, and fertilizers discharged to the MS4.

§122 26(d)(2)(iv)(A)(6) [The application must include a] description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities

The proposed program should include educational measures for the public and commercial applicators, and should include integrated pest management measures that rely on non-chemical solutions to pest control. The program should also describe how educational materials will be developed and distributed Applicants are encouraged to consider providing information for the collection and proper disposal of unused pesticides, herbicides, and fertilizers, or to establish their own program An effective and safe program would include

- Development of an inventory of products that may be accepted under the program, and collection of the Material Safety Data Sheets (MSDSs) for these products,
- Identification of transportation, storage, and disposal requirements,
- A shelf-life program to dispose of expired products,
- Applicator training or certification (the pretreatment program may be helpful as a source of industry-specific information or as a model approach for obtaining and tracking information on chemical applicators and distributors), and
- Safety training

Any certification/training program for the collection and disposal of pesticides, herbicides, and fertilizers must be in compliance with Federal, State, and local laws such as the Resource Conservation and Recovery Act, the Federal Insecticide, Fungicide, and Rodenticide Act, the Department of Transportation's hazardous materials regulations, and State and local ordinances.

In addition, applicants must include a discussion of controls for the application of pesticides, herbicides, and fertilizers in public-rights-of-way and at municipal facilities Planting low-maintenance vegetation, such as perennial ground covers, reduces pesticide and herbicide use. Native vegetation is often preferable because there is less need to apply fertilizers and herbicides, and to perform other forms of maintenance, such as mowing (Horner, 1988).

If herbicides are used, a herbicide-use plan must be proposed as part of the storm water management program The plan might include

- A list of selected herbicides and their specific uses,
- Information about the formulations of various products, including how to recognize the chemical constituents from the label, and directions and precautions for applicators that explain if products should be diluted, mixed, or only used alone,
- Application methods and estimated quantities to be used,
- Equipment use and maintenance,
- Training in safe use, storage, and disposal of pesticides (safety requirements for individual products are listed on the products' MSDSs),
- Inspection and monitoring procedures, and

- Recordkeeping and public notice procedures

6.3.2 Construction Sites

As specified in §122 26(d)(2)(iv)(D), applicants must describe proposed regulatory programs to reduce pollutants in storm water runoff from construction sites to the MS4.

> **§122.26(d)(2)(iv)(D) [The application must include a] description of a program to implement and maintain structural and nonstructural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system**

This part of the proposed management program must address

- Implementation of BMPs,
- Procedures for reviewing site plans to ensure that they are consistent with local sediment and erosion control plans,
- Inspection of construction sites; and
- Enforcement measures and educational activities for construction site developers and operators

EPA encourages municipalities to (1) coordinate requirements to reduce pollutants in construction site runoff with management programs to reduce pollutants from new development, and (2) maintain, to the degree possible, pre-construction hydrologic conditions (Section 6 3 1 1) Applicants are encouraged to describe these two proposed management program components together Implementation of this program component will rely on the establishment and maintenance of both structural and nonstructural BMPs This requirement extends to all construction activity within the municipality

All construction sites, regardless of size, must be addressed by the municipality To begin to identify these sites, the applicant should obtain lists of construction site operators that are covered by general or individual storm water NPDES permits from the NPDES permitting authority However, **construction sites not covered by a storm water discharge permit also need to be addressed by the municipality. The best way to identify these construction sites and implement an effective BMP program to reduce pollutants in their runoff is through the site planning process (see Section 6.3.2.1).**

The BMPs envisioned for construction site runoff are generally well established technologies and practices They rely predominantly on erosion and sediment controls and other measures applicable to construction sites (e.g , control of solid wastes, and prohibitions on discharging concrete truck washing runoff into storm drains) The technologies proposed should be referenced, and a description of when and how the controls will be used should be included Municipality-specific technical guidance for construction site operators, such as handbooks and inspection checklists, are examples of suitable reference sources If an applicant chooses to develop such handbooks and checklists, they should be referenced and described in the application

The major requirements of this program component include

- Site planning that considers the potential impacts on water quality,
- Nonstructural and structural best management practices,
- Procedures that consider physical site characteristics when identifying priorities for inspection and enforcement, and
- Educational and training measures for construction site operators

Each of these requirements, and the reasons that they are important elements of a proposed storm water management program, is described in more detail below

6.3.2.1 Site Planning

Sediment runoff rates from construction sites are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times those of forest lands. Over a short period, construction sites can contribute more sediment to streams than had been deposited over several decades Runoff from construction sites can also include other pollutants such as phosphorus and nitrogen from fertilizer, pesticides, petroleum derivatives, construction chemicals, and solid wastes

To address these problems, the proposed management program should describe procedures for site planning that consider potential water quality impacts

> §122 26(d)(2)(iv)(D)(1) [The program for construction sites must include a] description of procedures for site planning which incorporate consideration of potential water quality impacts

The objective is for the municipality and the developer to address storm water discharges from construction activity early in the project design process so that potential water quality impacts can be eliminated or minimized and consequences to the aquatic environment assessed Nonstructural approaches to minimize the generation of runoff from the construction site will also need to be considered These measures may include phasing development to coincide with seasonal dry periods, minimizing areas that are cleared and graded to only the portion of the site that is necessary for construction, exposing areas for the briefest period possible, and stabilizing and reseeding disturbed areas rapidly after construction activity is completed

It is often easier and more effective to incorporate storm water quality controls during the site plan review process or earlier The process typically culminates with the developer of the construction site submitting detailed engineering plans to the municipality for review and approval

Upon completion of the site plan review stage, the developer and the municipality have invested considerable time and money into the project If storm water quality issues are considered only after significant detailed engineering has gone into the project, municipal site reviewers may only address minor drainage issues. In recent years, however, many municipalities have developed separate teams of site inspectors to implement erosion and sediment control measures in the field. In these municipalities, site inspectors should be part of the site review team (if they are not already) in order to incorporate their expertise on the appropriate erosion and sediment controls for the given circumstances

The above discussion reinforces the importance of site planning, as described in the section on site planning for new development (Section 6.3 1) In general, the sooner planners consider storm water quality issues, the better the opportunity for efficient and effective pollutant reduction In some cases storm water issues should be considered in the conceptual stage of planning (e g , as a planning or zoning function)

Some municipalities include a final step in the planning process that requires a developer to provide a far greater level of design detail than earlier conceptual design approvals This step may be required as a condition of the final approval for certain zoning categories Municipalities with such a step in the development process can consider potential storm water quality issues in detail at this stage Municipalities that do not currently require such detailed plans should consider adopting this procedure as part of their storm water management program

6.3.2.2 Nonstructural and Structural BMPs for Construction Activities

This component of the proposed management program should describe requirements for nonstructural and structural BMPs that operators of construction activities that discharge to MS4s must meet

> **§122.26(d)(2)(iv)(D)(2)** [The program for construction sites must include a] description of requirements for nonstructural and structural best management practices

As indicated above, applicants must propose site review and approval procedures that address sediment and erosion controls, storm water management, and other appropriate measures Approvals should be clearly tied to commitments to implement structural and nonstructural BMPs during the construction process Appropriate structural and nonstructural control requirements will vary by project Project type, size, and duration, as well as soil composition, site slope, and proximity to sensitive receiving waters will determine the appropriate structural and nonstructural BMPs Municipalities should acquire the authority to require operators to install and maintain applicable erosion and sediment control plans Exhibit 6-2 summarizes common construction-site BMPs

A description of the local erosion and sediment control law or ordinance is needed to satisfy this program requirement The description should include information that links the enforcement of the law or ordinance to the legal authority of the applicant, as discussed in Section 3 of this manual

While many municipalities have erosion and sediment control ordinances in place, their effectiveness is often limited because they are not adequately implemented and enforced Examples include silt fencing that is not maintained or excavated soils that are placed directly on top of the silt fencing Therefore, construction sites covered under NPDES permit regulations must indicate whether they are in compliance with State and local sediment and erosion control plans Site inspections are expected to be the primary enforcement mechanism by which erosion and sediment controls are maintained

To ensure that developers are in compliance with erosion and sediment control plans, applicants may wish to consider expanding the use of performance bonds. This approach might depart from a traditional site bonding approach For example, the size of bonds could be based on the amount of earth disturbed, the slope of the site, changes in grades, soil type, proximity to surface waters, sensitivity of surrounding area, and other relevant factors. In addition, the bond could clearly specify the storm water quality controls that must be included in the development. Appropriate maintenance and site cleanup could be tied to the bond-release process

6.3.2 3 Site Inspections and Enforcement of Controls For Construction Sites

Storm water BMPs associated with construction activities are highly susceptible to damage due to the intensity of activities commonly associated with construction Consequently, inspections are crucial to the effective operation of storm water BMPs Therefore, the proposed management program should describe construction site inspection and enforcement procedures The procedures should be flexible so that they can be tailored to specific construction activities and physical characteristics of the construction site

> **§122 26(d)(2)(iv)(D)(3)** [The program for construction sites must include a] description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality

Source: Modified from WDOE *Public Review Draft - Stormwater Management Manual for the Puget* [illegible] Washington State Department of Ecology, Publication #90-73 June 1991

Effective inspection and enforcement requires adequate staff, systematic inspection procedures, penalties to deter infractions, and intervention by the municipal authority to correct violations. Enforcement mechanisms, such as the ability to require additional storm water controls, administrative penalties (e.g., stop work orders) and injunctive relief (via citizen suits) also must be described. In addition, the applicant should describe who has the authority to require compliance.

Proposed procedures for inspecting construction sites may include minimum frequencies and an inspector's checklist. For example, the State of Delaware requires a minimum of one inspection every two weeks for sites over 50,000 square feet.

The proposed program should also specify the minimum number of inspectors that will be employed during the permit term and how they will be trained. For example, some erosion and sediment control programs require that certified private inspectors be used. In such case, procedures for inspector training and certification must also be described.

In formulating procedures to identify priorities for inspecting sites and enforcing control measures, applicants are encouraged to begin early in the process (i.e., at the site planning stage, as discussed previously) and continue throughout all ground disturbing activities. Once the nature of the construction activity has been established or perhaps modified during the site plan review process, the physical site constraints can be evaluated so that effective controls can be implemented.

For example, if the controls specified in the site plan prove to be ineffective, or if changes occur that were not anticipated during the planning process, site inspection and enforcement mechanisms can be required to mitigate the potential for pollutants to enter a downstream MS4. In this instance, a perimeter barrier, such as a temporary diversion dike, could be used to divert the concentrated runoff to a pipe slope drain terminating with a level spreader. The spreader would dissipate the erosive velocity of the runoff and release it into an undisturbed area beyond the limits of the clearing and grading at the toe of the slope.

The proximity and sensitivity of the receiving water to which the construction site discharges is an important consideration. For construction sites that discharge to receiving waters that do not support their designated use or other waters of special concern, additional construction site controls are probably warranted and should be strongly considered. These receiving waters are identified in the Part 1 municipal NPDES storm water permit application [§122.26(d)(1)(i)(C)].

6.3.2.4 Educational Measures for Construction Site Operators

Construction site operators often need training and education about the sources, control, and impacts of pollutants in runoff from construction sites (see Virginia, 1988). Therefore, applicants must describe examples of informational materials and activities to be used in education programs.

> §122.26(d)(2)(iv)(D)(4). [The program for construction sites must include a] description of appropriate educational and training measures for construction site operators.

Implementation and enforcement of erosion and sediment controls have historically been major problems even with many programs that may be otherwise exemplary. Therefore, technical information on how to incorporate storm water management with erosion and sediment control and other BMP training courses are recommended for municipal employees and construction site operators. Training on the available alternatives will help operators recognize and correct problems promptly. *Tools for such training* include videos, workshops, seminars, and demonstrations or field trips

An acceptable program must include a training program, which should be supplemented by a certification program for all construction site operators (contractors and developers) plan reviewers, and inspectors that work on sites that discharge to a MS4 For example, one NPDES State has a certification program based on adequate training and minimum-competency level testing of all private individuals involved in the preparation and implementation of erosion and sediment control plans

6.3.3 Program to Control Pollutants in Storm Water Discharges from Waste Handling Sites and from Industrial Facilities

> §122.26(d)(2)(iv)(C) [The application must include a] description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system

The storm water regulations envision that NPDES permitting authorities and municipal operators will cooperate to develop programs to monitor and control pollutants in storm water discharges to municipal systems from various sites that handle waste and certain industrial facilities

Operators responsible for storm water discharges associated with industrial activity must obtain NPDES permits from EPA or an authorized NPDES State These industrial storm water permits will establish requirements such as controls, practices, and monitoring for storm water discharges from the industrial facilities to the MS4 The industrial storm water permits will also provide a basis for enforcement actions directly against the industrial owner or operator

NPDES permits for MS4s will establish responsibilities for municipal system operators to control pollutants from industrial storm water discharged through their system. Proposed storm water management programs must address the reduction of pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to SARA Title III; and other priority industrial facilities, as determined by the applicant. Municipalities should consider the information gathered for the Part 1 application and other parts of the Part 2 application (particularly the Source Identification and Characterization Data components) when prioritizing storm water discharges from these sites. In addition, Appendix B contains a list of pollutants commonly associated with various industries.

In the Part 2 application, the Source Identification component (see Section 4 of this guidance manual) requires the applicant to provide an inventory of pollutant sources, organized by watershed. This inventory identifies and describes the products and services of each industrial facility that may discharge storm water to the MS4. The *Source Identification* component suggests applicants use standard industrial classification (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites that do not meet the regulatory definition of "storm water discharge associated with industrial activity" (i.e. not included in the *Source Identification* and *Discharge Characterization* components), but are identified as a high priority under the proposed management program. Applicants can obtain information on how SIC codes are used to describe the industrial facilities located within their jurisdictions from their NPDES permitting authority

Characterization data should also be evaluated. Applicants should analyze quantitative data from representative outfalls to establish a monitoring and control program.

An integral part of this requirement is the adequacy of the applicant's legal authority. If a municipality believes that a discharge of storm water associated with industrial activity violates the industrial facility's NPDES permit limits, but the municipality does not have authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action. Examples of possible actions by the NPDES permitting authority are:

- For a facility that already has a NPDES individual permit, the permit may be reopened and further controls imposed,
- For a facility covered by a NPDES general permit, an individual site-specific permit application may be required, or
- For a facility not covered by a NPDES storm water permit, a permit may be required

The municipality is ultimately responsible for discharges from their MS4. Consequently, the proposed storm water management program should describe how the municipality will help EPA and authorized NPDES States

- Identify priority industries discharging to their systems,
- Review and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them), and
- Inspect and monitor industrial facilities to verify that the industries discharging storm water to the municipal systems are in compliance with their NPDES storm water permit, if required

6.3.3.1 Identifying Priorities

Proposed management programs must clearly identify priority industrial facilities.

> **§122.26(d)(2)(iv)(C)(1).** [The applicant must] identify priorities and procedures for inspections and establishing and implementing control measures for such discharges

This section discusses how applicants might identify priority facilities Section 6.3.3.2 discusses how municipalities might develop procedures for inspections and implementation of control measures

At a minimum, priority facilities include:

- Operating and closed municipal landfills;
- Hazardous waste treatment, disposal or recovery facilities, and
- Facilities subject to SARA Title III

Municipalities must identify these and other priority industrial facilities and describe the criteria used to identify them For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. Other sources may include CWA Section 205 or 208 use-attainability studies, other studies that indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall, or records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or

a major contribution of pollutants The program should also describe procedures for modifying the inventory of priority industries based on additional evaluation that occurs throughout the permit term

Applicants may initially focus their implementation efforts on known pollution sources The municipality may have previously identified these sources, or they may be identified through existing information compiled during the permit application process However, the initial management program implementation strategy should be based on information gathered while completing the *Adequate Legal Authority, Source Identification,* and *Discharge Characterization* sections of the permit application (See Chapters 3, 4, and 5, respectively)

During the term of the permit, as additional information becomes available, the municipality should target and set priorities for other program elements that emerge. For example, if the municipality has incomplete characterization data about waste handling sites identified in this program component because the inventory of dischargers to the MS4 has not been completed, the municipality could propose to direct monitoring programs to those areas Upon acquiring sufficient characterization data, the priority of the sites discharging to these portions of the MS4 can be either determined or modified

As noted above, when identifying priority sites, applicants must consider all the facilities listed in §122 26(d)(2)(iv)(C)(*1*). When municipalities develop criteria for identifying additional priority industrial facilities, they are advised to consider, at a minimum:

- The type of industrial activity (SIC codes can help characterize the type of industrial activity),
- The use and management of chemicals or raw products at the facility and the likelihood that storm water discharge from the site will be contaminated; and
- The size and location of the facility in relation to sensitive watersheds

6.3.3.2 Developing Procedures

This program component should describe the specific steps that the municipality will take if it identifies a waste handling site or priority industrial facility when preparing the Part 2 application or during the permit term [§122.26(d)(2)(iv)(C)(*1*), printed in the box above]. The proposed management program must include procedures for inspecting priority industrial sites. The results of inspection may be used as a basis for requiring storm water management controls and enhanced pollution prevention measures. It should also establish an inspection schedule for each priority facility at the time it is identified

Applicants may want to consider establishing prior notification procedures The applicant will need to evaluate the legal authority it has over priority facilities to determine if prior notification is required This is another example of how EPA expects the different components of the application process to be linked In this instance, the Adequate Legal Authority section is tied directly to the prior notification procedure of the inspection and evaluation component of the proposed management plan

Applicants also should consider developing inspection documents such as standard forms or checklists for recording observations Forms and checklists can be used to identify high risk areas of priority facilities and to make comparisons among sites When characterization data or baseline estimates are factored into the evaluation process, the effectiveness of pollution prevention activities at a particular site could be quantified and compared to similar sites Other procedures that applicants should describe to effectively incorporate inspections as well as establish and implement control measures for these types of discharges can be derived from monitoring data

Applicants also should describe a procedure for conducting follow-up inspections, where necessary, as part of this program component For example, follow-up inspections might be needed to verify the installation of a specific control or implementation of a practice specified in a negotiated agreement between the municipality and the industrial site A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants should link these procedures with information from the *Source Identification* and *Discharge Characterization* components

6.3.3.3 Establishing and Implementing Controls

A municipality must consider if it should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water permit [§122 26(d)(2)(iv)(C)(1) printed in box above] Usually, the municipality will not need to impose controls beyond those required in the industrial facility's NPDES storm water permit (for more information on appropriate controls, refer to *Storm Water Management for Industrial Activities, Developing Pollution Prevention Plans and Best Management Practices*, EPA 832-R-92-006, September, 1992)

However, nothing in the Federal regulations would prohibit the municipality from requiring additional controls beyond the permit requirements for industrial activities For this reason, EPA recommends that municipal applicants incorporate a provision in the proposed storm water management program that allows the municipality to require priority industrial facilities to implement the controls necessary for the municipality to meet its permit responsibilities

Finally, the applicant should suggest procedures for requiring pollutant control measures in runoff from priority industrial facilities Applicants should provide information to the industrial facilities that discharge to the MS4s and industry-specific guidance on appropriate control measures that industries discharging to their systems should follow (WDOE, 1991).

Priority industrial facilities should focus on controlling activities such as the use, storage, and handling of toxic chemicals Standard methods for implementing control measures at different types of facilities should be described To facilitate this, municipalities should obtain copies of the pollution prevention plans developed by industrial permittees Control measures that the municipality may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators Applicants should provide a schedule for setting up this program component at priority industrial facilities. The schedule should include educational services for industrial site operators and technical BMP guidance, training courses, videos, workshops, and seminars for plan reviewers, inspectors, contractors, and developers

6.3.3.4 Inspection and Monitoring

The proposed management program should describe the inspection procedures that will be followed Storm water inspections can be coupled with inspections for other purposes (e.g., pretreatment programs, fire and safety) Proposed management programs should address minimum frequency for routine inspections. For example, how often, how much of the site, and how long an inspection may take are appropriate to explain in this proposed management program component Applicants should also describe procedures for conducting inspections and provide an inspector's checklist

In addition these inspection procedures should identify the minimum number of inspectors that will be employed and describe

the programs to train them For example, if the number of inspectors is expected to increase over the term of the permit, it should be noted in the proposed management program. Also, if storm water inspections are combined with other program inspections, means of cross-training inspectors and coordinating schedules should be outlined

Municipalities are urged to evaluate pollution prevention plans and discharge monitoring data collected by the industrial facility to ensure that the facility is in compliance with its NPDES storm water permit Site inspections should include (1) an evaluation of the pollution prevention plan and any other pertinent documents, and (2) an on-site visual inspection of the facility to evaluate the potential for discharges of contaminated storm water from the site and to assess the effectiveness of the pollution prevention plan. A municipality could begin the inspection process with information from the facility's notification to the municipality, which should have been submitted by May 15, 1991. Industrial facilities must also submit an individual NPDES permit application, participate in a group storm water permit application, or file a Notice of Intent (NOI) to be covered by a general permit to the NPDES permitting authority Section 308 of the CWA provides the legal authority for any individual (including a municipality) to obtain information from the NPDES permitting authority

The proposed management program also must include a description of a monitoring program for storm water discharges associated with industrial facilities [§122.26(d)(2)(iv)(C)(2)]

The monitoring program should describe the framework and rationale for selecting monitoring sites Sites that may be appropriate for monitoring include locations with several upstream industrial facilities, industrial facilities that are representative of a significant number of similar facilities, and priority industrial sites with significant potential for high levels of pollutants in their storm water discharges The description of the proposed

§122.26(d)(2)(iv)(C)(2) [The application must describe] a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of qualitative data on the following constituents any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).

monitoring program should address how the monitoring data will be used and what the frequency of the monitoring will be.

Identifying who will actually conduct the monitoring (e g , industry or municipality) is appropriate to include in the program description. Linking this element of the monitoring program to the Adequate Legal Authority section of the permit application is vital The legal authority to require monitoring should prescribe the specific monitoring protocols required elsewhere in the regulation [§122 26(d)(2)(i)(F)]. Applicants should describe proposed procedures for monitoring industrial facilities, including methods for determining parameters to be sampled throughout the term of the permit **At a minimum, parameters that must be considered for monitoring include**

- Any pollutant limited in effluent limitations guidelines for the subcategory of industry;
- Any pollutant that is controlled in a NPDES permit for the process discharge from an industrial site,
- Oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen; and

- Certain pollutant(s) known or suspected to be in the discharge, based on §122.21(g)(7)(iii) and (iv) (Section 5.3).

If a municipality believes (based on the results of monitoring and inspections) that an industrial facility is not meeting its NPDES permit requirements, the municipality should petition the NPDES authority to either require the facility to change its pollution prevention plan or institute an enforcement action. Municipalities may also file citizen suits under CWA Section 505 to enforce the conditions of the NPDES permit.

6.4 STRUCTURAL CONTROLS

6.4.1 Description of Structural Controls

Applicants are required to identify the location of major structural controls for storm water (retention basins, detention basins, major infiltration devices, etc.) in Part 1 of the application [§122.26(d)(1)(iii)(B)(5)]. In Part 2, applicants must describe additional controls that they plan to implement [§122.26(d)(2)(iv)]. The controls must address the activities described in Section 6.3. In addition, the applicant must describe maintenance procedures [§122.26(d)(2)(iv)(A)(1), discussed in Section 6.4.2]. Later, when the municipality submits its annual report, it will have to report on its progress in implementing these controls [§122.42(c)(1), discussed in Section 7.3 of this guidance].

The matrix in Exhibit 6-3 provides information on commonly used structural and source control BMPs. Structural practices to control urban storm water runoff rely on three basic mechanisms: **detention, infiltration,** and filtration. More detailed technical information about source controls (particularly in the selection of structural BMPs) is available in the technical BMP manuals (MWCOG, 1991, Schueler, 1987, WDOE 1991; and EPA 1990c). The following summary of structural and source control BMPs draws extensively from those manuals.

Applicants should note that CWA Section 404 permits may be required for some structural controls, including any control projects that involve the discharge of dredged or fill material into waters of the United States, including wetlands. States may also require permits that address water quality and quantity. To the extent possible, municipalities should avoid locating structural controls in natural wetlands. Before considering siting of controls in a natural wetland, the municipality should demonstrate that it is not possible or practicable to construct them in sites that do not contain natural wetlands, and that the use of other nonstructural or source controls are not practicable or as effective. In addition, impacts to wetlands should be minimized by identifying those wetlands that are severely degraded or that depend on runoff as the primary water source. Moreover, natural wetlands should only be used in conjunction with other practices, so that the wetland serves a "final polishing" function (usually targeting reduction of primary nutrients and sediments). Finally, practices should be used that settle solids, regulate flow, and remove contaminants prior to discharging storm water into a wetland.

Another concern for siting controls is the possible adverse effect that infiltration and detention controls may have on ground water. This issue is addressed in more detail in Section 7.2.3.

Exhibit 6-3
Structural Controls Matrix

CONTROL AND MAINTENANCE REQUIREMENTS	ADVANTAGES	DISADVANTAGES
Extended Detention Dry Basin • Periodic mowing • Regular debris removal • Sediment removal annually	• Provides peak flow control • Possible to provide good particulates removal • Can serve large development • Requires less capital cost and land area when compared to wet basin • Does not usually release warmed or oxygen-depleted water downstream • Protects against downstream channel erosion • Can create valuable wetland and meadow habitat when properly landscaped	• Low removal rates for soluble pollutants • Generally not feasible for drainage areas less than 10 acres • If not adequately maintained, can become a nuisance; (becomes unsightly, breeds mosquitos, and creates undesirable odors) • Periodic mowing and maintenance can be detrimental to nesting birds or other animals inhabiting the area
Vegetative Filter Strip • Inspection • Fertilizer use if necessary to maintain stable vegetation	• Low maintenance requirements • Can be used as part of the runoff conveyance system to provide pretreatment • Can reduce particulate pollutant levels in areas where runoff velocity is low to moderate • Enhances urban wildlife habitat diversity • Economical	• May concentrate water, significantly reducing effectiveness • Soluble pollutant removal highly variable • Limited feasibility in highly urbanized areas where runoff velocities are high and flow is concentrated • Requires periodic repair, regrading, and sediment removal to prevent channelization • Maintenance can be detrimental to nesting birds or other animals inhabiting the area • Fertilizer use can lead to higher nutrient loadings in storm water runoff
Grassed Swale • Periodic mowing • Fertilizer use if necessary to maintain stable vegetation	• Requires minimal land area • Can be used as part of the runoff conveyance system to provide pretreatment • Can provide sufficient runoff control to replace curb and gutter in single-family residential subdivisions and on highway medians • Economical and aesthetically pleasing	• Low pollutant removal rates • Leaching from culverts and fertilized lawns may actually increase the presence of trace metals and nutrients • Fertilizer use can lead to higher nutrient loadings in storm water runoff

Exhibit 6-3 (continued)
Structural Controls Matrix

CONTROL AND MAINTENANCE REQUIREMENTS	ADVANTAGES	DISADVANTAGES
Porous Pavement • Routine removal of fine particles from surface • May need weight limit of traffic imposed for protection	• Provides ground water recharge • Provides water quality control without additional consumption of land • Can provide peak flow control • High removal rates for sediment, nutrients, organic matter, and trace metals • When operating properly can replicate pre-development hydrologic conditions • Eliminates the need for storm water drainage, conveyance, and treatment systems off-site	• Requires regular maintenance • Possible risks of ground water contamination • Only feasible where soil is permeable, of sufficient depth to bedrock and water table, and gentle slopes are present • Not suitable for areas with high traffic volume or heavy vehicles • Need extensive feasibility tests, inspections, and very high level of construction workmanship • High failure rate due to clogging • Not suitable to serve large offsite pervious areas • Limited use in snowy climates where sanding and salting operations occur
Concrete Grid Pavement • Periodic mowing, if planted	• Provides peak flow control • Provides ground water recharge • Provides water quality control without additional consumption of land	• Requires regular maintenance • Not suitable for area with high traffic volume • Possible risk of contaminating ground water • Only feasible where soil is permeable, of sufficient depth to bedrock and water table, and gentle slopes are present
Filtration Basin • Periodic vacuuming and power washing	• Ability to accommodate moderately large-sized development (3-80 acres) • Flexibility to provide or not provide ground water recharge • Can provide peak volume control	• Requires pretreatment of storm water through sedimentation to prevent filter media from premature clogging

Exhibit 6-3 (continued)
Structural Controls Matrix

CONTROL AND MAINTENANCE REQUIREMENTS	ADVANTAGES	DISADVANTAGES
Wet Retention Basin • Periodic dredging, preferably from forebay area, if properly designed • Mowing of impoundment to prevent successional growth	• Provides peak flow control • Can serve large developments; most effective for large, intensively developed sites • Enhances species diversity, aesthetics, and provides recreational benefits • Little ground water discharge • Permanent pool in wet ponds helps prevent scour and resuspension of sediments • Provides moderate to high removal of both particulate and soluble pollutants	• Generally not feasible for drainage area less than 10 acres • Potential for safety and liability issues if not properly built and maintained • If not adequately maintained, can become a nuisance; (becomes unsightly, breeds mosquitos, and creates undesirable odors) • Requires considerable space, which limits use in densely urbanized areas with expensive land and property values • Not suitable for hydrologic soil groups "A" and "B" (SCS classification) • Potential for thermal discharge and oxygen depletion, which may severely impact downstream aquatic life
Extended Detention Wet Basin • Periodic dredging of sediment forebay	• Provides peak flow control • Can serve large developments; most effective for large, intensively developed sites • Enhances species diversity, aesthetics, and provides recreational benefits • Permanent pool in wet ponds helps prevent scour and resuspension of sediments • Provides better nutrient removal than traditional wet basin	• Not feasible for drainage area less than 10 acres • Potential for safety and liability issues if not properly built and maintained • If not adequately maintained, can become a nuisance; (becomes unsightly, breeds mosquitoes, and creates undesirable odors) • Requires considerable space, which limits use in densely urbanized areas with expensive land and property values • Not suitable for hydrologic soil groups "A" and "B" (SCS classification) • Potential for thermal discharge and oxygen depletion, which may severely impact downstream aquatic life

Sources Modified from MWCOG, 1991, Schueler 1987, and WDOE, 1991

6.4.1.1 Detention Controls

Detention controls temporarily store storm water runoff to control peak runoff rates and provide a reduction in pollutant concentrations by the gravitational settling of suspended solids and associated contaminants Except for incidental losses due to evaporation or percolation, essentially all the detained water is subsequently discharged to a surface water conveyance (e.g., a stream or MS4). The most common examples of detention practices are extended detention basins and wet (retention) basins

Variations on these basic detention controls include constructed storm water wetlands and multiple pond systems These types of controls also rely on detaining flows (leading to sedimentation) as the primary means of pollutant removal Recent investigations suggest that wetlands vegetation within a detention control can also reduce nutrient loads and certain other pollutants by incorporating them into plant tissue

If properly designed, detention controls can protect downstream channels by reducing the frequency of bankfull flood events and associated erosion Reduction in velocity and sediment load is also important for minimizing the adverse impacts of discharges to MS4s Detention facilities also can provide terrestrial and aquatic wildlife habitat if they are landscaped and planted appropriately

When considering detention controls, the municipality should consider the potential negative effects of downstream warming that may be caused by the shallowness of the water in the control The municipality should also consider negative impacts of detention controls, such as reduced baseflow; bacterial contamination due to waterfowl, and potential impacts to wildlife from concentrated contaminants, waterfowl diseases, and maintenance practices Safety and liability issues and nuisance factors, such as mosquitoes and odor, also should be considered. Setting detention controls in sensitive floodplains or in existing wetlands should generally be avoided. The flooding effect of impounding and detaining water is a particular concern if the upstream watershed drains more than 250 acres, because the volume of runoff and required detention times can cause inundation of upstream channels to occur.

Detention controls incorporating multiple pond systems and/or constructed storm water wetlands also treat runoff through the processes of absorption, filtration, biological uptake, volatilization, precipitation, and microbial decomposition. Recent investigations by the Metropolitan Washington Council of Governments suggest that multiple pond systems, in particular, have shown potential to provide higher and more consistent levels of treatment than traditional detention controls The redundancy afforded by the multiple pond system generally increases the reliability of the control. However, the potential concerns and drawbacks affecting retention basins also apply to these systems Many of these systems are currently being designed to include vegetative buffers and deep water areas to enhance wildlife habitat and to improve the appearance of the facility If a municipality selects one of these more innovative designs, it should recognize that periodic maintenance is necessary The effectiveness of these controls, like most controls, depends on proper operation, maintenance, and monitoring of the entire system

Wet (Retention) Basins

Wet (retention) basins are designed to maintain a permanent pool of water and temporarily store storm water runoff until it is released at a controlled rate Unlike extended detention ponds, wet basins cannot detain runoff for long times, because most of their storage capacity is needed for holding the permanent pool Enhanced designs include a forebay to trap incoming sediment where it can be easily removed A fringe wetland also can be established around the perimeter of the basin Similar to detention controls, locating

retention basins in sensitive floodplains or existing wetlands should be avoided if possible

Extended Detention Basins

Extended detention basins temporarily detain a portion of storm water runoff for 24 to 48 hours after a storm, gradually releasing the stored water through a fixed opening to allow urban pollutants to settle out. The basins normally return to a "dry" condition between storm events and do not have any permanent standing water. These basins are typically composed of two stages: an upper stage, which remains dry except during larger storms, and a lower stage, which is designed for typical storms. Pollutant removal from extended detention basins can be enhanced if they are equipped with plunge pools near the inlet, a micropool at the outlet, and an adjustable reverse-sloped pipe as the extended detention control device.

Water Quality Inlets

Water quality inlets (also referred to as catch basins) are small underground systems that, like retention basins, rely on settling to remove pollutants before discharging water to the MS4. Several designs of water quality inlets exist. In their simplest form, catch basins are single-chambered storm water inlets with the bottom lowered to provide 2 to 4 feet of additional space between the outlet pipe and the bottom of the structure for collection of trash and sediment. Some water quality inlets include a second chamber with a sand filter to provide additional removal by filtration The first chamber provides effective removal of coarse particles and helps prevent premature clogging of the filter media.

Water quality inlets may include an oil/grit separator. There are 3 basic types of oil/grit separators the spill control (SC), the coalescing plate interceptor (CPI), and a design credited to the American Petroleum Institute (API). Most of the oil/grit separators that are promoted for use in reducing hydrocarbon loads in storm water are a modification of the API design, although there are appropriate applications for all three separator designs. Oil/grit separators based on the API design consist of three chambers. The first chamber removes coarse material and debris. The second chamber provides separation of oil, grease, and gasoline from the storm water runoff; and the third chamber provides a safety relief should a blockage occur.

Recent experiences have shown that, because of their volume limitations, oil/grit separators have limited pollutant removal effectiveness. They are perhaps the best example of a structural control that is only effective with frequent maintenance. Proper disposal of the standing water, trapped sediments, and floating hydrocarbons are problems in the few locations that have been studied.

Constructed Storm Water Wetlands

Constructed storm water wetlands are a hybrid, drawing on elements of detention and retention basins. Constructed storm water wetlands are shallow pools and are often designed to simulate the pollutant removal functions of natural wetlands. Enhanced designs may include a sediment forebay, carefully contoured topography, and multiple species of wetland plants. Constructed storm water wetlands, while a promising technology for pollutant removal from storm water, may not replicate all the ecological functions of natural wetlands.

6.4.1.2 Infiltration Controls

Infiltration controls rely chiefly on absorption to treat storm water discharges. In the ideal case, storm water percolates through a porous medium and into native soils where filtration and biological action remove pollutants Typical controls of this type include infiltration trenches, infiltration basins, filtration basins, porous pavement, and concrete or block pavers. Systems that rely on soil absorption work best in deep, highly permeable soils that

are at least four feet away from the seasonal ground-water table.

The Soil Conservation Service (SCS) classifies soils into four major soil groups A-D. The soil groups are as follows:

Group A: Sand, loamy sand
Group B: Sandy loam, loam
Group C: Silt loam, sandy clay loam
Group D: Clay loam, silty clay loam, sandy clay, silty clay, and clay

Soils in Group A provide the highest infiltration rate while soils in Group D provide the lowest Suitable soils for infiltration-type controls typically fall in soil groups A and B. Other types of soils may be suitable, provided the clay content does not exceed 30 percent (clay has very low hydraulic conductivity). The clay content of soil may be determined from the SCS soil textural triangle, which can be found in many civil engineering references texts

If suitable soils are available, the widespread use of infiltration in a watershed can be useful in helping to maintain, restore, or replicate pre-development hydrology. Specific benefits of infiltration often include increased dry-weather baseflow in streams and a reduction in the frequency of bankfull floods. However, infiltration systems are not recommended unless soil conditions warrant. Also, infiltration should not be used where ground water requires protection. For example, the use of infiltration-type controls may not be appropriate in areas that recharge sole source aquifers.

Infiltration Basins

Infiltration basins are areas that intercept incoming storm water runoff and temporarily store it until it gradually infiltrates into the soil surrounding the basin. Infiltration basins should be designed to control drainage areas ranging from about 5 to 50 acres. They also should drain within 48 to 72 hours to maintain aerobic conditions favoring bacteria that aid in pollutant removal, and to ensure that the basin is ready to receive the next storm The runoff entering the basin is usually pretreated to remove coarse sediment that may clog the surface soil pores on the basin floor. Concentrated runoff may flow through a sediment trap or by sheet flow (vegetative filter strip).

Infiltration Trenches

Infiltration trenches are shallow (e.g., 2 to 10 feet deep) excavated ditches or vaults that have been backfilled with a coarse stone aggregate. The aggregate forms an underground reservoir that has approximately 40 percent void space. Storm water runoff diverted into the trench gradually infiltrates from the bottom of the trench into the subsoil and eventually into the ground water. Variations in the design of infiltration trenches include dry wells and percolation pits that are designed to control small volumes of runoff, such as the runoff from a rooftop A more complex variation is the enhanced infiltration trench, which is equipped with filter fabric or a more extensive pretreatment system to remove sediment and oil. Depending on the quality of the runoff, pretreatment may be necessary to lower the failure rate of the trench. Infiltration trenches are generally best suited for drainage areas of less than 10 acres They are particularly applicable for use on residential lots, small commercial areas, down slope from parking lots, and under drainage swales.

Grassed Swales

A grassed swale is an infiltration method that is usually used as a form of pretreatment before discharging runoff to another storm water control device (e.g., a detention basin) However, the grassed swale itself is a control that can remove significant amounts of pollutants through sediment entrainment A grassed swale is a shallow, vegetated, man-made ditch with the bottom elevation above the water table to allow runoff to infiltrate into the ground water. The vegetation helps to

prevent erosion, filters sediment, and allows for some uptake of nutrients.

Porous Pavement

Porous pavement, which is basically traditional asphalt aggregate without the fine particles, is an alternative to conventional pavement. Proper design and application of this control can reduce or eliminate the need for curbs and gutters, storm drains and sewers, and offside controls. Instead, runoff is diverted through a porous asphalt layer into an underground stone reservoir. The stored runoff gradually exfiltrates out of the stone reservoir into the subsoil. Soil considerations are important when evaluating the appropriateness of this control. Generally, grades should be gentle, and subsoil should be at least 3 feet thick (to bedrock) and moderately permeable (capable of infiltrating about one half inch per hour). Because porous pavement tends to clog with fine sediments and because it loses its effectiveness under heavy loads, its application should generally be limited to low-traffic areas (e g., overflow parking areas) and areas that are not exposed to large bearing loads caused by heavy vehicles

Concrete Grid Pavement

Concrete grid pavement has concrete blocks with regularly interdispersed void areas that are filled with pervious materials, such as gravel, sand, or grass The blocks are typically placed on a sand or gravel base. They are usually designed to provide a load-bearing surface adequate for supporting vehicles, while allowing infiltration of surface water into the underlying soil

6.4.1.3 Filtration Controls

Filtration controls treat storm water flows by using vegetation or sand to filter and settle pollutants Generally, these controls are most effective before the flows become concentrated (e g sheet flow) In certain instances, infiltration and treatment in the subsoil also may occur through the processes of absorption and adsorption After passing through the filtration media, the treated water is usually directed to a stream or MS4, although it may be evaporated or percolated into the ground Filtration controls include filter strips, grass swales, and sand filters Sand filters are particularly useful for ground water protection Applicants must consider the influence of climate when they select vegetative systems

Vegetative Filter Strips

Vegetative filter strips (also called bio-filters) are vegetated sections of land designed to accept runoff as overland sheet flow from upstream development They may adopt any natural vegetated form, from grassy meadow to small forest. The dense vegetative cover facilitates sediment reduction and pollutant removal Filter strips cannot treat high-velocity flows Therefore, these strips generally have been recommended for use in agriculture and low-density development and other situations where runoff does not tend to be concentrated Unlike grassed swales, filter strips are effective only for overland sheet flow, as opposed to concentrated flow Grading and level spreaders can be used to reduce the energy of concentrated flows and distribute the runoff evenly across the filter strip Vegetative filter strips are often used as pretreatment for other structural practices, such as infiltration trenches Leaving a buffer of natural vegetation along an urban stream valley is an example of a vegetative filter strip and also an example of a nonstructural control

Filtration Basins

Filtration basins are usually small impoundments lined with filter media, such as sand or gravel Storm water drains through the filter media and perforated pipes into the subsoil For optimal pollutant removal, recommended detention times range from 24 to 48 hours with a maximum drainage area of about 50 acres Grassed swales or other structural controls can be used to filter coarse sediments and thereby minimize clogging of the filter medium

6.4.2 Maintenance Activities

After summarizing the location of major structural storm water controls, applicants must submit a description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants.

> §122.26(d)(2)(iv)(A)(1) [The application must include a] description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers.

Typical maintenance requirements include:

- Inspection of basins and ponds after every major storm for the first few months after construction and annually thereafter,
- Mowing of grass filter strips and swales at the frequency necessary to prevent woody growth and promote dense vegetation,
- Regular removal of litter and debris from dry ponds, forebays, and water quality inlets,
- Periodic stabilization and revegetation of eroded areas,
- Periodic removal and replacement of filter media from infiltration trenches and filtration ponds,
- Deep tilling of infiltration basins to maintain infiltrative capability, and
- Frequent vacuuming or jet hosing of porous pavement or concrete grid pavements

Lack of maintenance often limits the effectiveness of storm water structural controls such as detention/retention basins and infiltration devices. Maintenance programs should address measures for catch basins and drainage channels in addition to major structural controls

The proposed program should provide for maintenance logs and identify specific maintenance activities for each class of control, such as removing sediment from retention ponds every five years, cleaning catch basins annually, and removing litter from channels twice a year. If maintenance activities are scheduled infrequently, inspections must be scheduled to ensure that the control is operating adequately. In cases where scheduled maintenance is not appropriate, maintenance should be based on inspections of the control structure or frequency of storm events If maintenance depends on the results of inspections or if it occurs infrequently, the applicant must provide an inspection schedule. The applicant should also identify the municipal department(s) responsible for the maintenance program.

Municipalities should use caution in adopting controls that do not have sufficient history of use for their performance characteristics and maintenance requirements to be adequately evaluated A good example is the oil/grit separator used on small commercial or retail sites Some municipalities have required the use of these technologies, but due to poor performance, municipalities have often rescinded the requirement. In these cases, it is not clear whether the control technology was ineffective or the maintenance program was flawed

Because maintenance is critical to successful program implementation, it must be considered throughout the term of the permit Applicants may wish to develop a matrix that identifies maintenance tasks on a timeline indicating criteria for inspection, repair, and replacement PERT charts, GANT charts, or other critical path analyses (available for personal computers) can help organize a maintenance program and schedule. For a summarized

listing of appropriate maintenance activities and schedules refer to the matrix in Exhibit 6-3.

6.4.3 Considerations for Planning and Siting Controls

The storm water management program should describe the criteria used to identify that a particular structural control is warranted and the circumstances under which it will be required. The possibilities for new control sites should be evaluated for their storm water quality control potential. Guidelines and performance standards that identify specific structural controls for new development should be proposed in the procedures for new development. From this evaluation, priorities based on the feasibility of implementing a particular control at a given location can be determined.

6.4.3.1 Use of Municipal Lands

Applicants should discuss existing major structural controls and sites that have the potential for new structural controls which could be installed on municipal lands and other major rights-of-way (e g , major roads and highways) Note that existing controls are identified in Part 1 applications [(§122 26(d) (1)(iii)(B)(5)] The location of publicly owned parks, recreational areas, and other open areas are also identified [§122 26(d)(1)(iii)(6)]

To determine what storm water quality controls are necessary for public lands and facilities, current activities and functions that may affect the quality of storm water discharges should be identified Such activities and functions include parks, trails, and other recreational land uses, road maintenance and snow management, and storage and repair yards/shops for municipal vehicles An inventory of public land uses may be necessary to help make determinations of what controls are needed An effective inventory should involve coordination among all of the local departments and agencies that have authority over the use of public lands and facilities

Opportunities for controlling storm water quality problems that are identified through the inventory process can be evaluated on a site-specific basis and included in the proposed management program

There are several benefits to the establishment of structural controls on municipal lands:

- Municipal lands often provide greater retrofit opportunities because they typically do not require additional property purchases;
- Municipal lands ensure opportunities to provide future maintenance and security in preservation of the retrofit control,
- Applicants may be able to adapt existing municipal functions (such as industrial pretreatment program implementation, fire-safety inspections, and flood-control activities) to address storm water quality concerns (Expanding their mission to address storm water concerns may be more cost-effective than initiating entirely new programs.),
- Applicants may be able to adapt functions of development on municipal lands (such as planning, zoning, and construction oversight functions), and
- After considering controls on municipal lands, the applicant will be in a better position to address the private land under its jurisdiction

As a precaution, however, applicants need to consider potential conflicts arising over the multiple use of public lands Criteria other than land ownership (e g , locating controls downstream of developed areas) also should be considered when deciding where to locate storm water runoff controls

6.4.3.2 Use of Private Lands

A municipality also may incorporate storm water quality controls into its land use plan to indicate controls that may be necessary for new development Some of the best opportunities to prevent pollution and to implement effective storm water quality controls occur during development Local governments typically play a strong role in overseeing new development and have, or can adapt, administrative infrastructure to address storm water quality concerns.

The storm water management process should begin with land use planning and zoning and continue through the development and redevelopment processes. Municipalities generally can obtain commitments from land developers more easily prior to relinquishing jurisdictional leverage over the parcel where the potential control is to be located Leverage can be achieved through plan approval or zoning changes The negotiation process for the dedication, condemnation, or other acquisition of land and the process for getting the land developer to construct or otherwise implement controls will vary dramatically among municipalities, particularly among those in different States

Source and structural controls are most cost-effective when development is planned with storm water quality controls in mind However, it is probably more appropriate for the municipality to propose a flexible plan that specifies a variety of program objectives through the development process rather than identifying a certain priority and rigid schedule Other benefits of early and flexible planning include ecological diversity, wetlands preservation, and the creation of controls that also function as amenities Comprehensive land use plans zoning ordinances, and subdivision ordinances are important mechanisms to implement these controls early in the development process Consideration of storm water quality during pre-development is one of the most effective ways to implement controls This is because the maximum flexibility (and opportunity) to incorporate BMPs exists prior to final land use decisions and construction activities (see Section 6.3 1 1)

6.4.3.3 Siting Considerations

Imperviousness

The degree of imperviousness affects the concentration of pollutants in storm water, which in turn affects the type of structural controls that may be necessary. As the imperviousness of an area increases, the runoff volume and the pollutant loading increase. Studies show that runoff from industrial areas, which generally have a high degree of imperviousness, can have a wider variety and greater concentration of pollutants than runoff from other land uses Recent studies also indicate that the degree of imperviousness can be inferred from the level of degradation in urban receiving streams (For example, see Schueler 1991 and Klien 1979) Population projections will not indicate the degree to which industrial land use will increase unless planning and zoning information is also considered

Soil Conditions

Controls designed to infiltrate storm water will be affected by site specific soil conditions For example, clay content of the soil and the antecedent moisture content (degree of soil saturation at the time of a given storm event) will strongly influence the effectiveness, and therefore the applicability, of infiltration controls for a given location

6.5 PROGRAM AND SCHEDULE TO DETECT AND REMOVE ILLICIT DISCHARGES AND IMPROPER DISPOSAL

NPDES permits for discharges from MS4s require effective detection and removal from the MS4 of illicit or improper discharges and disposal

§122 26(d)(2)(iv)(B) [The application must include a] description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer

The NURP study concluded that the quality of urban runoff can be adversely impacted by illicit connections and illegal dumping. Often, large amounts of wastes, particularly used oils, are improperly disposed of in storm sewers. Elimination of these sources of pollutants would result in a dramatic improvement in the quality of storm water discharges from MS4s. Procedures to eliminate such discharges should be an important part of the proposed management program.

The regulatory requirement cited above is intended to directly implement the mandate of Section 402(p)(3)(B)(ii) of the CWA, which requires permits for MS4s to effectively prohibit non-storm water discharges into storm sewers In certain instances, the most appropriate action will be for the municipality to ensure that illicit discharges become covered by a NPDES permit However, in most cases, elimination of illicit discharges or improper dumping is the appropriate focus of this program component The quality of storm water runoff from inner-city core areas, particularly in older parts of the country, would benefit most from this component

The applicant should propose a schedule for implementing this program component throughout the initial permit term This schedule should reflect the priorities identified by the municipality during the application process and be based on the problems particular to the specific MS4

6.5.1 Prohibiting Illicit Discharges

The proposed management program must include a description of inspection procedures, orders, ordinances, and other legal authorities necessary to prevent illicit discharges to the MS4.

§122.26(d)(2)(iv)(B)(1) [The application must include a] description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States . . . . *[these sources are listed in the guidance].*

This proposed management program component also should describe how the prohibition on illicit discharges will be implemented and enforced. The description should include a schedule and allocation of staff and resources A direct linkage should exist between this program component and the adequate legal authority requirements for the ordinances and orders to effectively implement the prohibition of illicit discharges

While this program component is required to prohibit all types of illicit discharges, the following categories of non-storm water discharges need only be prohibited by the MS4 when they are identified by the MS4 as sources of pollutants to waters of the United States:

- Water line flushing
- Landscape irrigation
- Diverted stream flows
- Rising ground waters
- Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to separate storm sewers
- Uncontaminated pumped ground water
- Discharges from potable water sources
- Foundation drains
- Air conditioning condensation
- Irrigation water

- Springs
- Water from crawl space pumps
- Footing drains
- Lawn watering
- Individual residential car washing
- Flows from riparian habitats and wetlands
- Dechlorinated swimming pool discharges
- Street wash water

While EPA does not consider these flows to be innocuous, they are only regulated by the storm water program to the extent that they may be identified as significant sources of pollutants to waters of the United States under certain circumstances. If an applicant knows, for example, that landscape irrigation water from a particular site flows through and picks up pesticides or excess nutrients from fertilizer applications, there may be a reasonable potential for a storm water discharge to result in a water quality impact. In such an event, the applicant should contact the NPDES permitting authority to request that the authority order the discharger to the MS4 to obtain a separate NPDES permit (or in this case, the discharge could be controlled through the storm water management program of the MS4)

The applicant should consider the specific land use, age, and stage of development in this program component. For example, one study in an established metropolitan area found that 60 percent of automobile-related businesses had improper storm drain connections. While some of the problems discovered in this study were the result of improper plumbing or illegal connections to storm drains, the majority of the connections were approved by the municipality when they were built

For problem identification and problem-solving, a municipality may elect to implement a follow-up study that traces identified pollution incidents to their source (e.g , up the system) A variety of pollutant-tracing techniques and field screening can be used to identify illicit discharges

6.5.2 Field Screening

Part 1 of the application requires applicants to submit the results of field screening studies to evaluate the possible occurrence of illicit connections and improper dumping [§122 26(d)(1)(iv)(D)]. Dry weather flows that were encountered during the initial field screening were sampled and analyzed. The analysis was intended to provide information about illicit connections and improper dumping.

In Part 2, applicants are required to propose procedures for continued field screening during the term of the permit.

> §122 26(d)(2)(iv)(B)(2) [The application must include a] description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens

Applicants can propose to use procedures similar to those used for field screening required in Part 1 of the application or they can propose alternative procedures and techniques. The Part 1 field screening requirements are found in §122.26(d)(1)(iv)(D) and are explained in the Part 1 guidance manual

The Part 2 proposed field screening program component should describe areas of the system where the continuation of the field screening program will be conducted and the rationale for selecting these areas For example, the rationale for continuing field screening at a given location might be that a wide variation in results was obtained during the initial screens In addition, the applicant should propose field screening for a portion of any recently-identified major outfalls that were not known to the applicant when it prepared its Part 1 application, provided sampling of these outfalls is safe and practicable

The potential for illicit discharges and improper disposal is generally higher for areas of older development, areas with many automobile-related industries, and areas with significant numbers of heavy industrial facilities Therefore, in most cases applicants should include these areas in the proposed field screening program.

The description of the field screening component should provide a detailed summary of the departmental responsibility for field activities, frequency of inspections, procedures and equipment to be used, and the procedures for documenting field activities, both in the field and in the office. Generally, the Part 2 field screening program should reflect a continuously narrowing process to trace illicit and improper sources.

6.5.3 Investigation of Potential Illicit Discharges

In order to submit a comprehensive proposed management program, applicants are required to describe procedures for investigating portions of the municipal system where field screening or other information indicates a reasonable potential for illicit discharges

> §122 26(d)(2)(iv)(B)(3). [The application must include a] description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium, testing with fluorometric dyes, or conducting in storm sewer inspections where safety and other considerations allow Such description shall include the location of storm sewers that have been identified for such evaluation)

Applicants should propose criteria to identify portions of the system where follow-up investigations are appropriate For example, calculating a frequency distribution of dry weather flows at each screening site could aid in establishing criteria to identify where follow-up investigations are appropriate.

Procedures to investigate priority locations for illicit connections include inspection of the storm sewer system, use of remote-control cameras, on-site inspections and dye-testing at priority or suspect facilities, and additional discharge monitoring to pinpoint pollutant sources. In some cases, these investigations may be coordinated with pretreatment program inspections. Such approaches are summarized in Exhibit 6-4. Coordinating inspections can be a very effective use of resources. For example, portions of the sanitary sewer system that need evaluation to detect illicit discharge may already be undergoing inspection by operators of the municipal treatment plant.

A checklist should be developed for inspectors to use to detect illicit connections. The checklist should be structured to ensure a comprehensive evaluation of the problem and stipulate the use of the easiest and least expensive detection methods first

Regardless of the format in which information is compiled (e.g., table, list, text description), EPA suggests that the applicant prepare a map identifying the location of suspected problem areas. The map should be provided as part of the Part 2 application.

The proposed program component description should describe a step-by-step process to investigate, identify, and prohibit illicit discharges If field screening leads to positive tests of fecal coliform, fecal streptococcus, surfactants, residual chlorine, fluorides, or potassium, a municipality should reconsider whether any of the non-storm water discharges described in Section 6.5.1 are the source (see previous section)

Exhibit 6-4
Sample Illicit Discharge Investigation Procedures Options

Results of Initial Field Screen	Procedures for Detailed Analysis	Comments
Plumbing unidentifiable	Cameras	Effective for identifying deterioration
Uncertain use of facility	On-site inspections	May be combined with other inspections
Several facilities or complex plumbing	Dye-testing	Simple and accurate if system not interconnected
Unusual pollutants	Monitoring	Particularly useful for fingerprinting

6.5.4 Spill Response and Prevention

The proposed management program must describe procedures that the municipality will implement during the term of the permit to prevent, contain, and respond to spills that may discharge into the MS4

> §122.26(d)(2)(iv)(B)(4) [The application must include a] description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer

The municipality and the property owners (and/or operators) of sites where spills may occur need to implement procedures to prevent, contain and respond to spills One way to implement these procedures is to modify the land use planning process and ordinance enforcement Such modifications would require notification and emergency preparedness procedures for any land use activity that could lead to leaks and spills Another method is to coordinate with on-going programs in other regulated areas where detection of spills is important, such as pretreatment and hazardous materials management. The goal of a spill-prevention program is to reduce the frequency and extent of spills of hazardous materials, oils, and other materials which can cause water quality impairment. Spill-containment programs may establish minimum chemical storage and handling requirements, require users to submit prevention and control plans, and ensure site inspections The content of the descriptions that should be submitted with the Part 2 application for each of these program elements is discussed in more detail below

Spill-response programs are intended to reduce risk to the public and the environment Although these programs tend to focus on issues of public health and safety, such as exposure to toxic materials, fires, or explosions, spill-response teams should attempt to prevent or minimize contamination of surface water, ground water, and soil. Spill-response programs often require a coordinated response from a number of municipal departments (e.g., fire, police, health, and public works). Municipalities should describe how response procedures within these programs attempt to mitigate potential pollutant discharges to surface waters

For example, some industrial pretreatment programs specifically require that leaks or spills be routed to the storm sewer rather than the sanitary sewer generally to protect worker health and safety and to protect biological treatment capabilities This issue serves to reinforce the need for coordination between the various municipal programs that are related in some way to storm water.

The proposed program should identify the municipal departments responsible for implementing the program, and also should address employee training, reporting procedures, containment of spills, storage and disposal activities, documentation, and follow-up procedures Generally, the proposed program for spill response and prevention should focus on good housekeeping and materials management practices, which are discussed in more detail below.

One of the initial elements in the development of a successful spill response and prevention program is to assess the potential of various sources at a particular property to contribute pollutants to the storm water discharges from the site This assessment should inventory the land use, types of materials handled, and the location and types of materials management activities. Factors to consider when evaluating the pollution potential of runoff from various portions of a site include those that are likely to lead to the identification of specific structural or nonstructural controls to address problems

Other factors to consider are the toxicity and quantity of any chemicals used, produced, stored, or discharged from the site, the history of any NPDES permit violations from a site, history of significant leaks or spills of toxic or hazardous pollutants, and the designated uses of the receiving waters

This program element should also include a description of storm water management controls that are appropriate for the site that would control or allow for the mitigation of any leak or spill and a proposal to implement such controls. The priorities developed in the implementation proposal should reflect the nature of identified sources of pollutants at the site

The description of spill response and prevention activities should include the steps a municipality will take to prevent, and when necessary, adequately respond to spills discharged to its MS4. The MS4 might identify special training requirements for municipal employees in order to respond to spills of hazardous chemicals from a particular facility into the storm sewer system.

Sources with the greatest potential for spills to occur (or cause the most severe damage) should be identified in the proposed storm water management program If appropriate, specific materials handling procedures and storage requirements should be identified for these sources Requirements for these sources could be modeled after the Spill Prevention, Control, and Countermeasure (SPCC) Plans that are required for certain facilities under Section 311 of the CWA

Under the SPCC program, for example, personnel are trained and given responsibility for inspecting the facility for leaks and spills. These inspections include equipment and materials handling areas, which need to be investigated for evidence of, or the potential for, pollutants entering the drainage system Procedures to ensure the availability of appropriate personnel and equipment for cleaning up spills must be identified A system to ensure that appropriate corrective action has occurred in response to inadequacies identified during the inspection is also established under the program.

Not all of the SPCC program elements may be necessary for municipal applicants However, EPA recommends that the proposed storm water management program describe how the records of inspections will be maintained and made available for investigations of causal factors and program effectiveness Incidents of leaks, spills, and

improper dumping, along with other information describing the quality and quantity of storm water discharges should be included in the records Inspections and maintenance activities, such as containment berm integrity testing or the cleaning of oil/water separators should be documented and recorded in a maintenance log

6.5.5 Public Awareness and Reporting Program

Applicants must propose a management program component that promotes, publicizes, and facilitates public reporting of illicit discharges or water quality impacts associated with discharges from MS4s

> §122 26(d)(2)(iv)(B)(5) [The application must include a] description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers

Timely reporting by the public of improper disposal and illicit discharges are critical components of programs to control such sources.

To enhance public awareness, programs may include setting up a public information hotline number, educating school students, establishing community and volunteer "watchdog" groups (e g , "Adopt-a-Stream Program"), using inserts into utility bills; and newspaper, television and radio announcements to inform the public about what to look for and how to report incidents The public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful storm water management program

6.5.6 Proper Management of Used Oil and Toxics

EPA estimates that annually, 267 million gallons of used oil, including 135 million gallons of used oil from do-it-yourself automobile oil changes, are disposed of improperly An additional 70 million gallons of used oil, most coming from service stations and repair shops, are used for road oiling (55 FR 48056, November 16, 1990). If private individuals find the proper disposal of used oil or toxic materials difficult, incidents of improper disposal increase For example, when a large fraction of service stations do not accept do-it-yourself used oil, improper disposal into the municipal storm sewer rises. Therefore, applicants are required to propose a program component that will facilitate the proper disposal of used oil and toxics from households by establishing municipally operated collection sites, or ensuring that privately-operated collection sites are available.

> §122.26(d)(2)(iv)(B)(6) [The application must include a] description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials

The proposed program should describe outreach plans to handlers of used oil and to the public, and operating plans for oil and household waste collection programs.

Examples of effective public outreach for these types of programs include dedicated municipal phone numbers (e.g , a used oil/toxic materials hotline), pamphlets, and requirements that oil retailers post the location of the nearest used oil collection facility. Programs can also inform the public about alternatives to toxic materials. Catch basin/storm sewer inlet stenciling programs can also be proposed as part of the program to increase public awareness of the connection between storm sewers and local water resources

6.5.7 Infiltration of Seepage

In order to effectively complete this portion of a proposed management plan, the applicant must describe controls to limit infiltration of seepage from municipal sanitary sewers to MS4s, if necessary.

> §122.26(d)(2)(iv)(B)(7). [The application must include a] description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary.

Raw sewage can seep from sanitary sewage collection systems through leaks and cracks in aging pipes, poorly constructed manholes and joints, and main breaks. Sewage from a leaky sanitary system can flow to storm sewers or contaminate ground water supplies. Interaction between sanitary sewers and separate storm sewers may occur at manholes and where sanitary sewer laterals and storm sewer trenches cross. Separate storm sewers and sanitary sewers may share the same trench, which is generally filled with very porous material such as gravel.

One indication of seepage from a sewage collection system may be infiltration of water. Often, the rate of exfiltration (seepage) from sanitary collection systems is significantly greater than the rate of infiltration into the system. An EPA study on sewer exfiltration found significant ratios of the rate of exfiltration of sewage to the rate of infiltration of ground water or storm water into sanitary sewers. Field and laboratory results found this ratio to vary between 1.5 to 1 and 14 to 1.

In some cases, preventive maintenance surveys or on-going infiltration and inflow (I&I) programs to determine where water is entering a sanitary sewer system may be modified to locate the source and fate of exfiltration from the system

Identifying infiltration of seepage into a MS4 is a good example of the need for various municipal functions to be effectively coordinated. Proposed storm water management programs might discuss how personnel responsible for inspections of the sanitary sewer system could inspect for sources of exfiltration during I&I inspections, and pass any findings to personnel responsible for maintaining the MS4. If seepage is believed to be a problem, a coordinated effort with the maintenance department of the municipal sanitary sewer system is recommended.

The proposed storm water management program also should include provisions to address the discovery of previously unknown problems. There should be procedures to enact a coordinated program between the operators of the storm sewer and sanitary sewer (which in many cases will be within the same municipal agency or department).

EPA recommends that the proposed storm water management program describe controls that will be used to address seepage from malfunctioning septic systems in areas not served by a sewage treatment works. Malfunctioning septic systems may lead to more significant surface runoff pollution problems than ground water problems. A malfunctioning septic system is less likely to cause ground water contamination where an impervious bacterial mat in the soil retards the downward movement of wastewater. (Poorly located septic systems that are operating properly are the greatest threat to ground water).

Surface malfunctions of septic systems are caused by clogged or impermeable soils, or when stopped up or collapsed pipes force untreated wastewater to the surface. Surface malfunctions can vary in degree from occasional damp patches on the surface to constant pooling or runoff of wastewater to a storm sewer. An improper remedy for a surface malfunction is to install a pipe or trench over soil absorption systems to route untreated overflow away from the septic

system. This results in direct discharges to drainage ditches, empty lots, or surface waters

Proper controls range from prescribing maximum intervals between tank pump-out to the installation of sand filters. Discharge from sand filters to surface waters may require a separate NPDES permit, because such discharge is not storm water.

Additional information about the most appropriate controls for use in correcting malfunctioning septic systems is probably best obtained from local or regional sources. Organizations such as extension services, soil and water conservation districts, and planning agencies may be good sources of information about methods that have been successful (and also those that have failed).

By obtaining this type of information, the applicant can determine what control techniques have been successful in correcting malfunctioning septic systems in similar types of soils The value of this approach is that the applicant will know that a certain control technique has been used to correct a malfunctioning septic system in the same types of soils that occur in the municipality. Where only part of the MS4 drainage area is served by septic systems, proposed programs should address setting and maintenance of septic systems, including draft requirements and implementation procedures.

6.6 SIGNATORY AND CERTIFICATION REQUIREMENTS

Under the Federal NPDES regulations [§122 22(a)], all NPDES permit applications (including municipal storm water permit applications) must be signed by an authorized person, as defined in the regulations Permit applications submitted by a municipality, State, Federal, or other public agency must be signed by either a principal executive officer or ranking elected official [§122 22(a)(3)] To fulfill the signatory requirements, the person signing the municipal application must provide his or her name (printed or typed), title, and date signed In addition, the applicant should provide the name, address, and telephone number of the person signing the application or another point of contact that can answer questions about the application.

In addition, §122.22(d) states that any person signing a permit application must make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

6.7 IMPLEMENTATION OF THE STORM WATER PROGRAM

EPA anticipates that municipal storm water management programs will mature over time to reflect advances in technology, additional data collection, changing conditions, program development, stage of implementation, and improvements in water quality. Therefore, applicants may emphasize different program components to reflect implementation priorities. The proposed management program should clearly identify each of the program components and include a schedule for implementation. Each component of the Part 2 application should be classified as: full implementation, phased implementation, pilot study, or feasibility analysis In annual reports on the progress of storm water management programs, municipalities must report on the status of implementing program provisions [§122 42(c)(1), or Section 7.3 of the guidance].

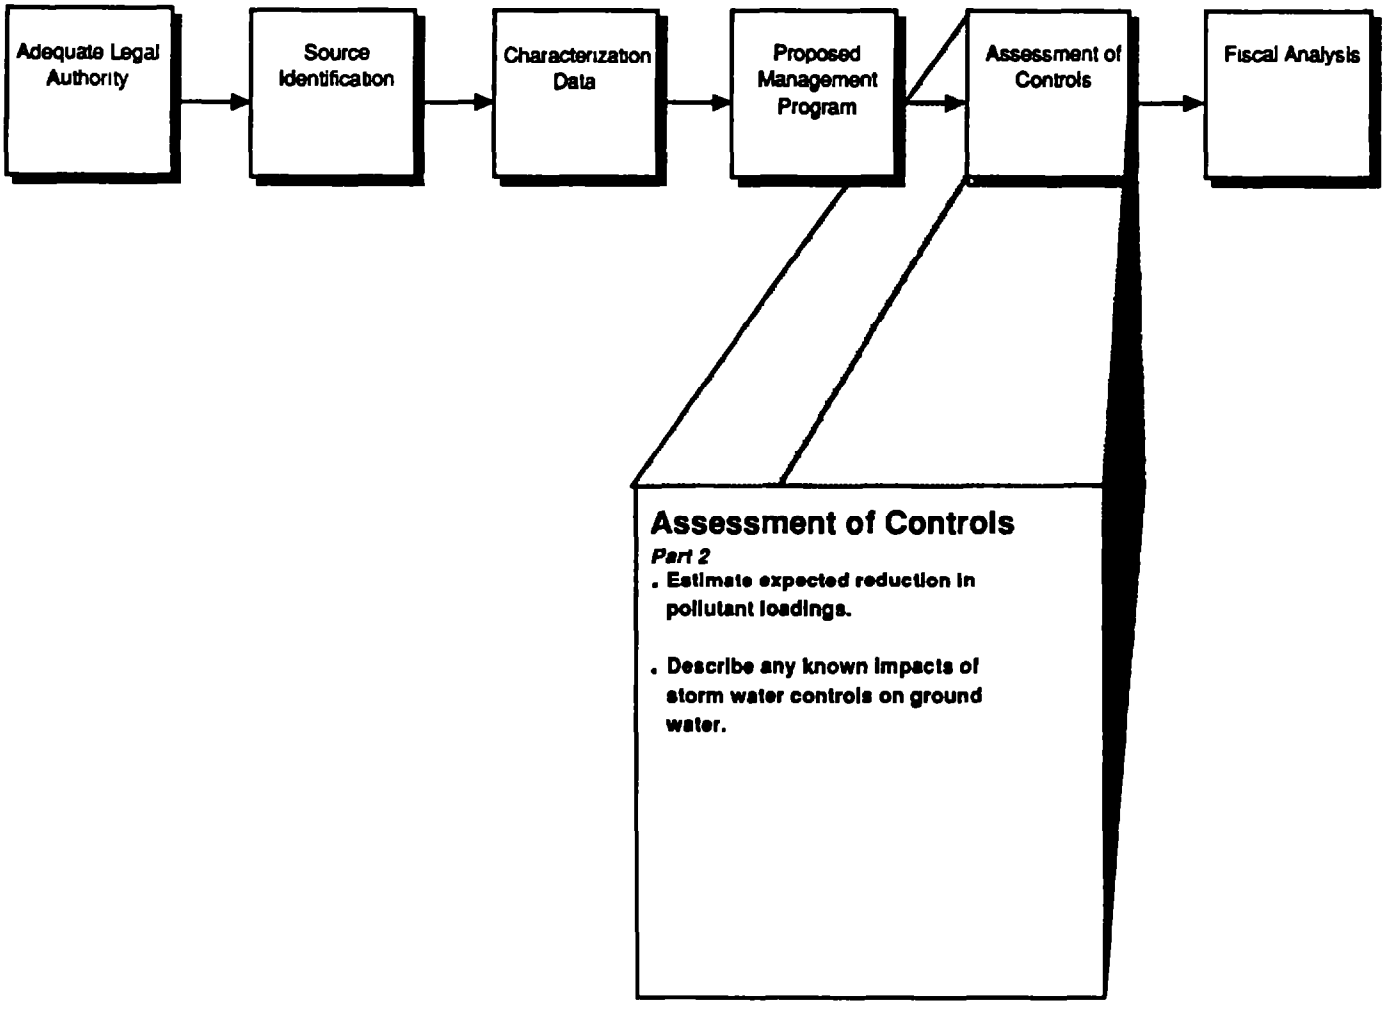
- **Full Implementation.** Fully implemented components should be proposed when the municipality is

prepared to begin or continue full implementation after its permit is issued and it expects to continue the component throughout the life of the permit. Full implementation of a program component is generally the preferred way of demonstrating the required level of control.

- **Phased Implementation.** Phased implementation should be proposed when the level of effort to implement the component will vary during the term of the permit. Phased implementation may be appropriate when additional data must be collected or technical guidance, training materials, or appropriate ordinances must be developed prior to full implementation. A schedule that includes milestones should be part of the description.

- **Pilot Studies.** Although the municipality must implement and comply with *each* provision of the municipal storm water permit, the municipality may choose to carry out pilot studies that involve limited experimental implementation of a program component. In some cases, pilot studies may be authorized by the permit. Used to evaluate the effectiveness of a program component, pilot studies may be appropriate when a technology is unproven or when data must be collected to develop operating standards or procedures. A schedule including milestones should be included in the description of a pilot study. This schedule should provide options for phased implementation of the program component, showing alternatives based on various possible results of the pilot study.

CHAPTER 7
ASSESSMENT OF CONTROLS



7.0 ASSESSMENT OF CONTROLS

7.1 BACKGROUND

Part 2 applications require that municipalities estimate the effectiveness of their proposed storm water quality management programs The regulations require an initial estimate or assessment because the performance of appropriate management controls is highly dependent on site-specific factors Program effectiveness can be estimated through both direct measurements (such as reductions in annual pollutant loads) and indirect measurements (such as measurements that demonstrate increased public awareness of storm water quality issues) At a minimum, applicants must submit estimated reductions in pollutant loads expected to result from implemented controls and describe known impacts of storm water controls on ground water

> 122 26(d)(2)(v) *Assessment of controls* [The application must include] estimated reductions in loadings of pollutants for discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program The assessment shall also identify known impacts of storm water controls on ground water

Reductions in pollutant loads due to the implementation and maintenance of structural controls provide direct measurements of the effectiveness of the storm water management program In addition, EPA encourages applicants to go beyond the minimum requirement and assess the effectiveness of their storm water management program through other direct measurements as well as indirect measurements As discussed below, indirect measurements provide surrogate estimates of qualitative factors, such as increased public awareness of storm water quality issues

Estimates of the effectiveness of the storm water management program will assist the municipality and the permit writer in:

- Determining whether the most cost-effective best management practices (BMPs) are included in the storm water management program;
- Ensuring that the storm water management program includes adequate public participation programs and intergovernmental coordination,
- Establishing on-going monitoring inspection and surveillance programs that help refine estimates of program effectiveness, and
- Developing a strategy to evaluate progress toward achieving water quality goals

7.2 ASSESSMENT OF STORM WATER MANAGEMENT PROGRAM

For some components of a proposed storm water management program, such as structural controls (e g , vegetative streambank stabilization, sediment pond or basin, etc.), the effect on pollution in storm water runoff is observable, and pollutant removal efficiencies can be estimated directly For other components, pollutant reductions may be difficult to quantify Applicants may need to use indirect estimates. For example, a program component may address source controls such as changing the behavior of citizens in the community, or improving the municipal control of industrial or commercial runoff For

components of the proposed management program where pollutant removal efficiency cannot be reasonably estimated, applicants are strongly encouraged to identify some indirect measurement that can be used to evaluate the success of the practice

7.2.1 Direct Measurements of Program Effectiveness

As discussed above, 40 CFR 122.26(d)(2)(v) requires that applicants submit estimates of expected pollutant load reductions with their Part 2 applications To supplement these estimates, applicants could provide estimates of other direct measurements of program effectiveness including

- Removal efficiencies of BMPs that control storm water quality,
- Reductions in the volume of storm water discharged,
- Reductions in event mean concentrations or
- Reductions in seasonal pollutant loadings

Such direct estimates do not have to be verified with quantitative data, but can be based on accepted engineering design practices However the applicant should describe its procedures for estimating the effectiveness of the control Applicants should present estimates of pollutant load reductions or other measurements separately for each component of the proposed management program Applicants should provide estimated reductions on a watershed basis and system-wide basis

Reductions in pollutant loadings can be estimated by first estimating the pollutant loading (based on concentrations and flows) that would result without the control measure The value should then be multiplied by the efficiency of the control expressed in terms of a fraction or percentage. Estimated control efficiencies can be obtained from published sources, such as Schueler (1987) (see bibliography in Appendix A) Note that for most control measures, the pollutant removal efficiency differs for different classes of pollutants

After the municipality's storm water management program is implemented, the municipality can work to refine its initial assessment of the program. For example, the permit will require applicants to submit estimates of event mean concentrations and estimates of annual pollutant loadings for each outfall in the system [§122.26(d)(2)(iii)(C), discussed in Section 5.5 of this guidance]. These estimates can be compared with the applicant's initial estimates

In addition, the estimated removal efficiencies can be refined through the monitoring program required by §122.26(d)(2)(iii)(D) (discussed in Section 5.6 of this guidance) To refine these estimates, the monitoring program should include measurements at the inflow and outflow points of the control Throughout the permit term, the municipality must submit refinements to its assessment or additional direct measurements of program effectiveness in its annual report (Section 7 3)

The applicant should use direct measurements of program effectiveness as it begins to assess its long-term progress in improving water quality through storm water management practices Direct measurements of program effectiveness may not provide meaningful conclusions on trends in water quality improvements for a couple of permit terms. However, applicants are encouraged to use direct measurements of program effectiveness, such as annual pollutant loads, event mean concentrations, and seasonal pollutant loadings, to begin to estimate long-term trends Several statistical methods that rely on linear regression have been developed

to model these measurements to determine if trends exist

7.2.2 Indirect Measurements of Program Effectiveness

When pollutant reductions cannot be estimated through direct measurement, appropriate indirect measurements may be used. These may include the estimated level of increased enforcement activity, increased public awareness, or reduction in number of illegal dumping incidents For example, a field screening program to identify illicit connections and improper dumping in Fort Worth, Texas, used reductions in observations of indicator pollutants as a measure of the success of the program (Fort Worth, 1988).

Other possible indirect measurements include.

- Gallons of used oil recycled,
- Amount of household hazardous waste collected,
- Number of educational brochures on storm water quality distributed;
- Number of public hearings on storm water and attendance at these hearings,
- Circulation of an annual report or periodic newsletters on progress in meeting storm water quality goals,
- Number of reports of illicit discharges or illegal dumping
- Number of spill clean-ups,
- Number of sewer inlets stenciled,
- Acres of open space,
- Number of construction and erosion and sediment control plans submitted and approved

Many of these indirect measurements will help to indicate whether the storm water management program includes adequate public participation and intergovernmental coordination.

7.2.3 Impacts of Storm Water Controls on Ground Water

Structural BMPs may have an impact on other media. Therefore, the Part 2 application requires that applicants discuss known impacts of storm water controls on ground water. Impacts should be identified separately for each component of the proposed management program. These controls may increase the quantity of ground water (such as infiltration leading to recharge), but degrade the quality of the ground water For example, in arid parts of the Southwest, imported water is often used for irrigation. This increases the quantity of ground water, but, because of high levels of nutrients and total suspended and dissolved solids in the irrigation water, also results in impacts on ground water quality

In addition, the applicant should evaluate whether structural controls for storm water impact other media, such as wetlands

7.3. ANNUAL REPORTS ON THE EFFECTIVENESS OF THE STORM WATER MANAGEMENT PROGRAM

Under §122.42(c), applicants must provide annual reports on the progress of their storm water management programs. These reports, which are due on the anniversaries of permit issuance, must include

- The status of implementing the components of the storm water management program that are required by the permit,
- Proposed changes to the storm water management programs that are established as permit conditions,

- Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application;

- Summary of data, including monitoring data, that are accumulated throughout the reporting year,

- Projected annual expenditures and budget for the year following each annual report;

- A summary describing the number and nature of enforcement actions, inspections, and public education programs; and

- Identification of water quality improvements or degradation

Applicants should refer to the specific regulatory language in §122 42(c) for a more complete discussion of annual reporting requirements

Although the Part 2 application requirements do not specifically address annual reporting requirements, applicants should consider their strategy for preparing annual reports when they complete their Part 2 applications. A municipality may develop a strategy to assess the progress of its storm water management program throughout the term of the permit in addition to providing a baseline assessment of its program. To develop the strategy, applicants should

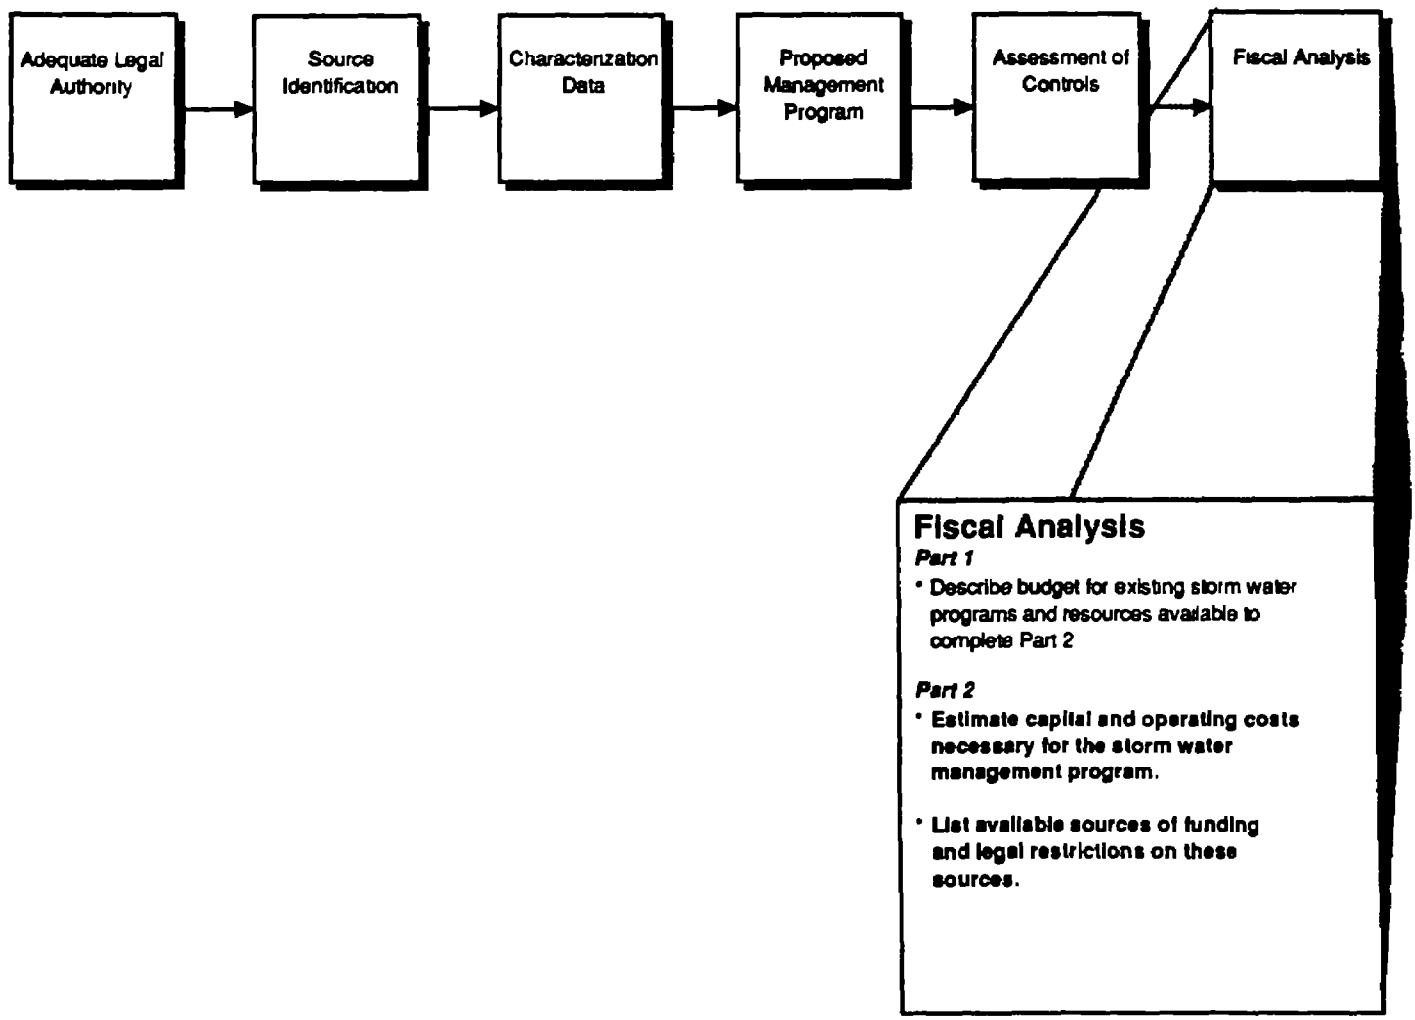
- Identify the direct or indirect measurements that will be used to track the long-term progress of the applicant's program towards achieving improvements in storm water quality (the results of this assessment would appear in the municipality's annual report);

- Discuss the role of monitoring data in substantiating or refining their assessment of the progress of their program towards established objectives and goals; and

- Discuss how future additions or revisions to the assessment measurements or strategy will be implemented by the municipality (e.g , what roles and responsibilities will participating municipal agencies and/or organizations have in this area)

It is anticipated that many municipalities will use the same criteria or measurements that were used in the baseline assessment to develop their long-term assessment strategy. This is an acceptable approach provided that the municipality delineates how their program provides for a longer term assessment of the progress of their storm water management program The municipality is encouraged to consider in advance the information requirements for annual reporting that are identified above when developing their long-term assessment strategy

CHAPTER 8
FISCAL ANALYSIS



8.0 FISCAL ANALYSIS

8.1 BACKGROUND

NPDES permits for discharges from MS4s will require municipal permittees to implement management programs, conduct long term storm water monitoring, and provide other information Because these activities will result in expense to the municipality, a fiscal analysis is required in the Part 2 application

Applicants must provide yearly cost estimates for these programs. Applicants also must provide a schedule indicating when funds will be available Examining the levels of proposed spending and funding allows the permitting authority to gauge the ability of the applicant to implement the program and predict its effectiveness The fiscal analysis also will help the permit writer determine whether the applicant has met the statutory requirement of reducing the discharge of pollutant to the MS4 to the maximum extent practicable Finally, the estimates help the applicant evaluate the feasibility and cost-effectiveness of its program A municipality must update its fiscal analysis each year for the annual report on the progress in implementing their storm water management program [40 CFR 122 42(c)(3) and (5), discussed in Section 7.3 of this guidance]

8.2 PROCEDURE FOR CONDUCTING A FISCAL ANALYSIS

Under §122 26(d)(2)(vi), each applicant must demonstrate sufficient financial resources to implement the conditions of the permit

Adequate resources may be demonstrated by performing a fiscal analysis of the estimated capital and operation and maintenance expenditures required to complete the activities required by the regulations This fiscal analysis must be performed for each fiscal year to be covered by the permit (5 years, in most cases). The analysis must describe the source of the funds used to meet the necessary expenditures, including any legal restrictions on the appropriated funds

> **§122.26(d)(2)(vi)** [The application must include] for each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2)(iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds

The following procedure is an example of a method of conducting the necessary fiscal analysis

Step 1. Identify the major tasks for each component covered by this application requirement, including

- Elements of the proposed management program,
- Estimates of seasonal loads and event mean concentrations for each major outfall covered by the permit, and
- Proposed monitoring program.

Step 2. Develop a schedule outlining when each of the tasks identified in Step 1 will be undertaken Some tasks may be performed just once, others may be on-going For example, the schedule should include, among other things·

- The installation of any new control measures identified in the proposed

management program [§122 26(d)(2)(iv), discussed in Section 6 4],

- A maintenance schedule for structural best management practices (BMPs) [§122 26(d)(2)(iv)(A)(*1*), discussed in Section 6 4.3];

- Development of seasonal pollutant loadings and event mean concentrations of a representative storm [§122.26(d)(2)(iii)(C), discussed in Section 5.5];

- Monitoring program for representative data collection for the term of the permit [§122.26(d)(2)(iii)(D), discussed in Section 5 6],

- Monitoring program for industrial facilities [§122 26(d)(2)(iv)(C)(2), discussed in Section 6.3.3];

- On-going field screening program for illicit discharges [§122.26(d)(2)(iv)(B), discussed in Section 6 5],

- Development of certification programs for construction workers or pesticide applicators, if appropriate [§122 26(d)(2)(iv), discussed in Sections 6.3.1 and 6 3 2], and

- Implementation schedules for other components of the storm water application that have not been fully implemented at the time of application, such as additional legal authority or comprehensive development plans

Step 3. Estimate the capital expenses necessary to accomplish the tasks identified in Step 1 and determine a schedule for purchase Applicants may elect to define categories of capital expenditures such as "monitoring equipment," "miscellaneous monitoring supplies," "personal protective equipment," etc

Step 4. Estimate other non-capital costs to implement the tasks identified in Step 1. Use the schedule developed in Step 2 to spread costs over the term of the permit Costs should be presented as a total annual cost for each proposed program component In addition, estimates of the total annual costs and annual per capita costs should be provided. Per capita costs can be compared with the per capita costs of other programs, such as sewage treatment programs.

These costs may include items such as :

- Newspaper ads announcing new programs or recycling centers;

- Holding public meetings or hearings, and

- Labor for department personnel to speak to citizens groups

Step 5. Identify funding to be applied. Applicants must describe the sources of funding and any legal restrictions on that funding Sources may include general revenues, storm water utilities, plan review fees, permit fees, industrial/commercial user fees, special assessment district funds, and revenue bonds Some funding sources, such as general revenues based on property taxes, are generally unrestricted, but can be allocated by local officials annually In a few cases, a local property tax may be dedicated to finance a storm water management program For example, one county finances its storm water management program through a dedicated property tax of $0.135 per $100 assessed valuation Other municipalities add special assessments to property tax bills.

A storm water utility is another source of funding dedicated to financing storm water management activities The storm water utility offers the advantage of a stable and predictable source of funds. Other advantages of storm water utilities over general revenues are that utility charges can be more equitably based on

the user's contribution to local storm water problems, and a utility provides a mechanism to incorporate incentives for on-site storm water management

In many cases, municipalities will evaluate sources of funds that are not currently available, such as a new storm water utility. In these cases, applicants must include a schedule of when funds will be available. For example, it usually takes a municipality 18 to 24 months of planning before local elected officials authorize a storm water utility, and another 6 to 12 months to implement the utility (Lindsey, 1988) Key milestones for planning and implementing the funding mechanism must be identified in the schedule The following components have been found to be important in establishing storm water utilities

- Determining the most appropriate administrative structure for implementing a storm water management program,
- Adopting a storm water utility ordinance,
- Estimating revenue needs and planning for cost recovery,
- Establishing a utility rate structure and billing system,
- Establishing a system for developer contributions, and
- Implementing a public information program

Step 6. Compare the funding sources with the funding needs. As a last step in this process, the municipality must ensure that adequate funding is available to cover the cost of implementing the storm water management program If adequate funding is not available, the municipality must consider alternate sources of funding such as a storm water utility

APPENDIX B:
PART 2 APPLICATION REQUIREMENTS

certify, pursuant to 5 U S.C 605(b) that these amendments do not, have a significant impact on a substantial number of small entities.

List of Subjects in 40 CFR Parts 122, 123, and 124

Administrative practice and procedure Environmental protection, Reporting and recordkeeping requirements, Water pollution control

Authority: Clean Water Act, 33 U S C 1251 *et seq*

Dated October 31, 1990

William K. Reilly,

Administrator

For the reasons stated in the preamble, parts 122, 123, and 124 of title 40 of the Code of Federal Regulations are amended as follows

PART 122—EPA ADMINISTERED PERMIT PROGRAMS; THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Subpart B—Permit Application and Special NPDES Program Requirements

1 The authority citation for part 122 continues to read as follows

Authority Clean Water Act 33 U S C 1251 *et seq*

2 Section 122 1 is amended by revising paragraph (b)(2)(iv) to read as follows

§ 122.1 Purpose and scope

* * * * *

(b) * * *

(2) * * *

(iv) Discharges of storm water as set forth in § 122 26, and

* * * * *

3 Section 122 21 is amended by revising paragraph (c)(1) by removing the last sentence of paragraph (f)(7), by removing paragraph (f)(9) by adding two sentences at the end of paragraph (g)(3) by revising paragraph (g)(7) introductory text by removing and reserving paragraph (g)(10) and by revising the introductory text of paragraph (k) to read as follows

§ 122 21 Application for a permit (applicable to State programs, see § 123 25)

* * * * *

(c) *Time to apply* (1) Any person proposing a new discharge, shall submit an application at least 180 days before the date on which the discharge is to commence unless permission for a later date has been granted by the Director Facilities proposing a new discharge of storm water associated with industrial activity shall submit an application 180 days before that facility commences industrial activity which may result in a discharge of storm water associated with that industrial activity Facilities described under § 122.26(b)(14)(x) shall submit applications at least 90 days before the date on which construction is to commence. Different submittal dates may be required under the terms of applicable general permits Persons proposing a new discharge are encouraged to submit their applications well in advance of the 90 or 180 day requirements to avoid delay. See also paragraph (k) of this section and § 122.26 (c)(1)(i)(G) and (c)(1)(ii).

* * * * *

(g) * * *

(3) * * * The average flow of point sources composed of storm water may be estimated. The basis for the rainfall event and the method of estimation must be indicated.

* * * * *

(7) *Effluent characteristics.* Information on the discharge of pollutants specified in this paragraph (except information on storm water discharges which is to be provided as specified in § 122 26) When "quantitative data" for a pollutant are required, the applicant must collect a sample of effluent and analyze it for the pollutant in accordance with analytical methods approved under 40 CFR part 136 When no analytical method is approved the applicant may use any suitable method but must provide a description of the method When an applicant has two or more outfalls with substantially identical effluents the Director may allow the applicant to test only one outfall and report that the quantitative data also apply to the substantially identical outfalls The requirements in paragraphs (g)(7) (iii) and (iv) of this section that an applicant must provide quantitative data for certain pollutants known or believed to be present do not apply to pollutants present in a discharge solely as the result of their presence in intake water, however, an applicant must report such pollutants as present Grab samples must be used for pH, temperature, cyanide total phenols, residual chlorine, oil and grease, fecal coliform and fecal streptococcus For all other pollutants 24-hour composite samples must be used However, a minimum of one grab sample may be taken for effluents from holding ponds or other impoundments with a retention period greater than 24 hours In addition, for discharges other than storm water discharges, the Director may waive composite sampling for any outfall for which the applicant demonstrates that the use of an automatic sampler is infeasible and that the minimum of four (4) grab samples will be a representative sample of the effluent being discharged For storm water discharges, all samples shall be collected from the discharge resulting from a storm event that is greater than 0 1 inch and at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event Where feasible, the variance in the duration of the event and the total rainfall of the event should not exceed 50 percent from the average or median rainfall event in that area For all applicants, a flow-weighted composite shall be taken for either the entire discharge or for the first three hours of the discharge. The flow-weighted composite sample for a storm water discharge may be taken with a continuous sampler or as a combination of a minimum of three sample aliquots taken in each hour of discharge for the entire discharge or for the first three hours of the discharge, with each aliquot being separated by a minimum period of fifteen minutes (applicants submitting permit applications for storm water discharges under § 122 26(d) may collect flow weighted composite samples using different protocols with respect to the time duration between the collection of sample aliquots, subject to the approval of the Director) However, a minimum of one grab sample may be taken for storm water discharges from holding ponds or other impoundments with a retention period greater than 24 hours For a flow-weighted composite sample, only one analysis of the composite of aliquots is required For storm water discharge samples taken from discharges associated with industrial activities, quantitative data must be reported for the grab sample taken during the first thirty minutes (or as soon thereafter as practicable) of the discharge for all pollutants specified in § 122 26(c)(1) For all storm water permit applicants taking flow-weighted composites quantitative data must be reported for all pollutants specified in § 122 26 except pH temperature, cyanide total phenols residual chlorine, oil and grease fecal coliform, and fecal streptococcus, The Director may allow or establish appropriate site-specific sampling procedures or requirements including sampling locations, the season in which the sampling takes place the minimum duration between the previous measurable storm event and the storm event sampled the minimum or maximum level of precipitation required for an appropriate storm event, the form of precipitation sampled (snow melt or rain fall) protocols for collecting samples under 40 CFR part 136 and additional time for submitting data on a

case-by-case basis. An applicant is expected to "know or have reason to believe" that a pollutant is present in an effluent based on an evaluation of the expected use, production, or storage of the pollutant, or on any previous analyses for the pollutant. (For example, any pesticide manufactured by a facility may be expected to be present in contaminated storm water runoff from the facility.)

• • • • •

(k) *Application requirements for new sources and new discharges.* New manufacturing, commercial, mining and silvicultural dischargers applying for NPDES permits (except for new discharges of facilities subject to the requirements of paragraph (h) of this section or new discharges of storm water associated with industrial activity which are subject to the requirements of § 122.26(c)(1) and this section (except as provided by § 122.26(c)(1)(ii)) shall provide the following information to the Director, using the application forms provided by the Director:

• • • • •

4 Section 122.22(b) introductory text is revised to read as follows

§ 122.22 Signatories to permit applications and reports (applicable to State programs, see § 123.25).

• • • • •

(b) All reports required by permits, and other information requested by the Director shall be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if

• • • • •

5 Section 122.26 is revised to read as follows

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25)

(a) *Permit requirement.* (1) Prior to October 1, 1992, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2. The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2;

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(3) *Large and medium municipal separate storm sewer systems.* (i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to all discharges owned or operated by the same municipality, located within the same jurisdiction; all discharges within a system that discharge to the same watershed, discharges within a system that are similar in nature, or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(*1*) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due;

(*2*) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application;

(*3*) Each of the operators of municipal separate storm sewers within the systems described in paragraphs (b)(4)(i), (ii), and (iii) or (b)(7)(i), (ii), and (iii) of this section, that are under the purview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) *Discharges through large and medium municipal separate storm sewer systems* In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge: the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) *Other municipal separate storm sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges

(6) *Non-municipal separate storm sewers* For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications

(iii) Any permit covering more than one operator shall identify the effluent limitations or other permit conditions, if any, that apply to each operator

(7) *Combined sewer systems* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of § 122.21 and are not subject to the provisions of this section.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. *See* 40 CFR part 35, subpart I, appendix A(b)H.2.j.

(b) *Definitions.* (1) *Co-permittee* means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) *Illicit discharge* means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) *Incorporated place* means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the latest Decennial Census by the Bureau of Census (appendix F); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers.

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of th section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters, and

(E) Other relevant factors, or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.

(5) *Major municipal separate storm sewer outfall* (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres), or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharg from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more)

(6) *Major outfall* means a major municipal separate storm sewer outfall.

(7) *Medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the latest Decennial Census by the Bureau of Census (appendix G), or

(ii) Located in the counties listed in appendix I, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties, or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may cons the following factors

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters, or

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains)

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States,

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2

(9) *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) *Overburden* means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) *Runoff coefficient* means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) *Significant materials* includes, but is not limited to: raw materials; fuels, materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

(13) *Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) *Storm water discharge associated with industrial activity* means the discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 CFR part 122. For the categories of industries identified in paragraphs (b)(14) (i) through (x) of this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR part 401); sites used for the storage and maintenance of material handling equipment, sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (b)(14)(xi) of this section, the term includes only storm water discharges from all the areas (except access roads and rail lines) that are listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in this paragraph (b)(14)(i)–(xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection.

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;
