- Variability of Standard Runoff Coefficient and Pollutant Concentration Values—The mean standard runoff coefficients and pollutant concentrations are used in the assessments. In reality, there is a range associated with the real-world land use runoff conditions for both runoff coefficients and pollutant concentrations. For example, land use runoff pollutant concentrations can vary based on socio-economic factors across a single land use category. The 2015 City of San Diego trash study found that median income of people living in a given drainage area affected trash assessment results at the corresponding outfall. It is possible a similar pattern could be seen for other pollutants (City of San Diego, 2015).

4.3.1 Land Use Storm water Runoff Coefficient (D.4.b.(2)(b)(i)[a])

The average storm water runoff coefficient ("C") was calculated for each land use type in the WMA, based on data collected through three seasons of wet weather MS4 outfall monitoring (2013–2014, 2014–2015, and 2015–2016). This calculation is based on the measured flow and rainfall values for each monitored outfall (Table 4-2), along with the outfall drainage area characteristics. The quantity (area and percentage) of each land use type by outfall drainage area is presented in Table 4-5. Agriculture and Open Space land uses are subdivided by hydrologic soil group (A, B, C, or D).

Intentionally Left Blank

1. Water land use excluded from MS4 outfall assessments. Water land use assumed to be a sink for runoff storage.

% = percent; WMA = Watershed Management Area

Intentionally Left Blank

The observed “C” was calculated for each outfall, based on the monitored event characteristics (event flow, event rainfall, and outfall drainage area). For outfalls that were monitored for more than one monitoring season, the “C” is averaged across all years of monitoring at that outfall. This value was compared with the expected “C” for each outfall, based on runoff coefficients listed in the San Diego County Hydrology Manual (County of San Diego, 2003) The current observed “C” value for each outfall, as well as the expected “C” for each outfall, is presented in Table 4-6.

Table 4-6
2015–2016 San Dieguito River WMA Observed vs. Expected Outfall Runoff Coefficients

Monitoring Location	Observed “C”	Hydrology Manual “C”
MS4-SDC-1	0.23	0.61
MS4-SDC-2	0.17	0.52
MS4-SDC-3	0.03	0.45
MS4-SDC-4	0.28	0.54
MS4-SDC-5	0.14	0.69
MS4-SDC-6	0.59	0.54

The WMA “C” for each land use was calculated using an area-weighted average of all monitored event “C” values for the monitored wet weather outfalls. To improve the accuracy of the calculation over time, historical (2013–2015) and current (2015–2016) “C” values were included in the calculation. The historical and 2015–2016 WMA area-weighted average “C” values for each land use are presented in Table 4-7.

Table 4-7
Current and Historical San Dieguito River WMA Calculated Land Use Runoff Coefficients

Residential: Single Family	0.23	0.22	0.21
Transportation	0.43	0.37	0.36

1. Because of limited WMA monitoring data for agriculture land use, "C" and event mean concentrations (EMC) values are based on San Dieguito River WMA monitored outfalls data for Open Space with corresponding soil type land use type.
2. Agriculture and Open Space land use types were divided into subgroups based on hydrologic soil type. See http://www.nrcs.usda.gov/wps/portal/nrcs/detail/ny/soils/?cid=nrcs144p2_027279 for more information on hydrologic soil types.
3. "C" and EMC values are based on San Dieguito River WMA monitored outfalls data for Commercial and Multi-Family Residential land use types (averaged).
4. Open Space-A land use, Runoff "C," and EMC values are based on San Dieguito River WMA monitored outfalls data for Open Space-B land use type.

4.3.2 Monitored MS4 Outfall Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[b])

The volume of storm water and pollutant loads discharged from the MS4 outfalls to receiving waters in the jurisdictions within the WMA was calculated for each storm event with measurable rainfall greater than 0.1 inch. The wet season rainfall data for the ALERT rain gauge closest to each monitoring location were used to calculate the qualifying measured rainfall for each site. Table 4-8 presents the annual wet season storm water volume and pollutant load discharged from each outfall.

4.3.3 Jurisdictional Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[c])

The volume of storm water and pollutant loads discharged from the jurisdictions of Responsible Agencies within the WMA over the course of the wet season was calculated for each storm event with measurable rainfall greater than 0.1 inch. The wet season rainfall data for the closest ALERT rain gauge that most represented the WMA were used. Because the San Dieguito River WMA contains more than one ALERT rain gauge, data from the Rancho Bernardo rain gauge were used, because this station was closest to a majority of wet season MS4 outfall monitoring stations. Table 4-9 presents the annual wet season storm water volume and pollutant load discharged from the jurisdictions of Responsible Agencies in the San Dieguito River WMA.

1. The qualifying measured rainfall amount used to calculate monitored outfall flow volumes and pollutant loads for the City of Del Mar, City of Escondido, and City of Solana Beach outfall monitoring stations (MS4-SDC-1, MS4-SDC-2, and MS4-SDC-5, respectively) was less than the rainfall amount used to calculate jurisdictional flow volumes and pollutant loads for these jurisdictions. The rainfall gauge that most represented the WMA as whole was used for WMA and jurisdictional calculations, while the rainfall gauge that most represented each outfall was used for outfall calculations.

cf = cubic feet; in = inches; lb = pounds; MPN = most probable number; N = nitrogen; P = phosphorus; TDS = total dissolved solids; TKN = total Kjeldahl nitrogen

4.3.4 Land Use Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[d])

The percent contribution of storm water and pollutant loads discharged from each land use type within each HSA with a major MS4 outfall in the jurisdiction of each Responsible Agency within the San Dieguito River WMA was calculated. The wet season rainfall data for the ALERT rain gauge closest that most represented the WMA were used. As in the jurisdictional load calculations described in Section 4.3.3, the Rancho Bernardo ALERT station data were used to calculate the qualifying measured rainfall for the WMA. Tables 4-10 through 4-15 present, by Responsible Agency jurisdiction, the percentage of the wet season storm water volume discharged from each HSA with a major outfall in the San Dieguito River WMA. The percentage of the wet season storm water volume and pollutant loads discharged from each land use type within each HSA with a major outfall in the San Dieguito River WMA, by Responsible Agency, is presented in Attachment E.4.

Table 4-10

Jurisdictional HSA 905.41 - Ramona	81,840,245	21%
Jurisdictional HSAs with No Major Outfall[1]	158,307,220	40%
Jurisdictional WMA	**396,564,132**	**100%**

1. The County of San Diego has jurisdictional land area in HSAs 905.24, 905.31, 905.33, 905.34, 905.35, 905.36, 905.42, 905.43, 905.44, 905.45, 905.46, 905.47, 905.51, 905.52, 905.53, and 905.54, but has no major outfalls in those HSAs.

% = percent; cf = cubic feet; HSA = hydrologic subarea; NA = not applicable; WMA = Watershed Management Area

4.4 Evaluation of Monitoring Locations and Frequencies

Provision D.4.b.(2)(b)(ii) of the MS4 Permit allows the Responsible Agencies to modify the wet weather MS4 outfall discharge monitoring locations and frequencies to better identify pollutants in storm water discharges from the MS4s in the WMA.

An analysis of wet weather MS4 outfall monitoring locations was performed in the 2014–2015 Transitional Monitoring and Assessment Report for the San Dieguito River WMA (TMAR) (San Diego County Municipal Copermittees, 2016). The purpose of the recommendations provided was to accurately quantify the storm water volume and loads from the various land uses in the WMA to improve the effectiveness of MS4 monitoring in meeting the intended MS4 Permit goal. As part of the evaluation of monitoring locations, a comparison of the WMA land use with the monitored outfall drainage area land uses was performed. The results of this comparison are provided in Table 4-16.

Table 4-16
Land Use Comparison, WMA and Monitored Drainage Areas

Land Use	WMA Area (acres)[1]	WMA Area (%)[1]	Outfalls Area (acres)	Outfalls Area (%)	(% Difference)
Agricultural (Combined)	31,871	17.5%	1	0.2	-17.5
Commercial	3,059	2.1%	23	4.0	2.3
Educational	673	0.4%	1	0.1	-0.2
Industrial	1,419	0.8%	11	2.0	1.2
Mixed Use	0	0.0%	0	0.0	0.0
Open Space (Combined)	92,779	51.4%	109	19.3	-32.3
Residential: Multi-Family	923	0.5%	23	4.1	3.6
Residential: Rural	28,655	15.6%	3	0.5	-15.4
Residential: Single-Family	15,027	8.3%	284	50.5	42.2
Transportation	5,367	3.3%	108	19.1	16.1
Total	**179,776**	**–**	**563**	**–**	**–**

1. Acreage excludes state, federal, tribal, and Phase II lands

% = percent; WMA = Watershed Management Area

Because the wet weather outfall monitoring locations did not change between the 2014–2015 and 2015–2016 monitoring seasons, the conclusions reached in the TMAR remain valid:

- The wet weather MS4 outfall monitoring locations are, overall, representative of land uses in the WMA.
- Agricultural and open space land uses are under-represented in the monitored outfall drainage areas; however, the intention of monitoring is to characterize drainage from the MS4 (i.e., developed land uses).
- Single-family residential and transportation land uses are well represented in the monitored outfall drainage areas.

The evaluation of monitoring frequency includes a comparison of monitored event rainfall conditions with annual rainfall conditions. During the 2015–2016 wet season (October through April), rainfall totals at ALERT system gauges within the San Dieguito River WMA ranged from 11.22 inches at the Rancho Bernardo rain gauge to 16.66 inches at the Mt. Woodson rain gauge. All ALERT gauges within the WMA registered more rainfall during the wet season than the official National Weather Service (NWS) gauge at Lindbergh Field (7.42 inches). The storms that occurred generally had totals of less than

1 inch of rainfall, although one very large storm beginning January 4, 2016, produced more than 3 inches of rainfall throughout the WMA. The average wet season storm event rainfall total at the Rancho Bernardo ALERT gauge is 0.83 inch. The rainfall total for the outfall monitoring event that took place on March 5, 2016, was less than this average. The rainfall total for the outfall monitoring event that took place on January 30, 2016, was greater than this average.

It was recommended in the TMAR to target more monitoring events during average (greater than 0.5 inch) and large (greater than 1 inch) storms. The 2015–2016 sampling targeted one smaller (less than 0.5 inch) and one large storm. It is recommended to continue targeting storm events of various sizes during future wet seasons, to capture a range of data for “C” calculations.

Intentionally Left Blank

5 Special Study Assessments

Special studies for the San Dieguito River WMA have been selected to further investigate the HPWQC: impairment of contact recreation due to bacteria indicator at the Pacific Shoreline. The special studies have been conducted and are summarized and assessed in this section. Studies included the San Diego Regional Streams and Beaches Studies, the San Dieguito Bacteria Source Identification Study, and the Proposed Nutrient Load Characterization for Lake Hodges Study led by the City of San Diego's Public Utilities Department.

5.1 San Diego Regional Reference Streams and Beaches Studies

The San Diego Regional Reference Stream and Beach Studies (SCCWRP, 2015 and SCCWRP, 2016) were designed to measure FIB concentrations and loads at streams and beaches that are minimally disturbed by anthropogenic activities, representing "reference" conditions. Nutrients, metals, and toxicity data were also collected. The resulting data may be used by the Regional Board in the Bacteria TMDL Reopener to derive reasonable and accurate numeric targets for bacteria on the basis of a reference system approach.

5.1.1 San Diego Regional Reference Streams Study

The goal of the San Diego Regional Reference Stream Study was to characterize the natural background concentrations of bacteria, nutrients, heavy metals, and conventional constituents in undeveloped watershed catchments during wet and dry weather. To meet the goal, the study was designed to categorize the exceedance frequencies of FIB water quality objectives (WQOs) by geomorphologic, hydrologic, biotic, and abiotic factors. The human-associated microbial source marker was used to exclude sites and samples with potential human fecal contamination, ensuring that the documented exceedance rates are attributable to nonhuman sources. This summary focuses on presenting the findings for FIB, specifically *Escherichia coli (E. coli)*, *Enterococcus*, and total and fecal coliforms.

The San Diego Reference Stream Study had seven major findings:

1. FIB levels in natural streams likely result from a combination of natural inputs, such as wildlife, birds, and soil erosion and instream bacterial growth facilitated by high summer temperatures, availability of nutrients, and presence of decaying organic matter.

2. Storm event mean concentration exceedances were low except for *Enterococcus*. Based on seven storms, exceedances of single-sample WQOs were 0% for *E. coli*, fecal coliform, and total coliform. The exceedance frequency for *Enterococcus* on the day of the storm was 87%, compared with 37% for the following three days after the end of the storm. The exceedance frequency increased for both *E. coli* and total coliform to 29% if the pollutograph maximum was used. The number of storm events captured was not sufficient to investigate the effect of geology or watershed size on storm event mean concentrations.

3. FIB exceedances occurred in natural sites and were highest in summer dry weather (April through August). No exceedances of fecal coliform single sample WQOs were observed; however, single sample WQO exceedances of *Enterococcus* were as high as 30%. Annual 30-day geomean exceedance frequencies were 0% for both *E. coli* and fecal coliform, but were 48% and 30% for *Enterococcus* and total coliform, respectively. Exceedance frequencies were highest in the summer, particularly for *Enterococcus*, spiking up to 40% and 68% for single sample and 30-day geometric mean WQOs, respectively. Using a rolling 30-day geometric mean rather than a monthly mean to calculate exceedance frequencies increased the exceedance frequencies for *Enterococcus* and total coliform as much as 20%.

4. Temperature, and to a lesser extent, nutrients and organic carbon, was the major factor associated with elevated summer dry weather FIB concentrations and exceedance frequencies.

5. No significant relationships were found between FIB concentrations and watershed size or geology during dry weather.

6. Water column FIB concentrations could not be attributed directly to instream benthic algal biomass as a measure of stream trophic status, which was low and showed no distinct seasonal variation. In contrast, FIB, temperature, organic carbon, and nitrogen measurements spiked at the end of the season, coinciding with the end of stream flow. This cycle occurs naturally; organic carbon and nutrients are increasingly recycled from organic matter as flow diminishes and temperature increases, conditions that coincide with increased FIB concentrations.

7. Event mean concentration fluctuations during wet weather were found to be 2 to 3 times greater than dry weather FIB fluctuations. Wet and dry weather fluctuations were comparable to those documented in previous southern California regional studies.

5.1.2 San Diego Regional Reference Beaches Study

The goal of the San Diego Regional Reference Beach Study was to characterize natural background concentrations of FIB and determine WQO exceedance frequencies at two “reference” recreational beaches and their adjoining estuary or mixing zones. Two beaches in southern California, San Onofre Creek in San Diego County and Deer Creek in Ventura County, were selected for the Reference Beach Study for dry and wet weather assessments of *Enterococcus*, fecal and total coliforms, and *E. coli*. These locations were selected because watersheds discharging to the beaches were more than 93% undeveloped and had not been subject to fires within the last three years. Additionally, both beaches are openly exposed with breaking waves and contain freshwater inputs. Analysis of human genetic markers was used to eliminate sites or samples with potential human contamination and therefore not representative of reference conditions.

The San Diego Regional Reference Beach Study was initiated in October 2014 and continued through April 2016. Sampling was conducted in the ocean immediately in front of the inlet or estuary, in the inlet mouth just upstream of the mixing zone, and in the freshwater flowing creek, for a total of three locations at each reference site. Dry weather monitoring was conducted during both wet and dry seasons to characterize baseline conditions throughout the year. Bacteria samples were collected weekly, such that five samples were collected in each 30-day period, to calculate a 30-day dry weather geometric mean. In creeks, dry weather sampling occurred when there was measurable flow at a site. During wet weather, samples were collected during and after the storm. A special study was also conducted to quantify FIB concentrations in the San Onofre estuary. When the estuary was open to tidal exchange, monitoring was extended to collect samples at high and low tides at all sites.

The San Diego Regional Reference Beach Study began during an extended period of drought in the southern California region, which limited the number of samples collected from creeks and during storms, as well as the overall volume of freshwater input to beaches. Dry weather beach sampling achieved the prescribed frequency, but samples from freshwater input sources were limited by extreme drought. From the onset of sampling, San Onofre Creek did not flow during the study period because of the extended drought. Deer Creek began flowing at the end of December 2014 and ceased in early May 2015; Deer Creek did not flow during the 2015–2016 winter dry weather period. In a similar effect, wet weather sampling was limited to only one storm during this study period because of the drought conditions. However human genetic markers were detected and so the results were excluded from the exceedance frequency analysis. The estuary special study was not completed because the San Onofre estuary berm remained closed throughout the study period for all but one storm event, which coincided with a tide in excess of 7 feet. The sampling locations were deemed inaccessible during that event, and so the estuary data collected only characterize concentrations during conditions with a closed estuary mouth.

Although drought conditions limited the conditions in which data were collected, the Reference Beach Study had several key findings:

1. The ranges of annual dry weather FIB concentrations at both beaches were considered low. The ranges are comparable to results from previous FIB beach bacteria reference studies that had estuaries closed to tidal exchange (i.e., San Onofre Creek) or flow to the beach without an estuary (i.e., Deer Creek), with WQO exceedance frequencies in the range of 0% to 3.5%. Prolonged drought conditions resulted in intermittent dry weather flow at Deer Creek and no dry weather flow at San Onofre Creek, which provides important context to interpret data on exceedance frequencies.

2. Concentrations of FIB in the estuary or freshwater mixing zone of both San Onofre and Deer Creeks were typically one to three orders of magnitude higher than their respective beaches, with the highest WQO exceedance frequencies found in San Onofre Creek.

3. In the San Onofre Creek estuary, the dry weather geometric mean exceedance frequency during summer was 72% for fecal coliform; the dry weather geometric exceedance frequency during summer was 100% for both *Enterococcus* and *E. coli*. Dry weather geometric mean exceedances during wet season months ranged from roughly 55% (for total coliform) to 100% (for *Enterococcus*). The higher WQO exceedance frequencies of San Onofre Creek estuary relative to the mixing zone of Deer Creek could be expected, given the abundance of labile organic matter to support microbial growth as well as the presence of water birds typically found in estuaries.

4. At both beaches, no significant relationship was found with water temperature, salinity, or antecedent dry days. In contrast to San Onofre Beach, where FIB concentrations declined with the increasing duration of dry weather, the range and mean FIB concentrations in San Onofre Creek estuary increased with increasing antecedent dry days and salinity, suggesting that freshwater input from the ephemeral channel tended to dilute concentrations, rather than be a source of bacteria to the beach. The slight increase of FIB concentrations as a function of temperature and the lack of surface freshwater input in San Onofre Creek estuary suggests that regrowth may be a factor, which is credible given the organic rich environment of the San Onofre Creek estuary.

5.1.3 Conclusions and Recommendations

Per the MS4 Permit (Provision D.4.c) data resulting from special studies should be used to (1) assess their relevance to the Responsible Agencies' characterization of receiving water conditions, (2) understand sources of pollutants and/or stressors, and (3) control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters. The San Diego Regional Stream and Beach Reference Studies characterized FIB levels in reference waterbodies and contributed to the understanding of non-anthropogenic sources of FIB. The data generated by the study are intended to be used by the Regional Board in the Bacteria TMDL Reopener to derive reasonable and accurate numeric targets for bacteria that account for contributions from natural sources as characterized by the study.

- The San Diego Regional Stream Study is directly related to the highest priority water quality condition. The adaptive management process may use the following key findings to inform the Bacteria TMDL Reopener:
- During dry weather conditions (streams):
  - There are exceedances of FIB WQOs at natural sites for *Enterococcus* and total coliform (single sample and annual 30-day geomean).
  - These are highest during summer months (April to August).
  - There were no exceedances of the fecal coliform single sample WQOs along with a 0% exceedance frequency of the annual 30-day geomean.
  - *E. coli* also had a 0% exceedance frequency of the annual 30-day geomean.

- During wet weather conditions (streams):
  - Storm event mean concentration exceedances of single sample WQOs were 0% for *E. coli*, fecal coliform, and total coliform, but if the storm maximum pollutograph was included, there were exceedances for *E. coli* and total coliform.
  - For the storm event mean concentration exceedances of single sample WQOs for *Enterococcus*, the exceedance frequency on the day of the storm was 87%, compared with 37% for the following three days after the end of the storm.
- In summary for reference streams:
  - *Enterococcus* concentrations can often exceed the WQO in both dry and wet weather conditions in streams with no anthropogenic impacts.
  - Total coliform concentrations exceeded the WQO only during wet weather conditions in the reference watershed streams when the storm peak was incorporated into the event mean concentration.
  - *E. coli* concentrations exceeded the WQO only during wet weather conditions in the reference watershed streams when the storm peak was incorporated into the event mean concentration.
  - Fecal coliform concentrations did not exceed WQO in dry and wet weather conditions in any reference watershed streams.
- During dry weather conditions (beaches):
  - The Enterococcus dry weather annual 30-day geomean exceedance frequency was 100% for the whole year in the San Onofre Creek estuary.
  - The *Enterococcus* dry weather annual 30-day geomean exceedance frequency was 100% for the whole year in the San Onofre Creek estuary.
  - The total coliform dry weather annual 30-day geomean exceedance frequency was 55% during winter months (October to March) in the San Onofre Creek estuary.
  - The *E. coli* dry weather annual 30-day geomean exceedance frequency was 100% during summer months (April to August) in the San Onofre Creek estuary.
  - The fecal coliform dry weather annual 30-day geomean exceedance frequency was 72% during the summer months in the San Onofre Creek estuary.
- During wet weather conditions (beaches):
  - No wet weather reference samples were analyzed for the beach study because human genetic markers were found in the samples during the one wet weather sampling event..

- In summary for reference beaches:
  - *Enterococcus* dry weather 30-day geomeans were exceeded during the whole year.
  - Total coliform dry weather 30-day geomeans were exceeded during the winter months (October to March).
  - *E. coli* and fecal coliform dry weather 30-day geomeans were exceeded during the summer months.

Concentrations of FIB were one to three times higher in estuary or freshwater mixings zones than at the beaches. For reference beaches with both streams and estuaries closed from tidal exchange, *Enterococcus* exceeded WQOs. Total coliform, *E. coli*, and fecal coliform concentrations exceeding WQOs varied for seasons and waterbody types. Additionally, the variability in dry weather FIB concentrations is less than the variability in wet weather FIB event mean concentrations, confirming the findings of previous studies.

5.2 San Dieguito River WMA Bacteria Source Identification and Prioritization Process Special Study

The San Dieguito River WMA Bacteria Source Identification and Prioritization Special Study looked to assess sources of bacteria in the watershed using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process (San Dieguito Responsible Agencies, 2015b) (Attachment E). The original focus was on the beach and lagoon area of the lower San Dieguito River WMA, with inputs from the upper watershed were also considered where relevant and necessary to identify sources of bacteria to the beach and lagoon. After reviewing the historical water quality data, it was determined that certain areas in the WMA exhibited higher bacteria concentrations than others. This finding led to a modification in the special study design, where the bacteria source identification would be focused on the specific areas in the WMA exhibiting higher concentrations of bacteria, rather than broadly assessing the whole WMA. The Responsible Agencies examined individual focus areas within their jurisdictions to be able to modify or tailor efforts in those specific areas.

The focus area drainages were selected because of elevated *Enterococcus* concentrations and known persistent dry weather flows. *Enterococcus* was selected for its qualification as an indicator of human health risk and to remain consistent with the USEPA's 2012 Recreational Water Quality Criteria, which recommends criteria for *E.coli* and *Enterococcus* and has removed criteria for fecal coliform. The focus areas also allowed each participating Responsible Agency to identify bacteria sources to target in their jurisdictions. The study used geospatial data, water quality data, and the prioritization process to determine potential bacteria sources in selected focus areas.

Water quality samples collected during dry weather for *Enterococcus* were the primary source of information used to determine the focus areas within the San Dieguito WMA. After filtering the region-wide bacteria dataset for these conditions, a total of 38 MS4 outfall sampling locations were identified, representing 340 individual data points. After calculating the geomean for each MS4 outfall location, and evaluating the location of the outfall within the WMA, the dry weather flow at the outfall, and the land use draining to the outfall, the focus area selection process identified six focus areas, as shown in Figure 5-1.

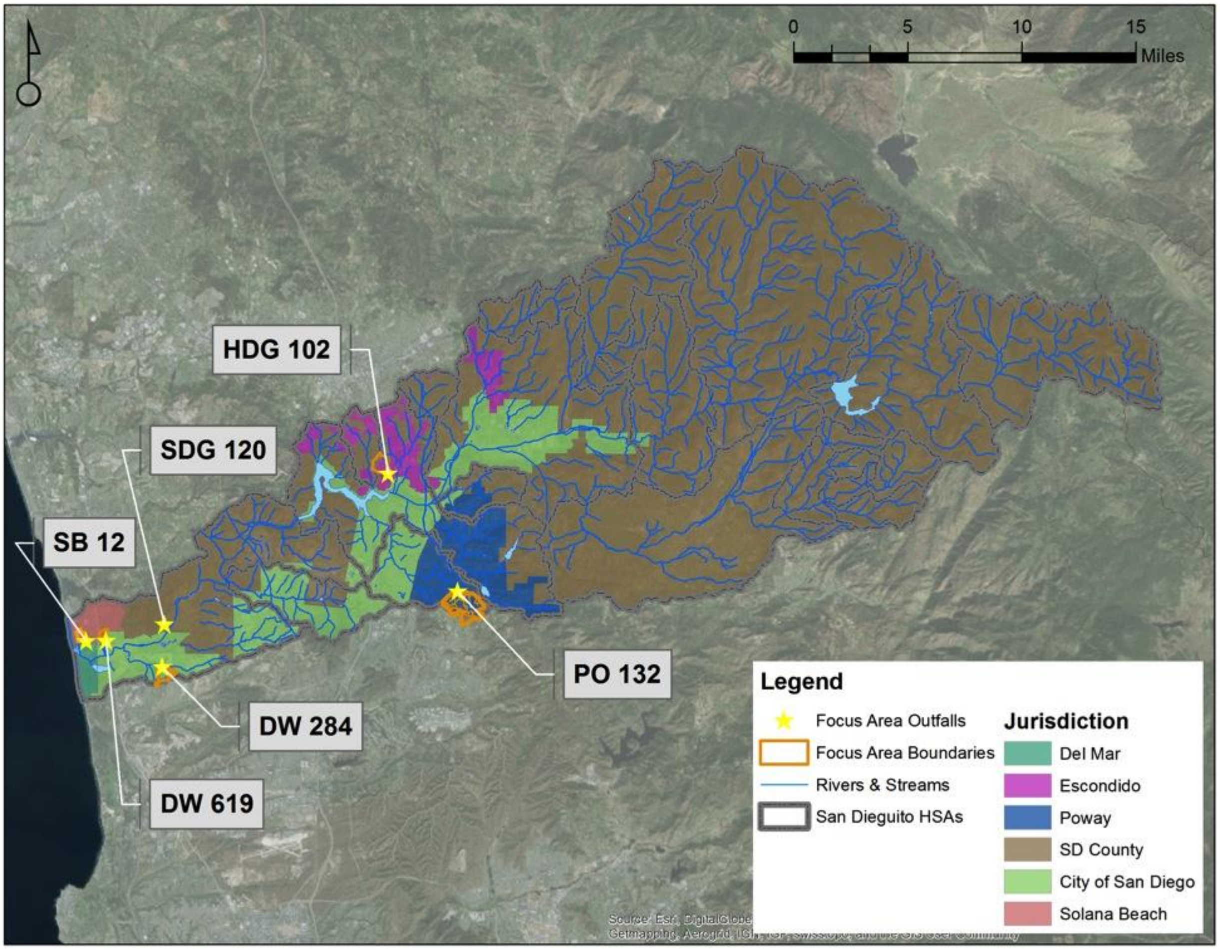

Figure 5-1
Bacteria Source Identification Special Study Focus Areas

Focus areas were selected for all Responsible Agencies other than the City of Del Mar. The City of Del Mar actively tracks and manages geospatial inventory data and conducts monthly patrols to identify any potential issues and sources related to pollutants and urban runoff. Through the analysis of bacteria concentrations (geomeans of *Enterococcus* concentrations), MS4 outfall locations within the jurisdiction, and dry weather flow observations and information, the City of Del Mar does not currently have a focus area identified. The City of Del Mar does not have any persistently flowing major MS4 outfalls that drain to the San Dieguito River or Lagoon. Based on the currently available data, no bacteria exceedances have been recorded for these locations. In addition, since 2013, the City of Del Mar has performed visual outfall monitoring at every outfall, minor or major, on a monthly basis, and the monitored outfalls identified above have never flowed persistently. An analysis of the monthly data from 2013 to the present shows six of the seven MS4 outfalls are consistently dry and one outfall has had minor flow observed twice. The City of Del Mar will continue to conduct frequent city-wide patrols and assessment of data to determine whether specific focus areas will need to be established in the future. Any changes will be documented in applicable WQIP Annual Reports or updates.

The other Responsible Agencies evaluated 50 potential bacteria sources within each focus area, and considered dry and wet weather conditions separately. Of the 50 sources of bacteria, those that were identified as present within the focus area were then prioritized. The potential bacteria sources were grouped into three categories on the basis of bacterial origin: human waste, anthropogenic nonhuman sources, and non-anthropogenic sources. Within these categories, characteristics of the potential sources are evaluated and scored on the basis of five key prioritization metrics:

- **Human health risk** refers to the nature and probability of adverse health effects for those who may be exposed to bacteria produced by a source. The level of human health risk associated with various sources is given a relative score ranging from very low risk and to an exceptionally high risk. Research indicates that the origin of the bacteria may affect the human health risk associated with recreational waters.

- **Magnitude** refers to the concentration or load of bacteria produced by a source. As part of the bacteria source prioritization process, the magnitude associated with various sources is given a relative score ranging very low concentration or load to an exceptionally high concentration or load. Elevated concentrations, even with low flow, can result in high loads, potentially causing increased bacteria concentrations in receiving waters.

- **Transport feasibility** refers to the likelihood of storm water or urban runoff containing bacteria from specific sources of reaching receiving waters. Sources with a lower probability of reaching and influencing water quality in receiving waters are assigned a low score, while sources with a higher likelihood receive a higher score. Transport feasibility is largely affected by weather conditions (i.e., wet weather versus dry weather). The presence of structural BMPs should also be considered when evaluating transport feasibility.

- The **frequency** of a source refers to its presence or absence in the WMA. Where there are relatively lower numbers of a particular source, a lower score is assigned; where there are many numbers of a particular source in the WMA, a higher score is assigned accordingly.

- The **controllability** of a source refers to the ability of the Responsible Agency to control the source with respect to its influence on bacterial water quality. Low scores are deemed difficult to control, whereas higher scores are given to sources that are considered readily controllable.

For each potential source, the Responsible Agencies ranked the five prioritization metrics using a scoring scale of 1 to 10 to evaluate human health risk, magnitude, and frequency, and a scale of 1 to 5 for transport feasibility and controllability. Scores were determined not only based on the results of the source analysis and literature review, but also on each Responsible Agency's local knowledge of the focus area. As a result of the prioritization process, each Responsible Agency ranked 50 potential bacteria sources included in the San Diego Bacteria Source Identification and Prioritization Process for its focus area. The top two bacteria sources for wet and dry weather conditions for each focus areas are presented in Table 5-1.

Table 5-1
Top Two Potential Bacteria Sources for Wet and Dry Weather in Each Focus Area

Outfall ID/Focus Area	Wet Weather Potential Bacteria Source[1]	Dry Weather Potential Bacteria Source[1]
DW-284	1. Pets (Anthropogenic Nonhuman/Domestic Animals) 2. Manure/Compost (Anthropogenic/Landscaping)	1. Pets (Anthropogenic Nonhuman/Domestic Animals) 2. Manure/Compost (Anthropogenic/Landscaping)
SDG-210	1. Illegal Discharges (Human Waste/Other Wastewater) 2. Illicit Connections (Human Waste/Other Wastewater)	1. Illegal Discharges (Human Waste/Other Wastewater) 2. Portable Toilets (Human Waste/Other Wastewater)
HDG_102	1. Leaking Failing Septic Systems (Human Waste/Sewage Infrastructure) 2. Sanitary Sewer Overflows (Human Waste/Sewage Infrastructure)	1. Leaking Failing Septic Systems (Human Waste/Sewage Infrastructure) 2. Sanitary Sewer Overflows (Human Waste/Sewage Infrastructure)
PO-132	1. Wildlife (Birds and Others) (Nonanthropogenic/Wildlife [Birds and Others]) 2. Manure/Compost (Anthropogenic/Landscaping)	1. Wildlife (Birds and Others) (Nonanthropogenic/Wildlife [Birds and Others]) 2. Sanitary Sewer Overflows (Human Waste/Sewage Infrastructure)
SB-12	1. Pets (Anthropogenic Nonhuman/Domestic Animals) 2. Manure/Compost (Anthropogenic/Landscaping)	1. Pets (Anthropogenic Nonhuman/Domestic Animals) 2. Manure/Compost (Anthropogenic/Landscaping)
DW-619	1. Leaking Sewer Pipes (Exfiltration) (Human Waste/Sewage Infrastructure) 2. Sanitary Sewer Overflows (Human Waste/Sewage Infrastructure)	1. Leaking Sewer Pipes (Exfiltration) (Human Waste/Sewage Infrastructure) 2. Sanitary Sewer Overflows (Human Waste/Sewage Infrastructure)

1. Source information presented as Source (Category/Subcategory).

5.2.1 Conclusions and Recommendations

Per the MS4 Permit (Provision D.4.c), data resulting from special studies should be used (1) assess their relevance to the Responsible Agencies' characterization of receiving water conditions, (2) understand sources of pollutants and/or stressors, and (3) control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters. The San Dieguito River WMA Bacteria Source Identification and Prioritization Special Study allowed the Responsible Agencies to prioritize potential sources of bacteria in unique focus areas using existing monitoring and geospatial data. This process can serve as a framework for the Responsible Agencies to review bacteria sources at MS4 outfalls where WQBEL exceedances occur without implementing costly source identification studies and to potentially modify or enhance WQIP strategies in these focus areas.

Each Responsible Agency now has a detailed list of sources to investigate if further exceedances are found at the focus area outfalls. Specific actions by Responsible Agencies include continued frequent city-wide patrols and assessment of data by the City of Del Mar, including determining whether specific focus areas will need to be established in the future. The City of Escondido will fill an identified data gap and conduct a source evaluation to determine the number of registered septic tanks within city limits.

5.3 Proposed Nutrient Load Characterization for Hodges Reservoir

Both the Regional Board and members of the public have requested that the Responsible Agencies further evaluate Hodges Reservoir nutrient impairments as a potential HPWQC. In the WQIP acceptance letter dated February 17, 2016, the Regional Board stated that a nutrient impairment in Hodges Reservoir is "significantly impacting the use of Lake Hodges waters for municipal water supply, restricting water supply blending opportunities, and increasing treatment costs for downstream water supply agencies" (Regional Board, 2016). Maintaining the quality of local potable water supplies is of particular importance as California experiences its fifth consecutive year of drought conditions; as of April 2016, Hodges Reservoir was operating at 40% of capacity (San Diego County Water Authority, 2016).

In fiscal year (FY) 16, the Responsible Agencies completed the Lake Hodges Nutrients Evaluation Technical Memorandum to analyze the receiving water and MS4 data collected. In addition, the Responsible Agencies and the City of San Diego Public Utilities Department (Public Utilities) are currently developing a Study Plan, Monitoring Plan, and Quality Assurance Project Plan (QAPP) for what is now called the Hodges Reservoir Nutrient Source Study.

The goals of the Hodges Reservoir Nutrient Source Study are as follows:

- ❖ Develop a conceptual model that incorporates applicable information from existing models and other available information from Public Utilities, and MS4 inputs within the subwatershed above Hodges Reservoir (subwatershed) to characterize all sources of nutrients in Hodges Reservoir and the subwatershed.
- ❖ Provide data recommendations to refine existing watershed models developed by Public Utilities.

- Develop a study plan to fully characterize the sources detailed in the nutrient conceptual model and available information on identified sources from previous and ongoing studies. The study plan will incorporate pertinent findings from data already collected and ongoing reservoir monitoring projects conducted by Public Utilities, and identify any data gaps. It will include recommended future data collection to refine the conceptual model, as well as the data needed to refine existing models. The monitoring plan and QAPP will provide framework for future monitoring efforts.

Intentionally Left Blank

6 Publicly Available Data

The MS4 Permit requires the Responsible Agencies to provide monitoring data and assessment results to the public. The following sections provide the locations where the public may obtain this information.

6.1 California Environmental Data Exchange Network Upload and Retrieval

Provision F.4.a.(6) of the MS4 Permit requires monitoring data collected as part of the San Dieguito River WMA MAP to be uploaded to CEDEN. Certifications from CEDEN confirming data upload as required will be included in Attachment G.

CEDEN is a central location for finding and sharing information about California's waterbodies and aggregates water quality, aquatic habitat, and wildlife health data. The data are accessible in downloadable forms at www.ceden.org.

Data collected under the San Dieguito River WMA MAP for the October 2015–September 2016 monitoring year will be available in 2017. Data in the CEDEN are searchable by date and by location, project, station, or parameter. Data collected as part of the programs described in this Monitoring Results and Assessment Appendix of the San Dieguito River WQIP Annual Report can be retrieved using the project names listed in Table 6-1.

Table 6-1
Project Names for CEDEN Data Retrieval

Monitoring Program	CEDEN Project Name Field Name "ProjectCode"
MS4 Outfall (Wet and Dry Weather)	MS4_WW_OFM MS4_DW_OFSM
Bacteria TMDL	SanDieguito_BacteriaTMDL

CEDEN = California Environmental Data Exchange Network; MS4 = Municipal Separate Storm Sewer System;
TBD = to be determined; TMDL = Total Maximum Daily Load

6.2 Regional Clearing House

For the 2015–2016 monitoring year, the Responsible Agencies are providing the following data and documentation on the Project Clean Water website (Project Clean Water, 2016), which can be accessed by the general public:

- 2015–2016 Annual Report, including all appendices and associated attachments, including:
  - JRMP Annual Report for each Responsible Agency within the WMA
  - Monitoring Results and Assessment Appendix

  - SMC Bioassessment Summary
  - Bacteria TMDL Compliance Report
  - Reports from special studies conducted in the WMA not previously submitted (San Dieguito River WMA Bacteria Source Identification and Prioritization Process Special Study)
- BMP Design Manual for each Responsible Agency within the WMA and all updated versions with date of update
- Monitoring data uploaded to the CEDEN with links to the uploaded data
- Available geographic information system (GIS) data, layers, and/or shapefiles used to develop the maps to support the WQIP, Annual Reports, and JRMPs

EXECUTIVE SUMMARY

This report presents the 2015–2016 compliance monitoring data required by the Bacteria Total Maximum Daily Load (TMDL)[1] for the San Dieguito River Watershed Management Area (WMA), as incorporated into the Municipal Separate Storm Sewer System (MS4) Permit[2] (San Diego Regional Water Quality Control Board [Regional Board], 2010 and 2013, respectively).

The Bacteria TMDL Compliance Monitoring Program is designed to assess the conditions of the receiving waters and has the following objectives:

- Characterize levels of bacteria concentrations at compliance monitoring locations.
- Track progress toward meeting the Bacteria TMDL numeric targets.

Fecal indicator bacteria[3] (FIB) sampling for the compliance monitoring period (October 2015 through September 2016) was conducted at the following beach compliance monitoring location:

- **San Dieguito Lagoon Mouth–EH-380:** The Pacific Ocean Shoreline at the San Dieguito Lagoon Mouth.

Wet weather samples were collected between October 1, 2015, and April 30, 2016, within 72 hours of the end of rainfall for three wet weather events. Dry weather samples were collected at least weekly in October 2015 and from April 2016 through September 2016, and at least monthly on dry weather days from November 1, 2015, through March 31, 2016. Weekly monitoring was scheduled so that at least five samples were collected in each calendar month. Samples were analyzed for the FIB compliance constituents: total coliform, fecal coliform, and *Enterococcus*.

This report summarizes FIB concentrations and key hydrologic data at the compliance monitoring location by season. Compliance was assessed by comparing analytical results for total coliform, fecal coliform, and *Enterococcus* with the applicable receiving water limitations (RWLs), in accordance with the Bacteria TMDL requirements in Attachment E of the MS4 Permit. The RWLs are a combination of numeric targets for bacteria density and allowable exceedance frequencies. The MS4 Permit clarifies the final RWLs (in terms of the most probable number [MPN]) for total coliform, fecal coliform, and *Enterococcus*. The single-sample maximum numeric targets are required to be achieved only during wet weather, with an allowable exceedance frequency of 22 percent (%). For dry weather days, the 30-day geometric mean numeric targets must be achieved, with a 0% exceedance frequency. Table ES-1 lists the numeric targets for beaches.

[1] *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) To Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria Project I—Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek),* Resolution No. R9-2010-0001, Regional Board, February 10, 2010 (Bacteria TMDL).

[2] *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) Draining the Watersheds Within the San Diego Region,* Order Number R9-2013-0001, Regional Board, May 14, 2013 (MS4 Permit).

[3] Fecal indicator bacteria (FIB) include total coliform, fecal coliform, and *Enterococcus*.

**Table ES-1.
Final Receiving Water Limitations for Beaches**

(Maximum Bacteria Densities and Allowable Exceedance Frequencies)

Constituent	Wet Weather Days [a] Single-Sample Maximum		Dry Weather Days [b] 30-Day Geometric Mean	
	Numeric Target [c] (MPN/100mL)	Final Allowable Exceedance Frequency [d]	Numeric Target [e] (MPN/100mL)	Final Allowable Exceedance Frequency
Total Coliform	10,000	22%	1,000	0%
Fecal Coliform	400	22%	200	0%
Enterococcus	104	22%	35	0%

Notes:
% = percent; mL = milliliters; MPN = most probable number
Source (including footnotes): Bacteria TMDL, Regional Board, Order No. R9-2010-0001, 2010.

a. Wet weather days are defined as days with rainfall events of 0.2 inch or greater, plus the following 72 hours.
b. Dry weather days are defined as days with less than 0.2 inch of rainfall observed on each of the previous 3 days.
c. Wet weather numeric objectives are based on the single-sample maximum (or equivalent) water quality objectives in the *California Ocean Plan* (State Water Resources Control Board [SWRCB], 2012). Compliance with the wet weather TMDLs in the receiving water is based on the frequency of the wet weather days in any given year exceeding the wet weather numeric objective, but the 30-day geometric mean must also be met.
d. The wet weather allowable exceedance frequency is set at 22%. In the calculation of the wet weather TMDLs, the Regional Board chose to apply the 22% allowable exceedance frequency as determined for Leo Carrillo Beach in Los Angeles County. At the time the wet weather watershed model was developed, this 22% exceedance frequency was the only reference beach exceedance frequency that was available. The 22% allowable exceedance frequency that is used to calculate the wet weather TMDLs is justified because the San Diego region watersheds' exceedance frequencies will likely be close to the value calculated for Leo Carrillo Beach, and are consistent with the exceedance frequency that was applied by the Los Angeles Regional Board.
e. Dry weather numeric objectives are based on the 30-day geometric mean (or equivalent) water quality objectives in the California Ocean Plan (SWRCB, 2012). Compliance with the dry weather TMDLs in the receiving water is based on the frequency of the dry weather geometric mean exceeding the dry weather numeric objective.

Monitoring Results and Compliance Discussion

In accordance with the monitoring and assessment requirements in the MS4 Permit, three separate weather-based evaluations were used to address the program objectives: wet weather, wet season, and dry season. Table ES-2 summarizes the 2015–2016 exceedance frequency results and compares them with interim and final allowable exceedance frequencies.

Table ES-2.
2015–2016 Bacteria TMDL Exceedance Frequency Results for San Dieguito River WMA

Site ID	Bacteria TMDL Constituent	Wet Weather [a] Single-Sample Maximum (CFU/100mL)			Wet Season [a, c] 5-Sample Geometric Mean (CFU/100mL)			Dry Season [b] 30-Day Geometric Mean (CFU/100mL)		
		2015–2016 [d] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency
EH-380	Total Coliform	0%	33%	22%	0%	3.0%	0%	0%	3.0%	0%
	Fecal Coliform	0%	33%	22%	0%	5.5%	0%	0%	5.5%	0%
	Enterococcus	13.3%	36%	22%	0%	8.5%	0%	0%	8.5%	0%

Notes:
% = percent; CFU = colony-forming unit; EH-380 = San Dieguito Lagoon Mouth; mL = milliliters; TMDL = total maximum daily load
Green shaded cells show the 2015-2016 observed exceedance frequency.

a. October 1, 2015–April 30, 2016
b. May 1, 2016–September 30, 2016
c. In accordance with the MS4 Permit, wet and dry weather FIB data were combined to calculate geometric means for the wet season and compared to the dry weather RWLs as shown in Table ES-1.
d. The exceedance frequency was derived by dividing the total number of wet weather days (days with 0.2 inch of rainfall or greater plus the following 72 hours) that exceeded the single-sample maximum numeric target divided by the total number of wet weather days during the wet season. To determine exceedances for non-sampled wet weather days, the geometric mean of the analytical results from three monitored storm events was applied to the remaining observed wet weather days that were not sampled. The results from the total number of wet weather days, with either assigned averages or analyzed result values, were then compared with single-sample maximum numeric targets.
e. The exceedance frequency was derived by dividing the total number of geometric exceedances by the total number of geometric means calculated during the season.

This page intentionally left blank.

Wet Weather Single-Sample Maximum Exceedance Frequencies

The wet weather exceedance rate applies only to wet weather days (days with 0.2 inch of rainfall or more, plus the following 72 hours) between October 1 and April 30 of each year. Wet weather exceedance rates for total coliform, fecal coliform, and *Enterococcus* were derived by calculating the average result of wet weather samples and applying that average to the remaining (not sampled) observed wet weather days. Sampling results and the assigned averages were compared with single-sample maximum numeric targets, as established in the Bacteria TMDL. A total of three storm events were sampled during the 2015–2016 wet weather season, at the following location:

- **EH-380:** During wet weather, the receiving waters at the San Dieguito Lagoon Mouth achieved 0% single-sample maximum exceedance frequencies for compliance constituents total coliform and fecal coliform. The single-sample maximum exceedance frequency for *Enterococcus* was 13.3%.

Wet Season Geometric Mean Exceedance Frequencies

The wet season is from October 1 through April 30 of each year. Wet season exceedance rates for total coliform, fecal coliform, and *Enterococcus* are derived by calculating a rolling geometric mean using results from the last five sampling results (combined dry weather and wet weather):

- **EH-380:** During the wet season, the receiving waters at the San Dieguito Lagoon Mouth achieved a 0% exceedance frequency for compliance constituents total coliform, fecal coliform, and *Enterococcus.*

Dry Season Geometric Mean Exceedance Frequencies

The dry season is May 1 through September 30 of each year. Dry season exceedance rates for total coliform, fecal coliform, and *Enterococcus* are derived by calculating a rolling 30-day geometric mean using the last five sampling results, as described in the *California Ocean Plan* (Ocean Plan) (SWRCB, 2012), at the compliance monitoring location:

- **EH-380:** During the dry season, the receiving waters at the San Dieguito Lagoon Mouth achieved a 0% exceedance frequency for compliance constituents total coliform, fecal coliform, and *Enterococcus.*

Summary

Wet and dry weather data collected during the 2015–2016 wet season and the 2016 dry season were used to evaluate compliance on the basis of current conditions. Overall, the San Dieguito Lagoon Mouth compliance monitoring location achieved full compliance with dry and wet weather RWLs for the 2015–2016 monitoring year.

During the wet season, which evaluates a combination of both wet and dry weather samples, *Enterococcus* (during wet weather) was the only constituent detected in concentrations that exceeded the wet weather single-sample maximum. However, the *Enterococcus* exceedance frequency was not above the interim allowable exceedance frequency and, therefore, the San Dieguito Lagoon Mouth compliance monitoring location achieved full compliance with the RWL during wet weather. The San Dieguito Lagoon Mouth compliance monitoring location also achieved full compliance with the RWL during the wet season for all three FIB constituents.

During the dry season, when recreational activities occur with more regularity, the San Dieguito Lagoon Mouth location achieved 0% exceedance frequencies for compliance constituents total coliform, fecal coliform, and *Enterococcus*.

Collectively, the datasets suggest that, during the monitoring year, bacteria densities support water contact recreation beneficial use (REC-1) conditions in the San Dieguito River WMA.

Ongoing Efforts

Certain studies and activities of the San Dieguito River WMA RAs may provide additional data that could be used in subsequent Bacteria TMDL compliance assessments:

- The City and County of San Diego are participating in data assessments and coordination meetings with the Regional Board and other RAs to determine potential modifications to be considered in the Bacteria TMDL Reopener. During the Bacteria TMDL Reopener, the Regional Board may update the TMDL based on current data and United States Environmental Protection Agency (USEPA) policy, which may lead to revised terms of compliance. The Bacteria TMDL Reopener is in progress and is expected to be completed in 2018.
- The RAs have completed the San Diego Regional Reference Stream and San Diego Regional Reference Beaches Studies. The data are being used in the Bacteria TMDL Reopener to evaluate natural sources of bacteria in reference streams and at beaches and these data are being utilized in the Bacteria TMDL Reopener to update numeric targets (Southern California Coastal Water Research Project [SCCWRP], 2015, 2016).
- The RAs completed a bacteria source identification study specific to the San Dieguito River WMA. Additional information regarding bacteria densities and sources in the San Dieguito River WMA may be included in the Water Quality Improvement Plan Annual Report.
- RAs will continue to monitor for the Bacteria TMDL Compliance Monitoring Program for fiscal year (FY)17.

1.0 INTRODUCTION

This report presents the 2015–2016 San Dieguito River Watershed Management Area (WMA) Bacteria Total Maximum Daily Load (TMDL)[4] (San Diego Regional Water Quality Control Board [Regional Board], 2010) compliance monitoring data, in accordance with Attachment E.6 of the Municipal Separate Storm Sewer System (MS4) Permit[5]. The San Dieguito River WMA Bacteria TMDL Compliance Monitoring Plan (Compliance Monitoring Plan) was developed to meet the Bacteria TMDL requirements of the MS4 Permit and to generate data to support the San Dieguito River WMA Water Quality Improvement Plan (San Dieguito River WMA Responsible Agencies [RAs] 2015, 2016). Supporting information for this Compliance Monitoring Report is in the Compliance Monitoring Plan and San Dieguito River WMA Water Quality Improvement Plan located on the Project Clean Water website (www.projectcleanwater.org).

The Bacteria TMDL Compliance Monitoring Program is designed to assess the conditions of the receiving waters and has the following objectives:

- Characterize levels of bacteria concentrations at the compliance monitoring locations.
- Track progress toward meeting the Bacteria TMDL numeric targets.

In accordance with the Compliance Monitoring Plan, the San Dieguito River WMA RAs monitored the Pacific Ocean Shoreline at the San Dieguito Lagoon Mouth (San Dieguito Lagoon Mouth compliance monitoring location, EH-380). Table 1-1 provides the location name and coordinates for the compliance monitoring location, and Figure 1-1 presents a map of the compliance monitoring location within the watershed. Indicator bacteria sampling for the 2015–2016 compliance monitoring season was conducted during wet and dry weather at the San Dieguito Lagoon Mouth compliance monitoring location and samples were analyzed for three fecal indicator bacteria (FIB) compliance constituents: total coliform, fecal coliform, and *Enterococcus.*

Table 1-1.
Bacteria TMDL Compliance Monitoring Location

Site ID	Site Name	Site Type	Latitude	Longitude

1.1 Document Overview

This report has five sections that contain the following information:

- **Section 1—Introduction:** Information on purpose of report, the Bacteria TMDL, compliance monitoring location, numeric targets, and schedule.
- **Section 2—Monitoring Results Summary:** Overview of the compliance monitoring conducted during the reporting period, including any changes to monitoring or analytical methods, hydrology summaries, event data and observations, and FIB concentration in wet and dry weather during 2015–2016, along with an evaluation of seasonal patterns in FIB concentrations.
- **Section 3— Compliance Evaluation:** Evaluation of current receiving water conditions and a comparison with the Bacteria TMDL receiving water limitations (RWLs) based on 2015–2016 data.

- **Section 4—Summary:** Program objectives and ongoing efforts.
- **Section 5— References:** Sources used to prepare this report.

1.2 Compliance Requirements for Bacteria Total Maximum Daily Load

As described in the San Dieguito River WMA Water Quality Improvement Plan, the basis for Bacteria TMDL compliance is demonstrated through interim and final water quality-based effluent limitations (WQBELs). The WQBELs include RWLs for the San Dieguito Lagoon Mouth compliance monitoring location and are provided in Table 1-2.

Table 1-2.
Final Receiving Water Limitations for Beaches

(Maximum Bacteria Densities and Allowable Exceedance Frequencies)

Constituent	Wet Weather Days [a]		Dry Weather Days [b]	
	Single-Sample Maximum (MPN/100mL) [c]	Single-Sample Maximum Allowable Exceedance Frequency [d]	30-Day Geometric Mean (MPN/100mL) [e]	30-Day Geometric Mean Allowable Exceedance Frequency
Total Coliform	10,000	22%	1,000	0%
Fecal Coliform	400	22%	200	0%
Enterococcus	104	22%	35	0%

Notes:
% = percent; mL = milliliters; MPN = most probable number
Source (including footnotes): Bacteria TMDL, Regional Board, Order No. R9-2010-0001, 2010.

a. Wet weather days are defined as days with rainfall events of 0.2 inch or greater, plus the following 72 hours.
b. Dry weather days are defined as days with less than 0.2 inch of rainfall observed on each of the previous 3 days.
c. Wet weather numeric objectives are based on the single-sample maximum (or equivalent) water quality objectives in the *California Ocean Plan* (State Water Resources Control Board [SWRCB], 2012). Compliance with the wet weather TMDLs in the receiving water is based on the frequency of the wet weather days in any given year exceeding the wet weather numeric objective, but the 30-day geometric mean must also be met.
d. The wet weather allowable exceedance frequency is set at 22%. In the calculation of the wet weather TMDLs, the Regional Board chose to apply the 22% allowable exceedance frequency as determined for Leo Carrillo Beach in Los Angeles County. At the time the wet weather watershed model was developed, this 22% exceedance frequency was the only reference beach exceedance frequency that was available. The 22% allowable exceedance frequency that is used to calculate the wet weather TMDLs is justified because the San Diego region watersheds' exceedance frequencies will likely be close to the value calculated for Leo Carrillo Beach, and are consistent with the exceedance frequency that was applied by the Los Angeles Regional Board.
e. Dry weather numeric objectives are based on the 30-day geometric mean (or equivalent) water quality objectives in the *California Ocean Plan* (SWRCB, 2012). Compliance with the dry weather TMDLs in the receiving water is based on the frequency of the dry weather geometric mean exceeding the dry weather numeric objective.

The San Dieguito River WMA Water Quality Improvement Plan provides the compliance timeline for the Bacteria TMDL, and outlines the interim and final reduction milestones for both dry and wet weather. Per Attachment E.6.c(1) of the MS4 Permit, interim compliance dates may be modified by an accepted Water Quality Improvement Plan. Full dry weather compliance requires a 0 percent (%) exceedance frequency for all dry weather periods by 2021, and full wet weather compliance requires a 22% allowable exceedance frequency during wet weather periods by 2031.

The "existing" or historical exceedance frequency is used to calculate 50% interim milestones for both wet and dry weather. Progress toward achieving dry weather and wet weather milestones is demonstrated through comparison with interim and final allowable exceedance frequencies. Table 1-3 presents dry weather existing, interim, and final allowable exceedance frequencies. Per the San Dieguito River WMA Water Quality Improvement Plan, the 50% reduction milestone is to be met in 2019 for the Cities of Del Mar, Escondido, Poway, San Diego, and Solana Beach and in 2020 for the County of San Diego, with a 100% reduction milestone in 2021 for all RAs.

Table 1-3.
San Dieguito River WMA Bacteria TMDL Compliance Reduction Milestones—Dry Weather

Constituent	Receiving Water Exceedance Frequency		
	"Existing" Exceedance Frequency [a,b]	2019 [c] or 2020 [d] Interim Milestone	2021 [e] Final Compliance
Total Coliform	6%	3%	0%
Fecal Coliform	11%	5.5%	0%
Enterococcus	17%	8.5%	0%

Notes:
% = percent; ID = identification
a. Percentage fractions are rounded to the nearest whole number.
b. "Existing" dry weather exceedance frequency is determined using the historical data from January 1, 1996, to December 31, 2002, comparing the total number of historical geometric means with TMDL numeric targets. The existing dry weather exceedance frequency was derived using available California Assembly Bill 411 (AB 411) data from 1996 through 2002.
c. Interim milestone for the Cities of Escondido, Del Mar, Poway, San Diego, and Solana Beach.
d. Interim milestone for the County of San Diego.
e. The final milestone is a 100% reduction from the existing exceedance frequency to the allowable exceedance frequency

Table 1-4 presents wet weather existing, interim, and final allowable exceedance frequencies. Per the San Dieguito River WMA Water Quality Improvement Plan, the 50% reduction milestone is to be met in 2024 for the Cities of Del Mar, Escondido, Poway, San Diego, and Solana Beach and 2028 for the County of San Diego, with a 100% reduction milestone in 2031 for all RAs.

Table 1-4.
San Dieguito River WMA Bacteria TMDL Compliance Reduction Milestones—Wet Weather

Constituent	Receiving Water Exceedance Frequency		
	"Existing" Exceedance Frequency [a]	2024[b] or 2028[c] Interim Milestone	2031[d] Final Compliance
Total Coliform	44%	33%	22%
Fecal Coliform	43%	33%	22%
Enterococcus	49%	36%	22%

Notes:
% = percent; ID = identification
a. Source: Bacteria TMDL
b. Interim milestone for the Cities of Escondido, Del Mar, Poway, San Diego, and Solana Beach.
c. Interim milestone for the County of San Diego.
d. The final milestone is a 100% reduction from the existing frequency to the allowable exceedance frequency.

1.3 Monitoring and Analytical Methods

The Pacific Ocean Shoreline at San Dieguito Lagoon Mouth segment named in the Bacteria TMDL was removed from the Clean Water Act 303(d)-List for REC-1 impairment in 2010 and is considered de-listed. Per Attachment E of the MS4 Permit, because of the de-listed status of their segment, the San Dieguito River WMA RAs have the flexibility to propose alternative monitoring procedures (such as reduced monitoring) for Bacteria TMDL compliance monitoring as part of the Water Quality Improvement Plan and its updates. For their first year of implementation, the RAs elected to monitor more frequently than the minimum monitoring requirements described in Attachment E of the MS4 Permit.

The Compliance Monitoring Plan describes the monitoring and analytical methods (Sections 3 and 4) and data management methods (Section 5.1). Compliance monitoring was performed in accordance with the Compliance Monitoring Plan, except as noted in Sections 1.3.1 and 1.3.2 and the Quality Assurance Quality Control Summary (Appendix A).

1.3.1 Dry Weather Monitoring

Per the Compliance Monitoring Plan, weekly dry weather monitoring was scheduled for the months of April through October so that five samples were collected in each calendar month. However, in May 2016 and September 2016, only four samples were collected in each of these months because of wet weather interference.

1.3.2 Precipitation Data

Per the Compliance Monitoring Plan, precipitation data from the National Weather Service (NWS) Del Mar rain gauge were to be used to track the total number of wet weather days as defined in the MS4 Permit. However, the NWS Del Mar rain gauge was relocated in September 2015, and was also missing data for a portion of the 2015–2016 monitoring year. To provide a more complete dataset, the NWS Miramar Naval Air Station (MNAS) gauge was used in its place. Because MNAS officially became Marine Corps Air Station Miramar (Miramar) in 1999, this gauge is referred to as the Miramar gauge in this document (Shettle, 2001). The Miramar gauge is technically within the Mission Bay WMA; however, it is the nearest gauge that is representative of rainfall in the middle of the San Dieguito River WMA. Historical daily rainfall amounts generated by the NWS will be used to assess the annual rainfall and historical average for San Diego County.

This page intentionally left blank.

2.0 MONITORING RESULTS SUMMARY

This section outlines hydrology summaries, event data and observations, and FIB concentrations for both wet and dry weather conditions.

Precipitation data from the NWS Miramar rain gauge were used to track the total number of wet weather days as defined in the MS4 Permit. Historical daily rainfall amounts generated by the NWS at the Miramar rain gauge were used to compare the annual rainfall and historical averages for San Diego County.

A summary of quality assurance and quality control data is provided in Appendix A. Field measurements and analytical results for wet weather are presented in Appendix B. Field measurements and analytical results for dry weather are presented in Appendix C.

2.1 Wet Weather Compliance Monitoring

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) conducted wet weather monitoring at the San Dieguito Lagoon Mouth compliance monitoring location, EH-380. Three storm events were monitored during the 2015–2016 wet season, as summarized in Section 2.1.1. The RAs elected to monitor during wet weather at a higher frequency than required by the Compliance Monitoring Plan to provide additional baseline data. Storms resulting in greater than 0.2 inch of precipitation were targeted for analysis. One grab sample was collected per storm event along with *in situ* field measurements within 72 hours of the end of precipitation. Event field data, including atmospheric conditions, sample characteristics, sampling times, field measurements, and other notable observations, were documented. Bacteria grab samples were submitted to Weck Laboratories Inc. or the City of San Diego's Environmental and Technical Services (EM&TS) Laboratory for analysis.

2.1.1 Wet Weather Hydrology Summary

Precipitation data from the Miramar gauge were used to track the total number of wet weather days. Measured rainfall is also compared with the historical average measured at Miramar from 1981 to 2010. This comparison will support future evaluations of annual precipitation and potential effects on FIB concentrations or the assessment of exceedances. The rainfall data were accessed through the National Oceanic and Atmospheric Agency (NOAA) National Centers for Environmental Information website (http://www.ncdc.noaa.gov/cdo-web/).

Total precipitation recorded at Miramar for the 2015–2016 wet season was 10.74 inches, which was below the historical average of 10.97 inches. The season began with above-average rainfall in October 2015; below-average rainfall was recorded in November and December 2015, and February and March 2016; above-average rainfall was recorded in January and April 2016.

Table 2-1 summarizes wet weather monthly precipitation data for the Miramar gauge for this wet season, along with the historical data for comparison.

Table 2-1.
Wet Weather Monthly Rainfall Summary

Month	Miramar Rainfall (inches)	
	2015–2016 Monitoring Season	1981–2010 Historical Average
October	0.53	0.36
November	0.47	1.19
December	1.3	1.86
January	6.0	2.18
February	0.06	2.60
March	1.29	2.07
April	1.09	0.71
Total Rainfall	**10.74**	**10.97**

Source: NOAA National Centers for Environmental Information website (http://www.ncdc.noaa.gov/cdo-web/)

Three storm events were successfully monitored at the San Dieguito Lagoon Mouth compliance monitoring location. The monitored storms represent storms of various sizes, as recorded at the Miramar gauge. Wet Weather Event 1 was a large storm with 5.39 inches of rainfall, and Wet Weather Event 2 was a smaller storm with 0.59 inch of rainfall. Wet Weather Event 3 was a medium storm with 0.85 inch of rainfall. Table 2-2 presents the precipitation as measured at the Miramar gauge for the three monitored wet weather events. Each monitored storm event is described in detail in the following sections.

These storms depict the usual range of events that may occur during the wet season. The watershed response varies throughout the wet season, based on factors such as antecedent soil moisture conditions, impervious area, rainfall amount, and rainfall intensity. During larger storms, runoff from pervious surfaces can increase after soils are completely saturated. Earlier in the wet season, soil conditions throughout the watershed are drier and increased infiltration results in less runoff. Later in the wet season, the ground is more saturated, resulting in greater volumes discharged to ocean receiving waters.

Table 2-2.
Total Rainfall for 2015–2016 Monitored Events

Event	Event Start Date	Event End Date	Sampling Date	Rainfall Miramar (inches)
Wet Weather Event 1	1/4/2016	1/11/2016	1/9/2016	5.39
Wet Weather Event 2	1/30/2016	2/3/2016	2/3/2016	0.59
Wet Weather Event 3	3/5/2016	3/11/2016	3/10/2016	0.85

2.1.1.1 Wet Weather Event 1 – January 9, 2016

A qualifying wet weather event (greater than or equal to 0.2 inch of rainfall preceded by at least 72 hours of less than 0.1 inch of rainfall) began on January 4, 2016. This event was the largest storm event of the 2015–2016 wet season, with a total of 5.39 inches of rainfall. The greatest amount of rainfall occurred on January 6 (2.03 inches), followed by January 5, 2016 (1.87 inches) and January 7, 2016 (1.26 inches), with lesser amounts recorded on January 4, 8, and 9, 2016 (0.08 inch, 0.14 inch, and 0.01 inch, respectively).

Wet weather samples were collected within 72 hours after the end of a storm event. Bacteria grab samples were collected at the San Dieguito Lagoon Mouth compliance monitoring location at 12:12pm on January 9, 2016, approximately 34 hours after the end of precipitation. Grab samples were submitted to Weck Laboratories Inc. for analysis within the prescribed holding times. In addition, *in situ* field measurements and field observations were collected and recorded for the location.

2.1.1.2 Wet Weather Event 2 – February 3, 2016

The second monitored storm event began on January 30, 2016. On January 30, 2016, 0.02 inch of rainfall was measured, followed by 0.57 inch on January 31, 2016, as recorded at the Miramar gauge. Precipitation totals exceeded 0.2 inch at the Miramar gauge (0.59 inch). Bacteria grab samples were collected at the San Dieguito Lagoon Mouth compliance monitoring location at 10:35am on February 3, 2016, approximately 68 hours after the end of precipitation. Grab samples were submitted to Weck Laboratories Inc. for analysis within the prescribed holding times. In addition, *in situ* field measurements and field observations were collected and recorded for the location.

2.1.1.3 Wet Weather Event 3 – March 10, 2016

The third monitored event for the 2015–2016 wet season began on March 5, 2016. Showers continued through March 7, 2016. Precipitation totals exceeded 0.2 inch, with the Miramar gauge recording 0.85 inch of rainfall.

A wet weather sample was collected at the San Dieguito Lagoon Mouth compliance monitoring location approximately 57 hours after the end of precipitation. Bacteria grab samples were collected at the compliance monitoring location at 8:40am on March 10, 2016. Grab samples were submitted to Weck Laboratories Inc. for analysis within the prescribed holding times. In addition, *in situ* field measurements and field observations were collected and recorded for the location.

2.1.2 Wet Weather FIB Concentrations

Elevated FIB concentrations were observed only during one of the three monitoring events, for one of the three compliance constituents. For Wet Weather Event 1, which was the largest monitored storm with 5.39 inches of rainfall, *Enterococcus* concentrations were elevated above the numeric target; fecal and total coliform concentrations, however, were not elevated. Wet Weather Events 2 and 3 did not have elevated concentrations of any of the three compliance constituents. Table 2-3 presents 2015–2016 wet weather analytical results for compliance constituents. Figure 2-1 illustrates 2015–2016 wet weather bacteria densities as compared with the single-sample maximum numeric targets. Additional wet weather monitoring data or information are included in the following appendices:

- Appendix B: Optional field measurements for 2015–2016 wet weather monitoring;
- Appendix D: 2015–2016 wet weather laboratory reports; and
- Appendix E: 2015–2016 wet weather field data sheets.

Table 2-3.
Wet Weather Analytical Results for San Dieguito River WMA

Analyte	Unit	Numeric Target	Method	MDL[a]	RL[a]	Analytical Results – Site ID EH-380		
						Wet Weather Event 1 1/9/2016 [c]	Wet Weather Event 2 2/3/2016 [c]	Wet Weather Event 3 3/10/2016 [c]
Total Coliform	CFU/100mL	10,000	SM 9222B	2	2 (20 [b])	2,600	200	<20
Fecal Coliform	CFU/100mL	400	SM 9222D	2	2	270	4	2
Enterococcus	CFU/100mL	104	USEPA 1600	1	2 (10 [b])	**290**	86	<2

Notes:
% = percent; CFU = colony-forming unit; EH-380 = San Dieguito Lagoon Mouth; ID = identification; mL = milliliters; TMDL = total maximum daily load; MDL = method detection limit; RL = reporting limit; SM = USEPA Standard Method; USEPA = United States Environmental Protection Agency;
Bolded value = concentration exceeds the single-sample maximum numeric target.
a. MDL/RL values vary with the dilutions used to generate plates within the countable range.
b. Reporting limit used for Wet Weather Event 1.
c. Date sample was collected.

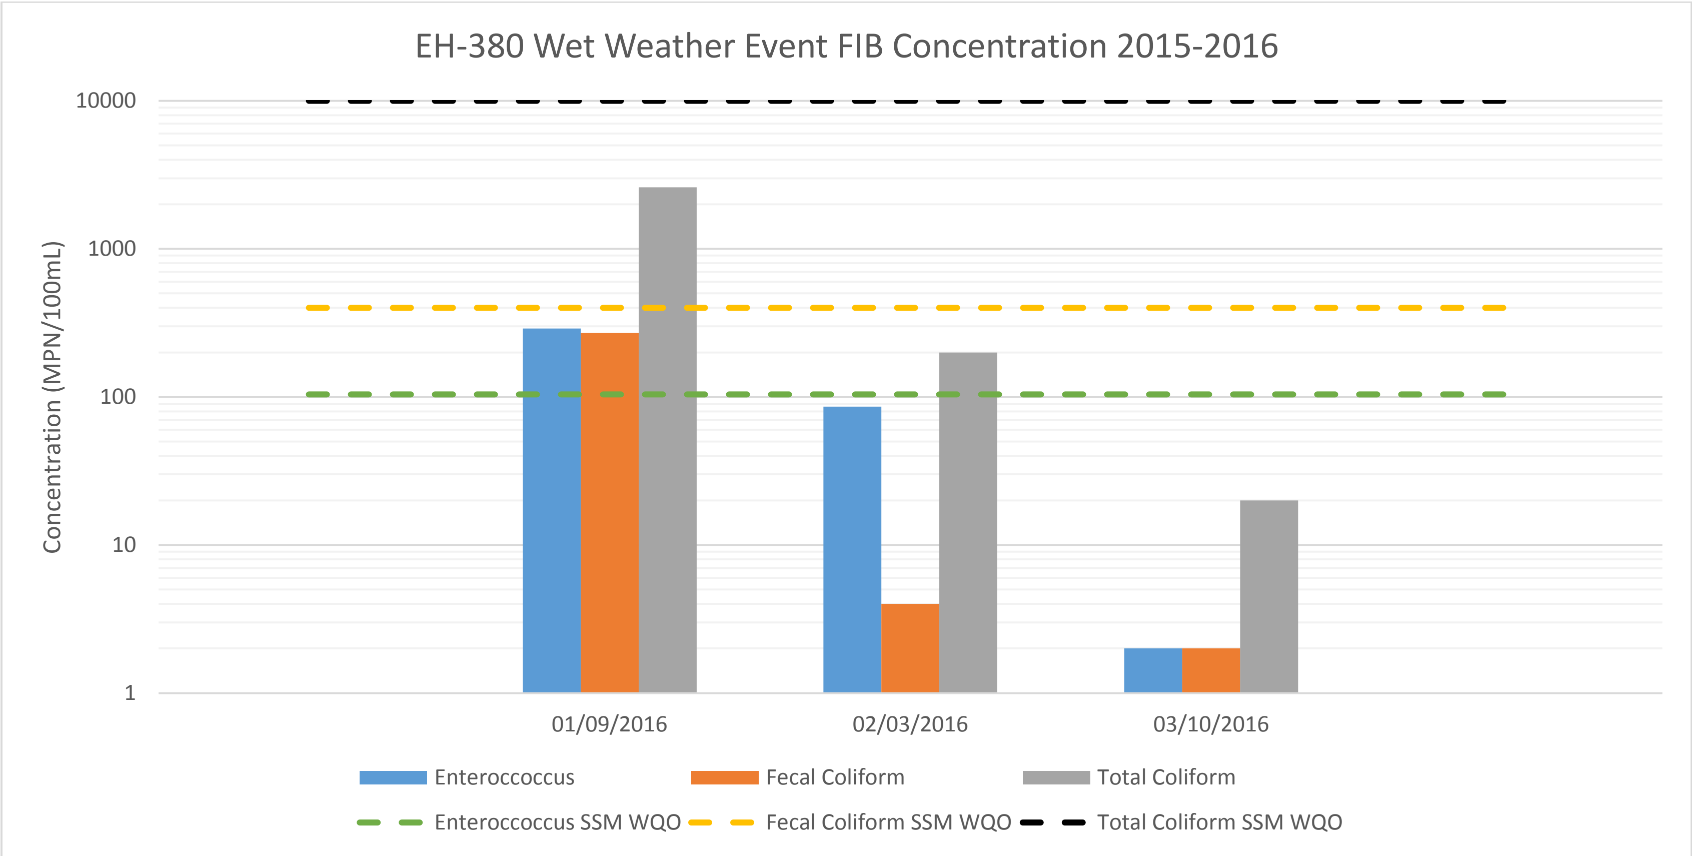

Figure 2-1.
2015–2016 Wet Weather Fecal Indicator Bacteria Concentrations – EH-380

2.2 Dry Weather Compliance Monitoring

Dry weather monitoring was performed during both the wet season (October 1, 2015, through April 30, 2016) and the dry season (May 1, 2016, through September 30, 2016). As specified in the Compliance Monitoring Plan, the following sampling was conducted:

- Weekly dry weather monitoring in October 2015 and from April 2016 through September 2016.
  - RAs elected to perform weekly monitoring during October 2015 and from April 2016 through September 2016 to capture potential conditions with more recreational activities, consistent with the recreational monitoring season of the California Assembly Bill 411 (the Beach Safety Act, or AB 411) program. Weekly dry weather sampling is also above and beyond the requirements of Attachment E of the MS4 Permit: only monthly sampling is required.
  - At least five samples were collected in each calendar month, except during May 2016 and September 2016, when only four samples were collected because of wet weather interference.
- Monthly dry weather monitoring from November 2015 through March 2016.

Dry weather events, as defined by Attachment E of the MS4 Permit, may occur on dry weather days with an antecedent dry period of 72 hours with less than 0.1 inch of rainfall. All dry weather samples were collected by the City of Del Mar's Clean Water Program on behalf of the RAs. Bacteria samples were submitted to the City of San Diego's EM&TS Laboratory for analysis.

2.2.1 Dry Weather Monitoring Summary

During each successful dry weather event, water grab samples were collected in the receiving waters at the San Dieguito Lagoon Mouth compliance monitoring location. Tables presenting dry weather FIB concentrations and field measurements for the 2015–2016 monitoring year are provided in Appendix C.

The field scientists noted visual observations during each dry weather sampling event. In general, field observations such as the presence of algae or trash occurred only during a few sampling events. Table 2-4 presents sampling event information (approximate tidal stage and total antecedent dry weather days before each event), with wet season dry weather sampling dates highlighted in blue.

During the wet season (October through April), a total of 15 dry weather sampling events were conducted at the San Dieguito Lagoon Mouth compliance monitoring location.

During the dry season (May through September), a total of 25 dry weather sampling events were scheduled at the San Dieguito Lagoon Mouth compliance monitoring location. In both May and September 2016, one planned sampling event was canceled because of rainfall. Therefore, the total sample count for San Dieguito Lagoon Mouth was 23 for the dry season.

Table 2-4.
Dry Weather Sampling Summary and Antecedent Dry Days

Date Visited	Tide Height [a] (feet)	Antecedent Dry Days [b]	
		<0.1 inch	<0.2 inch
10/12/2015	3	6	6

9/13/2016	4	130	130
9/27/2016	3	6	7
9/28/2016	4	7	8

Notes:
Source = National Oceanographic and Atmospheric Administration (NOAA)
DW = dry weather
Blue-shading indicates dry weather events during the wet season.

a. Tide height is approximate and pertains to all sampled sites.
b. National Weather Service (NWS) archived rain gauge data for Miramar were used to determine antecedent dry days, unless otherwise noted.
c. 4/13/16 was defined as a wet weather day based on precipitation >0.2 inch on 4/10/16. However, hourly weather observations at the Miramar gauge place the end of measureable precipitation on 4/10/16 at 04:55 PDT, before the first sampling time. Thus, samples collected on 4/13/16 were collected >72 hours after the end of precipitation and are considered dry weather samples.

Although total measured rainfall during the wet season was below average, above average rainfall was recorded throughout the 2016 dry season. From May 1, 2016, through September 30, 2016, a total of 0.95 inch of precipitation was measured at the Miramar station. Table 2-5 summarizes total monthly rainfall for the 2016 dry season.

Table 2-5.
Dry Season Monthly Rainfall Summary

Month	Miramar Rainfall (inches)	
	2015–2016 Monitoring Season	1981–2010 Historical Average
May	0.59	0.16
June	0	0.06
July	0	0.06
August	0	0.02
September	0.36	0.19
Total Rainfall	**0.95**	**0.49**

2.2.2 Dry Weather FIB Concentrations

Dry weather samples were collected during the 2015–2016 wet season and the 2016 dry season, as noted in Section 2.2. Dry weather samples collected during the 2016 dry season consistently displayed lower bacteria concentrations than dry weather samples collected during the wet season.

During the dry weather conditions in the dry season, no elevated FIB concentrations at the San Dieguito Lagoon Mouth compliance monitoring location were observed, which is typically when beach visitation and recreation use are at the highest levels. During dry weather conditions in the wet season, fecal and total coliform concentrations were not observed to be elevated; however, *Enterococcus* concentrations exceeded the single-sample maximum for two events: one in October 2015 and one in February 2016. Based on current monitoring, the sources of elevated FIB concentrations are not known; potential sources include land areas draining directly to the San Dieguito Lagoon Mouth and Pacific Ocean and natural sources (regrowth and marine life). Marine mammals, birds, and seaweed are potential natural sources of bacteria. According to the Southern California Bight 2008 Regional Monitoring Program (Bight ’08) Shoreline Microbiology Study conducted by the Southern California Coastal Water Research Project (SCCWRP) at Southern California beaches (SCCWRP, 2012), resident bird populations are natural sources of FIB; FIB regrowth on beach wrack and beach sand is a potential source of increased FIB densities.

Figure 2-2 depicts FIB concentrations for each dry weather monitored event between October 1, 2015, and September 30, 2016. The blue-shaded area indicates dry weather results generated during the wet season, when elevated FIB densities are more likely to occur.

3.0 COMPLIANCE EVALUATION

This section presents the results of the compliance evaluation for dry and wet seasons in accordance with the assessment requirements of Attachment E of the MS4 Permit.

3.1 Compliance Evaluation Methods

Separate evaluations were completed using geometric means for dry season dry weather and wet season combined all weather, and single-sample maximums for wet weather results as described in this report. FIB data collected between October 2015 and September 2016 in accordance with the Compliance Monitoring Plan were used in the compliance assessments.

Several inconsistencies were identified in Attachment E.6.6 of the MS4 Permit that may affect the interpretation of compliance; these inconsistencies are explained in detail in Appendix F.

3.1.1 Wet Weather Single-Sample Maximum Exceedance Frequency

Wet weather exceedances are based on a comparison of the rate of exceedances of the single-sample maximum numeric target with the allowable 22% exceedance frequency. Wet weather events include the storm day(s) (0.2 inch of rainfall or greater) and the following 72 hours, resulting in a minimum wet weather event duration of 4 days. Per of Attachment E of the MS4 Permit, for monitored storm events, the highest reported result from a storm event is applied to each day for the duration of that event. An inferred exceedance rate must be calculated to account for non-monitored storm events.

For the remaining wet weather days that are not associated with a monitored event, the average (geometric mean) of the highest reported results from each of the three monitored wet weather events is assigned to the remaining wet weather days in the wet season:

$$\text{Geometric Mean} = \quad n^{th} \text{ root of } (X_1)(X_2)_{\dots} X_n$$

where: $X_1, X_2, etc.$ is the highest reported concentrations of the monitored event
n is the number of monitored storm events

The wet weather exceedance frequency is then determined by dividing the number of wet weather days that exceeded the single-sample maximum numeric target by the total number of wet weather days observed during the 2015–2016 wet season. A list of observed wet weather days for the 2015–2016 wet season, both monitored and observed, is provided in Appendix B.

$$\text{Wet Weather Exceedance Frequency (\%)} = 100 * \frac{\Sigma(\text{WWD} > \text{Wet Weather RWL})}{\Sigma \text{WWD}}$$

where: ΣWWD is the sum of wet weather days (0.2 inch of rainfall or more) and the following 72 hours

3.1.2 Wet Season Geometric Mean and Exceedance Frequency

Per of Attachment E of the MS4 Permit, a wet season exceedance frequency was calculated using the combined wet and dry weather results between October 1 and April 30 and compared with dry weather RWLs. During the wet season, the amount of time summarized by each geometric mean varies. Dry weather sampling was conducted weekly during the wet season in October 2015 and April 2016, and monthly from November 2015 through March 2016. In addition, three wet weather events were monitored during the wet season; one sample was collected for each wet weather event. A rolling geometric mean calculation was calculated from the five most recent wet season samples. With each subsequent sample collected, the first sample from the preceding five-sample geometric mean was dropped. The wet season geometric mean is calculated as follows:

$$\text{5-Sample Geometric Mean} = n\sqrt{(X_1)(X_2)(X_3)(X_4)(X_5)}$$

where: n is the number of individual results used in the calculation
X_n is sample *n* result (e.g., X_1 = November result, X_2 = Wet Weather 1 Result)

A wet season exceedance occurs when a geometric mean exceeds the dry weather numeric target. The first geometric mean was calculated after the fifth sample in October. To determine the wet season exceedance frequency, the number of wet season geometric means that exceed the dry weather numeric target was divided by the total number of calculated wet season geometric means, as expressed below.

$$\text{Wet Season Exceedance Frequency (\%)} = 100 * \frac{\text{Wet Season } G_n > \text{DW NT}}{\text{Wet Season } G_n}$$

where: Wet Season G_n is the number of wet season geometric means
DW NT is the dry weather numeric target

3.1.3 Dry Season Geometric Mean and Exceedance Frequency

Per Attachment E of the MS4 Permit, the geometric mean calculation should be consistent with that in the Ocean Plan (SWRCB, 2012). A 30-day rolling geometric mean calculation was based on a minimum of five samples for any 30-day period. Geometric means were calculated as follows:

$$\text{30-Day Geometric Mean} = n\sqrt{(X_1)(X_2)(X_3)(X_4)(X_5)}$$

where: n is the number of individual results used in the calculation
X_n is week *n* result (e.g., X_1 = week 1 result)

Dry weather monitoring began in early May 2016; the first geometric mean was calculated after the fifth sample. With each subsequent sample collected, the first sample from the preceding five-sample geometric mean was dropped outside of a 30-day window. Samples collected between May 1 and September 30 are used in this calculation.

A dry weather exceedance occurs when the geometric mean exceeds the dry weather numeric target. The first exceedance rate was calculated after the first geometric mean calculation. The number of geometric means that exceed the dry weather numeric target is divided by the total number of calculated dry season geometric means to determine the dry season exceedance frequency, as expressed below:

$$\text{Dry Season Exceedance Frequency (\%)} = 100 * \frac{\text{Dry Season } G_{\boldsymbol{n}} > \text{DW NT}}{\text{Dry Season } G_n}$$

where: Dry Season G_n is the number of dry season geometric means
DW NT is the dry weather numeric target

3.2 Wet Weather Exceedance Rates and Compliance Evaluation

During the 2015–2016 wet season, 45 wet weather days were observed, as recorded by the Miramar gauge, and are presented in Appendix B. For the compliance monitoring location, this assessment applies the average of the three wet weather sampling results to each non-sampled wet weather day. A total of 15 of the 45 wet weather days were associated with sampled storm events (three storm events plus the following 72 hours per event) and the average of the results was assigned to each of the remaining 30 wet days.

Based on current monitoring, the San Dieguito River WMA is meeting interim and final RWLs for total coliform, fecal coliform, and *Enterococcus.* The San Dieguito River WMA achieved 0% wet weather exceedance frequencies for total and fecal coliforms. There was one wet weather exceedance for *Enterococcus*, and the geometric mean of the three wet weather results did not exceed the single-sample maximum numeric target. Based on the compliance requirements, the single *Enterococcus* exceedance was applied to all six wet weather days for the wet weather event. As a result, the wet weather exceedance frequency for *Enterococcus* in the San Dieguito River WMA is 13.3% (6 wet weather day exceedances divided by 45 wet weather day results). The 13.3% exceedance frequency is below the allowable interim and final Bacteria TMDL wet weather exceedance frequencies.

Table 3-1 presents wet weather single-sample maximum exceedance frequencies for the San Dieguito Lagoon Mouth compliance monitoring location. The geometric means are presented in the table to illustrate the averages (means) derived from the three sampled events applied to the remaining non-sampled wet weather days, as compared with the numeric target.

Table 3-2 compares 2015–2016 exceedance frequencies with historical exceedance rates, and interim and final RWLs.

Table 3-1.
2015–2016 Wet Weather Single-Sample Maximum Exceedance Rates

Site ID	Analyte	Single-Sample Maximum (CFU/100mL)		Number of Results	Number of Exceedances	2015–2016 Wet Weather Exceedance Rate
		Numeric Target	Geometric Mean			
EH-380	Total Coliform	10,000	218.3	44	0	0%
	Fecal Coliform	400	12.9	44	0	0%
	Enterococcus	104	36.8	44	6	13.3%

Notes:
% = percent; ID = identification; CFU = colony-forming unit; mL = milliliters
Site IDs: EH-380 = San Dieguito Lagoon Mouth
Bolded values = Geometric mean or exceedance rate is greater than the final allowable limit established in the Bacteria TMDL.

Table 3-2.
2015–2016 Wet Weather Exceedance Rates and Compliance Reduction Milestones

Site ID	Analyte	Existing Exceedance Rate [a]	2015–2016 Exceedance Rate	50% Reduction Milestone	50% Reduction Achieved?	Final Allowable RWLs	100% Reduction Achieved?
EH-380	Total Coliform	44%	0%	33%	Yes	22%	Yes
	Fecal Coliform	43%	0%	33%	Yes	22%	Yes
	Enterococcus	49%	13.3%	36%	Yes	22%	Yes

Notes:
% = percent; ID = identification; RWL = receiving water limitation
Site IDs: EH-380 = San Dieguito Lagoon Mouth.
Bolded values = Current rate exceeds final Bacteria TMDL RWLs.
a. Existing exceedance rate for wet season is a modeled estimate established in the Bacteria TMDL.

3.3 Wet Season Geometric Mean Exceedance Rates

The overall wet season evaluation combines bacteria results during both dry weather and wet weather events. Higher exceedance rates are expected during the wet season, with the inclusion of storm samples that reflect high-flow conditions. However, based on the 2015–2016 monitoring, the San Dieguito River WMA is currently meeting interim and final goals for total coliform, fecal coliform, and *Enterococcus* with 0% wet season exceedance frequencies for all FIB.

Table 3-3 presents the wet season geometric mean exceedance rates for the San Dieguito Lagoon Mouth compliance monitoring location, based on the available data, including the number of geometric means calculated from the results, the number of geometric means that exceeded the numeric target, and the maximum geometric mean.

Table 3-4 compares current wet season geometric exceedance frequencies with the existing dry weather exceedance rates and the status of progress as compared with interim and final RWLs.

Table 3-3.
2015–2016 Wet Season Geometric Mean Exceedance Rates

Site ID	Analyte	5-Sample Geometric Mean (CFU/100mL)		Number of Geomeans	Number of Exceedances	2015–2016 Wet Season Exceedance Rate
		Numeric Target	Maximum Geomean			
EH-380	Total Coliform	1,000	83.9	14	0	0%
	Fecal Coliform	200	8.8	14	0	0%
	Enterococcus	35	28.2	14	0	0%

Notes:
% = percent; CFU = colony forming unit; ID = identification; mL = milliliters

Table 3-4.
2015–2016 Wet Season Exceedance Rates and Compliance Reduction Milestones

Site ID	Analyte	Existing Exceedance Rate [a]	Exceedance Rate	50% Reduction Milestone	50% Reduction Achieved?	Final Allowable RWLs	100% Reduction Achieved?
EH-380	Total Coliform	6%	0%	3.0%	Yes	0%	Yes
	Fecal Coliform	11%	0%	5.5%	Yes	0%	Yes
	Enterococcus	17%	0%	8.5%	Yes	0%	Yes

Notes:
% = percent; ID = identification; RWL = receiving water limitation
Site IDs: EH-380 = San Dieguito Lagoon Mouth.
RWL = receiving water limit; TMDL = total maximum daily load
a. Existing exceedance rate is based on available 1996–2002 historical data.

3.4 Dry Season Exceedance Rates

The overall dry season evaluation combines bacteria results during dry weather events from May 1 through September 30, 2016. Lower exceedance rates are typically expected during the dry season, which do not include the influence of wet weather events that reflect high-flow conditions. FIB compliance constituent concentrations were below the numeric objects and the interim and final RWLs were met at the San Dieguito Lagoon Mouth during the 2016 dry season with zero exceedances.

Dry season monitoring occurred weekly, and exceedances were based on a 30-day geometric mean composed of the preceding five samples. Of the 23 monitored events during the dry season at the San Dieguito Lagoon Mouth compliance monitoring location, there were zero exceedances of total and fecal coliform and *Enterococcus*. In addition, the San Dieguito Lagoon Mouth geometric mean did not exceed dry weather numeric objectives during the dry season for the FIB compliance constituents.

Table 3-5 presents the dry season geometric mean exceedance rates for the San Dieguito Lagoon Mouth, including the number of geometric means calculated from the results, the number of geometric means that exceeded the numeric target, and the maximum geometric mean.

Table 3-6 compares current dry season geometric exceedance frequencies with the existing dry weather exceedance rates, and provides the status of progress as compared with interim and final RWLs.

Table 3-5.
2016 Dry Season Geometric Mean Exceedance Rates

a. Existing exceedance rate was calculated based on available 1996 - 2002 historical data.

3.5 Wet and Dry Season Overview

Figures 3-1 through 3-3 present the 2015–2016 rolling geometric means throughout the wet and dry season from October 1, 2015, through September 30, 2016. Wet season geometric means are illustrated using a yellow line with yellow markers throughout the blue areas (wet season), which reflects the rolling geometric mean using the last five samples. Wet weather numeric targets are illustrated with a blue dashed line. FIB concentrations in dry and wet weather are indicated with gold circles and blue circles, respectively. The gray line with gray markers illustrates the rolling 30-day geometric means throughout the dry season (May through September). Dry weather Bacteria TMDL numeric targets are illustrated with an orange dashed line.

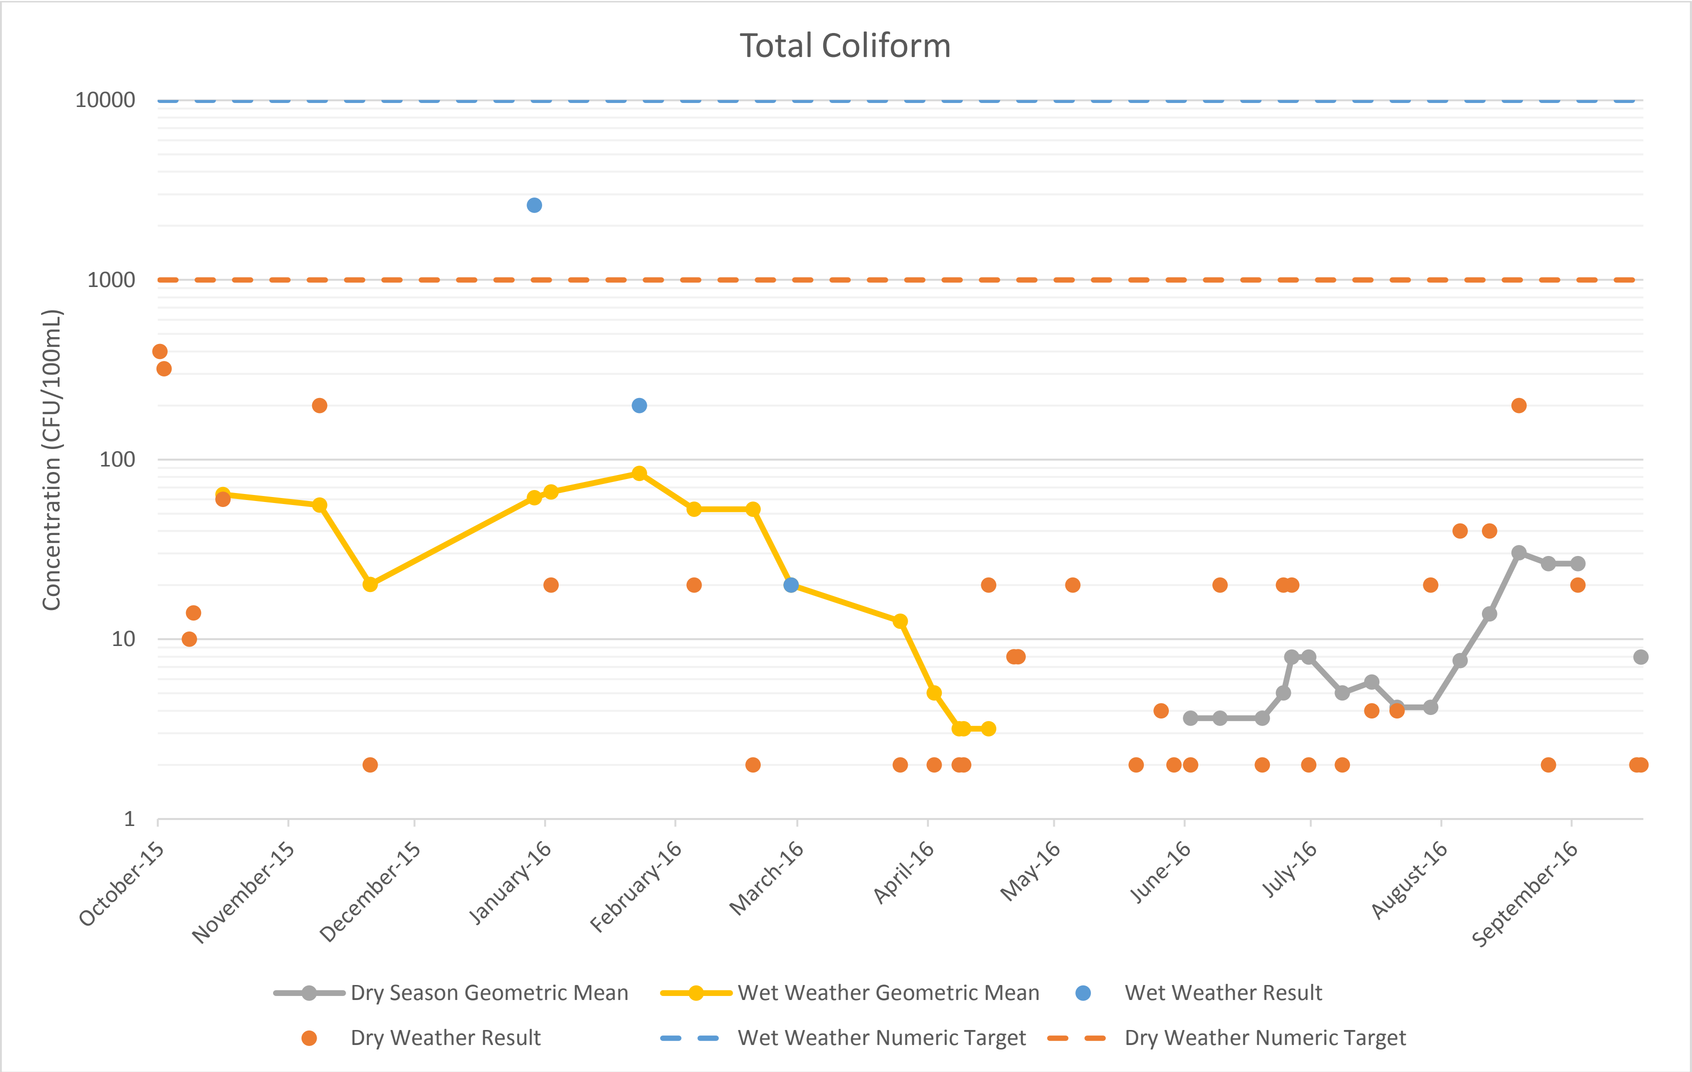

Figure 3-1.
Total Coliform Densities and Geometric Means, 2015–2016 Wet and Dry Season – EH-380

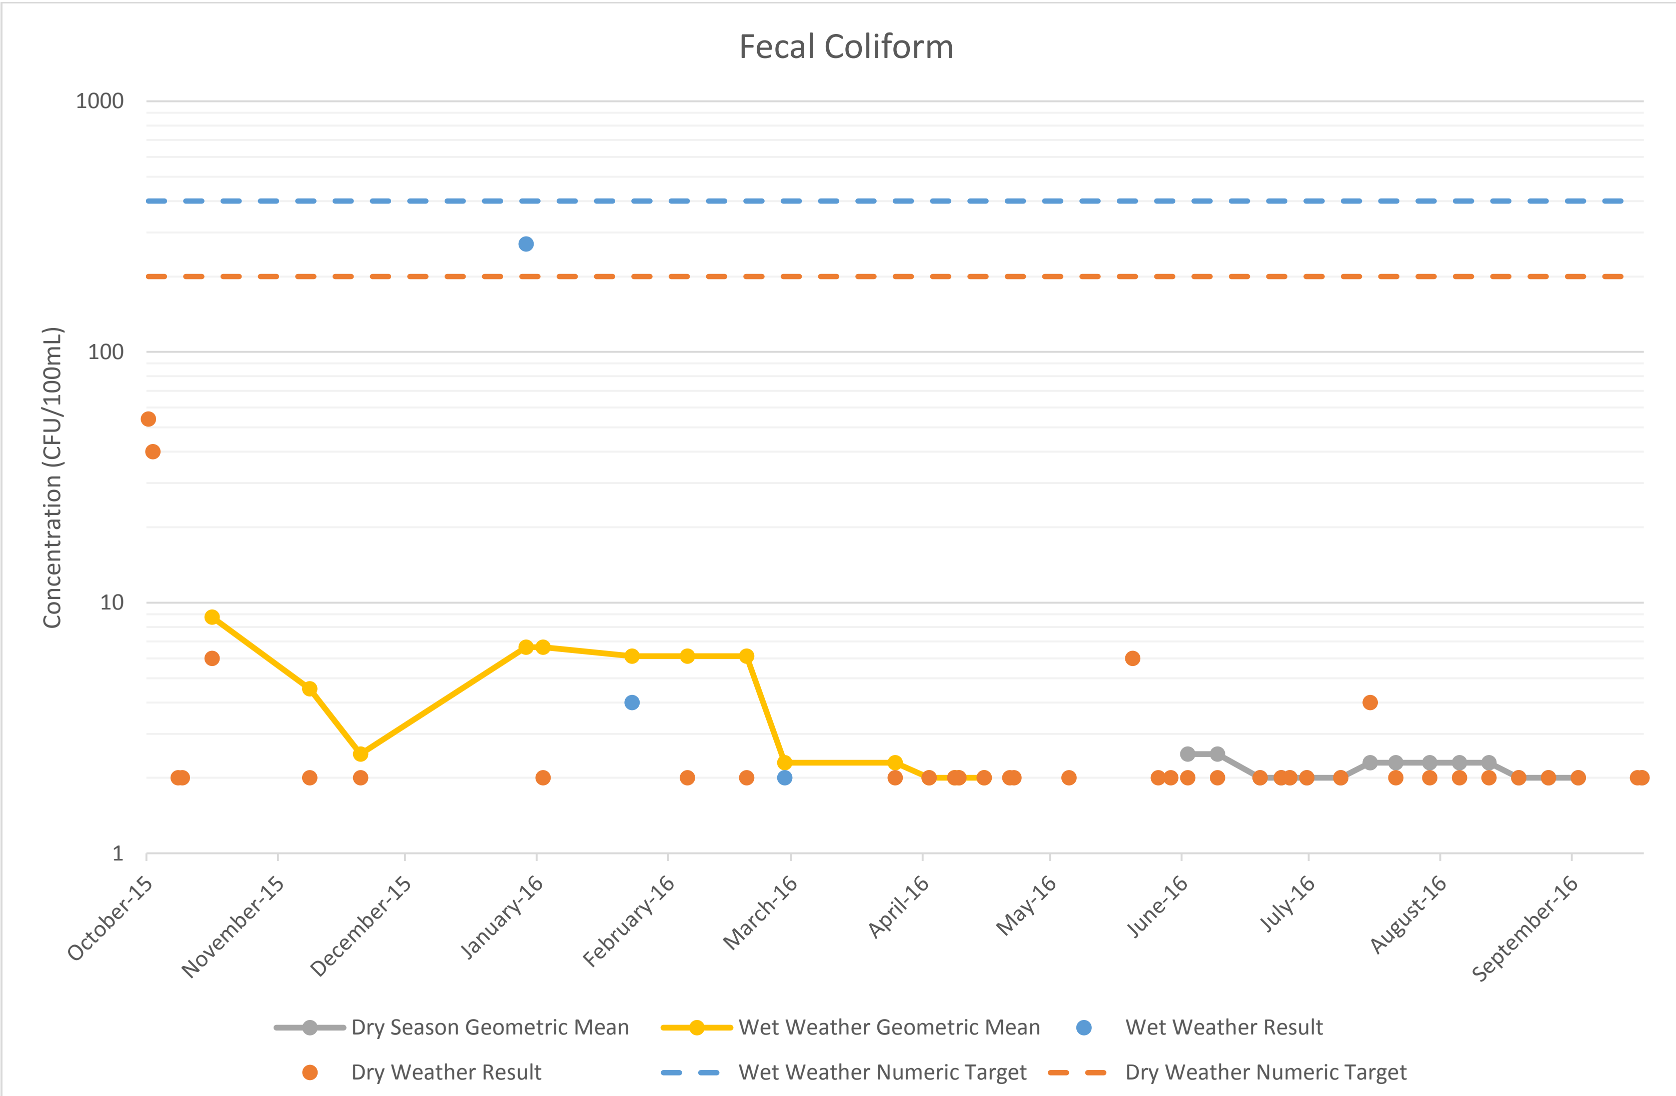

Figure 3-2.
Fecal Coliform Densities and Geometric Means, 2015–2016 Wet and Dry Season – EH-380

3.6 Progress Toward Attaining Interim and Final Receiving Water Limitations

Table 3-7 depicts the general progress toward meeting interim and final numeric targets by season for the San Dieguito Lagoon Mouth compliance monitoring location. This table indicates whether targets for collective FIB have been met (●), have been partially met (**O**), or have not yet been met (**X**). A partially met goal means that at least one of the FIB constituents is meeting the RWL.

Table 3-7.
General Progress Toward Interim and Final Targets
for San Dieguito River WMA, 2015–2016

Monitoring Location	2015–2016 Wet Weather Single-Sample Maximum		2015–2016 Wet Season Geomeans		2016 Dry Season Geomeans	
	Interim	Final	Interim	Final	Interim	Final
EH-380	●	●	●	●	●	●

Note:
Site IDS: EH-380 = San Dieguito Lagoon Mouth
● = Currently, interim or final receiving water limitations (RWLs) have been fully achieved.
O = Currently, interim or final RWLs have been partially achieved, but not all compliance constituents have attained the RWL.
X = Currently, no fecal indicator bacteria (FIB) constituents meet Bacteria Total Maximum Daily Load (TMDL) RWL.

This page intentionally left blank.

4.0 SUMMARY

This section describes current receiving water conditions in the San Dieguito River WMA related to the project goals. Dry and wet weather data collected during the 2015–2016 wet season, and dry weather data from the 2016 dry season were used to evaluate compliance on the basis of current conditions.

4.1 Characterization of Current FIB Concentrations

Overall, the San Dieguito Lagoon Mouth achieved full compliance with wet weather, wet season, and dry season interim and final RWLs for the 2015–2016 monitoring season.

During the wet weather, the San Dieguito River WMA compliance monitoring location achieved a 0% exceedance frequency for both total coliform and fecal coliform and a 13.3% exceedance frequency for *Enterococcus.* The final allowable exceedance frequency for wet weather is 22%.

During the wet season, which evaluates a combination of both wet and dry weather samples using dry weather geometric mean RWLs, 0% exceedance frequencies were achieved for all compliance constituents. Full compliance with both interim and final dry weather RWLs was achieved for the 2015–2016 wet season.

During the dry season, when recreational activities occur with more regularity, the San Dieguito River WMA compliance monitoring location achieved 0% exceedance frequencies for compliance constituents total coliform, fecal coliform, and *Enterococcus*. Collectively, these datasets suggest that, for most of the year, bacteria densities support REC-1 conditions in the San Dieguito River WMA.

The 2015–2016 monitoring results are summarized below.

Wet Weather Single-Sample Maximum Comparison

- An exceedance of *Enterococcus* was detected during one wet weather event at the San Dieguito Lagoon Mouth.
- The compliance monitoring location is achieving interim and final wet weather RWLs for all three compliance constituents.

Wet Season Geometric Mean Comparison

- The compliance monitoring location is achieving interim and final dry weather RWLs for all three compliance constituents for combined wet and dry samples during the wet season.

Dry Season Geometric Mean Comparison

- The compliance monitoring location is achieving interim and final dry weather RWLs for all three compliance constituents during the dry season.

Table 4-1 presents the 2015–2016 exceedance frequency results by season in the San Dieguito River WMA.

This page intentionally left blank.

Table 4-1.
2015–2016 Bacteria TMDL Exceedance Frequency Results for San Dieguito River WMA

Site ID	Bacteria TMDL Constituent	Wet Weather [a] Single-Sample Maximum (CFU/100mL)			Wet Season [a, c] 5-Sample Geometric Mean (CFU/100mL)			Dry Season [b] 30-Day Geometric Mean (CFU/100mL)		
		2015–2016 [d] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency	2015–2016 [e] Exceedance Frequency	Interim Allowable Frequency	Final Allowable Frequency
EH-380	Total Coliform	0%	33%	22%	0%	3%	0%	0%	3%	0%
	Fecal Coliform	0%	33%	22%	0%	5.5%	0%	0%	5.5%	0%
	Enterococcus	13.3%	36%	22%	0%	8.5%	0%	0%	8.5%	0%

Notes:
% = percent; CFU = colony-forming unit; EH-380 = San Dieguito Lagoon Mouth; ID = identification; mL = milliliters; TMDL = total maximum daily load
Green shaded cells show the 2015-2016 observed exceedance frequency.

a. October 1, 2015–April 30, 2016
b. May 1, 2016–September 30, 2016
c. In accordance with the MS4 Permit, wet and dry weather FIB data were combined to calculate geometric means for the wet season and compared to dry weather RWLs as shown in Table ES-1.
d. The exceedance frequency was derived by dividing the total number of wet weather days (days with 0.2 inch of rainfall or greater plus the following 72 hours) that exceeded the single-sample maximum numeric target divided by the total number of wet weather days during the wet season. To determine exceedances for non-sampled wet weather days, the geometric mean of the analytical results from three monitored storm events was applied to the remaining observed wet weather days that were not sampled. The results from the total number of wet weather days, with either assigned averages or analyzed result values, were then compared with single-sample maximum numeric targets.
e. The exceedance frequency was derived by dividing the total number of geometric exceedances by the total number of geometric means calculated during the season.

APPENDIX A

QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

A.1 Quality Assurance/Quality Control Summary

Quality assurance and quality control (QA/QC) activities from both field sampling and laboratory analyses have been assessed to ensure that they to conform sampling techniques to Surface Water Ambient Monitoring Program (SWAMP) protocol. Additionally, deviations from the Compliance Monitoring Plan are discussed herein. The field quality control (QC) samples are used to measure potential contamination and sampling error introduced before the submittal of samples to the laboratory. Laboratory QA/QC activities provide information needed to evaluate laboratory contamination, analytical precision, and analytical accuracy.

Deviations from the Compliance Monitoring Plan

Optional Field Measurements - Dissolved oxygen was added as an optional field measurement for dry weather monitoring during the 2015-2016 monitoring year. It was not measured during wet weather monitoring. Additionally, minor adjustments were made to the detection ranges as noted in Table A-1 to reflect the actual meters used.

Table A-1.
Optional In-Situ Field Measurements and Detection Ranges

Parameter	Method	Range	Units
Conductivity [a,b]	Field Meter	0 to 200	mS/cm
pH [a,b]	Field Meter	0 to 14	pH units
Temperature [a,b]	Field Meter	-5 to 55	°C
Dissolved Oxygen [a,b]	Field Meter	0 to 50	mg/L
Turbidity [a,c]	Field Meter	0 to 1,000	NTU

Notes:

a. Wet weather field measurements were collected with a Horiba U-52. Dissolved oxygen was not measured during wet weather.
b. Dry weather field measurements were collected with a Hanna HI 98194 from 10/20/2015 onward. The samples taken before these dates were collected with a PC Tester 35 Multi-Parameter.
c. Dry Weather field measurement was collected with a Hanna HI 93414.

µS/cm = microSiemens per centimeter; °C = degree Celsius; NTU = Nephelometric Turbidity Unit

Dry Weather Monitoring – Per the Compliance Monitoring Plan, weekly dry weather monitoring was scheduled so that five samples were collected in each calendar month. However, in May 2016 and September 2016, only four samples were collected in each of these months because of wet weather interference.

Precipitation Data - Per the Compliance Monitoring Plan, precipitation data from the National Weather Service (NWS) Del Mar rain gauge were to be used to track the total number of wet weather days as defined in the MS4 Permit. However, the NWS Del Mar rain gauge was relocated in September 2015, and was also missing data for a portion of the 2015–2016 monitoring year. To provide a more complete dataset, the NWS Miramar Naval Air Station (MNAS) gauge was used in its place. Because the MNAS officially became the Marine Corps Air Station Miramar (Miramar) in 1999, this gauge is referred to as the Miramar gauge herein (Shettle 2001). The

Miramar gauge is technically within the Mission Bay WMA; however, it is the nearest gauge that is representative of rainfall in the middle of the San Dieguito River watershed. Historical daily rainfall amounts generated by the NWS will be used to assess the annual rainfall and historical average for San Diego County.

Field Quality Control

The number and frequency of field QC samples collected are presented in Table A-2. Field grab QC samples were submitted blind to the analytical laboratory. For laboratory replicates, additional samples were collected and clearly identified on the chain of custody (COC) form. Field blanks are samples of reagent-grade, analyte-free, deionized water collected in the field to verify the field conditions and air deposition are non-contaminating during field sampling activities. Field blanks were analyzed for the same suite of analyses as regular samples. The project frequency for field blanks is 5 percent of the total sample count. Concentrations of field blanks should be below the reporting limit (RL) for each analyte. Duplicate samples consist of two distinct samples (an original and a duplicate) of the same matrix collected at the same time and location using the same sampling technique. Field duplicate samples were collected by filling two grab sample containers at the same time, or in rapid sequence. The purpose of field duplicates is to measure the consistency of field sampling; project frequency for field duplicates is 5 percent of samples. The result for each field duplicate is compared with the sample result to estimate a relative percent difference between the two sample results.

Table A-2.
Field Quality Control Parameters

Field QC	Frequency	Acceptance Limit
Field Blank	≥ 5% of all project samples	Concentrations should be below the RL
Field Duplicate	≥ 5% of all project samples	$R(log) \leq 3.27\bar{R}$

Notes:
RL = reporting limit; $R_{(log)}$ = range of logarithms for each pair of duplicates; $\bar{R}$ = mean of $R_{(log)}$ for duplicates analyzed

Of the three wet weather field samples, one field blank and one duplicate were collected to assess QA/QC. The frequency for both field blanks and duplicates is 33.3 percent, which is above the required frequency of 5 percent of all project samples. The field blank sample concentrations were not detected at or above the reporting limit of 2 colony-forming units per 100 milliliters (CFU/100mL) for fecal coliform and total coliform, and were within the acceptance limits. The *Enterococcus* concentration was also not detected at or above the reporting limit of 1 CFU/100mL, and was within the acceptance limits.

The one set of wet weather field duplicate results were within the acceptance criteria. The differences of the logarithms were less than the mean logarithmic difference multiplied by 3.27. Values for field duplicate differences were calculated between 0.15 and 0.95, below the $3.27\bar{R}$ value of 1.52; thus, duplicate values were within the acceptance limits.

Of the 38 dry weather field samples, field blanks were collected for 7 samples and duplicates for 9 samples. Both are above the required frequency of 5 percent for all project samples, with a frequency of 18.4 percent for field blanks and 23.7 percent for duplicates. The field blank sample concentration on March 1, 2016, for *Enterococcus* was reported as 2 CFU/100mL, which was above the reporting limit of 1 CFU/100mL. Therefore, this result was not within acceptance limits. All other field blank sample concentrations were less than the reporting limit of 1 CFU/100mL, and within acceptance limits.

The range of logarithms for dry weather field duplicate results on March 1, 2016, for total coliform was 1.2, which is more than $3.27\bar{R}$ = 0.86, the mean logarithmic difference multiplied by 3.27. Therefore, this result was not within acceptance limits. The remaining wet weather field duplicate results were all less than 0.86, and were within the acceptance limits.

Laboratory Quality Control

Laboratory QC samples include laboratory duplicates, and the positive and negative controls described in Table A-3. Laboratory QC sampling results were provided in a laboratory report and SWAMP compatible electronic data deliverable (EDD) with a batch identification (ID) number to correlate with the corresponding environmental sample data set. The table below describes the frequency and types of quality control samples for each constituent category.

Laboratory Replicate – For a laboratory replicate, a sample is prepared and analyzed twice to assess the repeatability (precision). The results are evaluated by calculating the relative percent difference (RPD) between the two sets of results. This serves as a measure of the reproducibility, or precision, of the sampling analysis. A minimum of one laboratory replicate is analyzed per batch.

Positive and Negative Controls – A negative control is created as a separate plate count after the buffered rinse water is filtered and incubated the same way as a sample. There should be no bacteria growth on the filter after incubation. It is used to detect laboratory bacterial contamination of the sample. A positive control is created as a separate plate count after a water sample known to contain bacteria (such as wastewater treatment plant influent) is filtered and incubated the same way as a sample. There should be bacteria growth on the filter after incubation. It is used to detect procedural errors or the presence of contaminants in the laboratory analysis that might inhibit bacteria growth.

Table A-3.
Laboratory Quality Control Parameters

Laboratory QC	Frequency	Acceptance Limit
Laboratory Replicate	One per 20 samples or analytical batch, whichever is more frequent	$R(log) \leq 3.27\bar{R}$
Positive and Negative Controls	Per new lot or batch	Positive Control = Growth on filter Negative Control = No growth on filter

Notes:
RL = reporting limit; $R_{(log)}$ = range of logarithms for each pair of duplicates; $\bar{R}$ = mean of $R_{(log)}$ for duplicates analyzed

Data qualifiers are used to clarify and define each concentration result. The data qualifiers for wet weather concentrations include:

- “e” for estimated value;
- “<” for less than;
- “=” for equal to;
- “ND” for non-detect; and
- “None” for no qualifier.

For the data qualifiers for wet weather samples including field blanks and duplicates, “e” occurs in 20 percent of the samples, “<” occurs in 13 percent of the samples, “=” occurs in 40 percent of the samples, “ND” occurs in 20 percent of the samples, and “None” occurs in 7% of the samples.

The data qualifiers for dry weather concentrations include:

- “e” for estimated value;
- “<” for less than; and
- “None” for no qualifier.

For the data qualifiers for dry weather samples, including field blanks and duplicates, “e” occurs in 34.5 percent of the samples, “<” occurs in 63.5 percent of the samples, and “None” occurs in 2 percent of the samples.

APPENDIX B

2015–2016 WET WEATHER ANALYTICAL RESULTS

Table B-1
2015–2016 Wet Weather Field Results

Station ID	Date	Time	Temp (°C)	Conductivity (mS/cm)	Turbidity (NTU)	pH
EH-380-RW	1/9/2016	12:10	16.98	43.4	27.9	8.06

APPENDIX F

BACTERIA TMDL AND MS4 PERMIT DISCREPANCIES

F.1 Inconsistencies in Bacteria Total Maximum Daily Load (TMDL) Requirements (Attachment E.6)

The Bacteria TMDL Compliance Monitoring Program and this compliance monitoring report are designed to address the monitoring and assessment requirements defined in Attachment E.6.6 of the MS4 Permit. A number of inconsistencies were identified that may affect the interpretation of compliance.

MS4 Permit Monitoring and Assessment:

This report includes three compliance evaluations outlined in Sections 2.7 through 2.9, based on the MS4 Permit assessment requirements *(*San Diego Regional Water Quality Control Board [Regional Board], 2013*,* page E-49).

There is discrepancy between Table 6.2b–*Final Receiving Water Limitations Expressed as Bacteria Densities and Allowable Exceedance Frequencies for Creeks (Regional Board, 2013,* page E-32) and Table 6.5–*Interim Wet Weather Receiving Water Limitations Expressed as Interim Wet Weather Allowable Exceedance Frequencies (Regional Board, 2013,* page E-44).

As a clarification to the TMDLs, Table 6.2b in the MS4 Permit clarifies the final receiving water limitations (RWLs) for fecal coliform and *Enterococcus* and removes total coliform as a numeric target for creeks. However, Table 6.5 still includes a 41 percent interim wet weather allowable exceedance frequency for total coliform.

There is discrepancy between the monitoring procedures and assessment requirements. The sampling frequency defined in the monitoring procedures would provide insufficient data to complete the dry season geometric mean assessment requirement. The following are summaries of the MS4 Permit requirements and how the monitoring program addressed the discrepancies:

- The monitoring procedures of MS4 Permit Attachment E.6 require dry weather samples at creeks to be consistent with those of receiving monitoring stations in accordance with Provision D of the MS4 Permit as stated in Provision E.6.d(2)b.(i) (Regional Board, 2013, page E-50). Provision D of the MS4 Permit requires three dry weather monitoring events at receiving water stations.
- The assessment requirements for dry weather geometric mean exceedance frequencies state that the method and number of samples must be consistent with the requirements of the Basin Plan, which requires 5 samples per 30 days (Regional Board, 2010). The wet season geometric mean evaluation requirements do not stipulate that the Basin Plan methodology be applied.
- The Bacteria TMDL Monitoring Program was designed to generate the data needed to complete the assessment requirements. Dry weather monitoring was conducted at a higher frequency than required by the Bacteria TMDL monitoring procedures. Dry weather monitoring was conducted weekly during the dry season and monthly during the wet season to compare results with the dry weather geometric mean numeric targets.

There is an inconsistency between RWLs and assessment requirements that is traced back to inconsistencies between written requirements and tables in the Bacteria TMDL. The assessment section does not require a calculation of single-sample maximum (SSM) exceedances for dry weather. The following are summaries of the MS4 Permit requirements and how the monitoring program addressed the discrepancies:

- The assessment section requires exceedance frequencies to be calculated for dry season geometric means, wet season geometric means, and wet weather SSMs. The assessment requirements of the MS4 Permit are reinforced by the table of RWLs for creeks and the discussion of numeric targets, as presented in the Bacteria TMDL (Regional Board, 2010, pages A52 and A13, respectively).
- The footnotes of Table 6.2b of the MS4 Permit state that for "*dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved" and "wet weather days, only the single sample maximum receiving water limitations are required to be achieved" (*Regional Board, 2013, page E-32). These are not consistent with the footnotes for the same table presented in the Bacteria TMDL. The footnotes in the MS4 Permit are reinforced by the discussion of compliance with dry weather TMDLs described in the Bacteria TMDL, which states that, "*In addition to geometric means, the bacteria densities must be consistent with the SSM REC-1 WQOs in the Basin Plan for creeks.*"
- The Bacteria TMDL Compliance Monitoring Program was designed to generate the data needed to complete the assessment requirements.

The MS4 Permit assessment section clearly defines an evaluation of wet season geometric means that includes wet weather sampling results and dry weather sampling results. This assessment applies the dry weather numeric target to a data set that includes storm samples.

Notes:
< = Analyte not detected at method detection limit shown; J = Analyte detected above the method detection limit but below the reporting limit; e = CFU/100mL, estimated value, plate count falls outside recommended reporting limits per EPA method guidelines; NA = Not Analyzed; NR = Not Required, * = CFU/100mL; ** = Laboratory methods for Chromium (III) and Chromium (VI) require filtering the sample; therefore, the dissolved and total fractions of Chromium (III) and Chromium (VI) are equal; *** = Nitrite and nitrate can be analyzed separately or together (Table D-7, MS4 Permit), ****= NAL analyte not required for Ocean Receiving Waters.

Attachment C.2 – Major MS4 Outfall Dry Weather Visual Observation Data

(Electronic Submittal)

Intentionally Left Blank

Major MS4 Outfall Dry Weather Monitoring Data Files

The following dry weather MS4 outfall data files are included in this attachment:

- County of San Diego Major MS4 Outfall Dry Weather Visual Observation Data
- City of Del Mar Major MS4 Outfall Dry Weather Visual Observation Data
- City of Escondido Major MS4 Outfall Dry Weather Visual Observation Data
- City of Poway Major MS4 Outfall Dry Weather Visual Observation Data
- City of Solana Beach Major MS4 Outfall Dry Weather Visual Observation Data
- City of San Diego Major MS4 Outfall Dry Weather Visual Observation Data

All data files are referenced in the Monitoring Results and Assessment Appendix C.

Intentionally Left Blank

Attachment C.3 – Dry Weather Assessment Methodology

Intentionally Left Blank

1 Assessment of Dry Weather Outfall Monitoring Results

In 2013 the San Diego Regional Water Quality Control Board (Regional Board) issued *Order No. R9-2013-0001 (amended by Order Nos. R9-2015-0001 and R9-2015-0100), National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region*, herein referred to as the MS4 Permit, regulating MS4 discharges throughout the San Diego Region. The MS4 Permit requires a series of dry weather MS4 outfall assessments be performed annually to assess and report the progress of each Copermittee toward effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction. This Attachment describes the methodology used to perform these required assessments.

Dry weather monitoring requirements are not discussed here, and can be found in the MS4 outfall monitoring plan for each Watershed Management Area (WMA). MS4 outfall monitoring plans are available through Project Clean Water (www.projectcleanwater.org).

Per MS4 Permit Provision D.4.b(1)(b), Copermittees will annually assess and/or report the following, beginning in the Transitional Monitoring Annual Reports and continuing in the Water Quality Improvement Plan Annual Reports:

(i) The known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area;

(ii) Sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and

(iii) Modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.

The following additional assessments, listed in Permit Provision D.4.b(1)(c), are required in the Water Quality Improvement Plan Annual Reports:

(i) The assessments listed in Provision D.4.b.(1)(b);

(ii) Based on the data collected and applicable NALs [non-storm water action levels] in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations;

(iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances;

(iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water

volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually.

[a] Each Copermittee must calculate or estimate the annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each known source for each MS4 outfall; and

[b] Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.

The sections that follow describe the assessments in greater detail. Within each section are references to the data sources used in each assessment; these are suggestions for regional consistency, and additional supporting data may be used as necessary. Data sources are provided [within brackets] and include the following:

- Jurisdictional MS4 outfall inventory;
- Jurisdictional Illicit Discharge Detection and Elimination (IDDE) investigation results and follow-up actions;
- Jurisdictional Runoff Management Program (JRMP) Annual Report Forms; and
- Dry Weather MS4 Data Sharing Template (Data Sharing Template) results.

2 Provision D.4.b.(1)(b) Assessments

2.1 Persistent Flow Classification

As part of the MS4 Outfall Discharge Monitoring Station Inventory required by Permit Provision D.2.a(1), each Copermittee must identify all major outfalls that discharge directly to receiving waters within its jurisdiction in the WMA. Each Copermittee must maintain the following information for each major MS4 outfall:

- Latitude and longitude of MS4 outfall point of discharge;
- Watershed Management Area;
- Hydrologic subarea;
- Outlet size;
- Accessibility (i.e. safety and without disturbance of critical habitat);
- Approximate drainage area; and
- Classification of whether the MS4 outfall is known to have persistent dry weather flows, transient dry weather flows, no dry weather flows, or unknown dry weather flows.

Copermittees regularly update this information and include the geo-located outfalls on an MS4 map as part of their JRMP. The accuracy of the MS4 map must be confirmed during field screening monitoring. The frequency with which each Copermittee must field screen the MS4 outfalls in its inventory varies according to the number of major MS4 outfalls discharging from a Copermittee's jurisdiction to receiving waters within the region and within each WMA. The frequency of required field screening is outlined in MS4 Permit Provision D.2.a.(2)(a).

A summary of the updated persistent flow classification will also be reported in the Water Quality Improvement Plan Annual Report. This information will include the number of persistent, transient, dry, and unknown dry weather flow sites for each jurisdiction [Data Sharing Template, "Station Information" tab, "Current Flow Classification" column]. These flow classifications can be defined as the following:

- Persistent - having flowing, pooled, or ponded water more than 72 hours after a measurable rainfall event of 0.1 inch or greater during the three consecutive most recent monitoring and/or inspection events;
- Transient - having flowing, pooled, or ponded water during at least one but not on all three most recent consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥ 0.1 inch;
- Tidal - persistent or transient flow with ocean tides as the source;
- Dry - having no flowing, pooled, or ponded water during the last three consecutive monitoring and/or inspection events conducted more than 72 hours after rainfall with daily precipitation ≥ 0.1 inch; and
- Unknown - site cannot be evaluated, or has not been visited enough times to determine flow status.

2.2 Known and Controllable Source Categorization

As described in Provision E.2 of the MS4 Permit, each Copermittee must seek to identify the source(s) of non-storm water discharge from their MS4, where there is evidence of non-storm water having been discharged into or from the MS4 [i.e., ponding or flow, in the absence of wet weather]. In the Water Quality Improvement Plan Annual Reports, the Copermittees will categorize the known and suspected controllable sources of transient and persistent flows within their jurisdiction in the WMA. As part of this categorization, each Copermittee will report the number of major outfalls within its jurisdiction in the WMA, the number of dry weather visual inspections performed in the monitoring year (October 1 through September 30), and the following additional information:

1) The number of sites with flowing or ponded observations in the monitoring year [Data Sharing Template, "Visual Observation" tab, "Flow Status" column];
2) Whether the sources of flow at the identified flowing and/or ponded sites are known or suspected [Data Sharing Template, "Runoff Sources" tab, "Runoff Sources Suspected or Known?" column];
3) If the source of flow is known or suspected, whether it is:
    a. Authorized by a separate NPDES Permit [Data Sharing Template, "Runoff Sources" tab, "NPDES Allowable Discharge"/ column];
    b. Identified as a category of non-storm water discharge that must be addressed as an illicit discharge, based on Provision E.2.a of the MS4 Permit [Data Sharing Template, "Runoff Sources" tab, "Unpermitted Discharge" column]; or
    c. Identified as a category of non-storm water discharge that is not controllable by the Copermittee (e.g., ground water seepage) [Data Sharing Template, "Runoff Sources" tab, "Unpermitted Discharge" column].

It should be noted that a site with flowing or ponded observations may have multiple known or suspected sources of flow. For example, a site may be impacted by both irrigation runoff and groundwater seepage.

2.3 Dry Weather Flow Elimination Assessment

As described in their Jurisdictional Runoff Management Plans (JRMPs), each Copermittee must initiate the implementation of procedures, in a timely manner, to eliminate all detected and identified illicit discharges and connections within its jurisdiction. If the Copermittee identifies the source of illicit discharge or connection as controllable, the Copermittee must implement its Enforcement Response Plan as described in its JRMP. Copermittees will submit a summary of the non-storm water discharges and illicit discharges and connections eliminated within its jurisdiction in the previous monitoring year as part of the JRMP Annual Report Form (Permit Attachment D, Section IV). Specific investigations initiated through monitoring are compiled [Data Sharing Template, "Runoff Sources" tab, "Was Flow Source Eliminated" column; Jurisdictional IDDE investigation forms (optional)] and summarized in the Water Quality Improvement Plan Annual Report Monitoring and Assessment Appendix.

2.4 Field Screening Modifications

Copermittees will identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.

Modifications to the field screening monitoring locations will be reported in the Water Quality Improvement Plan Annual Reports [Data Sharing Template, “Station Information” tab, “Modifications to Locations and Frequencies Necessary to Identify and Eliminate Sources of Flow D.4.b.(1).(b).(iii)” column].

3 Provision D.4.b.(1)(c) Assessments

3.1 Dry Weather MS4 Outfall Prioritization

Based on the data collected and applicable NALs in the Water Quality Improvement Plan, each Copermittee will rank the MS4 outfalls in the their jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action. The prioritization will be conducted annually by each Copermittee and will include at least five highest priority major MS4 outfalls with non-storm water persistent flows, per WMA, that will be monitored in the subsequent monitoring year. If a Copermittee has fewer than five major MS4 outfalls with non-storm water persistent flows in the WMA, all the Copermittee's persistently flowing sites in the WMA will be monitored. For Copermittee's identified as responsible parties to a TMDL in Attachment E of the MS4 Permit, additional highest priority outfall monitoring locations may be selected if five sites are not sufficient to determine compliance with the TMDL.

Each Copermittee's prioritization methodology may differ. Data that will be used in the prioritization may include but are not limited to:

- Persistent flow status (defined as evidence of flow in each of the 3 most recent visual inspections) [Data Sharing Template, "Station Information" tab, "Current Flow Classification" column];
- Receiving water connectivity [Data Sharing Template, "Visual Observations" tab, "Flow Reaches Receiving Water" column];
- Potential to contribute to Highest Priority Water Quality Condition [Data Sharing Template, "Laboratory Data" tab];
- NAL exceedance [Data Sharing Template, "Laboratory Data" tab];
- Historical data; and
- Data not collected by the Copermittees.

The updated prioritization will be included in the Water Quality Improvement Plan Annual Reports, with explanations for any sites that have been added or removed from the Copermittee's list of highest priority outfalls. Once a site has been identified as highest priority, it may only be removed from the prioritization for one of the following reasons identified in Provision D.2.B.(2).(b).(ii) of the MS4 Permit:

- The non-storm water discharges have been effectively eliminated (i.e. no flowing, pooled, or ponded water) for three consecutive dry weather monitoring events; or
- The source(s) of the persistent flows has been identified as a category of non-storm water discharges that does not require an NPDES permit and does not have to be addressed as an illicit discharge because it was not identified as a source of pollutants (i.e. constituents in non-storm water discharge do not exceed NALs), and the persistent flow can be re-prioritized to a lower priority; or
- The constituents in the persistent flow non-storm water discharge do not exceed NALs, and the persistent flow can be re-prioritized to a lower priority; or

- The source(s) of the persistent flows has been identified as a non-storm water discharge authorized by a separate NPDES permit.

If a site has been removed from the list of five highest priority outfalls, it will be replaced with the Copermittee's next highest priority major MS4 outfall in the WMA, unless there are fewer than five persistently flowing major MS4 outfalls remaining.

3.2 Analysis of NAL Exceedance

Each major MS4 outfall identified as a highest priority persistently flowing outfall will be monitored under dry conditions at least semi-annually. The semi-annual monitoring event includes field observations, field monitoring, and analytical monitoring, including monitoring of NAL constituents. NALs are based on the receiving water type, and different NALs will be applicable to different outfalls in each WMA, depending on whether the outfall discharges to ocean receiving waters, bays, harbors, lagoons, estuaries, or inland streams and rivers. The NALs are presented in tables in the MS4 Permit by receiving water type, as follows:

- Ocean Surf Zone:
  - Table C-1: total coliform, fecal coliform, and *Enterococcus*.
- Bays, Harbors, and Lagoons/Estuaries:
  - Table C-2: turbidity, pH, fecal coliform, *Enterococcus*, and priority pollutants from Table C-3 (cadmium, copper, chromium III, chromium VI, lead, nickel, silver, and zinc).
- Inland Surface Waters:
  - MS4 Permit Table C-4: dissolved oxygen, turbidity, pH, fecal coliform, *Enterococcus*, total nitrogen, total phosphorus, methylene blue active substance (MBAS), iron, manganese, and priority pollutants from Table C-3 (cadmium, copper, chromium III, chromium VI, lead, nickel, silver, and zinc).

The NALs from the MS4 Permit tables are replicated in Tables 3-1 through 3-4. The Water Quality Improvement Plans may include additional WMA-specific NALs related to the highest priority water quality conditions in that WMA, or any applicable TMDLs in Attachment E of the MS4 Permit.

Table C.2-1
Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100mL	1,000	–	10,000/1,000[1]	OP
Fecal Coliform	MPN/100mL	200[2]	–	400	OP
Enterococcus	MPN/100mL	35	–	104[3]	OP

AMAL = average monthly action level; MDAL = maximum daily action level; OP = Ocean Plan water quality objective; MPN/100mL = most probable number per 100 milliliters

1. Total coliform density NAL is 1,000 MPN/100 mL when the fecal/total coliform ratio exceeds 0.1.
2. Fecal coliform density NAL is 200 MPN/100mL during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas."

Table C.2-2
Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	–	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times.			OP
Fecal Coliform	MPN/100mL	200[1]	–	400[2]	BP
Enterococcus	MPN/100mL	35	–	104[3]	BP
Priority Pollutants	µg/L	See Table 3-4			

BP = Basin Plan water quality objective; µg/L = microgram per liter.

1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN/100mL during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to water bodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C.2-3
Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters.			BP
Turbidity	NTU	–	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times.			BP
Fecal Coliform	MPN/100mL	200[1]	–	400[2]	BP
Enterococcus	MPN/100mL	33	–	61[3]	BP
Total Nitrogen	mg/L	–	1.0	See MDAL	BP
Total Phosphorus	mg/L	–	0.1	See MDAL	BP
MBAS	mg/L	–	0.5	See MDAL	BP
Iron	mg/L	–	0.3	See MDAL	BP
Manganese	mg/L	–	0.05	See MDAL	BP
Priority Pollutants	µg/L	See Table 3-4			

WARM = warm freshwater habitat beneficial use; COLD = cold freshwater habitat beneficial use;
MBAS = Methylene Blue Active Substance

1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN/100mL during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater “designated beach areas” and is not applicable to water bodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C.2-4
Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	µg/L	**	**	16	8
Copper	µg/L	*	*	5.8	2.9
Chromium III	µg/L	**	**	–	–
Chromium VI	µg/L	16	8.1	83	41
Lead	µg/L	*	*	14	2.9
Nickel	µg/L	**	**	14	6.8
Silver	µg/L	*	*	2.2	1.1
Zinc	µg/L	*	*	95	47

CTR = California Toxics Rule

* Action levels developed on a case-by-case basis (see below).

** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431.

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver, and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis based on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to 40 CFR 131.38(b)(2).

For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, Copermittees will identify the known and suspected sources within the Copermittee's jurisdiction in the WMA that may cause or contribute to the NAL exceedances [Data Sharing Template, "Runoff Sources" tab; Jurisdictional IDDE forms].

3.3 Non-Storm Water Volume and Pollutant Load Assessment

Each Copermittee must analyze the data collected under the Dry Weather MS4 Outfall Discharge Monitoring program, and utilize a model or other method to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually.

3.3.1 Identification of Dry Weather Days

The first step in calculating annual non-storm water volumes and pollutant loads is to determine the number of dry weather days in the monitoring year. The number of dry weather days will be determined using County of San Diego ALERT Station Data (https://sandiego.onerain.com). A single ALERT Station will be selected to represent rainfall conditions in each WMA. This representative ALERT Station will be the same station utilized in Wet Weather MS4 Outfall Discharge Monitoring Assessments, and will be the station that is closest to a majority of wet weather MS4 outfall discharge monitoring stations. This station may vary each year, depending on the wet weather MS4 outfall discharge stations monitored and the availability of ALERT Station data.

A wet weather day is defined as any day with at least 0.1 inches of measurable rainfall within a 24-hour period, and the subsequent 72 hours. A dry weather day will be defined as all other days during the monitoring year (October 1-September 30).

3.3.2 Non-Storm Water Volume Assessment

An annual non-storm water volume will be assigned to each persistently flowing major MS4 outfall station in the Copermittee's jurisdiction in the WMA. This annual non-storm water volume will be calculated by summing a daily flow volume for each persistently flowing major MS4 outfall station across each dry weather day. The following guidelines will be applied:

- Scenario A: If a major MS4 outfall station was visited once during the monitoring year, and a single discrete flow rate was measured, this flow rate will be applied across all dry weather days within the year. In Scenario A, the following equations will be applied.

$$V_{Daily} = Q \times 86{,}400$$

$$V_{Annual\_Outfall} = V_{Daily} \times (\#Dry\ Days)$$

Where:

V_{Daily} = Daily flow volume from MS4 Outfall (cubic feet)

Q = Monitored outfall flow rate (cfs)

86,400 = Conversion Factor, seconds per day

$V_{Annual\_Outfall}$ = Annual flow volume from MS4 Outfall (cubic feet)

$\#Dry\ Days$ = Number of dry weather days as assessed at the applicable County ALERT Station

- Scenario B: If a major MS4 outfall station was visited more than once during the monitoring year, and more than one discrete flow rate was measured, monthly dry weather flow volumes will be calculated. The monthly flow volume calculation method will vary based on whether a flow measurement was logged at the outfall during that month. For calendar months in which the outfall was visited one or more times, the mean of the measured flow rates will be applied to all dry weather days within the month. For calendar months in which the outfall was not visited, the mean of all flow rates observed at that site during the calendar year will be applied. In Scenario B, the following equations will be applied.

For each month in the monitoring year with at least one site visit and corresponding instantaneous flow estimate:

$$V_{Month\_Mon} = \frac{\sum Q_{n\_Month}}{n_{Month}} \times 86{,}400 \times (\#Dry\ Days/month)$$

For each month in the monitoring year with no site visits or instantaneous flow estimates:

$$V_{Month\_NonMon} = \frac{\sum Q_{n\_Year}}{n_{Year}} \times 86{,}400 \times (\#Dry\ Days/month)$$

To calculate an annual dry weather flow volume:

$$V_{Annual\_Outfall} = \sum V_{Month\_Mon} + \sum V_{Month\_NonMon}$$

Where:

V_{Month_Mon}= Monthly flow volume from MS4 Outfall during month when outfall was visited one or more times (cubic feet)

Q_{n_Month} = Monitored outfall flow rate during visual observation event “n”, during month when outfall was visited one or more times (cfs)

n_{Month} = Number of site visits with instantaneous flow measurements during month when outfall was visited one or more times

86,400 = Conversion Factor, seconds per day

#Dry Days = Number of dry weather days as assessed at the applicable County ALERT Station

V_{Month_NonMon}= Monthly flow volume from MS4 Outfall during month when outfall was not visited (cubic feet)

Q_{n_Year} = Monitored outfall flow rate during visual observation event “n”, during monitoring year (cfs)

n_{Year}= Number of site visits with instantaneous flow measurements during monitoring year

$V_{Annual\_Outfall}$ = Annual flow volume from MS4 Outfall (cubic feet)

- Scenario C: If a major MS4 outfall station was monitored continuously for a period of time longer than a day, a measured daily flow volume will be calculated for each monitored day. The mean of these daily flow volumes will be applied to all non-monitored dry days. In Scenario C, the following equations will be applied.

$$V_{Daily\_n} = Measured\ Daily\ Flow\ Volume$$

$$V_{Daily\_Mean} = \frac{\sum V_{Daily_n}}{n}$$

$$V_{Annual\_Outfall} = \sum V_{Daily\_n} + V_{Daily\_Mean} \times (\#Dry\ Days - n)$$

Where:

V_{Daily_n} = Daily flow volume from MS4 Outfall during dry weather day with a continuous flow monitoring event (cubic feet)
V_{Daily_Mean} = Mean of measured daily outfall flow volumes (cubic feet)
n = number of dry days of continuous flow data at the outfall
$V_{Annual\_Outfall}$ = Annual flow volume from MS4 Outfall (cubic feet)
#Dry Days = Number of dry weather days as assessed at the applicable County ALERT Station

- Scenario D: If a major MS4 outfall station was not visited during the monitoring year, the mean of annual outfall flow volumes for all monitored stations in the jurisdiction in the WMA will be applied.

When the annual dry weather flow volume has been calculated for each persistently flowing major MS4 outfall within the jurisdiction within the WMA, a Copermittee's annual non-storm water volume will be calculated by summing the annual dry weather flow volume for each persistently flowing outfall.

Within all the above scenarios, observations of ponding (i.e., evidence of non-storm water in the MS4, with no connectivity to the receiving water) will be assigned a flow rate of zero.

The methodology above assumes that a persistently flowing major MS4 outfall is flowing on 100% of dry weather days. This assumption is highly conservative.

3.3.3 Non-Storm Water Pollutant Load Assessment

The Copermittees will estimate the annual non-storm water pollutant loads collectively discharged from their persistently flowing major MS4 outfalls to receiving waters in the MS4. A load will be calculated for each pollutant analyzed at each high priority outfall, based on the arithmetic mean of the analytical results from the two dry weather outfall monitoring events at that outfall during the monitoring year. The following equation will be applied:

$$Pollutant\ Load_{Annual} = \left(V_{Annual} \times \frac{Pollutant\ Concentration_{Event1} + Pollutant\ Concentration_{Event2}}{2}\right) \times \mathrm{UC}$$

Where:

$Pollutant\ Load_{Annual}$ = Annual dry weather pollutant load from monitored outfall (lb or MPN)
V_{Annual} = Annual flow volume from MS4 outfall (cubic feet)
$Pollutant\ Concentration_{Event1}$ = Pollutant concentration measured at the outfall during dry weather monitoring event 1 (units vary)
$Pollutant\ Concentration_{Event2}$ = Pollutant concentration measured at the outfall during dry weather monitoring event 2 (units vary)
UC = Unit Conversion. Varies according to units used to express pollutant concentration, but common conversions are:

a. mg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\ g}{1000mg}\right)\left(\frac{1\ lb}{453.592\ g}\right)$
b. µg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\ g}{1\times10^6 \mu g}\right)\left(\frac{1\ lb}{453.592\ g}\right)$
c. MPN/100mL: $UC = \left(\frac{100mL}{0.1L}\right)\left(\frac{28.317L}{1ft^3}\right)$

For each non-high priority persistently flowing outfall in a Copermittee's jurisdiction in the WMA, the mean of that Copermittee's monitored outfall results for each pollutant will be applied. It should be noted that only analytical data for outfalls that were identified as persistently flowing during the monitoring year will be included in the mean. In this case, the following equation will be applied:

$$Pollutant\ Load_{Annual} = \left(V_{Annual} \times Pollutant\ Concentration_{Mean}\right) \times \mathrm{UC}$$

Where:
$Pollutant\ Load_{Annual}$ = Annual dry weather pollutant load from non-monitored outfall (lb or MPN)
V_{Annual} = Annual flow volume from MS4 outfall (cubic feet)
$Pollutant\ Concentration_{Mean}$ = Mean pollutant concentration measured across high priority persistently flowing outfalls within the Copermittee's jurisdiction in the WMA during the monitoring year (units vary)
UC = Unit Conversion. Varies according to units used to express pollutant concentration, but common conversions are:

a. mg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\,g}{1000mg}\right)\left(\frac{1\,lb}{453.592\,g}\right)$
b. µg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\,g}{1\times10^6\mu g}\right)\left(\frac{1\,lb}{453.592\,g}\right)$
c. MPN/100mL: $UC = \left(\frac{100mL}{0.1L}\right)\left(\frac{28.317L}{1ft^3}\right)$

For any pollutants not detected at the method detection limit (MDL), a concentration of MDL/2 will be applied in calculating loads.

3.4 Non-Storm Loads Not Subject to Copermittee's Legal Authority

Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters. If a Copermittee has identified a source of non-storm water not subject to their jurisdiction during field screening events or IDDE inspections, the volumes and loads for this source will be quantified according to the methodology outlined in Section 3.3.

4 Dry Weather Assessment Methodology Assumptions and Limitations

The calculation of the MS4 Permit required assessments necessitates a number of assumptions be made to translate the monitoring data into conclusions regarding flow volume and load for the entire WMA. This may introduce potential sources of error, while propagating potential errors inherent to the monitoring data. A summary of these assumptions and sources of error follows:

- Monitoring Error—Annual non-storm water volumes and pollutants loads are based on the results from dry weather visual observations and dry weather outfall monitoring events. Error in the monitoring data could have the effect of propagating error in all subsequent calculations. Potential sources of error in the monitoring data include the following:
  - *Monitored Flow Selection*—The pollutant loading estimations rely on monitoring data from one or more non-storm water visual observations per major MS4 outfall per year. The 2015-2016 monitoring year is the first year of dry weather flow volume and load calculation, and this period generally has represented a drought condition. This can affect the type and volume of non-storm water sources such as irrigation and ground water. The potential for inter-annual variability is a source of error in both the flow and chemistry data.
  - *Flow Measurement Method*—The MS4 Outfall Monitoring Plans provides different options to determine the non-storm water volume: (1) field-based estimation methods (e.g., “float method” or “bucket and stopwatch method”) and (2) equipment-based flow measurements. The method chosen varies among outfalls and Copermittees, introducing inter-site variability in volume estimations. The field-based estimation methods introduce various amounts of human error with the use of stopwatches and error in determining volume amounts in non-graduated buckets. Consistent equipment-based flow monitoring approach is more accurate and precise compared to the field-based estimation methods. However, this approach introduces variability through the flow measurement device and sensor type used to account for site-specific conditions, and can also be cost and time prohibitive across the number of outfalls monitored. Each measurement device and sensor type has an inherent accuracy range (e.g., ±2% accuracy for sub-AV probes). Additionally, each flow measurement device and sensor type can produce slightly different values for the same event, adding a layer of inter-site variability.
  - *Rainfall Measurement*—The accuracy of determining the number of dry days relies on the accuracy of the rainfall measurements representing that outfall. Rainfall measurements were based on the County of San Diego ALERT rain gauge closest to the majority of wet weather outfalls in each WMA, and not site specific rain data. Rainfall totals across the San Diego area can vary widely within a given storm.

- *Chemistry Results*—An attempt to maintain regional consistency in reporting limits (RLs) and method detection limits (MDLs) was made. However, differences in lab capabilities can sometimes lead to different RLs and MDLs. This can introduce error if constituent concentrations are near or below the MDL for one monitoring event or Copermittee, and the MDL differs for another monitoring event or Copermittee. An attempt was made to account for this type of error by assigning constituents that were not detected a value of MDL/2 for the purposes of the assessment calculations.

❖ Assessment Methodology Error—The assessments require a series of assumptions and extrapolations be made regarding the determination of annual volumes and pollutant loadings. Each assumption carries the possibility of error, including the following:

- *Annual Volume Estimation Representativeness*—Regardless of the flow measurement method utilized, error is introduced when utilizing the median of more than one field measurement to determine an annual volume estimation. It is assumed these field measurements are representative of "typical" non-storm water conditions since persistently flowing non-storm water flows are relatively consistent through the year. However, this may not be the case, and error could be introduced into these estimations. For example, groundwater base flows can increase during the wet season, increasing dry weather flow rates. Or, alternatively, irrigation and irrigation runoff may increase during the dry season, increasing dry weather flow rates. Unless flow observations are made throughout the year under a variety of conditions, this seasonal variation may not be captured.

- *Annual Volume Estimation Confidence*—Based on availability of data, multiple calculation methods are used to estimate annual flow volume. The confidence associated with each estimate varies because differing amounts of data go into each estimate. That is to say, volumes calculated based on continuous flow data are associated with a higher confidence than volumes based on one or two instantaneous flow measurements.

- *Annual Pollutant Load Estimations*—The annual volume estimation error introduced previously disseminates into the annual pollutant load estimations through calculations discussed in Section 3.3.3. Although persistent non-storm water flows are relatively consistent throughout the year, collecting two grab samples in one year provides a very brief snapshot in time of the pollutant concentration at an outfall, which may not be indicative of typical conditions or pollutant loadings. Additionally, using an arithmetic mean as a "typical" value of pollutant concentrations to estimate pollutant loads can introduce error if the sample size of the mean is too small, as means are sensitive to sample size.

1. Del Mar outfall S-07 was classified as a highest priority persistently flowing outfall in the WQIP, but was re-classified as transient following the 2015-2016 monitoring season. No dry weather flows volumes or loads are presented. Analytical results for this outfall are included in Attachment C.1.
2. Outfall S-05 is less than 36 inches in diameter and not classified as a major MS4 outfall. It is monitored voluntarily.

* = Laboratory methods for Chromium (III) and Chromium (VI) require filtering the sample; therefore, the dissolved and total fractions of Chromium (III) and Chromium (VI) are equal

** = Nitrite and nitrate can be analyzed separately or together (Table D-7, MS4 Permit), ***NAL analyte not required for Ocean Receiving Waters

Attachment D – Data Quality Objectives and Quality Control

Intentionally Left Blank

1 Data Quality Objectives

This attachment addresses Quality Assurance/Quality Control (QA/QC) activities associated with the San Dieguito River Watershed Management Area Monitoring Program for both Dry Weather Persistent MS4 Outfall Discharge Monitoring and Wet Weather MS4 Outfall Monitoring, and the relevant data quality objectives (DQOs). The QA/QC program included both field and laboratory procedures.

DQOs are quantitative and qualitative statements that define project objectives and specify the acceptable ranges of field sampling and laboratory performance. Results that did not meet data quality objectives were qualified and may be considered estimates. Data quality objectives for this project included the following:

- Precision
- Frequency

Precision describes how well repeated measurements agree. The evaluation of precision described here relates to repeated measurements/samples collected in the field (field duplicates). Precision measurements were determined by comparing results from field duplicates to the precision objectives. Relative percent differences (RPDs) were calculated to determine the precision between duplicate samples. This calculation is shown below:

$$RPD = \frac{abs[x_1 - x_2]}{0.5 * (x_1 + x_2)}$$

Where:

abs is the absolute value.

x_1 is measurement 1 (e.g., Sample).

x_2 is measurement 2 (e.g., Duplicate).

Frequency is the rate at which a required analysis is performed. The frequency of field QC samples and laboratory QC samples is verified with stated DQOs. The field QC frequency DQOs were five percent. Laboratory frequency DQOs were dependent upon the QC sample type.

DQO results for precision and frequency are presented in the following sections.

2 Field Quality Assurance/Quality Control

This section addresses QA/QC activities associated with field sampling. The field QA/QC samples were used to evaluate potential contamination and sampling errors applicable to field sampling introduced prior to submittal of the samples to the analytical laboratory. Field QA/QC procedures utilized field blanks and field duplicates. A brief summary of each measurement type is described below, followed by a summary of their respective DQOs, and frequencies in Table D-1:

- **Field Blank** – Field blanks were collected to check for cross-contamination. A field blank sample was prepared during a non-storm water monitoring event and for each type of grab sample collected as part of a storm water monitoring event. A field blank was not conducted for composite samples during the storm water monitoring event per the Monitoring Plan. The field blanks were created by pouring laboratory-grade distilled, deionized water into laboratory supplied bottles at one of the monitoring locations.

- **Field Duplicates** – Field duplicates were collected to check the reproducibility of both laboratory procedures and field collection procedures. Field duplicate samples were collected during non-storm water events and for each type of grab sample collected as part of a storm water monitoring event. A field duplicate was not collected for composite samples during the storm water monitoring event. A field duplicate of in-situ parameters was not performed per the Monitoring Plan.

Table D-1
Field Quality Control Samples

Constituent Category	Measurement Quality Objectives		Frequency of Analysis
	Field Blank	Field Duplicate	
Conventionals	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Indicator Bacteria	<RL for target analyte	RPD < 25%[(b)]	5% of total project sample count
Metals	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Nutrients	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Solid Parameters	<RL for target analyte	RPD < 25%[(a)]	5% of total project sample count
Organics	<RL for target analyte	Per method	5% of total project sample count

Notes: NA= Not applicable; RL = reporting limit; RPD = relative percent difference.
(a) NA if native concentration of either sample <RL.
(b) Field duplicates are not a current SWAMP requirement for indicator bacteria. However, the collection and analysis of a field duplicate is recommended.

Analytical results from the field QA/QC sampling program are summarized below.

2.1 Wet Weather Results

A field blank was collected at MS4-SDC-2 during Wet Weather Event 2 for fecal indicator bacteria analytes. No analytes were detected above their reporting limits. Table D-2 presents the reported results of the field blanks below.

Table D-2
Wet Weather Field Blank Results

Analyte	Units	Reporting Limit	MS4-SDC-2
			3/6/16
Enterococcus	MPN/100 mL	1	< 1
Fecal Coliform	MPN/100 mL	18	< 18
Total Coliform	MPN/100 mL	18	< 18

A precision goal of less than twenty-five percent RPD was assessed using results obtained from a field duplicate sample taken at RW-SDC-6 during Wet Weather Event 1. Because microbiological constituents have an exponential growth curve, their RPDs are typically higher than chemical constituents. To give an accurate representation, their results are log transformed prior to calculating the RPD value. Parameters met this DQO for the analyzed parameters total hardness, total calcium, total magnesium, and fecal indicator bacteria. Relative percent difference values calculated from field duplicate data are provided in Table D-3 below.

Table D-3
Wet Weather Field Duplicate Results

Relative Percent Difference					
Analyte	**Units**	**RW-SDC-6-01**	**RW-SDC-6-02**	**1/31/2016**	**DQO**
Parameters					
Calcium	mg/L	96	95.1	0.9%	< 25%
Hardness as CaCO3	mg/L	431	428	0.7%	< 25%
Magnesium	mg/L	46.4	46.3	0.2%	< 25%
Indicator Bacteria					
Enterococcus	log(MPN/100mL)	3.8	3.7	3%	< 25%
Fecal Coliform	log(MPN/100mL)	2.4	2.6	8%	< 25%
Total Coliform	log(MPN/100mL)	4.0	4.6	14%	< 25%

2.2 Dry Weather Results

Of the 28 dry weather samples taken within 5 jurisdictions, only one field blank collected, which was from Poway Outfall 140 on 7/29/16. No analytes were detected above their reporting limits in this field blank, as shown in Table D-4 below.

Table D-4

3 Laboratory Analyses Holding Times

All wet weather samples were analyzed within the required holding time limits.

Fecal Indicator Bacteria exceeded the 8-hour hold time for the dry weather samples. Nitrate, Nitrite, and Orthophosphate exceeded the 48-hour hold time for samples taken on 2/16/16. Nitrate, Nitrite, and Total Dissolved Solids exceeded the 7 day hold time for dry weather samples taken on 3/28/16, 6/30/16, 7/29/16, and 8/12/16. All other samples were analyzed within the required holding time, as shown in Table D-6 below. The results were within the historical range, and thus are considered valid. Details of hold time exceedances are shown in Table D-7. The laboratory reports are included in Appendix C.

Table D-6
Dry Weather Holding Time Results

Analyte	Holding Time Limits	QA/QC Results
Conventional Parameters		
Chloride	28 days	Samples analyzed within holding time.
Color	48 hours	
Hardness (Total)	6 months	
MBAS	7 days until extraction; 40 days after extraction	
Indicator Bacteria		
Enterococcus	8 hours	**Dry Weather samples exceeded hold time.**
Fecal Coliform	8 hours	
Total Coliform	8 hours	
Total Metals		
Aluminum	6 months at room temp following acidification	Samples analyzed within holding time.
Cadmium	6 months at room temp following acidification	
Chromium	6 months at room temp following acidification	
Chromium (III)	6 months at room temp following acidification	
Chromium (VI)	28 days at 6°C; 24 hours without preservation	
Copper	6 months at room temp following acidification	
Iron	6 months at room temp following acidification	
Lead	6 months at room temp following acidification	
Manganese	6 months at room temp following acidification	
Mercury	90 days at room temp following acidification	
Nickel	6 months at room temp following acidification	
Silver	6 months at room temp following acidification	
Zinc	6 months at room temp following acidification	

Table D-6

Attachment E.3 – Wet Weather Assessment Methodology

Intentionally Left Blank

1 Assessment of Wet Weather Outfall Results

In 2013 the San Diego Regional Water Quality Control Board (Regional Board) issued *Order No. R9-2013-0001 (amended by Order Nos. R9-2015-0001 and R9-2015-0100), National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region*, herein referred to as the MS4 Permit, regulating MS4 discharges throughout the San Diego Region. The MS4 Permit requires a series of wet weather MS4 outfall assessments be performed annually to assess and report the progress of water quality improvement strategies toward reducing pollutants in storm water discharges from the MS4. This Attachment describes the methodology used to perform these required assessments. The methodology outlined here is largely based on the transitional methodology described in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego Regional Copermitees, 2015). Areas where the methodology differs from the transitional methodology are described in the relevant section, and also summarized in Section 5.0

Per MS4 Permit Provision D.4.b.(2)(b), Copermittees will annually assess and report the following:

- The average storm water runoff coefficient for each land use type within the Watershed Management Area (WMA);
- The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch;
- The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls;
- The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; and
- Modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify pollutants in storm water discharges from the MS4s in the Watershed Management Area.

Following acceptance of the Water Quality Improvement Plans and completion of the first year of Water Quality Improvement Plan Wet Weather MS4 Outfall Discharge Monitoring (2015-2016), annual assessments will also include comparison to applicable storm water action levels (SALs) in each Watershed Management Area as required by MS4 Permit Provision D.4.b.(2)(c). Compliance with applicable SALs will be used to evaluate whether the analyses and assumptions used to develop the Water Quality Improvement Plan should be updated as a component of the adaptive management process (MS4 Permit Provision B.5).

Table 1-1 provides the equations used in this methodology and lists the input and output variables for each equation. The sections that follow describe the application of these equations in greater detail.

Table 1-1
MS4 Wet Weather Outfall Assessment Equations

Permit Provision	Equation Reference	Equation	Inputs	Outputs
D.4.b.(2)(b)(1)[a]	A.1	$C_{Outfall\_Actual} = \frac{V_{Outfall\_Event}}{A_{Outfall} \times d_{Outfall\_Event}} \times \frac{12in}{1ft} \times \frac{1acre}{43{,}560\ ft^2}$	$V_{Outfall\_Event}$ (cf) $A_{Outfall}$ (acre) $d_{Outfall\_Event}$ (in)	$C_{Outfall\_Actual}$ (dimensionless)

Notes:

1) For those outfalls monitored for more than one monitoring year, the outfall runoff “C” ($C_{outfall\_Actual}$) will be averaged across all years of monitoring. This average value ($C_{outfall\_His}$) is to be substituted for the calculated outfall runoff “C” ($C_{outfall\_Actual}$) in all subsequent calculations.
2) Historical data are included in this calculation. The WMA land use runoff “C” (C_{WMA_LU}) is calculated based on the area-weighted average of all years of outfall monitoring data.
3) Unit conversion (UC) varies by units used to express pollutant concentration. Common unit conversions include:
   a. mg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\,g}{1000mg}\right)\left(\frac{1\,lb}{453.592\,g}\right)$
   b. µg/L: $UC = \left(\frac{28.317L}{1ft^3}\right)\left(\frac{1\,g}{1\times10^6\mu g}\right)\left(\frac{1\,lb}{453.592\,g}\right)$
   c. MPN/100mL: $UC = \left(\frac{100mL}{0.1L}\right)\left(\frac{28.317L}{1ft^3}\right)$
4) The WMA land use EMC is averaged across all years of monitoring. This average EMC (EMCWMA_LU_HIS) is included in all subsequent calculations.

V=Runoff Volume; A=Area; d=depth; C=Runoff Coefficient
HM=County of San Diego Hydrology Manual; LU=Land Use; CF=Correction Factor; WMA=Watershed Management Area; EMC=Event Mean Concentration; HSA=Hydrologic SubArea; Juris=Jurisdictional; UC=Unit Conversion
in = inches; cf=cubic feet; lb=pounds

2 Land Use Analysis

2.1 Land Use Categorization

The process of calculating average storm water runoff coefficients for land use types first requires defining land use types within the WMA and locating the boundaries of each type. Geographic Information Systems (GIS) can be used to locate the boundaries and measure the area of each land use type. Grouping specific land use types into larger categories simplifies the calculation of average storm water runoff coefficients within the WMA. The categorizations used are based on the updated land use categorizations in the Transitional Monitoring and Assessment Program Report for the San Diego River WMA (2014-2015) (San Diego County MS4 Copermittees, 2016). These categories differ slightly from the categories presented in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego Regional Copermitees, 2015).

Table 2-1 lists each San Diego Geographic Information Source (SanGIS) land use type and the corresponding land use category used in the wet weather MS4 assessments. The latest SanGIS land use GIS data layer can be downloaded from the SanGIS website (www.sangis.org).

Table 2-1
Land Use Types and Categories for Wet Weather MS4 Outfall Assessments

Land Use Category	SanGIS Land Use Type	SanGIS Land Use Code
Agriculture	Golf course	7204
	Orchard and Vineyard	8001
	Intensive Agriculture	8002

Source: San Diego County MS4 Copermittees, 2016
Notes:
1) Water land uses excluded from MS4 outfall assessments. Water land uses assumed to be a sink for runoff storage.

The Agriculture and Open Space land use categories were further subdivided based on hydrologic soil group (i.e., Soil Group A, B, C, or D). Any Agriculture or Open Space areas with an undefined soil group were classified as belonging to Soil Group D.

Federal, State, and Indian Reservation land uses were excluded from the load calculations. MS4 Permit Copermittees have limited jurisdiction over these land uses. Categorization of these land uses was based on the SanGIS LAND_OWNERSHIP_SG shape file. The following categories were excluded:

- Bureau of Land Management
- California Department of Fish and Game
- Indian Reservations

- Military Reservations
- Other Federal
- State
- State (Caltrans)
- State Parks
- U.S. Fish & Wildlife Service
- U.S. Forest Service

2.2 Expected Runoff Coefficients

Each land use category was assigned an expected runoff coefficient (Runoff "C") based on values listed in the San Diego County Hydrology Manual (County of San Diego, 2003). The Runoff "C" is a unitless coefficient representing fraction of rainfall that runs off a given land area rather than infiltrating. A larger Runoff "C" (approaching one) corresponds to a higher fraction of runoff, and typically corresponds to areas of low permeability (e.g., parking lots). A smaller Runoff "C" is often associated with undeveloped areas or other areas of high permeability.

Table 2-2 lists the expected runoff coefficients for each land use category (San Diego Regional Copermitees, 2015).

Table 2-2
Expected Runoff "C" Values by Land Use Category

Land Use Category	Runoff Coefficient
Agriculture[1]	0.2, 0.25, 0.3, OR 0.35
Commercial	0.82
Educational	0.58
Industrial	0.87
Mixed Use	0.66
Residential: Multi-Family	0.6
Residential: Rural	0.41
Residential: Single-Family	0.49
Open Space[1]	0.2, 0.25, 0.3, OR 0.35
Transportation	0.71

Notes:
1) Runoff coefficient varies by hydrologic soil group. Values presented are for soil groups A, B, C, and D, respectively.

Source: County of San Diego, 2003

2.3 Volumes and Loads of Storm Water Discharges

2.3.1 Land Use Storm Water Runoff Coefficient (D.4.b.(2)(b)(i)[a])

MS4 Permit Provision D.4.b.(2)(b)(i) requires calculation of the average storm water runoff coefficient (Runoff "C") for each land use type within the WMA. This calculation is based on the measured flow and rainfall values for each monitored outfall, along with the outfall drainage area characteristics.

The average Runoff "C" is calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the observed (actual) runoff coefficient for each monitored outfall. The observed runoff coefficient for each outfall ($C_{Outfall\_Actual}$) is calculated based on the observed runoff volume, size of the outfall drainage area, and depth of observed rainfall for the monitored storm. Rainfall data for each event is obtained from the County of San Diego Automatic Local Evaluation in Real Time (ALERT) System rain gauge closest to each monitoring station. [Equation A.1]. This is repeated for each monitored outfall in the WMA. For those outfalls monitored during more than one monitoring year (e.g., during 2014-2015 and 2015-2016), the observed runoff coefficient is averaged across all years of monitoring. This new value ($C_{Outfall\_His)}$ is used in place of $C_{Outfall\_Actual}$ in all subsequent calculations [Equation A.1.a].

2) Calculate the expected Runoff "C" for each monitored outfall. The expected Runoff "C" ($C_{Outfall\_HM}$) for each outfall is calculated based on the areas of each land use category in the outfall drainage area and the expected Runoff "C" for each land use category from the San Diego County Hydrology Manual, as listed in Table 1-2. [Equation A.2]. This is repeated for each monitored outfall in the WMA.

3) Calculate a Runoff "C" correction factor ($CF_{Outfall\_C}$) for each monitored outfall. The Runoff "C" Correction Factor is calculated by dividing the observed runoff coefficient ($C_{Outfall\_Actual}$) by the expected runoff coefficient ($C_{Outfall\_HM}$) [Equation A.3]. This is repeated for each monitored outfall in the WMA.

4) Calculate a land use Runoff "C" for each land use represented in the drainage area of each monitored outfall. A unique Runoff "C" ($C_{Outfall\_LU}$) is calculated for each land use category represented in each outfall drainage area [Equation A.4]. This is repeated for each land use category in each monitored outfall drainage area.

5) Calculate a WMA Runoff "C" for each land use category in the WMA. The WMA Runoff "C" (C_{WMA_LU}) is calculated as the area-weighted average of the outfall land use Runoff "C" values calculated in Step 4. In order to improve the accuracy of the resulting WMA Runoff "C" over time, results from each year of MS4 Outfall Monitoring are incorporated into the average [Equation A.5]. This equation is repeated for each land uses category in the WMA.

2.3.2 Monitored MS4 Outfall Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[b])

MS4 Permit Provision D.4.b.(2)(b)(i)[b] requires calculation of the storm water volume and pollutant loads discharged from each of the Responsible Agency's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area, for each storm event with measurable rainfall greater than 0.1 inch. This calculation is based on the actual Runoff "C" values, the size of each outfall drainage area, ALERT rain data for the rain gauge closest to each outfall, and the observed chemistry data.

The wet season storm water volume and pollutant loads are calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the annual storm water volume from each outfall. The storm water volume ($V_{Outfall\_Annual}$) is calculated using the actual runoff coefficient for each outfall ($C_{Outfall\_Actual}$ from Equation A.1) and the area of each outfall, multiplied by the total rainfall for the wet season. Total rainfall is calculated as the sum of rainfall from qualifying wet season rain events, based on the closest ALERT system gauge for each outfall. A qualifying storm event is defined as a wet season storm event with measureable rainfall greater than 0.1 inch. [Equation B.1]. This equation is repeated for each monitored outfall.

2) Calculate annual pollutant loads for each pollutant at each monitored outfall. The monitored event analytical result for each pollutant at each outfall is used to calculate an annual pollutant load ($PollutantLoad_{Outfall}$). [Equation B.2]. This equation is repeated for each pollutant at each monitored outfall.

2.3.3 Jurisdictional Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[c])

MS4 Permit Provision D.4.b.(2)(b)(i)[c] requires calculation of the total flow volume and pollutant loadings discharged from each Responsible Agency's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls. The WMA Runoff "C" values, calculated as described in Section 3.1, will be used in combination with land use area data and ALERT rainfall data to calculate a total flow volume for each jurisdiction. The annual volumes will be applied to pollutant event mean concentrations (EMCs) to calculate annual jurisdictional pollutant loadings.

The jurisdictional flow volume and pollutant loads are calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the wet season flow volume from each land use area in each jurisdiction in the WMA. An annual flow volume for each land use type in each jurisdiction ($V_{WMA\_Jurisd\_LU}$) is calculated using the land use Runoff "C" (C_{WMA_LU}), calculated as described in Section 3.1, the area of each land use type in each jurisdiction within the WMA, and the total qualifying wet season rainfall. The total qualifying wet season rainfall (sum of rainfall from events with rainfall totals exceeding >0.1inch) is calculated using a representative ALERT station from each WMA. If more than one ALERT station is present in a WMA, the station closest to the majority of monitoring locations will be used. [Equation C-1]. This equation is repeated for each land use type for each Responsible Agency.

2) Calculate the wet season flow volume from each jurisdiction in the WMA. The wet season flow volume from each land use in a jurisdiction will be summed to generate the wet season jurisdictional flow volume (V_{WMA_Juris}). [Equation C.2]. This equation is repeated for each Responsible Agency in the WMA.

3) Define the event mean concentration (EMC) for each monitored event. The event mean concentration (EMC) for each constituent ($EMC_{Outfall\_Actual}$) for each monitored outfall is defined as the measured constituent concentration for the outfall [Equation C.3].

4) Calculate the expected (calculated) EMC for each pollutant at each monitored outfall. An expected (calculated) EMC ($EMC_{Outfall\_Calculated}$) for each constituent at a monitored outfall will be calculated as the area-weighted average of literature EMC values for each land use type represented by the monitored outfall drainage area. The literature EMC values, based on literature EMCs provided in the San Diego River WMA Water Quality Improvement Plan (LWA & Amec Foster Wheeler, 2016) are provided in Table 2-3. [Equation C.4]. This equation is repeated for each pollutant at each monitored outfall.

5) Calculate an EMC correction factor for each pollutant measured from each monitored outfall. A ratio, or correction factor for the Estimated Mean Concentration ($CF_{Outfall\_EMC}$), is calculated using the actual EMC and the expected (calculated) EMC for each constituent at each outfall [Equation C.5]. This equation is repeated for each pollutant at each monitored outfall.

6) Calculate a land use EMC for each land use represented in the drainage area of each monitored outfall. The EMC correction factor is multiplied by the expected EMC (Table 2-3) for each constituent at each monitored outfall [Equation C.6], resulting in a corrected EMC for each constituent for each outfall ($EMC_{Outfall\_LU}$). This equation is repeated for each pollutant and each land use at each outfall.

7) Calculate a WMA EMC for each pollutant and each land use category. An EMC for each monitored constituent in the WMA by each land use type (EMC_{WMA_LU}) is then calculated as the area-weighted average of the outfall land use EMC [Equation C.7]. This equation is repeated for each pollutant and each land use in the WMA.

8) Calculate the historical average WMA EMC for each pollutant and each land use category. Each EMC calculated using Equation C.7 is averaged with the historical EMCs for that constituent and land use, to derive the historical average WMA EMC ($EMC_{WMA\_LU\_HIS}$) [Equation C.8]. This equation is repeated for each pollutant and each land use in the WMA.

9) Calculate the annual pollutant load for each pollutant from each Responsible Agency in the WMA. Wet season jurisdictional pollutant loads ($Pollutant\ Load_{WMA\_Juris}$) are calculated for each constituent by summing the load from each land use in the jurisdiction [Equation C.9]. This equation is repeated for each pollutant and each Responsible Agency.

Notes:
NA=Not applicable. EMCs not provided because annual load not calculated for these constituents.
1. Distribution of constituent EMCs based on values listed for fecal coliform
2. Distribution of constituent EMCs based on values listed for nitrate as N
3. Distribution of constituent EMCs based on values listed for total lead
4. Distribution of constituent EMCs based on values listed for dissolved copper.
5. Distribution of constituent EMCs based on values listed for total suspended solids.
6. Values for Agricultural land use based on average of Agriculture (Row Crop) and Orchard values.
7. Values for Mixed Use land use based on average of Commercial and Residential: Multi-Family values.

2.3.4 Land Use Flow Volume and Pollutant Loadings (D.4.b.(2)(b)(i)[d])

MS4 Permit Provision D.4.b.(2)(b)(i)[d] requires calculating the percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea (HSA) with a major MS4 outfall to receiving waters, or within each major MS4 outfall to receiving waters, in the Responsible Agency's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch. The methods used to perform these calculations are similar to those used to calculate the WMA jurisdictional storm water volumes and pollutant loads described in Section 2.4.3, except HSAs without a major outfall are excluded.

The HSA flow volume and pollutant loads are calculated according to the following steps. The corresponding equation or equations for each step, as listed in Table 1-1, are provided in brackets.

1) Calculate the wet season flow volume from each land use area in each HSA with a major outfall in the WMA. An annual flow volume for each land use type in each HSA ($V_{HSA\_Juris\_LU}$) is calculated using the land use Runoff "C" (C_{WMA_LU}), calculated as described in Section 2.4.1, the area of each land use type in each HSA in each jurisdiction within the WMA, and the total qualifying wet season rainfall. [Equation D.1]. This equation is repeated for each land use type in each HSA for each jurisdiction in the WMA.
2) Calculate the wet season flow volume from each jurisdiction in each HSA with a major outfall in the WMA. The wet season flow volume from each land use in the HSA (by jurisdiction) is added to calculate the total storm water volume by HSA (V_{HSA_Juris}) for the jurisdiction [Equation D.2]. This equation is repeated for each Responsible Agency.
3) Calculate the percent of storm water volume discharged from each HSA, by jurisdiction. A percent volume for each jurisdiction ($\%V_{HSA\_Juris}$) can be calculated by dividing the wet season flow volume from the HSA by the total jurisdictional runoff volume in the WMA [Equation D.3]. This equation is repeated for each Responsible Agency.
4) Calculate the annual pollutant load for each pollutant from each Responsible Agency in the WMA, by HSA. Pollutant loads by HSA by jurisdiction ($\text{Pollutant Load}_{HSA\_Juris}$) are calculated for each constituent by summing the load from each land use area in the HSA [Equation D.4]. This equation is repeated for each pollutant, each Responsible Agency, and each HSA in which that Responsible Agency has a major outfall.
5) Calculate the percent pollutant load contribution for each pollutant from each HSA. The percent contribution of pollutant load for each jurisdiction ($\%\text{Pollutant Load}_{HSA\_Juris}$) can be calculated by dividing the HSA pollutant load for each jurisdiction by the WMA pollutant load for that jurisdiction [Equation D.5]. This equation is repeated for each pollutant, each Responsible Agency, and each HSA in which that Responsible Agency has a major outfall.

3 Storm Water Action Level Comparison

Per MS4 Permit Provision D.4.b.(2)(c), Responsible Agencies must compare pollutant concentrations from monitored wet weather outfalls to applicable Storm Water Action Levels (SALs). The Responsible Agencies will include this comparison in each Water Quality Improvement Plan Annual Report. The SALs listed in Provision C.2 of the MS4 Permit are provided in Table 3-1. Additional SALs may apply, on a WMA-specific basis, for pollutants that cause or contribute to a receiving water condition associated with the highest priority water quality condition. These SALs will be provided in the applicable Water Quality Improvement Plan Annual Report.

Table 3-1
Storm Water Action Levels (SALs) for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)[1]	µg/L	3.0
Copper (Total Cu)[1]	µg/L	127
Lead (Total Pb)[1]	µg/L	250
Zinc (Total Zn)[1]	µg/L	976

Notes:
NTU= Nephelometric Turbidity Units; mg/L = milligrams per liter; µg/L = micrograms per liter
1) If a total metals concentration exceeds the listed action level, the concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If the sample does not exceed the USEPA 1-hr maximum concentration criterion for the measured level of hardness, the sample results will not be considered above the SAL.

4 Summary of Changes from Transitional Methodology

The methodology presented is largely identical to the transitional methodology outlined in the Transitional Wet Weather MS4 Outfall Discharge Monitoring Work Plan (San Diego Regional Copermitees, 2015). Differences from the transitional work plan include the following:

- Land use categorization, presented in Table 2-1, is based on the revised categorization presented in the San Diego River Transitional Monitoring Annual Report.
- For the purposes of calculating land use areas, agricultural and open space land uses of an undefined soil group are classified as soil group D.
- Literature EMCs are based on values listed in the San Diego River WMA Water Quality Improvement Plan (LWA & Amec Foster Wheeler, 2016). Literature EMCs for constituents not described in that document are estimated as described in Table 2-3.
- For outfalls monitored during more than one monitoring season, the outfall runoff coefficient (Runoff “C”) is averaged based on all years of monitoring.
- The WMA land use Runoff “C” is an area-weighted average across all years of monitoring.
- The land use EMC values are based on an average of the land use EMC values for all years of monitoring.
- The assessment excludes State, Federal, and Indian Reservation lands from the WMA and HSA load calculations. The transitional monitoring and assessment program excluded Federal and Indian Reservation lands only. These land uses are often outside the jurisdiction of the Copermittees.

Introduction

BACKGROUND

The San Diego Regional Municipal Separate Storm Sewer System (MS4) Permit (Order R9-2013-0001 as amended by Order Nos. R9-2015-0001 and R9-2015-0100) requires the San Dieguito Watershed Management Area (WMA) to perform two special studies. These special studies are designed to address pollutant data gaps and to develop the information necessary to more effectively address the highest priority water quality conditions within the WMA as identified in the Water Quality Improvement Plan. Through the development and acceptance of the recent Water Quality Improvement Plan, the highest priority water quality conditions for the San Dieguito WMA were identified as:

- Potential impairment of contact water recreation beneficial use at the Pacific Ocean at the San Dieguito Lagoon Mouth due to indicator bacteria from the sub-watershed above Lake Hodges during wet weather when rainfall causes the Lake Hodges Dam to overflow, and

- Potential impairment of contact water recreation beneficial use at the Pacific Ocean at the San Dieguito Lagoon Mouth due to indicator bacteria during both wet and dry weather conditions.

The San Dieguito Water Quality Improvement Plan included development of a Bacteria Source Identification Special Study Plan (Study Plan) to identify data gaps with respect to five key metrics used to identify and prioritize bacteria sources within the WMA: human health risk, magnitude of the bacteria source, transport feasibility of the source, frequency of occurrence, and controllability of the source. The San Dieguito Special Study Technical Memorandum #1 Summary of Updated Literature Review, Geographic Information System (GIS) Data Call, and Data Gaps, included as **Appendix A**, provides an enhanced literature review to fill these data gaps.

PURPOSE

Based on the updated literature review and GIS data collection efforts, the goals of the source identification portion of the special study are to:

- Identify focus areas for intensive source identification efforts using water quality data collected from 2007–2015;
- Use GIS and other available data to perform an in-depth source identification exercise within each focus area; and
- Prioritize the identified sources within each focus area using the prioritization methods and matrix developed as part of a previous Regional Study. The prioritization process will be informed by the outcomes of the GIS work and the updated findings of the literature review.

The purpose of this technical memorandum is to provide the updated source identification methodology, the results of the prioritization exercise, and a prioritized list of bacteria sources for each focus area within the San Dieguito WMA. The prioritized list of bacteria sources will allow Responsible Agencies to review their WQIP strategies to determine whether existing practices address these sources or whether updates to these strategies are needed. Updates could include targeting public outreach efforts, working with other agencies to address bacteria sources, or reviewing stormwater inspection programs.

SOURCE INFORMATION

During the development of the Study Plan, a number of geospatial and water quality data gaps were noted. The first phase of the Study Plan implementation included gathering information to fill those data gaps and pull together the information into a concise database related to bacteria sources in the WMA. Data needed for the bacteria source identification that were collected as part of the Study Plan development and further refined during the study data call are presented in **Table 1**.

Table 1. Summary of Information Obtained from the Data Call

Data Type	GIS[1] Data Gaps	CSD[2]	CoSD[3]	DM[4]	ESC[5]	POW[6]	SB[7]
MS4	MS4 inventory from all jurisdictions in the WMA	a	a		a	a	a
MS4	Stormwater best management practices (BMPs)	a	-		a	a	a
Sewer	Sanitary sewer system inventory from all jurisdictions and special districts in the WMA	b	x		a	a	a
Sewer	Sanitary sewer condition assessments for each jurisdiction as available (2007-2015)	-	-		a	-	a
Sewer	Sanitary sewer overflows with locations, volumes, and whether flow reached receiving waters (2007-2015)	c	a		a	c	c
Sewer	Onsite Wastewater Treatment Systems (OWTS)	-	-		c	a	a

[1] Geospatial data were analyzed in ArcGIS v. 10.2 in North American Datum 1983 (NAD 1983) with a projection in NAD 1983 California State Plane VI FIPS (US Feet). Water quality data was analyzed using Microsoft Excel.
[2] City of San Diego (CSD)
[3] County of San Diego (CoSD)
[4] The City of Del Mar (DM) conducted a separate data analysis and provided jurisdiction-specific information for this special study.
[5]City of Escondido (ESC)
[6] City of Poway (POW)
[2] City of Solana Beach (SB)
a) Denotes data that were obtained from or updated by the Responsible Agency
b) Denotes preexisting data from the Study Plan
c) Denotes data created from publicly available data
x) Denotes known unavailable data
-) Denotes data that were not provided or available

The data call was successful and able to complete or nearly complete inventories of the MS4, sanitary sewer system, and commercial, municipal, and industrial sites. Additionally, information regarding bacteria monitoring locations and general administrative boundaries of the study region were obtained in the data call. However, gaps in data continue for a few potential sources of bacteria for some jurisdictions, including the locations of Onsite Wastewater Treatment Systems (OWTS), homeless encampments, and recycled water systems.

The City of Del Mar conducted an individual jurisdictional data analysis for the special study. The City of Del Mar actively tracks and manages geospatial inventory data and conducts monthly patrols identify any potential issues and sources related to pollutants and urban runoff.

Through these methods in combination with other jurisdictional data sources, the City of Del Mar does not currently have identified data gaps for potential sources of bacteria.

Methods

WATER QUALITY DATA ANALYSIS AND IDENTIFICATION OF FOCUS AREAS

After the data call was completed, the existing bacteria-related water quality data within the San Dieguito WMA were compiled. Monitoring data containing the concentrations of total coliform, *Enterococcus*, and fecal coliform were gathered from several monitoring datasets:

- ***Responsible Agencies Dry Weather Monitoring Data* –** Includes data collected at various points within the MS4 or at MS4 outfalls as part of the Dry Weather Monitoring Programs developed to comply with Orders R9-2001-01 and R9-2007-0001. The data set spans approximately 2007-2013 and includes 110 sampling locations.
- ***MS4 Outfall Monitoring Data* –** Includes data collected at MS4 outfalls discharging to receiving waters within Responsible Agencies' jurisdictions. These data were collected under the targeted and random MS4 outfall programs developed to meeting permit requirements under Order R9-2007-0001. The data set spans approximately 2008–2012 and includes 81 sampling locations.
- ***Mass Loading Stations (MLSs)/Temporary Watershed Assessment Stations (TWASs)* –** Includes data collected in receiving waters at MLSs and TWASs. The MLS is located near the bottom of the WMA on the San Dieguito River upstream of the San Dieguito Lagoon Mouth. TWASs are located in receiving waters higher up in the watershed. The MLS data set spans approximately 2002–2012 at the single MLS. The two TWASs were monitored from 2007–2012.
- ***California Assembly Bill (AB) 411* –** Includes data collected in the Pacific Ocean as part of the County of San Diego's Beach Water Quality Monitoring Program mandated under AB 411. Data collected at this location span 2007–2012 and three locations 75 feet north and south of the San Dieguito Lagoon Mouth and directly in front of the lagoon. The City of Del Mar also used Coastal Storm Drain Monitoring data, spanning 2008–2012.

A total of 2,362 analyses were conducted for the three bacteria types across 187 sampling locations. Review of these data determined that certain areas in the WMA exhibited higher bacteria concentrations than others. This finding led to a modification in the special study design, where the bacteria source identification would be focused on the specific areas in the WMA exhibiting higher concentration of bacteria, rather than broadly assessing the whole WMA. The Responsible Agencies examined individual focus areas within their jurisdictions to be able to target future management efforts in those specific areas.

Partitioning of the water quality monitoring data was based on the season of data collection and the bacteria species. For the purposes of the special study, only dry weather samples for *Enterococcus* were used to identify focus areas. This combination of characteristics is assumed to identify the highest bacterial risk to the beneficial uses of the receiving waters. Dry weather flows can potentially generate high concentrations of bacteria when recreational beneficial uses are most likely to occur. Additionally *enterococcus* was selected for its qualification as an indicator of human health risk, as well as to retain consistency with the EPA's 2012 Recreational Water Quality Criteria, which recommends criteria for *E.coli* and *enterococci* and has removed criteria for fecal coliform.

The focus area for each Responsible Agency was determined on the basis of several considerations, as follows:

- ***Bacteria Concentration*s** – Outfall monitoring locations with the highest geometric mean (geomean) concentration and with at least three samples were selected first. Geomeans of the *Enterococcus* concentrations were calculated for each unique monitoring location. For some monitoring locations where three samples were not taken, the best available data were used to determine outfalls with high concentrations of *Enterococcus*.
- ***WMA Location*** – Focus areas were chosen on the basis of their location within the San Dieguito WMA. An emphasis on outfalls and their catchments downstream of Lake Hodges were selected to correspond with the extent of the high priority condition for the San Dieguito WMA during dry weather.
- ***Dry Weather Flows*** – Outfall monitoring locations with known persistent dry weather flows were then prioritized.
- ***Land Use*** – The land use break down was also considered; catchments that contained a greater number of land use classifications were prioritized. .

After appropriate outfalls were identified through the water quality data analysis considerations, the boundaries of each focus area were delineated and assessed through a geospatial exercise:

1. MS4 drainage area boundaries were obtained for each outfall.
2. Sewer infrastructure conduits were overlaid on the MS4 drainage area.
3. The MS4 drainage area boundary layer was expanded to include continuous portions of the sewer infrastructure than fell outside the boundary of the MS4 drainage area.
4. Topographic characteristics of the landscape were considered throughout the delineation process to ensure that assessment area boundaries followed hydrologic flow.
5. A final assessment area, known as a focus area, was developed for each outfall based on the delineation process, and all additional geospatial analyses were conducted within the boundaries of the final assessment area.

DESKTOP ANALYSIS OF SOURCES

Once geographic focus areas and their boundaries were identified, the source identification exercise detailed in the Study Plan was conducted. Only potential sources within the boundaries of the focus area were considered in the assessment. The geospatial information provided was used to develop an inventory of potential sources for the focus area. Using data collected through the initial Data Gaps/Literature Review analysis, spatial layers associated with potential bacteria sources were geospatially clipped to the boundaries of each focus area, examined, and cataloged, as follows:

- ***MS4 Infrastructure*** – Geospatial data for MS4 infrastructure varied for each Responsible Agency, but generally consisted of MS4 structures, such as catch basins, curb inlets, and manholes, best management practices (BMPs), and MS4 conduits, such as pipelines, and open or natural channels. Types of structures, lengths of pipeline (in miles), and composition of pipe within each focus area were recorded when available.
- ***Wastewater Infrastructure, Septic Systems, and Sanitary Sewer Overflows*** – Similar to the MS4 infrastructure data, available geospatial data for wastewater infrastructure varied among Responsible Agencies. In general, the layers consisted of wastewater structures, such as manholes and junctions, and wastewater conduits, such as force mains, gravity

mains, and lateral lines. The length and composition of pipeline within each focus area were examined and recorded when available. Wastewater infrastructure inspection records were available for the City of Solana Beach. Septic systems were assumed to be used in areas with no known or mapped wastewater infrastructure, unless otherwise determined by the Responsible Agency. Data regarding regional sanitary sewer overflows (SSOs) and private lateral sewer discharge (PLSDs) were obtained from the publically available State Water Resources Control Board database (California Integrated Water Quality System (CIWQS)) for incidents between 2007 and 2015.

- ***Land Use*** – The composition of land uses for each focus area was examined using the regional geospatial land use data set obtained from San Diego Association of Governments (SANDAG)[1]. The spatial data were clipped to the boundaries of the focus area. The area of each land use category was calculated, and based on the land use definition, the land uses were reclassified as residential, commercial, open space, roads, public land, crops, and utilities. The area of each land use was also calculated as a percentage of the entire focus area.
- ***Existing Development*** – Commercial properties and other existing developments were examined using the San Dieguito WMA business inventories developed during the Study Plan design, and updated commercial business inventories were provided by the Responsible Agencies, if available. The number and type of commercial establishments were tabulated for each focus area.
- ***Illicit Discharge Data*** **–** The availability of illicit discharge data varied for each Responsible Agency. For some focus areas, illicit discharge data were unavailable, or there were no incidents recorded within the focus area. The number of illicit discharges was recorded for each focus area, and the type of illicit discharge was recorded when available.

PRIORITIZATION OF POTENTIAL BACTERIA SOURCES

For this source identification project, the San Diego County Bacteria Source Prioritization Process (San Diego County MS4 Responsible Agencies, 2012) was adapted for use in the San Dieguito WMA. The prioritization process was originally developed by a workgroup of San Diego County Stormwater Responsible Agencies and was to be used for a WMA scale assessment. Based on conceptual models for the San Dieguito WMA developed as part of the source identification efforts, 50 potential bacteria sources were evaluated for each focus area and were included in a prioritization scoring sheet. During the scoring process, each potential source is considered separately in dry and wet weather conditions. Evaluation and scoring of the characteristics of the potential sources are based on the five key prioritization metrics:

- ***Human health risk*** refers to the nature and probability of adverse health effects for those who may be exposed to bacteria produced by a source. As part of the bacteria source prioritization process, the level of human health risk associated with various sources is given a relative score from 1 to 10, with 1 being a very low risk and 10 being an exceptionally high risk. As noted in the literature review in the Summary of Updated Literature Review, GIS Data Call, and Data Gaps located in **Appendix A**, research

[1] Land use data were obtained from the LANDUSE_CURRENT dataset located at the public data portal SANDAG/SANGIS Regional GIS Data Warehouse (www.sandag.org).

indicates that the origin of bacteria may affect the human health risk associated with recreational waters.

- ***Magnitude*** refers to the concentration or load of bacteria produced by a source. As part of the bacteria source prioritization process, the magnitude associated with various sources is given a relative score from 1 to 10, with 1 being a very low concentration or load and 10 being an exceptionally high concentration or load. Elevated concentrations, even with low flow, can result in high loads, potentially causing increased bacteria concentrations in receiving waters.
- ***Transport feasibility*** refers to the likelihood of stormwater or urban runoff containing bacteria from specific sources reaching receiving waters. Sources with a lower probability of reaching and influencing water quality in receiving waters are assigned a low score, while sources with a higher likelihood receive a higher score. Transport feasibility is largely affected by weather conditions (i.e., wet weather versus dry weather). The presence of structural BMPs should also be considered when evaluating transport feasibility.
- The ***frequency*** of a source refers to its presence or absence in the WMA. Where there are relatively lower numbers of a particular source, a lower score is assigned; where there are many numbers of a particular source in the WMA, a higher score is assigned accordingly.
- The ***controllability*** of a source refers to the ability of the Responsible Agency to control the source with respect to its influence on bacterial water quality. Low scores are deemed difficult to control, whereas higher scores are given to sources that are considered readily controllable.

With enhanced knowledge of potential bacteria sources within each focus area, a modified scoring system was designed for these smaller assessment areas. The prioritization scoring sheet was tailored for each Responsible Agency on the basis of the results of the source analysis. Potential sources that were listed in the original scoring sheet but were not present in the focus area analysis were removed. For example, landfills were not found in any of the focus areas, and thus were removed as a potential source. In addition, the range of scoring values attributed to the factor, "Frequency," was expanded from 1 to 5 points to 1 to 10 points, to clearly differentiate between the varied numbers of sources within the focus area locations.

The stormwater managers from the Responsible Agencies performed the prioritization assessment for potential bacteria sources in a collaborative workshop setting, as well as in internal consultations. For each focus area, the Responsible Agencies prioritized the potential bacteria sources using source information categorized and identified through the geospatial desktop analysis. For potential source characteristics where data were absent, such as the magnitude of leaky sewer pipes, the Responsible Agencies considered the information gathered through the literature review to help inform their decisions.

For each potential source, the Responsible Agencies ranked the five factors of human health risk, magnitude, frequency, transport feasibility, and controllability of each source of bacteria. The Responsible Agencies used a scoring system from 1 to 10 to evaluate human health risk, magnitude, and frequency, and ranked transport feasibility and controllability on a scale of 1 to 5. Scores were based not only on the results of the source analysis and literature review, but also on each Responsible Agency's local knowledge of the focus area. After evaluating each of the five factors, the scores were summed for each potential bacteria source, and then the sources were automatically ranked from highest to lowest based on the scoring spreadsheet. The prioritization assessment generated a unique, prioritized list of bacteria sources for each focus area and Responsible Agency.

Results

This section summarizes the results of the focus area selection, the desktop evaluation of potential sources, and the prioritization of the sources. Information is provided for each focus area.

FOCUS AREA SELECTION

Water quality samples collected during dry weather for *Enterococcus* analysis were the primary source of information used to determine the focus areas within the San Dieguito WMA. After filtering the region-wide bacteria data set for these conditions, a total of 38 MS4 outfall sampling locations were identified, representing 340 individual data points. After calculating the geomean for each MS4 outfall location and evaluating the location of the outfall within the WMA, the dry weather flow at the outfall, and the land use draining to the outfall, the focus area selection process identified six focus areas. A summary of the characteristics for each focus area outfall is in **Table 2**. A single, unique focus area was identified for the each participating Responsible Agency within the San Dieguito WMA, except for the City of Del Mar, and these are shown in **Figure 1**. One outfall, DW-619, drained a catchment that crossed the boundary between the jurisdictions of the City of Solana Beach and the City of San Diego. These two Responsible Agencies decided to evaluate potential bacteria sources in the shared focus area draining to DW-619.

Table 2. Summary Characteristics of Individual Focus Areas: *Enterococcus* Geomeans and Area

Responsible Agency	Outfall ID/Focus Area	Area of Focus Area (acres)	Geomean (MPN/100mL)	Sample Number (n)	Rationale
City of San Diego	DW-284	156	30,728	3	Elevated *Enterococcus* concentrations Lower watershed Persistent flow
County of San Diego	SDG-210	17	24,000	1	Elevated *Enterococcus* concentrations Lower watershed Persistent flow
City of Escondido	HDG-102	188	845	6	Elevated *Enterococcus* concentrations Existing high priority catchment Persistent flow
City of Poway	PO-132	723	1,709	3	Elevated *Enterococcus* concentration
City of Solana Beach	SB-12	74	10,197	2	Elevated *Enterococcus* concentrations Existing high priority catchment and source identification efforts Persistent flow
City of San Diego / Solana Beach	DW-619	60.42	38,620	3	Elevated *Enterococcus* concentrations Consistent flow Diverse land uses

ID = identification; MPN/100mL = most probable number per 100 milliliters

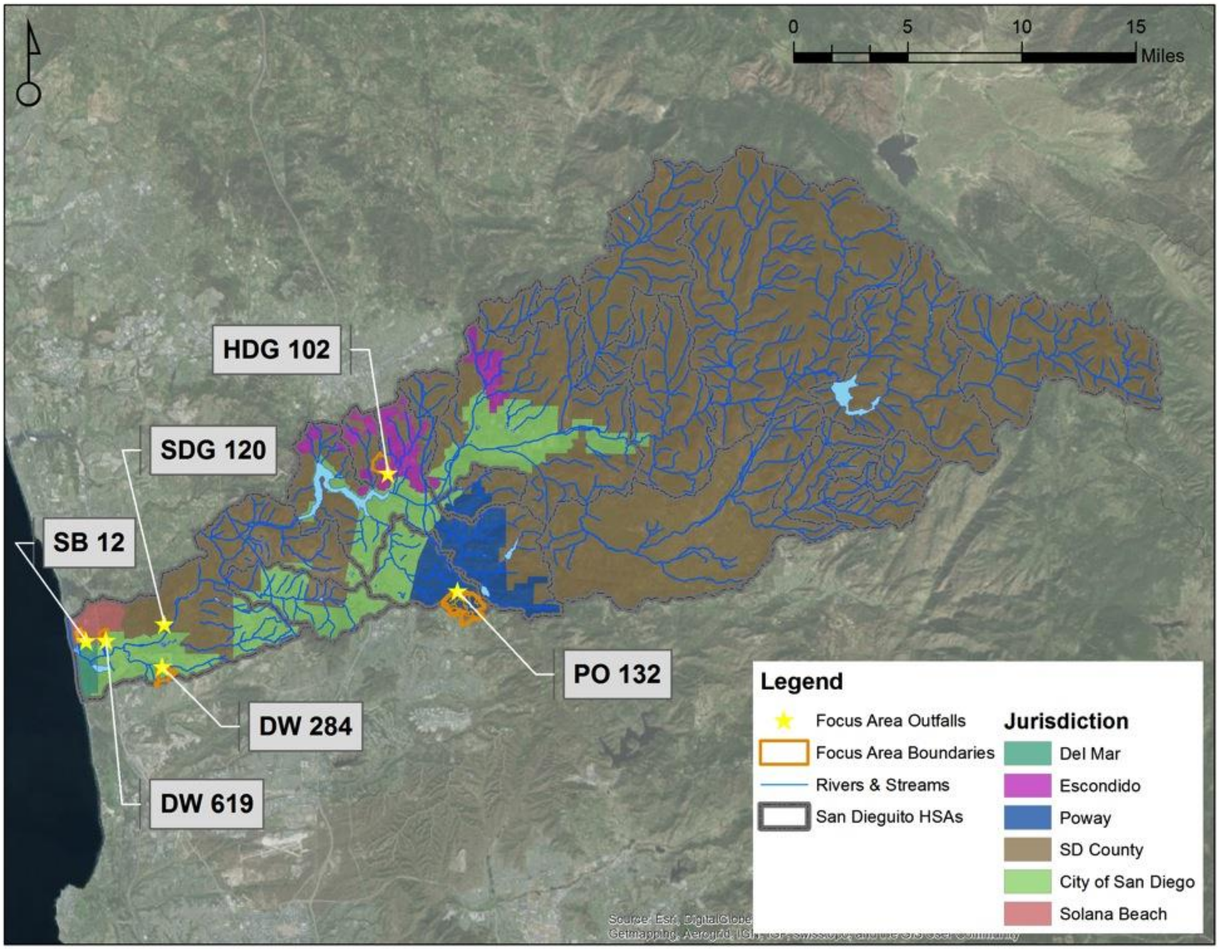

Figure 1. Locations of Focus Areas for the Bacteria Special Study Source Identification

Through the analysis of bacteria concentrations (geomeans of *Enterococcus* concentrations), MS4 outfall locations within the jurisdiction, and dry weather flow observations and information, the City of Del Mar does not currently have a focus area identified. The City of Del Mar does not have any persistently flowing major MS4 outfalls that drain to the San Dieguito River or Lagoon[2]. The City of Del Mar has one major MS4 outfall (S-14) and six minor MS4 outfalls (S-09, S-10, S-11, S-13, S-14, S-16, and S-21) that flow into the San Dieguito River or Lagoon (**Figure 2**). Based on the currently available data, no bacteria exceedances are recorded for these locations. In addition, since 2013, the City of Del Mar has performed visual outfall monitoring at every outfall, minor or major, on a monthly basis, and the seven MS4 outfalls identified above have never persistently flowed. An analysis of the monthly data from 2013 to present day shows that six of the seven MS4 outfalls are consistently dry and one outfall has had minor flow observed twice. The City of Del Mar will continue to conduct frequent City-wide patrols and assessment of data, and will determine whether specific focus areas will need to be established in the future. Any changes will be documented in applicable WQIP Annual Reports or updates.

[2] The City of Del Mar has only one persistently flowing major MS4 outfall, S-07, which drains to the Pacific Ocean south of the San Dieguito Lagoon mouth. 2008–2012 Coastal Storm Drain Monitoring Program data was used to calculate the geomean for this location (geomean = 92.08 MPN/100mL with a sample number of 69).

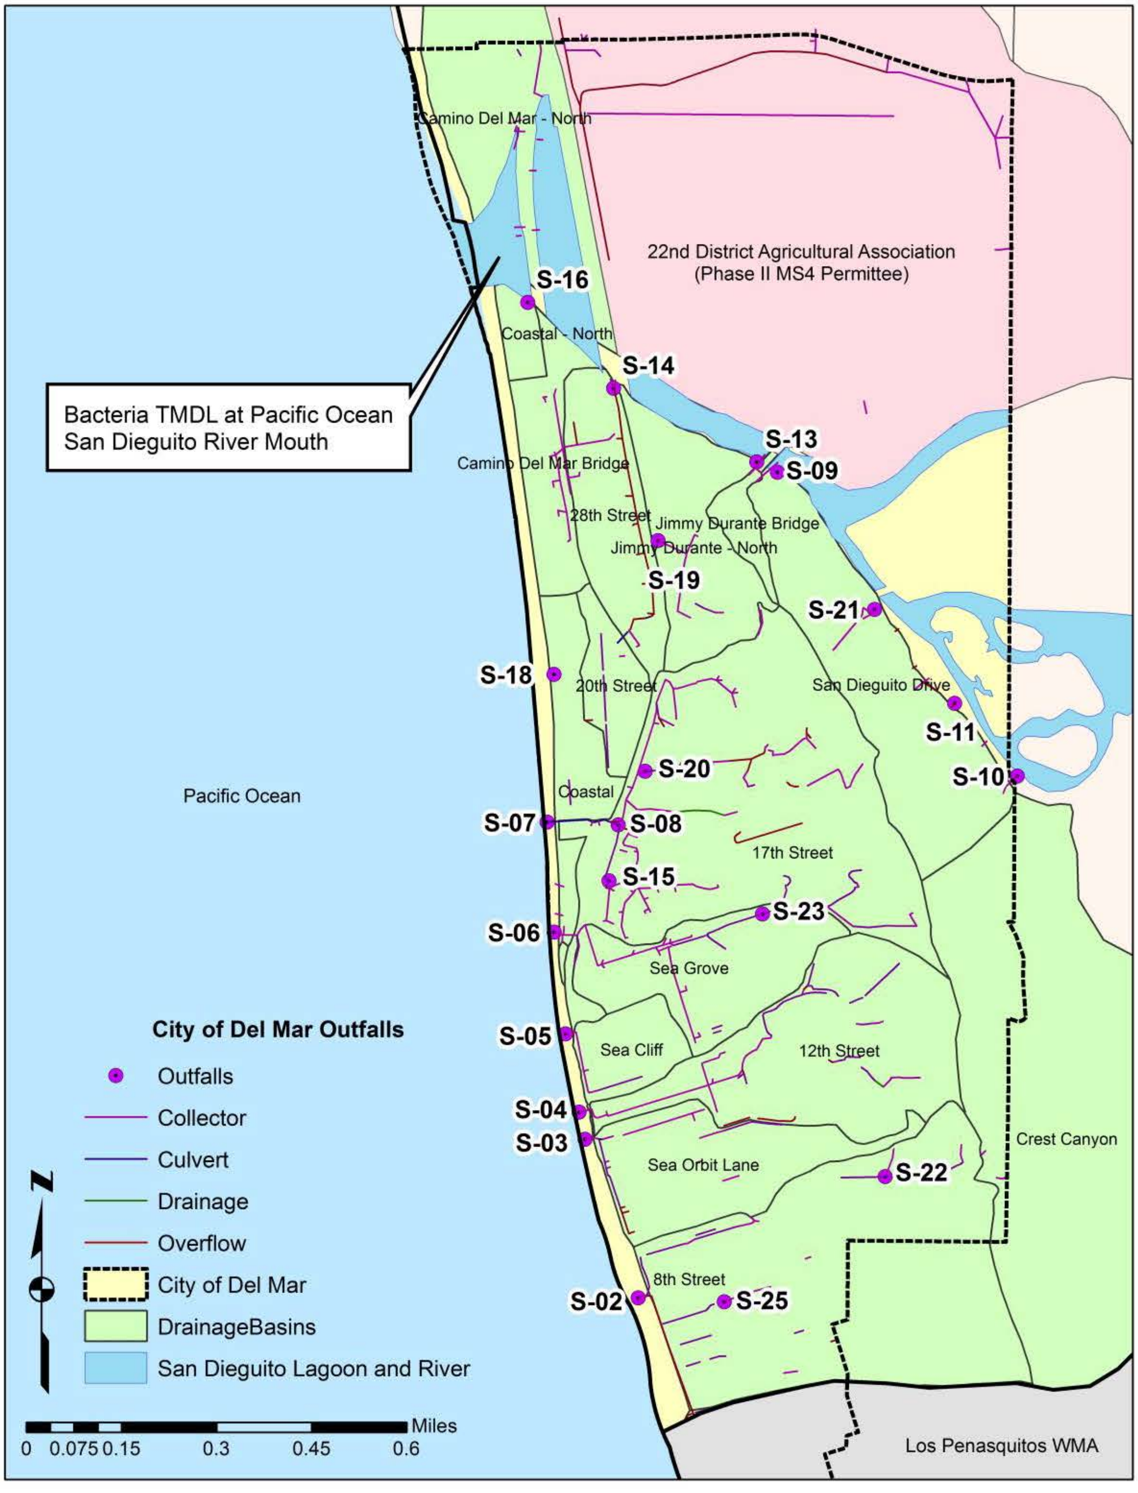

Figure 2. Minor and Major MS4 Outfall Locations in the City of Del Mar

POTENTIAL SOURCES

Potential sources of bacteria were initially identified in Section 3.0 of the San Dieguito WMA Water Quality Improvement Plan. Further desktop analyses characterized the potential sources and developed a catalog of detailed source information for each of focus areas described above. Based on information from the Responsible Agencies, sanitary sewer infrastructure was added to the list of potential sources in the Water Quality Improvement Plan. The enhanced literature search performed as part of the study, detailed in **Appendix A**, found that sanitary sewer infrastructure has the potential to impact bacteria concentrations in the MS4, particularly when SSOs occur and at locations of older infrastructure.

Based on the spatial analysis of sources in the focus area, Responsible Agencies were able to identify key sources of bacteria. They also were able to exclude sources not present within their focus areas. Each jurisdiction and focus area contained a unique catalog of potential sources. A summary of potential sources assessed within each focus area is described in **Table 3**, and a full characterization of these potential sources and their complete rankings is in **Appendix B**.

PRIORITIZATION RESULTS BY FOCUS AREA

The Responsible Agencies evaluated 50 potential bacteria sources within each focus area, and considered dry and wet weather conditions separately. Of the 50 sources, those that were identified as present within the focus area were then prioritized. The potential bacteria sources were grouped into three categories on the basis of bacterial origin: human waste, anthropogenic non-human sources, and non-anthropogenic sources. Within these three general categories, sources and subcategories are further identified.

Detailed results for the potential bacteria sources within each focus area are in **Appendix B**. In the tables below, the highest priority sources for each focus area are presented for dry and wet weather. These results consist of the highest potential bacteria sources based on the highest scores across the three bacteria origin categories. In some instances, the scores generated several ties, and results presented below include potential sources with the same score.

City of San Diego (DW-284)

The City of San Diego's primary focus area drains to the outfall site, DW-284, shown in **Figure 3**. The total area assessed is 156 acres, and consists of 49 percent (%) residential land uses, 34% open space, 16% road infrastructure, and 1% institutional land uses. With single family residential land uses and open space comprising over 80% of this focus area, the top two potential bacteria sources in both dry and wet weather are pets and manure/compost. Although six businesses are located within the focus area, none of the commercial businesses are food or eating and drinking establishments. The other potential sources are most highly associated with infrastructure and land use.

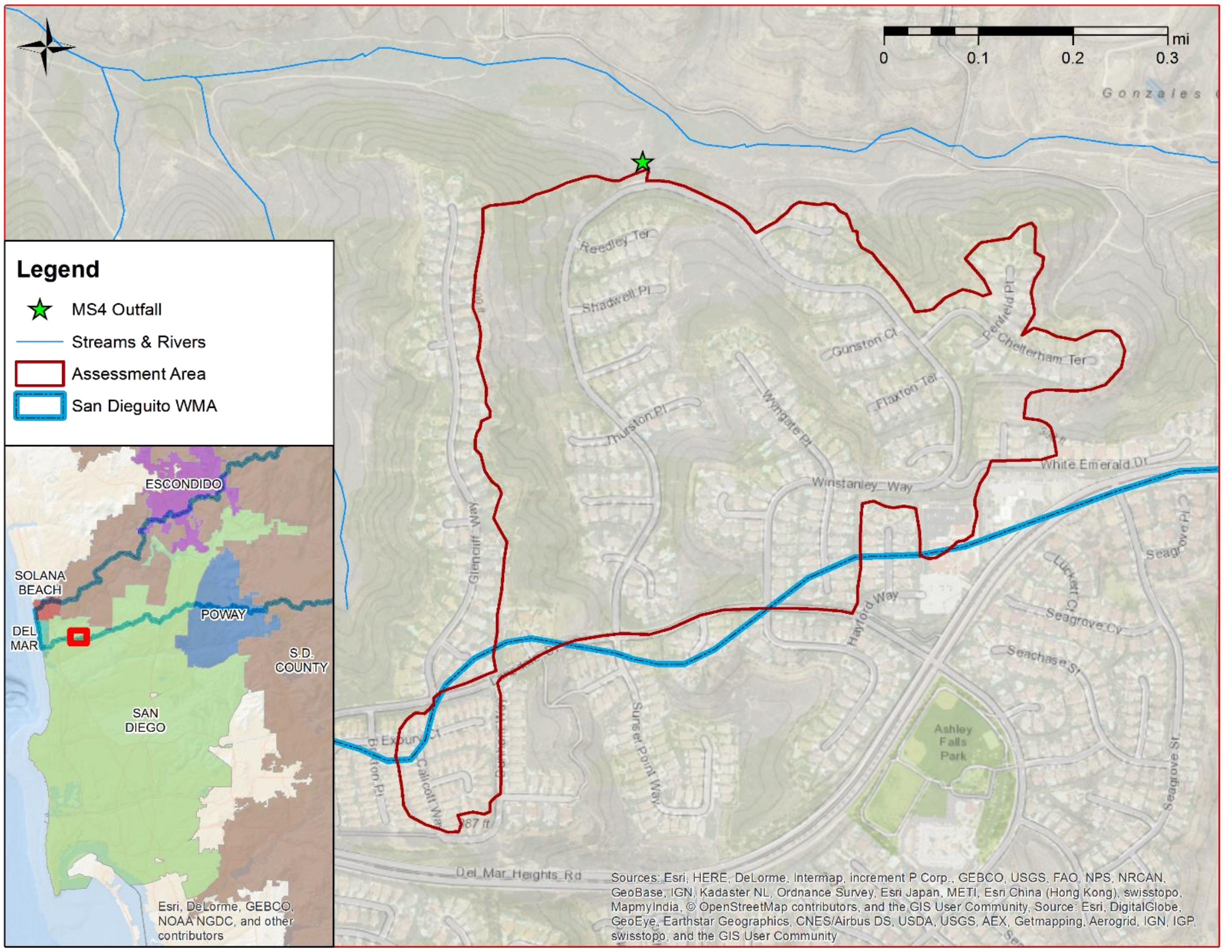

Figure 3. Focus Area for the City of San Diego: Outfall DW-284

The potential bacteria sources within the City of San Diego's focus area comprise a mixture of anthropogenic non-human and human waste bacteria origins. A summary of the top 10 sources is in **Table 4**, while the full list of prioritized sources is in **Appendix B.**

County of San Diego (SDG-210)

The County of San Diego's primary focus area drains to the outfall site, SDG-210, shown in **Figure 4**. The total area assessed is 17 acres, and consists of 63% residential land uses, 18% open space, and 19% road infrastructure. The land uses are mainly single-family residential with associated open space. One of the residential areas has an active homeowners association and the focus area borders a golf course. Information regarding the sanitary sewer infrastructure for this focus area was unavailable. The potential bacteria sources in this focus area are associated with residential land uses, human activities, and any potential sources associated with open space and wildlife.

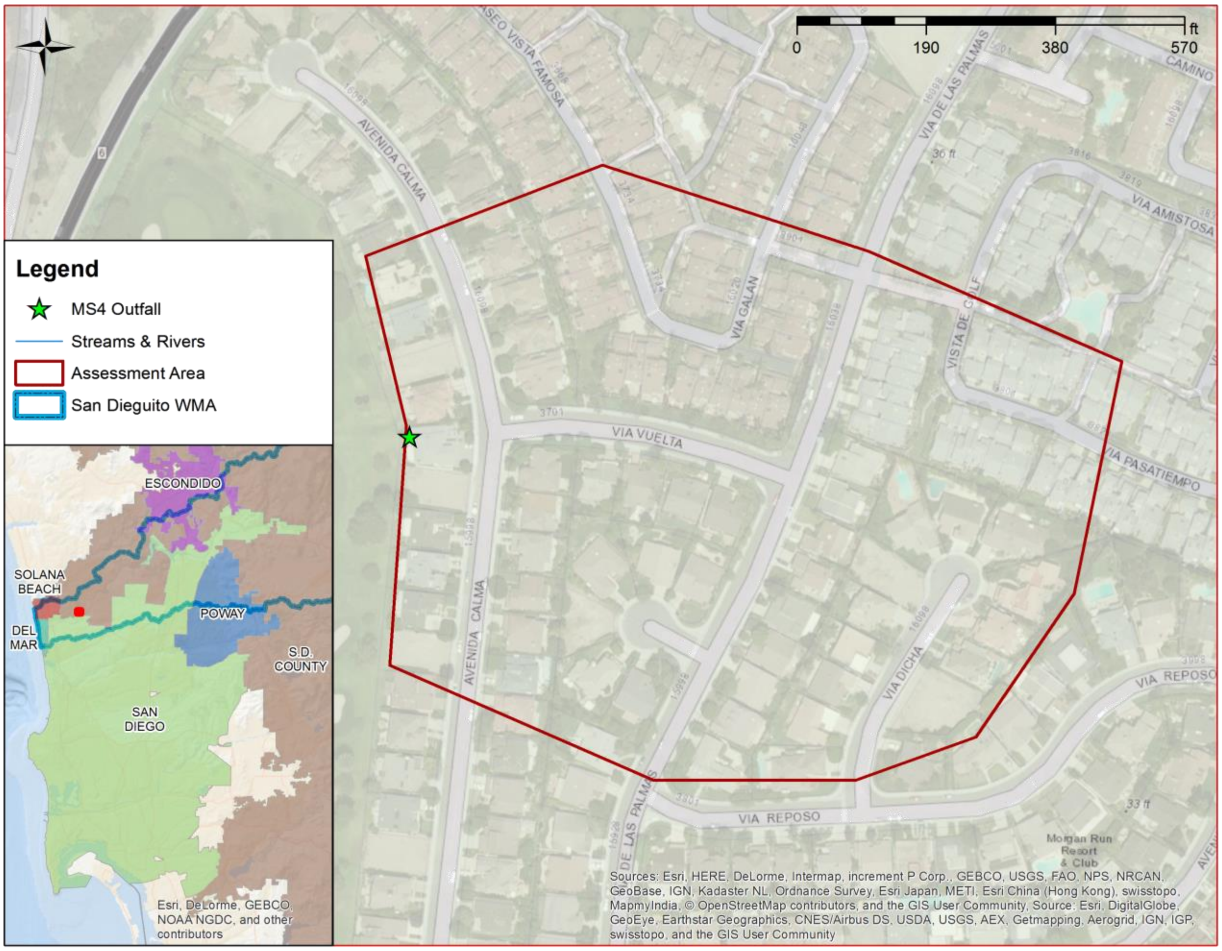

Figure 4. Focus Area for the County of San Diego: Outfall SDG-210

The potential bacteria sources within the County of San Diego's focus area comprise a mixture of anthropogenic non-human and bacteria related to human waste. A summary of the top 10 sources are in **Table 5**, and the complete prioritization results are in **Appendix B**.

City of Escondido (HDG-102)

The City of Escondido's primary focus area drains to the outfall site, HDG-102, shown in **Figure 5**. This outfall was previously identified by the City of Escondido as an outfall of interest for additional investigation because it is the only major MS4 outfall with persistent flow, based on transitional MS4 visual outfall monitoring. The total area is 188 acres, and consists of 73% residential land uses, 5% open space, 1% commercial land uses, and 20% road infrastructure. Despite the fact that the focus area is mostly composed of residential land uses, the commercial inventory provided by the City of Escondido shows a neighborhood shopping center with several food service establishments in the southeastern portion of the assessment area. A total of 10 food service establishments are within the assessment area. The potential bacteria sources within this focus area represent residential and commercial activities associated with human waste, existing infrastructure, and other anthropogenic and non-human sources of bacteria.

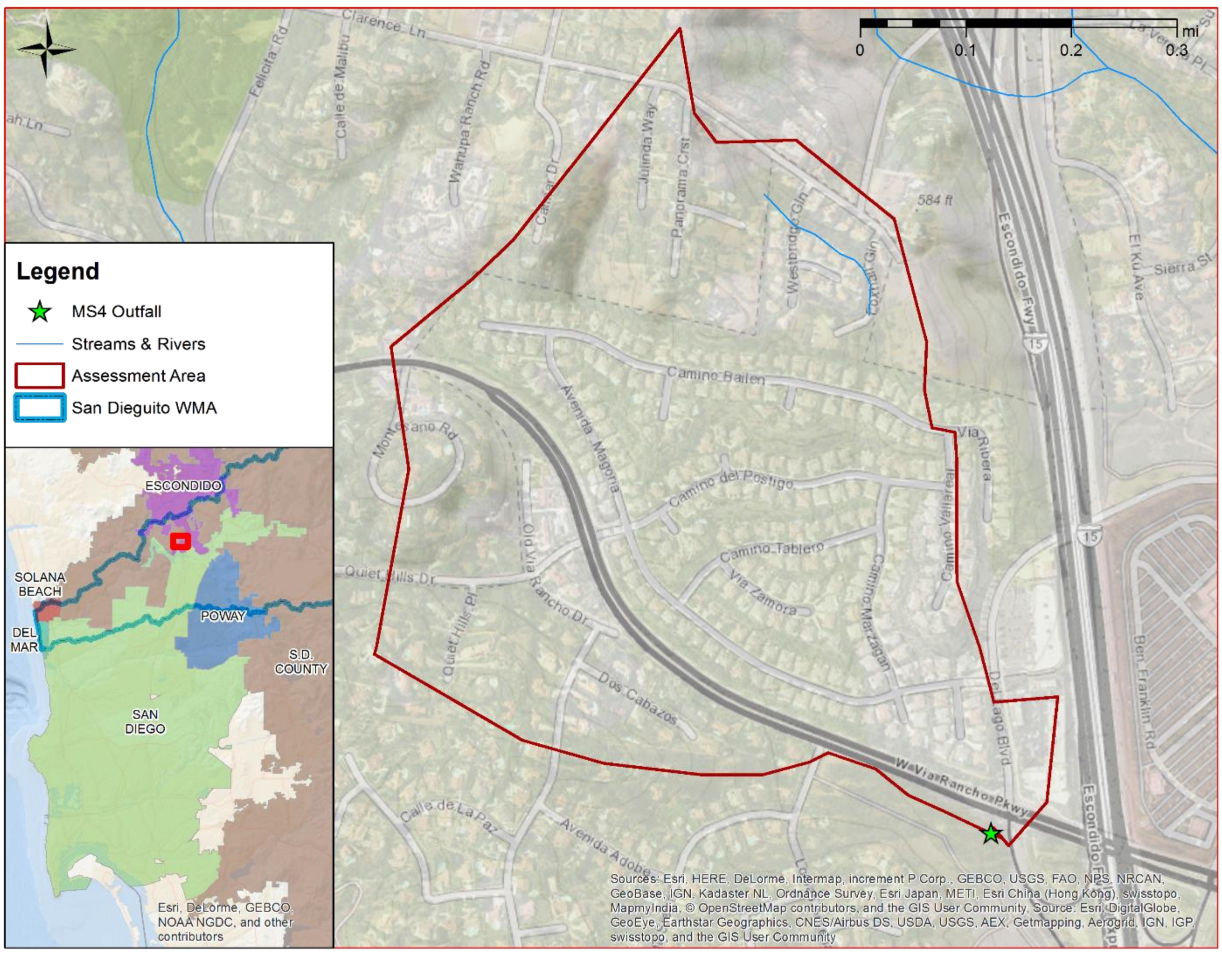

Figure 5. Focus Area for the City of Escondido: Outfall HDG-102

The potential bacteria sources within the City of Escondido's focus area comprise a mixture of anthropogenic non-human related to commercial activities and human waste bacteria origins. The potential bacteria sources related to human waste received higher ranking because of an evaluation of the human health risk in this focus area. Although sewer overflows and leaky sewer pipes received a high ranking as a potential bacteria source, the data used in this special study did not identify any SSOs. The sanitary sewer in the focus area is composed of polyvinyl chloride (PVC) pipes, which are not as likely as other pipe materials (such as vitrified clay pipe [VCP]) to leak. Additionally, the City of Escondido has a sewer system management plan to prevent SSOs and the City inspects all food service establishments one to two times per year (stormwater inspections are included in this inspection). A summary of the top 10 sources is in **Table 6**, and the complete prioritization results are in **Appendix B**.

City of Poway (PO-132)

The City of Poway's primary focus area drains to the outfall site, PO-132, shown in **Figure 6**. The total area is 723 acres, and consists of 74% residential land uses, 9% open space, 7% public land, and 1% crops, and 9% road infrastructure. The City of Poway's focus area comprises over 80% single-family residential and open space land uses. The area includes a high school and a few in-home businesses. The bacteria source priorities are mainly associated with wildlife (both non-anthropogenic and anthropogenic). Other potential sources include leaky infrastructure, sources related to garbage, and other wastewater sources.

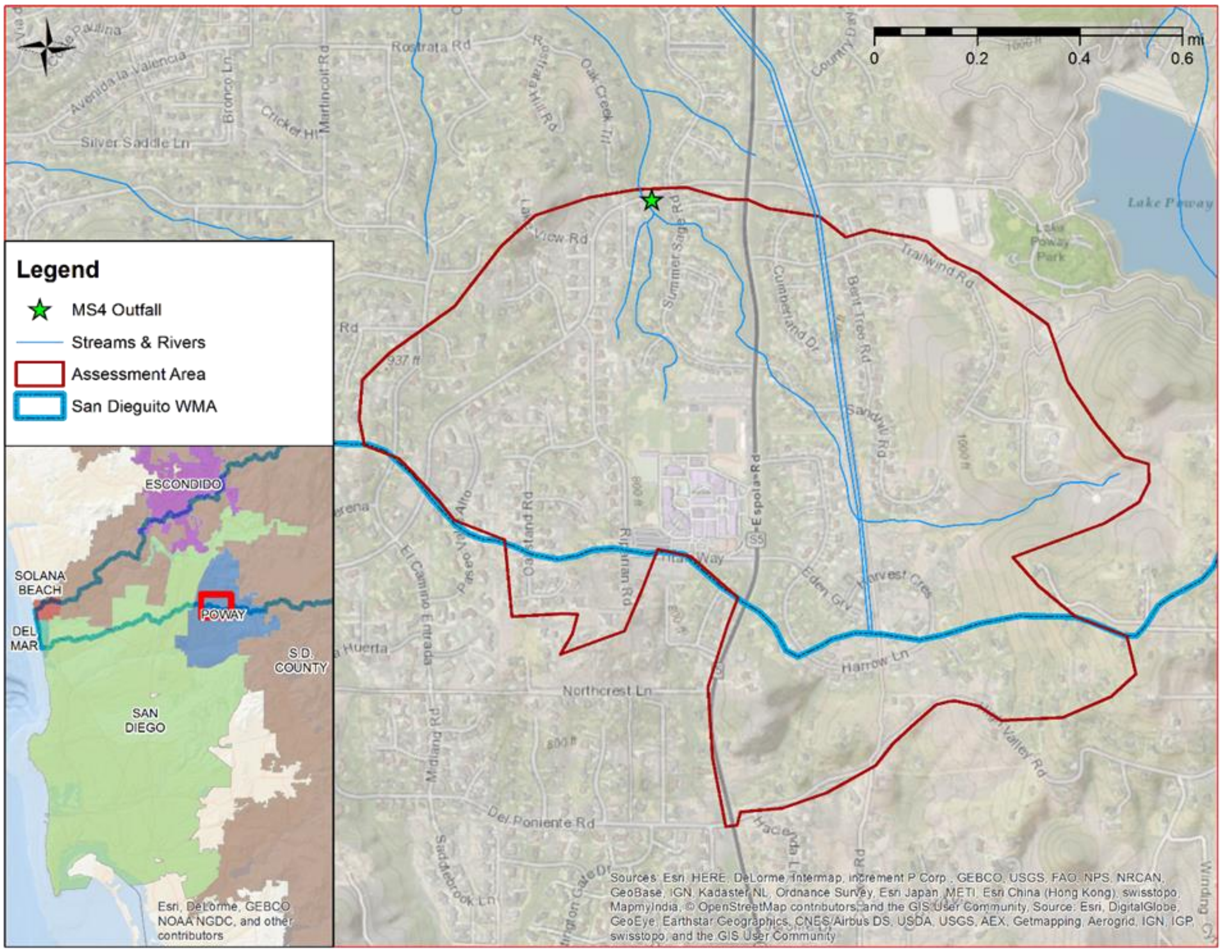

Figure 6. Focus Area for the City of Poway: Outfall PO-132

The potential bacteria sources within the City of Poway's focus area comprise a mixture of non-anthropogenic, anthropogenic non-human, and human waste bacteria origins. A summary of the top 10 sources is in **Table 7**, and the complete prioritization results are in **Appendix B**.

City of Solana Beach (SB-12)

The City of Solana Beach's primary focus area drains to the outfall site, SB-12, shown in **Figure 7**. The total area is 74 acres, and consists of 72% residential land uses, 7% open space, 1% institutional land use, and 20% road infrastructure. In addition, the majority of the residential parcels contain multi-family residential units. While commercial businesses are rare within the boundaries of the focus area, multi-family residential units may have similar features that are commonly associated with business activities, such as large dumpsters. The potential bacteria sources within this focus area represent both residential and commercial activities associated with human waste, as well as some infrastructure. This focus area was previously identified as an area of interest for the City of Solana Beach because it drains to the San Dieguito River and ultimately the San Dieguito Lagoon Mouth.

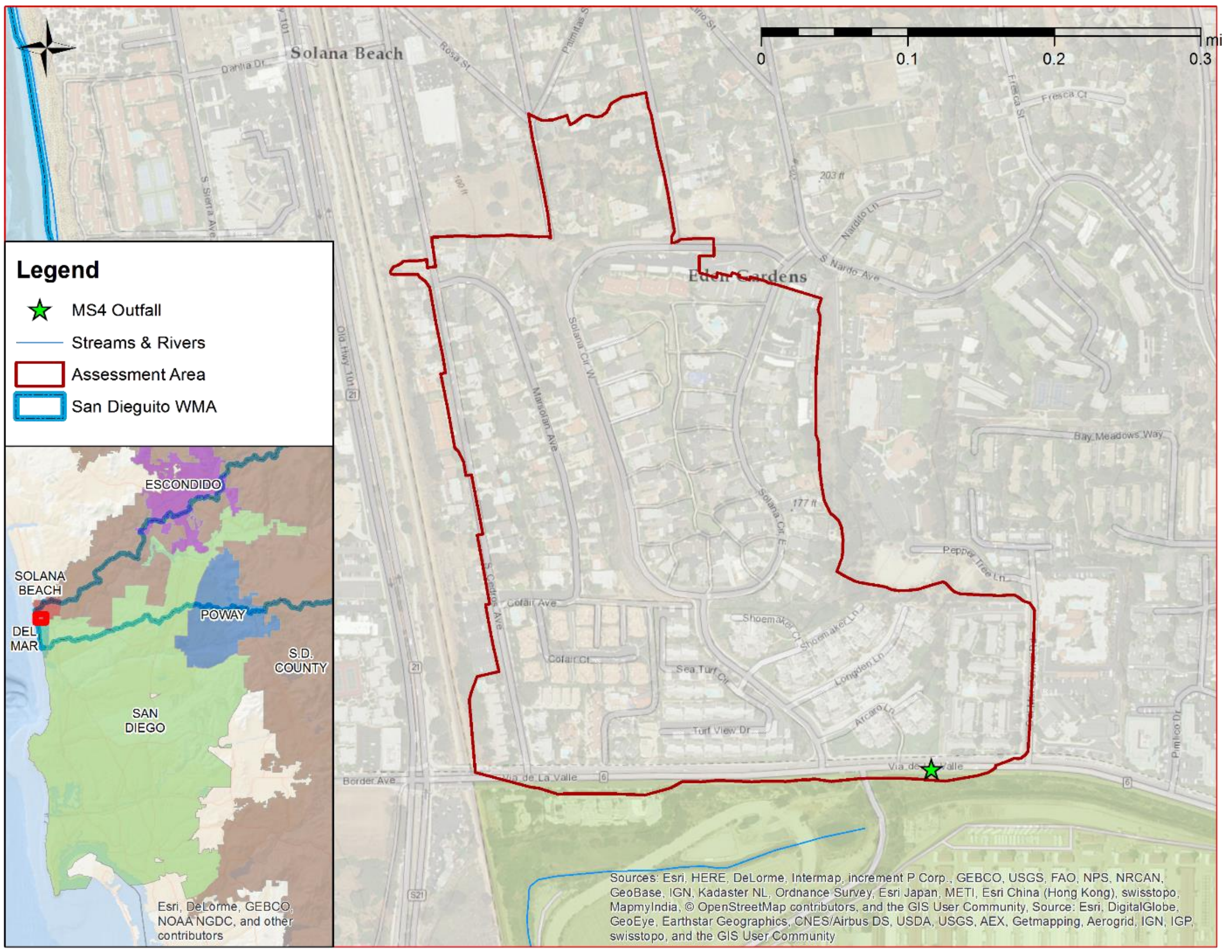

Figure 7. Focus Area for the City of Solana Beach: Outfall SB-12

The potential bacteria sources within the City of Solana Beach's focus area comprise a mixture of anthropogenic non-human and human waste bacteria origins. A summary of the top 10 sources is in **Table 8**, and the complete prioritization results are in **Appendix B**.

City of San Diego/City of Solana Beach – Shared Focus Area (DW-619)

The Cities of San Diego and Solana Beach assessed and prioritized bacteria sources within a focus area that drains through an outfall in the City of San Diego's jurisdiction but includes drainage areas serving both the Cities of San Diego and Solana Beach, shown in **Figure 8**. In this focus area, identified by outfall DW-619, the total area is 60.42 acres, with 17.91 acres in the City of San Diego and 42.51 acres in the City of Solana Beach. For the area within the City of San Diego, 46% of the land use consists of commercial parcels, while the remaining portions are composed mostly of roads and rights of way. In particular, the City of San Diego's infrastructure drains a large neighborhood shopping center. The potential bacteria sources within this focus area represent these land uses and activities, including the potential for secondary wildlife associated with these activities.

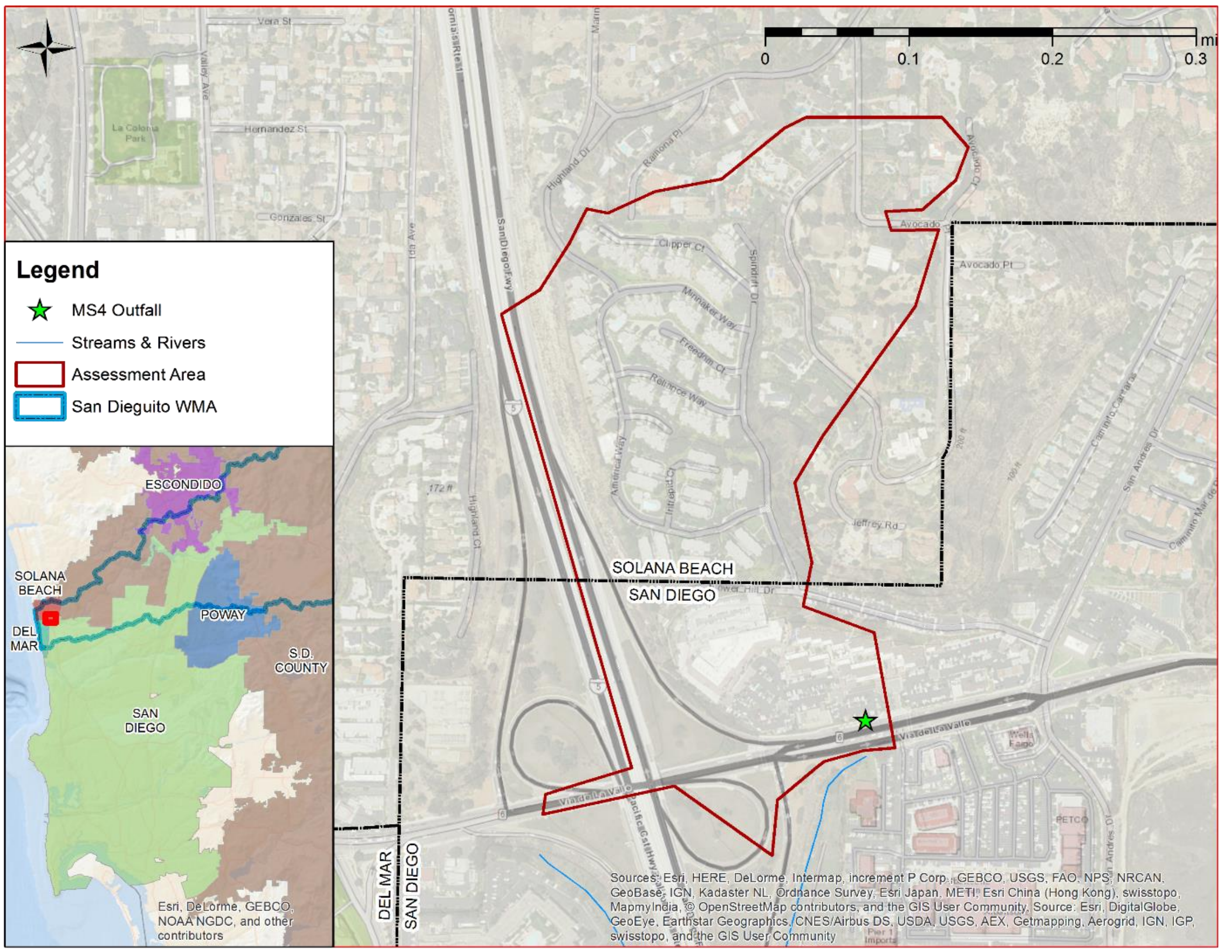

Figure 8. Focus Area within the Cities of Solana Beach and San Diego: Outfall DW619

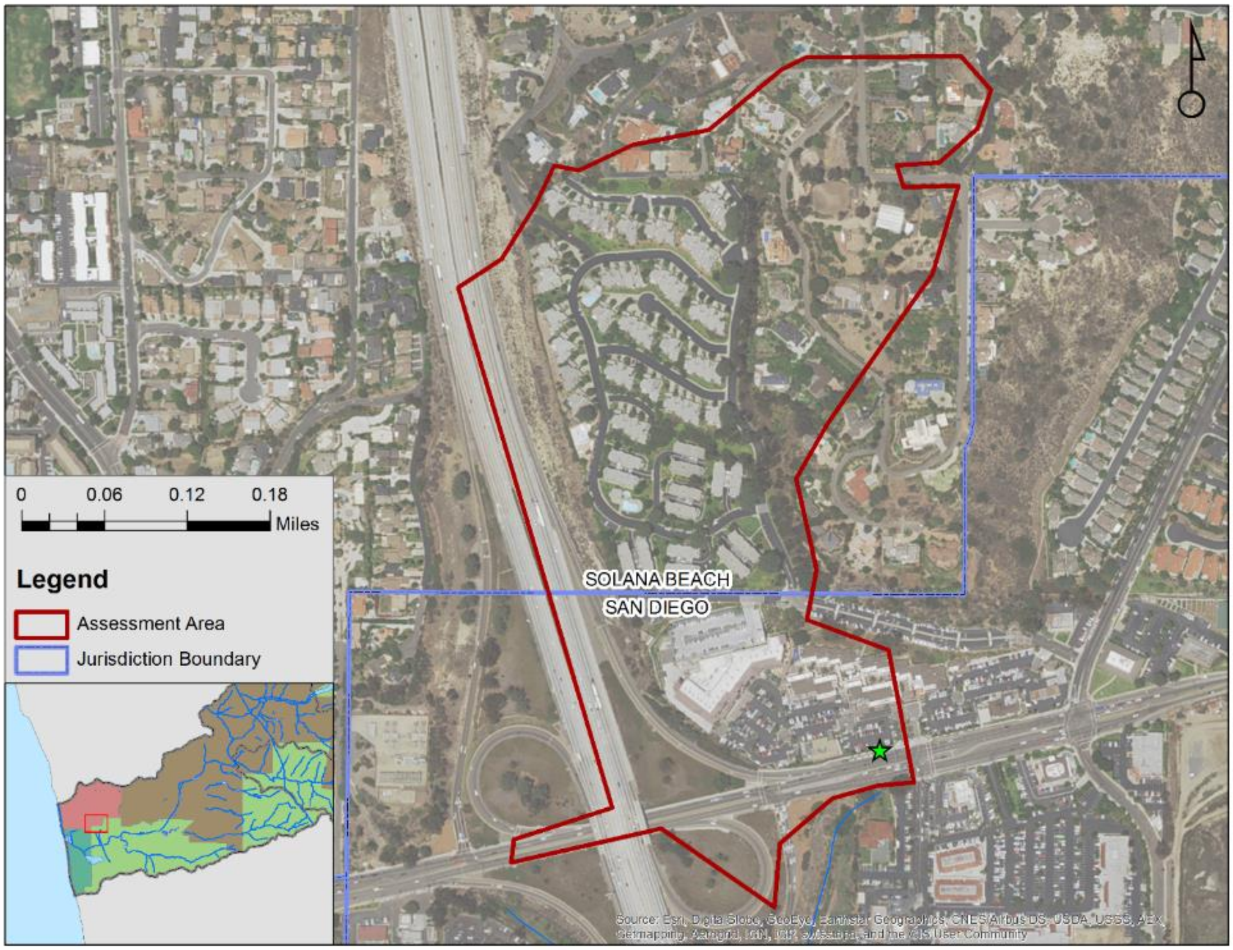

Figure 8. Focus Area Within the Cities of Solana Beach and San Diego: Outfall DW-619

The potential bacteria sources within the City of San Diego's portion of the focus area comprise a mixture of human waste and anthropogenic non-human bacteria origins. A summary of the top 10 sources is in **Table 9**, and the complete prioritization results are in **Appendix B**.

The land uses within the City of Solana Beach's jurisdiction comprise 83% multi-family and single-family residential homes. The remaining portion of land use consists of road infrastructure. The potential bacteria sources within this focus area represent the activities and sources more commonly associated with residential land use. The residential parcels are split between single-family residential and multi-family residential land uses. The potential bacteria sources within the City of Solana Beach's portion of the focus area comprise a mixture of human waste and anthropogenic non-human bacteria origins. A summary of the top ten sources is in **Table 10**, and the complete prioritization results are in **Appendix B**.

COMMON SOURCES IN SAN DIEGUITO FOCUS AREAS

The bacteria source prioritization results for the San Dieguito WMA focus areas show many similarities across the region, summarized in

Table 11. The table illustrates the number of times a particular source was prioritized in the top 10 results for each Responsible Agency and drainage area analyzed, separated by the frequency of occurrence in the top five ranked results versus bottom five ranked results. Prioritized sources were occasionally ranked within the top 10 potential sources for all seven combinations of Responsible Agencies and focus areas, such as SSOs during dry weather. However, given the variation in each focus area's source analysis, potential sources and their prioritizations vary from one focus area to the next, as well as between wet and dry weather conditions. Although SSOs were ranked as one of the top five potential sources in all Responsible Agency and focus area combinations during dry weather conditions, in wet weather conditions, the potential source was ranked in the top 10 for only 6 of the 7 possible combinations of Responsible Agency and focus area: five Responsible Agencies ranked SSOs in the top 5 of 10 sources, one Responsible Agency ranked SSOs in the bottom 5 of 10 sources, while another Responsible Agency did not have SSOs ranked within the top 10 potential bacteria sources during wet weather conditions. Results are presented for wet and dry weather. The results often corroborated several of the key findings of the literature review.

Table 11. Frequency of Prioritized Source Occurrences in Dry and Wet Weather Conditions for All Focus Areas

Source	Category	Subcategory	Dry Weather Frequency[1]		Wet Weather Frequency[1]

1. *The number of times a particular source was prioritized in the top 10 results for each agency and drainage area analyzed, separated by the frequency of occurrence in the top 5 versus e bottom 5 ranked results.*

For the majority of the focus areas, the land use characteristics were a key factor driving the prioritization and prevalence of bacteria sources. The focus areas were predominantly characterized by residential land uses, and the bacteria sources identified were most often associated with residential activities. Pet waste, compost, manure, irrigation runoff, and porta-potties associated with construction were common potential bacteria sources associated with residential land uses throughout the region. Over-irrigation has the potential to be a key transport mechanism for bacteria. It is also considered an illegal discharge. Over-irrigation occurs mainly in residential areas, but can occur in commercial and industrial land uses as well. The correlation between residential land uses in areas with discharges containing relatively high geomeans of *Enterococcus* is corroborated by findings in the literature review. In particular, Reeves et al. (2004) found that the concentration of fecal indicator bacteria is extraordinarily high in sources of urban runoff, particularly residential runoff.

The sanitary sewer infrastructure was also identified as a potential priority bacteria source across the six focus areas. In the literature review, the sanitary sewer/wastewater has been shown to be a prevalent source of human-derived bacteria from storm drainage systems, particularly during dry weather flows (Field et al., 1994; Sauer et al., 2011; Sercu et al., 2009, 2011). Sercu et al. (2011) determined that sewage can be transmitted directly from leaking sanitary sewers to storm drains, suggesting that chronic sanitary sewer leakage can contribute to downstream fecal contamination of coastal beaches. Marsalek and Rochfort (2004) noted that levels of *E. coli* in urban runoff greater than 10^5/100 milliliters (mL) suggest the presence of cross-connections with sanitary sewers. In addition to cross-connections, leaking sanitary sewers can contribute bacteria to groundwater (Paul et al., 2004), which can then infiltrate into the MS4 system or impact surface waters directly. Wastewater exfiltration and subsequent infiltration was quantified by Guérineaua et al. (2014) to be 0.6-15.7 cubic meters per day per kilometer (m^3/d per km) in dry weather and 1.1 to 19.5 m^3/d per km in wet weather. The geomeans measured during dry weather at outfalls in the San Dieguito WMA were not as high as the value in the literature. It is possible that exfiltration from the sanitary sewer may influence bacteria concentrations within several of the focus areas in the study, but its true impact cannot be known without field investigations. Based on data from CIWQS, sanitary sewer overflows and private lateral sewer discharges appear to be relatively rare occurrences in the San Dieguito WMA focus areas.

The literature review suggests that natural bacteria sources likely contributed high numbers of *Enterococci*, including regrowth on the walls of the MS4 system (Weston Solutions, 2010). The high flows generated during wet weather were found to cause significant biofilm sloughing, potentially impacting wet weather loads. Sediments and biofilms the Tecolote Creek and MS4 system were found to be significant reservoirs (Weston Solutions, 2010). While biofilm within the MS4 infrastructure may be a priority bacteria source in some of the focus areas, these sources are very difficult for managers to control.

The Responsible Agencies also identified and prioritized dumpsters/trash-related activities as a potential bacteria source within their focus areas. This conclusion is supported by the literature review, particularly regarding trash bacteria sources in commercial land uses. Urban areas may contain bacteria from leaking trash dumpsters or restaurants that hose food waste into storm drains. Stormwater system inspections in Dyes Inlet, Washington identified 7 of 207 properties (dumpster, restaurant cleaning areas, and food compactor areas) that discharged food waste to the storm drain system (Kitsap County Public Works, 2009). Secondary bacteria sources, such urban wildlife, may also contribute bacteria to the stormwater system as the animals are in search of food waste associated with dumpsters and trash.

WET/DRY WEATHER CONSIDERATIONS

For the purposes of this study, focus areas were identified and developed from an initial water quality monitoring data set for three bacteria types: total coliform, fecal coliform, and *Enterococcus.* The Responsible Agencies decided that the approach for determining focus areas should utilize *Enterococcus* monitoring data from MS4 outfalls during dry weather conditions. It was determined that the set of dry weather monitoring data was more robust than the available wet weather monitoring data set, and that dry weather conditions are more directly related to recreational beneficial use within the San Dieguito WMA.

The prioritization process then examined all potential sources within each focus area, irrespective of wet or dry weather conditions, and prioritized those sources under each condition. The findings appear to show similarities in potential bacteria sources between wet and dry weather conditions. Based on these similarities, if the Responsible Agencies were to develop programs to address the priority bacteria sources, they would likely see benefits to water quality under both conditions.

However, the differences between wet weather and dry weather may not be adequately investigated in this study, as the underlying assumption for identifying bacteria sources was predicated on the designation of a focus area by a geomean of dry weather sampling results. As more wet weather MS4 data are collected, Responsible Agencies may build upon the results of this study by examining geomeans of bacteria concentrations during wet weather, and developing an additional source identification prioritization effort for focus areas identified for wet weather conditions.

Conclusions

The Bacteria Special Study in the San Dieguito WMA was successful in identifying and prioritizing potential bacteria sources for each Responsible Agency in the watershed. The methodology applied in this study provides the Responsible Agencies with several tools with which to focus efforts to reduce bacteria loadings to the lower San Dieguito River. The highest potential bacteria sources ranged from residential sources (pet waste, compost, manure, irrigation runoff, and porta-potties associated with construction) to sources related to sewage infrastructure (leaking sewage infrastructure and sanitary sewer overflows). This process can serve as a framework for the Responsible Agencies to review bacteria sources at MS4 outfalls where water quality-based effluent limitation (WQBEL) exceedances occur without implementing costly source identification studies, and to potentially modify or enhance WQIP strategies in these focus areas.

The City of Del Mar used the Bacteria Special Study as a mechanism to analyze information and determine whether program implementation revisions were needed to effectively address the sources that cause or contribute to indicator bacteria, which is the highest priority water quality condition identified for the City of Del Mar in the San Dieguito WMA WQIP. Through jurisdiction-specific data analysis and review of the results of the Bacteria Special Study, the City of Del Mar determined that no program implementation revisions are needed at this time. Because a high priority focus area was not identified for the City of Del Mar, the City of Del Mar will continue to conduct frequent City-wide patrols as an effective method to identify and address potential bacteria sources.

1 Introduction

BACKGROUND

The San Diego Regional MS4 Permit (Order R9-2013-0001 as amended by Order Nos. R9-2015-0001 and R9-2015-0100) requires each watershed management area (WMA) to perform two special studies within the permit term to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to the highest priority water quality conditions (HPWQC) within the WMA as identified within the Water Quality Improvement Plan (WQIP).[1] The San Dieguito WQIP identified bacteria as the HPWQC for the WMA and included the development of a Bacteria Source Identification Special Study Plan (Study Plan) outlining one of the special studies to be implemented within the WMA to satisfy permit requirements. The Study Plan identified data gaps with respect to information that would be helpful in the identification and prioritization of bacteria sources within the watershed. The data gaps were focused on five key metrics used to identify and prioritize bacteria sources in the WMA: human health risk, magnitude, transport feasibility, frequency, and controllability.

[1] Provision D.3, Order R9-2013-0001 as amended by Order Nos. R9-2015-0001 and R9-2015-0100

PURPOSE

To address these data gaps, an expanded literature review was performed to better understand the latest science related to bacteria sources and source tracking. In addition, an in depth data call was issued to the Responsible Agencies in the watershed to collected the necessary GIS information to further support the prioritization of bacteria sources within the WMA. The purpose of this technical memorandum is to summarize the results of the literature review and data collection process and identifies any remaining data gaps. The literature review and GIS information collected to date will provide the foundation for the remainder of the Special Study.

2 Updated Literature review

2.1 BACKGROUND

The San Dieguito River Watershed Management Area Bacteria Source Identification Special Study Plan (Study Plan) included a literature review to provide an overview of the methods used in microbial source tracking (MST) studies to identify the host origin of fecal indicator bacteria (FIB), as well as a summary of the pertinent studies involving bacteria source identification and the application of MST methods within urban areas. To inform the source prioritization process, studies were reviewed that characterized relative loadings and contributions from specific host sources to the extent that relevant information was available. The relative human health risk from different pathogen sources is also important for prioritization, and studies related to health risk were also summarized.

The Study Plan (Section 4.6 Summary of Data Gaps) identified data gaps from the literature review, which are summarized in **Table 1**. The Study Plan identified data gaps associated with sources from human origins as the highest priority, followed by anthropogenic non-human, and non-anthropogenic. However, considering the availability of data, local knowledge, and other factors such as the frequency of predominant sources, the Copermittees' priorities for filling the data gaps will vary by source type.

Table 1. Study Plan Data Gap Summary

Bacterial Origin	Data Gap Identified in Study Plan
Human Origin	Magnitude: Data related to the magnitude (i.e., concentration or loads) associated with FIB from human origins could be accessed through an expanded literature review and/or contacting local POTWs.
Anthropogenic Non-human Origin	Human health risk: Most of the data collected in source tracking studies to date provides insight into the potential sources of bacteria, but does not provide information related to health risk. The majority of the epidemiology studies performed focus on health effects related to human sources of FIB. Magnitude: Data related to the magnitude of bacteria concentrations associated with anthropogenic non-human sources is also lacking.
Non-anthropogenic Origin	Data gaps related to bacteria influenced by non-anthropogenic activities are primarily focused on frequency and there were no data gaps identified to be addressed through the literature review. Non-anthropogenic sources of bacteria have been identified through various studies and appear to be ubiquitous in the environment. However, additional data could be compiled if

	new or expanded information is found through the update to the literature review.

2.2 LITERATURE REVIEW

The updated literature review is focused on filling in the data gaps identified in the Study Plan, and on providing a more comprehensive review of studies identifying bacterial sources within urban watersheds, along with the human health risks associated with human and non-human sources. An expanded literature search was performed to inform the updated literature review, focusing on recently published studies and on filling data gaps. The additional literature utilized in this updated review are listed, along with a brief summary of key findings, in **Attachment A**. A list of literature sources that are specific to sanitary sewer and septic systems as sources of bacteria is provided in **Attachment B**. The sections below build upon the literature review provided in the Study Plan, with additional information included from the expanded literature search.

Traditional source identification studies have been performed in a number of urban areas, but quantitative data on specific watershed sources (activities, locations, or areas) is sparse. MST studies have predominantly focused on species-level bacteria identification using analytical methods to characterize the host organisms as human or other non-human species, from which indicator the bacteria likely originated. At this time, there has been very little bacteria source identification research that has focused on tracing the specific physical origin of bacteria to determine the relative magnitude of source contributions within a watershed.

2.2.1 Microbial Source Tracking Methods

Recent research on MST has focused on species-specific techniques that target bacteria of the order *Bacteroidales*, which are anaerobic bacteria that are highly abundant in feces, animal rumen, and other cavities of humans and animals (Paster et al., 1994), often in greater abundance than traditionally-used coliform bacteria (Menaia et al., 1998). Their anaerobic nature is desirable because they are only contributed to the environment from feces, and are likely unable to grow or survive for long periods outside of the original host. Their environmental persistence is thought to be much less than aerobic microbes (e.g., fecal coliform) which can persist for months or years, and perhaps even re-grow in the environment. *Bacteroidales* were shown to be the most reliable human marker in comparison studies of microbial source tracking methods by the Southern California Coastal Waters Research Program (SCCWRP; Griffith et al., 2003; SCCWRP, 2013). In addition, USEPA utilized *Bacteroidales* during epidemiological studies (Wade et al., 2006), and found a positive correlation between *Bacteroidales* concentrations and gastrointestinal illness in swimmers.

The basis of *Bacteroidales* source tracking methods is the fact that *Bacteroidales* in different hosts (humans, horses, birds, etc.) often contain unique DNA sequences due to differences in animals' diets and lifestyles, which can be detected and used to target fecal pollution from that host. *Bacteroidales* were first proposed as an indicator of fecal pollution over two decades ago (Allsop and Stickler, 1985; Fiksdal et al., 1985). A decade later, PCR-based assays were used to detect *Bacteroidales* species and thereby monitor human fecal pollution in water (Kreader, 1995). The work of Kate Field and colleagues at Oregon State University has since led to the popularization of *Bacteroidales* as a source tracking tool, and fostered development of assays to detect general fecal pollution (from all warm blooded animals, called "universal"; Dick and

Field, 2004), humans (Bernhard and Field, 2000), pigs and horses (Dick et al., 2005), dogs (Kildare et al., 2007), cows (Layton et al., 2006), and elk (Dick et al., 2005).

Bacteroidales marker assays have been used in many applications both in the United States and globally. There has been much recent interest in the practical applications of microbial source tracking. However, while *Bacteroidales* methods represent the latest state of the science with respect to the microbial source tracking (Santo Domingo et al., 2007; Stewart et al., 2013), they are still non-standard and subject to continued refinement and testing.

2.2.2 Applications of Source Identification and Tracking

There have been numerous studies conducted in recent years to apply source identification and microbial source tracking techniques to investigate sources of bacteria in California waterbodies. An extensive literature search conducted to inform the San Dieguito Watershed Management Area Source Prioritization process identified many studies that characterized the relative contribution of bacteria from different host species, with most studies focusing on ambient water or storm drain characterizations. While the studies did not point toward specific relative contributions from source types (e.g., dumpsters, livestock operations, parks), some studies did identify host-specific contributions that can be linked to land use. The most relevant studies are briefly summarized below, organized by major finding.

2.2.2.1 Regrowth and non-human sources potentially contribute to high bacteria concentrations in storm drain systems and street gutters.

The contribution of non-human sources of bacteria was quantified at coastal reference beaches in southern California that receive runoff from undeveloped (>97% open space) watersheds. Results suggested that natural non-human sources were predominant, resulting in bacterial concentrations exceeding water quality objectives (Schiff et al., 2005). A dry weather monitoring study conducted in San Diego County found that enterococci in storm drain systems came from predominantly natural sources and include strains that are capable of growing on drain pipe surfaces (Griffith and Ferguson, 2011). Regrowth in street gutters was found to be the likely source of bacteria in residential sidewalk wash-off in another study conducted in Orange County (Skinner et al., 2010).

2.2.2.2 Indicator bacteria loading during wet weather may be attributed to erosion of contaminated sediments.

A study by Rowney and Stewart (2012) indicated that seasonal dry-weather loading patterns were dwarfed by storm event loading. This study indicated that FIB do not follow loading profiles of a first flush model, but appear to uniformly partition into runoff over the course of storm events, suggesting influence by environmental reservoirs of FIB.

Sercu et al. (2011) found that increased fecal indicator bacteria numbers during wet weather were likely associated with terrestrial sources, instead of human waste sources that dominated during dry weather flow. During wet weather flow, FIB numbers increased and were more similar across locations and between watersheds. Association with terrestrial bacteria suggests that “naturalized” sources may be important. Wet weather non-point sources in this study may be considered less threatening to public health compared to the dry weather point sources containing human waste.

Similarly, Reeves et al. (2004) found that FIB loads scale as a power law of runoff volume, consistent with a theoretical model that assumes FIB in storm runoff originate from erosion of contaminated sediments. Erosion of sediments containing FIB may drive loading of FIB from urban watersheds to beaches.

2.2.2.3 Human sources may be prevalent in urban areas.

Dry weather monitoring in urbanized Santa Barbara indicated that human sources were prevalent in storm drains. Human waste markers were present and relatively concentrated throughout each of three storm drain systems, and were entering the creeks from storm drains discharging flow continuously during dry weather (Sercu et al., 2009).

The sanitary sewer/wastewater has been shown to be a prevalent source of human-derived bacteria from storm drainage systems, particularly during dry weather flows (Field et al. 1994; Sauer et al., 2011; Sercu et al. 2009, 2011). Sercu et al. (2011) determined that sewage is transmitted directly from leaking sanitary sewers to storm drains, suggesting that chronic sanitary sewer leakage contributes to downstream fecal contamination of coastal beaches. Marsalek and Rochfort (2004) noted that levels of *E. coli* in urban runoff greater than 10^5/100 mL suggest the presence of cross-connections with sanitary sewers. In addition to cross-connections, leaking sanitary sewers can contribute bacteria to groundwater (Paul et al., 2004), which can then infiltrate into the MS4 system or impact surface waters directly. Wastewater exfiltration and subsequent infiltration was quantified by Guérineaua et al. (2014) to be 0.6-15.7 m^3/d per km in dry weather; 1.1-19.5 m^3/d per km in wet weather.

Homeless encampments are recognized as a potential source of human-derived bacteria to urban waterways. The City of Los Angeles (1997) has measured concentrations of 10^6 MPN/100 mL E. coli in storm drains that discharge to the Los Angeles River, resulting from defecation of homeless encampments. A study in Santa Barbara attributed FIB in urban streams to multiple sources, including contamination from a transient homeless population (Izbicki et al., 2009). Another study in Santa Barbara examined sources of human fecal contamination to Arroyo Burro Beach, and found a homeless encampment along a creek was a source of elevated human-associated markers (Ervin et al., 2013). The researchers noted that, in the upper Arroyo Burro watershed, it will be necessary to continuously and vigilantly monitor and remove homeless encampments near the creeks as fecal inputs from only a few individuals can have a large impact on creek water quality.

2.2.2.4 Land usage and management practices can inform the potential for bacteria loading.

A study in Tecolote Creek watershed indicated that wet weather bacteria loads did not differ substantially between different land uses, but that higher loads may be attributable to transportation corridors, commercial areas, and industrial land uses. Dry weather loads were higher in residential and commercial areas with specific activities identified as including poorly maintained dumpsters leaking high concentrations of indicator bacteria. A key transport mechanism found especially in commercial and industrial areas was over-irrigation. Natural bacteria sources likely contributed high numbers of enterococci, including regrowth on the walls of the MS4 system. The high flows generated during wet weather were found to cause significant biofilm sloughing, impacting wet weather loads. Sediments and biofilms within the creek and MS4 system were found to be significant reservoirs (Weston Solutions, 2010).

Commercial sites were identified as sources of bacteria in several studies (Malin et al., 2016; Kitsap County Public Works, 2009; Griffith et al., 2013). Urban areas may contain bacteria from leaking trash dumpsters or restaurants that hose food waste into storm drains. Stormwater system inspections in Dyes Inlet, WA identified that 7 of 207 properties (dumpster, restaurant cleaning areas and food compactor areas) discharged food waste to the storm drain system (Kitsap County Public Works, 2009). Food waste is a potential bacteria source from urban wildlife concentrated around stormwater systems.

A study of 10 coastal dairies and ranches evaluated fecal coliform concentration and loading to surface water during storm events from manure management systems, gutters, storm drains, pastures, and corrals and lots. Fecal coliform loads from management units of concentrated animals and manure were significantly higher than units such as pastures, though storm flow amounts were significantly lower (Lewis et al., 2005).

A study by Rowney and Stewart (2012) showed that more developed watersheds were associated with higher concentrations of FIB.

Reeves et al. (2004) found that the concentration of fecal indicator bacteria is extraordinarily high in sources of urban runoff, particularly residential runoff.

Numerous studies indicated that septic tanks or onsite wastewater treatment systems (OWTS) in rural areas may contribute indicator bacteria of human origin to surface waters (Graves et al., 2001; Carroll et al., 2005; Sokolova et al., 2012, 2013; Virani, 2014). Bacteria from septic systems can migrate to groundwater (Hagedorn, 1984; Kneirim, 2015; Yates, 1995) and potentially travel greater than 400m through groundwater, with impacts to surface waters or MS4 pipes (Hagedorn, 1984). Septic tank density can impact water quality (Anderson, 2010). Verhougstraetea et al. (2015) found a direct and significant correlation between estimated number of septic systems and a human-specific marker (*Bacteroides thetaiotaomicron; B. theta*) in water. In particular, watersheds with more than 1,621 septic systems had significantly higher *B. theta* concentrations.

2.2.3 Source Tracking Guidance

SCCWRP recently released a guidance document for conducting microbial source tracking at beaches, which presents a six-tiered approach combining traditional (i.e., smoke and dye testing) and *Bacteroidales* methods (SCCWRP, 2013). The six steps include:

1. Characterize the watershed using maps, interviewing relevant local experts, and conducting physical inspections to identify potential sources.
2. Examine monitoring data to identify conditions resulting in with high concentrations of indicator bacteria, and examine linkages to the greatest potential sources.
3. Investigate potential leakages from sanitary systems using traditional tools such as smoke testing, dye testing, or camera inspection.
4. Where human sources are a potential contributor, test ambient waters using human source-specific genetic markers. Place a high priority on identifying human sources.

5. Where human sources have been accounted for and the relative human loadings are better understood, and/or a likely animal fecal pollution source has been identified, test ambient waters using animal source-specific genetic markers.
6. Consider testing ambient waters using genetic community analysis methods if specific genetic markers have not been developed for the potential sources. This approach can be used in combination with traditional chemical testing methods.

The Special Study effectively incorporates steps 1–3 above from the SCCWRP MST guidance document.

2.2.4 Health Risks from Human versus Non-human Sources

The EPA considered differential health risks from human versus nonhuman sources in developing its 2012 Recreational Water Quality Criteria. Research indicates that the source of contamination may affect the human health risk associated with recreational waters, and that the potential health risks due to human and nonhuman sources can vary considerably. The health risk associated with a particular indicator density from human sources may be variable. Studies of the risk associated with various human sources have shown that the risk levels for a particular *enterococci* density can vary, depending on the indicator source and assay method used to detect *enterococci* (Schoen et al., 2011). For example, *enterococci* assayed by culture was contributed mostly by untreated sewage or non-pathogenic fecal indicator sources. Whereas, *enterococci* estimated by qPCR were contributed by secondary-treated disinfected municipal wastewater effluent or non-pathogenic fecal indicator sources.

The differences in health risks between human versus non-human sources are complex, and may be due to differing infectious agents present in human and nonhuman fecal contamination. For instance, many studies have indicated that viruses are likely the cause of illnesses resulting from exposure to wastewater treatment plant effluent (Soller et al., 2010a; WERF, 2011), and human viruses are less likely to occur in animal feces.

However, other human pathogens are present in animal fecal matter, and research on the relative risk of animal sources relative to human sources suggests that certain non-human sources may have lower risk to human health than human sources, while other sources have similar risk. Studies indicate that certain nonhuman sources, such as cattle, potentially have similar risks as human sources (Soller et al., 2010b, USEPA, 2010). The study by Soller et al. (2010b) considered cases of direct contamination to surface waters (feces deposited directly to surface waters, rather than transported over land through storm runoff). In the case of direct contamination, the risks from cattle-impacted waters appeared clearly higher than those from pig or chicken-impacted waters. Similarly, a study by McBride et al. (1998) compared human-impacted waters in New Zealand with waters impacted by animal wastes (cattle and sheep in rural areas), and reported similar potential for illness risks, with both higher than non-impacted waters.

Other studies indicated a lower potential health risk due to other nonhuman sources (WERF, 2011; Schoen and Ashbolt, 2010; Soller et al., 2010b). The study by Soller et al. (2010b), in particular, noted substantially lower risks associated with gull, chicken, and pig fecal sources. Due to the mixed findings of epidemiological studies, and the potential for comparable risks, the EPA did not develop separate national criteria for waterbodies with primarily nonhuman sources.

In developing the 2012 Criteria, the EPA convened a workgroup of experts in 2011 to evaluate the human health risks due to avian and wildlife sources of fecal pollution. The workgroup considered results from quantitative microbial risk assessment (QMRA) studies of recreation in poultry, livestock, and waterfowl-impacted water, where different pathogen composition within fecal material from different sources accounted for the risk variation among sources. For instance, cow feces contained numerous different types of pathogens, while avian feces had fewer different types of pathogens (USEPA, 2011).

A recent study by Soller et al. (2015) examined the risk levels of agricultural animal sources of fecal material transported indirectly to surface waters (manure mobilized by rainfall events), and determined that the risks associated were at least an order of magnitude lower than the 2012 recreational water quality criteria benchmarks based on contamination from human sewage sources. However, if human sources are present along with non-human sources, there can still be a substantial human health risk. Soller et al. (2014) found that human health risks are influenced by the nature and magnitude of the fecal contamination sources. Risks for mixtures with moderate or higher human source proportions are not substantially reduced, despite the contribution of non-human sources to the total indicator bacteria concentration. Risks from mixed sources are driven predominantly by the proportion of the contamination source with the greatest ability to cause human infection (potency), not necessarily the greatest source(s) of FIB.

In summary, research suggests that it makes sense to prioritize human sources as the highest priorities, but that cow sources may pose a comparable health threat and also should be prioritized highly. Epidemiological and QMRA research support a lower prioritization for other nonhuman sources such as birds or pigs, based on a lower human health risk.

2.2.5 Magnitude of Impacts

The updated literature search identified several references containing data for the magnitude of indicator bacteria from various sources. Reported data for concentrations, or relative amounts, of indicator bacteria for human and non-human sources are summarized in **Table 2**.

Table 2. Concentrations or Relative Magnitude of FIB for Human and Non-human Sources

Bacterial Origin	Source	Concentration (Fecal coliform density/gm) or Relative Magnitude	Unit Discharge (lbs/day)	Reference
Human Origin	Human	1.3×10^7	0.35	CWP, 1999
	Raw sewage	6.4×10^6 MPN/100 mL		CWP, 1999
	Failed septic system	10^4-10^6 MPN/100 mL		CWP, 1999
	Homeless encampments	10^6 MPN/100 mL *E. coli*		City of Los Angeles, 1997
	Human bathers	6.0×10^5 CFU/100 mL enterococci		Elmir et al., 2007
Anthropogenic Non-human Origin	Cattle	Each cow contributes a waste output equivalent to seven humans.		McBride et al. 1998
	Cattle	2.3×10^5	15.4	CWP, 1999
	Cats	7.9×10^6	0.15	CWP, 1999
	Dogs	2.3×10^7	0.32	CWP, 1999
	Rats	1.6×10^5	0.08	CWP, 1999
Non-anthropogenic Origin	Ducks	3.3×10^7	0.15	CWP, 1999
	Waterfowl	3.3×10^7	0.18-0.35	CWP, 1999
	Forest runoff	10^1-10^2 MPN/100 mL		CWP, 1999

2.3 DATA GAPS ANALYSIS

A summary of the data gaps identified within the Study Plan and the results of the literature review are provided in **Table 3**.

Table 3. Data Gaps after Literature Review

Bacterial Origin	Data Gap Identified in Study Plan	Addressed in Expanded Literature Review?
Human Origin	Magnitude: Data related to the magnitude (i.e., concentration or loads) associated with FIB from human origins could be accessed through an expanded literature review and/or contacting local POTWs.	Yes
Anthropogenic Non-human Origin	Human health risk: Most of the data collected in source tracking studies to date provides insight into the potential sources of bacteria, but does not provide information related to health risk. The majority of the epidemiology studies performed focus on health effects related to human sources of FIB.	Yes
	Magnitude: Data related to the magnitude of bacteria concentrations associated with anthropogenic non-human sources is also lacking.	Magnitudes associated with anthropogenic animal sources were identified. Magnitude for commercial contributions is a remaining data gap.
Non-anthropogenic Origin	Data gaps related to bacteria influenced by non-anthropogenic activities are primarily focused on frequency, and there were no data gaps identified to be addressed through the literature review.	Additional information was added, but there were no data gaps to address.

3 GIS Data Gaps Update

The San Dieguito watershed consists of six (6) different jurisdictions. In assessing the 2014 Study Plan and current Bacteria Special Study needs, current and available GIS data was reviewed, assessed, and updated. GIS Layers previous compiled or created as part of the Study Plan were reassessed for relevance to the Bacteria Special Study. Some layers were removed due to jurisdictional irrelevance, while other layers were completely updated. Table 1 shows which of the original GIS data were omitted, retained, or updated during the 2015 Bacteria study reopener.

Table 4. 2014 GIS Layers Compiled or Created: Updated and Reassessed in 2015

File Name	Info Type	Data Type	2015 Data Gaps Analysis

In addition to reviewing and assessing current available GIS data, a significant data call was performed to update and obtain and include GIS data previously described as a data gap. A data call was put out for the following information:

- A complete MS4 inventory from all jurisdictions in the watershed.
    - Data pertaining to flow at MS4 outfalls (i.e., persistent, transient, none).
    - Locations of permanent BMPs within the watershed (e.g., dry weather diversions, retention/detention basins).
- A complete Sanitary Sewer System inventory from all jurisdictions in the watershed.
    - Sanitary sewer condition assessments for each jurisdiction as available.
    - Sanitary sewer overflows with locations, volumes, and whether flow reached receiving waters.
    - Locations of known OWTS.
- Commercial, industrial, municipal inventories containing latitude and longitude coordinates for all jurisdictions in the watershed.
- Locations of known homeless encampments.
- ICID data with locations of incidents and pollutants discharged.
- Locations of recycled water distribution systems and users within the watershed.

All six jurisdictions were asked to participate in the data gaps data call. Five jurisdictions, including the City of San Diego (CSD), the County of San Diego (CoSD), Escondido (ESC), Poway (POW), and Solana Beach (SB) participated in the data gaps data call by updating and providing GIS information. Del Mar was the only jurisdiction to opt out of the Bacteria Special

Study, and did not provide any additional GIS data for the data call. A summary of the information obtained from or updated in the data gaps data call can be found in the table below.

Table 5 Summary of Data Gaps Data Call

Data Type	GIS Data Gaps	City of San Diego	County of San Diego	Del Mar	Escon-dido	Poway	Solana Beach
MS4	MS4 inventory from all jurisdictions in the watershed.	a	a		a	a	a
MS4	Stormwater BMPS	a	-		a	a	-
MS4	Dry Weather Flow Data	a	a		a	-	-
Sewer	Sanitary Sewer System inventory from all jurisdictions and special districts in the watershed.	b	x		a	a	a
Sewer	Sanitary sewer condition assessments for each jurisdiction as available. (2007-2015)	-	-		a	-	-
Sewer	Sanitary sewer overflows with locations, volumes, and whether flow reached receiving waters. (2007-2015)	c	a		a	c	c
Sewer	Onsite Wastewater Treatment Systems (OWTS)	-	-		x	a	-
Inventory	ICID data (2007-2015)	a	a		a	-	-
Inventory	Commercial inventories	a	a		a	-	-
Inventory	Industrial inventories	a	a		a	-	-
Inventory	Municipal inventories	a	a		a	-	-
Inventory	Homeless encampments	-	a		x	-	-
Recycled Water	Recycled Water	-	x		a	a	-

a) denotes data that was obtained from or updated by the Copermittee
b) denotes preexisting data from the Study Plan
c) denotes data created from publicly available data
x) denotes known unavailable data

A few data types were easier to update and obtain than others. From both previous data and updated information provided by the jurisdictions, a full MS4 inventory was gathered from the five participating jurisdictions. A complete MS4 inventory consisted of many different layers of data, including not only gravity mains and lateral lines, but also MS4 structures, junctions, and outfalls. Drainage areas were only available for the City of San Diego, County of San Diego, and Solana Beach. Although stormwater BMPs are an important part of the MS4 inventory, GIS data was provided by three of the five jurisdictions: City of San Diego, Escondido, and Poway.

A full sanitary sewer system inventory was also updated and acquired in the data gaps data call. The complete inventory included gravity mains, lateral lines, as well as fittings, structures, and wastewater treatment plans. While the structural inventory was complete, Escondido was the only jurisdiction able to provide a sanitary sewer condition assessment for the Study. Sanitary

Sewer Overflows (SSOs) were provided directly by Escondido, and the County of San Diego. However, public records of SSO were obtained and digitized from the State Board's CIWQS reporting system for the San Dieguito Watershed.

The location of Onsite Wastewater Treatment Systems remains a critical and continued data gap. Although Poway was able to provide the locations of known OWTS, and Escondido does not have any known OWTS within the San Dieguito Watershed, there is very little information regarding the locations of OWTS in other jurisdictions. Obtaining this type of data is critical for the Bacteria Study, as OWTS have the potential to be a significant source of bacteria in the watershed.

The data gaps data call was successful in receiving ICID data and commercial, municipal, and industrial inventory and inspections from the City of San Diego, the County of San Diego, and Escondido. However, ICID and inventory data for Poway and Solana Beach are still outstanding.

Recycled water data, including the locations of recycled water distribution systems and users within the watershed, as well as the location of known homeless encampments are two types of data that were much more difficult to obtain. Only two jurisdictions, Escondido and Poway, were able to provide information regarding recycled water. The County of San Diego was the only copermittee that provided the location of known homeless encampments, while Escondido determined that none of its known homeless encampments were within the San Dieguito Watershed. Recycled water and homeless encampments continue to have the potential to be bacteria sources, and the lack of data makes it difficult to determine their relative contributions to the watershed.

Overall, the data gaps data call was successful in obtaining complete or near complete inventories of the MS4, sanitary sewer system, and commercial, municipal, and industrial sites. However, there remain some significant gaps in data for a few potential sources of bacteria. The locations of OWTS and known homeless encampments have the potential to be significant sources of bacteria, and remain areas of uncertainty in the Bacteria Special Study.

4 Conclusions and Recommendations

Based on the updated literature review and GIS data collection efforts, the next steps of the study are recommended as follows:

- Use water quality data collected from 2007-2015 to identify focus areas for further source identification.
- Upon selection of focus areas, GIS data will be used to perform an in depth source identification within those areas.
- The identified sources will then be prioritized within the focus areas using the prioritization methods and matrix developed as part of the previous Regional Study. The prioritization will rely on the outcomes of the GIS work combined with the updated findings of the literature review.
- Once sources have been prioritized, the Copermittees may use the prioritization to examine existing strategies or to develop new strategies to address the highest priority sources within the focus areas if appropriate.
- Using these strategies and identified focus areas, the monitoring program will then be evaluated as part of the Special Study Assessment in the Annual WQIP Report to determine if that the monitoring program may need to be adjusted to assess related information for key strategies and focus areas.

Attachment A: Expanded Literature Review on Sources of Indicator Bacteria

Reference	Key Points
Sercu, B., Van De Werfhorst, L., Murray, J., Holden P. 2011. Storm Drains are Sources of Fecal Pollution during Dry Weather in Three Urban Southern California Watersheds. Environ Sci. Technol. 43:293-298	• Increased fecal indicator bacteria numbers during wet weather were likely associated with terrestrial sources, instead of human waste sources that dominated during dry weather flow. • During wet weather flow, FIB numbers increased and were more similar across locations and between watersheds. Association with terrestrial bacteria suggests that “naturalized” sources may be important. Wet weather non-point sources in this study may be considered less threatening to public health compared to the dry weather point sources containing human waste.
Rowny, J. and Stewart, J. 2012. Characterization of nonpoint source microbial contamination in an urbanizing watershed serving as a municipal water supply. Water Research 46: 6143-6153	• More developed watersheds were associated with higher concentrations of FIB. • Seasonal dry-weather loading patterns were dwarfed by storm event loading. • FIB do not follow loading profiles of a first flush model. FIB appear to uniformly partition into runoff over the course of storm events, consistent with a mud-puddle hypothesis that suggests influence by environmental reservoirs of FIB. FIB do not follow loading profiles of a first flush model.
Reeves, R., Grant, S., Mrse, R., Copil Oancea, C. Sanders, B., Boehm, A. 2004. Scaling and Management of Fecal Indicator Bacteria in Runoff from a Coastal Urban Watershed in Southern California.Environ. Sci. Technol. 38: 2637–2648	• The concentration of fecal indicator bacteria is extraordinarily high in sources of urban runoff, particularly residential runoff. • FIB loads scale as a power law of runoff volume, consistent with a theoretical model that assumes FIB in storm runoff originate from erosion of contaminated sediments. Erosion of sediments containing FIB may be driving the loading of FIB from urban watersheds to beaches.
Lee, D., Lee, H., Trevors, J., Weir, S., Thomas, J., Habash, M. 2014. Characterization of sources and loadings of fecal pollutants using microbial source tracking assays in urban and rural areas of the Grand River Watershed, Southwestern Ontario. Water Research 53: 123-131.	• Found continuous inputs of human-originated fecal pollution from point sources (WWTP effluent) in the Grand River, Ontario, Canada, with no pattern of wet weather loading.

Reference	Key Points
Risk from Non-human Sources	
Soller, J., Bartrand, T., Ravenscroft, J., Molina, M. Whelan, G., Schoen, M. and Ashbolt, N. 2015. Estimated human health risks from recreational exposures to stormwater runoff containing animal faecal material. Environmental Modeling & Softwater 72: 21-32.	• Used QMRA to determine that risks associated with agricultural animal fecal sources would be at least an order of magnitude lower than the benchmark level of public health protection associated with current US recreational water quality criteria, which are based on contamination from human sewage sources. • This study considered indirect contamination, where FIB and pathogens from animal manure-applied land are mobilized into surface water via a rainfall event. • In cases of indirect contamination, risks from cattle-impacted water are similar to pig or chicken-impacted water.
Soller, J., Schoen, M., Varghese, A., Ichida, A., Boehm, A., Eftim, S., Ashbolt, N., Ravenscroft, J. 2014. Human health risk implications of multiple sources of faecal indicator bacteria in a recreational waterbody. Water Research 66:254-264.	• Human health risks are influenced by the nature and magnitude of the fecal contamination sources. This study examined fresh gull feces, fresh pig manure, fresh chicken manure, and aged pig manure as sources. • Alternative recreational water quality standards can be justified for some non-human sources. • Risks for mixtures with moderate or higher human source proportions are not substantially reduced. Risks from mixed sources are driven predominantly by the proportion of the contamination source with the greatest ability to cause human infection (potency), not necessarily the greatest source(s) of FIB.
McBride, G., Salmond, C., Bandaranayake, D., Turner, S., Lewis, G., Till, D. 1998. Health effects of marine bathing in New Zealand. Int. J. Environ. Health Res. 8: 173-189.	• Compared human-impacted waters in New Zealand with waters impacted by animal wastes, and reported similar potential for illness risks, with both higher than non-impacted waters.
Variable Risk from Human Sources	
Schoen, M., Soller, J., Ashbolt, N. 2011. Evaluating the importance of faecal sources in human-impacted waters. Water Research 45: 2670-2680	• Ingestion of human-impacted water with a faecal indicator density at the recreational water quality limit resulted in a range of GI risk using QMRA. • When GI risk was set at 0.03, secondary-treated disinfected municipal wastewater effluent was the major waterbody contaminant by volume. • Enterococci assayed by culture was contributed mostly by untreated sewage or non-pathogenic faecal indicator sources. Whereas, enterococci estimated by qPCR was contributed by secondary-treated disinfected municipal wastewater effluent or non-pathogenic faecal indicator sources. • *Norovirus* genome density and GI risk were contributed by a combination of untreated sewage and secondary-treated disinfected municipal wastewater effluent.

Reference	Key Points
Anthropogenic Non-Human	
Ervin, J., Van De Werfhorst, L., Murray, J., Holden, P. 2014. Microbial Source Tracking in a Coastal California Watershed Reveals Canines as Controllable Sources of Fecal Contamination. Environ. Sci Technol. 48: 9043-9052	• Microbial source tracking study in the Arroyo Burro watershed in Santa Barbara, CA. Fecal sources into the lagoon included upstream human sources and coastal birds, but canine sources were the most important. • Canine sources input from upstream creek water decreased after creek-side residences were educated about proper pet waste disposal. This study found that canine waste was an influential, yet controllable, fecal source to suburban coastal beaches. • 24 g/d of fresh dog feces would be enough to cause the elevated FIB levels observed in the creek.
Commercial Sites	
Malin, M., Turner, M., McIver, M., Toothman, B., Freeman, H. 2016. Significant Reduction of Fecal Bacteria and Suspended Solids Loading by Coastal Best Management Practices. Journal of Coastal Research, In press.	• The set of stormwater volume reduction and treatment BMPs in the municipal area caused fecal coliform bacteria and Enterococcus concentration reductions of 57% and 71%, respectively, 50% stormwater discharge reduction, 28–55% fecal bacteria load reductions, and 99% TSS load reduction. • The pollutant concentration and load decreases in the municipal area of Wrightsville Beach are particularly striking because the BMPs only capture about 50% of the runoff from the drainage area that enters the outfall into Lee's Cut.
Kitsap County Public Works. (2009?) Bacterial Pollution Reduction in an Urban Watershed. Kitsap County Public Works, Surface and Stormwater Management. Port Orchard, WA.	• Stormwater system inspections in Dyes Inlet, WA identified that 7 of 207 properties (dumpster, restaurant cleaning areas and food compactor areas) discharged food waste to the storm drain system. Food waste is a potential bacteria source from urban wildlife concentrated around stormwater systems.
Griffith, J., Layton, B., Boehm, A., Holden, P., Jay, J., Hagedorn, C., McGee, C., Weisberg, S. 2013. The California Microbial Source Identification Manual: A Tiered Approach to Identifying Fecal Pollution Sources in Beaches. Southern California Coastal Water Research Project, Technical Report 804, December 2013.	• Urban areas may contain bacteria from leaking trash dumpsters or restaurants that hose food waste into storm drains.

Reference	Key Points
Homeless Encampment Sources	
City of Los Angeles. 1997. A study of pollutants entering storm drains from street and sidewalk washing operations in Los Angeles, CA. City of Los Angeles, Stormwater Management Division. Los Angeles, CA.	• City of LA has measured concentrations of 10^6 MPN/100 mL E. coli in storm drains that discharge to the Los Angeles River, resulting from defecation of homeless encampments.
Izbicki, J., Swarzenski, P., Reich, C., Rollins, C., Holden, P. 2009. Sources of Fecal Indicator Bacteria in Urban Streams and Ocean Beaches, Santa Barbara, California. Annals of Environmental Science 3: 139-178.	• During low flow, FIB were associated with point-source discharges. • During wet weather, FIB sources to near shore ocean water include surface discharges from urban streams, fecal material from sand birds, and beachfront kelp. • Groundwater discharge and leakage from a sewer line buried in the sand were not large sources of FIB contamination to near-shore waters. • FIB in urban streams may come from leaking sewer lines and laterals, discharges from urban baseflow, stormwater runoff, and contamination from a transient homeless population.
Elmir, S., Wright ME, Abdelzaher A, Solo-Gabriele HM, Fleming LE, Miller G, Rybolowik M, Peter Shih MT, Pillai SP, Cooper JA, Quaye EA. 2007. Quantitative evaluation of bacteria released by bathers in a marine water. Water Res. 41:3–10.	• Potential contributors to enterococci in recreational waters may include beach visitors themselves or as carriers of sand- borne bacteria during recreational activities • An individual bather might contribute as many as 6.0 x 10^5 CFU of enterococci through bathing, and that the enterococci contribution from sand particles adhered to the skin was minimal compared to the amount shed directly from the bodies of bathers.
Ervin, J., Van De Werfhorst, L., Holden, P. Arroyo Burro Beach Microbial Source Tracking Study. (2013?) Conducted by the University of California Santa Barbara (UCSB) as part of the Source Identification Protocol Project (SIPP).	• A source of human fecal contamination from a homeless encampment was discovered in upper Las Positas Creek. Quantifiable levels of both human-associated markers were detected at a site downstream of a homeless encampment, but markers did not persist at downstream sampling locations due to low creek flow. • For the upper AB watershed, it will be necessary to continuously and vigilantly monitor and remove homeless encampments near the creeks. Fecal inputs from only a few individuals can have a large impact on creek water quality • Improper management of pet waste from domestic dogs living along creeks upstream of the lagoon can be solved by homeowner education. Further, dog waste at the beach and lagoon can be controlled by increasing education of beachgoers regarding pet waste pickup. • Septic-served homes near the sampling were not a source of human markers to the surf zone.

Sanitary Sewer Sources	
Field, R., Pitt, R., Lalor, M., Brown, M., Vilkelis, W., Phackston, E. 1994. Investigation of dry weather pollutant entries into storm drainage systems. J. Environ. Eng. 120, 1044–1066.	• The sanitary sewer/wastewater is one of the most significant sources of pollutant loadings from dry weather flows from storm-drainage systems.
Guérineaua, H., Dornerb, S. Carrièrea, A. McQuaida, N., Sauvéc, S., Aboulfadlc, K., Hajj-Mohamada, M, Prévosta, M. 2014 Source tracking of leaky sewers: A novel approach combining fecal indicators in water and sediments. Water Research, 58: 50–61.	• Sewage exfiltration from leaky sanitary sewer pipes contributes wastewater to an urban canal during wet and dry weather. • Identified and quantified wastewater exfiltration and subsequent infiltration (0.6-15.7 m^3/d per km in dry weather; 1.1-19.5 m^3/d per km in wet weather). Paired *E. coli* monitoring with detection of wastewater micropollutants (WWMPs) to measure gradients in water and sediment along an engineered canal in an urban area of Canada.
Marsalek, J., Rochfort, Q. 2004. Urban wet-weather flows: sources of fecal contamination impacting on recreational waters and threatening drinking-water sources. Journal of Toxicology and Environmental Health, Part A: Current Issues 67: 1765-1777	• Levels of E. coli greater than 10^5/100mL suggest presence of cross-connections with sanitary sewers. • Levels of E. coli in combined sewer overflows (CSOs) can be as high as 10^6/100mL.
Paul, M.; Wolf, L.; Fund, K.; Held, I.; Winter, J.; Elswirth, M.; Gallert, C.; Hotzl, H. 2004. Microbiological condition of urban groundwater in the vicinity of leaky sewer systems. Acta Hydrochim. Hydrobiol. 32, 351–360.	• Leaky sewer systems elevate fecal indicator concentrations in groundwater with associated potential health risk where such waters are used for potable water supply.
Sauer, E., VandeWalle, J., Bootsma, M., McLellan, S. 2011. Detection of the human specific Bacteroides genetic marker provides evidence of widespread sewage contamination of stormwater in the urban environment. Water Research 45: 4081-4091.	• Found urban stormwater systems that collect and convey runoff from impervious surfaces act as a conduit for sewage originating from breeches in sanitary sewer infrastructure.
Sercu et al. 2009. Storm drains are sources of human fecal pollution during dry weather in three urban Southern California watersheds. Environ. Sci. Technol. 43, 293–298.	• Exfiltrating sanitary sewers a possible source of human waste in storm drains. • Quantified human-specific *Bacteroides* marker in three urbanized watersheds in Santa Barbara over two summers, in creeks, urban storm drains that discharged to creeks, creek outlets to lagoons, and ocean.

Reference	Key Points
Sercu et al. 2011. Sewage Exfiltration As a Source of Storm Drain Contamination during Dry Weather in Urban Watersheds. Environ. Sci. Technol., 45 (17): 7151–7157.	• Determined that sewage is transmitted directly from leaking sanitary sewers to storm drains, suggesting that chronic sanitary sewer leakage contributes to downstream fecal contamination of coastal beaches. • Performed field experiments in three watersheds in Santa Barbara: Identified high risk areas, added dye pulses to sanitary sewers and tracked dye to storm drains, and confirmed sewage contamination using *Bacteroidales* markers.
Septic Tank/ Onsite Treatment System Sources	
Anderson, J. 2010. The Effects of High Density Septic Systems on Surface Water Quality in Gwinnett County, Georgia. Thesis, Georgia State University.	• Found that septic tank density impacted surface water (stream) quality in GA, with rainfall causing increases in fecal coliform, BOD, temperature, and metals.
Carroll, S. Hargreaves, M., Goonetilleke, A. 2005. Sourcing Fecal Pollution from Onsite Wastewater Treatment Systems in Surface Waters Using Antibiotic Resistance Analysis. Journal of Applied Microbiology 99(3): 471-482.	• Linked fecal contamination in surface waters in the Gold Coast region of Australia to presence of OWTS. • Contamination of ground and surface water resources by effluent discharged from OWTS is of critical concern due to health risks, and the degradation of recreational and drinking water resources due to nutrient inputs
Graves, A., Hagedorn, C., Teetor, A., Mahal, M., Booth, A., Reneau, R. 2001. Antibiotic Resistance Profiles to Determine Sources of Fecal Contamination in a Rural Virginia Watershed. Journal of Environmental Quality 31: 1300-1308.	• Found enterococci of human origin in a stream passing through a rural non-sewered community in VA, where stream samples exceed recreational standards for fecal coliform. There were no human isolates upstream of the community, and the number of human isolates declined downstream.
Hagedorn, C. 1984. Microbiological aspects of groundwater pollution due to septic tanks. In G. Bitton & C. Gerba (Eds.), *Groundwater pollution microbiology.* Brisbane: John Wiley and Sons, 191-195.	• Reported that bacteria from septic systems have travelled greater than 400m in aquifers.
Knierim, K., Hays, P., Bowman, D. 2015. Quantifying the variability in *Escherichia coli* (*E. coli*) throughout storm events at a karst spring in northwestern Arkansas, United States. Environmental Earth Sciences, 74: 4607-4623.	• Septic-tank effluent may be degrading the water quality of the karst spring based on the dominance of on-site septic tank usage in the recharge area, unsuitable topography and soil type for septic tank absorption fields, increased nitrate and chloride concentrations concomitant with increased urbanization, and increase of *E. coli* following storm events.

Appendix B

San Dieguito WMA Special Study

Detailed Focus Area Prioritization Results

Appendix B. Potential Sources & Full Prioritization Results by Focus Area

PURPOSE

The purpose of this appendix is to document the characteristics and inventory of potential sources found within each focus area. The methods for determining the focus areas presented in **Figure 1** are discussed in detail in the Technical Memorandum accompanying this document. Potential bacteria sources in the watershed were drawn from the San Dieguito WMA Water Quality Improvement Plan and are summarized in **Table 1**. These and other sources were assessed based on five key metrics used to identify and prioritize bacteria sources within the WMA. These metrics include the human health risk, magnitude of the bacteria source, transport feasibility of the source, frequency of occurrence, and controllability of the source. This appendix presents a summary of the characteristics and potential bacteria sources of each focus area, along with the full list of prioritized potential sources and their rankings.

PRIORITIZATION RESULTS BY FOCUS AREA

City of San Diego

The City of San Diego's primary focus area drains to the outfall site: DW-284, shown in **Figure 2**. The total area assessed is 156 acres, and consists of 49% residential land uses, 34% open space, 16% road infrastructure, and 1% institutional land uses. With single family residential land uses and open space comprising of over 80% of this focus area, the top two potential bacteria sources in both dry and wet weather are pets and manure/compost. Although 6 businesses are found to be located within the focus area, none of the commercial businesses re food or eating and drinking establishments. The potential sources are most highly associated with infrastructure and land use.

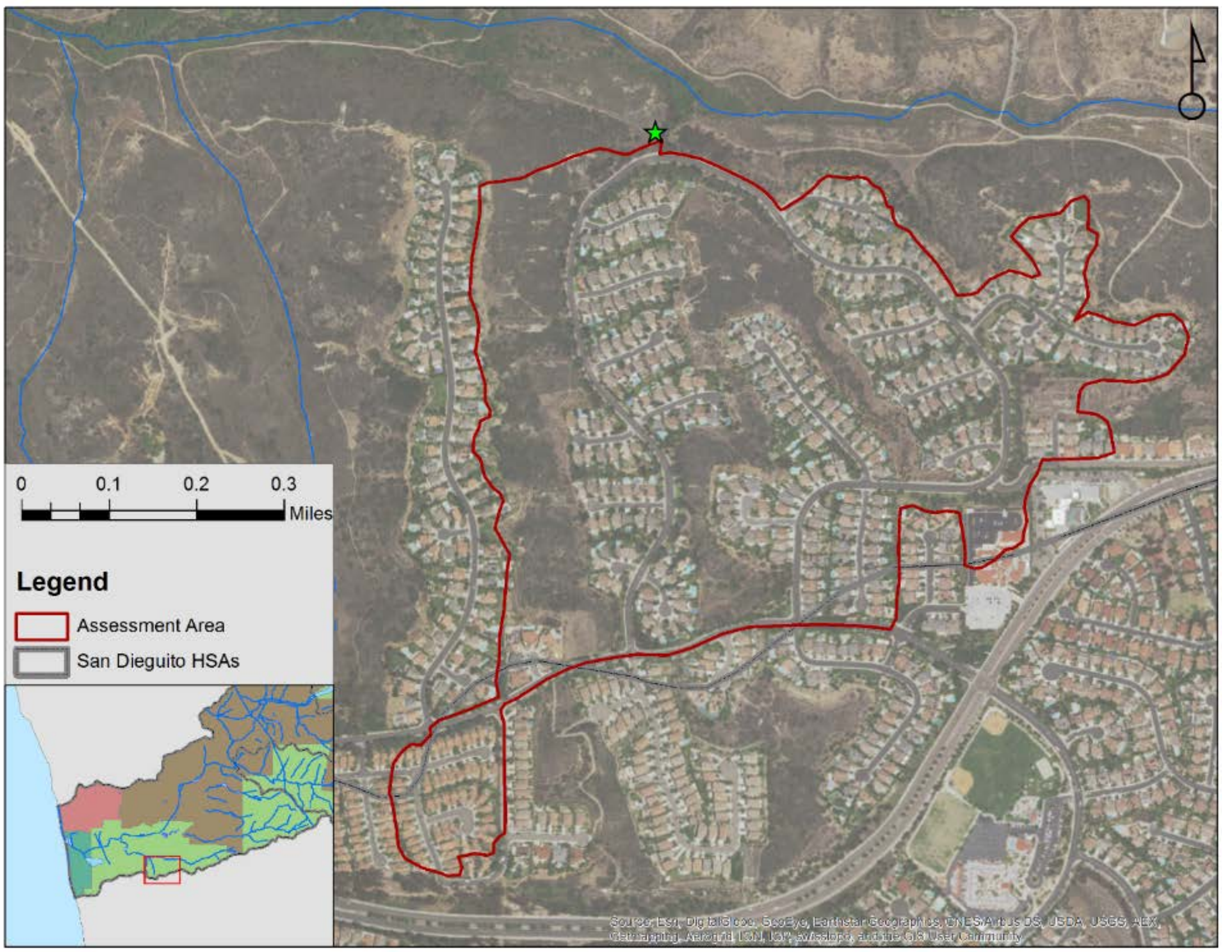

Figure 2. Focus area for the City of San Diego: Outfall DW-284

Table 2. Summary of Potential Bacteria Source Characteristics within DW-284

Source	Human Health Risk	Magnitude	Transport Feasibility	Frequency	Controllable?
Residential	Med	Med/High	Irrigation	48% (75 ac)	Yes
Sanitary Sewer Infrastructure	High	High	Low (PVC)	3 miles (100% PVC)	Yes

County of San Diego

The County of San Diego's primary focus area featured the outfall site, SDG-210, shown in **Figure 5**. The total area assessed is 17 acres, and consists of 63% residential land uses, 18% open space, and 19% road infrastructure. The land uses are mainly single family residential with associated open space. One of the residential areas has an active homeowners association and the focus area borders a golf course. The potential bacteria sources in this focus area are associated with residential land uses, human activities, and any potential sources associated with open space and wildlife.

Figure 5. Focus area for the County of San Diego: Outfall SDG-210

Although informative source information was available for this focus area, information regarding the sanitary sewer infrastructure was unavailable. A summary of available source data is provided in **Table 5**. The potential bacteria sources within the County of San Diego's focus area include of a mixture of anthropogenic non-human and human waste bacteria origins. A summary of the top ten sources is presented in **Table 6**, and the complete prioritization results are located in **Table 7**.

City of Escondido

The City of Escondido's primary focus area drains to the outfall site, HDG-102, shown in **Figure 7**. This outfall was previously identified by the City as an outfall of interest for additional investigation because it drains to the San Dieguito River. The total area is 188 acres and consists of 73% residential land uses, 5% open space, 1% commercial land uses, and 20% road infrastructure. Despite the fact that the focus area is comprised by a majority of residential land uses, the commercial inventory provided by the City shows a neighborhood shopping center with several food service establishments located in the southeast portion of the assessment area. There are a total of ten food service establishments within the assessment area. The potential bacteria sources within this focus area represent residential and commercial activities associated with human waste, existing infrastructure, and other anthropogenic and non-human sources of bacteria.

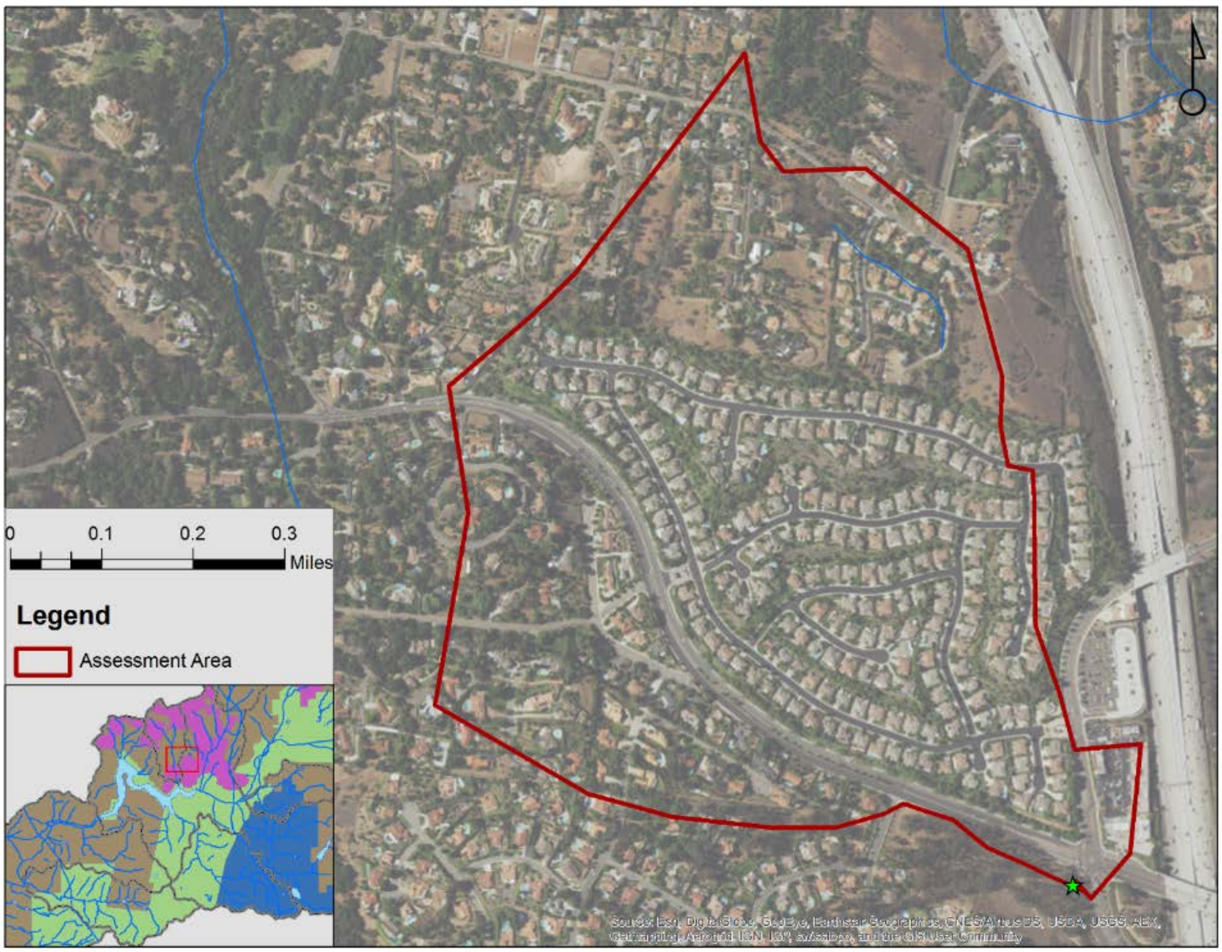

Figure 7. Focus Area for the City of Escondido: Outfall HDG-102

Table 8. Summary of Potential Bacteria Sources Characteristics within HDG-102

Source	Human Health Risk	Magnitude	Transport Feasibility	Frequency	Controllable?

City of Poway

The City of Poway's primary focus area drains to the outfall site: POW132, illustrated in **Figure 10**. The total area is 723 acres, and consists of 74% residential land uses, 9% open space, 7% public land, and 1% crops, and 9% road infrastructure. As a result, the City of Poway's focus area is over 80% single family residential and open space land uses. The focus area includes a high school and a few in-home businesses. The bacteria source priorities are mainly associated with wild life (both non-anthropogenic and anthropogenic). Other potential sources include leaky infrastructure, sources related to garbage, and other waste water sources.

City of Solana Beach

The City of Solana Beach's primary focus area drains to the outfall site: SB12, illustrated in **Figure 13**. The total area is 74 acres, and consists of 72% residential land uses, 7% open space, 1% institutional land use and 20% road infrastructure. In addition, the majority of the residential parcels contain multi-family residential units. While commercial businesses are rare within the boundaries of the focus area, multi-family residential units contain similar features that are commonly associated with business activities, such as large dumpsters. The potential bacteria sources within this focus area represent both residential and commercial activities associated with human waste, as well as some infrastructure. This focus area was previously identified as an area of interest for the City of Solana Beach.

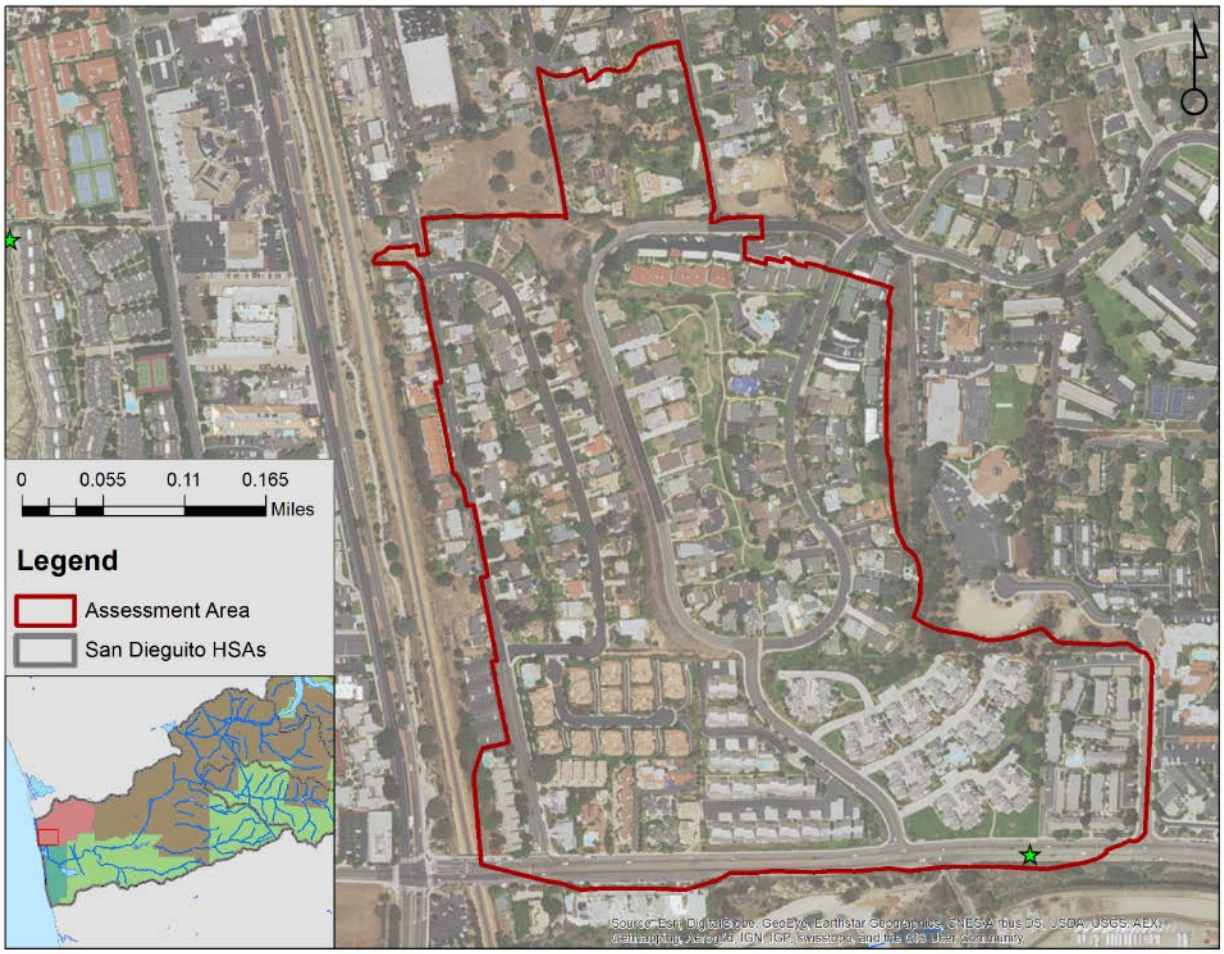

Figure 13. Focus area for the City of Solana Beach at Outfall SB-12

City of San Diego/City of Solana Beach – Shared Focus Area (DW-619)

The Cities of San Diego and Solana Beach assessed and prioritized bacteria sources within a focus area that drain through an outfall within the City of San Diego's jurisdiction but included areas draining the City of Solana Beach, shown in **Figure 16**. In this focus area, identified by outfall DW-619, the total area is 60.42 acres, with 17.91 acres within the City of San Diego and 42.51 acres within the City of Solana Beach. For the area within the City of San Diego, 46% of the land use consists of commercial parcels, while the remaining portion are comprised of mostly commercial land uses. In particular, the City's infrastructure drains a large neighborhood shopping center. The potential bacteria sources within this focus area represent these land uses and activities, including the potential for secondary wildlife associated with these activities.

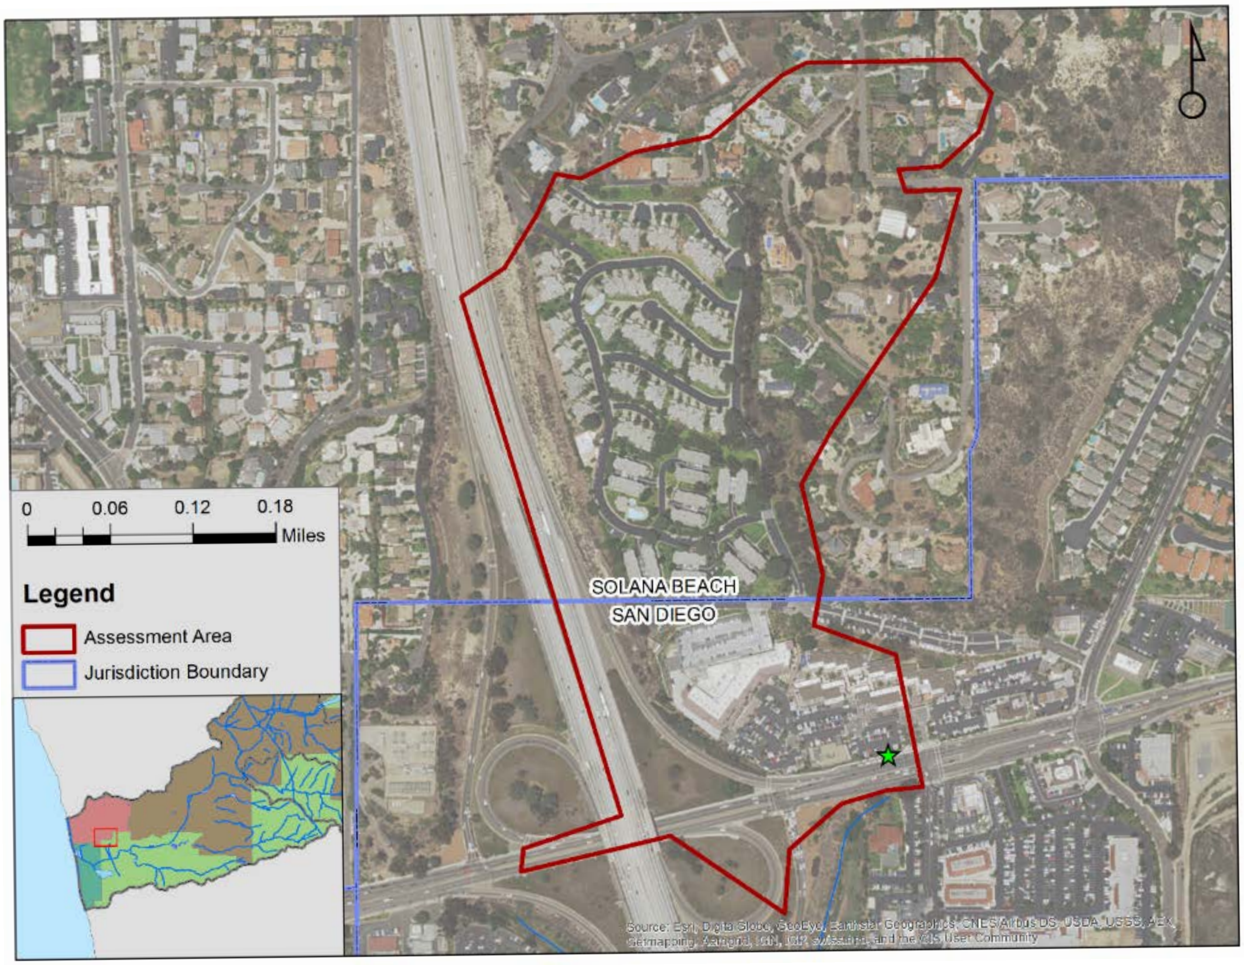

Figure 16. Shared Focus Area, Cities of Solana Beach and San Diego: Outfall DW-619

* Ranks are shown within each category (Human, Anthropogenic Non-Human, Non-Anthropogenic)

The land uses within the City of Solana Beach's jurisdiction are comprised of 83% multi-family and single-family residential homes. The remaining portion of land use consists of road infrastructure. The potential bacteria sources within this focus area represent the activities and sources more commonly associated with residential land use. These residential parcels were split between single family residential and multi-unit residential land uses.

Subject: WQIP Annual Report Data Submittal to CEDEN

Hello Roger and Christina,

As the Water Boards' program manager for the California Environmental Data Exchange Network (CEDEN), I'm been working with Amec Foster Wheeler on submitting WQIP Annual Report data to the CEDEN database. They have been able to successfully submit many files to CEDEN, however, there are 16 files, listed below, for which certificates of submittal cannot be obtained at this time due to new vocabulary values (requested by Amec Foster Wheeler) that are not yet fully incorporated into the CEDEN database. Adding new controlled vocabulary to CEDEN requires a number of steps and some of the values requested got hung-up because of issues within the CEDEN process. I have accepted these files outside of the data checker process and as soon as the vocabulary request is active, we will upload the files and deliver the certificates to the Regional Board.

The affected files are:
Tijuana River WMA
–TJ MS4_CSD_DW_ChemResults_2015-2016
–TJ MS4 WW1_ChemResults_2015-2016
–TJ MS4 WW2_ChemResults_2015-2016
–TJ MS4 WW3_ChemResults_2015-2016
–TJ MS4 WW4_ChemResults_2015-2016
–TJ MS4 WW5_ChemResults_2015-2016
–TJ MS4 WW6_ChemResults_2015-2016

Table D-9 County of San Diego Jurisdictional Strategies for San Dieguito River WMA D-141
Table D-10 County of San Diego Optional Strategies for San Dieguito River WMA D-147

Jurisdictional strategies are required as part of the Water Quality Improvement Plan (WQIP), under Provision B of the San Diego Regional Water Quality Control Board (Regional Board) National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) Draining the Watersheds Within the San Diego Region, Order Number R9-2013-0001 (MS4 Permit). The Responsible Agencies (RAs) identified water quality improvement strategies outlined in the WQIP and implemented those strategies in fiscal year (FY) 16, the first year of WQIP implementation, to address the highest priority water quality conditions (HPWQCs). The strategies were selected on the basis of their ability to effectively and efficiently eliminate non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the maximum extent practicable, and achieve the interim and final numeric goals identified in the San Dieguito River Watershed Management Area (WMA) WQIP.

STATEMENT OF CERTIFICATION

San Dieguito Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report

And

Legal Authority Establishment and Enforcement

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations. (40 C.F.R. 122.22(d)).

Further, I certify under penalty of law that the City of Del Mar has taken necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in section E.1 of the San Diego Regional Water Quality Control Board Order No. R9-2013-0001 as amended by Order No. R9-2015-0100 (Municipal Permit). The Del Mar Municipal Code (DMMC), including the following provisions, provides the City with full legal authority as required by the Municipal Permit as well as authorizes judicial and administrative enforcement procedures to mandate compliance:

1. Stormwater Management and Discharge Control, DMMC Section 11.30
2. Clean Water Storm Drain Program – General, DMMC Section 11.32

II. LEGAL AUTHORITY

Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☒ ☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES[1] NO	☒ ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☒ ☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES[2] NO	☒ ☐

Number of non-storm water discharges reported by the public	18
Number of non-storm water discharges detected by Copermittee staff or contractors	22
Number of non-storm water discharges investigated by the Copermittee	40
Number of sources of non-storm water discharges identified	40
Number of non-storm water discharges eliminated	40
Number of sources of illicit discharges or connections identified	8
Number of illicit discharges or connections eliminated	8
Number of enforcement actions issued	6
Number of escalated enforcement actions issued	3

V. DEVELOPMENT PLANNING PROGRAM

Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES NO	☒ ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES NO	☒ ☐

Number of proposed development projects in review	101
Number of Priority Development Projects in review	2
Number of Priority Development Projects approved	1
Number of approved Priority Development Projects exempt from any BMP requirements	1
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	0

Number of completed Priority Development Projects in inventory	2
Number of high priority Priority Development Project structural BMP inspections	22
Number of Priority Development Project structural BMP violations	0
Number of enforcement actions issued	0
Number of escalated enforcement actions issued	0

FY 2015-2016

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001? YES ☒ NO ☐

Number of construction sites in inventory	52
Number of active construction sites in inventory	41
Number of inactive construction sites in inventory	0
Number of construction sites closed/completed during reporting period	11
Number of construction site inspections	408
Number of construction site violations	22
Number of enforcement actions issued	22
Number of escalated enforcement actions issued	1

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001? YES ☒ NO ☐

	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	24	81	0	37
Number of existing development inspections	264	891	0	407
Number of follow-up inspections	0	0	0	0
Number of violations	1	61	0	3
Number of enforcement actions issued	1	61	0	3
Number of escalated enforcement actions issued	0	2	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001? YES ☒ NO ☐

Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001? YES ☒ NO ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001? YES ☒ NO ☐

X. CERTIFICATION

I ☒ Principal Executive Officer ☐ Ranking Elected Official ☐ Duly Authorized Representative certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

[1] The City of Del Mar was required to submit an updated JRMP with the WQIP and post it to the Regional Clearinghouse portal.
[2] The timeframe used for the Illicit Discharge Detection and Elimination component of this JRMP Annual Report matches the timeframe used in the WQIP Annual Report (10/1/15-9/30/16).

1. Fiscal Analysis

1.1 Jurisdictional Runoff Management Program Implementation

This section of the Jurisdictional Runoff Management Program (JRMP) Annual Report provides a fiscal analysis of the City's stormwater management programs. On May 8, 2013 the RWQCB adopted a revised Municipal Permit, Order No. R9-2013-0001, however, during this transitional period the City of Del Mar continued to develop its fiscal analysis according to Section G of the previous Municipal Permit, Order No. R9-2007-0001.

On January 29, 2009, the San Diego Municipal Copermittees adopted the "Standardized Fiscal Method and Format" which provides a model for the City of Del Mar and other Copermittees to perform the review and annual reporting as required in Order R9-2007-0001, Section G. This methodology and reporting format proved to be an effective model for reporting on City expenditures, and for consistency, the City of Del Mar will continue to use the format for this reporting period FY 2015-2016. The City, however, recognizes the additional elements required to be included in the fiscal analysis as specified in Order No. R9-2013-001 Section E.8, and has included those components in the year's report.

1.1.1 Clean Water Program Budget

The City of Del Mar's Clean Water Program is a multi-departmental program, funded as an enterprise fund in the City's Annual Budget. Enterprise funds account for operations that are financed and operated in a manner similar to private businesses, with the costs of providing the services recovered largely through user fees. Fund 55 ("The Clean Water Fund"), is one of three (3) enterprise funds in the City's budget, and was added to the City's budget in Fiscal Year 2004 to account for the mandated costs of the City's responsibilities in order to comply with the Municipal Permit. The budget for the City of Del Mar has the appropriate funds allocated to meet the requirements of Permit 2013-0001, including any development, implementation, and enforcement activities required.

The City of Del Mar Operating and Capital Improvement Budgets for Fiscal Years 2015-2016 and 2016-2017 were presented to the Del Mar City Council on June 1, 2015. The budget was formally adopted during the same meeting.

For the Fiscal Year 2015-2016 reporting period, the final amended budget for Fund 55 totaled $550,670. **Table 1-1** below provides a breakdown of program budget by major budget category for Fiscal Year 2015-2016.

Table 1-1: Budget Summary – Clean Water Fund 55

Fund Account		Adopted Budget Fiscal Year 2015-2016	Description/Comments
55-5530	Clean Water Planning	45,700	Active enforcement of clean water regulations including project plan review, permitting, construction monitoring and plan review of BMPs.
55-5536	Clean Water Code Enforcement	24,830	Active in-field enforcement of clean water regulations, including response to resident complaints.
55-5539	Clean Water Program Management	268,000	All clean water program management and reporting activities, fees to agencies, and interaction with regional and watershed Copermittee groups.
55-5840	Public Works (General)	212,140	Provides for administration and general support for all clean water programs for property and facilities, including supervision of maintenance staff.
Total Clean Water Program Budget – Fund 55		**$550,670**	–

1.1.2 Fiscal Analysis Methods

The City of Del Mar used the format and guidelines included in the Fiscal Analysis Method for reporting purposes; however, given the City's financial accounting methods, a few modifications were necessary. These adjustments are described below.

1.1.3 Fiscal Analysis Results

The City's Fiscal Year 2015-2016 jurisdictional, watershed, and regional projected expenditures for the implementation of the Municipal Permit requirements are summarized in **Table 1-2** below.

Table 1-2: Fiscal Year 2015-2016 Expenditure Summary by Program Component

Component Description	Fiscal Year 2015-2016 Projected Expenditures
Jurisdictional Component	
Administration	60,883
Development Planning	42,690
Construction	29,376
Municipal (Including Non-Emergency Fire Flows)	195,510
Industrial and Commercial	10,700
Residential, Education, and Public Participation	51,278
IDDE	37,066
Jurisdictional Total	**$427,503**
Watershed Component	
San Dieguito Watershed	47,975
Los Peñasquitos Watershed	37,275
Watershed Total	**$85,250**
Regional Component	
Total Copermittee Cost Share for Del Mar	37,918
Total Costs	**$550,670**

1.1.4 JRMP Expenditures

The City of Del Mar used the expenditure categories detailed in the Fiscal Analysis Method for jurisdictional reporting. However, due to the implementation overlap of some of the City's municipal permit components; it is difficult to separate out individual component costs. As a result, the expenditures for residential, education, and public participation are reported as one expenditure category. Additionally, since the City does not explicitly track expenditures by permit component for its budgeting purposes, in many cases estimated percentages were utilized to allocate expenditures into the appropriate municipal permit component categories.

A total of $550,670 was projected to be expended in Fiscal Year 2015-2016 for the implementation of JRMP activities. An overview of the expenditures reflected in JRMP activity component is described below.

Administration

Activities identified in this component represent labor and non-labor expenditures for materials, supplies, equipment, or tools that are not otherwise incorporated into other expenditure categories, general administrative functions (e.g., program planning, budgeting, staff supervision), and program assessment and reporting.

Development Planning

Activities identified in this component represent labor and non-labor expenditures related to issuance or oversight of permits or of plans (e.g., permit counter support, plan checks, permit or application processing), project planning and engineering (e.g. project design specifications, capital improvement projects).

Construction

Activities identified in this component represent labor and non-labor expenditures related to construction site inspections and enforcement.

Municipal

Activities identified in this component represent labor and non-labor expenditures related to maintenance inspections of streets, roads, catch basins and inlets, open channels, and the MS4, municipal facility inspections, street and parking lot sweeping, catch basins and inlets, open channels, and MS4 cleaning, and municipal BMP implementation. Since the City of Del Mar conducts all fire-fighting training outside of the City, and no non-emergency fire-fighting flows occurred during the reporting period, the City does not currently track expenditures relating to non-emergency fire-fighting flows. Any costs associated with preparing for these flows are included in the municipal component.

Industrial and Commercial

Activities identified in this component represent labor and non-labor expenditures related to evaluation and enforcement of program requirements at industrial and commercial sites or sources (e.g. routine inspections and complaint investigations).

Residential, Education, and Public Participation

Activities identified in these components represent labor and non-labor expenditures related to investigation and enforcement of residential areas or activities, staffing outreach events, development and production of outreach materials, and any expenditures associated with waste collection and recycling (e.g. household hazardous waste, used oil).

Illicit Discharge Detection and Elimination

Activities identified in this component represent labor and non-labor expenditures related to the identification and elimination of illicit discharges or connections, enforcing the City of Del Mar's storm water ordinance, and any expenditures related to monitoring programs (e.g. dry weather monitoring, coastal storm drain monitoring, special investigations, field or sampling equipment, materials and supplies).

1.1.5 Watershed Expenditures

The City of Del Mar used the expenditure categories (administration, watershed activities, cost share contribution, and other) detailed in the Fiscal Analysis Method for watershed reporting. The watershed expenditures included in this report only capture City of Del Mar expenditures and do not account for any expenditure disbursed by other Copermittees included in the watershed(s).

A total of $85,250 was projected to be expended in Fiscal Year 2015-2016 for the implementation of planned strategies for the San Dieguito and Los Peñasquitos Watersheds.

1.1.6 Regional Expenditures

The City of Del Mar utilized the expenditure categories (administration, cost share contribution, regional activities, and other) detailed in the Fiscal Analysis Method for regional reporting. The regional expenditures included in this report only capture City of Del Mar expenditures and do not account for any expenditure disbursed by other Copermittees in the region. A total of $37,918 was projected to be expended in Fiscal Year 2015-2016 for the implementation of regional activities and coordination.

1.1.7 Funding Sources

To ensure adequate funding for the Clean Water Program, the City uses a combination of user fees and general fund monies.

The City of Del Mar City Council created and adopted a user fee, called the Clean Water Fund Service Charge to offset the costs of the program. Initially, the rate was adopted to collect $100,000 of the estimated $300,000 for the program, with an escalator to achieve full cost recovery by 2009. Mid-way through the five-year schedule, on July 24, 2006, the California Supreme Court published a decision in the case of Bighorn-Desert View Water Agency v. Verjil (2006) 39 Cal. 4th 205, which held that consumption-based rates such as water and sewer rates are subject to the notice and hearing requirements of California Constitution, Article XIIID, Section 6 (commonly known as "Proposition 218"). Therefore, on January 22, 2007, and February 5, 2007, the Del Mar City Council held public hearings to receive written protests to comply with Proposition 218. No majority protest was received, and the Council ratified the previously approved five-year rate schedule, including the City's Clean Water Service Charge. However, the adopted rate increases did not account for the actual increases in the costs associated program requirements.

As an additional measure to obtain voter approval of the five-year rate schedule for the City's Clean Water Service Charge, the Council directed staff on April 2, 2007, to start the process to perform a mail ballot election procedure. During the process of researching the mail ballot election procedures and the current rates, it became apparent that the process would immediately need to be repeated to set the Fiscal Year 2010 rates and charges, since the current five-year rate schedule was due to expire in June of 2009. Due to the additional costs incurred in complying with the new requirements of the 2007 Permit, increases to the Clean Water Service Charge were proposed, including an annual rate escalator. All monies appropriated as part of the Clean Water Service Charge are directly identified for the Clean Water Program, and pursuant to law, may not be used by the City for any other purpose.

During the Fiscal Year 2009 reporting period, in compliance with Proposition 218, both the majority protest hearing and mail ballot process were conducted for the proposed increases. Both the ratification of the existing rate structure (required by Proposition 218), and the new rates, including the rate escalator, passed by more than 62%. As a result of the passage of the Clean Water Service Charge, the City will continue to have a secure funding source for the Clean Water Program, outside of general fund monies.

Based on current water allocations for the City of Del Mar, the projected revenues from the Clean Water Service Fee will be $482,700 (page 88 of city budget) for Fiscal Year 2015-2016.

D.1.3 City of Del Mar Strategies

City of Del Mar's strategies are detailed in Table D-1.

Table D-1
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
JRMP (E.2 – E.7) Strategies (E.3.b.(1)(a))								
E.3 Development Planning								
All Development Projects								
DM-1	For all development projects, administer a program to ensure implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area, where applicable and feasible.	Refer to JRMP Section 5. As commercial/residential patrol inspections are conducted (see JRMP Section 7 – Existing Development), staff will both inspect and verify 100% of the structural BMPs within the City. These inspections occur a minimum of six times per year.	FY16	Continuous-Ongoing	Y	N	Y	Construction of the Del Mar Civic Center is currently ongoing. Project provides opportunity for LID and structural benefits
DM-2	Train staff on LID regulatory changes during annual storm water training.	Formal staff training implemented annually during storm water training.	FY16	Continuous – Ongoing	Y	N	Y	-
DM-3	Maintain existing floor area ratio requirements to limit impervious surface areas.	Incorporate into planning phase of Land Development program implementation.	FY16	Continuous – Ongoing	Y	N	Y	-
DM-4	Continue retention of native vegetation - New or redevelopment projects within the Lagoon Overlay Zone shall include the retention of the maximum amount of native vegetation on the site. Revegetation or landscaping of sites within the Lagoon Overlay Zone shall include the use of non-invasive, drought tolerant species native to the San Diego coastal region and which are compatible with adjacent wetland habitat species.	Retention of native vegetation is a requirement in the City's Municipal Code.	FY16	Continuous – Ongoing	Y	N	Y	-
Priority Development Projects (PDPs)								
DM-5	For PDPs, administer a program requiring implementation of on-site structural BMPs to control pollutants and manage hydromodification. Includes confirmation of design, construction, and maintenance of PDP structural BMPs.	Refer to JRMP Section 5.	FY16	Continuous – Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
DM-6	Update BMP Design Manual procedures to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	Refer to JRMP Section 5.	FY15	Continuous – Ongoing	Y	N	Y	-
Construction Management								
DM-7	Administer a program to oversee implementation of BMPs during the construction phase of land development. Includes inspections at an appropriate frequency and enforcement of requirements.	Refer to JRMP Section 6; Construction site inventory updated monthly and inspections of prioritized sites are conducted biweekly year round.	FY16	Continuous-Ongoing	Y	N	Y	-
Existing Development								
Commercial, Industrial, Municipal, and Residential Facilities and Areas								
DM-8	Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and PGAs, as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods.	Refer to JRMP Section 7. All industrial, commercial, residential, and municipal areas are inspected at least once every two months. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Y	N	Y	-
DM-8.1	Update minimum BMPs for commercial, industrial, and municipal existing development and enforce. Includes BMPs for water-using mobile businesses.	Refer to JRMP Appendix A and Attachment 1 of this WQIP for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing; Updated as needed	Y	N	Y	-
DM-8.2	Provide BMP factsheet to water-using mobile businesses when business license is granted.	To ensure implementation of minimum BMPs for water -using mobile businesses, when a business license is granted for a water-using mobile business, a BMP factsheet is provided.	FY16	Continuous-Ongoing	Y	N	Y	-
DM-8.3	Conduct property-based commercial, industrial, municipal, and residential inspections. Includes identification and addressing unmitigated incidents of power washing discharges.	Refer to JRMP Section 7. Inspections of commercial, industrial, municipal, and multifamily residential areas conducted a minimum of six times per year.	FY16	Continuous-Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
DM-8.4	Update municipal swimming pool discharge ordinance to ensure discharges from swimming pools meet permit requirements.	Municipal Code updated; Refer to JRMP Section 3.	FY15	Continuous-Ongoing	Y	N	Y	-
DM-9	Implement pet waste program.	Implement education and prevention program. Pet waste bag dispensers and trash bins provided in public areas. Pet waste removal occurs as part of Dog Beach maintenance.	FY15	Continuous-Ongoing	Y	N	Y	-
DM-10	Promote and encourage implementation of designated BMPs at residential areas.	Implement education and prevention program. Utilize over-irrigation door hangers for education and prevention.	FY15	Continuous-Ongoing	Y	N	Y	-
DM-11	Promote and encourage implementation of designated BMPs in commercial areas.	Implement education and prevention program through patrol-based program and contact with commercial area owners, tenants etc.	FY15	Continuous-Ongoing	Y	N	Y	-
MS4 Infrastructure								
DM-12	Implementation of operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, detention basins, etc.).	Refer to JRMP Section 7. The MS4 inventory is inspected by Public Works staff at least once per year. Based on the findings of the inspections, the City performs required cleanings and proper disposal of collected material. Removal of the collected trash and debris prevents the materials from being pushed through the system and into the receiving waters from runoff.	FY16	Continuous-Ongoing	Y	N	Y	-
DM-12.1	Perform catch basin cleaning.	Inspect and clean catch basins annually.	FY16	Continuous-Ongoing	Y	N	Y	Approximately 101.5 cubic yards of material is removed as a result of catch basin cleaning in the City of Del Mar
DM-12.2	Repair and replace MS4 components as needed to provide source control from MS4 infrastructure.	In order to limit inflow of pollutants and reduce pollutant loads, the City will take proactive measures to improve, repair, and replace MS4 components.	FY16	Continuous-Ongoing	Y	N	Y	-
DM-13	Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers and identify sewer leaks and areas for sewer pipe replacement.	Refer to JRMP Section 4.7 and the City's Sanitary Sewer Management Plan. The conducts a variety of activities to effectively operate, maintain, repair and replace sewer mains, manholes, and pump stations.	FY15	Continuous - Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Roads, Street, and Parking Lots								
DM-14	Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways.	Refer to JRMP Section 7. The City implements the street sweeping schedule as follows: • Twice per month o Primary roads o Business district o Collection and bike lanes o Medians o Parking facilities • Twice per year o Residential areas	FY16	Continuous-Ongoing	Y	N	Y	882.92 total miles of streets are swept in the City of Del Mar on an annual basis
DM-14.1	Enhanced street sweeping by use of regenerative air vacuum sweepers.	Enhanced sweeping implemented by using regenerative air vacuum sweepers. Residential areas are swept 2x per year; primary roads (Camino Del Mar) and business district are swept 2x per month. Collection and bike lanes and medians are swept 2x per month.	FY16	Continuous-Ongoing	Y	N	Y	882.92 total miles of streets are swept in the City of Del Mar on an annual basis
DM-14.2	Perform sweeping of medians on high-volume arterial roadways.	Primary roads and business district medians are swept 2x per month.	FY16	Continuous-Ongoing	Y	N	Y	882.92 total miles of streets are swept in the City of Del Mar on an annual basis
Pesticide, Herbicides, and Fertilizer BMP Program								
DM-15	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	Refer to JRMP Section 7. The City of Del Mar is committed to the application of Integrated Pest Management (IPM) procedures and the use of updated BMPs to prevent or reduce the use of pesticides, fertilizers, and subsequently their discharge into the MS4.	FY16	Continuous-Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Retrofit and Rehabilitation in Areas of Existing Development								
DM-16	Develop and implement a strategy to identify candidate areas of existing development appropriate for retrofitting projects and facilitate the implementation of such projects.	Refer to JRMP Section 8. The process for identifying retrofits will evaluate the following considerations: • Water Quality Improvement Plan (WQIP) Priority and Highest Priority Water Quality Conditions • Likely sources of pollutants generating pollutants related to WQIP conditions • Focus areas identified in WQIP • Vintage of geographic areas of the City – time period existing development was constructed • Public retrofit opportunities through Capital Improvement Program (CIP) projects • Areas of persistent discharges • Inspection/Illicit Discharge Detection and Elimination program findings • Identified areas of hydromodification or other stream impacts Using the considerations above, the City will identify areas where opportunities could provide water quality improvement benefits. Evaluation will include layering of the findings to determine where compounding factors overlap. The City will consider the locations where overlapping occurs and significance of the factors to prioritize areas suited for retrofits and rehabilitation projects. Once specific areas within the City have been identified and prioritized for retrofits and/or rehabilitation projects, the City will perform field verifications on an as-needed basis to substantiate the: • need for retrofits or rehabilitation projects • locations of potential retrofits or rehabilitation projects • appropriate type(s) of retrofit or rehabilitation project • appropriate responsible party to implement the retrofits or rehabilitation projects Specific retrofit projects are included in the Non-JRMP, Structural Strategies categories.	FY18	Continuous-Ongoing	Y	N	Y	Project was slated to be implemented in FY18. However, project was implemented in FY16 and is ongoing

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
DM-17	Develop and implement a strategy to identify candidate areas of existing development for stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	Refer to JRMP Section 8. The process for identifying retrofits will evaluate the following considerations: • Water Quality Improvement Plan (WQIP) Priority and Highest Priority Water Quality Conditions • Likely sources of pollutants generating pollutants related to WQIP conditions • Focus areas identified in WQIP • Vintage of geographic areas of the City – time period existing development was constructed • Public retrofit opportunities through Capital Improvement Program (CIP) projects • Areas of persistent discharges • Inspection/Illicit Discharge Detection and Elimination program findings • Identified areas of hydromodification or other stream impacts Using the considerations above, the City will identify areas where opportunities could provide water quality improvement benefits. Evaluation will include layering of the findings to determine where compounding factors overlap. The City will consider the locations where overlapping occurs and significance of the factors to prioritize areas suited for retrofits and rehabilitation projects. Once specific areas within the City have been identified and prioritized for retrofits and/or rehabilitation projects, the City will perform field verifications on an as-needed basis to substantiate the: • need for retrofits or rehabilitation projects • locations of potential retrofits or rehabilitation projects • appropriate type(s) of retrofit or rehabilitation project appropriate responsible party to implement the retrofits or rehabilitation projects	FY18	Continuous-Ongoing	Y	N	Y	Project was slated to be implemented in FY18. However, project was implemented in FY16 and is ongoing

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Illicit Discharge, Detection, and Elimination (IDDE) Program								
DM-18	Implement Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include: maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	Refer to JRMP Section 3.	FY16	Continuous-Ongoing	Y	N	Y	-
Public Education and Participation								
DM-19	Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences.	Refer to JRMP Section 10 and 11.	Prior to FY16	Continuous-Ongoing	Y	N	Y	-
DM-19.1	Continue outreach to property managers responsible for HOAs and Maintenance Districts.	As part of the patrol-based program for the residential existing development inventory, provide frequent education and contact to HOAs and maintenance districts targeting outdoor activities and trash areas.	Prior to FY16	Continuous-Ongoing	Y	N	Y	-
DM-19.2	Continue education and outreach to reduce over-irrigation through patrol program.	Once per year outside of business hours, patrol jurisdiction for incidents of over-irrigation and leave door-hangers identifying problem areas and appropriate corrective actions.	FY16	Continuous-Ongoing	Y	N	Y	-
DM-19.3	Conduct trash cleanups through community-based organizations involving target audiences.	In partnership with I Love a Clean San Diego, host a site in Del Mar during two beach clean-ups per year.	FY16	Continuous-Ongoing	N	N	Y	1st clean up to take place 9/17/16
DM-19.4	Review City storm water website and identify and implement required updates to reflect WQIP and JRMP revisions.	Update City Clean Water Program website with WQIP and JRMP information and highlight what the community can do for water quality.	FY16	Continuous-Ongoing	Y	N	Y	Currently being updated
DM-19.5	Collaborate with regional education and outreach efforts.	Participate in Regional Think Blue campaign and collaborate with other regional efforts to provide consistent message or efficiency in training for targeted audiences.	FY16	Continuous-Ongoing	Y	N	Y	Participated in various outreach events

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Enforcement Response Plan								
DM-20	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	Refer to JRMP Section 9.	FY16	Continuous-Ongoing	Y	N	Y	-
Non-JRMP Strategies (Optional Strategies, B.3.b(1)(b))								
Additional Nonstructural Strategies								
DM-21	Promote and collaborate with water agencies and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water in residential areas.	Collaborate with MWD and promote their SoCal Water$mart rebates and products such as weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and turf removal. Collaborate with San Diego County Water Authority (SDCWA) and promote their Water Smart irrigation system checkups and turf replacement incentives.	FY16	Continuous – Ongoing	Y	N	Y	Information regarding rebate opportunities are listed on the City's webpage
DM-22	Continue program to address and capture trash and debris.	Properly maintain trash guards.	FY15	Continuous - Ongoing	Y	N	Y	-
DM-23	Continue participating in source reduction initiatives.	Continue implementation of cigarette ban on beaches, parks and in commercial areas.	FY15	Continuous - Ongoing	Y	N	Y	-
DM-24	Proactively monitor for erosion and complete minor repair and slope stabilization as needed.	Post-storm monitoring is conducted to identify slope and bluff erosion in priority areas. As-needed, repairs and slop stabilization are completed.	FY15	Continuous-Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
DM-25	Protect areas that are functioning naturally.	As feasible opportunities arise, the City will protect areas that are functioning naturally. This may include avoiding hardscape development and degradation in unpaved open space areas and creating permanent open space protections to undeveloped city-owned land. This strategy will be triggered on a case by case basis. The following resources, funds, and steps are needed to implement this strategy 1) Identify project locations (3 months) 2) Secure funds in the form of general funds, bonds, or grants if necessary (2 -18 months) 3) Obtain City Council approval	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered
DM-26	Collaborate with the 22nd District Agricultural Association (Del Mar Fairgrounds) on water quality-related issues.	The City will collaborate with the 22nd DAA on water-related issues as appropriate. The DAA is a Phase II NPDES discharger and is regulated under a separate stormwater permit. The 22nd DAA discharges directly to Steven's Creek and San Dieguito Lagoon and River.	Must be Triggered	As needed	N/A	N/A	N/A	Not triggered
DM-27	Implement a program to require septic system maintenance practices.	Require maintenance practices and provide education.	FY16	Continuous-Ongoing	Y	N	Y	-
DM-28	Conduct special studies	San Diego Regional Reference Stream Study (currently being conducted by the Southern California Coastal Water Research Project). The study will develop numeric targets that account for “natural sources” to establish the concentrations or loads from streams in a minimally disturbed or “reference” condition. Refer to Section 5.1 for further details.	FY15	One Time	Y	N	Y	-
DM-29	Reference watershed study	Assess sources of bacteria in the watersheds using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process. Focus is on the beach/lagoon area of the San Dieguito River WMA, with inputs from the upper watershed also considered where relevant and necessary to identify sources of bacteria to the beach/lagoon. Refer to Section 5.1 for further details.	Optional	One Time	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
DM-30	Visually inspect all major and minor MS4 outfalls.	All major and minor MS4 outfalls are inspected a minimum of six times per year to assist in the identification of any illegal discharges, persistently flowing outfalls or any other issues that may be identified.	FY15	Continuous – Ongoing	Y	N	Y	-
Structural Strategies								
Green Infrastructure								
DM-31	If interim load reduction goals are not met, potential opportunities for green infrastructure will be considered.	Adaptive management process.	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered
Multiuse Treatment Areas								
Stream, Channel and Habitat Rehabilitation Projects								
DM-32	San Dieguito Wetland Restoration Project is a project that is already underway and near completion. This regional project with multi-jurisdictional involvement is discussed further in Section 4.2.5.	San Dieguito Wetland Restoration Project is a project that is already underway and near completion. This regional project with multi-jurisdictional involvement is discussed further in Section 4.2.5.	FY15	Continuous-Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Dry Weather Flow Separation and Treatment Projects								
DM-33	If interim load reduction goals are not met, dry weather flow separation and treatment projects may be considered.	Construction of dry weather flow separation and treatment projects, where identified. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in downstream reaches where persistent dry weather flows have been observed. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3 months) 2) Secure funds in the form of general funds, bonds, or grants (2 -18 months) 3) Obtain City Council approval 4) Initiate preliminary engineering, design and develop construction plans and cost estimates (6 months -2 Years) 5) Bid and Award process for construction phase (6 months) 6) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project). 7) Operation and maintenance will be in perpetuity.	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered
DM-34	Operate and maintain infiltration pits and low flow diverters in the northern coastal portion of the City.	The northern coastal portion of the City is relatively flat and nuisance ponding can occur easily. To address non-storm water nuisance ponding the City has installed infiltration pits which are intended to infiltrate waters into the sand beneath the streets, thereby preventing discharge to receiving waters. In another effort to address the relatively flat areas of the northern portion of the City, a low flow diverter was installed that pumps nuisance non-storm water discharges that are collected in a street basin to the sanitary sewer system for treatment and disposal.	FY15	Continuous – Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA Strategies (Optional Strategies, B.3.b.(2))								
WMA-1	San Dieguito Wetland Restoration Project	The Cities of San Diego and Del Mar are collaborating organizers of the San Dieguito River Park (SDRP) to restore the San Dieguito coastal wetlands and lagoon system. The 150-acre wetland restoration work has been primarily accomplished by Southern California Edison (SCE) and partner owners of the San Onofre Nuclear Generating Station (SONGS), including San Diego Gas & Electric (SDG&E), City of Riverside, and City of Anaheim. Construction began in fall 2006 and the $90-million Restoration Project was officially dedicated in 2011. The Restoration Project has enhanced southern California's unique coastal and marine environment as the restoration has provided adequate tidal flushing and circulation to support biologically diverse habitats. Beyond protecting endangered species and providing habitat to hundreds of bird species and fish, the restoration project has also added a coastal segment to the Coast to Crest Trail, allowing public enjoyment of the wetlands area while protecting sensitive habitat and vegetation. Funding for monitoring and managing the wetlands is ongoing.	Prior to FY16	Continuous-Ongoing	Y	N	Y	-
WMA-2	Collaborative Approach to Irrigation Reduction	Responsible Agencies are collaborating with water agencies to encourage implementation of water conservation efforts. Water conservation that attempts to reduce irrigation and minimize storm water runoff can also improve water quality of receiving waterbodies. MWD's SoCal Water$mart Program supports conservation efforts by offering incentives in the form of rebates for rain barrels, rotating sprinkler nozzles, weather-based irrigation controllers, soil moisture sensor systems, and turf replacement. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council or appropriate legislative body (i.e. Board).	Prior to FY16	Continuous-Ongoing	Y	N	Y	Information regarding rebate opportunities are listed on the City's webpage

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-3	Offsite Alternative Compliance Option (WMAA)	The WMAA provides alternative compliance methods in lieu of meeting structural BMP design standards and/or hydromodification management criteria on the project site. The San Diego County Copermittees have collectively funded and provided guidance for development of a regional WMAA. Copermittees compiled a list of candidate projects that consider the numeric goals of the WMAs as well as projects previously identified in JRMPs and other regulatory documents. Next steps include submittal of the water quality equivalency standards final document, anticipated in September 2015. Following a public review and Executive Officer approval, anticipated by November 2015, jurisdictions can formally implement an optional Alternative Compliance Program by December 2015 (time coincident with implementation of standards set forth in the regional BMP Design Manual and local Storm Water Standards Manuals).	Prior to FY16	Continuous-Ongoing	Y	N	Y	-
WMA-4	Collaboration with the Regional Board.	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Industrial General Permit, 2) enforcement of other non-MS4 dischargers, and 3) Bacteria TMDL updates. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous-Ongoing	Y	N	Y	-

Table D-1 (continued)
City of Del Mar Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-5	Participation in Watershed Council	If a Watershed Council is re-established, the City of San Diego, County of San Diego and potentially other Responsible Agencies will participate. Watershed Councils are typically locally organized, voluntary, non-governmental organizations, and are intended to broadly represent various stakeholders in the WMA. Goals of Watershed Councils may vary, but they generally promote protecting the watershed and sustaining natural resources. This coordination could assist in selecting WMA projects, identifying potential funding opportunities, and promoting communication among community groups and regulated agencies. Resources necessary to implement this strategy include participating jurisdictional staff to coordinate with the regional effort and the development of an agreement (e.g. MOU, JPA) among participating entities. Projected funding needs may be met through grant funding, support from community groups or other institutions, or jurisdictional General Funds. General Funds are contingent on approval of the annual budget by City Council or appropriate legislative body. Participation is dependent on funding availability.	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered

D.1.4 Modifications to the BMP Design Manual

No modifications to the BMP Design Manual have been made since the WQIP was approved in fall 2015. The current Del Mar BMP Design Manual is posted on the Del Mar's website, and the link to this page is listed on Project Clean Water.

D.1.5 Modifications to the Jurisdictional Runoff Management Plan

No modifications to the Del Mar's JRMP have been made since the WQIP was approved in fall 2015. The current Del Mar JRMP is posted on the Del Mar's website, and the link to this page is listed on Project Clean Water.

D.2 City of Escondido

D.2.1 Annual Report Certifications

The City of Escondido's required certifications regarding the preparation of the Water Quality Improvement Plan Annual Report, as well as the legal authorities required by the MS4 Permit are included on the following pages.

D.2.2 Annual Report Form

Escondido's completed JRMP Annual Report form and fiscal analysis for FY16 are included on the following pages.

STATEMENT OF CERTIFICATION

San Dieguito Watershed Management Area Water Quality Improvement Plan

2015-2016 Annual Report

and

Legal Authority Establishment and Enforcement

I certify that this Water Quality Improvement Plan Annual Report and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I also certify that the City of Escondido has taken necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in section E.1 of San Diego Regional Water Quality Control Board Order No. R9-2013-0001 as amended by Order No. R9-2015-0100. This includes entering into contracts, updating and enforcing the Escondido Municipal Code, and regularly reviewing and updating the policies and procedures described in the Jurisdictional Runoff Management Program and Water Quality Improvement Plans.

Christopher W. McKinney

I. COPERMITTEE INFORMATION

Copermittee Name: City of Escondido – SAN DIEGUITO WATERSHED

Copermittee Primary Contact Name: Helen Davies

Copermittee Primary Contact Information:
Address: 201 North Broadway
City: Escondido County: San Diego State: CA Zip: 92025
Telephone: 760-839-6315 Fax: 760-839-4597 Email: hdavies@escondido.org

II. LEGAL AUTHORITY

Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES ☒	NO ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES ☒	NO ☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES ☐	NO ☒
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES ☐	NO ☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES ☒	NO ☐

Number of non-storm water discharges reported by the public	36
Number of non-storm water discharges detected by Copermittee staff or contractors	4
Number of non-storm water discharges investigated by the Copermittee	40
Number of sources of non-storm water discharges identified	40
Number of non-storm water discharges eliminated	40
Number of sources of illicit discharges or connections identified	40
Number of illicit discharges or connections eliminated	40
Number of enforcement actions issued	5
Number of escalated enforcement actions issued	0

V. DEVELOPMENT PLANNING PROGRAM

Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES ☒	NO ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES ☐	NO ☒
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES ☐	NO ☐

Number of proposed development projects in review	1
Number of Priority Development Projects in review	1
Number of Priority Development Projects approved	1
Number of approved Priority Development Projects exempt from any BMP requirements	0
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	1

Number of completed Priority Development Projects in inventory	14
Number of high priority Priority Development Project structural BMP inspections	7
Number of Priority Development Project structural BMP violations	10
Number of enforcement actions issued	0
Number of escalated enforcement actions issued	0

FY 2015-16

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

Number of construction sites in inventory	7
Number of active construction sites in inventory	3
Number of inactive construction sites in inventory	0
Number of construction sites closed/completed during reporting period	4
Number of construction site inspections	50
Number of construction site violations	15
Number of enforcement actions issued	2
Number of escalated enforcement actions issued	0

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

	Municipal#	Commercial	Industrial	Residential#
Number of facilities or areas in inventory	14	115	0	8
Number of existing development inspections	6	139	0	8
Number of follow-up inspections	5	68	0	0
Number of violations	2	71	0	4
Number of enforcement actions issued	2	57	0	0
Number of escalated enforcement actions issued	0	8	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL FISCAL ANALYSIS
FY 2015-16
CITY OF ESCONDIDO

SAN DIEGUITO WATERSHED

Categories	Sub Categories	Costs
CAPITAL COSTS	None	$0
OPERATIONS AND MAINTENANCE	None	$295,241
OTHER EXPENDITURES	MONITORING PROGRAM	$7,886
	WATERSHED PROGRAM	$52,038
	REGIONAL PROGRAM	$20,349
STAFF RESOURCES	PROGRAM DEVELOPMENT	$11,934
	PROGRAM IMPLEMENTATION	$181,609
	ENFORCEMENT	$17,563
	Total	**$586,620**

Staff Resources

Necessary staff resources needed were allocated to meet municipal permit (R9-2013-0001)(Municipal Permit) requirements. Many of the permit requirements specific to various City departments (such as street sweeping, the responsibility of Public Works) continue to be implemented by the relevant staff with input, as needed, from Environmental Programs (Stormwater) personnel.

Funding Sources

Funds allocated through the City's Wastewater Fund provides funding for Municipal Permit compliance. The legal restrictions on the use of these funds are those associated with a municipal utility fee. Sufficient funds were made available for compliance with the Municipal Permit during fiscal year 2015-16 and sufficient funds have been budgeted for fiscal year 2016-17.

D.2.3 City of Escondido Strategies

City of Escondido’s strategies are detailed in Table D-2.

Table D-2
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
JRMP (E.2 – E.7) Strategies (E.3.b.(1)(a))								
E.3 Development Planning								
All Development Projects								
ES-1	For all development projects, administer a program to ensure implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area, per BMP Manual requirements.	Refer to JRMP Chapter 4 and BMP Manual. All high priority development projects are inspected annually prior to the rainy season. 20% of all priority development projects are inspected annually. Maintenance inspections of PDPs include examination of structural BMPs to verify proper maintenance and function as designed, and compliance with applicable City ordinances and permits.	Prior to FY16	Continuous - Ongoing	Y	No	Y	All inventoried projects were inspected this year. The inventory was reviewed and updated to be consistent with JRMP prioritization criteria.
ES-1.1	Weekly meetings to facilitate communication and assess compliance across divisions/departments, including stormwater, for all development projects.	EP Div meets weekly with Engineering Land Development Dept. to discuss project compliance on project submittals. Separate weekly meeting with Planning, Fire, and Engineering for co-compliance for all development during the planning stage.	FY16	Continuous - Ongoing	Y	No	Y	Storm Water staff with relevant background (planning/engineering) typically attend.
ES-2	Amend municipal code and ordinances, including zoning ordinances, as needed to meet BMP Design Manual requirements and facilitate and encourage LID opportunities.	Implemented as needed. Update occurred FY14-15 for permit compliance. All updates to the municipal code and ordinances must be brought to City Council for consideration.	Prior to FY16	Continuous - As needed	Y	No	Y	No updates needed during the fiscal year.
ES-3	Train staff on BMP regulatory changes and BMP Design Manual.	Formal staff training implemented as needed based on changes, such as the revision of the BMP Design Manual or staff turnover. Informal training or assistance occurs continuously with communication between Environmental Programs staff and land development staff on a regular basis.	FY16	Continuous - As needed	Y	No	Y	Formal in house training; regional training as part of BMP Manual update.
Priority Development Projects (PDPs)								
ES-4	For PDPs, administer a program requiring implementation of on-site structural BMPs to control pollutants and manage hydromodification.	Refer to JRMP Chapter 4. Includes confirmation of design, construction, and maintenance of PDP structural BMPs. Follow-up inspections conducted on some properties. Enforcement as required.	FY16	Continuous - Ongoing	Y	No	Y	The City has undertaken a comprehensive review of this program and is transitioning it to an asset management program.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
ES-4.1	Administer self-certification verification and enforcement program for treatment control BMP maintenance compliance.	BMP maintenance agreements required on all PDPs. Letters sent annually to remind property managers to self-certify. Follow-up inspections conducted on some properties. Enforcement as required.	FY16	Continuous - Ongoing	Y	No	Y	–
ES-5	Update BMP Design Manual procedures to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	Refer to JRMP Chapter 4. County Model BMP Design Manual was used and adapted for the City.	FY16	Continuous - As needed	Y	No	Y	The BMP Design Manual was updated per amended permit requirements.
E.4 Construction Management								
ES-6	Administer a program to oversee implementation of BMPs during the construction phase of land development. Includes inspections at an appropriate frequency and enforcement of requirements.	Refer to JRMP Chapter 5; Currently the inspection rate is dependent on time of year (dry versus wet season) and priority of site (based on threat to water quality). Most frequent inspection (high priority, wet weather) is once every 2 weeks, lowest is "as-needed." Per 2007 permit requirements.	FY16	Continuous - Ongoing	Y	No	Y	The coordinator for Environmental Programs now joins the engineering field inspectors during their weekly staff meetings.
E.5 Existing Development								
Commercial, Industrial, Municipal, and Residential Facilities and Areas								
ES-7	Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and PGAs, as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods.	Refer to JRMP Chapter 7; Highest priority inspection of food establishments is performed at a frequency of at least once a year with expectations to reach twice per year by FY2018. Others inspected per permit requirements. Please see Attachment 1 for details on PDP related BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16 with full implementation by FY18	Continuous - Ongoing	Y	No	Y	A project transitioning inspections to an asset management system was completed during this fiscal year.
ES-7.1	Update minimum BMPs for existing residential, commercial, and industrial development and enforce them.	Refer to JRMP Chapter 7; minimum BMPs updated as part of JRMP update. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	As needed	Y	No	Y	Completed as part of program update during FY14-15.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
ES-7.2	Design, implement, and enforce property- based inspections in high priority focus areas	This inspection program involved annual drive-by inspections of focus drainage areas where major MS4 outfalls have persistent flows. At the time of WQIP development, only one MS4 outfall in this WMA has persistent flow, HDG_102. That drainage area includes mostly residential properties. Follow up and enforcement will be pursued as necessary to ensure compliance. Inspections will cover all visible outdoor areas and compliance with Stormwater Ordinance requirements. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous - Ongoing	Y	No	Y	–
ES-7.3	Review policies and procedures to ensure discharges from swimming pools meet permit requirements.	Completed. Refer to BMP Manual and Escondido Municipal Ordinance Chapter 22.	FY16	Continuous - Ongoing	Y	No	Y	Completed as part of program update during FY14-15.
ES-7.4	Implement program to require retrofit of trash enclosures for certain permit applications.	All applicants seeking approval for a tenant improvement, improvements to buildings, or redevelopment, are assessed for their potential to generate pollutants through their trash enclosure. If the applicant has a pollutant-generating activity on-site, a retrofit of their trash enclosure to include a roof is required. For example, a restaurant would trigger this requirement. Costs are considered when determining if the applicant is required to implement the retrofit. The retrofit is generally not required if the improvement is less than the cost of the retrofit. Determination is made on a case-by-case basis. This measure is expected to reduce trash and associated pollutants, including bacteria, from leaving the enclosure site. See JRMP Chapter 7.	FY16	Continuous - Ongoing	Y	No	Y	–

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
ES-7.5	Water-using mobile business inspection and permitting.	Implement permitting program to ensure that water-using mobile businesses are using appropriate BMPs to prevent discharges to the storm drain drains. A permit is required for water-using mobile businesses including power-washers, mobile detailing, and organizations holding charity car washes. As part of the permit process, the applicant must schedule an inspection. The inspection requires applicants to set up their equipment and demonstrate how they will do the work. A permit is not issued until they have demonstrated that they have appropriate BMPs to manage the discharge.	FY16	Continuous - Ongoing	Y	No	Y	–
ES-7.6	Update and Implement Water Efficient Landscape Ordinance.	Refer to JRMP. Updates to landscape regulations encourage a reduction in the use of water for irrigation and reduce water waste in the form of runoff.	FY16	Continuous - Ongoing	Y	No	Y	–
ES-8	Promote and encourage implementation of designated BMPs at residential areas through residential inspection program.	Refer to JRMP Chapter 8 (Table 8-1). Also see Attachment 1 for details on residential BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous - Ongoing	Y	No	Y	–
ES-8.1	Promote and collaborate with water agencies and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water.	The City of Escondido collaborates with MWD and promotes their SoCal WaterSmart rebates. Rebates include; weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and turf removal. The City also collaborates with the San Diego County Water Authority (SDCWA) to promote their WaterSmart Checkups and turf replacement incentives. City of Escondido provides funding for the WaterSmart Checkups.	FY16	Continuous - Ongoing	Y	No	Y	–
ES-9	Promote and encourage implementation of designated BMPs, including water conservation BMPs, in commercial, agricultural, residential, and industrial areas.	Collaborate with MWD and promote their SoCal Water$mart rebates and products such as weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and/or turf removal.	FY16	Continuous - Ongoing	Y	No	Y	–

Table D-2 (continued)

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
MS4 Infrastructure								
ES-10	Implementation of operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, detention basins, etc.).	Refer to JRMP; Catch basins inspected annually and cleaned as needed based on observations. City is developing system for inspection and cleaning prioritization based on previous cleaning data.	FY16	Continuous - Ongoing	Y	No	Y	Review and reprioritization is underway.
ES-10.1	Implement open-channel cleaning and maintenance to reduce pollutant loads.	Implement annual channel cleaning based on priority locations and highest maintenance needs. Sites to be addressed each year will be established annually and may be prioritized based on potential for pollution reduction; implementation schedule subject to change pending prioritization. Some sites must have a biological monitor if maintained within the bird nesting season, which may limit certain work to September – January each year. BMPs are implemented as needed to reduce potential for discharge and in accordance with regulatory permits.	FY16	Continuous - Ongoing	Y	No	Y	Resource Agency permits to implement this work (401, 404, 1600) obtained August 2015. Implemented in accordance with requirements.
ES-11	Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers.	Sewer infrastructure is cleaned annually. Televising of sewer infrastructure is completed to identify and prioritize areas in need of upgrade or slip lining. As areas for maintenance are identified, corrective action is taken. Refer to JRMP Chapter 6.	FY16	Continuous - Ongoing	Y	No	Y	-
Roads, Street, and Parking Lots								
ES-12	Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways	Refer to JRMP Chapter 6.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-12.1	Perform street sweeping.	Refer to JRMP Chapter 6; High priority areas swept twice per month. Medium priority areas swept once per month. Low priority areas swept as needed.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-12.2	Perform sweeping of medians on high-volume arterial roadways.	Refer to JRMP Chapter 6; Medians swept according to priority area frequency. Medians in high priority areas swept twice per month; medium priority areas swept once per month; and in low priority areas swept as needed.	FY16	Continuous - Ongoing	Y	No	Y	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Pesticide, Herbicides, and Fertilizer BMP Program								
ES-13	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	Refer to JRMP. City does not have authority over application of pesticides, but will implement BMPs. Water conservation activities encourage residential and commercial area BMPs. Industrial and commercial inspections cover requirement. Parks and Recreation implement the municipal program.	FY16	Continuous - Ongoing	Y	No	Y	-
Retrofit and Rehabilitation in Areas of Existing Development								
ES-14	Develop and implement a strategy to identify candidate areas of existing development appropriate for retrofitting projects and facilitate the implementation of such projects.	Refer to JRMP Chapter 9. City currently conducting study to identify potential projects.	FY16	Continuous - Ongoing	Y	No	Y	Completed a hydraulic study in February 2016 that identifies potential locations for retrofit.
ES-15	Develop and implement a strategy to identify candidate areas of existing development for stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	Refer to JRMP Chapter 9. City currently conducting study to identify potential projects.	FY16	Continuous - Ongoing	Y	No	Y	A 4.44-acre habitat restoration project was completed in Kit Carson Park during FY16.
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program								
ES-16	Administer, implement, and enforce Illicit Discharge, Detection, and Elimination (IDDE) Program.	Refer to JRMP Chapter 3.Requirements include: maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-16.1	Implement "We Care" Program for employee reporting of potential illicit discharges.	Continue supporting the city-wide "We Care" program which encourages employees to report problems that they observe throughout the City. Reports of irrigation issues are currently included. In FY16, updates to specifically include and encourage reporting of other storm water related issues will be complete.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-16.2	Support "Report It" smartphone application to encourage residents to report potential illicit discharges or other storm water violations.	Continue supporting the city-wide "Report It" smart phone application which encourages the public to report problems that they observe throughout the City, including potential illicit discharges and other storm water related violations.	FY16	Continuous - Ongoing	Y	No	Y	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.7 Public Education and Participation (B.3.b.(1)(a)(iii))								
ES-17	Implement pet waste education program.	Implement education and prevention program. Pet waste bag dispensers and supplies provided for neighborhood groups, dog parks, and other municipal parks.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-18	Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences.	Refer to JRMP Chapter 10.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-18.1	Expand outreach, training, and incentive programs to homeowners' associations (HOAs).	Investigate expansion of municipal outreach programs and collaboration with MWD and SDCWA to expand incentive programs targeting landscape practices and turf replacement programs.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-18.2	Conduct trash cleanups through community-based organizations involving target audiences.	Continue implementation of "We Clean Escondido" program targeting litter removal. "We Clean Escondido" programs encourage groups to adopt their neighborhood and conduct weekly litter removal events. Continue collaboration with "I Love a Clean San Diego" to host two Creek to Bay Cleanups at Dixon Lake, or other locations in Escondido. Litter removal reduces one source of bacteria to the MS4.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-18.3	Review City storm water website and identify and implement required updates to reflect WQIP and JRMP revisions.	Review City storm water website and identify and implement required updates to reflect WQIP and JRMP revisions.	FY16	Continuous - Ongoing	Y	No	Y	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
ES-18.4	Continue partnership with MWD to provide rebates for water efficient products to large businesses and agricultural customers.	Continue partnership with MWD to provide rebates for water efficient products to large businesses and agricultural customers. Continue Water Savings Incentive Program and Conservation Programs through support for rebates such as rotating irrigation nozzles, residential smart controllers, rain barrels, soil moisture sensor systems and incentives such as turf replacement program, SoCal water smart turf removal program, WaterSmart checkups, California friendly landscape training classes, WaterSmart landscape makeover workshops, and garden friendly plant fairs.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-18.5	Continue school and recreation-based education and outreach	Partner with organizations such as the Escondido History Center, Humane Society, the Chamber of Commerce, and the Downtown Business Association to host education events targeting adults and children through the year. Continue with robust school outreach and summer camp education program. Program targets 6-12 yr olds.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-18.6	Collaborate with regional education and outreach efforts.	Participate in Regional Think Blue campaign and collaborate with other regional efforts to provide consistent message or efficiency in training for targeted audiences.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-19	Municipal staff training	Conduct mandatory training for all new City employees. Engage new employees with storm water jeopardy game reinforcing training on watersheds, the MS4, and MS4 permit requirements.	FY16	Continuous - Ongoing	Y	No	Y	-
ES-20	Provide technical education and outreach to the development community on the design and implementation requirements of the MS4 Permit and Water Quality Improvement Plan requirements.	Provide outreach materials to the development community on the City's website, written material and in person education at the City's Development Services counter.	FY16	Continuous - Ongoing	Y	No	Y	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.6 Enforcement Response Plan								
ES-21	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	Refer to JRMP Chapter 2, Escondido Municipal Code Chapter 22, and Enforcement Response Plan.	FY16	Continuous - Ongoing	Y	No	Y	-
Non-JRMP Strategies (Optional Strategies, B.3.b.(1)(b))								
Nonstructural Strategies								
ES-22	Administer an alternative compliance program to on-site structural BMP implementation (includes identifying Watershed Management Area Analysis [WMAA] candidate projects). Refer to Section 4.2.5. and Appendix N for further details.	Refer to JRMP Chapter 4. The City of Escondido will develop a draft water quality credit system option consistent with Provision E.3(d) to place water quality improvement projects throughout Escondido, including Focus Areas. The resources required to complete this optional strategy include: staff time allocation, administrative plan and procedures for the program consistent with regional standards, and approval by the City Council and the Regional Water Quality Control Board. Furthermore, candidate projects must be identified, permitted, and funded. The cost for developing and implementing this program during the permit cycle is unknown, but funds have been secured for FY2016 for program development. The trigger for implementation of Alternative Compliance Program is: when resources have been secured and leadership consensus and community support has been achieved. Expected length of time for program development is two to five years.	Triggered	Continuous - Ongoing	Not applicable	Not applicable	Not applicable	City staff have participated in the development of water quality equivalency guidelines and will continue participating in other regional efforts. The City completed a hydraulic study in February 2016 to evaluate potential alternative compliance projects.
ES-23	Participated in Reference Watershed Study.	San Diego Regional Reference Stream Study (conducted by the Southern California Coastal Water Research Project). The study developed numeric targets that account for “natural sources” to establish the concentrations or loads from streams in a minimally disturbed or “reference” condition. Refer to Section 5.1 for further details. Occurred region-wide.	FY16	One time	Y	No	N	Study completed FY15-16.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
ES-23.1	Participate in San Dieguito River WMA Bacteria Source Identification and Prioritization Process.	Assess sources of bacteria in the watersheds using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process. Focus is on the beach/lagoon area of the San Dieguito River WMA, with inputs from the upper watershed also considered where relevant and necessary to identify sources of bacteria to the beach/lagoon. Refer to Section 5.1 for further details. Funding and resources have been secured for FY2016. The study is not expected to extend beyond this year; if needed, future funding would need to be approved by City Council during the annual budget meeting.	FY16	One time	Y	No	Y	Study completed FY15-16.
ES-25	Assessment of agricultural operations within City jurisdiction and active engagement with growers as needed to attain water quality objectives.	If agricultural properties within the City of Escondido are determined to be a potential source of bacteria, and interim load reduction goals are not met, this strategy will be triggered and the City will take action to more actively engage with agricultural operations within our jurisdiction. This may include: Prepare and maintain a figure of the locations of agricultural operations in Escondido; identifying agricultural land close to receiving waters and/or MS4 system; conducting a site reconnaissance to assess if discharges are likely to occur; developing a series of follow-up actions specific to those risks. Sites of concern will be referred to the Irrigated Lands Group at the RWQCB. The resources required for this strategy include: staff time and budget to administer the program, administrative procedures developed and enacted, and (potentially) outreach materials developed directed at this specific audience. The estimated cost of implementation of this strategy is unknown at this time, and it would be an ongoing strategy with approximately 6-12 months to develop the program.	Triggered	Continuous - Ongoing	Not applicable	Not applicable	Not applicable	City staff has participated in the development of waste discharge requirements for agricultural operations. Any complaints relating to agricultural facilities have been addressed through our IDDE program.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
ES-24	If invasive plant removal is necessary in key locations, collaborate with and/or support volunteer groups as needed to encourage invasive plant removal and habitat restoration.	This strategy will be triggered if invasive species removal is determined to be a high priority in sections of the WMA within City of Escondido jurisdiction, and all necessary resources are secured to support such projects. The City will participate in opportunities for collaboration with qualified volunteer groups for the removal of invasives at key locations, as needed and as possible with available resources. The resources required for this strategy include: identifying potential volunteer group partners to manage the work, identifying key locations within the WMA in need of invasive species removal, securing necessary permits from resource agencies and/or permission from landowners to perform the work, and staff or equipment resources as needed to complete each volunteer event. The estimated cost of this strategy is unknown at this time, and dependent on the size of the area, the number of volunteers, and the leadership capacity of volunteer organizations. This would be an ongoing strategy on an as-needed basis, with approximately 3-6 months needed to plan a single invasive plant removal event; more time would be needed if resource agency permits are required.	Triggered	Continuous - As needed	Not applicable	Not applicable	Not applicable	While this optional strategy was not triggered, the City implemented a mitigation plan for 4.44 acres of wetland habitat in Kit Carson Park as part of the channel maintenance program. The City also monitors and maintains another 2.60 acre mitigation project within Kit Carson Park (for RGP87). Both projects incorporate the removal of invasive species.
ES-25	Participate in a Felicita Creek Subwatershed Group	Should citizens choose to pursue organizing a forum dedicated to addressing issues specific to Felicita Creek, this strategy will be triggered and the City will participate in said group, as it relates to addressing MS4 sources, habitat restoration. The City will consider providing staff or equipment resources to address issues which can be addressed through group collaboration (e.g. invasive species removal). The resources required to implement this strategy include: staff time allocation for participation in the group. Resources such as equipment or resource agency permits may need to be secured for activities outside the scope of group participation, and the City's commitment to providing such resources will be considered on a case-by case basis and must be approved by City Council in the annual budget hearing. This strategy would be ongoing and would require approximately 3-9 months to contact representative stakeholders and plan the initial meeting(s).	Triggered	As needed	Not applicable	Not applicable	Not applicable	No group has convened.

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Structural Strategies								
Multiuse Treatment Areas								
Infiltration and Detention Basins								
ES-26	Eagle Scout (formerly Sand) Lake Project	Eagle Scout Lake (formerly Sand Lake) is an existing multiuse treatment area and sediment detention basin in the City of Escondido. A major restoration project in early 2014 improved water flow, water quality issues (providing capacity for sediment settlement) and health and safety issues (vector control). The project drains the water from Kit Carson Creek and an adjacent ephemeral stream an area of approximately 4 acres. It is anticipated to be regularly maintained as needed, current estimates are once every five years, but will be determined on visual evaluation. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	As needed, likely once every five years	Y	No	Y	Restoration was completed in 2014. Ongoing observational monitoring and minor maintenance conducted during FY15-16.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Stream, Channel and Habitat Rehabilitation Projects (B.3.b.(1)(b)(iii))								
ES-27	If interim load reduction goals are not met and additional stream, channel, and habitat rehabilitation projects are required, implement as needed.	This strategy may be triggered if interim load reduction goals are not met, funding and staff resources are identified and secured, partners have been identified and agreed upon, permits required by regulatory agencies are secured, and recommendations from the community are identified and support has been achieved. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs; up to$500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project) 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function will be by approval by City Council as part of the City's annual budget, or through an alternative funding source	Triggered	Continuous - Ongoing	Not applicable	Not applicable	Not applicable	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Green Infrastructure								
ES-28	If interim load reduction goals are not met and additional green infrastructure is required, approximately 26.15 acres of available space have been identified as potential opportunities for green infrastructure implementation on public parcels.	If monitoring data suggests that it is unlikely that goals will be met using the strategies identified for implementation through FY20, construction, operation and maintenance of potential green infrastructure projects on public parcels will be investigated by initiating planning and assessing feasibility for 25% of the total parcel acreage identified. If feasibility study supports that this is beneficial then initiation of securing funding this strategy will be triggered. The resources required to complete this strategy include: securing of grant funding, City Council approval of seeking grant funding and using funds for this purpose, staff resources secured, and contracts secured to complete designs and permitting. The estimated cost of this strategy is unknown at this time, and depends largely on the size and scope of projects and grant funding available. A source of funding for maintenance will also need to be secured.	Triggered	Continuous - Ongoing	Not applicable	Not applicable	Not applicable	-
ES-29	Evaluate additional green infrastructure opportunities, including green streets, as needed to achieve final goals.	This strategy will be triggered if interim load reduction goals are not met and additional green infrastructure is required. The strategy includes application of green street design principles to planned Capital Improvement Projects, and the construction, operation and maintenance of such streets, if and where feasible and as funding allows. Resources necessary to implement this strategy include: staff time allocation, approval of such projects as part of the Capital Improvement Project list by City Council (annual), securing adequate funding through City Council approval of annual budget and/or securing grants with Council approval, selecting and contracting with firms for both the design and the construction of such projects. The estimated cost of this strategy is unknown and depends on the size of each individual project, the timeframe in which it will be accomplished, and any grant funding secured to support said projects. A funding source for maintenance will also need to be secured.	Triggered	Continuous - Ongoing	Not applicable	Not applicable	Not applicable	Green streets are being incorporated as requirements for offsite developer improvements. This year no developments required green street improvements in this watershed.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA Strategies (Optional Strategies, B.3.b.(2))								
WMA-1	Collaborative Approach to Irrigation Reduction	Collaborate with jurisdictional water agencies to encourage implementation of water conservation efforts. Water conservation that attempts to reduce irrigation and minimize storm water runoff can also improve water quality of receiving waterbodies. MWD's SoCal Water$mart Program supports conservation efforts by offering incentives in the form of rebates for rain barrels, rotating sprinkler nozzles, weather-based irrigation controllers, soil moisture sensor systems, and turf replacement. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous - Ongoing	Y	No	Y	-
WMA-2	Offsite Alternative Compliance Option (WMAA)	The WMAA provides alternative compliance methods in lieu of meeting structural BMP design standards and/or hydromodification management criteria on the project site. The San Diego County Copermittees have collectively funded and provided guidance for development of a regional WMAA. Copermittees compiled a list of candidate projects that consider the numeric goals of the WMAs as well as projects previously identified in JRMPs and other regulatory documents. Next steps include submittal of the water quality equivalency standards final document, anticipated in September 2015. Following a public review and Executive Officer approval, anticipated by November 2015, jurisdictions can formally implement an optional Alternative Compliance Program by December 2015 (time coincident with implementation of standards set forth in the regional BMP Design Manual and local Storm Water Standards Manuals).Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.		Continuous - Ongoing	-	-	-	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-3	Collaboration with the Regional Board	Collaborate with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Ag Waiver, 2) enforcement of other non-MS4 dischargers, and 3) Bacteria TMDL updates. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Resources to implement this strategy include staff time and are currently secured for FY16. Funding for future fiscal years is contingent on annual budget approval by Council.	Prior to FY16	Continuous - Ongoing	Y	No	Y	-
WMA-4	Participation in Watershed Council	If a Watershed Council is re-established, the City of Escondido will participate. Watershed Councils are typically locally organized, voluntary, non-governmental organizations, and are intended to broadly represent various stakeholders in the WMA. Goals of Watershed Councils may vary, but they generally promote protecting the watershed and sustaining natural resources. This coordination could assist in selecting WMA projects, identifying potential funding opportunities, and promoting communication among community groups and regulated agencies. Resources necessary to implement this strategy include participating jurisdictional staff to coordinate with the regional effort and the development of an agreement (e.g. MOU, JPA) among participating entities, which may take up to one year to coordinate. Projected funding needs may be met through grant funding, support from community groups or other institutions, or jurisdictional General Funds. Participation is dependent on funding availability and continued benefit to the watershed.	Triggered	Continuous - Ongoing	Not applicable	Not applicable	Not applicable	No group has convened.

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
WMA-5	Participation as a stakeholder in the San Diego Integrated Regional Water Management Program as appropriate	Escondido participates as a stakeholder in the San Diego IRWM program as appropriate and necessary, and provides matching funding for a project in the San Dieguito WMA. The City of San Diego, County of San Diego, and San Diego County Water Authority form the Regional Water Management Group (RWMG) and administer and implement the San Diego IRWM Program. The Regional Advisory Committee (RAC) include rotating members from various functional areas related to water management. In San Dieguito River WMA, two integrated projects, funded through Proposition 50 and 84, target water quality in Lake Hodges: 1) San Dieguito Watershed Management Plan Implementation – Lake Hodges Natural Treatment System Conceptual Design and 2) Lake Hodges Water Quality and Quagga Mitigation Measures. Along with grant funding, the City of San Diego Public Utilities Department, City of Escondido, San Dieguito River Valley Conservancy, Santa Fe Irrigation District, and the San Diego County Water Authority are providing local match or in-kind funding. All General Funds are secured on an annual basis and are contingent upon annual budget approval by each participating Responsible Agency.	Prior to FY16	Continuous - Ongoing	Y	No	Y	The City provided documentation of expenses for City projects relating to project grant applications for Lake Hodges to be counted as a project match.
Other Identified Strategies to be considered in future WQIP updates. Insufficient information available at this point to commit to these strategies.								
ES-30	Collaborate with the City of San Diego Lake Hodges source investigations effort	The City of San Diego's Public Utilities Department will conduct studies that can characterize the nutrient budget or "loading rate" for Lake Hodges. Escondido will participate in collaborative watershed efforts as they relate to the MS4.	TBD	TBD	-	-	-	-
ES-31	Proactively repair and replace corrugated metal pipe (CMP) MS4 components to provide source control from MS4 infrastructure	This strategy is unfunded and there is no firm timeframe for development. The timeframe for this strategy will be updated in future WQIP updates, as funding becomes available. Need funding and council approval to use funding for that purpose.	TBD	TBD	-	-	-	-

Table D-2 (continued)
City of Escondido Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
ES-32	If a regional social services effort is established, support workgroup to provide sanitation and trash management for persons experiencing homelessness and determine if the program is suitable and appropriate for jurisdictional needs to meet goals	If a regional effort is established, participate in workgroup and determine if the program is suitable and appropriate for jurisdictional needs to meet goals.	TBD	TBD	-	-	-	-

D.2.4 Modifications to the BMP Design Manual

No modifications to the BMP Design Manual have been made since the WQIP was approved in fall 2015. The current Escondido BMP Design Manual is posted on the Escondido's website, and the link to this page is listed on Project Clean Water.

D.2.5 Modifications to the Jurisdictional Runoff Management Plan

Escondido's JRMP is being updated and re-submitted concurrent with this WQIP Annual Report. The changes to the JRMP are mostly related to changes in the final approved WQIP for the Carlsbad Watershed Management Area. In the process of reviewing the JRMP for resubmittal, several clarifications, corrections, and updates were made, but no notable changes were made to strategies presented in this WQIP. A summary table of the changes is included below. The current Escondido JRMP is posted on Escondido's website, and the link to this page is listed on Project Clean Water.

Section	Description of Change
Executive Summary; Chapters 1, 3, 5, 6, 7, 8, 9, and 10	Revised references to the applicable highest priority water quality conditions (HPWQCs) for the City of Escondido based on the changes made to the HPWQCs and associated goals in the final, accepted Carlsbad Watershed Management Area Water Quality Improvement Plan (November 2016). When the City's Jurisdictional Runoff Management Program (JRMP) document was finalized in June 2015, the applicable HPWQC listed in the Carlsbad WMA WQIP was indicator bacteria; however, the final HPWQCs that are applicable to the City of Escondido are riparian habitat degradation for the Escondido Creek hydrologic subarea (HSA) and nutrients for the San Marcos Creek HSA. San Dieguito River WQIP HPWQC of indicator bacteria remains the same.
Chapters 3, 7, 8, and 9	Revised references to City's goals, strategies, and schedules related to the HPWQCs listed in the final, accepted Carlsbad WMA WQIP. Removed references to dry weather flow reduction goals in Carlsbad WMA Focus Areas. Edited Chapter 9 (Retrofit and Stream Rehabilitation Programs) and other sections as necessary to highlight the Spruce Street Channel Improvement Project as the City's goal in the Carlsbad WMA WQIP. Added text to Chapter 9 regarding WQIP strategies in Upper San Marcos Creek HSA. Removed reference to rehabilitation at Escondido Creek at Harmony Grove due to focus on Spruce Street Channel Improvement Project in Escondido Creek HSA and other projects.

Section	Description of Change
Chapter 3, Appendix C-3a	Added text to provide clarification on how the City determines if a non-storm water discharge is considered a threat to human health or the environment. Added information regarding spill response through existing and updated City programs. Updated Major MS4 Outfall Inventory and associated text.
Chapter 3	Updated the criteria used to prioritize non-storm water discharges for investigation to better represent the City's IDDE program and the criteria provided by the MS4 Permit.
Chapter 3	Removed Table 3-5 and references, and replaced with reference to analyte list and monitoring plans in WQIPs.
Chapter 6, Appendix C-6A	Updated the municipal inventory, including the removal of nine facilities and the addition of eight facilities. The removed facilities have been sold or are not operated by the City and are addressed by other inspection programs (i.e., through industrial and commercial facility inspections or through residential area inspections).
Chapter 7	Clarified language related to the food service establishment facilities inspections; only high priority Food Service Establishments are inspected twice annually.
Chapter 8	Updated the residential management area inventory, map, and text to correct alignment with water district.
Chapters 4, 9	Updated language describing the City's Hydraulic Analysis, as it has now been completed, and grant funding sought in Storm Water Resource Plans. Described implementation progress and process for updating retrofit and rehabilitation programs.
Appendix C-7a	Appendix C-7a was removed since it must be updated annually and is not required to be included in the City's JRMP document. Industrial facilities are included in the City's Industrial/Commercial inventory and available upon request.
All chapters	Administrative updates were made to the document including updating page numbers, terminology, and organizational updates since JRMP submittal in 2015.

D.3 City of Poway

D.3.1 Annual Report Certifications

The City of Poway's required certifications regarding the preparation of the Water Quality Improvement Plan Annual Report, as well as the legal authorities required by the MS4 Permit are included on the following pages.

D.3.2 Annual Report Form

Poway's completed JRMP Annual Report form and fiscal analysis for FY16 are included on the following pages.

CITY OF POWAY

STATEMENT OF CERTIFICATION

San Dieguito River Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report and JRMP Certificate of Legal Authority

I certify, under penalty of law, that this Water Quality Improvement Plan Annual Report submittal and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for known violations.

I also certify that the City of Poway has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 9th day of January, 2017, at the City of Poway.

Date 1/9/17

Robert J. Manis
Director
Development Services Department

City Hall Located at 13325 Civic Center Drive

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2015/2016

I. COPERMITTEE INFORMATION

Copermittee Name: City of Poway (San Dieguito Watershed)

Copermittee Primary Contact Name: Steven Strapac

Copermittee Primary Contact Information:
Address: 13325 Civic Center Drive
City: Poway, CA | County: San Diego | State: CA | Zip: 92064
Telephone: (858) 668-4653 | Fax: | Email: sstrapac@poway.org

II. LEGAL AUTHORITY

Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES	☒
	NO	☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES	☒
	NO	☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES	☐
	NO	☒
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES	☐
	NO	☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES	☒
	NO	☐

Number of non-storm water discharges reported by the public	2
Number of non-storm water discharges detected by Copermittee staff or contractors	9
Number of non-storm water discharges investigated by the Copermittee	11
Number of sources of non-storm water discharges identified	11
Number of non-storm water discharges eliminated	3
Number of sources of illicit discharges or connections identified	11
Number of illicit discharges or connections eliminated	3
Number of enforcement actions issued	11
Number of escalated enforcement actions issued	0

V. DEVELOPMENT PLANNING PROGRAM

Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES	☒
	NO	☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES	☐
	NO	☒
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES	☐
	NO	☐

Number of proposed development projects in review	10
Number of Priority Development Projects in review	3
Number of Priority Development Projects approved	0
Number of approved Priority Development Projects exempt from any BMP requirements	0
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	0

Number of completed Priority Development Projects in inventory	16
Number of high priority Priority Development Project structural BMP inspections	0
Number of Priority Development Project structural BMP violations	0
Number of enforcement actions issued	0
Number of escalated enforcement actions issued	0

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001? YES ☒ NO ☐

Number of construction sites in inventory	30
Number of active construction sites in inventory	30
Number of inactive construction sites in inventory	0
Number of construction sites closed/completed during reporting period	10
Number of construction site inspections	49
Number of construction site violations	5
Number of enforcement actions issued	5
Number of escalated enforcement actions issued	0

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001? YES ☒ NO ☐

	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	42	7	2	23
Number of existing development inspections	15	4	0	23
Number of follow-up inspections	0	2	0	0
Number of violations	0	2	0	1
Number of enforcement actions issued	0	2	0	1
Number of escalated enforcement actions issued	0	0	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001? YES ☒ NO ☐

Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001? YES ☒ NO ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001? YES ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

FISCAL ANALYSIS

Fiscal information for 2015/2016 is reported in the tables on the following page. The tables are based largely on the standard templates used by the Copermittees in previous fiscal years, but with a distinction between labor costs and other expenses (materials, contracts, etc.) as requested in the Municipal Permit (San Diego Regional Water Quality Control Board, Order No. R9-2013-0001 as amended by Order No. R9-2015-001 and Order No. R9-2015-0100).

Regional programs include Copermittee shared costs for education and other regional expenses, as well as City staff time to participate in regional meetings. Watershed costs include meeting participation, monitoring, and the City's portion of watershed cost shares.

The City anticipates using the same funding sources as shown in Table 2 for 2015/2016 program funding needs. Developer fees are contingent on the number of development projects in the City, and the fees are only used for reviews and similar services provided for those development projects.

Table 1: 2015/2016 Expenditure Summary

Jurisdictional Components	Labor	Expenses	Total
Administration and Permit Fee	$192,655	$24,220	$216,875
Development Planning	$12,120	$0	$12,120
Construction	$22,372	$0	$22,372
Municipal	$703,942	$355,244	$1,059,186
Industrial and Commercial	$27,325	$31,760	$59,085
Residential	$14,375	$176,075	$190,450
IDDE	$0	$48,500	$48,500
Education	$0	$1,000	$1,000
Public Participation	$0	$0	$0
Jurisdictional Total	**$972,789**	**$636,799**	**$1,609,588**
Watershed Programs			
Los Peñasquitos	$14,256	$145,360	$159,616
San Dieguito	$14,256	$27,301	$41,557
Watershed Programs Total	**$28,512**	**$172,660**	**$201,172**
Regional Programs	**$12,217**	**$20,500**	**$32,717**
Total Costs	**$1,013,517**	**$829,960**	**$1,843,477**

Table 2: 2015/2016 Funding Source Summary

Funding by Source	Amount
General Fund	$1,674,987
Storm Water Fee	$0
Developer Deposits and Fees	$21,000
Registration and Inspection Fees	$4,752
Grant Funds	$13,903
Other	$175,075
Total Funding	**$1,889,717**

D.3.3 City of Poway Strategies

City of Poway's strategies are detailed in Table D-3.

Table D-3
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
JRMP (E.2 – E.7) Strategies (E.3.b.(1)(a))								
E.3 Development Planning								
All Development Projects								
PW-1	For all development projects, administer a program to ensure implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area, where applicable and feasible.	Refer to JRMP. All high priority projects are inspected annually prior to the rainy season. 20% of all projects are inspected annually.	FY16	Continuous-Ongoing	Y	None	Y	None
Priority Development Projects (PDPs)								
PW-2	For PDPs, administer a program requiring implementation of on-site structural BMPs to control pollutants and manage hydromodification. Includes confirmation of design, construction, and maintenance of PDP structural BMPs.	Refer to JRMP. For structural BMPs, all high priority projects will be inspected prior to the start of the rainy season. Any projects that do not provide sufficient documentation to verify that appropriate maintenance work has been performed through the annual maintenance verification program will also be inspected before the end of the fiscal year.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-3	Update BMP Design Manual procedures to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	Refer to JRMP.	FY16	Continuous- As needed	Y	None	Y	None
PW-3.1	Amend BMP Design Manual for trash areas. Require full four-sided enclosure, siting away from storm drains and cover.	Implemented through the Minor Development Review process and the plan check process.	FY16	Continuous- As needed	Y	None	Y	None
PW-4	Administer an alternative compliance program to on-site structural BMP implementation (includes identifying Watershed Management Area Analysis [WMAA] candidate projects). Refer to Section 4.2.5. And Appendix N for further details.	Refer to JRMP.	FY16	Continuous- As needed	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.4 Construction Management								
PW-5	Administer a program to oversee implementation of BMPs during the construction phase of land development. Includes inspections at an appropriate frequency and enforcement of requirements.	Refer to JRMP; Perform daily inspections during construction. During the wet season, high priority construction sites are inspected every two weeks, medium priority are inspected monthly, and low priority sites are inspected as needed. During the dry season, all construction sites are inspected as needed.	FY16	Continuous-Ongoing	Y	None	Y	None
E.5 Existing Development								
Commercial, Industrial, Municipal, and Residential Facilities and Areas								
PW-6	Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and PGAs, as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods.	Refer to JRMP; Commercial/industrial/municipal are inspected annually, with municipal receiving more frequent inspections by staff.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-6.1	Review policies and procedures to ensure discharges from swimming pools meet permit requirements.	Annually review policies and procedures.	Prior to FY16	Continuous- As needed (Annually)	Y	None	Y	None
PW-6.2	Track stationary and mobile businesses through communication with Business Licensing Division.	Maintain through the City's Commercial/Industrial program.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-7	Promote and encourage implementation of designated BMPs in commercial areas.	Collaborate with MWD and promote their SoCal Water$mart rebates and products such as weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and turf removal.	FY16	Continuous-Ongoing	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
PW-8	Implement program to investigate illegal grading on private property.	Program to investigate reports of illegal grading. Maintain records of reported illegal gradings and immediately investigate. If activity violates grading or stormwater regulation, issued a "Stop Work" notice and must obtain grading permit and correct stormwater violations. Reports are tracked in "Trackit" software as a code violation and bi-monthly meetings to discuss the status of reports. Grading cases are subject to a strict timeline of action, and enforcement is upped until either compliance, or a Notice of Violation is filed against the property. If it is a stormwater issue, the City's on-call stormwater contractor corrects the issue and City liens the property for payment.	FY16	Continuous-Ongoing	Y	None	Y	None
MS4 Infrastructure								
PW-9	Implementation of operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, detention basins, etc.).	Refer to JRMP.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-9.1	Perform catch basin cleaning.	Inspect and clean catch basins annually.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-9.2	Clean open-channels to reduce pollutant loads and invasive plants and animals.	Inspect and clean open channels annually.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-10	Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers and identify sewer leaks and areas for sewer pipe replacement.	Program implemented through sewer maintenance and inspection program.	FY16	Continuous-Ongoing	Y	None	Y	None
Roads, Street, and Parking Lots								
PW-11	Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways.	Refer to JRMP; the City of Poway is divided into 8 zones for road operation and maintenance activities; rotational cycle: one zone inspected each year.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-11.1	Implement street sweeping.	Refer to JRMP; all areas swept twice per month.	FY16	Continuous-Ongoing	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
PW-11.2	Continue maintenance on access roads and trails by proactively monitoring for erosion and completing minor repair and slope stabilization.	Actively identify and repair eroding slopes that may be contributing to sediment loading. Prepare an inventory and assessment of eroding areas and their risk to surface waters. Follow assessment with a schedule for ongoing inspection and stabilization (potentially based on a number or percentage of sites annually). Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Y	None	Y	None
Pesticide, Herbicides, and Fertilizer BMP Program								
PW-12	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	Refer to JRMP.	FY16	Continuous-Ongoing	Y	None	Y	None
Retrofit and Rehabilitation in Areas of Existing Development								
PW-13	Develop and implement a strategy to identify candidate areas of existing development appropriate for retrofitting projects and facilitate the implementation of such projects.	The Offsite Alternative Compliance Program will include methods for identifying and assessing potential retrofit projects in existing development areas. Retrofit project selection will be based upon a variety of factors including proximity to high priority water quality conditions, potential pollutant load removal effectiveness, and feasibility of implementation. The development of such program is contingent on the completion of a current water quality equivalency study and development of a crediting system across multiple Responsible Agencies. Specific retrofit projects are included in the Non-JRMP, Structural Strategies categories.	FY18	Continuous-Ongoing	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
PW-14	Develop and implement a strategy to identify candidate areas of existing development for stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	The Offsite Alternative Compliance Program will include methods for identifying and assessing potential stream, channel, or habitat rehabilitation projects in existing development areas. Rehabilitation project selection will be based upon a variety of factors including existing stream or habitat degradation, potential future cumulative stream or habitat impacts, and feasibility of implementation. The development of such program is contingent on the completion of a current water quality equivalency study and development of a crediting system across multiple Responsible Agencies.	FY18	Continuous-Ongoing	Y	None	Y	None
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program								
PW-15	Implement Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include: maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	Refer to JRMP. The City must visually inspect at least 80% of their outfalls two times per year during dry weather conditions.	FY16	Continuous-Ongoing	Y	None	Y	None
E.7 Public Education and Participation (B.3.b.(1)(a)(iii))								
PW-16	Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences.	Refer to JRMP.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-16.1	Target school-based education and outreach.	Through "I Love a Clean San Diego," give school presentations to fourth-graders eight times per year.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-16.2	Conduct education through community-based organizations.	Through "I Love a Clean San Diego," staff street fair booths twice per year. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
PW-16.3	Review City storm water website and identify and implement required updates to reflect WQIP and JRMP revisions.	Review City storm water website, identify and implement required updates to reflect WQIP and JRMP revisions.	Prior to FY16	Continuous- As needed	Y	None	Y	None
PW-16.4	Collaborate with regional education and outreach efforts.	Participate in Regional Think Blue campaign and collaborate with other regional efforts to provide consistent message or efficiency in training for targeted audiences.	FY16	Continuous- Ongoing	Y	None	Y	None
E.6 Enforcement Response Plan								
PW-17	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	Refer to JRMP.	FY16	Continuous- Ongoing	Y	None	Y	None
Non-JRMP Strategies (Optional Strategies, B.3.b.(1)(b))								
Nonstructural Strategies								
PW-18	Require implementation of low impact development BMPs with all new construction.	The City requires LID at all sites, with an emphasis on an effective combination of both erosion control BMPs and sediment control BMPs to reduce discharges of sediment. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous- Ongoing	Y	None	Y	None
PW-19	Promote MWD and other groups to encourage implementation of water conservation programs that improve water quality by reducing over-irrigation with smart products or turf replacement and capturing rain water in residential areas.	Collaborate with MWD to promote their SoCal Water$mart rebates and products such as weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and turf removal. Collaborate with San Diego County Water Authority (SDCWA) to promote their Water Smart irrigation system checkups and turf replacement incentives. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous- Ongoing	Y	None	Y	The City also partnered with the San Diego County Water Authority to promote their artificial turf rebate program.

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
PW-20	Proactively repair and replace corrugated metal pipe (CMP) MS4 components to provide source control from MS4 infrastructure.	Implement CMP replacement program with an emphasis on pipes in open canyons.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-21	Target human behavior in parks and other public areas including trash reduction or other high impact behavior to habitat, wildlife, and water quality.	Implement trash reduction programs by increasing the number of trash and recycling bins during high-traffic public events and in public parks. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Y	None	Y	None
PW-22	Participate in Reference Watershed Study.	The San Diego Regional Reference Stream Study (currently being conducted by the Southern California Coastal Water Research Project). The study will develop numeric targets that account for “natural sources” to establish the concentrations or loads from streams in a minimally disturbed or “reference” condition. Refer to Section 5.1 for further details. Will occur region-wide. Funding and resources were previously secured.	Prior to FY16	One Time, With Continuous O&M	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
PW-23	As opportunities arise and funding sources are identified, protect areas that are functioning naturally by avoiding impervious development and degradation on unpaved open space areas, creating permanent open space protections on undeveloped city-owned land, and acquiring privately-owned undeveloped open areas.	As opportunities arise, where feasible, avoid hardscape development and degradation in unpaved open space areas, create permanent open space protections to undeveloped city-owned land, and acquire privately owned undeveloped parcels of land. This strategy may be implemented if there is interest in participation by the public or private entity with current control of the land. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) identification of partners, if needed (public, private, non-profit), 2) identification of costs and potential sources of funding, 3) final agreement by public or private entity with current control of the land, 4) final agreement by all other participating partners including acceptance by intended land- or asset-owning City department, and 5) funding in place. Resources necessary to implement this strategy include a coordinator or manager and maintenance for acquired lands. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The time frame for implementation will vary by project. Implementation is in perpetuity as long as funding is available.	Triggered	Continuous as funding allows	Strategy not triggered in FY16	None	If triggered	None
Structural Strategies								
PW-24	Reconfiguring DPW waste yard to reduce pollutants/runoff.	Follow the site's SWPPP and perform annual monitoring. Relocate activities to limit exposure to reduce pollutants and runoff. Monitoring will continue. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Y	None	Y	None

Green Infrastructure								
PW-25	If interim load reduction goals are not met and additional green infrastructure is required, 0.26 acre has been identified as potential opportunities for green infrastructure implementation on public parcels to treat an impervious drainage area of 74.58 acres with a total storage volume of 3.64 acre-feet.	Construction, operation and maintenance of 0.26 acre of potential green infrastructure projects on public parcels to treat an impervious drainage area of 74.58 acres with a total storage volume of 3.64 acre-feet. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project) 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Triggered	Continuous-Ongoing	Strategy not triggered in FY16	None	If triggered	None

Table D-3 (continued)

Multiuse Treatment Areas								
Infiltration and Detention Basins								
PW-26	If interim load reduction goals are not met and additional multiuse treatment areas are required, an infiltration basin can be implemented near Chaparral Elementary School.	There are 4.4 acres available to construct an infiltration basin to treat 45.5 acres of primarily single-family residential areas. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months;) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project) 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Triggered	Continuous-Ongoing	Strategy not triggered in FY16	None	If triggered	None

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA Strategies (Optional Strategies, B.3.b.(2))								
WMA-1	Collaborative Approach to Irrigation Reduction	Responsible Agencies are collaborating with water agencies to encourage implementation of water conservation efforts. Water conservation that attempts to reduce irrigation and minimize storm water runoff can also improve water quality of receiving waterbodies. MWD's SoCal Water$mart Program supports conservation efforts by offering incentives in the form of rebates for rain barrels, rotating sprinkler nozzles, weather-based irrigation controllers, soil moisture sensor systems, and turf replacement. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous - Ongoing	Y	None	Y	None
WMA-2	Offsite Alternative Compliance Option (WMAA)	The WMAA provides alternative compliance methods in lieu of meeting structural BMP design standards and/or hydromodification management criteria on the project site. The San Diego County Copermittees have collectively funded and provided guidance for development of a regional WMAA. Copermittees compiled a list of candidate projects that consider the numeric goals of the WMAs as well as projects previously identified in JRMPs and other regulatory documents. Next steps include submittal of the water quality equivalency standards final document, anticipated in September 2015. Following a public review and Executive Officer approval, anticipated by November 2015, jurisdictions can formally implement an optional Alternative Compliance Program by December 2015 (time coincident with implementation of standards set forth in the regional BMP Design Manual and local Storm Water Standards Manuals).	Prior to FY16	Continuous - Ongoing	Y	None	Y	None

Table D-3 (continued)
City of Poway Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-3	Collaboration with the Regional Board	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Ag Waiver, 2) enforcement of other non-MS4 dischargers, and 3) Bacteria TMDL updates. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous - Ongoing	Y	None	Y	None
WMA-4	Participation in Watershed Council	If a Watershed Council is re-established, the City of San Diego, County of San Diego and potentially other Responsible Agencies will participate. Watershed Councils are typically locally organized, voluntary, non-governmental organizations, and are intended to broadly represent various stakeholders in the WMA. Goals of Watershed Councils may vary, but they generally promote protecting the watershed and sustaining natural resources. This coordination could assist in selecting WMA projects, identifying potential funding opportunities, and promoting communication among community groups and regulated agencies. Resources necessary to implement this strategy include participating jurisdictional staff to coordinate with the regional effort and the development of an agreement (e.g. MOU, JPA) among participating entities. Projected funding needs may be met through grant funding, support from community groups or other institutions, or jurisdictional General Funds. Participation is dependent on funding availability.	Triggered	Continuous as funding allows	Strategy not triggered in FY16	None	If triggered	None

Intentionally Left Blank

D.3.4 Modifications to the BMP Design Manual

No modifications to the BMP Design Manual have been made since the WQIP was approved in fall 2015. The current Poway's BMP Design Manual is posted on the Poway's website, and the link to this page is listed on Project Clean Water.

D.3.5 Modifications to the Jurisdictional Runoff Management Plan

No modifications to the Poway's JRMP have been made since the WQIP was approved in fall 2015. The current Poway JRMP is posted on the Poway's website, and the link to this page is listed on Project Clean Water.

Intentionally Left Blank

D.4 City of San Diego

The City of San Diego is proposing the administrative changes in the table below to the San Dieguito River Water Quality Improvement Plan. The proposed administrative changes include clarifications, corrections to errors and typos, and other minor edits that only apply to the City of San Diego.

WQIP Section		Administrative Changes
1	Appendix I – Jurisdictional Strategies and Schedules; Section I.4.2 Funding Needs for the City of San Diego	Included the following text: "Funding needs presented in this section are a snapshot in time and are based on the best information available at the time they were prepared. As program implementation progresses, updates to estimated funding needs are likely to change. For the most recent estimate of funding needs, refer to the WAMP available at the Storm Water Division website, www.sandiego.gov/stormwater/plansreports.
2	Appendix I – Jurisdictional Strategies and Schedules; Table I-5 City of San Diego Jurisdictional Strategies	Refined the text (shown as track changes in red text in Appendix D) to provide greater clarity and/or to correct errors and typos.
3	Appendix I – Jurisdictional Strategies and Schedules; Table I-5 City of San Diego Jurisdictional Strategies	Changed strategy identification numbering system (See Appendix D).
4	Appendix I – Jurisdictional Strategies and Schedules; Table I-5 City of San Diego Jurisdictional Strategies	Structural Strategies, Priority Development Project (PDP) BMPs: All PDP BMPs have been combined into a single strategy for ease of viewing. A table with an updated list of PDP BMPs is included in the WQIP Annual Report (See Appendix D).
5	Appendix I – Jurisdictional Strategies and Schedules; Table I-5 City of San Diego Jurisdictional Strategies	Structural Strategies, Multi Use Treatment Areas (MUTAs): Planned MUTAs that are not yet built have been combined into a single strategy for ease of viewing. The total sum of drainage area treated (level of commitment) has not changed. A table with all structural strategies (MUTAs, Green Infrastructure, Green Streets, etc.) is included in the WQIP Annual Report (See Appendix D).

D.4.1 Annual Report Certifications

The City of San Diego's required certifications regarding the preparation of the Water Quality Improvement Plan Annual Report, as well as the legal authorities required by the MS4 Permit are included on the following pages.

D.4.2 Annual Report Form

City of San Diego's completed JRMP Annual Report form and fiscal analysis for FY16 are included on the following pages.

D.4.3 City of San Diego Strategies

City of San Diego's strategies and project implementation status are detailed in Tables D-4 through D-7.

THE CITY OF SAN DIEGO

STATEMENT OF CERTIFICATION

San Dieguito River Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report

I certify, under penalty of law, that this Water Quality Improvement Plan Annual Report submittal and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for known violations.

CITY OF SAN DIEGO

SCOTT CHADWICK
CHIEF OPERATING OFFICER

January 27, 2017

Mr. David W. Gibson, Executive Officer
Regional Water Quality Control Board
San Diego Region
2375 Northside Drive, Suite 100
San Diego, CA 92108

Subject: Certification of Adequate Legal Authority

Dear Mr. Gibson:

Pursuant to San Diego Regional Water Quality Control Board Order No. R9-2013-0001, as amended by Order No. R9-2015-0100 (Municipal Permit or Permit), Provision E.1.b, the City of San Diego, as a Copermittee in the above referenced permit, submits this certification of adequate legal authority with the first Water Quality Improvement Plan Annual Report. The City has adequate legal authority to implement and enforce each requirement contained in 40 C.F.R. section 122.26(d)(2)(i)(A)-(F), and the Municipal Permit (including Provision E.1.a(1)-(10)). The San Diego Municipal Code, including the following provisions, provides the City with adequate legal authority as required by the Municipal Permit:

1. Storm Water Management and Discharge Control, sections 43.0301 through 43.0312. These provisions are being amended, although the current version also complies with the requirements of the Municipal Permit.
2. General Construction Permit Authority and Procedures, sections 129.0101 through 129.0120.
3. Grading Regulations, sections 142.0101 through 142.0150.
4. Storm Water Runoff Control and Drainage Regulations, sections 142.0201 through 142.0230.

The City looks forward to working with you and the Regional Board on storm water management matters. If you have any questions, please contact Senior Planner Jim Harry at (858) 541-4353 or email JHarry@sandiego.gov.

Sincerely,

Scott Chadwick
Chief Operating Officer

I. COPERMITTEE INFORMATION			
Copermittee Name: **City of San Diego (San Dieguito WMA)**			
Copermittee Primary Contact Name: **Drew Kleis, Deputy Director, Storm Water Division, Transportation & Storm Water Department**			
Copermittee Primary Contact Information:			
Address: **9370 Chesapeake Drive, Suite 100**			
City: **San Diego**	County: **San Diego**	State: **CA**	Zip: **92123**
Telephone: **858-541-4320**	Fax: **858-541-4350**	Email: **Akleis@sandiego.gov**	

II. LEGAL AUTHORITY	
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	**YES**[1] ☒ **NO** ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	**YES** ☒ **NO** ☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE	
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	**YES**[1] ☒ **NO** ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	**YES** ☒ **NO** ☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM[2]	
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	**YES**[1] ☒ **NO** ☐
Number of non-storm water discharges reported by the public	**119**
Number of non-storm water discharges detected by Copermittee staff or contractors	**60**
Number of non-storm water discharges investigated by the Copermittee	**171**
Number of sources of non-storm water discharges identified	**143**
Number of non-storm water discharges eliminated	**141**
Number of sources of illicit discharges or connections identified	**142**
Number of illicit discharges or connections eliminated	**140**[3]
Number of enforcement actions issued	**141**[3]
Number of escalated enforcement actions issued	**69**

V. DEVELOPMENT PLANNING PROGRAM[2]	
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	**YES**[1] ☒ **NO** ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	**YES** ☒ **NO** ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	**YES**[4] ☒ **NO** ☐
Number of proposed development projects in review	**70**[5]
Number of Priority Development Projects in review	**5**[6]
Number of Priority Development Projects approved	**88**[7]
Number of approved Priority Development Projects exempt from any BMP requirements	**0**
Number of approved Priority Development Projects allowed alternative compliance	**0**
Number of Priority Development Projects granted occupancy	**76**[8]
Number of completed Priority Development Projects in inventory	**118**[9]
Number of high priority Priority Development Project structural BMP inspections	**1**
Number of Priority Development Project structural BMP violations	**1**[10]
Number of enforcement actions issued	**1**[11]
Number of escalated enforcement actions issued	**0**

VI. CONSTRUCTION MANAGEMENT PROGRAM[2]	
Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES[1,12] ☒ NO ☐
Number of construction sites in inventory	1,364
Number of active construction sites in inventory	26
Number of inactive construction sites in inventory	12
Number of construction sites closed/completed during reporting period	23
Number of construction site inspections	10,074
Number of construction site violations	169
Number of enforcement actions issued	114
Number of escalated enforcement actions issued	65

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM[2]	
Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?	YES[1] ☒ NO ☐

	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	23	1,542 (includes mobile)	81	12[13]
Number of existing development inspections	22	308	6	1[13]
Number of follow-up inspections	0	14	0	0
Number of violations	3	49	0	109[13]
Number of enforcement actions issued	4	58	0	107[13]
Number of escalated enforcement actions issued	0	23	0	50

VIII. PUBLIC EDUCATION AND PARTICIPATION	
Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES[1] ☒ NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES[1] ☒ NO ☐

IX. FISCAL ANALYSIS	
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES[1,14] ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

---

[1] The City of San Diego approved an update to the Jurisdictional Runoff Management Plan (JRMP) in FY 16. The update of the JRMP was done in compliance with Order No. R9-2013-0001.

[2] See the JRMP Annual Report FY 2016 Attachment 1 for a citywide summary of this data.

[3] The number of enforcement actions issued does not equal the number of identified illicit discharges or connections because some discharge complaints in the last quarter of FY 2016 were still under investigation at the end of FY 2016.

[4] The Storm Water Standards Manual (Part 1: BMP Design Manual, and Part 2: Construction BMP Standards) was updated in January 2016.

[5] The number of ongoing Standard and Priority Development Projects in review as of 6/30/16. The Development Services Department processes other types of permits, in addition to those included in the JRMP Annual Report, that are not subject to the requirements of the municipal permit.

[6] The number of ongoing Priority Development Projects in review as of 6/30/16. Only a portion of the projects that the Development Services Department processes qualify as a priority development project.

[7] The number of Priority Development Projects approved in FY 2016.

[8] This number includes the City's Priority Development Projects that received final inspection in FY 2016 as well as certain Priority Development buildings and grading projects that did not require a Certificate of Occupancy, that were completed in FY 2016.

[9] Represents the total number of completed Priority Development Projects in the City's inventory as of the end of FY 2016. These projects include projects entered into the inventory as complete in previous years.

[10] The number of Priority Development Project structural BMP violations included Notices of Violation, Notices of Deficient Maintenance, and Administrative Citations issued to public and private entities within the City's jurisdiction in this watershed.

[11] The number of enforcement actions included Notices of Violation and Notices of Deficient Maintenance issued to public and private entities within the City's jurisdiction in this watershed. The City has achieved compliance at 146 of the 150 sites identified in the San Diego RWQCB's Notice of Violation (Order Number R9-2014-0034). The San Diego RWQCB granted the City an extension to achieve compliance at the remaining four sites by May 26, 2017.
During the process of achieving compliance for the aforementioned 150 identified sites, the City has discovered an additional 74 sites which initially appear to be out of compliance due to varying degrees of circumstances. Each of these potential violations consist of post-construction BMP issues. Continuing the same process as outlined in our quarterly reports to the RWQCB, the City is currently researching each case. After initial research to verify non-compliance or not, we will follow our established procedures to have each site be in conformance to the MS4 permit under which it was permitted.

[12] Responses in this report are based on the City's internal data. Potential program deficiencies were identified by the Board in FY 2016, however, the City has taken steps to correct issues identified by the Board as detailed in the JRMP Annual Report FY 2016 Appendix. The City has implemented several improvements that address the Regional Board's concerns. These improvements ranged from procedural changes to creating multi-language brochures for contractors. Several operating and internal procedures have been refined to improve enforcement actions, add clarity to how sites are inspected, and to better define the staff's roles and expectations.

[13] Existing facilities for residential uses are characterized as Residential Management Areas (RMA), which could include hundreds of residences. When all of the residences in an RMA are inspected by City staff that is only counted as one inspection. However, all individual issues noted at each residence during an RMA inspection is counted as a separate violation and/or enforcement action.

[14] See the JRMP Annual Report FY 2016 Appendix for the FY 2016 Fiscal Analysis.

THE CITY OF SAN DIEGO

January 30, 2017

Christina Arias
San Diego Regional Water Quality Control Board
2375 Northside Drive, Suite 100
San Diego, CA 92108

Dear Ms. Arias:

Subject: City of San Diego Jurisdictional Runoff Management Plan (JRMP) FY 2016 Annual Report, Public Works Department, Project Implementation Division Contributions

Please accept this letter as certification of the City of San Diego Public Works Department, Project Implementation Division's contributions to the City of San Diego's JRMP Fiscal Year 2016 Annual Report, and associated Appendices.

If you have any questions, please contact Catherine Dungca, Senior Civil Engineer, at (619) 533-3778.

I certify, under penalty of law, that this Jurisdictional Runoff Management Plan Fiscal Year 2016 Annual Report and attachments (associated with the Public Works Department, Project Implementation Division) were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for known violations.

Sincerely,

Marnell Gibson
Assistant Director
Public Works Department

APPENDIX

1 OPERATIONAL ADAPTIVE MANAGEMENT

In Fiscal Year (FY) 2016 the City of San Diego (City) completed technical and non-technical monitoring, special studies, pilot studies, and various other efforts related to its Storm Water Program. The City gained valuable information that led to effective adaptation of procedures and operations, which ultimately led to more effective implementation of its Storm Water Program and the Jurisdictional Runoff Management Plan (JRMP). The following are operational adaptive management improvements that the City made during FY 2016:

- **Get it Done Application**
  In late FY 2016, the City released the Get it Done Application (App), which provides a modern, efficient method for members of the public to report issues to the City. One of the App's features allows illicit discharges to be reported by taking a photo with a phone that includes Global Positioning System (GPS) coordinates, and uploading it to the App. According to a recent City survey, 83 percent of respondents stated that they did not want to call the City government to report a problem. The new Get It Done App eliminates the need to call the City for various problems, by allowing residents to report issues online, which was the preferred method of 50 percent of survey respondents. The App also allows residents to report problems using their name or anonymously.

- **Phase V Street Sweeping Pilot**
  The City completed the fifth and final pilot study of the Targeted Aggressive Street Sweeping Pilot Program in FY 2016, which tested the effectiveness of posting limited-hour "no parking" signs on traditionally non-posted street sweeping routes. After two years of data collection on two subject routes, the study confirmed the hypothesis that a significant amount of additional debris (48% and 58% over baseline on the subject routes) can be removed from posting no parking signs on traditionally non-posted roadways. Based on this finding, the City will consider posting additional routes if supported by the community.

- **Enhanced Catch Basin Cleaning Optimization**
  Enhanced catch basin cleaning is a strategy to address pollutant removal from the Municipal Separate Storm Sewer System (MS4) in three of the City's six watersheds. While most catch basins are inspected once per year, this strategy involves inspecting catch basins within the specified watersheds between two and four times per year. The optimization study assigned priorities to individual basins and watersheds based on eight years of historic debris removal. This optimization focused efforts by reducing the number of inspections performed per year, while increasing total debris removal from those inspections. This enhancement will allow the City to target high priority drains to maximize pollutant removal while maintaining cost efficiencies. In FY 2016, approximately 2,500 additional catch basin inspections and cleanings (if necessary) were completed in the Chollas Creek area of the San Diego Bay Watershed.

- **Flood Control Pump Stations**
  To help minimize the risk of flooding in flood-prone areas during storm events, the City utilizes a number of pump stations to increase the flow of water through the conveyance network. Considering the pump stations are connected to the electric network, they only

function when power is running. In FY 2016, a 2,400 volt automatic transfer switch and generator were installed at a critical pump station that are capable of pumping 130,000 gallons of water per minute. This significantly decreases the risk of flooding in the related drainage area because the pump station will continue to operate during a storm event. The City also replaced or refurbished 11 other critical pump stations. Additionally, the City modernized operations at 14 pump stations by installing a telemetry system that remotely alerts staff of failures, allowing for a more immediate response.

- **Storm Drain Inspections**
  To help prioritize replacement of corrugated metal piping in the City's conveyance network, the City used closed-circuit televising at 62 locations in FY 2016 to assess pipe conditions. The City assessed the condition of 28,000 linear feet of corrugated metal piping in FY 2016.

- **Property-Based Inspections**
  In FY 2016, the City further committed to implementing property-based inspections to increase the business inspection program's efficiency and effectiveness. A previously conducted pilot study on inspection practices found property-based inspections more effective at identifying and resolving water quality issues (e.g., improper trash disposal practices and irrigation runoff, etc.) associated with commercial and industrial businesses. The inspections are focused on areas and activities associated with businesses that would not otherwise be inspected for storm water compliance. The inspections greatly increase the number of businesses subjected to storm water inspections while focusing on the pollution generating areas and activities without unduly increasing the inspection load of City inspectors. In FY 2016, the City performed 835 property-based inspections that accounted for over 4,700 business inspections.

- **Tiger Team**
  The Tiger Team was established in FY 2016 to identify, locate and eliminate sources of human specific bacteria sources in the MS4. The Transportation & Storm Water Department (TSW) leads this effort in partnership with the Public Utilities Department. After a specific portion of the MS4 with elevated human specific bacteria was identified, the Tiger Team performed escalated enforcement activities through TSW Code Enforcement, MS4 sampling, MS4 sanitary sewer line televising, and MS4 and sanitary sewer cleaning. Over several months during the reporting year, one problem area within the City was investigated extensively and a source of human specific bacteria in the MS4 was identified and abated.

- **Increased Non-Stormwater Discharge Investigations**
  The City received 215 more complaints of non-stormwater discharges in FY 2016. Approximately 81% of the complaints citywide were resolved. A majority of the investigations that were resolved involved irrigation runoff. Cases were unresolved either because the source could not be identified or the source was groundwater.

  The identification and elimination of irrigation efforts in FY 2016 involved the following:
  1) Special irrigation patrols were conducted on a monthly basis. All violating properties were issued notices of violation and/or a citation.
  2) TSW code compliance partnered with the Public Utilities Department. If a complaint of irrigation with runoff was received, a storm water code compliance officer would issue a notice of violation. If the property had multiple complaints,

that property would become part of an irrigation patrol and could result in a citation.

- **Waterways Maintenance Plan**
  The City began development of the Waterways Maintenance Plan in FY 2016, which will replace the Master Storm Water System Maintenance Program, which expires in 2018. The goals of the Plan are to create an overall holistic storm water management strategy with standard mitigation measures and streamlined maintenance approvals. Objectives of the Plan include flood risk reduction, infrastructure sustainability and resource protection and restoration. In addition to technical scoring criteria, the Plan also includes a unique public input metric so that public concerns are given a tangible value. Planning efforts will continue in FY 2017, with implementation beginning in FY 2019.

- **Off-Site Alternative Compliance Program**
  In FY 2016, the City implemented phase I of the Alternative Compliance Program. This gives development projects that would require on-site structural Best Management Practices (BMPs) to comply with pollutant control and hydromodification management the option to propose off-site alternative compliance projects. The development of phase II also began in FY 2016 and includes establishing an in-lieu fee structure and credit system as an alternative to installing on-site stormwater BMPs.

- **Watershed Master Planning**
  To provide the high-resolution data needed to drive systematic and cost-effective implementation of green infrastructure (GI) projects, the City has developed a comprehensive and dynamic Watershed Master Plan (WMP) in the Chollas Creek Watershed that quantifies progress towards water quality goals and incorporates synergies with other municipal programs. The WMP has the capability to dynamically assess the cost-based water quality benefits of specific GI projects against one another and incorporates a robust prioritization logic that realizes the complex nature of implementing retrofit GI facilities within a highly urbanized environment. Ultimately, the output of this project gives the City a project-by-project roadmap that is prioritized to implement high-impact and high-efficiency BMPs first, leaving less desirable projects for later implementation.

- **Bacteria Regrowth Study**
  The bacteria regrowth study currently being completed by the City includes monitoring to characterize the magnitude and extent of potential *Enterococcus* loading due to regrowth within the City's storm drain system. This study will quantify the amount of bacteria in receiving water samples that are harmless to humans and would potentially be used to refine bacteria water quality standards of the Bacteria TMDL as a part of the re-opener process.

- **Los Peñasquitos Lagoon Restoration Project**
  Modeling was completed in FY 2016 to confirm the preferred alternative for the Los Peñasquitos Lagoon Restoration project. The City was identified as the "lead" for the project. The upcoming tasks in FY 2017 include completing the concept design and starting the public outreach process. In coordination with Copermittees, Caltrans and SANDAG completed the environmental and construction phases for various rail and transit, highway, and environmental protection projects.

2 Stormwater Program Accomplishments/Notable Updates

The City continued to implement the key elements of the JRMP. The following are stormwater accomplishments and notable updates that occurred during the FY 2016 reporting period.

- **Water Quality Improvement Plans**

  In FY 2016, the San Diego Regional Water Quality Control Board (Regional Board) accepted the six Water Quality Improvement Plans (WQIPs) that included City jurisdiction. The goal of the WQIPs is to protect, preserve, enhance, and restore the water quality of receiving water bodies. These WQIPs identify the adaptive planning and management process necessary to address the highest priority water quality conditions within a watershed. The WQIPs also identify strategies to achieve improvements in the quality of discharges from the Responsible Agencies' storm drain systems. The City is the lead on the WQIP for the San Dieguito, Los Penasquitos, and Mission Bay watersheds. The City is also a participating agency in the San Diego River, San Diego Bay, and Tijuana River watersheds.

- **JRMP Refinements**

  In FY 2016, the City identified refinements to the JRMP. These refinements were incorporated into the JRMP and will be completed in mid FY 2017. Refinements included minor changes to text to update the discussions of WQIP strategies, updates to the fiscal analysis, updates to the minimum BMPs to address pesticide applications, and updated references to the Storm Water Standards Manual that was adopted in FY 2016. The updated JRMP can be viewed at https://www.sandiego.gov/stormwater/plansreports/jrmp.

- **General Plan and Community Plan Amendments**

  Southeastern San Diego and Encanto Neighborhoods Community Plan Updates:

  The recently adopted Southeastern San Diego and Encanto Neighborhoods Community Plans incorporate language, policies and recommendations concerning the reduction of urban runoff and storm water quality. Stormwater quality plays a significant role in both of these communities since Chollas Creek is a significant feature within both plan areas lead directly to the San Diego Bay. A primary recommendation in both community plans is the restoration and enhancement of the creek, consistent with the Chollas Creek Enhancement Program, which includes the reduction of pollutants that enter the storm water system from nearby uses (see respective Conservation Elements). Specific stormwater language and policies have been adopted for the newly updated Southeastern San Diego and Encanto Neighborhoods Community Plans (adopted October 2015 by City Council).

The following policies have been adopted and will be used to implement BMPs for new development projects in Encanto as an example:

- PLU-53:
    - Facilitate urban gardening as a strategy for creating local healthy food systems and fighting chronic obesity related illnesses, contributing to stormwater retention, and fostering community interaction;
    - Figure 3-4 in the Southeastern San Diego and Encanto Neighborhoods Community Plan illustrates stormwater treatment for streets;
    - Images on page 4-15 in the Southeastern San Diego Encanto Neighborhoods Community Plan illustrate stormwater treatment images;

- P-UD-88: Utilize permeable paving, bioswales, green alleys and/or other stormwater design features that will manage rain water and irrigation runoff while supporting the heavy load vehicles that would service the loading docks and refuse containers;

- Upgrade infrastructure for water and sewer facilities and institute a program to clean the storm drain system prior to the rainy season.

- Install infrastructure that includes components to capture, minimize, and/or prevent pollutants in urban runoff from reaching San Diego Bay and Chollas Creek. (See also Urban Runoff Management in the Conservation and Sustainability Element.)

- P-RE-20: Require that all stormwater and urban runoff drainage be filtered or treated before entering into open space lands.

Draft North Park Community Plan: The draft North Park Community Plan, scheduled to be adopted by City Council in October 2016, also contains specific Stormwater and BMP language in the Conservation Element of the Community Plan as well as in the appendices. The draft North Park Community Plan incorporates language, policies and recommendations concerning the reduction of urban runoff and storm water quality specifically in relation to tree planting as well as "Green Streets". Specific policies include:

- PF-1.15 Implement water improvements programs so there are systematic improvements and gradual replacement of water and wastewater facilities throughout the community. Also see General Plan PF-F.6 PF-G.2, PFH. 3, and PF-I.1.
    - Implement Green Infrastructure strategies to address storm water runoff throughout North Park.

- SE-3.17 Encourage property owners to design or retrofit landscaped or impervious areas to better capture stormwater runoff.

Draft Uptown and Golden Hill Community Plans: Public review drafts of the community plans for Uptown and Golden Hill plan updates were made available for public review in June 2016. The Conservation Elements of the draft community plans address conservation of the natural resources in each community, including open space, natural habitats, canyon sewer maintenance, and management of water resources and

urban runoff. The Public Facilities, Services and Safety Elements also address water, sewer and stormwater infrastructure. The discussion and policies related to these topics are intended to guide sustainable development practices that will minimize ecological footprints within each community and preserve natural features and resources. The Draft Programmatic Environmental Impact Reports were released in the summer of 2016. Adoption of the community plans are anticipated at the end of 2016.

San Ysidro Community Plan Update: A comprehensive community plan update started in San Ysidro in June of 2010 and aims to reflect the current conditions, improve mobility, include the pedestrian environment, and address quality of life issues. A Community Plan Update Stakeholders Advisory Committee (Advisory Committee) was established as part of the plan update effort and consists of diverse representation from the residents, property owners, various business interests, local community organizations, and not-for-profit groups, and participating public agencies within the plan update boundary. The San Ysidro Community Planning Group, which provides City decision-makers with input and recommendations regarding land use plans and development proposals within the San Ysidro plan boundary, makes up the majority of the Advisory Committee members. The Plan update effort is informed by technical studies and the City's 2008 General Plan which promotes current storm water, urban runoff, and water conservation policies. A discussion draft of the plan was released in June 2014 and a public review draft was released in April 2015 and 2016. The plan includes a Conservation Element as well as a Public Facilities Services and Safety Element, and contains specific policies related to reducing storm water runoff in the San Ysidro Community planning area. The plan is anticipated to be adopted in fall 2016.

- **Notices of Violation**

Treatment Control BMPs Notice of Violation: The City has achieved compliance at 146 of the 150 sites identified in the Regional Board's Notice of Violation (Order Number R9-2014-0034). The Regional Board granted the City an extension to achieve compliance at the remaining four sites by May 26, 2017.

During the process of achieving compliance for the aforementioned 150 identified sites, the City has discovered an additional 74 sites which initially appear to be out of compliance due to varying degrees of circumstances. Each of these potential violations consist of post-construction BMP issues. The City is continuing the same process outlined in its quarterly reports to the Regional Board, and is researching each case. After initial research to verify non-compliance or not, the City will follow its established procedures to achieve compliance at each site as required by the MS4 permit that it was permitted.

Administrative Civil Liability Complaint: The Regional Board conducted an audit of the City's construction management program during the 2014-2015 rainy season, and issued an Administrative Civil Liability Complaint in July 2016 for several alleged violations involving the City's construction oversight and enforcement practices. The City has worked diligently to address their initial concerns, and will continue to evaluate and implement strategies to ensure long-term success.

Since 2011, there has been a steady increase in the number of construction projects citywide. This surge in activity required the City to respond in a manner that would

enable the staff to keep up with the demand and allow the managers to effectively oversee the growth.

Several substantial improvements have been made, ranging from updating our standard procedures and increasing our outreach efforts to improving the City's escalating enforcement practices and issuing Administrative Citations and Administrative Civil Penalties to repeat offenders. In addition, the City established bi-weekly coordination meetings with the Storm Water teams from Public Works, Development Services and TSW to more effectively share up-to-date project information, discuss various strategies, collaborate on solutions, and coordinate enforcement on a more routine basis so that escalated enforcement is effective.

Another significant improvement involves the development of a unified storm water enforcement database. This will ensure collaboration between Resident Engineers (RE) and storm water inspectors while in the field so they will know the full inspection and enforcement history prior to entering a site. This resource is expected to be available in FY 2017.

Updating the Storm Water Standards Manual is another milestone improvement that was completed during FY 2016. The additional clarity that's now provided in the Construction BMP Standards section (Part 2) gives the responsible party increased guidance to help prevent construction activities from adversely impacting water quality downstream.

The frequency of the citywide storm water training has increased and proven to be a key factor in equipping and empowering our staff to properly address various field challenges and confidently communicate concerns and violations to the responsible parties. Some of the trainings included mandatory annual storm water training for the REs, Inspectors and Code Enforcement Officers, as well as training for our operations staff from the Public Utilities Department and TSW Streets Division.

3 FISCAL ANALYSIS

3.1 GENERAL BUDGET INFORMATION

The Storm Water Division is responsible for reporting annually on the jurisdictional, watershed and regional fiscal analyses to the Regional Board in accordance with the regional Fiscal Analysis Method developed by the Copermittees in response to Regional Board Order No. R9-2007-0001 (2007 Permit). During the reporting period, the Storm Water Division collected and analyzed financial information from 23 City departments/divisions through its "Annual Report Form" questionnaire, as well as from within the Storm Water Division. A summary of the findings is included below.

FY 2016 fell within the transitional period, as defined under Regional Board Order No. R9-2013-0001, as amended by Order No. R9-2015-0001 (Municipal Permit). During the transitional period, most of the jurisdictional portions of the City's program continue to follow the requirements of the 2007 Permit, while the JRMP and WQIPs were being developed in response to the current Municipal Permit. The WQIPs were approved by the Regional Board at the end of FY 2016. The expenditures described for FY 2015 therefore reflect costs to comply with the transitional period stormwater requirements in effect during FY 2015, which are a combination of 2007 Permit and current Municipal Permit standards. Since the WQIPs were approved during FY 2016, partial implementation began, but full implementation will commence in FY 2017.

It is expected that the City will begin full implementation of current Municipal Permit requirements during FY 2017. The City will implement the revised JRMP, which updates the City's jurisdictional stormwater program to follow the current Municipal Permit requirements rather than the 2007 Permit requirements. The City's fiscal analysis reporting structure in turn will change, reporting expenditures, and funding sources in the following three main categories: JRMP (jurisdictional), WQIP (watershed), and flood risk management. That structure is consistent with the framework described in the City's Watershed Asset Management Plan (WAMP), the WQIPs to which the City is a party, and the JRMP. FY 2015 is the last year in which JRMP and flood risk management will be lumped together under the heading of "Jurisdictional Component" rather than reported separately.

3.2 FISCAL ANALYSIS METHODS

While the City used the format and guidelines included in the Fiscal Analysis Method for reporting purposes, a few modifications were necessary to address how the City tracks accounts internally. Modifications to the expenditure categories are described in the relevant sections below. In many cases, estimated percentages were used to allocate expenditures into the appropriate municipal permit component categories, including watershed and regional.

3.2.1 Fiscal Analysis Results

3.2.1.1 Expenditures

The City's FY 2016 Transitional JRMP Regional Program total expenditures ($75,934,083) for implementing the Municipal Permit requirements are summarized in Table 1.

Table 1: FY 2016 Jurisdictional, Watershed, and Regional Expenditures Summary

Jurisdictional Component	
Administration	$11,179,605
Development Planning (including public and private projects)	$1,897,784
Construction (including public and private projects)	$632,646
Municipal (including Non-emergency Fire Fighting expenditures)	$30,146,109
Storm Water Division Capital Improvements Program (CIP)	$7,929,308
Industrial and Commercial	$2,001,544
Residential, Education, and Public Participation	$2,159,991
Illicit Discharge Detection and Elimination (IDDE)	$11,339,120
Jurisdictional Total	**$67,286,108**
Watershed Component[1]	
San Dieguito Watershed	$1,105,348
Los Peñasquitos Watershed	$2,061,071
Mission Bay Watershed	$1,242,769
San Diego River Watershed	$680,843
San Diego Bay Watershed	$2,165,456
Tijuana River Watershed	$686,584
Watershed Total	**$7,942,071**
Regional Component	
Total Copermittee Cost Share for the City of San Diego	$342,001
Additional Regional Costs for education efforts, monitoring, document reviews, regional meeting attendance, and special projects	$363,903
Regional Total	**$705,904**
Total Costs	**$75,934,083**

[1] Watershed Component costs do not include Capital Improvements Program (CIP) costs. CIP costs are only included in the Jurisdictional Component's Storm Water Division Capital Improvements Program Category.

Transitional JRMP Expenditures

The City's FY 2016 Citywide expenditures for implementing the jurisdictional Municipal Permit requirements are depicted in Figure 1. Expenditures were provided as actual costs in most cases, and when the actual costs could not be determined, estimates of actual costs were provided. The Storm Water Division used the expenditure categories detailed in the Fiscal Analysis Method for jurisdictional reporting. However, because of implementation overlap with the City's education, public participation, and residential Municipal Permit components, it is difficult to separate out individual component costs. Therefore, the expenditures for residential, education, and public participation are reported as one expenditure category.

A total of $67,286,108 was expended in FY 2016 to implement JRMP activities citywide. This amount includes costs paid by sewer and water rate payers (which are used for sewer and water-related services) and costs reimbursed by project applicants. An overview of the expenditures reflected in this component is described below.

Administration ($11,179,605)

Activities identified in this section represent personnel and non-personnel expenses for administration and contracts, grant management, citywide management, staff training, reporting, and assessment of the Municipal Permit.

Development Planning ($1,897,784)

Activities identified in this section represent personnel and non-personnel expenses for plan check reviews, incorporating BMPs into project designs, BMP Design Manual development, and General Plan updates. This category includes expenses for private and public projects.

Construction ($632,646)

Activities identified in this section represent personnel and non-personnel expenses for plan check review services, field inspections related to grading permits, public improvements, and building activities. This category includes expenses for private and public projects.

Municipal ($30,146,109)

Activities identified in this section represent personnel and non-personnel expenses for street sweeping, storm drain and channel maintenance, BMP implementation, and municipal facility and activity inspections. Additionally, this section includes the expenditures for Fire Department activities not related to emergency firefighting, such as facility inspections, stormwater BMPs, etc.

Capital Improvement Program ($7,929,308)

Activities identified in this section represent personnel and non-personnel expenses for implementation of new construction and planned improvements to existing facilities for storm water management. Projects may include, but are not limited to, the construction, purchase, or major renovation of buildings, utility systems, and other facilities to achieve storm water requirements. In addition, they may also include land acquisitions and roadway projects to install storm water facilities.

Industrial and Commercial ($2,001,544)

Activities identified in this section represent personnel and non-personnel expenses for inspection of industrial and commercial facilities. This also includes personnel and non-personnel expenses for the stormwater components of Food Establishment Wastewater Discharge Program (FEWD) and Industrial Wastewater Control Program (IWCP) inspections.

Residential, Education, and Public Participation ($2,159,991)
Activities identified in this section represent personnel and non-personnel expenses for educational materials, outreach efforts and events, public service announcements (PSAs), household hazardous waste (HHW) and used oil outreach, and community events.

Illicit Discharge Detection and Elimination ($11,339,120)
Activities identified in this section represent personnel and non-personnel expenses for identification and elimination of illicit discharges, enforcing the City's stormwater ordinance and implementation of the administrative civil penalties and citation process, and the urban runoff monitoring program.

Watershed Expenditures

The City's watershed expenditures during FY 2016 for the implementation of the watershed Municipal Permit requirements were provided as actual costs and when the actual costs could not be determined, estimates of actual costs were provided. The Storm Water Division used the expenditure categories (administration, watershed activities, cost share contribution, and other) detailed in the Fiscal Analysis Method for watershed reporting. The watershed expenditures included in this report only capture City expenditures and do not account for any expenditure disbursed by other Copermittees within the watershed(s).

In total, $7,942,071 was expended in FY 2016 for the implementation of citywide watershed activities. This amount includes costs for the implementation of applicable TMDLs along with special studies.

Regional Expenditures
The City's FY 2016 regional expenditures ($705,904) for the implementation of the regional Municipal Permit requirements are primarily the City's share of regional Copermittee stormwater program costs. Additional costs include estimated staff time to attend regional meetings and other related administration costs. The Storm Water Division used the expenditure categories (administration, cost share contribution, regional activities, and other) detailed in the Fiscal Analysis Method for regional reporting. The regional expenditures included in this report only capture City expenditures, and do not account for any expenditure disbursed by other Copermittees in the region.

*3.2.1.2 **Grant Funding for Special Studies***
In addition to resources identified for Municipal Permit requirements, the City actively seeks grants, and other funding sources, for special studies and Capital Improvement Projects. For the most part, funding for these projects may be limited to the projects specified and the City may restrict funding reallocation to other projects. Therefore, these resources are currently not incorporated in calculations for total Municipal Permit requirements expenditures detailed in Section 2.2.1.4 above. Table 2 lists projects that were initiated and/or in progress during FY 2016. It is important to note that the projects span multiple years and the amounts listed below are not just representative of FY 2016.

Table 2: Funding for Special Projects

Funding Source	Project	Amount	Matching Fund Amount	Total Amount[2]
San Diego County Water Authority (SDCWA)	Memorial Park Infiltration Basin Construction	$255,651.00	$295,904.00	$551,555.00
State Water Resources Control Board (SWRCB)	43rd & Logan Monitoring & Assessment	$689,300.00	$85,362.00	$774,662.00
SDCWA	Bannock Avenue Infiltration Construction	$630,500.00	$893,300.00	$1,523,800.00
SWRCB	Southcrest Park Infiltration Project	$1,880,070.00	$777,970.00	$2,658,040.00
Total Grant Funding		**$3.5 million**	**$2.0 million**	**$5.5 million**

2 Amounts span multiple years and not just FY 2016

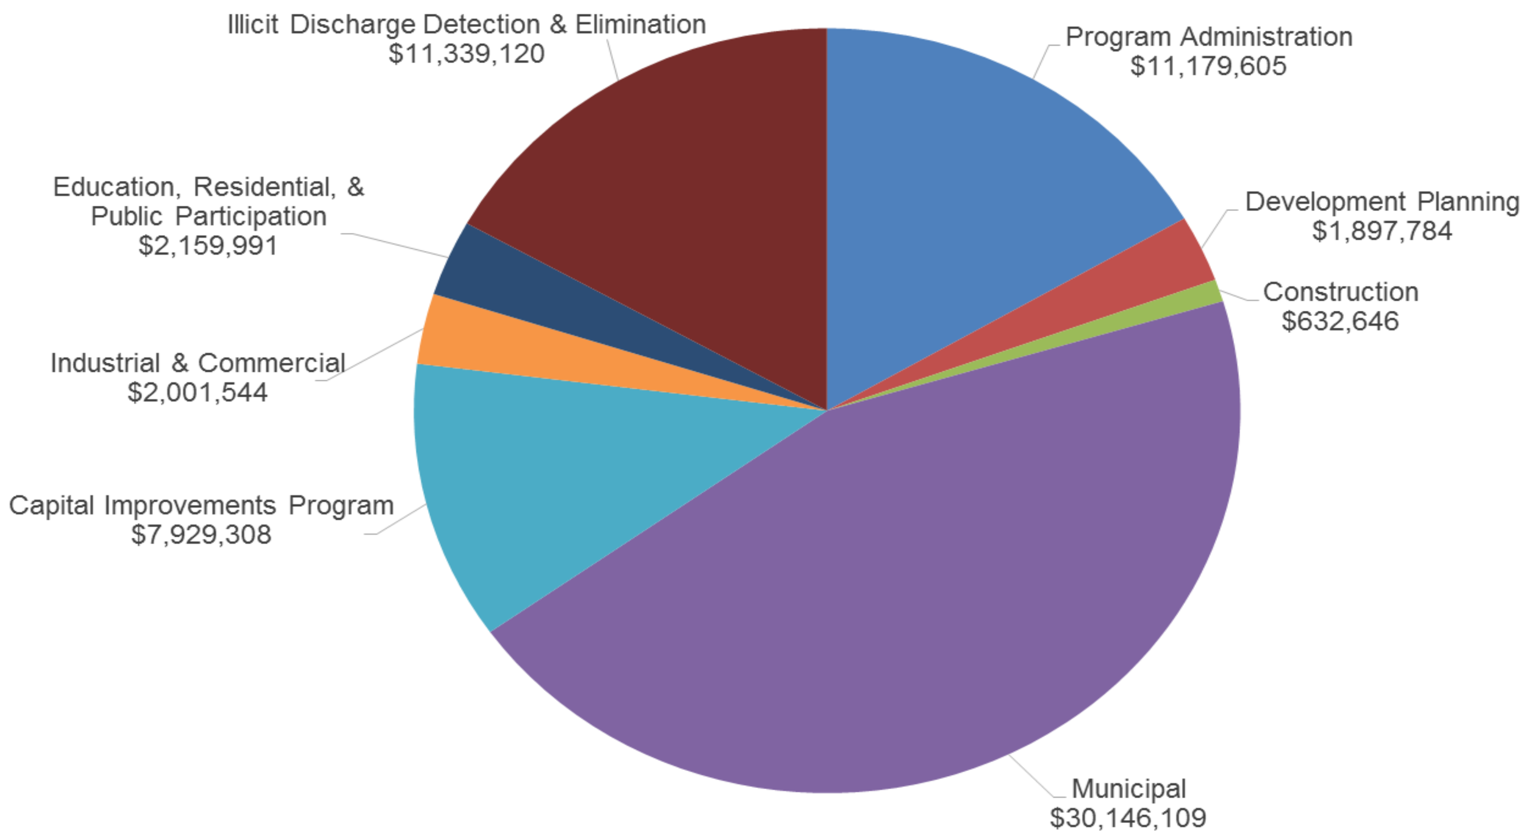

Figure 1: FY 2016 Citywide JRMP Expenditures by Permit Area

This page intentionally blank for printing purposes.

3.2.2 Funding Sources
Citywide implementation of Municipal Permit requirements is funded through four main types of governmental funds: the General Fund, Special Revenue Funds, Enterprise Funds, and Internal Service Funds.

3.2.2.1.1 General Fund
The General Fund is the main fund for the City and is supported by major revenue sources, including property tax, sales tax, transient occupancy tax, and franchise fees. Departments funded by the General Fund provide core community services.

3.2.2.1.2 Special Revenue Funds
Special Revenue Funds account for revenues received for specifically identified purposes. Some of the larger funds that fall under this category include TransNet, Gas Tax, and Special Promotion programs.

3.2.2.1.3 Enterprise Funds
Enterprise Funds are initiated for specific purposes and funded through fees for services. This funding type is designated for the operations, management, maintenance, and development of the department providing the service. For implementation of citywide JRMP activities, activities are funded through the following enterprise funds:

- Airports Fund
- Development Services Enterprise Fund
- Golf Course Enterprise Fund
- Recycling Fund
- Refuse Disposal Fund
- Sewer Revenue Funds
- Water Utility Fund

3.2.2.1.4 Internal Service Funds
Internal Service Funds are comprised of fees for services provided by one City department to another City department or division. For implementation of citywide JRMP activities, activities are funded through the following internal service funds:

- Engineering and Capital Projects Fund
- Equipment Division Funds

This page intentionally blank for printing purposes.

~~Strikeouts~~ and red text are text edits that have been made up to the current date since the WQIP September 2015 submittal.

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Jurisdictional Strategies								
Note: Strategy IDs with an asterisk indicate those strategies that are considered "jurisdictional" in the MS4 Permit, but are considered enhancements to the JRMP to target highest priority water quality conditions.								
JRMP (E.2-E.7) Strategies (E.3.b.(1)(a))								
E.3 Development Planning								
All Development Projects								
CSD-JRMP-01	Establish guidelines and standards for all development projects; provide technical support related to implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area or implement easements to protect water quality, where applicable and feasible. Includes internal coordination and collaboration between City departments (DSD, PWD, and Engineering) to improve success and long-term benefits of BMPs.	Refer to JRMP Section 4. ~~All high priority projects will be inspected annually prior to the rainy season. 20 percent of all projects will be inspected annually. Maintenance inspections include examination of all structural BMPs at a project to verify that each structural BMP is working, being maintained properly, and is in compliance with all applicable City ordinances and permits.~~ May include providing technical support and consultation for other City departments that review project submittals for compliance with Storm Water Standards Manual requirements. May also include review of City projects for compliance with Storm Water Standards Manual requirements.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Revised Storm Water Standards Manual went into effect on February 16, 2016. FY17 Notes: The Storm Water Standards will be revised to include Critical Coarse Sediment Yield Area mitigation measures that were developed through a TAC process, along with other minor clarifications.
CSD-JRMP-02	Develop Design Standards for Public LID BMPs.	Improve quality of design to ensure efficiency and reliability in public designs.	FY14-FY15	Continuous- As needed	Yes	No Change	Yes	FY16 Notes: Draft Green Infrastructure standard drawings and specifications are currently in the review process. FY17 Notes: Plan to develop more standard drawings and specifications for other green infrastructure components.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-03	Outreach to impacted ~~industry~~ commercial, industrial, municipal, and residential development regarding minimum BMP requirement updates.	~~Affects commercial, industrial, and residential development.~~ May include onsite education at the time of inspections, city staff training, and mailers to business owners and prospective business owners.	FY15	Continuous- As needed	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Sent out monthly business Tax License renewal mass mailings, which included information about storm water BMPs. Violation location information from the Residential Patrol Program is used to target outreach.
CSD-JRMP-04*	Train staff on LID regulatory changes and LID practices.	Formal training is required for all staff involved in development plan review to increase knowledge of LID BMPs. Goal of training associated with LID practices and regulations is to promote LID implementation and to avoid adverse conditions such as trees planted within swales, or planned drainage patterns which obstruct or inhibit LID performance.	FY16	Continuous- As needed	Yes	No Change	Yes	FY16 Notes: Presented at a PWD training to discuss the revised Storm Water Standards Manual. Provided a plan check training for plan reviewers at DSD and PWD staff in May 2016.
CSD-JRMP-05*	Amend municipal code and ordinances, including zoning ordinances, to facilitate and encourage LID opportunities to support compliance with the MS4 Permit and TMDLs in a reasonable manner. Ensure consistency with the City of San Diego's BMP Design Manual. Update the Storm Water Standards Manual accordingly.	Municipal codes and ordinances will be brought to City Council for consideration to encourage LID implementation (e.g., runoff detention and filtration using natural filters and stormwater retention for reuse). LID stormwater management will be encouraged in proposed codes and ordinances associated with development and redevelopment projects, which are brought to City Council for consideration.	FY15	Continuous- As needed	Yes	No Change	No	None
CSD-JRMP-06	Provide technical education and outreach to the development community on the design and implementation requirements of the MS4 Permit and Water Quality Improvement Plan requirements.	Technical education and outreach to the development community includes outreach on design standards, City design manuals, and the WMAA.	Prior to FY16	Continuous- Ongoing	Yes	No Change	Yes	FY16 Notes: Presented the revised draft Storm Water Standards at two public workshops in September 2016.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
Priority Development Projects (PDPs)								
CSD-JRMP-07	For PDPs, administer a program and provide technical support to other City departments to ensure implementation of on-site structural BMPs to control pollutants and manage hydromodification by developing City wide storm water development standards and design guidelines.	Administer a program in coordination with other City departments to promote and confirm a thorough understanding of requirements for implementing structural BMPs that control pollutants and manage hydromodification. Includes requirements to confirm proper design and construction through processes controlled by other City departments. Please see Attachment 1 for details on PDP related BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City enhanced the Storm Water Quality Management Plan (SWQMP) template that was developed as a Copermittee effort for developers to use.
CSD-JRMP-08	Institute a program to verify and enforce maintenance and performance of treatment control BMPs.	Refer to JRMP Section 4.5. The Storm Water Division is responsible for annually verifying that all structural BMPs within its inventory are being properly maintained. The Storm Water Division performs verification through an Annual Maintenance Verification mailing and a direct maintenance inspection program. Parties responsible for maintenance of structural BMPs are required to complete and sign the Annual Maintenance Verification, certifying that the structural BMPs are being properly maintained. Direct maintenance inspections will be performed at all projects for which an Annual Maintenance Verification Form was not completed. All high priority projects will be inspected annually prior to the rainy season. 20 percent of all projects will be inspected annually. Inspect additional BMPs as needed. Medium and low priority projects will not require inspection if they have completed their Annual Maintenance Verification form, unless they are part of the 20 percent of projects that are annually inspected.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY17 Notes: For porous pavement BMPs, staff plan to use an infiltrometer to measure BMP effectiveness.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-09	Update ~~BMP Design Manual procedures~~ Storm Water Standards Manual to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	Refer to JRMP Section 4. Storm Water Standards Manual will be updated in accordance with the Permit and made available on the City's website.	FY15	Continuous every 5 years/ permit cycle	Yes	Revised to clarify strategy.	Yes	FY17 Notes: The Storm Water Standards will be revised to include Critical Coarse Sediment Yield Area mitigation measures that were developed through a TAC process, along with other minor clarifications.
CSD-JRMP-10*	Amend BMP Design Manual for trash areas. Require full four-sided enclosure, siting away from storm drains and cover. Consider the retrofit requirement.	Amend BMP Design Manual and zoning standards/requirements which address reduction of pollutants for common areas of trash build-up (e.g. restaurants, supermarkets, "big box" retail stores with food, pet stores). Most effective method for source control of bacteria and trash is to employ four-sized trash enclosures with a cover over trash areas.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on trash enclosures (See Part 1, Appendix E of the Storm Water Standards).
CSD-JRMP-11*	Amend BMP Design Manual for animal-related facilities, such as such as animal shelters, "doggie day care" facilities, veterinary clinics, breeding, boarding, and training facilities, groomers, and pet care stores.	Amend BMP Design Manual and zoning requirements (including retrofits) to provide supplemental standards for animal facilities (including animal shelters, dog daycares, veterinary clinics, groomers, pet car stores, and breeding, boarding, and training facilities). Supplemental standards may include requiring covered trash enclosures, identification of landscaped relief areas on site plans, ensuring drainage connections and treatment swales for areas that will not drain to the sanitary sewer, as well as inspection of grading, drainage, and landscaping for outdoor exercise areas.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on animal facilities(See Part 1, Appendix E of the Storm Water Standards).

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-12*	Amend BMP Design Manual for nurseries and garden centers.	Amend BMP Design Manual to provide supplemental standards for plant nurseries and garden centers. Standards will focus on reducing irrigation runoff, and loading of sediment, pesticides, and nutrients. Measures may include: covered outdoor storage, green waste management BMPs, improved irrigation efficiency to reduce dry-weather runoff, and containment of runoff from impervious areas where plants and materials are stored.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on nurseries (See Part 1, Appendix E of the Storm Water Standards).
CSD-JRMP-13*	Amend BMP Design Manual for auto-related uses.	Amend BMP Design Manual to provide supplemental standards for automotive-related uses to reduce loading of metals, oils, grease, and trash. Measures may include: four-sized covered trash enclosures, and careful review of auto-related usage areas (e.g. garage bays at repair shops) for grading, drainage, and drain connections to sanitary sewer systems.	FY15	Completed within schedule	Yes	No Change	Completed	FY16 Notes: Developed a fact sheet on auto-related facilities (See Part 1, Appendix E of the Storm Water Standards).

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-14*	~~Develop and administer an alternative compliance program for on-site structural BMP implementation (includes identifying Watershed Management Area Analysis [WMAA] candidate projects). Refer to Section 4.2.5.~~ Offsite Alternative Compliance Option	Refer to JRMP Section 4.2.3.1. WMAA and Water Quality Equivalency Study completed in FY15. Phase I, applicant implemented projects, is anticipated to be in effect by the end of FY16 contingent on Regional Board's approval of the WQIPs. Phase II, the expansion of the program to include other alternative compliance options, is expected to begin in FY16.	FY15	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Phase 1 of the Alternative Compliance Program (ACP) went into effect on 2/16/16. Development on Phase 2 of the ACP, including public involvement via Technical Advisory Committee (TAC) meetings, began during FY16. FY17 Notes: Continue developing Phase 2 of ACP. Topics to discuss include: environmental permitting, long-term facility maintenance, legal agreements and credit tracking, maintenance and permitting rules, and credit tracking and legal rules. Public involvement via TAC meetings will continue.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.4 Construction Management								
CSD-JRMP-15	Administer a program to oversee implementation of temporary BMPs that control sediment and other pollutants during the construction phase of projects. Includes requirements to inspect at appropriate frequencies and effectively enforce requirements through process controlled by other City departments.	Refer to JRMP Section 5. Inspections performed by the City or City staff provide verification that each site is in conformance with the Construction Storm Water BMP Performance Standards in the Storm Water Standards Manual. Inspections are tracked to ensure that they meet the minimum inspection frequencies. High priority active and inactive sites are inspected bi-weekly during the rainy season. Medium priority sites are inspected monthly during the rainy season. Low priority sites are inspected as-needed during the rainy season. All sites are inspected as-needed during the dry season. Please see Attachment 1 for details on construction BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None
E.5 Existing Development								
Commercial, Industrial, Municipal, and Residential Facilities and Areas								
CSD-JRMP-17	Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and PGAs, as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods.	Refer to JRMP Sections 6, 7, and 8. All industrial and commercial areas are inspected once within ~~the Permit term (~~five years~~)~~. At a minimum, 20 percent of industrial and commercial areas receive onsite inspections every year. Municipal facilities are inspected twice annually, once prior to the rainy season, and once during the rainy season. Residential management areas (RMAs) within the City are to be inspected once within five years ~~the Permit term~~, at a minimum. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: The City began patrols of residential management areas in FY16. See the City's JRMP Annual Report form, also included in Appendix 2, for numbers of inspections, violations, and enforcement actions for all types of existing development.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-18	Update minimum BMPs for existing residential, commercial, and industrial development. Specific updates to BMPs include required street sweeping, catch basin cleaning, and maintenance of private roads and parking lots in targeted areas.	Refer to JRMP Appendix IX. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY15	Continuous every 5 years/ permit cycle	Yes	No Change	Completed	None
CSD-JRMP-19	Outreach to property managers and trash haulers to elevate the emphasis of power washing as a pollutant source.	Emphasis will be placed on non-compliant washing as an enforceable violation. Will occur city-wide in residential, commercial, and industrial areas.	FY15	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: City staff utilized a new fact sheet consistent with updated permit conditions to inform non-compliant power-washing operators of BMP requirements. The fact sheet was also provided to the San Diego Downtown Partnership as part of the City's education and outreach effort for downtown businesses. FY17 Notes: The City anticipates distributing a comprehensive BMP guidebook to businesses and business district leaders in areas with regular power-washing activities.
CSD-JRMP-20	Implement property based inspections.	Property-based inspections increase awareness and responsibility for individual properties to tackle issues associated with trash, landscapes, and parking areas. Expanding beyond the business-level inspections will achieve different and more effective opportunities for education, outreach, inspection, and enforcement to encourage water conservation strategies. Inspection frequency dependent on type of facility. See CSD-9 for inspection frequency.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Inventoried properties have been mapped in GIS. The City's inspection data management system has also been set up to track and map the properties inspected each fiscal year and over the Permit cycle.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-21	Review policies and procedures to ensure discharges from swimming pools meet permit requirements.	Verify and bring to City Council for consideration an update (as needed) for the City's Municipal Code (43.0301) to meet new permit requirements for swimming pool discharges.	FY15	Continuous- As needed	Yes	No Change	Completed	None
CSD-JRMP-22*	Promote and encourage implementation of designated BMPs for residential and non-residential areas.	Landscape-based rebates are a "gateway" for adoption of other beneficial practices and are one of the nonstructural methods which address impacts from single-family residential areas (City of San Diego 2011 program development background study). Residential incentives can include: education and training ~~(neighborhood watershed field days)~~, and aggressive subsidies or rebates for grass replacement and rainwater harvesting. Existing programs will be expanded overall, and ~~also have targeted expansion within specific subwatershed, particularly with highest water quality priority conditions. W~~will occur city-wide in residential, commercial, and industrial areas.	Prior to FY16	Continuous- Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
MS4 Infrastructure								
CSD-JRMP-23	Implementation of operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, channels as allowed by resource agencies, detention basins, pump stations, etc.) for water quality improvement and for flood control risk management.	Refer to JRMP Section 7. Storm drain inlets are inspected ~~at least once per year~~ generally annually, and cleaned when accumulated materials are present. Other MS4 and related structures are inspected as needed.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: 2,438 storm drain inspections were completed in the WMA, and 125.2 tons of sediment, trash, and debris were removed during storm drain cleaning. In addition to routine maintenance of the MS4 across its entire jurisdiction the City repaired or replaced 12 pump stations and modernized another 14 pump stations, televised 28,000 linear feet of pipe in 62 locations, and began the development of the Waterways Maintenance Plan and Channel Maintenance Prioritization Plan. Removed 0.06 tons of trash from routine open channel trash cleaning in the WMA.
CSD-JRMP-28	Proactively repair and replace MS4 components to provide source control from MS4 infrastructure.	In order to limit inflow of pollutants and reduce pollutant loads, proactive measures will be taken to improve, repair, and replace MS4 components. The City of San Diego will start a multi-year program of repairing and replacing storm drain pipes to reduce sediment loading to the MS4. Development of an assessment management program and bond issues will be addressed. Exploration of daylighting pipes will take place where feasible and appropriate.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None
CSD-JRMP-29	Replacement of hard assets.	Includes needed replacement of storm drains and structures.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-30	Coordinate with other City departments (PUD) to implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers.	Refer to JRMP Section 7.	FY16	Continuous- Ongoing	Yes	No Change	Yes	FY16 Notes: The Tiger Team was established in the in FY16 as a joint effort between TSW & PUD to identify and eliminate exfiltration sources from the sanitary sewer system to the MS4. Since the team was created, it has successfully eliminated one major source. FY17 Notes: For FY17, the team is focusing on two sites within the City and are identifying more.
CSD-JRMP-31*	Identify sewer leaks and areas for sewer pipe replacement prioritization.	Risk assessment to include identifying targeted areas (age, location, proximity to MS4), coming up with methodology, pilot, desktop exercise/analysis.	FY16	Continuous- As needed	Yes	No Change	Yes	None
Roads, Streets, and Parking Lots								
CSD-JRMP-32	Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways.	Refer to JRMP Section 7.	FY16	Continuous- Ongoing	Yes	No Change	Yes	FY16 Notes: 2,878 curb miles of roads, streets and highways were swept in the WMA.
CSD-JRMP-35*	Initiate sweeping of medians on high-volume arterial roadways.	Medians of roadways are also a potential source of pollutants. Consider implementing or increasing sweeping of medians. Consider mechanical and hand sweeping techniques.	FY17	Continuous- Ongoing	Yes	No Change	Yes	FY16 Notes: Median sweeping began in FY16. A total of 4,315 median miles were swept in FY16 City-wide.
Pesticides, Herbicides, and Fertilizer BMP Program								
CSD-JRMP-37	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education. ~~permits, and certifications.~~	Refer to JRMP Sections 7, 8, and 9.	FY16	Continuous- Ongoing	Yes	Revised to clarify strategy.	Yes	None

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Retrofit and Rehabilitation in Areas of Existing Development								
CSD-JRMP-38	Development of a strategy and identification of candidate areas of existing development necessary for implementing retrofit projects and facilitate the implementation of such projects.	Refer to JRMP Appendix XIX. The Offsite Alternative Compliance Program will include methods for identifying and assessing potential retrofit projects in existing development areas. Retrofit project selection will be based upon a variety of factors including proximity to high priority water quality conditions, potential pollutant load removal effectiveness, and feasibility of implementation. The program will include protocols related to funding mechanisms for project construction and long-term maintenance, payment and credit structures, and water quality equivalency standards. Specific retrofit projects are included in the Non-JRMP, Structural Strategies categories.	FY18	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	No Change	NA, Not scheduled to be implemented in FY17	None
CSD-JRMP-39	Development of a strategy and identification of candidate areas necessary to implement stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	Refer to JRMP Appendix XIX. The Offsite Alternative Compliance Program ~~(Section 4.2.5.3 and Appendix N)~~ will include methods for identifying and assessing potential stream, channel, or habitat rehabilitation projects in existing development areas. Rehabilitation project selection will be based upon a variety of factors including existing stream or habitat degradation, potential future cumulative stream or habitat impacts, and feasibility of implementation. The program will include protocols related to funding mechanisms for project construction and long-term maintenance, payment and credit structures, and water quality equivalency standards.	FY18	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	Revised to clarify strategy.	NA, Not scheduled to be implemented in FY17	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program								
CSD-JRMP-40	Implement Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include: maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	Refer to JRMP Section 3. ~~The City must visually inspect at least 500 identified and prioritized major MS4 outfalls at least annually during dry weather conditions.~~ Inspections of major MS4 outfalls conducted in response to public reports and staff or contractor reports and notifications may count toward the required visual inspections of MS4 outfall discharge monitoring stations. Please see Attachment 1 for details on how the IDDE Program will address sources causing or contributing to the HPWQC.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: 171 cases were investigated, including 119 reported by the public; 140 illicit discharges or illicit connections were eliminated; and 141 enforcement actions and 69 escalated enforcement actions were issued in the WMA. City-wide, the number of discharges investigated has almost tripled since FY14 (1,186 in FY14 to 3,335 in FY16). The increase is believed to be mainly due to increased reports of irrigation runoff discharges from the public and from PUD.
E.7 Public Education and Participation (B.3.b(1)(a)(iii))								
CSD-JRMP-42	Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences.	Refer to JRMP Section 9.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City continued its extensive education and outreach effort across each of the six watershed areas in the City. This included regular attendance at community events in order to share education materials and the continuing sponsorship of community clean-up and pollution prevention education events with the City's Non-Governmental Organization partners, including I Love A Clean San Diego and San Diego Coastkeeper.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-43	Continue implementation of a Pet Waste Program.	Pet Waste Program includes outreach on "Scoop the poop", installation of posts for dispensers, distribution of lawn signs, and attendance at dog-related community activities.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Printed and distributed more pet waste signage. FY17 Notes: New bag dispensers will be installed and there will be outreach at community events. More signage will be installed.
CSD-JRMP-44	Promote and encourage implementation of designated BMPs in commercial and industrial areas.	Provide education and outreach on BMPs for commercial businesses and industrial facilities. Will occur city-wide in non-residential areas.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City continued its mandated commercial and industrial facility inspection effort sharing industry specific education materials with business and property owners when BMP deficiencies were discovered. FY17 Notes: The City will continue its inspection and education effort while also introducing alternative compliance strategies for new developments and sharing the updated Storm Water Standards Manual with target audiences.
CSD-JRMP-45*	Expand outreach to homeowners' association (HOA) common lands and HOA incentives.	Approaches to consider include: offering incentives to HOAs and maintenance districts to adopt water-conserving/efficiency and stormwater-reduction changes to their landscapes, irrigation, and maintenance; conducting workshops with property managers; providing supplemental standards, inspection, or enforcement for HOA-managed properties.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Finalized updated code compliance fact sheets applicable to common lands activities. Coordinated water conservation pollution prevention incentive programming with PUD.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-46*	Develop an outreach and training program for property managers responsible for HOAs and maintenance districts.	Approaches to engage HOAs and property managers include: conducting workshops with property managers, providing supplemental standards, inspections or enforcement around HOA properties, and offering incentives to HOAs and maintenance districts to adopt changes to landscapes, irrigation, or maintenance which promote water conservation or stormwater reduction. Property managers are also a target for enhanced outreach.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None
CSD-JRMP-47	Develop a targeted education and outreach program for homeowners with orchards or other agricultural land uses on their property.	Educate residents on practices of small-scale or on-site composting to protect local water quality. May include targeted education of owners of chickens to address bacteria. Outreach can be coordinated through the San Diego County Agriculture, Weights, and Measures division.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-48	Enhance school and recreation-based education and outreach.	Develop curriculum and establish distribution in public schools. Includes education on water conservation.	FY15	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City worked with its NGO partners to expand the number of children reached through school-aged education programs. The City updated curriculum materials for Project Swell in conjunction with San Diego Coastkeeper and provided printed education materials to leaders with the Ocean Discovery Institute in hope of establishing new partnerships with that organization. FY17 Notes: The City will be expanding the Blue Brigade Middle and High School program sponsored with I Love A Clean San Diego. The City will also distribute written education materials through the newly completed Ocean Discovery Institute headquarters.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-49	Develop education and outreach to reduce irrigation runoff.	Example approaches to reduce or eliminate irrigation runoff may include: education and outreach, prohibition, enhanced enforcement of existing prohibitions, and pilot projects such as the City of Del Mar's pilot door hanger project.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City used communication materials designed to address potential threats from El Nino rains as a new vehicle for educating the public about the need to eliminate irrigation runoff. FY17 Notes: The City is working with partner agencies and other City operations to develop new education and outreach efforts targeting urban runoff.
CSD-JRMP-50*	Develop and distribute regional training materials for water-using mobile businesses.	Consider development of supplemental standards for mobile businesses including: covered trash enclosures, careful review of washing areas (grading, drainage, landscaping, sanitary sewer system connectivity), and appropriate signage (either through zoning for retrofits or "best fix" approaches, or through BMP Design Manual standards). Businesses may include carpet cleaners, tile installers, plumbers, etc.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: The City updated its suite of fact sheets related to mobile business activities to bring them up-to-date with current permit requirements.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-51*	Enhance education and outreach based on results of effectiveness survey and changing regulatory requirements.	Use effectiveness surveys to enhance existing education and outreach programs while proactively keeping up with and incorporating changing regulatory requirements.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City annually conducts thousands of event-based surveys gathering information about public understanding of pollution prevention and about the City's storm water management efforts. The survey effort continued in FY16 and allowed the City to update its education materials and strategies based on current findings about public awareness. FY17 Notes: The City will contract with a new public opinion research firm to perform a statistically valid assessment of general public awareness. The finding from that effort will be combined with the discoveries of the ongoing event survey effort to drive future outreach priorities.
CSD-JRMP-52	Continue to promote and encourage implementation of Integrated Pest Management (IPM) for residents and businesses.	The City will continue to provide education on IPM techniques during presentations and on the City's Think Blue website.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
CSD-JRMP-53*	Improve consistency and content of websites to highlight enforceable conditions and reporting methods.	Websites will be updated to provide a user-friendly format and clarity for stormwater violations, conditions which citizens can and should report, and how to make such reports. Examples of reports for common incidents will be developed and posted which may vary locally and regionally. Photographs of allowable practices as well as illegal practices should be shown for utmost clarity. Displaying hotline numbers prominently on the website and near the photographs of illegal practices will ensure that those seeking to report will be able to do so easily. Also ensure hotline number and website are searchable and can be retrieved by simple internet searches.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City completely revamped its website improving public access and availability of web-based resources including the storm water management and pollution prevention materials developed and posted by the City. The City also brought forward the environmental response documents associated with its channel maintenance efforts. These documents include descriptions of water quality protections undertaken by the City allowing the public to view our agency's watershed protection strategies. FY17 Notes: The Storm Water City will review and renew the entire portfolio of education materials available for public downloading from the City's website.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.6 Enforcement Response Plan								
CSD-JRMP-54	Continue to implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Storm Water Code Enforcement Unit's Standard Operating Procedures (SOPs) - Enforcement Response Plan.	Refer to JRMP Appendix XIII.	Prior to FY16	Continuous- Ongoing	Yes	No Change	Yes	None
CSD-JRMP-55*	~~Increase~~ Focused enforcement of irrigation runoff.	~~Increased~~ Focused enforcement policies against irrigation runoff will be established in tandem with the education and outreach programs on how these actions lead to pollutant loading. By shifting to property-based inspections irrigation runoff can be handled as enforceable violations once the public is well-informed.	FY16	Continuous- Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Performed irrigation patrols and one Residential Management Area Patrol within the WMA throughout FY16. Also receive referrals from Water Conservation at PUD for over irrigation cases that have runoff entering the curb and gutter.
CSD-JRMP-56*	~~Increase~~ Focused enforcement of water-using mobile businesses.	In addition to education, pollution associated with mobile business sources can be handled through policy, code development, inspections of business practices, and enforcement.	FY16	Continuous- Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Performed early morning patrols to find mobile sources and over-irrigation to the MS4.
CSD-JRMP-57*	~~Increase~~ Focused enforcement of all minimum BMPs for existing residential, commercial, and industrial development.	~~Increased~~ Focused enforcement of existing development minimum BMPs.	FY16	Continuous- As needed	Yes	Revised to clarify strategy.	Yes	None
CSD-JRMP-58*	~~Increase~~ Focused enforcement associated with property-based inspections.	Shifting inspections from businesses-specific to property-based will increase effectiveness and sense of responsibility and ownership. Education and outreach must be followed up with inspection and enforcement of regulations to encourage proper landscape and water conservation strategies.	FY16	Continuous- Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-JRMP-59*	~~Increase~~ Focused enforcement of sweeping and maintenance of private roads and parking lots in targeted areas.	Refer to Minimum BMPs in JRMP (Appendix IX).	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None
CSD-JRMP-60*	~~Increase~~ Focused identification and enforcement of actionable erosion and slope stabilization issues on private property and require stabilization and repair.	Eroding and unstable slope areas on private property (excluding construction sites) will be identified as potential sediment loading sources and subject to enforcement. In the short term, this will target enhanced inspection and enforcement programs to ensure inspectors address erosion and slope instability for the purpose of education.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: City staff completed patrols of construction sites that included sediment discharges. They also began the Residential Patrol Program, which notes and addresses sediment discharges in residential areas.
Non-JRMP Strategies (Optional Strategies, B.3.b(1)(b))								
Nonstructural Strategies								
CSD-NS-02	Investigation and research of emerging BMP technology.	Annually the Construction & Development Standards Group identifies new tasks to conduct literature review, communication with researchers outside of the City, physical testing and experimentation of new or emerging technologies, and other research with the goal of updating tools available for reducing pollutant loads from development and redevelopment sites. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous- As needed	Yes	No Change	Yes	FY16 Notes: Continued monitoring and assessment of the biofiltration basin and curbside filtration units at 43rd and Logan.
CSD-NS-03	Approve and implement a green infrastructure policy.	The City will begin developing a policy in FY16 that will increase the green infrastructure requirements for City CIP projects. This policy will be coordinated with ongoing efforts to update City design manuals and LID design standards for public LID BMPs. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous- As needed	Yes	No Change	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-04	Create a manual that outlines right-of-way design standards.	Create a manual that includes flood control performance standards, permanent BMP elements design standards, design standards for green streets and other BMPs, and maintenance access. Provides drainage and streets design standards. Opportunity to merge various existing manuals and provide consistency. Funding and resources were secured for FY2015.	FY15	Completed within schedule	Yes	No Change	Yes	FY17 Notes: Will be published in FY17.
CSD-NS-05	Create a fund that allows habitat acquisition, protection enhancement, and restoration in conjunction with other cooperating entities including community groups, academic institutions, state county, and federal agencies, etc.	This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, and 4) consensus and community support has been achieved. Resources necessary to implement this strategy include a coordinator or manager and maintenance for acquired or restored lands. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. It is anticipated that a minimum of 1 FTE will be needed to implement the program. Once initiated, the time frame for planning to initial implementation is expected to be 3 years. Implementation is in perpetuity as long as funding is retained.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-06	Residential and Commercial BMP: Rain Barrel	The existing PUD rebate program will continue for residential properties and expand for commercial properties for water collection, conservation, and reuse with rain barrels. Will occur city-wide in residential areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Rebates for rain barrels were issued to capture 772,740 gallons of rainwater City-wide.
CSD-NS-07	Residential and Commercial BMP: Grass Replacement	The existing PUD grass replacement cash rebate program will continue and expand for residential and commercial properties. Program encourages a reduction in water use through the conversion of non-artificial grass to water wise plant material, while maintaining a high level of living landscape to benefit the environment. Program does not allow for conversion to artificial turf. Will occur city-wide in residential and commercial areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Rebates were issued to convert 61,032 sq. ft. of turf in the WMA.
CSD-NS-08	Residential and Commercial BMP: Downspout Disconnect	Disconnecting downspouts provide alternate runoff pathways from rooftops, sidewalks, driveways, and roads. Disconnecting downspouts from residential areas to pervious land can allow for depression storage and infiltration. Will occur city-wide in residential and commercial areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Completed downspout redirect guidelines in collaboration with PUD.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-09	Residential and Commercial BMP: Microirrigation	The existing PUD micro-irrigation rebate program will continue and increase for residential and commercial properties. Application of microirrigation aims to improve the efficiency of landscape irrigation through the precise application of water. Will occur city-wide in residential areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Rebates were issued for installing microirrigation for 10,657 sq. ft. of landscaping in the WMA.
CSD-NS-10	Provide Onsite Water Conservation Surveys.	Provide free onsite water conservation surveys to commercial and residential customers to reduce overirrigation and to encourage water conservation. Will occur city-wide in residential and commercial areas. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	None
CSD-NS-11	Enhance and expand trash cleanups through community-based organizations involving target audiences.	Increase effectiveness and reach of trash/beach cleanups and community based efforts by engaging community groups to self-define and carry-out trash clean-ups. Longstanding partnerships and sponsorships with I Love A Clean San Diego and others are recommended to be continued and enhanced. To effectively target stream clean-up efforts, focus on partnerships with community organizations which provide strong engagement with target audiences and communities. Cleanups target trash, however a reduction in trash also reduces other pollutants such as bacteria and nutrients that can attach to food waste wrappers and yard waste. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY 16 Notes: The City partnered with I Love a Clean San Diego on four clean-ups, which resulted in the removal of 24,674 pounds of trash and debris in the WMA.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-16	Conduct a Comprehensive Benefits Analysis to identify benefits other than water quality that are applicable to each of the specific WQIP strategies.	The analysis identifies which other benefits apply to each strategy, and documents the assumptions making those linkages. The delineation of other benefits to strategies includes a general description of each benefit, and a listing of the assumptions that were made to link those benefits to strategies. In addition, the other benefits are characterized with respect to who is directly affected: the city, local residents, local businesses, or visitors. This analysis may be used as part of the adaptive management process to modify future strategies. Funding and resources were secured for FY2015.	FY15	Completed within schedule	Yes	No Change	No	None
CSD-NS-17	Address and clean up trash from transient encampments with collaboration from the Environmental Services Department, which consults with the Homeless Outreach Team.	Coordinate with the Environmental Services Department, in conjunction with the Homeless Outreach Team, to respond to transient encampment trash complaints. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None
CSD-NS-18	Continue participating in source reduction initiatives.	Source reduction initiatives are ultimately the most effective measure to remove pollutants from surface waters, where feasible. Bans or progressive phase-outs that may be considered include: leaf blowers, plastic bags, architectural copper (generally a legacy issue), as well as prohibiting or more aggressively regulating vehicle washing. Additional source reduction initiatives to consider include pesticide sales at hardware stores and irrigation supply stores. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: The City began development of plastic bag ban ordinance. FY17 Notes: Pursuit of City-specific plastic bag ban ordinance will depend on whether Statewide plastic bag ban ballot initiative passes.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-19	Coordinate with Fleet Services to replace City-owned vehicle brake pads with copper-free brake pads as they become commercially available.	Consider legislative mandate and cooperative implementation of copper-free brake pads on city-owned vehicle to reduce pollutant deposition. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council.	FY18	Continuous-Ongoing	NA, Not scheduled to be implemented in FY16	No Change	NA, Not scheduled to be implemented in FY17	None
CSD-NS-22	~~Proactively~~ Coordinate with appropriate City Departments that monitor for erosion, and complete minor repair and slope stabilization on municipal property.	~~Actively~~ Coordinate with Streets Division and other appropriate City Departments that identify and repair eroding slopes that may be contributing to sediment loading. Prepare an inventory and assessment of eroding areas and their risk to surface waters. Follow assessment with a schedule for ongoing inspection and stabilization (potentially based on a number or percentage of sites annually). Consider Caltrans program as a template. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None
CSD-NS-23	Conduct special studies.	Special studies will be conducted to gather data to identify pollutant sources, appropriate targets, or other information. Includes collaboration with universities. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-26	Participate in Reference Watershed Study.	The San Diego Regional Reference Stream Study (currently being conducted by the Southern California Coastal Water Research Project). The study will develop numeric targets that account for "natural sources" to establish the concentrations or loads from streams in a minimally disturbed or "reference" condition. Refer to Section 5.1 for further details. Will occur region-wide. Funding and resources were previously secured.	Prior to FY16	Completed within schedule	Yes	No Change	Completed	FY16 Notes: See Section 5.2 in Appendix C for more information.
CSD-NS-27	Participate in Reference Beach Study.	The San Diego Regional Reference Beach Study (currently being conducted by the Southern California Coastal Water Research Project) will develop numeric targets that account for "natural sources" to establish the concentrations or loads from the beach in a minimally disturbed or "reference" condition. The purpose of this monitoring program is to advise the public of potential health risks that could occur with water contact recreation at local beaches. DEH will post a health advisory notice or close a beach when FIB results are above REC-1 water quality standards. Will occur region-wide in the Los Peñasquitos, San Dieguito River, Mission Bay, and San Diego River WMAs. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	One time	Yes	Revised to clarify strategy.	Completed	FY16 Notes: See Section 5.1 in Appendix C for more information.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-29	San Dieguito Source Identification and Prioritization Process	Assess sources of bacteria in the watersheds using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process. Focus is on the beach/lagoon area of the San Dieguito River WMA, with inputs from the upper watershed also considered where relevant and necessary to identify sources of bacteria to the beach/lagoon. Refer to Section 5.1 for further details. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	One time	Yes	No Change	Completed	None
CSD-NS-30	Collaborate with City of San Diego PUD and other watershed stakeholders in the Lake Hodges Water Quality Concentration Study. Study will characterize conditions and identify sources.	The City of San Diego's Public Utilities Department will conduct studies that can characterize the nutrient budget or "loading rate" for Lake Hodges. The proper characterization of nutrient loads to Lake Hodges include two components: (1) Uninterrupted sampling during storm events or high water flow to Lake Hodges; and (2) Independent characterizations of nitrogen and phosphorus loads to the reservoir. This strategy will include collaboration with other watershed stakeholders. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council.	FY17	Completed within schedule in 2 yrs.	NA, Not scheduled to be implemented in FY16	No Change	Yes	FY 16 Notes: The Responsible Agencies completed the Lake Hodges Nutrients Evaluation Tech Memo to analyze the receiving water and MS4 data collected. FY17 Notes: RAs plan work with PUD on development of a draft work plan for a conceptual model of nutrient sources in the subwatershed surrounding Hodges Reservoir; and, a Study Plan, Monitoring Plan, and Quality Assurance and Project Plan (QAPP) for the Hodges Reservoir Nutrient Source Study.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-31	Using adaptive management, delist the beach segment from the TMDL and Attachment E of the MS4 Permit.	Using the adaptive management process outlined in Section 6, remove 303(d) delisted beach segments from the Bacteria TMDL and Attachment E of the MS4 Permit. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Working with the Regional Board on re-evaluating the bacteria TMDL.
CSD-NS-32	Conduct a Storm Water Fee ~~Cost of Service~~ Study.	Conduct a Storm Water Fee ~~Cost of Service~~ Study that will examine the full cost of flood control and storm water strategies needed to comply with storm water regulations for the City of San Diego. The City of San Diego's Watershed Asset Management Plan will be used as the basis for the study. Funding and resources have been secured for FY2016.	FY16	Completed within schedule	Yes	No Change	Yes	FY16 Notes: Significant progress was made on the fee study; it will be finalized and posted on the City website in FY17. FY17 Notes: Study results to be posted in FY17.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-33	Conduct Sustainable Return on Investment (SROI) analysis to estimate strategies' co-benefits and impacts to the public and the private sector on a common scale.	SROI is an economics-based framework for evaluating quantitative and qualitative performance metrics and monetizing them, if possible, along a triple bottom line (i.e. financial, societal, and environmental). This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, and 4) consensus and community support has been achieved. Resources necessary to implement this strategy include City staff or consulting team. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The anticipated one-time cost to implement is $115,000. Once initiated, the analysis is expected to be complete in 1 year.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-34	Collaborate with the County, if a County-led regional social services effort is established, to provide sanitation and trash management for individuals experiencing homelessness and determine if the program is suitable and appropriate for jurisdictional needs to meet goals.	Support a non-profit or consortium to provide sanitation services associated with hygiene as well as trash management for persons experiencing homelessness. Rented or purchased shower/sanitary trailers providing mobile showers may be organized at specifically scheduled locations and times. This provision has been proposed as a method for preventing surface water usage for sanitation and bathing, as well as opportunity for outreach and referral by social service agencies. The trash management services will include providing trash bags, trash collection areas, and shower/sanitary facilities at centers which provide daytime shelter to their clients, or on a mobile-basis for known transit camps. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, and 4) consensus and community support has been achieved. Resources necessary to implement this strategy include City staff to coordinate with the regional effort. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City’s General Fund.	Must be triggered	Continuous as funding allows	Not Triggered	Revised to clarify strategy.	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-34 (continued)	Collaborate with the County, if a County-led regional social services effort is established, to provide sanitation and trash management for individuals experiencing homelessness and determine if the program is suitable and appropriate for jurisdictional needs to meet goals.	All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The anticipated cost to implement the strategy includes an initial first year planning cost of $30,000 and implementation is expected to cost $10,000 annually thereafter. Once initiated, development of the program is expected in 1 year. Implementation is in perpetuity as long as funding is available.	Must be triggered	Continuous as funding allows	Not Triggered	Revised to clarify strategy.	If Triggered	None
CSD-NS-35	Identify strategy, resources, and funding to support mapping and assessment of agricultural operations.	Prepare and maintain an inventory of the locations of agricultural operations. Identify agricultural land close to receiving waters and/or MS4 system and conducting a site reconnaissance to assess if discharges are likely to occur and develop a series of follow-up actions specific to those risks. Coordinate with other City of San Diego departments that own and lease land for agricultural uses. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured and 2) staff resources are identified and secured. Resources necessary to implement this strategy include a coordinator or project manager. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Once initiated, development of the program is expected in 2 years.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-36	Coordinate with County of San Diego and identify resources and funding to implement a program to target on-site wastewater treatment (septic) systems. May include mapping and risk assessment, inspection, or maintenance practices.	Coordinate with County of San Diego program. The extent, age, and location of on-site systems are generally not well documented. Recommended first step is to inventory and map all of the on-site systems. Techniques involve cross-referencing addresses for customers of central sewer provides with addresses of properties on the associated tax assessor's list, and identifying those addresses without a sewer account. Once on-site systems have been identified, the following parameters can be estimated or analyzed for risk assessment: location on the property, system age (from permit or property tax records), soil and slope conditions, development densities, and proximity to surface and groundwater resources. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured and 2) staff resources are identified and secured. Resources necessary to implement this strategy include a coordinator or project manager. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Once initiated, development of the program is expected in 2 years.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-37	Participate in an assessment to determine if implementation of an urban tree canopy (UTC) program would benefit water quality and other City goals, where feasible.	Perform a feasibility study to determine if implementing an UTC program would be beneficial to the City's goals. UTC intercepts rainfall through increased coverage of leaves, branches, and stems and reduces runoff from the storm drainage system. Benefits associated with enhancing an UTC include reducing heat island effects and air pollution in addition to aesthetics and community benefits. Where feasible, native trees will be utilized to prevent invasive trees from migrating to open spaces and to conserve water. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured and 2) staff resources are identified and secured. Resources necessary to implement this strategy include City staff or consulting team. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Once initiated, implementation and assessment is expected in 2 years.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-38	Conduct a feasibility study to test Permeable Friction Course (PFC), a porous asphalt that overlays impermeable asphalt.	Perform an assessment to determine the feasibility of implementing PFC on City streets. PFC, an overlay of porous asphalt, is an innovative roadway material that improves driving conditions in wet weather and water quality. Placed in a layer 25-50mm thick on top of regular impermeable pavement, PFC allows rainfall to drain within the porous layer rather than on top of the pavement. PFC has also been shown to reduce concentrations of pollutants commonly observed in highway runoff. PFC incorporates stormwater treatment into the roadway surface and does not require additional right-of-way. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) funding to address MS4 discharges is identified and secured and 2) staff resources are identified and secured. Resources necessary to implement this strategy include City staff or consulting team. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The anticipated cost to implement the strategy is $50,000. Once initiated, implementation and assessment is expected in 2 years.	Must be triggered	Completed within schedule	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-39	As opportunities arise and funding sources are identified, protect areas that are functioning naturally by avoiding impervious development and degradation on unpaved open space areas, creating permanent open space protections on undeveloped city-owned land, and accepting privately-owned undeveloped open areas.	This strategy may be implemented if there is interest in participation by the public or private entity with current control of the land. This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) identification of partners, if needed (public, private, non-profit), 2) identification of costs and potential sources of funding, 3) final agreement by public or private entity with current control of the land, 4) final agreement by all other participating partners including acceptance by intended land- or asset-owning City department, and 5) funding in place. Resources necessary to implement this strategy include a coordinator or manager and maintenance for acquired lands. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. The time frame for implementation will vary by project. Implementation is in perpetuity as long as funding is available.	Must be triggered	Continuous as funding allows	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-43	Lake Hodges Natural Treatment System Project	This strategy may be implemented at any time at the City's discretion. This strategy will coordinate with watershed stakeholders on Integrated Regional Water Management (IRWM) Proposition 84 funding grant project to model the Lake Hodges watershed (hydrology and water quality loading) to assist in siting locations for nutrient reducing BMPs. Recommendations include using the 85th percentile event for sizing multiuse treatment area BMPs, locating and defining baseflow within key reaches. Resources necessary to implement this strategy include City staff time for coordination with the collaborative effort. Projected funding needs may be met through award of a grant, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Proposition 84 grant application has been submitted. Grantees will be identified in FY2016.	Must be triggered	Continuous as funding allows	Yes	No Change	Yes	FY16 Notes: The City of San Diego's Public Utilities Department secured $2.9M in Prop 84 funding. FY17 Notes: Complete the preliminary design and permitting phase.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-44	Participate in a watershed council or group if one is established.	This strategy may be implemented at any time at the City's discretion if the following triggers are met: 1) partners have been identified and formal MOUs have been developed and 2) consensus and community support has been achieved. Resources necessary to implement this strategy include a coordinator or project manager. Projected funding needs may be met through award of a grant, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council. Once initiated, development of the program is expected in 2 years. Implementation would be in perpetuity as long as funding is retained.	Must be triggered	Continuous as funding allows	Not Triggered	City-specific version of WMA strategy.	If Triggered	None
CSD-NS-47	Coordinate with Development Services Department to ~~P~~prohibit introduction of invasive plants in new development and redevelopment projects.	Coordinate with the City's Development Services Department to continue to prohibit introduction of invasive species such as Arundo donax and Cortaderia selloana for new development or redevelopment projects as specified in the City's municipal code for landscape. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
CSD-NS-50	San Dieguito Wetland Restoration Project	Collaborate with Copermittees and organizers of the San Dieguito River Park (SDRP) to restore the San Dieguito coastal wetlands and lagoon system. The 150-acre wetland restoration work has been primarily accomplished by Southern California Edison (SCE) and partner owners of the San Onofre Nuclear Generating Station (SONGS), including San Diego Gas & Electric (SDG&E), City of Riverside, and City of Anaheim. Construction began in fall 2006 and the $90-million Restoration Project was officially dedicated in 2011. Funding for monitoring and managing the wetlands is ongoing. Resources necessary to implement this strategy include City staff to coordinate with the regional effort. Projected funding needs may be met through grant funding, support from community groups or other institutions, or the City's General Fund. All General Funds are secured on an annual basis and are contingent upon annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	City-specific version of WMA strategy.	Completed	None
CSD-NS-51	Collaboration with the Regional Board.	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Industrial General Permit, 2) enforcement of the Ag Waiver, 3) enforcement of other non-MS4 dischargers, and 4) Bacteria TMDL updates, as appropriate for each WMA. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous-Ongoing	Yes	City-specific version of WMA strategy.	Yes	<u>FY16 Notes:</u> Provided written comments to the Regional Board, State Water Board, and US Environmental Protection Agency (EPA) regarding proposed rules and regulations.

Table D-4 (continued)

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Structural Strategies								
Green Infrastructure								
CSD-GI-15	If interim load reduction goals are not met and additional green infrastructure is required, additional publicly-owned parcels have been identified as potential opportunities for green infrastructure implementation.	Construction, operation, and maintenance of bioretention and permeable pavement on prioritized public parcels. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs.) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx. $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs.; approx. $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr.; project construction costs are TBD and are based on size of the project). 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Green Streets								
CSD-GS-03	Callado Road	Construction, operation and maintenance of a green street project at Callado Road and Pastoral Street to treat a drainage area of 9.86 acres. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council.	FY16	Completed within schedule in FY18	Yes	No Change		See Table D-6 for an updated list of completed and planned Structural Projects.
CSD-GS-11	If interim load reduction goals are not met and additional green infrastructure is required, the additional acreage of bioretention and permeable pavement may be implemented through green streets if potential opportunities for green infrastructure implementation on public parcels are not available.	This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs.) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx. $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs.; approx. $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr.; project construction costs are TBD and are based on size of the project) 8) Operation&M will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	
Multiuse Treatment Areas								
Infiltration and Detention Basins								
CSD-MUTA-10	If interim load reduction goals are not met and additional multiuse treatment areas are required, an infiltration basin may be implemented on open space across from San Pasqual Union Elementary School can be implemented upon detailed site assessment.	Construction, operation and maintenance of an Infiltration basin that would treat a total drainage area of 5,818 acres on 19 acres of available space. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured.	Must be triggered	Continuous-Ongoing	Not Triggered	No Changes	If Triggered	None
CSD-MUTA-11	If interim load reduction goals are not met and additional multiuse treatment areas are required, an infiltration basin may be implemented on open space between I-15 and West Bernardo Drive.	Construction, operation and maintenance of an infiltration basin that would treat a total drainage are of 146 acres on 6.0 acres of available space. The site is centrally located in the San Dieguito WMA, between I-15 and West Bernardo Drive (south of the Ed Brown Center). This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None
CSD-MUTA-12	If interim load reduction goals are not met and additional multiuse treatment areas are required, an infiltration basin(s) may be considered on publicly owned open spaces in canyon areas on a case-by-case basis when no other opportunities for load reductions exist.	Construction, operation, and maintenance of infiltration basin(s) in canyon areas. 9 potential canyon sites, owned by the City of San Diego or CSD Open Space Parks, have been identified in San Dieguito WMA that provide up to 1,406 acres of available space (1,885 total parcel acreage). This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, and 3) staff resources are identified and secured.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Stream, Channel and Habitat Rehabilitation Projects (B.3.b.(1)(b)(iii))								
CSD-MUTA-20	If interim load reduction goals are not met and additional stream, channel, and habitat rehabilitation projects are required, implement as needed.	This strategy may be triggered as 1) funding to address MS4 discharges is identified and secured, 2) staff resources are identified and secured, 3) partners have been identified and formal MOUs have been developed, 4) permits required by regulatory agencies are secured, and 5) recommendations from the community are identified and consensus and community support has been achieved. Will occur in areas identified during feasibility studies.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None
Water Quality Improvement BMPs								
Priority Development Projects (PDPs)								
CSD-PDP-05	Priority Development Project BMPs in San Dieguito River WMA.	Per the Storm Water Standards Manual, all non-exempt public PDPs are subject to requirements to construct and maintain permanent BMPs. See WQIP Annual Report for updated PDP BMP Inventory. Funding and resources have been secured for PDPs implemented prior to FY16. Funding for PDP BMPs constructed in future fiscal years is contingent on annual budget approval by City Council.	Prior to FY16	Continuous-Ongoing	Yes	Multiple similar strategies were compiled into this new strategy listing to simplify recordkeeping and reporting.	Yes	See Table D-7 for a current list of PDP BMPs.

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Dry Weather Flow Separation and Treatment Projects								
CSD-WQBMP-09	If interim load reduction goals are not met and additional dry weather flow separation and treatment projects are required, implement as needed.	Construction of dry weather flow separation and treatment projects, where identified. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in downstream reaches where persistent dry weather flows have been observed. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3-6 months) 2) Secure funds in the form of general funds, bonds, or grants (6 months-2 yrs.) 3) Obtain City Council approval of Capital Improvement Projects budget (occurs annually in May) 4) Initiate preliminary engineering to narrow project scope (6 months; approx. $30K per CIP project) 5) Hire design consultant to develop detailed construction plans and construction cost estimates (2 yrs.; approx. $500K per CIP project) 6) Complete construction contractor bid and award process for construction phase (6 months) 7) Construct project (4 months- 1 yr.; project construction costs are TBD and are based on size of the project) 8) Operation and maintenance will be in perpetuity. Funds and staff resources for this function must be approved by City Council as part of the City's annual budget.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Trash Segregation								
CSD-WQBMP-10	If interim load reduction goals are not met and additional trash segregation projects are required, implement as needed.	Construction of trash segregation (Trash Guards, etc.) projects, where identified. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in high loading areas city-wide.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None
WMA Strategies (Optional Strategies, B.3.b.(2))								
WMA-3	San Dieguito Wetland Restoration Project	The Cities of San Diego and Del Mar are collaborating organizers of the San Dieguito River Park (SDRP) to restore the San Dieguito coastal wetlands and lagoon system. The 150-acre wetland restoration work has been primarily accomplished by Southern California Edison (SCE) and partner owners of the San Onofre Nuclear Generating Station (SONGS), including San Diego Gas & Electric (SDG&E), City of Riverside, and City of Anaheim. Construction began in fall 2006 and the $90-million Restoration Project was officially dedicated in 2011. The Restoration Project has enhanced southern California's unique coastal and marine environment as the restoration has provided adequate tidal flushing and circulation to support biologically diverse habitats. Beyond protecting endangered species and providing habitat to hundreds of bird species and fish, the restoration project has also added a coastal segment to the Coast to Crest Trail, allowing public enjoyment of the wetlands area while protecting sensitive habitat and vegetation. Funding for monitoring and managing the wetlands is ongoing.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Completed	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-4	Collaborative Approach to Irrigation Reduction	Responsible Agencies are collaborating with water agencies to encourage implementation of water conservation efforts. Water conservation that attempts to reduce irrigation and minimize storm water runoff can also improve water quality of receiving waterbodies. MWD's SoCal Water$mart Program supports conservation efforts by offering incentives in the form of rebates for rain barrels, rotating sprinkler nozzles, weather-based irrigation controllers, soil moisture sensor systems, and turf replacement. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council or appropriate legislative body (i.e. the Board).	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-6	Offsite Alternative Compliance Option ~~(WMAA)~~	The WMAA provides alternative compliance methods in lieu of meeting structural BMP design standards and/or hydromodification management criteria on the project site. The San Diego County Copermittees have collectively funded and provided guidance for development of a regional WMAA. Copermittees compiled a list of candidate projects that consider the numeric goals of the WMAs as well as projects previously identified in JRMPs and other regulatory documents. Next steps include submittal of the water quality equivalency standards final document, ~~anticipated in September 2015. Following a public review and Executive Officer approval, anticipated by November 2015,~~ which was submitted and approved in FY 2016. Following this approval, jurisdictions can formally implement an optional Alternative Compliance Program by ~~December 2015~~ February 2016 (time coincident with implementation of standards set forth in the regional BMP Design Manual and local Storm Water Standards Manuals).	Prior to FY16	Continuous-Ongoing	Yes	Revised to clarify strategy.	Yes	FY16 Notes: Phase 1 of the Alternative Compliance Program (ACP) went into effect on 2/16/16. FY17 Notes: Proposed Water Quality Equivalency (WQE) guideline development for stream restoration.
WMA-7	Collaboration with the Regional Board	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Ag Waiver, 2) enforcement of other non-MS4 dischargers, and 3) bacteria TMDL updates. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	FY16 Notes: Working with Regional Board to include non-Phase I MS4s in general permits, waivers, and Waste Discharge Requirements (WDRs).

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications		Notes
						Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	
WMA-13	Participation in Watershed Council	If a Watershed Council is re-established, the City of San Diego, County of San Diego and potentially other Responsible Agencies will participate. Watershed Councils are typically locally organized, voluntary, non-governmental organizations, and are intended to broadly represent various stakeholders in the WMA. Goals of Watershed Councils may vary, but they generally promote protecting the watershed and sustaining natural resources. This coordination could assist in selecting WMA projects, identifying potential funding opportunities, and promoting communication among community groups and regulated agencies. Resources necessary to implement this strategy include participating jurisdictional staff to coordinate with the regional effort and the development of an agreement (e.g. MOU, JPA) among participating entities, which may take up to one year to coordinate. Projected funding needs may be met through grant funding, support from community groups or other institutions, or jurisdictional General Funds. General Funds are contingent on approval of the annual budget by City Council or appropriate legislative body. Participation is dependent on funding availability and continued benefit to watershed.	Must be triggered	Continuous-Ongoing	Not Triggered	No Change	If Triggered	None

Table D-4 (continued)
City of San Diego Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Proposed Modifications: Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Proposed Modifications: Plan to implement next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-14	Participation in San Diego Integrated Regional Water Management Program	The City of San Diego, County of San Diego, and San Diego County Water Authority form the Regional Water Management Group (RWMG) and administer and implement the San Diego IRWM Program. The Regional Advisory Committee (RAC) includes rotating members from various functional areas related to water management. In San Dieguito River WMA, two integrated projects, funded through Proposition 50 and 84, target water quality in Lake Hodges: 1) San Dieguito Watershed Management Plan Implementation – Lake Hodges Natural Treatment System Conceptual Design and 2) Lake Hodges Water Quality and Quagga Mitigation Measures. Along with grant funding, the City of San Diego Public Utilities Department, City of Escondido, San Dieguito River Valley Conservancy, Santa Fe Irrigation District, and the San Diego County Water Authority are providing local match or in-kind services. All General Funds are secured on an annual basis and are contingent upon annual budget approval by each participating Responsible Agency.	Prior to FY16	Continuous-Ongoing	Yes	No Change	Yes	Hodges Reservoir Natural Treatment System was awarded $2.9 million in grant funding. This project will create a biofiltration wetland at Hodges Reservoir to improve water quality. The wetland also will provide habitat and species conservation benefits, in addition to recreational opportunities. – More information on IRWM efforts is available at http://www.sdcwa.org/more-31-million-awarded-water-projects-san-diego-region#sthash.5sYifWjP.dpuf.

* Strategy IDs with an asterisk indicate those strategies that are considered “jurisdictional” in the MS4 Permit, but are considered enhancements to the JRMP to target highest priority water quality conditions.

Total Completed/Planned BMPs	9.86
Total Completed/Planned PDP BMPs	0.80
Remaining to Goal	-0.06 **(Goal Met/Exceeded)**

D.4.4 Modifications to the BMP Design Manual

In FY16 the City, along with other government agencies, professional engineers and members of the local development community, developed a new Regional Best Management Practices (BMP) Design Manual that conforms to the 2013 Municipal Storm Water Permit (Order No. R9-2013-0001, as amended by R9-2015-0001 and R9-2015-0100). The Manual supersedes the San Diego County-wide Model Standard Urban Runoff Storm Water Management Plan (SUSMP) and provides technical guidance and regional standards for pollutant and flow control requirements for new development and significant redevelopment. The City of San Diego's local version of the BMP Design Manual, the Storm Water Standards Manual, became effective on February 16, 2016.

D.4.5 Modifications to the Jurisdictional Runoff Management Program

The City of San Diego is proposing the following administrative changes to its JRMP. The updated JRMP can be viewed at https://www.sandiego.gov/stormwater/plansreports/jrmp.

	JRMP Section/ Appendix	JRMP Update
1	Executive Summary	Strategy categories and definitions were modified to align with the categories and definitions in the Municipal Storm Water Permit and San Diego Water Board's approved Water Quality Improvement Plans (WQIPs).
2	Section 2.3	In accordance with the Municipal Storm Water Permit, Section 2.3 was updated to state that JRMP updates can be proposed/submitted as part of the WQIP Annual Reports.
3	Section 7.3.13-8	Updated BMP #16 to provide greater clarity.
4	Section 7.3.14	Updated section to include new BMPs for herbicide application.
5	Section 10	Strategy categories and definitions were modified to align with the categories and definitions in the Municipal Storm Water Permit and San Diego Water Board's approved WQIPs. Updated tables, graphs, charts, and text to reflect funding needs to meet the goals and schedules identified in the WQIPs. Added language stating "Estimates of funding needs presented were based on the best information available at the time they were prepared."
6	Sections 7.3.1, 7.3.2, and 7.3.4-15	Updated Minimum BMP language to reflect changes to Appendix IX.

	JRMP Section/ Appendix	JRMP Update
7	Section 3, Section 4, Section 5, Section 6, Section 7, Section 8, Section 9	Based on updates made to the categories and definitions of strategies noted above, the “JRMP Strategies Identified in the WQIPs” tables and “Additional Public Education and Participation Program WQIP Strategies” tables for these sections have been updated for consistency. The strategy identification numbering system and text was updated to reflect administrative changes included in the WQIP Annual Reports.
8	Appendix VI- Residential Management Areas and Patrol Protocols	Updated the residential management areas maps and included newly developed patrol protocols.
9	Appendix IX - Minimum BMPs for Residential, Industrial, Commercial, and Municipal Sites/Sources	Updated references to ordinance sections, changed the “Think Blue” references to the Storm Water Division, and made minor changes to some BMP and description wording for clarification.
10	Appendix XIV- Certificate of Adequate Legal Authority	Signed Certificate of Adequate Legal Authority was added.
11	Appendix XX- Water Quality Improvement Plan Strategies	Updated strategies to reflect the administrative changes made to strategies in the Fiscal Year 2016 WQIP Annual Reports.
12	Appendix XXII- Storm Water Division Projected Funding Needs, 2016-2035	Updated Appendix XX to reflect the funding needs to meet the goals and schedules identified in the WQIPs.

D.5 City of Solana Beach

D.5.1 Annual Report Certifications

The City of Solana Beach's required certifications regarding the preparation of the Water Quality Improvement Plan Annual Report, as well as the legal authorities required by the MS4 Permit are included on the following pages.

D.5.2 Annual Report Form

Solana Beach's completed JRMP Annual Report form and fiscal analysis for FY16 are included on the following pages.

CITY OF SOLANA BEACH www.cityofsolanabeach.org
635 SOUTH HIGHWAY 101 • SOLANA BEACH, CA 92075 • (858) 720-2400 • Fax (858) 720-2455

January 3, 2017

STATEMENT OF CERTIFICATION

SAN DIEGUITO WATERSHED MANAGEMENT AREA
WATER QUALITY IMPROVEMENT PLAN 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations. (40 C.F.R. 122.22(d)).

STATEMENT OF CERTIFICATION

SAN DIEGUITO WATERSHED MANAGEMENT AREA 2015-2016 JRMP ANNUAL REPORT LEGAL AUTHORITY ESTABLISHMENT AND ENFORCEMENT

I certify under penalty of law that the City of Solana Beach has taken necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in section E.1 of the San Diego Regional Water Quality Control Board Order No. R9-2013-0001 as amended by Order No. R9-2015-0100 (Municipal Permit). The Solana Beach Municipal Code (SBMC), including the following provision, provides the City with full legal authority as required by the Municipal Permit as well as authorizes judicial and administrative enforcement procedures to mandate compliance:

1. Storm Water Management, SBMC Section 13.10
2. Excavation and Grading, SBMC Section 15.54

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
CITY OF SOLANA BEACH – ANNUAL REPORT FORM
FY 2015-2016

I. COPERMITTEE INFORMATION		
Copermittee Name: City of Solana Beach – San Dieguito HU		
Copermittee Primary Contact Name: Ron Borromeo		
Copermittee Primary Contact Information: Address: 635 South Highway 101 City: Solana Beach County: San Diego State: CA Zip: 92075 Telephone: 858-720-2474 Fax: Email: rborromeo@cosb.org		
II. LEGAL AUTHORITY		
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☒ ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?[1]	YES NO	☒ ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☒ ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM[2]		
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
Number of non-storm water discharges reported by the public		10
Number of non-storm water discharges detected by Copermittee staff or contractors		18
Number of non-storm water discharges investigated by the Copermittee		28
Number of sources of non-storm water discharges identified		28
Number of non-storm water discharges eliminated		27[3]
Number of sources of illicit discharges or connections identified		22
Number of illicit discharges or connections eliminated		21[3]
Number of enforcement actions issued		28
Number of escalated enforcement actions issued		0
V. DEVELOPMENT PLANNING PROGRAM		
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES NO	☒ ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES NO	☒ ☐
Number of proposed development projects in review		47
Number of Priority Development Projects in review		4
Number of Priority Development Projects approved		4
Number of approved Priority Development Projects exempt from any BMP requirements		0
Number of approved Priority Development Projects allowed alternative compliance		0
Number of Priority Development Projects granted occupancy		0
Number of completed Priority Development Projects in inventory		10
Number of high priority Priority Development Project structural BMP inspections		10
Number of Priority Development Project structural BMP violations		0
Number of enforcement actions issued		0
Number of escalated enforcement actions issued		0

[1] The City of Solana Beach submitted an update to the JRMP with the San Dieguito WQIP. The document has been posted to the regional clearinghouse
[2] Illicit Discharge Detection and Elimination data was reported based on the monitoring year as presented in the WQIP annual report versus the FY15-16. The IDDE data presented in this report is for the time period 10/1/2015-9/30/2016.
[3] One issue is currently an open investigation; the City of Solana Beach is actively working with the property owner to close out this issue.

FY 2015-2016

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☒	NO ☐

Number of construction sites in inventory	27
Number of active construction sites in inventory	24
Number of inactive construction sites in inventory	3
Number of construction sites closed/completed during reporting period	30
Number of construction site inspections	400
Number of construction site violations	22
Number of enforcement actions issued	22
Number of escalated enforcement actions issued	0

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?	YES ☒	NO ☐

	Municipal	Commercial	Industrial	Residential[4]
Number of facilities or areas in inventory	15	69	1	2
Number of existing development inspections	15	138	1	4
Number of follow-up inspections	0	21	0	0
Number of violations	0	37	0	1
Number of enforcement actions issued	0	37	0	1
Number of escalated enforcement actions issued	0	0	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES ☒	NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES ☒	NO ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES ☒	NO ☐

X. CERTIFICATION

I ☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

4 The City of Solana Beach has two designated Residential Management Areas fully encapsulated within the San Dieguito Watershed.

1. Fiscal Analysis

1.1 Jurisdictional Runoff Management Program Implementation

This section of the Jurisdictional Runoff Management Program (JRMP) Annual Report provides a fiscal analysis of the City's stormwater management programs. On May 8, 2013 the RWQCB adopted a revised Municipal Permit, Order No. R9-2013-0001 requiring Copermittees to conduct an annual fiscal analysis of its jurisdictional runoff program in line with the requirements specified in Section E.8 Fiscal Analysis.

On January 29, 2009, the San Diego Municipal Copermittees adopted the "Standardized Fiscal Method and Format" which provides a model for the City of Solana Beach and other Copermittees to perform the review and annual reporting as required in Order R9-2007-0001, Section G. This methodology and reporting format proved to be an effective model for reporting on City expenditures, and for consistency the City of Solana Beach will continue to use the format for this reporting period FY 2015-2016. The City however, recognizes the additional elements required to be included in the fiscal analysis as specified in Order No. R9-2013-001 Section E.8, and has included those components in this year's report.

1.1.1 General Budget Information

The City of Solana Beach's Budget for FY 2015-2016 was presented to the Solana Beach City Council and approved at a public hearing held on June 10, 2015. The City's NPDES program is primarily implemented by the Public Works Department's Environmental Services. Environmental Services is responsible for the coordination of all storm water related tasks. Therefore, the majority of the reported projected expenditures included in this section are part of the Environmental Services Program's FY 2015-16 budget, which is approximately 6% of the total FY 2015-2016 Public Works Department budget. The budget for the City of Solana Beach has the appropriate funds allocated to meet the requirements of Permit 2013-0001, including any development, implementation, and enforcement activities required.

1.1.2 Fiscal Analysis Methods

The City of Solana Beach used the format and guidelines included in the Fiscal Analysis Method for reporting purposes; however, given the City's financial accounting methods, a few modifications were necessary. These adjustments are described below.

1.1.3 Fiscal Analysis Results

The City's Fiscal Year 2015-2016 jurisdictional (JRMP), watershed and regional projected expenditures for the implementation of the Municipal Permit requirements are summarized in **Table 1-1**.

Table 1-1: Fiscal Year 2015-2016 Expenditure Summary by Program Component

Component Description	Fiscal Year 2015-2016 Projected Expenditures
Jurisdictional Component	
Administration	62,331
Development Planning	22,290
Construction	24,870
Municipal (Including Non-Emergency Fire Flows)	147,385
Industrial and Commercial	14,930
Residential, Education, and Public Participation	23,630
IDDE	57,230
Jurisdictional Total	**$352,666**
Watershed Component	
Carlsbad Watershed	26,287
San Dieguito Watershed	33,787
Watershed Total	**$60,074**
Regional Component	
Total Copermittee Cost Share for Solana Beach	**23,350**
Total Costs	**$436,090**

1.1.4 JRMP Expenditures

The City of Solana Beach used the expenditure categories detailed in the Fiscal Analysis Method for jurisdictional reporting. However, due to the implementation overlap of some of the City's municipal permit components; it is difficult to separate out individual component costs. As a result, the expenditures for residential, education, and public participation are reported as one expenditure category. Additionally, since the City does not explicitly track expenditures by permit component for its budgeting purposes, in many cases estimated percentages were utilized to allocate expenditures into the appropriate municipal permit component categories.

A total of $436,090 was projected to be expended in Fiscal Year 2015-2016 for the implementation of JRMP activities. An overview of the expenditures reflected in JRMP activity components is described below.

Administration
Activities identified in this component represent labor and non-labor expenditures for materials, supplies, equipment, or tools that are not otherwise incorporated into other expenditure categories, general administrative functions (e.g., program planning, budgeting, staff supervision), and program assessment and reporting.

Development Planning
Activities identified in this component represent labor and non-labor expenditures related to issuance or oversight of permits or of plans (e.g., permit counter support, plan checks, permit or application processing), project planning and engineering (e.g. project design specifications, capital improvement projects).

Construction
Activities identified in this component represent labor and non-labor expenditures related to construction site inspections and enforcement.

Municipal
Activities identified in this component represent labor and non-labor expenditures related to maintenance inspections of streets, roads, catch basins and inlets, open channels, and the MS4, municipal facility inspections, street and parking lot sweeping, catch basins and inlets, open channels, and MS4 cleaning, and municipal BMP implementation. Any costs associated with preparing for non-emergency fire-fighting flows are included in the municipal component.

Industrial and Commercial
Activities identified in this component represent labor and non-labor expenditures related to evaluation and enforcement of program requirements at industrial and commercial sites or sources (e.g. routine inspections and complaint investigations).

Residential, Education, and Public Participation
Activities identified in these components represent labor and non-labor expenditures related to investigation and enforcement of residential areas or activities, staffing outreach events, development and production of outreach materials, and any expenditures associated with waste collection and recycling (e.g. household hazardous waste, used oil).

Illicit Discharge Detection and Elimination (IDDE)
Activities identified in this component represent labor and non-labor expenditures related to the identification and elimination of illicit discharges or connections, enforcing the City of Solana Beach's storm water ordinance, and any expenditures related to monitoring programs (e.g. dry weather monitoring, coastal storm drain monitoring, special investigations, field or sampling equipment, materials and supplies).

1.1.5 Watershed Expenditures

The City of Solana Beach used the expenditure categories (administration, watershed activities, cost share contribution, and other) detailed in the Fiscal Analysis Method for watershed reporting. The watershed expenditures included in this report only capture City of Solana Beach's expenditures and do not account for any expenditure disbursed by other Copermittees included in the watershed(s).

A total of $60,074 was projected to be expended in Fiscal Year 2015-2016 for the implementation of watershed activities, which primarily included the development of Water Quality Improvement

Plans (WQIP) for the Carlsbad Watershed and the implementation of planned strategies in the San Dieguito Watersheds.

1.1.6 Regional Expenditures

The City of Solana Beach used the expenditure categories (administration, cost share contribution, regional activities, and others) detailed in the Fiscal Analysis Method for regional reporting. The regional expenditures included in this report only capture the City of Solana Beach's expenditures and do not account for any expenditure disbursed by other Copermittees in the region. A total of $23,350 was projected to be expended in Fiscal Year 2015-2016 for the implementation of regional activities and coordination.

1.1.7 Funding Sources

The City primarily finances its Storm Water Management Department via revenues from an NPDES solid waste fee that was initiated in 2004. The City went through a long, arduous process to establish a long-term funding source to ensure the program would be sufficiently financed from 2004 through 2007. The City was sued by the Howard Jarvis Taxpayer's Association (HJTA), and the fee was put to a vote of the community. In September 2007, property owners in Solana Beach voted in favor of the fee which ultimately results in the City having a funding source to maintain, enhance, and ensure the long-term future of the NPDES program at the City. The NPDES Fee is to be used exclusively for the mandated NPDES Permit programs. For more information on the City's NPDES Solid Waste Fee, please see the City's website at http://www.cityofsolanabeach.org

The City also utilizes the General Fund to assist in supporting some elements of the City's NPDES program. The General Fund is supported by major revenue sources that include property tax, the local portion of the sales tax and use tax, and transient occupancy tax.

D.5.3 City of Solana Beach Strategies

City of Solana Beach's strategies are detailed in Table D-8.

Table D-8
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
JRMP (E.2 – E.7) Strategies (E.3.b.(1)(a))								
E.3 Development Planning								
All Development Projects								
SB-1	For all development projects, administer a program to ensure implementation of source control BMPs to minimize pollutant generation at each project and implement LID BMPs to maintain or restore hydrology of the area, where applicable and feasible.	Refer to JRMP Section 5.	FY16	Continuous-Ongoing	Y	N	Y	Guidelines specified in BMP Design Manual. City has a construction verification process to ensure post construction BMPS are installed.
SB-2	Municipal code and ordinances will be amended as necessary to encourage LID opportunities.	Refer to JRMP Section 5.	FY16	Continuous – Ongoing	In progress	N	Y	Planning staff emphasizes LID incorporation in conceptual design process.
SB-3	Development Planning staff will review LID regulatory changes and ensure compliance with BMP Design Manual.	The City, due to its small size, has one staff member overseeing implementation of the development planning MS4 Permit requirements and ensures compliance with new requirements.	FY16	As required or needed by permit	Y	N	Y	BMP Design Manual has been updated.
SB-4	Provide technical education and outreach to the development community on the design and implementation requirements of the MS4 Permit and WQIP requirements.	At the initial plan review, a Stormwater Checklist is provided which lists the minimum standards required. One-on-one education is available at that time and throughout the development planning process.	FY16	Continuous – Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Priority Development Projects (PDPs)								
SB-5	For PDPs, administer a program requiring implementation of on-site structural BMPs to control pollutants and manage hydromodification. Includes confirmation of design, construction, and maintenance of PDP structural BMPs.	Refer to JRMP Section 5.	FY16	Continuous – Ongoing	Y	N	Y	Annual inspection and verification program.
SB-6	Update BMP Design Manual procedures to determine nature and extent of storm water requirements applicable to development projects and to identify conditions of concern for selecting, designing, and maintaining appropriate structural BMPs.	Refer to JRMP Section 5. County BMP Design Manual will be used and adapted for the City.	FY16	As needed or required by permit	Y	N	Y	BMP Design Manual has been updated.
SB-7	Expanded requirement for on-site treatment if impervious area is planned to increase by more than 500 square feet, a detention basin is required.	With increased impervious area of greater than 500 sq. ft., the City requires a detention basin to treat stormwater runoff. An agreement to maintain the detention basin is also required. This encourages LID and the protection of open space.	Prior to FY16	As needed or required by permit	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-8	Institute a program to verify and enforce maintenance and performance of treatment control BMPs.	Refer to JRMP Section 5. The City has an annual verification of effective operation and maintenance of constructed structural BMPs. The City's structural BMP verification program utilizes the following steps to verify the effective operation and maintenance of each structural BMP constructed under the City's processes: 1) Utilize the structural BMP inventory to create a list of sites, responsible parties, addresses and the associated BMPs. 2) Annually mail out a verification form to be returned to the City. The form will include the following information: a. BMPs to verified b. Description of maintenance taken during previous year c. Requirement to supply information to demonstrate maintenance and/or operating status (vendor invoices, photos etc.) d. Certification from the responsible party that the BMP(s) were maintained and are operating In the event that a responsible party does not respond the City may use its available enforcement measures to obtain compliance.	FY15	Continuous – Ongoing	Yes, the City of Solana Beach has completed visual inspections of all TCBMPS, but has not yet sent out letters.	Letters to be sent out in FY17	Y	-
E.4 Construction Management								
SB-9	Administer a program to oversee implementation of BMPs during the construction phase of land development. Includes inspections at an appropriate frequency and enforcement of requirements.	Refer to JRMP Section 6. BMPs are inspected once a month and before known rain events. Inventory is updated weekly.	FY16	Continuous-Ongoing	Y	N	Y	City has a construction verification process to ensure BMPs are appropriately installed and annual inspection thereafter.
SB-10	Maintain and update a watershed-based inventory of all construction projects issued a local permit that allows ground disturbance or soil disturbing activities.	Create a watershed-based inventory to track all construction projects issued a permit that allow ground disturbance or soil disturbing activities. Track the frequency and results of inspections.	FY16	Continuous-Ongoing	Y	N	Y	Construction database in place.

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-11	Implement or require implementation of BMPs that are site specific, seasonally appropriate and construction phase appropriate. Includes inspections at an appropriate frequency and enforcement of requirements.	Ensure that erosion control plans and BMP plans are appropriately designed at the permit and plan review phase. Perform and document BMP inspections per the Permit.	FY16	Continuous-Ongoing	Y	N	Y	-
E.5 Existing Development								
Commercial, Industrial, Municipal, and Residential Facilitates and Areas								
SB-12	Administer a program to require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types, and PGAs, as appropriate. Includes inspection of existing development at appropriate frequencies and using appropriate methods.	Refer to JRMP Sections 7, 8, & 9. . All existing commercial and industrial facilities are inspected annually. All existing municipal facilities are inspected monthly. Please see Attachment 1 for details on updated minimum BMPs that will be implemented to address sources causing or contributing to the HPWQC.	FY16	Continuous-Ongoing	Y	N	Y	Low flow diverters are vacuumed out monthly.
SB-12.1	Inspection of all commercial and industrial facilities annually	All commercial and industrial facilities are inspected annually.	FY16	Continuous-Ongoing	Y	N	Y	-
SB-12.2	Require minimum BMPs for mobile businesses.	Water-using mobile businesses require minimum BMPs including recovery and removal of waste water.	FY16	Continuous-Ongoing	Y	N	Y	-
SB-12.3	Review policies and procedures to ensure discharges from swimming pools are meeting current permit requirements.	Refer to JRMP.	FY16	Continuous-Ongoing	Y	N	Y	Policies meet permit requirements.
SB-13	Implement pet waste program. May include installation and maintenance of pet waste bag dispensers and trash bins, signage and education, physical removal of pet waste, and enforcement.	Implement education and prevention program. Pet waste bag dispensers and trash bins provided in public areas.	Prior to FY16	Continuous-Ongoing	Y	N	Y	2,000 bags used up every 3 months.

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
MS4 Infrastructure								
SB-14	Implementation of operation and maintenance activities (inspection and cleaning) for MS4 and related structures (catch basins, storm drain inlets, detention basins, etc.).	Refer to JRMP Section 7. The City inspects all MS4 facilities that receive or collect high volumes of trash and debris between May 1st and September 30th once per year. These locations are assessed periodically to determine if inspection frequency revisions are necessary. All remaining MS4 facilities are inspected at any time during the year.	FY16	Continuous-Ongoing	Y	N	Y	-
SB-14.1	Perform catch basin inspection and cleaning	All catch basins inspected annually. Catch basins with excess trash and debris are cleaned annually.	FY16	Continuous-Ongoing	Y	N	Y	More than 300 catch basins Citywide inspected and 18 catch basins cleaned totaling 1.25 cubic yards of debris removed.
SB-14.2	Inspect open-channels and repair scour ponds to reduce pollutant loads and invasive plants and animals as needed.	Stevens Creek Channel is inspected annually. Maintenance is conducted as-needed.	FY16	Continuous-Ongoing	Y	Corrected to Stevens Creek Channel	Y	On May 9, 2016 500 ft of Stevens Creek channel was inspected.
SB-14.3	Repair and replace MS4 components to provide source control from MS4 infrastructure.	Refer to JRMP Section 7. The City proactively repairs and replaces corrugated metal pipe throughout the MS4 in order to control and prevent pollutant sources from within the MS4 infrastructure.	Prior to FY16	Continuous - Ongoing	Y	N	Y	-
SB-15	Implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers and identify sewer leaks and areas for sewer pipe replacement.	The City will continue to implement an aggressive sewer infrastructure replacement program. The City CCTVs a quarter of the sewer infrastructure each year. The results lead to a prioritized list of sewer line replacement projects. The City invests approximately $500,000 in sewer replacement projects per year.	Prior to FY16	Continuous - Ongoing	Y	20% annually	Y	-
Roads, Streets, and Parking Lots								
SB-16	Implement operation and maintenance activities for public streets, unpaved roads, paved roads, and paved highways.	Refer to JRMP Section 7.	FY16	Continuous-Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-16.1	Implement street sweeping on roads and in parking lots	Refer to JRMP Section 7. High priority streets are swept twice per month. Medium priority streets, including all residential streets, are swept once per month. Low priority streets, including 12 parking lots, are cleaned once per month.	FY16	Continuous-Ongoing	Y	N	Y	718,491 total miles swept in FY16.
SB-16.2	Perform sweeping of medians on high-volume arterial roadways.	Refer to JRMP Section 7. Medians on Highway 101 and Lomas Santa Fe are swept once per month.	FY16	Continuous-Ongoing	Y	N	Y	Swept twice per month.
Pesticides, Herbicides, and Fertilizer BMP Program								
SB-17	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	Refer to JRMP Section 7. City does not have authority over application of pesticides, but will implement BMPs. Industrial and commercial inspections cover requirement.	FY16	Continuous-Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Retrofit and Rehabilitation in Areas of Existing Development								
SB-18	Develop and implement a strategy to identify candidate areas of existing development appropriate for retrofitting projects and facilitate the implementation of such projects.	Refer to JRMP Section 8. The process for identifying retrofits will evaluate the following considerations: • Water Quality Improvement Plan (WQIP) Priority and Highest Priority Water Quality Conditions • Likely sources of pollutants generating pollutants related to WQIP conditions • Focus areas identified in WQIP • Vintage of geographic areas of the City – time period existing development was constructed • Public retrofit opportunities through Capital Improvement Program (CIP) projects • Areas of persistent discharges • Inspection/Illicit Discharge Detection and Elimination program findings • Identified areas of hydromodification/other stream impacts Using the considerations above, the City will identify areas where opportunities could provide water quality improvement benefits. Evaluation will include layering of the findings to determine where compounding factors overlap. The City will consider the locations where overlapping occurs and significance of the factors to prioritize areas suited for retrofits and rehabilitation projects. Once specific areas within the City have been identified and prioritized for retrofits and/or rehabilitation projects, the City will perform field verifications on an as-needed basis to substantiate the: • need for retrofits or rehabilitation projects • locations of potential retrofits or rehabilitation projects • appropriate type(s) of retrofit or rehabilitation project • appropriate responsible party to implement the retrofits or rehabilitation projects Specific retrofit projects are included in the Non-JRMP, Structural Strategies categories.	FY18	Continuous-Ongoing	N/A	N/A	N/A	-

Table D-8 (continued)

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-19	Develop and implement a strategy to identify candidate areas of existing development for stream, channel, or habitat rehabilitation projects and facilitate implementation of such projects.	Refer to JRMP Section 8. The process for identifying retrofits will evaluate the following considerations: • Water Quality Improvement Plan (WQIP) Priority and Highest Priority Water Quality Conditions • Likely sources of pollutants generating pollutants related to WQIP conditions • Focus areas identified in WQIP • Vintage of geographic areas of the City – time period existing development was constructed • Public retrofit opportunities through Capital Improvement Program (CIP) projects • Areas of persistent discharges • Inspection/Illicit Discharge Detection and Elimination program findings • Identified areas of hydromodification or other stream impacts Using the considerations above, the City will identify areas where opportunities could provide water quality improvement benefits. Evaluation will include layering of the findings to determine where compounding factors overlap. The City will consider the locations where overlapping occurs and significance of the factors to prioritize areas suited for retrofits and rehabilitation projects. Once specific areas within the City have been identified and prioritized for retrofits and/or rehabilitation projects, the City will perform field verifications on an as-needed basis to substantiate the: • need for retrofits or rehabilitation projects • locations of potential retrofits or rehabilitation projects • appropriate type(s) of retrofit or rehabilitation project appropriate responsible party to implement the retrofits or rehabilitation projects	FY18	Continuous-Ongoing	N/A	N/A	N/A	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.2 Illicit Discharge, Detection, and Elimination (IDDE) Program								
SB-20	Implement Illicit Discharge, Detection, and Elimination (IDDE) Program per the JRMP. Requirements include: maintaining an MS4 map, using municipal personnel and contractors to identify and report illicit discharges, maintaining a hotline for public reporting of illicit discharges, monitoring MS4 outfalls, and investigating and addressing any illicit discharges.	Refer to JRMP Section 3.	FY16	Continuous-Ongoing	Y	N	Y	Online reporting system, staff training and IDDE follow-up investigations completed.
E.7 Public Education and Participation (B.3.b.(1)(a)(iii))								
SB-21	Implement a public education and participation program to promote and encourage development of programs, management practices, and behaviors that reduce the discharge of pollutants in storm water prioritized by high-risk behaviors, pollutants of concern, and target audiences.	Refer to JRMP Section 12 and 13.	FY16	Continuous-Ongoing	Y	N	Y	City supports community based organizations and partnerships and conducts trash and beach cleanups.
SB-21.1	Expand outreach, training, and incentive programs to homeowners' associations (HOAs).	Refer to JRMP Section 12 and 13.	FY16	Continuous-Ongoing	N	Strategy shifted from FY16 to FY17 due to scheduling delays and limited resources	Y	-
SB-21.2	Develop outreach and training program for property managers responsible for HOAs and Maintenance Districts.	Refer to JRMP Section 12 and 13.	FY16	Continuous-Ongoing	N	Strategy shifted from FY16 to FY17 due to scheduling delays and limited resources	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-21.3	Conduct trash cleanups through community-based organizations involving target audiences.	In partnership with I Love a Clean San Diego, host a site in Solana Beach during two beach clean-ups per year.	FY16	Continuous-Ongoing	Y	N	Y	600 pounds of trash collected from sites in Solana Beach over three different cleanup events.
SB-21.4	Target school-based education and outreach.	Collaborate with Solana Center to present relevant watershed and storm water pollution prevention information to school groups once a year.	FY16	Continuous-Ongoing	Y	N	Y	City of Solana Beach provides funding to the Solana Center for stormwater presentations.
SB-21.5	Develop education and outreach to reduce over-irrigation.	Work with SFID to educate residents about reducing over irrigation. Municipal code will be modified to address over irrigation issues.	FY16	Continuous-Ongoing	Yes, Solana Beach works with the SFID. Municipal code modifications forthcoming	N	Y	-
SB-21.6	Continue to support the Clean and Green Committee; a committee of local residents and business owners working to preserve Solana Beach's environment.	Encourage public participation by supporting the Clean and Green Committee. The Clean and Green Committee addresses issues pertaining to water quality, air quality, and climate change. The City Council has also formed a Council Ad-Hoc subcommittee on Environmental Sustainability to work closely with the Clean and Green committee and provide direction to City staff on sustainability programs.	FY16	Continuous-Ongoing	Y	N	Y	-
SB-21.7	Collaborate with regional education and outreach efforts.	Participate in Regional Think Blue campaign and collaborate with other regional efforts to provide consistent message or efficiency in training for targeted audiences.	FY16	Continuous-Ongoing	Y	N	Y	Participates in regional meetings.

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
E.6 Enforcement Response Plan								
SB-22	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	Refer to JRMP Section 11.	FY16	Continuous-Ongoing	Y	N	Y	-
SB--23	Increase enforcement of over-irrigation. Enforcement of power-washing included here.	Refer to JRMP Section 11.	FY16	Continuous-Ongoing	Y	N	Y	Online reporting system and patrol implemented.
Non-JRMP Strategies (Optional Strategies, B.3.b.(1)(b))								
Nonstructural Strategies								
SB-24	Promote and encourage implementation of designated BMPs at residential areas.	Collaborate with Santa Fe Irrigation District (SFID) to promote runoff reduction products and services and provide education to residential customers. Includes residential landscape evaluations and links to MWD and SDCWA rebates and incentives including weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and turf removal.	FY16	Continuous – Ongoing	Y	N	Y	-
SB-25	Promote and encourage implementation of designated BMPs in commercial areas.	Collaborate with SFID to promote MWD's SoCal Water$mart rebates and products such as weather based irrigation controllers, rotating sprinkler nozzles, soil moisture sensor system, rain barrels, and turf removal to commercial facilities.	FY16	Continuous – Ongoing	Y	N	Y	-
SB-26	Continue to apply NPDES pollution management fee to residential and commercial waste and recycling to secure funding for implementation of water quality related programs.	To ensure continued implementation of water quality improvement efforts, the City has secured funding through a NPDES pollution management fee.	FY16	Continuous - Ongoing	Y	N	Y	-
SB-27	Continue participating in source reduction initiatives.	The City was the first to ban non-reusable plastic bags within the region in 2012.	Prior to FY16	Continuous - Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-28	Develop a program to address and capture trash and debris.	Continue to maintain catch basin inserts to collect trash and prevent from flowing into the MS4 and subsequently the receiving water. Two catch basin inserts are installed within the jurisdiction in the San Dieguito River WMA	FY16	Continuous-Ongoing	Y	N	Y	-
SB-29	Conduct special studies.	San Diego Regional Reference Stream Study (currently being conducted by the Southern California Coastal Water Research Project). The study will develop numeric targets that account for “natural sources” to establish the concentrations or loads from streams in a minimally disturbed or “reference” condition. Refer to Section 5.1 for further details.	FY15	One Time	Y	N	N	Completed
SB-30	Reference watershed study.	Assess sources of bacteria in the watersheds using the San Diego Bacteria Source Identification and Prioritization Process developed in 2012 as part of the MS4 Permit Report of Waste Discharge process. Focus is on the beach/lagoon area of the San Dieguito River WMA, with inputs from the upper watershed also considered where relevant and necessary to identify sources of bacteria to the beach/lagoon. Refer to Section 5.1 for further details.	FY15	One Time	Y	N	N	Completed
SB-31	If projects are unable to meet structural BMP design standards or hydromodification management criteria, administer an alternative compliance program for on-site structural BMP implementation (includes identifying Watershed Management Area Analysis [WMAA] candidate projects). Refer to Section 4.2.5 and Appendix N for further details.	This strategy may be triggered if the City decides to administer an alternative compliance program for development and redevelopment	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-32	If a regional social services effort is established, support workgroup to provide sanitation and trash management for persons experiencing homelessness and determine if the program is suitable and appropriate for jurisdictional needs to meet goals.	This strategy may be triggered if a regional effort is established. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) a City staff member to participate in workgroup and determine if the program is suitable and appropriate for jurisdictional needs to meet goals.	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered
SB-33	As opportunities arise and funding sources are identified, protect areas that are functioning naturally by avoiding impervious development and degradation on unpaved open space areas, creating permanent open space protections on undeveloped city-owned land, and acquiring privately-owned undeveloped open areas.	As feasible opportunities arise, the City will protect areas that are functioning naturally. This may include avoiding hardscape development and degradation in unpaved open space areas and creating permanent open space protections to undeveloped city-owned land. This strategy will be triggered on a case by case basis. The following resources, funds, and steps are needed to implement this strategy 1) Identify project locations (3 months) 2) Secure funds in the form of general funds, bonds, or grants if necessary (2 -18 months) 3) Obtain City Council approval	Must be Triggered	Continuous – Ongoing	N/A	N/A	N/A	Not triggered
Structural Strategies								
Green Infrastructure								
SB-34	Highway 101 curb cuts	Curb cuts were installed along Hwy 101 in 2014 and will continue to be maintained.	Prior to 2014	Continuous-Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	**Implemented as planned in current FY (FY16)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(ii)	**Modification for FY17 (If modified or canceled, provide rationale)** MS4 Permit Section: F.3.b.(3)(d)(iv))	**Plan to implement into next FY (FY17)? (Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
SB-35	If interim load reduction goals are not met and additional green infrastructure is required, 8.9 ac of available space have been identified as potential opportunities for green infrastructure implementation on public parcels.	Will utilize the adaptive management process to determine if green infrastructure is necessary to achieve goals. City will assess opportunities and implement as applicable. This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in downstream reaches where persistent dry weather flows have been observed. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3 months) 2) Secure funds in the form of general funds, bonds, or grants (2 -18 months) 3) Obtain City Council approval 4) Initiate preliminary engineering, design and develop construction plans and cost estimates (6 months -2 Years)	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered

(Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Green Streets								
SB-36	If interim load reduction goals are not met and additional green infrastructure is required, the additional acreage required can be implemented through green streets if potential opportunities for green infrastructure implementation on public parcels are not available.	City will assess opportunities and implement as applicable This strategy may be triggered as 1) interim goals are not met, 2) funding to address MS4 discharges is identified and secured, 3) staff resources are identified and secured, and 4) permits required by regulatory agencies are secured. Will occur in downstream reaches where persistent dry weather flows have been observed. The following resources, funds, and steps are needed to implement this strategy if the above triggers are met or at the City's discretion: 1) Identify project locations (3 months) 2) Secure funds in the form of general funds, bonds, or grants (2 -18 months) 3) Obtain City Council approval 4) Initiate preliminary engineering, design and develop construction plans and cost estimates (6 months -2 Years) 5) Bid and Award process for construction phase (6 months) 6) Construct project (4 months- 1 yr; project construction costs are TBD and are based on size of the project) 7) Operation and maintenance will be in perpetuity.	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered
Water Quality Improvement BMPs								
Proprietary BMPs								
SB-37	CDS treatment unit	Installation of a CDS treatment unit at the north end of N. Cedros in 2004. (CG-3064)	2004	Continuous-Ongoing	Y	N	Y	Installed and maintained
SB-38	CDS treatment unit	Installation of a CDS unit in Fletcher Cove Park in 2007. Drainage area is 2.5 acres. (PF-004)	2007	Continuous – Ongoing	Y	N	Y	Installed and maintained
SB-39	Biofilter	Installation of a biofilter at La Colonia Park in 2002. (CG-3069)	2002	Continuous – Ongoing	Y	N	Y	Installed and maintained

(Y/N)** MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
Dry Weather Flow Separation and Treatment Projects								
SB-40	Seascape Sur Outfall Storm Water Diversion Structure Project	Proposed Seascape Sur Outfall Storm Water Diversion Structure Project. Approximate drainage area is 40.5 acres. Plan to start construction September 2014. Funded by Proposition 84 IRWM grant. Estimated cost is between $79,000 and $105,000. (Latitude 32.985441 Longitude 117.273058). Partner agency is San Elijo Joint Powers Authority.	Prior to FY16	Continuous-Ongoing	Y	N	Y	Installed and maintained
WMA Strategies (Optional Strategies, B.3.b.(2))								
WMA-1	Collaborative Approach to Irrigation Reduction	Responsible Agencies are collaborating with water agencies to encourage implementation of water conservation efforts. Water conservation that attempts to reduce irrigation and minimize storm water runoff can also improve water quality of receiving waterbodies. MWD's SoCal Water$mart Program supports conservation efforts by offering incentives in the form of rebates for rain barrels, rotating sprinkler nozzles, weather-based irrigation controllers, soil moisture sensor systems, and turf replacement. Funding and resources have been secured for FY2016. Funding for future fiscal years is contingent on annual budget approval by City Council or appropriate legislative body (i.e. Board).	Prior to FY16	Continuous-Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-2	Offsite Alternative Compliance Option (WMAA)	The WMAA provides alternative compliance methods in lieu of meeting structural BMP design standards and/or hydromodification management criteria on the project site. The San Diego County Copermittees have collectively funded and provided guidance for development of a regional WMAA. Copermittees compiled a list of candidate projects that consider the numeric goals of the WMAs as well as projects previously identified in JRMPs and other regulatory documents. Next steps include submittal of the water quality equivalency standards final document, anticipated in September 2015. Following a public review and Executive Officer approval, anticipated by November 2015, jurisdictions can formally implement an optional Alternative Compliance Program by December 2015 (time coincides with implementation of standards set forth in the regional BMP Design Manual and local Storm Water Standards Manuals).	Prior to FY16	Continuous-Ongoing	Y	N	Y	-
WMA-3	Collaboration with the Regional Board	The Responsible Agencies will work with the Regional Board to identify solutions and address sources of potential water quality impairments. Priorities include 1) enforcement of the Ag Waiver, 2) enforcement of other non-MS4 dischargers, and 3) Bacteria TMDL updates. Discussions with the Regional Board were initiated in FY15. Collaboration will continue in FY16 to identify an appropriate path forward, including a more detailed time line. Funding and resources have been secured for FY16. Funding for future fiscal years is contingent on annual budget approval by each Responsible Agency.	Prior to FY16	Continuous-Ongoing	Y	N	Y	-

Table D-8 (continued)
City of Solana Beach Jurisdictional Strategies for San Dieguito River WMA

ID	Strategy	Implementation Approach	Implementation or Construction Year	Implementation Schedule	Implemented as planned in current FY (FY16)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(ii)	Modification for FY17 (If modified or canceled, provide rationale) MS4 Permit Section: F.3.b.(3)(d)(iv))	Plan to implement into next FY (FY17)? (Y/N) MS4 Permit Section: F.3.b.(3)(d)(iii))	Notes
WMA-4	Participation in Watershed Council	If a Watershed Council is re-established, the City of San Diego, County of San Diego and potentially other Responsible Agencies will participate. Watershed Councils are typically locally organized, voluntary, non-governmental organizations, and are intended to broadly represent various stakeholders in the WMA. Goals of Watershed Councils may vary, but they generally promote protecting the watershed and sustaining natural resources. This coordination could assist in selecting WMA projects, identifying potential funding opportunities, and promoting communication among community groups and regulated agencies. Resources necessary to implement this strategy include participating jurisdictional staff to coordinate with the regional effort and the development of an agreement (e.g. MOU, JPA) among participating entities. Projected funding needs may be met through grant funding, support from community groups or other institutions, or jurisdictional General Funds. General Funds are contingent on approval of the annual budget by City Council or appropriate legislative body. Participation is dependent on funding availability.	Must be Triggered	Continuous-Ongoing	N/A	N/A	N/A	Not triggered

D.5.4 Modifications to the BMP Design Manual

The BMP Design Manual was modified since the WQIP was approved in fall 2015. The current Solana Beach's BMP Design Manual is posted on the City of Solana Beach website, and the link to this page is listed on Project Clean Water.

D.5.5 Modifications to the Jurisdictional Runoff Management Plan

The City of Solana Beach's JRMP is being updated and re-submitted concurrent with this WQIP Annual Report. The changes to the JRMP are mostly related to changes in the final approved WQIP for the Carlsbad Watershed Management Area. The updated Solana Beach JRMP will be posted on Solana Beach's website, and the link to this page is listed on Project Clean Water.

STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT SAN DIEGUITO RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the County of San Diego has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 6th day of January, 2017, at the County of San Diego.

I.B Copermittee Primary Contact Name: Todd Snyder

I.C Copermittee Primary Contact Information:
Address: 5510 Overland Avenue, Suite 410
City: San Diego County: San Diego State: California Zip: 92123
Telephone: (858) 694-3672 Fax: (858) 495-5623 Email: Todd.Snyder@sdcounty.ca.gov

II. LEGAL AUTHORITY

II.A Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES	☒
	NO	☐
II.B A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES	☒
	NO	☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

III.A Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES	☒
	NO	☐
III.B If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES	☒
	NO	☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

IV.A Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES	☒
	NO	☐

IV.B.1 Number of non-storm water discharges reported by the public	286
IV.B.2 Number of non-storm water discharges detected by Copermittee staff or contractors	95
IV.B.3 Number of non-storm water discharges investigated by the Copermittee	375
IV.B.4 Number of sources of non-storm water discharges identified	115
IV.B.5 Number of non-storm water discharges eliminated	112
IV.B.6 Number of sources of illicit discharges or connections identified	85
IV.B.7 Number of illicit discharges or connections eliminated	84
IV.B.8 Number of enforcement actions issued	93
IV.B.9 Number of escalated enforcement actions issued	1

V. DEVELOPMENT PLANNING PROGRAM

V.A Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES	☒
	NO	☐
V.B Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES	☒
	NO	☐
V.C If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES	☒
	NO	☐

V.D.1 Number of proposed development projects in review	925
V.D.2 Number of Priority Development Projects in review	237
V.D.3 Number of Priority Development Projects approved	96
V.D.4 Number of approved Priority Development Projects exempt from any BMP requirements	0
V.D.5 Number of approved Priority Development Projects allowed alternative compliance	0
V.D.6 Number of Priority Development Projects granted occupancy	62

V.E.1 Number of completed Priority Development Projects in inventory	410

FISCAL ANALYSIS COMPONENT

1.1. Introduction

This section presents an estimated annual budget for the County's runoff management programs for FY 2015-16.

1.2. Fiscal Analysis Methods

This section continues to utilize the methodologies and standards established in *Fiscal Analysis Method* submitted by the Copermittees in January 2009.

1.3. Fiscal Analysis Results

As shown the County estimated its total FY 2015-16 expenditures at $27,414,216. This fiscal analysis addresses each of the County's Runoff Management Program elements (jurisdictional, watershed, and regional activities) for the current reporting period (FY 2015-16). Expenditures are described by department and major program area. They represent an estimate of the expenditures that the County incurred in meeting its compliance obligations for FY 2015-16. They should not be interpreted as either budgeted or actual expenditures. Because stormwater program expenditures are distributed throughout a considerable number of County programs, a single consolidated "budget" does not exist for the program as a whole. As such, these figures should be considered best estimates of stormwater-related expenditures.

1.3.1 Expenditures

1.3.1.1. Jurisdictional

Table 1.1 presents the County's estimated jurisdictional expenditures for FY 2015-16.

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
1	**ADMINISTRATION**	**$6,840,583**	These costs correspond to the DPW WPP development, administrative oversight, and assessment of the County's stormwater programs. The WPP is responsible for the development of new and augmented County stormwater programs, regulatory reporting, and program assessment. Some administrative costs are associated with other specific functions shown below, but are included here because they could not be separated out.
2	**DEVELOPMENT PLANNING**	**$1,109,654**	
A	**Land Use Planning**	$0	Expenditures not reported for FY 2015-16; included in other elements.
B	**Environmental Review**	$0	Expenditures not reported for FY 2015-16; included in other elements.
C	**Development Project Approval and Verification**	**$1,109,654**	
C1	**Public Projects (CIP)**	$824,219	
	Project Planning and Engineering	$570,229	Costs include: preparing and reviewing plans and specifications for stormwater BMPs, and SWPPP/WPCP review. These costs apply to DPW, DPR, and DGS.
	Compliance Inspection and Enforcement	$15,000	
	BMP Implementation	$238,990	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
C2	**Private Projects**	$285,435	
	Permitting and Licensing	$285,435	This cost covers PDS plan reviews at permitted sites. Total costs are estimated as fixed percentages of annual plan-checking fees.
3	**CONSTRUCTION**	**$4,500,593**	
A	**Public Projects (CIP)**	$2,886,893	Costs include: BMP compliance inspections during construction, and implementation of construction phase BMPs. These costs apply to DPW, DPR, and DGS.
	Compliance Inspection and Enforcement	$1,613,880	
	BMP Implementation	$1,273,013	
B	**Private Projects**	$1,613,700	
	Compliance Inspection and Enforcement	$1,613,700	This cost primarily covers DPW and PDS construction inspections at permitted sites. Total costs are estimated as fixed percentages of inspection program fees.
4	**MUNICIPAL**	**$7,572,297**	
A	**Administration**	$267,805	Expenditures associated with the administrative oversight of the stormwater programs, regulatory reporting, and program assessment of municipal facilities by the DPW - Watershed Protection Program.
B	**Streets, Roads, and Highways Element**	$2,256,091	
	Administration	$291,160	Founded road operations activities include: culvert inspections and cleaning;

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	Maintenance Inspections	$1,890,813	increased culvert waste disposal costs, street sweeping, installation and maintenance of BMPs and road structures, and the placement of additional controls. 10% of the Maintenance and Inspections and BMP Implementation is reported as Administration cost.
	BMP Implementation	$74,118	
	Other	$0	
C	**MS4 Element**	$1,530,000	
	Administration	$191,000	The combined costs shown here apply across (1) DPW Flood Control -- conversion of existing concrete lined channels to natural bottom channels, updating flood control master plans, increased maintenance of flood control systems, and construction and maintenance of regional treatment BMPs; and (2) DPW Flood Control MS4 Operation & Maintenance -- maintenance on flood control facilities throughout the unincorporated areas of the County, exclusive of facilities within road rights-of-way (included in 4.B above). Other includes the cost of disposal of debris removed from MS4.
	Maintenance Inspections	$1,046,900	
	BMP Implementation	$290,500	
	Other	$2,500	
D	**Solid Waste Facilities Element**	$406,618	
	Administration	$35,047	Costs include Regional Board stormwater permit fees, consultant costs associated with stormwater upgrade and repair projects, and office staff time.
	Maintenance Inspections	$16,922	Costs include staff time to perform site inspections.
	BMP Implementation	$79,149	Costs include stormwater consultant site inspections, sampling/testing and BMP materials.
	Other (construction)	$275,500	Drainage improvement projects and BMP site maintenance projects.
E	**Wastewater Facilities Element**	$187,000	
	Administration	$10,000	This includes costs associated with JRMP report, the sanitary sewer system and facilities including: pump stations, sewage treatment plants and Spring Valley Operations facility. Also includes the cost of BMP design, acquisition,
	Maintenance Inspections	$127,000	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	BMP Implementation	$50,000	maintenance and monitoring, for wastewater Capital Improvement Projects, and Major maintenance projects, and at various wastewater facilities.
	Other	$0	
F	**Road Stations Element**	$919,867	
	Administration	$83,624	This includes DPW road station operations related to Permit compliance. The Administration cost is determined as 10% of the total costs of maintenance and Inspections and BMP Implementation as reported by the DPW Roads Divisions.
	Maintenance Inspections	$799,414	
	BMP Implementation	$36,829	
	Other	$0	
G	**Fleet Maintenance Element**	$11,722	
	Administration	$1,036	This includes costs associated with operation of the County's fleet maintenance and fueling facilities.
	Maintenance Inspections	$7,392	
	BMP Implementation	$3,294	
	Other	$0	
H	**Municipal Airfields Element**	$338,110	These costs involve site inspections, annual reporting, and maintenance of BMPs at airports, including oversight of tenant operations. The BMP implementation item includes Palomar asphalt cap repairs.
	Administration	$12,737	
	Maintenance Inspections	$0	
	Compliance Inspection and Enforcement	$0	
	BMP Implementation	$300,623	
	Other (sampling and analysis)	$24,750	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
I	**Parks & Recreational Facilities Element**	$1,214,562	
	Administration	$121,362	This includes: coordinating all training requirements, preparing and reviewing reports, and overseeing the overall implementation of the stormwater program for DPR.
	BMP Implementation	$991,603	This includes costs associated with implementation of BMPs at County parks.
	Compliance Inspection and Enforcement	$101,597	Costs are for DPR enforcement of stormwater requirements at County parks.
	Other	$0	
J	**Office Buildings & Other Municipal Facilities Element**	$297,867	
	Administration	$0	DGS conducts a variety of storm water activities including: inspections and clean-up of County-owned, occupied, and leased facilities and vacant lands; maintenance and signage of storm drain inlet inserts and trash dumpsters; placement of inlet filters; maintenance of coverage and containment improvements for on-site supplies and materials; parking lot sweeping and controlled parking lot power washing; and application of erosion and sediment control measures. These costs are exclusive of fleet maintenance and fueling operations.
	Maintenance Inspections	$99,808	
	BMP Implementation	$198,059	
	Other	$0	
	Management of Pesticides, Herbicides, & Fertilizers	$142,656	
	Administration	$142,656	Integrated Pest Control Program within the Department of Agriculture, Weights and Measures (AWM) performs eradication and control of invasive weeds. This program also provides weed control on roadsides, airports, flood control channels,
	Maintenance Inspections	$0	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	BMP Implementation	$0	sewage treatment plants and inactive landfills. It also provides structural pest control to facilities owned and operated by the county.
	Other	$0	
5	**INDUSTRIAL and COMMERCIAL**	**$1,575,635**	
	Administration	$253,047	DPW and AWM conduct inspections of a variety of businesses in the unincorporated County, provide regulatory oversight of mobile businesses, and conduct follow-up and enforcement of stormwater violations.
	Compliance Inspection and Enforcement	$1,245,279	
	Educational Outreach	$77,309	
	Other expenditures	$0	
6	**RESIDENTIAL**	**$1,205,386**	
	Compliance Inspection and Enforcement	$688,453	DPW conducts complaint investigations for residential sources in the unincorporated County, and conduct follow-up and enforcement of stormwater violations. DPW also operates a regional hotline.
	Educational Outreach	$516,933	Several County departments coordinate and provide outreach to the residential sector and schoolchildren in support of Permit Section D.5 requirements. Costs reported here correspond to DPW only. Funded activities include developing pollution prevention content and providing direct outreach to various target audiences within the general residential and schoolchildren target audiences.
7	**IDDE**	**$321,523**	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
		$321,523	DPW conducts monitoring programs, assesses scientific data, and provides technical and scientific support to other County program staff. They also provide support for all technical and scientific aspects of JRMP development and implementation. These costs are exclusive of the regional monitoring program which is addressed separately under regional costs.
8	**EDUCATION**	**$0**	Education costs are included in other sections as applicable.
9	**PUBLIC PARTICIPATION**	**$0**	Public participation costs are included in other sections as applicable.
10	**SPECIAL INVESTIGATIONS**	**$0**	Expenditures not reported for FY 2015-16; included in other elements.
11	**NON-EMERGENCY FIREFIGHTING**	**$0**	Expenditures not reported for FY 2015-16; included in other elements.
		$23,125,671	

1.3.1.2 Watershed

Table 1.2 presents the County's estimated watershed expenditures for FY 2015-16.

Table 1.2 – Estimated Watershed Expenditures for FY 2015-16

	Santa Margarita WMA	San Luis Rey WMA	Carlsbad WMA	San Dieguito WMA	Peñasquitos WMA	San Diego River WMA	San Diego Bay WMA	Tijuana WMA
Administration	$37,583	$201,492	$82,653	$113,035	$75,309	$105,117	$37,583	$75,309
Cost Share Contribution	$0	$62,494	$46,204	$8,885	$1,062	$68,970	$6,659	$2,346
Watershed Activities	$626,917	$119,390	$14,860	$171,640	$26,423	$125,705	$111,491	$80,300
Other	$0	$0	$0	$0	$0	$0	$0	$0
Total Estimated Watershed Costs	**$664,500**	**$383,376**	**$143,717**	**$293,560**	**$102,794**	**$299,792**	**$155,733**	**$157,955**

1.3.1.3 Regional

Table 1.3 presents the County's estimated regional expenditures for FY 2015-16. This includes only those expenditures associated with the Copermittees' adopted Regional Budget and Work Plan. Other costs associated with regional participation (meeting attendance, etc.) are included within the jurisdictional expenditures presented above.

Table 1.3 – Estimated Regional Expenditures for FY 2015-16

Regional Programs	County Costs
Administration	$0
Cost Share Contribution	$2,087,118
Regional Activities	$0
Other	$0
Total Estimated Regional Costs	**$2,087,118**

1.3.1.4 Total Expenditures

Table 1.4 presents the County's total estimated expenditures for FY 2015-16 (jurisdictional, watershed, and regional).

Table 1.4 – Total Estimated County Expenditures for FY 2015-16

Component / Sub-component	Estimated Expenditures
Jurisdictional	
Administration	$6,840,583
Development Planning	$1,109,654
Construction	$4,500,593
Municipal	$7,572,297
Industrial And Commercial	$1,575,635
Residential	$1,205,386
IDDE	$321,523
Education	$0
Public Participation	$0
Special Investigations	$0
Non-emergency Firefighting	$0
Jurisdictional Total	**$23,125,671**
Watershed	
Santa Margarita WMA	$664,500
San Luis Rey WMA	$383,376
Carlsbad WMA	$143,717
San Dieguito WMA	$293,560
Peñasquitos WMA	$102,794
San Diego River WMA	$299,792
San Diego Bay WMA	$155,733
Tijuana WMA	$157,955
Watershed Total	**$2,201,427**
Regional	**$2,087,118**
Total Estimated County Costs	***$27,414,216***

1.3.2 Funding Source

Table 1.5 shows the major sources of funding for the County's urban runoff management programs in FY 2015-16, and describes the legal restrictions applicable to the use of each.

Table 1.5 – Legal Restrictions on the Use of Program Funding

Funding Source	Legal Restrictions
General Fund	There are no restrictions on the use of general fund for County water quality programs and activities except that they must be used only for the purposes for which they are budgeted and allocated by the County Board of Supervisors.
Flood Control District Fees	Revenue generated from these fees must be expended for activities related to flood and storm management.
Developer Deposits / Permit Fees	Deposits / fees may be used only to fund activities related to the work for which the permits are issued.
Gas Tax	Gas Tax is collected by the state and allocated to local government for transportation-related work including maintenance of existing transportation systems and construction of new transportation facilities. These funds may not be used for other purposes.
Sanitary District Fees	Sanitary District Fees are used for work related to the maintenance of sewer lines, pump stations, force mains, and several treatment plants that serve the unincorporated areas. They may be used only for such maintenance-related purposes within the respective sewer district for which they are collected.
Other Funding Sources	Other funding sources collectively account for a relatively small portion of ongoing expenditures. However, all funding for the County's stormwater compliance programs is expended within applicable legal restrictions and limitations.

1.4. Conclusions and Recommendations

The figures presented here are an estimate of the expenditures that the County incurred to meet its compliance obligations for FY 2015-16. For the reasons explained above, they should be considered only best estimates of stormwater-related expenditures.

D.6.3 County of San Diego Strategies

County of San Diego’s strategies are detailed in Tables D-9 and D-10.

Table D-9
County of San Diego Jurisdictional Strategies for San Dieguito River WMA

Jurisdictional Runoff Management Programs (JRMP) Strategies		Implemented in FY16? *(No/Partially/Fully)*	Comments on Implementation (#events, #attendees, miles swept etc.)	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
Illicit Discharge, Detection, and Elimination (IDDE) Program						
1	Maintain stormwater conveyance system map to facilitate IDDE program	Yes	Updated as needed	N	N/A	Y
2	Utilize municipal personnel and contractors to identify and report Illicit Connections and Discharges	Yes	IDDE Program	N	N/A	Y
3	*Updated focused training for County field staff*	Yes	Updated training for BMP Design Manual and Stormwater Implementers	N	N/A	Y
4	Collect effluent on the ground (EOG), sanitary sewer overflow (SSO) data	Yes, fully	Approximately 87 EOG complaints related to septic systems and 14 SSO events recorded and responded to.	N	N/A	Y
5	*Address septic system failures where observed*	Yes, fully	Suspected septic discharges are reported to DEH HIRT Response line when they occur after hours and DEH Land and Water Quality Division during normal hours. All complaints resolved during 15-16.	N	N/A	Y
6	Facilitate public reporting of ICID via telephone and email	Yes	Bilingual hotline, dedicated e-mail address, and multiple online reporting tools	N	N/A	Y
7	*Refer homeless issue complaints to Sheriff or appropriate jurisdictions*	Yes	Collaborate with multi-departmental group to address homeless encampments	N	N/A	Y
8	*Bilingual hotline answered by a live operator (I Love a Clean San Diego) to provide better customer service*	Yes	Bilingual hotline operated by ILACSD	N	N/A	Y
9	Implement practices and procedures to address spills with the potential to enter the storm drain system	Yes	NOV issued by DEH for failing septic systems when effluent could reach the storm drain. Prompt follow up and mitigation is implemented. Such cases are rare; <5 in 15-16	N	N/A	Y
10	*Coordinate spill response with responsible sewer agencies*	Yes	Major DEH role is to inform the public of risks associated with sewer spills, conducting sampling, reporting, posting signs, etc.	N	N/A	Y
11	Implement practices and procedures to prevent/limit infiltration of seepage from sanitary sewers	Yes	If illicit connections are identified as part of an IDDE investigation, investigation will be conducted to define and eliminate the source.	N	N/A	Y
12	Coordinate with upstream entities to prevent illicit discharges from upstream sources entering into the storm drain system	Yes	If illicit connections are identified as part of an IDDE investigation, investigation will be conducted to define and eliminate the source. If determined to be from an upstream entity, coordination will occur.	N	N/A	Y
13	Utilize municipal personnel and Contractors to monitor stormwater outfalls for discharges of potential ICIDs	Yes	This is part of the IDDE Program	N	N/A	Y
14	Develop and implement a strategy for investigating and addressing ICIDs.	Yes	Focused, collaborative investigations with Planning and Science staff of high priority outfalls.	N	N/A	Y

Table D-9 (continued)
County of San Diego Jurisdictional Strategies for San Dieguito River WMA

Jurisdictional Runoff Management Programs (JRMP) Strategies		Implemented in FY16? *(No/Partially/Fully)*	Comments on Implementation (#events, #attendees, miles swept etc.)	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
Development Planning						
15	Require implementation of source control and Low Impact Development (LID) BMPs for all development projects.	Fully	The County BMP DM requires all projects regardless of size and location to implement SC and SD BMPs. These requirements are captured in the WPO and County's BMP DM.	N	N/A	Y
16	Priority Development Projects: In addition to requirement for all development projects, implement or require implementation of onsite structural BMPs to control pollutants and manage hydromodification for PDPs.	Fully	The County BMP DM requires all PDPs to implement PC and HMP BMPs. These requirements are captured in the WPO and County's BMP DM.	N	N/A	Y
17	Update BMP Design Manual procedures to specify stormwater requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria, and establish where implemented alternative compliance options.	Partially	Updated to reflect the Regional Model BMP DM with additional changes to incorporate County implementation practices. BMP DM became effective on February 26, 2015. Rene can provide details on the differences between CoSD BMP DM and Model BMP DM.	N	N/A	N
18	*Conduct internal (staff) training on the updated BMP Manual.*	Fully	The JRMP requires the County to conduct internal training every fiscal year and after release of new guidance documents.	N	N/A	N
19	*Hold external land development workshops targeting the development community.*	Fully	The County conducts external training regularly and after release of new guidance documents.	N	N/A	N
20	Implement a program that ensures that all structural and Low Impact Development (LID) BMPs are designed, constructed and maintained on Priority Development and Redevelopment Projects.	Fully	Structural BMPs and LID BMPs are designed and constructed per the BMP Design Manual. In addition, Structural BMPs are tracked for maintenance through inspections and self verification letters. LID BMPs that are installed as a result of implementation of the BMP Design Manual are proposed to be inspected.	N	N/A	Y
21	Impose legal authority to ensure all development and redevelopment projects are in compliance with all post construction requirements.	Fully	The Watershed Protection Ordinance was updated in FY16 to include modifications necessary as the result of the updated permit and the inclusion of applicant-implement offsite alternative compliance.	N	N/A	Y
22	*Update County codes, ordinances, and stormwater design standards consistent with the permit and the updated BMP Manual.*	Fully	The Watershed Protection Ordinance was updated in FY16 to include modifications necessary as the result of the updated permit and the inclusion of applicant-implement offsite alternative compliance. WPO update became effective on February 26, 2016.	N	N/A	N
Construction Management						
23	Maintain, update, and prioritize a watershed based inventory of all projects issued local permits that allow soil disturbing activities.	Yes	Projects that are issued local permits that allow soil disturbance activities are part of the inventory that is watershed-based.	N	N/A	Y

Table D-9 (continued)
County of San Diego Jurisdictional Strategies for San Dieguito River WMA

Jurisdictional Runoff Management Programs (JRMP) Strategies		Implemented in FY16? *(No/Partially/Fully)*	Comments on Implementation (#events, #attendees, miles swept etc.)	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
24	Require implementation of BMPs that are site specific, seasonally appropriate, and appropriate to the construction phase, year round.	Yes	Every project requires implementation of site specific construction BMPs, seasonably appropriate and appropriate to the construction phase.	N	N/A	Y
25	Impose legal authority to ensure inventoried construction projects are in compliance with all requirements.	Yes	The Watershed Protection Ordinance is the current legal authority to insure inventoried construction projects are in compliance with all requirements.	N	N/A	Y
26	*Make updates to County ordinances related to construction; reference to existing grading ordinance.*	Yes	County ordinances are updated with subsequent Construction General Permit updates; the Watershed Protection Ordinance will be updated as necessary as a result of the future Grading Ordinance Update.	N	N/A	N
27	Provide internal staff training related to construction storm water management.	Yes	The County conducts construction stormwater training annually and it targets construction inspectors in DPW-PDCI, PDS-Building, and CIP Inspectors in DPW and DGS.	N	N/A	Y
Existing Development						
28	Maintain and update a watershed-based inventory of existing development (i.e. commercial, industrial, municipal, and residential areas).	Yes	Inventory is tracked in Accela Automation.	Y	Database is continually updated to increase accuracy and efficiency	Y
29	*Improve the tracking of watershed based inventories via consolidated database.*	Yes	see 28	Y	see 28	Y
30	Designate a minimum set of BMPs required for all existing development inventories, including special event venues. The designated minimum BMPs must be specific to facility or area types and pollutant generating activities, as appropriate.	Yes	JRMP establishes minimum BMPs for all land use types.	N	N/A	Y
31	*Create an Equestrian BMP Handbook.*	No	Handbook created in FY2014-15	Y	Handbook will be revised in FY2016-17 to encompass additional BMPs and be more user friendly.	Y
32	Require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types and pollutant generating activities, as appropriate.	Yes	See 30	N	N/A	Y
33	*Pet waste management and outreach in County Parks.*	Yes	Mutt-mitt dispensers are installed and maintained in many County parks, providing people who are walking their dogs with waste disposal bags to use to pick up after their pets.	N	N/A	Y

Table D-9 (continued)
County of San Diego Jurisdictional Strategies for San Dieguito River WMA

Jurisdictional Runoff Management Programs (JRMP) Strategies		Implemented in FY16? *(No/Partially/Fully)*	Comments on Implementation (#events, #attendees, miles swept etc.)	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
34	Implement a schedule or operation and maintenance activities for the stormwater conveyance system and related structures.	Yes	Stormwater maintenance is referred to appropriate departments when needed.	N	N/A	Y
35	Implement a schedule of operation and maintenance for County paved and unpaved roads.	Yes	County Road Crews employ a schedule for maintenance of County Roads.	N	N/A	Y
36	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	Yes	1. 450 Facilities received the Agricultural Water Quality Best Management Practices for Pesticides through annual registration notifications. 2. Inspections were conducted at 83 Commercial Ag Facilities	N	N/A	Y
37	Promote and encourage implementation of designated BMPs in residential areas.	Yes	Through implementation of strategies described in the JRMP the County encourages the use of BMPs in residential areas. All Residential Management Areas were inspected in FY15-16	N	N/A	Y
38	Conduct inspections of inventoried existing development to ensure compliance.	Yes	Through implementation of strategies described in the JRMP the County encourages the use of BMPs in residential areas.	N	N/A	Y
39	*Conduct focused residential inspections based on strategic assessments.*	Yes	Focused, collaborative investigations with Planning and Science staff of high priority outfalls.	N	N/A	Y
40	*Develop a residential inspections tracking program via mobile platform - miles, violations, etc.*	Yes	In pilot testing phase	Y	Modifications based on pilot testing phase to increase effectiveness	Y
41	*Improve inspections data tracking through mobile phone applications.*	Yes	See 40	Y	see 40	Y
42	Enforce legal authority established for all inventoried existing development to achieve compliance.	Yes	see JRMP	N	N/A	Y
43	*Update county ordinance related to existing development; reference to existing guidance documents.*	Yes	Watershed Protection Ordinance and BMP Design Manuals were updated.	N	N/A	N
44	Promote incentive program for BMP retrofits (e.g. water smart irrigation controllers, turf replacements programs, residential landscape evaluation program).	Yes	The County continues to collaborate with and promote the efforts of partner agencies incentive programs.	N	N/A	N
45	Collaborate with partner agencies and groups to promote non-County sponsored incentive programs for BMP retrofits, including rain barrels, smart controllers, soil sensors, turf replacement, etc.	Yes	The County continues to collaborate with and promote the efforts of partner agencies incentive programs.	N	N/A	Y

Table D-9 (continued)
County of San Diego Jurisdictional Strategies for San Dieguito River WMA

Jurisdictional Runoff Management Programs (JRMP) Strategies		Implemented in FY16? *(No/Partially/Fully)*	Comments on Implementation (#events, #attendees, miles swept etc.)	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
46	Identify candidate areas of existing development for stream, channel, and/or habitat rehabilitation projects and facilitate implementation of such projects.	No	N/A	N	N/A	N
Outreach and Public Participation						
47	*Develop, improve, and distribute outreach materials*	Yes	Improved outreach materials through a focused Community-based Social Marketing approach.	Y	Continual improvement of existing materials, including translation into Spanish	Y
48	*Give outreach presentations to elementary, middle, and high school students*	Yes	Offer presentations to elementary, middle, and high schools serving unincorporated communities.	N	N/A	Y
49	*Outreach to mobile landscaping service providers*	Yes	Pesticide Regulation Program collaboration with the California Department of Pesticide Regulation on a pilot program to offer workshops for maintenance gardeners. Two workshops were held where attendees were provided training materials and concluded with a pesticide certification exam. Attendees at both workshops had high success rates for the exam.	N	N/A	Y
50	*Conduct large residential property pet waste management outreach*	No	Unable to implement due to lack of community service organization partners.	N	N/A	N
51	*Conduct over irrigation outreach pilot study*	Yes	Community-based Social Marketing pilot study on the effectiveness of irrigation runoff prevention materials.	Y	N/A	Y
52	*Conduct Homeowners Associations Outreach and Coordination Pilot Study*	Partial	HOA Outreach materials in draft format. Additional development will take place in FY2016-17.	Y	N/A	Y
53	*Expand Homeowners Associations Outreach and Coordination based on the pilot project within San Luis Rey, San Dieguito, or San Diego River as needed and as funding is identified*	No	Additional development may occur based on pilot study in FY2016-17.	N	N/A	N
54	Collaborate with watershed partners to develop consistent messaging to targeted audiences such as commercial, residents to conserve water and reduce dry weather flows	Yes	Collaboration between the Regional Education Workgroup and Think Blue San Diego Region to develop and distribute educational materials such as the "Be the Solution to Pollution" booklet which includes irrigation and runoff reduction measures. Other items developed under this included posters, calendars and coloring books.	N	N/A	y
55	*Sponsor Trash Collection Events through public outreach and participation*	Yes	The County sponsors ILACSD to establish cleanup sites at the Coastal Cleanup Day and Creek to Bay events.	N	N/A	Y
56	*Educational Workshops on Integrated Pest Management, manure management and others as needed*	Yes	Various workshops presented throughout the year by County staff including UCCE, FHA and contractors.	N		Y

Table D-9 (continued)
County of San Diego Jurisdictional Strategies for San Dieguito River WMA

Jurisdictional Runoff Management Programs (JRMP) Strategies		Implemented in FY16? *(No/Partially/Fully)*	Comments on Implementation (#events, #attendees, miles swept etc.)	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
57	Partner with Master Gardeners Programs to provide education opportunities on water use and practices for gardening	Yes	Various workshops presented throughout the year by County staff including UCCE, FHA and contractors.	N	N/A	Y
58	*Conduct Effectiveness Survey's on Education & Outreach programs*	Yes	Surveys to determine the efficacy of watershed education to unincorporated elementary, middle, and high schools serving unincorporated communities.	N	N/A	Y
Enforcement Response Plan						
59	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	Yes	County implemented the ERP as described in the JRMP.	N	N/A	Y
60	Notify the SDWB by email (Nonfilers_R9waterboards.ca.gov) within five (5) calendar days of issuing escalated enforcement to a construction site that poses a significant threat to water quality as a result of violations or other noncompliance	Yes	County implemented the ERP as described in the JRMP.	N	N/A	Y
61	Notify the SDWB by email (Nonfilers_R9waterboards.ca.gov) any persons required to obtain coverage under the statewide Industrial General Permit and Construction General Permit and failing to do so, within five (5) calendar days from the time the Copermittee become aware of the circumstances.	Yes	County implemented the ERP as described in the JRMP.	N	N/A	Y
Public Education and Participation						
62	Implement a public education and participation program to promote and encourage development of programs, management practices and behaviors that reduce the discharge of pollutants in storm water prioritized by high risk behaviors, pollutants of concern, and target audiences.	Yes	The County completes numerous education and public participation programs for a diverse target audiences. See JRMP.	N	N/A	Y

Table D-10
County of San Diego Optional Strategies for San Dieguito River WMA

	Optional Jurisdictional Runoff Management Programs (JRMP) Strategies	Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implemen-tation into next FY? *(Y/N)*
Provision B.3.b.(1)(b)(i) - BMPs, incentives, or programs that may be implemented that are in addition to requirements of Provision B.3.b.(1)(a)										
1	Implement Sustainable Landscapes Program to encourage landscape retrofits.	FY 2016-17; Continuous until grant funding and incentives are depleted	Implementation of this strategy may be triggered if (1) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (2) all of the necessary resources have been secured. Continue implementation when the funding and incentives items are secured.	Staff resources, Grant funding, Incentive items, Partnerships	No	Partially	N/A	N	N/A	Y
2	Implement an incentive program for BMP Retrofits (Public-Private Partnerships - a County sponsored program to offer incentives for rain barrel installation, downspout disconnects from the stormwater system, etc.).	FY 2015-16; Continuous, as resources allow	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) pilot program success; and (4) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Incentive items, Partnerships	No	Partially	N/A	N	N/A	Y
3	Implement a program that provides rebates or incentives for pumping septic systems, with a focus in high risk areas adjacent to waterways (within 600 feet).	Once triggered, Pilot program 1 -2 years, as needed thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) pilot program success; and (4) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Incentive items	No	No	Funding source not identified. All 4 triggers have not been met.	No	N/A	N

Table D-10 (continued)
County of San Diego Optional Strategies for San Dieguito River WMA

Optional Jurisdictional Runoff Management Programs (JRMP) Strategies		Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implemen-tation into next FY? *(Y/N)*
4	Identify where sewer and stormwater infrastructure are in close proximity and subsequently, confirm the absence of flow at nearby stormwater MS4 outfall during dry weather.	Once triggered, 2-3 years; one-time	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships	No	No	N/A	No	N/A	N
5	Implement a program for on-site wastewater treatment (septic) systems. May include mapping and risk assessment, inspection, or maintenance practices.	Once triggered, 2-3 years	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) septic systems have been determined to be a pollutant sources to the MS4; and (4) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships	No	Partially	Under the Local Area Management Plan (LAMP) for onsite wastewater treatment systems the treatment systems with supplemental treatment are required to be permitted annually. The annual operating permit will define the monitoring and maintenance requirements as specified by the manufacturer and/or qualified professional who designed the system. The LAMP ordinance can be found at: http://www.sandiegocounty.gov/content/dam/sdc/deh/lwqd/RWQCB%20Approved%20LAMP%20Final%202-24-15.pdf	N	N/A	Y

County of San Diego Optional Strategies for San Dieguito River WMA

Optional Jurisdictional Runoff Management Programs (JRMP) Strategies		Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implemen-tation into next FY? *(Y/N)*
6	Divert persistent dry weather flows from storm drains to sewer.	Once triggered, 3-6 years per project	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) permission is granted from sewer agency; and (4) ground water or permitted discharges have been ruled out; and (5) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Engineering design, Environmental review, Permits, Ongoing funding for operation/maintenance	No	No	Diversions are a last resort strategy and will be reviewed for outfalls that are persistently flowing after all other implementation strategies have been exhausted.	N	N/A	N
Provision B.3.b.(1)(b)(ii) - Incentives or programs that may be implemented to encourage or implement projects to retrofit areas of existing development										
7	Implement trash capture program (e.g., retrofit storm drain intakes with trash capture devices).	Baseline study 2-3 years; FY 15-16 implementation as needed and as resources allow	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) baseline study completion and success; and (4) focus areas identification; and (5) detailed inlet inventory of focus areas; and (6) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Equipment, Permits, Ongoing funding for operation/maintenance	No	Partially	The County of San Diego is in process of conducting several studies to develop Baseline Trash Generation Rates.	N	N/A	Y

Table D-10 (continued)

Optional Jurisdictional Runoff Management Programs (JRMP) Strategies		Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implemen-tation into next FY? *(Y/N)*
8	Implement a Green Streets Retrofits Program.	Once triggered, 3-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered on a project-by-project basis if (1) a specified interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) pilot program success; and (4) all of the necessary resources have been secured.	Each green street retrofit project is preliminary estimated to cost an average of $5,500,000 per linear mile of retrofit for construction. Resources include: Staff resources, Grant funding or alternative source, Contractor funding, Engineering or landscaping design, Permits, Environmental review, Right of way acquisition, Ongoing funding for operation/maintenance	No	Partially	Design standards and specifications have been developed. Green streets are now being used to meet compliance for all retrofit and/or redeveloped road projects that in the Capital Improvement Projects plan. Pursuing Grant Funding	N	N/A	Y
9	Construct Treatment Control BMPs (retrofits projects).	Once triggered, 4-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Engineering or landscaping design, Permits, Environmental review, Ongoing funding for operation/maintenance	No	No	N/A	N	N/A	N

Table D-10 (continued)
County of San Diego Optional Strategies for San Dieguito River WMA

Optional Jurisdictional Runoff Management Programs (JRMP) Strategies		Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implemen-tation into next FY? *(Y/N)*
10	Implement an alternative compliance program to enable "offsite" compliance for new and redevelopment projects.	Once triggered, 3-6 years per project	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Engineering design , Permits, Environmental review, Right of way acquisition (if needed), Ongoing funding for operation/maintenance	No	Partially	Currently applicant implemented offsite alternative compliance is available for use by the development community. The Water Quality Equivalency (WQE) provides the currency for structural BMPs and some natural system management practices (NSMPs). Additional work on the WQE will be conducted during FY17. The County is not currently pursuing a credit system but is participating as a stakeholder on the City of San Diego TAC and as a member of the Western Riverside Coalition of Governments (WRCOG) discussion on offsite alternative compliance.	N	N/A	Y

Table D-10 (continued)

Optional Jurisdictional Runoff Management Programs (JRMP) Strategies		Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implemen-tation into next FY? *(Y/N)*
Provision B.3.b.(1)(b)(iii) - Incentives or programs that may be implemented to encourage or implement projects that will rehabilitate the conditions of channels or habitats										
11	Flood Control Channel Rehabilitation Projects (e.g., removal of impervious lining in flood control channel and replacement with earthen or vegetated surface)	Once triggered, 4-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (4) engineering design, monitoring, and outreach plans are approved; and (5) all of the necessary resources have been secured.	Project costs vary by size and complexity. Resources include: Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Engineering design, Permits, Environmental review, Right of way acquisition (if needed), Ongoing funding for operation/maintenance	No	Partially	One project has been identified in SDR for retrofit/rehabilitation. Project planning, design and environmental review will begin in FY17	N	N/A	Y
12	Implement a program to remove invasive non-native plants (i.e. Arundo) upstream areas rivers or tributaries.	Once triggered, 1-2 years per project	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) community support and partnerships established; and (4) it has been determined that invasive plants have been found to have an impact on water quality; and (5) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships	No	No	The County has developed several Habitat Restoration Plans and Non-Native Plant Removal Guidelines including for the Otay Valley Regional Park. Implementation of projects resulting from these guidelines requires acquisition of land and funding. No projects were completed during this reporting period.	N	N/A	N

Table D-10 (continued)

Optional Jurisdictional Runoff Management Programs (JRMP) Strategies		Implementation Timeframe	Triggers	Resources	Triggered? *(Y/N)*	Implemented in FY16? *(No/Partially/ Fully)*	Comments on Implementation	Proposed Modifications? *(Y/N)*	Modification Type & Rationale *(if none, N/A)*	Planned Implementation into next FY? *(Y/N)*
13	Habitat Restoration and rehabilitation projects in County Parks	Once triggered, 4-7 years per project; ongoing operation & maintenance thereafter	Implementation of this strategy may be triggered if (1) an interim goal has not been met; and (2) it has been determined by the County of San Diego through adaptive management that implementation is necessary; and (3) all of the necessary resources have been secured.	Staff resources, Grant funding or alternative source, Contractor funding, Partnerships, Restoration / Rehabilitation Designs Approved, Environmental Permits issued, CEQA / NEPA Environmental review, Ongoing funding for maintenance and monitoring	No	Partially	Habitat restoration and rehabilitation has occurred in the Tijuana River Valley Regional Park and will continue for an additional 3-5 years. Additionally habitat restoration and rehabilitation has been initiated for the Sweetwater Loop Trail Phase I and Phase III however additional funding is necessary to complete Phase I. Phase III will begin in Fall 2016.	N	N/A	Y

D.6.4 Modifications to the BMP Design Manual

No modifications to the BMP Design Manual have been made since the WQIP was approved in fall 2015. The current County of San Diego's BMP Design Manual is posted on the County of San Diego's website, and the link to this page is listed on Project Clean Water.

D.6.5 Modifications to the Jurisdictional Runoff Management Plan

No modifications to the County of San Diego's JRMP have been made since the WQIP was approved in fall 2015. The current County of San Diego's JRMP is posted on County of San Diego's website, and the link to this page is listed on Project Clean Water.

Appendix E: Adaptive Management

Intentionally Left Blank

Adaptive Management – Changes to Water Quality Improvement Plan Elements

1. The assessment of Provision A.4 will now be considered once per MS4 Permit term during the development of the Regional Monitoring and Assessment Report.
2. A number of Responsible Agencies have made adminstrative changes to their strategies. Updates are described in Appendix D.

Mr. David W. Gibson
San Diego Regional Water Quality Control Board
Storm Water Management Unit
2375 Northside Drive, Suite 100
San Diego, CA 92108-2700

Dear Mr. Gibson:

COUNTY OF SAN DIEGO, PERMIT R9-2013-001, PIN 255223 – SAN LUIS REY RIVER WATERSHED MANAGEMENT AREA WATER QUALITY IMPROVEMENT PLAN 2015-2016 ANNUAL REPORT, PIN NO. 794836: ERYAN

On behalf of the Cities of Oceanside, Vista, and the California Department of Transportation, the County of San Diego is pleased to submit the San Luis Rey River Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report (Report) in accordance with requirements set forth in Provisions F.3.b(3) of Order No. R9-2013-0001, as amended by Orders No. R9-2015-0001 and No. R9-2015-0100, the *National Pollution Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Dischargers form the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region*, NPDES No. CAS0109266 (Permit).

Appendix 2 of the Report contains the following Jurisdictional Runoff Management Program Information from each agency, as applicable:

- Certification Statements for the 2015-2016 Water Quality Improvement Plan Annual Report pursuant to 40 C.F.R Section 122.41(k);
- Certification Statements for the legal authority within their jurisdictions to implement and enforce each of the requirements contained in the Municipal Permit pursuant to Provision E.1.b;
- Completed Jurisdictional Runoff Management Program Annual Report Forms pursuant to Provision F.3.b.(3)(e);
- Updates to jurisdictional runoff management programs pursuant to Provision F.3.b.(2)(a)(3);
- Updates to the BMP Design Manual pursuant to Provision F.3.b.(2)(b)(2); and
- Proposed administrative changes to the Water Quality Improvement Plan.

If you have any questions or comments, please feel free to contact me at (858) 694-3672 or e-mail at Todd.Synder@sdcounty.ca.gov.

Sincerely,

Todd Snyder

TODD E. SNYDER, Manager
Watershed Protection Program

Attachment: San Luis Rey River Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report

HMP	Hydromodification Monitoring Program
HPWQC	highest priority water quality condition(s)
HSA	hydrologic subarea
HU	hydrologic unit
IBI	Index of Biotic Integrity
IC/ID	illegal connection and illicit discharge
IDDE	Illicit Discharge Detection and Elimination
ILACSD	I Love a Clean San Diego
IM	instantaneous maximum
JRMP	Jurisdictional Runoff Management Program
LID	Low Impact Development
LOE	line of evidence
LTMS	long term monitoring station
MAP	Monitoring and Assessment Plan
MBAS	methylene blue active substance
MRCD	Mission Resources Conservation District
MCL	maximum contaminant level
MDAL	maximum daily action level
mg/L	milligram per liter
mL	milliliter
MPN/100 mL	most probable number per 100 milliliters
MS4	municipal separate storm sewer system (storm drain system)
MST	microbial source tracking
NAL	non-stormwater action level
ND	not detected
NOAA	National Oceanic and Atmospheric Administration
NPDES	National Pollutant Discharge Elimination System
NS	not sampled
NTU	nephelometric turbidity unit
NWS	National Weather Service
O/E	observed to expected
Permit	Regional MS4 Permit
pMMI	predictive multi-metric index
ppt	parts per thousand
PWQC	priority water quality condition(s)
QA	quality assurance
QMRA	quantitative microbial risk assessment

Regional Board (RWQCB)	San Diego Regional Water Quality Control Board
RMA	Residential Management Area
SAL	stormwater action level
SCCWRP	Southern California Coastal Water Research Project
SLRWC	San Luis Rey Watershed Council
SMC	Stormwater Monitoring Coalition
SQO	sediment quality objective
SSM RWL	single sample maximum receiving water limitations
SSO	sanitary sewer overflow
SUSMP	Standard Urban Stormwater Mitigation Plan
SWRCB	State Water Resources Control Board
TDS	total dissolved solids
TIE	toxicity identification evaluation
TMDL	total maximum daily load
TRE	toxicity reduction evaluation
TSS	total suspended solids
USEPA	United States Environmental Protection Agency

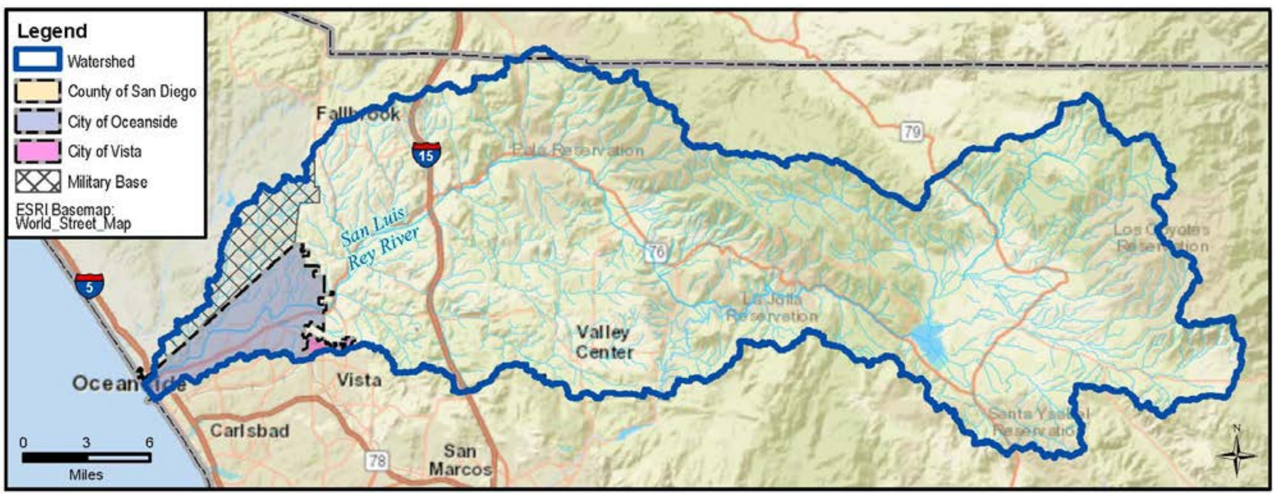
VCP	vitrified clay pipes
WMA	Watershed Management Area
WMAA	Watershed Management Area Analysis
WQIP	Water Quality Improvement Plan
WQO	water quality objective
WRCC	Western Regional Climate Center

Executive Summary

ES.1 INTRODUCTION

This first Water Quality Improvement Plan (WQIP) Annual Report for the San Luis Rey River Watershed Management Area (WMA) was developed in compliance with the Regional municipal separate storm sewer system (MS4) Permit (Permit) (San Diego Regional Water Quality Control Board [Regional Board], 2013). This Annual Report represents the work of the Participating Agencies in the WMA, including the Cities of Oceanside and Vista, the County of San Diego, and the California Department of Transportation (Caltrans). These Participating Agencies implement strategies through their WQIP and Jurisdictional Runoff Management Programs (JRMPs) to achieve improvements in the quality of stormwater (wet weather) and non-stormwater (dry weather) discharges from the MS4 (storm drain system) and, in turn, within the receiving waters by focusing on the highest priority water quality condition (HPWQC) and priority water quality condition(s) (PWQC) within the watershed. Caltrans' participation in the development of the WQIP was voluntary as they are regulated under a separate Permit from the California State Water Resources Control Board. Therefore, while they participated in the WQIP development on certain strategies, they do not participate in the Monitoring and Assessment Programs under the WQIP.



The HPWQC and PWQCs for the WMA were identified based on an assessment of receiving water conditions, storm drain outfall discharges and their potential impacts, and the sources of pollutants in the watershed. Using the methodology outlined in the WQIP, bacteria was identified as the HPWQC for the WMA.

HPWQC:
Bacteria (Wet and Dry)

PWQCs:
Nitrogen, Phosphorus, Total Dissolved Solids, Toxicity (Wet and Dry)

Eutrophic Conditions, Chloride, Index of Biotic Integrity (Dry)

ES.2 MONITORING AND ASSESSMENT

The 2015-2016 monitoring year was the first under the Monitoring and Assessment Plan (MAP) of the accepted WQIP that focuses on addressing bacteria. Monitoring results as they relate to bacteria are presented in the following discussion, with details provided in the AR. Overall, monitoring results support the selection of bacteria as the HPWQC and provide substantial data to assess progress toward goals.

ES.2.1 Total Maximum Daily Load (TMDL) Monitoring

Bacteria Total Maximum Daily Load (TMDL) sampling was conducted during wet and dry weather at one receiving water monitoring location, Oceanside City Beach at the mouth of the San Luis Rey River (OC-100), in accordance with TMDL requirements specified in the Permit. Additional detail is provided in Section 3.1.2.

Oceanside City Beach in vicinity of TMDL Compliance Monitoring Location (OC-100)

- The only exceedance measured at OC-100 was the wet weather single-sample maximum (SSM) for *Enterococcus* for one of three monitored wet weather events.
- The arithmetic mean of the three wet weather events was only one unit above the SSM, but this resulted in a 75% frequency of exceedance when this mean was used to represent the unmonitored wet weather days.
- All other interim and final receiving water limitations (RWL) are currently being met.

- Interim numeric targets are not required to be achieved until 2020 for dry weather and 2028 for wet weather; therefore, the exceedances observed during 2015-2016 do not indicate non-compliance at this time.

ES.2.2 Lower San Luis Rey River Goal Monitoring

In addition to TMDL monitoring, receiving water monitoring to measure bacteria concentrations in the lower San Luis Rey River was conducted at Olive Hill Rd (SLR25). The downstream site at Benet Bridge was visited but was dry and therefore not sampled during 2015-2016. Bacteria sampling is conducted to evaluate the progress of strategies toward achieving the dry weather and wet weather goals for the lower river as presented in the WQIP. These goals are focused on bacteria load reductions in storm drain discharges (wet weather) and elimination of dry weather flows to the lower river. Monitoring in both the lower river and at storm drain outfalls (ES.2.6) support the assessment of strategies implemented towards achieving these goals. Additional detail is provided in Section 3.1.3.

Olive Hill Rd (SLR25) Monitoring Location

- All eight dry weather samples (taken monthly from February to September 2016) were above the SSM for *Enterococcus*, and one was above the SSM for fecal coliform.
- During the single wet weather event on February 1, 2016, the *Enterococcus* concentration was above the SSM, while the fecal coliform was below the limit.

ES.2.3 Storm Drain Outfall Dry Weather Field Screening

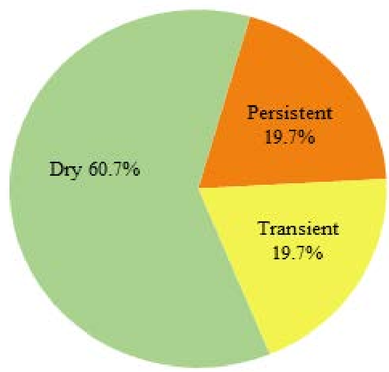
Field screening is conducted to identify non-stormwater and illicit discharges from the Participating Agencies' major storm drain outfalls, determine which discharges are persistent, and prioritize those discharges that will be investigated and eliminated.

- There was no trash or little trash (less than 50 pieces) during the majority (83%) of the trash assessments (n = 129) at visited outfalls.
- Outfalls were dry during 65% of routine field screening visits; flowing water was present during 20% of routine visits.
- When flow was observed, more than half (14 of 26) of the flow rates were less than five gallons per minute.

Based on field screening visits and available historical data, the Participating Agencies determined the flow status of each major storm drain outfall as persistent, transient, or dry. As defined in the Permit, flow status for a given outfall is "dry" if no flowing or standing water is observed at the outfall over three most recent visits, and "persistent" flow is defined as presence of flowing or standing water upon three most recent visits. Otherwise, the outfall status is classified as "transient." Additional detail is provided in Section 3.2.1.1.

Overall, since the prior monitoring year:

- The number of "dry" outfalls increased by four,
- Outfalls categorized as "transient" decreased by six,
- Outfalls with "persistent" flow increased by four,
- All outfalls have been visits three or more times and therefore none have a flow classification of "undetermined."
- No modifications to field screening monitoring locations or frequencies are planned for 2016-2017 in the WMA.



Flow Determinations for Major Storm Drain Outfalls (n=61)

Major storm drain outfalls are prioritized for monitoring by each Participating Agency based on criteria such as persistence of non-stormwater flow, monitoring data results, and the potential threat to receiving water quality. The highest priority outfalls shown in Figure ES-1 were monitored under the Highest Priority Storm Drain Outfall Monitoring described in ES.2.4. These outfalls were also a specific focus for the Illicit Discharge Detection and Elimination (IDDE) investigations by each Participating Agency as described in Section ES.2.5.

ES.2.4 Highest Priority Storm Drain Outfall Dry Weather Monitoring

Analytical monitoring during dry weather was conducted at the highest priority outfalls identified by each Participating Agency. Monitoring locations are shown in Figure ES-1, and results for fecal coliform in non-stormwater samples at these outfalls are shown in Figure ES-2. Additional detail is provided in Section 3.2.1.2.

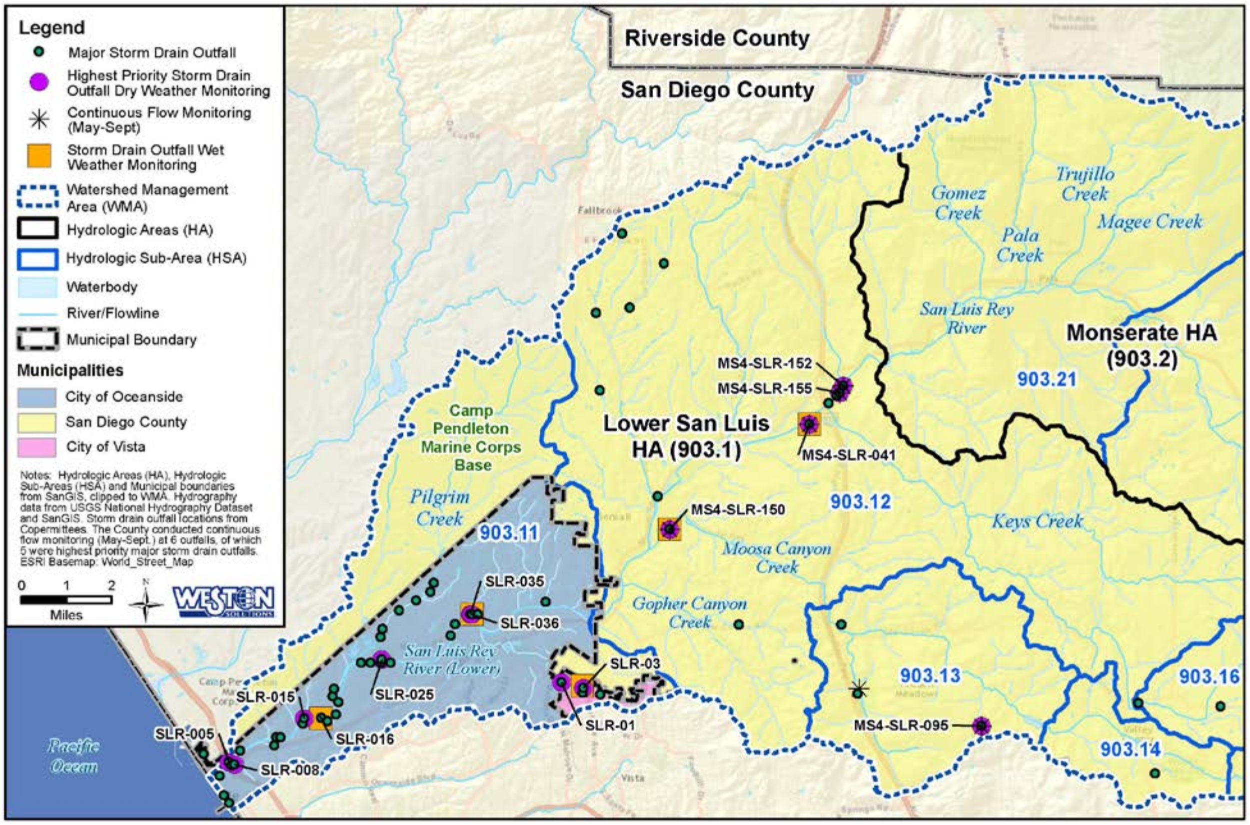


Figure ES-1. 2015-2016 Dry and Wet Weather Storm Drain Outfall Monitoring Locations

- 75% of *Enterococcus* and 50% of fecal coliform results were above non-stormwater action levels (NALs).
- No re-prioritizations of the highest priority outfalls are planned for 2016-2017 by the City of Vista or County of San Diego.
- The City of Oceanside is updating its outfall priorities. Two outfalls that were dry for three consecutive visits will be replaced with the next two high priority outfalls.

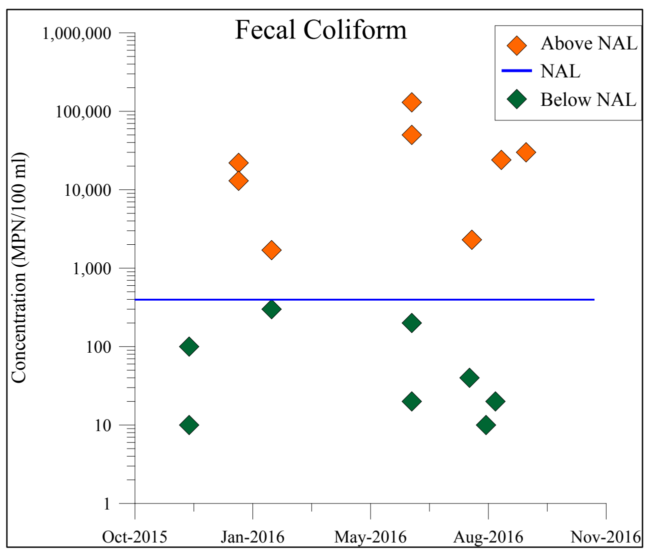

Figure ES-2. Fecal Coliform Concentrations at the Highest Priority Outfalls

ES.2.5 Illicit Discharge Detection and Elimination (IDDE) Program

Each Participating Agency's IDDE Program seeks to address and reduce the potential contribution of pollutants from stormwater and non-stormwater discharges through the storm drain system. The highest priority outfalls were a specific focus of IDDE investigations conducted during the 2015-2106 monitoring year. Additional detail is provided in Section 3.2.1.3.

Flow sources identified through the Participating Agencies' outfall flow investigations included:

- The most common source of non-stormwater flow was irrigation runoff, followed by groundwater. Irrigation runoff includes over-watering of residential and commercial landscaping.
- In several cases, the sources of non-stormwater flows investigated were allowable (e.g., groundwater), were reported to enforcement for follow-up actions, or were partially eliminated (e.g., irrigation runoff at SLR-025). Agricultural runoff, which is separately regulated and not under the Participating Agencies' legal authority, was identified as a source during investigations at two highest priority outfalls.
- The majority of sources were categorized as suspected while three were listed as known.

ES.2.6 Storm Drain Outfall Wet Weather Monitoring

Storm drain outfall wet weather monitoring identifies and quantifies pollutants in stormwater discharges from the storm drain system, guides pollutant source identification efforts, and tracks progress toward achieving wet weather numeric goals set forth in the WQIP. Monitoring locations are shown in Figure ES-1 in Section ES.2.4. Additional detail is provided in Section 3.2.2.

- 100% of *Enterococcus* and fecal coliform concentrations in storm drain outfall wet weather discharges were above the SSM water quality based effluent limitations specified in the Bacteria TMDL.

ES.2.7 Special Studies

Special studies conducted in the San Luis Rey River WMA are described in Section 3.3 and included the following:

- Reference Streams (Tiefenthaler et al., 2015) and Beaches (Tiefenthaler et al., 2016) Studies - provide a scientific basis for updating the "reference" conditions to be considered in evaluating compliance levels in the Bacteria TMDL, and will be useful in the re-evaluation of the Bacteria TMDL.
- San Luis Rey River Microbial Source Tracking (MST) Study (Geosyntec Consultants, 2015) - will be used to support Permit compliance and Bacteria TMDL implementation planning, and may potentially serve as the first step in future Natural Source Exclusion and/or Quantitative Microbial Risk Assessment (QMRA) work.

ES.3 WATERSHED STRATEGY IMPLEMENTATION AND PROGRESS TOWARD GOALS

The Permit requires the Participating Agencies to select the HPWQC for the WMA and develop strategies and numeric goals to address that HPWQC. Since the acceptance of the WQIP in February 2016, the Participating Agencies have implemented strategies and have begun making progress toward achieving numeric goals for bacteria. Strategies focusing on reducing bacteria from both human and non-human sources were implemented across the watershed and included the following:

- Preventing discharges of bacteria from human sources to the storm drain system by addressing sanitary sewer overflows, leaky sewer pipes, homeless encampments, and failing septic systems.
- Preventing discharges of other, non-human, bacteria sources to the storm drain system through public outreach programs related to pet waste management, discharge of wash water, and livestock.

Strategies implemented by the Participating Agencies were also focused on reduction and elimination of non-stormwater flow and address not only bacteria but other PWQC in the watershed, including nutrients. These strategies included irrigation runoff identification and control, additional source investigations and flow monitoring, inspections, and outreach (e.g., water conservation, trash control).

Progress made toward achievement of the interim Permit-term watershed numeric goals is measured using water quality and program activity data collected during 2015-2016. Progress is summarized below, with additional detail and a discussion of the strategies and progress specific to each Participating Agency provided in Section 4.

Permit Term Bacteria TMDL Numeric Goals for the San Luis Rey River Mouth:

- Dry Weather Goal: Flow Reduction – **Baseline Estimations are Complete**
- Wet Weather Goal: Programmatic BMP Implementation – **On Track to Achieve Goal**
- Wet Weather Goal: Distributed BMP Operation and Maintenance – **Goal Has Been Achieved**

Permit Term Numeric Goals for the Lower San Luis Rey River:

- Dry Weather Goal: Flow Reduction – **Baseline Estimations are Complete**
- Wet Weather Goal: Bacteria Load Reduction from Storm Drain Outfalls – **On Track to Achieve Goal**
- Wet Weather Goal: Meet Bacteria Goals in Lower River – **On Track to Achieve Goal**

ES.4 CONCLUSIONS

Data collected in the San Luis Rey River WMA during the 2015-2016 monitoring year support the identified priority and highest priority water quality conditions as provided in the WQIP and provide the information necessary to assess progress. Since the acceptance of the WQIP in February 2016, the Participating Agencies have begun implementing their strategies intended to result in achievement of dry and wet weather interim goals for the term of the current Permit, and progress has been demonstrated toward each goal. The strategies implemented by the Participating Agencies and identified in the WQIP focus on reducing bacteria discharges, but also address other pollutants, providing a multi-benefit approach to implementation.

The Participating Agencies will continue to implement these identified strategies, collect additional monitoring and programmatic data, and assess their progress toward goals on an annual basis. New data and information will be utilized as it becomes available to improve the WQIP with updates to priorities, assessments of and adjustments to goals, updates to strategies to meet the latest goals, and updates to the MAP as necessary through the adaptive management process.

1 Introduction

The San Diego Regional Water Quality Control Board (Regional Board) regulates discharges from municipal separate storm sewer systems (MS4s) (storm drain systems) in the San Diego Region under the Regional MS4 Permit[1] (Permit) (Regional Board, 2013). The Permit covers portions of San Diego County, southern Orange County, and southwestern Riverside County and regulates Phase I municipalities who own and operate storm drain systems, which discharge stormwater (wet weather) runoff and non-stormwater (dry weather) runoff to surface waters throughout the San Diego Region. One of the main goals of the Permit is to focus on water quality improvement outcomes rather than completing specific actions, giving the Participating Agencies more control over how their stormwater programs are implemented.

Within the Permit, the San Diego Region is sub-divided into 10 watershed management areas (WMAs), which cover the major, natural drainages in the region[2]. The Permit requires the development of a Water Quality Improvement Plan (WQIP) for each WMA, which guides the Participating Agencies' Jurisdictional Runoff Management Programs (JRMPs) (their local plans) towards an outcome-based approach and improved water quality. This process is accomplished through an adaptive planning and management method that identifies the highest priority water quality condition(s) (HPWQC) within a watershed and implements strategies through the WQIP and JRMPs to achieve improvements in the quality of discharges from the storm drain system and within the receiving waters.

Participating Agencies within each WMA are required by the Permit to submit an Annual Report to communicate the implementation status and progress of the WQIPs and corresponding JRMPs in meeting the defined numeric goals[3]. This San Luis Rey River WMA Annual Report covers two reporting periods on different schedules. The first is from July 1, 2015 to June 30, 2016 for the JRMPs and WQIP strategy implementation (note that the WQIP was accepted in February 2016), and the second is from October 1, 2015 to September 30, 2016 for monitoring and assessment programs. Progress to achieve goals may be assessed for either reporting period, depending on the goal metric. This Annual Report, the first under the San Luis Rey River WMA's WQIP, addresses the requirements of the Permit. Table 1-1 provides a summary of the Permit requirements that must be addressed by the Annual Report, and where they are discussed within this document. Appendix 1 includes additional detail regarding the specific Permit requirements as well as where they are addressed within the Annual Report[4]. Appendix 2 provides information related to each Participating Agency's JRMP.

[5]Appendix 1 includes additional detail regarding the specific Permit requirements as well as where they are addressed within the Annual Report.

This San Luis Rey River WMA Annual Report is structured as follows:

Section 1. Introduction – Provides an overview of the Permit, the WQIP, and the Annual Reporting requirements.

Appendix 1. Crosswalk of Permit Requirements and Annual Report References

Appendix 2. Jurisdictional Runoff Management Program Annual Report Certifications and Forms, Strategies, and Changes to the Best Management Practices (BMP) Manual (as applicable)

Section 2. San Luis Rey River WMA Priorities and Numeric Goals – Introduces the WMA, the priority water quality conditions of the watershed, and the numeric goals and schedules developed to measure progress in addressing the priority conditions.

Appendix 3. Water Quality Improvement Plan Numeric Goals

Section 3. Monitoring and Assessment – Summarizes the monitoring programs and provides an assessment of the data collected.

Appendix 4. Monitoring Results and Assessments

Section 4. Implementation and Progress toward Achieving Numeric Goals – Provides a detailed assessment of the progress towards meeting the numeric goals, with a focus on those numeric goals occurring during the Permit term. The section also provides an overview of the strategies implemented to meet the numeric goals, the status of implementation, and plans for the coming year.

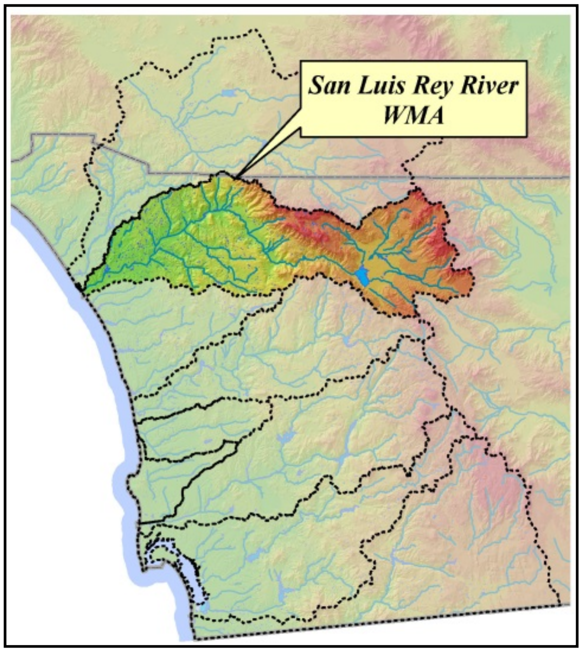
Section 5. Adaptive Management – Provides a summary of the elements of the WQIP process which can be altered during the course of Permit implementation and any changes that were made as a result of new information realized during the reporting period.

Appendix 5. Adaptive Management Modifications

Section 6. Conclusions and Recommendations – Provides the conclusions and recommendations that are based on the data collected and assessments conducted during implementation of the WQIP.

Section 7. References

2 Overview of San Luis Rey River Watershed



The San Luis Rey River WMA is located in northern San Diego County, bordered by the Santa Margarita River WMA to the north and the Carlsbad and San Dieguito River WMAs to the south. Major surface water bodies and the municipalities/agencies responsible for stormwater management within the WMA are summarized in Table 2-1. Although Caltrans is not a part of the Permit, Caltrans works cooperatively with the other Participating Agencies in accordance with their statewide National Pollutant Discharge Elimination System (NPDES) permit.

The WMA encompasses 360,000 acres or 562 square miles, and is the largest WMA located entirely within San Diego County. The WMA (hydrologic unit [HU] 903) consists of three hydrologic areas (HAs): Lower San Luis Rey (903.1), Monserate (903.2), and Warner Valley (903.3). These HAs are comprised of 11 hydrologic subareas (HSAs). The San Luis Rey River extends over 55 miles across northern San Diego County and discharges to the Pacific Ocean within the City of Oceanside. Lake Henshaw is the main reservoir for the San Luis Rey watershed and is the third largest reservoir in San Diego County. Henshaw Dam controls 36 percent (%) of the watershed drainage and is the dividing point between the Monserate HA and Warner Valley HA. One-third of the WMA is located above the dam and two-thirds is located below the dam. The principal aquifers in the watershed are the Warner, Pauma, Pala, Bonsall, Moosa, and Mission Basins. Additional information is provided in the San Luis Rey River WMA WQIP (Larry Walker Associates et al., 2016). A map of the watershed is shown in Figure 2-1. The area surrounding Oceanside Harbor within the City of Oceanside's jurisdiction has been assigned to the San Luis Rey River WMA for reporting and assessment under the 2013 Permit. Therefore, all acreages and outfalls for the area surrounding the Oceanside Harbor within the City of Oceanside's jurisdiction will be included in the San Luis Rey River WMA assessments. The Hydrologic Basin boundaries from SanGIS have not been modified on maps to reflect this assignment.

Table 2-1. Major Surface Water Bodies and the Municipalities/Agencies Responsible for Stormwater Management within the San Luis Rey River WMA

Hydrologic Unit	Major Surface Water Bodies	Municipalities/Agencies
San Luis Rey (903.00)	▪ San Luis Rey River ▪ San Luis Rey Estuary ▪ Pacific Ocean	▪ City of Oceanside ▪ City of Vista ▪ County of San Diego ▪ Caltrans[6]

[6]Caltrans is regulated under a separate permit from the State Water Resource Control Board (Order No. 2012-0011 DWQ). However, Caltrans has voluntarily participated in the development of Water Quality Improvement Plans throughout the San Diego Region.

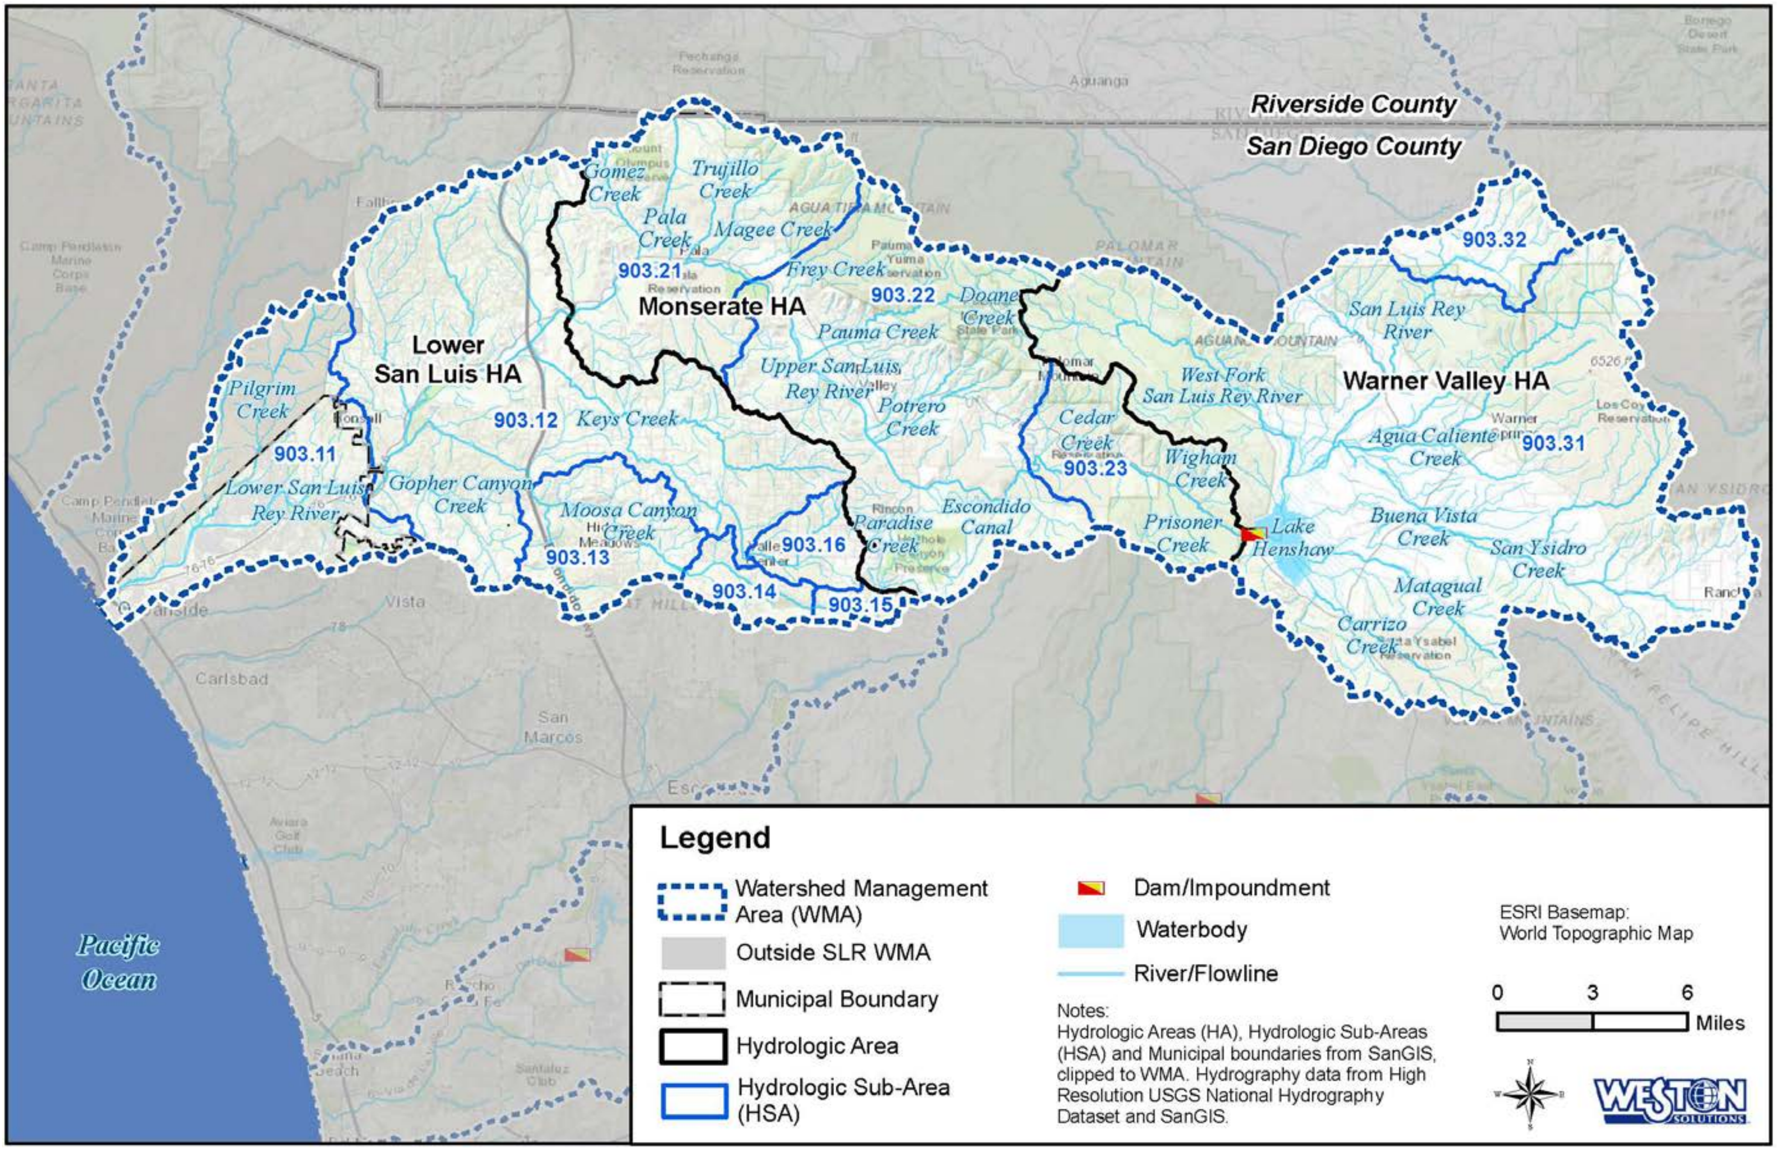


Figure 2-1. San Luis Rey River Watershed Management Area

The total annual rainfall in the region during the reporting period (October 2015 through September 2016), as measured at Oceanside Harbor, was 5.69 inches. Despite El Niño conditions reported by the National Weather Service (NWS) Climate Prediction Center through the spring of 2016 (National Oceanic and Atmospheric Administration [NOAA], 2016a), this total is below the historical (1909 to 2016) annual mean of 9.87 inches (Western Regional Climate Prediction Center [WRCC], 2016). Long-term drought conditions persisted in the San Diego region during the 2015-2016 monitoring year, and temperatures were generally above average (NOAA, 2016b).

Shown in Figure 2-2 are annual rainfall totals at four Alert System Precipitation Gauges (http://sdcfcd.org/whatalert.html) in the northern San Diego County, including two stations in the San Luis Rey River WMA, Oceanside (903.11) and Fallbrook (903.12). Annual rainfall totals at these stations ranged from 9.92 to 13.6 inches. Precipitation totals at the Alert Stations is provided for the fiscal year (FY) (July 1, 2015 to June 30, 2016) for consistency with the wet weather storm drain outfall assessments provided in Appendix 4. The rainfall total at Oceanside Harbor for FY 2015-2016 was lower at 7.51 inches (WRCC, 2016) than the inland Oceanside Alert station.

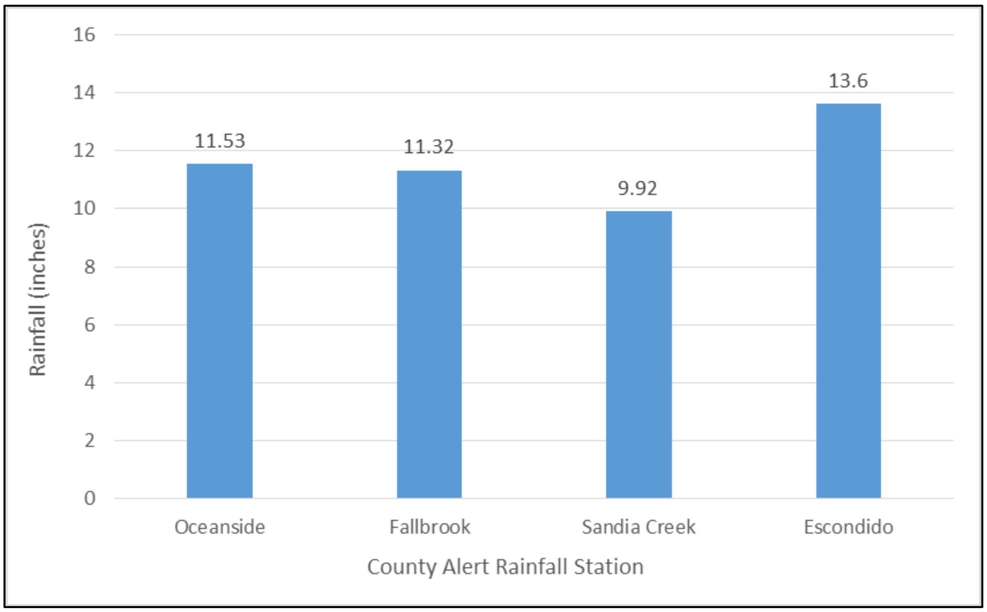

Figure 2-2. Rainfall Amounts for 2015-2016 Fiscal Year at Four County Alert Stations

2.1 SAN LUIS REY RIVER WATER QUALITY IMPROVEMENT PLAN

The WQIP for the San Luis Rey River WMA identifies strategies that will be implemented through JRMPs to address bacteria in pursuit of measurable numeric goals that will achieve improvements in the quality of storm drain outfall discharges and, in turn, the receiving waters. The WQIP outlines how the Participating Agencies within the watershed are evaluating water quality conditions, prioritizing those water quality conditions, and using these common priorities to guide jurisdictional and watershed scale programs to address the highest priorities. Figure 2-3 illustrates the general planning, implementation, monitoring, and adaptive management process and the text that follows briefly describes the components of the WQIP.

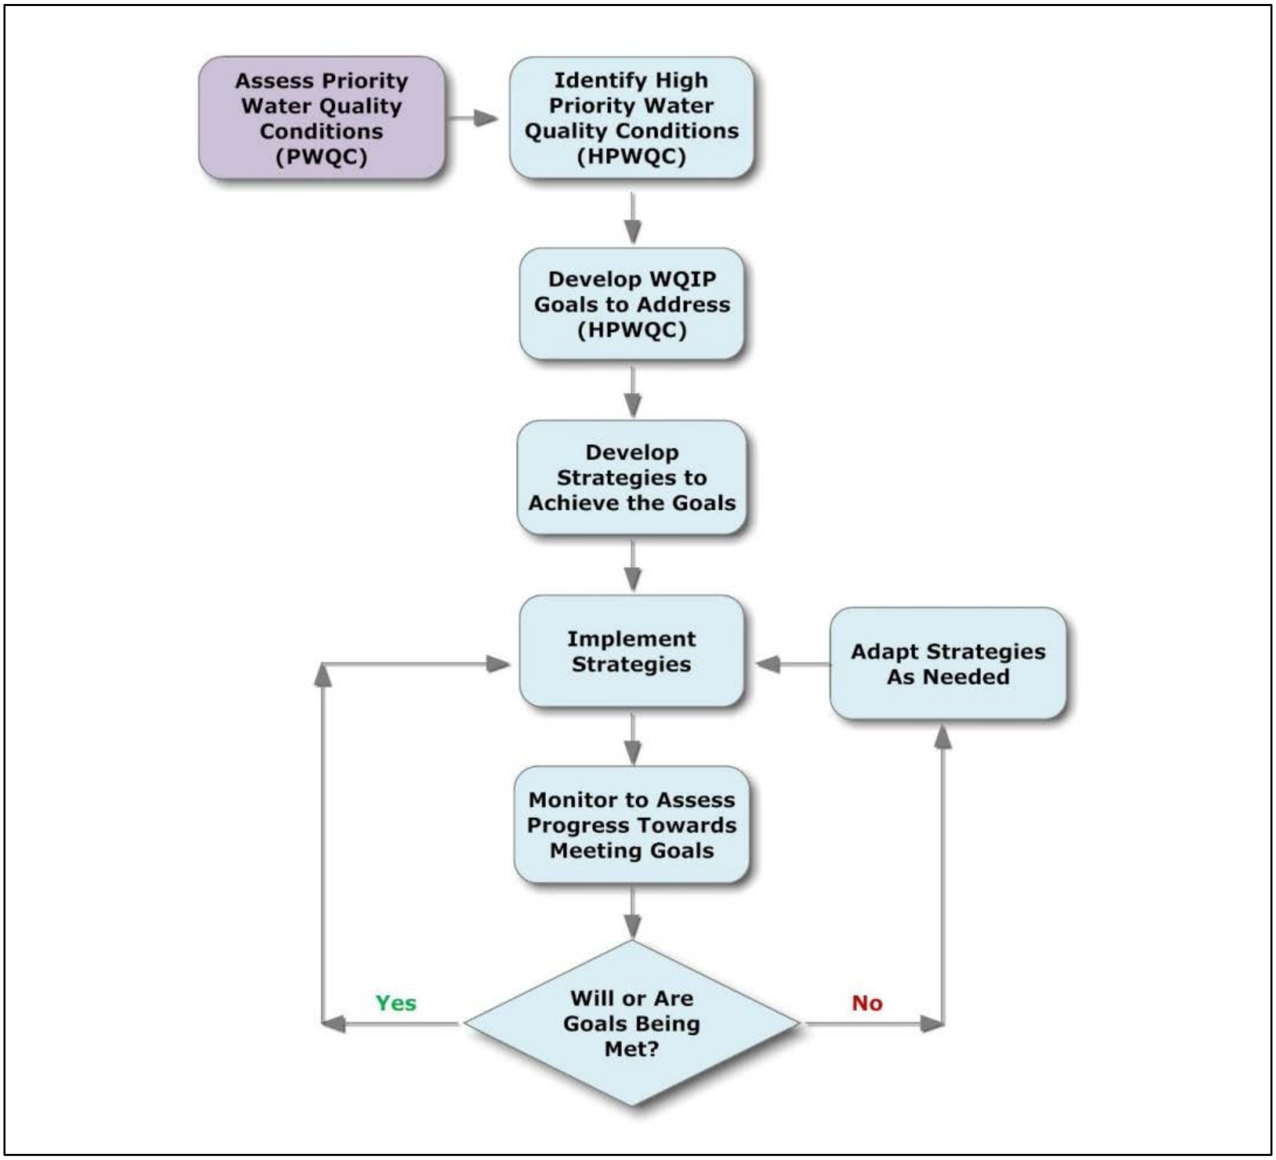

Figure 2-3. Water Quality Improvement Plan Process

The complete WQIP document contains the following components identified in the 2013 Permit:

- Priority Water Quality Conditions.
- Goals, Strategies and Schedules.
- Watershed Management Area Analysis (WMAA), which the Permit indicates is optional.
- Monitoring and Assessment Program (MAP), which also documents how the Participating Agencies will comply with the applicable monitoring and assessment portions of the Permit.
- Iterative Approach and Adaptive Management Process.

The complete WQIP was provided to the Regional Board on June 27, 2015. Comments from the Regional Board and from the public were received in August and September 2015. Appropriate revisions were made to address public comments and Regional Board concerns, and a revised WQIP was submitted to the Regional Board for acceptance on September 29, 2015. The Regional Board advised the WMA Participating Agencies on January 6, 2016 that minor deficiencies remained, and the Participating Agencies provided proposed corrections on January 29, 2016. The Regional Board accepted the revised WQIP, with the proposed corrections, on February 12, 2016. WQIP documents can be accessed on the Regional Board website: http://www.waterboards.ca.gov/sandiego/water_issues/programs/stormwater/wqip.shtml.

2.2 PRIORITY AND HIGHEST PRIORITY WATER QUALITY CONDITIONS

Using the methodology outlined in the WQIP, bacteria was identified as the HPWQC for the San Luis Rey River WMA. The HPWQC and additional priority water quality conditions (PWQCs) for the WMA are summarized in Table 2-2. Each of the waterbodies listed in Table 2-2 are located in the Lower San Luis HA except the Upper San Luis Rey River, which is located in the Lower San Luis and Monserate HAs. Additional information is provided in Section 2 and Appendix 2D of the WQIP.

Table 2-2. San Luis Rey River WMA Priority Water Quality Conditions

Constituent	Wet	Dry	Beneficial Use*	Geographic Area
Highest Priority Water Quality Condition				
Bacteria	X	X	REC-1 (water contact recreation)	Pacific Ocean Shoreline at San Luis Rey River Mouth, Lower San Luis Rey River
Priority Water Quality Conditions				
Eutrophic Conditions		X	WARM (warm freshwater habitat)	Guajome Lake
Chloride		X	MUN (municipal and domestic supply)	Lower San Luis Rey River
Nitrogen	X	X	WARM (warm freshwater habitat)	Lower San Luis Rey River, Upper San Luis Rey River
Phosphorus	X	X	WARM (warm freshwater habitat)	Lower San Luis Rey River
Total Dissolved Solids (TDS)	X	X	AGR (agricultural supply)	Lower San Luis Rey River
Toxicity	X	X	WARM (warm freshwater habitat)	Lower San Luis Rey River
Index of Biotic Integrity (IBI)		X	WARM (warm freshwater habitat)	Lower San Luis Rey River

* Source: Water Quality Control Plan for the San Diego Region (Basin Plan) (Regional Board, 1994).

Bacteria are important indicators of water quality for recreational users like surfers, swimmers, and beach waders. Indicator bacteria are used as detection surrogates or proxies for pathogens because they are easier and less costly to measure. Allowable bacteria loads for the watershed are defined by the Bacteria TMDL[7], which requires the Participating Agencies to improve water quality in local waters during both dry weather and wet weather conditions within a 10- and 20-year compliance timeline, respectively (see Section 2.3).

2.3 WATER QUALITY IMPROVEMENT PLAN NUMERIC GOALS

The Participating Agencies identified and developed specific water quality improvement numeric goals and strategies to address bacteria within the WMA. The numeric goals (interim and final) and corresponding schedules support implementation of the WQIP and measure reasonable progress towards addressing bacteria. In addition, the Participating Agencies' monitoring and assessment programs measure progress towards attaining these goals.

The numeric goals for the San Luis Rey River WMA WQIP are designed to demonstrate progress towards compliance with the Bacteria TMDL, which differentiates between wet and dry conditions. Since wet weather bacteria loads are more challenging to control, the wet and dry TMDL targets and load reductions have different schedules. The targets for dry and wet weather are on a 10- and 20-year timeline, respectively. As a result, some of the goals extend beyond the timeframe of the current Permit. For this reason, the numeric goals within the WQIP are categorized into three distinct time periods:

1. Interim goals within the five-year Permit term.
2. Interim goals based on interim Bacteria TMDL compliance pathways.
3. Final goals based on final Bacteria TMDL compliance options.

Attachment E.6 of the Permit outlines interim dry and wet weather TMDL compliance dates of April 4, 2017 and April 4, 2021, respectively. The Permit allows the Participating Agencies to propose alternative schedules. The Participating Agencies proposed moving the interim TMDL compliance dates for dry and wet weather to April 4, 2020 and April 4, 2028, respectively, to allow adequate time to investigate and mitigate sources of bacteria and to monitor progress and adjust implementation through the adaptive management process. The detailed numeric goals for the WMA are presented in Appendix 3, and the timeline for achievement of these goals is illustrated in Figure 2-4.

[7]Revised TMDL for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (including Tecolote Creek). Resolution No. R9-2010-0001. Approved February 10, 2010.

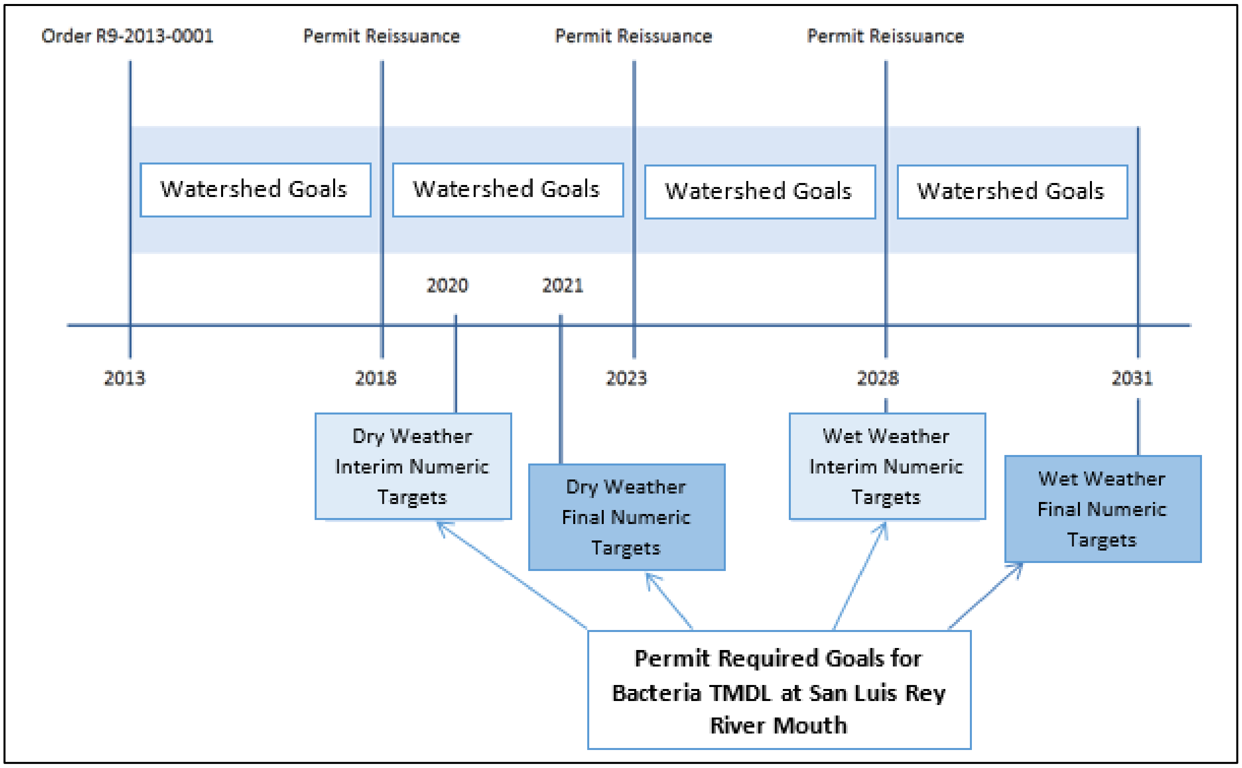

Figure 2-4. Timelines and Relationships between Bacteria TMDL Numeric Targets

3 Monitoring and Assessment

The Permit requires an outcome-based approach to improve water quality in stormwater and non-stormwater discharges, guided by strategies and goals identified in the WQIP. By conducting multiple types of monitoring activities, the Participating Agencies are collecting data to evaluate progress toward achieving numeric goals, and determine if modifications to stormwater program activities are necessary. Caltrans is not a Participating Agency for the monitoring and assessment program described in this section, as Caltrans is regulated under a separate permit from the State Water Resource Control Board.

This Annual Report assesses the data collected within the San Luis Rey River WMA in combination with the Participating Agencies' management actions to determine what actions are improving the quality of storm drain outfall discharges and/or receiving water conditions (Section 4) and where additional actions may be necessary (Section 5).

The Monitoring and Assessment Program includes five major components:

1. Receiving water monitoring that measures the long-term health of the watershed during dry and wet weather conditions;
2. Storm drain outfall discharge monitoring that investigates illicit non-stormwater flows from outfalls and measures changes in quality of the discharges from the storm drain system during wet weather;
3. Special studies that look further into the sources, pollutants, and/or stressors that contribute to bacteria;
4. Illicit Discharge Detection and Elimination (IDDE) investigations and inspections of potential pollutant sources; and
5. Monitoring to assess progress toward goals and schedules.

This section describes results from implementation of the MAP for the WMA as they pertain to bacteria. The MAP was developed and implemented to:

1. Measure the progress toward addressing bacteria;
2. Assess the progress toward achieving the numeric goals, strategies, and schedules; and
3. Evaluate each Participating Agency's overall efforts to implement the WQIP.

Because bacteria in the lower San Luis Rey River watershed was identified as the HPWQC for the WMA, monitoring is being conducted to identify sources of non-stormwater flow and assess the effectiveness of strategies to address non-stormwater flows that transport bacteria. Monitoring and IDDE program activities are also focused on identifying and eliminating non-stormwater flows that may discharge bacteria and other PWQC pollutants in urban runoff. Additionally, these programs will generate data to track the trends related to the PWQCs and the general water quality conditions within the watershed.

Monitoring programs where information related to bacteria was collected during the 2015-2016 monitoring year (October 1 - September 30) are shown in Table 3-1. Relevant results of these programs are summarized in the sections below, with details provided in Appendix 4. Monitoring program results not directly related to bacteria, such as those from the Bight and Southern California Stormwater Monitoring Coalition (SMC) regional programs, are also presented in Appendix 4.

Additional Monitoring to Assess Progress toward Goals and/or Strategies	X	

[1]HMP monitoring was conducted regionally but no sites were located in the San Luis Rey River WMA. The objectives and results of the program are summarized in Appendix 4.

[2]Long-term receiving water monitoring includes bacteria sampling but has not yet been conducted in the San Luis Rey River WMA due to lack of flow. Monitoring will be conducted during the 2016-2017 monitoring year, or when sufficient flow occurs.

[3]No bacteria data are collected for these programs.

3.1 RECEIVING WATER MONITORING

The purpose of receiving water monitoring is to characterize trends in the chemical, physical, and biological conditions of a receiving water to determine whether beneficial uses are being protected, maintained, or enhanced. An overview of receiving water monitoring activities for the WMA for the current Permit term is presented in Table 3-2. A summary of the results from each of these programs for the 2015-2016 monitoring year with respect to bacteria is presented below. Additional details and results for programs not related to bacteria in the WMA are presented in Appendix 4.

The receiving water assessments required by the Permit will be addressed in the Regional Monitoring and Assessment Report (RMAR) submitted to the Regional Board in December 2017 with the Report of Waste Discharge (ROWD).

SMC = Southern California Stormwater Monitoring Coalition; Bight = Southern California Bight Regional Monitoring Program; TIE=Toxicity Identification Evaluation; TRE=Toxicity Reduction Evaluation

[a.] The Permit was adopted on May 8, 2013 and became effective on June 27, 2013.

[b.] Long-term receiving water monitoring has not yet been conducted in the San Luis Rey River WMA due to lack of flow. Monitoring will be conducted during the 2016-2017 monitoring year, or when sufficient flow occurs.

[c.] The 2018 Southern California Bight Regional Monitoring will occur during the summer of 2018 or 2019.

[d.] Includes the San Luis Rey River Mouth.

3.1.1 Regional Monitoring Participation

Regional monitoring includes several studies that provide information to evaluate various aspects of receiving water health on a regional scale. The Participating Agencies participated in the SMC Regional Monitoring Program during the 2015-2016 monitoring year. Because data collected under this program do not include bacteria, results are not included in this section. Detailed results are presented in Appendix 4, including results related to PWQCs.

3.1.2 Total Maximum Daily Load Monitoring

In February 2010, the Regional Board adopted Resolution No. R9-2010-0001, *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)* (Bacteria TMDL) (Regional Board, 2010). This TMDL amendment to the Water Quality Control Plan for the San Diego Region (Basin Plan) (Regional Board, 1994) includes one segment within the San Luis Rey River WMA, the Pacific

Ocean Shoreline at the San Luis Rey River Mouth. The Participating Agencies within the WMA that are named as responsible in the TMDL include the Cities of Oceanside and Vista and the County of San Diego. The compliance requirements and monitoring and reporting requirements of the TMDL have been incorporated into Attachment E of the 2013 Permit.

The Bacteria TMDL requires pollutant load reductions to restore and protect the designated beneficial use of water contact recreation (REC-1), as it is designated within the Basin Plan. The purpose of the TMDL monitoring program is to assess progress toward achieving compliance with the interim and final TMDL numeric targets, and is used to address the following questions:

- Are TMDL numeric targets for indicators being met at the compliance monitoring locations?
- Are levels of bacteria decreasing at the compliance monitoring locations?

During the monitoring season (October 1, 2015 through September 30, 2016), sampling was conducted during wet and dry weather at one receiving water monitoring site, OC-100, located at Oceanside City Beach at the mouth of the San Luis Rey River (Table 3-3, Figure 3-1). This was the third year of monitoring in accordance with the Bacteria TMDL. Samples were analyzed for the indicator bacteria compliance constituents (total coliform, fecal coliform, and *Enterococcus*) in accordance with the requirements of Attachment E.6 of the Permit.

Table 3-3. 2015-2016 Bacteria TMDL Beach Monitoring Summary

Season	Date Range	Event Type	Event Frequency	Monitoring Location	Samples Per Site Per Event[a]	Total Number of Samples
2015-2016 Wet Season	10/01/2015-04/30/2015	Wet	Three storm events	OC-100	1	3
	10/01/2015-03/30/2016	Dry	Monthly			6
	04/01/2016-04/30/2016	Dry	Weekly[b]			5
2016 Dry Season	05/01/2016-09/30/2016	Dry	Weekly[b]			25

[a] Quality assurance (QA) or replicate samples are not included in the count.

[b] A minimum of 5 samples are collected in a 30-day period.

Figure 3-1. Bacteria TMDL Compliance Monitoring Location

Table 3-4 presents the exceedance rates for each indicator bacteria at the monitored station within the San Luis Rey River WMA. The exceedances observed during the 2015-2016 monitoring year do not indicate non-compliance at this time. Progress toward meeting water quality based effluent limitations (WQBELs), in terms of interim and final receiving water limitations, is presented in Table 3-5 for each analyzed constituent. Interim WQBELs are not required to be achieved until 2020 for dry weather and 2028 for wet weather, while final WQBELS must be met by 2021 for dry weather and 2031 for wet weather. Based on the sampling data from 2015-2016, receiving water limitations that have already been achieved are indicated by (●), whereas receiving water limitations that have not yet been achieved are indicated by (X).

In summary, the only exceedances observed at OC-100 were for the wet weather single-sample maximum for *Enterococcus*. This outcome was due to a measured concentration of 220 colony-forming units per 100 milliliters (CFU/100 mL) during one monitored wet weather event, resulting in arithmetic mean of 104.67 CFU/100 mL for the three monitored events, which was applied to all of the unmonitored days with qualifying precipitation as required by the Permit. Had the arithmetic mean been lower by just 1 CFU/100 mL, the single-sample wet weather exceedance frequency would have been 10% and would have been in compliance with the single-sample wet weather allowable exceedance frequency. *Enterococcus* concentrations during the remaining two wet weather events were below the receiving water limitation of 104 most probable number (MPN)/100 mL[8]. All other interim and final WQBELs are currently being achieved.

Table 3-4. 2015–2016 Bacteria TMDL Monitoring Exceedance Frequency Results

Segment	Monitoring Location	Bacteria TMDL Constituent	2016 Dry Season Geometric Mean (CFU/100mL)	2015-2016 Wet Season Geometric Mean (CFU/100mL)	2015-2016 Wet Weather Single-Sample Maximum (CFU/100mL)
Pacific Ocean Shoreline	OC-100	*Enterococcus*	0%	0%	75%
		Fecal Coliform	0%	0%	0%
		Total Coliform	0%	0%	0%

CFU - colony-forming units per 100 milliliters. The Permit identifies WQBELs in most probable number per 100 mL (MPN/100 mL); the laboratory methods provide results in CFU. CFU and MPN units are comparable.

Table 3-5. 2015–2016 General Progress Toward Bacteria TMDL Interim and Final WQBELs

Monitoring Location	Bacterial TMDL Constituent	2015-2016 Dry Season Geometric Means		2015-2016 Wet Season Geometric Means		2015-2016 Wet Weather Single-Sample Maximum	
		Interim	Final	Interim	Final	Interim	Final
OC-100	*Enterococcus*	●	●	●	●	X	X
	Fecal Coliform	●	●	●	●	●	●
	Total Coliform	●	●	●	●	●	●

● = Numeric targets are met; X= Numeric targets are not yet met.

Additional information is provided in the 2015-2016 Bacteria TMDL Compliance Monitoring Report provided as Attachment 4B to Appendix 4. This data will also be uploaded to CEDEN (see Attachment K to Appendix 4).

3.1.3 Lower San Luis Rey River Goal Monitoring

To evaluate progress toward achieving goals for the lower San Luis Rey River, receiving water monitoring to measure bacteria concentrations was conducted during the 2015-2016 monitoring year at one in-stream site at Olive Hill Rd (SLR25). A second in-stream site, Benet Bridge (MLS),

[8] The Permit identifies receiving water limitations in MPN/100 mL; the laboratory methods provide results in CFU. CFU and MPN units are comparable.

was visited for monitoring but was dry during the entire year, and therefore was not sampled. Both sites are located along the San Luis Rey River, west of Interstate-15, with Olive Hill Rd (SLR25) located upstream of Benet Bridge. These monitoring locations are shown in Figure 3-2.

The lower San Luis Rey River location at Olive Hill Rd (SLR25) was sampled monthly during dry weather from February through September 2016, and once within 24 hours after a storm event in February 2016. Samples were analyzed for the indicator bacteria compliance constituents (fecal coliform and *Enterococcus*) in accordance with the Lower San Luis Rey River Bacteria Monitoring Plan (Attachment 4A-7 to the WQIP). Samples were also analyzed for *E. coli*, which is not a constituent of the indicator bacteria TDML and is not listed in the Lower San Luis Rey River Bacteria Monitoring Plan. The United States Environmental Protection Agency's (USEPA's) 2012 Recreational Water Quality Criteria recommends using *Enterococcus* and *E. coli* as indicators of fecal contamination for fresh water and *Enterococcus* for marine water (USEPA, 2012). Therefore, collection of *E. coli* data in advance of these anticipated changes provides historical data moving forward under revised recreational water quality standards developed in accordance with the USEPA guidelines. While the *E. coli* results are not presented here, the analytical data can be found in the laboratory reports provided in Attachment 4C to Appendix 4 and will be uploaded to CEDEN (see Attachment K to Appendix 4).

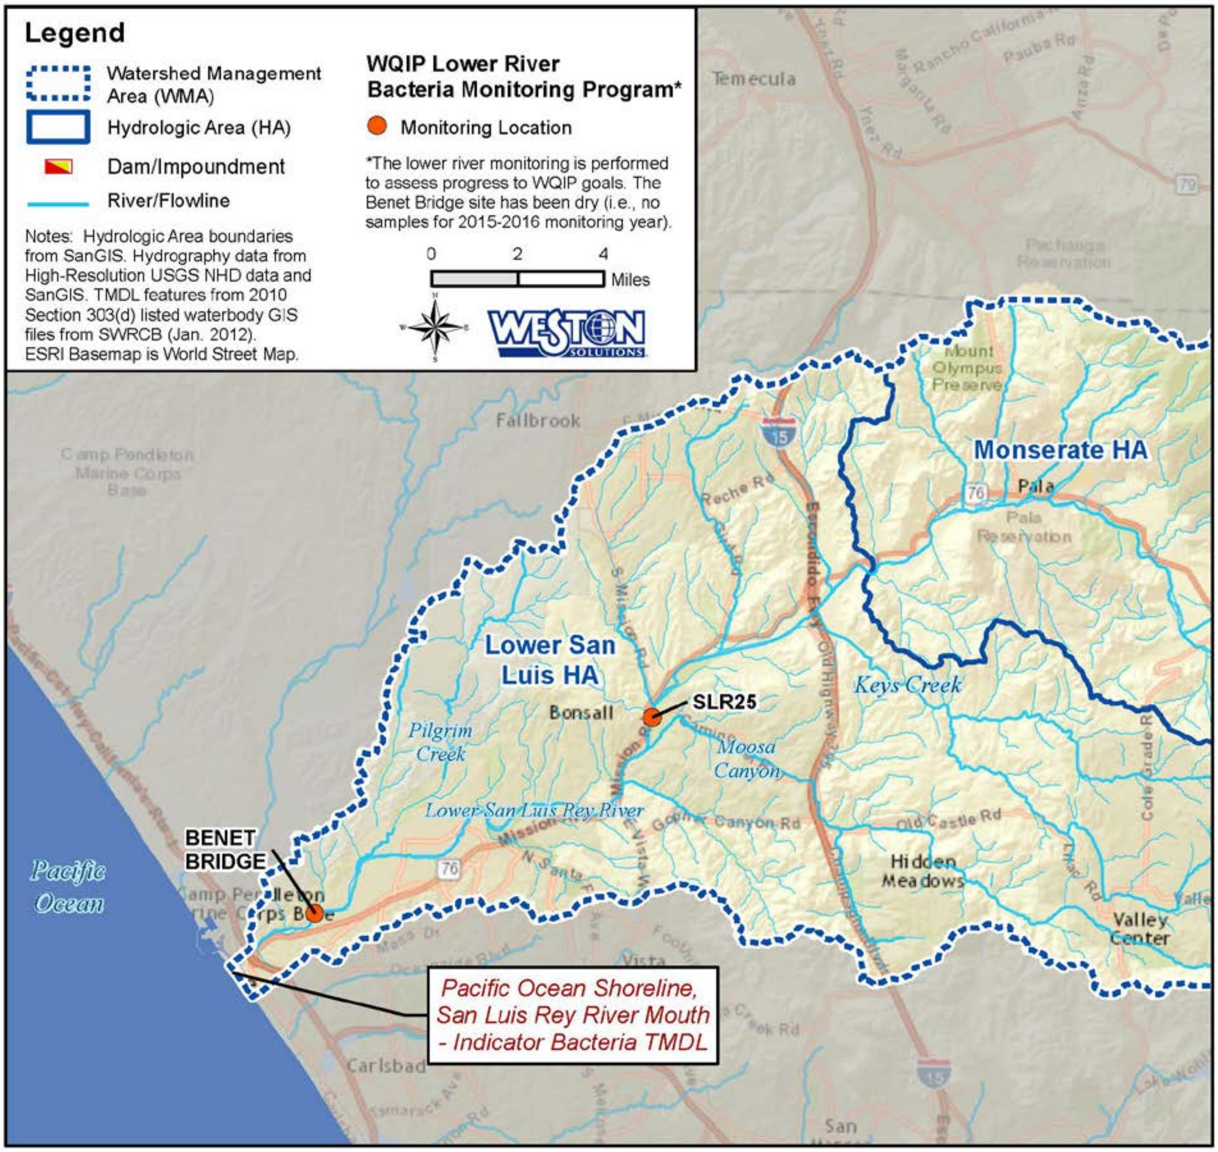

Figure 3-2. Bacteria WQIP Monitoring Locations in the Lower San Luis Rey River WMA (The Benet Bridge Location was Dry for the Entire Monitoring Season)

Individual dry and wet weather event data for *Enterococcus* and fecal coliform indicator bacteria are presented in Table 3-6 and Table 3-7, respectively, and exceedance rates are shown in Table 3-8. *Enterococcus* results from the single wet-weather event were above the freshwater single sample maximum water quality objective (WQO), whereas the fecal coliform concentration was below the WQO. Exceedance frequencies for the eight monitored dry weather events were 100% for *Enterococcus* and 13% (one event) for fecal coliform. These data will be used to inform progress by the Participating Agencies in meeting the lower San Luis Rey River bacteria goals (see Section 4.2). Supporting data are provided in Attachment 4C to Appendix 4.

Table 3-6. 2015-2016 Lower San Luis Rey River Bacteria Dry Weather Monitoring Event Results

Date	*Sample Results (CFU/100 mL)	
	Enterococcus (CFU/100 mL)	Fecal Coliform (CFU/100 mL)
SSM WQO	**61**	**400**

3.2 STORM DRAIN OUTFALL MONITORING

The purpose of Storm Drain Outfall Monitoring is to evaluate potential impacts from storm drain outfall discharges on the beneficial uses of a waterbody during dry and wet weather conditions. During dry conditions, the program also facilitates elimination of non-stormwater discharges to waterbodies through follow-up investigations and IDDE program activities. The data generated are used to identify and quantify pollutants in discharges, guide pollutant source identification efforts, and track progress towards achieving numeric goals set forth in the WQIP.

An overview of the conducted and planned storm drain outfall monitoring activities for the current Permit term is presented in Table 3-9.

Table 3-9. Elements of Water Quality Improvement Plan Storm Drain Outfall Monitoring

Monitoring Programs	Dry	Wet	Monitoring Element	Permit Schedule[a]				
				2013-2014[b]	2014-2015	2015-2016	2016-2017	2017-2018
Field Screening	X		Visual: flow condition, presence and assessment of trash in and around the station, IC/IDs, descriptions	●	●	●	●	●
Storm Drain Outfall	X		Field parameters, conventionals, bacteria, nutrients, metals	-	-	●	●	●
		X	Field parameters, conventionals, bacteria, nutrients, metals	●	●	●	●	●
Illicit Discharge Detection and Elimination	X		Visual surveys, field parameter testing, analytical testing and follow-up investigations, if warranted	–	–	●	●	●

IC/ID – Illegal connection and illicit discharge

a. The Permit was adopted on May 8, 2013 and became effective on June 27, 2013.

b. Completed under the Transitional Monitoring Program.

The major storm drain outfalls currently included in the storm drain outfall discharge monitoring station inventory for the WMA are shown in Figure A4-5 in Appendix 4.

The number of major outfalls monitored under each element of the Storm Drain Outfall Monitoring Program by each Participating Agency in the WMA is provided in Table 3-10. In accordance with the Permit, Participating Agencies with fewer than 125 major storm drain outfalls in their inventory must conduct dry weather field screening at 80% of these major outfalls twice per year. The number of major outfalls monitored per year is subject to change based on new information, updates to the Participating Agencies' storm drain outfall inventories, changes in transient or persistent flow classifications, and/or changes or updates to the priority water quality conditions over the life of the WQIP.

Table 3-10. Number of Major Storm Drain Outfalls per Participating Agency in the San Luis Rey River WMA

Participating Agency	Number of Storm Drain Outfalls Monitored Per Year		
	Field Screening	Dry Weather Monitoring	Wet Weather Monitoring
County of San Diego	21	5*	2
City of Oceanside	36	5*	2
City of Vista	4	2	1

*Three outfalls in the City of Oceanside and one County outfall were dry or ponded with insufficient water to sample during monitoring visits; therefore analytical samples were not collected at four outfalls that had been identified for persistent flow storm drain outfall monitoring.

3.2.1 Storm Drain Outfall Dry Weather Monitoring

Storm drain outfall dry weather monitoring consisted of dry weather field screening, IDDE investigations, and highest priority storm drain outfall analytical monitoring. These programs are described in the following subsections.

3.2.1.1 Dry Weather Field Screening and Outfall Prioritization

Field screening is visual monitoring of major storm drain outfalls conducted to identify non-stormwater and illicit discharges, determine which discharges are persistent, and prioritize those discharges that will be investigated and eliminated. This program is designed to assess the effectiveness of jurisdictional programs to effectively prohibit non-stormwater discharges. Each Participating Agency performs field screening of a certain number of outfalls and at a frequency required by the Permit to maintain an up-to-date inventory of persistently flowing outfalls and to initiate follow-up investigations that identify and mitigate the source(s). The data collected during field screening are one of the sources of information for the Participating Agencies' IDDE Programs (see Section 3.2.1.3).

The number of storm drain outfall stations included in the field screening and the total number of visual observations conducted by each Participating Agency in the WMA are presented in Table 3-11. Field screening at upstream proxy locations (e.g., manholes) for inaccessible outfalls may result in more than one location representing an outfall, and these upstream locations are included in the station counts and visits. Some source investigations were performed during routine visits and are included in the routine visits column, while others were conducted as separate follow-up visits and are included in the source investigations column.

Table 3-11. Number of Visual Observations Conducted in the San Luis Rey River WMA During the 2015-2016 Monitoring Period

Participating Agency	Number of Major Storm Drain Outfall Stations Visited	Number of Routine Visits[1]	Number of Separate Source Investigations	Number of Additional Visits for Other Programs[2]
County of San Diego	21	48	41[3] (6 outfalls)	70 visits (16 stations)
Oceanside	36	72	NA[4]	NA
Vista	4	8	NA[4]	NA

[1] Includes persistent flow monitoring events.

[2] Includes flow data but may not include all visual observations typically conducted during a routine field screening visit. Data were used in flow determinations and estimation of annual non-stormwater volumes.

[3] Six source investigations were associated with SLR-045, a storm drain outfall of less than 36 inches in diameter with persistent non-storm water flow.

[4] Source investigations were performed during persistent flow monitoring events.

Participating Agencies recorded numerous visual observations regarding outfall and flow characteristics including flow conditions (flowing, ponded, dry, or tidal), whether or not the flow reached the receiving water, whether or not there was a non-storm water flow source, potential non-storm water sources, if the flow source was eliminated, evidence of obvious illicit connections or illicit discharges (IC/ID), whether trash was present and the relative amount, and whether there was evidence of illegal dumping. The results from these observations are discussed in detail in Appendix 4, and the complete set of visual observations recorded during dry weather field screening visits are provided in Attachment 4D to Appendix 4. Field screening observations included the following:

- Field screening trash assessment results indicated that there was no trash or a low (<50 pieces) presence of trash during the majority (83%) of the trash assessments (n = 129 at visited outfalls.
- Visual observations indicated no flowing water or standing water for 81% of visits conducted by the City of Oceanside, 50% by the City of Vista, and 47% by the County of San Diego. Flow was observed during 6% of the 72 visits conducted by the City of Oceanside, 50% of the 8 visits by the City of Vista, and 34% of the 53 visits by the County of San Diego.
- When flow was observed, more than half (14 of 26) of the flow rates were less than five gallons per minute.

Based on these field screening visits and available historical data, the Participating Agencies determined the flow status of each major storm drain outfall as persistent, transient, or dry. As defined in the Permit, flow status for a given outfall is "dry" if no flowing or standing water is observed at the outfall over three most recent visits, and "persistent" flow is defined as presence of flowing or standing water upon three most recent visits. Otherwise, the outfall status is classified as "transient." The number of storm drain outfalls in each category are shown by Participating

Agency in Table 3-12. Additional details and a map of these outfall flow determinations can be found in Appendix 4.

Overall, since the prior monitoring year (WESTON, 2016a), the number of dry outfalls increased by four, the number of transient outfalls decreased by six, and the number of persistent outfalls increased by four, two of which were previously classified as undetermined. No modifications to field screening monitoring locations or frequencies are planned for the 2016-2017 monitoring year in the San Luis Rey River WMA.

Table 3-12. 2015-2016 Dry Weather Storm Drain Outfall Flow Determinations for the San Luis Rey River WMA

Participating Agency	Persistent	Transient	Dry/No Flow	Grand Total
County of San Diego	7	4	10	21
City of Oceanside	3	8	25	36
City of Vista	2	0	2	4
GRAND TOTAL	**12**	**12**	**37**	**61**

Major storm drain outfalls are prioritized for monitoring based on criteria such as persistence of non-stormwater flow, monitoring data results, and the potential threat to receiving water quality. The highest priority outfalls for each Participating Agency in the WMA for the 2015-2016 monitoring year are shown in Table 3-13. These outfalls are also presented in Figure 3-3, which shows the dry and wet weather storm drain outfall monitoring locations in the San Luis Rey River WMA. The City of Oceanside began the season with five highest priority outfalls and added a sixth outfall (SLR-025) due to dry conditions at the several of the initial five highest priority outfalls.

Table 3-13. Highest Priority Outfalls in the San Luis Rey River WMA During the 2015-2016 Monitoring Year

Participating Agency	Station
County of San Diego	MS4-SLR-041, MS4-SLR-095, MS4-SLR-150, MS4-SLR-152, MS4-SLR-155
City of Oceanside	SLR-005, SLR-008, SLR-015, SLR-025, SLR-035, SLR-036
City of Vista	SLR-01, SLR-03

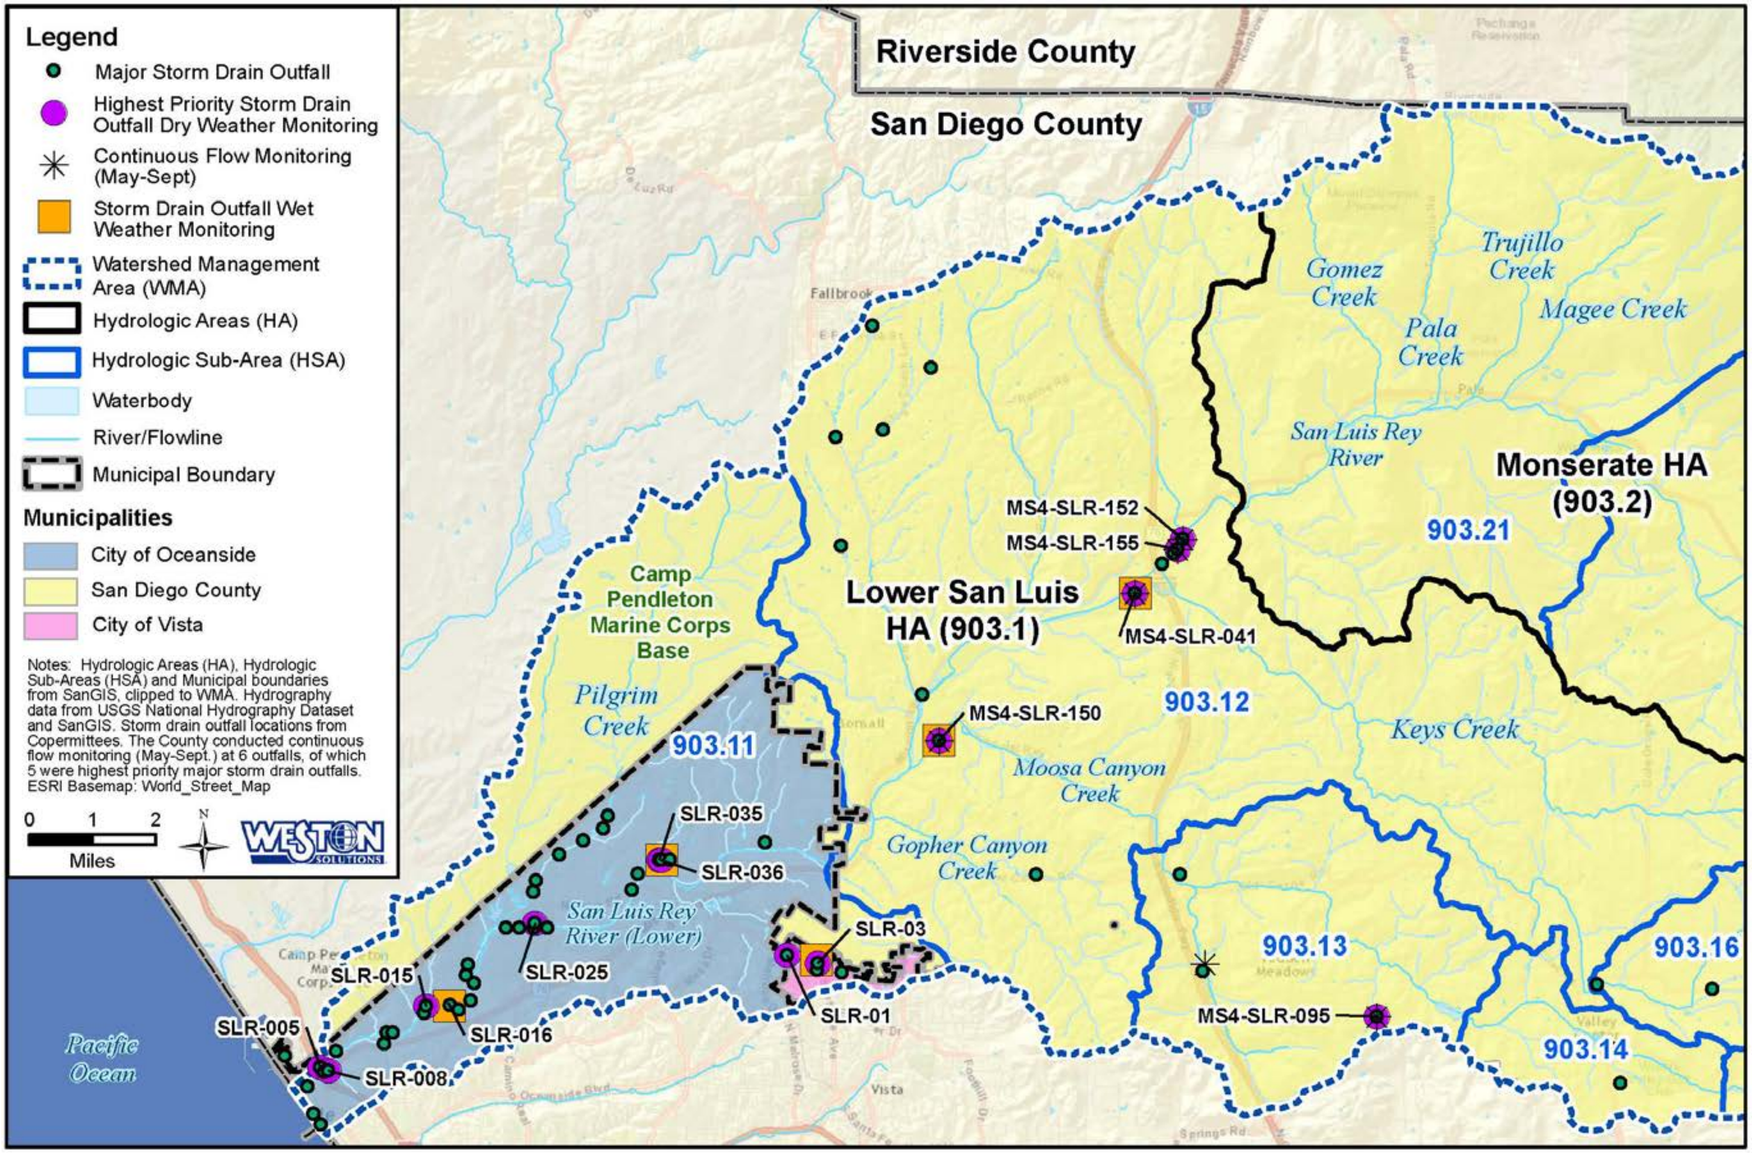

Figure 3-3. 2015-2016 Dry and Wet Weather Storm Drain Outfall Monitoring Locations in the San Luis Rey River WMA

3.2.1.2 Highest Priority Storm Drain Outfall Dry Weather Monitoring

The purpose of highest priority storm drain outfall dry weather monitoring is to evaluate the potential contribution from storm drain outfall discharges to receiving water quality during dry weather and to assess the ability of programs to effectively eliminate non-stormwater discharges to waterbodies or waterways.

The 2015-2016 monitoring year was the first year of dry weather storm drain outfall analytical sampling under the WQIP MAP, and monitoring was conducted at the highest priority outfalls identified for each Participating Agency in the WMA (Table 3-13). These monitored outfalls are shown in Figure 3-3. Two sampling events were conducted at each of the flowing outfalls. Three of the outfalls under the jurisdiction of the City of Oceanside were dry during both visits, and one was dry or ponded during three visits. These outfalls were not sampled due to lack of flow. In addition, one of the outfalls under the jurisdiction of the County of San Diego was dry during the first persistent flow monitoring visit and enough ponded water was available for analytical sampling during the subsequent monitoring visits. Temperature, pH, conductivity, dissolved oxygen, and turbidity were analyzed using field meters. Grab samples were analyzed in the laboratory for constituents contributing to the HPWQC, 303(d) List impairments, TMDLs, stormwater action levels (NALs), and those listed in Table D-7 of the Permit. Visual observations were also recorded.

A summary is provided in Table 3-14 in relation to bacteria in the WMA, and detailed results are presented in Sections 4.2.2 (data) and 4.2.3 (assessments) of Appendix 4. *Enterococcus* concentrations were above the instantaneous maximum (IM) NAL except in both samples from SLR-01 and one of two samples collected at MS4-SLR-095 and MS4-SLR-150. Fecal coliform concentrations were above the IM in approximately half of the samples collected. Both samples from MS4-SLR-095, MS4-SLR-155, and SLR-01 and one of two samples from MS4-SLR-152 and SLR-036 were below the IM. These highest priority outfalls were a specific focus for IDDE investigations (Section 3.2.1.3).

No re-prioritizations of the highest priority outfalls by the City of Vista or County of San Diego are planned for the 2016-2017 monitoring year in the WMA. The highest priority outfalls selected for analytical monitoring in 2015-2016 will continue to be monitored until one of the following conditions outlined in the Permit have been met:

- No flowing or standing water observed over the three most recent consecutive visits.
- No exceedances of NALs.
- Identified as a non-stormwater discharge authorized under a separate NPDES permit.

When an outfall fulfills one of these criteria or the threat to water quality has been reduced (as outlined in the Permit), it will be replaced with the next highest priority outfall on the Participating Agency's list for the WMA. Based on the 2015-2016 monitoring results, the City of Oceanside is updating its outfall prioritization due to changes in outfall flow determinations. SLR-005 and SLR-035, which were dry for three consecutive visits, will be replaced with the next two high priority outfalls, SLR-007 and SLR-025, in the top five high priority outfalls for analytical monitoring in 2016-2017.

Table 3-14. Dry Weather Storm Drain Outfall Discharge Monitoring Analytical Results for Bacteria

Outfall	Date	*Enterococcus* (MPN/100 mL)	Fecal Coliform (MPN/100 mL)	Total Coliform (MPN/100 mL)
NAL – Instantaneous Maximum		**61**	**400**	**NA**

	09/19/2016	**>2,420**	**30,000**	160,000

MPN/100 mL – most probable number per 100 milliliters
Bold and shaded results are greater than the Instantaneous Maximum.
< - Results are less than the reporting limit.
#- Reporting limit greater than Instantaneous Maximum benchmark.

Since persistent non-stormwater flows were identified in the storm drain system by each of the Participating Agencies in the WMA, the Participating Agencies are required to calculate or estimate the non-stormwater volumes and pollutant loads collectively discharged from these persistently flowing outfalls to receiving waters, and estimate percent contributions from each known source for each outfall. The Participating Agencies are also required to identify and quantify (i.e., volume and pollutant loads) sources of non-storm water not subject to the Participating Agency's legal authority that are discharged from the major storm drain outfalls, with persistent flow, to downstream receiving waters. Annual discharge volumes and non-stormwater pollutant loads were estimated for the persistently flowing outfalls using instantaneous flow measurements made during field visits and continuous flow data where available. Dry weather visual observation and field investigation data related to known and/or suspected sources of non-stormwater discharge were used to estimate the percent contribution from each source, including suspected sources. The assessment was not limited to known sources given that most of the sources were recorded as suspected.

The estimated annual non-storm water volumes collectively discharged from major storm drain outfalls with persistent non-stormwater flows from each jurisdiction in the San Luis Rey WMA are presented in Table 3-15. Estimated pollutant loads and source percentages are provided in Attachment 4E to Appendix 4.

Table 3-15. 2015-2016 Non-stormwater Flow Estimates for Major Storm Drain Outfalls with Persistent Flow

Participating Agency	No. Persistently Flowing Major Storm Drain Outfalls	Annual Non-Storm Water Discharge (cf)	Annual Average Discharge by Outfall (cf/outfall)
County of San Diego	7	5,945,734	849,391
City of Oceanside	3	322,363	107,454
City of Vista	2	65,122 to 100,061	32,561 to 50,031*

*Range based on SLR-03 discharge for August-September 2016 (56 dry days) since IC/ID discovery, and continuous discharge for the year (298 dry days) to represent the most conservative result, given that the start date of the leak is unknown. Repair work is scheduled. Follow-up assessment is ongoing.

3.2.1.3 Illicit Discharge Detection and Elimination (IDDE) Program

In order to reduce the pollutant loads from the storm drain system to receiving waters, each Participating Agency implements a program to reduce non-stormwater flow into its storm drain system. These programs are designed to meet the requirements of the Permit related to IDDE. Each Participating Agency's IDDE Program is one of the primary programs of their JRMP.

Each Participating Agency's IDDE Program seeks to address and reduce the potential contribution of pollutants from stormwater and non-stormwater discharges. The IDDE Programs seek to achieve the following goals:

- Controlling the contribution of pollutants to and the discharges from the storm drain system within its jurisdiction,
- Effectively prohibiting non-stormwater discharges to the storm drain system, and
- Reducing the discharge of pollutants in stormwater to the maximum extent practicable.

In pursuit of these goals, and in addition to the programmatic elements of the IDDE Programs, the Participating Agencies prioritize outfalls and sources, conduct follow-up investigations, and seek to identify sources of non-stormwater discharges on the basis of the following:

- Field screening visual observations at major storm drain outfalls,
- Non-stormwater monitoring at prioritized outfalls, and
- Reports or notifications of illicit discharges, illicit connections, or other sources of non-stormwater flow (e.g., from hotlines).

In addition to outfall monitoring and associated source investigations, the IDDE programs also include the following components to prevent, identify, and eliminate IC/IDs:

- Educating the local community about prohibited discharges and how to prevent them. During the 2015-2016 fiscal year, this outreach program included working closely with water utilities to educate communities about outdoor water conservation, including preventing irrigation runoff.
- Operating a public complaint phone hotline and website and investigating the complaints received.
- Inspecting industrial/commercial and municipal facilities, construction sites, and residential areas. In addition to identifying and eliminating IC/IDs where applicable, inspectors also proactively educate responsible parties about how to avoid IC/IDs, such as cleaning outdoor areas by sweeping instead of hosing them off.
- Maintaining the storm drain system and sewer system, which provide opportunities to identify unpermitted connections to the storm drain system, cross connections, and other potential sources of IC/IDs.

The IDDE components listed above are described in more detail in Section 4 and in the jurisdictional strategy tables in Appendix 2. The Participating Agencies' JRMP Annual Report forms, also included in Appendix 2, list the total numbers of IC/IDs identified and eliminated through all IDDE program activities during the fiscal year. More details about source investigation and elimination specifically related to the dry weather MS4 outfall monitoring component of the IDDE program are described in greater detail in Appendix 4.

3.2.1.3.1 Dry Weather Storm Drain Outfall Source Identification Results

Source investigations for storm drain outfall monitoring broadly categorize identified sources as "controllable" and "uncontrollable." Uncontrollable sources include natural sources such as groundwater and springs. Controllable and uncontrollable sources are further classified as known and suspected. All but three sources were categorized as suspected; two known sources were groundwater and one was irrigation. The most common source of non-stormwater flow suspected during the Participating Agencies' investigations was irrigation runoff, a controllable source. This flow source includes over-watering of residential and commercial landscaping, and does not include irrigation runoff from agricultural areas, which is regulated by the Regional Board under a separate program and is outside of the jurisdiction of the Participating Agencies. Figure 3-4 shows the known or suspected flow sources identified during the 2015-2016 monitoring year through the Participating Agencies' outfall flow investigations.

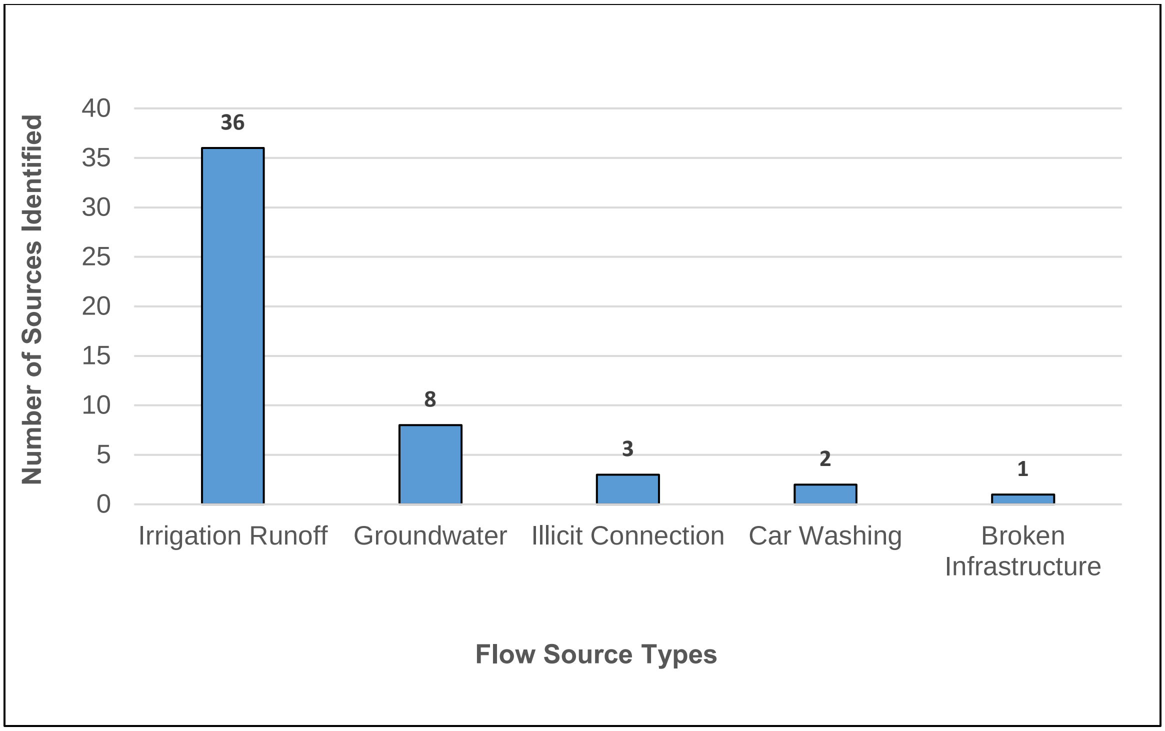

Figure 3-4. Known or Suspected Non-stormwater Flow Sources Identified for Participating Agencies' Outfalls

3.2.1.3.2 Storm Drain Outfall Investigation Details for Participating Agencies

The City of Oceanside conducted five non-stormwater flow source investigations upstream of two priority outfalls and found over irrigation as a known source for flows at one outfall during one visit and rising groundwater as a known source at the other outfall. The City of Vista conducted four non-stormwater flow source investigations upstream of two of its priority outfalls and did not find over irrigation as a source flow; instead, it suspected groundwater seepage, which is an allowable discharge, and a leaking fire hydrant as sources of flow. The County of San Diego conducted 41 non-stormwater flow source investigations upstream of six of its outfalls in the San Luis Rey River WMA, five of which are their highest priority outfalls and one which is not a major storm drain outfall (i.e., less than 36 inches in diameter) but was nonetheless prioritized for an IDDE investigation as it was found to have persistent non-stormwater flow, high concentrations of indicator bacteria in the discharge, and evidence of a potential human source of contamination (see Attachment 4J to Appendix 4). The County found numerous sources of non-stormwater flows draining to these outfalls; over-irrigation was the most common suspected source.

This information is presented in greater detail in Appendix 4, and additional information on these efforts and on other Participating Agencies' activities is provided in Section 4.

3.2.2 Storm Drain Outfall Wet Weather Monitoring

The purpose of storm drain outfall wet weather monitoring is to identify and quantify pollutants in stormwater discharges from the storm drain system, guide pollutant source identification efforts, and track progress in achieving numeric goals set forth in the WQIP. The Participating Agencies' five monitoring locations were chosen to be representative of the Residential, Commercial, Industrial, and typical Mixed-use land uses within the watershed in accordance with the Permit.

Three outfalls were located in the Mission HSA and two were in the Bonsall HSA. This is the first year of storm drain outfall wet weather monitoring in accordance with the WQIP MAP. The prior two years of wet weather monitoring were under the transitional monitoring program with a different list of analytical parameters. The storm drain outfall wet weather monitoring stations for the WMA are presented in Table 3-16 with both the station name used in the wet weather monitoring program and the identifier used by the jurisdiction in their storm drain outfall inventory. The monitored outfalls and their drainage areas are shown in Figure A4-10 in Appendix 4. The locations of outfalls MS4-SLR-1 and MS4-SLR-2 have not been adjusted since the second year of transitional monitoring, and the locations of outfalls MS4-SLR-3, MS4-SLR-4, and MS4-SLR-5 have been unchanged since transitional monitoring began. Therefore, two years of storm drain outfall wet weather monitoring data have now been collected at MS4-SLR-1 and MS4-SLR-2, and three years of data have been collected at MS4-SLR-3, MS4-SLR-4, and MS4-SLR-5.

Table 3-16. Storm Drain Outfall Wet Weather Monitoring Stations

Storm Drain Outfall Name	Jurisdictional Identifier	Participating Agency	HSA Name/No.	Latitude	Longitude
MS4-SLR-1	SLR-036	City of Oceanside	Mission/903.11	33.25583	-117.29243
MS4-SLR-2	SLR-016	City of Oceanside	Mission/903.11	33.22186	-117.34984
MS4-SLR-3	SLR-03	City of Vista	Mission/903.11	33.232546	-117.249591
MS4-SLR-4	MS4-SLR-150	County of San Diego	Bonsall/903.12	33.283702	-117.217033
MS4-SLR-5	MS4-SLR-041	County of San Diego	Bonsall/903.12	33.317871	-117.163833

Monitoring events were conducted in accordance with the WQIP MAP on December 11, 2015 at MS4-SLR-4; on January 5, 2016 at MS4-SLR-1 and MS4-SLR-2; and on January 31, 2016 at MS4-SLR-3 and MS4-SLR-5. Grab samples were collected and analyzed for pH, temperature, conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria. Composite samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, and stormwater action levels (SALs). Observational and hydrologic data were also recorded. The rainfall statistics for these monitored events, based on nearby Alert station gauges, are presented in Table 3-17. The highest event volume was observed at MS4-SLR-5 in the Bonsall HSA, and the highest peak flow was observed at MS4-SLR-2 in the Mission HSA. The lowest event volume and peak flow were observed at MS4-SLR-4 in the Bonsall HSA. Wet weather MS4 flow data are presented in Attachment 4F to Appendix 4.

Table 3-17. 2015-2016 Rainfall Statistics for Storm Drain Outfall Wet Weather Monitoring Events

Date	Outfall Name/ Jurisdictional Identifier	Total Rain (in)	Duration (hours)	Intensity (in/hour)	Antecedent Dry Days	Event Volume (cf)	Peak Flow (cfs)
01/05/2016	MS4-SLR-1/ SLR-036	1.20	7.55	0.16	13	33,644	9.54
01/05/2016	MS4-SLR-2/ SLR-016	1.20	7.55	0.16	13	76,181	14.6
01/31/2016	MS4-SLR-3/ SLR-03	0.55*	7.60*	0.07*	19	30,585*	6.75*
12/11/2015	MS4-SLR-4/ MS4-SLR-150	0.28	3.13	0.09	12	18,516	8.06
01/31/2016	MS4-SLR-5/ MS4-SLR-041	0.68	14.3	0.05	19	84,099	13.4

in – inches cf – cubic feet cfs – cubic feet per second

*Intermittent flow not associated with sampling activities was observed between 02:30 and 04:00 (peak of 0.88 cfs; discharge of 1,520 cf).

A summary is provided below in relation to bacteria, and detailed results are presented in Appendix 4 Section 4.25 (data) and 4.26 (assessments).

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that the highest concentrations were measured at MS4-SLR-1, located in the Mission HSA (903.11). Concentrations of *Enterococcus* and fecal coliform in stormwater discharges from all five outfalls were above the single sample maximums specified for the Bacteria TMDL (WQBELs discharging to freshwater creeks with REC-1 beneficial use). Results are summarized in Table 3-18. Analytical results for all constituents and the assessments required by the Permit are provided in Appendix 4. The required assessments are also provided in Appendix 4 and its attachments. The land-use based assessment required by the Permit was completed for the third year; a more robust data set was developed for the land-use based assessment of wet weather storm drain outfall discharge, and land-use based event mean concentrations (EMCs) were refined based on three years of monitoring. Details are provided in Appendix 4 and its attachments.

Table 3-18. Storm Drain Outfall Wet Weather Monitoring Analytical Results for Bacteria

Analyte	Single Sample Maximum[1]	MS4-SLR-1 (903.11)	MS4-SLR-2 (903.11)	MS4-SLR-3 (903.11)	MS4-SLR-4 (903.12)	MS4-SLR-5 (903.12)
		SLR-036	SLR-016	SLR-03	MS4-SLR-150	MS4-SLR-041
		1/5/2016	1/5/2016	1/31/2016	12/11/2015	1/31/2016
Enterococcus (MPN/100 mL)	61	**100,000**	**32,000**	**11,000**	**350**	**2,200**
Fecal Coliform (MPN/100 mL)	400	**34,000**	**4,400**	**800**	**500**	**2,400**

3.3 SPECIAL STUDIES SUMMARY

Special Studies are conducted to "address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to highest priority water quality conditions identified in the Water Quality Improvement Plan (Regional Board, 2013)." An overview of the conducted and planned special studies for the watershed for the current Permit term is presented in Table 3-19. Descriptions of the studies and results, where available and applicable to bacteria, are provided below. An assessment of special study results is presented in Appendix 4.

Table 3-19. Special Studies Occurring within the San Luis Rey River Watershed

Monitoring Programs	Dry	Wet	Monitoring Element	Permit Schedule[a]				
				2013-2014	2014-2015	2015-2016	2016-2017	2017-2018

[a] The Permit was adopted on May 8, 2013; the Permit became effective on June 27, 2013.

3.3.1 San Diego Regional Reference Streams and Beaches Studies

From 2014 to 2016, the Participating Agencies participated in the San Diego Regional Reference Streams (Tiefenthaler et al., 2015) and Beaches (Tiefenthaler et al., 2016) Studies, which measured levels of indicator bacteria that account for natural sources to establish the background concentrations, or "reference conditions," for streams or beaches minimally disturbed by anthropogenic activities. This reference system approach results in allocation of allowable exceedance days based on the frequencies of exceedance at reference sites with natural sources of bacteria. The results of these studies support the forthcoming re-evaluation of the Bacteria TMDL and numeric target development for future TMDLs. These studies were intended to provide data to support discussions of reasonable, accurate targets for indicator bacteria at Southern California streams and beaches.

3.3.1.1 Reference Streams Study

This study investigated concentrations of indicator bacteria, nutrients, metals, and conventional constituents occurring naturally at reference streams in minimally disturbed watersheds in

Southern California during wet and dry weather. Although additional constituents were analyzed, the primary focus of the study was indicator bacteria. The study also sought to categorize exceedance frequencies for indicator bacteria by hydrologic, geomorphologic, biotic, and abiotic factors. Human genetic marker results were used to exclude sites and samples with potential human sources of fecal contamination so that observed exceedance rates were not due to human sources of bacteria. Results are presented in detail in the Technical Report (Tiefenthaler et al., 2015) provided as Attachment 4H to Appendix 4 of this Annual Report.

Findings from the study included the following:

- Indicator bacteria concentrations measured during the study were generally below water quality objectives except for *Enterococcus*, and exceedance frequencies were highest during summer dry weather.
- Wet weather EMC exceedance frequencies were low except for *Enterococcus*. The number of events was not sufficient to determine whether relationships exist between the exceedance frequencies and watershed size and/or geology.
- Temperature was the major factor associated with elevated summer dry weather concentrations of indicator bacteria, although total suspended solids (TSS), nutrients, and organic carbon were also positively correlated. No significant relationships between indicator bacteria concentrations and watershed size or geology were observed during dry weather.
- EMC fluxes (flux was calculated as the ratio of mass loading and watershed area) during wet weather were two to three times greater than during dry weather and were comparable to those described in previous studies.

3.3.1.2 Reference Beaches Study

This study investigated concentrations of indicator bacteria occurring naturally at reference beaches during a period of prolonged drought. Results are presented in detail in the Technical Report (Tiefenthaler et al., 2016) provided as Attachment 4I to Appendix 4 of this Annual Report.

Findings from the study included the following:

- Indicator bacteria concentrations and exceedance frequencies during both winter and summer dry weather were low at both monitored beaches. This is consistent with results from previous studies of beaches with blocked estuary inlets or beaches with flowing creeks and no estuary.
- Indicator bacteria concentrations in the estuary or mixing zone associated with both beaches were one to three orders of magnitude greater than those at the corresponding beach, and were higher at San Onofre Creek than Deer Creek. Exceedance frequencies were also higher in the estuary associated with San Onofre Creek compared to the mixing zone associated with Deer Creek. This suggests that dry weather exceedance frequencies may have been greater if the estuary had been open to tidal exchange.
- At both study locations, no significant relationships between indicator bacteria and water temperature, salinity, or antecedent dry days were observed, but indicator bacteria concentrations decreased with the number of antecedent dry days at the San Onofre Creek

beach and increased with the number of antecedent dry days in the associated estuary. Significant positive correlations were found between total coliform concentrations and water temperature, salinity, and antecedent dry days and between *E. coli* and fecal coliform and salinity in the estuary associated with San Onofre Creek. These correlations indicate that freshwater input from the creek dilutes bacteria concentrations. Regrowth of bacteria may have been a factor at this estuary.

- During the single monitored storm event, indicator bacteria exceedances were common in the San Onofre Beach creek and estuary samples, but exceedances were observed at the beach only on the day of the storm. Since all samples associated with this storm event were positive for human genetic marker, results could not be used to determine natural background exceedance frequencies. However, positive human marker results were rare throughout the study overall, indicating that the study locations may be suitable reference sites.

3.3.2 San Luis Rey River Microbial Source Tracking Study

A dry weather microbial source tracking (MST) study was conducted in the San Luis Rey River watershed consisting of a preliminary outfall investigation, a storm drain network investigation, and an evaluation of potential remedial activities. Preliminary findings were reported in the Dry Weather Microbial Source Tracking Study Preliminary Findings Report (December 2015) included in the current report as Attachment 4J to Appendix 4. The findings are summarized below.

The preliminary outfall investigation involved inspections and sampling of storm drain outfalls in the sewered portions of the unincorporated area of San Diego County within the watershed. Of the 130 outfalls investigated, 14 were flowing and were sampled. Human marker was detected at quantifiable levels in samples from three of these 14 flowing outfalls (human marker was detected at a level below the quantification limit at one additional outfall). In addition, dog marker was found in samples from four outfalls, and pig and ruminant markers were found in one sample. Concentrations of fecal coliform and/or *Enterococcus* were above water quality objectives in all but one sample.

The storm drain network investigation involved water sampling for outfalls positive for human marker during the preliminary outfall investigation and visual observations for all outfalls flowing during the preliminary outfall investigation. Indicator bacteria results were elevated in all water samples, but none were positive for genetic markers. Several sources of non-stormwater flow and bacteria were observed, but no potential human sources of bacteria were identified in the vicinity of flowing outfalls. In addition, no illicit connections or leaks were observed during the storm drain network investigation. Irrigation runoff was identified as the most common source of non-stormwater flow, and agriculture discharge was identified as the largest contributor to flow volume.

The evaluation of potential remedial activities resulted in prioritization of several actions to achieve compliance with the Permit during dry weather. These actions included notifying agricultural owners of their pollutant contributing flows and discussing compliance approaches with the Conditional Waiver of Discharges from Agricultural and Nursery Operations, implementing source control measures (e.g., public outreach, ordinance development and enforcement, wildlife access restriction devices, and storm drain cleaning), evaluating the effectiveness of source control measures and identifying remaining flowing outfalls requiring additional remediation, and eliminating remaining non-stormwater flows using structural best management practices (BMPs) (e.g., wet weather BMPs recommended in the San Luis Rey Comprehensive Load Reduction Plan [CLRP], pervious gutters, catch basin drywells, and green street-type bioretention swales).

Results from this preliminary MST study will be used to support Permit compliance and Bacteria TMDL implementation planning, and may potentially serve as the first step in future Natural Source Exclusion and/or Quantitative Microbial Risk Assessment (QMRA) work. “Next steps” identified in the preliminary MST investigation report include:

- Conduct follow-up outfall investigations.
- Investigate whether recycled water tests positive for human genetic markers, and determine which outfalls may contribute recycled water.
- Conduct the dry weather MST study in the septic served areas of the County of San Diego’s jurisdiction in the San Luis Rey watershed.
- Continue to implement special studies that may potentially modify TMDL WQBELs during the TMDL reopener.
- Notify agriculture owners of their pollutant contributing flows and discuss compliance approaches with the Conditional Waiver of Discharges from Agricultural and Nursery Operations.
- Enhance source control measures.
- Develop an ongoing study evaluating the effectiveness of source control measures and monitoring the presence of non-stormwater flows.

4 Implementation and Progress Toward Achieving Numeric Goals

The Permit requires the Participating Agencies to develop specific water quality improvement numeric goals and strategies to address their HPWQC, which is identified as bacteria for the San Luis Rey River WMA.

Each year, the Participating Agencies assess specific water quality data and programmatic information in order to gauge progress towards achieving the numeric goals. These assessments provide information to determine whether intended outcomes are being realized or whether adaptations of Participating Agencies' programs are necessary. This section discusses the strategies that have been implemented during the reporting period, the progress towards achieving specific Permit term goals for the watershed, and provides an overview of proposed modifications to goals, strategies, and schedules. Data collected per the JRMP and MAP, along with the schedules developed in conjunction with each goal, were used to assess goals. Note that the selected strategies necessarily target bacteria in the watershed, but also address other pollutants as well, providing a multi-benefit approach to implementation.

4.1 STRATEGIES AND SCHEDULES

The strategies being implemented by the Participating Agencies are the mechanisms that enable improvements in water quality to achieve the numeric goals outlined in Section 2. The chosen strategies have been identified and selected based on their likelihood of achieving one or more of several of the following outcomes:

- Effectively prohibiting non-stormwater discharges to the storm drain system (dry weather);
- Reducing pollutants in stormwater discharges from the storm drain system to the maximum extent practicable (wet weather); and/or
- Protecting the beneficial uses of receiving waters from storm drain outfall discharges.

Achievement of these outcomes and the success of the strategies will ultimately be measured against the interim and final numeric goals.

4.1.1 Overall Watershed Strategy Implementation Highlights

During FY 2015-2016, the Participating Agencies implemented a broad range of strategies to target bacteria, as well as other constituents such as nutrients and trash. Highlights of some of the strategies being implemented by the Participating Agencies during FY 2015-2016 are described below. Tables presenting all strategies by jurisdiction are presented in Appendix 2.

In the San Luis Rey River WMA, numerous strategies focusing on reducing bacteria from both human and non-human sources were implemented across the watershed and are highlighted below.

- **Preventing discharges of bacteria from human sources to the storm drain system**. Human sources of bacteria are the highest priority from a public health perspective.
  - Sanitary Sewer Overflows (SSOs)
    - Implementation of internal staff training programs to identify and report SSOs to ensure a prompt response.
    - Existing development inspections programs address SSOs through outreach, inspections, and enforcement of ordinances.
  - Leaky Sewer Pipes
    - New monitoring programs focusing on persistent dry weather flows and investigations continue to identify areas where bacteria concentrations are elevated and trigger source investigations.
    - Participating Agencies may prioritize sewer lines repairs with analysis of water quality data.
  - Homeless Encampments
    - Sponsoring periodic trash cleanups along the lower San Luis Rey River, which reduce the impacts of trash and associated bacteria on receiving waters.
    - Coordination with local efforts to curb homeless issues in the region.
  - Failing Septic Systems
    - Residential inspections programs to identify properties with failing septic systems, triggering response and follow up.
    - Coordination with the County Department of Environmental Health for follow-up remediation and enforcement.

- **Preventing discharges of other bacteria sources to the storm drain system**. Non-human sources of bacteria can contribute to overall bacteria loads in our waterways. These sources are important to control as their prevalence makes them an important element of overall bacteria load reduction efforts for the Participating Agencies.
  - Pets
    - Pet waste management and outreach in municipal parks includes posting signs and installation of pet waste bag stations at trailheads. Agency maintained trails often have pet waste stations for use by the public.
  - Wash water
    - Extensive public outreach programs to educate the public about discharge prohibitions and the effect on the environment and to encourage their use of public hotlines to report illegal discharges of wash water.
    - Dry weather monitoring programs designed to focus on unusual flows, investigate their sources, and eliminate the discharge.
  - Livestock
    - The establishment and enforcement of minimum BMPs for existing development where livestock is present.
    - Outreach materials and programs provide information to owners of livestock explaining required BMPs, reasons for their necessity, and ways to implement BMPs properly.

Specific implementation approaches and actions are further described below for each of the Participating Agencies.

4.1.2 City of Oceanside

During FY 2015-2016, the City of Oceanside implemented strategies as described in the WQIP. The full list of strategies implemented is presented in Appendix 2. Notable accomplishments demonstrating progress towards applicable numeric goals related to bacteria during the reporting period are summarized below.

4.1.2.1 Illicit Discharge Strategies - Irrigation Runoff Control (IDDE 1-3, 10, 11)

Based on previously completed field screening of its outfalls in the WMA, the City of Oceanside conducted field reconnaissance in upstream residential areas to identify potential sources of non-stormwater flow into the stormwater system. In order to maximize the ability of City staff to identify these potential sources of non-stormwater flow, the City utilizes meter readers from its Water Department to identify and document runoff from residential irrigation. These staff are working in residential areas for much of their time and have the opportunity to cover large areas of the City's jurisdiction at a pace and level of detail that enables them to observe over-irrigation from residences. During the summer of 2015 the City also hired two part-time code enforcement officers to focus on residential irrigation runoff. The City has enacted drought-related restrictions on landscape irrigation and instances of over-irrigation are documented by the meter readers and followed up on by the City's Code Enforcement Division. During FY 2015-2016, 33 cases of residential irrigation runoff were documented by the meter readers, and 18 of those were in the San Luis Rey River watershed. Properties where irrigation runoff was observed were forwarded to City Code Enforcement so that a notification letter could be sent to the property owner/manager. Code Enforcement used escalated enforcement procedures as necessary for properties with recurrent irrigation runoff.

The City conducted sampling at five priority outfalls during dry weather for the 2015-2016 monitoring year to characterize the non-stormwater discharges flowing into the storm drain system and to further identify potential contributing sources of flow. Based on additional field observations of outfalls identified in the WQIP as persistently flowing, the City changed the classification of four of the five of these outfalls to dry or transient during 2015-2016, and added one new site to the priority list. These changes left the City with two of the five highest priority outfalls in the WMA that are subject to highest priority storm drain outfall dry weather monitoring during 2015-2016. Replacement outfalls with persistent flow will be added to the priority list as needed for the 2016-2017 monitoring year based on outfall field screening data. The monitoring and investigations conducted during 2015-2016 at the two outfalls mentioned above helped determine that irrigation runoff from an upstream apartment complex was a source of flow to one of the outfalls, and rising groundwater was contributing to the other. As groundwater is a natural source of flow that is exempt under the Permit, no further follow up was needed. However, the irrigation runoff case was referred for enforcement and a verbal and written warning were issued which resulted in partial termination of the flow. Subdrainage of irrigation water and other unknown sources may also be contributing flow to this site. The City will continue to monitor the outfall to determine all known and potential sources of non-stormwater discharge.

4.1.2.2 Illicit Discharge Strategies – Sanitary Sewer Line Inspections (IDDE 9, OPT-2)

In an effort to reduce the potential for sewage to leak from the City's sanitary sewer pipes, the City is in the process of using a specially designed 360-degree visualization closed circuit television (CCTV) system to inspect the sanitary sewer system. The City has determined that an effective strategy under the WQIP to reduce bacteria pollution would be to visually inspect its older vitrified clay pipes (VCP) in the sanitary sewer system which may be prone to leakage, allowing identification of potential problem areas and prioritization of repairs. The City has developed a plan to use a CCTV system to visually inspect 100% of its VCP sanitary sewer lines to look for signs of damage to the pipes where infiltration or exfiltration could occur. During FY 2015-2016, City contractors and staff visually inspected an approximate total of 130 miles of sewer lines across the entire City. Approximately 30 miles of the total footage inspected by CCTV was within the San Luis Rey River watershed. The City of Oceanside's in-house sewer collections crews inspected 98,652 linear feet (18.6 miles) of City-owned sewer lines within the watershed during FY 2015-2016.

4.1.2.3 Illicit Discharge Strategies – Slip Lining Sanitary Sewer Pipes (IDDE 8)

In an effort to minimize the potential for exfiltration from the sanitary sewer system, which could impact surrounding soils, the proximal storm drain system, and/or receiving waters, the City rehabilitated approximately 4,000 feet of sanitary sewer lines with new cured in place pipe (CIPP) liners within its entire jurisdictional area during FY 2015-2016. CIPP provides a new lining of the insides of the sanitary sewer pipes through insertion of a flexible liner pipe into the existing sanitary sewer pipes. The liner is then expanded to fit the old pipe and hardens in place providing a new leak resistant pathway for the sewage to flow. This method of retrofitting old sewer lines extends their service, reduces the potential for exfiltration, reduces sewer pipe replacement costs, and minimizes surface disruption as it requires little if any excavation of the old pipes.

4.1.2.4 Illicit Discharge Strategies – Illicit Discharge/Bacteria Source Control (IDDE 5, 10)

In order to reduce the potential impacts of homeless encampments on water quality, during FY 2015-2016, the City applied for grant funding under the Integrated Regional Water Management Program's Disadvantaged Communities grant programs. If the application is successful, the grant funds will be used to help conduct a survey of homeless citizens to determine what types of incentives could be implemented to assist them in helping to adopt behaviors related to trash and human waste management to help reduce bacteria pollution.

4.1.2.5 Illicit Discharge Strategies – Sanitary Sewer Systems (Strategies IDDE 5, 6, 10)

The City is a member of the San Luis Rey Watershed Council (SLRWC), a non-profit organization of diverse stakeholders who are working together to help restore and maintain the natural resources of the WMA. The SLRWC has been an active group in the watershed for many years and has implemented programs locally which aim to benefit water quality in the watershed. Their efforts have included water use efficiency conservation programs, which seek to help educate citizens about wise use of limited local water supplies. In addition, the SLRWC has provided assistance to homeowners in the Warner Springs community who have experienced problems with their onsite septic systems, which have been identified as potentially significant sources of bacteria if not properly sited and maintained. The SLRWC also installed composting toilets in various locations of the watershed.

4.1.2.6 Existing Development Strategies - Water Conservation Outreach (Strategies ED 1-3, 8)

The City of Oceanside hosted a series of landscaping educational workshops for residential property owners during FY 2015-2016. These workshops focused on helping citizens to understand watershed concepts which they can mimic on a small scale on their own properties in order to reduce water use and minimize irrigation runoff. The workshops promoted incentives to help homeowners undertake water saving changes such as replacing lawns or inefficient plumbing fixtures and appliances. Turf replacement is an effective tool for reducing residential water consumption, and during FY 2015-2016 more than 31,000 square feet of turf where replaced within the City. Additionally, as part of its irrigation system rebate program, the City provided 36 rebates for water conserving irrigation controllers and 19 rebates for sprinkler retrofits.

4.1.3 City of Vista

During FY 2015-2016, the City of Vista implemented strategies as described in the WQIP. The full list of strategies implemented is presented in Appendix 2. Notable accomplishments by the City in terms of progress towards achieving applicable numeric goals related to bacteria during the reporting period are summarized below.

4.1.3.1 Illicit Discharge Strategies – Identify and report (IDDE 1-7, 10)

In order to help reduce the potential for the discharge of bacteria, the City conducts an extensive program focused on eliminating illegal discharges or connections to its storm drain system. This IDDE program utilizes municipal staff and contractors to identify instances of runoff, spills, or illegal dumping that could pose a threat to water quality. When suspicious discharges are found, the City investigates the nature of the discharge and its potential sources and takes appropriate action to eliminate the discharge. During FY 2015-2016, the City documented five cases of illicit discharges in the WMA. One was a municipal source, one was an unconfirmed residential irrigation discharge, two were residential pool water discharges, and another was a residential sediment discharge. All four discharges that were able to be confirmed were eliminated upon investigation by the City.

4.1.3.2 Illicit Discharge Strategies – Dry weather flow control (IDDE 10)

During the 2015-2016 monitoring year, the City investigated its four major outfalls (SLR-01 through SLR-04) in the WMA in an effort to assess and eliminate non-stormwater flows. SLR-01 was found with persistent non-stormwater flow, and is the subject of an ongoing investigation. The source of its flow appears to be foundation drains discharging groundwater from a local school; however, the City is currently awaiting lab results to help identify the potential source. SLR-02 has been dry during all visits by City staff. SLR-03 has exhibited persistent flow from initially inconclusive sources; numerous field visits with varying degrees of flow have complicated source tracking efforts. However, a concerted effort by City staff suggests the source is a leaking fire hydrant. The hydrant is scheduled for repair, which should eliminate this source of flow. SLR-03 is one of the sites being studied in Vista (Special Study #1), which is intended to characterize persistent flows through the use of continuous flow monitoring equipment and the collection of water quality samples analyzed for the highest priority water quality conditions. Results from the study will be available upon completion. SLR-04 has been dry during investigations under this Permit term.

4.1.3.3 Illicit Discharge Strategies – Sponsor trash collection events (ED5)

During FY 2015-16, the City sponsored a site for the annual Creek to Bay cleanup day (April 23, 2016). City staff supporting the event distributed outreach materials and were available to talk directly with residents about environmental issues. Although the site was within the Carlsbad

WMA, a large number of attendees were members of an organization based within the San Luis Rey WMA. By involving and educating residents from throughout the region, cleanup events like this provide benefits beyond the limits of a particular WMA. Overall, cleanup events provide residents with the inspiration and tools to be stewards of the environment, including any waterways located near their own neighborhoods.

4.1.3.4 Existing Development Strategies - Inspections (ED 1, 12)

Similar to its efforts during FY 2014-2015, the City conducted inspections of industrial and commercial facilities during FY 2015-2016. To facilitate tracking and reporting of BMP compliance at existing development facilities, inspection forms were updated during FY 2015-2016. These revisions also included the addition of trash-related BMPs. The City conducted two municipal facility inspections, two commercial facility inspections, one industrial facility inspection, and five residential inspections in the WMA during FY 2015-2016. One commercial facility violation was found during the inspection, and zero violations were found during the municipal and industrial inspections.

Facilities likely to require a State General Industrial Permit were prioritized for inspection, enabling staff to focus inspections on facilities with an elevated potential to discharge pollutants to stormwater. Following inspections during FY 2014-2015, facilities with violations requiring follow-up were inspected again during FY 2015-2016 (along with additional sites). Although the number of enforcement actions initiated on a citywide basis for industrial and commercial facilities during these two reporting years was similar, the number of violations per site dropped substantially. This demonstrates that focused inspections have proven to be an effective use of City resources. In the upcoming fiscal year, the City plans to initiate an outreach program focused on homeowners associations within Residential Management Areas. The program will target behaviors associated with homeowner maintenance activities that have the potential to generate pollutants, which can impair water quality. This effort will include the distribution and use of bi-lingual outreach materials that were redesigned during FY 2015-2016. These materials include brochures and posters that focus on residential BMPs and the control of fats, oils, and grease (FOG).

4.1.4 County of San Diego

During FY 2015-16, the County of San Diego implemented strategies as described in the WQIP. The full list of strategies implemented is presented in Appendix 2. Notable accomplishments by the County in terms of progress towards achieving applicable numeric goals related to bacteria during the reporting period are summarized below.

4.1.4.1 Illicit Discharge Strategies - Investigation and Elimination (IDDE 1,2,4,5 and 6)

Non-stormwater flow into the storm drain system may be problematic as it can pick up and transport pollutants that have accumulated on land surfaces like roads, driveways, lawns, gutters and sidewalks. These pollutants can include bacteria from sources such as pet waste, illegal dumping, and septic systems, which can wash into the storm drain system, into receiving waters, and ultimately to local beaches. The County has enacted several strategies aimed at the reduction of non-stormwater flows to address bacteria pollution in the San Luis Rey River watershed.

Central to the County's efforts to address bacteria pollution in the WMA are programs designed to investigate and eliminate illicit discharges to the storm drain system, thereby reducing non-stormwater flows. These programs fall under the County's IDDE program, which is one of the primary programs under the JRMP. The IDDE program aims to reduce non-stormwater flow by following a process of steps as follows:

1. Determine where there are non-stormwater flows through the storm drain system by field screening major stormwater outfalls.
2. Prioritize persistently flowing outfalls for further investigation.
3. Investigate which pollutants may be in the flows by sampling the discharged water from the priority outfalls.
4. Identify where the flow is coming from by investigating areas upstream for signs of illicit discharges, like over-irrigation or wash water discharges, or by following up on complaints about illicit flows.
5. Eliminate illicit sources of flow through education, technical assistance, and/or enforcement actions.

Storm drain outfall dry weather monitoring conducted by the County is a key element of the IDDE program. Field screening of outfalls is performed following a standardized County monitoring procedure in which data and observations are recorded using the County's Storm Drain Outfall Visual Observation Field Datasheet. During the 2015-2016 monitoring year, the County conducted dry weather field screening in the WMA at 21 major storm drain outfalls. Storm drain outfall dry weather monitoring including field and analytical water quality sampling was performed at the five highest priority persistent flow outfalls determined through a prioritization/ranking process outlined in the Permit.

In addition to the Permit-required visual screening monitoring of all major storm drain outfalls in the WMA, the County of San Diego conducted visual screening monitoring of non-stormwater flows for all outfalls (including those with diameters less than 36 inches) that have been inventoried. This included all outfalls investigated during the 2015 Microbial Source Tracking Study (provided as Attachment 4J to Appendix 4). During 2015-2016, this screening was conducted approximately once every two months during dry weather. The purpose of this additional effort was to characterize the extent and distribution of non-stormwater discharges from the storm drain outfalls throughout the County of San Diego jurisdictional area subject to the Bacteria TMDL.

Further, the County has performed continuous flow monitoring using level loggers installed at six targeted outfalls during the dry season (May through September). The six outfalls included the five highest priority outfalls (Table 3-13) and one additional outfall (SLR-045) that has been prioritized due to the presence of persistent non-stormwater flow, high concentrations of indicator bacteria, and potential human source of the bacteria as determined during the 2015 Microbial Source Tracking Study (provided as Attachment 4J to Appendix 4). The County is analyzing these data in terms of flow patterns, rates and volumes in an effort to identify potential sources. The County also conducts direct investigations at these outfalls to determine management actions for elimination of non-stormwater flows. These continuous flow data are also used to determine baseline non-stormwater flows for comparison to WQIP pathway 6a goals and to determine non-stormwater flow volumes for assessments required by the Permit.

Supplemental to routine visits, extensive field investigations and discharge reconnaissance for illicit discharges in upstream areas were conducted at the six outfalls (including the County's five highest priority outfalls) to identify and eliminate sources of flow subject to the Participating Agency's legal authority. During 2015-2016, the County performed a total of 35 sources investigations associated with the six sites, making progress towards understanding the sources of these flows. Section 3.2.1.3 and Appendix 4 Section 4.2.4 of this report provide the details of these IDDE investigations, including suspected and known sources and progress made in reducing and eliminating non-stormwater flows. During 2016-2017, the six outfalls will be the subject of focused effort including additional inspections to determine key sources of the flows during the times of peak flow that were detected with the continuous monitoring.

Another program that provided key IDDE-related information during the 2015-2016 monitoring year was Residential Management Area (RMA) inspections conducted in accordance with the Permit within the WMA. RMAs were visited at least once, and investigations were conducted at various times of day to capture different water usage times, including "wee-hours" reconnaissance from 5 to 9 a.m. and 8 a.m. to 8 p.m.

In addition to field reconnaissance looking at surface sources of flow and pollution, the County also worked to find sources within its own stormwater and sewer systems. During FY 2015-2016, the County's Roads Section secured funding for the purchase of new trucks with remote camera systems which can be used to help the IDDE program to investigate conditions inside of underground pipes. These camera systems will be used by County staff to help investigate potential illicit discharges and illicit connections to the storm drain system. Also these camera systems can help locate areas of stormwater and sewer pipes in need of repair that may be leaking water or sewage, and can be sources of both non-stormwater flow and bacteria contamination.

4.1.4.2 Existing Development Strategies - Water Conservation/Partnering (ED 3, 4, 7, and 15, OPT 5)

The County undertakes a number of strategies designed to reduce the contribution of pollutants from existing development within the WMA. In order to track and record many of its efforts related to existing development, the County maintains a database inventory of existing development in the watershed. This database is continually updated with the new information as it becomes available to ensure the accuracy of the County's records and make its use by Staff as efficient and effective as possible.

As a regional leader in water conservation, several of the County's existing development strategies are implemented both independently and in partnership with other agencies to help conserve local water supplies. During FY 2015-2016, these efforts included the County conducting two rain barrel distribution events (Figure 4-1) in partnership with other agencies which provided 55 gallon water collection drums to qualifying local citizens. The County has also worked in partnership with local water agencies, including the San Diego County Water Authority under its WaterSmart campaign, to provide assistance within its jurisdiction on the distribution of water conservation educational materials. This effort has included the promotion of available water conservation rebates and incentives including water efficiency audits and other tools to help save water.

Figure 4-1. Rain Barrel Distribution Event

Through the County's collaboration with a diverse group of partners, the Sustainable Landscapes Program (SLP)[9] was developed to integrate multiple sustainability concepts and resource benefits for residential-scale urban landscapes. The program aims to reduce the amount of potable water applied to the landscape, capture and use rainwater as a resource, and reduce pollutant infiltration into local waterways. The comprehensive approach includes the following:

1. the development of landscape guidelines,
2. residential and professional landscape training courses,
3. technical landscaping assistance including planting and irrigation plans,
4. marketing and outreach
5. financial incentives for turf conversions, and
6. landscape materials provisions, including mulch and compost/compost tea.

During FY 2015-2016, the SLP partners offered free education and training opportunities to over 1,000 homeowners and professionals throughout San Diego County. All training opportunities align with the San Diego SLP Guidelines, which details best practices and recommendations for a watershed approach to landscaping, such as downspout diversion to landscaped areas, Low Impact Development (Site Design BMPs), use of water efficient irrigation equipment, low water use plants and compost and mulch to amend soils for maximum water retention. Financial incentives for turf conversions and discounts on landscape material are scheduled to commence in late 2016.

[9] Information on the San Diego Sustainable Landscapes Program can be found at http://sustainablelandscapessd.org/.

In addition, the County has taken a multi-faceted approach to reduce water consumption and limit non-stormwater flows through collaboration among departments. In response to drought conditions in the region, the County recently implemented a Water Shortage and Drought Response Plan to reduce water use at its facilities. For example, a collaborative effort between the Departments of Parks and Recreation and General Services resulted in installation of synthetic turf at several parks, including Clemmens Lane Park Soccer Field in Fallbrook (Figure 4-2). Since 2009, Parks and Recreation's installation of high-efficiency irrigation heads and smart irrigation controllers was completed in 20 parks county-wide, which has enabled the County to save over 180 millions of gallons of irrigation water. Other measures taken include, but are not limited to, elimination of regularly scheduled exterior window washing at County facilities and identification of parks and facilities with the potential for recycled water connections.

Figure 4-2. Clemmens Lane Park Soccer Field

4.1.4.3 Existing Development Strategies – Outreach/Source Control (ED 6, 7, 8, 10, and 12)

In addition to these water conservation focused efforts, the County has implemented a variety of other programs and strategies which aim to reduce bacteria pollution loads in the San Luis Rey River watershed. This work has included participation in and sponsorship of focused clean up events including the statewide Coastal Cleanup Day and Creek to Bay Cleanup Day. These events both take place at locations throughout the County and focus volunteer trash and debris removal efforts on specific locations. During FY 2015-16, these events, conducted in coordination with I

Love a Clean San Diego (ILACSD), were great successes, removing approximately half a million pounds of debris. These cleanup programs and have been shown to have multiple benefits including:

- removing significant amounts of garbage and debris;
- getting people out into local watersheds to connect with natural places;
- raising awareness about local water quality and the challenges posed to clean water; and
- raising awareness about the County's efforts to keep local waters clean, and the importance of proper disposal of all trash.

Also as part of the ILACSD program, during FY 2015-2016 the County overhauled its outreach presentations for local middle and high schools. These presentations include activities which are engaging and hands-on and help empower students to learn the difference they can make. Topics covered include watershed basics, stormwater pollution, ocean conservation and marine debris, waste reduction and water conservation. The County has also prepared a new outreach effort and materials packet for distribution specifically to homeowners associations, focusing on residential behaviors and pollution sources which will be piloted during FY 2016-2017. The County endeavors to continually update and improve its outreach materials to ensure their accuracy and effectiveness. This includes translating materials into other languages, including Spanish.

Also during FY 2015-2016, the County distributed three water quality related educational door hangers covering the topics of green waste and trash, sediment management, and water conservation (Figure 4-3). All three were designed using principles of community-based social marketing which aims to change selected public behaviors with specific, simple messages.

As the County's websites are also important conduits for the distribution of educational information, outreach materials related to water conservation programs were added to the Project Clean Water and County Department of Public Works websites. These outreach materials were also distributed to the County's water quality list serve of interested citizens who have requested additional information about the County's efforts to protect local waters.

Figure 4-3. Water Conservation Door Hanger

The County is also working to control sources of bacteria before they can enter local waters. One potentially significant source of bacteria is onsite waste treatment systems, including septic systems. If not properly sited or maintained these systems can fail and leak human sewage into the surrounding soils and water bodies. The County is planning to employ new technology that can look for certain kinds of human sewage specific bacteria to help determine the source of bacterial contamination in local water bodies. This process is known as Microbial Source Tracking (MST), and it can help pinpoint failing septic systems or other sources of bacteria loads and may be implemented in the watershed as part of future illicit connection or discharge investigations.

Another potential source of bacteria pollution is poorly managed manure from horses and livestock. In the San Luis Rey River WMA, the County began a program during FY 2014-2015 to conduct evaluations on residential equestrian properties and to provide technical assistance to help reduce the potential for pollution from leaving these properties. Follow up evaluation visits were started during FY 2015-2016, and will likely continue into the next fiscal year. In addition, the County has developed numerous outreach materials designed specifically for horse owners on BMPs that can help reduce bacterial pollution associated with horse ownership. These materials are available for download on the County's website. This type of rural outreach work in the watershed is often done in coordination with the Mission Resources Conservation District (MRCD). MRCD is a state conservation district which is a non-regulatory government agency which provides assistance to local property owners and agencies on effective management of soil and water resources. In the watershed, the MRCD also has conducted removal of giant reed (*Arundo donax*), an invasive weed which takes over creeks and riparian areas, outcompeting native plants such as willows. *Arundo* crowds out native, local plants, destroying wildlife habitat and it consumes large amounts of water which it pulls from the ground as it takes over local creek beds. It is also difficult to remove as it is very persistent and requires special tools, training and removal techniques which MRCD provides for the benefit of the local environment and local residents.

4.1.4.4 Development Planning Program Strategies – Updated Material/Outreach (DP 1,2,3)

The County is committed to improving training and guidance materials for construction contractors, businesses, and internal staff. The 2007 Low Impact Development (LID) Handbook[10] was updated to better align with the County's Standard Urban Stormwater Mitigation Plan (SUSMP) and Hydromodification Management Plan, and to reflect the most current data on LID approaches and their efficacy. For its distinguished efforts, the County was named the recipient of the 2015 Outstanding Innovation in Green Planning and Design Award by the San Diego Chapter of the California Association of Environmental Professionals (AEP), a non-profit organization established in 1974 and dedicated to enforcing and supporting the California Environmental Quality Act (CEQA). Additionally, the County received a similar award in October 2016 for work done during the fiscal year on development of its Guidance on Green Infrastructure[11], a document outlining tools to uniformly design, install, and maintain LID features in the public right-of-way.

4.2 WATERSHED GOALS

As discussed in Section 2, interim and final numeric goals were established for the watershed as a means of tracking progress in reducing bacteria loads, consistent with Bacteria TMDL and lower San Luis Rey River (WQIP) requirements. These goals are outlined in Chapter 3 of the WQIP and in Appendix 3 of this Annual Report. Each year, the Participating Agencies assess specific water quality data and programmatic information in order to gauge progress towards achieving the numeric goals. These assessments provide information to determine whether intended outcomes are being realized or if adaptations of Participating Agencies' programs are necessary.

Progress toward achieving numeric goals is measured by use of water quality and program activity data collected during the 2015-2016 monitoring year. The WQIP was accepted in February 2016, and none of the outlined goals were scheduled to be achieved during 2015-2016. The Participating Agencies are demonstrating progress towards meeting Bacteria TMDL goals at the San Luis Rey River mouth through the WQIP implementation option presented in Table 3-3 of the WQIP. This option involves the reduction of dry and wet weather bacteria loading from the storm drain system through implementation of non-structural BMPs in order to meet interim, and eventually final, goals. Progress toward meeting bacteria goals for the lower San Luis Rey River is focused on flow elimination at persistently flowing outfalls during dry weather and load reductions in storm drain outfall discharges during wet weather, also through implementation of non-structural BMPs. Tables detailing the Participating Agencies' non-structural BMPs can be found in Appendix 3B of the WQIP. Progress is summarized in Table 4-1 (for the Bacteria TMDL goals) and Table 4-4 (for the lower San Luis Rey River goals) and in the following subsections.

4.2.1 Bacteria TMDL Goals

Interim goals to address the Bacteria TMDL are provided in Tables 3-4 and 3-5 in the San Luis Rey WQIP. A summary of these goals, as applicable to the 2015-2016 monitoring year, is provided in Table 4-1.

---

[11] http://www.sandiegocounty.gov/content/sdc/dpw/watersheds/DevelopmentandConstruction/BMP_Design_Manual.html

4.2.1.1 Dry Weather

The final dry weather goal for Compliance Pathway 6a (WQIP implementation) is to eliminate 100% of anthropogenic non-stormwater discharges and accompanying bacteria loads from storm drain outfalls to the receiving water by 2021. The Participating Agencies have established an interim goal for the first Permit term (2013-2018) to reduce by 20% the aggregate flow or the number of persistently flowing outfalls (see WQIP Table 3-4; Compliance Pathway 6a).

The 2015-2016 monitoring year was to be used to establish a baseline for non-stormwater flow. It should be noted that 2015-2016 was similar to other recent monitoring years in that the ongoing drought has resulted in dry conditions in the region. Flow has not been observed at the WMA's mass loading station since 2012-2013. During transitional period and 2015-2016, the Participating Agencies conducted dry weather field screening monitoring at all of their major storm drain outfalls to document the presence of standing or flowing water. These data were used to determine which outfalls have persistent non-stormwater flows and should be prioritized in accordance with the Permit for their potential impact on the quality of receiving waters. These highest priority storm drain outfalls were targeted for additional bi-annual field and analytical monitoring and focused source reduction activities during 2015-2016 in accordance with the Permit. The County also installed continuous flow monitoring equipment in their five highest priority outfalls and in one additional outfall to measure dry season baseline non-stormwater flows and to screen for cyclical trends in these flows. These data were used to determine baseline non-stormwater flows for comparison to WQIP Pathway 6a goals and to determine non-stormwater flow volumes for assessments required pursuant to the Permit. This information will be used to assist the Participating Agencies in reducing or eliminating non-storm water flows through source identification and abatement activities. Additional continuous flow monitoring by other Participating Agencies may be incorporated in the future to further develop the baseline.

Results for the 2015-2016 monitoring year demonstrate that persistent non-stormwater flow was observed at a total of 12 of 61 major storm drain outfalls in the WMA (seven of 21 under the jurisdiction of the County of San Diego, three of 36 under the jurisdiction of the City of Oceanside, and two of four under the jurisdiction of the City of Vista). Therefore, a 20% reduction in the number of persistent outfalls in the WMA would be equivalent to three fewer persistently flowing outfalls by 2018. The mean flow rate as measured at the six outfalls with continuous flow monitoring equipment equaled 15.88 gallons per minute (gpm). These preliminary flows represent a baseline against which progress toward achieving the goal of reducing and effectively eliminating anthropogenic non-stormwater flows from the storm water conveyance system to the receiving waters can be measured. Progress is summarized in Figure 4-4 and Table 4-1.

4.2.1.2 Wet Weather

The wet weather interim goal for the current Permit has two components. In WQIP Pathway 6a, Participating Agencies implement non-structural BMPs to achieve source reduction of bacteria loads from the storm drain outfalls. In WQIP Pathway 6b, the Participating Agencies reduce by 0.3% the baseline bacteria loads from distributed BMPs constructed between 2003 and 2009 during redevelopment (see WQIP Table 3-5; Compliance Pathway 6). These BMPs are outlined and mapped in Appendix E to WQIP Chapter 3. Since these BMPs were implemented to mitigate anticipated development, they are considered as contributing to the pollutant load reductions achieved under the WQIP. The County implemented all planned programmatic BMPs and is on track to achieve the first wet weather goal for the current Permit term. The Participating Agencies have achieved the second wet weather goal through operation and maintenance of existing distributed BMPs. Progress is summarized in Figure 4-4 and Table 4-1.

Permit Term Goal (2013-2018)	Baseline Estimations Complete	On Track to Meet Goal	Permit-Term Goal Met
Dry Weather Goal: Flow Reduction	✓		
Wet Weather Goal #1: Programmatic BMP Implementation		✓	
Wet Weather Goal #2: Distributed BMP Operation and Maintenance			✓

Figure 4-4. Progress towards Permit Term Bacteria TMDL Numeric Goals at the San Luis Rey River Mouth

Table 4-1. Permit Term Bacteria TMDL Numeric Goals for the San Luis Rey River Mouth (2013-2018)

Permit Term Goal (2013-2018)	Metric	Schedule	Baseline Data	Data Collected/Results	Progress
Dry Weather					
Reduce by 20% the aggregate flow or the number of persistently flowing outfalls.	(1) Reduction of flow volume. OR (2) Number of outfalls with flows mitigated from persistently flowing storm drain outfalls.	Achieve during Permit Term (expires June 27, 2018).	A dry weather flow monitoring study was conducted during 2015-2016 in order to establish the baseline. (1) 11 of total 61 outfalls had persistent non-storm water flows. (2) Mean flow rate at outfalls with continuous flow monitoring equipment was 15.88 gpm.	Dry weather flow data from major storm drain outfalls were collected during the 2015-2016 monitoring year to establish a baseline.	Data from the 2015-2016 monitoring year were used to set a baseline. Future years' data will be compared to that baseline. Baseline may be further refined using additional continuous flow data.
Wet Weather					
Implement programmatic (non-structural) BMPs to achieve source reduction of bacteria loads from the storm drain outfalls.	% bacterial load reduction. Interim compliance is implementation of strategies in accordance with schedule in WQIP.	Achieve during Permit Term (expires June 27, 2018).	3,835 x 10^{12} MPN during Water Year 1993.	During FY 15-16 the County implemented all planned programmatic BMPs according to the schedule in the WQIP.	The first year of BMP implementation under the WQIP was completed successfully; and the County is on track to achieve the goal via continued BMP implementation through 2018.
Reduce by 0.3% the baseline bacteria loads from distributed BMPs constructed between 2003 and 2009 during redevelopment.	Implementation and maintenance of BMPs. % bacterial load reduction is based on quantitative model.	Achieve during Permit Term (expires June 27, 2018).	3,835 x 10^{12} MPN during Water Year 1993.	BMPs were constructed between 2003 and 2009 and have continued to be operated and maintained.	The County is on track to achieve the goal via continued BMP operation and maintenance through 2018.

4.2.2 Lower San Luis Rey River Goals

Lower San Luis Rey River goals are focused on improving water quality in storm drain outfall discharges and in the receiving water, with an emphasis on eliminating non-stormwater flows at persistently flowing outfalls. Interim numeric goals for the current Permit term are shown in Table 4-4.

4.2.2.1 Dry Weather

During dry weather, the interim goal identified for the Permit term is a 20% reduction in the number of outfalls with persistent flows or a 20% reduction in aggregate flow from persistently flowing outfalls (see WQIP Table 3-6). Progress will be measured by assessing whether or not flow has been eliminated from 20% of persistently flowing outfalls or by assessing whether flow has been reduced by 20%.

As described in Section 4.2.1.1, to demonstrate progress toward the goal of reducing and eventually eliminating non-stormwater discharges, dry weather monitoring of priority major outfalls was conducted during the 2015-2016 monitoring year to develop a baseline flow rate. Monitoring during 2015-2016 indicated that 12 of 61 major storm drain outfalls in the WMA have persistent non-storm water flows. The mean flow rate at these outfalls, based on continuous flow monitoring equipment, was 15.88 gpm. Progress toward meeting the dry weather interim goal is summarized in Figure 4-6 and Table 4-4.

4.2.2.2 Wet Weather

Lower San Luis Rey River wet weather goals are focused on reducing bacteria loads in storm drain outfall discharges or reducing bacteria concentrations in the receiving water. For wet weather, the final goal to be achieved by 2031 is to reduce bacteria loads cumulatively or at key outfalls by 11.9% or meet the Bacteria water quality objective in the lower San Luis Rey River. The interim goal for the current Permit term is to reduce bacteria loads cumulatively or at key outfalls by 0.3% or to meet bacteria water quality objectives in the lower river (see WQIP Table 3-7). Progress will be measured by comparing bacteria loads per acre to baseline bacteria loads calculated as described below.

4.2.2.2.1 Baseline Calculation

Baseline wet weather bacteria loads were presented in the WQIP as 2.44E+10 MPN/storm/acre for fecal coliform and 1.18E+11 for *Enterococcus.* These baseline loads for San Luis Rey River WMA storm drain outfalls could not be reproduced using the methodology described in Attachment 3K of the WQIP; therefore the baseline values were recalculated to fix the apparent error. The new calculations were made using the same methodology, but with some modifications as described below.

As described in Attachment 3K of the WQIP, the calculations included wet weather data collected at random storm drain outfalls in the WMA during the five years of the 2007 Permit's storm drain outfall monitoring program (WESTON, 2015c). In this program, a grab sample was collected at five randomly-selected storm drain outfall stations within the WMA each year. No continuous flow data were collected during storm events. Therefore, the storm water runoff volume for a standardized storm event (daily precipitation = 0.5 inches) was estimated using hydrology manual

(HM) runoff coefficients based on the land use within the drainage area in order to estimate a pollutant load for the sample. At the completion of the five-year program, there were 27 stations in the WMA with estimated pollutant loads for a 0.5 inch model storm. The load/storm/acre or "flux" was determined by dividing the estimated pollutant load at each station by the drainage area acreage of the station.

The baseline was refined by including only 16 of the 27 stations from the 2007 Permit program in the calculation of average flux. This modification was made due to the difference between the current major storm drain outfall inventory and the original inventory of potential monitoring stations used in the random storm drain outfall program under the 2007 Permit. Some of the stations that were provided on the random list were in fact culverts that are not subsequently included in the major storm drain outfall inventory as advanced under the 2013 Permit. The drainage area sizes of the random program monitored sites varied widely, with some drainage areas appearing to represent large receiving water subwatersheds due to the inclusion of culverts. In an effort to make the monitoring locations more comparable between the 2007 program and 2013 programs, only the stations having drainage areas within the size range of the drainage areas for the current monitoring stations (less than 500 acres) were selected for the baseline estimation. This refinement in the methodology resulted in use of 16 samples from the random study to calculate the baseline, and results are shown below in Table 4-2. The revised baselines are an order of magnitude lower than the WQIP baseline loads of 2.44E+10 MPN/storm/acre for fecal coliform and 1.18E+11 for *Enterococcus*. Therefore, lower flux values will be necessary to demonstrate reductions during the current and future permit terms.

Table 4-2. "Baseline" Calculated Using 16 Storm Drain Outfall Random Program Monitored Stations (Drainage Areas less than 500 acres)

Analyte	Mean (MPN/Storm/Acre)
Fecal Coliform	6.67E+09
Enterococcus	2.02E+10

4.2.2.2.2 Comparison of 2015-2016 Monitoring Data to Baseline

Progress toward reducing storm drain outfall wet weather loads against these new baselines is summarized in Figure 4-6 and Table 4-4. In order to compare the 2015-2016 wet weather monitoring data to the baseline loads, the 2015-2016 monitored concentrations at the five outfalls were multiplied by the estimated runoff for a 0.5 inch storm based on HM coefficients similar to the methods used to estimate storm water volume from the random storm drain outfall stations in the 2007 Permit study. Although flow data were collected as part of the 2015-2016 monitoring program, the storm event loads for comparison to the baseline were calculated for a 0.5 inch storm using HM runoff coefficients rather than the actual monitored amount of rainfall and measured runoff coefficients in order to make the results more comparable to the random program. In general, the HM coefficients are larger than the actual runoff coefficients measured at the five storm drain outfall locations sampled, resulting in estimated storm loads that were generally larger than the actual event loads for a standardized 0.5 inch storm, and making the estimates a lot more conservative when compared to the recalculated baseline loads.

The calculated fecal coliform and *Enterococcus* loads in MPN/storm/acre for each of the five monitored storm drain outfalls is shown in Table 4-3 with a comparison to the arithmetic mean baselines represented as percent difference from baseline. Negative percentages indicate that the 2015-2016 monitoring result was lower than baseline.

Table 4-3. Estimated Loads for 2015-2016 Monitored Storm Drain Outfall Stations Compared to Baseline

Analyte	Station/Jurisdictional Identifier	2015-2016 Load (MPN/Storm/Acre)	Compared to Baseline*
Fecal Coliform	MS4-SLR-1/SLR-036	8.46E+09	27%
	MS4-SLR-2/SLR-016	1.19E+09	-82%
	MS4-SLR-3/ SLR-03	2.17E+08	-97%
	MS4-SLR-4/MS4-SLR-150	1.01E+08	-98%
	MS4-SLR-5/MS4-SLR-041	4.52E+08	-93%
Enterococcus	MS4-SLR-1/SLR-036	2.49E+10	23%
	MS4-SLR-2/SLR-016	8.64E+09	-57%
	MS4-SLR-3/ SLR-03	2.98E+09	-85%
	MS4-SLR-4/MS4-SLR-150	7.08E+07	-100%
	MS4-SLR-5/MS4-SLR-041	4.14E+08	-98%

*Percent change calculated as (2015-2016 Load – Baseline)/Baseline using the arithmetic mean baselines

Given the high variability in bacteria data, the 2015-2016 loads were also compared to the baseline range and distribution, as shown in the box and whisker plot in Figure 4-5. This figure shows the 2015-2016 load/storm/acre results as points for each of the five stations on a box and whisker plot of the random program data used in generating the baseline. This plot shows that the majority of the 2015-2016 samples were below the median load/storm/acre of the storm drain outfall data from the 2007 Permit random wet weather program. MS4-SLR-1 (SLR-036) was the only station with loads above the above the median of the historical data.

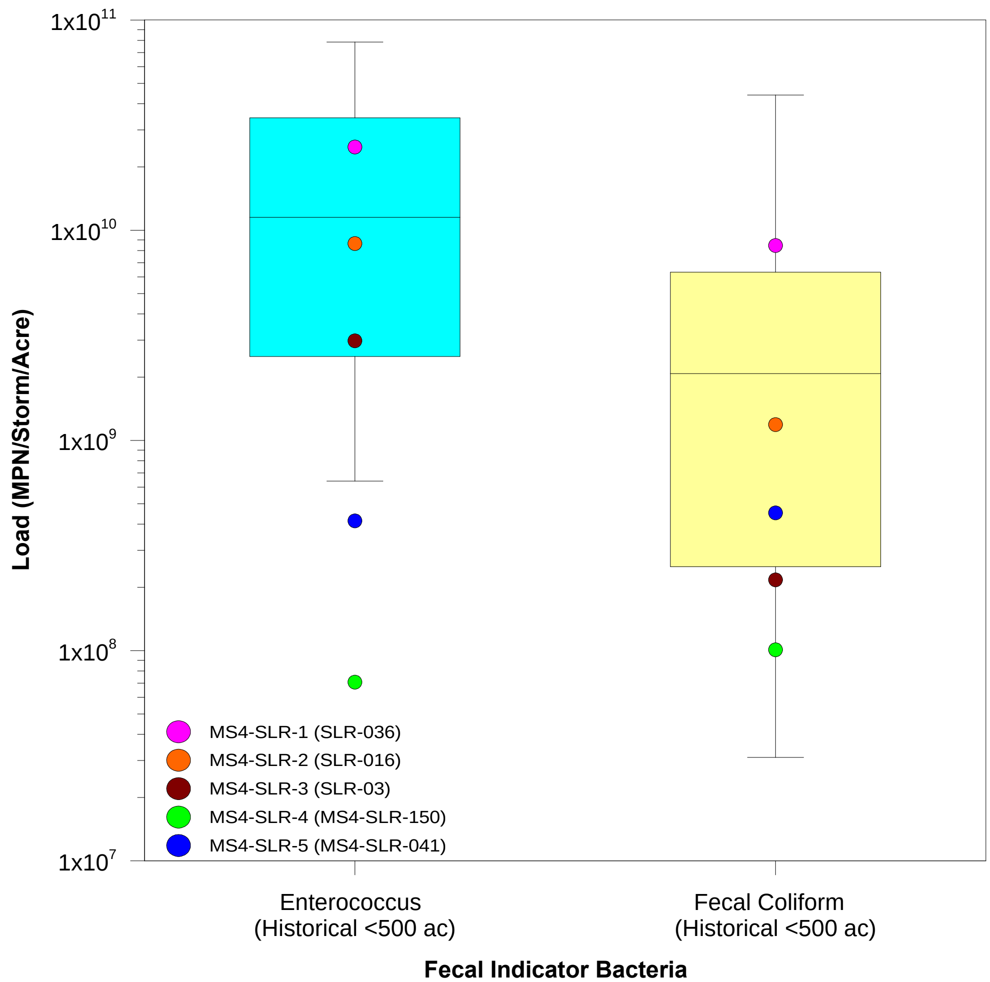

Figure 4-5. Box and Whisker Plot of Baseline Data Compared to 2015-2016 Monitoring Results for Each of the Five Monitored Outfalls

The wet weather goal can also be achieved by meeting the bacteria water quality objectives in the lower San Luis Rey River. Progress was evaluated by comparing bacteria concentrations measured at SLR25 in the lower River to REC-1 water quality objectives. The fecal coliform concentration during the wet weather event achieved the water quality objective, but the *Enterococcus* concentration did not.

Permit Term Goal (2013-2018)	Baseline Estimations Complete	On Track to Meet Goal	Permit-Term Goal Met
Dry Weather Goal: Flow Reduction	✓		
Wet Weather Goal #1: Bacteria Load Reduction from Storm Drain Outfalls		✓	
Wet Weather Goal #2: Meet Bacteria Goals in Lower River		✓	

Figure 4-6. Progress towards Permit Term Lower San Luis Rey River Numeric Goals

Table 4-4. Permit Term Lower San Luis Rey River Numeric Goals for Bacteria (2013-2018)

Permit Term Goal (2013-2018)	Metric	Schedule	Baseline Data	Data Collected/Results	Progress
Dry Weather					
Reduce by 20% the aggregate flow or the number of persistently flowing outfalls.	(1) Presence/absence of dry weather flow at persistent flowing outfalls. OR (2) Dry weather flow measurements at persistently flowing outfalls.	Achieve during Permit Term (expires June 27, 2018).	A dry weather flow monitoring study was conducted during 2015-2016 in order to establish the baseline. (1) 11 of 61 outfalls had persistent non-storm water flows. (2) Mean flow rate at outfalls with continuous flow monitoring equipment was 15.88 gpm.	Dry weather flow data from major storm drain outfalls were collected during the 2015-2016 monitoring year to establish a baseline.	Data from the 2015-2016 monitoring year were used to set a baseline. Future years' data will be compared to that baseline. Continuous flow data are also be analyzed in terms of flow patterns, rates and volumes in an effort to identify potential sources, direct investigations, and determine management actions for elimination of dry weather flows.
Wet Weather					
Reduce bacteria loads cumulatively or at key outfalls (MS4-SLR-1 through MS4-SLR-5 as described in Section 3.2.2) by 0.3%.	Bacteria load reductions per acre at key outfalls (5 wet weather monitoring outfalls) as described in Section 3.2.2).	Achieve during Permit Term (expires June 27, 2018).	Fecal coliform: $2.44*10^{10}$ MPN/storm/acre *Enterococcus*: $1.18*10^{11}$ MPN/storm/acre	Wet weather bacterial loads were calculated from historical data in order to update the baseline. Results indicated: (1) Fecal coliform: $6.67E*10^{9}$ MPN/storm/acre (2) *Enterococcus*: $2.02*10^{10}$ MPN/storm/acre	This goal was partially achieved. See Figure 4-5. Loads from outfalls MS4-SLR-2, MS4-SLR-3, MS4-SLR-4, and MS4-SLR-5 are below the updated baseline loads for both *Enterococcus* and fecal coliform. Loads from MS4-SLR-1 are above the updated baseline loads for both *Enterococcus* and fecal coliform.
OR					
Meet Bacteria water quality objectives in the lower San Luis Rey River.	Bacteria concentrations in the lower San Luis Rey River.	Achieve during Permit Term (expires June 27, 2018).	Water quality objectives for freshwater Single Sample Maxima: Fecal Coliform: 400 MPN/100 mL *Enterococcus*: 61 MPN/100 mL	Compliance with bacteria water quality objectives was evaluated as part of the Monitoring to Assess WQIP Goals, Strategies, and Schedules as described in Section 3.1.4 of this Annual Report. Based on data collected during 2015-2016: (1) The *Enterococcus* result from the single wet-weather event at SLR25 exceeded the objective. (2) The fecal coliform concentration met the objective.	This goal was partially achieved. The fecal coliform water quality objective has been met based on data from the 2015-2016 monitoring year, but the *Enterococcus* water quality objective has not been met.

5 Adaptive Management

This section presents a summary of the potential triggers for adaptation of the WQIP and the results of the adaptive management process for the San Luis Rey River WMA after the 2015-2016 monitoring year, with additional detail provided in Appendix 5.

Adaptive management entails using an iterative approach to re-evaluate the water quality conditions, priorities, numeric goals, strategies, and schedules based on the requirements of the Permit. The adaptive management process details how the Participating Agencies use new data and information to improve the WQIP through updates to priorities, assessments of and adjustments to goals, updates to strategies to meet the latest goals, and updates to the monitoring and assessment program to provide the necessary data to support the process.

Multiple triggers may warrant adaptive management or changes to stormwater program activities, including exceedances of water quality standards in receiving waters, new information, recommendations from the Regional Board, and public participation. Effectiveness assessments of JRMP programs and strategies may also trigger adaptations to the WQIP. The adaptive management process is used in conjunction with water quality and programmatic data to evaluate whether modifications to numeric goals, schedules, and/or strategies are necessary to achieve compliance with the interim and final compliance numeric goals. The timing of the adaptive management requirements is typically either annually or at the end of the Permit term.

5.1 DRIVERS FOR ADAPTIVE MANAGEMENT

The adaptive management process may be triggered when new information becomes available, including results of routine monitoring and special studies, new regulatory drivers, results of program effectiveness assessments and progress towards numeric goals, and recommendations from the public and/or Regional Board. Modifications may be made to the priority water quality conditions, goals, strategies, schedules, and/or the MAP. The potential triggers for adaptation that must be considered annually are summarized in Table 5-1. The assessments related to each of these potential triggers are included in Appendix 5.

With the acceptance of the WQIP in February 2016, the Participating Agencies have been implementing the WQIP for less than a year. Therefore, it is too early in the implementation process to have significant feedback necessary to drive the adaptive management process. Continued and further implementation of strategies and collection of additional monitoring and programmatic data is necessary for an evaluation that leads to meaningful adaptive management. The elements considered in the adaptive management process are identified in the section to follow; however, no changes to the WQIP are recommended at this early stage of implementation.

Table 5-1. Causes for Adaptive Management within the Water Quality Improvement Plan

Trigger	Frequency for Assessment	Potential Area(s) for Adaptation			
		Priority Water Quality Conditions	Goals and Schedules	Strategies and Schedules	Monitoring and Assessment
Exceedances of Receiving Water Limitations	Annual			X	X
Exceedances of Non-stormwater Action Levels or Stormwater Action Levels	Annual			X	X
Special Studies Results	Annual, as results are available		X	X	X
New Regulatory Actions	Annual, as applicable	X	X	X	X
Regional Board Recommendations	Annual, as applicable	X	X	X	X
Program Effectiveness Assessments/ Progress Towards Goals	Annual			X	X

5.2 WATER QUALITY IMPROVEMENT PLAN ADAPTIVE MANAGEMENT

The purpose of this section is to document changes to components of the WQIP, including priority water quality conditions, numeric goals, strategies, and/or schedules, if applicable, based on analyses and findings in this 2015-2016 Annual Report. Supporting information for these modifications are detailed in Appendix 5, if applicable. The potential areas for adaptation were presented in Table 5-1, which also shows the information that may trigger adaptation.

5.2.1 Water Quality Conditions

In accordance with the Permit, the priority water quality conditions within the watershed may be re-evaluated as needed as part of the annual reporting process. PWQCs, HPWQCs, and numeric goals are generally established based on longer periods of record compared to a monitoring year. The assessment of HPWQC would most appropriately be conducted following the collection of sufficient data to make scientifically-based decisions. At earliest, such consideration may be given during the preparation of the ROWD, which is due to the Regional Board in December 2017.

As outlined in Section 5, receiving water and storm drain outfall monitoring results from the 2015-2016 monitoring year supported the identified priority and highest priority water quality conditions as provided in the WQIP, and no modifications are necessary at this time. Further, there have been no new regulatory actions or Regional Board recommendations since the acceptance of the WQIP that would warrant reconsideration of priorities for the WMA through the annual reporting process. The baseline for the wet weather watershed goals for lower San Luis Rey River was revised to both correct the calculation and refine the methodology. This resulted in a lower baseline from which reductions will be measured.

5.2.2 Strategies and Schedules

On an annual schedule, it is more likely that modifications may be made to strategies and implementation schedules. These WQIP components may require updates on a more frequent basis to ensure effective implementation and assessment of progress in reducing pollutant loads and achieving established goals. Evaluation of the current goals, strategies, and schedules is required by the Permit as part of this Annual Report. The information that may be used to modify these elements of the WQIP through adaptive management is summarized in Table 5-2.

No changes to numeric goals or schedules for achieving them as listed in the WQIP are proposed at this time. Minor clarification to the text of two strategies has been proposed and is shown as markup in the jurisdictional strategy tables of Appendix 2. Since the acceptance of the WQIP in early 2016, the Participating Agencies have begun implementing jurisdictional strategies intended to result in achievement of dry and wet weather interim goals for the term of the current Permit. While one year of monitoring data have been collected in accordance with the MAP of the WQIP, only a few months of this time period have been under the accepted WQIP and implementation. These efforts to date have not identified the need for significant changes and, as described in Section 4.1, the Participating Agencies are demonstrating progress in implementing the existing strategies. Additional evaluation will be conducted and reported in the ROWD, due to the Regional Board in December 2017.

Table 5-2. Information Used to Modify Strategies and Schedules

Evidence	WQIP Sections	2015-2016 Status	Changes Triggered (Y/N)
Receiving water monitoring results.	Section 3, Appendix 4	No new information pertaining to receiving water exceedances not addressed by the WQIP.	N
Storm drain outfall monitoring results.	Section 3, Appendix 4	NAL and SAL exceedances are consistent with WMA priority constituents.	N
Special studies results.	Section 3, Appendix 4	Data from these studies will be useful for the re-evaluation of the Bacteria TMDL and to support Permit compliance and Bacteria TMDL implementation planning.	N
New or updated regulations.	Section 5	No new regulatory drivers; adaptive management will be required as new TMDLs are approved and as the Trash Amendments are incorporated into the Permit.	N
Program effectiveness assessments.	Section 5	Additional data will be necessary to supplement 2015-2016 data before program effectiveness can be evaluated.	N
Progress towards achieving numeric goals.	Section 4	Initial results related to program effectiveness indicate that the Participating Agencies have made progress towards meeting each of their dry and wet weather interim goals for the current Permit term.	N

5.2.3 Monitoring and Assessment Plan

Changes to the MAP may be triggered by several factors including:

- Modifications to other elements of the WQIP, including priority water quality conditions, numeric goals and schedules, and/or strategies and schedules.
- Identification of data gaps through the Permit-required assessments.
- Results of special studies.
- Requests/requirements from the Regional Board.

None of these triggers are applicable to the 2015-2016 monitoring year, and adaptive management of the MAP is not required at this time. Modifications not requiring adaptive management include:

- Modifications have been made to the outfall priorities for dry weather monitoring due to highest priority outfalls becoming dry. Further detail is provided in Appendix 5.
- The baseline established to determine progress towards meeting wet weather lower San Luis Rey River bacteria goals was revised (lowered), requiring lower monitored loads to demonstrate load reductions.

Additional assessments are planned for the ROWD, including evaluation of the monitoring data and receiving water limitations.

6 Conclusions

This was the first year of monitoring under the accepted WQIP and its associated MAP. The monitoring performed during 2015-2016 in the San Luis Rey River WMA, which was focused on addressing bacteria as the HPWQC in the WMA, is summarized in Table 6-1. Although the goals and strategies outlined in the WQIP are focused on bacteria, implementation of the chosen strategies are expected to also improve conditions in relation to the PWQCs and other potential contaminants, providing a multi-benefit approach to implementation.

Table 6-1. Monitoring Conducted during 2015-2016 in the San Luis Rey River WMA

Monitoring Element	Related to HPWQC? (Y/N)
Receiving Water Monitoring*	
SMC Regional Monitoring	N
TMDL	Y
Monitoring for Assessment of WQIP Goals and/or Strategies	
Bacteria Monitoring in the Lower San Luis Rey River	Y
Storm Drain Outfall Monitoring	
Field Screening	Y
Dry Weather Monitoring	Y
Wet Weather Monitoring	Y
Illicit Discharge Detection and Elimination	Y
Special Studies	
Reference Streams and Beaches Study	Y
San Luis Rey River Microbial Source Tracking Study	Y

* HMP monitoring was conducted regionally but not in the San Luis Rey River WMA. The objectives and results of the program are summarized in Appendix 4.

A summary of findings and achievements as they pertain to bacteria is presented in Table 6-2. Detailed results and the related assessments required by the Permit are found in the referenced sections of Appendix 4.

Table 6-2. Summary of Findings and Achievements Related to the Highest Priority Water Quality Condition in the San Luis Rey River WMA for the 2015-2016 Monitoring Year

Monitoring Element	Location of Detailed Results	Major Findings and Achievements
Regional Monitoring		
TMDL	Section 3.1.3 Appendix 4 Section 4.1.6	• Interim and final numeric targets are achieved at OC-100 for: o Fecal and total coliform dry and wet season geometric means and wet weather single-sample maximum. o *Enterococcus* dry and wet season geometric means. • Interim and final numeric targets are not being met for the *Enterococcus* wet weather single-sample maximum.
Additional Monitoring for Assessment of Goals and/or Strategies		
Bacteria Monitoring in the Lower San Luis Rey River	Section 3.1.4 Appendix 4 Section 4.1.7	• Based on a single wet-weather event monitored at SLR25, the *Enterococcus* concentration exceeded the bacteria water quality objective, whereas fecal coliform did not. • Based on eight dry weather events monitored, the exceedance frequencies were 100% for *Enterococcus* and 13% (one event) for fecal coliform.
Storm Drain Outfall Monitoring		
Dry Weather Field Screening	Section 3.2.1.1 Appendix 4 Section 4.2.1	• There was no trash or a low presence of trash (less than 50 pieces) during most (83%) of the trash assessments (n = 129) at visited outfalls. • Dry conditions/no flow were observed for 81% of visits conducted by the City of Oceanside, 50% by the City of Vista, and 47% by the County of San Diego. Flow was observed during 6% of the 72 visits conducted by the City of Oceanside, 50% of the 8 visits by the City of Vista, and 34% of the 53 visits by the County of San Diego. • For outfalls with flowing or standing water, more than half (14 of 26 estimations) had flow rates lower than five gallons per minute. • Based on the latest three field visits, the number of dry outfalls increased from 33 to 37, the number of transient outfalls decreased from 18 to 12, and the number of persistent outfalls increased from 8 to 12. • The highest priority outfalls in each jurisdiction were prioritized for dry weather monitoring.
Highest Priority Storm Drain Outfall Dry Weather Monitoring	Section 3.2.1.2 Appendix 4 Section 4.2.2	• Samples collected from most of the monitored outfalls exceeded the NAL (instantaneous maximum) for *Enterococcus* and fecal coliform (HPWQCs in the WMA) and NALs for total nitrogen and total phosphorus (PWQCs in the WMA); this indicates that the HPWQC and PWQCs for the WMA and the highest priority outfalls for the WMA were properly selected. • Data collected during this first monitoring year were used to estimate the non-stormwater volumes and pollutant loads collectively discharged from the major storm drain outfalls with persistent non-stormwater flows in each Participating Agency's jurisdiction.
Storm Drain Outfall Wet Weather Monitoring	Section 3.2.2 Appendix 4 Section 4.2.5	• Samples collected from all five monitored outfalls exceeded the single sample maximum final effluent limitations for *Enterococcus* and fecal coliform. • Building upon the transitional wet weather storm drain outfall program, a more robust data set was developed for the land-use based assessment of wet weather storm drain outfall discharges and land-use based EMCs were refined based on two years of monitoring at MS4-SLR-1 and MS4-SLR-2 and three years of monitoring at MS4-SLR-3, MS4-SLR-4, and MS4-SLR-5.
Illicit Discharge Detection and Elimination Program	Section 3.2.1.3 Appendix 4 Section 4.2.4	• The highest priority outfalls with persistent non-stormwater flow were a focus for IDDE investigations. Irrigation runoff was the most common known or suspected source of non-stormwater flows, followed by groundwater infiltration, an uncontrollable source.
Special Studies		
Reference Streams and Beaches Studies	Section 3.3.1.1 Appendix 4 Section 4.3.1	• These studies measured concentrations of indicator bacteria that account for natural sources to establish the background concentrations, or "reference conditions", for streams and beaches minimally disturbed by anthropogenic activities. Data will support the forthcoming re-evaluation of the Bacteria TMDL and numeric target development for future TMDLs.
San Luis Rey River Microbial Source Tracking Study	Section 3.3.1.2 Appendix 4 Section 4.3.2	• *Enterococcus* concentrations exceeded the water quality objective in all but one of the investigated storm drains. • Genetic indicators of human and/or animal waste were detected in some of the samples collected from the outfalls, but were not confirmed during the network investigations. • No illicit sewer connections or leaks were found. • Results from this preliminary MST study will be used to support Permit compliance and Bacteria TMDL implementation planning, and may potentially serve as the first step in future Natural Source Exclusion and/or Quantitative Microbial Risk Assessment (QMRA) work.
Jurisdictional Programs		
Vary by Jurisdiction	Section 4 Appendix 2	• Participating Agencies in the San Luis Rey River WMA have begun implementing jurisdictional strategies aimed at achieving their interim dry and wet weather goals for the current Permit term and are demonstrating progress. • The Participating Agencies are on track to meet or have already met the Permit-term goals for the watershed.

During FY 2015-2016, the Participating Agencies implemented a broad range of strategies focusing on reducing both human and non-human sources of bacteria across the watershed, as well as other constituents such as nutrients and trash. Human sources of bacteria are the highest priority from a public health perspective, but non-human sources can contribute to overall bacteria loads in waterways and are important to control. Highlights included the following:

- Preventing discharges of bacteria from human sources to the storm drain system by addressing sanitary sewer overflows, leaky sewer pipes, homeless encampments, and failing septic systems.
- Preventing discharges of other, non-human, bacteria sources to the storm drain system through public outreach programs related to pet waste management, discharge of wash water, and livestock.

Strategies implemented by the Participating Agencies were also focused on reduction and elimination of non-stormwater flow, which address not only bacteria but other PWQC in the watershed, including nutrients. These strategies address the final dry weather goal associated with the WQIP Implementation pathway to compliance with the Bacteria TMDL (6a), which is to eliminate 100% of anthropogenic non-stormwater discharges and accompanying bacteria loads from storm drain outfalls to the receiving water by 2021. Strategies by Participating Agency were presented in Section 4.1 and include the following:

- **City of Oceanside**
    - Illicit discharge strategies
        - Irrigation runoff control
        - Sanitary sewer line inspections
        - Slip lining sanitary sewer pipes
        - Illicit discharge/bacteria source control
        - Sanitary sewer systems
    - Existing development strategies
        - Water conservation outreach
- **City of Vista**
    - Illicit discharge strategies
        - Identification and reporting
        - Dry weather flow control
        - Trash collection events
    - Existing development strategies
        - Inspections
- **County of San Diego**
    - Illicit discharge strategies
        - Investigation and elimination
    - Existing development strategies
        - Water conservation/partnering
        - Outreach/source control

Progress made toward achievement of the interim Permit-term watershed numeric goals was measured using water quality and program activity data collected during 2015-2016. The Participating Agencies are making progress toward achieving each of their Permit-term goals.

The WQIP requires implementation of an adaptive management process, used to evaluate whether updates to priorities, assessments of and adjustments to goals, updates to strategies to meet the latest goals, and/or updates to the MAP are necessary. This process may be triggered when new information becomes available, including results of routine monitoring and special studies, new regulatory drivers, results of program effectiveness assessments and progress towards numeric goals, and recommendations from the public and/or Regional Board. With the acceptance of the WQIP in February 2016, the Participating Agencies have been officially implementing the WQIP for less than a year. Therefore, it is too early in the implementation process to have significant feedback necessary to drive the adaptive management process. Continued and further implementation of strategies and collection of additional monitoring and programmatic data is necessary for an evaluation that leads to meaningful adaptive management. Therefore, no changes to the WQIP are recommended at this early stage of implementation.

APPENDIX 1

Crosswalk of Permit Requirements and Annual Report References

Appendix 1 – Crosswalk of Permit Requirements and Annual Report References

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix: Appendix 2 Jurisdictional Information	WQIP Appendix: Appendix 3 Numeric Goals	WQIP Appendix: Appendix 4 Monitoring	WQIP Appendix: Appendix 5 Adaptive Management
Provision A						
A.4.a.(2)	If ***exceedance(s) of water quality standards persist in receiving waters*** notwithstanding implementation of this Order, the Copermittees must comply with the following procedures: (2) Upon a **determination** by either the Copermittees or the San Diego Water Board that discharges from the MS4 are **causing or contributing to a new exceedance** of an applicable water quality standard **not addressed** by the Water Quality Improvement Plan, the Copermittees must submit the following updates to the Water Quality Improvement Plan pursuant to Provision F.2.c ***or as part of the Water Quality Improvement Plan Annual Report*** required under Provision F.3.b, unless the San Diego Water Board directs an earlier submittal:	Section 5.2			X	X
	(a) The water quality improvement ***strategies being implemented that are effective and will continue to be implemented***,	Section 5.2	X			
	(b) ***Water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation projects, adjustments to jurisdictional runoff management programs, etc.) that will be implemented*** to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards,	Section 5.2				X
	(c) ***Updates to the schedule for implementation*** of the existing and additional water quality improvement strategies, and	Section 5.2				X
	(d) ***Updates to the monitoring and assessment program*** to track progress toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a of this Order;	Section 5.2				X
Provision B						
B.5.a.	a. The **priority water quality conditions** and potential **water quality improvement strategie**s included in the Water Quality Improvement Plan pursuant to Provisions B.2.c and B.2.e ***may be re-evaluated by the Copermittees as needed during the term of this Order as part of the Water Quality Improvement Plan Annual Report***. Re-evaluation and recommendations for modifications to the priority water quality conditions and potential water quality improvement strategies **must be provided in the Report of Waste Discharge**, and must consider the following: (1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan; (2) New information developed when the requirements of Provisions B.2.a-c have been re-evaluated; (3) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality conditions and implementation strategies to address the highest priority water quality conditions; (4) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees; (5) San Diego Water Board recommendations; and (6) Recommendations for modifications solicited through a public participation process.	Section 5.2			X	X
B.5.b.	b. The water quality improvement goals, strategies and schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.3, ***must be reevaluated and adapted as new information becomes available*** to result in more effective and efficient measures to address the highest priority water quality conditions identified pursuant to Provision B.2.c. ***Re-evaluation of and modifications to the water quality improvement goals, strategies and schedules must be provided in the Water Quality Improvement Plan Annual Report***, and must consider the following:	Section 5.2		X		X
	(1) Modifications to the **priority water quality conditions** based on Provision B.5.a;	Section 5.2				X
	(2) Progress toward **achieving interim and final numeric goals** in receiving waters and MS4 discharges for the highest priority water quality conditions in the Watershed Management Area,	Section 4.2				
	(3) Progress toward achieving outcomes according to established schedules;	Section 4.2				
	(4) New policies or regulations that may affect identified numeric goals;					X
	(5) Measurable or demonstrable reductions of non-storm water discharges to and from each Copermittee's MS4;	Section 3.2			X	
	(6) Measurable or demonstrable reductions of pollutants in storm water discharges from each Copermittee's MS4 to the MEP;	Section 3.2			X	
	(7) New information developed when the requirements of Provisions B.2.b and B.2.d have been re-evaluated;	Section 5.1			X	X
	(8) Efficiency in implementing the Water Quality Improvement Plan;	Section 5.1	X			X
	(9) San Diego Water Board recommendations; and	Section 5.1				X
	(10) Recommendations for modifications solicited through a public participation process.	Section 5				X

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix			
			Appendix 2 Jurisdictional Information	Appendix 3 Numeric Goals	Appendix 4 Monitoring	Appendix 5 Adaptive Management
B.5.c.	c. The water quality improvement monitoring and assessment program, included in the Water Quality Improvement Plan pursuant to Provision B.4, ***must be reevaluated and adapted when new information becomes available***. Re-evaluation and recommendations for modifications to the monitoring and assessment program, pursuant to the requirements of Provision D, ***may be provided in the Water Quality Improvement Plan Annual Report***, but must be provided in the Report of Waste Discharge.	Section 5.1 Section 5.2			X	X
Provision D						
D.1.e.(2)(c)	**Sediment Quality Monitoring** (c) The Copermittees must incorporate a ***Sediment Monitoring Report as part of the Water Quality Improvement Plan Annual Report*** in accordance with the schedule contained in the Sediment Monitoring Plan, unless otherwise directed in writing by the San Diego Water Board Executive Officer. The Sediment Monitoring Report must contain the following information: (i) Analysis: An evaluation, interpretation and tabulation of the water and sediment monitoring data, including interpretations and conclusions as to whether applicable Receiving Water Limitations in this Order have been attained at each sample station; (ii) Sample Location Map: The locations, type, and number of samples must be identified and shown on a site map; and (iii) California Environmental Data Exchange Network: A statement certifying that the monitoring data and results have been uploaded into the California Environmental Data Exchange Network (CEDEN).	N/A			X	
D.2.b.(iv)	**Dry Weather MS4 Outfall Discharge Monitoring** (iv) Each Copermittee must document ***removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(a) in the Water Quality Improvement Plan Annual Report***. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized major MS4 outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.	Section 3.2.1			X	
D.4.b.(1)(a)(ii)	**Non-Storm Water Dischargers Reduction Assessments** (a) Each Copermittee must assess and report the ***progress of its illicit discharge detection and elimination program***, required to be implemented pursuant to Provision E.2, toward effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows: (ii) Based on the data collected pursuant to Provisions D.2.b, the ***assessments required under <u>Provision D.4.b.(1)(c)</u> must be included in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3).***	Section 3.2.1			X	
D.4.b.(1)(b)	(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each Copermittee must assess and report the following: (i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area; (ii) Identify sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and (iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.	Section 3.2 Section 5.2			X	X

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix: Appendix 2 Jurisdictional Information	WQIP Appendix: Appendix 3 Numeric Goals	WQIP Appendix: Appendix 4 Monitoring	WQIP Appendix: Appendix 5 Adaptive Management
D.4.b.(1)(c)	(c) Based on the **dry weather MS4 outfall discharge field screening monitoring** required pursuant to Provision D.2.b.(1), each Copermittee must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(1)(b); (ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations; (iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances; (iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually. [a] Each Copermittee must calculate or estimate the annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction, with an estimate of the percent contribution from each known source for each MS4 outfall; [b] Each Copermittee must annually identify and quantify (i.e. volume and pollutant loads) sources of non-storm water not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.	Section 3.2.1			X	X
	(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) at least once during the term of this Order to: [a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction. (vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(1)(c)(i)-(v).	Section 3.2.1 Section 5.1 Section 5.2			X	X
D.4.b.(2)(a)	**Storm Water Pollutant Discharge Reduction Assessments** (a) The Copermittees must assess and report the ***progress of the water quality improvement strategies, required to be implemented pursuant to Provisions B and E, toward reducing pollutants in storm water discharges*** from the MS4s within the Watershed Management Area as follows: (ii) Based on the data collected pursuant to Provisions D.2.c, the ***assessments required under Provision D.4.b.(2)(c) must be included in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).	Section 3.2.2 Section 5.1			X	X
D.4.b.(2)(b)	(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following: (i) The Copermittees must analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate the following for each monitoring year: [a] The average storm water runoff coefficient for each land use type within the Watershed Management Area; [b] The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; [c] The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored MS4 outfalls; and [d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major MS4 outfall to receiving waters or within each major MS4 outfall to receiving waters in the Copermittee's jurisdiction within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).	Section 3.2.2 Section 5.1			X	X

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix: Appendix 2 Jurisdictional Information	WQIP Appendix: Appendix 3 Numeric Goals	WQIP Appendix: Appendix 4 Monitoring	WQIP Appendix: Appendix 5 Adaptive Management
D.4.b.(2)(c)	(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(2)(b); (ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed pursuant to Provision B.3, and evaluate whether those analyses and assumptions should be updated as a component of the adaptive management efforts pursuant to Provision B.5 for follow-up action to update the Water Quality Improvement Plan; (iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) at least once during the term of this Order to: [a] Identify reductions or progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area; [b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and [c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP. (iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).	Section 3.2.2 Section 5.1			X	X
D.4.b.(2)(d)	(d) The Copermittees must evaluate all the data collected pursuant to Provision D.2.c, and incorporate new outfall monitoring data into time series plots for each long-term monitoring constituent for the Watershed Management Area, and perform statistical trends analysis on the cumulative long-term wet weather MS4 outfall discharge water quality data set.	Section 3.2.2			X	
D.4.c.	**Special Studies Assessments** c. The Copermittees must ***annually evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3***, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must ***report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Water Quality Improvement Plan Annual Reports*** required pursuant to Provision F.3.b.(3).	Section 3.3			X	X
D.4.d.	Integrated Assessment of Water Quality Improvement Plan d. As part of the ***iterative approach and adaptive management process*** required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:	Section 5.1 Section 5.2			X	X
D.4.d.(1)	(1) The Copermittees ***must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a.*** The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The priority water quality conditions and numeric goals for the Watershed Management Area must be reevaluated as follows: (a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a; (b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b; (c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d; (d) Identify beneficial uses of the receiving waters that are protected in accordance with Provision D.4.a; (e) Evaluate the progress toward achieving the interim and final numeric goals for protecting impacted beneficial uses in the receiving waters.	Section 5.2			X	X

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix			
			Appendix 2 Jurisdictional Information	Appendix 3 Numeric Goals	Appendix 4 Monitoring	Appendix 5 Adaptive Management
D.4.d.(2)	(2) The Copermittees ***must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b.*** The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows: (a) Identify the non-storm water and storm water pollutant loads from the Copermittees' MS4 outfalls in the Watershed Management Area, calculated or estimated pursuant to Provisions D.4.b; (b) Identify the non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the interim and final numeric goals identified in the Water Quality Improvement Plan for protecting beneficial uses in the receiving waters; (c) Identify the non-storm water and storm water pollutant load reductions, or other improvements to the quality of MS4 discharges, that are necessary for the Copermittees to demonstrate that non-storm water and storm water discharges from their MS4s are not causing or contributing to exceedances of receiving water limitations; (d) Evaluate the progress of the water quality improvement strategies toward achieving the interim and final numeric goals identified in the Water Quality Improvement Plan for protecting beneficial uses in the receiving waters.	Section 5.2	X			X
D.4.d.(3)	(3) The Copermittees ***must re-evaluate and adapt the water quality monitoring and assessment program for the Watershed Management Area when new information becomes available to improve the monitoring and assessment program pursuant to Provision B.5.c.*** The re-evaluation and recommendations for modifications to the monitoring and assessment program ***may be provided in the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. Modifications to the water quality monitoring and assessment program must be consistent with the requirements of Provision D.1-D.3. The re-evaluation of the water quality monitoring and assessment program for the Watershed Management Area must consider the data gaps identified by the assessments required pursuant to Provisions D.4.a-b, and results of the special studies implemented pursuant to Provision D.4.c	Section 5.2			X	X
Provision E						
E.1.b.	**b.** With the first ***Water Quality Improvement Plan Annual Report*** *required pursuant to Provision F.3.b.(3),* ***each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority*** within its jurisdiction to implement and enforce each of the requirements contained in this Order.	Cert Statement	X			
E.2.d.(4)	(4) Each Copermittee must submit a ***summary of the non-storm water discharges and illicit discharges and connections investigated and eliminated within its jurisdiction with each Water Quality Improvement Plan Annual Report required under Provision F.3.b.(3)*** of this Order.	Section 3.2.1.3			X	
E.8.c.	**c.** Each Copermittee must submit a ***summary of the annual fiscal analysis with each Water Quality Improvement Plan Annual Report required pursuant to Provision F.3.b.(3)***.		X			
Provision F						
F.1.b.(6)	(6) During implementation of the Water Quality Improvement Plan the Copermittees must ***correct any deficiencies in the Plan identified by the San Diego Water Board in the updates submitted with the Water Quality Improvement Plan Annual Report*** following a request by the Board to do so.	Section 5.1 Section 5.2				X
F.2.a.(2)	(2) Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E concurrent with the submittal of the Water Quality Improvement Plan. Each Copermittee must ***correct any deficiencies in the jurisdictional runoff management program document based on comments received from the San Diego Water Board in the updates submitted with the Water Quality Improvement Plan Annual Report;***		X			X
F.2.a.(3)	(3) Each Copermittee must submit ***updates to its jurisdictional runoff management program, with the supporting rationale for the modifications, either in the Water Quality Improvement Plan Annual Report*** required pursuant to Provision F.3.b.(3), or as part of the Report of Waste Discharge required pursuant to Provision F.5.b	Section 5	X			X
F.2.b.(1)	(1) Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provisions E.3.a-d concurrent with the submittal of the Water Quality Improvement Plan. Each Copermittee must ***correct any deficiencies in the BMP Design Manual based on comments received from the San Diego Water Board in the updates submitted with the Water Quality Improvement Plan Annual Report;***	Section 5.1	X			
F.2.b.(2)	(2) Any ***future updates to the BMP Design Manual*** made after it update pursuant to Provision F.2.b.(1) is completed must be consistent with the requirements of Provisions E.3.a-d and ***must be submitted as part of the Water Quality Improvement Plan Annual Reports required pursuant to Provision F.3.b.(3)***, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b; and		X			

Permit Provision	Permit Language	WQIP AR Section	WQIP Appendix

APPENDIX 2

Jurisdictional Runoff Management Program Information

Appendix 2 – Jurisdictional Runoff Management Program Information

The following sections present agency-specific information for the San Luis Rey River Watershed Management Area (WMA), including:

- Annual Report Certifications – included to satisfy the requirements of 40 CFR 122.41(k), which requires that applications, reports, or information submitted to the San Diego Regional Water Quality Control Board (Regional Board), State Water Resources Control Board (SWRCB), or United States Environmental Protection Agency (USEPA) must be signed and certified by a principal executive officer or ranking elected official, or by a duly authorized representative of that person.

- Jurisdictional Runoff Management Program (JRMP) Annual Report Forms – the completed JRMP Annual Report form (Attachment D to the Permit).

- Jurisdictional Strategies – tables present the actual and planned jurisdictional strategies utilized by the Participating Agencies in the San Luis Rey River WMA to address the highest priority water quality condition (HPWQC) (i.e., bacteria). The tables may include strategies currently being implemented and/or planned for implementation, as well as optional jurisdictional strategies. Descriptions of the symbols used are as follows:

  ● = full implementation during the reporting period
  ◖ = partial implementation during the reporting period
  "×" = will not be implemented in the next reporting period

  Modified strategies are designated using "track changes" showing additions (underlined) and removals (strikeouts) of text and an explanation is provided in the "Rationale for Modification to the Strategy" column. New strategies are added as appropriate and are **bold**.

- Modifications to the Best Management Practice (BMP) Design Manual – originally submitted with the Water Quality Improvement Plan (WQIP); deficiencies in the BMP Design Manual noted by the Regional Board are corrected and submitted within this section, if applicable. Future updates will also be included in this section, when applicable.

- Modifications to the JRMP – Itemized in this section or may be provided as an attachment to the JRMP Annual Report Form.

STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT SAN LUIS REY RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the County of San Diego has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 6th day of January, 2017, at the County of San Diego.

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2015-2016

I. COPERMITTEE INFORMATION

I.A Copermittee Name: County of San Diego (PIN 255223)

I.B Copermittee Primary Contact Name: Todd Snyder

I.C Copermittee Primary Contact Information:
Address: 5510 Overland Avenue, Suite 410
City: San Diego County: San Diego State: California Zip: 92123
Telephone: (858) 694-3672 Fax: (858) 495-5623 Email:Todd.Snyder@sdcounty.ca.gov

II. LEGAL AUTHORITY

II.A Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
II.B A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☒ ☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

III.A Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES NO	☒ ☐
III.B If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☒ ☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

IV.A Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES NO	☒ ☐

IV.B.1 Number of non-storm water discharges reported by the public	286
IV.B.2 Number of non-storm water discharges detected by Copermittee staff or contractors	95
IV.B.3 Number of non-storm water discharges investigated by the Copermittee	375
IV.B.4 Number of sources of non-storm water discharges identified	115
IV.B.5 Number of non-storm water discharges eliminated	112
IV.B.6 Number of sources of illicit discharges or connections identified	85
IV.B.7 Number of illicit discharges or connections eliminated	84
IV.B.8 Number of enforcement actions issued	93
IV.B.9 Number of escalated enforcement actions issued	1

V. DEVELOPMENT PLANNING PROGRAM

V.A Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES NO	☒ ☐
V.B Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES NO	☒ ☐
V.C If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES NO	☒ ☐

V.D.1 Number of proposed development projects in review	925
V.D.2 Number of Priority Development Projects in review	237
V.D.3 Number of Priority Development Projects approved	96
V.D.4 Number of approved Priority Development Projects exempt from any BMP requirements	0
V.D.5 Number of approved Priority Development Projects allowed alternative compliance	0
V.D.6 Number of Priority Development Projects granted occupancy	62

V.E.1 Number of completed Priority Development Projects in inventory	410
V.E.2 Number of high priority Priority Development Project structural BMP inspections	691
V.E.3 Number of Priority Development Project structural BMP violations	170
V.E.4 Number of enforcement actions issued	170
V.E.5 Number of escalated enforcement actions issued	0

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2015-2016

VI. CONSTRUCTION MANAGEMENT PROGRAM	
VI. A Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
VI.B.1 Number of construction sites in inventory	2,748
VI.B.2 Number of active construction sites in inventory	2,684
VI.B.3 Number of inactive construction sites in inventory	0
VI.B.4 Number of construction sites closed/completed during reporting period	1,124
VI.B.5 Number of construction site inspections	18,858
VI.B.6 Number of construction site violations	416
VI.B.7 Number of enforcement actions issued	590
VI.B.8 Number of escalated enforcement actions issued	38

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM	
VII.A Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

	Municipal	Commercial	Industrial	Residential
VII.B.1 Number of facilities or areas in inventory	a. 263	b. 1,779	c. 150	d.110
VII.B.2 Number of existing development inspections	a. 1,885	b. 974	c. 38	d.468
VII.B.3 Number of follow-up inspections	a. 23	b. 131	c. 12	d.165
VII.B.4 Number of violations	a. 46	b. 279	c. 31	d.346
VII.B.5 Number of enforcement actions issued	a. 28	b. 130	c. 10	d.0
VII.B.6 Number of escalated enforcement actions issued	a.0	b.1	c.0	d.0

VIII. PUBLIC EDUCATION AND PARTICIPATION	
VIII.A Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
VIII.B Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

IX. FISCAL ANALYSIS	
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

FISCAL ANALYSIS COMPONENT

1.1. Introduction

This section presents an estimated annual budget for the County's runoff management programs for FY 2015-16.

1.2. Fiscal Analysis Methods

This section continues to utilize the methodologies and standards established in *Fiscal Analysis Method* submitted by the Copermittees in January 2009.

1.3. Fiscal Analysis Results

As shown the County estimated its total FY 2015-16 expenditures at $27,414,216. This fiscal analysis addresses each of the County's Runoff Management Program elements (jurisdictional, watershed, and regional activities) for the current reporting period (FY 2015-16). Expenditures are described by department and major program area. They represent an estimate of the expenditures that the County incurred in meeting its compliance obligations for FY 2015-16. They should not be interpreted as either budgeted or actual expenditures. Because stormwater program expenditures are distributed throughout a considerable number of County programs, a single consolidated "budget" does not exist for the program as a whole. As such, these figures should be considered best estimates of stormwater-related expenditures.

1.3.1 Expenditures

1.3.1.1. Jurisdictional

Table 1.1 presents the County's estimated jurisdictional expenditures for FY 2015-16.

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
1	**ADMINISTRATION**	**$6,840,583**	These costs correspond to the DPW WPP development, administrative oversight, and assessment of the County's stormwater programs. The WPP is responsible for the development of new and augmented County stormwater programs, regulatory reporting, and program assessment. Some administrative costs are associated with other specific functions shown below, but are included here because they could not be separated out.
2	**DEVELOPMENT PLANNING**	**$1,109,654**	
A	**Land Use Planning**	$0	Expenditures not reported for FY 2015-16; included in other elements.
B	**Environmental Review**	$0	Expenditures not reported for FY 2015-16; included in other elements.
C	**Development Project Approval and Verification**	**$1,109,654**	
C1	**Public Projects (CIP)**	$824,219	
	Project Planning and Engineering	$570,229	Costs include: preparing and reviewing plans and specifications for stormwater BMPs, and SWPPP/WPCP review. These costs apply to DPW, DPR, and DGS.
	Compliance Inspection and Enforcement	$15,000	
	BMP Implementation	$238,990	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
C2	**Private Projects**	$285,435	
	Permitting and Licensing	$285,435	This cost covers PDS plan reviews at permitted sites. Total costs are estimated as fixed percentages of annual plan-checking fees.
3	**CONSTRUCTION**	**$4,500,593**	
A	**Public Projects (CIP)**	$2,886,893	Costs include: BMP compliance inspections during construction, and implementation of construction phase BMPs. These costs apply to DPW, DPR, and DGS.
	Compliance Inspection and Enforcement	$1,613,880	
	BMP Implementation	$1,273,013	
B	**Private Projects**	$1,613,700	
	Compliance Inspection and Enforcement	$1,613,700	This cost primarily covers DPW and PDS construction inspections at permitted sites. Total costs are estimated as fixed percentages of inspection program fees.
4	**MUNICIPAL**	**$7,572,297**	
A	**Administration**	$267,805	Expenditures associated with the administrative oversight of the stormwater programs, regulatory reporting, and program assessment of municipal facilities by the DPW - Watershed Protection Program.
B	**Streets, Roads, and Highways Element**	$2,256,091	
	Administration	$291,160	Founded road operations activities include: culvert inspections and cleaning;

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	Maintenance Inspections	$1,890,813	increased culvert waste disposal costs, street sweeping, installation and maintenance of BMPs and road structures, and the placement of additional controls. 10% of the Maintenance and Inspections and BMP Implementation is reported as Administration cost.
	BMP Implementation	$74,118	
	Other	$0	
C	**MS4 Element**	$1,530,000	
	Administration	$191,000	The combined costs shown here apply across (1) DPW Flood Control -- conversion of existing concrete lined channels to natural bottom channels, updating flood control master plans, increased maintenance of flood control systems, and construction and maintenance of regional treatment BMPs; and (2) DPW Flood Control MS4 Operation & Maintenance -- maintenance on flood control facilities throughout the unincorporated areas of the County, exclusive of facilities within road rights-of-way (included in 4.B above). Other includes the cost of disposal of debris removed from MS4.
	Maintenance Inspections	$1,046,900	
	BMP Implementation	$290,500	
	Other	$2,500	
D	**Solid Waste Facilities Element**	$406,618	
	Administration	$35,047	Costs include Regional Board stormwater permit fees, consultant costs associated with stormwater upgrade and repair projects, and office staff time.
	Maintenance Inspections	$16,922	Costs include staff time to perform site inspections.
	BMP Implementation	$79,149	Costs include stormwater consultant site inspections, sampling/testing and BMP materials.
	Other (construction)	$275,500	Drainage improvement projects and BMP site maintenance projects.
E	**Wastewater Facilities Element**	$187,000	
	Administration	$10,000	This includes costs associated with JRMP report, the sanitary sewer system and facilities including: pump stations, sewage treatment plants and Spring Valley Operations facility. Also includes the cost of BMP design, acquisition,
	Maintenance Inspections	$127,000	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	BMP Implementation	$50,000	maintenance and monitoring, for wastewater Capital Improvement Projects, and Major maintenance projects, and at various wastewater facilities.
	Other	$0	
F	**Road Stations Element**	$919,867	
	Administration	$83,624	This includes DPW road station operations related to Permit compliance. The Administration cost is determined as 10% of the total costs of maintenance and Inspections and BMP Implementation as reported by the DPW Roads Divisions.
	Maintenance Inspections	$799,414	
	BMP Implementation	$36,829	
	Other	$0	
G	**Fleet Maintenance Element**	$11,722	
	Administration	$1,036	This includes costs associated with operation of the County's fleet maintenance and fueling facilities.
	Maintenance Inspections	$7,392	
	BMP Implementation	$3,294	
	Other	$0	
H	**Municipal Airfields Element**	$338,110	These costs involve site inspections, annual reporting, and maintenance of BMPs at airports, including oversight of tenant operations. The BMP implementation item includes Palomar asphalt cap repairs.
	Administration	$12,737	
	Maintenance Inspections	$0	
	Compliance Inspection and Enforcement	$0	
	BMP Implementation	$300,623	
	Other (sampling and analysis)	$24,750	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
I	**Parks & Recreational Facilities Element**	$1,214,562	
	Administration	$121,362	This includes: coordinating all training requirements, preparing and reviewing reports, and overseeing the overall implementation of the stormwater program for DPR.
	BMP Implementation	$991,603	This includes costs associated with implementation of BMPs at County parks.
	Compliance Inspection and Enforcement	$101,597	Costs are for DPR enforcement of stormwater requirements at County parks.
	Other	$0	
J	**Office Buildings & Other Municipal Facilities Element**	$297,867	
	Administration	$0	DGS conducts a variety of storm water activities including: inspections and clean-up of County-owned, occupied, and leased facilities and vacant lands; maintenance and signage of storm drain inlet inserts and trash dumpsters; placement of inlet filters; maintenance of coverage and containment improvements for on-site supplies and materials; parking lot sweeping and controlled parking lot power washing; and application of erosion and sediment control measures. These costs are exclusive of fleet maintenance and fueling operations.
	Maintenance Inspections	$99,808	
	BMP Implementation	$198,059	
	Other	$0	
	Management of Pesticides, Herbicides, & Fertilizers	$142,656	
	Administration	$142,656	Integrated Pest Control Program within the Department of Agriculture, Weights and Measures (AWM) performs eradication and control of invasive weeds. This program also provides weed control on roadsides, airports, flood control channels,
	Maintenance Inspections	$0	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
	BMP Implementation	$0	sewage treatment plants and inactive landfills. It also provides structural pest control to facilities owned and operated by the county.
	Other	$0	
5	**INDUSTRIAL and COMMERCIAL**	**$1,575,635**	
	Administration	$253,047	DPW and AWM conduct inspections of a variety of businesses in the unincorporated County, provide regulatory oversight of mobile businesses, and conduct follow-up and enforcement of stormwater violations.
	Compliance Inspection and Enforcement	$1,245,279	
	Educational Outreach	$77,309	
	Other expenditures	$0	
6	**RESIDENTIAL**	**$1,205,386**	
	Compliance Inspection and Enforcement	$688,453	DPW conducts complaint investigations for residential sources in the unincorporated County, and conduct follow-up and enforcement of stormwater violations. DPW also operates a regional hotline.
	Educational Outreach	$516,933	Several County departments coordinate and provide outreach to the residential sector and schoolchildren in support of Permit Section D.5 requirements. Costs reported here correspond to DPW only. Funded activities include developing pollution prevention content and providing direct outreach to various target audiences within the general residential and schoolchildren target audiences.
7	**IDDE**	**$321,523**	

Table 1.1 – Estimated Jurisdictional Expenditures for FY 2015-16

	Jurisdictional Worksheet Component		Explanation/Notes
		$321,523	DPW conducts monitoring programs, assesses scientific data, and provides technical and scientific support to other County program staff. They also provide support for all technical and scientific aspects of JRMP development and implementation. These costs are exclusive of the regional monitoring program which is addressed separately under regional costs.
8	**EDUCATION**	**$0**	Education costs are included in other sections as applicable.
9	**PUBLIC PARTICIPATION**	**$0**	Public participation costs are included in other sections as applicable.
10	**SPECIAL INVESTIGATIONS**	**$0**	Expenditures not reported for FY 2015-16; included in other elements.
11	**NON-EMERGENCY FIREFIGHTING**	**$0**	Expenditures not reported for FY 2015-16; included in other elements.
		$23,125,671	

1.3.1.2 Watershed

1.3.1.3 Regional

Table 1.3 presents the County's estimated regional expenditures for FY 2015-16. This includes only those expenditures associated with the Copermittees' adopted Regional Budget and Work Plan. Other costs associated with regional participation (meeting attendance, etc.) are included within the jurisdictional expenditures presented above.

Table 1.3 – Estimated Regional Expenditures for FY 2015-16

Regional Programs	County Costs
Administration	$0
Cost Share Contribution	$2,087,118
Regional Activities	$0
Other	$0
Total Estimated Regional Costs	**$2,087,118**

1.3.1.4 Total Expenditures

Table 1.4 presents the County's total estimated expenditures for FY 2015-16 (jurisdictional, watershed, and regional).

Table 1.4 – Total Estimated County Expenditures for FY 2015-16

Component / Sub-component	Estimated Expenditures
Jurisdictional	
Administration	$6,840,583
Development Planning	$1,109,654
Construction	$4,500,593
Municipal	$7,572,297
Industrial And Commercial	$1,575,635
Residential	$1,205,386
IDDE	$321,523
Education	$0
Public Participation	$0
Special Investigations	$0
Non-emergency Firefighting	$0
Jurisdictional Total	**$23,125,671**
Watershed	
Santa Margarita WMA	$664,500
San Luis Rey WMA	$383,376
Carlsbad WMA	$143,717
San Dieguito WMA	$293,560
Peñasquitos WMA	$102,794
San Diego River WMA	$299,792
San Diego Bay WMA	$155,733
Tijuana WMA	$157,955
Watershed Total	**$2,201,427**
Regional	**$2,087,118**

Total Estimated County Costs ***$27,414,216***

1.3.2 Funding Source

Table 1.5 shows the major sources of funding for the County's urban runoff management programs in FY 2015-16, and describes the legal restrictions applicable to the use of each.

Table 1.5 – Legal Restrictions on the Use of Program Funding

Funding Source	Legal Restrictions
General Fund	There are no restrictions on the use of general fund for County water quality programs and activities except that they must be used only for the purposes for which they are budgeted and allocated by the County Board of Supervisors.
Flood Control District Fees	Revenue generated from these fees must be expended for activities related to flood and storm management.
Developer Deposits / Permit Fees	Deposits / fees may be used only to fund activities related to the work for which the permits are issued.
Gas Tax	Gas Tax is collected by the state and allocated to local government for transportation-related work including maintenance of existing transportation systems and construction of new transportation facilities. These funds may not be used for other purposes.
Sanitary District Fees	Sanitary District Fees are used for work related to the maintenance of sewer lines, pump stations, force mains, and several treatment plants that serve the unincorporated areas. They may be used only for such maintenance-related purposes within the respective sewer district for which they are collected.
Other Funding Sources	Other funding sources collectively account for a relatively small portion of ongoing expenditures. However, all funding for the County's stormwater compliance programs is expended within applicable legal restrictions and limitations.

1.4. Conclusions and Recommendations

The figures presented here are an estimate of the expenditures that the County incurred to meet its compliance obligations for FY 2015-16. For the reasons explained above, they should be considered only best estimates of stormwater-related expenditures.

1.3 JURISDICTIONAL STRATEGIES

Table A2-1. County of San Diego, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.						
IDDE 1	Utilize municipal personnel and contractors to identify and report illicit discharges and connections.	●	●	A/P		• IDDE Program
IDDE 2	Utilize municipal personnel and Contractors to monitor stormwater outfalls for discharges of potential ICIDs.	●	●	A/P		• Part of the IDDE Program
IDDE 3	Updated focused training for County Field Staff.	●	●	A/P		• Updated training for BMP Design Manual and Stormwater Implementers
IDDE 4	Facilitate public reporting of illicit discharges and connections via Water Quality Hotline (i.e., telephone and email).	●	●	A/P		• Bilingual hotline, dedicated e-mail address, and multiple online reporting tools
IDDE 5	Bilingual hotline answered by a live operator (I Love a Clean San Diego) to provide better customer service.	●	●	A/P		• Bilingual hotline operated by ILACSD
IDDE 6	Coordinate with upstream entities to prevent illicit discharges from upstream sources entering into the storm drain system.	●	●	A/P		• If illicit connections are identified as part of an IDDE investigation, investigation will be conducted to define and eliminate the source. If determined to be from an upstream entity coordination will occur.

Table A2-1. County of San Diego, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
IDDE 7	Refer homeless issue complaints to Sheriff or appropriate jurisdictions.	●	●	A/P		• Collaborate with multi-departmental group to address homeless encampments
2. Develop and implement approaches to address the impacts of septic systems within the watershed.						
IDDE 8	Address septic system failures where observed.	●	●	A/P		• Suspected septic discharges are reported to DEH HIRT Response line when they occur after hours and DEH Land and Water Quality Division during normal hours. All complaints resolved during 15-16.
IDDE 9	Implement practices and procedures to address spills with the potential to enter the MS4.	●	●	A/P		• NOV issued by DEH for failing septic systems when effluent could reach the storm drain. Prompt follow up and mitigation is implemented. Such cases are rare; <5 in 15-16.
IDDE 10	Coordinate spill response with responsible sewer agencies.	●	●	A/P		• Major DEH role is to inform the public of risks associated with sewer spills, conducting sampling, reporting, posting signs, etc.
IDDE 11	Implement practices and procedures to prevent/limit infiltration of seepage from sanitary sewers	●	●	A/P		• If illicit connections are identified as part of an IDDE investigation, investigation will be conducted to define and eliminate the source.
IDDE 12	Collect effluent on the ground (EOG), sanitary sewer overflow (SSO) data	●	●	A/P		• Approximately 87 EOG complaints related to septic systems and 14 SSO events recorded and responded to.

Table A2-1. County of San Diego, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
3. Enforce prohibitions related to illicit discharges and connections.						
IDDE 13	Develop and implement a strategy for investigating and addressing illicit discharges and connections.	●		N/A		• One time. Focused, collaborative investigations with Planning and Science staff of high priority outfalls.
IDDE 14	Impose legal authority to ensure all illicit discharges and connections that are identified are eliminated.	●	●	A/P		• Ongoing.
4. Other Related Programs and Activities						
IDDE 15	Maintain stormwater conveyance map to facilitate implementation of the IDDE program.	●	●	A/P		• Updated as needed.

Table A2-2. County of San Diego, Development Planning Program Strategies

Number	San Luis Rey River Development Planning Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Provide updated materials and enhanced outreach to convey land development requirements.						
DP 1	Update BMP Design Manual procedures to specify stormwater requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria, and establish where implemented alternative compliance options.	◖		A/P		• In Development. Updated to reflect the Regional Model BMP DM with additional changes to incorporate County implementation practices. BMP DM became effective on February 26, 2015.
DP 2	Conduct internal (staff) training on the updated BMP Manual	●		A		• One time. BMP Manual training conducted when required. JRMP required internal training is conducted every fiscal year.
DP 3	Hold external land development workshops targeting the development community	●		A		• One time. The County conducts external training regularly and after release of new guidance documents
DP 4	Update County codes, ordinances, and stormwater design standards consistent with the permit and the updated BMP Manual	●		A		• One time. The Watershed Protection Ordinance was updated in FY16 to include modifications necessary as the result of the updated permit and the inclusion of applicant-implement offsite alternative compliance. WPO update became effective on February 26, 2016.

Table A2-2. County of San Diego, Development Planning Program Strategies

Number	San Luis Rey River Development Planning Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
2. Implement a BMP compliance program to ensure proper design and maintenance planning.						
DP 5	Implement a program that ensures that all structural and Low Impact Development (LID) BMPs are designed, constructed and maintained on Priority Development and Redevelopment Projects.	●	●	A/P		• Structural BMPs and LID BMPs are designed and constructed per the BMP Design Manual. In addition, Structural BMPs are tracked for maintenance through inspections and self-verification letters. LID BMPs that are installed as a result of implementation of the BMP Design Manual are proposed to be inspected
3. Enforce post construction requirements related to new and redevelopment.						
DP 6	In addition to requirement for all development projects, implement or require implementation of onsite structural BMPs to control pollutants and manage hydromodification for PDPs.	●	●	A/P		• The County BMP DM requires all PDPs to implement PC and HMP BMPs. These requirements are captured in the WPO and County's BMP DM.
DP 7	Impose legal authority to ensure all development and redevelopment projects are in compliance with all post construction requirements.	●	●	A/P		• The Watershed Protection Ordinance was updated in FY16 to include modifications necessary as the result of the updated permit and the inclusion of applicant-implement offsite alternative compliance.

Table A2-3. County of San Diego, Construction Management Program Strategies

Number	San Luis Rey River Construction Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Improve data tracking methods for construction inventories and inspections where necessary.						
CM 1	Maintain, update, and prioritize a watershed-based inventory of all projects issued local permits that allow soil disturbing activities.	●	●	A		• Projects that are issued local permits that allow soil disturbance activities are part of the inventory that is watershed-based.
2. Ensure that minimum BMPs are designated and required for construction projects.						
CM 2	Require implementation of BMPs that are site specific, seasonally appropriate and appropriate to the construction phase, year round.	●	●	A/P		• Every project requires implementation of site specific construction BMPs, seasonably appropriate and appropriate to the construction phase.
CM 3	Make updates to County ordinances related to construction; reference to existing grading ordinance	●		A		• One time. County ordinances are updated with subsequent Construction General Permit updates; the Watershed Protection Ordinance will be updated as necessary as a result of the future Grading Ordinance Update.
3. Enforce Construction Management Requirements						
CM 4	Impose legal authority to ensure inventoried construction projects are in compliance with all requirements.	●	●	A/P		• The Watershed Protection Ordinance is the current legal authority to insure inventoried construction projects are in compliance with all requirements.
CM 5	Notify the SDWB by email (Nonfilers_R9waterboards.ca.gov) within five (5) calendar days of issuing escalated enforcement to a construction site that poses a significant threat to water quality as a result of violations or other noncompliance		●	A/P		• County implemented the ERP as described in the JRMP.

Table A2-3. County of San Diego, Construction Management Program Strategies

Number	San Luis Rey River Construction Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Provide enhanced outreach and coordination to convey construction requirements.						
CM 6	Provide internal staff training related to construction storm water management.	●	●	A/P		• The County conducts construction stormwater training annually and it targets construction inspectors in DPW-PDCI, PDS-Building, and CIP Inspectors in DPW and DGS.

Table A2-4. County of San Diego, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Improve data tracking methods for existing development inventories where necessary.						
ED 1	Maintain and update a watershed-based inventory of existing development (i.e., commercial, industrial, and municipal facilities and residential areas).	●	●	A/P		• Database is continually updated to increase accuracy and efficiency.
ED 2	Improve the tracking of watershed based inventories via consolidated database	●				• See ED 1
2. Develop and implement approaches to address the impacts of improper water use and irrigation runoff.						
ED 3	Collaborate with partner agencies and groups to promote non-County sponsored incentive programs for BMP retrofits, including rain barrels, smart controllers, soil sensors, turf replacement, etc.	●	●	A/P		• The County continues to collaborate with and promote the efforts of partner agencies incentive programs.
ED 4	Promote incentive program for BMP retrofits (e.g. water smart irrigation controllers, turf replacements programs, residential landscape evaluation program).	●				• The County continues to collaborate with and promote the efforts of partner agencies incentive programs.
3. Improve and/or continue existing pet waste programs.						
ED 5	Pet waste management and outreach in County Parks.	●	●	A/P		• Mutt-mitt dispensers are installed and maintained in many County parks, providing people who are walking their dogs with waste disposal bags to use to pick up after their pets.

Table A2-4. County of San Diego, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Improve trash management strategies within the watershed.						
ED 6	Sponsor Trash Collection Events (public outreach and participation).	●	●	A/P		• The County sponsors ILACSD to establish cleanup sites at the Coastal Cleanup Day and Creek to Bay events.
5. Improve and implement existing outreach programs to target key sources and pollutants.						
ED 7	Develop, improve, distribute outreach materials.	●	●	A/P		• Improved outreach materials through a focused Community-based Social Marketing approach. Continual improvement of existing materials, including translation into Spanish.
ED 8	Give outreach presentations to elementary, middle, and high school students	●	●	A/P		• Offer presentations to elementary, middle, and high schools serving unincorporated communities.
ED 9	Outreach to mobile landscaping service providers	●	●	A/P		• Pesticide Regulation Program collaboration with the California Department of Pesticide Regulation on a pilot program to offer workshops for maintenance gardeners. Two workshops were held where attendees were provided training materials and concluded with a pesticide certification exam. Attendees at both workshops had high success rates for the exam.
ED 10	Educational Workshops on Integrated Pest Management, manure management and others as needed	●	●	A/P		• Various workshops presented throughout the year by County staff including UCCE, FHA and contractors.
ED 11	Conduct Effectiveness Survey's on Education & Outreach programs	●	●	A/P		• Surveys to determine the efficacy of watershed education to unincorporated elementary, middle, and high schools serving unincorporated communities

Table A2-4. County of San Diego, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 12	Create an Equestrian BMP Handbook		●	A/P		• Handbook created in FY2014-15. Handbook will be revised in FY2016-17 to encompass additional BMPs and be more user friendly.
ED 13	Conduct over irrigation outreach pilot study	●	●	A/P		• Community-based Social Marketing pilot study on the effectiveness of irrigation runoff prevention materials.
ED 14	Conduct Homeowners Associations Outreach and Coordination Pilot Study	◖	◖	A/P		• HOA Outreach materials in draft format. Additional development will take place in FY2016-17.
ED 15	Implement a public education and participation program to promote and encourage development of programs, management practices and behaviors that reduce the discharge of pollutants in storm water prioritized by high risk behaviors, pollutants of concern, and target audiences.	●	●	A/P		• The County completes numerous education and public participation programs for a diverse target audiences. See JRMP.
6. Enhance existing stormwater conveyance system maintenance program.						
ED 16	Implement a schedule or operation and maintenance activities for the stormwater conveyance system and related structures.	●	●	A/P		• Stormwater maintenance is referred to appropriate departments when needed.
7. Develop and implement targeted programs to address issues in residential areas.						
ED 17	Promote and encourage implementation of designated BMPs in residential areas.	●	●	A/P		• Through implementation of strategies described in the JRMP the County encourages the use of BMPs in residential areas. All Residential Management Areas were inspected in FY15-16

Table A2-4. County of San Diego, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 18	Conduct focused residential inspections based on strategic assessments.	◖	◖	A/P		• Focused, collaborative investigations with Planning and Science staff of high priority outfalls. 20% per year, all within 5 years.
ED 19	Implement a schedule of operation and maintenance for County paved and unpaved roads.	●	●	A/P		• County Road Crews employ a schedule for maintenance of County Roads.
ED 20	Conduct inspections of inventoried existing development to ensure compliance	◖	◖	A/P		• Through implementation of strategies described in the JRMP the County encourages the use of BMPs in residential areas. 20% per year, all within 5 years.
ED 21	Improve inspections data tracking through mobile phone applications		●	A/P		• In pilot testing phase, modifications based on pilot testing to increase effectiveness
8. Additional strategies to address Existing Development						
ED 22	Designate a minimum set of BMPs required for all existing development inventories, including special event venues. The designated minimum BMPs must be specific to facility or area types and pollutant generating activities, as appropriate.	●	●	A/P		• JRMP establishes minimum BMPs for all land use types.
ED 23	Require implementation of minimum BMPs for existing development (commercial, industrial, municipal, and residential) that are specific to the facility, area types and pollutant generating activities, as appropriate.	●	●	A/P		• JRMP establishes minimum BMPs for all land use types.

Table A2-4. County of San Diego, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 24	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties. Includes education, permits, and certifications.	●	●	A/P		• 1. 450 Facilities received the Agricultural Water Quality Best Management Practices for Pesticides through annual registration notifications. 2. Inspections were conducted at 83 Commercial Ag Facilities.
ED 25	Enforce legal authority established for all inventoried existing development to achieve compliance	●	●	A/P		• See JRMP for details.
ED 26	Update county ordinance related to existing development; reference to existing guidance documents	●		A		• One time. Watershed Protection Ordinance and BMP Design Manuals were updated.
ED 27	Identify candidate areas of existing development for stream, channel, and/or habitat rehabilitation projects and facilitate implementation of such projects.	●		A		• NA
ED 28	Implement escalating enforcement responses to compel compliance with statutes, ordinances, permits, contracts, orders, and other requirements for IDDE, development planning, construction management, and existing development in the Enforcement Response Plan.	●	●	A/P		• County implemented the ERP as described in the JRMP.

Table A2-4. County of San Diego, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 29	Notify the SDWB by email (Nonfilers_R9waterboards.ca.gov) any persons required to obtain coverage under the statewide Industrial General Permit and Construction General Permit and failing to do so, within five (5) calendar days from the time the Copermittee become aware of the circumstances.	●	●	A/P		• County implemented the ERP as described in the JRMP.

Table A2-5. County of San Diego, Optional Strategies*

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
OPT-3	Implement a program for on-site wastewater treatment (septic) systems. May include mapping and risk assessment, inspection, or maintenance practices.	◖				Not triggered. Partially implemented in FY 2016. Under the Local Area Management Plan (LAMP) for onsite wastewater treatment systems the treatment systems with supplemental treatment are required to be permitted annually. The annual operating permit will define the monitoring and maintenance requirements as specified by the manufacturer and/or qualified professional who designed the system. The LAMP ordinance can be found at: http://www.sandiegocounty.gov/content/dam/sdc/deh/lwqd/RWQCB%20Approved%20LAMP%20Final%202-24-15.pdf
OPT-5	Implement Sustainable Landscapes Program to encourage landscape retrofits.	◖				Not triggered. Partially implemented in FY 2016.
OPT-6	Implement an incentive program for BMP Retrofits (Public-Private Partnerships - a County sponsored program to offer incentives for rain barrel installation, downspout disconnects from the stormwater system, etc.)	◖				Not triggered. Partially implemented in FY 2016.
OPT-7	Implement trash capture program (e.g., retrofit storm drain intakes with trash capture devices)	◖				Not triggered. Partially implemented in FY 2016. The County of San Diego is in process of conducting several studies to develop Baseline Trash Generation Rates.

Table A2-5. County of San Diego, Optional Strategies*

Number	San Luis Rey River Existing Development Management Program Strategies - County of San Diego	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
OPT-8	Implement a Green Streets Retrofits Program	◖				Not triggered. Partially implemented in FY 2016. Design standards and specifications have been developed. Green streets are now being used to meet compliance for all retrofit and/or redeveloped road projects that in the Capital Improvement Projects plan. Pursuing Grant Funding
OPT-10	Implement an alternative compliance program to enable "offsite" compliance for new and redevelopment projects.	◖				Not triggered. Partially implemented in FY 2016. Currently applicant implemented offsite alternative compliance is available for use by the development community. The Water Quality Equivalency (WQE) provides the currency for structural BMPs and some natural system management practices (NSMPs). Additional work on the WQE will be conducted during FY17. The County is not currently pursuing a credit system but is participating as a stakeholder on the City of San Diego TAC and as a member of the Western Riverside Coalition of Governments (WRCOG) discussion on offsite alternative compliance.

*Included optional strategies for the SLR watershed are those whose implementation was begun but not triggered. For a full list of optional strategies see the corresponding appendix of strategies in the SLR WQIP.

1.4 MODIFICATIONS TO BMP DESIGN MANUAL

The County of San Diego BMP Design Manual (BMP DM) provides guidance for land development and public improvement projects to comply with the 2013 Municipal Separate Storm Sewer System (MS4) Permit (Order No. R9-2013-0001 as amended by R9-2015-0001 and R9-2015-0100). This Manual replaces County of San Diego Standard Urban Stormwater Mitigation Plan (SUSMP). It is focused on project design requirements and related post-construction requirements, not on the construction process itself. No modifications to the BMP DM have been made since its publication on February 2016. The BMP DM is available online on the County of San Diego's website:

http://www.sandiegocounty.gov/content/sdc/dpw/watersheds/DevelopmentandConstruction/BMP_Design_Manual.html.

1.5 MODIFICATIONS TO THE JRMP

The County's Jurisdictional Runoff Management Program (JRMP) was prepared in response to new regulatory requirements adopted by the Regional Water Quality Control Board. The purpose of the JRMP document is to guide implementation of programs and strategies to reduce pollutants discharged from the County's storm drain system to receiving waters. No modifications were made to the JRMP during the 2015-2016 fiscal year. The JRMP is accessible from the Project Clean Water website at:

http://www.projectcleanwater.org/index.php?option=com_content&view=article&id=105:jurmp-plan&catid=34

2.1 ANNUAL REPORT CERTIFICATION

CITY OF OCEANSIDE
WATER UTILITIES DEPARTMENT

STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT

SAN LUIS REY RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the City of Oceanside has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-0001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 13th day of January, 2017, at the City of Oceanside.

M.A. Lahsaiezadeh

Mo Lahsaiezadeh, Ph.D., REHS
Environmental Officer
City of Oceanside

2.2 ANNUAL REPORT FORM

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY 2015-2016

I. COPERMITTEE INFORMATION			
Copermittee Name: **City of Oceanside**			
Copermittee Primary Contact Name: **Mo Lahsaiezadeh**			
Copermittee Primary Contact Information: **ID 245793**			
Address: **300 N COAST HWY**			
City: **OCEANSIDE**	County: **SAN DIEGO**	State: **CA**	Zip: **92054**
Telephone: **760-435-5803**	Fax: **760-435-5821**	Email: **mlahsaie@ci.oceanside.ca.us**	

II. LEGAL AUTHORITY		
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	**YES** **NO**	☒ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	**YES** **NO**	☒ ☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	**YES** **NO**	☐ ☒
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	**YES** **NO**	☐ ☒

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM		
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	**YES** **NO**	☒ ☐

Number of non-storm water discharges reported by the public	75
Number of non-storm water discharges detected by Copermittee staff or contractors	73
Number of non-storm water discharges investigated by the Copermittee	129
Number of sources of non-storm water discharges identified	58
Number of non-storm water discharges eliminated	51
Number of sources of illicit discharges or connections identified	60
Number of illicit discharges or connections eliminated	57
Number of enforcement actions issued	48
Number of escalated enforcement actions issued	14

V. DEVELOPMENT PLANNING PROGRAM		
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	**YES** **NO**	☒ ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	**YES** **NO**	☒ ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	**YES** **NO**	☒ ☐

Number of proposed development projects in review	49
Number of Priority Development Projects in review	36
Number of Priority Development Projects approved	3
Number of approved Priority Development Projects exempt from any BMP requirements	0
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	17

Number of completed Priority Development Projects in inventory	134
Number of high priority Priority Development Project structural BMP inspections	85
Number of Priority Development Project structural BMP violations	39
Number of enforcement actions issued	12
Number of escalated enforcement actions issued	0

VI. CONSTRUCTION MANAGEMENT PROGRAM	
Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
Number of construction sites in inventory	41
Number of active construction sites in inventory	38
Number of inactive construction sites in inventory	3
Number of construction sites closed/completed during reporting period	11
Number of construction site inspections	1350
Number of construction site violations	140
Number of enforcement actions issued	40
Number of escalated enforcement actions issued	4

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM				
Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐			
	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	161	945	71	21
Number of existing development inspections	55	202	28	12
Number of follow-up inspections	0	14	3	0
Number of violations	0	14	3	0
Number of enforcement actions issued	0	1	0	0
Number of escalated enforcement actions issued	0	0	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION	
Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

IX. FISCAL ANALYSIS	
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☒ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

City of Oceanside

Jurisdictional Runoff Management Program

Annual Report Fiscal Year 2015-2016

ID # 245793

Attachment 1

INTRODUCTION

The information included in this Attachment is intended to supplement the data presented in the City of Oceanside's Jurisdictional Runoff Management Program (JRMP) annual report form for the 2015-2016 Fiscal Year (FY15-16). Each section below corresponds to the sections presented in the JRMP report template from Attachment D. of Order No. R9-2013-0001. The information presented herein provides context to the report information, including a brief description of the data sources and data compilation methods where needed.

The City of Oceanside's summary of the required annual Fiscal Analysis can be found on page 4 of this Attachment.

I. COPERMITTE INFORMATION

The required information is presented on page 1 of the report form.

II. LEGAL AUTHORITY

The City of Oceanside established and continued to implement its legal authority within its jurisdiction to control pollutant discharges into and from its MS4 to comply with Order No. R9-2013-0001 during FY15-16. A Duly Authorized Representative has certified that the City of Oceanside maintains adequate legal authority, and a certifying signature is provided in Section X of the report form.

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE

During FY15-16, no updates were made to the City's Jurisdictional Runoff Management Program document, nor were updates required by the San Diego Regional Water Quality Control Board (SD-RWQCB). The City's JRMP was last updated and submitted to the SD-RWQCB in June 2015, as required under Provision F.2.a. of Order R9-2013-0001.

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM

During FY15-16 the City of Oceanside continued to implement its program to actively detect and eliminate illicit discharges and connections to its MS4 to comply with Order No. R9-2013-0001.

The data presented in Section IV were compiled from various City divisions to accurately reflect the City's cumulative effort to identify and eliminate non-stormwater and illicit discharges throughout FY15-16. The data were summarized from the following sources:

- Discharges reported by the public and the associated response by City Code Enforcement officers.
- Discharges observed by City staff and contractors during compliance inspections performed pursuant to Provisions E.3.e.(3), E.4.d., and E.5.c.
- Discharges identified through the City's Dry Weather MS4 Outfall Discharge Monitoring program, performed pursuant to Provisions D.2.b. and E.2.c-d.
- Discharges of potentially hazardous substances reported by the public and their associated responses by the City of Oceanside Fire Department.

V. DEVELOPMENT PLANNING PROGRAM

During FY15-16 the City of Oceanside continued to implement a development planning program that complies with Order No. R9-2013-0001.

During FY15-16, the SD-RWQCB required the Copermittees to update their BMP Design Manuals pursuant to the timelines specified in Provision F.2.b., to allow for concurrent submittal of the Manual with the Water Quality Improvement Plans. To comply with this Provision, the City of Oceanside made jurisdictional-specific updates to the San Diego Regional Model BMP Design Manual that became effective on February 16, 2016. The City of Oceanside made its updated jurisdictional BMP Design Manual available to the public both on the County's Regional Clearinghouse (Project Clean Water) and the City's website.

The data presented in Section V summarize the City's Priority Development Project (PDP) inventory tracking and BMP inspection program for FY15-16.

VI. CONSTRUCTION MANAGEMENT PROGRAM

The City of Oceanside continued to implement its construction management program in FY15-16 to comply with Order No. R9-2013-0001.

The data presented in Section VI summarize the City's construction site inventory and inspection program activity for FY15-16.

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

The City of Oceanside continued to implement its existing development management program in FY15-16 to comply with Order No. R9-2013-0001.

The data presented in Section VII summarize the City's existing development facility inventory and inspection program activity for FY15-16. The inspection data include both initial and follow-up compliance inspections.

VIII. PUBLIC EDUCATION AND PARTICIPATION

During FY15-16 the City of Oceanside continued to implement its public education and public participation components to comply with Order No. R9-2013-0001.

IX. FISCAL ANALYSIS

A summary of the City's annual Fiscal Analysis performed pursuant to Provision E.8.b-c. can be found on page 4 of this Attachment. The Fiscal Analysis includes the City's expenditures to implement its jurisdictional programs to comply with Order No. R9-2013-0001, and also includes annual costs for cooperative regional and watershed-based programs.

X. CERTIFICATION

The City of Oceanside JRMP Annual Report form has been certified by a Duly Authorized Representative. Please see page 2 of the report form for signature.

Fiscal Analysis

Program Funding

The City of Oceanside secures funding for the implementation of the storm water program through the Water Utilities, Public Works Departments, and Engineering Divisions in the City. To secure adequate funding, the Water Utilities Department collects a Clean Water Program surcharge. The surcharge is based on the customer's water consumption, so the surcharge is also designed as an incentive for individuals to conserve water. During FY15-16, the surcharge was $0.11 per unit of water from July – December 2015, then was increased to $0.12 per unit of water from January to June 2016. Total revenue for FY15-16 generated though the surcharge fee was $1,048,015.93. In addition, the Clean Water Program received $20,500 via a Gas Tax fund. This totals $1,068,515.93 for revenue directly available to the Clean Water Program.

The City Engineering Division as part of the Development Services Department secures funding from development-related programs. The Engineering Division receives funding through fees assessed on developers for grading plan checks and inspections and water quality plan checks and inspections.

Funding for Public Works tasks related to water quality protection, including channel maintenance and storm drain inlet cleaning, are obtained by Flood Control Fees. Enterprise funds are used to fund for Code Enforcement and Solid Waste programs. Street Sweeping is funded by and Enterprise Fund.

Expenditure and Budget Reporting

During FY15-16 approximately $2,447,925 was expended amongst the departments and divisions for the implementation of and tasks that support the Clean Water Program. Table 1 below provides a summary of the City of Oceanside expenditures during FY15-16.

Table 1: City of Oceanside Stormwater Expenditure Summary

Category	Cost
Administration	$187,710
Development Planning	$215,000
Construction	$130,624
Municipal	$1,318,063
Industrial & Commercial	$137,398
Residential, Education & Public Participation	$95,699
IDDE	$57,699
Special Investigations	$104,094
Watershed Participation	$52,555
Regional Participation	$149,083
Total	**$2,447,925**

2.3 JURISDICTIONAL STRATEGIES

Table A2-6. City of Oceanside, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.						
IDDE 1	Utilize municipal personnel to identify and report illicit discharges and connections.	●	●	A		
IDDE 2	Utilize municipal personnel and contractors to monitor stormwater outfalls for discharges of potential illicit discharges and connections.	●	●	A		
IDDE 3	Utilize water department meter readers to document irrigation runoff, with a focus on residential areas.	●		A		Meter readers completed Residential Management Area (neighborhood-based) inspections in response to drought restrictions for landscape irrigation, and documented irrigation runoff for follow-up by Code Enforcement.
IDDE 4	Facilitate public reporting of illicit discharges and connections via telephone, ~~and~~ email and online request portal.	●	●	A	Modification to reflect City's use of online request portal for public ICID reporting.	The City utilizes an online request portal (PublicStuff) to allow the public to create a request and track progress toward completion.
IDDE 5	Educate the public regarding illegal discharges/ dumping.	●	●	A		Educational door hangers used during irrigation runoff response and non-stormwater MS4 outfall investigations.

Table A2-6. City of Oceanside, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
IDDE 6	Coordinate with upstream entities to prevent illicit discharges from upstream sources from entering the MS4.	●		A		Annual voluntary agricultural area inspections in east Oceanside are completed by City staff to prevent illicit discharges in to the San Luis Rey River.
2. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.						
IDDE 7	Implement practices and procedures to prevent and address spills with the potential to enter the MS4.	●	●	A		In FY16-17 the City will implement a unified inspection program for FOG, solid waste, recycling, and stormwater
IDDE 8	Slip line sewer pipes to prevent exfiltration from sanitary sewers to the MS4.	●	●	A		Citywide, the City completed approximately 4000 feet of CIPP sewer line rehabilitation in FY 15-16 under its CIP program.
IDDE 9	CCTV 100% of City VCP sewer lines to identify infiltration, exfiltration, and needed pipe repair or replacement.	◖	◖	A		Citywide, during FY 15-16, the City televised approximately 80 miles of sewer lines under its CIP program. And additional 19 mi. were televised by City crews.

Table A2-6. City of Oceanside, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
3. Actively enforce prohibitions related to illicit discharges and connections.						
IDDE 10	Investigate and eliminate illicit discharges and connections.	●	●	A		Two of the five non-stormwater persistently flowing MS4 outfalls listed in the SLR WQIP are now classified as dry and will be reprioritized. Code Enforcement completed drought response, overwatering and illegal discharge investigations throughout FY 15-16. All complaints go to code enforcement.
IDDE 11	Enforce legal authority to ensure all illicit discharges and connections identified are eliminated within timeframes established in the MS4 Permit.	●	●	A		Tied in with IDDE-10 narrative.

Table A2-7. City of Oceanside, Development Planning Program Strategies

Number	San Luis Rey River Development Planning Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Implement a post construction BMP compliance program to ensure proper construction and maintenance.						
DP 1	Implement a program that ensures that all structural BMPs are designed, constructed, and maintained on PDPs.	●	●	A		All high priority TCBMP sites in the City were inspected in FY 15-16, and 17 self-certification forms were sent to TCBMP owners/operators.
DP 2	Inspect all high priority structural BMPs annually (prior to the rainy season).	●	●	A		All 45 high priority structural BMP sites in the City were inspected in FY15-16 prior to the rainy season. (27 inspections across 15 sites in SLR WMA specifically)

Table A2-8. City of Oceanside, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Develop and implement approaches to address the impacts of improper water use and irrigation runoff.						
ED 1	Promote rain barrel incentive programs.	●	●	A		The City continued to promote and advertise the rain barrel rebate program through the San Diego County Water Authority.
ED 2	Continued enforcement of drought-related restrictions on landscape irrigation frequency	●	N/A	A		May not be applicable moving forward; restrictions have been lifted at this time. The City returned to Level 1 Drought Watch in July 2016.
ED 3	Relay information to residents, businesses and municipal staff regarding water agency-sponsored turf replacement programs	●	●	A		Notification when rebate programs are available. Turf removal rebate programs sponsored by water districts ran out of funding in summer of 2015. Oceanside Municipal Golf Course turf replacement project was completed in FY 15-16.
2. Improve and/or continue existing pet waste programs.						
ED 4	Install and maintain SLR Bike Trail Pet Waste Dispensers.	●	●	A		Pet waste bag dispensers were maintained for public use along the SLR Bike Trail in FY 15-16.
3. Improve trash management strategies within the watershed.						
ED 5	Coordinate Trash Collection Events (public outreach/ participation).	●	●	A		The City coordinates the San Luis Rey River Cleanup Event in March every year. A total of four sites along the river are staffed by City employees for this event.

Table A2-8. City of Oceanside, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Improve and implement existing outreach programs to target key sources and pollutants.						
ED 6	Distribute watershed based outreach posters.	●	●	A		
ED 7	Provide pollution prevention and water conservation presentations at elementary schools.	●	●	A		Water conservation calendar contests were held across Oceanside schools in FY15-16 to promote conservation education. School presentations on smart water use are planned for FY16-17. Project SWELL curriculum continues to be implemented at Oceanside schools as staff time and resources allow.
ED 8	Educational Workshops (e.g., landscape irrigation and maintenance, agricultural).	●	●	A		Three homeowners landscape workshops are held annually in the City to promote water efficient landscape practices and methods to mimic watershed functions on a local scale.
5. Develop and implement targeted programs to address issues in residential areas.						
ED 9	Implement residential irrigation runoff study.	X	●	P		Phase I of a residential runoff reduction and monitoring study began in the Loma Alta Watershed due to TMDL alternative. Phase I will be implemented in San Luis Rey Watershed in FY16-17 as funding and staff resources are available.
ED 10	Conduct residential management area focused inspections.	●	●	A		Tie back to IDDE-3

Table A2-8. City of Oceanside, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 11	Conduct inspections of inventoried existing development including residential areas to ensure compliance. Each area/site is inspected once every five years (minimum) and 20% of all industrial, commercial, and municipal sites are inspected on-site annually.	●	●	A		City staff completed 96 inspections of existing development in the City's jurisdiction of the San Luis Rey WMA in FY 15-16.
6. Other BMPs/Activities						
ED 12	Require implementation of BMPs to address application, storage, and disposal of pesticides, herbicides, and fertilizers on commercial, industrial, and municipal properties.	●	●	A		Refer back to ED 11 above – existing development inspections addresses BMP implementation.

Table A2-9. City of Oceanside, Optional Strategies

Number	San Luis Rey River Existing Development Management Program Strategies - City of Oceanside	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
OPT-1	Implement an ozone water treatment system to treat MS4 discharge water.	X				Not triggered.
OPT-2	CCTV of VCP pipe.	●	●	A		Available funding and approval by City Council.
OPT-3	Implement incentive programs…	●	●	A		Staff resources were available and partnership funding provided for incentive items.
OPT-4	Implement alternative compliance program…	X				Not triggered; no activity.
OPT-5	Structural BMPs	X				Not triggered.
OPT-6	Habitat restoration and rehabilitation.	X				Not triggered.

2.4 MODIFICATIONS TO THE BMP DESIGN MANUAL

No modifications to the BMP Design Manual have been made since the WQIP was approved. The current City of Oceanside's BMP Design Manual is posted on the City's website, and the link to this page is listed on Project Clean Water.

2.5 MODIFICATIONS TO THE JRMP

No modifications to the City of Oceanside's JRMP have been made since the WQIP was approved. The current City's JRMP is posted on the City's website, and the link to this page is listed on Project Clean Water.

3 City of Vista

3.1 ANNUAL REPORT CERTIFICATION

CITY OF VISTA
CALIFORNIA

STATEMENT OF CERTIFICATION AND LEGAL AUTHORITY ESTABLISHMENT

SAN LUIS REY RIVER WATERSHED MANAGEMENT AREA, WATER QUALITY IMPROVEMENT PLAN FISCAL YEAR 2015-2016 ANNUAL REPORT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations [40 CFR 122.22(d)].

I also certify that the City of Vista has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements within Order No. R9-2013-001 as amended by Orders R9-2015-0001 and R9-2015-0100.

Executed on the 11th day of January, 2017 at the City of Vista.

Greg Mayer
City Engineer

3.2 ANNUAL REPORT FORM

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM – City of Vista, San Luis Rey WMA
ANNUAL REPORT FORM

FY 2015-16

I. COPERMITTEE INFORMATION			
Copermittee Name: City of Vista (Permit No. R9-2013-0001, amended by R9-2015-0001: PIN 270704)			
Copermittee Primary Contact Name: Cheryl Filar			
Copermittee Primary Contact Information:			
Address: 200 Civic Center Drive			
City: Vista	County: San Diego	State: CA	Zip: 92084
Telephone: 760-643-5412	Fax: 760-639-6112	Email: cfilar@cityofvista.com	

II. LEGAL AUTHORITY	
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES ☒ NO ☐

III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE	
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES ☐ NO ☒
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES ☐ NO ☐

IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM	
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
Number of non-storm water discharges reported by the public	2
Number of non-storm water discharges detected by Copermittee staff or contractors	3
Number of non-storm water discharges investigated by the Copermittee	5
Number of sources of non-storm water discharges identified	4
Number of non-storm water discharges eliminated	4
Number of sources of illicit discharges or connections identified	4
Number of illicit discharges or connections eliminated	4
Number of enforcement actions issued	5
Number of escalated enforcement actions issued	0

V. DEVELOPMENT PLANNING PROGRAM	
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES ☒ NO ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES ☒ NO ☐
Number of proposed development projects in review	3
Number of Priority Development Projects in review	3
Number of Priority Development Projects approved	3
Number of approved Priority Development Projects exempt from any BMP requirements	0
Number of approved Priority Development Projects allowed alternative compliance	0
Number of Priority Development Projects granted occupancy	0
Number of completed Priority Development Projects in inventory	3
Number of high priority Priority Development Project structural BMP inspections	26
Number of Priority Development Project structural BMP violations	3
Number of enforcement actions issued	1
Number of escalated enforcement actions issued	0

FY 2015-16

VI. CONSTRUCTION MANAGEMENT PROGRAM

Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

Number of construction sites in inventory	3
Number of active construction sites in inventory	3
Number of inactive construction sites in inventory	0
Number of construction sites closed/completed during reporting period	0
Number of construction site inspections	108
Number of construction site violations	13
Number of enforcement actions issued	11
Number of escalated enforcement actions issued	0

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM

Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory	2	19	1	n.a.
Number of existing development inspections	2	2	1	5
Number of follow-up inspections	0	0	0	3
Number of violations	0	1	0	5
Number of enforcement actions issued	0	1	0	5
Number of escalated enforcement actions issued	0	0	0	0

VIII. PUBLIC EDUCATION AND PARTICIPATION

Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

IX. FISCAL ANALYSIS

Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES ☒ NO ☐

X. CERTIFICATION

I [☒ Principal Executive Officer ☐ Ranking Elected Official ☐ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

Attachment A.

Jurisdictional Runoff Management Program Annual Report – San Luis Rey WMA: Support Data and Supplemental Information

Information provided in this attachment is presented in order of program element, as identified in the Annual Report Form.

1 Copermittee Information

The City of Vista's jurisdictional area resides within two watershed management areas (WMAs), the Carlsbad WMA and the San Luis Rey WMA. Approximate land area within each WMA is summarized in Table 1-1. As required by regional stormwater permit (San Diego Region Water Quality Control Board, Order No. 99-2013-0001) the City summarizes annual activities for these WMAs in two separate annual reports.

Table 1-1. City of Vista Jurisdictional Area within Watershed Management Areas

Watershed Management Area	Acres
Carlsbad	10,968
San Luis Rey	700
City of Vista Total	*11,668*

2 Legal Authority

Revisions to Vista Municipal Code (VMC) Chapter 13.18 *Stormwater Management and Discharge Control Program* were completed and adopted by City Council toward the end of the previous reporting period (on June 9, 2015). During Fiscal Year 2015-16, the City of Vista replaced its former Standard Urban Stormwater Mitigation Plan (SUSMP) document with the new *City of Vista BMP Design Manual.* This new manual describes stormwater site design, treatment, and hydromodification management requirements for new and redevelopment projects. The manual became effective February 16, 2016 and is available on the City's Land Development resources website at:

http://www.cityofvista.com/services/city-departments/community-development/building-planning-permits-applications/land-development-autocad-templates/storm-water-forms

The *City of Vista BMP Design Manual* has undergone minor revisions since its implementation, as follows:

Date	Document Section(s)	Summary of Update
June 2016	Section 1.4.3	Added local 'green street' exemption consistent with Order No. R9-2013-0001
	Section 6.3.7	Removed text from title of section; section content unchanged
	Section 7.2	Clarified property owner as responsible party to conduct maintenance
	Section 8.1.1	Updated titles for forms and checklists
	Section 8.2.1	Updated titles for forms and checklists
	Section 8.2.1.1	Clarified use of O&M Plan template
	Section 8.2.2	Clarified requirements for construction plans
February 2016	New document	Replaced 2011 Standard Urban Stormwater Mitigation Plan with BMP Design Manual

3 Jurisdictional Runoff Management Program Document Update

The City completed an update to its Jurisdictional Runoff Management Plan (JRMP) during the previous reporting period, Fiscal Year 2014-15. The San Luis Rey Water Quality Improvement Plan (WQIP) was accepted by the San Diego Regional Water Quality Control Board (RWQCB) on February 12, 2016. However, revisions to the Carlsbad WQIP had not been accepted by the RWQCB, and acceptance is anticipated by the end of calendar year 2016. Following acceptance of the Carlsbad WQIP, the City anticipates initiating minor revisions to its JRMP to reflect strategies and goals identified in the accepted WQIPs.

Sections 4 through 7 discuss inspections related to various program components and are also numerically summarized by component on the Annual Report Form. Please note that multiple violations can be cited on one enforcement action; therefore, the total number of enforcement actions will often not equal the number of violations observed.

4 Illicit Discharge Detection and Elimination Program

Illicit Discharge Detection and Elimination Program activities are summarized in Section IV on the Annual Report Form. The City's jurisdictional area within the San Luis Rey WMA is approximately 700 acres. As a result of this relatively small area, only 5 cases of non-stormwater discharges were reported and investigated. These cases were related to existing development and are summarized in Section 7 of this attachment.

5 Development Planning Program

Three Priority Development Project (PDP) sites were under construction during the reporting year in San Luis Rey WMA. Once granted occupancy, BMPs at these sites will be added to the inspection inventory.

Prior to the rainy season, the City is required to annually inspect all structural BMPs at PDP sites designated as high priority. Criteria considered for designation of high priority sites included the following:

- PDP sites where 'follow-up' inspections were required following initial inspections conducted during the summer of 2014 or 2015
- PDP sites that did not return adequate materials for 2015 annual certification process
- City-owned PDP sites

Two of the three PDP sites within the San Luis Rey WMA were inspected during the reporting period. Of the 26 BMPs inspected at these sites, three violations were observed at one site, resulting in one written warning. PDP sites were inspected throughout the summer season, considered a 'Program Year'. In early Fiscal Year 2016-17, an additional 33 PDP sites throughout the City are anticipated to be inspected. As a result, cumulatively for the Program Year throughout both the San Luis Rey WMA and Carlsbad WMA, an anticipated 57 PDP sites (45 percent of the PDP site inventory) will have structural BMPs inspected.

6 Construction Management Program

City staff continued to implement the construction management program that underwent improvements in previous fiscal years (i.e., updated forms, checklists, and procedures). All construction sites are considered high priority, and therefore are inspected monthly during the dry season and weekly during the rainy season. Attachment B provides a summary of construction site enforcement actions within the San Luis Rey WMA.

Table 6-1. Number of Active and Inactive Construction Sites in San Luis Rey WMA, FY 2015-16

	ACTIVE SITE[1]:Priority Level			INACTIVE SITE[2]: Priority Level			
Watershed	**High**	**Medium**	**Low**	**High**	**Medium**	**Low**	*TOTAL SITES*
San Luis Rey	3	-	-	-	-	-	3

[1]Active Site: Site was actively under construction during reporting period

[2] Inactive Site: Site that ceased conducting construction activities and was incomplete

Table 6-2. Number of Construction Site Inspections Completed by Month in San Luis Rey WMA, FY 2015-16

Month	Inspections Performed at Site by Priority				Total Sites Closed[2] or Completed
	High Priority	Medium Priority	Low Priority	TOTAL INSPECTIONS	
July	4	-	-	4	0
August	3	-	-	3	0
September	4	-	-	4	0
October[1]	12	-	-	12	0
November[1]	14	-	-	14	0
December[1]	13	-	-	13	0
January[1]	12	-	-	12	0
February[1]	11	-	-	11	0
March[1]	16	-	-	16	0
April[1]	13	-	-	13	0
May	3	-	-	3	0
June	3	-	-	3	0
TOTAL	**108**	**0**	**0**	**108**	**0**

[1]Indicates wet season

[2]Closed sites include sites that discontinued construction during the reporting period, were stabilized and no longer inspected

7 Existing Development Management Program

As in the previous reporting period, City staff prioritized existing development inspections on facilities that were likely to require filing a notice of intent for the statewide General Industrial Permit. This allowed City staff to focus inspections on facilities with a potential for pollutant discharges to the storm drain system, while also educating local businesses about the recently updated permit. The San Luis Rey WMA has 22 existing development facilities (industrial, commercial, municipal) in its inventory, of which 5 facilities, or 23 percent of inventory, were inspected (see Section VII of Annual Report Form). During the reporting period, no facilities in the San Luis Rey WMA were referred to the RWQCB regarding General Industrial Permit non-filer status.

City staff conducted IDDE complaint investigations (Table 7-1) and dry weather major outfall inspections to support stormwater pollution prevention in existing residential development areas (Table 7-2). With anticipated approval of the Carlsbad WQIP in late 2016, at that time the City plans to initiate a parcel-based existing development inspection program. A parcel-based program will facilitate efficient and effective inspections of multi-tenant industrial and commercial properties, while also establishing a city-wide inventory of Residential Management Areas (RMAs) to support future inspections.

During the reporting period, City staff were not called to any sanitary sewer spills within the San Luis Rey WMA. The Sanitary Sewer Overflow Response Plan was updated in June 2016, and maintenance activities associated with the sanitary sewer system (repairs, televise lines, etc.) focused on areas outside of the San Luis Rey WMA where sanitary sewer infrastructure is older. Existing development facilities expected to contribute Fats, Oils, and Grease (FOG) were inspected reduced the potential for FOG-related sanitary system overflow events (Table 7-3). Portions of the San Luis Rey WMA are believed to have septic systems instead of direct connection to the sanitary sewer system. Consistent with strategies identified in the San Luis Rey WQIP (strategies ED 6, ED 7, ED 9) during the upcoming reporting period the City will develop an inventory of septic systems within Vista's portion of the San Luis Rey WMA. Outreach and education regarding septic system maintenance is anticipated to follow.

Storm drain inlet maintenance activities are summarized in Table 7-4. Street sweeping frequencies were maintained throughout the City, with high and moderate rated roadways being swept twice a month and low rated roadways being swept monthly. Not specific to the San Luis Rey WMA, the following events supported stormwater pollution prevention at existing development facilities within the City:

- Two Christmas tree collection locations were active between December 26 and January 11. Approximately 31 tons of debris was collected.
- Multiple site-specific trash and debris cleanups were conducted in the City, removing approximately 8.5 tons of debris.
- Through coordination with I Love a Clean San Diego (ILACSD), supported 14 Certified Oil Collection Centers within the City and conducted two oil filter exchange events. ILACSD also updated the Waste Free SD website (www.wastefreesd.org) with sites local to Vista.
- Continued operation of the Household Hazardous Waste facility that serves member cities of Carlsbad, Encinitas, Escondido, Solana Beach, and San Marcos. During the reporting year, approximately 2,600 Vista residents utilized the facility, donating over 259,500 pounds of hazardous waste.

Table 7-1. Summary of All Stormwater Compliance Cases Initiated in San Luis Rey WMA, FY 2015-16

Case Type	Case Count
IDDE	5*
Structural BMPs	2
Total	*7*

*One reported case was unfounded upon investigation

8 Public Education and Outreach

Education and outreach activities are typically not differentiated between watersheds that Vista's jurisdictional area contributes to (San Luis Rey WMA and Carlsbad WMA). As such, Tables 8-1 and 8-2 present summaries of all notable education and outreach activities within the City during the reporting period.

Although outside of the San Luis Rey WMA, targeted outreach and education was conducted in association with the Phase 1 of the Paseo Santa Fe Streetscape Improvement Project in the Carlsbad WMA. The project reduced a four-lane roadway to two lanes and also enhanced a pedestrian-friendly environment. The project features stormwater structural BMPs, including pervious pavers, silva cells, and Clearwater inlet BMPs. As a component to Proposition 84 grant funding for this project, outreach materials were distributed, as well as surveys and focused business site inspections were conducted. A technical memorandum will be completed by the end of 2016, summarizing outcomes and 'lessons learned' that may guide future outreach efforts.

Table 8-1. Summary of Outreach Events

Outreach Opportunity	Description	Details
Green Machine	Outdoor education for elementary children, coordinated by San Diego County Office of Education.	Multiple events
Splash Science Lab	Science and chemistry education for children, coordinated by San Diego County Office of Education.	Multiple events
Presentations to schools	I Love a Clean San Diego support for motor oil presentations to automotive classes at Vista High School	5 presentations ~100 students
Presentations to schools	I Love a Clean San Diego support for watershed and stormwater pollution presentations at multiple middle schools and high schools	13 presentations ~360 students
Used Oil Filter Collection Events	Hosted oil waste/recycling and education events at automotive retail store in Vista.	Autozone O'Reilly's Auto Parts
Carlsbad WQIP Public Workshop	Public workshop to present plan development process and highlights.	July 7, 2015
Composting Workshop	Clean Green Vista and City of Vista workshop at Alta Vista Gardens.	July 18, 2015
Industrial General Permit Workshop	Informational workshop hosted by Vista Chamber of Commerce and Tory Walker Engineering. City of Vista promoted and attended event.	July 30, 2015
Vista Summer Fun Fest & Safety Fair	Enviroscape watershed model and interaction with residents.	August 8, 2015
National Prescription Drug Take Back Day	Prescription drug collection event at Walgreens.	September 26, 2015
Rainy Season Informative Letters	Letters sent to owners and developers with open grading permits to inform of preparations for upcoming rainy season.	October 2015
Our Vista Magazine	Advertise Christmas tree recycling program and sites.	Winter 2015
Landscape Workshop	Presented by Vista Irrigation District	November 14, 2015
Creek to Bay Cleanup: Buena Creek Cleanup Event	Support and promote cleanup site for annual Creek to Bay Cleanup event.	April 23, 2016
San Diego County Apartment Association Rental Housing Education Conference	Staff support for region's "Think Blue" campaign booth, educating rental housing staff about water quality and pollution prevention	April, 19, 2016
National Prescription Drug Take Back Day	Prescription drug collection event at Walgreens.	April 30, 2016
Vista Strawberry Festival	I Love a Clean San Diego support for Enviroscape watershed model and interaction with residents	May 29, 2016
Shredding and e-waste Event	Shredding and electronic waste collection event at Civic Center.	June 11, 2016

Table 8-2. Summary of Municipal Education Activities

Workshop/Training	Audience	Attendees	Location	Host	Date (s)
ESRI – GIS User Conference (2 annual events)	Engineering staff GIS users	Multiple staff & days	San Diego	ESRI	July 2015 & June 2016
Workshop: "Stormwater Design Requirements are Changing"	Land Development Staff and Construction Inspection Staff	6	San Diego	Construction Management Association (CMAA)	July 23, 2015
Water Quality Equivalency (WQE) Public Workshop	Stormwater Staff	2	San Diego	County of San Diego	July 28, 2015
Public Works Annual Training	Public Works Staff	60	Vista Corporate Yard Meeting Room	Stormwater Staff, Public Works	October 7, 2015
CASQA Annual Conference	Stormwater Professionals	2	Monterrey	CASQA	October 19-21, 2015
Model BMP Design Manual Workshop	Stormwater and Land Development Staff	7	San Diego	County of San Diego	November 5 and 10, 2015
Stormwater Performance Assessment: Inspection, Testing, and Monitoring	Municipal employees	3	Webcast	Forester University	March 3, 2016
Spotlight on Vista Employee Newsletter	Municipal employees	City-wide	Vista	Stormwater Staff	March/April 2016 issue
Treatment Control BMP Workshop	Stormwater Staff	3	San Diego	City of San Diego and Regional Water Quality Control Board	April 21, 2016
San Diego Hydrology Model (SDHM) Workshop	Land Development Staff	2	San Diego	County of San Diego, American Public Works Association (APWA)	May 3, 2016
Stormwater Permit Compliance Workshop (Industrial General Permit)	Stormwater Staff	2	San Marcos	Filtrexx, Alta Environmental	May 31, 2016
Qualified Industrial Storm Water Practitioner (QISP)	Stormwater Staff	2	Vista	State Water Resources Control Board	June 2016

9 Fiscal Analysis

The Standardized Fiscal Analysis Method and Format (Fiscal Analysis Method) was collaboratively developed and adopted by the Copermittees in January 2009 in accordance with Sections G, J.1.a(3)(k), and J.1.c(1)(d) of NPDES Order No. R9-2007-0001. The Fiscal Analysis Method document was submitted to the San Diego RWQCB on January 31, 2009, as Attachment 1 of the Regional Urban Runoff Management Plan (RURMP) Annual Report for FY 2007-08. In this Annual Report, the Standardized Method for reporting budgets is utilized. The Standardized Method allows for categorization of expenditures by permit component.

The City's Jurisdictional Urban Runoff Management Program is primarily funded by the City's Enterprise Fund, although the City's General Fund and other sources support some elements of it, such as land development. The City continues to pursue and utilize funding from grant sources, such as state grant Prop 84 funds and, more recently, state Prop 1 grant funds to complete phases 2 and 3 of a green street project initiated with Prop 84 funds. The City will also continue to pursue other state funds as part of watershed collaboration efforts.

The City continues to use the fiscal reporting methodology developed by the copermittees in 2009. Moreover, in conformance with the Regional Standards, the individual jurisdictional components are tracked, as well as watershed and regional expenditures. For fiscal year 2015-16, the City performed the analysis according to the Standardized Fiscal Analysis Method, which is consistent with requirements under the 2013/15 municipal discharge permit. Table 10.1 contains results of this analysis.

Although annual reporting is now divided by watershed, Vista is providing a jurisdiction-wide fiscal analysis, because it is difficult to separate various program components by watershed. However, because most of Vista's developed area is located in the Carlsbad WMA, it is estimated that 95 percent, or $4.4 million, of the FY 2015/16 expenditures supported activities undertaken in this area; for the area of Vista located in the San Luis Rey WMA, it is estimated that five percent, or $232,878 was spent.

The majority of the City's Water Quality Protection Program administration and core programs, such as industrial and commercial inspections, as well as infrastructure maintenance and cleaning are funded by enterprise funds. These funds are generated from sewer utilities within the City of Vista and the Buena Sanitation District. Approximately 58 percent of the program is funded by the City of Vista's enterprise fund, 36 percent is supported by the general fund, and six percent is supported by state-appropriated funds, as well as state grant funds (Table 9-2).

Table 9-1. Expenditure Summary

JURISDICTIONAL COMPONENTS	
ADMINISTRATION	$ 770,315
DEVELOPMENT PLANNING	$ 527,720
CONSTRUCTION	$ 1,069,880

3.3 JURISDICTIONAL STRATEGIES

Table A2-10. City of Vista, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.						
IDDE 1	Utilize municipal personnel and contractors to identify and report illicit discharges and connections.	●	●	A/P		• 5 IDDE cases in SLR for FY 2015-16, including: 1 municipal, 1 residential irrigation unconfirmed, 2 residential pool water discharge, 1 residential sediment
IDDE 2	Coordinate with Vista Irrigation District to identify and report ICIDs (e.g., over-irrigation).	●	●	A/P		• Met with VID on 6/18/2015 to discuss programs and coordination. Focus on water conservation programs and irrigation runoff. • City staff contacts VID on confirmed over-irrigation complaints.
IDDE 3	Facilitate public reporting of illicit discharges and connections via Water Quality Hotline (i.e., telephone and email).	●	●	A/P		• Hotline printed on all outreach materials and freebees distributed at outreach events. • Materials at outreach events: Summer Fun Fest--8/8/2015; Public Works Training--10/7/2015; Employee Spotlight Newsletter-- 02/02/2016.
IDDE 4	Educate the public regarding illegal discharges/ dumping.	●	●	A/P		• April 2016 – New residential BMP brochure and stormwater poster (bi-lingual) distributed. • Promoted Household Hazardous Waste (HHW) collection facility at Summer Fun Fest outreach event (8/8/2015), distributing brochures about proper HHW disposal. • Supported creek cleanup event in Carlsbad WMA for Creek to Bay Cleanup Day (4/23/2016).

Table A2-10. City of Vista, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
IDDE 5	Coordinate with adjacent entities to prevent illicit discharges from upstream sources from entering the MS4.	●	●	A/P		• No applicable discharges or compliance cases to report for this period within SLR WMA. • Within the Carlsbad WMA, city staff coordinate with other agencies (typically County of SD) on compliance cases when discharges are sourced from upstream and outside city jurisdiction.
IDDE 6	Coordinate with neighboring jurisdictions to investigate results of outfall inspections.	●	●	A/P		• No applicable discharges or cases to report for this period. • Vista and Oceanside staff have initiated discussion regarding outfall in Loma Alta (Carlsbad WMA) with persistent flow and runoff from Vista properties. Similarly, worked with County on complaints that bordered limits of each jurisdiction.
2. Develop and implement approaches to address the impacts of septic systems within the watershed.						
IDDE 7	Investigate and eliminate identified sources of illicit discharges and connections.	●	●	A/P		See IDDE 1.
IDDE 8	Develop inventory of septic systems within Vista's portion of the SLR watershed.	X	●	P		• To be initiated in FY 2016-17
IDDE 9	Implement practices and procedures to address spills with the potential to enter the MS4.	●	●	A/P		• Coordinate all private lateral sewer spill responses with Wastewater staff. No spills in SLR this reporting period. • Create compliance cases in Cityworks to track resolution of spill response. See IDDE 1 for summary of cases. • Conduct existing facility inspections to prevent spills and pollutants from impacting stormwater. See ED 20.

Table A2-10. City of Vista, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
IDDE 10	Investigate and eliminate identified sources of illicit discharges and connections.	●	●	A/P		• Of 5 IDDE compliance cases initiated this reporting period, 4 had discharge source eliminated (5th case was unconfirmed irrigation discharge). • 4 major outfalls in SLR (SLR-01, SLR-02, SLR-03, SLR-04): • SLR-01 is a persistent flow site. Upstream investigations and review of development plans suggests this flow ~1gpm is due to perforated foundation drain pipes that discharge groundwater at Guajome Academy. Water quality data and persistent flow monitoring already completed for the 2015-2016 monitoring year. Currently awaiting lab results. • SLR-02 has been observed dry during all site visits. • SLR-03 is a persistent flow site of inconclusive upstream source. Outfall was not flowing during first of two planned sampling efforts. During the second visit, flow was present and sampled. Upstream investigation suggests a leaking fire hydrant may be the source, about which VID was notified to initiate repair. Repair scheduled for September 6, 2016. In addition, a special study has commenced for SLR-03 outfall, which includes continuous flow monitoring and bacteria grab samples. • SLR-04 exhibited flow during one of the transitional flow monitoring visits. Upstream investigation concluded the source was irrigation runoff, which ceased. The site has been dry during all other dry monitoring visits.

Table A2-10. City of Vista, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
IDDE 11	Update Sanitary Sewer Overflow Response Plan (SSORP) and reporting procedures.	●	X	A		• The City's SSORP was updated in June 2016 to be streamlined and easier to use.
IDDE 12	Increase coordination between storm water and sanitary sewer programs.	●	●	A/P		• Private lateral sewer overflow response is coordinated with Stormwater and Wastewater staff. Crews notify Stormwater staff if on scene of spill. • Stormwater staff work with Wastewater engineer to issue appropriate stormwater code (VMC Chapter 13.18) violation notice, wastewater lateral repair notice, and/or citation.
IDDE 13	Implement public sanitary sewer system maintenance consistent with current Sewer System Management Plan.	●	●	A/P		• Completed bi-annual self-audit of SSMP in June 2016. • Zero spills in the SLR basin for FY 2015-16.
3. Implement monitoring programs to provide new information to refine the prioritization of drainage areas.						
IDDE 14	Special Study #1: Conduct assessment of baseline flows at select outfalls with persistent flows[a]	◖	●	A/P		• Initiated contract for study in FY 2015-16; will be conducting monitoring in SLR during end of summer 2016 (currently in place; FY 2016-17)
IDDE 15	Special Study #2: Assess hydraulic connectivity to lower San Luis Rey River.[b]	X	●			• Planned for FY 2016-17

Table A2-10. City of Vista, Illicit Discharge Detection and Elimination Program Strategies

Number	San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
4. Actively enforce prohibitions related to illicit discharges and connections.						
IDDE 16	Investigate and eliminate identified sources of illicit discharges and connections.	●	●	A/P		See IDDE 1
IDDE 17	Implement Enforcement Response Plan to require minimum BMPs to prevent and/or eliminate illicit discharges	●	●	A/P		• Stormwater Standards Manual and VMC Chapter 13.18 are used as basis of requirements, violations, and enforcement actions. All complaints investigated, support data/photos, and enforcement actions are documented in Cityworks as compliance cases. Existing facility inspections also used to proactively confirm minimum BMPs being implemented.
5. Other Related Programs and Activities.						
IDDE 18	Maintain MS4 map to facilitate implementation of the IDDE program.	●	●	A/P		• Cityworks (GIS-based) software used to track all inspections, work orders, investigations, and compliance cases—inclusive of IDDE cases. • Staff are evaluating ability to incorporate outfall monitoring data and visual assessments in Cityworks (FY2016-17).

a. Conduct assessment of baseline flow and bacteria discharges during dry weather at 3 major outfalls with persistent flow. Collect flow and water chemistry data. Outfall sites include: 1) Carlsbad Watershed, Agua Hedionda Focus Area Site #AH-01; 2) Carlsbad Watershed, Buena Vista Focus Area Site #BV-12; 3) San Luis Rey Watershed, Site #SLR-03.

b. Conduct assessment of hydraulic connectivity between Vista's existing development discharges in San Luis Rey. Assess discharges in context of Guajome Lake and adjacent wetlands, and connectivity to Lower San Luis Rey River during both wet and dry weather conditions.

Table A2-11. City of Vista, Development Planning Program Strategies

Number	San Luis Rey River Development Planning Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Provide updated materials and enhanced outreach to convey land development requirements.						
DP 1	Establish criteria designating priority development projects for new and redevelopment consistent with the Permit.	●	●	A		• Vista Municipal Code Chapter 13.18 (Stormwater Management and Discharge Control Program) revised and presented to City Council for adoption on June 9, 2015. • The City of Vista Stormwater Standards Manual was revised in June 2015 to include minimum BMPs for dischargers, enforceable through VMC Chapter 13.18. • The City of Vista BMP Design Manual presents requirements for land development projects and replaced former SUSMP documents in February 2016. Minor revisions to text, checklists, and project submittal forms have occurred since then. • Continued minor updates/revisions to BMP Design Manual forms to facilitate accurate and complete project submittals/evaluations.
DP 2	Update BMP design manual procedures to specify storm water requirements applicable to development and redevelopment projects, identify and design appropriate BMPs, establish maintenance criteria.	●	NA	A		• The City of Vista BMP Design Manual presents requirements for land development projects and replaced former SUSMP documents in February 2016. Minor revisions to text, checklists, and project submittal forms have occurred since then.
DP 3	Internal staff training on updated BMP design manual.	◖	●	A/P		• City staff participated in development meetings, regional workgroup meetings, and public workshops related to preparation and implementation of the BMP Design Manual. • Initiated preparation of staff training presentation of the BMP Design Manual. Training of CIP, Land Development, and inspection staff planned for early FY 2016-17.

Table A2-11. City of Vista, Development Planning Program Strategies

Number	San Luis Rey River Development Planning Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
DP 4	Educate developers /applicants regarding new requirements.	●	●	A/P		• Developers and applicants will be educated regarding the new requirements on an ongoing basis (e.g., through the submittal review process and through pre-construction meetings).
2. Implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation and identify a list of candidate projects that could be used as alternative compliance options for Priority Development Projects.						
DP 5	Develop and implement a Watershed Management Area Analysis to develop watershed specific requirements for structural BMP implementation	●	●	A/P		• WMAA was conducted for SLR WMA and completed in October 2014. The analysis examines the watershed and suggests optional candidate projects that will provide water quality benefits. As the watershed programs evolve, the analysis will be consulted to determine candidate projects on an as-needed basis.
3. Implement a post construction BMP compliance program to ensure proper construction and maintenance.						
DP 6	Implement a program that ensures that all structural BMPs are designed, constructed, and maintained on PDPs.	●	●	A/P		• Land Development staff review project plans for compliance. Contractor reviews SWQMP. • Land Development inspectors oversee project construction, including BMPs. • Stormwater staff and Land Development inspectors conduct joint structural BMP occupancy inspection of sites prior to release of bonds.

Table A2-11. City of Vista, Development Planning Program Strategies

Number	San Luis Rey River Development Planning Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
DP 7	Inspect all high-priority structural BMPs annually prior to the rainy season.	●	●	A/P		• All BMP inspections for summer 2015 were done prior to July 1, 2015 (completed prior to this reporting year). • BMP inspections for Summer 2016 were conducted both before and after July 1, 2016 (in FY 2015-16 and FY 2016-17) • There are three PDP BMP sites (27 structural BMPs) in SLR: o 2 sites (26 BMPs) were inspected during reporting year o Of 26 BMPs inspected, 3 had violations that require staff follow-up.
DP 8	Require implementation of source control, LID, and on-site structural controls for all priority development projects.	●	●	A/P		• Intake forms for standard and PDP SWQMPs provide instructions to address Source Controls, LID, and structural BMPs.
DP 9	Enforce legal authority to ensure all development projects are in compliance with all post construction requirements.	●	●	A/P		• Within the SLR Watershed, 2 cases were initiated for BMP-related investigations. Both cases involved review of project plans at the same site. No violations resulted.
DP 10	Update codes, ordinances, and stormwater design standards consistent with permit and BMP Manual.					See DP1

Table A2-12. City of Vista, Construction Management Program Strategies

Number	San Luis Rey River Construction Management Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Improve data tracking methods for construction inventories and inspections where necessary.						
CM 1	Maintain, update, and prioritize a watershed-based inventory of all projects issued local permits that allow soil disturbing activities.	●	●	A		• Sites issued a grading permit are tracked in the Cityworks system (a GIS-based database). • An Excel spreadsheet is used to track inventoried construction sites, their watershed locations, inspection results, and enforcement actions.
CM 2	Maintain and update a watershed-GIS-based inventory of construction sites and associated site inspection documentation.	X	●	P		• See CM 1. • City staff plan to explore the ability to integrate inspection documents (photos, reports, etc.) with the GIS-based Cityworks system.
2. Ensure that minimum BMPs are designated and required for construction projects.						
CM 3	Require submittal of pollution control plan, construction BMP plan, and/or erosion and sediment control plan for projects requiring local permits involving soil disturbance activities.	●	●	A/P		• Projects requiring local permits for soil disturbing activities are required to submit construction BMP sheets or erosion and sediment control plans. • Construction BMP installation is discussed at pre-construction meetings. • On site inspectors have the authority to require additional BMPs if necessary.
CM 4	Review and confirm that the submitted plan is in compliance.	●	●	A/P		• Staff review BMP sheets and erosion and sediment control plans, provide comments, and confirm corrections are made.
CM 5	Implement or require implementation of BMPs that are site-specific, seasonally appropriate, and appropriate to the construction phase year round.	●	●	A/P		• Site inspection frequency varies by season to ensure site compliance with changing site and seasonal conditions.

Table A2-12. City of Vista, Construction Management Program Strategies

Number	San Luis Rey River Construction Management Program Strategies - City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
CM 6	Inspect construction sites at an appropriate frequency to require and confirm compliance with local permits and ordinances, as well as the MS4 Permit requirements.	●	●	A/P		• All construction sites are considered to be a high threat to water quality. As such, active inventoried sites were inspected weekly during the wet season and monthly during the dry season.
CM 7	Enforce legal authority to ensure inventoried construction projects are in compliance with all requirements.	●	●	A/P		• All enforcement actions are written and city staff continued to exercise its legal authority to ensure sites are in compliance with all requirements.

a. Wet Season = Minimum Weekly, Dry Season = Minimum Monthly

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
1. Improve data tracking methods for existing development inventories where necessary.						
ED 1	Maintain and update a watershed-based inventory of existing development (i.e., commercial, industrial, and municipal facilities and residential areas).	◖	◖	A/P		• Business sites (Industrial and Commercial facilities) and municipal facilities are inventoried in GIS. Cityworks interfaces with GIS, and is used to document inspections, work orders, and compliance cases associated with those facilities. • The SLR WQIP was not approved until late in the reporting year, and approval of the Carlsbad WQIP is not anticipated until mid-FY 2016-17. The City will establish residential management areas when able to do so with consistency between the two watersheds across the jurisdiction. • During the reporting period, outfall monitoring and complaint case response occurred in the SLR watershed, most of which is predominately residential land uses.
2. Develop and implement approaches to address the impacts of improper water use and irrigation runoff.						
ED 2	Develop and distribute outreach materials targeting over-irrigation.	●	●			• New stormwater brochure (April 2016) developed and targeted for residential pollutant sources includes reference to over-irrigation. • One residential over-irrigation complaint case responded to during reporting period. Response used as opportunity to educate resident about over-irrigation.
ED 3	Promote inter- and/or multi-agency water conservation and incentive programs.					• See IDDE 2 for coordination with VID. • See ED 34 for water conservation-related activities.

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
3. Improve and/or continue existing pet waste programs.						
ED 4	Expand pet waste program based on municipal and residential area inspections.	X	●	P		• No new stations were installed in SLR WMA during the period. • Parks staff will be replacing old stations throughout the city as needed.
4. Improve trash management strategies within the watershed.						
ED 5	Sponsor Trash Collection Events (public outreach/part).	●	●	A/P		• Creek to Bay Cleanup April 23, 2016 • Distribute Household Hazardous Waste collection site brochure at Summer Fun Fest August 8, 2015
5. Develop and implement approaches to address the impacts of septic systems within the watershed.						
ED 6	Develop and distribute outreach materials targeting septic system maintenance.	X	●	P		• Anticipated in FY 2016-17, consistent with implementation timeline and likely to follow septic system inventory assessment in strategy ED 7.
ED 7	Develop inventory of septic systems within Vista's portion of the SLR Watershed (see also IDDE 8).	X	●	P		• Anticipated in FY 2016-17, consistent with implementation timeline.
ED 8	Develop and distribute outreach materials targeting sewer lateral maintenance.	●	●	A/P		• New FOG brochure and poster developed in April 2016. Distributed during FOG inspections.
ED 9	Undertake next phase of sewer exfiltration study.	X	●	P		• Anticipated in FY 2016-17, consistent with implementation timeline.
ED 10	Continue citywide sanitary sewer rehabilitation and repair programs.	●	●	A/P		• Current sanitary sewer repair programs are focused in portions of the Buena Sanitation District that are outside of the SLR WMA. Last year, approximately 4 miles of pipeline rehabilitation was completed.

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 11	Conduct FOG inspections to decrease private lateral spills.	●	●	A/P		• 8 FOG inspections were conducted in SLR WMA during reporting period. None required follow-up.
6. Improve and implement existing outreach programs to target key sources and pollutants.						
ED 12	Develop, improve, and distribute outreach materials.	●	●	A/P		• April 2016 – redesigned residential brochure and poster, also redesigned FOG brochure and poster. Distribution will occur as opportunities arise.
ED 13	Implement outreach per JRMP (see Table 10-2)					• Outreach, education, and training events are summarized in the City's Jurisdictional Runoff Management Program Annual Report Form, Attachment A.
ED 14	Educational Workshops (e.g., IPM, manure management).	●	●	A/P		• Industrial General Permit – cooperative with Vista Chamber & Tory Walker (July 30, 2015) • Public works training – operations yard pollution prevention and MS4/JRMP overview (October 7, 2015). • Parks staff with pesticide applicator licenses maintain 20 hours of training every two years for license.
7. Enhance existing MS4 maintenance programs.						
ED 15	Implement a schedule of operation and maintenance activities for the MS4 and related structures.	●	●	A/P		• Public Works regularly maintains the MS4 and related structures in accordance with several variables, including high-impact areas, weather, etc.

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
8. Develop and implement targeted programs to address issues in residential areas.						
ED 16	Implement an oversight program to promote designated BMPs in residential areas.	●	●	A/P		• Outfall inspections and monitoring contribute to residential area oversight in predominant residential land use: o Sampling is conducted at 2 persistently flowing outfalls, twice per monitoring season. o Visual inspections are conducted at 4 major outfalls, twice per monitoring season. • 4 of the 5 IDDE cases in SLR during the reporting period were related to residential areas. See IDDE 1 for summary. • New residential BMP brochure and poster (bi-lingual) produced and printed for distribution. • Promoted HHW collection facility at Summer Fun Fest outreach event (August 8, 2015), distributing brochures about proper HHW disposal.
ED 17	Develop targeted outreach materials for priority residential issues and BMPs.	●	X	A		• April 2016 – new residential BMP brochure and stormwater poster (bi-lingual)

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
ED 18	Outreach to and coordination with homeowners associations.	●	●	A/P		• Stormwater staff supported a regional outreach booth at the 42nd annual Rental Housing Education Conference & Expo on 4/19/2016. Emphasis was to educate property owners and managers about stormwater BMPs. • Targeted outreach and coordination with HOAs is anticipated next fiscal year, consistent with the implementation timeline, through designation of residential management areas within the city. Results from outfall monitoring may also contribute to this effort.
9. Improve existing inspections programs to more efficiently target key sources.						
ED 19	Implement a schedule of operation and maintenance for public streets, unpaved roads, paved roads, and paved highways.	●	●	A/P		• Continued to implement street sweeping schedule consistent with past reporting periods.
ED 20	Conduct inspections of inventoried existing development to ensure compliance. Each area/activity inspected once every five years.	●	●	A/P		• Existing Development Inspection Summary for SLR: • Inventory – 2 MUNI, 19 COM, 1 IND, n.a. RES • Inspections – 2 MUNI, 2 COM, 1 IND, 5 RES
10. Actively enforce stormwater and urban runoff requirements for existing development.						
ED 21	Designate and require minimum BMPs for all inventoried existing development.	●	●	A/P		• Established minimum BMPs in City of Vista Stormwater Standards Manual (June 2015).
ED 22	Enforce legal authority to ensure inventoried existing development facilities and/or areas are in compliance with all minimum BMP requirements.	●	●	A/P		• 1 COM inspection found 1 violation • 0 violations found at MUNI and IND inspections • 5 IDDE compliance cases (see IDDE 1)

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
11. Develop and implement a strategy to identify and facilitate retrofit opportunities in areas of existing development.						
ED 23	As an optional strategy, develop retrofit projects in areas of existing development.	◖	X	P		• The city has budgeted to conduct a soil infiltration feasibility study in FY 2016-17. Results of this effort are anticipated to help guide strategic structural BMP projects and retrofit efforts. • This optional strategy will be implemented if/when triggers identified in the WQIP are met.
ED 33	Evaluate MS4 maintenance program for target areas and potential retrofit opportunities.	◖	●	P		• Soil infiltration feasibility study is budgeted for FY 2016-17 (see ED 23).
ED 34	Investigate incentives for BMP retrofits, such as weather-based irrigation controllers, in partnership with water agency(ies).	●	●	P		• Rather than using traditional turf, artificial turf was installed at the warmup/practice field at Vista Sports Park in May 2015. • Given drought conditions and water use restrictions by VID, irrigation systems throughout city were programmed for limited watering schedules. Activities not in SLR, but within the city include: • Multiple city-owned landscape areas had irrigation systems replaced, including Civic Center property, East Broadway, and Vista Village Drive (Carlsbad WMA). • 1 acre of turf was removed and replaced with drought tolerant plants at Brengle Terrace Park (Carlsbad WMA). Total cost was $149k, with a Metropolitan Water District rebate of $48k awarded for the project. • August 2016, Raintree Park scheduled for replacement of turf with artificial turf (Carlsbad WMA).

Table A2-13. City of Vista, Existing Development Management Program Strategies

Number	San Luis Rey River Existing Development Management Program Strategies City of Vista	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments
12. Improve coordination between agencies. See strategies ED 3, ED5.						
13. Other BMPs/Activities						
ED 24	Develop and distribute outreach materials targeting sediment control.	●	●	A/P		• Sediment and erosion control BMP brochure is handed out with every grading and building permit enquiry at front desk. Typically order ~250 brochures printed per year.

STATEMENT OF CERTIFICATION

San Luis Rey River Watershed Management Area Water Quality Improvement Plan 2015-2016 Annual Report

I certify, under penalty of law, that this Water Quality Improvement Plan Annual Report submittal and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for known violations.

4.2 JURISDICTIONAL STRATEGIES

Table A2-14. Caltrans, Illicit Discharge Detection and Elimination Program Strategies

San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
1. Engage the public, jurisdictional staff, and other agency staff to proactively identify and report illicit discharges.					
Utilize ~~municipal~~ Caltrans personnel and contractors to identify and report illicit discharges and connections.	●	●	A		The *Illegal Connection, Illicit Discharge (IC/ID) and Illegal Dumping Response Plan* (CTSW-RT-13-999.02) was submitted to the SWRCB in December 2013. The plan describes procedures and BMPs used to protect its MS4 and stormwater quality from potential pollutant loading due to the illicit deposition of solid or liquid materials to Caltrans' right of way. NPDES Permit Section E.2.h.4)b)ii), Page 47.
Facilitate public reporting of illicit discharges and connections via telephone and email.	●	●	A		
Educate the public regarding illegal discharges/dumping.	●	●	A		
Coordinate with upstream entities to prevent illicit discharges from upstream sources from entering the MS4.	●	●	A		
Annual training for appropriate staff on implementation of ICID and Illegal Dumping Response Plan.	●	●	A		

Table A2-14. Caltrans, Illicit Discharge Detection and Elimination Program Strategies

San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
Develop and implement procedures for educating the public with respect to ICIDs and illegal dumping.	●	●	A		
2. Develop and implement approaches to address the impacts of septic systems within the watershed.					
Investigate and eliminate illicit discharges and connections.	●	●	A		
3. Develop and implement approaches to reduce the impacts of public and private sanitary sewer systems within the watershed.					
Implement practices and procedures to address spills with the potential to enter the MS4.	●	●	A		
Investigate and eliminate illicit discharges and connections.	●	●	A		
4. Implement monitoring programs to provide new information to refine the prioritization of drainage areas.					
Develop Comprehensive TMDL Monitoring Plan.	●	●	A		Caltrans submitted the Comprehensive TMDL Monitoring Plan to the State Board on January 1, 2015. State Board staff provided review and comment within the reporting period, and Caltrans submitted a revised plan to State Board staff in June 2016.
TMDL Reach Prioritization	●	●	A		
Perform Tier 1 Monitoring.	●	●	A		Four sites performed monitoring in District 11 during the reporting period at Tier 1 sites.

Table A2-14. Caltrans, Illicit Discharge Detection and Elimination Program Strategies

San Luis Rey River Illicit Discharge Detection and Elimination Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
5. Actively enforce prohibitions related to illicit discharges and connections.					
Investigate and eliminate illicit discharges and connections.	●	●	A		The *Illegal Connection, Illicit Discharge (IC/ID) and Illegal Dumping Response Plan* (CTSW-RT-13-999.02) was submitted to the SWRCB in December 2013. The plan describes procedures and BMPs used to protect its MS4 and stormwater quality from potential pollutant loading due to the illicit deposition of solid or liquid materials to Caltrans' right of way.
6. Other Related Programs and Activities.					
Develop and Implement an ICID and Illegal Dumping Response Plan.	●	●	A		
Develop and implement procedures for investigating, remediating, and eliminating illicit connections and discharges.	●	●	A		
Develop and implement procedures for the prevention of illegal dumping.	●	●	A

Table A2-15. Caltrans, Development Planning Program Strategies

San Luis Rey River Development Planning Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
1. Implement a post construction BMP compliance program to ensure proper construction and maintenance.					
Implement a program that ensures that all structural BMPs are designed, constructed, and maintained.	●	●	A		Create a new website application (CT Portal) dedicated for reporting all structural BMPs that were designed, constructed and maintained.
Inspect all high priority structural BMPs annually.	●	●	A		
Maintain an inventory of structural BMPs.			A		
Stormwater Treatment BMP Technology Report and Stormwater Monitoring and BMP Development Status Report in Annual Report.	●	●	A		*Stormwater Monitoring and BMP Development Status Report: Fiscal Year 2015-2016 Update*, September 2015, which provides an update on the status of stormwater treatment technology studies, source control studies (including erosion control studies), and stormwater quality characterization
2. Enforce post construction requirements related to new and redevelopment.					
Enforce legal authority to ensure all development projects are in compliance with all post construction requirements.	●	●	A		

* Information source is Caltrans Annual Report, Fiscal Year 2015-2016

Table A2-16. Caltrans, Construction Management Program Strategies

San Luis Rey River Construction Management Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
1. Ensure that minimum BMPs are designated and required for construction projects.					
Implement or require implementation of BMPs that are site specific, seasonally appropriate, and appropriate to the construction phase year round.	●	●	A		Caltrans continued to track new and/or emerging post-construction stormwater treatment technologies
Develop and implement new construction guidance as needed to comply with new Statewide Construction General Permit (CGP).	●	●	A		Full implementation of the CGP occurred in this fiscal year.
2. Provide enhanced outreach and coordination to convey construction requirements.					
Provide internal staff training related to construction storm water management.	●	●	A		During the fiscal year, construction stormwater classes were offered to Construction personnel on stormwater topics.
Provide public education and outreach targeting the construction industry.	●	●	A		

* Information source is Caltrans Annual Report, Fiscal Year 2015-2016

Table A2-17. Caltrans, Existing Development Management Program Strategies

San Luis Rey River Existing Development Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
1. Improve data tracking methods for existing development inventories where necessary.					
2. Improve trash management strategies within the watershed.					
Implement "Don't Trash California" campaign.	●	●	A		Caltrans collects trash through several activities that District Maintenance personnel perform on a regular basis. These activities include storm drain maintenance, roadway sweeping, District crew/California Conservation Corps (CCC) trash collection, and the Adopt-A-Highway Program, and public education emphasizing trash and litter prevention.
Implementation of Adopt-A-Highway Statewide Program through coordination with local organizations.	●	●	A		The Caltrans Adopt-A-Highway Program provides an avenue for individuals, organizations, or businesses to help maintain sections of roadside for various activities including litter removal within California's State Highway System.
Report and evaluate trash and litter activities.	●	●	A		
3. Improve and implement existing outreach programs to target key sources and pollutants.					
Implement and annually evaluate public education program.	●	●	A		The Division of Maintenance helps sponsor the California Statewide Litter Collection, Enforcement and Beautification Day event held in the spring on or around Earth Day each year. Caltrans staff volunteers to collect litter and raise public awareness of the issue. Caltrans participates in supporting the California "Keep California Beautiful" campaign with Caltrans' "Protect Every Drop" campaign.

Table A2-17. Caltrans, Existing Development Management Program Strategies

San Luis Rey River Existing Development Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
Implement “Don’t Trash California” campaign.	●	●	A		
Co-sponsor CASQA’s Water Quality Newsflash.	●	●	A		
Implementation of Adopt-A-Highway Statewide Program through coordination with local organizations.	●	●	A		Adopt-A-Highway is a cooperative program between organizations with volunteers to collect trash along the highways, and be recognized for their contribution to keeping the environment and highways clean.
Implementation of Statewide Storm Drain Stenciling Program.	●	●	A		
4. Enhance existing maintenance programs.					
Implement a schedule of operation and maintenance activities.	●	●	A		The Division of Construction staff continued providing the coordinates of treatment BMPs to facilitate transfer to the Division of Maintenance using a designated handoff form. The Division of Maintenance uses its Integrated Maintenance Management System (IMMS) to track maintenance records of treatment BMPs as provided by the Districts.
5. Improve existing inspections programs to more efficiently target key sources.					
Implement a schedule of operation and maintenance for highways.	●	●	A		The Division of Construction staff continued providing the coordinates of treatment BMPs to facilitate transfer to the Division of Maintenance using a designated handoff form. The Division of Maintenance uses its Integrated Maintenance Management System (IMMS) to track maintenance records of treatment BMPs as provided by the Districts.

Table A2-17. Caltrans, Existing Development Management Program Strategies

San Luis Rey River Existing Development Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
Implement highway maintenance activities as required.	●	●	A		Year- End Performance Report FY 2015-2016, A Summary of Maintenance Activity Storm Water Compliance Reviews, September 2015 (CTSW-RT-15-321.04.4), which summarizes the stormwater compliance reviews of Maintenance activities.
6. Actively enforce stormwater and urban runoff requirements for existing development.					
Develop and implement Facility Pollution Prevention Plans.	●	●	A		Year- End Performance Report FY 2015-2016, A Summary of Maintenance Activity Storm Water Compliance Reviews, September 2015, which summarizes the stormwater compliance reviews of Maintenance activities. Caltrans is required to develop a Facility Pollution Prevention Plan (FPPP) for each of its maintenance facilities. Each FPPP describes the activities conducted at the facility and the BMPs to reduce or eliminate the discharge of pollutants in stormwater runoff from the facility. All FPPPs will be updated or revised as needed during each year.
7. Develop and implement a strategy to identify and facilitate retrofit opportunities in areas of existing development.					
Develop a strategy to identify opportunities and facilitate the implementation of retrofit projects in areas of existing development.	●	●	A		

Table A2-17. Caltrans, Existing Development Management Program Strategies

San Luis Rey River Existing Development Program Strategies - Caltrans	FY15-16	FY16-17	Actual / Planned	Rationale for Modification to the Strategy	Comments*
8. Improve coordination between agencies.					
Develop and implement a Municipal Coordination Plan.	●	●	A		Caltrans' Municipal Coordination Plan was under development during the reporting period. In the interim, the Districts participated in municipal coordination activities by attending meetings, taking part in special studies, and collaborating with local agencies. District staff attended meetings statewide with municipal stormwater permittees to coordinate public education and outreach, regional planning, and other related activities.
9. Other BMPs/Activities					
Implement and evaluate the Vegetation Controls Program.	●	●	A		

* Information source is Caltrans Annual Report, Fiscal Year 2015-2016

APPENDIX 3

Water Quality Improvement Plan Numeric Goals

Appendix 3 Water Quality Improvement Plan Numeric Goals

Compliance with the Bacteria Total Maximum Daily Load (TMDL) may be demonstrated via several methods. The pathways that may be used to demonstrate progress toward the interim and final TMDL goals in the San Luis Rey River Watershed Management Area (WMA or Watershed) are presented below in Table A3-1 and Table A3-2, respectively. These tables, along with additional details regarding these pathways, can be found in Sections 3.1.1 (for interim pathways) and 3.1.2 (for final pathways) of the San Luis Rey Water Quality Improvement Plan (WQIP).

Table A3-1. Pathways to Achieve Required Interim TMDL Goals

Pathway	Title	Interim Target	Metric	Values to be met		
				Indicator	Dry	Wet
1 OR	Meet bacteria allowable exceedance frequency of receiving water objectives	No exceedances of the interim receiving water limitations;	Exceedance frequencies as measured in receiving waters.	Total Coliform[a]	4.7% AEF[c]	45% AEF
				Fecal Coliform	12.6% AEF	44% AEF
				Enterococcus	16% AEF	47% AEF
2 OR	No discharge from stormwater drain outfalls	No direct or indirect discharge from the Participating Agencies' storm drain outfalls to the receiving water;	Assessment of presence/ absence of flow and connectivity with receiving water.	No discharge from storm drain outfalls to receiving waters.		
3 OR	Reduce loads at storm drain outfalls	The pollutant load reductions for discharges from the Participating Agencies' storm drain outfalls are greater than the required load reduction;	Pollutant load reductions.	Total Coliform	19.07% reduction	2.81% reduction
				Fecal Coliform	19.55% reduction	1.56% reduction
				Enterococcus	43.69% reduction	5.85% reduction
4	Implement WQIP and use adaptive management	The Participating Agencies develop and implement an accepted WQIP.[b]	Implementation of jurisdictional strategies	Implementation of jurisdictional strategies as developed in accepted Plan and designed to meet interim goals 1, 2 and/or 3.		

a. Receiving water limitations for total coliform only apply to beaches.

b. The accepted Plan must provide reasonable assurance that the interim TMDL compliance requirements in Attachment E of the Permit will be met via implementation, must be accepted by the Regional Board, and must be fully implemented by the Participating Agencies.

c. AEF - allowable exceedance frequency is the percent of samples that can exceed the single sample maximum of geometric mean and still be in compliance; the AEF is calculated based on bacteria concentration measurements from a reference beach.

Table A3-2. Pathways to Achieve Required Final TMDL Goals

Compliance Pathway	Final Target	Final Metric	Measurement: Indicator	Dry Weather			Wet Weather	
1 OR	No exceedances of the final allowable exceedance frequency in the receiving water;	Bacteria concentrations (MPN or CFU/100 ml) and exceedance frequencies in receiving waters;		SSM[a]	GM[b]	AEF[c]	SSM	AEF
			Total Coliform	10,000	1,000	0%	10,000	22%
			Fecal Coliform	400	200	0%	400	22%
			Enterococcus	104	35	0%	104	22%
2 OR	No direct or indirect discharge from the Participating Agencies' storm drain outfalls to the receiving water;	Assessment of presence/absence of flow and connectivity with receiving water;	Flow observations or measurements.					
3 OR	There are no exceedances of the final allowable exceedance frequencies at the Participating Agencies' storm drain outfalls;	Bacteria concentrations (MPN or CFU/100 ml) and exceedance frequencies in discharges;		Dry			Wet	
				SSM	GM	AEF[d]	SSM	AEF[e]
			Total Coliform[f]	10,000	1,000	0%	10,000	22%
			Fecal Coliform	400	200	0%	400	22%
			Enterococcus	104[g] 61[h]	35	0%	104[g] 61[h]	22%
4 OR	The pollutant load reductions for discharges from the Participating Agencies' storm drain outfalls are greater than or equal to the final required load reductions;	Load reductions in discharges are greater than or equal to required load reductions. The calculation requires an understanding of the baseline load[i], which can be used to estimate a target load reduction[j];		Percent Reduction (Dry)			Percent Reduction (Wet)	
			Total Coliform	38.13%			5.62%	
			Fecal Coliform	39.09%			3.12%	
			Enterococcus	87.38%			11.69%	
5 OR	Exceedances of the final allowable exceedance frequencies in the receiving water are due to loads from natural sources and pollutant loads from the Participating Agencies' storm drain outfalls are not causing or contributing to the exceedances;	Microbial source tracking results as measured in the receiving water downstream of storm drain outfalls;	Microbial source tracking results show anthropogenic markers are below the limits of reporting for most receiving water samples at the time of the bacteria exceedance(s).					
6	The Participating Agencies develop and implement an accepted Water Quality Improvement Plan that includes a watershed model or other watershed analytical tool(s).	Implementation of jurisdictional strategies designed to meet goals. Use an adaptive management approach to improve implementation of jurisdictional strategies to reach goals.	Implementation of jurisdictional strategies as outlined in the Water Quality Improvement Plan, and of the required monitoring and assessment program.					

a. SSM = single sample maximum or the highest allowable concentration of bacteria contained in one discreet sample.
b. GM = geometric mean calculated based on multiple samples over a given time frame as defined by the Ocean Plan.
c. AEF = allowable exceedance frequency is the percent of samples that can exceed the single sample maximum of geometric mean and still be in compliance; the AEF is calculated based on the presence of bacteria loading from natural sources.
d. For dry weather days, the dry weather bacteria densities must be consistent with the single sample maximum REC-1 water quality objectives in the Ocean Plan for discharges to beaches and the Basin Plan for discharges to creeks and creek mouths.
e. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days.
f. Total coliform effluent limitations only apply to storm drain outfalls that discharge to the Pacific Ocean Shorelines and creek mouths listed in Table 6.0 of Attachment E of Order R9-2013-0001.
g. This enterococcus effluent limitation applies to storm drain discharges to segments of areas of the Pacific Ocean Shoreline listed in Table 6.0 of Attachment E of Order R9-2013-0001.
h. This enterococcus effluent limitation applies to storm drain discharges to segments of areas of creeks or creek mouths listed in Table 6.0 of Attachment E of Order R9-2013-0001.
i. The baseline loads for the lower watershed were determined through modeling and are presented in Appendix 3C.
j. The baseline fecal coliform load (1993 water year) equals 6,186 x 10^{12} MPN resulting in a target load reduction of 723 x 10^{12} MPN for wet weather.

The watershed goals identified by the Participating Agencies in the San Luis Rey River WMA to demonstrate progress toward compliance with the Bacteria TMDL at the mouth of the San Luis Rey River are presented below in Table A3-3 (dry weather) and Table A3-4 (wet weather). The goals outlined in these tables are based on TMDL compliance pathways. The Participating Agencies also outlined goals for the Lower San Luis Rey River, which are intended to improve water quality at storm drain outfalls and receiving waters. These goals are presented in Table A3-5 (dry weather) and Table A3-6 (wet weather) below. Each of the following four tables, along with additional details regarding these goals, can be found in Section 3.1.3 of the San Luis Rey River WQIP.

Table A3-3. Watershed Management Area Numeric Dry Weather Goal for Bacteria TMDL – San Luis Rey Hydrologic Unit at the San Luis Rey River Mouth

Compliance Pathway	Title	Metric[a]	Baseline	Final Outcome	1st Permit Term 2013 – 2018	2nd Permit Term 2018 – 2023: TMDL Interim Compliance Date April 4, 2020[b]	2nd Permit Term 2018 – 2023: TMDL Final Compliance Date April 4, 2021
1; or	No Discharge from MS4	Discharge from MS4 outfall	To be established during FY 15-16 monitoring	Elimination of flow from MS4 discharges	Flow eliminated from 25% of outfalls or cumulative flow from storm drain outfalls reduced by 25 %	Flow eliminated from 50% of outfalls or cumulative flow from storm drain outfalls reduced by 50 %	Flow eliminated from 100%[c] of outfalls or cumulative flow from storm drain outfalls reduced by 100 %[c]
2; or	Meet TMDL Limits in Receiving Water	Bacteria concentrations & exceedance percentage in receiving waters	Not applicable	Achievement of WQOs or allowed exceedance percentage for bacteria	None	Bacteria concentrations at the compliance point identified in the Monitoring and Assessment Plan are below the applicable WQO (e.g., 400 mpn/100mL single sample maximum for Fecal Coliform)[j] or TMDL allowed exceedance percentage[d] of 4.7% for Total Coliform; 4% for Fecal Coliform; 16% for *Enterococcus*	Bacteria concentrations at the compliance point identified in the Monitoring and Assessment Plan are below the applicable WQO or TMDL allowed exceedance percentage[e] of 0% for Total Coliform, Fecal Coliform and *Enterococcus*
3; or	MS4 Discharge Meets TMDL Limits	Bacteria concentrations & exceedance percentage in MS4 discharges					
4;	MS4 Discharge Load Reduction	Load reductions in MS4 discharges	10.0×10^{12} MPN during Water Year 1993 (based on TMDL modeling)[f]	Reach mandatory reduction of dry weather bacteria loading from MS4 discharges identified in Attachment E	Loads[g] are reduced by 9.5% for Total Coliform; 9.8% for Fecal Coliform; 21.8% for Enterococcus from MS4 outfalls	Loads[h] are reduced by 19.07% for Total Coliform (TC), 19.55% for Fecal Coliform (FC), 43.69% for *Enterococcus (Ent)* from the MS4 outfalls	Loads[i] are reduced by 38.13% for Total Coliform (TC), 39.09% for Fecal Coliform (FC), 87.38% *for Enterococcus (Ent)* from the MS4 outfalls
5; or	Exceedance due to Natural Sources	Exceedances due to natural sources, and MS4 outfall loads not causing or contributing to exceedances	To be established during FY 14-15 monitoring	Elimination of anthropogenic fecal markers from MS4 discharges	Number of MS4 outfalls with human fecal markers detected are reduced by 25%	Number of MS4 outfalls with anthropogenic fecal markers detected are reduced by 50%	Number of MS4 outfalls with anthropogenic fecal markers detected are reduced by 100% and storm drain outfall loads are not causing or contributing to exceedances.
6	Water Quality Improvement Plan (WQIP)	Implement WQIP	Not Applicable	Implementation of the WQIP in accordance with Attachment E of Permit	Implement WQIP supported by a reasonable assurance as accepted by the San Diego Water Board	Submit and fully implement WQIP, accepted by the San Diego Water Board, which provides reasonable assurance that interim TMDL compliance requirements will be achieved by the interim compliance dates	Develop and implement WQIP as follows: (i) incorporate BMPs required under Permit Provision 6.b.(2)(c) in WQIP (ii) Include analysis to demonstrate that implementation of BMPs required by Provision 6.b.(2)(c) achieves compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), and/or 6.b.(3)(e) (iii) The results analysis must be accepted San Diego Water Boards as part of the WQIP (iv) Responsible Copermittee continue to implement the BMPs in (i), AND (v) Responsible Copermittee continue to perform specific monitoring and assessments from Provision 6.d to demonstrate compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), 6.b.(3)(e), and/or 6.b.(3)(f)
	a. Eliminate anthropogenic dry weather flows from storm drain outfalls	% reduction of flow or number of outfalls with persistent flows	To be established FY 15-16 using dry weather flow measurements.	Effectively eliminate anthropogenic dry weather flow from storm drain outfalls to receiving water.	Reduce by 20% the aggregate flow or the number of persistently flowing outfalls.	Reduce by 75% the aggregate flow or the number of persistently flowing outfalls.	Eliminate 100% anthropogenic dry weather discharges and accompanying bacteria loads from storm drain outfalls to the receiving water.

a. In accordance with Permit Provisions 6.b.(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.

b. Request moving Interim TMDL Compliance Date from April 4, 2017 (per Attachment E, 6.c(1)) to April 4, 2020 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.

c. Goal of 100% flow elimination in accordance with Provision 6.b.(3)(a).

d. Interim dry weather Allowable Exceedance Percentages were calculated based on half the value of the existing 30-day Geometric Mean of exceedance percentages based on beach sample data from 2004 through 2010: ; Annual Bacteria TMDL Monitoring Report is included in Appendix I of the Transitional Monitoring and Assessment Report for the San Luis Rey River Watershed Management Area (2012-2014). From this report, the San Luis Rey River watershed compliance reduction milestones/existing and interim and final exceedance frequencies are provided in Table 1–2 on page 1 – 8 (specifically, footnote "a" under the table). The interim and existing exceedance frequency calculation methodology is summarized in Section 2.4 on page 2-6 of the document.

e. Final dry weather Allowable Exceedance Percentages are from Tables 6.2a, 6.2b, and 6.2c of Attachment E to Order No.R9-2013-0001.

f. Value derived from table on page A33 of Attachment A to TMDL Resolution No.R9-2010-0001 for the San Luis Rey River watershed; monthly value translated in annual load for watershed by multiplying by 12. Baseline load for County of San Diego was calculated as a proportion of County land area to that of the overall watershed, i.e. approximately 48%Values calculated as half of the interim goals.

g. Values taken from Table 6.6 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* was the highest reduction at 43.69%.

h. Values taken from Table 6.3 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* was the highest reduction at 87.38%.

i. Goal of 100% of exceedances demonstrated to be due to natural sources in accordance with Provision 6.b.(3)(e).

6	Water Quality Improvement Plan (WQIP)[l]	Implement WQIP	Not Applicable	Implementation of the WQIP in accordance with Attachment E of Permit	Implement WQIP supported by a reasonable assurance as accepted by the San Diego Water Board	Implement WQIP supported by a reasonable assurance as accepted by the San Diego Water Board	Submit and fully implement WQIP, accepted by the San Diego Water Board, which provides reasonable assurance that interim TMDL compliance requirements will be achieved by the interim compliance dates	Develop and implement WQIP as follows: (i) incorporate BMPs required under Permit Provision 6.b.(2)(c) in WQIP (ii) Include analysis to demonstrate that implementation of BMPs required by Provision 6.b.(2)(c) achieves compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), and/or 6.b.(3)(e) (iii) The results analysis must be accepted San Diego Water Boards as part of the WQIP (iv) Responsible Copermittee continue to implement the BMPs in (i), AND (v) Responsible Copermittee continue to perform specific monitoring and assessments from Provision 6.d to demonstrate compliance with Specific Provisions 6.b.(3)(a), 6.b.(3)(b), 6.b.(3)(c), 6.b.(3)(d), 6.b.(3)(e), and/or 6.b.(3)(f)
	a. Focus on programmatic BMPs and use adaptive management to increase effectiveness	% bacterial load reduction	3,835 x 10^{12} MPN during Water Year 1993	Reduce bacteria loads from baseline by at least 10% from storm drain outfalls to meet TMDL required load reductions.	Implement programmatic (non-structural) BMPs to achieve source reduction of bacteria loads from the storm drain outfalls.	Reduce bacteria loads by 2% from the storm drain outfalls through continued implementation of programmatic BMPs and, based on adaptive management, focus and enhance efforts where needed.	Reduce bacteria loads by an additional 4% (total 6%) from the storm drain outfalls by continued implementation of programmatic BMPs.	Reduce bacteria loads by an additional 4% (at least 10% total) from the storm drain outfalls by continued implementation of programmatic BMPs.
	b. Structural BMPs[m] (as needed and as funding is available)	% bacterial load reduction based on quantitative model	3,835 x 10^{12} MPN during Water Year 1993	Reduce baseline bacteria loads by 1.7% from storm drain outfalls to receiving water to meet TMDL required load reductions.	Reduce by 0.3% the baseline bacteria loads from distributed BMPs constructed between 2003 and 2009 during redevelopment.	Reduce bacteria loads by an additional 0.5% (total 0.8%) through participation in the public private partnership program. Begin planning & design for additional long-term structural BMPs.	Reduce bacteria loads by an additional 0.6% (total 1.4%) through additional participation in the public private partnership program and reduction through BMPs required through redevelopment (3.2 %); Continue planning & permitting for long-term structural BMPs.	Reduce bacteria loads by 0.3% (total 1.7%). Construct distributed and regional structural BMPs if necessary to meet goal.

a. In accordance with Permit Provisions 6.b.(3)(a)-(e) and 6.c.(3)(a)-(g) of Attachment E to Order R9-2013-0001.
b. Request moving Interim TMDL Compliance Date from April 4, 2021 (per Attachment E, 6.c(1)) to April 4, 2028 to allow adequate time to investigate and mitigate bacteria sources, and monitor progress and adjust implementation through the adaptive management process.
c. Goal of 100% flow elimination in accordance with Provision 6.b.(3)(a).
d. Interim wet weather Allowable Exceedance Percentages are from Tables 6.5 of Attachment E to Order No.R9-2013-0001.
e. Final wet weather Allowable Exceedance Percentages are from Tables 6.2a, 6.2b, and 6.2c of Attachment E to Order No.R9-2013-0001.
f. Value from modeled baseline load as indicated in Appendix 3C of the WQIP.
g. Values calculated as half of the 2nd Permit Term goals.
h. Values calculated as half of the interim goals
i. Values taken from Table 6.6 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* is the controlling indicator.
j. Values taken from Table 6.3 of Attachment E to Order R9-2013-0001: Anticipated load reductions for WQIP strategies were modeled using Fecal Coliform (FC) as a surrogate for all Fecal Indicator Bacteria as noted in WQIP Appendices 3C and 3F, therefore target FC load reductions were set according to the largest required indicator bacteria reduction (among TC, FC and *Ent*) to be conservative; *Enterococcus* is the controlling indicator.
k. Goal of 100% of exceedances demonstrated to be due to natural sources in accordance with Provision 6.b.(3)(e).
l. To meet the final wet weather target load reduction of 11.69% for Fecal Coliform, the County through quantitative modeling has demonstrated a 10% reduction from programmatic BMPs and a 1.7% reduction from structural BMPs. Progress will be monitored and adjustments through adaptive management will be used to update the plan.
m. The County of San Diego is concerned that a long-term funding source is not identified for constructing and maintaining structural BMPs, if structural BMPs are needed to meet compliance. The implementation of strategies to achieve goals will depend upon approval of funding in future annual budgets.

Table A3-5. Dry Weather Watershed Goals for Lower San Luis Rey River[a]

Title [b]	Number	Metric	Baseline	Interim Numeric Goals Permit Term 2013 – 2018	Final Numeric Goals Permit Term 2018 – 2023 (April 4, 2021)
Reduce bacteria contributions from persistent dry weather flowing outfalls	1; or	Presence/absence of dry weather flow at persistent flowing outfalls [c]	Establish during transitional monitoring or FY15-16 monitoring and update annually as needed	Effectively eliminate flow from 20% of persistently flowing outfalls	Effectively eliminate anthropogenic flow from 100% of outfalls
	2	Dry weather flow at persistent flowing outfalls [c]	Establish during transitional monitoring or FY15-16 monitoring and update annually as needed	Reduce by 20%, the aggregate flow from persistently flowing outfalls	Reduce by 100%, the aggregate flow from persistently flowing outfalls

a. West of Interstate 15
b. The goals may be adapted as monitoring data is collected and analyzed.
c. Flow is defined as all dry weather flows except groundwater, other exempt, or other permitted non-stormwater flows

Table A3-6. Wet Weather Watershed Goals for Lower San Luis Rey River[a]

Title [b]	Metric	Baseline[c]	Interim Numeric Goals Permit Term 2013 – 2018	Interim Numeric Goals Permit Term 2018 – 2023	Interim Numeric Goals Permit Term 2023 - 2028	Final Numeric Goals Permit Term 2028-2033 (April 4, 2031)
Reduce bacteria contributions from outfalls during wet weather	Bacteria load reductions per acre at key outfalls or bacteria concentration in the lower River	Fecal coliform: $2.44*10^{10}$ MPN/storm/acre Enterococcus: $1.18*10^{11}$ MPN/storm/acre	Reduce bacteria loads cumulatively or at key outfalls[d] by 0.3% or meet Bacteria WQOs in the lower River[f].	Reduce bacteria loads cumulatively or at key outfalls[d] by 1.3% or meet Bacteria WQOs in the lower River[f].	Reduce bacteria loads cumulatively or at key outfalls[d] by 6.0% or meet Bacteria WQOs in the lower River[f].	Reduce bacteria loads cumulatively or at key outfalls[d] by 11.9%[e] or meet Bacteria WQOs in the lower River[f].

a. West of Interstate 15
b. The goals may be adapted as monitoring data is collected and analyzed.
c. Refer to Appendix 3K for baseline determination methodology.
d. The five selected key drainage areas are the wet weather storm drain outfall monitoring locations identified in Table 3-1 and Figure 3-1 of Attachment 4A-5 to the Monitoring and Assessment Plan as MS4-SLR1 through MS4-SLR5. The selected key drainage areas are all typical drainages that are representative of the San Luis Rey Watershed Management Area.
e. This final load reduction goal of 11.9% was arrived at by adding the mean difference between the Enterococcus load reduction requirements to meet the stream freshwater standards and those to meet the ocean standards in Attachment E of the Permit (0.16%), to the required final load reductions for San Luis Rey River at the Pacific Ocean Shoreline (11.69%), see Table 3-8. The modeling was designed to meet the receiving water limits in the river; no dilution was assumed.
f. Meet the water quality objectives for freshwater Single Sample Maxima of 400 MPN/100 mL for Fecal Coliform and 61 MPN/100 mL for *Enterococcus* at the two stream monitoring locations identified in Table 4-5 of the WQIP. Bacteria loads will be measured in the freshwater section of the stream.

Caltrans Numeric Goals

Caltrans storm water flows are not included in the Municipal Stormwater Permit; however, Caltrans is subject to similar requirements through its own stormwater permit (State Water Resources Control Board [SWRCB], 2012). Caltrans has voluntarily contributed to the WQIP effort to provide a consistent and subwatershed-wide approach to meeting applicable TMDL requirements. The baseline strategies are continuously implemented and augmented as resources become available. Attachment IV to the Caltrans Stormwater Permit outlines a methodology for prioritizing stream segments included in TMDLs to which Caltrans is subject. The Permit establishes best management practice (BMP) implementation requirements, evaluated in terms of compliance units. Caltrans is expected to achieve 1,650 compliance units per year through the implementation of retrofit BMPs, cooperative implementation, and post-construction treatment beyond Permit requirements.

Impaired reaches throughout the state will be prioritized on the basis of several factors, including, but not limited to, percent reduction needed, Caltrans drainage area contributing to the reach, and proximity to receiving waters. Reaches with metals TMDLs will likely be prioritized. This prioritization list is currently under negotiation between Caltrans Head Quarters and the State Board.

Areas under Caltrans' jurisdiction include roadways, land adjacent to roadways, and facilities. Caltrans' jurisdictional strategies specifically focus on BMP implementation to reduce known pollutants within these areas. Caltrans' strategies vary from those of other Participating Agencies (in both type and name) to best address freeway characterization discharges from its right-of-way. Strategies include programs developed by Caltrans Headquarters for statewide execution and District 11 implementation. Caltrans' implementation of strategies with the watershed is dependent on legislative approval. For Bacteria TMDLs, Caltrans is expected to eliminate dry weather flows by implementing control measures to ensure effective prohibition (Provision B.2 of the Stormwater Permit). For wet weather flows, Caltrans is expected to implement control measures or BMPs to prevent discharge of bacteria from the right-of-way; this can be source control and preemptive activities such as street sweeping, cleanup of illegal dumping, and public education on littering. Implementation of these controls is per the TMDL prioritization list.

APPENDIX 4

Monitoring and Assessment Results

Appendix 4 Monitoring and Assessment

The purpose of this appendix is to provide the monitoring and assessment results for the 2015-2016 monitoring year for the San Luis Rey River Watershed Management Area (WMA or Watershed). Whereas Section 3 of this Annual Report focuses on the highest priority water quality condition (HPWQC) in the WMA (i.e., bacteria), this appendix will present all of the receiving water and storm drain outfall monitoring data collected during the 2015-2016 monitoring year, including the priority water quality conditions (PWQCs). The PWQCs for the watershed include nitrogen, phosphorus, total dissolved solids (TDS), and toxicity during wet and dry weather and eutrophic conditions, chloride, and the Index of Biotic Integrity (IBI) during dry conditions. Also described below are monitoring programs required by the Permit for which no data were collected during the 2015-2016 monitoring year because the monitoring requirement has been met, or will be met in future years of the Permit term. Caltrans is not a Participating Agency for the monitoring and assessment program described in this section, as Caltrans is regulated under a separate permit from the State Water Resource Control Board (SWRCB).

4.1 Receiving Water Monitoring

Receiving water monitoring in the San Luis Rey River WMA during the 2015-2016 monitoring year was limited to participation in the Southern California Stormwater Monitoring Coalition (SMC) and Hydromodification Management Program (HMP) regional monitoring programs. Total maximum daily load (TMDL) monitoring and lower San Luis Rey River Water Quality Improvement Plan (WQIP) goals monitoring for indicator bacteria was also conducted in receiving waters during 2015-2016. Receiving water results collected under these programs are summarized below.

The receiving water assessments required by Provision D.4.a will be addressed in the Regional Monitoring and Assessment Report (RMAR), which will be submitted to the Regional Board in December 2017 with the Report of Waste Discharge (ROWD) in accordance with Provision D.4.a.1.(b).

4.1.1 *Long Term Receiving Water Monitoring*

Due to dry conditions and lack of flow, long-term monitoring has not yet been conducted at the long-term monitoring station (LTMS), SLR-MLS, which is the historical mass loading station located on the lower San Luis Rey River. The most recent receiving water quality data from SLR-MLS were collected during the 2012-2013 monitoring year. Detailed results for all monitored analytes can be found in the Transitional Monitoring and Assessment Program Report for the San Luis Rey River Watershed Management Area (2012-2014) (WESTON, 2015a). SLR-MLS will be monitored during the 2016-2017 monitoring year or when sufficient flow occurs. A map showing the location of the SLR-MLS is presented in Figure A4-1.

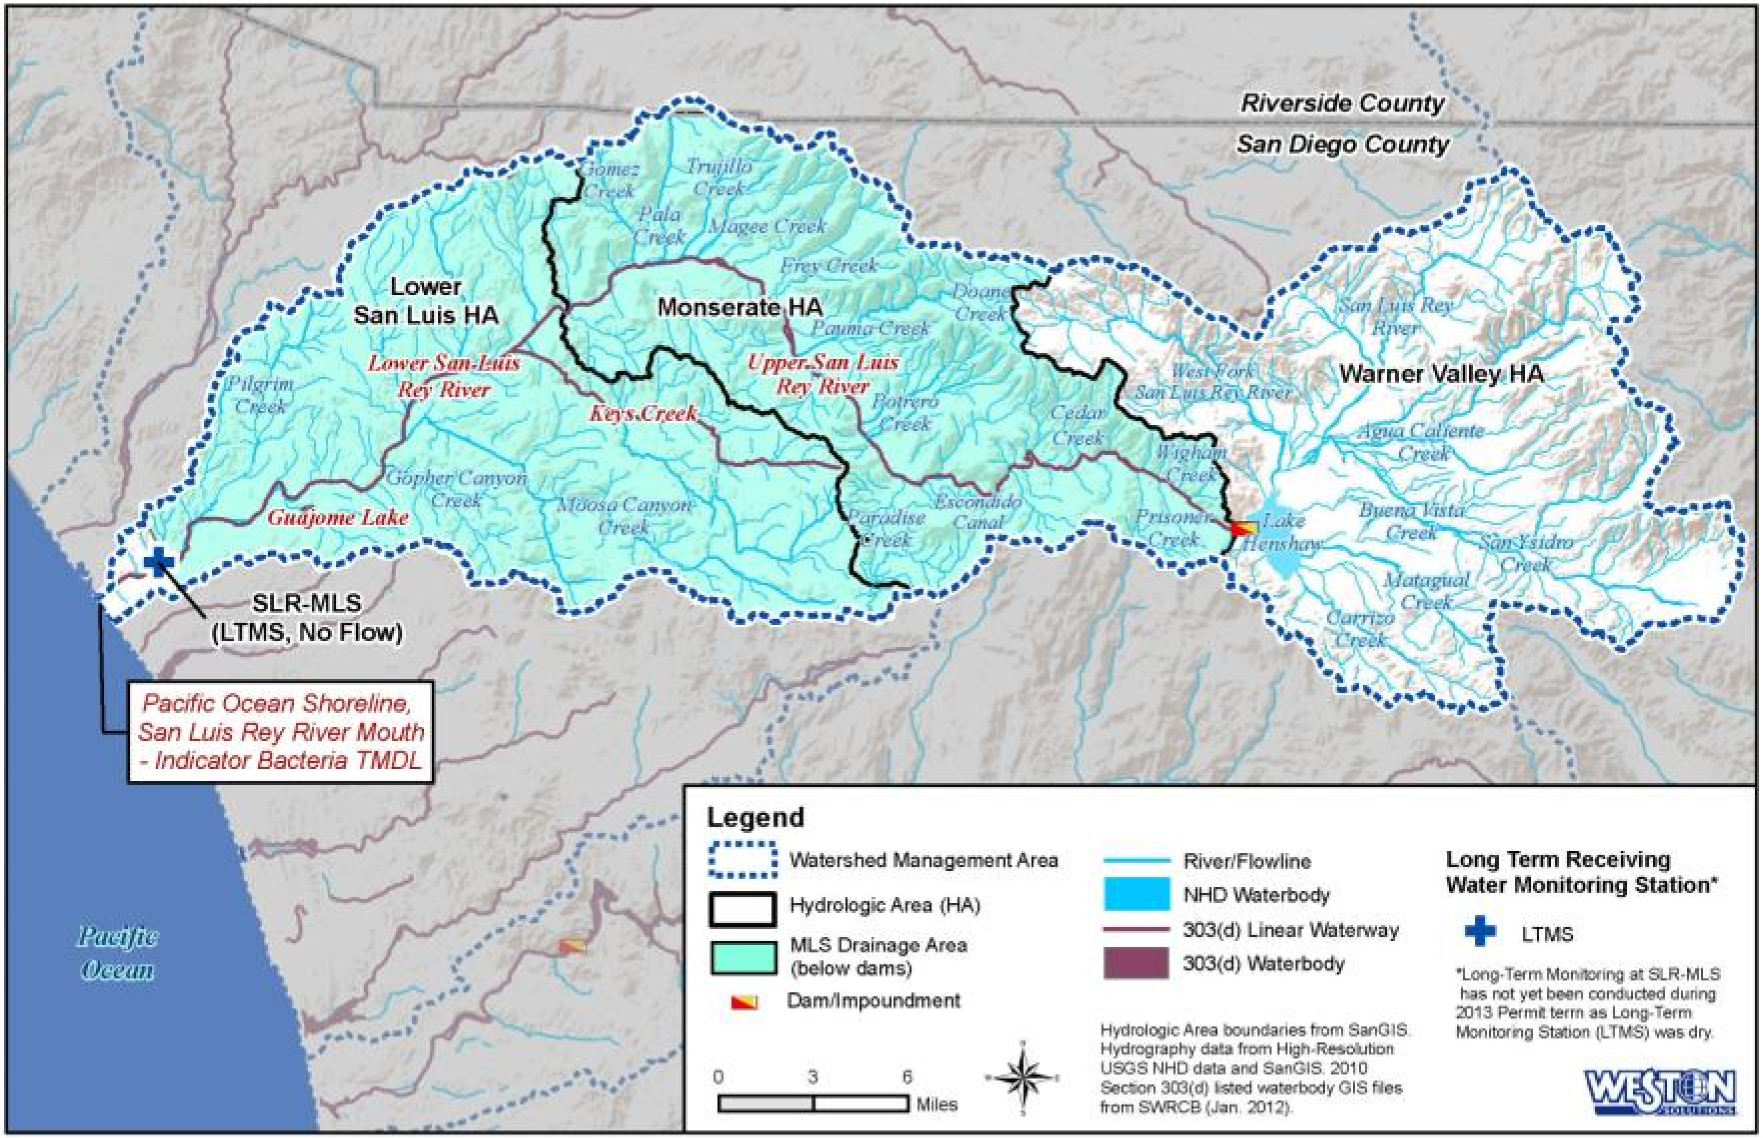

Figure A4-1. Long-Term Receiving Water Monitoring Location in the San Luis Rey River WMA

4.1.2 *Bight Regional Monitoring Program*

The Bight regional monitoring program is a multi-agency collaborative effort to assess the ecological condition of the Southern California Bight (from the Mexican border to Point Conception) from a regional perspective. The core program consists of monitoring of sediment chemistry, sediment toxicity, and benthic infauna.

Sediment quality monitoring was conducted during the summer of 2013 at a total of 22 sites in nine estuaries and lagoons in the San Diego region. San Luis Rey River Estuary has been disconnected from the ocean in recent years due to dry conditions, and therefore does not meet sediment quality objective requirements and was excluded from monitoring under the Bight 2013 Program. During the current Permit term, the Participating Agencies are participating in the planning for the Bight 2018 monitoring program. The Participating Agencies will update the Regional Board of the status of the San Luis Rey River Estuary prior to the California Bight 2018 Study.

4.1.3 *Sediment Quality Monitoring*

Sediment quality monitoring is designed to assess compliance with the sediment quality receiving water limits applicable to enclosed bays and estuaries in accordance with the State Board's Water Quality Control Plan for Enclosed Bays and Estuaries of California–Part I Sediment Quality (Sediment Control Plan) (SWRCB, 2009).

The sediment sampling conducted in the estuaries and lagoons in the San Diego Region as a part of the Bight Program contributes to fulfillment of sediment quality monitoring requirements of the Permit. Follow-up sampling and additional studies are needed for sites not characterized as unimpacted or likely unimpacted.

As mentioned in Section 4.1.2, San Luis Rey River Estuary was excluded from monitoring under the Sediment Control Plan since it does not fit the criteria for sediment quality objective monitoring.

4.1.4 *Stormwater Monitoring Coalition Regional Monitoring*

Since 2001, the Participating Agencies have partnered with regulated stormwater municipalities in southern California, the Regional Boards of Southern California and the Southern California Coastal Water Research Project (SCCWRP) to form the SMC. The goal of the SMC is to develop the technical information necessary to better understand stormwater mechanisms and impacts and develop the tools to improve stormwater quality through programmatic decision-making (SMC, 2016).

The Participating Agencies are continuing to participate in the SMC Regional Freshwater Stream Bioassessment Monitoring Program (SMC Regional Bioassessment Program). In 2015, a new five-year SMC program began that extended the initial survey to answer key management questions about the impacts of stormwater on stream conditions. Several modifications were made to the previous surveys to emphasize detection of trends and to address data gaps. Specifically, monitoring of high-priority stressors (i.e., habitat, nutrients, and ionic composition) was continued, whereas monitoring of low-priority stressors (i.e., water column metals, pyrethroids, and toxicity) was discontinued. Flow regime (hydrologic state checklist derived from Gallart et al. [2010] and water level loggers), vertebrate occurrence, and new stressors of interest (i.e., sediment pyrethroids and toxicity) were added to the list of monitored parameters, although sediment sampling has been deferred until further action by the SMC Executive Committee. In addition, the physical habitat assessment has been enhanced with hydromodification screening (modified from Bledsoe et al., 2010) at unarmored or partially armored condition sites and a channel engineering checklist at all condition sites. The hydromodification screening and channel engineering checklist will be conducted at trend sites at least once during the five-year study. The trend sites were selected from previously sampled sites under earlier probabilistic surveys in order to estimate changes in regional conditions over time, and the condition sites were selected from a new probabilistic sample draw in order to estimate current regional conditions.

The 2015-2016 monitoring year was the second under the updated 2015-2019 SMC Regional Bioassessment Program. Within the SMC Program, the San Diego Region is divided into several strata, and the San Luis Rey River WMA is in the Northern San Diego stratum along with the Santa Margarita River WMA. In the San Luis Rey River WMA portion of the stratum, two condition sites were monitored during 2016, 903M20165 in Guajome Tributary in the Mission hydrologic subarea (HSA) (903.11) and 903M20166 in Moosa Creek in the Bonsall HSA (903.12) (Table A4-1, Figure A4-2).

Table A4-1. 2016 Bioassessment Monitoring Locations in the San Luis Rey River WMA

Site ID	Site Type	Land Use	Date Sampled	Latitude	Longitude
903M20165 – Guajome Tributary	Condition	Agricultural	6/7/2016	33.27586	-117.18406
903M20166 – Moosa Creek	Condition	Urban	5/2/2016	33.23989	-117.23664

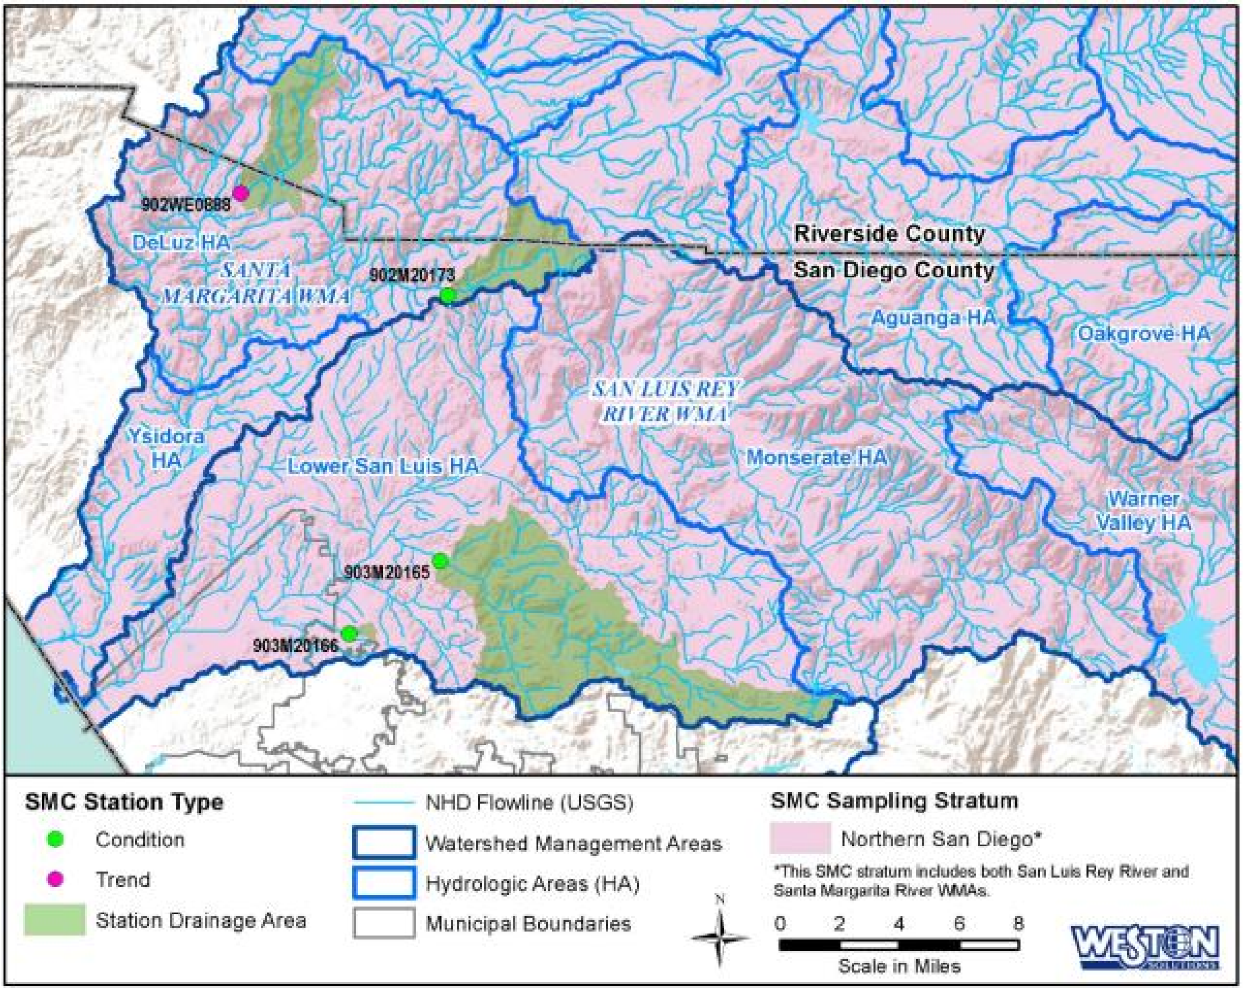

Figure A4-2. SMC Regional Monitoring Program Locations, Northern San Diego Stratum

Laboratory analyses included benthic macroinvertebrate (BMI) taxonomy by Ecoanalysts Inc., BMI taxonomic QC analysis by the California Department of Fish and Wildlife (CDFW) Aquatic Bioassessment Laboratory, benthic algae taxonomy by California State University – San Marcos (soft algae and diatoms), and chemistry analyses by Weck Laboratories, Inc. and PHYSIS Environmental Laboratories, Inc. Samples were collected following the protocols outlined in the Bioassessment Survey of the Stormwater Monitoring Coalition (SCCWRP, 2015). BMI data analyses included a taxonomic listing of all BMIs identified in the surveys and calculation of the biological metrics listed in the California Stream Bioassessment Procedure (CSBP). Additionally, the calculation of the California Stream Condition Index (CSCI), an index that rates the overall BMI community quality, was performed. The CSCI is a newly developed analytical tool, finalized in 2013 (Mazor et al., 2016), that is applicable statewide in California and is now being utilized in place of the IBI to assess the health of freshwater streams. The CSCI combines a predictive multi-metric index (pMMI) (a measure of ecological structure) with a predictive observed to expected (O/E) ratio index (a measure of taxonomic completeness), and also incorporates local watershed geology and climate factors. The predictive components of the CSCI scoring tool allow for comparisons of the site being scored to a subset of other sites in California that the CSCI determines to be most similar. Algal data analyses included a taxonomic listing of all taxa identified and calculation of algal metrics and three algal IBIs (Fetscher et al., 2014 and SCCWRP, 2014). These data are typically available in February of the year following the survey (i.e., February 2017).

Bioassessment monitoring results for the Guajome Tributary and Moosa Creek locations are presented in Table A4-2 (CSCI scores). Table A4-3 shows the physical habitat assessment scores, and chemistry results are presented in Table A4-4. Additional data are provided in Attachment 4A, including the Taxonomic Listing of Benthic Macroinvertebrates (4A-1), Ranked Abundance of Benthic Macroinvertebrates (4A-2), and CSCI Metrics (4A-3). Results are summarized below, and more detailed results will be available in the interim and final reports developed by the SMC Workgroup. Interim reports are expected every one to two years, and the final report produced under the 2015-2019 Workplan is anticipated in Spring 2021 (SCCWRP, 2015).

Whereas data related to bacteria in the WMA are not collected under the SMC Regional Bioassessment Program, data are collected for chloride, nitrogen, and phosphorus, which are PWQCs for the watershed. Chloride and total phosphorus were above water quality objectives (WQOs) at both locations, and total nitrogen was above the WQO at the Guajome Tributary location.

4.1.4.1 Guajome Tributary

The CSCI score for the Guajome Tributary location, 903M20166, indicated that the benthic community is very likely altered. The score was in the upper portion of the very likely altered range (almost within the likely altered range) (Table A4-2). Taxa richness was below the predicted taxonomic richness at this location (Attachment 4A-3). The BMI community was dominated by chironomid midges *Tanytarsus sp.* and *Micropsectra sp.* and the crustacean class *Ostracoda* (24%, 21%, and 18% of the composition of the sample, respectively) (Attachment 4A-2). The numbers of several types of taxa that tend to decrease in response to impairment were below predicted numbers (the site-specific predicted numbers are those expected if the site was healthy) (Attachment 4A-3). Physical habitat quality as measured by the California Rapid Assessment Method (CRAM) score was moderate (Table A4-3).

Chemistry data was collected for physical and general chemistry, periphyton (ash-free dry mass [AFDM] and chlorophyll-a), and nutrients. Results indicated that chloride, sulfate, total nitrogen, and total phosphorus were above WQOs. The total phosphorus concentration was only slightly above the WQO. All other parameters met WQOs, where applicable, although conductivity (specific conductance) was elevated (Table A4-4). High specific conductance may have an effect on BMI. Specific conductance is a measurement of the ability of water to conduct electricity where dissolved ions (i.e., Na^+, Ca^{+2}, SO_4^{-2}, etc.) serve as the conductor (SWRCB Fact Sheet-3.1.3.0(EC)V2e) (2004). As such, specific conductance is related to TDS content. Although the effect of elevated TDS on BMI is variable among different taxa and not well understood, a number of studies have demonstrated a correlation between changes in conductivity/TDS with both altered BMI (Minshall and Minshall, 1978) and algal communities (Leland and Porter, 2000). Results from the first SMC five year report suggest that elevated TDS is a condition common to the entire region, affecting 76% of stream miles in Southern California (SMC, 2015).

4.1.4.2 Moosa Creek

At the Moosa Creek location, 903M20165, the CSCI score indicated that the benthic community is very likely altered. The score was in the upper portion of the very likely altered range (almost within the likely altered range) (Table A4-2). Taxa richness was below the predicted taxonomic richness at this location (Attachment 4A-3), and the BMI community was dominated by the crustacean *Hyalella sp.* (52% of the composition of the sample) (Attachment 4A-2). The numbers of several types of taxa that tend to decrease in response to impairment were below predicted numbers (Attachment 4A-3). Physical habitat quality as measured by the CRAM score was in the upper portion of the moderate range (Table A4-3).

Chemistry results indicated that dissolved oxygen was below the WQO (did not meet WQOs) and chloride, sulfate, and total phosphorus were above their respective WQOs. All other parameters met WQOs, where applicable, although specific conductance was elevated (Table A4-4).

Table A4-2. 2016 CSCI Scores for the San Luis Rey River WMA

Station Code	Count	E	Mean_O	OoverE	MMI	CSCI
903M20165 – Guajome Tributary	537	7.62	5.55	0.73	0.45	0.59
903M20166 – Moosa Creek	666	7.61	5.70	0.75	0.35	0.55

Count - the total number of organisms in the sample.
E-the sum of all capture probabilities >0.5 at a site (# of common taxa).
Mean_O - The number of common taxa observed at a site.
OoverE - O/E as calculated.
MMI - the pMMI score, a minimum threshold has not been established, but low values should be considered indicative of degradation.
CSCI - the CSCI score, calculated as the average of the O/E and the pMMI. CSCI scores indicate benthic communities that are very likely altered (scores of 0.00 to 0.62), likely altered (0.63 to 0.79), possibly intact (0.80 to 0.91), or likely intact (above 0.92).

Table A4-3. 2016 Physical Habitat Assessment Scores for the San Luis Rey River WMA

Physical Habitat Measures	Guajome Tributary	Moosa Creek
	903.11	903.12
	903M20166	903M20165
	5/2/2016	6/7/2016
Elevation (feet)	106	70
CRAM Physical Habitat Score*	61	72
Canopy Cover (% of reach)	89%	83%
Macroalgal Cover (% of reach)	2%	3%
Substrate Composition		
Fines	8%	3%
Sand	60%	53%
Gravel	0%	1%
Cobble	1%	0%
Boulder	0%	1%
Roots	20%	32%

Total Phosphorus	mg/L	0.1 (flowing waters)	Basin Plan	**0.11**	**0.31**

<-Results less than the method detection limit.
NS - Not sampled.
(a) Water Quality Benchmark is based on the criterion continuous concentration (CCC) using water temperature and pH as described in the USEPA, 2013 Aquatic Life Ambient Water Quality Criteria for Ammonia - Freshwater, EPA-822-R-13-001, April 2013.
(b) Water Quality Benchmark is based on the MUN beneficial use as described in the Basin Plan, 1994 (with amendments effective on or before April 4, 2011). MUN beneficial use does not apply to these stations (waterbodies listed as exempt).
J - Analyte was detected at a concentration below the reporting limit and above the method detection limit. Reported value is estimated.
Bold/shaded values do not meet water quality benchmarks.

4.1.5 *Regional Hydromodification Monitoring Program (HMP)*

Hydromodification is the potential alteration and erosion of creeks, streams, and natural habitats that may be associated with urbanization of the tributary watershed. A regional Hydromodification Management Plan has been developed to manage increased runoff discharge rates and durations and address impacts to beneficial uses and stream habitat (County of San Diego, 2011). A regional HMP was also developed to evaluate the criteria established in the Hydromodification Management Plan. While no monitoring sites were located within the San Luis Rey River WMA, the Hydromodification Management Plan criteria will apply to future development in the WMA, and therefore the results of this monitoring are applicable.

The 2011 HMP represents a five-year monitoring program that involved channel sediment transport assessments, and continuous flow monitoring of pre-project, post-project, and reference conditions. An iterative and phased approach was used in implementation of each year of monitoring. The fifth and final year of monitoring was completed in 2015-2016. Results of the HMP are presented in the *Effectiveness Assessment of the San Diego Hydromodification Management Plan,* which is available online at:
http://www.projectcleanwater.org/attachments/article/75/2016_LDW_HMPrpt.pdf.

The results of the HMP indicate that the Hydromodification Management Plan is working as planned. Sediment rating curves were developed based on extensive wet weather monitoring data collected from the 2011-2012 to 2015-2016 wet weather seasons. Analysis of these curves shows that the Plan's channel susceptibility tools appropriately define flow rates that initiate the movement of channel and bank materials (ESA et al., 2016). As shown by monitoring of stream cross sections, no major changes in channel stability were observed to occur within the nine monitored channel sites that were located throughout the San Diego Region. Wet weather data from 2015-2016 indicated that a constructed best management practice (BMP) system worked as designed to prevent hydromodification across a wide range of geomorphically significant conditions. Collectively, this shows that the Plan provides for the protection of the beneficial uses of receiving waters from the effect of hydromodification from new and redevelopment. Based on these findings, the HMP effectiveness assessment monitoring is completed and no additional monitoring is recommended (ESA et al., 2016).

4.1.6 *Total Maximum Daily Load Monitoring*

In February 2010, the San Diego Regional Water Quality Control Board (Regional Board) adopted Resolution No. R9-2010-0001, *A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)* (Bacteria TMDL) (Regional Board, 2010). This TMDL amendment to the Water Quality Control Plan for the San Diego Region (Basin Plan) (Regional Board, 1994) includes one segment within the San Luis Rey River WMA, the Pacific Ocean Shoreline at the San Luis Rey River Mouth. The TMDL was approved by the SWRCB in December 2010; by the Office of Administrative Law on April 4, 2011; and by the United States Environmental Protection Agency (USEPA) on June 22, 2011. The TMDL became effective under state law on April 4, 2011, the date of Office of Administrative Law approval. The responsible Agencies within the WMA that are regulated under the Permit include the Cities of Oceanside and Vista and the County of San Diego. The compliance requirements and monitoring and reporting requirements of the TMDL have been incorporated into Attachment E.6 of the 2013 Permit.

The goal of the Bacteria TMDL is to achieve the pollutant load reductions necessary to restore and protect the designated beneficial use of water contact recreation (REC-1), as it is designated within the Basin Plan. The purpose of the TMDL monitoring program is to assess progress toward achieving compliance with interim and final TMDL water quality based effluent limitations (WQBELs). Wet and dry weather sampling is conducted each year at the compliance point. The data generated is used to address the following questions:

- Are TMDL numeric targets for indicators being met at the compliance monitoring location?
- Are levels of bacteria decreasing at the compliance monitoring location?

Sampling was conducted for the 2015–2016 compliance monitoring year (October 1, 2015 through September 30, 2016) during wet and dry weather at receiving water monitoring site OC-100, located at Oceanside City Beach at the mouth of the San Luis Rey River (Table A4-5, Figure A4-3). This was the third year of monitoring in compliance with Provision 6.d of Attachment E of the Permit. A summary of the monitoring conducted is presented in Table A4-6. Samples were analyzed for the indicator bacteria compliance constituents (total coliform, fecal coliform, and *Enterococcus*) in accordance with the requirements of Attachment E.6 of the Permit.

Table A4-5. 2015-2016 Bacteria TMDL Beach Monitoring Location for the San Luis Rey River WMA

Site ID	Site Name	Site Description	Latitude	Longitude
OC-100	Oceanside City Beach at the mouth of the San Luis Rey River	Pacific Ocean Shoreline	32.20156	-117.39220

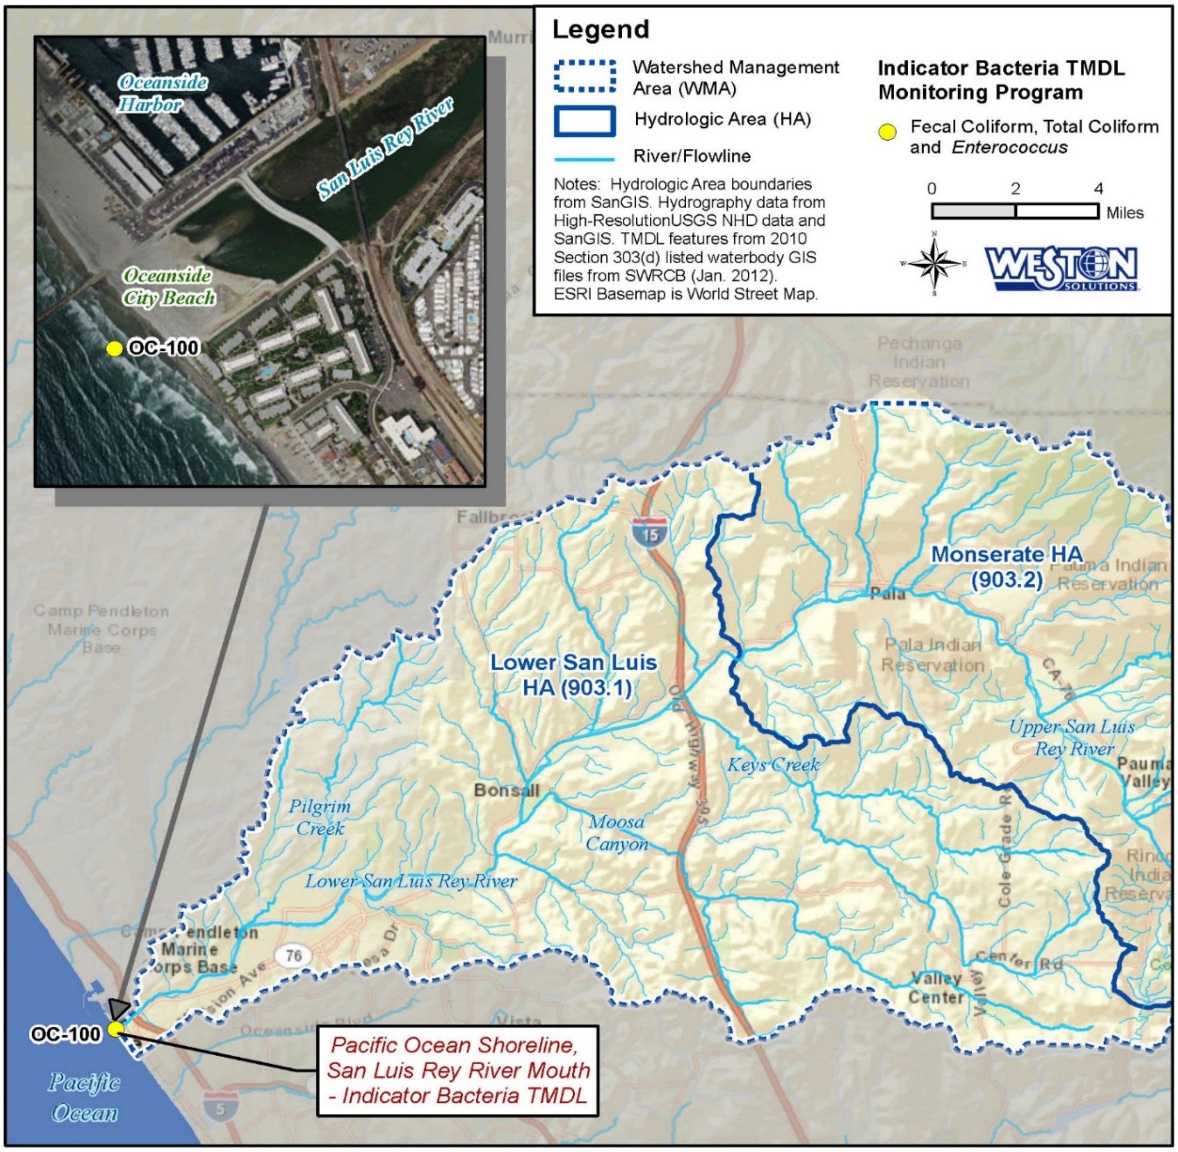

Figure A4-3. Bacteria TMDL Compliance Monitoring Location in the San Luis Rey River WMA

Table A4-6. 2015-2016 Bacteria TMDL Beach Monitoring Summary for the San Luis Rey River WMA

Season	Date Range	Event Type	Event Frequency	Monitoring Location	Samples Per Site Per Event[a]	Total Number of Samples
2015-2016 Wet Season	10/01/2015-04/30/2015	Wet	Three storm events	OC-100	1	3
	10/01/2015-03/30/2016	Dry	Monthly			6
	04/01/2016-04/30/2016	Dry	Weekly[b]			5
2016 Dry Season	05/01/2016-09/30/2016	Dry	Weekly[b]			25

[a] Quality assurance (QA) or replicate samples are not included in the count.
[b] A minimum of 5 samples are collected in a 30-day period.

Table A4-7 presents the exceedance rates for each indicator bacteria at OC-100. Progress toward achieving WQBELs, in terms of interim and final receiving water limitations, are presented in Table A4-8 for each analyzed constituent. Interim WQBELs are not required to be achieved until 2020 for dry weather and 2028 for wet weather, while final WQBELS must be achieved by 2021 for dry weather and 2031 for wet weather. Based on the sampling data from the 2015-2016 monitoring year, receiving water limitations that have been achieved are indicated by (●), whereas goals that have not been achieved are indicated by (X).

In summary, the only exceedances observed at OC-100 were for the wet season single-sample maximum for *Enterococcus*. This outcome was due to a measured concentration of 220 colony-forming units per 100 milliliters (CFU/100 mL) during one monitored wet weather event, resulting in an arithmetic mean of 104.67 CFU/100 mL for the three monitored events, which was applied to all of the unmonitored days with qualifying precipitation (i.e., greater than 0.1 inch within 24 hours). Had the arithmetic mean been lower by just 1 CFU/100 mL, the single-sample wet season exceedance frequency would have been 10% and would have been in compliance with the single-sample wet season allowable exceedance frequency. *Enterococcus* concentrations during the remaining two wet weather events were below the receiving water limitation of 104 most probable number (MPN)/100 mL[1]. All other interim and final WQBELs are currently being met.

Table A4-7. 2015–2016 Bacteria TMDL Monitoring Exceedance Frequency Results

Segment	Monitoring Location	Bacteria TMDL Constituent	2016 Dry Season Geometric Mean (CFU/100mL)	2015-2016 Wet Season Geometric Mean (CFU/100mL)	2015-2016 Wet Season Single-Sample Maximum (CFU/100mL)
Pacific Ocean Shoreline	OC-100	*Enterococcus*	0%	0%	75%
		Fecal Coliform	0%	0%	0%
		Total Coliform	0%	0%	0%

CFU - colony-forming units per 100 milliliters.

Table A4-8. 2015–2016 General Progress Toward Bacteria TMDL Interim and Final WQBELs

Monitoring Location	Bacterial TMDL Constituent	2015-2016 Dry Season Geometric Means		2015-2016 Wet Season Geometric Means		2015-2016 Wet Season Single-Sample Maximum	
		Interim	Final	Interim	Final	Interim	Final
OC-100	*Enterococcus*	●	●	●	●	X	X
	Fecal Coliform	●	●	●	●	●	●
	Total Coliform	●	●	●	●	●	●

● = Numeric targets are met; X= Numeric targets are not yet met.

Additional details are presented in the TMDL report provided as Attachment 4B to this appendix. California Environmental Data Exchange Network (CEDEN) data submittals can be found in Attachment K of this appendix.

[1] The Permit identifies receiving water limitations in MPN/100 mL; the laboratory methods provide results in CFU. CFU and MPN units are comparable.

4.1.7 *Lower San Luis Rey River Goal Monitoring*

To evaluate progress toward achieving goals for the lower San Luis Rey River, receiving water monitoring to measure bacteria concentrations was conducted during the 2015-2016 monitoring year at one in-stream site, SLR25 (Olive Hill). A second in-stream site, Benet Bridge (MLS), was dry and was not sampled for the duration of the monitoring year. Both sites are located along the San Luis Rey River, west of Interstate-15, with SLR25 located upstream of Benet Bridge (Table A4-9, Figure A4-4).

Table A4-9. 2015-2016 Lower San Luis Rey River Bacteria Monitoring Locations

Site ID	Site Name	Jurisdiction	Latitude	Longitude
Benet Bridge* (MLS)	Benet Road Bridge over San Luis Rey River	City of Oceanside	33.22065	-117.35825
SLR25 (Olive Hill)	Camino Del Rey Bridge over San Luis Rey River	County of San Diego	33.28802	-117.22313

*Station was dry throughout the 2015-2016 monitoring year.

The lower San Luis Rey River location SLR25 was sampled monthly during dry weather from February through September 2016, and once within 24 hours after a storm event in February 2016. Samples were analyzed for the indicator bacteria compliance constituents (fecal coliform, *Enterococcus*) in accordance with the Lower San Luis Rey River Bacteria Monitoring Plan (Attachment 4A-7 to the WQIP). Samples were also analyzed for *E. coli*, which is not a constituent of the indicator bacteria TDML and is not listed in the Lower San Luis Rey River Bacteria Monitoring Plan. USEPA's 2012 Recreational Water Quality Criteria recommends using *Enterococcus* and *E. coli* as indicators of fecal contamination for fresh water and *Enterococcus* for marine water (USEPA, 2012). Therefore, collection of *E. coli* data in advance of these anticipated changes provides historical data moving forward under revised recreational water quality standards developed in accordance with the USEPA guidelines. While the *E. coli* results are not presented here, the analytical data can be found in the laboratory reports provided in Attachment 4C to this appendix and will be uploaded to the CEDEN. CEDEN data submittals can be found in Attachment K to this appendix.

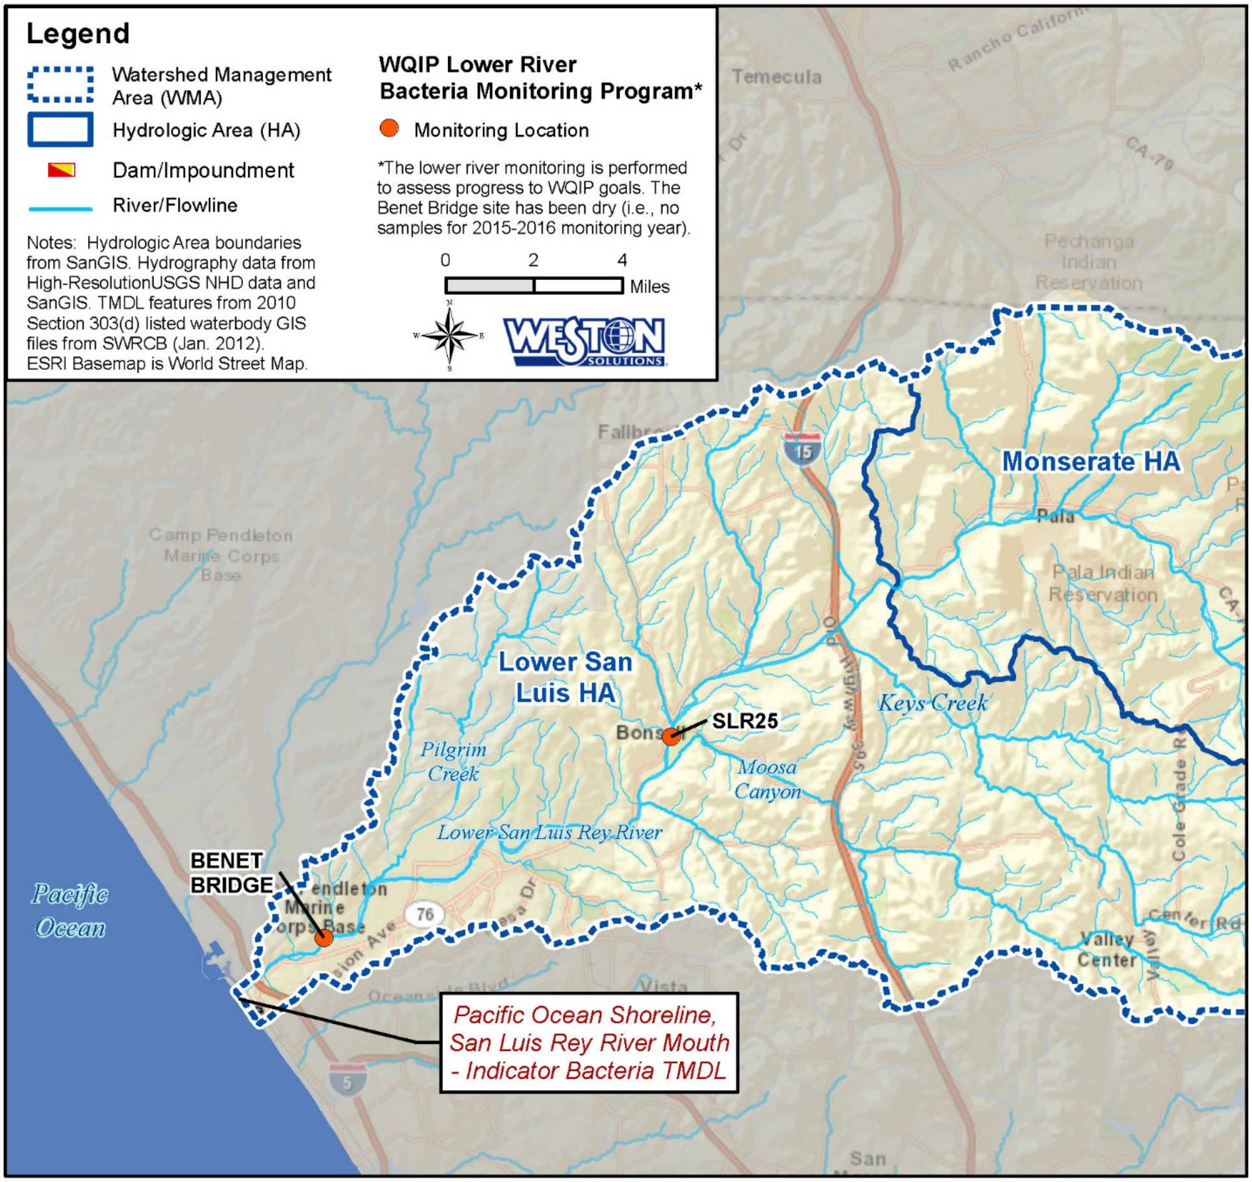

Figure A4-4. Bacteria WQIP Monitoring Locations in the Lower San Luis Rey River WMA

Individual dry and wet weather event data for *Enterococcus* and fecal coliform indicator bacteria are presented in Table A4-10 and Table A4-11, respectively, and exceedance rates are shown in Table A4-12 for results compared to freshwater single sample maximum (SSM) WQOs. *Enterococcus* results from the single wet weather event were above the WQO, whereas the fecal coliform concentration was below the WQO. Exceedance frequencies for the eight monitored dry weather events were 100% for *Enterococcus* and 13% (one event) for fecal coliform. These data will be used to inform progress by the Participating Agencies in achieving the lower San Luis Rey River bacteria goals. Supporting data are provided as Attachment 4C to this appendix.

Table A4-10. 2015-2016 Lower San Luis Rey River Bacteria Dry Weather Monitoring Event Results

Date	*Sample Results (CFU/100 mL)	
	Enterococcus (CFU/100 mL)	Fecal Coliform (CFU/100 mL)

4.2 Storm Drain Outfall Monitoring

As part of the WQIP process, the Participating Agencies in the San Luis Rey River WMA have developed a program to monitor discharges from storm drain outfalls during dry and wet weather that meets the requirements of Provisions D.2.b and D.2.c of the Permit. The purpose of storm drain outfall monitoring is to evaluate the potential impacts from storm drain outfall discharges on the beneficial uses of a receiving waterbody during dry and wet weather conditions. In addition, under dry conditions, the program is used to assess the ability of jurisdictional and watershed programs to effectively eliminate non-stormwater discharges to receiving waters. The data generated are used to identify pollutants in discharges, guide pollutant source identification efforts, and track progress towards achieving numeric goals set forth in the WQIP.

During the 2013-2014 monitoring year, the inventory of major storm drain outfalls discharging directly to a receiving water was developed in accordance with Provision D.2.a.(1) of the Permit, and refinements were made during the 2014-2015 monitoring year. The major storm drain outfalls currently included in the storm drain outfall discharge monitoring station inventory for the WMA are shown in Figure A4-5. Dry weather storm drain outfall monitoring locations are also shown in Figure A4-5. Wet weather storm drain outfall monitoring locations are shown on a separate map with their associated drainage areas in Section 4.2.5.

The number of major outfalls monitored under each element of storm drain outfall monitoring by each Participating Agency in the WMA is provided in Table A4-13. In accordance with Provision D.2.b.(1) of the Permit, Participating Agencies with fewer than 125 major storm drain outfalls in their inventory must conduct field screening at 80% of these major outfalls twice per monitoring year (October 1st through September 30th). The number of major outfalls monitored per year is subject to change based on new information, updates to the storm drain outfall inventories, changes in transient or persistent flow classifications, and/or changes or updates to the priority water quality conditions over the life of the WQIP.

Table A4-13. Number of Major Storm Drain Outfalls Monitored per Participating Agency

Participating Agency	Number of Storm Drain Outfalls Monitored Per Year		
	Field Screening (Provision D.2.b(1))	Dry Weather Monitoring (Provision D.2.b(2))	Wet Weather Monitoring (Provision D.2.c)
County of San Diego	21	5*	2
City of Oceanside	36	5*	2
City of Vista	4	2	1

*Three outfalls in the City of Oceanside and one County outfall were dry or ponded with insufficient water for sampling during monitoring visits; therefore, analytical samples were not collected at four outfalls that had been identified for persistent flow storm drain outfall discharge monitoring.

Program descriptions, monitoring results, and assessments conducted during the 2015-2016 monitoring year under the Storm Drain Outfall Monitoring Program are presented in the following subsections. Methodology is described in greater detail in the WQIP Monitoring and Assessment Plan (MAP).

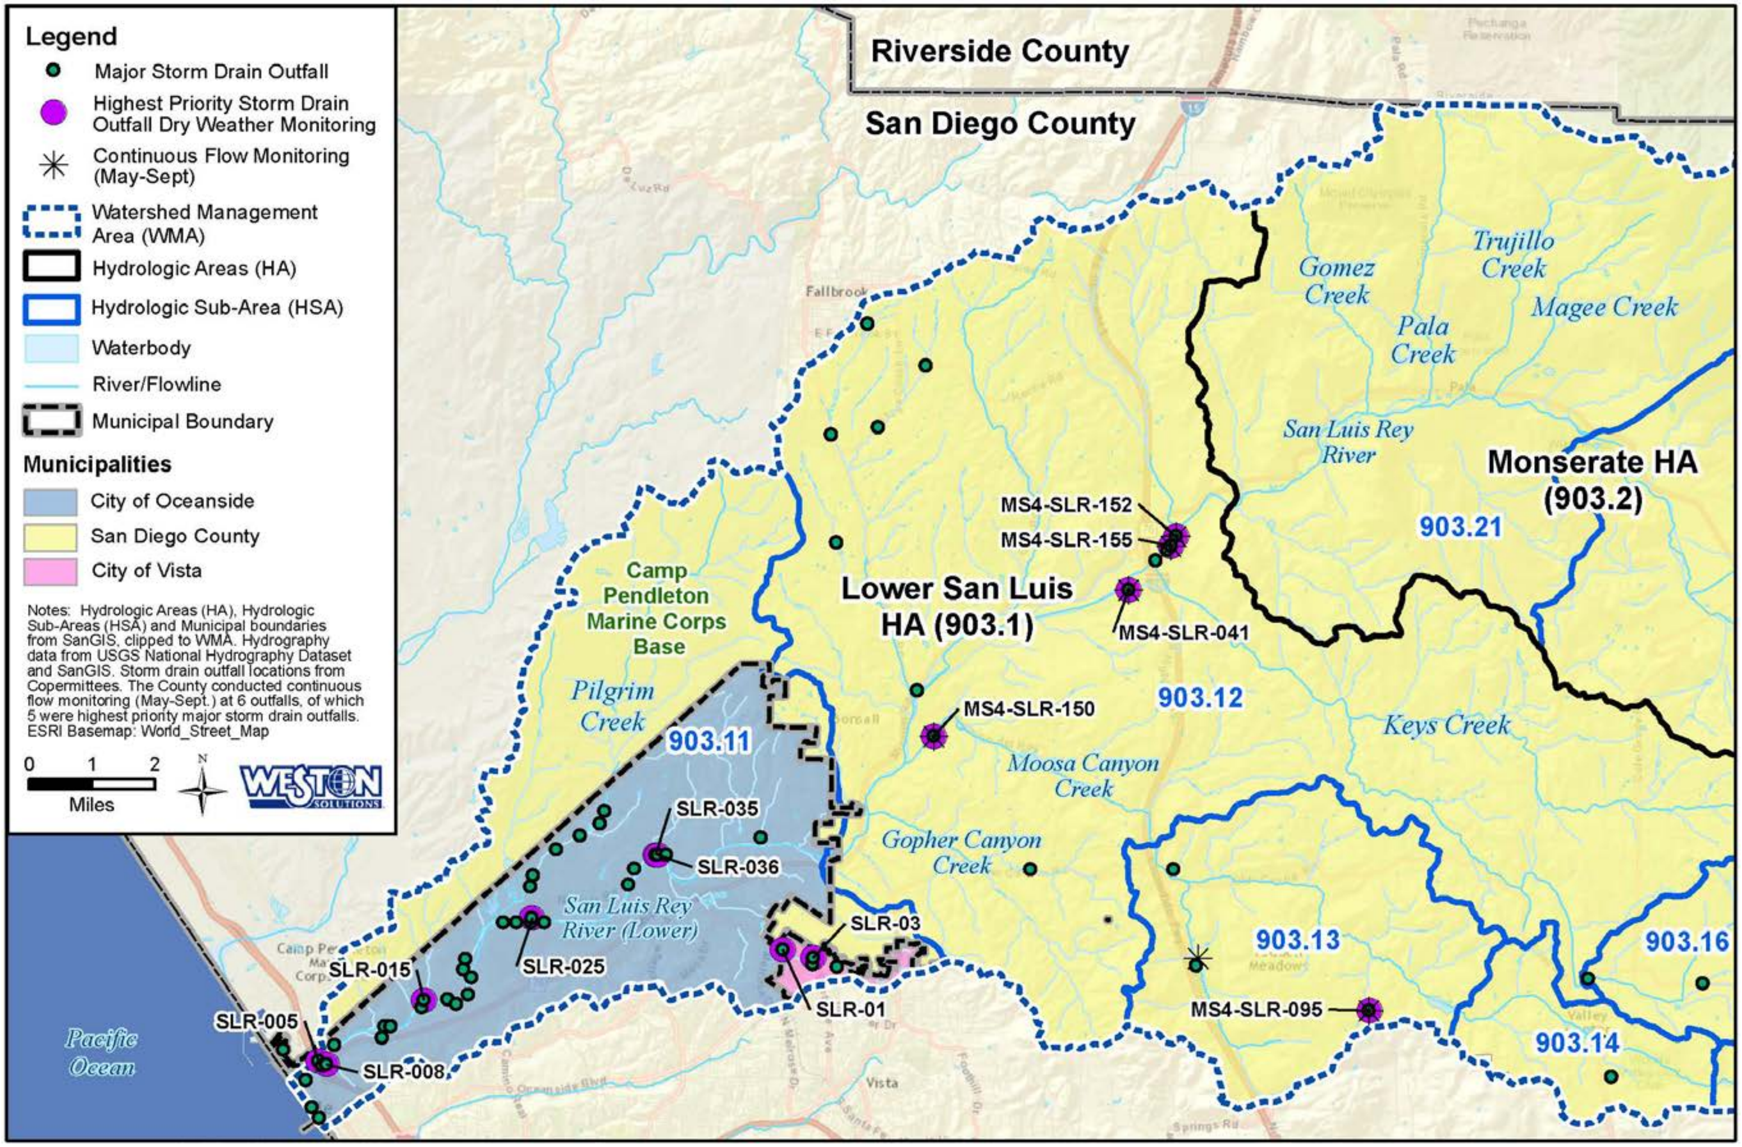

Figure A4-5. Major Storm Drain Outfall Inventory and Dry Weather Analytical Monitoring Station Locations in the San Luis Rey River WMA

4.2.1 *Dry Weather Field Screening and Outfall Prioritization*

Field screening is visual monitoring of major storm drain outfalls as outlined in Table D-5 of the Permit. Field screening is conducted to identify non-stormwater and illicit discharges, determine which discharges are transient and which are persistent, and prioritize those discharges that will be investigated and eliminated. This program is designed to assess the effectiveness of jurisdictional programs to effectively prohibit non-stormwater discharges. Each Participating Agency performs field screening of a certain number of outfalls on an annual basis to maintain an up-to-date inventory of persistently flowing outfalls and to initiate follow-up investigations that identify and mitigate the source(s). The data collected during field screening are one of the sources of information for the Participating Agencies' Illicit Discharge Detection and Elimination (IDDE) Programs (see Section 4.2.4).

The required frequency of field screening varies from once to twice per year depending on the number of major outfalls within the jurisdiction, in accordance with Provision D.2.a.(2)(a) of the Permit. The number of storm drain outfall stations included in dry weather field screening and the total number of visual observations conducted by each Participating Agency during the 2015-2016 monitoring year are shown in Table A4-14. Some source investigations were performed during routine visits and are included in the routine visits column, while others were conducted as separate follow-up visits and are included in the source investigations column.

Table A4-14. Number of Visual Observations Conducted During the 2015-2016 Monitoring Year

Participating Agency	Number of Major Storm Drain Outfall Stations Visited	Number of Routine Visits[1]	Number of Separate Source Investigations	Number of Additional Visits for Other Programs[2]
County of San Diego	21	48	41[3] (6 outfalls)	70 visits (16 stations)
Oceanside	36	72	NA[4]	NA
Vista	4	8	NA[4]	NA

[1] Includes persistent flow monitoring events.

[2] Includes flow data but may not include all visual observations typically conducted during a routine field screening visit.

[3] Six source investigations were associated with SLR-045, a storm drain outfall of less than 36 inches in diameter with persistent non-storm water flow.

[4] Source investigations were performed during persistent flow monitoring events.

Participating Agencies recorded numerous visual observations regarding outfall and flow characteristics including flow conditions (flowing, ponded, dry, or tidal), whether or not the flow reached the receiving water, whether or not there was a non-storm water flow source, potential non-storm water sources, whether the flow source was eliminated, evidence of obvious illicit connections or illicit discharges (IC/IDs), whether trash was present and relative amount, and whether there was evidence of illegal dumping. The complete set of visual observations recorded during dry weather field screening visits are provided in Attachment 4D to this appendix, and CEDEN data submittals can be found in Attachment K. The field screening trash assessment results for the San Luis Rey River WMA are summarized in Table A4-15. There was no trash or a low presence of trash during the majority (83%) of the trash assessments at visited outfalls.

Table A4-15. Dry Weather Field Screening Trash Assessments for the San Luis Rey River WMA

Participating Agency	HSA	No Trash Present	Trash Present		
			Low (<50 pieces)	Medium (50 to 400 pieces)	High (>400 pieces)
County of San Diego	903.12	4	26	2	0
	903.13	2	5	0	0
	903.14	0	6	0	0
	903.16	0	4	0	0
SUB-TOTAL		**6**	**41**	**2**	**0**
City of Oceanside	903.11	9	43	19	1
SUB-TOTAL		**9**	**43**	**19**	**1**
City of Vista	903.11	7	1	0	0
SUB-TOTAL		**7**	**1**	**0**	**0**
GRAND TOTAL		**22**	**85**	**21**	**1**

A summary of the flow conditions (i.e., flowing, ponded, dry, or tidal) at the outfall stations during the 2015-2016 field visits is shown in Figure A4-6, where the stacked bars represent the number of observations in each flow category by jurisdiction. The observations included in this figure are routine visits and follow-up source identification visits to the outfall, but do not include additional visits for other programs. Given that some outfalls were visited more than once, the number of observations is greater than the number of actual storm drain outfalls monitored.

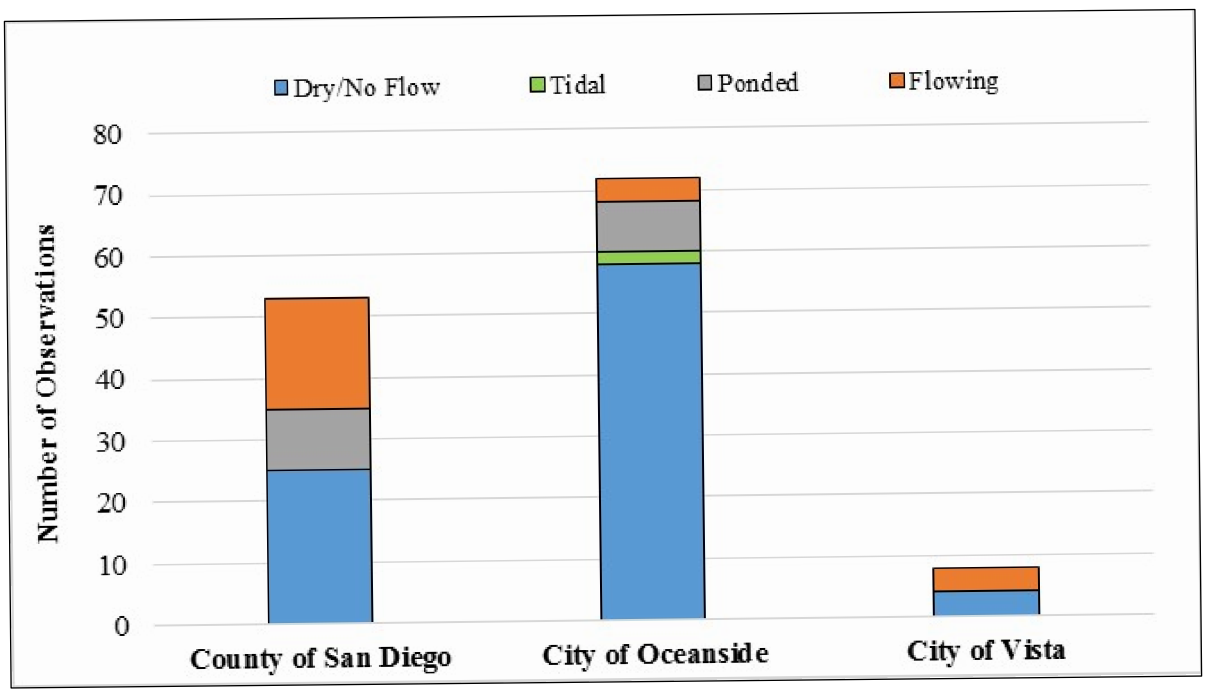

Figure A4-6. Dry Weather Field Screening Flow Observations at Storm Drain Outfall Stations by Participating Agency

During dry weather field screening, Participating Agencies estimated flow at stations where flow was present, as required by Table D-5. Eighty-one % of observations made by the City of Oceanside, 50% made by the City of Vista, and 47% made by the County of San Diego indicated dry conditions. A compilation of flow estimations (n=26) recorded by the Participating Agencies, in gallons per minute (gpm), is presented in Figure A4-7. More than half of the flow rates were low, with 14 of 26 estimations categorized as less than five gpm. The observations included in this figure include routine visits and follow-up source identification visits to the outfalls, but do not include additional visits for other programs.

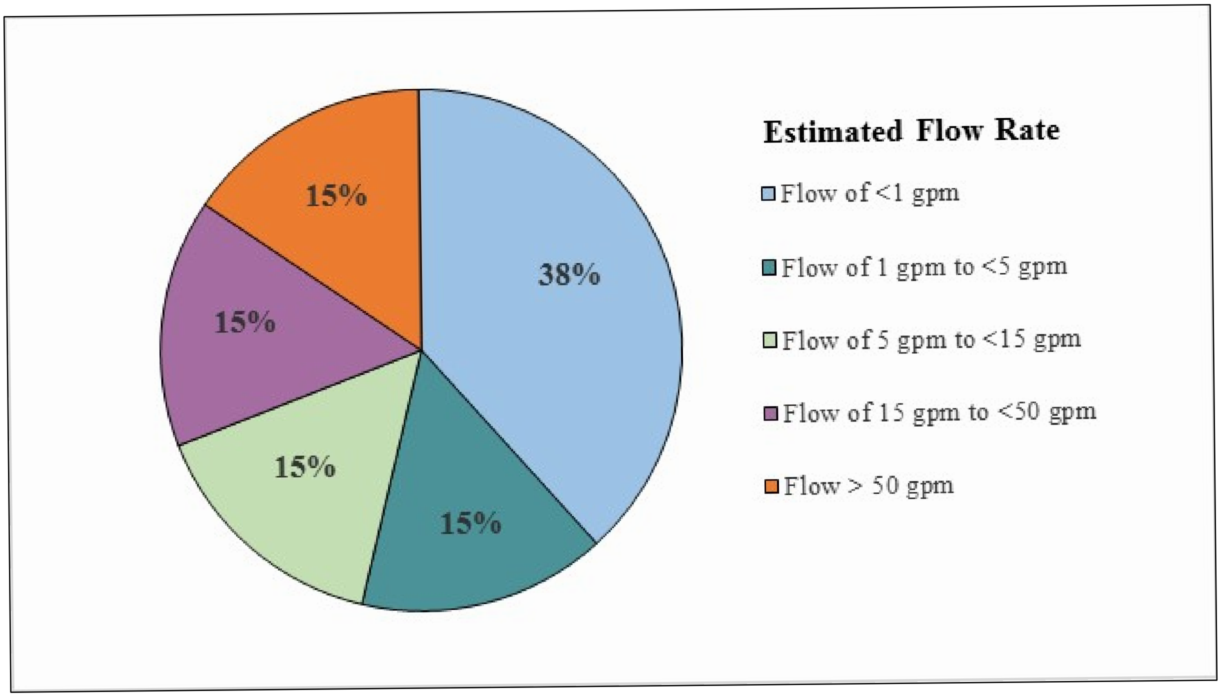

Figure A4-7. Outfall Flow Rate Estimations

Where an illicit discharge is observed during outfall screening, investigations are performed in an effort to locate the source and eliminate the discharge. In cases where flow sources are known due to historical data, this is listed on the field sheet and the upstream area is briefly checked for additional sources. In cases where discharges are observed, but no obvious illicit discharge was identified as the source, appropriate documentation is recorded, and the locations are prioritized with others for follow-up.

Based on these field screening visits and available historical data, the Participating Agencies determined the flow status of each major storm drain outfall as persistent, transient, or dry. As defined in the Permit, flow status for a given outfall is "dry" if no flowing or standing water is observed at the outfall over three most recent visits, and "persistent" flow is defined as presence of flowing or standing water upon three most recent visits. Otherwise, the outfall status is classified as "transient." The numbers of storm drain outfalls in each category are shown by Participating Agency and HSA in Table A4-16, and the flow determinations are shown with the locations of the storm drain outfalls in Figure A4-8. Overall, since the prior monitoring year (WESTON, 2016a), the number of dry/no flow outfalls has increased by four, the number of transient outfalls have decreased by six, and the number of persistent outfalls has increased by four. The two outfalls previously classified as undetermined are now known to be persistent, and have become highest priority outfalls for 2016-2017 non-stormwater persistent flow monitoring.

Table A4-16. 2015-2016 Dry Weather Storm Drain Outfall Flow Determinations for the San Luis Rey River WMA

Participating Agency	HSA	Persistent	Transient	Dry/No Flow	Grand Total
County of San Diego	903.12	5	4	4	13

GRAND TOTAL		**12**	**12**	**37**	**61**

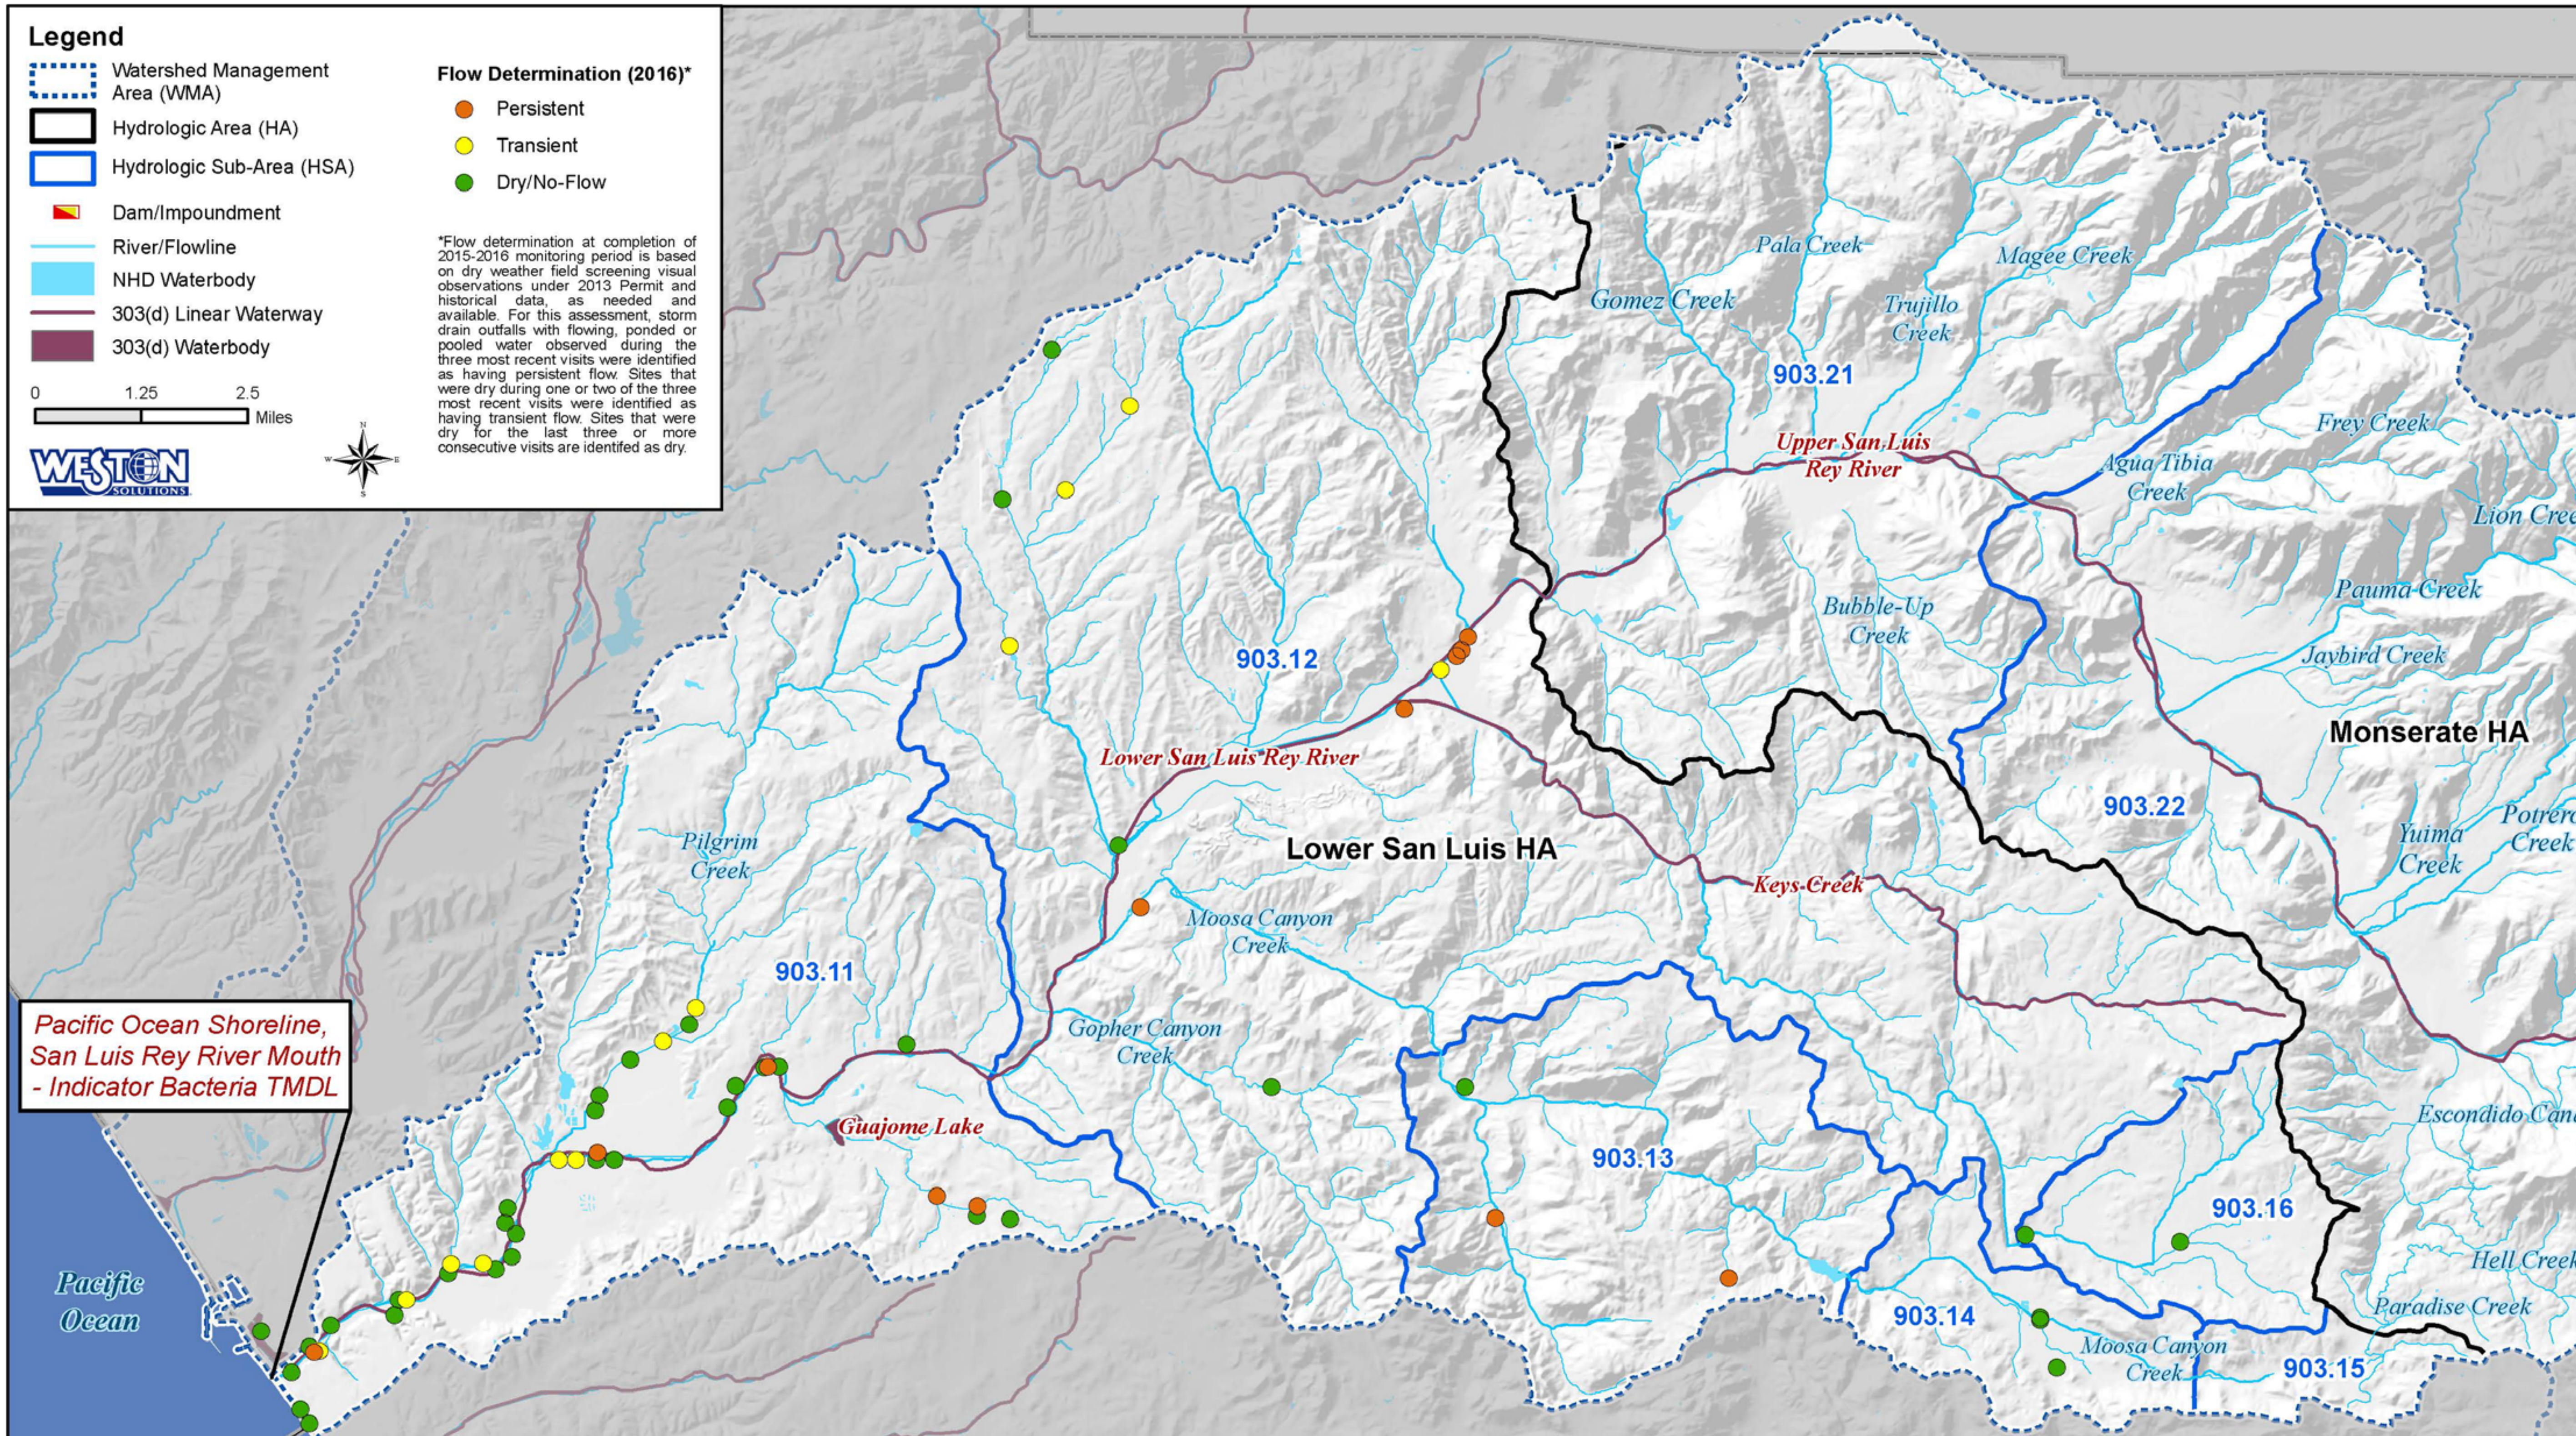

Figure A4-8. 2015-2016 Dry Weather Field Screening Locations with Flow Determinations for the San Luis Rey River WMA

The list of prioritized outfalls based on field screening results is maintained and updated as program implementation develops and monitoring occurs. Prioritization is based on non-stormwater flow status and the potential threat to receiving water quality. These prioritized outfalls were originally outlined in the San Luis Rey River Watershed Storm Drain Outfall Monitoring Plan (Storm Drain Outfall Monitoring Plan), Attachment 4A-5 to the WQIP. The City of Oceanside listed five highest priority outfalls in the Storm Drain Monitoring Plan, two of which were not named. During the 2015-2016 monitoring year, the City of Oceanside added a sixth outfall (SLR-025) due to dry conditions at the several of the initial five highest priority outfalls.

The highest priority outfalls for each jurisdiction during 2015-2016 are summarized in Table A4-17. Section 4.2.3.2 provides changes to the stations planned for 2016-2017 persistent flow monitoring.

Table A4-17. Highest Priority Outfalls during the 2015-2016 Monitoring Year

Participating Agency	HSA	Station	Latitude (NAD83)	Longitude (NAD83)	Dates Sampled	
County of San Diego	903.12	MS4-SLR-041	33.31787	-117.16385	Not Sampled*	
		MS4-SLR-150	33.2837	-117.21707	1/19/2016	6/14/2016
		MS4-SLR-152	33.33031	-117.15101	12/8/2015	6/14/2016
		MS4-SLR-155	33.32802	-117.15234	12/8/2015	6/14/2016
	903.13	MS4-SLR-095	33.22145	-117.09704	1/19/2016	6/14/2016
City of Oceanside	903.11	SLR-005	33.20741	-117.38491	Dry	Dry
		SLR-008	33.20678	-117.38284	Dry	Dry
		SLR-015	33.22183	-117.3563	3 visits - dry or ponded	
		SLR-025	33.24105	-117.32679	2/16/2016	8/29/2016
		SLR-035	33.25572	-117.29312	Dry	Dry
		SLR-036	33.25582	-117.29243	2/16/2016	8/2/2016
City of Vista	903.11	SLR-01	33.23424	-117.25785	8/4/2016	8/16/2016
		SLR-03	33.23253	-117.24958	8/24/2016	9/19/2016

*MS4-SLR-041 was not sampled because it was dry on the first visit and not enough ponded water was available to sample on the second visit. As flowing or ponded water was found at MS4-SLR-041 during additional visits (resulting in persistent flow determination), the outfall will remain a highest priority outfall for the County of San Diego for the 2016-2017 monitoring year. MS4-SLR-156 was substituted for sampling on 01/19/2016 but is not a high priority persistent flow site. These additional sample data can be found in Attachment 4K to this appendix and will be uploaded to CEDEN.

Based on the additional visual observations from 2015-2016 field screening monitoring, the updated status of the 2015-2016 highest priority outfalls are shown in Table A4-18.

Table A4-18. Highest Priority Dry Weather Storm Drain Outfall Station Status after 2015-2016 Monitoring Year

Participating Agency	Station ID	2015-2016 Priority (Y/N)	2015-2016 Results
County of San Diego	MS4-SLR-041	Yes	Persistent
County of San Diego	MS4-SLR-095	Yes	Persistent
County of San Diego	MS4-SLR-150	Yes	Persistent
County of San Diego	MS4-SLR-152	Yes	Persistent
County of San Diego	MS4-SLR-155	Yes	Persistent
City of Oceanside	SLR-005	Yes	Dry/No-Flow
City of Oceanside	SLR-008	Yes	Transient
City of Oceanside	SLR-015	Yes	Transient
City of Oceanside	SLR-025	Yes	Persistent
City of Oceanside	SLR-035	Yes	Dry/No-Flow
City of Oceanside	SLR-036	Yes	Persistent
City of Vista	SLR-01	Yes	Persistent
City of Vista	SLR-03	Yes	Persistent

4.2.2 *Highest Priority Storm Drain Outfall Dry Weather Monitoring*

The purpose of highest priority storm drain outfall dry weather monitoring is to evaluate the potential contribution from storm drain outfall discharges on receiving water quality during dry weather conditions and to assess the ability of programs to effectively eliminate non-stormwater discharges to waterbodies or waterways.

The 2015-2016 monitoring year was the first year of dry weather storm drain outfall analytical sampling under the WQIP MAP. Dry weather storm drain outfall monitoring was conducted at the highest priority outfalls identified for each jurisdiction in the WMA (Table A4-17, Figure A4-5). Sampling was conducted between December 8, 2015 and September 19, 2016, and two sampling events were conducted at each outfall with flowing water or sufficient standing water. Three of the outfalls under the jurisdiction of the City of Oceanside were dry during both visits, and one was dry or ponded during three visits. These outfalls were not sampled. In addition, one of the outfalls under the jurisdiction of the County of San Diego was dry during the first persistent flow monitoring visit and did not have enough ponded water to sample during the subsequent monitoring visit. This outfall was also not sampled. Sampling was conducted in accordance with the procedures described in the WQIP MAP. In-situ measurements were made for pH, temperature, conductivity, dissolved oxygen, and turbidity. Grab samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, TMDLs, stormwater action levels (NALs), and those listed in Table D-7 of the Permit. Grab samples were also collected from receiving waters to which the sampled outfalls were discharging and analyzed for total hardness, a measurement needed to compare concentrations of metals to NALs that are hardness-dependent (see footnote *a* in Table A4-19). Visual observations were also recorded.

Analytical results for samples collected during dry weather at the highest priority outfalls are summarized by Participating Agency in Table A4-19 through Table A4-21. Results are compared to NALs, where available. In accordance with Table C-4 of the Permit, indicator bacteria concentrations are compared to instantaneous maximum value (IM) NALs, and the remaining constituent concentrations, including general and physical chemical constituents, nutrients, and total and dissolved metals, are compared to maximum daily action level (MDAL) NALs, where available. Results are presented below by Participating Agency. Laboratory and field data collected for the Highest Priority Storm Drain Outfall Dry Weather Monitoring will be uploaded to CEDEN and data submittals are provided in Attachment K of this appendix.

4.2.2.1 County of San Diego

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform (i.e., the HPWQC in the WMA) indicated that the highest concentrations were measured at MS4-SLR-150 in the Bonsall HSA (903.12) for all three indicator bacteria. *Enterococcus* concentrations were above the IM in all samples except one each from MS4-SLR-095 in the Moosa HSA (903.13) and MS4-SLR-150. Fecal coliform concentrations were above the IM in both samples from MS4-SLR-150 and one sample from MS4-SLR-152, also located in the Bonsall HSA (903.12) (Table A4-19).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL except total nitrogen in one of two samples from MS4-SLR-095 and total phosphorus in one of two samples form MS4-SLR-152.

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- MS4-SLR-095: dissolved oxygen (one sample) (below the MDAL indicates impairment), turbidity (one sample), total iron, total manganese, dissolved manganese.
- MS4-SLR-150: dissolved oxygen (one sample) (below the MDAL indicates impairment), turbidity (one sample), total iron (one sample), total manganese (one sample), dissolved manganese (one sample).
- MS4-SLR-152: total iron (one sample).
- MS4-SLR-155: total manganese (one sample).

The remaining constituents were below applicable MDALs, where available.

4.2.2.2 City of Oceanside

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that the highest concentrations were measured at SLR-036 for *Enterococcus* and at SLR-025 for fecal coliform. Both outfalls are located in the Mission HSA (903.11). Concentrations were above the *Enterococcus* IM in all samples and were above the fecal coliform IM in all samples except one from outfall SLR-036 (Table A4-20).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus, and each of these PWQC concentrations was measured above the MDAL except total phosphorus in one of two samples form SLR-036, which was measured at the MDAL.

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- SLR-025: total manganese (one sample).
- SLR-036: total manganese, dissolved copper (one sample), dissolved manganese (one sample).

The remaining constituents were below applicable MDALs, where available.

4.2.2.3 City of Vista

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform indicated that all concentrations measured at SLR-01 were below IMs and all concentrations measured at SLR-03 were above IMs (Table A4-21). Both outfalls are located in the Mission HSA (903.11).

The only existing MDALs that relate to PWQC in the WMA are for total nitrogen and total phosphorus. At SLR-01, total phosphorus was above the MDAL in one sample. At SLR-03, all samples were above the MDALs for total nitrogen and total phosphorus.

Other constituents in exceedance of MDALs are listed below. Unless noted, exceedances occurred in both samples collected at the outfall.

- SLR-01: total iron, total manganese, dissolved manganese.
- SLR-03: turbidity (one sample), total iron, total manganese, dissolved manganese.

The remaining constituents were below applicable MDALs, where available.

< - Results are less than the reporting limit.

NA - Not analyzed.

J - Results are greater than the method detection limit but below the reporting limit. Reported result is estimated.

(a) Water Quality Benchmark for dissolved metal fractions is based on total hardness and is calculated as described by 40 CFR Part 131.38 (May 18, 2000). The CCC was applied to dry weather results with the exception of Silver for which the CMC was applied as there is no CCC.

(b) If calculated CCC values exceeded the Maximum Contaminant Levels (MCLs) as given in the basin plan, concentrations were compared to the MCLs. No MCLs were exceeded for these constituents.

(c) Instantaneous Maximum for storm drain outfall discharges to inland surface waters with Rec-1 beneficial use (Table C-4 of 2013 Permit).

- Reporting limit greater than Instantaneous Maximum benchmarks.

Bolded/shaded results greater than Maximum Daily Action Level or the Instantaneous Maximum for the Fecal Indicator Bacteria.

J - Results are greater than the method detection limit but below the reporting limit. Reported result is estimated.

(a) Water Quality Benchmark for dissolved metal fractions is based on total hardness and is calculated as described by 40 CFR Part 131.38 (May 18, 2000). The CCC was applied to dry weather results with the exception of Silver for which the CMC was applied as there is no CCC.

(b) If calculated CCC values exceeded the Maximum Contaminant Levels (MCLs) as given in the basin plan, concentrations were compared to the MCLs. No MCLs were exceeded for these constituents.

(c) Instantaneous Maximum for storm drain outfall discharges to inland surface waters with Rec-1 beneficial use (Table C-4 of 2013 Permit).

Bolded/shaded results greater than Maximum Daily Action Level or the Instantaneous Maximum for the Fecal Indicator Bacteria.

4.2.3 *Storm Drain Outfall Dry Weather Monitoring Data Assessments*

Provision D.4.b.(1).(c)(i-vi) of the Permit requires the storm drain dry weather outfall monitoring data assessments summarized in Table A4-22. The information necessary to demonstrate compliance with each Provision is outlined in the following discussion. In instances where compliance has been demonstrated in previous sections of this Annual Report, those sections are referenced.

Table A4-22. Storm Drain Outfall Dry Weather Monitoring Data Assessments

Assessment	Components	Provision(s)
WQIP Annual Report		
Identify known and suspected controllable sources.	Identify known and suspected controllable sources (e.g., facilities, areas, land uses, pollutant generating activities) of transient and persistent flows.	D.4.b.(1)(b)(i)
Identify sources that have been reduced or eliminated.	Identify sources of transient and persistent flows that have been reduced or eliminated.	D.4.b.(1)(b)(ii)
Identify necessary modifications to monitoring locations and frequencies.	Identify necessary modifications to monitoring locations and frequencies necessary to identify and eliminate sources of persistent flows.	D.4.b.(1)(b)(iii)
Rank and prioritize non-stormwater discharges.	Rank persistently flowing outfalls according to potential threat to receiving water quality.	D.4.c.(1)(c)(ii)
	Produce/update prioritized list of outfalls.	
Identify sources contributing to NAL exceedances.	Identify known and suspected sources that may cause or contribute to exceedances.	D.4.b.(1)(c)(iii)
Estimate volumes and loads of non-stormwater discharges.	Analyze data collected as part of the Permit-required dry weather outfall monitoring. Use a model or other method to calculate and estimate collective persistent non-stormwater discharge volumes and pollutant loads. Specific calculations/estimates include: 1) Annual non-stormwater volumes and loads discharged from the Copermittee's major storm drain outfalls to receiving waters within its jurisdiction, with an estimate of the percent contribution from each known source for each storm drain outfall. 2) Annual identification and quantification (by volume and pollutant load) of sources of discharged non-stormwater not subject to the Copermittee's legal authority.	D.4.b.(1)(c)(iv)
Identify data gaps.	Identify data gaps in the monitoring data necessary to fulfill assessment requirements.	D.4.b.(1)(c)(vi)

Table A4-22. Storm Drain Outfall Dry Weather Monitoring Data Assessments

Assessment	Components	Provision(s)
Once during Permit Term		
Evaluate progress in achieving non-stormwater volume and load reductions.	Identify reductions and progress in achieving reductions.	D.4.c.(1)(c)(v)
	Assess the effectiveness of WQIP improvement strategies, with estimates of volume and load reductions attributed to specific strategies when possible.	
	Identify modifications necessary to increase the effectiveness of WQIP strategies.	

4.2.3.1 Provision D.4.b.(1)(b)

The dry weather storm drain outfall discharge field screening monitoring assessments that were first required by Provision D.4.b.(1)(b)(i-iii) during the transitional monitoring period (2013-2014 and 2014-2015 monitoring years) are required to be continued by Provision D.4.b.(1)(c)(i). The assessments related to (i) and (ii) are described in Section 4.2.4 below. To comply with (iii), the data collected under the dry weather storm drain outfall discharge field screening monitoring program (Sections 4.2.1 and 4.2.2) were assessed, and no modifications to field screening monitoring locations or frequencies are planned for 2016-2017 in the San Luis Rey River WMA.

4.2.3.2 Provision D.4.b.(1)(c)(ii)

In addition to continuing the assessments required by Provision D.4.b.(1)(b)(i-iii), the 2015-2016 monitoring year is the first requiring analytical monitoring of dry weather storm drain outfall discharge samples, and the first requiring the assessments of Provision D.4.b.(1)(c)(ii-v).

Provision D.4.b.(1)(c)(ii) requires the prioritization of major storm drain outfalls within each Copermittee's jurisdiction based on the dry weather storm drain outfall monitoring data. These data were presented in Section 4.2.1, and the analytical data collected at the highest priority outfalls for each jurisdiction during 2015-2016 are presented in Table A4-19 through Table A4-21 in Section 4.2.2. Based on the 2015-2016 monitoring results, the City of Oceanside is updating its outfall prioritization due to changes in outfall flow determinations. SLR-005 and SLR-035, which were dry for three consecutive visits, will be replaced on the list of five highest priority outfalls. SLR-007 will be added to the highest priority outfall list, and SLR-025 which was added during 2015-2016 will serve as the other replacement in the top five for 2016-2017. No re-prioritizations are planned for 2016-2017 by the City of Vista or County of San Diego in the San Luis Rey River WMA. Although the flow determination changed for two outfalls from persistent to transient, these high priority outfalls selected for analytical monitoring in 2015-2016 will continue to be monitored until one of the conditions of Provision D.2.b.(2)(b)(ii) have been met (i.e., three consecutive dry visits, no exceedance of NALs, or identified as a discharge authorized under a separate National Pollutant Discharge Elimination System [NPDES] permit). When an outfall fulfills one of these criteria or the threat to water quality has been reduced (per Provision D.2.b.(2)(b)(iii)), it will be replaced with the next highest priority outfall on the Copermittee's list for the WMA. Monitored outfalls with updated flow determinations are shown in Table A4-18.

4.2.3.3 Provision D.4.b.(1)(c)(iii)

This Provision requires further investigation into sources at the highest priority outfalls with persistent flows exceeding NALs. The highest priority outfalls are listed for each jurisdiction in Table A4-17, and the analytical results collected at these outfalls are presented in Table A4-19 through Table A4-21.

These highest priority outfalls were a specific focus for IDDE investigations during the 2015-2016 monitoring year. The results from these investigations are presented in Section 4.2.4.2. The majority of the sources were recorded as "suspected", while three were identified as "known". The most common suspected source of non-stormwater flows was runoff from over-irrigation, which has been acknowledged as a source associated with several types of pollutants including nutrients, bacteria, pesticides, and sediment (Regional Board, 2013). The 2015-2016 highest priority storm drain outfall dry weather monitoring results showed exceedances of NALs for the HPWQC and PWQCs *Enterococcus*, fecal coliform, total nitrogen, and total phosphorus. Agricultural runoff was also suspected at two County outfalls with total nitrogen and total phosphorus exceedances. Concentrations of iron and manganese were also above NALs at some outfalls, and groundwater seepage in addition to over-irrigation were suspected as sources of flows at many of the outfalls. Groundwater can be a natural source of these minerals, and over-irrigation can contribute to rising groundwater and groundwater seepage. In cases where groundwater is a suspected source of non-stormwater flow, it is generally not possible to use standard field screening techniques to discern naturally occurring groundwater from other infiltrated water sources. This type of source investigation would require significant time, resources, and effort, and may not result in conclusive delineation of non-stormwater runoff sources. There was one NAL exceedance for dissolved copper at a monitored outfall in the watershed. Non-stormwater flow source at this outfall has been traced to a detention basin outlet on multiple occasions. Groundwater spring influence was discovered during the 2015-2016 monitoring year, which may contribute a substantial portion of the continuing discharge observed. Details regarding source investigations are provided in Section 4.2.4.2, including the sources identified in Table A4-30 through Table A4-32.

4.2.3.4 Provision D.4.b.(1)(c)(iv)

Persistent non-stormwater flow was identified by each of the Participating Agencies in the San Luis Rey River WMA. Since persistent flow was observed, the Participating Agencies are required to calculate or estimate the non-stormwater volumes and pollutant loads collectively discharged from these persistently flowing outfalls to receiving waters, and estimate percent contributions from each known source for each outfall. The Participating Agencies are also required to identify and quantify (i.e., volume and pollutant loads) sources of non-stormwater discharge not subject to the Participating Agency's legal authority that are discharged from the major storm drain outfalls, with persistent flow, to downstream receiving waters. Assessment methodology and results are summarized below and are described in greater detail in Attachment 4E. Suspected sources were included in this assessment.

4.2.3.4.1 Discharge Volumes from Persistently Flowing Major Storm Drain Outfalls

For each major storm drain outfall with persistent flow during the 2015-2016 monitoring year, the non-stormwater discharge was modeled by multiplying the total number of dry weather days for the month by a unique instantaneous flow rate for the outfall for that month. The number of dry weather days (i.e., less than 72 hours since rain event of 0.1 inches or more) for each calendar month was determined using rainfall data from the County of San Diego Alert Station 67-Oceanside. For months with field visits, the instantaneous flow measurement recorded for that visit was applied to the month, and if there were multiple field visits within a given month these were averaged and applied to the month (averages included instantaneous flow measurements and zero flow for dry/tidal/ponded conditions). For months where no outfall-specific data were available, the average of all instantaneous flow measurements for the outfall was applied to that month. The annual non-stormwater discharge for each major storm drain outfall represents the sum of cumulative monthly flows. These non-stormwater discharge volumes should be considered rough estimates that are based on limited field observations and measurements. When feasible, instantaneous flow measurements are based on the area-velocity method, which applies measured flow depth, width, and velocity. Velocity is often measured using a float. Although multiple velocity measurements may be collected to overcome inherent variability and a roughness factor may be applied to address friction, the float method represents a rough estimation tool for velocity. Where site conditions limit accurate collection of area-velocity field measurements, non-stormwater discharge may be estimated either using a volumetric flow rate method (e.g., filling a container of known volume in a measured interval of time), or best professional judgement based on field observations.

The County of San Diego collected continuous flow monitoring data at five major storm drain outfalls, and for these outfalls, the continuous flow data were used rather than the instantaneous flow measurements provided by field visits. The continuous flow datasets were adjusted to exclude wet weather days and the subsequent 72-hour wet periods and then were used to calculate the cumulative monthly discharge for the period when flow was monitored. For months with no continuous flow data, but available visual observation flow data, the monthly discharge was calculated using the approach described above. For months with no outfall-specific flow data, an average of the daily discharge values using the continuous flow dataset was applied to the days of that month.

Table A4-23 presents the estimated annual non-stormwater volume and the average annual discharge calculated for major storm drain outfalls with persistent non-stormwater flows, by Participating Agency.

Table A4-23. 2015-2016 Non-stormwater Flow Estimates for Major Storm Drain Outfalls with Persistent Flow

Participating Agency	No. Persistently Flowing Major Storm Drain Outfalls	Annual Non-Storm Water Discharge (cf)	Annual Average Discharge by Outfall (cf/outfall)
County of San Diego	7	5,945,734	849,391
City of Oceanside	3	322,363	107,454
City of Vista	2	65,122 to 100,061	32,561 to 50,031*

cf – cubic feet

*Range based on SLR-03 discharge for August-September 2016 (56 dry days) since IC/ID discovery, and continuous discharge for the year (298 dry days) to represent the most conservative result, given that the start date of the leak is unknown. Repair work is scheduled. Follow-up assessment is ongoing.

4.2.3.4.2 Pollutant Loads for Persistent Flow Outfalls

Pollutant loads were calculated based on whether analytical monitoring data were available for a major storm drain outfall. Loads were calculated as follows:

- Major Storm Drain Outfalls with Parameter-Specific Monitoring Data (High Priority Outfalls): The annual load represents the product of the outfall-specific annual discharge volume and the mean of the measured pollutant concentrations for the major storm drain outfall if two samples were collected.

- Other Persistent Flow Outfalls: Where site-specific monitoring data were not available for a persistently flowing outfall, the pollutant load was calculated by taking the product of the outfall-specific annual discharge volume and the mean pollutant concentration from all the dry weather monitoring events for the jurisdiction for the parameter.

For each persistently flowing outfall, estimates of annual non-stormwater pollutant loads are provided for each monitored constituent. Table A4-24 provides the pollutant load estimates for the County of San Diego outfalls; City of Oceanside outfalls are presented in Table A4-25, and City of Vista in Table A4-26. Two estimates of pollutant loads are provided for the City of Vista's SLR-03 as it is unknown when the illicit discharge began. These estimates represent the range of potential pollutant loading for the monitoring year based on assuming leak beginning in August 2016 (56 dry days) when it was discovered, or a continuous discharge for the year (298 dry days).

**Assumes Continuous discharge for the year (298 dry days)

cf – cubic feet kg – kilogram MPN – most probable number

Dry weather visual observation and field investigation data regarding known and/or suspected sources of non-stormwater discharges were used to estimate percent contributions from each known or suspected source for each persistent flow outfall in accordance with Provision D.4.b.(1)(c)(iv)(a). These results are provided in Table A4-27. During field investigations, agricultural run-off was identified as a primary source of non-stormwater discharges (approximately 90%) for two persistent flow outfalls. Agricultural irrigation runoff is not within the jurisdiction of Participating Agencies. This type of runoff is regulated by a State Agricultural Waiver, which expired in February 2014, and a Waste Discharge Requirement Permit will eventually be issued to replace it. As a source not subject to the Participating Agencies' legal authority, this source is identified and quantified per Provision D.4.b.(1)(c)(iv)(b). The stormwater volume and pollutant loads for the agricultural runoff source is provided in Attachment 4E to this Appendix.

Table A4-27. 2015-2016 Dry Weather Assessment of Discharge by Flow Source for Persistently Flowing Major Storm Drain Outfalls

Participating Agency	Major Storm Drain Outfall	Annual Dry Weather Discharge (cf)	Estimated Percent of Non-Stormwater Discharge from Suspected Flow Sources						Notes
			Non-Jurisdictional: Agricultural Runoff	Source Unknown	Irrigation	Vehicle Washing	Uncontrollable Source: Groundwater/ Springs	Leaking Fire Hydrant	
County of San Diego	MS4-SLR-041	6,632			95%	5%			
	MS4-SLR-095	50,310			50%		50%		
	MS4-SLR-097	0		No Data					
	MS4-SLR-150	28,994			100%				
	MS4-SLR-152	592,655	90%		5%	5%			Non-jurisdictional agricultural runoff was identified (suspected) as the only flow source for several upstream drainages. Near the outfall, other potential non-stormwater flow sources were observed.
	MS4-SLR-154	11,590		No Data					Not a designated highest priority site for 2015-2016 monitoring year.
	MS4-SLR-155	5,255,553	90%		10%				Non-jurisdictional agricultural runoff was identified (suspected) as the only flow source for several upstream drainages.
City of Oceanside	SLR-007	0		No Data					Not a designated highest priority site for 2015-2016 monitoring year. Persistent flow monitoring planned for 2016-2017.
	SLR-025	8,234			100%				
	SLR-036	314,129					100%		Rising groundwater identified as a known source. No other sources were identified during field investigations.
City of Vista	SLR-01	57,326					100%		Source suspected to be groundwater seepage based upon previous investigations.
	SLR-03	7,796 to 42,735						100%	Source is suspected to be from a fire hydrant leak. Repair work is scheduled and follow-up ongoing.

cf – cubic feet

4.2.3.5 Provision D.4.b.(2)(c)(v)

This Provision requires the Participating Agencies to review the data collected under the dry weather storm drain outfall monitoring program in order to identify pollutant reduction progress, assess water quality improvement strategy effectiveness, and identify modifications necessary to increase effectiveness. This assessment is required once during the Permit term and will be provided in the San Luis Rey River WMA chapter of the RMAR, which is scheduled for submittal to the Regional Board in December 2017.

4.2.3.6 Provision D.4.b.(2)(c)(vi)

No gaps have been identified in the monitoring data. Because the 2015-2016 monitoring year was the first year of monitoring under the WQIP MAP and the first year requiring the assessments outlined in Provision D.4.b.(1)(c)(ii-iv), the collection of additional data may be necessary before the Participating Agencies are able to identify data gaps.

4.2.4 *Illicit Discharge Detection and Elimination Program Data and Assessment*

In order to reduce pollutant loading into local receiving waters, each Participating Agency implements a program to reduce non-stormwater flows into its storm drain system. These programs are designed to meet the requirements of the Permit related to IDDE. Each Participating Agency's IDDE Program is one of the primary components of their Jurisdictional Runoff Management Program (JRMP).

Each Participating Agency's IDDE Program seeks to address and reduce the potential contribution of pollutants from stormwater and non-stormwater discharges. The IDDE Programs seek to achieve the following goals:

- Controlling the contribution of pollutants to and the discharges from the storm drain system within its jurisdiction,
- Effectively prohibiting non-stormwater discharges to the storm drain system, and
- Reducing the discharge of pollutants in stormwater to the maximum extent practicable.

In pursuit of these goals, and in addition to the programmatic elements of the IDDE Programs, the Participating Agencies prioritize outfalls and sources, conduct follow-up investigations, and seek to identify sources of non-stormwater discharges on the basis of the following:

- Field screening visual observations at major storm drain outfalls,
- Non-stormwater monitoring at prioritized persistent flow outfalls, and
- Reports or notifications of illicit discharges, illicit connections, or other sources of non-stormwater flow from hotlines or other sources.

In addition to outfall monitoring and associated source investigations, the IDDE programs also include the following components to prevent, identify, and eliminate IC/IDs:

- Educating the local community about prohibited discharges and how to prevent them. During the 2015-2016 fiscal year, this outreach program included working closely with water utilities to educate communities about outdoor water conservation, including preventing irrigation runoff.

- Operating a public complaint phone hotline and website and investigating the complaints received.
- Inspecting industrial/commercial and municipal facilities, construction sites, and residential areas. In addition to identifying and eliminating IC/IDs where applicable, inspectors also proactively educate responsible parties about how to avoid IC/IDs, such as cleaning outdoor areas by sweeping instead of hosing them off.
- Maintaining the storm drain system and sewer system, which provide opportunities to identify unpermitted connections to the storm drain system, cross connections, and other potential sources of IC/IDs.

Much of the IDDE program information is described in more detail in Section 4 of the Annual Report and is reported in the JRMP Annual Report form provided as Attachment D to the Permit. The form includes a series of questions related to the central elements of the JRMP programs being implemented by each Participating Agency. The IDDE section includes quantification of the activities of the program in the previous reporting year, such as the number of non-stormwater discharges identified or eliminated, per the requirement of Permit Section II.E.2.D.4. The JRMP Annual Report forms for each Participating Agency are provided in Appendix 2.

4.2.4.1 Dry Weather Storm Drain Outfall Source Identification Results

The Participating Agencies prioritized the outfalls under their jurisdictions in the San Luis Rey River Watershed based on these field screening results and analysis of the collected outfall flow data. Extensive field investigations and discharge reconnaissance visits looking for illicit discharges in upstream areas were then conducted to identify and eliminate sources of flow to these priority outfalls. Illicit discharges or connections contributing non-stormwater flow may be subject to enforcement; however, many sources of non-stormwater flow can be terminated with education or technical assistance.

Source investigations for storm drain outfall monitoring broadly categorize identified sources as “controllable” and “uncontrollable.” Uncontrollable sources include natural sources such as groundwater and springs. Controllable and uncontrollable sources are further classified as known and suspected. All but three sources were categorized as suspected; two known sources were groundwater and one was irrigation. Table A4-28 summarizes the controllable flow sources investigated by each Participating Agency during the 2015-2016 monitoring year. It is important to note that more than one source may contribute flow to a single outfall. In cases where flow was observed at the outfall, but the source was not directly observed or otherwise definitively identified, Participating Agencies may have identified the sources as “suspected” rather than “known.” Suspected sources may require additional investigation to identify them more specifically before they can be reduced or eliminated. Table A4-29 summarizes the uncontrollable flow sources investigated by each Participating Agency during 2015-2016.

Table A4-28. Known and Suspected Controllable Sources of Flows in the San Luis Rey WMA

Participating Agency	Known Controllable Sources				Suspected Controllable Sources				
	Commercial Washing Activities	Irrigation Runoff	Vehicle Washing	Other	Irrigation Runoff	Commercial Washing Activities	Residential Vehicle Washing	Residential Impervious Surface Washing	Other
County of San Diego					34[1]		2		3 (illicit connections)
City of Oceanside		1			1				
City of Vista									1 (leaking hydrant)[2]

Note:
[1] Does not include agricultural irrigation runoff. See notes of Table A4-23 for further detail.
[2] Repair work to be scheduled, follow-up ongoing.

Table A4-29. Known and Suspected Uncontrollable Sources of Flows in the San Luis Rey WMA

Participating Agency	Known Uncontrollable Source			Suspected Uncontrollable Source			
	Groundwater	Springs	Tidal	Groundwater	Agricultural Runoff	Springs	Other
County of San Diego				4	10[1]		
City of Oceanside	2					1	1 (detention basin seepage)
City of Vista				1			

. **Note:**
[1] Agricultural irrigation runoff is not within the jurisdiction of the Participating Agencies, and this type of runoff is regulated by a State Agricultural Waiver which was included in Resolution No. R9-2007-0104, Amendment to the Water Quality Control Plan for the San Diego Basin (9) to Incorporate the Revised Conditional Waivers of Waste Discharge Requirements for Specific Types of Discharge within the San Diego Region. This waiver expired in February 2014 and a Waste Discharge Requirement Permit will replace it.

The most common source of non-stormwater flow found during the Participating Agencies' investigations was irrigation runoff, a controllable source. This flow source includes over-watering of residential and commercial landscaping. The flow category of "irrigation runoff" in Table A4-28 and Table A4-29 and in Figure A4-9 do not include irrigation runoff from agricultural areas, which is regulated by the Regional Board under a separate program and is outside of the jurisdiction of the Participating Agencies. Agricultural runoff was among the suspected sources during 10 investigations involving two outfalls. Figure A4-9 shows the known or suspected flow sources identified during the 2015-2016 monitoring year through the Participating Agencies' outfall flow investigations by monitoring program staff.

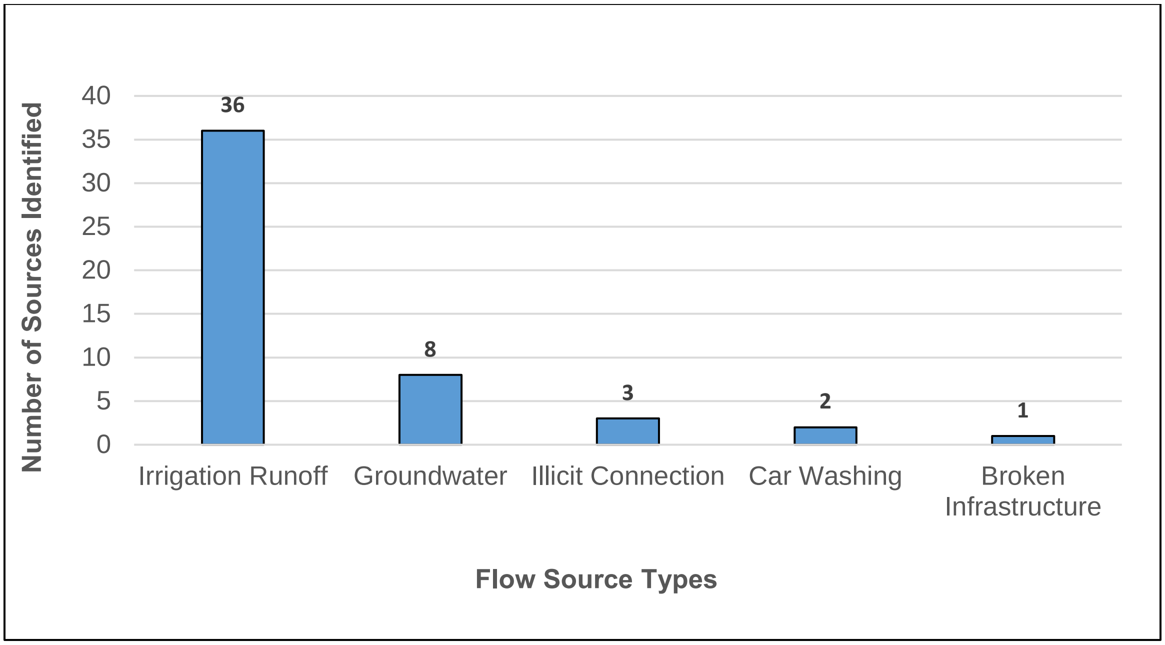

Figure A4-9. Known or Suspected Flow Sources Identified for Participating Agencies' Outfalls

More detail about source investigations and associated source elimination activities at the highest priority outfalls is provided in Appendix 2 and in Table A4-30 through Table A4-32 below.

4.2.4.2 Outfall Investigation Details for Participating Agencies

Within the San Luis Rey WMA, the City of Oceanside conducted five non-stormwater flow source investigations upstream of its two priority outfalls and found over-irrigation as the source for flows at one of the outfalls; see Table A4-30 for further details on their investigations. The City of Vista conducted four non-stormwater flow source investigations upstream of two of its priority outfalls and did not find over-irrigation as a source flow; instead it found groundwater seepage, which is an allowable discharge, and a leaking fire hydrant as sources of flow. See Table A4-31 for further details on the City of Vista's investigations. The County of San Diego conducted 35 non-stormwater flow source investigations upstream of its five highest priority outfalls, and six investigations at a non-major storm drain outfall SLR-045 (less than 36 inches in diameter) with persistent non-stormwater flow and evidence of human indicator bacteria source(s) based on the Microbial Source Tracking study results (see Attachment 4J). The six outfalls have also been fitted with continuous flow monitoring equipment to more precisely track and characterize the non-stormwater flows at those locations throughout the dry season (May through September). The County found numerous sources of flow into the stormwater system draining to these outfalls, with over-irrigation being the most common source suspected. For further details about the County's investigations, including upstream assessments of flow sources for the six outfalls see Table A4-32.

Table A4-30. City of Oceanside Non-stormwater Flow Source Investigation Summary for FY 2015-2016

*SLR-045 is not a major storm drain outfall (less than 36 inches in diameter). The County monitors flows at this persistent outfall to assess progress toward WQIP goals, and the outfall was an IDDE investigation site this monitoring year.

4.2.5 *Storm Drain Outfall Wet Weather Monitoring*

Storm drain outfall wet weather monitoring was conducted at five outfalls in the San Luis Rey River WMA. Five stations representative of storm water discharges from Residential, Commercial, Industrial, and typical Mixed-use land uses were selected from the inventory of major storm drain outfalls, and at least one station was selected for each Participating Agency within the WMA. Three outfalls were located in the Mission HSA, and two in the Bonsall HSA. The storm drain outfall wet weather monitoring stations for the San Luis Rey River WMA are presented in Table A4-33 and are shown with corresponding land uses in Figure A4-10. The outfall names for the wet weather monitoring stations differed from the jurisdictional station names in the Participating Agencies' inventories; therefore, both station identifiers are given in Table A4-33. This is the first year of wet weather storm drain outfall monitoring in accordance with the WQIP MAP. The prior two years of wet weather monitoring were under the transitional monitoring program with a different list of analytical parameters. However, the locations of outfalls MS4-SLR-1 and MS4-SLR-2 have not been adjusted since the second year of transitional monitoring (2014-2015), and the locations of outfalls MS4-SLR-3, MS4-SLR-4, and MS4-SLR-5 have been unchanged since transitional monitoring began (2013-2014). Therefore, two monitoring years of wet weather storm drain outfall monitoring data have now been collected at MS4-SLR-1 and MS4-SLR-2, and three years of data have been collected at MS4-SLR-3, MS4-SLR-4, and MS4-SLR-5.

Table A4-33. Storm Drain Outfall Wet Weather Monitoring Stations in the San Luis Rey River WMA

Storm Drain Outfall Name	Jurisdictional Identifier	Jurisdiction	HSA Name/No.	Latitude	Longitude
MS4-SLR-1	SLR-036	City of Oceanside	Mission/903.11	33.25583	-117.29243
MS4-SLR-2	SLR-016	City of Oceanside	Mission/903.11	33.22186	-117.34984
MS4-SLR-3	SLR-03	City of Vista	Mission/903.11	33.232546	-117.249591
MS4-SLR-4	MS4-SLR-150	County of San Diego	Bonsall/903.12	33.283702	-117.217033
MS4-SLR-5	MS4-SLR-041	County of San Diego	Bonsall/903.12	33.317871	-117.163833

Sampling at the storm drain outfall wet weather monitoring locations in the San Luis Rey River WMA was conducted between December 11, 2015 and January 31, 2016. The rainfall statistics for the monitored event at each outfall, based on nearby Alert station gauges, are presented in Table A4-34. The highest event volume was observed at MS4-SLR-5 in the Bonsall HSA, and the highest peak flow was observed at MS4-SLR-2 in the Mission HSA. The lowest event volume and peak flow were observed at MS4-SLR-4 in the Bonsall HSA. Wet weather storm drain outfall flow data are presented in Attachment 4F to this appendix.

Table A4-34. 2015-2016 Rainfall Statistics for Storm Drain Outfall Wet Weather Monitoring Events in the San Luis Rey River WMA

Date	Outfall Name/ Jurisdictional Identifier	Total Rain (in)	Duration (hours)	Intensity (in/hour)	Antecedent Dry Days	Event Volume (cf)	Peak Flow (cfs)
01/05/2016	MS4-SLR-1/ SLR-036	1.20	7.55	0.16	13	33,644	9.54
01/05/2016	MS4-SLR-2/ SLR-016	1.20	7.55	0.16	13	76,181	14.6
01/31/2016	MS4-SLR-3/ SLR-03	0.55*	7.60*	0.07*	19	30,585*	6.75*
12/11/2015	MS4-SLR-4/ MS4-SLR-150	0.28	3.13	0.09	12	18,516	8.06
01/31/2016	MS4-SLR-5/ MS4-SLR-041	0.68	14.3	0.05	19	84,099	13.4

in – inches cf – cubic feet cfs – cubic feet per second
*Intermittent flow not associated with sampling activities was observed between 02:30 and 04:00 (peak of 0.88 cfs; discharge of 1,520 cf).

Monitoring was conducted in accordance with the WQIP MAP. Grab samples were collected and analyzed for pH, temperature, conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria. Composite samples were collected and analyzed for constituents contributing to the HPWQC, 303(d) List impairments, TMDLs, and stormwater action levels (SALs). A receiving water sample was also collected and analyzed for hardness, where feasible. Observational and hydrologic data were also recorded.

Analytical results for samples collected at the five wet weather storm drain outfall monitoring locations are summarized in Table A4-35. Bacteria concentrations are compared to SSM effluent limitations from the Bacteria TMDL, and results for the remaining required constituents, including general and physical chemical constituents, nutrients, and total and dissolved metals, are compared to SALs, where available.

Bacteriological results for *Enterococcus*, fecal coliform, and total coliform (i.e., the HPWQC within the WMA) indicated that the highest concentrations were measured at MS4-SLR-1, located in the Mission HSA (903.11). Concentrations of *Enterococcus* and fecal coliform in wet weather discharges from all five outfalls were above the SSMs specified in the Bacteria TMDL (WQBELs discharging to freshwater creeks with REC-1 beneficial use). The only existing SALs that relate to PWQC in the WMA are for nitrate/nitrite as N and total phosphorus, and the only PWQC concentration measured above one of these SALs was total phosphorus at MS4-SLR-5. Turbidity was also above the SAL at this location. No other constituent concentrations were above the corresponding SALs, where available.

It should be noted that the drainage area of MS4-SLR-5 is located almost entirely within the footprint of the Highway Fire, which burned the area in May 2014. Potential effects of wild fires on water quality may include elevated concentrations of constituents associated with sediment transport (e.g., total suspended solids [TSS] and turbidity), organic contaminants, metals, and nutrients. Data collected at MS4-SLR-5 for the 2014-2015 monitoring year, approximately six months following the fire, indicated that the fire affected water quality at this station, as the turbidity values and concentrations of TSS, total phosphorus, total Kjeldahl nitrogen (TKN), and several metals at this outfall were much higher than those at the other outfalls located in the San Luis Rey River WMA and much higher than those measured at this location during 2013-2014 (WESTON, 2015a). As shown in Table A4-35, concentrations of these constituents remained elevated compared to the other outfalls in the WMA and the concentrations measured prior to the fire, including exceedances of SALs for turbidity and total phosphorus.

Laboratory and field data collected for the Storm Drain Outfall Wet Weather Monitoring will be uploaded to CEDEN and data submittals are provided in Attachment K of this appendix.

4.2.6 *Storm Drain Outfall Wet Weather Monitoring Data Assessments*

Provision D.4.b.(2).(c) of the Permit requires the storm drain outfall wet weather monitoring data assessments summarized in Table A4-36. The information necessary to demonstrate compliance with each Provision is outlined in the following sections. In instances where compliance has been demonstrated in previous sections of this Annual Report, those sections are referenced.

Table A4-36. Storm Drain Outfall Wet Weather Monitoring Data Assessments

Assessment	Components	Provision(s)
WQIP Annual Report		
Estimate loads and volumes.	Calculate or estimate the average stormwater runoff coefficient for each land use type.	D.4.b.(2).(b)(i)(a)
	Calculate or estimate the volume of stormwater and pollutant loads discharged from each monitored storm drain outfall for each qualifying storm event.	D.4.b.(2).(b)(i)(b)
	Calculate or estimate the total volume and pollutant load discharged from the Copermittee's jurisdiction over the course of the wet season.	D.4.b.(2).(b)(i)(c)
	Calculate or estimate the percent contribution of stormwater volumes and pollutant loads discharged from each land use type within each hydrologic subarea with a major storm drain outfall or each major storm drain outfall for each qualifying storm event.	D.4.b.(2).(b)(i)(d)
	Identify necessary modifications to monitoring locations and frequencies necessary to identify pollutants in stormwater discharges.	D.4.b.(2).(b)(ii)
Evaluate WQIP analysis.	Using data and applicable SALs, evaluate and compare data collected to the analyses and assumptions used to develop the WQIP.	D.4.b.(2).(c)(ii)
	Evaluate whether analyses and assumptions should be updated as a component of the adaptive management efforts.	D.4.b.(2).(c)(ii)
Identify data gaps.	Identify data gaps in the monitoring data necessary to fulfill assessment requirements.	D.4.b.(2).(c)(iv)
Evaluate trends.	Evaluate data collected pursuant to D.2.c, incorporate new data into time-series plots for each long-term monitoring constituent and perform statistical trends analysis on cumulative long-term wet weather data set.	D.4.b.(2)(d)
Once during Permit Term		
Evaluate progress in achieving stormwater pollutant reductions.	Identify reductions and progress in achieving reductions from different land uses and/or drainage areas.	D.4.b.(2).(c)(iii)
	Assess the effectiveness of WQIP improvement strategies, with estimates of volume and load reductions attributed to specific strategies when possible.	
	Identify modifications necessary to increase the effectiveness of WQIP strategies.	

4.2.6.1 Provision D.4.b.(2)(b)

Provision D.4.b.(2)(c)(i) requires that the Copermittees continue to conduct the land-use based wet weather storm water outfall discharge monitoring assessment previously required by the transitional monitoring requirements of Provision D.4.b.(2)(b).

Since the wet weather storm drain outfall discharge monitoring station locations have not been modified, the general approach and land use data and groupings presented in the transitional monitoring and assessment report from the 2014-2015 monitoring year (WESTON, 2016a) are applicable to the 2015-2016 monitoring year. The technical approach and applicable equations can be found in the Transitional Wet Weather MS4 Monitoring Workplan (WESTON, 2015b). Assessment results are presented in detail by jurisdiction in Attachment 4G to this appendix. As more data are collected and incorporated into the assessment, the results are becoming increasingly representative of the variation in runoff coefficients and constituent concentrations associated with different land uses and wet weather conditions to generate a more robust prediction of jurisdictional loads based on land use.

Assessment results specific to 2015-2016 include pollutant volumes and loads at each outfall for the monitored event (Table A4-37) and for the monitoring year (Table A4-38). Updated land use event mean concentration (EMC) summary tables based on three monitoring years of data are included in the detailed assessment results provided as Attachment 4G to this Appendix.

In compliance with Provision D.4.b.(2)(b)(ii), the wet weather storm drain outfall discharge monitoring locations and frequencies were evaluated in order to identify recommended modifications that may be considered for implementation in the future. A review of the collective land use data associated with monitored storm drain outfall drainage areas was conducted to determine whether the WMA contains any categories of land use types not represented within the monitored storm drain outfall drainage areas. The results and recommendations were presented in the 2014-2015 Transitional Monitoring and Assessment Report submitted under the Permit (WESTON, 2016a) and remain unchanged since the monitored wet weather storm drain outfalls were the same during the 2014-2015 and 2015-2016 monitoring years.

The evaluation of monitoring frequency included a review of the monitoring data to determine how well the data from the single storm event monitored at each outfall represented the wet weather conditions on an annual basis. The total qualifying rainfall characterizing storms greater than 0.1 inch for 2015-2016 was 11.0 inches and 10.4 inches at the Oceanside and Fallbrook Alert precipitation stations, respectively. These rainfall values are comparable to the official regional rainfall average of 10.82 inches (Lindbergh Field). Wet weather events in the San Luis Rey River WMA were small to average in size, with rainfall totals of approximately 0.5 inch or less in 24 hours. A slightly higher frequency of wet weather days was recorded along the Pacific coastline compared to inland areas. At the Oceanside Alert station, three wet weather days had over one inch of recorded precipitation within 24 hours (September 15, 2015 and January 5-6, 2016); whereas, the Fallbrook Alert station only had two wet weather days (September 15, 2015 and January 5, 2016) with over one inch of recorded precipitation.

4.2.6.2 Provision D.4.b.(2)(c)[ii]

In addition to the land-based assessment presented in Section 4.2.6.1, the 2015-2016 monitoring year is the first requiring the additional assessments of Provision D.4.b.(2)(c)(ii-iv).

Provision D.4.b.(2)(c)(ii) requires the Copermittees to evaluate and compare data collected during 2015-2016 to the analyses and assumptions used to develop the WQIP and evaluate whether adaptive management is necessary for updates. The analytical results for samples collected at the five storm drain outfall wet weather monitoring locations in the San Luis Rey River WMA are summarized in Table A4-35 in Section 4.2.5. Results showed that indicator bacteria concentrations in wet weather discharges from all five monitored outfalls were above the single sample maximums specified in the Bacteria TMDL. The analyses and assumptions used to develop the WQIP resulted in the selection of bacteria as the HPWQC in the San Luis Rey River WMA and in the selection of the five outfalls monitored during wet weather. Because concentrations of indicator bacteria in wet weather discharges from each of these outfalls were above Bacteria TMDL targets, continued monitoring of these outfalls is consistent with the intentions of the WQIP and adaptive management for updates are not necessary at this time.

4.2.6.3 Provision D.4.b.(2)(c)[iii]

This Provision requires the Copermittees to review the data collected under the storm drain outfall wet weather monitoring program in order to identify pollutant reduction progress, assess water quality improvement strategy effectiveness, and identify modifications necessary to increase effectiveness. This assessment is required once during the Permit term and will be provided in the RMAR, which is scheduled for submittal to the Regional Board in December 2017.

4.2.6.4 Provision D.4.b.(2)(c)[iv]

No gaps have been identified in the monitoring data. Since the 2015-2016 monitoring year was the first year of monitoring under the WQIP MAP and the first year requiring the assessments outlined in Provision D.4.b.(2)(c)(ii-iii), the collection of additional data will be necessary before the Copermittees are able to identify data gaps.

4.2.6.5 Provision D.4.b.(2)(d)

This provision requires creation of time-series plots for long-term monitoring data collected under Provision D.2.c and a trend analysis on this cumulative long-term wet weather storm drain outfall discharge monitoring data set. This assessment will be addressed when sufficient data (i.e., at least three monitoring years are required for a statistical test) have been collected under the WQIP MAP.

4.3 Special Study Results

4.3.1 *San Diego Regional Reference Streams and Beaches Studies*

The Participating Agencies participated in the San Diego Regional Reference Streams and Beaches Studies from 2014 to 2016, which measured levels of indicator bacteria that account for natural sources to establish the background concentrations, or "reference conditions", for streams or beaches minimally disturbed by anthropogenic activities. This reference system approach results in allocation of allowable exceedance days based on frequencies of exceedance at reference sites with natural sources of bacteria. The results of these studies support the forthcoming re-evaluation of the Bacteria TMDL and numeric target development for future TMDLs. These studies were intended to provide data to support discussions of reasonable, accurate targets for indicator bacteria at Southern California streams and beaches.

4.3.1.1 Reference Streams Study

This study investigated concentrations of indicator bacteria, nutrients, metals, and conventional constituents occurring naturally at reference streams in minimally disturbed watersheds in Southern California during wet weather (during a storm and the three days following a storm) and dry weather conditions. Although additional constituents were analyzed, the main focus of the study was indicator bacteria. The study also sought to categorize exceedance frequencies for indicator bacteria by hydrologic, geomorphologic, biotic, and abiotic factors. Study questions included the following:

- How does the WQO exceedance frequency for indicator bacteria vary between wet weather, summer dry weather, and winter dry weather?
- How does indicator bacteria vary by stream landscape and site-specific factors, including:
  - Catchment size and geology?
  - Wet weather parameters such as size, timing of storm, and number of antecedent dry days?
  - Dry weather factors such as flow, stream physiochemical parameters (temperature, conductivity, and turbidity), chemical parameters (nutrients, organic carbon, metals, and conventional constituents) and trophic status, as measured by algal abundance?

The sampling locations selected for this study were chosen to meet reference screening criteria and represent varying watershed size and geology. Samples were collected during eight storm events at five locations, and dry weather samples were collected weekly at 10 intermittent stream locations in 10 watersheds in Southern California. Five locations were in San Diego County, three were in Orange County, and two were in Ventura County. In addition to indicator bacteria analysis, samples were collected biweekly and analyzed for nutrients, metals, and conventional constituents. Samples were also analyzed for the presence of human genetic marker in order to eliminate locations with potential human sources of fecal bacteria. The chosen "reference" streams had drainage areas that were at least 95% undeveloped, were relatively homogenous geologically, had year round flow or at least prolonged dry weather flow, did not include drainage areas affected by wildfires, were not included on the 303(d) list, and had no evidence of anthropogenic effects. Findings from the study included the following:

- Indicator bacteria concentrations measured during the study were generally below WQOs except for *Enterococcus*, and exceedance frequencies were highest during summer dry weather.
- Wet weather EMC exceedance frequencies were low except for *Enterococcus*. The number of events was not sufficient to determine whether relationships exist between exceedance frequencies and watershed size and/or geology.
- Temperature was the major factor associated with elevated summer dry weather concentrations of indicator bacteria, although TSS, nutrients, and organic carbon were

also positively correlated. No significant relationships between indicator bacteria concentrations and watershed size or geology were observed during dry weather.
- EMC fluxes (flux was calculated as the ratio of mass loading and watershed area) during wet weather were two to three times greater than during dry weather and were comparable to those described in previous studies.

Results are presented in greater detail in the Technical Report (Tiefenthaler et al., 2015, which is provided as Attachment 4H to this appendix.

4.3.1.2 Reference Beaches Study

The reference beaches study investigated concentrations of indicator bacteria occurring naturally at reference beaches during a period of prolonged drought. The goals of this study included the following:

- Quantify concentrations and exceedance frequencies for indicator bacteria at reference beaches during wet and dry weather (natural, background conditions), while evaluating the presence of human genetic marker to determine whether samples were contaminated by human sources.
- Quantify concentrations and exceedance frequencies for indicator bacteria at the associated, minimally-impacted estuary.

The chosen "reference" beaches had minimal human impact with open beaches and breaking waves, received freshwater runoff from a beach or estuary, and received runoff originating from undeveloped watersheds with over 93% open space. The two sites meeting these criteria were San Onofre Creek in San Diego County, which has an associated bar-built estuary, and Deer Creek in Los Angeles County, which has an associated mixing zone. Weekly dry weather sampling was conducted at both locations, and wet weather sampling was conducted over four days for one event at San Onofre Creek (only one storm event breached the creek mouth). Samples during each event were collected at the beach, creek, and the respective estuary or mixing zone. Findings from the study included the following:

- Indicator bacteria concentrations and exceedance frequencies during both winter and summer dry weather were low at both monitored beaches. This is consistent with results from previous studies of beaches with blocked estuary inlets or beaches with flowing creeks and no estuary.
- Indicator bacteria concentrations in the estuary or mixing zone associated with both beaches were one to three orders of magnitude greater than those at the corresponding beach, and were higher at San Onofre Creek than Deer Creek. Exceedance frequencies were also higher in the estuary associated with San Onofre Creek compared to the mixing zone associated with Deer Creek. This suggests that dry weather exceedance frequencies may have been greater if the estuary had been open to tidal exchange.
- At both study locations, no significant relationships between indicator bacteria and water temperature, salinity, or antecedent dry days were observed, but indicator bacteria concentrations decreased with the number of antecedent dry days at the San Onofre Creek beach and increased with the number of antecedent dry days in the associated

estuary. Significant positive correlations were found between total coliform concentrations and water temperature, salinity, and antecedent dry days and between *E. coli* and fecal coliform and salinity in the estuary associated with San Onofre Creek. This indicates that freshwater input from the creek dilutes bacteria concentrations. Regrowth of bacteria may have been a factor at this estuary.

- During the single monitored storm event, indicator bacteria exceedances were common in the San Onofre Beach creek and estuary samples, but exceedances were only observed at the beach on the day of the storm. Because all samples associated with this storm event were positive for human genetic marker, results could not be used to determine natural background exceedance frequencies. However, positive human marker results were rare throughout the study overall, indicating that the study locations may be suitable reference sites.

Results are presented in greater detail in the Technical Report (Tiefenthaler et al., 2016), which is provided as Attachment 4I to this appendix.

4.3.2 *San Luis Rey River Microbial Source Tracking Study*

A dry weather microbial source tracking (MST) study was conducted in the San Luis Rey River Watershed consisting of a preliminary outfall investigation, a storm drain network investigation, and an evaluation of potential remedial activities. Preliminary findings were reported in December 2015. These findings are summarized below and are provided as Attachment 4J to this appendix.

The preliminary outfall investigation involved inspections and sampling of storm drain outfalls in the sewered portions of the unincorporated area of San Diego County within the San Luis Rey River Watershed. Of the 130 outfalls investigated, 14 were flowing and were sampled. Human marker was detected at quantifiable levels in samples from three of these 14 flowing outfalls (human marker was detected at a level below the quantification limit at one additional outfall). In addition, dog marker was found in samples from four outfalls, and pig and ruminant markers were found in one sample. Concentrations of fecal coliform and/or *Enterococcus* were above WQOs in all but one sample.

The storm drain network investigation involved water sampling for outfalls positive for human marker during the preliminary outfall investigation and visual observations for all outfalls flowing during the preliminary outfall investigation. During the storm drain network investigation, indicator bacteria results were elevated in all water samples, but none were positive for genetic markers. Several sources of non-stormwater flow and bacteria were observed, but no potential human sources of bacteria were identified in the vicinity of flowing outfalls. In addition, no illicit connections or leaks were observed during the storm drain network investigation. Irrigation runoff was identified as the most common source of non-stormwater flow, and agriculture discharge was identified as the largest contributor to flow volume.

The evaluation of potential remedial activities resulted in prioritization of several actions to achieve compliance with the Permit during dry weather. These actions included notifying agricultural owners of their pollutant contributing flows and discussing compliance approaches with the Conditional Waiver of Discharges from Agricultural and Nursery Operations, implementing source control measures (e.g., public outreach, ordinance development and enforcement, wildlife access restriction devices, and storm drain cleaning), evaluating the effectiveness of source control measures and identifying remaining flowing outfalls requiring additional remediation, and eliminating remaining non-stormwater flows using structural BMPs (e.g., wet weather BMPs recommended in the San Luis Rey Comprehensive Load Reduction Plan [CLRP], pervious gutters, catch basin drywells, and green street-type bioretention swales).

Results from this preliminary MST study will be used to support Permit compliance and Bacteria TMDL implementation planning, and may potentially serve as the first step in future Natural Source Exclusion and/or Quantitative Microbial Risk Assessment (QMRA) work. "Next steps" identified in the preliminary MST investigation report include:

- Conduct follow-up outfall investigations.
- Investigate whether recycled water tests positive for human genetic markers, and determine which outfalls may contribute recycled water.
- Conduct the dry weather MST study in the septic served areas of the County of San Diego's jurisdiction in the San Luis Rey watershed.
- Continue to implement special studies that may potentially modify TMDL WQBELs during the TMDL reopener.
- Notify agriculture owners of their pollutant contributing flows and discuss compliance approaches with the Conditional Waiver of Discharges from Agricultural and Nursery Operations.
- Enhance source control measures.
- Develop an ongoing study evaluating the effectiveness of source control measures and monitoring the presence of non-stormwater flows.

The Dry Weather MST Study Preliminary Findings Report, which presents additional detail and presents results specific to each monitored outfall, is provided as Attachment 4J.

4.3.3 *Special Studies Assessments*

Provision D.4.c of the Permit requires an annual evaluation of special studies results to assess their relevance to the Participating Agencies' characterization of receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the storm drain outfalls to receiving waters. This Provision also requires the Participating Agencies to identify modifications and/or updates to the WQIP that are necessary based on special study results.

Results from the special studies outlined above supplement the bacteria data collected under Provisions D.1 (receiving water) and D.2 (storm drain outfalls). Results from these studies may be used in conjunction with data from other studies in re-assessing numeric targets related to bacteria. The Regional Reference Streams and Beaches Study provides a scientific basis for updating the "reference" conditions to be considered in evaluating compliance levels in the Bacteria TMDL, and will be useful in the re-evaluation of the Bacteria TMDL. The San Luis Rey River MST study will be used to support Permit compliance and Bacteria TMDL implementation planning, and may potentially serve as the first step in future Natural Source Exclusion and/or QMRA work. Once these re-evaluations occur, adaptive management may be utilized to modify the priorities of the WQIP.

4.4 Action Levels

The action levels for storm drain outfall samples utilized to evaluate the data collected in the San Luis Rey River WMA are presented in Table A4-39. Suggested analytical methods and reporting limits are presented in Attachment 4A-5d to the WQIP MAP.

Table A4-39. Action Levels for the San Luis Rey River WMA – Storm Drain Outfalls

Analyte	Benchmark Reference	Units	Action Level(s)				Notes
Non-Stormwater Action Levels for Discharges from Storm Drain Outfalls to Ocean Surf Zone							
			AMAL		IM		
Total coliform	Ocean Plan	MPN/100 mL	1000		10,000/1,000		For IM, total coliform density NAL is 1,000 MPN/100 mL when the fecal/total coliform ratio exceeds 0.1.
Fecal coliform	Ocean Plan	MPN/100 mL	200		400		For AMAL, fecal coliform density NAL is 200 MPN/100 mL during any 30 day period.
Enterococcus	Ocean Plan	MPN/100 mL	35		104		IM value has been set to the Basin Plan WQO for saltwater "designated beach areas".
Non-Stormwater Action Levels for Discharges from Storm Drain Outfalls to Bays, Harbors, and Lagoons/Estuaries							
			AMAL		IM		
Turbidity	Ocean Plan	NTU	75		225		
pH	Ocean Plan	Units	Within limit of 6.0-9.0 at all times				
Fecal coliform	Basin Plan	MPN/100 mL	200		400		AMAL is based on a minimum of not less than five samples for any 30-day period. For IM, the NAL is reached if more than 10 percent of the total samples exceed 400 MPN/100 ml during any 30 day period.
Enterococcus	Basin Plan	MPN/100 mL	35		104		IM value has been set to the Basin Plan WQO for saltwater "designated beach areas" and is not applicable to water bodies that are not designated with water contact recreation (REC-1) beneficial use.
Non-Stormwater Action Levels for Discharges from Storm Drain Outfalls to Inland Surface Waters							
			AMAL	MDAL	IM		
Dissolved Oxygen	Basin Plan	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters				
Turbidity	Basin Plan	NTU	-	20	See MDAL		
pH	Basin Plan	Units	Within limit of 6.5-8.5 at all times				
Fecal Coliform	Basin Plan	MPN/100 mL	200	-	400		AMAL is based on a minimum of not less than five samples for any 30-day period. For IM, the NAL is reached if more than 10 percent of total samples exceed 400 MPN/100 mL during any 20 day period.
Enterococcus	Basin Plan	MPN/100 mL	33	-	61		IM value has been set to the Basin Plan WQO for saltwater "designated beach areas" and is not applicable to water bodies that are not designated with water contact recreation (REC-1) beneficial use.
Total Nitrogen	Basin Plan	mg/L	-	1	See MDAL		
Total Phosphorus	Basin Plan	mg/L	-	0.1	See MDAL		
MBAS	Basin Plan	mg/L	-	0.5	See MDAL		
Iron	Basin Plan	mg/L	-	0.3	See MDAL		
Manganese	Basin Plan	mg/L	-	0.05	See MDAL		
Non-Stormwater Action Levels for Priority Pollutants							
			Freshwater		Saltwater		
			AMAL	MDAL	AMAL	MDAL	
Cadmium	CTR	µg/L	**	**	8	16	
Copper	CTR	µg/L	*	*	2.9	5.8	See footnote.
Chromium III	CTR	µg/L	**	**	-	-	
Chromium VI	CTR	µg/L	8.1	16	41	83	
Lead	CTR	µg/L	*	*	2.9	14	See footnote.

Table A4-39. Action Levels for the San Luis Rey River WMA – Storm Drain Outfalls

Analyte	Benchmark Reference	Units	Action Level(s)				Notes
Nickel	CTR	µg/L	**	**	6.8	14	See footnote.
Silver	CTR	µg/L	*	*	1.1	2.2	See footnote.
Zinc	CTR	µg/L	*	*	47	95	See footnote.
Stormwater Action Levels							
Turbidity	Order No. R9-2013-0001	NTU	126				
Nitrate & Nitrite (Total)	Order No. R9-2013-0001	mg/L	2.6				
Phosphorus (Total P)	Order No. R9-2013-0001	mg/L	1.46				
Cadmium (Total Cd) †	CTR	µg/L	3				See footnote.
Copper (Total Cu) †	CTR	µg/L	127				See footnote.
Lead (Total Pb) †	CTR	µg/L	250				See footnote.
Zinc (Total Zn) †	CTR	µg/L	976				See footnote.

* Action levels designated on a case by case basis.

** Action levels designated on a case by case basis, but calculated criteria are not to exceed MCLs under the CCR, Title 22, Division4, Chapter 15, Article 4 Section 64431.

The cadmium, Copper, Chromium (III), Lead, Nickel, Silver, and Zinc NALs for storm drain outfall discharges to freshwater receiving waters will be developed on a case-by-case basis on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to 40 CFR 131.38(b)(2).

† Sampling must include a measure of receiving water hardness at each storm drain outfall. If a total metal concentration exceeds the corresponding metals SAL in the table, that concentration must be compared to the CTR and the USEPA 1-hour maximum concentration for the detected level of RW hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hr maximum concentration criterion for the measured level of hardness, then the sample result will not be considered above the SAL for that measurement.

4.5 California Environmental Data Exchange Network Data Upload and Retrieval

Provision F.4.a.(6) of the Permit requires that monitoring data collected pursuant to Provision D (Monitoring and Assessment Program Requirements) must be uploaded to the CEDEN, a central location for finding and sharing information about California's waterbodies. CEDEN aggregates water quality, aquatic habitat, and wildlife health data and makes them accessible in downloadable forms at www.ceden.org.

Data in the CEDEN are searchable by date and by location, project, station, or parameter using the "Find Data" functionality of the CEDEN website. The data from the San Diego Region Copermittee Program can be retrieved by identifying the Program as "National Pollutant Discharge Elimination System (NPDES) Program" and Project as "San Diego Region NPDES", which is the parent Project name. Within this overall retrieval, the specific datasets described in this Annual Report can be identified using the project names listed in Table A4-40. Data are limited to those parameters that are currently storable in CEDEN (CEDEN does not currently accept calculated values, and therefore CSCI values cannot be submitted). SMC data are submitted to the SMC Program.

In accordance with the Permit, data collected during the 2015-2016 monitoring year will be submitted to CEDEN by January 31, 2017, and will become available from CEDEN once loaded by the Regional Data Center into the system during 2017. CEDEN data submittals and receipts are provided as Attachment K to this appendix.

Table A4-40. Project Names for CEDEN Data Retrieval

Project Code	Project Name
BacteriaTMDL_SLR	San Luis Rey River Bacteria TMDL Monitoring Program
MS4_WW_OFM	Wet Weather MS4 Outfall Monitoring
MS4_DW_OFSM	Dry Weather MS4 Outfall Field Screening and Discharge Monitoring
NPDES_RWM	NPDES Receiving Water Monitoring

APPENDIX 5

Adaptive Management/Modifications

Appendix 5 Adaptive Management/Modifications

5.1 TRIGGERS FOR ADAPTIVE MANAGEMENT

The adaptive management process may include modifications to the priority water quality conditions, numeric goals, strategies, and schedules, and/or to the monitoring and assessment program outlined in the Water Quality Improvement Plan (WQIP). This appendix contains analyses and information in support of the adaptive management process. With the acceptance of the WQIP in February 2016, the Participating Agencies have been officially implementing the WQIP for less than a year. Therefore, it is too early in the implementation process to have significant feedback necessary to drive the adaptive management process. Only one year of monitoring data have been collected under the WQIP Monitoring and Assessment Plan (MAP), and additional monitoring years under the Permit term are necessary for feasible evaluation of the effectiveness of jurisdictional strategies. Minor modifications to the descriptions of strategies and schedules are provided in Appendix 2. No significant modifications to the MAP are warranted based on data collected during the 2015-2016 monitoring year. The results of the Permit-required assessments of these data are presented in Appendix 4.

5.1.1 Routine Monitoring Results

Results from routine monitoring programs may trigger updates to the WQIP, potentially prompting additions or changes to the strategies that are implemented. The evaluation of monitoring results occurs at two levels:

(1) comparison to receiving water limitations and determination of the influence of storm drain outfall discharges to any persistent exceedances, and
(2) comparison of dry and wet weather storm drain outfall discharge data to non-stormwater action levels (NALs) and stormwater action levels (SALs).

5.1.1.1 Receiving Water Limitations

The primary focus of this assessment is on conditions within receiving waters and their relationship to storm drain outfall discharges. An assessment methodology to determine whether discharges from storm drain outfalls are potentially sources of pollutants "causing or contributing" to "persistent" receiving water exceedances is currently being developed, and the results of the assessment will be presented in the San Luis Rey River Watershed Management Area (WMA) chapter of the Regional Monitoring and Assessment Report (RMAR) to be submitted with the Report of Waste Discharge (ROWD) in December 2017. Long-term receiving water monitoring, required once during the Permit cycle, has not yet not been conducted at the Long-term monitoring station in the WMA (SLR-MLS), which has been dry for the past two monitoring years. Therefore, the trigger for adaptive management pertaining to receiving water exceedances would be more appropriately addressed after the collection of the long-term monitoring data, but will be addressed regardless of the availability of new data in the next report deliverable, the RMAR, which is due prior to the 2016-2017 WQIP Annual Report.

5.1.1.2 Exceedances of NALs and/or SALs

The primary focus of this assessment is on exceedances of NALs or SALs in discharges from the storm drain system during dry and wet weather, respectively. NALs and SALs are incorporated into the WQIP in order to:

(1) support the development and prioritization of water quality improvement strategies,
(2) assess the effectiveness of the water quality improvement strategies, and
(3) support the detection and elimination of non-stormwater and illicit discharges to the storm drain system (NALs only).

Appendix 4 includes the results of the dry and wet weather storm drain outfall discharge monitoring programs and compares the data to applicable NALs or SALs included in Provision C of the Permit. A summary of these results is presented in Table A5-1, and the locations of the highest priority storm drain outfall dry weather monitoring locations and storm drain outfall wet weather monitoring locations are shown in Appendix 4 in Figures A4-5 and A4-10, respectively. Repeated exceedances for constituents that are not currently addressed by the WQIP may indicate that these constituents warrant further consideration. During the 2015-2016 monitoring year, the NALs most often exceeded in the San Luis Rey River WMA were consistent with those identified by the WQIP as priority water quality conditions, with the exception of iron and manganese.

The comparison of the storm drain outfall monitoring results to NALs and SALs may also be used to guide the adaptation of strategies. If the jurisdictional strategies outlined in Section 4 result in reductions in pollutant loads from outfalls with discharges in exceedance of NALs or SALs, an assessment of the effectiveness of these strategies could be made. To date, only one year of monitoring data have been collected in accordance with the MAP, and the Participating Agencies in the WMA have just begun to implement their jurisdictional strategies under the accepted WQIP intended to result in achievement of dry and wet weather interim goals for the term of the current Permit (see Annual Report Section 4). Additional data will be necessary before an assessment of the effectiveness of these strategies can be made.

Table A5-1. Exceedances of NALs and SALs during the 2015-2016 Monitoring Year in the San Luis Rey River WMA

Constituent	Outfalls with NAL Exceedances	Outfalls with SAL Exceedances[3,4]
Fecal Coliform[1]	MS4-SLR-150, MS4-SLR-152, SLR-025, SLR-036, SLR-03	MS4-SLR-041, MS4-SLR-150, SLR-016, SLR-036, SLR-03
Enterococcus[1]	MS4-SLR-095, MS4-SLR-150, MS4-SLR-152, MS4-SLR-155, SLR-025, SLR-036, SLR-03	MS4-SLR-041, MS4-SLR-150, SLR-016, SLR-036, SLR-03
Turbidity[1,2]	MS4-SLR-095, MS4-SLR-150, SLR-03	None
pH[1]	None	N/A
Cadmium[1,2]	None	None
Copper[1,2]	SLR-036	None
Chromium VI[1]	None	N/A
Lead[1,2]	None	None
Zinc[1,2]	None	None
Dissolved Oxygen[1]	MS4-SLR-095, MS4-SLR-150	N/A
Total Nitrogen[1]	MS4-SLR-095, MS4-SLR-150, MS4-SLR-152, MS4-SLR-155, SLR-025, SLR-036, SLR-03	N/A
Total Phosphorus[1]	MS4-SLR-095, MS4-SLR-150, MS4-SLR-152, MS4-SLR-155, SLR-025, SLR-036, SLR-01, SLR-03	N/A
MBAS[1]	None	N/A
Iron[1]	MS4-SLR-095, MS4-SLR-150, MS4-SLR-152, SLR-01, SLR-03	N/A
Manganese[1]	MS4-SLR-095, MS4-SLR-150, MS4-SLR-155, SLR-025, SLR-036, SLR-01, SLR-03	N/A
Nitrate + Nitrite (total)[2]	N/A	None
Phosphorus (Total P)[2]	N/A	MS4-SLR-041

N/A = not applicable. No NAL or SAL in Provision C.
1. Applicable to non-stormwater discharges from storm drain outfalls to inland surface waters.
2. Applicable for discharges of stormwater from storm drain outfalls to receiving waters.
3. Exceeds Single Sample Maximum Final Effluent Limitations (Bacteria TMDL).
4. Outfall station names shown are the Jurisdictional ID.

5.1.1.3 Special Studies Results

As part of the MAP, the Participating Agencies are engaged in special studies related to the highest priority water quality condition (HPWQC) for the watershed (i.e., bacteria). Results from the special studies outlined in Annual Report Section 3.3 and Appendix 4 Section 4.3 supplement the bacteria data collected under Provisions D.1 (receiving water) and D.2 (storm drain outfalls). As relevant data, conclusions, and lessons learned become available from these studies, the numeric goals, strategies, schedules, and the MAP may be impacted and may require modification. Additionally, lessons learned and study results from outside the watershed, especially those related to the bacteria impairments, may also be incorporated into the WQIP.

The Regional Reference Streams and Beaches Study provides a scientific basis for updating the "reference" conditions to be considered in evaluating compliance levels in the Bacteria Total Maximum Daily Load (TMDL), and will be useful in the re-evaluation of the Bacteria TMDL. The San Luis Rey River MST study will be used to support Permit compliance and Bacteria TMDL implementation planning, and may potentially serve as the first step in future Natural Source Exclusion and/or QMRA work. Once these re-evaluations occur, adaptive management may be utilized to modify the WQIP.

5.1.2 Regulatory Considerations

The purpose of this section is to summarize changes in the regulatory landscape including:

(1) new regulatory actions at the State or local level, and

(2) Regional Board recommendations that must be considered as part of the adaptive management process.

5.1.2.1 New Regulatory Actions

When new regulations or policies are adopted that impact watershed planning and implementation processes, modifications to the WQIP numeric goals, strategies, schedules, and/or MAP may be warranted, and, in some cases, required. For example, an update to the WQIP must be initiated no later than six months following approval of a TMDL Basin Plan Amendment by the Office of Administrative Law and the United States Environmental Protection Agency (USEPA). The trigger applies to TMDLs containing wasteload allocations assigned to Participating Agencies within the watershed during the term of the Order (see Provision F.2.c.(2)). Other examples of regulatory drivers that may trigger modifications to the WQIP include new state policies or plans (e.g., trash, toxicity, biological objectives, bacteria standards updates) and changes resulting from modifications to existing Permit requirements (e.g., as a result of revising a TMDL).

5.1.2.2 Regional Board Recommendations

In cases where the Regional Board makes recommendations for modifications to the WQIP or Jurisdiction Runoff Management Program (JRMP), these recommendations must be considered as part of the adaptive management process. No such recommendations were made during the 2015-2016 monitoring year.

5.1.3 Program Effectiveness Assessments/Progress Toward Numeric Goals

Strategies developed within the WQIP have been incorporated into Participating Agencies' monitoring programs through implementation of their JRMPs. Each Participating Agency is implementing programs that are focused on addressing bacteria in the watershed. As strategy implementation progresses, periodic refinements to the programs may provide additional focus on the specific water quality issues identified in the WQIP. Participating Agencies utilize various assessment methods to determine which program refinements are effective and which are not. In some cases, the program effectiveness assessment results may provide useful information leading to adaption of elements of the WQIP. Where new information is applicable and available, it may be used to modify numeric goals, strategies, schedules, and the MAP.

At this time, only one year of data have been collected in accordance with the MAP, and strategy implementation under the WQIP, accepted in February 2016, was less than a year. Initial results related to program effectiveness (Annual Report Section 4.2) indicate that the Participating Agencies have made progress towards achieving each of their dry and wet weather interim goals for the current Permit term and, in most cases, they are on track to achieve the identified goals during the Permit term. Additional data from subsequent monitoring years will be necessary to supplement this data before evaluations leading to adaptive management actions are feasible and modifications to strategies considered.

5.2 ADAPTIVE MANAGEMENT - CHANGES TO WATER QUALITY IMPROVEMENT PLAN ELEMENTS

The potential triggers that may result in adaptive management of the San Luis Rey River WMA WQIP's numeric goals, strategies, schedules, and/or MAP are outlined in Section 5.1. In general, priority and highest priority water quality conditions and numeric goals are established based on longer periods of record compared to a monitoring year and their assessment would most appropriately be conducted following the collection of sufficient data to make scientifically-based decisions. At earliest, such consideration may be given during the preparation of the ROWD, which is due to the Regional Board in December 2017.

The 2015-2016 monitoring year was the first under the accepted WQIP and MAP. As outlined in Section 5, receiving water and storm drain outfall discharge monitoring results from 2015-2016 support the identified priority and highest priority water quality conditions as provided in the WQIP, and no modifications are necessary at this time.

On an annual schedule, it is more likely that modifications may be made to strategies and implementation schedules. These are elements that may require updates on a more frequent basis to ensure effective implementation and assessment as the WQIP progresses. The information that may be used to modify these elements of the WQIP through adaptive management is summarized in Table A5-2. While one year of monitoring data have been collected in accordance with the MAP of the WQIP, only a few months of this time period have been under the accepted WQIP and implementation. The Participating Agencies in the WMA began planning and implementing their jurisdictional strategies intended to result in achievement of dry and wet weather interim goals for the term of the current Permit. Sufficient information is not yet available to warrant adaptive management of the water quality strategies and schedules. Collection of additional data will be necessary to supplement this data before the combined data set can be evaluated and adaptive management considered. Proposed minor clarifications to two strategies are shown in the jurisdictional strategy tables in Appendix 2 as markup.

Table A5-2. Information Used to Modify Strategies and Schedules

Evidence	WQIP Sections	2015-2016 Status	Adaptive Management Required after 2015-2016? (Y/N)
Receiving water monitoring results.	Section 3, Appendix 4	No new information pertaining to receiving water exceedances not addressed by the WQIP.	N
Storm drain outfall monitoring results.	Section 3, Appendix 4	NAL and SAL exceedances are consistent with WMA priority constituents.	N
Special studies results.	Section 3, Appendix 4	Data from these studies will be useful for the re-evaluation of the Bacteria TMDL and to facilitate consideration of site-specific water quality criteria for bacteria.	N
New or updated regulations.	Section 5	No new regulatory drivers; adaptive management will be required as new TMDLs are approved and as the Trash Amendments are incorporated into the Permit.	N
Program effectiveness assessments.	Section 5	Additional data will be necessary to supplement 2015-2015 data before program effectiveness can be evaluated.	N
Progress towards achieving numeric goals.	Section 4	Initial results related to program effectiveness indicate that the Participating Agencies have made progress towards achieving each of their dry and wet weather interim goals for the current Permit term.	N

In addition to the strategies and schedules, it is also feasible that updates to the MAP may be necessary more often than priority water quality conditions and numeric goals and schedules. Changes to the MAP may be triggered by several factors including:

- Modifications to other elements of the WQIP, including priority water quality conditions, numeric goals and schedules, and/or strategies and schedules.
- Identification of data gap through the required assessments under Provision D.4.
- Results of special studies.
- Requests/requirements from the Regional Board.

None of these triggers are applicable to the 2015-2016 monitoring year, and adaptive management of the MAP is not required at this time. Modifications have been made to the outfall priorities for dry weather monitoring due to highest priority outfalls becoming dry. The baseline for the wet weather watershed goals for Lower San Luis Rey River WMA was revised to both correct the calculation and refine the methodology. This resulted in a lower baseline from which reductions will be measured, requiring lower monitored loads to demonstrate load reductions. Additional assessments are planned for the ROWD, including evaluation monitoring data and receiving water limitations.

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On March 29, 2024, I served the:

- **Current Mailing List dated March 28, 2024**
- **Notice of Waiver of Procedural Requirements, Extension Request Approval, and Postponement of Hearing issued March 29, 2024**
- **Claimants' Comments on the Draft Proposed Decision and Parameters and Guidelines (Volumes 1-14) filed February 20, 2024**

  San Diego Regional Water Quality Control Board Order No. R9-2007-0001, Permit CAS0108758, Parts D.3.a.(3)(b)(iii), D.5.a.(1), D.5.a.(2), D.5.b.(1)(a), D.5.b.(1)(b)(iii-vi), D.5.b.(1)(c), D.5.b.(1)(d), D.5.b.(2), D.5.b.(3), E.2.f., E.2.g., F.1., F.2., F.3., I.1., I.2., I.5., J.3.a.(3)(c)(iv)-(viii), (x)-(xv), the first sentence of L.1. as it applies to the newly mandated activities, and L.1.a.(3)-(6), 07-TC-09-R County of San Diego, Cites of Carlsbad, Del Mar, Imperial Beach, Lemon Grove, Poway, San Marcos, Santee, Solana Beach, Chula Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, San Diego, and Vista, Claimants

by making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on March 29, 2024 at Sacramento, California.
